THE MONEY MARKET

APPLICATIONS for the £230 million of bills again on offer at last week's Treasury bill tender fell by less than £2 million from last week's record level, to £415.4 million. But the market maintained its bid at £99 9s. 7d. per cent, and its allotment fell again, from 44 to 38 per cent. The average rate of discount was virtually unchanged at £2 1s. 7.34d. At yesterday's tender the offer remained at £230 million.

Credit conditions in Lombard Street eased further in the week covered by the Bank return. Special purchases were made direct from the market on a small scale on Friday before the week-end, but on subsequent days credit was at first adequate and then plentiful. By Tuesday a surplus of funds had emerged and outside money was available at 1¾ per cent, and on Wednesday the authorities attempted to mop up the idle funds by operating in reverse and selling bills to the market. Throughout the week the banks bought June and July maturities at 2⅛ per cent.

The gold market has had an active week. Strong demands for gold evoked by the international situation brought London prices to their highest point since the reopening of the market. On Wednesday the price at the fixing was 249s. 1d., while on Tuesday some dealings after the fixing were transacted at 249s. 1½d.

The Bank return shows a post-Easter reflux of notes of £2.5 million. Bankers' deposits fell by £3.2 million to £289.3 million.

THE LONDON OMNIBUS

A VEHICLE OF INFORMATION

LATE IN THE 90's this double-decker steam omnibus served the public up and down the Thames Valley.

Buses come and buses go. But one London Omnibus has been serving the public for over 200 years—the "omnibus" collection of all kinds of insurance policies for all kinds of people offered by the London Assurance. Here are a few of them:

SCHOOL SUMS

When fathers start adding up school fees they are sometimes nonplussed. By taking out an Educational Policy long before school bills get really formidable, they find this problem greatly simplified.

SAFE GUARD

You may be very cautious about your valuables. Your safe may be sound, your watchdogs may bite. But even so, valuables vanish and furs fly. Sentimental value apart, the loss won't hurt so much if you have an All-Risks policy to safeguard you.

'TOP HAT' EVENINGS

Directors and senior executives, unlike those they employ, are often left to provide for the evening of their much-taxed days as best they can out of savings. The London Omnibus carries a 'Top Hat' scheme; which fits almost anyone who wants a 'Top Hat'.

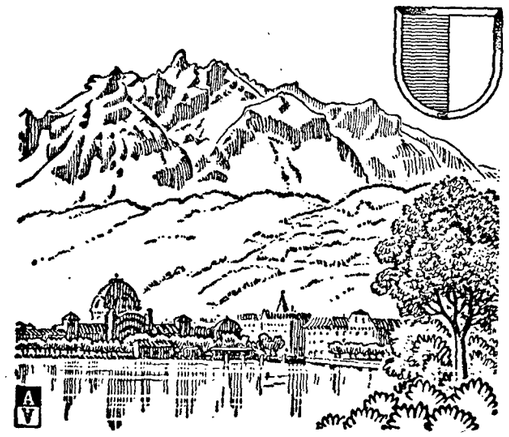
FURTHERMORE . . . .

If you would know more about any of the policies outlined here, if we can provide information about any other policies or about insurance problems generally — pray make what use of us you wish. Our address is 1 King William Street, Department V6, London, E.C.4.

THE LONDON ASSURANCE

"Very good people to deal with"

Perhaps you didn't know that LUCERNE



the heart of historic Switzerland, is connected by rail with the summit of mighty Mt. Pilatus (6,995 ft.).

One travels by ordinary railroad to Alpnachstad, and from there ascends, by the steepest and most daringly built electric train in the world (maximum gradient: 48%).

But everybody knows

that such enterprising railways cannot be built without full co-operation of the banking world. Should you intend visiting beautiful Lucerne, the Lucerne Branch of the Union Bank of Switzerland will be pleased to encash your Travellers' Cheques, to effect payments under your Travellers' Letters of Credit and to be of service in any other direction.

The Company undertakes the duties of Executor and Trustee

The Chartered Bank of India, Australia and China was incorporated in England by Royal Charter on 29th December, 1853, and during the ensuing century its system of Branches has been progressively extended to most centres of commercial importance throughout Southern and South Eastern Asia and the Far East. At all these Branches a complete banking service is available and, in particular, facilities are provided for the financing of international trade in co-operation with the Bank's offices in London, Manchester and Liverpool, its Agencies in New York and Hamburg, and a world-wide range of Banking correspondents.

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

Head Office: 38 Bishopsgate, London, E.C.2.

'Realms of Silver,' Sir Compton Mackenzie's history of the Bank, has been published by Routledge & Kegan Paul. Copies of the book may be ordered through any bookseller at a cost of 25/-

COMPANY MEETINGS

THE BRISTOL AEROPLANE COMPANY, LIMITED

TURNOVER REACHES NEW HIGH LEVEL

CONTINUED EXPANSION OF ACTIVITIES

FURTHER PROGRESS ON NEW PROJECTS

SIR WILLIAM G. VERDON SMITH'S SURVEY

The forty-fourth annual general meeting of The Bristol Aeroplane Company, Limited, will be held on May 20th at Filton House, Filton, Bristol.

The following is the statement by the chairman, Sir William G. Verdon Smith, CBE, which has been circulated with the report and accounts for the year ended December 31, 1953:

This year we have decided to issue the chairman's statement with the report and accounts in advance of the meeting, and it is the board's hope that stockholders will approve of this course.

FINANCIAL MATTERS

The directors' report comments on special items in the accounts and it is only necessary in this statement to refer briefly to one or two important features. References are to the consolidated statements which reflect the combined results of the parent company's divisions and the subsidiaries.

The general picture presented by the accounts is encouraging and your board is again able to report that group turnover reached a new high level, both as regards sales of military equipment for HM forces and other products for the home and export markets.

The consolidated profit and loss account shows that the trading profit for the year before charging depreciation has increased by £239,480 from £2,316,427 to £2,555,907. Against this we have a substantial rise in the depreciation charge from £860,796 to £1,132,443 reflecting the continued high level of our investment in buildings and plant both here and abroad, leaving our trading profits after depreciation at £1,423,464 compared with £1,455,631 in 1952.

There is now a full year's charge for interest amounting to £21,661 on the $1,200,000 of 5 per cent mortgage bonds which, as we reported last year, were raised in Canada in 1952 in connection with the construction of our new plant in Montreal. The charge for other interest at £18,040 compares with a credit of £44,036 in the previous year, this change being largely due to the increased level of advances from our bankers.

The total charge for taxation at £795,115 is equivalent to 58 per cent of our profits, compared with 62 per cent in 1952.

The net profit for the year, to which all our subsidiaries have contributed, amounts to £582,661, compared with £563,829 in the previous year. This increase in net profits may be considered small in relation to a record turnover, but stockholders will realise that at a time when the company's business is expanding there are many initial outlays to be borne out of profits in connection with the new and large projects upon which we are engaged.

BALANCE SHEET FIGURES

The consolidated balance sheet clearly illustrates the continuing expansion of our activities. Fixed assets have risen from £5.2 million to £6.6 million, following a further rise in our capital expenditure from just over £2 million in 1952 to nearly £2.5 million in 1953. Our commitments on capital expenditure at December 31, 1953, amounted to £1,322,822, and the annual outlay must continue on a substantial scale if we are to maintain our competitive position; it is therefore a matter of vital concern to stockholders that Government policy in relation to taxation and the procurement of military equipment should permit us to retain sufficient funds to cover at least a major portion of this capital expenditure from our internal resources. We therefore welcome the new investment allowances introduced by the Chancellor of the Exchequer in his recent budget.

Stocks have again increased by £1.2 million to £10.6 million though the rate of increase has been rather less than in the previous year. Debtors have increased from £4.9 million to £5.4 million reflecting increased turnover during the year. Advances from our bankers have risen from £.68 million to £2.3 million in line with our expectations as reported to you last year. Your board continue to keep the relationship of permanent capital and temporary borrowing under close review.

From the net profit of £582,661 the board have made a transfer of £250,000 to general reserve which makes the total at the credit of that account £3 million and, after bringing in the balance of £455,035 from the previous year, there is a sum of £787,696 available.

The board are recommending a final dividend of 6¼ per cent on the ordinary stock making with the interim dividend of 3¼ per cent already paid, a total of 10 per cent for the year and leaving £498,946 to be carried forward. The gross dividend distribution for 1953 on the ordinary and preference capital, as increased in December, 1952, by a bonus issue to ordinary stockholders, is therefore £525,000—an increase of £35,475 over the gross distribution of £489,525 in 1952. This sum of £35,475 is equivalent to an addition of slightly more than 1 per cent on the old ordinary capital of £3.3 million.

GENERAL REVIEW

The year 1953 was for the company primarily one of further progress in the development of our principal new projects. At the same time our manufacturing resources were well occupied with a steady programme of aircraft and engines, and our engine overhaul shops at home and overseas were busier than ever before in peace time. We shared with the aircraft industry generally the high level of activity stimulated by the defence programme and we also succeeded in increasing our overseas sales in approximately the same proportion as the total export sales of the whole industry, an increase over last year of 45 per cent. During the year we continued to add to our technical and production resources, we strengthened our overseas representation, and we brought into active operation new plants in Sunderland, Montreal and Sydney. At the same time as our current sales were increasing, the prospects for further orders looked bright.

AIRCRAFT, HELICOPTERS AND MISSILES

In our aircraft division, current deliveries for the year were chiefly of Bristol Freighters and of Bristol Sycamore helicopters, together with armament equipment for all three Services and a growing programme of test vehicles for the guided weapon ranges in this country and in Australia.

With regard to helicopters, after a long period of disappointment a really encouraging degree of interest is now being taken in our projects by the Services as well as by civil operators, and the prospect of orders for the Sycamore and for the Type 173 has justified a substantial increase in productive capacity. This is being achieved by making our Weston-super-Mare factory a part of the aircraft division, establishing helicopter production there, together with other aircraft and allied work, and transferring the aluminium building activity, hitherto carried on at Weston, to other nearby premises which we shall occupy as tenants of the Ministry of Supply. The production of helicopters to British designs is now assured; during the next few years valuable experience will thus be gained, and we can now look forward to a time, in our judgment still further away than popular opinion recognises, when the civil operation of helicopters has become less of a novelty and more of a normal means of economic transport.

BRITANNIA AIRLINER PROGRAMME

During the year excellent progress was made with the development and early production stages of the Britannia airliner programme. By the end of the year the prototype had flown over 220 hours and the second aircraft had just started handling trials; no major problems had been encountered, and the prospects of making the first deliveries to BOAC this year as promised looked good. It was a serious disappointment therefore to lose the second aircraft in the River Severn after an emergency landing on February 4th last. But aircraft and aero engine development is punctuated by such experiences; it is of course the very aim and purpose of development flying to learn in good time, and thus to secure the highest possible standards of flight safety for all who will be using our aircraft on passenger services. The cause of the trouble has since been satisfactorily analysed; the remedies to be adopted have been determined; and every effort is being made to recover the time lost.

Our confidence in Britannia as an outstandingly fine aircraft is extensively shared and promising negotiations are in progress with many of the leading airlines. In order to match their estimated requirements with sufficient numbers at the right time we have made arrangements with Short Brothers and Harland Limited of Belfast for them to prepare capacity at their Belfast works so as to supplement the programme already arranged at Filton.

You will appreciate that the combined programmes of both factories not only make a big demand upon our resources but represent—together with similar plans on the part of our competitors in this country—a direct attack upon the civil aviation markets of the world, the outcome of which is of great significance both to the export effort and to the technical reputation of the British aircraft industry. Neither the real risks nor the possible rewards of such a policy should be underestimated.

From the foregoing paragraphs it will be apparent that our aircraft division, which has been greatly strengthened and expanded during the past few years, has a big manufacturing programme ahead of it. In addition, other projects still in the early stages, as well as our guided weapons programmes, give promise of interesting and important tasks ahead.

AERO ENGINES

In our Engine Division the enthusiasm and determination of the engineering team have been handsomely rewarded by the progress which has been made with the Bristol Olympus "two-spool" turbo-jet, which is maintaining its lead as the most powerful turbo-jet engine yet flying. After securing the world's altitude record in an English Electric Canberra last summer, the Olympus was publicly displayed at the SBAC Flying Display as the accepted power plant for the Avro Vulcan Delta Bomber. Further applications of this outstandingly fine engine will be made known in due course. During last year we went ahead well with preparations for Olympus production. Deliveries from the production line start shortly, overlapping the completion of contracts for the Rolls-Royce Avon engines which have occupied much of our capacity for the past two years. In this connection it is perhaps fitting to refer to the friendly collaboration which has existed between the engine constructors who have worked so closely together both in the Avon Group and more generally. It would be hard to find another branch of industry in which the keenest rivalry in the designing and selling stages is accompanied by such a high degree of mutual help in the execution of engineering and manufacturing programmes. This unusually well developed relationship between competitors is both valuable to the defence effort of the country and significant of the way in which the technicians in an industry can, if they are given the encouragement, blend competition and co-operation to great effect.

Last year output from our Engine Division included further deliveries of Hercules and Centaurus engines, some thousands of which continue in use throughout the world. The civil version of the Centaurus has been performing with conspicuous success in the Elizabethan fleet operated by British European Airways, and Hercules have continued to play their part with many different operators. It is likely that, on a modest scale, there will be a continuing demand for our piston engines and, of course, for their spares and overhaul for some years to come.

The Proteus turbo-prop—an engine to which, as we mentioned to stockholders last year, we are looking for important new successes in the transport field—is, like the Olympus, just coming into production after a long and thorough programme of development and testing.

Among the new engine projects to which public reference has already been made we have in the design stage a lightweight axial flow turbo-jet known as the Bristol Orpheus, which we believe will have an important place as the power unit of several new aircraft—light fighters, trainers and others; it has attracted much interest both at home and overseas.

Other new projects being tackled during the year, including an extensive programme of ramjet development, hold out the prospect of a high level of production in the future.

MOTOR CARS

Bristol cars have had another successful year. The demand for the Type 403 saloon has been well sustained and our latest model, the Type 404 two-seater coupé has been well received at motor shows both at home and abroad. A variant of the 404 with a special Italian sports body was recently announced by the Arnolt Corporation who are marketing this model in the United States. We are continuing our policy of a steady development programme to maintain the high standard of technical excellence already achieved by this comparatively new division of the company. During the past year our two-litre engines fitted to Frazer-Nash, Cooper and Kieft cars have had many notable racing successes throughout the world and in our own Bristol Type 450 achieved six international Class E records.

ALUMINIUM BUILDINGS

The comparatively high price of aluminium continues to restrict the development of this business, but during the year we completed a wide variety of contracts, chiefly primary schools for local authorities, and in spite of keen competition, we continued to secure valuable orders, both in the United Kingdom and overseas. The Australian market, in which our sales of aluminium buildings for schools, hospitals and other Government purposes have amounted to close on £4 million during the past three years, has now very greatly reduced, partly on account of increased availability of local building resources and partly by reason of the high import duties now charged on our products. Vigorous efforts are being made to open up other markets at home and abroad, and our designs are being modified to meet changing requirements, including the development of multi-storey schools for the United Kingdom building programme and simpler and cheaper structures for certain overseas markets.

ROTOL LIMITED AND BRITISH MESSIER LIMITED

These two associated companies traded profitably and effectively, and their resources were fully employed in meeting their rising programmes. Their scale of operations is now extensive and one or other of their products is used on practically every type of aircraft in production in this country. Their boards have steadfastly pursued a conservative policy, as a result of which the value of the net assets considerably exceeds the nominal value of the share capital and advances.

BRISTOL AEROPLANE COMPANY OF CANADA LIMITED

Our Canadian company and its two operating subsidiaries had a successful year's trading and our interests in Canada continue to expand. In Montreal, Bristol Aero Engines Limited's new plant, to the construction of which I referred last year, came into operation in the second half of the year and has attracted much favourable comment. Bristol freighters, already in use with the RCAF and other Canadian operators, have also gone into service with Trans-Canada Airlines as part of an interesting campaign for the development of specialised air freight services between principal cities of Eastern Canada. More recently an agreement has been concluded with the Canadian Government under which a military version of the Bristol Britannia is to be constructed by Canadair Limited in collaboration with ourselves for maritime reconnaissance and other purposes. These are the first fruits of the efforts which we have made over the past five years to develop our Canadian business. It is our confident belief that further benefits will accrue in due course.

BRISTOL AEROPLANE COMPANY (AUSTRALIA) PROPRIETARY LIMITED

Our activities in Australia are as yet on a small scale but during the year we took over from our friends the Overseas Corporation of Australia their share of the capital of Airflite Limited which we have now renamed Bristol Aviation Services Limited. The leasehold premises at Bankstown Airfield have been equipped for helicopter and aircraft overhaul work and a new factory nearby has been leased and equipped for the overhaul of aero engines. Our guided weapons department has made use of the workshop premises we now occupy at Salisbury and trials of weapons sent out from Bristol have made a promising start at Woomera.

EUROPEAN ASSOCIATES

In France our associated company, Société d'Exploitation et de Constructions Aeronautiques, continues to be actively engaged on aircraft and engine overhauls.

In Spain, the company has participated in the formation of a new company, Talleres Aeronauticos de Barajas, S.A., which will carry on an aircraft overhaul business at Barajas Airport, Madrid, the primary object being to provide good maintenance in Spain for the increasing number of Bristol aircraft and engines in use in that country.

RE-EQUIPMENT AND EXPANSION

During the year considerable increases were made to our fixed assets as evidenced by the increase in balance sheet value to which reference has already been made. The major part of this large sum was spent on new machine tools for both manufacturing divisions, on new and elaborate test plant for ramjets and turbo-jets, and on conversion to turbo-jets of a section of our engine repair factory at Whitchurch near Bristol. The process of re-equipment has no finality and despite the high level of taxation we have regarded it as having a paramount claim upon our resources.

It has continued to be exceedingly difficult to attract both skilled men and design draughtsmen to the Bristol area in sufficient numbers. We have therefore further developed our branch on the North Eastern Trading Estate at Sunderland by occupying a third factory built to meet our requirements, and we have gained considerable benefit from branch drawing offices in the London area which supplement the main offices in Bristol.

We are pressing on with the construction of our new apprentices' school in order to increase the annual intake both of trade and engineering apprentices and to raise the quality of their training. Engagement of engineering graduates has been steadily maintained and, in addition, some twenty of our Higher National Certificate engineering apprentices are currently working for their engineering degrees in universities. Much of our training programme is still in the experimental stages and it is good that this should be so; we have no doubt that the continuous recruitment and training of able men is of vital importance to our future—every bit as important indeed as the provision of all the expensive plant and equipment the need for which is unquestioned—and we are emphasising more and more the need for well considered schemes of selection, further training, and promotion, believing that some of the best sources of talent are to be found within our own ranks.

PROSPECTS AND PROBLEMS

It is to be hoped that this review has given stockholders a comprehensive picture, both of the current state of our business and of the future outlook. On the credit side, there is every reason for having confidence in the technical merits of our products and their suitability to the market over the years ahead, and for having equal confidence in the excellence of our workmanship. We have good justification on these grounds for expecting our turnover to continue at a high level. On the other side—and this is something that applies to the whole of British industry and not just to ourselves—we cannot ignore the trend of costs, in which the basic element is the cost of wages and salaries. Despite many warnings, there is still a dangerous failure to recognise that we may, by high costs, price ourselves out of the competitive markets of the world: if we do so the maintenance of a high level of employment will become impossible. There is also a dangerous and widespread failure to understand that a better standard of living depends not on bigger money incomes, but on the amount of genuine and intelligent hard work contributed by each of us to our common purpose, the defence and prosperity of our country.

So far as we in this company are concerned, we shall, so far as it lies in our power, continue steadily on the course which we have set ourselves—that is the course of increasing our efficiency and of providing stable employment in good and improving conditions on work which we are proud to think is of considerable service to the State. I thank once again the thousands of our staff and workpeople who, by their loyalty and hard work, help to make possible the achievement of these ends.

MONSANTO CHEMICALS · PLASTICS

MONSANTO CHEMICALS LIMITED

The following is a précis of the circulated statement of the Chairman, Mr. Edward A. O'Neal, Jr. which will be made at the Annual General Meeting on 8th June, 1954.

SALES AND PROFITS

Despite the continuance of some of the difficulties of 1952 the year 1953 has shown marked improvement in turnover and profit.

Sales increased by 9 per cent. to a record total of £10,852,854.

Exports, at 40 per cent. of total sales, were also a record at £4,320,000.

Profit at £670,860 compared with £293,718 for 1952.

An interim dividend of 6⅜ per cent. in September, 1953, was followed in February, 1954, by a further interim dividend of 13¾ per cent., making the total dividend for 1953 20 per cent. on the nominal value of the stock.

FINANCE

The remaining £2,000,000 of 5 per cent. Unsecured Loan Stock 1982 was issued in May, 1953. Part of the £3,500,000 obtained from this and the initial issue in 1952 has been expended on new plant, in investment in subsidiary and associated companies and for use as working capital. A substantial proportion remains available for expansion.

OPERATIONS

Despite intensive competition and falling prices sales increased both in volume and tonnage, and both factories were consequently able to operate more efficiently. At the year's end the company had 3,435 employees compared with 3,318 at the end of 1952.

EXPANSION

At Ruabon new facilities include increased production capacity and process improvements for synthetic phenol, chemicals for the rubber industry and other products. A major pilot plant unit was completed to accelerate production of new products.

At Newport major expansions were made to plant producing synthetic detergent chemicals and Lustrex polystyrene. Units producing chlorine and organic chemical specialities were expanded.

Close attention has been given to manufacturing projects outside the United Kingdom through the expansion of existing interests and through new investment abroad.

SUBSIDIARY AND ASSOCIATED COMPANIES

Monsanto Chemicals (Australia) Limited showed increased earnings for 1953. The company commissioned the first polystyrene plant in Australia during the year.

Monsanto Chemicals of India Limited. Following a survey made in 1952 negotiations on the possibility of manufacture in India are now in progress.

Forth Chemicals Limited, now in full production of styrene monomer, is to double its capacity.

PLANS FOR 1954

Higher sales targets have been set for 1954. Additional supplies of certain products will become available. The company expects to add new products to its list, both from its own research and through its facility for acquiring new processes and process improvements from its associates in the United States.

INDUSTRIES SERVED BY MONSANTO CHEMICALS LIMITED

Adhesives: Agriculture: Aircraft: Dental Products: Disinfectants: Dyestuffs: Electrical: Engineering: Food: Glass: Iron and Steel: Leather: Motor: Packaging: Paint, Varnish and Lacquers: Paper: Perfumery and Cosmetics: Petroleum: Pharmaceuticals: Plastics: Printing Inks: Rubber: Soap and Laundry: Textiles: Timber

Copies of the Annual Report are available on application to the Institute of Industrial and Public Relations.

MONSANTO CHEMICALS LIMITED Registered Office: 8, Waterloo Place, London, S.W.1.
Sales Offices: Victoria Station House, Victoria Street, London, S.W.1. 601/602, Royal Exchange Buildings, Manchester.

THE ROYAL LONDON MUTUAL INSURANCE SOCIETY LIMITED

TOTAL ASSETS EXCEED £110 MILLION

INCREASE IN ORDINARY BRANCH INTERIM BONUS

The ninety-third annual general meeting of this Society was held on April 27th in London.

Mr C. H. Shuttleworth, FCII, chairman and joint managing director, in the course of his speech, said: The investment of the policyholders' funds is one of the most important—if not the most important—of the duties of the Board, who must always bear in mind certain vital principles. In this matter the directors of a life assurance office regard themselves as acting in the capacity of trustees.

The collection of premiums periodically at the home of the policyholder makes an industrial branch endowment assurance the most convenient method of saving; the allocation of profits in the form of bonus additions makes this type of policy financially attractive and the inclusion of life assurance cover from the inception provides the dependants of the policyholder with security, in the event of death, which can be obtained in no other way.

The increased building of houses for purchase which is now taking place prompts me once again to emphasise the advantages of house purchase by means of the Society's house purchase scheme.

The Labour Party has, in recent years, on several occasions, put forward proposals for the nationalisation of all classes of insurance carried on by the Industrial Life Offices. I have no hesitation in affirming once again the belief of your board that Government interference with the industrial assurance business would be harmful to the interests of the policyholders.

PROGRESS OF BRANCHES

The premium income in the ordinary branch (including consideration for annuities granted) amounted to £3,804,000, an increase of £50,000 over the previous year. The fund at the end of the year amounted to £31,441,000, an increase of £1,760,000.

Improved mortality has been a feature of our experience in the ordinary branch and this, combined with the recent improvement in the yield on the investments in the fund makes it possible for me on this occasion to announce an increased rate of interim bonus on participating policies in this branch.

On with-profit policies in the ordinary branch becoming claims, etc., during the current year the interim bonus will be at the rate of £1 10s. per cent per annum in respect of the years 1951, 1952 and 1953, and £1 14s per cent per annum in respect of the year 1954.

In the industrial branch the premium income for the year amounted to £8,988,000, an increase of £251,000 over the previous year. The fund at the end of the year amounted to £69,559,000, an increase during the year of £4,376,000. Claims and surrenders amounted to £4,347,000.

The total income of the Society during 1953 was £17,342,000, while benefits paid to policyholders amounted to £6,892,000. The total payments to policyholders since the inception of the society amount to more than £125 million.

The report was adopted.

THE CUNARD STEAM-SHIP COMPANY, LIMITED

DIFFICULTIES DULY MET AND OVERCOME

STATEMENT OF THE CHAIRMAN

Colonel Denis H. Bates, chairman of the company, in a statement to stockholders for submission at the seventy-seventh annual meeting to be held on May 19th says:

At the meeting of the board following the last annual meeting Mr F. A. Bates expressed the wish to be relieved of the responsibilities of the chairmanship and the directors honoured me with the appointment.

1953 has been no exception in providing the customary quota of difficulties for the group. That they have as usual been duly met and overcome is owing to the energy and devotion of our staffs, at sea and ashore, throughout the world. I wish to pay a warm tribute to them all for their magnificent work which has enabled our services in the seven seas to be satisfactorily maintained. I would also express our best thanks to our agents everywhere for working so closely with us and for backing up our staffs so well.

The surplus for the year in the consolidated profit and loss account at £3,065,339 is £559,000 lower than in 1952. The 1953 figure is arrived at after providing £3,076,318 for United Kingdom taxation, a decrease of £1,481,000 on 1952.

PASSENGER CARRYINGS SATISFACTORILY MAINTAINED

In the North Atlantic the final results of our trading in 1953 have been somewhat lower than 1952 for while our passenger carryings were satisfactorily maintained there was a decline in homeward cargoes, caused by our national lack of dollar currency. Freight rates also fell throughout the year. The Mediterranean service made a smaller contribution because of more difficult trading conditions. The greater part, however, of the reduction in the operating surplus has resulted from less remunerative operations in the Australian and New Zealand freight services and in those from India, Pakistan and Ceylon. At the same time operational costs have continued to rise.

Wear and tear allowances form the backbone of funds to replace our ships, and as stockholders are well aware, my predecessor has written year after year emphasising their inadequacy under the conditions of current costs. Indeed, so much has been said and written by owners generally at all possible opportunities that virtually there is nothing unsaid and the warnings are there for all to read.

INVESTMENT ALLOWANCES WELCOMED

I therefore welcome with intense relief the new proposals by the Chancellor in his Budget under the heading of "Investment Allowances." This "help," as he himself described it, may not be large but in a year when the economy of Britain is under strain and has very little elbow room, any assistance in the replacement problem ahead of us is helpful, especially so perhaps in the implied admission that at long last the Treasury as the sleeping partner in industry realises that the problem itself exists at all.

The Treasury has absorbed over nineteen million pounds of our earnings in the past five years, despite annual warnings that insufficient is left towards the replacement of the tools of our trade. The new investment allowances mean, apparently, that so long as there are sufficient profits and with taxation at its present level, nearly 2s. in every £ expended on ship construction will be remitted. With our current shipbuilding liability higher than for many years past and needing further additions before long, this gesture is helpful to our endeavours as well as being calculated to maintain employment, for I would emphasise that the building of ships, especially passenger liners, provides work for many industries far beyond the shipyard concerned.

At the same time it is essential to remember there is NO true profit until provision is made annually for the renewal at current costs of the wear and tear or wastage in the ships themselves. Refusal to accept the truth of that axiom inevitably leads to inability to replace them all. I regard to Chancellor's new proposal as a tacit recognition of that principle, but it must be said that in its material effect it represents only a very modest first step towards bridging the gap between historic or first cost and current cost of building, especially of tonnage constructed before the war.

Taxation at £3,076,000 is less than last year's figure by £1,481,000. This decrease is due to the smaller operating surplus and to the effect of the reintroduction of initial allowances on new tonnage for 1953, now to be replaced by investment allowances.

The amounts retained by the subsidiary companies are much lower this year than last because of reduced profits. They are essential for their replacement programmes and cover the future repercussions of the 1953 initial allowances.

Following £460,000 set aside last year for pension funds, £100,000 should this year be sufficient to maintain the aim of the board, accorded such warm approval by stockholders at last year's annual meeting.

Transfer to Cunard reserves is £1,200,000 compared with £1 million last year. A part of this provision is to meet the future effects of initial allowances operated in 1953.

REPLACEMENT OF THE FLEET

In the consolidated balance sheet general reserves at £33,898,000 show an increase of £2,370,000. The type of tonnage required by the parent company and its subsidiaries is necessarily of the highest class in the world and correspondingly expensive. Our continued existence depends on our ability to set aside sufficient money for replacement. This is a heavy task but I should be failing in my duty if I did not consider this a cardinal point in our yearly financial policy. Provision for ship replacements is the life blood of any shipping company as the fleet ages year by year. The magnitude of the task ahead of us can be gauged by outstanding liabilities on ships under construction estimated at £17,820,000. Fixed assets are £33,781,761, an increase of £1,930,000 accounted for by instalments on new tonnage. Cash at £13,297,625 and tax reserve certificates at £3,865,000 are available for future shipbuilding payments, operational expenses and taxation liabilities.

A final dividend of 13½ per cent is recommended, a total of 15 per cent for the year. For the past ten years an interim dividend of 2½ per cent has been declared within the first four months of the current year and paid alongside the final dividend for the past completed year, making one annual payment. It is difficult to assess the year's prospects in the first three months and a more even split in two payments will be appreciated by stockholders. The 1954 interim is 2½ per cent to be paid with the final dividend for 1953. The situation will be assessed again in October and for 1955 onwards an interim dividend will be considered in October instead of April. The carry forward at £1,238,910 is £15,000 below last year's figure.

CONTINUING FAITH IN CANADA'S DESTINY

A number of directors and managers have maintained personal touch with our interests abroad. Mr Donald has toured Australia and New Zealand, Mr Dawson has visited USA and Canada and Sir John Brocklebank the USA.

Saxonia, the first of our new Canadian ships, was launched at Clydebank on February 17th. Lady Churchill graciously carried out this duty. The second vessel, *Ivernia*, we expect will be ready for launching towards the end of the year and we have high hopes that Mme. St. Laurent will find it possible to make the journey from Canada to be her sponsor. With continuing faith in the destiny of Canada, and in pursuance of our policy of prudent and orderly renewal of our fleet we have placed an order with Clydebank for a third ship for delivery in 1956.

The first of our three new Mediterranean ships, the *Pavia*, began her working life last July and has justified our expectations. The second, *Lycia*, will shortly be ready for launching and will, we hope, be in service just after the middle of the year, to be followed shortly by the *Phrygia*.

The Port and Brocklebank Lines also have a full replacement programme in train. The former took delivery of the *Port Montreal* in February last and hope that another ship will be completed before the turn of the year. The Brocklebank Line *Masirah* has recently been sold for scrap and the new *Maskeliya* is expected to be delivered in June.

PROSPECTS FOR 1954

Our 1954 prospects for North Atlantic passenger traffic are reasonably good: this year we have not the magnet of the Coronation, which, however, in the result served rather to alter the timing of the movement than to produce any great increase. The North Atlantic cargo outlook is of the same pattern as last year, the eastbound position still being adversely affected by currency restrictions, while the west bound movement is likely to be well maintained except that—I trust only temporarily—it is at the moment suffering from labour troubles on the American water front. The outward trades to Australia and India should benefit from the relaxation of import restrictions.

Attempt at prophecy in all these matters, which are so entirely beyond our control and influence, is at most a vain thing but backed by the loyalty and devotion of our whole organisation I believe we are fitted and ready in all respects to maintain and give service, be it Cunard, Port or Brocklebank.

INTERNATIONAL NICKEL OF CANADA

YEAR OF PROGRESS

The annual general meeting of the International Nickel Company of Canada, Limited, was held on April 28th in Toronto.

Dr John F. Thompson, chairman, in the course of his speech, said: In 1953 the company again enjoyed a period of substantial progress marked particularly by important achievements in expansion of our production facilities and development of process improvements. The output of nickel, our principal product, was maintained at capacity for the fourth consecutive year, ore mined was at a new high and proven ore reserves at the year-end were the highest in the company's history.

Our nickel producing capacity at the end of the year was at an annual rate in excess of 275 million pounds, compared to about 250 million pounds at the close of 1952. Deliveries of nickel, to countries of the free world also showed an increase over the previous year. Our ability to provide additional plant capacity and the progress achieved in our mining expansion programme made it possible for us to enter into a five-year contract with the United States Government for "quick" delivery of 120 million pounds of metallic nickel and 100 million pounds of electrolytic copper. Initial shipments under the contract were made in January, 1954.

Net earnings for the year of $53,694,000, or $3.54 a share on the common stock, were the third highest in the company's history and its strong financial position was well maintained. In 1952 net earnings were $58,891,000, or $3.90 a common share.

The company's price for nickel continued unchanged at the level of 60 cents (United States), or its equivalent, established in January, 1953. This price is up by 3½ cents per pound from the 1952 level.

PRODUCTS

The company's deliveries of nickel in all forms during 1953 amounted to 251,417,000 pounds. This volume was about 13 per cent greater than the average for the five years immediately following World War II.

The company has become a principal producer of heat-resistant alloys for the aircraft industry. Our alloys meet a wide range of jet engine requirements for materials of construction and they are used in turbine buckets and vanes, combustion chambers and afterburners.

At the company's previous metal refinery at Acton, England, process research continued to improve current operating methods and to initiate more economical techniques.

Our Mond laboratories and our Clydach refinery have developed a special type of nickel powder now being commercially employed in a sintered plate nickel-cadmium battery.

Metallurgy and research are a means of revealing and employing the latent worth possessed by nickel, which in many instances does what no other metal can do. It is on this premise that further progress of the nickel industry largely depends. Your company, as the world's leading nickel producer, has for over half a century devoted much time and effort to its search for new applications for the metal. It is to be hoped that other producers and those newly coming into the field will feel, as we do, that production carries with it the responsibility for developing and expanding the market for nickel.

The report was adopted.

UPSONS LIMITED

(The Dolcis Shoe Company)

MR F. J. STRATTON'S SPEECH

The thirty-fourth annual general meeting of Upsons Limited was held on April 22nd in London.

Mr F. J. Stratton, CBE, chairman and managing director, in the course of his speech, said: When I had the pleasure of addressing you last year I said that in spite of the prospect of increased buying of fashion shoes throughout the Coronation and holiday period, I did not share the opinions of those who took an optimistic view of trading possibilities in our section of the shoe industry for the year 1953. The difficulties which we had foreseen persisted throughout the earlier part of the year, but there was an improvement in the resilience of turnover in the second half of the year. Costs of all sorts—rents, rates, wages, lighting and heating, in particular—increased, but I am glad to say that in spite of these disadvantages we completed the financial year showing once more an increase in the number of customers served.

PROGRESS IN CANADA

I am glad to be able to report favourably on the further progress of Dolcis (Canada) Limited, which enterprise we share jointly with our friends, Messrs Bally. Each of the stores which have been open more than a year have shown encouraging increases in trade and our new store at London, Ontario, has given us excellent results right from the opening date. Particulars are to be found in the appendix to the report and accounts of this and some of our other Coronation year extensions. Meanwhile, we have added to the ownership of Dolcis (Canada) Limited additional properties at Peterborough and Kitchener, and negotiations are pending for developments elsewhere in the Dominion.

The trade which we do with Dolcis (Canada) Limited, additionally to the work of our export division in the United States of America and elsewhere, enables us to continue to make a substantial contribution of dollars to the national finances.

I am glad to record that our affairs will be helped by the Chancellor's new investment allowance with regard to plant and machinery, though I must mention once more our regret that the special claims of the footwear industry to be relieved of purchase tax, which bears unjustly on our end of the industry, have not been met.

SATISFACTORY OUTLOOK

The outlook for 1954 is satisfactory. We have decided to transfer the sum of £200,000 to a reserve for the modernisation of premises and this amount will be applied to that purpose as rapidly as circumstances allow, thus improving our presentation and service to our customers. Prices have reached a certain stability and manufacturers as a whole are up to date with production, thus lessening the gap between ordering and delivery and promoting a healthier and more competitive atmosphere in our industry. Though I do not underestimate the difficulties ahead, I think we may regard the immediate future with sober confidence. Management and staff are working as hard as ever and are well-qualified to surmount the problems which lie ahead.

It is against this background that my colleagues and I have thought fit to recommend the issue of option shares to mark still further the active co-partnership which exists between shareholders and staff in your enterprise.

The report and accounts were adopted.

JOHN BARKER & CO.

RECORD OF UNCEASING EXPANSION

The sixty-first ordinary general meeting of John Barker & Company Limited was held on April 23rd in London.

Mr Trevor A. Bowen, DL, JP (the chairman), in the course of his speech, said: The result of the year's operations is a profit of £680,668. Of this amount taxation absorbs £350,108, or 51¼ per cent, leaving a balance profit of £330,560.

I should like to call attention to the fact that the company (which was incorporated on June 26, 1894) celebrates its Diamond Jubilee this year. From that day to this it has been a record of unceasing expansion to the present outstanding position in the nation's trading and in world reputation.

In the early part of the year business was most difficult but it certainly improved as the year went on. Since the abolition of price controls the general retail price level of many commodities has fallen, despite the rise in expenses.

Shoppers have become more selective in their wants, and there is a growing demand for better merchandise at the lowest price possible consistent with quality.

Of all forms of taxation I think that purchase tax is the most harsh, and in its present operation the most unjustifiable. By all known adverse results it should be utterly abolished as quickly as possible.

All the floors of the new branch store at Eastbourne are now open and the business is in full operation, and your directors hope that our Eastbourne shop will be a worthy addition to the Barker group.

The report was adopted.

THE SAPONG RUBBER ESTATES LIMITED

In his address, circulated with the directors' report and the accounts for the year 1953, the chairman, Mr H. W. Horner, says:

The accounts for 1953 show a profit before taxation of £1,276 as compared with £37,886 in the previous year. During the twelve months in which the 1953 crop came to market, the price, from about 1s. 11d. at the start, declined almost continuously until it settled for some months at a fairly steady level not much above 1s. 4d. a lb.

One of the effects of the rise in prices of rubber and other commodities, resulting from the Korean war, was that wages and the local prices of goods of almost all kinds rose too. The decline in prices has not been accompanied by any significant reduction in wages in North Borneo, because the supply of labour, both skilled and unskilled, is insufficient to meet the demand. It has lately been possible to effect some reduction in costs and at the present price of rubber—about 1s. 6d. a lb—the company is operating without loss. Estate expenditure in 1953 included the completion of an extensive programme of manuring nearly the whole of the planted area and no such expenditure is necessary in the current year.

The small profit of £1,276 earned in 1953 has been added to the balance brought forward from the previous year's accounts, which is accordingly £14,120. You will see that capital expenditure in 1953 was considerable. An extension of the planted area is now in hand. The trees now being planted are expected to yield much more rubber per acre than those which were planted in the early days of the industry.

W. & A. GILBEY

(Wine Merchants and Distillers)

"THE WINE MERCHANTS OF THE PEOPLE"

HOME AND EXPORT TRADE EXPANSION

The annual general meeting of W. & A. Gilbey Limited was held on April 26th in London, Mr. R. D. Gilbey (the chairman) presiding.

The following is an extract from his statement:

As I and my colleagues see it, apart from the penal taxation which bears so heavily upon the trade, circumstances of today are not unfavourable to our business. Better housing, coupled with the development of television, is undoubtedly favouring the "Off" trade at the expense of the "On"; and we are fully alive to the possibilities of this trend. Additionally, there is no doubt that the public are evidencing a lively interest in wines and spirits. Costs generally have continued to rise, but we have thought it desirable to build up our goodwill while this interest is so pronounced, and only in the last few weeks have we increased our selling prices (and then by only a modest amount) as we are confident that the modernisation and re-equipping we are carrying out will bear fruit very soon and enable us to give even better value than ever. Our policy today, as from the inception of the business, is to be "The Wine Merchants of the People."

In the United Kingdom our turnover showed a satisfactory increase, particularly as regards beverage wines, in which the upward trend of sales, to which reference was made last year, was maintained. While our well-known "Triple Crown" port is now selling better than ever, sales of port and sherry, generally, are still far below the prewar level, due, of course, to the high prices which the current rates of duty on these wines necessitate. Unfortunately, too, sales of Scotch whisky in the home market must still be restricted until stocks reach the necessary maturity.

BRITISH VODKA

We began to market a British vodka during the year, feeling that, in view of the vogue for vodka which has swept the USA, there would be a demand for this "all-purposes" spirit in this country. We were fortunate in persuading the present owners of the recipe for "Smirnoff"—"the greatest name in vodka"—to allow us to make it under licence, and we have been well pleased with the results to date. Sales have not been sensational, but the monthly figures are encouraging; and, in order to satisfy the demand for a high-strength vodka, we have just introduced a "Blue Label" brand which we hope will be equally well received.

Our export trade continued to expand in spite of the difficulties of import restrictions, blocked currencies and other vexations.

The trading profits for the year, compared with those for 1952, show a fall, but I feel that the business is on a very sound basis and that we can confidently look forward to increasing turnover, coupled with greater operating efficiency. As it is well covered by the profits, your board feel fully justified in recommending a final dividend of 4.2d. per share, making 6.6d. per share for the whole year. This is the same as was distributed last year and the year before, though we have thought the time ripe for merging into the dividend the small element formerly described as bonus.

The report and accounts were adopted.

THE RHEOSTATIC COMPANY

INCREASED TURNOVER

The seventeenth annual general meeting of The Rheostatic Company, Limited, was held on April 28th at Slough, Mr M. J. Gartside (the chairman) presiding.

The following are extracts from his circulated review for the year to September 30, 1953:

During the year your company's manufacturing capacity was again used to its full extent; the final net profit is appreciably higher at £51,152 compared with last year's figure of £44,585. The board recommends a final dividend of 12½ per cent (less tax). With the interim dividend the total distribution for the year is at the rate of 20 per cent.

Satchwell thermostats and other temperature controls for the control of domestic heating appliances, oil burners, coal stokers, central heating and air conditioning plant generally continue to enjoy a well deserved reputation. The domestic market has continued its growth following the removal of controls.

Export sales have shown a similar modest increase to that experienced in the home market, the proportion of export sales being well maintained. A new subsidiary, Satchwell Controls (Canada) Limited, commenced trading on October 1, 1953.

Your company is fully engaged with a lengthening order book and is planning means of increased production, but it is difficult to judge at this stage whether this additional turnover will result in an increase to, or even maintenance of, the level of profit of the past two years.

The report and accounts were adopted.

RAND MINES, LIMITED

(INCORPORATED IN THE UNION OF SOUTH AFRICA.)

SUMMARISED BALANCE SHEET, 31st DECEMBER, 1953

CAPITAL AND RESERVES		£	£
Share Capital—			
Authorized:	2,200,000 Shares of 5s. each	550,000

"SOFINA"

The annual shareholders' meeting of Société Financière de Transports et d'Entreprises Industrielles (Sofina) was held on April 22nd in Brussels, Vicomte Van de Vyvere, chairman of the board, presiding.

In their introductory remarks to the report, the directors refer to the rapidity with which the expansion of productive capacity has taken place since the outbreak of the Korean conflict. While defence production continues at a pace which was only surpassed during World War II, the preoccupation of most governments and men of affairs is no longer concentrated on ways of avoiding inflation, but on the steps that should be taken to prevent a slackening in the demand for goods and services.

The question as to whether the stimulation of economic activity can best be achieved by tax reductions for the producer or the consumer, is primarily one of priority since whenever defence expenditures can be further reduced, substantial tax relief will be granted to consumers and producers alike. In the meantime, the stimulation of construction and of the application of new processes proceeds apace in the industrial countries.

The directors add, however, that the problem of restoring the movement of international capital, the gravity of which has been masked, first, by American Government aid and, second, by the inflationary effects of defence expenditures, is likely to assume an increasingly important place in the preoccupations of all whose thoughts must be directed to the maintenance and the increase of world prosperity.

The problem is difficult because it is less economic than political, and perhaps above all psychological.

The tangible benefits obtained from the normal process of letting the more mature assist the younger in their development are there for all to see.

No doubt there were imperfections in method in the past, but we shall not succeed in maintaining a steadily expanding economy if the recollection of past mistakes is allowed to obscure the recognition of benefits that are there to be reaped today and tomorrow. These benefits will escape us if the preoccupation of those countries requiring capital is concentrated on the fear of its future withdrawal or on the possibility of its earning more than a "fair return." In fact, legislation designed to avoid these two misfortunes is most likely to provoke them or to lead investment capital to stay at home, for who would be inclined to export his capital to a country which, by every kind of restriction, displays a lack of confidence in the prosperous development of its own economy?

If a capital-importing country wishes to make certain that the profits of foreign capital will remain "fair" it can do no better than to create an internal situation which will encourage foreign capital to come from various sources, thus leading to competition, which will be of immense benefit to the local consumer; and if competition—as is generally the case with public services—is not economically feasible, the capital-importing country will assure to its nationals the cheapest possible service by granting fair treatment to existing investments so that new money may be raised in the capital markets of the world at the lowest possible cost.

These are not theories; they are only the observation of a few simple things that have existed for many long years and are repeating themselves today.

There is perhaps one way of allaying the fears which recourse to foreign capital seems to create, namely through an association between foreign and local capital. The only assurance of harmonious development lies in the recognition of a common interest.

BALANCE SHEET AND PROFIT AND LOSS ACCOUNT AS AT DECEMBER 31, 1953

The book value of investments is Belg. fr. 1,939,292,000, as against Belg. fr. 1,998,869,000 at December 31, 1952.

The portfolio includes shares of associated companies having their principal interests in the Argentine, with a book value of Belg. fr. 248,936,000, as against Belg. fr. 263,780,000 at the end of 1952.

The market value of quoted shares and the estimate of unquoted shares give a total estimated value to the portfolio of Belg. fr. 3,426,191,000, compared with Belg. fr. 3,119,575,000 at December 31, 1952.

Net liquid assets and debtors, after deduction of liabilities to third parties, amount to Belg. fr. 812,170,000, as against Belg. fr. 702,814,000 at the end of 1952. (These amounts include Belg. fr. 392,684,000 and Belg. fr. 374,638,000 at the end of 1953 and 1952 respectively, representing claims against associated companies having their principal interests in Argentina.)

The profit and loss account shows an increase in earnings of Belg. fr. 10,811,000, bringing the total to Belg. fr. 185,725,441. This amount includes a sum of Belg. fr. 22,267,961, representing earnings which could not be cashed in Belgian francs.

Earnings cashed in Belgian francs amounted to Belg. fr. 163,457,000, as against Belg. fr. 140,830,000 for the year 1952.

In addition, profits were realised from sales of securities in an amount of Belg. fr. 40,851,656 (Belg. fr. 96,790,630 in 1952). Part of the above total, Belg. fr. 8,376,394, which is exempt from taxation, has been placed in a special reserve and the balance of Belg. fr. 32,475,262 credited to the profit and loss account.

As in previous years, income which could not be cashed in Belgian francs (22,267,961 fr.), as well as part of the profits from sales of securities (9,960,382 fr.), have been applied to writing down investments.

In addition, profits to the extent of Belg. fr. 4,047,515 have been applied to writing down buildings, furniture, materials, etc.

The balance of the profit and loss account amounts to Belg. fr. 98,574,740, as against Belg. fr. 67,440,004 for the year 1952.

It is proposed to transfer to the reserve account the sum of Belg. fr. 33,514,880 and to distribute a dividend of Belg. fr. 90 net on each of the 630,000 ordinary shares, as against Belg. fr. 80 net for the preceding year.

DERBYSHIRE STONE LIMITED

SUBSTANTIALLY HIGHER SALES

The eighteenth annual general meeting of Derbyshire Stone Limited was held on April 23rd in London, Mr John Hadfield, MSc, ARIC (chairman and managing director), presiding.

The following is an extract from his statement:

I am pleased to report that the gross profit of £317,003 for the year ended December 31, 1953, is considerably higher than the 1952 profit of £264,205. Taxation takes £112,594, and the net profit, after all charges, is £91,623, compared with £73,418 in 1952; £59,688 is added to the balance carried forward in the profit and loss account.

It is recommended that a dividend on the increased issued ordinary stock be paid for the year 1953 at the rate of 17½ per cent, less income tax.

The consolidated balance sheet has a healthy look; the current assets are pleasingly liquid and the net current assets at December 31, 1953, are £387,725, compared with £259,287 at December 31, 1952.

Application has been made to the Capital Issues Committee for permission to capitalise reserves to the amount of £112,500 and, if the necessary permission is received, it is proposed to distribute to holders of ordinary stock one new unit of stock for every three units held. If permission is received from the Capital Issues Committee and the proposed scrip issue made, the amount of issued ordinary stock available for dividend in respect of the year ending December 31, 1954, will be lifted from £337,500 to £450,000.

It would be unwise to prophesy to what extent that dividend may vary from the one proposed to be paid for the year 1953, and at this stage I can only say that the board's dividend recommendation for the year 1954 will be determined by the circumstances which exist when the time comes to make the recommendation.

PROSPECTS

After reviewing in detail the many and diverse activities in which the company is engaged, the statement continued: Sales in 1953 were substantially higher than in 1952 and I am hopeful that the 1954 sales will show no adverse trend.

The money spent in 1953 on improvements at a number of the company's quarries and works has increased efficiency and has provided greater service facilities and added capacity for production. The overall capacity for production is now considerably in excess of the general level of demand if there should be increased demand for our products for use in road construction or in any other consuming industry, the facilities are available to provide for any foreseeable requirements.

The company's operations, actual and potential, are constantly under review and the many and diverse activities in which the company is engaged will cushion to a considerable degree any impact caused by a low demand in any one department.

With an expansion in British industry, which I regard as inevitable, there is good reason to suppose that the demand for our raw materials will steadily increase, which does indicate a future for the company to which the members can look forward with confidence.

The report was adopted.

CAPITALISATION AND SCRIP ISSUE

At the extraordinary general meeting which followed the annual general meeting, the chairman reported that the consent of HM Treasury had been received to the proposed issue of 450,000 ordinary shares of 5s. each as capitalisation of reserves.

The resolutions proposed at the extraordinary general meeting were passed and renouncable allotment letters for the new ordinary shares are being posted to stockholders immediately. The issue is being made on the basis of one new ordinary share of 5s. each fully paid for each 15s. nominal amount of ordinary stock held by ordinary stockholders at the close of business on April 23, 1954.

THE ASSOCIATION OF CERTIFIED AND CORPORATE ACCOUNTANTS

The forty-ninth annual general meeting of the Association of Certified and Corporate Accountants was held on April 27, 1954, in London. The Right Hon Lord Latham, JP, FACCA, president of the Association, was in the chair. He said: Our membership now exceeds 9,000 and we have some 8,500 registered students.

GOLDEN JUBILEE

This year the Association attains its golden jubilee, and the Council is sure that all members will wish the occasion to be marked by celebrations of an appropriate character. These will extend over the course of three days, namely, November 30 and December 1 and 2, 1954.

JUBILEE SCHOLARSHIP

Jubilee year should be chosen as the time for a significant advance in the educational facilities offered to members and students. Particulars have already been published of the new scholarship which the Association has instituted and which is to be known as the Certified Accountants' Jubilee Scholarship. We are prepared to make grants up to £200 per annum, or £600 in all, during the term of the scholarship, which is tenable at the London School of Economics. The Council will consider the award of one new scholarship each year and we anticipate making the first award with effect from Michaelmas term this year.

RESEARCH ACTIVITIES

Our research committees were recently entirely reorganised, and they are now holding frequent meetings, and a number of specialised projects are under way. The Council seek to publish in booklet form material of interest and assistance to members of the profession, both in practice and in industry.

It is greatly to be deplored that the Chancellor proposes to do nothing at the present time towards implementing the recommendations of the Millard Tucker Committee for removing the manifest injustices inherent in the present taxation treatment of provisions for retirement by self-employed persons and controlling directors. If equity of treatment for taxation between classes of taxpayers is still to be regarded as a feature to be sought in our tax system, then here in the present almost penal taxation of the prudent provision for old age is a place where its application is long overdue.

Mr Butler's proposals for investment allowances in substitution for initial allowances is a step in the right direction. They replace what was an interest-free loan to be repaid over the remaining years of the life of an asset by a positive concession which is in reality a subsidy by way of tax relief to promote and encourage investment in the modernisation of the nation's industrial and agricultural equipment.

This scheme of investment allowances will have the added merit of simplifying somewhat the accountancy treatment of depreciation, and it is also a step forward towards recognising the substantial gap between the original cost of equipment, on which the depreciation is at present admitted for taxation, and replacement cost. Whether in the substitution of this more attractive method of encouraging the replacement of the old by the new any such considerations were officially in mind one can only conjecture.

HOFFMANN MANUFACTURING COMPANY, LIMITED

REASONABLE LEVEL OF PRODUCTIVITY

The annual general meeting of the Hoffmann Manufacturing Company, Limited, was held on April 28th in London, Mr J. W. Garton, chairman and managing director, presiding.

The following is an extract from his statement circulated with the report and accounts for the year to December 31, 1953:

Last year I pointed out that the incoming orders had been considerably less than in the previous year and that we now had a much shortened order book. It has continued to contract during 1953, but we have been able to maintain the company's productivity on a reasonable scale and with the economies that have been achieved by new plant coming into production, the reorganisation of layouts, and improved methods, we have had a fairly successful year.

The profit of the Hoffmann group for the year 1953 before taxation but after all other charges amounts to £1,117,024, and compares with £1,469,061 for the previous year. Income tax, profits tax and excess profits levy absorbed £625,017, against £1,002,987 for 1952. The net profit of the group for the year 1953 after taxation is, therefore, £492,007, and compares with £466,074 for 1952.

The question of the ordinary dividend has been given very careful thought by the directors, and it is their intention to recommend a final dividend of 10 per cent (free of tax) which together with the 5 per cent (free of tax) interim dividend paid, will be the same as last year. They have also added a special cash bonus of 5 per cent (free of tax) which is an increase of 2½ per cent (free of tax) on last year.

CAPITAL EXPENDITURE

Although we have gone a long way over the last few years to replace much of the old plant and machinery, there is still a considerable amount to be done. Your board constantly has this in mind so that the company can compete both in this country and abroad with its products, and to that end they have agreed to expend over the next few years, but including the amount shown as the group capital commitment at the end of the year, a sum of no less than £1 million.

The liquid resources at the end of the year totalled £2,464,056 which compares with £1,917,370 at December 31, 1952. The main change is due to the sale of our American investment for which we have received payment during the year under review. The excess of current assets over current liabilities at December 31, 1953, was £2,888,919 compared with £2,417,475 at the same time last year.

NORMA-HOFFMANN BEARINGS CORPORATION

After protracted negotiations we were able during 1953 to effect a sale of our entire holdings at a price which has shown a profit of £286,685.

The year in question has been a very difficult one brought about by adjustments from a very heavy defence programme to an ordinary commercial trade with the utmost competition both at home and abroad, but over the last few months there seems to be a little more confidence and orders are coming in better but not at the rate they were in 1952.

The report and accounts were adopted.

THE LIVERPOOL & LONDON & GLOBE INSURANCE COMPANY, LIMITED

Fire, accident and marine premium income at £28,734,115, and record new life business at £8,235,705, were figures given in a statement issued by the chairman, Sir Alan C. Tod, CBE, TD, DL, with the hundred and eighteenth annual report and accounts of The Liverpool & London & Globe Insurance Company, Limited.

The combined premiums fell short of the previous year's record by only a small margin. Accident premiums were higher, but this increase was accompanied by a fall in the fire and marine departments which, in 1953, reflected some reduction in commercial and industrial activity and a levelling off in values.

Total underwriting profit at £1,348,782 showed a modest improvement (last year, £1,231,231). The balance of the results had changed for the better, and, if the fire profit had receded slightly, this had been offset by a most welcome improvement in the accident and marine department results.

New life sums assured reached a new high record. As a result of the life quinquennial valuation, made at December 31st last, an increased life bonus of 38s. per cent per annum had been declared on the company's participating life policies.

An increased final dividend of 21s. 6d. per share is recommended, making 41s. for the year, against 37s. for 1952.

EBURITE CORRUGATED CONTAINERS LIMITED

INCREASED NET PROFIT

The ordinary general meeting of Eburite Corrugated Containers Limited was held on April 29th in London, Mr J. F. Fielding, chairman, presiding.

The following are extracts from his circulated statement for 1953:

The net profit of the Group after all charges other than taxation is £720,439, as compared with £474,236 for the preceding year. Total taxation of £467,020 is incurred including £92,000 in respect of Excess Profits Levy. Your directors propose to increase the rate of ordinary dividend for the year to 2s. per share by the payment of a final dividend of 1s. 6d. per share.

Your directors propose to increase the authorised share capital to £1 million by the creation of one million additional ordinary shares of 5s. each, and that £286,688 should be capitalised out of the undivided profits to be applied in paying up in full 1,146,750 unissued ordinary shares to be distributed to existing ordinary shareholders. The distribution is equal to one new ordinary share for every two ordinary shares held.

The year shows a considerable increase in the output of the Parent Company at Park Royal compared with the previous year. An extension to the Andrew Ritchie, Glasgow, factory was completed at the end of February last and is in operation. At Autolex Limited, Sunbury-on-Thames, a further increase in factory space is nearing completion. Further plans for the development of the Group are under consideration.

The business done by the Group for the first three months of the current year has shown an improvement. With the demand for our products still increasing, the indications for the future are encouraging.

The report and accounts were adopted and the board's capital proposals were approved.

JOSIAH PARKES & SONS

(Manufacturers of Union Locks and Builders' Hardware)

TURNOVER MAINTAINED

The ordinary annual general meeting of Josiah Parkes & Sons, Limited, was held on April 26th at Willenhall, Mr Cyril W. Parkes, JP (chairman and joint managing director), presiding.

The following is an extract from his circulated review:

The results of our operations during 1953 were very much as were expected. It was a difficult year, starting badly but improving steadily as it went on, and despite some fall in the trading profit we feel that the final result is very satisfactory having regard to the conditions.

Due to the falling off in demand at the end of 1952, we started the year with a restricted order book and production cut back substantially. In the spring the position changed completely; the level of orders improved and we went back to full production. By the autumn we were having to work regular overtime to meet the demand and output was equal to the best we have ever achieved. Over the year as a whole, therefore, turnover was maintained at substantially the same level as the previous year, but profit margins were again narrowed as a result of the slight fall in the average level of selling prices and a substantial increase in wages costs.

DIVIDEND INCREASED

To deal with the consolidated profit statement, the net profit before taxation at £136,638 is lower than that of 1952 by £25,583, a fall of 15 per cent. As a result of reductions in taxation chargeable, however, the more important figure of profit after tax at £59,378 is actually higher by £1,258. Because of the reduction in the rate of income tax after the 1952 accounts were issued this is not strictly a true comparison, but, taking into account an appropriate adjustment, the difference in net profit is a fall of only £3,800, or 6½ per cent.

The balance sheet continues to show a strong position, net fixed assets are higher by £24,472, and net current assets by £4,534, reflected in the increase in capital employed from £616,009 to £545,401.

We have decided this year to recommend a small increase in the distribution by adding a further 2½ per cent to the final dividend, making a total for the year of 17½ per cent.

OUTLOOK GOOD

I am also pleased that I can report a healthy trading situation, both at home and in South Africa. All our factories are fully employed, we have satisfactory order books, the level of new business is well maintained and the outlook for this year is good. At the same time it must be remembered that trading conditions are becoming increasingly competitive the world over, and in the export field licensing and currency restrictions remain a handicap.

Your company is unremitting in its attention to the development of new products, new methods and improved technique. We believe this to be essential if we are to hold and expand our trade, and to be the basis of higher efficiency and productivity. The sales outlook is very promising.

In view of the improved outlook your directors have recently approved a policy of further expansion both at Willenhall and in South Africa. The report was adopted.

GEORGE MALLINSON & SONS, LIMITED

The seventeenth annual general meeting of this company was held on April 29th in London, Mr Dyson Mallinson, chairman, presiding.

The following is an extract from his circulated statement:

The accounts for the 52 weeks to February 20, 1954, show a net profit of £125,649, an increase of £7,367 on the previous year. The plant and equipment have been maintained in good order, and we consider the depreciation written off is adequate. The liquid assets exceed current liabilities by £789,451, which I am sure you will consider satisfactory.

The directors are pleased to report an increase in trading and recommend that the final dividend should be 30 per cent, making a total of 40 per cent for the year, and in addition a bonus of 5 per cent both less tax.

We recommend that the sum of £25,000 should be added to the materials and contingencies reserve, making this figure now £200,000, and the balance of £34,237 added to the credit of the profit and loss account leaving this figure at £207,241.

Orders on the books will keep us fully employed for several months, and in the absence of any unforeseen circumstances, we have every reason to look to the future with confidence. You will be interested to know that during the year under review, in accordance with powers contained in the company's articles, a non-contributory retirement benefits scheme has been set up for the directors and senior staff employees. Shareholders will no doubt approve of this action which is greatly appreciated by those concerned.

The report was adopted.

THE RIO DE JANEIRO FLOUR MILLS AND GRANARIES

The sixty-eighth ordinary annual general meeting was held on April 22nd in London, Mr G. McT. Sheppard (the chairman) presiding.

The chairman drew attention to the fact that the exchange rate used for the profit and loss account and the conversion of Brazilian current assets and liabilities was that of the free exchange rate at September 30, 1953, namely, Cr.$106,80 to the £, as against the official rate of Cr.$52,416 used last year. It had been necessary to draw heavily upon the exchange reserves in both the parent company and group accounts as a result of the new free exchange rate.

It was not only exchange problems that had caused the decline in the group results, as the trading results had been materially affected by a number of factors beyond the directors' control.

Fluctuations in the free exchange market had been wide, but they had not prevented the company making some appreciable sterling remittances to this country.

Supplies of wheat had again been at a low level, the shortage of dollars and prices in Argentina being well above world market levels, being contributory factors.

As regards the current financial year, trading conditions had continued to be difficult. Availabilities of imported wheats had dwindled, and it had become necessary to grind larger proportions of Brazilian wheat, which were more expensive; the resultant smaller grists and higher overheads emphasised the necessity for larger imports in order to compensate for the increased charges. The report was adopted.

ARMY & NAVY STORES

TRADING PROFIT DOUBLED

The eighty-second annual general meeting of Army & Navy Stores, Limited, will be held on May 21st at the registered office of the company, 105 Victoria Street, London.

The following is an extract from the statement by Commander S. C. Lyttelton, OBE, DSC, RN, chairman and managing director, circulated with the report and accounts for the year to January 31, 1954: The group trading profit is £177,909 after transfer of £14,672 from contingencies reserve to cover purchase tax losses and trading loss in India. This compares with £104,646 for the previous year, which included a transfer from contingencies reserve of £23,187. Omitting the transfers, therefore, the group trading profit is more than doubled.

The directors recommend a dividend of 15 per cent on the ordinary stock, leaving £100,853 to be carried forward. As some capital profit has been realised as a result of the sale of certain of the company's redundant properties, your directors, for this year, recommend a further distribution of 5 per cent on the ordinary stock. This distribution of capital profit will be free of all tax to the stockholders.

I dislike trying to foretell the future and will only say that with the two additional subsidiaries we are already in a much better position for trading than we were a year ago. We intend to pursue our policy and to expand the business into the provinces and suburbs in order to provide as broad a geographical base as possible while continuing the reorganisation and improvement here in London. We are actively pursuing this policy and have hopes of further developments shortly.

BIRMINGHAM RAILWAY CARRIAGE & WAGON

CENTENARY YEAR

The one hundredth annual ordinary general meeting of The Birmingham Railway Carriage & Wagon Company, Limited, was held on April 28th at Birmingham, Sir Bernard D. F. Docker, KBE (chairman), presiding.

The following are extracts from his circulated statement for 1953:

The shortage in the supply of vital steel plate and the reduction in works personnel continued throughout 1953 and the financial results are not as favourable as in recent years. Happily the steel position for 1954 has improved and we may be able to employ our works to greater capacity in the current year.

The value of sales was only slightly lower than last year's figure, but it included the full effect of the 1952 wage increases. The profit on trading is £64,403 lower and after providing for the same dividend distribution as last year (10 per cent) the balance carried forward to next year is £2,852 higher at £141,169.

A few years ago we broadened the scope of our activities by developing a very determined interest in the diesel field of rail transport and in our centenary year, we can claim some considerable repute from the diesel trains and locomotives which have been designed and built by our company.

Our most recent achievement in this field is a locomotive destined for Australia where, I am confident, from the satisfaction it will give to our customer, the Commonwealth Railways, it will add to the prestige of The

Birmingham Railway Carriage & Wagon Company and all associated with us in its production. The courage and initiative to enter upon such new endeavours augurs well for the future and should be a matter of satisfaction to our stockholders.

The report and accounts were unanimously adopted and an ordinary dividend at the rate of 10 per cent per annum, less income tax, was approved.

TRIBUTE TO CHAIRMAN

Mr H. J. S. Moyses, OBE (deputy chairman and managing director), proposing the re-election of the retiring director, Sir Bernard D. F. Docker, KBE, said: I am sure we all appreciate how fortunate this company is in having Sir Bernard Docker as chairman. His long experience of the rolling-stock industry and to his father before him have been invaluable to us. His keen interest in everything appertaining to the company's welfare has been a source of great strength to the board and I have very much pleasure in moving "That Sir Bernard D. F. Docker, KBE, be and is hereby re-elected a director."

The motion was approved, as also was one authorising the directors to fix the remuneration of the joint auditors, Messrs Agar, Bates, Neal & Co. and Messrs Chantrey, Button & Co.

Replying to a vote of thanks to the chairman, managing director and directors, proposed by Mr H. J. Thornton, the chairman said: May I say straight away that I am glad you mentioned Mr Moyses specially, for he has been for a long time the mainspring of this business. It is quite true that trading is not easy. It is customary for a chairman to say that it has been a difficult year for any company and those engaged in any business these days realise that it has not been easy. We hope and believe that one day we shall get some help from the authorities. We need incentives; I call them "carrots"; maybe one day we shall get them. In the meantime the success of this business depends entirely upon team work. You have a jolly good team and that is the reason why the results are so satisfactory.

The proceedings then terminated.

The Times
FURNISHING (HOLDINGS)

MOST SUCCESSFUL YEAR

The sixth annual general meeting of The Times Furnishing (Holdings), Limited, was held on April 29th in London, Mr Henry Jacobs (the chairman) presiding.

In the course of his circulated statement the chairman said:

Total book value of current assets at December 31, 1953, was £1,849,716, an increase of £151,038 over last year's figure.

Stocks out on hire-purchase agreements were increased by £423,872.

Combined profits of the group for the year to December 31, 1953, before tax were £788,137, an increase of £83,378 over last year. Taxation amounted to £521,258, which includes £103,500 for EPL. Net profits after providing for tax are £266,879, an increase of £45,700 over last year.

The directors have allocated £15,000 to the staff pension and benevolent fund, bringing that fund up to £55,000.

A final dividend of 15 per cent is recommended, less tax, making with the interim dividend already paid 25 per cent, less tax, for the year, and a capital scrip bonus of one ordinary share for eleven of such shares held, involving the application of £50,000, the same amount as applied last year.

The results for the year showed an advance of 20 per cent in the turnover of The Times Furnishing business and an advance of 12½ per cent in the Willerby Tailoring business.

Trading during the first three months of the current year in both businesses has exceeded that of the year under review, and failing any set-back in the national prosperity, your directors feel confident in forecasting another year of continuing success.

Contracts have been entered into for the acquisition of three new buildings to house Times Furnishing branches, at Hounslow, Hammersmith and Southend-on-Sea. The report was adopted.

NORWICH UNION INSURANCE SOCIETIES

ANNUAL MEETINGS

LIFE SOCIETY

Speaking at the one hundred and forty-sixth annual meeting of the Norwich Union Life Insurance Society, held on April 27th, the President, Sir Robert Bignold, said 1953 was an outstanding year for the Society. New assurance business written exceeded £53 million, an increase of some £6 million. In addition, pension scheme deferred annuities were granted for a capital value of £29 million, an increase of over £17 million.

Total funds on December 31st amounted to £104½ million, a record increase of £10 million. Interim bonuses on full-profit policies had been increased by 3s. per cent per annum. The net rate of interest earned was £4 0s. 9d. per cent and the mortality experience was exceptionally favourable.

FIRE SOCIETY

At the one hundred and fifty-sixth annual meeting of the Norwich Union Fire Insurance Society Limited the Chairman, Sir Robert Bignold, said the 1953 premium income for fire, accident and marine was £14,634,800, an increase of £75,840. Fire premiums totalled £6,450,300, the profit in the fire account being £623,466.

The accident income had advanced by £445,485 to £7,013,296 and the accident account showed a profit of £548,420 against £120,042 in 1952.

Marine premiums totalled £1,171,204 and the transfer to profit and loss account of £75,000 left the marine fund at £1,819,672, or 155.37 per cent of the total net premiums.

Total transfers to profit and loss were £1,246,886. Taxation was £837,181 against £516,511; dividend required £193,600; pension fund received £150,000 and additional reserves £325,000.

Total assets had increased by £1,573,802 to £21,026,244.

The reports and accounts were adopted.

THE CUNARD STEAM-SHIP COMPANY, LIMITED

NOTICE IS HEREBY GIVEN that the seventy-seventh annual general meeting of The Cunard Steam-Ship Company, Limited, will be held in Cunard Building (fifth floor), Pier Head, Liverpool, on Wednesday, May 19, 1954, at eleven o'clock a.m.

(1) To receive and consider the Statement of Accounts for the year ended December 31, 1953, with the Reports of the directors and auditors.
(2) To sanction the declaration of final dividend for the year 1953.
(3) To elect directors in place of those retiring but who, being eligible, offer themselves for re-election. In accordance with the provisions of the Companies Act 1948, special notice has been received of the intention to move at the above meeting a resolution for the re-election as a director of the company of Mr. R. Crail who, at the date of the meeting, will be aged 70 years, and who retires and offers himself for re-election.
(4) To confirm re-appointment of auditors and to fix their remuneration.

By Order of the Board,
H. EAVES, Secretary.

Offices: Cunard Building, Liverpool.
April 24, 1954.

Note.—A member entitled to attend and vote is entitled to appoint one or more proxies to attend and vote instead of him. A proxy need not also be a member.

Motor packed up again, Mr. Watling?

When overloaded or working under adverse conditions, electric motors, transformers and coils become overheated, causing the insulation — and ultimately the equipment itself — to break down. Because overloading and bad working conditions cannot always be avoided, electrical engineers have been quick to take advantage of Silicones. In extremes of temperature which would cause ordinary insulating materials to fail, Silicone resins and rubbers still retain their outstanding insulating properties to the full. *The complete range of Silicone products can be obtained from Midland Silicones Ltd., an associated company of Albright & Wilson Ltd.*

Ready for a really hot bath

Here are some Crittall steel windows about to take a bath in molten zinc. When they come out, they will have a positively rustproofed, galvanized surface — a tough, deep amalgamation of zinc with steel. This is the finishing touch to well-finished Crittall windows. It makes it certain that — with ordinary care and with less than average maintenance cost — rust and corrosion will be kept at bay. It makes it more than ever desirable that Crittall rustproofed windows should grace and protect the buildings you are to live in and work in.

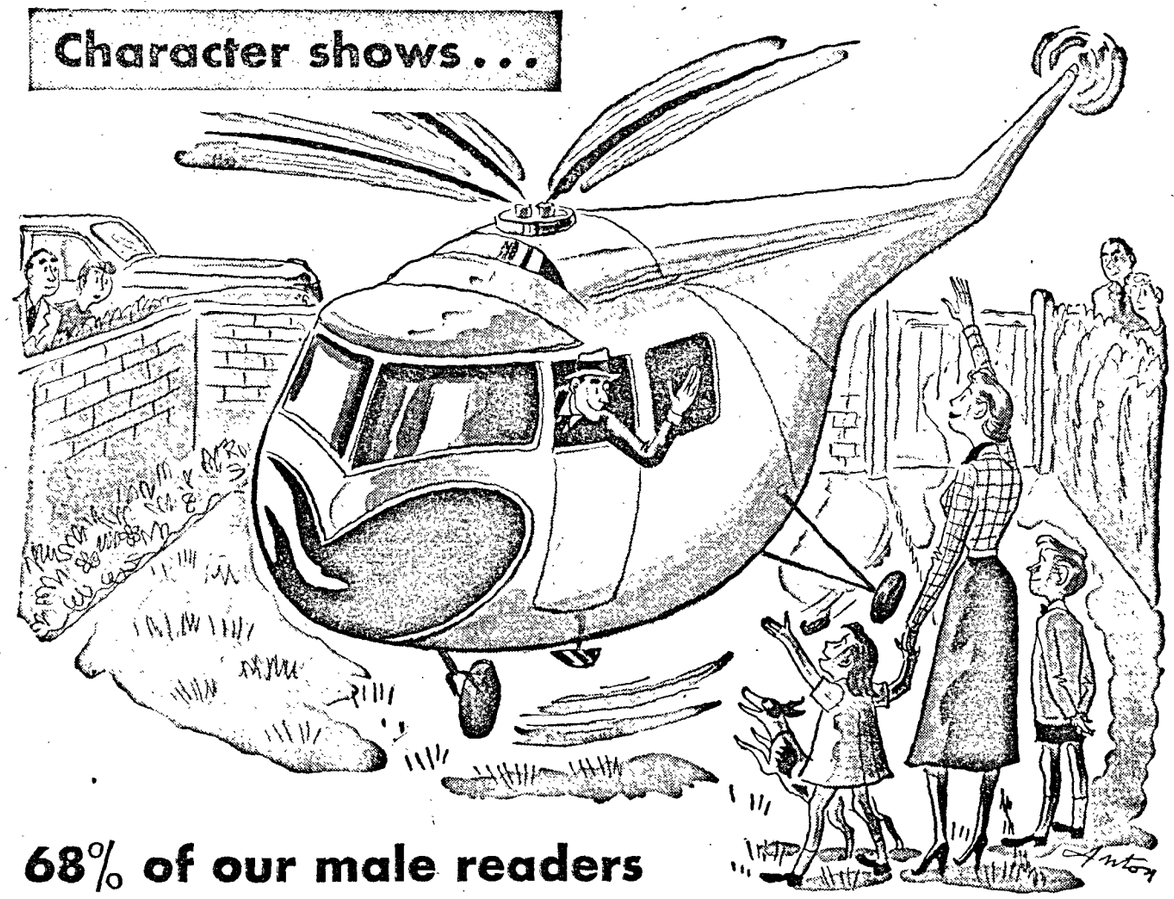
Character shows . . .



68% of our male readers are in the better paid positions

—men who influence others

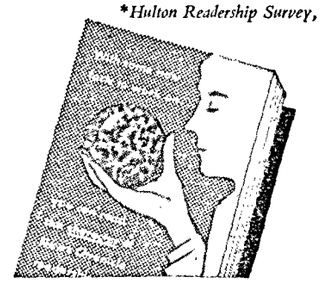
THE OLD GAME of "keeping up with the Joneses" has fruitful results for advertisers. But who are the Joneses?

From a recent analysis of our readership, it appears that nearly a quarter of the men who rely on the News Chronicle come from the tycoon, executive, and professional class. Another 45 per cent are drawn from that other category of big-money earners — the foremen, the skilled industrial workers, the craftsmen. Such readers are also leaders. From their position of responsibility and material success, they tend to influence the lives and habits of other people — and other customers for advertised goods.

If you are interested in the *character* of a big potential market (over 3,000,000* strong), you will find the booklet below worth studying. It examines News Chronicle readers in terms of their occupations, their enthusiasm for this paper, and their *responsiveness*.

**Hulton Readership Survey, 1953*

NEWS CHRONICLE



The findings in this booklet are based on a survey conducted originally for our private editorial use — but some of the information, we thought, would be very useful to advertisers or their agents. Copies of the booklet may be obtained by writing or telephoning to the Advertisement Director, The News Chronicle, Bouverie St., E.C.4. Central 5000.

What does he say about America?

What does he think of Britain?

Influential people in over 100 countries keep abreast of world news through TIME magazine

Five separate editions of TIME MAGAZINE, with the same editorial content, are published in English every week. One edition circulates only in the United States. The other four—the International Editions—published simultaneously, are read by important people in over 100 countries outside the U.S. 93% of the subscribers to the International Editions hold influential positions in business, government and the professions. They look upon TIME not only as the best means of keeping abreast of international news, but as an introduction to the world's foremost companies and products. People around the world can read *all* the week's important news—including your advertising news—on or before TIME's issue date. The Advertisement Manager will be pleased to give you further information.

You can buy advertising space in just the editions you want, covering the world markets in which you are most interested.

Famous advertisers like Hawker Siddeley Group are using this powerful International medium to develop their world markets.

Nailing through a PLASTIC!

LUSTREX TOUGHENED...

...new tougher polystyrene

LUSTREX* Toughened 1 is really tough—so tough that we have knocked nails through it in laboratory tests—but you will want to know about its practical, commercial advantages:

Here they are:

TO LUSTREX USERS. Here's what you want to know—

Lustrex T1 has all the advantages of general purpose Lustrex Plus—

Impact Strength 3 times as great.

Deflection at break 6-8 times as great.

Elongation at break 10-15 times as great.

Very good ageing.

Colour. Any opaque or translucent colour can be produced. The whiteness of the base stock means that pastel shades can be accurately matched.

And even better resistance to crazing, even greater ability to take drilling, turning, milling, sand blasting: not affected by weak acids, alkalis, and water.

TO NEW USERS. The new Lustrex Toughened 1 grade is better than ever for economical production of efficient battery boxes, refrigerator parts, radio cabinets, packaging containers, brush backs and many similar articles. Before your next production it would pay you to investigate fully the possibilities of this versatile plastic which can be injection moulded in any colour to any shape.

Lustrex is not yet available in sheet form and is supplied only in production quantities for injection moulding. Write now for full information.

Alliance in Danger

THE British press is clinging to its hopes for the Geneva conference. In Washington, on the contrary, the deepest gloom is reported to prevail. It is far too soon to say which is right. But it is not too soon to suggest that neither capital is really concentrating on the major issue. When people say they are hopeful or apprehensive about Geneva, they are usually referring to the prospects of reaching a satisfactory settlement with the Communist regimes. This is important; but it is not all-important. It will be a great pity—and perhaps much more than a pity—if the western statesmen fail to agree with the delegates from behind the iron curtain. But it will not be the first time, nor is it likely to be the last, when a conference with Communists has ended in deadlock. If, on the other hand, the conference ends with an open split between the western allies, that will be really dangerous.

It is questionable whether the disunity between the western allies is nearly as bad in reality as it appears on the surface of things. A fair amount of progress has been made in recent weeks in moving the three governments most directly concerned—the American, the British and the French—into agreement on a sensible line of policy on Indo-China. The three elements of that policy are to refrain from further intervention at the present; to negotiate for a truce, with a demarcation line; and to form a Nato for South East Asia which would guarantee the settlement, if one can be agreed, or support the French if it cannot. It would be rash to say that all three governments yet formally agree to all three parts of this policy. But they are moving into line, the Americans retreating from the more advanced position they had taken up (or appeared to take up), the British and French advancing from their various reluctances.

The trouble is that, for consumption by their various home audiences, the three Foreign Ministers, even if they are in fact moving into agreement, have to emphasise different facets of it. Mr Dulles dare not appear to be weak. Mr Eden will be in trouble with at least one section of British public opinion if he is too strong. And M. Bidault can hardly take any position without being criticised. So the appearance is created of deep fissures in the western alliance, when—as yet at least—there are no more than momentary cracks.

The urgent need of the moment is surely for all comment, official and private, in the free countries to eschew any unnecessary exaggeration of differences and to assist the negotiators in moving closer together. This journal will not be accused by anybody of anti-Americanism. But it must be frankly stated that most of the present appearance of crisis has been manufactured by wild and irresponsible talk in Washington. What is worse, there has been wild talk on two planes, both private and official. To the nonsense that Senators can talk, America's allies are gradually becoming accustomed. Nevertheless it has seemed recently to be worse than usual. Not only does the squalid McCarthy circus go on and on, without any

apparent prospect of cutting the Senator down to size. But even the majority leader of the Senate himself, Senator Knowland, is allowed to parade his irresponsibility daily, urging war with China and, when others hesitate to involve themselves in it, writing them off as unworthy allies. Is it surprising, with such goings on filling the press, that there should be a lack of confidence in the coherence, and even in the pacific intentions, of American diplomacy?

Moreover, there has been wild talk by the Administration itself. If American opinion has the impression that Mr Dulles's boldness is always being curbed by Britain's timidity, it is largely his fault for starting off with big talk and then coming down to less big doing. Bluff plays a proper part in diplomacy, if it is not tried too often and is never called. Unfortunately, too many of Mr Dulles's bluffs have not worked. The "liberation" bluff, the "agonising reappraisal" bluff, the "instant and massive retaliation" bluff—all these have been discovered to mean much less than they appeared to. The result has been to frighten America's allies much more than to impress the Communists. But though this is the natural effect of an unsuccessful bluff, it gets blamed on America's allies, and usually on Britain. For example, it is now being said that the Americans wanted to grant the French request for help in the air over Dien Bien Phu a fortnight ago, and that only British timidity stood in the way. It seems very doubtful whether, in fact, Congress would have agreed to American action. But in any case, one would have thought that the merits of intervening at this precise moment of time, and in a way that was much more likely to provoke Chinese counter-intervention than to save Dien Bien Phu were, to say the least, open to question. Nor is the British refusal to join a common front in South East Asia a permanent one; it is for the duration of the Geneva conference. Nevertheless it is being written about in Washington as if it were a second Munich, the end of all collaboration, a deliberate decision to precipitate the apocalypse.

★

It is not for any foreigner to say what can be done to stop this sort of back-biting in Washington. But seen from here, what would seem to be urgently needed is for the President to assert his leadership and authority both on the Administration and on his party in Congress. He himself has never been other than sensible and moderate in all that he has said. For example, he has denied some of the wilder stories of British obstruction and his own prescription for Indo-China is to try to find a *modus vivendi* between the unacceptable and the unattainable—which is exactly what Mr Eden is trying to do at Geneva. What foreigners can say is that unless the President finds some means of making his own steady voice sound louder in Washington than all the partisan screamers, he is going to have increasing difficulty in keeping the world alliance together.

But let us not be self-righteous. The state of British opinion is not perfect; nor could anybody say that the voices of moderation and responsibility in London always sound louder than the screamers. There are two matters in particular to which British opinion might well turn its attention. First, are we not in danger of mistaking the froth for the substance in our view of America? It is true that an astonishing amount of nonsense is talked in America and faithfully reported in the British press. But it is action that counts, and whatever may have been said in America, is there much ground for complaint about what has been done over the postwar period as a whole? It is now clear that General MacArthur's advance from the waist of Korea to the Yalu river late in 1950 was a mistake; but how many people who say so now thought so before it happened? This apart, is there anything else in American actions since the war to which a reasonable Englishman can take serious exception? And are there not, on the other side, many actions for which he ought to feel deeply grateful? As the Prime Minister said last week, we should pay tribute to the "disinterest, exertions and sacrifices" of the United States, "without whose unrivalled power, chaos or subjugation might overwhelm us all."

Secondly, if the British people do not like being told that they are an unreliable ally, they should take a little more trouble not to sound like one. The absolute necessity of the alliance of the free people—and specifically of the link with America—tends rather to be taken for granted in this country, perhaps largely because it is thought to be too obvious to require stating. It receives, of course, the conventional sentence or two in official speeches before they pass on to other topics. It is a long time since a Minister of the Crown really developed the theme of the Anglo-American alliance. One result is that almost the only people who have been devoting any attention to Anglo-American relations are the Bevanites, who are as ready to blame America for everything as Hitler was the Jews. Another result is that when people are asked by the Gallup Poll whether they approve of American policy, they think only of the irritation of recent weeks and a disconcertingly large number of them say they disapprove—though it is almost certain that only a tiny fraction of them would really like to see the alliance dissolved or would be other than horrified to be told that that was what their votes were being taken to mean. This sort of thing gets reported back to the American press, and the impression is created that the majority of the British people are indifferent to the fate of the alliance between the two countries.

There is one man who would do a very great deal to correct these false impressions and that is the Prime Minister. His words of last week, which have already been quoted, show that his mind is moving in this direction. The time is coming when he should devote a major speech to the preservation of that alliance of the English-speaking peoples the creation of which is one of the greatest of his many claims to the gratitude of both his father's and his mother's countrymen.

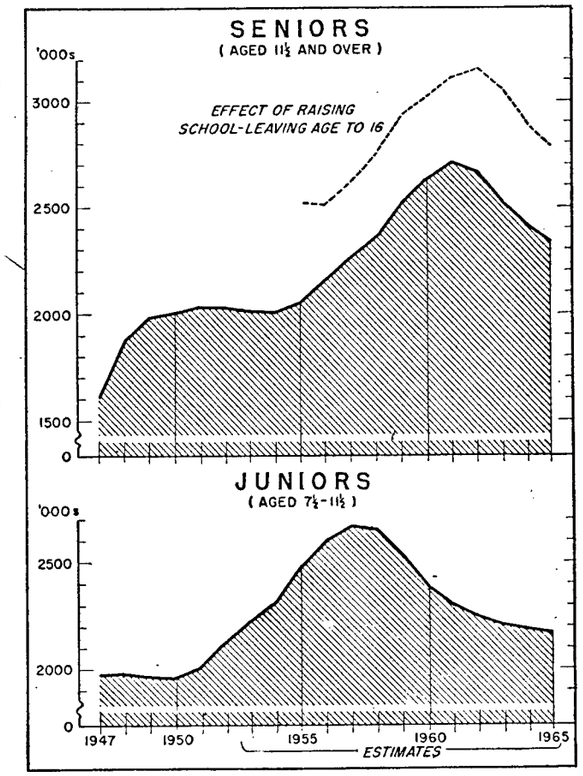
Towards Longer Schooldays

THE Minister of Education told an audience at Bristol last week that "there is no need to be down in the dumps about education." This was rather bland; but Miss Horsbrugh certainly went on to give some figures which strengthen the Government's defence of its education policy, and which could usefully have been produced in the House of Commons a few days earlier. On that occasion her Parliamentary Secretary, Mr Pickthorn, had seemed a little complacent in rejecting Mr Morley's motion that an attack should be made on overcrowded classes by building more schools, by recruiting more teachers, and by spending more money. The Minister was able to show that although the number of schoolchildren will increase rapidly between now and 1960, the overcrowding in schools will at least get no worse.

In other words, the amount of school building and the recruitment of teachers are keeping pace with the school population. In the last four years more than 700,000 extra children have been accommodated. Enough new places are under construction to cope with the further 80,000 children who will flood into the primary schools between now and 1960, and the number of overcrowded primary classes — now more than 40 per cent of the total — will shortly begin to diminish. It must be remembered, however, that by the official definition a primary class is not overcrowded until it consists of over 40 pupils, which by any commonsense standard is far too large. Not until after 1961 will it be possible, without a change of policy, to aim at a maximum of 30 for primary as well as for secondary classes. In the secondary schools, where nearly two-thirds of the classes now have more than 30 pupils, building has reached a level which, if it is maintained, should provide places for all the 700,000 extra senior children to be expected by the end of 1960.

As for the staffing problem, that is less serious than had at one time been feared. If new teachers come forward as they have been doing lately, the ratio of staff to pupils will slowly but steadily improve. The National Advisory Council had estimated the need for extra teachers at 5,000 a year for the years 1950 to 1953 in order to maintain the standards of 1950. Against this the net increase for those years has been about 6,000. As an example of the way this net increase comes about, 7,500 men and women left the teaching profession in 1952; but about 13,250 new teachers were recruited, of whom some 2,000 were married women who returned to their old calling. One-third of the women in this supposedly spinster's profession are now married. Just why wives are suddenly showing an interest in teaching it is hard to say, but they are certainly saving the day.

EXPECTED NUMBERS IN THE SCHOOLS



The Government can therefore claim that the line is being held. But this line is far, far behind the rosy expectations of ten years ago. It is just ten years since the Education Act passed through its final stages in Parliament, and in that time only one of its major provisions has been implemented—the raising of the school leaving age to fifteen. That was to have been the merest beginning. Among other things, county colleges were to have continued education up to the age of eighteen on one day a week; independent schools were to have been registered and inspected; and, above all, the school leaving age was to have been raised again to sixteen "as soon as possible."

In the five years that followed the passing of the Act, thousands of reunited couples made nonsense of the calculations on which it was based. If the higher birthrate and the need for economy could have been foreseen, it is certain that less would have been attempted. As it is, to "hold the line" has in itself become something of an achievement. But relief that the state of education is no worse may inhibit efforts to make it better. In a sense, one ought to be down in the dumps about education; for there is no doubt that its present inadequacy, both in quality and duration, is a great source of national weakness. It is true that the

leaving age in Britain is as high as it is in most European countries and higher than in many, but it makes a poor showing in comparison with the other English-speaking communities overseas. In the United States, for example, forty states have a leaving age of sixteen and the rest either seventeen or eighteen. It is true that the quality of American education sometimes still shows the effects of its over-rapid expansion, and that it suffers from the assembly-line methods that have had to be adopted to handle the enormous numbers of children in the schools and of students in the colleges. But the result has been to create a large educational middle class of men and women who, without ever coming within sight of being scholars or scientists, have nevertheless been trained far beyond the elementary level. Nobody who has had an opportunity of observing the strength and vitality that are thereby given to the American community can fail to want to build up a similar educational middle class in Britain, where it is still woefully small. This is not an aspiration of the welfare state; it is a necessary piece of nation-building.

*

It is, therefore, important not to be content with holding the line without looking forward impatiently to see when the next advance can be made. It is obvious that any improvement in the ratios of staff and buildings to children must first of all be used to reduce the size of classes. There is no point in just increasing the quantity and so the cost of schooling without getting value for the extra money. On the other hand, it would be wasteful to recruit more teachers and to build more schools than will be needed in the nineteen-sixties, when the school population will be falling. The peak years for juniors, as can be seen from the chart (which refers to England and Wales only), will be 1957 and 1958, and nothing that is done about the leaving age can affect either the size of the peak or the rapidity of the decline after it is passed. In the senior schools the peak will be reached, with the present leaving age of fifteen, in 1961. The effect of keeping all children at school for another year is shown by the dotted line in the chart. To do it now would mean an immediate and large increase in numbers, with even more overcrowding than there is now; and though it would postpone the peak by a year, it would make it nearly half a million higher.

Clearly, to raise the leaving age before this peak is passed is impossible—or if it is just conceivably possible, it would certainly be undesirable, in that many children would gain less by the additional year than they would lose from intensified overcrowding all through their school lives. When can it be done? If all goes well with building and with the recruitment of teachers, one may perhaps guess that by about 1965, overcrowding will be perceptibly less. Even so, to put the leaving age up at that time by twelve months would immediately restore the total numbers to above the

peak level of 1961—though with four years more building and recruitment to deal with them, and with the certainty of an immediate decline from the peak. It looks as if impatience will have to accept the fact that there must be a wait of a dozen years or more before a universal leaving age of sixteen will be possible. It might be possible to begin a little earlier if the change could be made in two stages—first to fifteen-and-a-half and then to sixteen. But, apart from the general and particular disadvantages of taking two bites at the cherry, it is unlikely that the first step could in any event be taken before 1964.

*

It may be that there is no escape at all from this unfortunate necessity to wait for the ebb tide of numbers. Certainly there is no possibility of escape without an upward jump in the supply of teachers. But there is something of a vicious circle at work, for the largest obvious source of more potential teachers is to be found among those grammar school children who now leave at the earliest opportunity, or as soon as they have got some kind of certificate. That over two-thirds of grammar school children should now leave before they are seventeen is the greatest waste in education today—a waste of ability and a waste of the places that could have been better used by other children. The National Advisory Council is due to report on the whole question in the summer, but meanwhile it is probably safe to assume that the main reason for leaving early is economic. Parents are always desperately anxious that their child should get to the grammar school. But they—and the children—are not always convinced that opportunities for work are any better at eighteen than they are at sixteen, and even if they are poor enough to qualify for an allowance from the local authority, this is no substitute for the good wages a child can now earn.

A higher scale of allowances might perhaps help in some cases. But it would not achieve very much unless it were accompanied either by a much wider recognition of the value of staying at school or by the compulsion of the law. Several local authorities, including a number where grammar school accommodation is scarce, have included in their private Acts of Parliament clauses allowing them to make the parents of children who are admitted to grammar schools sign an undertaking to keep them there until they are sixteen, with the penalty of a fine (usually £10) if the undertaking is broken. Others, like the London County Council, make the parents sign an undertaking, but without the backing of a private Act. It is tempting to think that what these authorities are doing piecemeal could be done on a national level—that the leaving age could be raised now to sixteen only for grammar schools and technical schools (where the course is also intended to last until at least that age) and that it could be enforced by the school attendance officer.

This seems at first sight to be easy. It would need only an Order in Council; its demands on class rooms and teachers (except in mathematics and science) would not be unmanageable because sixth-form classes are for the most part relatively small. But there are several difficulties. In the first place, there is no legal definition of a grammar school; it is not mentioned in the Education Act. Secondly, what about comprehensive schools, whose whole *raison d'être* is that the dividing line between the grammar and the other streams is not rigid or permanent? Thirdly, would poor parents start refusing to let their children take up grammar school places? Fourthly, even were these difficulties overcome, there is a danger that if sixteen is enshrined in legislation as the minimum age to leave a grammar school, it may be regarded as the proper age to leave; whereas it needs to be accepted that the proper age is eighteen, or at the earliest seventeen.

That idea is gaining ground. The number of pupils aged seventeen and over in maintained schools has risen from 26,000 in 1947 to 35,000 in 1953, although there has been little alteration in the provision of grammar school places. Britain is thus harvesting from its grammar schools larger numbers of better educated people in general and of potential teachers in particular. But meanwhile it is a long wait and everything should be done through propaganda inside the schools and outside them to hasten the realisation that the extra years at school are worth while. For on this the next big advance in education depends.

Auguries from Bonn

THIS month of May could be a terrible one for France. It might see the fall of Dien Bien Phu, with all the grief and recriminations that would follow; it might see the end of M. Laniel's government, to which there is no visible alternative; it might see M. Bidault facing in Geneva an agonising choice between the terms of enemies and the counsel of allies; it might see the Assembly, in a fit of bewildered exasperation, either killing outright the policy of European integration by voting against the treaty for a defence community or—what is more likely—condemning it to slow suffocation by postponing still further any debate. How many of France's troubles are due to postponed decisions, to brilliance of argument sapping at the roots of resolutions, to the failure of the politicians to rally the people on the issues that really matter? It is a time when friends can offer advice only with restraint and sympathy; yet it has to be said again and again in the coming weeks that Europe comes this summer to the parting of the ways, and that the decision about which way shall be taken lies mainly with France. What happens at Geneva is important, for it affects the future peace of Asia; but what happens in Europe is even more important, for it is the base from which the Atlantic alliance must function, whether in the West or the East.

It was, perhaps, this feeling of an approaching historic moment that underlay the long speech made last week by Dr Adenauer when the German Bundestag debated foreign affairs. He made, it is true, no striking new pronouncement save to welcome the American and British guarantees to the European Defence Community; and the Opposition's performance was colourless and on familiar lines. What, however, was significant was the note of foreboding that listeners sensed in his defence of his European policy. It is already clear to him, as it must be soon to everyone, that a decision must be made this year about the future of German rearmament, whether it is to take place within or outside a supranational organisation or framework. If the French Assembly does not decide on May 18th to fix a date for its vote on the EDC treaty—or if the vote is taken and goes against ratification—then an alternative will have to be sought to the policy on which the allies have concentrated for the last four years. The reappraisal—let there be no mistake about it—will be agonising for all concerned.

*

Some, of course, are ready to welcome such an outcome, without giving much thought to what comes afterwards. For example, the opponents of German rearmament in the Labour party and elsewhere nourish two delusions. The first is that the obvious alternative to EDC is the indefinite disarmament of Germany. There was a time when it could be thought possible, but only on a short-term view. Those who looked further ahead and who detested the idea of a new, independent *Wehrmacht* supported—some of them at least—the idea of the defence community as a safeguard against the inevitable day when Germans would demand on their own terms the rearmament that the EDC offers them on allied terms they are willing to accept. The wheels cannot now be reversed. There is still no public demand in Germany for an army. But there inevitably will be, just as there inevitably will be a demand from the Germans for everything else that other sovereign states possess. And the Germans, so strategically placed between the East and the West, will—if they are left free to do so—play one against the other, once Dr Adenauer's strong and wise leadership has gone, until they get what they want. (It should not be forgotten that the Russians have already offered them a national army once.) There is, therefore, only one question to be answered: that is in what manner the Germans shall be rearmed.

A second error regarding the EDC is widespread,

among military men who support it as well as among those who oppose it: that is the habit of judging the plans for a community in purely military terms, and of accusing Dr Adenauer of advocating them simply because he wants to see Germany rearmed. It is true that they were conceived to meet the military emergency of 1950, but they have grown into something bigger. They are now part of the project of a European house in which he aims, persistently and sincerely, to lodge Western Germany. The idea of a political community of six nations is for him an integral part of the EDC. Likewise, the coal-steel pool—whatever the cynics may say—is not just a new and cumbersome way of setting up a super-cartel for heavy industry, but the first step on a long progress towards a Federal Europe in which customs barriers fall and economic and social systems are brought into harmony.

★

The goal is obviously a distant one, but Dr Adenauer wants to see the course to it firmly set while he lives—so firmly that his successors will find it hard to change. There are many influential Germans, hard-headed industrialists among them, who declare that the coal-steel community cannot remain on its own; otherwise it will fail, and failure will bring into disrepute the whole idea of economic integration. And it is this coal-steel community that has been made the basis for all discussions of a political community among the six member states. It is under its auspices that they have tried to work out a draft political organisation that would embrace all the activities of the integrated six.

To judge from much that is said and written on the EDC, it is not grasped in this country how closely these various European aspirations are linked. But at this very moment the connection is showing itself in practical politics. The French declare that they will not ratify the EDC treaty until the future of the Saar has been decided with the Germans; but the Germans will accept the proposal to "Europeanise" the Saar only if there is to be a political community to exercise European authority. And until the EDC exists it is only in the coal-steel community that a project for the necessary West European political organisation can be drawn up. That is why Dr Adenauer in his speech dealt with the Saar and the coal-steel community together, pleading that Germany should continue along the path of collaboration with the West instead of returning to the narrow and dangerous track of national isolation. It must be admitted that on this occasion German logic is as good as French.

What is alarming at the present juncture is the feeling in Bonn that the best moment for setting Germany's new course has already passed. French obstruction has robbed the idea of "Europe" of much of its appeal to Germans. It is also true that many Germans have paid lip-service to the aspirations of EDC on the simple nationalist calculation that Germany must have an army if it is to make its influence felt in the world. But when all this—and worse—has been said, the fact remains that there has been in Germany a genuine wish to make a fresh start in co-operation with France. Certainly those young Germans who have any idealism left at all have sought to satisfy it through the idea of "Europe" and not through a return to militarism.

Now it is the cynics and the nationalists that are in the ascendant. They are saying that the Chancellor has made sacrifices to no purpose and that Germany should now develop an independent policy. The Free Democratic Party, with its strong right wing, is contesting with the Social Democrats the role of champion of German national claims. Under nationalist leadership the discontented Refugee Party is becoming a powerful pressure group. The industrialists are jibbing at the encroachments on their freedom of the High Authority in the coal-steel community. The military men, except for the lunatic fringe, are still restrained by their understanding of the fact that Germany is militarily dependent on France as well as on the United States, and that any rearmament of Germany without the co-operation and friendship of France would not make sense in the strategy of western defence. But the reformists, who saw in EDC a way of cutting clear from the bad aspects of Prussian militarism and of protecting the young republic against the professional staff officer, are now depressed. Their chances of success seem to be dwindling daily. Indeed, the present danger is that the whole European policy of Dr Adenauer may be written off by Germans as a failure if France delays its decision longer. As the Chancellor himself said in his speech, favourable constellations do not last and seldom recur in history.

★

For the time being the United States, Britain and France's partners in the European venture have said and done all that they can say and do; while Mr Molotov, both in public and in private, both in Geneva and in Paris, is straining every nerve to obstruct and if possible wreck the fulfilment of the Atlantic policy for Europe. If he is allowed to succeed, what is to be put in its place? Where is the plan that would at one and the same time link France and Germany, prevent the Germans from dragging the world into war for the lost territories, and give the allies the right to intervene in defence of German democratic institutions? Nothing less would command the support of American and British public opinion or justify the sweeping guarantees given to France. If no responsible French statesman has such a project, then the initiative must pass to London and Washington, where so far all discussion of alternatives to EDC has been loyally and wisely suppressed. The task will be undertaken only with the greatest reluctance, and there is little reason to believe that the conceivable alternatives would be more favourably received in France than the EDC treaty itself.

Cinderella in Downing Street

PARALYSIS of the will and confusion in the mind seem to seize Ministers when they are asked to make decisions about the British information services abroad. They have taken nine months to publish as a White Paper a summary of the report that the Drogheda Committee took ten months to produce. They appear to be little nearer to finding a remedy for the many shortcomings, the longstanding confusions and uncertainties that the report refers to; and they have done nothing to disperse the feeling among servants of the Foreign Office, the BBC, the British Council and the Central Office of Information that there hangs over them an axe in a faltering hand.

Some Ministers—is the Prime Minister one of them?—clearly do not believe in information work. To take an active interest in it brings no political kudos; to select one branch of it for abolition would be difficult; and to abolish it completely would be impossible. Whereas it is safe to speak well of the BBC, to say a word for the British Council is to bring Lord Beaverbrook into action with both barrels. Other Ministers are too ignorant of the subject to be capable of judging whether £10 million of public money is being each year well or badly spent. For this lack of interest and ignorance there is now less excuse; for the Drogheda Report makes it clear that information work as an activity of government has come to stay, that it is harmful if poorly done and useful if well done, and that to do it well will cost more money.

The essential point of the Report is the recommendation that the annual bill for information services should rise from £10 million to some £12½ million, and that this figure should be reached in the course of a five-year plan of reorganisation to which everyone—notably the Treasury—should stick. This sum represents 0.25 per cent of the total of public expenditure and is to be compared with the $162 million spent by the State Department and the $21 million spent by the Mutual Security Agency on information work abroad during 1952. It is not possible to estimate Soviet expenditure on similar activity, but the report points out that Moscow and satellite broadcasting has twice as many programme hours as the BBC, which is expected to serve the whole English-speaking world, the colonies, Asia, Middle East, Europe and Latin America. While other governments have been increasing their activity, the British effort has been decreasing, not only in broadcasting but in other media, not only in quantity but also in quality. That is to say, the need is not only to expand in a few directions, but to stop a falling away in most directions.

The report reveals a number of things damaging to British prestige: the falling out of date of BBC equipment because the Corporation has been expected to meet capital costs out of a revenue that has been uncertain year by year; the slowness of the press service that goes from London to missions abroad; out-of-date books in British libraries and out-of-date films at British centres; information officers tied to their desks for lack of staff; grotesque understaffing of British Council centres in great areas like India, where English might yet survive as the *lingua franca* and the key to science and technology for a whole continent; delays in starting vital work in Africa because the money could be found only by reducing the funds of some other department. It is not a pretty picture that the Drogheda Report sketches, with its references to an inter-departmental committee fighting to share out a dwindling income, to the lack of any central plan or principles for information policy, to the division of responsibility among Ministers, to the contrast between the jobs that are expected of the information services and the tools with which they have to work. But it is clear that the responsibility for it lies evenly between the present government and its predecessors.

★

It is a pity that the Drogheda Committee has recommended no clear remedy for what is held to be the main administrative weakness of the information services as they are at present organised. It appears most clearly in the lack of any responsible, co-ordinating Minister. It is nobody's job to wrestle with the Treasury for the services as a whole; to decide, for example, whether the BBC and the British Council can be afforded in Western Europe when a much bigger effort is needed from them in Asia; to rouse a lethargic Commonwealth Relations Office, or to assist by some redistribution of resources the Colonial Office in its growing problems. Nor is it anyone's concern to remind departments that there is a technique and a tradition in propaganda work; that this fourth arm needs in some simple, inexpensive form the equivalent of a staff college; that an information officer should understand what BBC and British Council are doing in the field at his side and what the Central Office of Information should be doing from the base in London.

The Drogheda Report says, with an obvious air of regret, that it appears to be politically impossible to revive the office of Minister of Information so that these things could be done. Instead it suggests—and it is a proposal well worth considering—that a permanent advisory committee should keep the manifold activities of the information service under constant review, making recommendations about the allocation of resources and trying to ensure that "when any particular bit of work was no longer required it should be brought to an end"—not by the indiscriminate

pressure of annual cuts, but by deliberate policy decisions.

Anyone reading only the main recommendations and conclusions of this report might judge that nothing had been said about the dangers of waste and ineffectiveness at a time when economy in government expenditure is vital. In fact, the body of the document offers some astringent principles by which information work is to be judged. It says, for example, that government activity abroad should be supplementary to private effort, especially in the promotion of cultural and commercial relations. Where a country is friendly, reliable, and reasonably prosperous the case for serving it with news, views and culture needs careful scrutiny. Information work must be judged by its results, both short and long term ; it is not to be regarded as a courtesy or a favour between friends. With limited resources the aim must be to influence the select few, and through them the mass. In other words, the object must always be to promote British interests with skill, dignity and persistence but only in those areas where the arguments for doing so clearly override the need for economy.

On the special kind of work that is called for behind the iron curtain, and in the Soviet Union and China, this report is most disappointing. Perhaps there are technical security reasons for omitting discussion of the great jamming war which costs the BBC so much money and effort ; or of the use that might be made in wartime of broadcasting and other media ; nor is there any discussion of greater Anglo-American co-operation in a field where there is much wasteful overlapping. (Both nations are, after all, using the same tongue.) Also surprising is the absence of any detailed forecast of the part that television services, and films for them, will play in the future. It looks, indeed, as if the direction of British overseas information services lacks not only coherence and central guidance but also the imagination to see what opportunities the future will bring. It is difficult to believe, for example, that the African territories do not offer tremendous scope for establishing the best techniques and traditions in broadcasting, in the production of newspapers and the guidance of the new intelligentsia. The Government will be well advised to see that information work is kept henceforth under continuous scrutiny by critical and independent people, who can ask awkward questions and lift policy-making above rivalries between departments. Otherwise the opportunity for a new start will be missed and there will be little disposition to entrust greater funds to the Cinderella of Whitehall.

Notes of the Week

M. Bidault in No Man's Land

Like General de Castries in Dien Bien Phu, so M. Laniel in Paris has seen his lines of defence contracting from day to day and his governmental stronghold in danger. But, unlike de Castries, he is threatened from within as well as from without. Communist and Socialist parliamentary troops attack the government's Indo-China position from the left flank. The right flank is defended grudgingly, half-heartedly and conditionally by the Gaullists, dissatisfied with the government's European policy. In the centre vice-premier Reynaud blows the call for a cease-fire, while Radical ministers clamour for a parliamentary debate within a week. It is significant that M. Edgar Faure, the Minister of Finance, has joined hands on this with his Radical colleague and chief critic of the official Indo-China line, M. Mendès-France. This may be a portent of things to come.

In the circumstances—with M. Bidault threatening from Geneva to resign if the debate does take place, and the Radicals threatening to resign if it does not—it is small wonder that M. Laniel wavered and could not make up his mind. Could he withdraw support from his Foreign Minister in the Geneva outpost ? Could he expose him to parliamentary fire at the very time when he should have been wrestling with what has been described as the task of finding "a compromise between the unattainable and the unacceptable" over Indo-China? M. Laniel finally managed to persuade the cabinet to postpone the time of reckoning. At the moment these lines are written he still has to convince the Assembly to do likewise.

The troubles of Mr Dulles, torn between Washington and Geneva, have been given much publicity. The tremors from Paris now serve as a reminder that even greater feats of agility are required of M. Bidault. He must keep his eye on Paris and Washington, Saigon and Dien Bien Phu without neglecting simultaneously to observe across the table the moves of Molotov, Chou En-lai and now the Viet Minh delegates. He holds poor cards, yet cannot afford to lose to these champion poker players. He was given no clear brief, but the National Assembly, it now appears, has little faith in his genius for improvisation. He knew all along that the fate of M. Laniel's government would largely depend on his performance in Geneva; but he rebels when it is proposed to submit him to an intermediate as well as a final examination.

France is now paying the penalty for past delaying tactics. For years Indo-China was the tabu subject, the matter that cabinets preferred to avoid from fear of provoking further dissensions. Hence, when the Viet Minh offensive and the approach of Geneva made further dallying impossible, the government found itself without a coherent policy, with day-to-day tactics instead of strategy. It proved necessary at the last moment to drag the associated states of Vietnam, Laos and Cambodia to the conference table, and their representatives are likely to be cumbersome partners for M. Bidault. They have just declared emphatically that they reject any idea of partition. What other solution, short of war to the end, have they to offer ? A coalition government with Ho as minister of the interior and Giap with the defence portfolio ?

France's tragedy is that it has little to offer itself, does not know how much its allies are willing to put into the bargain, and does not know the terms of the other side. Patience might seem the best weapon in this situation. But with Dien Bien Phu at the end of its tether and tempers rising in Paris, M. Bidault can hardly afford Fabian tactics. M. Laniel may finally weather the Indo-Chinese storm simply because his opponents are divided and cannot agree on an alternative solution ; but he is in no position to send reinforcements to Geneva.

Beside the Lake

It is frivolous to discuss the Geneva conference in terms of conventional musical comedy, but the resemblance has been temptingly close. The curtain rose on the brisk but aimless bustle of all opening scenes laid in a market place. Ethiopians, Siamese, Koreans and Greeks each added their touch of colour ; pedlars from Peking and Pyongyang spread out their gaudy wares, but none would buy. The opening choruses were sung, long and loud as usual, and, as usual, leaving the audience with no idea how the plot was to develop. A hush then fell, and an unaccompanied quartet seemed imminent ; Mr Molotov, insistent on bringing his own accompanist in the shape of Chou En-lai, blocked this move, but the action had at least begun. Mr Dulles has left the stage after delivering only one solo, but veteran playgoers may see in this the traditional build-up for a dramatic return in Act Three. Furtively scanning their programmes, they have noted with some relief that Mr Dinh and Mr Dong, the last on the list, have now made their entries. The cast is apparently complete.

It seems agreed, at all events, that the play must go on. Some essential concessions have been made: in particular, the Vietnam and Viet Minh governments, neither of which was originally willing to face the other across a table, have now agreed to a confrontation. Nothing, short of a political catastrophe in Paris, need prevent the Indo-Chinese part of the conference from getting under way this weekend. But is it to begin only to reach the same kind of apparent deadlock that has gripped the Korean talks ?

Admittedly, on the face of things, the obstacles to all progress on Korea do not yet seem insuperable. Any early reunion of the two halves of the country must obviously be ruled out as long as both governments reject the idea of strictly supervised elections ; but the two halves are separated by a clear dividing line, each has a firmly established government, and a degree of stability can undoubtedly be achieved if there is a little commonsense on both sides. But if, despite this, nothing can be done about Korea at Geneva, what hope can the conference offer as regards Indo-China, where no such favourable factors exist ?

Mr Eden's Task

At the moment, interest is focused more on the methods of underpinning an Indo-Chinese settlement than on the form the settlement itself might take. President Eisenhower, on Wednesday, indicated that the United States still expected early progress towards a South-East Asia security pact. But the President was wary about the whole subject, and rightly so. A pact in this area could not be cast in the same simple mould as Nato, and if it is to bring together the nations that are ready to defend others, those that are only willing to defend themselves, and those who are hesitant about fighting at all, it will have to take a supple, yet precise, form. From this point of view, it may fairly be said that the Indo-China crisis is as necessary to the pact as the pact is to it. Without something specific to underwrite, it would be impossible even to think of practical teamwork between the nations of Southern Asia, the Pacific and the West.

But even if a formula for Indo-China can be successfully evolved, in the face of natural Vietnamese hostility to any kind of partition, and the existence as far south as Cochin-China of Communist forces that must set a pretty problem in any tidying-up operation, the task for diplomacy will remain a severe one. And it will be primarily Mr Eden's task—not because Mr Dulles has returned to Washington to clean up his own rear areas, but because at Geneva the Foreign Secretary is coming to personify Sir Winston Churchill's famous description of Britain as standing at the point where the great circles of the free world intersect. No Indo-Chinese settlement can rest on solid foundations unless it has the approval of, and at least a modicum of explicit support from, the free nations of Southern Asia. Their Prime Ministers, in conference at Colombo last week, showed no enthusiasm for Mr Eden's idea that they might accept responsibilities towards Indo-China, but they did not close that door tight shut. No hand other than Mr Eden's can hold it open wide enough to secure this essential link between the free West and the free East.

Cracking the Whip

Mr Bevan having tripped over the ropes and fallen out of the ring, Labour's official leaders are now bent on keeping him out for good. Party discipline at Westminster is being tightened and Mr Morrison has given the signal for a general assault. In a remarkably bludgeoning article in the monthly *Socialist Commentary*, Mr Morrison has accused Mr Bevan of losing Labour 30 to 50 seats in 1950

by comparing the Tories to "vermin," of costing it office in 1951 by his resignation from the Government, and now of being "the answer to the Tories' prayer" by his escapade over Indo-China. Mr Morrison appeals to the constituency parties to turn away from "damaging foolishness" and he re-states in precise terms the moderates' approach to public ownership. He slams the door on personal compromise; there can surely be no turning away from the struggle of personalities now.

Mr Morrison would not take a step so momentous for himself and his party without careful calculation. He must have discounted, therefore, the obvious dangers now facing him. His article will delight MPs and union leaders who have been howling for Mr Bevan's blood ever since Morecambe; but it will dismay the middle-of-the-road men who still believe that Labour needs to digest, not eject, Mr Bevan as a man as well as Bevanism as a policy. Above all, Mr Morrison has lain himself open to charges of violating the very rules drawn up by the National Executive and the Parliamentary Party to curb the Bevanites after Morecambe. On October 23, 1952, the Parliamentary Party passed a resolution calling on all Labour MPs "to refrain from making attacks on one another, either in the House, in the press or on the platform."

The latest escapade of Mr Bevan and his friends has been to line up with the party's instinctive pacifists in last week's back-bench revolt on the Atomic Energy Authority Bill. No fewer than 65 Labour MPs supported a proposal that Parliamentary approval should be secured before Britain starts making a hydrogen bomb. The fact that no other country would be similarly placed was pointed out from their own front bench, but blandly disregarded. The possibility that a start may already have been made on the bomb—and that the Labour Government itself would have taken the preliminary steps if it knew how—was ignored. Among the rebels were three whips; two were unrepentant and were sacked, but the third is having his case reconsidered after admitting and apologising for his guilt. A whip has to pass on the leader's instructions to the backbenchers; he can scarcely be effective if he disobeys those instructions himself. Indeed, the most surprising thing about this incident is that the three whips did not resign before revolting.

Labour's New Loophole

IT may seem unfair, after this show of fierce courage in the battle of personalities, to say that the Labour leadership is still wobbling weakly in its attitude towards foreign affairs. But it is policies, not personalities, which matter now; and for this reason the statement by Labour's National Executive this week, about the conditions on which it will support German rearmament, is dismaying. The new feature of the statement is that it links Labour's support for German rearmament more closely to the creation of EDC; the new danger is that, by doing so, the National Executive may have left the way clearer for a cowardly retreat on this issue should EDC fail to materialise. The executive has put its most awkward eggs into a basket which it feels that the French are very likely to drop.

Labour's attitude to German rearmament is governed by the three conditions laid down by Mr Attlee in 1951—that there should be fresh German elections, a further approach to the Soviet Union on unification, and arrangements to prevent any re-emergence of German militarism. The first condition was met by the elections that returned Dr Adenauer to power last year. The second was—in Mr Attlee's view, but not in Mr Bevan's—met by the Berlin conference. There remains the third condition, and it is with this that the National Executive's statement is concerned. It declares that this condition "will best be met by the establishment of the EDC within the framework of Nato"; and calls on the British Government to make the "fullest provision" for EDC, including the integration of British forces if that is what the EDC countries would like.

From this it is clear that, so long as EDC remains a possibility, Labour's official leaders will back German rearmament; in that sense the National Executive's statement is an attempt to rally support for the policy that Mr Attlee knows to be right. But if the French do not ratify the treaty, the statement becomes an escape clause. The Executive has not deliberately ruled out other means of satisfying Mr Attlee's third condition; EDC is called the best, not the only, way. But there can be no doubt in Mr Attlee's mind that, if EDC is not ratified, the rank and file will now expect the whole question to be reviewed from scratch. Mr Attlee may then sadly report that there is no chance of the party accepting the alternative of German rearmament within Nato; and he will find himself presiding over a reunited party (at least on this issue) but gazing on the ruins of a bi-partisan policy which he himself inaugurated.

Television in the Tumbril

SOON after the committee stage of the Television Bill opened on Tuesday, Mr Gammans spoke of it becoming law by June or July. The House then settled down to a procrastinating rate of argument that would not even let it through by Christmas. Before the committee stage began there were 138 amendments on the order paper; eight of these were disposed of on Tuesday, but another 23 were added. Progress was not much quicker on Wednesday, and another batch of new amendments went down. All night sittings are no answer to progress at this pace; MPs would become somnambulists before the committee stage ended.

Faced with such inescapable facts of time and motion, the Government had no option but to resort to the guillotine and put down a time-table motion for the rest of the Bill. Allowing for a ten-day break at Whitsun, Parliament has only eleven weeks to go before the long summer recess. In that time the Government must pass its Finance Bill, provide the Opposition with several Supply Days, clear up some other legislative odds and ends and leave time for general debates on such matters as MP's pay and foreign affairs.

A silly ritual has grown up for such controversial measures as the Television Bill: the opening two or three clauses are discussed at unnecessary length until the guillotine is applied, and then the rest of the Bill tends to be skimped. On the Television Bill the House spent the first six hours discussing the name of the new Corporation and the date on which the Bill should come into operation; the first point, at any rate, was obviously not a major one. On later clauses, however, and not least on the schedules, the Opposition is preparing to battle for some important amendments, which would tighten the safeguards against so-called commercial abuse and which would make it even more difficult for the new scheme to be commercially viable; on the other side of the floor, some Tory backbenchers are preparing to battle for amendments with precisely opposite aims. It may be legitimate to regard the Bill, in its present form, as a boring, not very important, not very sensible and possibly not very lasting affair; but that is all the more reason why the timetable should allow it to be sensibly (but not boringly or everlastingly) discussed.

Mr Dulles in Italy

IT would be hard to imagine anything more flaccid than the communiqué issued in Milan on Monday after Mr Dulles's visit. As a piece of sheer diplomatic evasion it surely deserves an Oscar. The Secretary of State had taken the trouble to pay a flying visit to the Italian Prime Minister, Signor Scelba, and the Foreign Minister, Signor Piccioni, on his way from the Geneva Conference back to Washington. But all that could be allowed to leak out to the wide world was that they "discussed matters of mutual interest," that "there was a full exchange of views on aspects of the general international situation," and that "Mr Dulles took the opportunity to inform the Italian(s) . . . of developments at the conference."

Mr Dulles's visit was mainly concerned with Trieste, and the difficulty which has arisen in Italy of securing ratification of the EDC treaty until some progress can be made in a settlement with Jugoslavia. Recent rumours of an impending compromise solution to the Trieste dispute must be taken with a pinch of salt. Nothing that has been made public suggests that anything startlingly new is on foot. The Jugoslavs still want access to part at least of the port of Trieste, and the Italian government would still find it politically difficult to accept an agreement formally abandoning any claim to Zone B of the Free Territory, except on more favourable terms in regard to Zone A than anything Belgrade has apparently offered so far.

★

Although Italy has no direct concern with either the Korean war or the struggle in Indo-China, it is much concerned indirectly with the impact of the latter on France. For if it were stopped and the French at last went ahead with EDC, it would not be easy for the Italians alone to delay their own ratification debate any longer. On the other hand, so long as France does not ratify, Rome does not want to throw away its power to bargain acceptance of EDC against American assistance in getting something done about Trieste. If the Russians had not continually vetoed Italian membership of Uno, Italy might have been represented at Geneva as a contributor to the UN forces in Korea, and Mr Dulles's journey would not, perhaps, have been necessary. It is one of the difficulties of any government in postwar Rome that it still has to take a back seat in world affairs while other states, a half or a quarter of its size, are in the front row and talking loudly.

"The Tibet Region of China"

AFTER negotiations lasting four months, India has concluded an agreement with the Chinese People's Republic over what is now officially styled "the Tibet region of China." This treaty is based on the new situation arising out of the recent Chinese reconquest of Tibet, after the latter country had succeeded in maintaining its independence since 1912. India originally protested at the Chinese invasion of Tibet, but accepted the accomplished fact when the government in Peking disregarded the protest. The establishment of Chinese control made it necessary for India to negotiate with regard to Indian rights in the country taken over from the period of British rule in India. These included trading posts at Yatung, Gyantse and Gartok, with small military garrisons at the two former places, postal and telegraphic installations, and the right of Hindu pilgrims to visit certain sacred sites in western Tibet. By the new agreement India will withdraw the garrisons and sell the installations to the new rulers; trade will be permitted to continue at the posts mentioned above, but China in return will be entitled to establish trade agencies in Delhi, Calcutta and Kalimpong; the rights of pilgrimage are recognised. The treaty, according to Chinese Communist press comment, "expunges the remnants left by British aggression against China" and restores "the traditional intimate relations between the Chinese people in Tibet and the Indian people."

"The Chinese people in Tibet" are, of course, the Tibetans, just as, if this peculiar kind of double talk were to be applied here, the Irish might be described as "the British people in Ireland." Regarded simply as an agreement between sovereign states, the treaty that has just been signed seems to be a fair and sensible adjustment of issues arising in commercial intercourse and travel between two countries. It cannot escape notice, however, that it entirely ignores the existence of the Tibetan people, who are now treated merely as a section of the Chinese people inhabiting "the Tibet region of China." All this elaborate hocus-pocus is designed to cover up the fact that Communist China has subdued a non-Chinese people by force. Tibet was an independent country until conquered by the Manchu rulers of China in the eighteenth century, and the Tibetans differ profoundly from the Chinese in language, culture and traditional religion. But it seems that Asian nationalities

have rights to independence (or even identity) only against western powers, and not against China.

Turkey Chooses the Same Again

It is not often that a democratic government is returned to power with an increased majority after four years in office. That, however, is what happened to the Turkish Government in the general elections last Sunday. When the last parliament was dissolved, the Democrat Party (DP) held 385 seats out of a total of 487, with an absolute majority of 283. In the new parliament they will probably hold 508 seats out of an increased total of 541, an absolute majority of 475. Its principal opponent, the People's Republican Party (PRP), which at the dissolution of the last parliament held 52 seats, will now have only 28. The remaining five seats will go to the Republican National Party, the successor to the reactionary Nation Party which was dissolved by the Government early this year.

It is only fair to the PRP to point out that, owing to the peculiarities of the Turkish electoral system, their strength in the Grand National Assembly is by no means a true reflection of their voting strength in the country. (In 1950, with 43 per cent of the votes they gained only 68 seats.) On the other hand, in 1950 the Democrat Party had had *little opportunity* to show its paces and the electorate's choice was something of a shot in the dark; but in 1954 the Turks have clearly voted for a party whose performance they have watched and weighed and found satisfactory. The winning ace in the Democrat Party's hand has undoubtedly been Turkey's unparalleled economic development over the last four years. Pessimists and opposition politicians point to the alarming trade deficit and the menace of serious inflation; but over three-quarters of Turkey's voters come from the countryside where neither inflation nor the trade gap has yet made any serious impact. To the village people what counts is the money in their pockets, the tractor on the farm and the passable roads that now link them with the neighbouring town.

On the whole, as a supplement in next week's issue of *The Economist* will show, the Turkish people were justified in giving their government such an emphatic vote of confidence. But it is a pity that the Democrats will sit in the Grand National Assembly in such overwhelming strength. Turkey will, it is true, be spared the frustrations and deadlocks of a too closely divided parliament but, like any other democratic country, it is liable to suffer when the Opposition is virtually deprived of parliamentary expression.

Leave it to Uncle

The general council of the Trades Union Congress adopted an almost avuncular air when it told the Minister of Labour last week that it cannot support the proposal that a Royal Commission, or other "impartial body," should inquire into the economic problems affecting wage claims; it intimated that any representative commission would almost certainly produce conflicting majority and minority reports, which would both be out-of-date translations of the annual economic survey from bald into appropriately biased English and which would be misleading when applied to individual industries. The TUC has also advised against an attempt to operate the "Ince Plan." Under this plan the Minister of Labour intended to write to individual employers' associations and trade unions, suggesting that all agreements for the conduct of collective bargaining (of which there are an astonishing variety in Britain) should provide for disputes to be submitted to arbitration before strikes are called. The will to settle, explained the TUC as it turned down its thumb, is far more important than the mere provision of additional machinery.

There need be no great regret that these two proposals are now dead, at any rate in their original form. The TUC is likely to produce, before the end of the summer, its own pontifications about the economic situation, written by the same hand as would have written most of the minority report of any Royal Commission which included almost any official trade union representative. It will surprise nobody if such a document includes a modified call for restraint; and it may also suggest that some, though not all, of the unions which have opposed the incorporation of arbitration machinery in their collective bargaining agreements should look at the problem again. If such a call is made, comparatively few of the militant unions may listen to uncle; but at least there will be no excuse for the better-disposed to suspect that all this is really the thin end of a wedge that might eventually destroy industry-by-industry bargaining and replace it by something more top-heavy though more compact. If uncle calls for a modified Ince, nobody will accuse him—as they might accuse the Ministry of Labour—of secretly wanting an ell.

Local Gains for Labour?

Municipal elections took place in Scotland on Tuesday. As usual, polls were low (less than 20 per cent in some wards); and, as expected, Labour recorded gains. According to the best available estimate Labour gained 47 seats and lost 17.

Next week elections will take place in England and Wales for a third of the seats on the 395 borough councils and a third of the seats on some 600 urban and rural district councils. The complicated mosaic of local elections is described on the following page; this description shows how difficult it is to judge the trend of opinion from elections of this kind. But one forecast can fairly safely be made. It is very likely that Labour gains will predominate in these elections (as they did in 1952 and 1953, but not in preceding years).

Before these expected gains are taken as a sign of a swing to the left, it is important to answer the question "A swing since when?" Most of the seats to be contested next week were filled in the spring of 1951, when Labour popularity was low. At the nearest public opinion poll to those elections in the spring of 1951, 49 per cent of those who expressed a preference favoured the Conservatives,

40 per cent Labour and 9½ per cent the Liberals. Between then and the general election in October of that year there was a clear swing to the left; at that general election (when, admittedly, many Liberals did not have a candidate to vote for) 48.7 per cent of the electorate voted Labour, 48.0 per cent Conservative and 2.5 per cent Liberal. In the first six Parliamentary by-elections this year there was a swing to the Conservatives, compared with that general election, averaging just over 2 per cent; in the latest two (just after Mr Butler's no-change budget) there was a swing of 3½ per cent to Labour.

During the last three weeks, thanks to the Bevanite controversy, there may have been a swing back to the Conservatives again. But it will be very surprising if this has carried the Tories back to their high tide of the spring of 1951, and thus to a position where they can hope to hold on to all the net gains of 14 provincial borough seats and 23 urban district seats which (according to them) they secured in that year. Indeed it is much more likely that, with some 7,200 seats of all kinds to be contested, their losses will be fairly substantial; they will have a hard task to hold on not only to the seats that they won for the first time in 1951, but also to those that they won during their period of easy-riding opposition in 1948. A subsidiary factor is that, since about two-thirds of the 7,200 seats to be contested next week seem to be Conservative-held, Labour has a much bigger target to aim at.

Atomic Security

It is pleasant to be able to find one field in which last week's debate on atomic energy revealed a sane and liberal attitude on both sides of the House. Despite some fearfully muddled thinking about both international morality and strategic advantage, both parties had some sensible things to say about the relation between national security and individual rights. A Government amendment provided that the Lord President should give his consent before any person could be dismissed by the Atomic Energy Authority "on the ground that his political associations render his

Light on the Local Elections

There are 62 county councils, 395 borough councils, 568 urban district councils and 475 rural district councils in England and Wales; of the borough councils, 83 are county boroughs and 312 non-county boroughs. In addition there are the various local authorities for London: the Corporation of the City of London, the London County Council and 28 metropolitan borough councils.

There will be no county council or London metropolitan borough elections next week. County and metropolitan borough councillors are now elected every three years (the last elections were in 1952 and 1953 respectively), and all these councillors will retire together in 1955 and 1956 respectively.

In the 395 borough councils one-third of the members come out every twelve months; there will therefore be elections in all these next week, for the 3,200 odd seats last contested in 1951. In urban and rural districts elections may take place annually, with one-third of the councillors retiring each year, or all the councillors may be elected triennially (as is much more usual in rural districts). Next week elections will be held in some 450 urban districts and 150 rural districts; about 4,000 seats will be contested in these districts, and again these will be the seats that were last filled by elections in 1951.

Facts about local elections are hard to come by. No official count is made even of the total number of seats contested, let alone the way votes are cast at election time. Unofficial counts show that there are approximately 1,400 seats in the metropolitan boroughs, 3,800 in the counties, 6,000 in non-county and 3,600 in county boroughs, 9,200 in urban districts and 14,000 in rural districts. The seats to be contested next week number about 2,000 in non-county and 1,200 in county boroughs, 2,500 in urban districts and 1,500 in rural districts. Elections will go on throughout next week in the rural and urban districts, but polling in all the boroughs will take place next Thursday. Scotland had local elections this week, and the results are discussed in the note above.

The two main parties never manage to agree exactly in their tally of the results. The accompanying table shows the two sets of claims in England and Wales during the last five years. Ordinary errors of counting must, of course, creep in; but the main difference originates from the large number of candidates who still do not choose to carry a simple label round their necks. Not surprisingly, these candidates are often differently ascribed by the two parties—with a differing result according to which side makes the count. No full independent check is made of local election results, but the Press Association makes its own count in the boroughs. During the coming week some of the conflicting figures published in the newspapers may therefore seem confusing; and, as the above note on "Local Gains for Labour?" explains, there will also be plenty of opportunity for the public to become confused about the current trend of political opinion.

SOCIALIST NET GAINS (+) OR LOSSES (−) IN SEATS AT LOCAL ELECTIONS, 1949–1953
(England and Wales only)

	According to Labour				According to the Conservatives			
	Boroughs		Urban and Rural Districts	County	Boroughs		Urban Districts*	County
	Metropolitan	Provincial			Metropolitan	Provincial

* Figures not available for rural districts.

continued employment undesirable in the interests of national security." Labour wanted this safeguard extended to cover not only dismissals on account of political association but all dismissals on security grounds—grounds which might be as non-political as a tendency to babble after the third drink or as tragically beyond the victim's control as susceptibility to pressure because members of his family were behind the Iron Curtain. The Opposition also argued that in all cases short of active misconduct dismissed persons should have the right to transfer to non-secret work. Sir David Eccles rejected this blanket liability, but undertook that the Civil Service would do its best to find room for the Authority's displaced persons. He also conceded that the amendment was unsatisfactory on the question of rights of appeal and promised reconsideration in the Lords.

The difficulty is a genuine one. It would be absurd to pester the Lord President's office every time a somnolent night watchman or light-heartedly bibulous junior is felt to be a security risk; on the other hand the more summary procedure governing non-political dismissals could tempt the Authority, even in political cases, to base its overt decisions on non-political grounds—which might well be discreditable to the victim. At best, there will be cases in which, even if justice is done, it will not manifestly be seen to be done.

But one invaluable unanimity has emerged from the debate: a refusal to mix security provisions with character assassination. An attempt has been made to draw a rough moral line, for purposes of compensation and the right to alternative employment, between those who are dismissed by the Authority because of their private political opinions and those who are bad risks for other reasons; the result is admittedly unsatisfactory and the draftsmen will try again. This distinction apart, the question is not whether a near-fellow traveller deserves a moral stigma but whether his employment at an atomic station is any more compatible with public safety than the employment of the most morally impeccable epileptic at the wheel of a bus. That this principle should be accepted, under the shadow of the hydrogen bomb, is a credit to the temper of the House.

Fish-days for the Russians

At the recent meeting of the Supreme Soviet, Anastasi Mikoyan, the Minister of Trade, warned the Russians that many meatless days may lie ahead of them this summer. He urged them, therefore, to substitute fish for meat. Now *Pravda* follows suit, and in a leading article exhorts fishermen to do their duty. Mr Mikoyan made no bones about the fact that meat and butter supplies have fallen short of expectation (in fact, this is so for the second year running). He explained that farmers, encouraged by higher prices, are fattening their stock for the autumn.

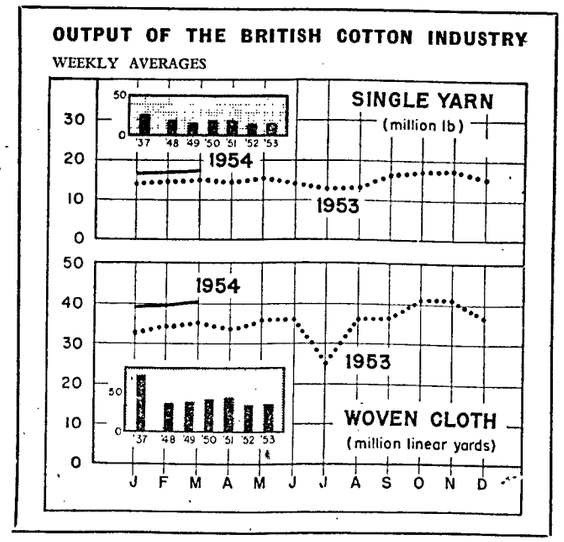
Thus, according to him, Nikita Khrushchev's policy of incentives launched last autumn has in the short run the opposite effect from the one for which it was designed: collective farms and farmers are temporarily holding off the market. Another possible explanation is that with the burden of taxation somewhat lightened the peasants have actually decided to consume more. Anyhow, shortage of meat seems a strange phenomenon after the announcement earlier this year of a tremendous increase in pig numbers. Moreover, whatever the reasons for this failure to reach the target of meat production, the government will certainly do everything in its power to step up supplies rapidly. Should the weeks of many Fridays extend well into the autumn, the Russians would take it as an unpleasant surprise to receive from the new regime.

German Industry and the EPU Credits

Federal Germany's surplus with the European Payments Union has now topped the $1,000-million mark, and the credit that is being extended to the Union by the reluctant Germans is now over $567 million. In these circumstances, there will probably be something of a tussle at the meeting of the OEEC Council of Ministers that opened this week which is discussed elsewhere in this issue (p. 471). Hostility to the British offer of part repayment of outstanding debts seems to be concentrated in the two ministries headed by Dr Erhard and Herr Blücher, who are representing Germany in Paris. And the Germans have evidently been briefed to argue against the OEEC's proposals that they should reduce their creditor position.

In point of fact, Dr Erhard should find it hard to refuse the OEEC's suggestion that Germany should import more and raise its standard of living, as that is precisely the policy he was vigorously advocating last year. But any attempt to remove quotas or lower tariffs on foodstuffs would mean changing the Bonn government's farm price policy, and antagonising the farm bloc. For its part, the German public, instead of clamouring for more imported goods, continues to save its money at a prodigious rate.

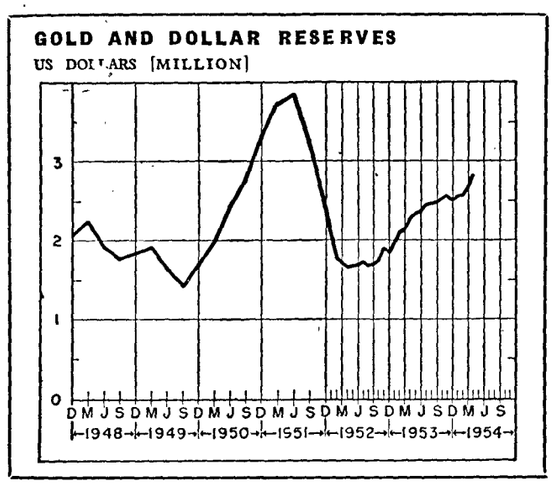
Moreover, Dr Erhard can do nothing that would hamper German exports, unless (as with export subsidies) he can prove that the British are doing the same. The Germans, claim, not unjustly, that they still have a long way to go before they gain the place in world markets that they held before the war. Their efforts are now concentrated upon modernising their plant in order to overcome competition. One of the most revealing statements of policy was made recently by an economic adviser of the *Bank deutscher Länder*, who declared that Germany would not go over to full convertibility until it was certain that Germans could meet the American export drive that would come with any recession in the United States. To make up for lost years, German industry has for some time past been crying for a revived capital market, in which risk capital can be raised or long-term funds borrowed at low interest rates. But this means that investors must be attracted by high dividend; and that in turn means several things that run counter to the OEEC's proposals for higher imports and accelerated repayment of prewar debts. It seems likely that German industrialists will insist that the Bonn ministries look after their interests first and foremost.



Half-cock in Honduras

As had been gloomily expected, the People's United Party, which has a strong anti-British and anti-colonial bias, won a sweeping victory in the elections in British Honduras last week. Under the new constitution, which came into effect this year, nine of the fifteen seats in the legislative council had to be filled by direct election. The PUP won eight of them. There can be no doubt about its claim to represent the 70,000 inhabitants of this poverty-stricken Central American colony. The poll was extraordinarily high, averaging as much as 70 per cent; and the PUP gained more than double the number of votes cast for its opponents.

This result will not have much immediate effect on the administration of the colony, since Mr Lyttelton has no intention of sanctioning the second instalment of constitutional reform—the admission of elected members into the Governor's executive council—unless there is a reasonable chance of their turning into responsible and loyal administrators. The Colonial Office may not have very high hopes of such a development. Certainly the PUP leaders' behaviour on the Belize city council is not a happy augury; and the evidence of connections with the Communist-infiltrated government of Guatemala, as revealed by Sir Reginald Sharpe's recent inquiry, must continue to disturb the authorities. But it is not entirely impossible that the prospect of the more exalted prize of executive office may sober the PUP; the proper attitude seems to be to fear that these people may continue as irresponsible Jagans, but to hope they may turn into responsible Nkrumahs—and meanwhile to remember that they cannot cause irreparable harm to Honduras while the constitution remains as it is.



Protection for Forestry?

The Secretary of State for Scotland and the Minister of Agriculture have set up a committee to investigate the marketing of home-grown timber; and last week several MPs told these Ministers what they want the committee to recommend. They want forestry to follow agriculture along the primrose path of protectionism; they want it to be shielded from the competition of imported supplies which has recently caused a sharp fall in timber prices. One suggestion is that a levy should be imposed on imported timber (which constitutes over 90 per cent of total supplies) to enable minimum prices to be guaranteed to home producers.

It can be plausibly argued that forestry has as much claim to Government protection as agriculture. Timber is bulkier to import than food in the event of war, and some timber imports cost dollars. Moreover judicious afforestation is an excellent corrective for the depopulation of the remoter rural areas, which otherwise might need public subsidies to prop them up. It is already Government policy to expand the production of timber as rapidly as possible. The main engine of expansion is the Forestry Commission. But private owners, whose woodlands have been extensively felled in the two wars, also have an important contribution to make; and they are asking for some incentive to make it.

Nevertheless, the present pressure should be resisted—especially as so high a proportion of supplies will always (except in war) be imported. Improvement grants are available to private owners who manage their woodlands in an approved manner; and this method is more likely to bring about the proper regeneration of devastated woodlands than would a guaranteed timber price. The useful advisory services rendered by the Forestry Commission should perhaps be put on a more formal basis; and as the commission becomes more directly competitive with private owners in the sale of timber, its regulatory functions should probably be separated from its business activities and transferred to other hands. Marketing improvements, such as the introduction of a proper grading scheme, are also desirable; but the departmental committee should set its face firmly against suggestions for the creation of another protectionist monopoly.

Eltham's Competition in Petitions

THE Minister of Education has reaffirmed that Eltham Hill School is to remain open. She announced this on Tuesday when she received a deputation from the London County Council. The deputation came to present a petition, signed by 5,000 people, protesting against her refusal to allow this well-known high school to be closed down, so that its pupils and staff might be transferred to the LCC's first new comprehensive school at Kidbrooke. This was a slightly larger petition than the one previously presented to the Minister, which had asked that the school should not be closed down, and which had prompted her intervention on its behalf.

Meanwhile, however, some interesting facts have come to light with the publication, in the correspondence columns of the *Kentish Mercury*, of letters from a former headmistress of Eltham and from the chairman of the parents' committee which organised the first petition. These letters assail the claim of Labour councillors that the staff and children at Eltham were ready and willing to move and that the opposition to closure was purely political. The staff, it appears, were not consulted about the original decision to close the school. It was only after they had been presented with an apparent *fait accompli* that they said they were prepared to go to Kidbrooke rather than to find another job, because they thought that they should stay with the children whose education they had begun. But once it was known that the school would not be closed, only one out of a staff of twenty-eight, and only four girls out of 467, have chosen to leave Eltham for Kidbrooke.

Since the interests of the children must come first, there can be little doubt that the Minister's decision is the right one. But the LCC is entitled to sympathy that it should have come so late. It may be years before Kidbrooke can fill all the 400-odd places that are thus left vacant. The Association of Education Committees has therefore joined with the LCC in trying to ensure that this should not happen again. They propose that if in future the establishment of a new school involves the closure of, or changes in, existing schools, combined notices should be issued on all the related proposals, and that the Minister should decide on the whole scheme at the earliest possible stage. Miss Horsbrugh has agreed that this would be a better procedure. Some means must certainly be found of avoiding similar *débâcles* over the other 66 comprehensive schools that the LCC, with extremist zeal, proposes to establish in its bailiwick.

Pressures on the Press Council

THE Press Council has had its first really difficult furrow to plough, and has come to the end of it by announcing that it "deplores" a recent action of Mr Herbert Gunn, the editor of the *Daily Sketch*. The case arose over the way Mr Tom Hopkinson's review of the film "Front Page Story" was treated by the *Daily Sketch* on January 22nd. Mr Hopkinson accepted a small alteration in his original text; but further changes, which cast a more favourable

light on the film than he regarded as warranted, were added without his knowledge. Mr Gunn, in a letter to Mr Hopkinson, is reported to have said that he added these sentences because the article as it stood did not do justice to a film with which he himself had been associated—an attitude the council did not regard as proper. Mr Gunn also explained that he gave orders for Mr Hopkinson's name to be removed from the article, but that his instructions were not carried out. He apologised privately to Mr Hopkinson, but the council thinks he should have made a public apology as well.

Mr Hopkinson allowed the whole affair to be ventilated in Mr Randolph Churchill's column in the *Daily Recorder* before giving the council a chance to pass judgment on it. By the time that the issued did reach the council, threats of legal proceedings were flying about; and Mr Gunn did not appear in person before it. The council is not a privileged body, and these rumours of possible invocation of the law must have made its quasi-judicial function doubly tricky. In the event all seems to have passed off smoothly, and the *Daily Sketch* published the eventual judgment with admirable grace. But the council cannot be sure that people who are criticised will always react like that. It is therefore in an unenviable position. Its job is to censure, but it can apparently be brought before the courts if it is unduly censorious.

Who Shall Be Master?

We cannot record the termination of the prolonged strife between the operatives and master manufacturers of Preston without a few words of comment, by way of what preachers call "improving the occasion." . . . The men had a bad cause to begin with; but we willingly confess that the mode in which they have conducted this cause has shown an improvement over former days, and has on the whole presented few points for blame. . . . But the great mistake they made, and the one which rendered their success impossible, was that [their] various demands were urged in a mode which left it obvious and undeniable that the contest was one less for money than for power. "No surrender," and "no dealing except with the committee of delegates," narrowed and defined the matter in dispute. What was really sought for, and even avowed by the more impulsive and incautious, was not so much an advance of wages as a victory which would have enabled them to dictate terms to their employers, and reduce them in future to carry on their business, as it were, under the supervision and control of a committee—not of their own workpeople, though that would have been bad enough, but—irresponsible delegates from trades' unions and operative associations. This made it absolutely essential for the master manufacturers, at any cost and by any means, to stand out to the last. To yield would have been to embrace a future of slavery, discomfort, and failures. This it was that secured them the wide sympathy and the liberal aid that enabled them to conduct the ruinous strife to a successful issue. It is possible enough that the masters have not always used their power well or kindly; that they have been sometimes harsh, sometimes inconsiderate, sometimes dictatorial; but it was necessary that they should remain masters, both for their own comfort and for the welfare of trade.

Laboratory check on a magnetron intended for use in radar equipment.

PROGRESS IN ELECTRONICS

THE possibility of using radio to detect and locate unseen objects has intrigued scientists since the turn of the century, but it was not until the advent of the multi-cavity magnetron during the late war that the history of modern radar began.

Radar targets are located by a beam of radio waves which upon striking an object are reflected to the sender. The direction of the beam when it is reflected, and the time taken by the waves on their outward and return journeys, indicate the exact position of the target.

For the system to be sensitive and accurate, the range of the transmitted beam must be long and its width narrow. This requires a powerful source of radio waves of very short wavelength but, unfortunately, such "microwaves" cannot be provided by an ordinary electronic valve. Faced with these difficulties the early radar pioneers developed the multi-cavity magnetron — a special valve which proved to be more powerful by a factor of hundreds than any other microwave generator then available.

Today, magnetrons are playing an essential part in radar navigation. Ships and harbours are no longer hidden by fog and mountain peaks cease to be obscured by cloud. The cathode ray tubes of air and sea nagivators present pictures of the way ahead even when visibility is zero.

Radar science is still undergoing ingenious and complex development. In the field of meteorology it is used for detecting and "tracking" clouds, as well as obtaining upper air measurements of wind velocity. A different role is also being played by the magnetron in accelerating electrons for the production of high-energy X-rays. In these and other microwave applications Mullard are contributing to further progress with the large-scale manufacture of high quality magnetrons and similar electronic devices.

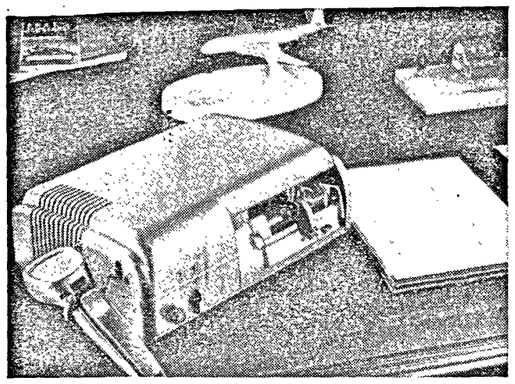
If you called on Sir Miles Thomas of B.O.A.C.



Should you call on Sir Miles Thomas, Chairman of British Overseas Airways, there are two things you would particularly notice on his desk: his beautiful and unusual jet-aircraft ashtray, and the slim grey elegance of his Dictaphone Time-Master.

ON THE DESKS of men of the calibre of Sir Miles Thomas—men whose business lives are full and successful—you will usually notice this trim little machine, the Dictaphone Time-Master.

Their time is precious. The Time-Master saves them time. Their ideas are more valuable still. The Time-Master records them instantly. And by dictating the Time-Master way they leave their secretaries time to be real *assistants*.

The Time-Master is as simple to use as your telephone. Yet, as thousands of business men have found, it can double your capacity to get things done. Indeed, old-fashioned methods of dictation may well be robbing you of many thousands of productive hours.

Why not try the Time-Master on your own desk? Without obligation, of course. Telephone or post the coupon to-day for a free trial.

Revolutionary plastic Dictabelts are "inside secret" of Time-Master. Each takes 15 minutes dictation, folds flat, can be mailed, filed.

Letters to the Editor

A Liberal Alternative?

SIR—Your article on the Liberals suggests, in effect, that in order to be different the Liberal Party should emerge as a party substantially to the right of the Conservatives. This would indeed be a distinctive line but the fact that it would involve a complete departure from the radical Liberal tradition, as it was developed from Asquith and Lloyd George through Keynes and Beveridge to the present, is apparently of no concern to *The Economist*.

It is undoubtedly true that a considerable body of frustrated Tory voters feel that their party has moved too far to the left but this is no reason why the Liberals, of all people, should offer them leadership. There may not be such a wide gulf between Mr Butler and Mr Gaitskell but how far are these two gentlemen typical of their parties? We all know that in the constituencies Labour is pretty solid for Bevanism. Powerful forces are at work aiming to pull Mr Butler and Mr Gaitskell apart and it never was more important for the Liberal party to develop its radical proposals for social reform without socialism.—Yours faithfully,

Radical Reform Group, DESMOND BANKS
Harrow, Middlesex

India and the Foreign Settlements

SIR—Among the many controversial statements contained in the article which appeared in *The Economist* of May 1st from your Bombay correspondent, there is one which perhaps more than any other calls for comment since it lends itself to misinterpretation. I refer to the passage at the end where, in support of the allegation that "the only place where Indians actually live under a police state is Goa," it is stated that "a Goan surgeon was deported to Lisbon for a nationalist remark made at a private tea party."

The true position is that the person in question is a Portuguese citizen born in Goa and a graduate of the Faculty of Medicine of Lisbon University, who, at a gathering of numerous people which included judges and other authorities, publicly protested at the statement that Goa is Portuguese territory. He was held to have infringed the provisions of paragraph 1 of Article 171 of the Penal Code which lays down penalties for crimes against the external security of the State, and was, in strict accordance with the law, arrested and conveyed to Lisbon where his case is undergoing due legal process and where he is to be tried before the competent ordinary Court.

Thus the case in question simply concerns the criminal responsibility of a Portuguese citizen in respect of an indictment for an act committed in Portuguese territory.—Yours faithfully,

ALBANO NOGUEIRA
Portuguese Embassy, W.1

Opening the Concertina

SIR—In the comment upon recent increases in coal prices on page 212 of your issue of April 17, you say that the NCB has shifted slightly from a price policy based on "scientific grading" towards ordinary commercial principles. I suggest that ordinary commercial principles cannot always be reconciled with an industry which is subject to planning in the national interest.

It will be noted that exceptional increases have been made in large coal prices, on the plea that these sizes are in exceptionally short supply. In ordinary commercial practice the Coal Board would seek to increase the production of its most paying products, and large coal is certainly one of these. But under national planning it has sought to produce the largest possible amount of coal, and has, no doubt rightly, used mechanised methods of mining to achieve its ends.

Mechanised mining produces more coal, but it produces much less large coal and much more small coal; so that the users of large coal, chiefly the domestic consumer and the railways, have suffered as a result. The Coal Board then rubs salt into the wounds of these consumers by discriminating against them in the recent price increases.

Surely it would have been fairer if those who have benefited by the fruits of mechanised mining were asked to bear an exceptional share of the burden, rather than those who have suffered?—Yours faithfully, JAMES W. STEWART
Coal Merchants' Federation of Great Britain, W.1

Quebec Picks a Quarrel

SIR—Although I am convinced that your Ottawa correspondent was sincere when commenting on the relations between the province of Quebec and the Federal Government, I am afraid that he missed the issue, at the end of his article. Whenever there is a difference of opinion between Quebec and Ottawa, many people in Canada and abroad see in it a revival of the old struggle between English- and French-speaking Canadians. It should be remembered, however, that Mr Duplessis is not a "nationalist"; he is fighting for his province when he believes that the provincial autonomy, by opposition to federal centralisation of powers, is endangered. This is where one is likely to fall into the trap and fail to draw the line between "nationalism" and "provincialism," the former without provincial boundaries and the latter circumscribed to a limited area.

When the Ontarian government disagrees with Ottawa, people recognise that it is generally defending the interests of the province. But when the same happens in Quebec, the past and the fact that approximately 80 per cent of the population is French-speaking confuse the outsider who sees a racial issue in it. This is understandable, perhaps, but most unfortunate, so much so that it does not help to keep cool heads and objective minds.—Yours faithfully, LOUIS C. ROY
Quebec City, Canada

Doncraile Fair

SIR—In your issue of May 1st, I note that "Local Government Official" is somewhat irritated at the views taken by certain English people on intolerance in Northern Ireland. He states that "charges of intolerance are always framed in the vaguest possible manner" and therefore hard to refute; he further declares that "persons of any religion are eligible for election to Parliament, to Local Authorities, or to any public office." Has he studied the statistics of Catholic representation in Parliament, in Local Government, and in public offices throughout the six counties? He might be interested to know that the Catholic minority get less than 5 per cent representation in the various Government bodies.

I will just take one example of deliberate misrepresentation in that portion of Ireland. In Belfast University one-fifth of the students are from the minority, yet not one of the principal offices—Chancellor, Pro-Chancellor, Registrar, Secretary or Librarian is held by a member of the minority. Only two of the 36 Professorships are so held, and not one of six Readerships. Of the 203 lesser posts, the minority hold 17. Of the administrative staff, the minority hold two posts out of 76; of the members of the Senate, three out of 41. Thus, of the whole personnel of this University, which serves an area with a 34 per cent Nationalist minority, that minority gets 6.4 per cent of the opportunities and not one of the foremost offices.—Yours faithfully,

London, S.W.10. W. J. GLEESON

Glasgow Chamber of Commerce

SIR—In your review of the "Scottish Journal of Political Economy" in your issue of April 3rd, you refer to the foundation of Glasgow Chamber of Commerce, which, you state, took place in 1873. No doubt this is simply a transposition of figures; the foundation of this Chamber took place on January 1, 1783.—Yours faithfully,

Glasgow THOS. CAMERON

Books & Publications

The Women's War

STUDIES IN THE SOCIAL SERVICES.
By S. M. Ferguson and H. Fitzgerald.
Her Majesty's Stationery Office and *Longmans.* 376 pages. 22s. 6d.

IT was an oft-repeated joke in the later stages of the war that to be sure of a maternity bed in a London hospital a woman had to book at least nine months ahead. The latest volume in the civil series of the official war histories shows that the joke was hard fact.

> From the records of voluntary hospitals, there emerged the astonishing story of women booking maternity beds before conception or during the first few weeks of pregnancy. Of twenty-seven voluntary hospitals in the County of London, four had their maternity beds fully booked for nine months ahead. . . .

These records refer to the early months of 1946. In the preceding six and a half years the emergency maternity service had developed from an improvised scheme designed to meet the needs of pregnant evacuated women into an essential supplement to the normal maternity services. Women went to the country for their confinement, not because of air-raids, but simply because it was the only way of obtaining a hospital bed. The authors of this history assert that the scheme proved to have been one of the Government's most successful wartime social ventures. It provided indispensable accommodation for mothers while the ordinary hospitals were expanding their services, and it stimulated progress in more backward areas where the maternity services had hitherto been neglected.

Nevertheless, the scheme did not always proceed smoothly. In the early days of the war, the mothers ignored it because they did not want to be evacuated. Then there arose the question of whether "local" mothers, that is, those who lived in the area of an emergency maternity unit, should be allowed to use it. Who should pay for the fare of a mother who came from a far city to be confined? Where should she stay immediately before and after her confinement? Who should look after her small children while she was away? And what about the growing numbers of unmarried mothers?

Contrary to experience in the first war, in the second there was a big rise in the number of illegitimate births—"I am inundated with small babies," wrote one probation officer. But the authors of this book emphasise that it is wrong to conclude from the statistics of illegitimacy alone that there was a big increase in immorality during the war. Through the Population (Statistics) Act of 1938 it had been learnt that "nearly 30 per cent of all mothers conceived their firstborn children out of wedlock. At ages under twenty this proportion was as high as 42 per cent." What happened during the war was that, for various reasons, the parents of a large number of babies, conceived out of wedlock, did not or could not get married before their children were born. So far from there being an increase in the proportion of irregularly conceived babies during the war, the proportion actually fell, compared with 1938-39, from one-seventh of all children born to one-eighth. Another interesting fact brought out by the authors is that when the irregularly conceived births are analysed according to the mother's age, the rate per thousand unmarried women under the age of 25 was lower throughout the war than in 1938-39. Even more astonishing is the big rise in the incidence among older women, the increase in the rate compared with 1938-39 being highest in the age-group 30-35.

Nine years after the war, all these statistics provide a salutary corrective to uninformed judgments about morality and immorality during 1939-45. At the time, however, the Ministry of Health was concerned, not with the extent of irregularly conceived maternities and extra-marital sexual relations, but simply with what—if anything—it should do about the large numbers of unmarried mothers. To have their babies, if they were away from home, they could use the emergency maternity service. But where should they go before and after their confinement?

So far as civilian mothers, especially war mothers transferred from their homes, were concerned, the question was never satisfactorily answered. The distress that occurred among them emerges clearly from these pages. The unmarried mother's last resort was public assistance; but even this might be denied her, for the local authorities in the reception areas were often only too willing to invoke the law of settlement and send her with her new baby back to her home town. Yet the Ministry of Health, though it had plenty of heart-searchings and inter-departmental conferences, barely nibbled at the problem. Such action as it did take was so rigidly and niggardly administered as to be quite unworthy of a social service department. Fortunately for the Ministry's good name its failure in this instance was in sharp contrast to its enlightened and humane scheme for unmarried mothers in the Services.

The introductory chapter says that the main concern of this volume of the war histories is the family. The social effects of the war on the family, already depleted in numbers by the low interwar birthrate and now losing its breadwinner to the armed forces, do indeed make up the thread running through the book. By day and residential nurseries, by hostels and in other ways, the Government frequently found itself taking action to bolster up the family's shrunken resources. In general, the lesson that emerged from Mr R. M. Titmuss's volume "Problems of Social Policy" (to which this is the successor) is driven home. As long as the Government relied on public assistance to resolve its problems, or when it based a new venture on a discriminatory principle (as in the tuberculosis allowances scheme), it was unsuccessful. Where it abandoned the poor law and discrimination and assumed wholehearted responsibility it helped to lay the basis of the welfare state.

But this book describes not so much the family's war as the war that women experienced. The pages abound in the problems that struck women with full force—particularly women as mothers but also women working with the voluntary or official welfare services or as nurses in hospitals. For this reason it is fortunate that it has fallen to two married women to give the story. Mrs Ferguson and Mrs Fitzgerald have a real appreciation of their theme. They write with insight and sympathy; and, with a fine sense of relevant detail, they convey to their readers a true and sometimes moving picture of the distress, worries and difficulties produced for so many women by six-and-a-half years of total war.

American Trade Unionism

AMERICAN LABOR FROM DEFENSE TO RECONVERSION.
By Joel Seidman.
University of Chicago Press (Cambridge University Press). 318 pages. 41s. 6d.

ALTHOUGH the American labour movement has a history of more than a hundred years, it did not begin to win its place in American life until the mid-nineteen thirties. In 1935 two important events occurred. The first was the passage of the Wagner Act, which gave labour its first effective protection against dictatorial and vindictive employers in the decade of the Depression. The second was the creation of the Congress of Industrial Organisations under the leadership of John L. Lewis, which was quickly to project the labour movement into the political arena. In the period covered by this book total union membership rose from less than four million in 1935 to fifteen million at the end of the war. But during the war-time years of its growth it had also to compete with a great deal of legislative activity, in the States and in Congress, which was overwhelmingly anti-union in spirit. Parallel, too, with labour's fight for recognition throughout America ran a struggle between the two great labour organisations: the American Federation of Labour, with its craft basis, and the Congress of Industrial Organisations, organised along industrial lines—with the story of the intrigues and political gyrations of that stormy figure John L. Lewis running like a highly-coloured thread through the whole pattern.

This book is a carefully documented account of the most formative period in the history of American trade unions. Mr Seidman is a sympathetic observer of the American labour movement, but he rightly recognises that the Taft-Hartley Act marked the end of an era. Just as in the 1930s it was public indignation against vindictive employers that led to the passage of the Wagner Act for the protection of unions, so in 1947 it was union indifference to public opinion that helped to create an atmosphere in which a restrictive Taft-Hartley Act was possible.

Mr Seidman has made a valuable contribution to the understanding of the recent development of the American labour movement. He has produced, in digestible form, a study of the major events and legislation of this period which is remarkably comprehensive for a book of this size.

A New Social History

SEX IN HISTORY.
By G. Rattray Taylor.
Thames and Hudson. 336 pages. 21s.

THIS is not, as the title might suggest, a *chronique scandaleuse* of the intrigues of great men's mistresses. It is a serious and ambitious attempt to trace throughout European history the shifting attitudes to sexual behaviour that were characteristic of society at each period. In Mr Taylor's view historians have almost entirely ignored sexual matters, not only in their interpretations of trends and influences, but even in recording facts. The Black Death and the Great Plague, for example, are described even in the simplest of school history books. But how many people know of the introduction of syphilis to Europe about the year 1495, presumably from the New World, and of the millions it killed in the next few years?

The author makes a courageous effort to redress the balance. He sweeps through medieval and modern history, pausing from time to time for a more extended discussion. He devotes a great deal of attention to the increasingly rigid moral code which the medieval Church attempted to impose, and to the harvest of hysterical symptoms and perverted forms of sexual behaviour it reaped; to the troubadours of Provence and Languedoc in the twelfth century; to the Cathars and the Manichean heresy; and to the Inquisition and the heyday of witch-hunting in the fifteenth century.

His description is vivid and lively. His interpretations, on the other hand, are expressed in orthodox psycho-analytical language and may for this reason alienate some readers. It would have been wiser, particularly, if he had avoided any comment on the causes of psychotic behaviour. Psychoanalytical theory is certainly weakest in this field and, many believe, positively misleading.

An attractive theme recurs throughout the book. The author describes two contrasting attitudes to sexual matters which have been in conflict or uneasy equilibrium for two thousand years: the first ascetic, inhibited, authoritarian, and moralist, for which the word "patrist" has been coined; the second spontaneous, liberal, indulgent, and permissive, which he terms "matrist." He traces the ebb and flow of these opposed attitudes and finds the patrist in the ascendant in the medieval Church and again in the times of Calvin, Luther and the Puritans. The matrist view prevailed to a large extent in Italy at the Renaissance and in Elizabethan and Jacobean England, and has again flowered in the last hundred years.

This book can best be read alongside a more orthodox social history; but anyone interested in the origin of our present legal and moral code will find it both novel and rewarding.

Founder of Modern Science

SIR ISAAC NEWTON.
By E. N. da C. Andrade.
Collins. 140 pages. 7s. 6d.

ISAAC NEWTON the man was not a romantic or lovable character, and the records of his life do not make a happy hunting ground for biographers. There was no sensational struggle against poverty in his youth; he was a bright schoolboy but not one who heralded genius; he was a retiring undergraduate who unobtrusively obtained a degree of no particular distinction; he did not devote his life exclusively to science; he was sensitive, reluctant to publish his work and petulant under criticism; he was indifferent to women; but he was not indifferent to money. Yet the achievements of this man were of astonishing originality and the virtue of this small book of Professor Andrade's (in the publishers' Brief Lives series) is that he manages to convey this in simple everyday language. He tells something about Newton's life but is concerned more with what he did and why it was so important to the growth of science.

In an age when every schoolboy takes it for granted that mechanics and physics are honest-to-goodness exact sciences with controlled experiments as their tools, it is not easy to explain the tremendous step that Newton took in first conceiving this approach. Mr Andrade does, however, succeed admirably in showing how Newton's notion of finding precise mathematical laws to explain observed phenomena was something entirely new from the muddled philosophy and unexplained laws which he inherited. In layman's language, this book conveys the wonder of the way in which, in some eighteen months of isolation at the time of the Great Plague when Newton was cut off from the stimulus of other intellectual minds,

were born the basic laws of motion, the law of universal gravitation, the methods of the calculus and the foundation of the theory of light. All this twenty years before their discoverer was induced to publish his findings in the "Principia."

Of Newton's later life as Warden of the Mint, President of the Royal Society, recipient of a knighthood, and quarreller with Leibniz, Mr Andrade writes straightforwardly. To the ordinary reader it is something that adds to the mystery of this great man that, in addition to the superb intellect which earned him the distinction of being the first modern scientist, he should have been such an efficient administrator and business man.

Operational Economics

ESSAYS IN POSITIVE ECONOMICS. By Milton Friedman.
University of Chicago Press (*Cambridge University Press*). 328 pages. 43s. 6d.

AS some artists are "painters' painters," so Professor Milton Friedman is an economist's economist—not only by reason of the rigour of his thought and the formality of its presentation but because of his concern with the standards, the procedure, and the intrinsic nature of the subject itself. A single thesis is expounded in his first essay, on "The Methodology of Positive Economics;" is briefly but firmly restated in the essays on "The Marshallian Demand Curve" and "The 'Welfare' Effects of an Income Tax and an Excise Tax;" is implicit in the six papers on a variety of monetary topics, and becomes explicit again in the two review essays (on "The Economics of Control" and on "Price Flexibility and Employment") with which the book closes. This is the thesis that economic theory should be "a positive tool for the analysis of concrete problems." It should not try to incorporate ethical judgments; but it should not, on the other hand, be "neutral" in the sense either of being merely descriptive or of providing an elegant, intellectually pleasing but non-operational system of mathematical abstractions. To many readers the elaboration of this thesis, the arguments which sustain it, and its wider implications for other social sciences, may well prove the most interesting element in the book.

Others will be more inclined to concentrate on the long essay on "A Monetary and Fiscal Framework for Economic Stability" or on that putting "The Case for Flexible Exchange Rates." Both are based on a deep mistrust for the discretionary powers of monetary authorities, a mistrust characterising the neo-classic school in general; but Professor Friedman worships none of the classical sacred cows. His "monetary and fiscal framework" is not constructed on the pre-Keynesian assumption that fluctuations would be rapidly self-righting if only Authority, trade unions, and monopolists would renounce their evil ways. His argument is rather that discretionary stabilisers are, for given reasons, likelier than not to be de-stabilising on balance; and that the automatic, built-in variety will be quicker-acting, more reliable, and less prone to overshoot their goal. His plea for flexible exchange rates (not variable official rates, but a freely moving price on an unrestricted market) is summed up, after close and serious argument, in a paragraph worthy of Sir Dennis Robertson. "Isn't it absurd," he asks, "to change the clock in summer when exactly the same result would be achieved by having each individual change his habits?" Of this essay, as indeed of several others, one may say that while its argument may not prove incontrovertible any opponent must, in future, tackle the job of controverting it if he wants to be taken seriously.

Neglected War

WAR IN THE EASTERN SEAS, 1793-1815.
By C. Northcote Parkinson.
Allen and Unwin. 477 pages. 35s.

IF Britain had been in an imperialist mood at the end of the Napoleonic wars it might have retained enormous prizes in the east which cost little to win. There was, however, a marked reluctance to extend the bounds of empire more than was absolutely necessary for the defence of trade. For such reasons alone the Cape, Mauritius and Ceylon were held, but Java and a number of other places were restored; the Philippines were not touched because they were regarded as too expensive to maintain; and when an admiral was asked to occupy Canton he refused to attack "this strange and almost totally defenceless rabble"—whereupon the Chinese proclaimed a naval victory. The government took so little interest in the east that for a time there was not even a warship stationed there. Nor was there any need for one, because the French had written off their possessions at the start. With Napoleon a more offensive spirit prevailed, but he had neither the ships nor the admirals to spare for any great undertaking.

Naval historians have followed the example of the Admiralty in their neglect of the East Indies station. Operations out there may have been small beer compared with what was taking place in European waters, but the issues at stake were very impor[illegible]t in terms of cash, trade and territory. Dr Parkinson is peculiarly well suited to tackle this neglected aspect of the long war with France. It is strange that his treatment of the conquest of Java is so cursory, because elsewhere he does not spare the reader the weight of his learning; nor does he include what should certainly come within his terms of reference—Napoleon's plans to annex part of Australia. But his description of the conditions under which the Navy fought and lived in the East is of the greatest value, and when he stands back from a somewhat overloaded narrative his judgments are forceful and his comments amusing.

THE KEMSLEY REPORT

on newspaper readership in the North of England

★ Some months ago Kemsley Newspapers instructed an independent firm to undertake a series of surveys into newspaper readership. The object was to add to existing data, and so to give a more definite picture of newspaper readership in provincial centres. Kemsley's wanted this information for their own use.

★ It was clear that this new information would interest a great many others, particularly those in the advertising world. Kemsley's decided to make this valuable information generally available in a series of detailed reports. They have now published the first of this series.

★ The first Kemsley Report gives up-to-date facts about one of Britain's richest markets—the North of England. It examines Sunday, Morning and Evening paper readership in this area; readership breakdowns; duplication of readership etc.

★ The research specialists, who conducted the survey, applied a very strict definition of 'readership' throughout. That definition increases the survey's value to advertisers; it enables them to judge exactly what they get for their money when they advertise in the North.

The Kemsley Report is available on request to the Advertisement Director, Kemsley Newspapers Ltd., Kemsley House, London W.C.1.

to designers for industry

Industrial Designers and Managers of Design Departments may like to know that in the B.I.P. Group there is a department that can be considered complementary to their own organisation. In the development of a new product or the modernisation of a well-tried one, the thought may arise at some stage "Can plastics help us here?" This is the point at which it is a good idea to consult our Product and Mould Design Service. Staffed with technicians and draughtsmen who are specialists in all sides of plastics and plastics moulding, it is in a strong position to help in a practical and unbiased way.

B·I·P GROUP

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

President and Press

Washington, D.C.

ON November 4, 1952, General Eisenhower was elected President with the support of a larger part of the press of the United States than almost any candidate has ever had before. Only three important newspapers supported his opponent and most of the rest gave Mr Stevenson less space and smaller headlines than they gave to Mr Eisenhower. On April 22, 1954, seventeen months and eighteen days later, President Eisenhower found it necessary to do what few Presidents have had the courage to do: he gave a lecture, not to the Washington reporters, but to an august meeting of their employers, on the present shortcomings of the press and on what he conceived its duties to be. He said to the American Newspaper Publishers' Association:

> I do believe most earnestly that the press should give emphasis to the things that unite the American people equal to that it gives to the things that divide them. News of events which divide may be more spectacular than news of developments which unify. But a free press can discharge its responsibility to free people only by giving all the facts in balance. . . . If the day comes when personal conflicts are more significant that honest debate on great policy, then the flame of freedom has flickered low indeed. . . . I know that . . . the haste of living discourages complete explanation and places a premium on clichés and slogans. We incline to persuade with an attractive label or to damn with a contemptuous tag. But catchwords are not information.

This homily was mild enough and it took no great intelligence to realise that, although no names were mentioned, the reference to "personal conflicts" was a reference to the conflict between Senator McCarthy and the Secretary of the Army, Mr Robert Stevens, which had that day begun its unlimited run before the television cameras in the Senate Office Building. But behind it lay a deeper irritation which is expressed less mildly in private by members of the Administration, and particularly by members of the White House staff. They have borrowed some lines from the Wisconsin Senator and complain endlessly about the "New Deal columnists" and "bleeding-heart left-wingers" of the Washington press corps, most of whom, as these presidential assistants have conveniently forgotten, were fervently supporting the Republican party eighteen months ago.

It is obvious that neither the President in his complaint, nor his assistants in theirs, understands the function of the press or the nature of news. As Mr Joseph Harsch explained to them in the *Christian Science Monitor*:

> To assume that the press created Senator McCarthy is to assume that the press has it within its power to resolve the problem of the Senator by ignoring him. But this is precisely what the Administration itself has attempted to do with markedly little success. . . . This attempt by the Administration to solve the problem of the Senator by pretending it does not exist has had the effect of leaving the positive headlines to the Senator.

Mr Walter Lippmann has pointed out that Mr McCarthy's charges of treason, subversion, espionage, corruption and perversion are news that cannot be ignored because they come from the chairman of one of the important Senate committees and "a politician, until recently at least, in good standing at the headquarters of the Republican party." He asked how the news of the McCarthy charges were to be "balanced," adding acidly, "not, I take it, with news of inspirational talks to the Girl Scouts." It appears to be the contention of many in the Administration that reporters employed by Republican newspapers should not ask embarrassing questions and that the newspapers themselves should either not publish unpleasant news, should hide it away on the back pages, regardless of its importance, or should invent good news with which to balance it. But, as Mr Lippmann says, it is from the President, more than from anyone else, that should come "the words and deeds which are the news that unites us." And so far the President, for his own reasons, has refused to make the news with which to balance Senator McCarthy. It is not enough to deplore personal abuse in generalities and to point out, as Mr Eisenhower has recently done, that Abraham Lincoln never indulged in it.

*

The Administration's disillusionment with the press began early with the publication of the news, provided by Republican Senators, that Mr Charles Wilson, who had been nominated as Secretary of Defence, believed that what was good for General Motors was good for the United States. It has grown as a result of incidents since and, to this day, many high Republican officials think that a press conference should be a function at which the reporters arrive, are given prepared statements containing more self-congratulation than hard fact, say "Thank You," and depart.

But the term "bleeding-heart" only began to be used about the Washington press corps after it started to ask searching questions about the "1,456 subversives" (a number subsequently changed as often as Senator McCarthy's original estimate of Communists in the State

Department) who had been dismissed from the government. It took some months of incessant pounding before the real figures were brought out bit by bit. There was nobody in government service whom the Justice Department had seen fit to prosecute, there were a few people against whom there was information indicating that they might be loyalty risks and the rest were an assorted batch of those who would, in happier times, have been got rid of for various unpleasant habits without being accorded the imposing title of "security risks." This whole episode, which will probably not be forgiven while there is a Republican in the White House, will long be remembered in Washington as one of the justifications, and the glories, of a free press. It also casts a sombre light on the President's complaint about the use of slogans and catchwords because there has never been an Administration which indulged in so many and so unnerved the country by their use.

And finally, how is it possible to demand that the press should print news about "the things that unite the American people" after the Attorney General had been authorised to divide them down the middle by accusing a former President of condoning treason? It was obviously unintended, but this handed the headlines back to Senator McCarthy, who was beginning to lose them but has never relinquished them again from that day to this. By doing what Mr Lippmann then called "a truly terrible thing"—using the secret files of the Federal Bureau of Investigation as political ammunition—the Administration started a train of events which it has quite evidently been unable to stop and which may well destroy the Republican party. But it was not the press who wrote the Attorney General's speech of November 6th; the press only reported it.

Fresh Start for Mr Dulles

AT his press conference last Wednesday the President, by reaffirming in the strongest terms his faith in his Secretary of State, and by insisting that satisfactory progress was being made with a "South East Asia security arrangement" and that the progress of the Geneva conference was at least not unsatisfactory, put the full support of his prestige behind Mr Dulles's expected attempt to get some firm commitment, or at least definite guidance, from Congress. It has become obvious that without something of the sort no further progress is to be expected, at least as far as the United States is concerned, either at Geneva or in the broader negotiations among America's allies. Together the President's calm statement and Mr Dulles's return to Washington also give an opportunity for a fresh examination of the whole confused question of how Indo-China can perhaps be saved.

Out of the fog of publicity that has surrounded Mr Dulles's alleged defeat and the network of conflicting accounts of policies and discussions in Washington and Europe, the development that finally emerged most definitely was Senator Knowland's attempt to put on British lack of co-operation the blame for something which he knew Congress would not agree to do, and which the Administration itself does not seem to want to do—yet, at any rate. Mr Knowland, who is not only the Republican leader in the Senate, but the recognised spokesman of those who refuse to consider any concession to Communism in the Far East, declared that, if other nations were also prepared to make a contribution (something which he claims Britain has refused), he himself would support a presidential request for authority to send American armed forces to Indo-China.

But the consultations that have taken place, rather belatedly and casually, with congressional representatives, have made it clear that in this election year Mr Knowland would be almost alone in supporting such a request. If the Administration had wished the United States to take an active part in the fighting, its only hope of getting congressional approval would have been to act first, as Mr Truman did in Korea, and ask afterwards. But to follow such an example would have been almost inconceivable, even if in its Far Eastern efforts the Republican Administration had not been the prisoner of the attacks which the Republican party made on its predecessor and of the promises which it made to the electorate. In fact, however, the President has now shown that, contrary to the impression given by other official spokesmen and by press reports both at home and abroad, he and Mr Dulles would both be glad to compromise not only with Congress but also with America's allies.

Too Easy Money?

WITH this week's new issue of four and three-quarter year notes at 1⅞ per cent, to raise $2 billion of new money, and offers of conversion, either into these notes or into 1⅛ per cent one-year certificates, to holders of about $7 billion worth of other issues which fall due shortly, the Treasury has completed its financing for the current fiscal year, which ends on June 30th. Contrary to expectations earlier this year, it has done it without furthering its ambition of adding to the proportion of long-term issues in the public debt, which would have enabled it to avoid going to the market every few weeks or months. The Treasury was helped to resist the temptation presented by the plentiful supply of money now available for such long-term borrowing by the exceptionally low rates of interest which prevail for shorter term issues. This week the yield of its 91-day bills fell to the record level of .773 per cent, and the interest rates on both the new notes and the new certificates are the lowest for comparable issues for several years.

But the Treasury's main desire was, as it has been all this year, to avoid any drain on private funds which might go into productive long-term investment at a time when the economy is "contracting"—the latest name for receding. The Administration is being most careful, for political as well as economic reasons, not to lay itself open to any further charges of having strangled prosperity by driving up the cost of money. The easy money which has now been officially encouraged for many months has ensured that construction activity, by private individuals and by state and local governments, has kept on rising while other types of economic activity have been going down.

But now that the situation is widely held, both officially and unofficially, to have been stabilised—the President this week went so far as to issue a warning against over-optimism—there are those who suggest that money may be becoming too easy, that the country may soon be driven into inflation again. This hardly seems an immediate danger, however, unless there should be a substantial increase in government spending on defence as a result of developments in South East Asia, or unless consumers should be driven into panic buying by a war scare.

AT NO EXTRA COST!

FLY TO Bermuda

ON YOUR TRIP TO NEW YORK

Your first class fare to New York, via any international airline, can include a trip to Bermuda—*at no extra cost!*

So why not enjoy a holiday in Bermuda when business is over in New York! Bermuda is less than three hours away, daily flights are frequent, and you'll be in the sterling area so you can stay as long as you please. For complete rest, and enjoyment, there is nothing like Bermuda's pink sandy beaches, varied sports and peaceful, leisurely living!

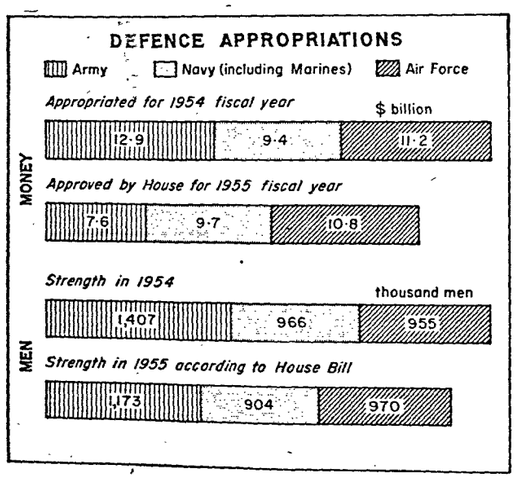
Dilemma in Defence

THE House of Representatives has given its blessing to the new defence appropriations and the Bill now goes to the Senate. The size and shape of the new authorisations (which cover the 1955 financial year beginning on July 1st) fit broadly into the contours of America's "new look" military policy. The House gave the President $1.2 billion less than he asked for in January, but more than half of this reduction was the result of second thoughts in the service departments themselves. The total sum, at $28.7 billion, is lower by $5.6 billion than last year's figure, but there is still a carryover from prior appropriations of about $48 billion. The cut in authorisations has fallen, as might be expected from the present emphasis on air power, almost entirely on the Army, with a small cut in Air Force appropriations offset by an addition to the Navy's budget. But the Air Force is still getting the largest share and the other services have accepted this, in public at least, with a grace that has in the past frequently been lacking.



An insight into the new American military tactics has just been provided at Fort Bragg, North Carolina, where Exercise "Flash Burn" and Air Force Exercise "Tic-Tac 54-7" have been staged in an atmosphere filled with nerve gases, biological agents, guided missiles and the rest—some of them, fortunately, only present in dummy form. "Getting so a soldier has to be a PhD to fight nowadays" was the comment of a participant, quoted in the *New York Times*.

In Washington meanwhile, some misgivings have been expressed as to whether concentration on "massive retaliation" is appropriate to the international situation as it is—and in particular to the war that might conceivably have to be fought in Indo-China. The Secretary of Defence, Mr Charles Wilson, has now admitted that the developments of the next few months may necessitate a new look at the "new look." The decision to reduce the strength of the Army was based on several assumptions which are already tottering. It was assumed that the European Defence Community would be ratified and Germany rearmed; that American troops in the Far East could be reduced by withdrawal from Korea; and that ground forces would not be involved in another "little war." The situation in Indo-China, the failure of the Geneva conference to produce a settlement in Korea and continued delay on EDC may force the Defence Department to think on new lines.

Sick of McCarthy?

WHETHER or not the average American realises the harm that Senator McCarthy has done to his country's reputation abroad, the President undoubtedly does. At his press conference this week he hoped, rather bitterly, that the United States might derive benefits at least comparable to its losses in international prestige from the current hearings on the dispute between the Senator and the Army. Mr Eisenhower had already shown his disgust with the proceedings by his manner when he wished that they might be concluded as quickly as possible. This wish is certainly shared by Mr Stevens, the Secretary of the Army, who has now undergone ten days of cross-examination. At this rate, however, the hearings will go on all summer, and the main issues will be lost in a mass of detail. But so far the investigating committee has failed in its attempt to work out some method of curtailing them, perhaps by examining only the two principals, Mr Stevens and Mr McCarthy.

The Democrats on the committee, and in Congress generally, have no desire for the proceedings to be cut short, for they feel that the longer a leading Republican Senator and a leading Republican administrative officer can be kept at each other's throats—and each other's reputations—in front of the voters, the better the Democrats are likely to do next November. Those in both parties who detest McCarthyism should also hope that the contest will continue, for it is bringing into millions of homes a clear picture of the Senator's overbearing and obscurantist methods. What at this stage look like two clear examples of tampering with the truth have been provided by the photograph of Mr Stevens and Private Schine, from which a third figure is said to have been removed, so that the picture gave an unjustified impression of friendliness between the two, and by the supposed copy of a report from the Federal Bureau of Investigation, of which no original appears to exist. The public are, however, it seems, already becoming bored with being disillusioned in this way, or with having their distaste for the Senator confirmed, and the television companies, unable to afford the loss of advertising revenue involved in giving so much time to a "public service" programme, are now covering the hearings less fully than they did last week.

Fair Trade at a Discount

New York

CUT price stores or "discount houses" are becoming so numerous in every large American city that the shop-keeper who adheres to the manufacturer's suggested retail price is in danger of being accused of overcharging. A discount house (which in this sense has no connection with the money market) is generally defined as a shop with a policy of selling goods at a discount of between 10 and 60 per cent off the manufacturer's list price. Some discount houses offer a wide range of goods, but the majority specialise in furniture and furnishings, heavy household appliances, such as washing machines, television sets and air conditioners, and small household articles, especially electrical goods. Owners of discount houses can afford to sell at these low prices because they can cut expenses drastically on advertising, salesmen, wrapping and delivery services, and can achieve a large sales volume and quick turnover at a smaller unit profit. There are now over 10,000 discount houses in the United States, and in certain major metropolitan markets they are already responsible for more than half of the total sales of some products.

Since resale price maintenance, known by the euphemism of "fair trade," is enforceable by law in forty-five of the forty-eight states, the rise of the discount houses is at first sight surprising. But, while recent federal legislation, and the subsequent refusal of the Supreme Court to hear an appeal against the constitutionality of the fair trade laws, has strengthened the legal position, it is still far from impregnable. Of greater significance than the loopholes in the law is the reluctance of all but a few manufacturers to enforce fair trade agreements; the General Electric Company and the Sunbeam Corporation are notable exceptions.

Enforcement is a difficult and expensive business, and the British alternative—a co-ordinated denial of supplies to price cutters—would be a violation of the anti-trust laws. Most manufacturers are afraid that the rise of discount houses may lead to a reduction in the total number of retail outlets for their products, either by eliminating small local shops or because retailers may refuse to stock goods unless the manufacturer protects them from "unfair competition." But it is no coincidence that the rise of the discount houses has been most marked in a period of business recession. This year many manufacturers, particularly the makers of household appliances, have been producing more than they can sell at list prices; while markets remain weak, the discount house provides a welcome opportunity for getting rid of burdensome stocks through the back door, without the need for a general price reduction. And the success of the discount houses shows that many consumers prefer lower prices to better service.

Labelling the Communists

Washington, D.C.

IS the American Communist party a "Communist action" organisation? The attempt to prove what would seem to be a truism has so far required five million words of testimony spread over three years of hearings. This exercise was initiated by the Subversive Activities Control Board, a quasi-judicial body set up under the Internal Security Act of 1950. The board, rather naturally, decided in the affirmative, but the Communist party retaliated by attacking the constitutionality of the Internal Security Act. Its case before the Court of Appeals of the District of Columbia has been completed and the decision is now awaited.

The purpose of the board is to investigate suspect organisations in public to determine whether or not they should be labelled "Communist action" or "Communist front" in character. Eight criteria have been established by which to judge a "Communist action" organisation; these concern the extent to which its views, finances and discipline derive from "the foreign government or organisation which controls world Communism." The four criteria applied to "Communist front" organisations establish the degree of communist domination and control of funds, officers and policies.

An organisation that is cited has the full rights of defence of an individual in court. But once one of these labels is formally stuck on it, that label must be used on all its propaganda, and a full statement of its finances must be lodged with the Attorney General. Also it must furnish the latter annually with the names and addresses of its members, if it is an "action" group, or of its officers only, if it is a "front" organisation. No person appearing on these lists can legally apply for or use an American passport, seek any office or employment under the government, or apply for a job in a defence industry without revealing his status. For every offence against these rulings a person can be fined $10,000 and sent to prison for five years; and every day that he breaks this law is a fresh offence.

While the Subversive Activities Control Board occasioned considerable public interest when it was first established as an instrument for dealing with "commies," it has tended to become overshadowed by demands for new legislation to outlaw the Communist party. However, Mr Brownell, the Attorney General, stated recently that he considered existing legislation—and particularly the Internal Security Act—provided an adequate framework for dealing with the Communist party. While the latter is the only "action" organisation in the dock, the Attorney General has started proceedings against twelve alleged Communist "fronts." The part of the Act dealing with the Subversive Activities Control Board was ingeniously drafted in an attempt to avoid all constitutional reefs; the Court of Appeals has now to decide whether in fact it was ingenious enough.

Hawaii's Expanding Economy

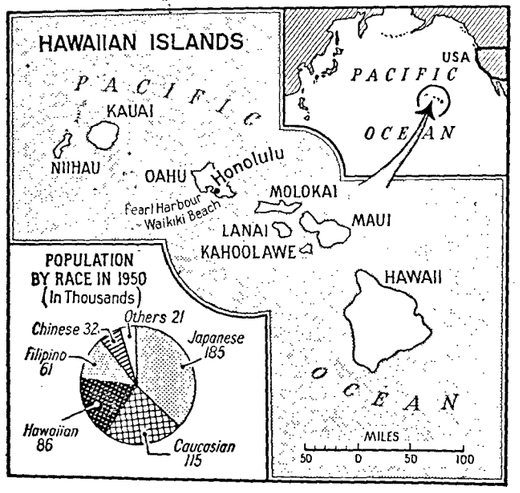
FROM A CORRESPONDENT IN HONOLULU

SINCE 1900, when the Hawaiian Islands first became a United States Territory, it has petitioned Congress 16 times for statehood and, since 1920, 37 Bills have been unsuccessfully introduced towards this end. Prospects for the current Bill, which at one time seemed so bright, are now decidedly dim. The addition of Alaska, by the Senate, to the Bill to grant Hawaii statehood seems to have brought the measure to a standstill. The background to the deadlock is mainly political: while the Republicans see an ally in Hawaii, Alaska would return Democrats to Congress. Arguments centre outwardly on whether these Territories are "ready" for statehood. Here Hawaii at least can put up a very strong case. In fact, on many of the points on which it has been judged inadequate, Hawaii can claim a better rating than can several of the states already in the Union.

When the first congressional committee visited the islands in 1935 to investigate the Territory's petition for statehood, it found a "modern unit of the American commonwealth, with a political, social and economic structure of the highest type." The committee noted that Hawaii's economic standards were high, with an "industrial and agricultural development forming a sound basis for the continued growth of the Territory." In the 19 years since that report was filed, Hawaii has lived up to the committee's prediction of

continued growth. Its half-million people of diverse racial ancestries enjoy a standard of living higher, probably, than that of any other island area in the world, and equal to that of the average American.

Visitors are usually surprised to find Hawaii a modern thriving community. Tourist publicity has tended to picture the islands as a tropical paradise where natives sing and dance their time away on balmy Waikiki Beach. A more realistic description would show that Hawaii has a billion-dollar-a-year, expanding economy. In 1952, retail trade alone was worth more than $500 million, and the Territory paid $135 million in taxes to the federal government last year—a larger sum than did nine of the 48 states. The income per head in 1952, at $1,721, was equal to the US national average and higher than that of 31 of the individual states, while agricultural wages in Hawaii are above those



on the mainland. There is one car to every three persons and one television set to every ten persons.

In the 176 years since the British navigator Captain James Cook discovered the Sandwich Islands (named in honour of the Earl of Sandwich), western influence has changed the face of these islands. From the simple agrarian economy of the early Polynesians, Hawaii has developed into a complex economy based on mechanised agriculture, military defence, and a tourist industry. Missionaries and whalers from New England started the evolution early in the nineteenth century. They and their descendants brought Yankee business methods to the bustling port of Honolulu. Later, the sugar planters imported labourers from the Far East to work in the cane fields; first the Chinese, then the Japanese and Filipinos were brought in.

Hawaii's population has grown steadily to approximately 500,000, larger than that of four states (Vermont, Delaware, Wyoming and Nevada). By race, the Japanese make up the largest segment, 37 per cent, followed by those of European stock (Caucasians), who contribute a further 23 per cent. However, classification by race grows less and less meaningful as a result of the increasing number of intermarriages. Eighty-four per cent of the population are native-born American citizens, and the common language of all these groups of diverse national backgrounds is English. Their loyalty to the United States has been demonstrated in two world wars and in the Korean conflict.

When Pearl Harbour, near Honolulu, became an important naval base, it brought millions of dollars of new "outside money" into the islands. Army posts and air bases further bolstered the economy. This growth was, and still is, concentrated on the island of Oahu, one of seven inhabited islands of the Hawaiian chain, where 70 per cent of the Territory's population live.

★

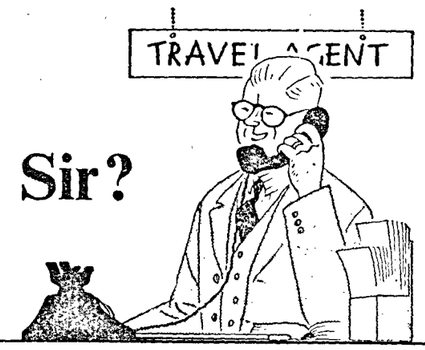
Revenue from abroad totalled $608 million in 1952. More than half of this—$368 million—was derived from "invisible" exports, from payments for the armed forces stationed in Hawaii, from tourists, and from shipping and airlines. Exports of sugar, pineapples, and other products were valued at $240 million. As well as being an important source of income, the federal government is at present the largest single employer in Hawaii, with a staff of 23,000 civilian workers and an annual payroll of $100 million. Federal spending has dropped since the Korean armistice but, so long as the "armed peace" prevails on the international front, the defence establishments in Hawaii can be expected to remain at a rather high level.

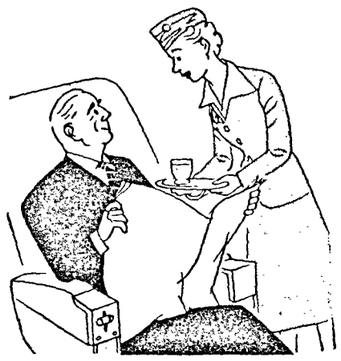
Last year some 78,000 tourists spent $43 million in Hawaii, and the Hawaii Visitors Bureau hopes this record will be increased to 100,000 this year. As the central Pacific port for shipping and airlines, Hawaii provides docks, airport and manpower for eleven airlines and steamship companies. The air age has brought Hawaii within eight hours of the mainland of the United States, and low-cost tourist fares between the West Coast and Hawaii have meant a great increase in turnover to the airlines. Travel between the Hawaiian islands is now done exclusively by air.

The growing and milling of sugar cane continues to be Hawaii's largest private industry. Hawaii supplies 24 per cent of the American sugar market under a quota system established by the government. Sales in pineapples brought in $100 million gross last year, but Hawaii's second largest private industry is facing an increasing volume of competition from foreign sources of supply. Twenty years ago, Hawaii produced practically all the pineapples required by the American market, but with increasing production in the Philippines, Cuba and Mexico, some 20 per cent of the American market is now supplied from other areas. Both sugar and pineapple production has become highly mechanised in recent years. Only by scientific mass production have these industries survived the economic pressures, particularly of high wages, which have beset them.

Having attained a high standard of living, Hawaii now faces the problem of continuing to support itself in the manner to which it has become accustomed. The islands import at present well over half their food requirements from the mainland of the United States at a total cost of $65 million annually. They are also dependent on imports for most of their construction materials and for many other essential goods. As an insurance against possible cuts in military expenditure in the islands, the civilian community is attempting to broaden their economic base by expanding the cultivation of coffee and tropical fruits and flowers and by promoting a clothing industry. Furthermore, there will be the need to assure enough jobs for the large number of youths who will be leaving the schools to seek employment during the next decade. These problems, although obscured by today's prosperity, are now being given serious attention by the territorial government and by private bodies.

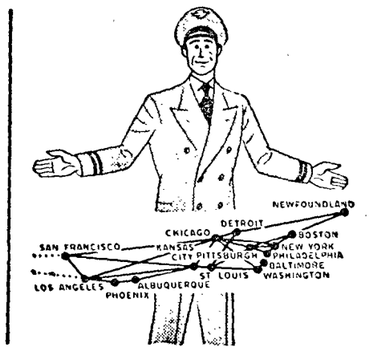
Going to America, Sir?





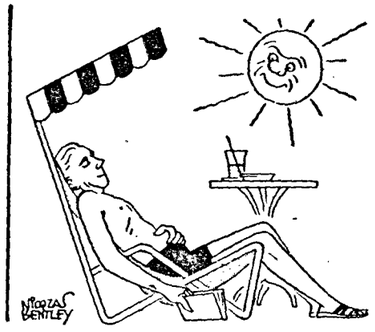
...I suggest you fly TWA...

...they'll look after you all the way...

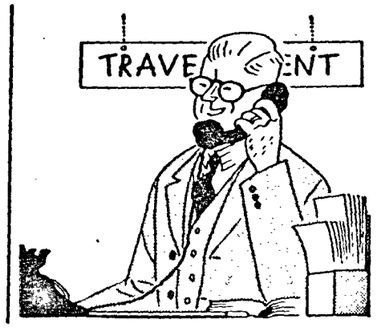


That's right, only TWA flies from London to & across the U.S.A.

...and TWA knows America*—that'll save you a lot of time...



...which no doubt you'll put to good use...



...Yes, Sir, we most certainly recommend TWA!"

* TWA is the only airline linking Britain with 60 major U.S. cities, coast to coast across America. This means *TWA knows America*—and it's one of the good reasons why—

Roman head of JUNO

Opinion is the great lady that rules the world—

JAMES HOWELL (1594—1666)

The first requisite of a great nation is an exacting public opinion. It is the surest guarantee of high standards of its conduct; the verdict of the nation, sitting as a jury. For individuals, to be 'easy to please' is no great sin; but a nation that is 'easy to please' has seen the last of its greatness.

How is such an opinion formed? All have a share—the world of education, the press, the cinema and stage, literature, parliament . . . and the public house. On it rests the fate of governments, and the fate of film stars. Industry has a part of its own to play in its creation: by maintaining, and continually raising, the standard of its social and economic contribution to the community.

When opinion has ceased to be 'a Great Lady', and has become a satisfied drudge, we shall be the poorer.

ESSO *Esso Petroleum Company, Limited*

The World Overseas

Uganda Turns a Page

FROM A SPECIAL CORRESPONDENT IN KAMPALA

NO sooner had the Owen Falls dam and power station been opened here by the Queen than enthusiasts began to talk of the new dams planned for lower down the river. To foresee such a vast industrial expansion is certainly going rather fast, but there is firm confidence here that every kilowatt the existing dam can produce will be taken up as fast as turbine sets are installed: the first, started by the Queen, replaces the existing thermal station. By 1959 the Uganda Electricity Board believes that revenue will be sufficient to meet all costs, and the various loads will be:

	Kilowatts
Domestic and small power users	25,000
Calico printers' textile factory	9,000
Bulk supply to Kenya	35,000
Copper smelting scheme	6,000
TOTAL	75,000

This estimate leaves out of account a number of other potential uses for the electricity consumers, for example in the working of the niobium deposits. It rests on the assumption that Uganda's progress will be rapid. At present electricity is not cheap; the average present price of a unit sold is 21.76 cents (10 cents = 1¼d.), but it is confidently expected that by 1962 the average price will be 10.7 cents, and Sir Charles Westlake, the chairman of the Uganda Electricity Board, told your correspondent that the power tariff will be competitive with anything that can be offered in Britain. Since in any case the textile motive power component is less than 2 per cent of production costs, it is not felt that industrialists' decisions whether or not to start industries in Uganda will be unduly influenced by the cost of power, especially as that cost is likely to fall. In fact, the capital cost per kilowatt is expected to work out around £100, which is very reasonable in the circumstances; to date some £9 million has been spent on the dam and station, and the final cost is expected to reach about £15 million.

What are Uganda's industrial prospects? It is still early to say. At the moment, several firms that had been planning to set up plants in the territory are holding their hand owing to the political uncertainties. And local businessmen believe there is another reason for reluctance of outside enterprises to enter Uganda. Official statements, they point out, have foreshadowed tighter control of industry and trade by the government. Managements are not encouraged by the prospect of payrolls padded by obligatory schemes for training Africans, or of regulations which, although mainly intended to give Africans a fair chance by limiting the Indians' trading activities, may involve discrimination against British firms too.

But a growing commercial and industrial centre, serving five million people, at the end of 800 miles of railway has a good deal of natural protection even in regard to some kinds of manufacturing; and Uganda's mineral wealth is still largely unknown. Its agricultural prosperity in recent years is unquestioned, although the secondary effects of high cotton and coffee prices have not been wholly good. But the high living standard of the people gives grounds for confidence, and it has undoubtedly damped down the response to political agitation. People are too busy making money, say both moderate and Congress politicians with some asperity. More important, there is every possibility of considerable improvement in agriculture itself, and this will appear more clearly as the hard work being done by the Agricultural Department and Makerere College on improvement of peasant farming makes itself felt.

Thus material hopes are high; but the political situation remains uneasy. The power of the vernacular press in keeping people away from the ceremonies associated with the Queen's visit was noticeable, though there was quite an impressive turnout for the inauguration of the dam itself, 56 miles from the Buganda capital, Kampala. Congress claims to be gaining ground, but the influence of its leaders, without much in the way of members, is not appreciable. Three of the leading members of the Baganda delegation that is to meet Sir Keith Hancock to work out the constitutional relationship between the Kabakaship, the Lukiko and the Legislative Council and administration have recently resigned, and the deadlock persists; yet there seems nothing at issue which time, tact and patience cannot resolve. However, the Hancock mission, even if successfully concluded on an agenda agreed by all parties, is only the beginning of a final settlement which will restore the Baganda's confidence in their future in a self-governing Uganda, and restore the administration's confidence in the Baganda as wholehearted participants in its political development.

In spite of the assurances given in Parliament, suspicion persists, and indeed Baganda leaders lament the loss of the former happy relations with Europeans—and Asians. Nor are the Baganda alone suspicious; the Basoga, the third largest tribe, seem also a little uneasy. Though African leaders insist that they now support a vigorous programme of industrialisation under the safeguards now reiterated for progressive native control and ultimate ownership, the

feeling that Owen Falls is essentially for the white man's benefit remains. Intuition tells the African that industry means bigger changes in the social order, and it is essentially conservatism which animates the resistance to it. Thus the opening of the Owen Falls hydro-electric scheme marks a turning-point in Uganda's history. All the signs are that development will mean more politics as well as more electricity.

The Resources of Indo-China

WARS spread the knowledge of geography. In the last few weeks the names of obscure localities in Indo-China have leapt into the front pages. With various partition plans and truce lines concocted at Geneva and elsewhere, the economic geography of Indo-China acquires a new importance. How wealthy is the country, and where do its resources lie? What French interests are at stake in this conflict? Seven years of war and devastation make it difficult to answer these questions. Prewar production figures seem to give a better idea of potential development, though the ravages of war must obviously be kept in mind.

Indo-China is still almost exclusively a primary producer. Before the war raw materials accounted for almost all its exports, while almost three quarters of the imports were manufactured goods.

Agriculture is the predominant occupation of the mass of the population, and rice is the chief product. Five sixths of the cultivated land is under rice, and production is concentrated in the two deltas—the Tonking delta in the north and the Mekong delta in the south. The latter, more sparsely populated, is the chief surplus producer and exporter. Before the war, with shipments averaging 1.5 million tons a year, Indo-China was the world's third rice exporter, and rice accounted for half the value of its exports.

INDO-CHINA NAMESMANSHIP

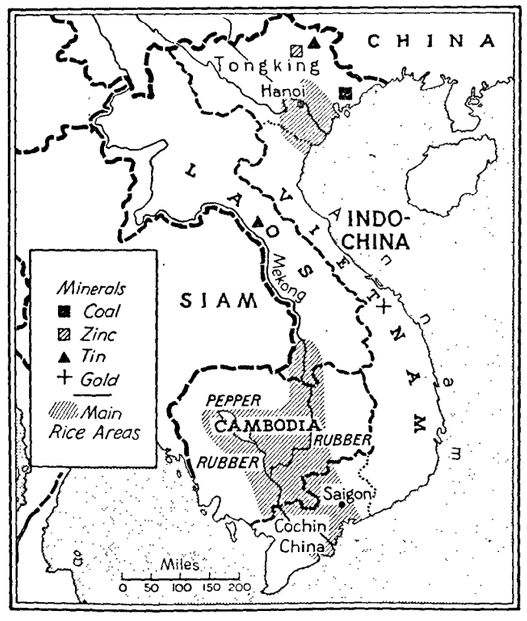
The three *Associated States*—associated with France in the French Union—are *Vietnam, Cambodia* and *Laos*. Together they make up Indo-China, but their peoples differ in language, racial origin and culture. Vietnamese culture derives largely from Chinese; the Laotians are close cousins to the Siamese (Thais); and Cambodia (anciently Khmer) retains clear Hindu affinities.

Vietnam itself comprises three formerly separate territories (sometimes called "the three *ky*"): *Tonking* in the north, *Cochin-China* in the south, and *Annam*, the narrow coastal plain which links the other two. The Vietnamese all speak a basically common language, usually called Annamese, although its Tonkinese and Cochinchinese forms vary considerably. Tonking centres on the *Red River* delta, Cochin-China on that of the *Mekong*.

As in Korea, confusion may arise in Vietnam because both the government recognised by France, Britain and most other countries, and the Communist rebel government, headed by Ho Chi Minh, use the name of Vietnam. The Communist regime terms itself the People's Democratic Republic of Vietnam; but it is more often, and more easily, termed the *Viet Minh*, its own name for its supporting movement.

Rubber plantations, introduced by the French, are limited to the basaltic red soil of Cochin-China and to a lesser extent of Cambodia. Prewar French holdings were valued at $45 million, and exports reached nearly 70,000 tons in 1939, but production and exports have always fluctuated greatly. Rubber exports last year nearly recovered their prewar level, but their earnings are much smaller because of the lower world prices.

Maize is another widespread culture and used to be Indo-China's second export item. The French have introduced coffee, but production has scarcely kept up with the growing internal demand. Output of pepper in Cambodia averaged about 4,000 tons before the war and was almost entirely exported. Sugar plantations are to be found in many parts of the country, but high costs have prevented large scale exploitation.



On the whole, however, rice and rubber are the chief sources of agricultural wealth and Cochin-China the main surplus area. On the other hand, the main mineral resources are to be found in the north, mainly in Tonking.

Of the mineral resources which are being developed coal is by far the most important. Rich deposits of high grade anthracite (similar to that of South Wales) are exploited in north-east Tonking, near the Along bay. More than 2.5 million tons were extracted in 1939, and four fifths of it were exported. It was estimated at the time that output could be easily expanded without fear of running down the reserves. Last year's output was less than one million tons.

Zinc is found in Upper Tonking and extraction reached more than 60,000 tons in 1926, but it never recovered after the prewar slump. Tin took its place as Indo-China's second mineral. Its two main centres are in North Tonking and in Laos (at Nam Patene). Before the war annual production of tin averaged 1,500 tons (metal content).

Among the deposits of secondary importance are wolfram (prewar annual output, 300 tons), lead, antimony in Tonking and North Annam and some manganese in the same regions.

(Some estimates have put the manganese deposits at as much as 25 million tons). Good iron is apparently to be found both in Cambodia and in Tonking but the deposits have never been fully surveyed and prewar output did not exceed 30,000 tons. Gold is also to be found in many places, but has been seriously exploited only in Central Annam.

These brief notes show that a division of the country would leave the rich rice and rubber surplus lands in the south, but most of the still undeveloped mineral resources are to be found in Tonking.

French capital in Indo-China has been estimated at rather less than 300 billion francs. Apart from rubber, it is chiefly invested in coal, tin, copper, zinc and cement works. Some companies have already recovered part of their capital through war damage payments, but there is little hope of returning to the prewar pattern. France then enjoyed a closed market, in which its manufactures and capital reigned supreme. Whatever the outcome of the war France has little hope of recovering this monopoly position.

NOTES FROM AUSTRALIA

These notes are contributed by or based on messages from our Correspondent in Australia

Election Month

THE government has to lose only eight seats to give Labour a victory in the general elections due on May 29th. The Liberal and Country parties now have 68 seats in the House of Representatives, against Labour's 53. A public opinion poll taken in February indicated that Labour might win 52 per cent of all votes; but, since then, political tipsters have been suggesting that the tide has changed. The personalities of the Prime Minister, Mr Menzies, and of Dr Evatt, the Leader of the Opposition, count for much; and until the beginning of April there seemed little promise of an election campaign fought on fundamental issues.

In the government's last term, the administration has been generally colourless. The Menzies-Fadden coalition took office in 1949 pledged to check the trend to socialism, to "put value back into the pound," and to outlaw Communism. Less than two years later it again went to the country to get a majority in the Senate, and since then has governed without Labour obstruction in the Upper House. It may have checked the trend to socialism, but Communism is still legal and the pound has lost more of its value.

However, Australia now stands at a peak of prosperity, with high employment and business buoyant. The threat of recession after the collapse of the wool boom in 1951 was met by drastic restriction of imports, which led to a spectacular improvement in the balance of trade. The government has therefore regained much of the ground it lost owing to fears of a recession two years ago; these fears, expressed in state elections, were partly responsible for the fact that five of the six states now have Labour governments, South Australia being the odd man out. Last September's budget gave general pleasure by substantially reducing taxation of both companies and individuals; the sizable cuts in sales tax also helped to hold down living costs. On the other hand, organised labour naturally reacted against the Arbitration Court's rulings in December and March, which "froze" both basic wages and margins for skill. In campaigning against a government that stands on a record of prosperity, the Labour party will have to offer the voters an expensive bait—such as the ending of the means test for pensions, which could cost £100 million a year.

★ ★ ★

Petrov and the Polls

THE revelation of the existence of a Soviet spy ring involving Australian undercover men must be accounted a most valuable asset to Mr Menzies in the elections; for he has long sought to declare the Communist party illegal, and was frustrated only by the loss of a referendum on this issue. The announcement on April 13th and the subsequent developments in the Petrov case will convince many electors that the Prime Minister's fears were well founded, and that the outlawing of the Communist party could have done much to check Soviet espionage in Australia. All the assurances that the Petrov case will be kept outside party politics cannot prevent it from influencing the elections, perhaps decisively.

Dr Evatt lost no time in accusing the government of using the affair as an instrument of propaganda. A brisk campaign of personal recrimination between government and opposition leaders developed at once. Although the Labour Party has offered its full co-operation "in every legitimate attempt to expose and punish all who are guilty of treason, sedition or subversion," it can hardly present a bold front on the general issue of Communism, for it opposed Mr Menzies's referendum project. Before April 13th, Communism did not look like being a live issue at the hustings; it had not been prominent in the political picture since the referendum, and there has been little serious industrial unrest in the last three years. But now the picture has changed and, if the sparring over Petrov is any indication, the election will be fought wtih more bitterness than could have been predicted a few weeks ago.

It has been emphasised several times since Mr Menzies's first disclosures that the lists provided by Petrov contained the names of no persons whose activities were not either known or suspected by the Australian security service.

Trade with Japan

JAPAN last year was Australia's second best customer, the second largest buyer of its wool, and the largest buyer of its barley. In all, Australia sold £84 million worth of goods to Japan in 1952-53, and took only £4.7 million worth in return. The federal government knows full well the value of Japanese support at wool sales, and is endeavouring to relax the rigid restrictions against the entry of Japanese goods into Australia without provoking too much opposition from manufacturers. It has just lifted restrictions on 41 groups involving a possible addition of 15 per cent to Japanese imports, which are now running at an annual rate of less than £6 million.

Trade with Japan is likely to be a lively election issue, for it concerns the sharply conflicting interests of manufacturers, importers, and woolgrowers. But a further relaxation of restrictions on the entry of Japanese goods seems inevitable, for, as the Prime Minister said recently,

"If Japan stopped buying Australian products tomorrow our income and our standard of living would fall." The government apparently does not fear a flood of low-priced Japanese goods in prewar fashion, reasoning that the post-war rise in the Japanese price structure makes it more difficult for Japan to compete.

* * *

Where to Put the Wheat?

AUSTRALIA is faced with the prospect of a carry-over of wheat of 100 million bushels when the new season's grain begins to arrive at railway sidings on November 30th next. This problem has developed almost overnight with a serious fall in the export demand for wheat consequent upon record crops in North America. Australia faces a possible decline of at least £25 million in receipts from wheat this year, based on an estimated fall of 40 million bushels in disposals. The country is witnessing the paradoxical spectacle of the chairman of the Australian Wheat Board, Sir John Teasdale, exhorting farmers to switch to animal husbandry for the next two or three years while big wheat surpluses continue. This makes strange reading when matched against the federal government's appeals two short years ago for farmers to grow more food for Britain.

Wheat stabilisation promises to be a Labour Party plank in this month's elections. Dr Evatt, the party leader, recently announced a ten-year plan designed to give wheat-growers a minimum home consumption price of at least 14s. a bushel for the first five years and a guarantee of 1s. 5d. a bushel above production costs for the remaining five years. In addition, all wheat exported would be given a guaranteed price based on cost of production. Unless there is a spectacular clearance of this season's crop before the end of November, Australia will not be able to find bulk storage for its new crop. Wheat will have to be held on farms at enormous waste, while farmers hope for crop failures in other countries.

* * *

Cost of Living Paradox

FOR the first time since 1944, the retail price index has recorded a fall in the cost of living in Australia. The cost of living fell by 0.4 per cent in Melbourne in the first quarter of the year, which would have reduced the basic wage in Victoria if the basic wage were still automatically adjusted to the cost of living. Last year the Commonwealth Arbitration Court suspended this adjustment in an endeavour to halt the spiralling of prices and costs of the previous three years. The decision was bitterly criticised by unions, but paradoxically this latest quarterly cost of living figure, which would have lowered the weekly wage in Melbourne, is having no effect on Arbitration Court awards. State employees will, however, lose a shilling a week, because the Victoria government decided that its workers should continue to be affected by changes in the index.

The extent of the galloping inflation in postwar Australia is shown by the 156 per cent increase in wages between June, 1945, and December, 1953, compared with a rise of 61 per cent over the same period in Britain, and 73 per cent in the United States. Australia "imported" a sizable dose of inflation in the wool boom, which reached its peak in March, 1951. Prices have eased since then, but the country now has a high cost structure.

A Home for the Queen

THE Royal visit has led to suggestions that the Queen might return for informal visits every five years or so. Successful as the tour was, cities and towns claimed much of the Queen's time, and she got only a fleeting glimpse of Australia's great outdoors. If, therefore, a real "home" could be built for her on, say, a farming property in a typical Australian setting, the Queen could return when she pleases without being considered a visitor among her own people.

The Prime Minister, who is understood to be very enthusiastic about the idea, has indicated that no decision will be made until after the elections. He has made it clear, however, that the aim would be to facilitate visits of an informal nature. If visits of the Queen or other members of the Royal family are always treated as formal organised tours, such a residence would receive little use. The government could hardly consider a site outside the Australian Capital Territory, as the six states would almost certainly be unable to agree upon any other choice. There are, however, a number of pleasant station properties within 25 miles of Canberra, any one of which could be adapted to become a home for the Queen. She could, in such a setting, enjoy official duties and at the same time see brief freedom from [illegible] something of the real Australia.

* * *

Fears of Overseas Borrowing

THE Australian Labour Party feels that development should not be financed by overseas loans, and accordingly has taken a stand to oppose further borrowing abroad. This decision reflects the lurking fear in many people's minds that heavy borrowing abroad, as in the 1920s, might again precipitate a depression. It is true that Australia found it difficult to meet its interest obligations when prices fell in the early 1930s, but it is generally realised now that it was the loss of export income, and not the free borrowing abroad, that produced the economic crisis.

Australia has obtained virtually no new money from London since the depression days. Development has been financed from internal borrowings, with the exception of $204 million recently obtained from the International Bank. Indeed, a case can be made that Australia is now "underborrowed," having regard to the debt obligations normally accepted by a rapidly developing country. In 1929-30, for example, the interest bill on its London and New York debt was equal to 6.8 per cent of total exports of £125 million. But in the year ending on June 30th last, the interest on £412.8 million of external debt amounted to only 1.6 per cent of exports of £872.2 million. Export income could fall a long way before Australia would find difficulty in servicing its overseas debt.

The fact that domestic borrowings have recently fallen far short of works programme estimates is proof that the country cannot develop without outside aid at the speed demanded by state premiers, most of whom head Labour ministries. This year, for example, the Commonwealth of Australia underwrote state works programmes of £200 million. Two loans have yielded £118 million, leaving the Commonwealth government to find the balance from its own resources—probably by the issue of treasury bills. It savours a little of bravado for Labour politicians to wipe their hands of overseas loans, as it were, for they might well find London less willing than before to provide finance for development works. If loans could have been raised in London in the last five years, they would undoubtedly have eased the inflationary strain on Australian resources.

Threat to Black Coal

BLACK coal is in grave danger of being ousted from its traditional position as the basic fuel of Australian industry by the development of oil, gas and electricity. A few years ago, it looked as if coal production in New South Wales would for a long time fall short of the minimum needs of Australian industry, and all manner of expedients were adopted to step up output. Now, the chairman of the NSW Joint Coal Board says that the coal industry no longer enjoys the semi-monopoly of a sellers' market and is likely to be faced with a shrinking market unless it can effectively meet the competition of other fuels. Not only is oil directly competing with coal as a source of power, as in the railways where diesel locomotives can be operated for about half the cost of coal-burning engines, but the use of residual fuel oils, a by-product of the rapidly expanding oil refining industry, is certain to lower the cost of town gas.

Victoria long ago reduced its dependence upon NSW black coal for electricity generation by establishing its main power plant near the great brown coal deposits at Yallourn. The state's gas and fuel corporation has plans to treat this brown coal by the Lurgi process and to pipe the gas to Melbourne, 90 miles away. The two great hydro-electric schemes in Australia—the Victoria government's 263,000 kW Kiewa undertaking and the giant Snowy Mountains project—will further reduce the demands of industry for black coal. Power is now about to be made available from the Snowy Mountains project, initially to the extent of 60,000 kW; but by the end of 1962 capacity may reach 660,000 kW. Cost is acknowledged by the Joint Coal Board as the main reason for the drift from coal. But another important reason has been the determination of other states to free themselves from the domination of their economic life by the New South Wales miners.

Mr Dutt's Empire

BY A CORRESPONDENT

"EMPIRE Conference's Call: For a Mighty Alliance of Our Peoples" ran the headline in the London *Daily Worker* last week. Some of its dwindling band of regular readers must have thought they had picked up the wrong newspaper. But there was no mistake. The British Communist party was holding an Empire Conference: more officially, a Conference of Communist and Workers' Parties in the Sphere of British Imperialism. Hardly reported in Britain except by the *Daily Worker*, firmly ignored by Moscow, it nevertheless deserves to be noticed.

Not even the most skilful presentation could make the conference look impressive. The "delegations" were a scratch lot, some of them one-man bands, some improvised from among students in London who clearly represented nobody but themselves. The organisers tried to plug the more obvious gaps by reading "reports" from parties who failed to send a spokesman. They also cast their net as widely as possible. The Empire (the party spurns the word Commonwealth) was defined as still including such countries as Ireland, Iraq, Jordan and Egypt. India was told that it had yet to free itself from British imperialism; Canada and Australia were also pictured as struggling in Whitehall's toils. Disraelian diehards who lament the decline of imperial glory may take comfort from these unexpected assurances. But their real interest lay in the unusually frank revelation that "imperialism" can be made to mean whatever the party chooses, detected in any part of the world (except the Soviet sphere), and used as justification for whatever policy is currently favoured by the Communists.

For the purposes of this conference, American and British imperialists were considered to be firm allies, regardless of the orthodox Communist dogma that they are tooth-and-nail rivals. The basic slogan was "All peoples in the struggle against British and American imperialism." The allied imperialists, it was announced, "threaten every people in the world." The postwar Labour government was tarred fully as black as the Tories; Mr Palme Dutt's verdict on Indian independence was that Britain had never made a single concession to any subject people except in the face of revolt, and the Gold Coast was mentioned only as a scene of uprisings and repression. The heroes of the conference were the Mau Mau: "the whole world has seen with admiration the heroic struggle of the Kenya African people against the armed onslaught of British imperialism." But both General Neguib and the Revolutionary Council in Cairo ranked as villains, and Mr Nehru was carefully denied either praise or blame.

"A voluntary association of free and equal peoples" was the ultimate shape proposed for the Empire. But in the arrangement of the conference itself there was no nonsense about equality. From start to finish it was dominated by the British party. Reports from other countries were censored by the British leaders (it was they who deleted all criticism of Mr Nehru from the drafts submitted for approval by the Indians). Speeches by colonial party members got no more than one-sixth of the space devoted to the proceedings by the *Daily Worker*. Mr Pollitt alone got more than that, and many other veteran Britons, including Mr Ivor Montagu and Mr Andrew Rothstein, got their word in or at least walked on carrying a spear. The mention of Mr Pritt's name drew the wild applause that was withheld from Mr Nkrumah, Mr Nehru or Seretse Khama. The British party, in fact, treated its colonial "equals" in much the same way as it in turn is treated by Moscow.

The star of the show was, naturally, Mr Palme Dutt, the British party's vice-chairman and, for practical purposes, superintendent of all the colonial parties. The main purpose of the conference was, indeed, not to confer but to enable Mr Dutt to rally his scattered flock. He drew up the manifesto and dominated the discussion on the "political report"—that is, on his own statement, from which nobody dissented. His points, which will now be widely circulated in the "sphere of British imperialism," included the following:

The Chinese Communists' successful manipulation of a "united independence front" (which means hitching bourgeois nationalists to the party waggon until the time comes to ditch them) must be studied and copied. Solidarity in "struggling for immediate needs" would open the way for "final liberation." (That is to say, the Communists

aim to infiltrate all local nationalist or reform movements and to emerge as their leaders.) "Upsurge in Africa" is the "most significant" current phenomenon. The time will come when all Africans will "fight in unity." But the fight for "independence" will spread not only in Africa but also in countries, like Britain itself, that were "previously independent." British, Canadian and other workers must join the colonial peoples in the common struggle against British and US imperialism. Above all, "the fight for peace is the principal task and governs the conditions for national liberation." (Put more plainly, colonial Communists must serve Soviet policy first and their own people's aspirations second.)

The Kremlin is evidently still content to let Mr Dutt do most of the ideological whip-cracking over the heads of the colonial parties. The time is not yet ripe for more overt direct guidance from Moscow—or Peking. But, for the present, it is China that is the more openly praised of the two holy lands of Communism—which suggests that the party still finds the exploitation of anti-white feeling a more profitable approach than honest Marxism.

Journal of Geneva—II

APRIL 29th. Mr Casey, the Australian Minister for External Affairs, opened the day's debate with a speech proposing all-Korean elections under UN supervision. Criticising the Communist proposals, he asked how free elections could be ensured without international supervision. He recalled Mr Rhee's opposition to all-Korea elections, but hoped he would agree to them to obtain a settlement.

Mr Molotov spoke of Soviet sympathy for Asian "liberation" movements, regretted that more Asian governments were not represented at Geneva, and denounced American policy towards China and the American project of a South East Asian alliance. A British spokesman later commented that Britain had done far more to establish the independence of Asian states than had Russia.

April 30th. A sub-committee of nine set up by the sixteen UN members that fought in Korea held its first meeting. Its members are Britain, France, the United States, Australia, Colombia, Philippines, South Korea, Siam and Turkey. They discussed the Australian proposal for all-Korean elections and other matters.

Mr Eden and some of his staff lunched with Mr Molotov and Chou En-lai. The desirability of discussing Korea in closed meetings of a smaller body than the plenary conference was discussed.

The plenary session of the day lasted a bare half hour. After Turkish and Siamese delegates had affirmed their support for the UN action in Korea and called for the completion of the UN task, no more speakers came forward and the session was closed.

May 1st. The four sponsoring powers, with China, South and North Korea, met in private committee and discussed, inconclusively, Korean matters including a compromise plan for the holding of elections in the North first and in all Korea later.

Mr Dulles again saw Mr Molotov, and the American reply to a Soviet note of April 27th on the Eisenhower atomic energy plan was delivered.

May 2nd. Mr Dulles and the Australian and New Zealand foreign ministers held a meeting, called by the former under the terms of the Anzus treaty, at which they were reported to have discussed relatively long-term matters.

Mr Nguyen Quoc Dinh, the Vietnamese foreign minister, arrived in Geneva.

May 3rd. After a meeting between the foreign ministers of Vietnam and the western governments, it was announced that Vietnam had agreed to the representation of the Viet Minh rebels at the Indo-China talks.

At the Palais des Nations in the afternoon, Mr Eden, who was in the chair, drew attention to the request of the five Asian prime ministers that the conference should note the passage on Indo-China in their joint Colombo communiqué. The South Korean foreign minister then criticised the Communist proposals for Korea on the ground that, while excluding the United Nations, they nevertheless implied foreign intervention; this meant that the UN would be superseded by an international body chosen by the Communists. The all-Korean commission proposed was likewise meant to supersede the authority of the South Korean government.

General Nam Il then repeated the North Korean proposals, elucidating one point by saying that the joint commission's decisions would be adopted only by agreement between its South and North Korean members. Chou En-lai followed him, with a demand that the 48,000 prisoners of war "illegally" released in Korea must be returned.

Mr Dulles and Mr Casey left Geneva to return home.

May 4th. Mr Lester Pearson pointed out that other nations shared Mr Molotov's sympathy for Asian freedom, but that they wanted that freedom to be more real than that of the Soviet satellites in Europe. As to the charge that the United States was aggressive and imperialist, if that were true Canada, its nearest neighbour, would not today be independent. Mr Pearson asked if Chou En-lai's denunciation of foreign bases in Asia applied to the Russian base at Port Arthur in China. Nam Il's revelation that the all-Korea commission he proposed must take decisions by agreement meant that the Communists would obtain a power of veto. The Colombo communiqué was important and constructive; Mr Pearson hoped that the free Asian states would take some responsibility for a peaceful settlement in Asia, and he noted the importance they attached to the United Nations. Failure at Geneva might compel those nations that felt increasingly threatened to discuss further means of meeting the threat.

For the Netherlands, Mr Luns said that the general debate had not made the task of the conference easier; he begged the Communists to abandon their "dogmatic blueprints" and join the other powers in narrowing discussion down to relevant issues. Recalling Chou En-lai's attempts to show that the Asians' interests were opposed to those of the West, Mr Luns quoted from UN resolutions that had been supported by all the non-Communist nations.

A Viet Minh delegation arrived in Geneva, led by Pham Van Dong, a deputy premier in Ho Chi Minh's government.

May 5th. A French spokesman announced that it was hoped that the Indo-China talks could begin on May 7th or 8th. M. Chauval of the French delegation discussed this question and also that of the chairmanship of these talks with Mr Gromyko, and apparently no disagreement emerged. No plenary session of the conference was held, but private talks between delegations continued.

all non-speculative ; it can safely be assumed that most of those who switch funds for the sake of a turn in interest rates simultaneously cover their exchange risk by a forward transaction. The first two types of transfer can also be regarded as virtually non-reversible. Whereas the interest arbitrage funds will be withdrawn as soon as renewal transactions cease to offer a sufficient profit-margin, the working capital balances will be maintained so long as London retains the ground it has won in world markets.

Superimposed upon these three types of business, however, are two further kinds of transfer. When the demand for working capital and interest arbitrage in London had lifted sterling to its upper limit, there was increasing discussion, both in London and overseas markets, of the possibility that the Bank of England might seek to restrain the pressure by widening the permitted range of fluctuation. So long as the authorities adhere to the IMF rules, they could widen the present range only very slightly from the present range of $2.78-82 to $2.77¼-82¾. But last week it was rumoured that Britain was intending to go beyond these limits and had, indeed, already opened discussions with the IMF. These rumours have since been categorically denied ; and it has also been implied that there is no intention to take advantage of the small additional latitude still left by the IMF rules.

The strength of the rumour, however, had made it highly influential. The expectation of a further rise in sterling sharply intensified the demand, though not in time to find reflection in the April gold figures. These additional demands were necessarily speculative. But it seems improbable that any large volume of international funds is free to move for speculative financial purposes as such ; the major international banks do not run unnecessary exchange risks and would be unlikely to gamble on a change in British policy, however strongly rumoured. The main source of "speculative" demand for sterling almost certainly came from the sudden anxiety of commercial and other interests to cover their normal future commitments in sterling. It should be noted that the purely speculative transfers may be reversed, whilst the commercial speculation definitely will be—in the sense that Britain is benefiting now by receiving payments not yet due, but later will be selling goods without further benefit to the reserves.

There is, unfortunately, no means of gauging the relative strengths of these several influences ; indeed, there are complex inter-relationships between them. The inter-relationship can best be illustrated by the interesting fluctuations that have occurred recently in the scope for interest arbitrage between New York and London. Early this year, when the forward rate for the dollar was almost at par, a New York banker who bought spot sterling and re-sold it three months forward could reap virtually the whole of the wide margin between the rates obtainable from, say, US government and British Government Treasury bills. But in the first three months of this year, partly because of these very transactions, the forward dollar moved to a wide premium ; hence, although the New York Treasury bill rate fell further, the additional interest that could be earned in London was substantially offset by the cost of obtaining the forward cover. That still seemed to be true of the rate pattern obtaining at the middle of last week ; for the London Treasury bill rate, under threat of a revival of demands of this kind, had eased ten days before from about 2⅛ to 2 3/32 per cent. If any perceptible scope for switches between these two markets still remained, it might have been expected to show itself in a further rise in the premium on forward dollars. But in fact, on Thursday and Friday of last week, the premium contracted sharply.

This sudden narrowing of the premium, coming so soon after the sterling rumours, is almost proof that the principal new factor in the market at that point was a sharp increase in the "speculative" commercial demand—the demand for forward sterling. Because of this drop in the forward dollar, the margin for interest arbitrage was opened up again, and at this point the impact on the London market was very clearly seen. In expectation of increased competition at last Friday's tender for British Treasury bills, the London discount houses again raised their tender prices ; the volume of applications for bills mounted sharply to the new high record of £437½ million, which suggests that there must have been a considerable "outside" demand, even though the official tender was known to have been large ; and the upshot was a fall in the average rate of allotment to £2 os. 11.36d. per cent, its lowest since March 7, 1952, when Bank rate still stood at 2½ per cent.

Even at this level, however, there remained a net margin for arbitrage transactions. This week's denial of the sterling rumours did not have any pronounced effect upon the exchange market—though it did, perhaps, arrest a further easing of the forward dollar. More significant still, the U.S. Treasury bill rate dropped still further at last Monday's tender ; the average allotment rate of 0.773 per cent, the lowest for more than six years, compared with 0.886 per cent in the previous week and with 1.066 per cent three weeks previously. At these levels, the margin between the yields in the two markets was at least ⅝ per cent more than the cost of covering the exchange risk.

For this reason, and because the easing of London rates strengthened the hopes of a fall in Bank rate, the pressure upon Lombard Street was intensified—with the result that bill rates eased still further. But on Thursday Bank rate was left unchanged. Given the prevailing bullishness in stock markets and the sharply falling trend of unemployment—to which the Chancellor himself drew attention on Monday—the "green light" signal of a cut in Bank rate could be dangerous. But if the authorities do intend to maintain the 3½ per cent Bank rate, they would do well to take more vigorous steps than have lately been seen to mop up surpluses in the money market. Otherwise, the frenzy of anticipatory dealings is likely to recur as each Thursday approaches.

New Thinking on EPU

THE main items on the agenda of this week's Ministerial Council of the Organisation for European Economic Co-operation were the future of the European Payments Union and the parallel problem of the further liberalisation of trade between the member countries. The two problems are obviously and inextricably intermingled. Only if member countries of the Union can maintain their balances of payments in reasonable equilbrium will the liberalisation of their mutual trade bear much promise of further progress. The elimination of the chronic unbalance, whether as creditor or debtor, of some countries' EPU accounts is one of the conditions for the continued satisfactory operation of the Union itself. The problem, therefore, is not only one of dealing with the relics of past disequilibrium in the form of large accumulated surpluses and deficits in the European Payments Union but also of ensuring that such excessive positions do not recur in future. The experts who have prepared for the present meeting and the Ministers who have been to Paris this week do not have to be reminded that it would be waste of time to display ingenuity in devising the mechanics for dealing with the present symptoms of disequilibrium if, at the same time, nothing were done to ensure that disequilibrium is not recreated in a matter of months.

The discussions of the terms on which EPU might be extended after June 30th next were begun last November and have since been debated almost continuously within the Managing Board of the Union. The report of the Managing Board, completed in March, contained two proposals put forward by the creditor countries in EPU. The first was that creditors earning surpluses beyond the level of their quotas should receive in settlement a higher proportion of gold than the 50 per cent they now receive. The second was that countries that had been in debt to the Union for an extended period—eighteen months was one suggestion—should fund part of that debt, withdraw it from the Union and make an immediate start in repayment. The extreme version of the creditor case was that put by Germany. It was strongly supported by the Netherlands, and less strongly by the two other creditor countries, Belgium and Switzerland. Throughout the discussions these two countries have taken a much more lenient attitude, both in the matter of "hardening" the EPU and of funding debts outstanding for more than a certain length of time.

The extreme debtor case was that put forward by the Scandinavian countries. They demanded an extension of EPU on exactly the same terms as those that obtain at present ; but this proposal was found so unacceptable to the creditors that it has been withdrawn in favour of certain compromise proposals made by the United Kingdom. It is these British proposals, tempered by some amendments made on Swiss initiative, that have held the centre of the stage at this week's ministerial discussions in Paris.

The view of the debtors as voiced by the United Kingdom has adamantly opposed any suggestion of hardening the EPU mechanism by increasing the ratio of gold payments to excessive creditors. It should be emphasised in this context that the proposals made by the creditors were not that the whole range of proportional gold payments should be increased for debtors and creditors alike, but only that the gold payments to creditors should be raised and then only where those creditors exceeded their EPU quotas. Even in this strictly limited form, however, the suggestion has been opposed because it was deemed that it would bring the Union nearer to the principle of full settlements in gold. It has been assumed that Germany will continue to build up surpluses with the rest of the Union and that under the formula proposed by Germany a time would soon come when the whole of those surpluses would, in effect, be payable in gold. The United Kingdom and the other debtor countries argued with considerable force that such an amendment of EPU could lead only to an immediate curtailment of intra-European trade and would, therefore, be hostile to the whole philosophy of expansion on which the OEEC and the EPU were conceived. The objection to the creditors' proposals was also based on the reasoning that such an increase in gold payments to the creditors, without corresponding adjustments of the gold obligations placed on debtors, would tend to denude the Union of gold and convertible currency, which might be needed later for assistance to certain countries when the present EPU mechanism makes way for a more convertible and multilateral system of payments.

*

On the second suggestion of the creditors, namely that long-term debtors should remove part of their overdraft from the Union, the United Kingdom came forward with a considerable concession that the United Kingdom would make bilateral arrangements with the creditors to repay its EPU debt and would earmark £30 million in gold as an immediate down-payment. This offer raises complex issues of both principle and technique. On the technical side it immediately poses the problem whether a debt removed from the EPU and funded in this manner should automatically be reconstituted in the facilities available to members of the Union through their quotas. The accountancy problems that would be created by the funding arrangements (which would immediately affect the positions of both creditors and debtors in EPU) and by the subsequent repayment of the loan bilaterally

(and therefore by payments that by-passed the EPU mechanism) are horrifying. Some hint of their complexity—mirrored, incidentally, in the more than usually obscure jargon that has surrounded them—is provided by the manner in which a Swiss loan of Sw. Frs. 100 million has recently been made to Italy. This particular loan has been handled through EPU and has, therefore, affected the Swiss and Italian cumulative positions in the Union, whereas the repayment of the loan over the proposed five-year period will be effected by direct transfers from Italy to Switzerland. In order to maximise the impact of this loan operation on the respective credit and debit positions of the two countries in EPU, the gold payments that would normally flow from the change in these positions are being temporarily waived and will take place only if and when the creditor and debtor positions of Switzerland and Italy are reversed. The device by which this result is achieved has been christened the "non-reversible sandwich tranche." It is presumably this technique that would apply to the proposed funding of the long outstanding debts owing to EPU. The matter is mentioned here only to illustrate the appalling complexity into which EPU accounting is now drifting, and to evoke the hope that the day may soon dawn when the movement towards convertibility will have caused EPU to wither away. For all the Union's good work, that final demise will not be an occasion for sorrow or regret. But the day of release is not yet and must still be shaped to accomplish the substantial work that still lies before it.

*

Assuming that the British offer of an immediate downpayment is accepted, it will then remain for Britain and the other debtors concerned to make bilateral arrangements with creditors for funding and repaying the balance of the debts due to them. By far the most important of these bilateral arrangements will be that between the United Kingdom and Western Germany. In envisaging its general character (a matter that will certainly have been discussed during Mr Butler's visit to Bonn at the end of this week), it will be well to bear in mind that it was only last year that an agreement was reached under which Western Germany was allowed to stretch the repayment of its external prewar and postwar debts over the generous period of twenty years. Germany has now asked that the EPU debts due to it should be repaid over a period of three or seven years. Any such settlement would be extremely hard to swallow and leave an unpleasant Schachtian taste in the mouth. Germany would be well advised not to press this matter too far—or, alternatively, to adjust the period over which it is prepared to repay its own external debt to that which it is demanding for the repayment of the debt to it.

This is but one of the matters of principle that will have to be discussed in the context of Britain's conditional offer for the funding and repayment of its debt to EPU. That offer depends on assurances from the creditors, mainly Germany, that they will follow a "good creditor policy" and take action that will reduce their current and future surpluses with EPU to manageable proportions. A creditor's *vade mecum* has recently been drawn up for Germany by the Economic Committee of OEEC. It makes many constructive suggestions for solving the problem of Germany's growing surpluses, including the accelerated repayment of Germany's external debt to which reference has already been made. It also suggests that Germany would be justified in adopting a more expansionist credit policy. This does not mean that Germany should inflate because its neighbours and colleagues have been so ill-advised as to do so (indeed, whether they have done so, and to what extent, are matters for argument). The proposal rests on the fact that it is difficult to reconcile Germany's persistent surpluses on its balance of payments with the established facts of that country's penal rates for commercial credit, its resort to artificial export incentives and, last but not least, its relatively low levels of nutrition. If Germany persists in its present ultra-hard credit and fiscal policy it should accept the logical sequel, namely, a substantial upvaluation of the Deutschemark. That would rapidly provide a cure for Germany's chronic surplus.

The differences that have been discussed in Paris this week symbolise not merely the traditional clash between creditors and debtors, but also that between the predilection of many Continental countries for formal and rigid agreements and Britain's tendency to lean on informal and flexible arrangements. A satisfactory compromise between these differences will assuredly be found, since all members of EPU are convinced of the continuing usefulness of the system in the months that lie ahead. The achievement of a satisfactory solution will be aided if all concerned will bear in mind the temporary and makeshift character of the Union and realise that, thanks to the increasing use of sterling in intra-European trade, a large part of the Union's work in clearing intra-European balances has already disappeared.

EYES WIDE OPEN

Whatever your business abroad—export, import, manufacture, investment—our three-monthly reports on over seventy countries will keep you abreast of the factors that affect your prospects. Political, economic, financial and other events that influence the business climate are dealt with expertly, clearly and concisely.

No Man's Land

GREAT TRACTS OF AFRICA remain today much as Livingstone found them—silent, often beautiful, potentially fertile, but without human inhabitants. No man lives here, for he cannot survive without his beasts, and in those regions even the hardiest cattle are struck down by a deadly disease—trypanosomiasis—which is carried by the tsetse fly. Today, modern science is mounting a powerful offensive against trypanosomiasis. The spearhead of its attack is aimed at the malady itself, by providing drugs to cure the disease or prevent it developing in animals living in tsetse-infested areas.

In 1949, a group of I.C.I. scientists, working in laboratories in Manchester, evolved an entirely new compound, 'Antrycide', which can cure cattle stricken with trypanosomiasis. Even more important, however, is the protective effect of 'Antrycide', for animals treated with it can live in, or pass through, tsetse-infested areas, where there is better grazing. Similarly, herds can be protected during the long treks which they may have to make across dangerous tsetse areas in order to reach markets hundreds of miles distant. Many obstacles have to be faced by those who hope to transform the fly-belts of Africa into productive regions where livestock and agriculture may flourish. But the increasing use of modern veterinary drugs—of which 'Antrycide' is an outstanding example—will undoubtedly help towards a solution of this important problem.

Time to spare . . . with this power mower

EASY on your time, EASY on your pocket, the ROTOSCYTHE does *everything* in *one* operation, and is so EASY to handle.

Why choose this particular mower? For these

DEFERRED TERMS available with initial payment of £13.3.0

ROTOSCYTHE REASONS:

- Light and easy to handle, the *engine* does the cutting.
- Cuts any length of grass by unique rotary action—your "after holidays" and "bad weather" troubles removed.
- Slices through all stalks, leaving a perfect finish.
- Collects *all* grass by vacuum suction.
- A full year's guarantee.
- Sucks up leaves, stalks, pine needles, etc.—no raking.
- It even removes moss by a simple adjustment.
- Gives an immaculate, smooth, banded finish.
- No regrinding, saving pounds each year.
- A free demonstration can be arranged.

POST THIS COUPON NOW for your FREE 20 page booklet "The Story of a Beautiful Lawn" full details of other Rotoscythes and the name of your nearest agent.

first

In 1831, Faraday discovered how to convert movement into electric current. He did it by electromagnetic induction—he made the first dynamo.

The giant turbo-alternators of today bear little resemblance to Faraday's primitive apparatus. But they work on the same principle, generating electrical energy for light, heat and power.

Often called the 'Father of Electricity', Faraday numbers among his progeny the world-famous A.E.I. family of today—a group of British companies that have been responsible for many Firsts. Firsts in invention, development, quality.

Associated Electrical Industries (for that is what A.E.I. stands for) are proud to follow where Faraday led. A.E.I.'s research is in the Faraday tradition.

The companies of A.E.I. will continue to work together, and separately, to discover and put into practice better ways of generating, distributing and using electricity.

Unilever Across the World

UNILEVER rounds off its revenue account and balance sheet figures to the nearest thousand pounds; there are few other groups that do so, or would be justified if they did. What matters in Unilever is not the last three noughts, but the figures in front of the *millions*—turnover £1,310 million in 1953, itself up nearly £100 million; capital employed £355 million, up £20 million; trading profit £62 million, up £23 million; and taxation £34 million, well over half the profit and £12 million more than in 1952. These figures have a significance stretching far beyond the 192,000 stockholders in the "Limited" leg of the Unilever giant and the unknown number of members of "NV," who hold bearer shares. They are the cause and consequence of trading operations stretching across the whole of the free world, in fats, detergents, a wide range of foods, chemicals, general merchandising and shipping. Unilever will make and sell artificial cream in Finland, plywood in Nigeria, petroleum cracking catalysts in Warrington; it will can hams in Holland and export them to America, spend £129,000 on tea-bagging machinery for the Lipton business in the United States, now hitting new records, and lift its sales of animal feeding stuffs from £90 million to a record £104 million to celebrate their decontrol.

All the trees in the Unilever forest are so tall that a few shafts of intense sunlight must serve to illuminate its complexities. The accounts are, as ever, a *tour de force*—about as simple as they could be made for an immense group consisting of its two partners, linked so far as ordinary dividend rights are concerned, with an indissoluble bond of twelve guilders to the pound and engaged in manufacturing and marketing on a global scale. Picking his way through the figures and narrative, the stockholder will mark the solid benefits of expanding turnover and firm but not extravagantly rising prices. There were no fortuitous profits from rising stock values last year; the £62 million trading profit that emerged (say, 4½ per cent on turnover, compared with just over 3 per cent in 1952) was full measure with no inflationary froth. The current year's sales and profits so far are described as "satisfactory"; on present signs, the outturn for the whole year may deserve a more enthusiastic word.

It had been widely expected that Unilever would revalue its fixed assets at the end of 1953. It has done so, and has also decided to consolidate all foreign assets and liabilities, fixed, permanent, or current, at the end-year rate of exchange without distinction. This will send accountancy students muttering to their textbooks, yet it has the logic of simple consistency. As for the revaluation, it discloses a much smaller understatement of fixed asset values in the books than might have been expected—about £13 million against £130 million of net fixed assets. This is not a revaluation that splits hairs over index numbers of replacement costs; it rests on broader judgments of efficient use and earnings potential. At the same time, the directors, having been forced to the conclusion that there was no clear way of revaluing the very real asset of goodwill, decided to eliminate it and this £61 million item has been written off largely from capital reserves (including the £34 million of additional depreciation that had been set aside to the end of 1952). The upshot is that fixed assets at the end of 1953 stood in the books at £157 million, after deducting £67 million of accumulated depreciation provisions; and the latest year's provision of £15.2 million, being based on current asset values, needs no supplement. Unilever has thus secured that full provision, as near as may be, is available for the replacement of fixed assets, and that goodwill, intangible but immensely valuable, no longer appears in the balance sheet.

Spending on new capital projects at the rate of over £20 million a year, and faced this very weekend with the finding of £15 million to re-enter the British margarine market as a principal instead of being a mere Ministry agent, as in the past fourteen years, Unilever's cash requirements are heavy. The consolidated balance sheet shows evidence of some preparation to meet these demands, for Limited's investments (mainly short-term, presumably) have risen from just over £1 million to £10¾ million, and the combined net current assets of the group are up from £172½ million to £185

million. Evidently last year's comparative stability of prices must have given a useful breathing space from the earlier pressure to find finance for stockholding at inflated prices.

★

Giants, like ordinary mortals, have their aches and pains. The Lever Brothers business in the United States lost money last year, largely because the disappointing Harriet Hubbard Ayer cosmetics subsidiary was sold at a loss. Other toilet preparations in the American market were disappointing too, and profits from soap and detergents in the United States showed no advance, although Lever's obtained a larger share of the synthetic detergent market. Between the lines of this report, the inference seems to emerge that the Lever business in the United States, though not so troublesome a child as it was a few years ago, has still to fight its way against the keenest competition into satisfactory profits. There are other places nearer home where the battle for markets is sharp—in Germany, for example, where for a time last year presents were given away with every packet of margarine, and in Holland where there was "no reasonable relationship" between the volume of margarine sold and the profits earned. Perhaps this suggests a question mark about what the stork will bring in Britain when it arrives next Monday.

It seems, indeed, that there are two contrapuntal themes in this report. The strains of gross inflation have eased, and with this relief the problems of finance and trading policy have shrunk to a more normal scale. But in markets across the world, the consumer has again become sovereign, and Unilever, for all its power and efficiency, recognises itself as the consumer's subject. From all the evidence of expanding prosperity in many of its markets, Unilever should enjoy a good year in 1954. It will always be subject in a marked degree to the changing tides of world prices and economic progress, but at present, at any rate, these are flowing favourably and not violently. It is on the expectation that present trends should be good for the rest of this year that Unilever ordinary stock has risen this week to 68s. 9d. and may justify its yield of £4 11s. 8d. on last year's dividend, for unless strange things happen, 1954 should produce more.

Business Notes

Return of the Bulls

INVESTORS have returned in strength to the share markets; as was widely suspected last week their change of mood proved no more than temporary—a healthy shake out after a long period of uninterrupted advance. They have bought gilt-edged substantially and industrials spasmodically; the settlement reveals that a "bull" account has been built up here and there, but it exists mainly in a few speculative favourites of the stores group. It is not possible to prove that the market as a whole is overbought, though it is legitimate to suspect that the advance is now entering a more dangerous phase. The vital indices meanwhile continue to rise steadily. *The Financial Times* industrial ordinary index reached 146.9 on Thursday compared with 145.2 at the end of last week; the fixed interest index rose to 114.02 compared with 113.54. The sun has come out again to shine on those who wish to make capital issues—particularly of fixed interest stocks.

Most important of the new issues is the £6 million 3¾ per cent stock 1970-1972 of Birmingham Corporation, offered at 98½. The terms, when the announcement was made, were none too generously adjusted to the market, the gross redemption yield to 1972 being £3 17s. 4d. per cent compared with £3 17s. 7d. per cent on the Glasgow 3¾ per cent stock to redemption in 1973. The further advance since last Monday's announcement has made the issue more inviting. Of the seven British corporation issues made in the last two years, Birmingham's Labour-controlled council thus accounts for two. Also of the type which may appeal to large investors is the issue of £3½ million unsecured loan stock 1971-74 at par in Metal Box Company. It is to be made only to existing preference and ordinary stockholders.

Strong markets are thus fulfilling a useful function in allowing refinancing projects to proceed. What is sustaining their strength? Fewer influences from foreign money have been apparent in the last few days in the long-te. investment markets. Talk of an early revision of the official upper and lower limits for the sterling exchange rate has also been hushed for the moment. One carrot which leads the donkey on is renewed speculation about a possible fall in Bank rate. The notion is proved wrong as often as it is raised; but if the donkey were allowed to eat the carrot might he not lose his taste for running?

The Golden Flood

THE gold and dollar reserves of the sterling area rose by more in April than in any other month since detailed figures were first given in January, 1952. The increase totalled $135 million, and brought the reserves to $2,820 million, or just over £1,000 million. American aid accounted for only $9 million, and receipts from the European Payments Union in respect of the March surplus to $7 million. The surplus on the residual gold and dollar account was thus also easily a record, at $119 million. The picture was further brightened by the announcement of a surplus of £28.2 million with EPU in April, which falls to be settled 50-50 in gold and repayment of credit in the middle of this month. This is far and away the largest surplus achieved with Europe since the end of 1952, when it was swollen by the officially sanctioned arbitrage scheme in dollar commodities; and it follows a long run of months in which the surpluses that were achieved were attributable mainly to non-commercial factors.

* After taking account of the payment of $181 million on December 31st for the service of United States and Canadian lines of credit, the United States lend-lease loan and the ERP loan.

† EPU settlements in any month depend on the surplus or deficit with Europe in the previous month.

The influx of foreign exchange has depleted the sterling resources of the Exchange Equalisation Account; a further issue of £300 million is accordingly to be made to the account, bringing its total resources to £975 million.

There has naturally been considerable conjecture about the extent to which this striking increase in both portions of the dollar surplus has been caused by the inflow of foreign funds; the nature and effects of this movement are fully discussed in a leading article on page 469 of this issue. The Chancellor has this week affirmed that the movement in the reserves was attributable to "commercial and financial transactions of a normal character." This statement does of itself suggest that an appreciable part of the inflow of exchange resulted, not from larger exports and smaller imports, but from financial transactions such as the building up of working balances in sterling in the gold and exchange market. To the extent that such transactions reflect the wider scope for international arbitrage that now exists in the London market they do not of course detract from the significance or usefulness of the increment in reserves. But, as the article on page 469 points out, some of the favourable factors now playing on the reserves are not only non-recurring but also self-reversing.

Britain and Schumania

IT seems unlikely that the discussions upon British association with the European Coal-Steel Community, for which the Government has invited M. Monnet to visit London, can begin before June. The Government has not quite completed its own discussions with the British coal and steel industries upon the subject; M. Monnet, too, may be pre-occupied with the meeting of the Community's assembly this month and with arrangements concerning the American loan of $100 million to the Community.

The British reply, which was published this week along with M. Monnet's skilfully drafted original letter, was roughly what had been expected; non-committal, though possibly warmer towards the idea of "intimate and enduring association" than some people in the two industries concerned would have preferred. It agreed that "a mutually acceptable system of association," if one could be worked out, "would be politically desirable and should enable economic advantages to be obtained" by both parties; and that association should lead to "the development of trade in an expanding world economy." But it proposed to M. Monnet merely discussions over the precise form that association might take.

M. Monnet's original proposals, which were offered in some detail as a basis for discussion, included:

Reducing or eliminating restrictive measures which impede coal trade, as well as the reduction or elimination of quantitative restrictions and customs duties on steel.

The application of "certain rules" to exchanges between the British and European markets; the High Authority would seek such rules "along the lines of those provided for in the Treaty constituting the Community."

Continued exchange of information, particularly before taking "important actions"; and

Establishment of a "Council of Association" to watch over the operation and development of the association.

The British Government "would like to examine" these suggestions—which, it may be noted, go rather beyond anything that any politician or industrialist has yet proposed in this country.

Houses on the Cheap

PLANS for reducing the down payment that an owner-occupier has to make for his house have at last been announced by Mr Harold Macmillan, Minister for Housing and Local Government, on the eve of this week's building society meeting. Two schemes are offered, both within the framework of existing legislation, and both encouraging building societies to lend a higher percentage of the valuation of the houses concerned than they would normally do. The risk attached to the additional advance is shared equally between the building society, the local authority and the

Treasury. Both schemes are limited to small dwellings; scheme "A" has an upper limit (purchase price or valuation, whichever is lower) of £2,500; the normal building society advance is taken at 70 per cent and the new maximum advance is to be 90 per cent on a 25 year mortgage at 4½ per cent. On scheme "B" applicable to dwellings built since 1918 of a maximum value of £2,000, the "normal advance" is assumed to be 66⅔ per cent and the new maximum advance on a 25 year mortgage at 4½ per cent is 95 per cent.

The Minister's motives in commending these plans to the local authorities (he has no power to compel) are all praiseworthy. He wants to encourage home ownership; he wants to do something for the £11 to £14 a week income group; and he wants to stop the steady increase of £6 million a year in housing subsidies on council houses. He supplements the plans by urging local authorities to lend more freely for improvements. But there are possible consequences that may not be so advantageous. It is reasonable to start with a limit in value a little above the present cost of council houses but if the limit is kept low there may be a tendency for better-type houses to be cut down to it, at a sacrifice of quality and appearance. It is also clear that the building societies have been allowed to drive a forceful bargain. Their "normal advance" has been surprisingly taken as 70 per cent under scheme "A" and 66⅔ per cent under scheme "B." The real practice has been to advance up to 80 per cent and sometimes even more on valuations under £2,000. Therefore, part of the field over which they receive a two-thirds indemnity against loss is one which in the normal course of business they cover without assistance. As the mortgage is repaid the guarantee to the building society is discharged, but not until the outstanding debt drops to the low figure of 60 per cent of valuation or cost under scheme "A" or 50 per cent under scheme "B." These concessions give generous compensation to the societies for taking a greater risk than normal.

Financial losses are not likely to be heavy, for the plans embody two wise decisions. First, there has been no interference with the practice of basing advances on the lower cost or valuation (often a very different figure from cost), and, secondly, the building societies retain the right to accept or reject the borrowers. They will use that power to discourage a man from taking on an excessive burden. Normally they do not like the charge for building society payments and rates to exceed one-fifth of the family income.

Building with "Hot" Money

THE speech with which the chairman of the Building Societies Association, Mr Hubert Newton, opened this week's conference in London must have gladdened the heart of Mr Algernon Denham, president of the Halifax Building Society. Just over a month ago Mr Denham raised the cry of "hot" money, issued a warning against the acceptance of temporary deposits from limited companies, and urged the association to set a limit to the intake of investments from any one source. Mr Newton gave a strong expression of official disapproval for the limited company type of investment in building societies: "We have to guard against what may be short-term borrowing since our main task is in long-term lending. These considerations must come before the making of new records for the annual balance sheet."

New records have certainly been made; the official estimates for 1953 by the Registrar of Friendly Societies shows records for 1953 in total assets, mortgage advances and on all the essential building society statistics save one. The exception is the number of building societies in Great Britain which each year declines mainly through amalgamation, and last year fell from 755 to 743. The general showing of the Registrar's figures for 1953 is slightly below the estimates made in *The Economist* a fortnight ago; the official figures are given below:

BUILDING SOCIETY GROWTH
Registrar's Figures
(£ million)

	1951	1952	1953
Total assets	1,357	1,478	1,642
Due to shareholders	1,057	1,186	1,339
Due to depositors	208	197	202
Due on mortgage	1,158	1,263	1,396
Advanced on mortgage (during year)	268	266	298
Number of shareholders (mn.)	*2·36*	*2·47*	*2·62*
Number of depositors (mn.)	*0·62*	*0·60*	*0·59*

The building society movement has a fine record behind it and with the new Government housing plans announced, big possibilities in front of it. Mr Newton's emphasis on stability of interest rates and the appeal to long-term savers provides a fitting footnote to this story of achievement and promise. Interest rates on shares and deposits, he declared, should be kept as stable as possible, and interest on mortgage advances as low as possible; and frequent changes of interest rates should be avoided.

Gateway to an Atomic Industry

THE Department of Atomic Energy has this week opened a door to the Windscale plutonium factory in Cumberland, production centre of the country's fission materials. The appearance of visitors in such a plant is a tangible sign that atomic energy is advancing from secret weapon to the status of a new industry. The most striking single impression that the plant makes at close quarters is the radical difference between the atomic industry and all others. The Windscale project is not a plant so much as an industrial site holding a number of separate inter-related plants. It covers more than 300 acres, and dominates the surrounding countryside with its two atomic piles and their 400-foot cooling towers. In these piles, atomic fission gradually transforms uranium metal into plutonium, the major atomic explosive material and the starting point of many phases of atomic development. Other plants on the site separate the plutonium from the uranium, a dangerous and difficult chemical operation; purify waste uranium so that it can be re-processed at the Springfield uranium metal factory; purify crude plutonium; and convert it into metal for use by the Department's other plants.

There is no discernible evidence in the plant that any of this processing actually takes place. Nothing moves outside the concrete shielding that surrounds the piles and the chemical plants; and there is no movement in any conventional sense going on inside them either—only the lethal activity of radiating atomic particles moving on a blind set course, colliding with and being diverted or destroyed by other atoms, joining with or being divorced from chemicals of the most dangerous kind. The only sound to be heard is the noise of fans blowing cooling air through the piles, and the occasional clucking of an electronic counter assaying radioactive samples. Against a static background of elegant white shapes of the plants and the occasional soaring chimney uncontaminated by smoke, the only tangible reminders of the reactions in the plant's core are the ritual safety precautions against the invisible hazard of radiation. It is as if those employed on the site are all on speaking terms with a ghost that the visitor cannot see.

Windscale and Beyond

THE design and building of the Windscale works was a major act of faith. The engineers, chemists and physicists commissioned to set up a full-scale plutonium plant had no information about the American plant. As it turned out, they overrated the difficulties of running a plant of this kind—and in one or two cases made new difficulties by underrating them. It was assumed that once the plants were working, the key sections would be surrounded by too much radiation to permit normal repair and maintenance. In practice it has proved possible to enter the plants and to carry out repairs under carefully controlled conditions. Scientists count this as a major advance in operating techniques; men are gradually coming to terms with nuclear technology and its attendant phenomenon of radiation, and are finding that quite heavy doses of radiation can be harmless, provided that the average safe dose over a period is not exceeded. The safety precautions in a plant of this kind are based on strict discipline; no shoes, clothing or food that might become contaminated are allowed across the barriers in the change rooms that divide the safe from the possibly contaminated sections of the plant; and close watch is kept on the amount of radiation to which each worker is exposed, so that the effects of an over-dose can be offset by a temporary change of work to a non-radioactive part of the plant.

The task of enforcing these precautions for each of the 3,000 workers employed at Windscale is a major administrative feat, and it gives a foretaste of problems peculiar to the new industry. Housing is likely to be another difficulty. Windscale is a typical atom site on a remote part of the Cumberland coast; since work began in 1947, a thousand new workers have been brought into the area and more than 700 houses built for or allocated to them. When the breeder reactor is built at Dounray, in the north of Scotland, communications, housing and social problems will be even more serious.

The next step at Windscale will be the completion of the Calder Hall power station; this may well be the world's first atomic generating plant. Construction work on the first of the two piles is approaching completion and foundations are being prepared for the second. When these piles are finished, they will provide heat for steam-raising, and will also double Windscale's output of plutonium. It is difficult to grasp the fact that these enigmatic structures, with their sheer concrete walls, are the producing units of a new industry and not a new Stonehenge. Windscale as it is today is undoubtedly the forerunner of many similar plants and the Department of Atomic Energy, caretaker for the new Authority, has done well to show, for the benefit of the public, that these plants can be run on a normal daily routine that demands a high degree of individual concentration but is in essence no more complicated than the watchful care required in an oil refinery.

Saudi Arabia's Tankers

A ROYAL decree is reported to have been issued in Saudi Arabia confirming the agreement by which M. Aristotle Onassis, the Greek-born shipowner, who is now an Argentine citizen, secures the right to ship all Arabian oil that is not shipped in the tankers of the four American companies that are partners in the Arabian American Oil Company. A tanker company, apparently to be owned by the Government and M. Onassis, is to be set up; M. Onassis, described as "a minority shareholder," is to make available 25-30 modern tankers, mostly unlaunched as yet, with a total tonnage of some 500,000 tons dw. Aramco, which has been carrying about 40-50 per cent of the oil shipped from Arabia in its own tankers, will be precluded from enlarging the fleet that it was operating on December 31, 1953; moreover, it will not be permitted to replace these vessels as they go out of service. An exclusive right to carry all the oil shipped from Arabia by sea, it would appear, might thus eventually accrue to the new company; and in the meantime it would have the sole right to ship additional tonnage as the country's oil output continues to grow.

M. Onassis's tankers, under the agreement as reported, are to carry any oil belonging to the Saudi Arabian Government free;—which presumably refers to oil that the government may take in lieu of cash royalties. He is to pay the government a royalty of 1s. 6d. a ton on all the other oil—produced by Aramco—that his tankers carry. At present Saudi Arabian output is about 42 million tons a year. About 15 million tons a year goes out through the pipeline to Sidon on the Eastern Mediterranean, and a roughly similar amount is piped to the refineries at Ras Tanura and Bahrein, from where it is distributed as products. Some 10 million tons of crude, therefore, are shipped by sea from Arabia, plus the refined products from Ras Tanura; it is still undisclosed whether this agreement refers only to crude shipments or includes refined products. The tankers initially planned for the new company would probably carry not much more than 3½ million tons a year—"10 per cent of the country's output" has been mentioned. To take full advantage of its expanding "second priority" it would presumably need to acquire or charter extra tonnage.

This new exercise in discrimination is deplorable and potentially dangerous to all international oil companies in the Middle East, apart from the restrictions it places upon tanker operators and purchasers of Arabian oil. It may not formally cut across Aramco's concession; but this

restriction upon the marketing of the company's oil, the substantial royalty payments from which already constitute most of Saudi Arabia's national revenue, will presumably be strongly opposed. As an example, this attempt to exact a share of marketing as well as production and refining products by a Middle Eastern government will inevitably attract envious attention nearby.

BIF's New Look

THIS year's British Industries Fair, which opened on Monday, is the last to be organised under the supervision of the Board of Trade. Just before the Fair opened, the formation of the new company, British Industries Fair Ltd., was announced, with Sir Arthur Smout as its chairman. This company will take over general responsibility for the BIF and will organise the London sections, while the Birmingham section will remain under the control of the Birmingham Chamber of Commerce.

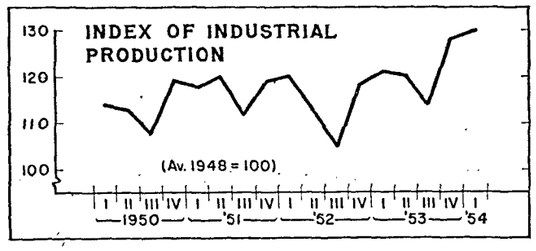
Exhibitors at this year's fair show a touching confidence in the ability of the new management to restore the BIF to some of its old glory, but the malaise from which the Fair has been suffering during the past three years has not been wholly due to its organisation. The new company will have the advantage of continuity of management, which was impossible under a civil service system of promotion, but its main task will be to pursuade companies, and in some cases whole industries, that a site at the Fair is worth the heavy expense incurred. Big companies are now in constant contact with their foreign markets, and it is only the small manufacturers who still find the Fair a useful occasion for establishing contact with foreign buyers. Even their needs are being met to an inreasing extent by special trade fairs. The Birmingham section of the exhibition, which has consistently shown a profit, has, indeed, much of the character of a trade fair for the engineering industries.

The problem is, therefore, how to win back support for the London light industry sections. New industries, like boat-building, pre-fabricated houses and caravans can, as this year's fair shows, only partly fill the gap left by defaulters in the textile and pottery industries and other once stalwart supporters of the Fair. The new company, however, is likely to get the support of many of this year's truants. It will then be up to the management to attract enough interest in the Fair at home and abroad, to justify this confidence. One obvious improvement could be in the general lay-out of the London sections of the Fair. The beautifully mounted Commonwealth section this year shows how great a difference can be made by coherent planning in a group of exhibits.

Output Records at Home and Abroad

DURING the first quarter of this year industrial output in Britain rose to a level never reached before. The production index for February is estimated provisionally at 130 (1948 = 100), and the March figure is expected to be 132-133; this quarterly average, 130, is about 1½ per cent better than that of the preceding three months, which are often the boom period of a year, and fully 7½ per cent better than in the first three months of 1953. Seasonal adjustments are not necessarily reliable, but in certain of the post-war years the level of production in the first month or two of the year approximated closely to the eventual average; should the present quarter similarly prove a true key to 1953, it would suggest that British industry as a whole will have made up for the leeway lost during 1951-52, and have regained the upward trend that was interrupted during 1951. Manufacturing output, during January and February, was not quite at the record levels of October and November last year; but it was 4 per cent higher than in January and February last year.

The industries that are breaking the records so far this year are iron and steel, certain building materials, sulphuric acid, gas and electricity, and the motor industry. Textile and clothing output has continued to increase, and production of many metal consumer goods has risen; the picture for machinery and capital plant is more patchy. Though unemployment is continuing to shrink, the rise in industrial employment has not matched the rise in output; productivity, therefore, has risen, and for industry as a whole perhaps as fast as earnings, so that labour costs are still fairly stable. An official estimate this week put the increase in "output per head of the working population" at 14 per cent in the last five years (which would seem two or three points too high, though it is not clear which indices were being compared). But it went on to compare this figure with increases of 20 per cent in Sweden in these five years, 27 per cent in "France and the Netherlands," 60 per cent in Italy, and 100 per cent in Germany. Whatever the qualifications to the figures, there is no getting away from the significance of those comparisons.



Sharp Rise in Bank Deposits

THE credit contraction experienced in the early months of the year has now been sharply reversed. In the five weeks to April 21st, net deposits of the London clearing banks rose by £78.6 million. This is indeed the season in which Government borrowing from the banks is normally resumed, as receipts into the Exchequer drop from their high level in the peak tax-gathering season. Deposits have in fact fallen only once in April in the past twenty-two years, and that was last year. This year's expansion was particularly large; and although at least two-thirds of it, and perhaps appreciably more, was attributable to the increased demands of the public sector on the banks, it is difficult, on the basis of the Exchequer's published receipts and outgoings, to account for this increased rate of Government borrowing.

The explanation almost certainly lies partly in the Government's need for sterling to finance the purchase of the foreign exchange that has been flowing into London for many weeks to build up foreign banks' and dealers' working balances. The expansion in the banks' assets that represent, directly or indirectly, lending to the Government —cash, call money and Treasury bills—was just £49 million in the five weeks; and in addition a sizable portion of the banks' net purchases of £10.5 million of investments may well have been made, directly or at one remove, from the Government. The Government's apparent needs in the nearest comparable five weeks, after taking into account finance from small savings, tax reserve certificates and the increase in the note issue, were no more than about £3 million. But the discrepancy of something over £50 million between apparent borrowings and apparent needs can hardly have been wholly accounted for by increased purchases of foreign exchange. It seems likely that there were distorting factors connected with the difference in dates of the Exchequer accounts and bank statements; in March the discrepancy was in precisely the opposite direction.

† Ratio of assets to published deposits.

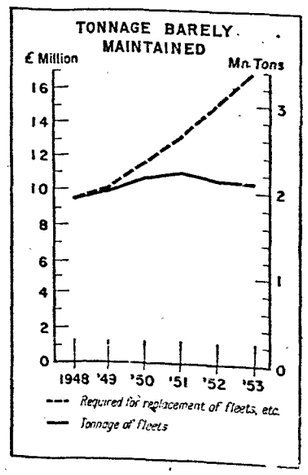
The expansion of finance of the private sector was, for the second month in succession, smaller than in the corresponding period of last year (but, this time, the comparison is with a four-week period). Commercial bill portfolios again expanded faster, but the increase in advances was perceptibly smaller, at £11.9 million against £16 million in 1953. Moreover, no fewer than five of the eleven banks registered a fall in advances. The National Provincial was again responsible for the bulk of the expansion; of the increase of £66 million in the total advances of the clearing banks in 1954 indeed, the National Provincial has accounted for some £30 million.

Pensions and the Future

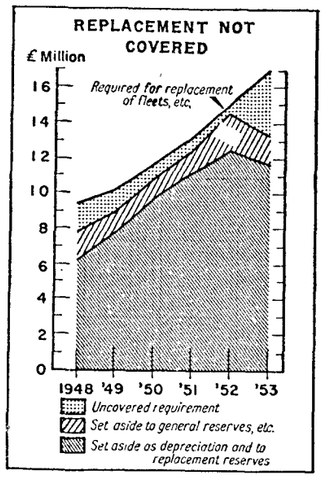
THE report which a panel of actuaries has prepared on the growth of pension rights and their impact on the national economy will require longer discussion than a mere note; but attention must be called at once to its path-breaking elucidation of the facts and to the high quality of its argument. Five million men and 1,300,000 women are covered by existing pension schemes, into which £240 million pours in annual contributions (£90 million from employers and £150 million from employees) and another £210 million goes into the National Insurance Fund.

Pensions at present being paid amount to £105 million for schemes covering public servants and employees under private schemes, and in round figures to a total of £600 million when national insurance and war pensions are swept in. But in thirty years' time, the report suggests, the total

Maintaining British Shipping



TODAY if a shipowner places an order with a British yard he does not even know the price. But he can guess that it will be more per ton than he has ever paid before. Peninsular and Oriental Steam Navigation Company is a rich, conservative shipowning group. It has kept its shareholders on ration and tried to plough back, not the statutory one twentieth of the original cost of the fleets, but one twentieth of the group tonnage at current prices. Presumably in practice it replaces with faster and more economical ships, so the test may be unduly stringent. But the P. and O. report reveals a gallant failure to attain such heroic standards. The directors conclude: "The outstanding position of British shipping today . . . is due largely to its rich inheritance from the past." The charts are from the P. and O. report, analysed on page 485.



expenditure on pensions comprised under existing schemes may reach 1,200 million; and the potential extension of pension schemes, given certain plausible assumptions, might raise the total outpayments by that time to £2,100 million. So from the present four per cent, the burden of pensions could easily rise to 14 per cent of the national income, if it remained unchanged.

The report then examines the possibilities of increasing the national income, taking an assumed increase in productivity per head of 1½ per cent per annum, and assuming that the terms of trade will remain "at least as favourable" as they were in 1952. This may be optimistic, for past history suggests that 1952 was a beneficient year at least in this respect. The increase in productivity that is assumed is not repugnant to observation and commonsense, but some part of the increase is already mortgaged for social welfare and certainly another part will be claimed by labour. The projection of advancing productivity at 1½ per cent per annum gives an increase of over 50 per cent in the national income in thirty years, which would leave room for an increase in the standard of living and also for the growing claims of dependency. This sounds a cheerful conclusion. But it is not too early to be considering, as the Phillips Committee is now doing, whether claims to future pensions are being created at a rate that may involve future economic and social strains.

Coal Prices and Steel

THE increases in coal prices that came into effect this week will cost the steel industry about £4½ million more a year, and the increase has brought a concerted protest from the Joint Iron Council, which represents the foundry pig iron makers and the iron foundries. The British Iron and Steel Federation, in its latest statistical bulletin, comments more circumspectly that the wide variations in price increases charged for coal from different areas, which may raise iron-making costs by as much as 9s. a ton more in one steel-producing district than in another, have introduced an element of great uncertainty that is more disquieting than the extent of the average increase.

The ironfounders have criticised some of the reasons given by the National Coal Board for this latest increase. They argue that provision should not at present be made to offset any of the board's accumulated deficit (which, on the new prices, might seem possible in 1955), and that the consumers should not have to bear either Profits Tax—"a transfer between Government departments"—or losses on imported coal. These arguments, which would drive the board further and further from considerations of commercial efficiency, are highly dubious.

But both the ironfounders and the steelmakers are concerned primarily with the Coal Board's departure from the strict "scientific principles" upon which, in 1951, it began to base its prices. Those principles implied that coal would be priced primarily according to its calorific value, and that supply and demand were quite secondary considerations. It is surely in the interests of efficiency that the coal industry, like others, should take more and more notice of "commercial considerations" in setting its prices. But the shift of policy has certainly inconvenienced consumers who were planning on the basis of the earlier policy. Moreover, the Coal Board's pricing policy is still a compromise of technical and commercial elements, and to the consumer it appears wholly arbitrary; when the whole policy is undergoing a change, more detailed explanations seem desirable.

Guarantees for Brazilian Credits

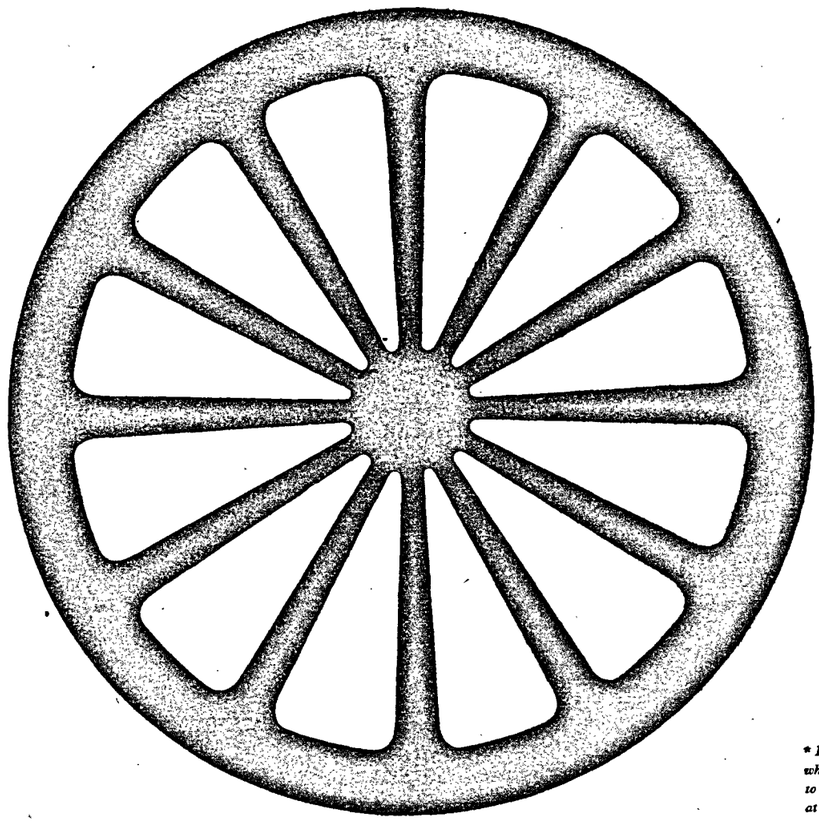
THE decision of the Export Credits Guarantee Department once again to insure exports to Brazil simply revives the machinery for encouraging British trade against the time when Brazil again makes sterling available for imports. After burning its fingers two years ago, the ECGD is proceeding warily, and so perforce must exporters. The department will cover 80 per cent of the credit granted, compared with the 90 per cent normally covered, and claims will not be met until twelve months after default. The normal period—to allow for official delays in permitting remittances—is six months. Goods produced outside Britain will not be eligible for cover. The chief safeguard is that exchange sale notes must be produced for all payments due. These notes, issued by the Bank of Brazil solely for imports deemed to be of national importance, oblige it to deliver sterling at a fixed rate of exchange within specified time limits. No sterling notes have been issued since the foreign currency auctions were introduced last October, because Brazil has little sterling to spare. Most of its present meagre earnings are earmarked for payments against the British commercial debt agreement, for invisibles and for oil. This debt originally amounted to £63 million, and when in May 1952, the ECGD suspended all fresh cover for Brazil, except for spare parts, its gross liabilities were £32 million.

The debt has since been reduced to about £40 million, by special exchange transactions in raw cotton, which have now ceased, and by direct payments of about £12 million, of which £10 million was loaned to Brazil by the International Monetary Fund. British exports to Brazil have dropped to a trickle of about £1 million a month, representing the sterling licences which Brazilian importers had outstanding when the currency auctions began. Brazilian exports to Britain have recovered slightly to about £2.5 million a month since cotton shipments have increased. Even allowing for a further rise in sales of cotton, and possibly for some sales of cocoa, the future supply of sterling notes can hardly provide for more than a small quantity of British goods. The issue of these notes, which should also protect exporters against a possible devaluation of the cruzeiro, will set an upper limit to the volume of British exports. The actual volume depends on how far the department's new terms of cover for Brazil attract exporters. And the department would no doubt withdraw cover again if it considered that sterling notes were being issued beyond Brazil's capacity to honour them.

Safety at 80 per cent

HAIR slides, tie clips, automatic bird scarers and wooden coffins may be imported freely from Western Europe next week. These and another eighty or so minor items are

A lot of spokes in our wheel*



** It is unnatural for any wheel connected with Crompton Parkinson to remain still. Blink steadily at this one and watch it revolve.*

...but none in yours

Within the seventy-five year old Crompton Parkinson organisation are a number of separate entities. Each is responsible for the manufacture of an essential piece of electrical plant—each is a vital spoke in a mighty wheel that, in turn, keeps the wheels of your industry turning. Yet each entity, though complete in itself, is but part of a common whole — the Crompton Parkinson service to a modern world.

When it comes to electrical equipment... you've got to

factories themselves to employ the men who were working on the Comets; but such a suspension is bound to entail heavy cost even if, as must be hoped, it proves temporary.

It is clear from the accounts themselves that the two tragic accidents occurred at the time when the group was in full stride. Profits were rising; new money, from the preference and ordinary share issues, had been introduced; the net book value of fixed assets had risen from £2.9 million to £5.3 million; and stocks had increased from £17.9 million to £20.4 million. If the accidents had not occurred all these changes would have been reckoned as signs of strength. Now they are overshadowed by a gigantic question mark.

The group's future prosperity is becoming increasingly dependent upon the production of civil aircraft. The chairman, Mr F. T. Hearle, justifies the company's conservative dividend policy by referring to the "more difficult times" that the industry may have to meet. He adds that "in the period to follow the passing of the peak of home rearmament business much will depend on the success of the latest military types and the further sales of the later versions of the Comet airliner." The market for military aircraft, both here and abroad, may soon begin to contract, and Mr Hearle adds that while "civil orders are substantial, yet the flow is not so great as it was."

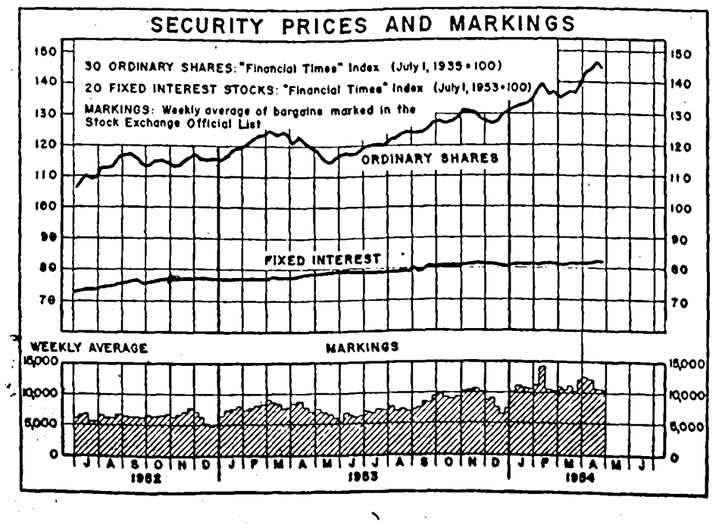
★

ASSOCIATED PORTLAND CEMENT. The boom in the building and construction trades has had the apparently paradoxical effect of reducing the profits of the "Blue Circle" group of cement manufacturers. The explanation is that demand ran ahead of capacity. The group had therefore to reduce its profitable exports of cement and, as demand was swollen by the need for cement in the flood damaged areas, had to import large quantities of cement from the Continent. This high cost cement was sold by the "Blue Circle" companies at ordinary home trade prices, which were considerably lower than purchase prices. The losses on these sales led to the slight decline in the trading profits of Associated Portland Cement from £4,172,379 to £4,036,510. Its two subsidiaries, Alpha Cement and British Portland Cement, also reported slight falls in their trading profits, from £1,270,021 to £977,440 and from £3,401,334 to £3,164,710 respectively.

The directors of these companies are, however, obviously confident that the decline in profits is due to temporary factors. Shipments of imported cement have already declined and the group has already set in train projects to increase capacity. Hence, they have not hesitated to put the ordinary dividend of Associated Portland up effectively from 15 to 17½ per cent. In 1952, a total dividend of 6s. 0h each £1 stock unit was paid on a capital of £4 million; for 1953 a total dividend of 3s. 6d. on each £1 unit will be paid on a capital of £8 million, as increased by the 100 per cent share bonus. At the current price of 75s. 6d. these units offer a yield of about 4¾ per cent.



LONDON STOCK EXCHANGE

Next Account begins: May 19th.

Next Settlement Day: May 11th.

GILT-EDGED stocks stole the limelight again in the market this week, but industrial equities also advanced. The strength of the Funds affected both short and long dated stocks; it was based upon the strength of sterling, the good showing of the gold and dollar figures, and renewed suggestions that Bank rate would be reduced. Bank and discount company shares appreciated in sympathy with this movement. With buying interest concentrated upon gilt-edged and industrial issues, the foreign bonds were neglected and only fractional movements were occurred.

Almost all the leading equities shared in the advance in the industrial market, which carried the *Financial Times* ordinary share index up to 146.2 by the close on Wednesday. Brewery shares took part in the rally, while store shares (particularly Marks and Spencer and United Drapery Stores) made some handsome gains. Throughout this period Unilever remained strong, closing on Wednesday at 68s. 9d. Cement shares were also prominent following the statement by the chairman of Rugby Portland Cement; the shares of that company put on 2s. 9d. to 33s. 6d. while the shares of the "Blue Circle" group were bought in advance of the dividend, Paper shares rose after the preliminary statement of Albert E. Reed, whose shares on Tuesday gained 2s. 9d. to 72s. 6d. Rayon shares were also in demand, partly in response to the announcement of the new Courtaulds factory. In a firm market for engineering shares, BSA gained 3s. 6d. to 55s. following strong buying in the Birmingham market. The only groups which did not take part in the rally were tobacco issues and shipping shares, which were unsettled by the P. and O. report. That company's deferred shares fell 3s. to 76s. Oils were firm, but rubber shares were dull. Little business was reported in Kaffirs, which, after closing the old account on a dull note began to pick up again when the new account opened.

The best of the Blackhearts* come from Gloucester

EVERY DAY THOUSANDS OF BLACKHEART* malleable castings flow from the mechanised line of Gloucester Foundry — every one to the customer's most exacting requirements, each with the easy machining qualities that mean lower production costs for the user.

Gloucester Foundry has an unrivalled capacity for large outputs and speedy service. It has the only elevator-type electric furnace that allows blackheart castings to be annealed in 48 hours instead of the usual 9 days. Call in Gloucester about that next casting job and save yourself time and money.

Give the job to

A sherry that is sheer delight

A perfect gift to the most critical palate, Pintail is an exceptionally fine sherry, both pale and beautifully dry. Specially selected at Jerez, this proud product of Spain is available in a trial pack of two bottles at 42/7d; subsequent supplies at £12 per dozen bottles. Your orders will have prompt attention.

Pintail SHERRY

Established 1800 MATTHEW GLOAG & SON LTD., PERTH, SCOTLAND

Basic chemical ingredients are as vital to the world's refineries as stock and seasoning are to the cook in the preparation of consommé. One of these basic chemicals is liquid sulphur dioxide, essential for the refining of modern jet fuels. The large independent company of Brotherton, established in 1878, is now one of the world's chief manufacturers of this basic chemical.

A BIG NAME IN THE CHEMICAL WORLD

Brotherton

One of the world's largest manufacturers of hydrosulphites, liquid sulphur dioxide and hexamine. Makers of an extensive range of Metachrome dyes for dyeing wool in all its forms.

Brotherton & Co. Ltd., City Chambers, Leeds, 1.
Also at Manchester, Glasgow, and London.
Works: Birmingham, Wakefield and Birkenhead.

being restored to open general licence. Specific licences will still be needed to import air guns, fireworks and egg timers; these and many other articles are still confined by the quotas that date from the emergency import restrictions of late 1951 and early 1952. The new quotas announced by the Board of Trade for such imports from Western Europe are substantially unchanged in value, at £13 million for the second half of this year. Lest it requires an undue feat of imagination to visualise the threat to Britain's balance of payments in freeing the remaining goods, the official viewpoint may help.

This year Britain liberalised 80 per cent of imports on private account from Western Europe, and some risks were taken in reaching that figure. The real increase in British overseas expenditure following the relaxations of March, 1953, has probably been masked by the fall in imports of textiles, and the relaxations made at the end of last year have not had time to show their effect. There have also been further relaxations on imports from dollar sources. Although many of the items in the groups still on quota appear trivial enough, past experience, and the fact that the existing quotas are being fully taken up, suggests that decontrol might result in an appreciable rise in expenditure. No increase in imports is expected to result from the items now freed; some of these quotas were not being fully used, and the inclusion of other items merely removes anomalies in the previous lists. So no additional risk is being accepted now, be sterling as strong as it may.

SHORTER NOTES

Against the strongest of competition from America and Germany, Metropolitan-Vickers has succeeded in obtaining the contract to build 94 diesel-electric motors for the Irish railways. The electric equipment will be made by Metropolitan-Vickers at Manchester and Sheffield, the diesel engines by Crossley Brothers of Manchester, and the mechanical parts by Metropolitan-Cammell Carriage and Wagon at Birmingham. The contract is worth £4¾ million.

★

Dunlop Rubber Company announces a 12 per cent dividend and 2 per cent cash bonus, making 14 per cent for 1953, payable on a capital increased by a 50 per cent scrip bonus last February. This compares with a total of 17½ per cent a year ago on the old capital. In terms of the present capital the comparison is between the equivalent of 11⅔ per cent for 1952 and 14 per cent. Group net profits after tax have risen from £3,497,825 to £4,068,426.

★

The issue of 780,000 new 10s. ordinary shares to shareholders of African and European Investment Trust at 45s. is being made in the ratio of one for three, and not one for ten as stated in *The Economist* of April 17th.

Company Notes

PENINSULAR & ORIENTAL. From the full accounts of P and O Steam Navigation Company the investor will gain a broad insight into the problems of shipping, for the group is one of the wealthy giants of the industry; it operates passenger liners, cargo liners and tramps and the directors' report is richly informative. He will probably also gain three impressions. First that even a wealthy giant of the shipping business does not carry anything like as much surplus wealth as is widely supposed; secondly, that a hard struggle lies ahead; and thirdly, that for the moment P and O appears to have passed the peak of its new shipbuilding programme though it remains to be seen whether Mr Butler's investment allowance will give it new impetus.

As a group P and O disclose their full consolidated profit and do not use the shipping exemption from the rigours of the 1948 Companies Act. The consolidated balance sheet includes some hidden reserves dating from before 1950 and individually the accounts of the subsidiaries use the escape clause in striking their profits (though these are adjusted to the full figures on consolidation). In discussing the preliminary figures on April 24th *The Economist* therefore gave the wrong impression. The fall in group net profits before tax for the year ended September 30th from £13.9 million to £8.5 million tells the full story. The 22 per cent deferred dividend is still handsomely covered by net profits; but the directors are evidently much impressed by the continued need to make large retentions of earnings in excess of statutary depreciation and give the broadest of hints that the one for one deferred share bonus may not lead to a more liberal distribution policy. "If the physical resources of the group are not to shrink, enough must be set aside each year to replace its existing physical assets, and in spite of all the companies' efforts they are not doing this." Indeed, formidable sums in addition to statutary depreciation are being ploughed back. Last year out of a consolidated net profit of £5.4 million, compared with £6.9 million, £2.1 million (compared with £3.4 million) was added to fixed assets replacement reserve, and £1.4 million (against £1.8 million) retained in the subsidiaries.

The report explains that the group has suffered most from lower freight rates applicable to the tramp trades and to bulk commodities. Except on the Eastern routes where the group suffered from Japanese competition the cargo liner trades fared less badly than the tramp section. Passenger trades actually showed some recovery after the set-back of 1952, but as each new vessel comes into service the depreciation charge grows substantially and the directors find no reduction in operating expenses as a whole.

The group's shipbuilding programme appears to have begun to run off. The estimated cost of ships under construction is down from £23.2 million to £18.6 million, the shipbuilding bills payable from £1.8 million to £900,000 and the capital commitments for ships ordered but not laid down at September 30th from £15.9 million to £12.3 million. The deferred units at 77s. 6d. yield 5⅛ per cent on the basis of a maintained 22 per cent dividend.

★

DE HAVILLAND. A slip of paper in the full report of de Havilland Aircraft Company explains why shareholders cannot use this report to assess the future of the company. It states that "since the report and accounts were put into the printer's hands there has unfortunately been a further Comet accident, with regrettable loss of life. The Certificate of Airworthiness for the type has been withdrawn pending the investigation of the cause, and at this stage it is possible only to express the hope that the cause will be quickly determined and rectified." Shareholders will have to wait until the annual general meeting to see how far the suspension of work on the Comet I and Comet II will affect the company's fortunes. It seems, however, that there is enough work on hand in the de Havilland

(1) From August, 1953, the index has been revised to show a more representative wheat price. (2) Figures up to July, 1953, relate to delivery prices and subsequently to ex-warehouse prices of H.C. electrolytic copper. (3) The index of retail prices has been linked back to 1938 with the aid of calculations made by Professor R. G. D. Allen for the London and Cambridge Economic Service. (4) Annual figures are based on unit values and are therefore influenced by changes in the composition of trade as well as price movements. (5) Surveys made twice a year: annual figures relate to October survey.

(1) This covers mining, manufacturing, electricity and manufactured gas with the following exceptions: Denmark and Greece exclude mining; Ireland and Sweden, electricity and manufactured gas; and Austria, manufactured gas. Germany excludes West Berlin. (2) Special trade (excluding re-exports) with the exception of Ireland which covers general trade; Belgium includes Luxemburg. (3) Average of third quarter.

Financial Statistics

EXCHEQUER RETURNS

For the week ended May 1st, there was an "above-line" surplus (after allowing for Sinking Funds) of £5,823,000 compared with a deficit of £22,351,000 in the previous week and a surplus of £21,827,000 in the corresponding period of last year, bringing the cumulative deficit to £58,904,000 (£26,576,000 in 1953-54). Net expenditure "below-line" absorbed £9,265,000, raising the total cumulative deficit to £68,935,000 (£49,979,000 in 1953-54).

THE MONEY MARKET

THE influx of funds to London was reflected in last Friday's Treasury bill tender, at which total applications rose by £22 million to £437.5 million, more than £20 million above the previous record level reached a fortnight earlier. The market had in anticipation raised its bid by 2d., to £99 9s. 9d. per cent for the 91-day bills; it bid at £99 9s. 8d. for the 92-day bills offered on account of the incidence of August bank holiday. Its applications for these bills were allotted in full and for the 91 day maturities at 34 per cent; the upshot was a fractional increase in its average "proportion" from 38 to 38½ per cent. The average rate of discount on all bills fell by 8d. to £2 0s. 11.36d.—the lowest rate since the increase in Bank rate in March, 1952.

In Lombard Street the week has been characterised by a superfluity of credit and sagging bill rates. By Wednesday the rate for July maturities was down to 1⅛ per cent and that for June maturities to 1⅞ per cent. Throughout the week money was lent against bonds at down to 1½ per cent.

The gold market has had a less active week. As the table below shows, prices at the fixing hovered round 249s., though on Tuesday there was some dealing after the fixing at 249s. 2d.

The Bank return shows, rather unexpectedly, a sharp fall in bankers' deposits, by £13.8 million to £275.5 million, mainly on account of an increase in public accounts and an effective fall in Government securities.

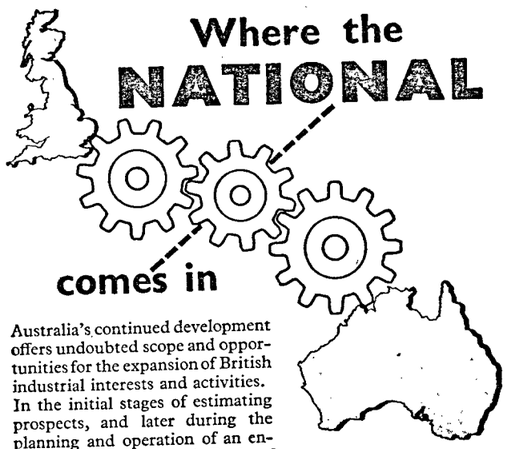
Where the NATIONAL comes in



Australia's continued development offers undoubted scope and opportunities for the expansion of British industrial interests and activities. In the initial stages of estimating prospects, and later during the planning and operation of an enterprise, The National Bank of Australasia is in a good position to help the wheels go round much more smoothly. 'On the spot' information, gathered from over 715 branches throughout Australia, is readily obtainable from the Information Department of the Bank's London Office.

THE NATIONAL BANK OF AUSTRALASIA LIMITED

(Incorporated in Victoria)

SIR NOEL MOBBS'S STATEMENT

The thirty-third annual general meeting of Slough Estates Limited will be held at Slough Estates House, 16 Berkeley Street, London, W.1, on May 18, 1954.

The directors report a net profit of £250,083 for the year ended December 31, 1953, compared with £205,741 for the previous year, and recommend the payment of a final dividend on the ordinary capital of 6 per cent, making with the 2½ per cent interim dividend already paid a total of 8½ per cent for the year.

The following is an extract from the statement by Sir Noel Mobbs, KCVO, OBE, chairman and managing director, which has been circulated with the report and accounts for the year to December 31, 1953:

My statement to the stockholders this year, the thirtieth I have made as your chairman, is of more than ordinary length and more than ordinary importance, because your board has been faced with a number of important decisions arising out of happenings in the year 1953.

ACCOUNTS FOR 1953

I will, first of all, refer to the profit for 1953, which in the consolidated profit and loss account of the company and its wholly-owned subsidiaries, is £259,000. It shows a satisfactory increase of £52,000 upon last year's figures.

This is in part due to 21-year-old leases as they expire being renewed at rentals more in conformity with post-war conditions.

It is also in some part due to our Canadian company—for its first eighteen months of necessity a liability—reaching the point where it is adding to our profits.

Both these sources of increased revenue should continue, and the board have decided therefore to recommend an increase of 1 per cent in the final dividend.

The board have throughout followed a policy of maximum distribution of profits to stockholders consistent with the normal preservation of the business.

On the 1951 accounts, after payment of taxation and contractual redemption of debentures and preference shares, the company declared a dividend of 7½ per cent, being rather more than the remaining balance of profit for that year. On the 1952 accounts the company paid a similar dividend of 7½ per cent, being very little less than the remaining balance of profit for that year, and on the 1953 accounts with an increased profit the directors recommend a dividend of 8½ per cent, which will absorb nearly the whole of the balance of profits of that year.

In 1949 the ordinary stockholders received a free issue of one share for each share held, when the dividend was reduced from 15 per cent to 7½ per cent.

The return on investment in the company can hardly, therefore, be considered to be other than satisfactory and should, slowly perhaps, but surely, increase in the future.

The company has some of the aspects of a public utility company. Eighty per cent of its assets are in Slough, to which town it is of considerable importance. Five of the directors live in that neighbourhood, and the business is conducted upon a careful policy which should be of long term value, both to the nation, the area in which it is developing and the stockholders.

BALANCE SHEET

Stockholders will note that there are important changes in the balance-sheet figures.

As at December 31, 1953, the properties (excluding the power house, which is subject to statutory depreciation, and your London and overseas properties, which are shown at cost) have been re-valued by Henry Butcher and Company, the city factory agents and valuers.

The resultant increase in asset values has been allocated as to £311,868 to a capital building reserve and as to £1,129,342 to general capital reserve.

In the development of trading estates it must be appreciated that it takes years for many of our assets to come into full earning capacity, but when they have done so, the position of your company should be very strong indeed.

DRAINAGE AT SLOUGH

In our earliest days your company had its own drainage system on the trading estate and its own sewerage works. It is, however, a statutory obligation to drain and we had to part with our plant to the local authority. The authority has been quite unable to keep pace with the developments on the trading estate and the neighbouring housing estates. I have no wish to criticise, nor is criticism warranted. The chief trouble arose during the war when the authorities could do little or nothing. The needful financial outlay, also, is very high. Your board, in conjunction with a few of the larger users of the town drainage system, has agreed to contribute voluntarily to the cost, although in the Commonwealth and elsewhere the local authorities are only too glad to provide drainage to our factories free of all cost.

Nearly all applications in the last year or two which have received Board of Trade approval for the building of new or extension of existing factories at Slough, have had to be deferred by the local authority because of the impossibility of handling the drainage. Even the few factories we have built have been at increased cost with special equipment to handle drainage at night; and today, and for how long I do not know, there is a serious hold-up of building operations.

REDUCED BUILDING AREA OF THE SLOUGH TRADING ESTATE

In 1947 the Town and Country Planning Act gave power to the local authorities to re-zone existing ripe industrial land for other purposes.

Notwithstanding the expenditure of millions of pounds upon its development and the possession of a special Act of Parliament covering the whole area of the estate, the authorities decided to re-zone for "nursery garden" purposes 80 acres out of the remaining 216 acres of our estate upon which factories have not yet been erected.

Under the terms of ministerial pronouncements since, damages will be paid to us for such re-zoning, but in my opinion, no money will compensate us or the town of Slough for the loss of such valuable industrial property.

LONDON COUNTY COUNCIL

I have already said that the LCC are building a large housing estate on the northern boundary of our trading estate at Slough. The Londoners will want to find employment either in additional factories on our trading estate or in competition with the present labour in the existing factories.

The LCC, to ensure new employment for its decanted population, applied for compulsory powers to purchase and build factories upon some of our land—by an ironical coincidence—almost precisely the land that has now been sterilised by the Local Authorities.

The Ministry of Town and Country Planning rejected the LCC's application, presumably upon the ground that your trading estate was quite capable of providing employment for the new population.

Hindered by the authorities from building because of the lack of drainage facilities and hamstrung in the loss of valuable land, I feel that there may be severe competition among workers for employment on our estate in a few years' time. This may ease the lot of our manufacturers, but I, personally, do not think it is for the good of the town or the nation.

POWER PLANT AT SLOUGH

The total generating capacity of the power station is now just upon 30,000 kW.

In March a new high-pressure Stirling boiler of 80,000 lb per hour capacity was installed and a new Parsons 5,970 kW Pass-Out Turbo Alternator.

These two items with the necessary auxi-

liaries involved a capital expenditure of approximately £320,000.

A record maximum load was experienced during the winter months and the question of further boiler plant is now under consideration for commissioning not later than 1958.

SERVICE TO THE PUBLIC

For thirty years I have felt that, notwithstanding a complete responsibility to the stockholders of the company, this responsibility included and did not clash with a duty to the town of Slough and its representatives; and covering all our trading estates, to the 100,000 people who depend upon continuous employment of the workers thereon.

In the supply of power, light, steam, water, railways and other services at Slough from our own plants, we are carrying out duties of a public utility character and even in the granting of leases to suitable manufacturers our actions impinge materially upon the build-up of the town's future. The rates charged for these public services and the factory rentals compare very favourably with those operative in new towns in the Greater London area, mostly upon State or municipally owned industrial land.

Not only industrially has your company done its best for the town of Slough, but it has also spent and continues to spend considerable sums in the neighbourhood of our trading estates, and principally at Slough upon social, health and community facilities. In this important work we have collaborated with the local authorities, and I would like publicly to thank the Bucks County Council's Education Committee, its chairman and chief officer, for the helpful spirit in which negotiations and co-operation have always taken place with me.

The community centre upon the borders of our estate continues to have our full support, and many manufacturers on the trading estate have felt it their duty and their wish to join in creating a community spirit in conjunction with the statutory authorities and employees.

Slough stands high for its size as a cultural and recreative centre, and in this age of increasing mechanisation perhaps little yields in importance to the need for us all to learn how culturally and recreatively to employ our leisure hours.

LEASEHOLD FACTORIES OR FREEHOLD FACTORIES

In the great depression of 1930-31 Slough weathered the storm far better than most towns.

In years gone by ownership of a factory may have been looked upon as a mark of responsibility. The modern trend is for a manufacturer to utilise his capital in his business rather than to sink it in bricks and mortar. Today, and particularly in the New World, many of the largest firms hold all their factories on lease.

BUILDING COSTS OF FACTORIES

A trading estate is a modern conception of concentrated light industry. One of the first policies upon which has been founded any success the company may have had is standardisation. All our factories vary in little but floor space area, and the cost of construction is much below that of a factory built by an architect for an individual manufacturer.

Added to this is over thirty years of experience, trial and error, in the economics of factory construction. In Canada we have gained valuable overseas experience, and our third, fourth and subsequent factories have cost to build over 25 per cent less than the first two.

Voids on all our trading estates are practically non-existent as for over twenty years there has been a waiting list of factory applicants.

AJAX, CANADA

I was at our trading estate at Ajax in February and found every completed factory was in full occupation and all partially completed factories already let. There is plenty of additional land.

Ajax had a population of 3,500 people when we went there two years ago. Since then the Municipality have spent—within a few hundred yards of our trading estate—£2 million in the development of roads, drainage, housing, a shopping centre, and other services and are spending another £500,000 in 1954.

Situate about the same distance from Toronto (1,200,000 inhabitants) as Slough is from London, it borders the main four-lane highway and the railway from Toronto to Montreal. It is on the north shore of Lake Ontario, a region that will be served by the new St. Lawrence Sea-way.

AUSTRALIA

In January of this year Mr Butler, the Chancellor of the Exchequer, said that Australia was "one of the most inspiring prospects for development."

In 1949 your company bought 1,500 acres of land suitable for trading estate development. It is situate a few miles from the centre of the city of Melbourne between that city and the modern, industrial town and port of Geelong, with the railway between them running through our land and the highway connecting them alongside our land.

The board do not consider that the time is ripe for building operations to commence but there are signs that in a year or two it should be economical to do so.

KING'S NORTON, BIRMINGHAM

This estate, of 140 factories, is almost completely developed. Every factory is let, services to the manufacturers are purchased on the lowest scale by your company from the local authorities and distributed to the individual factories.

GREENFORD, MIDDLESEX

This estate, of twenty-one factories, is fully let to the War Department under a lease expiring in 1959. Whether the War Office will require a new lease or whether the factories become available for commercial use, the rentals obtainable will be very much higher than those existing.

LONDON HEADQUARTERS

Slough Estates House in Berkeley Street, London, W.1, continues to act as an international trading centre for any of our manufacturers. It gives them many of the advantages of an expensive London organisation of their own, including an exhibition hall, interviewing, conference and board rooms and the services of a staff experienced in world trade and its modern difficulties. A club on the upper floors, of which over 150 directors and senior executives of our manufacturing firms are members, fosters that spirit of friendliness and intercommunication which is a feature of the Slough Trading Estates.

STAFF

I would like once again to thank the administrative staff and all our employees for their whole-hearted efforts in the interests of the company during the past year.

AGRICULTURAL MORTGAGE CORPORATION, LIMITED

FARMERS' GOOD YEAR

The twenty-fifth annual general meeting of this company will be held on May 19th in London.

The following is an extract from the statement by the chairman, Mr E. J. Bunbury, CBE, MC:

Farming in general enjoyed a good year in 1953. Remarkably good spring weather throughout England and Wales gave a flying start to the year, and provided ideal conditions for all seasonal work in cultivations and sowings; it favoured lambing and gave the assurance of abundant grass for hay and silage.

Farmers generally are to be congratulated on their impressive record of achievement during recent years in raising crop and livestock yields. These good results are the fruits of the greater use of fertilisers, the wise choice of new crop varieties, and improved and wider application of the latest scientific aids to weed and pest control. Ploughing-up grants, fertilisers subsidies and other measures initiated by the Government also helped to bring about this improvement.

The 1954 Annual Review of the economic condition and prospects of the agricultural industry emphasises the increasing importance attaching to the relationship between trends of world food prices and the costs of home production. We have now moved into a different economic climate, and it is clear that great attention must be given to improving efficiency on the farm in order to reduce production costs and to ensure that agricultural produce be sold more competitively. The new investment allowances for capital expenditure on farm buildings, plant and machinery, announced in the recent Budget statement, and which are additional to existing depreciation allowances, will help farmers to meet the new situation, and thus to effect a major contribution to the well-being of the national economy.

During the year we completed new mortgage loans amounting to £1,930,416, which compares with £4,474,819 last year. In addition, advances of £645,696 had been approved by the directors, subject to the completion of the legal formalities, against the comparable figure of £573,789 in 1953.

SLOWING DOWN OF NEW BUSINESS

I referred last year to the slowing down which we experienced in the volume of new business in our financial year 1952/53. In spite of the fact that we have been able to reduce our lending rate from 6 per cent to 5 per cent during the year, this falling off in new loans granted continued, particularly for loans for farm purchase and for the repayment of bank advances, which declined by £654,000 and £1,027,000 respectively compared with last year. This, to some extent, may be associated with the reduction in the number of farms changing hands, as well as the reluctance on the part of owners earlier in the year, when interest rates were higher, to change from temporary bank accommodation to the more permanent type of finance we are able to offer. Be that as it may, I have no doubt that as the benefits which accrue from long-term borrowing become more widely known and appreciated, and with long-term interest rates now at more attractive levels, the demand for our credit will increase.

The average loan granted during the year was £3,460 which compares with £3,754 for the overall average loan outstanding.

ROYAL EXCHANGE ASSURANCE

234th ANNUAL GENERAL COURT

ANOTHER YEAR OF PROGRESS

DIVIDEND OF 50 PER CENT

PROPOSED CAPITALISATION OF RESERVES

LORD BICESTER'S REVIEW OF "SPLENDID" RESULTS FOR 1953

The two hundred and thirty-fourth annual general court of the Royal Exchange Assurance will be held on May 26th at The Royal Exchange, London, E.C.

The following is the statement by the governor, the Right Hon Lord Bicester, which has been circulated with the report and accounts:

Before I review and amplify the report and accounts of our group of companies for 1953 there are certain matters to which I should like to refer.

During the latter months of 1953 Mr John Robarts, after serving upon the court for more than half a century, indicated his wish to retire because of ill-health. To my deep regret and that of all his former colleagues on the court of directors he died early in the current year.

Mr A. E. Phelps, after completing over fifty years' distinguished and unbroken service with the Corporation, retired on December 31st last from the office of general manager and secretary. During the eight years in which he held this position the general premium income of our group rose from some £9½ million to over £25½ million. The profitable results arising from these huge underwriting totals have been mirrored in all our postwar annual accounts and are in no small measure attributable to Mr Phelps's characteristic thoroughness and business acumen.

You will be pleased to know that he has agreed to continue as a director of our principal affiliated companies in the United Kingdom: his ripe experience and sound judgment will thus still be available to us. We wish him very many years of good health in which to enjoy his retirement.

On behalf of all stockholders I extend a warm welcome to Mr H. A. Walters who, on January 1, 1954, succeeded Mr Phelps as general manager and secretary. Mr Walters has spent the whole of his business life in the service of the "Royal Exchange" and he possesses an intimate knowledge of its world-wide organisation. We can confidently expect our affairs to prosper under his guidance. Mr H. R. Roberts was at the same time promoted to be an assistant general manager.

There have been two changes in the overseas field. On September 30, 1953, Colonel F. H. Wright, OBE, retired from the position of manager for Australia after many years' service in our group of companies, and he was succeeded by Mr F. H. Egerton. Mr V. K. Vipond, after long service in the East, retired at the end of March this year and Mr Alan Wolfe succeeded him as manager of our Eastern branch. To both these new managers we wish every success.

FIRE DEPARTMENT

Once again this account presents an eminently satisfactory picture. When measured by the amount and consistency of its underwriting profits this is certainly a very important section of our business.

Last year I expressed the view that the growth of premium income could not be expected to continue at the same high rate owing to the more stable economic conditions which were then in sight. In the event it so happened that the 1953 premium income was somewhat higher at £9,541,464; but the increase over 1952, a little more than £241,000, was entirely attributable to overseas business.

Although losses at some £4,055,000 amounted to 43.1 per cent of the premium income compared with 42.4 per cent in the previous year, you will no doubt regard last year's experience as not unfavourable in the light of my later comments. Commission and expenses together showed comparatively little change.

After setting aside £4,770,732 as our customary 50 per cent provision for unexpired risks and transferring £34,119 to the exchange adjustment account, we are able to transfer to the consolidated profit and loss account a record underwriting surplus of £1,142,952 (12.0 per cent) as compared with £895,819 (9.6 per cent) last year.

At home the year opened with the storm and flood disaster in the East Coast area which caused damage officially estimated to be between £40 million and £50 million. Published statistics also indicate that material fire wastage during the year reached a level higher than any previously recorded; and this does not take into account the inseparable consequential loss which it is impossible to compute.

So in a year when the losses suffered by Fire Offices generally were appreciably higher than normal, I think we may well regard the comparatively small increase in our own loss ratio as evidence of prudent underwriting and careful control of our commitments.

The increasing importance of "Special Perils" cover is underlined by the fact that, following the Lynmouth disaster in 1952 and the East Coast catastrophe in 1953—each regarded as an abnormal occurrence—the early months of 1954 were marked by unusually severe damage by frost. The extent of the loss which this caused has not received the same publicity because it was less spectacular and more widely distributed: but it may well prove to have been as costly to the national interests, and it might have been considerably reduced by more careful planning of water and heating installations.

In the overseas field, where almost throughout the world "Royal Exchange" service and security is offered to the public by our branch organisations and agents, we had a very satisfactory year of trading.

In this section of our business we have ever to reckon with the effects of natural disasters such as destructive windstorms and earthquakes and also with conflagrations such as, I am glad to say, are seldom met with in the home field. The year 1953 must be considered as fortunate in that it was comparatively free from these unpleasant happenings, although the earthquakes in the Ionian Islands were an unhappy exception. In such disasters as did occur we were lucky to escape heavy losses.

MARINE DEPARTMENT

Premiums totalled £1,883,979, compared with £2,242,256 in the previous year. The decline of some £360,000 can largely be attributed to lower commodity prices and reduced rates of premium arising out of highly competitive conditions in the marine insurance market. Moreover, it was our deliberate policy to decline to participate in business offered at rates which, if past experience is any guide, would have left no hope of any margin of profit.

For several years there has been a widespread feeling that, in general, the rates obtained for hull insurances would prove unremunerative to underwriters. With repair costs constantly increasing the premiums have been insufficient to meet normal damage claims and at the same time to make suitable provision for the risk of total loss and the exceptional crop of casualties which is experienced from time to time as the result of a spell of bad weather at sea.

But the outlook at the moment is not without encouragement, as there are signs that in the not too distant future competition may reduce the cost of ship repairs: and this would of course have a very beneficial effect, which is long overdue, upon the results of hull underwriting.

As far as cargo business is concerned we were fortunate in that major casualties did not bear very heavily on this section of the account; but theft and pilferage still take away far too large a slice of our cargo premium. The claims paid during the year were £1,530,391, against £1,618,312, whilst expenses of management took £220,318 compared with £224,560 in 1952. In respect of the underwriting years prior to 1952 we have been able to transfer £208,525 to the profit and loss account, leaving the fund at the end of 1953 at £3,753,396, or very nearly 200 per cent of that year's premiums—comparable figures for 1952 being £3,828,651 and 171 per cent.

GENERAL ACCIDENT DEPARTMENT

The activities of this department cover a very wide range of risks written throughout the world. In some directions the progress of earlier years was interrupted by trade conditions at home and abroad; but in others improved rate structures have increased both premium collections and the ratio of profit.

Our motor vehicle account, which represents a substantial proportion of the total premium income in the department, showed an improved claims experience and produced a fair measure of profit. The problem set by the mounting total of casualties which occur on the roads in this country every year is still, in my opinion, one of enormous importance, and we therefore welcome the decision of Her Majesty's Government to spend a further £10 million per annum for a period of several years on road construction. Not only improved roads, but greater care and courtesy on the part of all those who use

UNITED BISCUITS LIMITED

(Amalgamating McVitie & Price, Ltd., Macfarlane, Lang & Co., Ltd., Henderson & Sons, Ltd.)

CONTINUED EXPANSION OF BUSINESS

RECORD PRODUCTION AND SALES

MR PETER G. MACDONALD'S STATEMENT

The sixth annual general meeting of United Biscuits Limited will be held on May 27th in the Caledonian Hotel, Edinburgh.

The following is the statement by the chairman, Mr Peter G. Macdonald, WS, JP (*chairman of the company*), which has been circulated with the report and accounts for the year ended December 31, 1953:

I am glad to report that our business continues to expand and that the group's production and sales have once more reached record high levels. This is undoubtedly due to our having maintained, even in adverse times, the high standard of the quality of the biscuits made by our group and that at reasonable and competitive prices. That we have been able to achieve this result is due to the completion of the first phase of extending our buildings and installing additional up-to-date plant and we are rapidly obtaining the benefit from our five factories fully equipped with the most modern plant available.

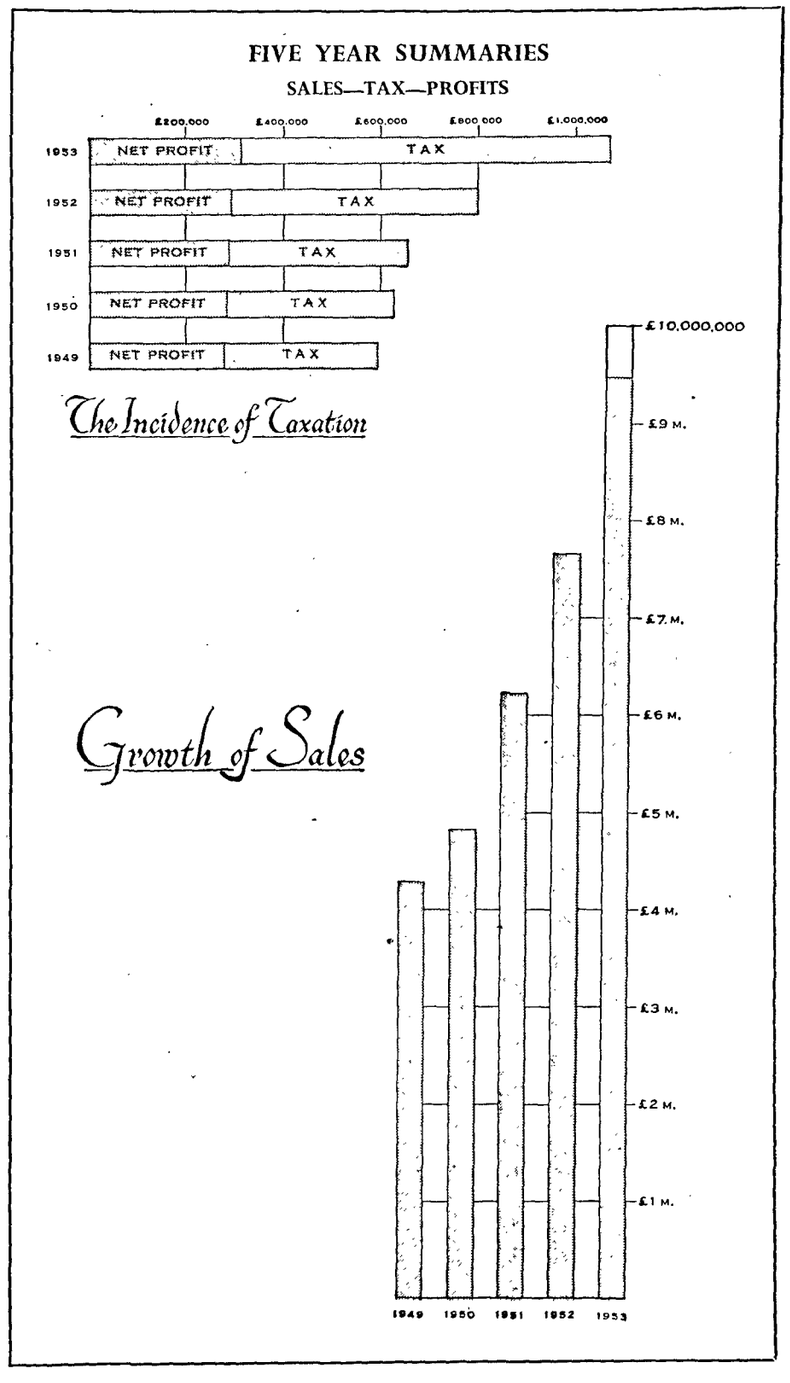
A few years ago your directors felt that the demand for biscuits in packets would increase and should be encouraged, as it places the biscuits into the hands of the housewife in the best possible condition. There are now many ingenious packaging machines which do this work mechanically and at a reasonable cost and rapid progress has been made towards the full equipment of all the group's factories with this up-to-date packaging plant.

ACCOUNTS

The group profit in the past year after charging depreciation, directors' remuneration, provision for pensions and auditors' fees amounted to £1,073,585, an increase of £278,218 over the previous year. Income tax, profits tax and excess profits levy devour £758,888, which represents more than 70 per cent of the year's total profit. Excess profits levy ended on December 31, 1953, and we are glad to see the last of that most unpopular imposition.

There remains after taxation a balance of £314,697 (1952 £290,463) from which the preference dividends and an interim dividend of 3 per cent less tax on the ordinary shares have been paid. Your directors recommend that a final dividend on the ordinary shares be paid at the rate of 9 per cent, less tax, making a total of 12 per cent for the year as against 10 per cent last year. A sum of £289,456 is brought in from last year and this together with the £149,697 retained in the business from this year's trading amounts to £439,153. The directors have transferred £140,000 to general reserve leaving £299,153 to be carried forward to next year.

During the year we have disposed of some surplus land and buildings at one of our London factories, the proceeds of which will be available for further expansion purposes and strengthening our liquid resources. This sale has resulted in a surplus of £160,000 over the book value, which amount has been



MARKET CONDITIONS

The day-to-day course of turnover in "call money" has recently begun to recall the market conditions in the 1920s, for there are often heavier transfers between overseas, foreign and merchant banks than those to which we have been for so long accustomed. There is not yet, however, evidence before the discount market of the temporary presence in London of any remarkable volume of fresh "hot money" seeking short employment.

In view of the alteration in the company's financial year the board intends, in the absence of unforeseen circumstances, to declare an interim dividend on the ordinary shares in November next of not less than 4 per cent actual, to correspond with the interim dividends paid in May to shareholders in past years. Your directors, on your behalf, express warm thanks to the company's staff for their consistent good work.

BANQUE FRANÇAISE DU COMMERCE EXTERIEUR

(Paris)

FURTHER EXPANSION OF BUSINESS

The annual general meeting of the Banque Française du Commerce Exterieur was held on April 7th. M. Belin, chairman of the board of directors, presided, and was assisted by M. Assemat, general manager. Government representatives were present.

The following is a summary of the report for 1953 given by the chairman:

The financial year has seen a further expansion of the volume of business transacted by the bank. This is indicated by an increase in the balance sheet, which, with a total of Frs. 111,754,000 million at the end of the year, is more than Frs. 30,000 million in excess of the figure at December 31, 1952. This progress is largely due to the financing of large-scale works abroad, export deliveries and offshore orders.

STRENGTHENING OF RESERVES

The results for the financial year 1953 show a distinctive improvement on those for 1952, in spite of a rise in costs of approximately 8 per cent. Profits available for distribution are, in fact, nearly Frs. 29 million in excess of the corresponding figure for the preceding year, and will enable the bank's reserves to be strengthened considerably.

Total gross profit for the year amounted to Frs. 1,950,143,618, as against Frs. 1,806,245,955 for the preceding year. After deducting all charges, redemption payments, and other provisions, the net profit amounted to Frs. 369,298,525, compared with Frs. 333,501,104 in the preceding year, showing an increase of nearly 11 per cent.

After making provision for statutory payments to shareholders, staff, and social security funds, the board have earmarked Frs. 120 million for the general reserve, and have placed a balance of Frs. 163,792,252 at the disposal of shareholders. Apart from provisions and redemption payments, the reserves have increased by Frs. 240 million compared with the preceding year, and have now reached a total of Frs. 1,146 million.

After the accountants' report and the observations of the management committee had been duly read, the accounts were adopted unanimously. Further motions, to distribute a bonus dividend of 5 per cent and thus double the ordinary dividend and to strengthen the general reserve by Frs. 120 million, were carried.

THE UNITED GLASS BOTTLE MANUFACTURERS, LIMITED

DEMAND FOR PRODUCTS WELL MAINTAINED

MR L. A. ELGOOD'S STATEMENT

The annual general meeting of The United Glass Bottle Manufacturers, Limited, will be held on May 26th in London.

The following is an extract from the statement by the chairman, Mr L. A. Elgood, OBE, MC, DL, JP, CA, circulated with the report and accounts:

In the statement which accompanied the 1952 report and accounts, I reiterated that it is your company's policy to maintain the glass container as the cheapest form of package for its many uses. To this end, and in the face of continuing increases in manufacturing costs, the home trade selling prices of glass containers, tableware and stemware were held throughout 1953 at the levels established in 1952.

The reduced demand for glassware and closures in the first half of 1953 which we experienced in common with others in the industry resulted in our glass and closure factories operating below capacity during that period, with consequent increases in the cost of ware manufactured. Trading conditions improved greatly thereafter and in the closing months of the year all available production units were again fully employed. Demand for our products in the present calendar year has been well maintained.

Sales in export markets were more difficult and at a lower level than in 1952, but I shall refer to this later in my statement. These circumstances, the over-all effect of which was a further reduction in our profit margins, provide the main background to the accompanying accounts, on the principal features of which I should now like to comment.

TRADING PROFIT

The consolidated profit and loss account opens with our group trading profit before taxation amounting to £702,929, a reduction of £161,565 on the profit for 1952. The incidence of taxation on trading profit was substantially the same as in 1952, but remains at a level which continues to curtail development and enterprise. The amount of taxation recoverable in respect of previous years, £38,896, was attributable in the main to adjustment of liability to tax of the company's wholly owned subsidiary, John Lumb and Company, Limited, which ceased trading on December 31, 1953, and to which reference is made in the directors' report.

The net group profit at £287,531 compares with £367,687 for 1952, and the holding company's profit for the year amounted to £248,403 compared with £316,042. The application of that profit and recommendations as to dividend are summarised in the directors' report and result in a balance of £298,258 available to be carried to the holding company's balance sheet, which amount compares with £302,243 in 1952. The balance carried to the consolidated balance sheet is £429,739 compared with £415,576 in 1952.

INCREASING COSTS OF RAW MATERIALS

Towards the end of 1952 it became necessary to impose a general price increase on bottle sales to meet in part the additional manufacturing costs that had been sustained up to that date. No sooner had this price increase been imposed than the industry as a whole was faced with increased costs of raw materials, increased transportation costs, wage claims and awards, so much so that without committing myself to precise figures I can say that in 1953 alone these additional charges on production amounted in the case of our company to approximately £200,000.

Unhappily in the present year this trend has not only continued, but the tempo of increase has even been accelerated. So far these burdens have been very largely absorbed, partly by increased efficiency which is our permanent aim and partly, as you will have seen, at the expense of profits.

While we believe we have been correct in our endeavours to hold prices, for the maintenance of the business on a sound basis and in the long-term interests of our stockholders, there is a limit to what can be absorbed, and I fear this limit has almost been reached. It will continue as our guiding principle to keep our bottle production in the field of the cheapest and most efficient form of packaging material of its type. This must be a warning, however, that until those controlling supplies and services to your company are equally activated by a need to hold prices, then we are fighting what might well prove to be a losing battle.

EXPORT MARKETS

Last year I referred specifically to the competition in export markets with which we were then faced from Western Europe. From frequent press references to this threat, it will be no news to stockholders to learn that, far from competition levelling off, it became intensified throughout 1953. While in that year your company could not match peak sales, nevertheless, both by volume and value, our contribution to the country's export effort exceeded estimates. The decline in export turnover has not been influenced by periods of increased home demand. I particularly stress this, as of industry in general it is frequently suggested export supplies are subservient to home needs. Fears of this were expressed in a report issued by the Organisation for European Economic Co-operation from Paris in December last. The theory presumably is, that in satisfying home demand, exportable goods are diverted into the domestic market.

To this school of thought I cannot point out too forcibly that the particular competition in export markets with which your company is faced springs largely from the United States and Western Europe. It is my belief and experience that in those countries there is little that is not available to the domestic buyer. This, I feel, is something on which to ponder, as, particularly in the case of Western Germany, their ability to compete overseas has, I believe, grown in direct relationship with the availability of goods for home consumption. In other words, a growing level of home supply there and in other competing countries has produced an ever growing overspill for export, a simple formula of trading under which this country has prospered in the past.

An important part of our group's activities is the service to customers of our closure division, who supply the products of our subsidiary, Kork-N-Seal Limited, which include stoppered corks, metal and moulded closures of every type and also capsules.

The company's activities in Scotland, which are already on an important scale, have been reorganised and strengthened.

STANHOPE STEAMSHIP COMPANY

MR J. A. BILLMEIR ON THE OUTLOOK

The second annual general meeting of the Stanhope Steamship Company Limited was held on May 6th in London. Mr J. A. Billmeir, CBE, FICS (the chairman), who presided, said:

The profit on ships trading after charging business expenses is £663,485 compared with £769,671 for the previous year. In the circumstances experienced in the year under review the directors feel that the company has done well to earn the profit now shown.

The ships have been fully employed for the whole of the year. Cargoes carried have amounted to 568,000 tons, of which bulk oils have accounted for at least 60 per cent.

As regards the future, it is quite impossible to make any forecast, but it can be said that we shipowners are going through a difficult period. The only favourable factor that can be discerned is that there is a certain feeling that the gradual freeing of commodity markets is opening up the possibility of movement which has hitherto been in check, and whilst it might be some time before such movement could be reflected by results, the shipping industry must be ready to play its part.

It is our policy to exert every endeavour to maintain our ships in full employment and top condition even in difficult and unfruitful times, so as to be in a position to take immediate advantage of any trend for the better in world affairs. The report was adopted and the dividend of 7½ per cent, less income tax, was approved.

EAGLE STAR INSURANCE

The annual general meeting of Eagle Star Insurance Company, Limited, will be held on May 28th in London.

The following summarises the statement by the chairman, Sir Brian Mountain, Bt, circulated with the 1953 accounts:

Life new business another record at over £56 million. Premiums now exceed £10 million with total Life Funds over £60 million. Net rate of interest increased to £4 0s. 1d. per cent. Current fund interim bonus was increased by 4s. per cent per annum from January 1, 1954.

Record fire premiums £3,321,504, and profit £396,000.

Accident premiums higher at £6,850,000 with profit of £253,000. Home Motor Account made progress, though damage claims cost rose against relative premiums. Overseas motor business was less unfavourable. Rate adjustment caused further improvement in home employers' liability results.

Marine net premiums were £1,776,864 and, after profit of £75,000 transferred, Fund was 109.92 per cent of premiums. Aviation department continued to develop.

Net investment income, at £488,540, was £65,000 higher. Trading transfers total £724,000 against £500,000 and balance for year was £515,973. £125,000 transferred to Fire Fund and £100,000 to Accident Fund as additional reserves. Final dividend 1s. 6d. making 5s. per share against 4s. 6d. £1,210,855 carried forward, an increase of £22,794.

Recent development has established company's operations on a wider and firmer basis than heretofore.

Premium income exceeds £22 million with assets exceeding £85 million.

CAMP BIRD, LIMITED

MR E. C. LEAMAN'S SPEECH

The fifty-second annual general meeting of Camp Bird, Limited, was held on May 4th in London.

Mr E. C. Leaman, who presided in the absence of the chairman, in the course of his speech said:

The profit and loss account shows a gross income for the year of £142,390, which is a reduction of £84,800 compared with the previous year. The reduction of our dividend income from base metal mining companies was greater than that shown in the accounts, but some of the deficiency was made up by receipts from other companies.

At the annual meeting last year the chairman gave warning that the full effect of the lower base metal prices might be felt in the year with which we are now dealing. We knew at that time that the Lake George Corporation had deferred consideration of its interim dividend, but it was not until later that we learned that no dividend was forthcoming in respect of that company's year to June 30, 1953.

Our holdings in gold and platinum mining companies in South Africa represent a very large proportion of our total investments.

It has become customary for the chairman to give what is described as the "break-up" value of our assets. At December 31st last this worked out at 18s. 1d. per share.

You may well ask me what of the future. If I were pressed on the point I should have to admit to a little pessimism about the immediate future, but with a prospect of ultimately realising better times.

The report was adopted.

PEARL

ASSURANCE COMPANY LIMITED

Chairman: **G. R. L. TILLEY, M.A., F.C.I.S.**

Points from the Annual Report and Balance Sheet for the year ending 31st December, 1953.

POLICYHOLDERS' FUNDS £203,686,072 **GROSS INCOME £42,090,994**

INVESTMENTS

The Assets show an increase of £7,859,869. The valuation of the investments taking Stock Exchange securities at middle market prices showed a comfortable margin compared with the values shown in the Balance Sheet after taking into account the Investments Reserve Funds.

LIFE BRANCHES

In the two Life Branches the total sums assured on new policies issued amounted to £49,760,330 compared with £47,010,518 for 1952 and the total sums assured and bonuses in force (including the Capital Redemption Fund) amounted to over £490 millions (an increase for the year of over £21 millions).

FIRE AND ACCIDENT

In this Branch the premium income was £7,103,716.

REVERSIONARY BONUSES

ORDINARY BRANCH—A reversionary bonus of **£1 16s. 0d.** per **£100** sum assured on United Kingdom policies entitled to participate in full profits.

INDUSTRIAL BRANCH—A sum of **£1,630,949** has been allocated to provide bonuses and other benefits to policyholders in the Industrial Branch making a total allocation up to date of **£22,528,017.**

CHIEF OFFICES: HIGH HOLBORN, LONDON, W.C.I.

THE EMPLOYERS' ASSURANCE

RECORD TRADING PROFIT

LORD COURTAULD-THOMSON'S REVIEW

The seventy-third annual general meeting of The Employers' Liability Assurance Corporation, Limited, will be held on May 26th in London.

The following is an extract from the statement by the chairman, the Rt Hon Lord Courtauld-Thomson, KBE, CB, circulated with the report and accounts for 1953:

On December 31st of this year, after thirty years as a director and twenty years as chairman, I propose to retire from the chairmanship of the Corporation, and it is the unanimous wish of the directors that Viscount Knollys should be invited to become chairman in my place. For many reasons the board would have been glad if Lord Knollys could have continued his notable and successful services as managing director. Lord Knollys, however, wishes to relinquish this post, to which he was first appointed twenty-one years ago, because he feels the time has come to facilitate promotion.

Amongst many other qualifications, he has very exceptional knowledge of the United States, where so much of our business lies, as well as of Canada and other business areas overseas, and the board are glad to feel that as an active chairman he will still be in a position to provide this experience and knowledge to a special degree, not least in maintaining contact with our overseas business by means of those personal visits which have been invaluable in the past.

We are glad to announce that it is the board's intention to appoint Mr C. E. Keysell chief executive officer of the Corporation with the title of general manager. With his fine record of service, his knowledge of our business overseas and his long co-operation with the managing director, we feel sure that Mr Keysell will prove successful in the highest degree.

LARGER PREMIUM INCOME

The combined premium income of our group of companies for 1953 was £27,664,156, an increase of £1,935,333 on that for 1952:

Fire	£2,590,511
Motor	10,239,014
Workmen's compensation	5,258,609
Other casualty	6,974,164
Marine	496,906
Life	2,104,952
	£27,664,156

The Corporation's own underwriting profit for the year was £915,828. Our share of the Life profits of the Clerical, Medical and General was £55,816, and the gross interest £849,851. After transferring £320,000 to the Staff Pension Account and charging sundry expenses of £43,386, there was a total trading profit of £1,458,109, the largest figure ever recorded by the Corporation. We have provided £885,891 for United Kingdom taxation, leaving our net profit at £572,218. With £750,667 brought forward from last year, we have available a total of £1,322,885. The directors have appropriated £250,000 to general reserve and recommend a final dividend of 3s. per share, making a total dividend for the year of 4s. 6d. per share, less income tax. This would cost £190,463 net, leaving the carry forward at £882,422, an increase of £131,755. The directors have approved the transfer of a further £500,000 from inner reserves to the general reserve, which now amounts to £4,250,000.

Having regard to the present strength of the reserves, the directors feel that the time has now come to pay up the uncalled capital of 15s. per share on the existing shares by capitalising £1,154,317 10s. from general reserve.

We are informing the shareholders of an issue of fresh capital which we are making. Apart from a small internal issue in 1928, the paid up capital, which is now £384,772, has not been changed since 1921. In this period its premium income has increased from £5,500,000 to almost £25 million per annum, and fresh capital is now desirable to enable the Corporation to continue even more actively its policy of world-wide development, particularly in fire business, to the full extent which its organisation is capable of in all other respects.

As the result of these operations the total issued share capital will be increased to £2 million, which, with the general reserve and carry forward, will then give a total of over £7,500,000.

DEPARTMENTAL FIGURES

We have continued our policy of the steady expansion of our fire business, and the premiums in this account again showed a considerable increase at £2,443,350, £338,825 higher than in 1952, with an underwriting profit of £119,266.

The premiums in the accident and general account have increased by £1,531,358 to £22,402,866, and the underwriting profit amounted to £796,562, compared with £233,171 a year ago. This welcome advance is due mainly to a more profitable experience in the United States, and to a very considerable improvement in the results from Canada, which has returned to its normal role as a source of steady profit.

Our associated Life office, the Clerical, Medical and General, continues to do well. Net new business for 1953, at £7,302,053, showed an increase of £583,933, and the annual premium income exceeded £2 million for the first time.

The results of our Marine subsidiary, The Merchants Marine, continue to be satisfactory. The net Marine premiums totalled £496,906 and the Marine Fund, at the end of the year, amounted to £698,568, or 140 per cent of the premium income.

INVESTMENTS

Total investments amounted to £32,579,590, an increase of £3,050,584. Their total market values at December 31, 1953, showed an even greater appreciation than last year over their total book values.

We were pleased to be able to announce, in September last, the appointment of Mr A. G. Stewart to a seat on the board. Mr Stewart is chairman of Stewarts and Lloyds Limited, president of the British Employers' Confederation and president-elect of the British Iron and Steel Federation.

We are very proud of the achievements of "The Employers" over the years, particularly because they have been largely accomplished through the splendid team-spirit of our executive management and staff throughout the world.

I am confident that Lord Knollys will make an ideal chairman, under whose leadership we can look forward to the future with hope and ample assurance.

ALLIANCE ASSURANCE COMPANY, LIMITED

CONTINUED PROGRESS

The annual general meeting of the Alliance Assurance Company, Limited, will be held on May 26th in London.

The following are points from the review of the report, accounts and balance sheets for the year 1953 by the chairman, Mr Anthony G. de Rothschild:

LIFE DEPARTMENT.—The net new sums assured completed during the year amounted to £8,532,922, compared with £7,911,269 in the previous year. The increase thus disclosed compares favourably with that of the offices generally.

The demand for immediate annuities remains small, the purchase money of £45,927 differing little from the 1952 figure of £43,546, but deferred annuities of £149,632 were issued, against £134,803 for the previous year.

The usual quinquennial valuation of the "Alliance" life and annuity funds as at December 31, 1953, revealed a surplus of £2,730,787, of which £1,918,648 was allotted to policyholders, in addition to interim bonuses of £216,872, which had already been paid during the quinquennium.

A compound reversionary bonus, at the rate of 36s. per cent per annum, was declared on participating policies issued in and after 1894.

FIRE DEPARTMENT.—The net premiums amounted to £5,875,913, an increase of £349,858 over those of 1952.

There was a small increase in the claims, which, with contributions to fire brigades, amounted to £2,044,971, being £26,790 more than those for the previous year.

The surplus for the year, after making provision for unexpired risks, amounts to £982,290, which has been transferred to the profit and loss account.

MARINE DEPARTMENT.—The net premium income amounted to £2,257,546, which is £316,072 less than that of the previous year.

The underwriting account for 1951 has now been closed, with a balance of £121,707, compared with the unusually high balance of £515,573 in the previous year. It was necessary to provide the sum of £195,878 for claims arising from previous years' accounts, so that in order to maintain the reserve for previous years at £425,000, the sum of £74,171 has been transferred from the profit and loss account.

ACCIDENT DEPARTMENT.—The net premiums amounted to £5,352,025, being an increase of £379,203 on the figures for 1952, and after providing for unexpired risks, surplus of £597,374 was transferred to the profit and loss account.

PROFIT AND LOSS ACCOUNT.—The profit of the group, after making provision for taxation and other outgoings, amounts to £1,299,463, which is slightly more than the previous year.

The following appropriations have been made:

£200,000 to the staff pension trust funds, of which £25,000 relates to the fund of a subsidiary company.

£22,000 to the widows' and orphans' fund.

£100,000 to the additional reserves in the fire insurance accounts of subsidiary companies.

£400,000 to the general reserve, which now stands at £3,650,000.

The board has decided to declare a dividend at the increased rate of 24s. per share.

BABCOCK & WILCOX

A SOUND AND PROGRESSIVE ENTERPRISE

MR W. LIONEL FRASER ON THE OUTLOOK

The fifty-fifth annual general meeting of Babcock & Wilcox Limited will be held on May 27th in London. The following are extracts from the circulated statement of the chairman, Mr W. Lionel Fraser, CMG:

In the prospectus which was published in October, 1953, in connection with the issue of £4 million 4½ per cent debenture stock, your directors said they considered that profits of the group, subject to UK taxation, and before setting aside to reserve additional depreciation to cover replacement values of fixed assets, should approximate to £4,500,000 and in the accounts now presented this forecast was exceeded by nearly £150,000. After setting aside sums for depreciation, providing for UK taxation and making other necessary adjustments, the balance standing to the credit of the consolidated profit and loss account is £1,571,273. Your directors now recommend that a final dividend of 7 per cent be paid on the ordinary stock, absorbing £289,689, making the equivalent of 12 per cent for the year on the increased capital, which is equal to 18 per cent on the ordinary stock as it stood before the recent one-for-two scrip issue.

The whole of the discount and expenses on the issue of the debenture stock having been written off in the accounts, your board further recommend that the sum of £150,000 be transferred to general reserve which, together with amounts placed to reserve in the accounts of the subsidiary companies and subject to the transfers from the reserve accounts made at the time of the scrip issue of ordinary stock, results in a new total of £5,431,749 for general reserves. It is also recommended that the sum of £100,000 be transferred to special research and development reserve.

At the time of the issue of debenture stock your directors considered the moment opportune to bring the ordinary share capital of your company more into line with the assets. The accounts reflect the changes approved by the stockholders, which took the form of the creation of 2,500,000 new ordinary shares of £1 and the issue to ordinary stockholders of 2,508,133 ordinary shares of £1 each credited as fully paid up by way of capitalisation of reserves on the basis of one share for every £2 stock held.

BANK OVERDRAFT AND INCREASED COSTS

Reference has been made in my previous statements to the considerable expansion of output in the postwar years, both at home and overseas, which, during a period of continued inflation, necessitated heavy inroads on the company's financial resources. During 1953, higher costs, resulting from increases in wages and in the prices of raw materials, further accentuated this situation and, in consequence, the bank overdraft mounted during the year. Your directors therefore thought it advisable to fund part of the bank borrowings, and an issue of £4,000,000 4½ per cent debenture stock 1980 was made on October 2, 1953. It was an outstanding success and showed the confidence felt in your company's status and prospects, both by stockholders and employees who were given priority of allotment, and by investors generally. In spite of the new issue, the total bank overdraft of the group at the end of the financial year was approximately £3,400,000, and I cannot see the end of the inflationary conditions which were the main reason for additional cash requirements.

Indeed, in my opinion, we shall be fortunate if the recent increases in wages, especially in the nationalised industries which contribute comparatively little to export business, but vitally affect export costs, do not presage a period of further inflation.

Employers in the heavy engineering industry are anxious to give their employees a just return for their labours, but at the same time the principal objective of employers must be to maintain a satisfactory order book and so to ensure full employment in future years. Both these endeavours will be in serious jeopardy if higher wages are not recompensed by extra effort, and we all know that, if our national exports fall away, this country will once again be faced with a most critical and dangerous situation.

It is relevant to point out at this stage that the sum expended in re-equipping and modernising your works during the last six years, together with those of your subsidiary companies in this country and overseas, has almost reached the figure of £7 million.

I am pleased to announce that, jointly with the Department of Atomic Energy, your company has designed the steam-raising plant for the first atomic power station in this country, and has been entrusted with the manufacture and construction of the plant to be erected at Calder Hall, Cumberland.

GENERAL REVIEW AND PROSPECTS

What of your company and its future? I affirm that, provided conditions beyond our control do not intervene, there is good reason to feel hopeful. In seeking to assess the prospects, various considerations naturally come into one's mind. On the one hand, we have many favourable factors: an encouraging order book, if being overtaken a little; modern plant and machinery; better production, which will ensure speedier delivery; team work, and a wealth of skill and engineering ability, of which we are rightly proud.

On the other hand, there is an underlying anxiety in British industry generally that rising costs and an unreal wage level may upset all carefully laid plans by reducing competitive power, and the margin of profit which is so necessary for capital replenishment. Vast sums of money may be disbursed on the provision of highly developed machines, but they cannot ensure greater and more economic production unless the industry and best efforts of all concerned are forthcoming.

On this my comment is that past experience gives assurance that those efforts will be achieved in your own company. Needless to say, your directors, on their part, will do all they can to support and encourage the progressive and enterprising spirit which exists in your company and without which it cannot continue to go forward. As to margins of profit, it must be emphasised that in our own case they are very modest. In fact, it is not too much to say that, with all the hazards and complications of a world-wide heavy engineering business, it would be very difficult satisfactorily to conduct the affairs of your company on any smaller profit margin.

We must expect that times will be testing and that new business will have to be fought for and, with more intense competition, may well be on a lower level. However, the whole organisation is keyed for further progress and your directors remain confident and optimistic, knowing that your company is strong and very much on the alert.

THE TELEGRAPH CONDENSER COMPANY

FACTORIES FULLY EMPLOYED

The twenty-first annual general meeting of The Telegraph Condenser Company, Limited, was held on May 6th in London, Mr P. V. Hunter, CBE, Hon MIEE (the chairman), presiding.

The following is an extract from his circulated statement:

The profit on trading for 1953 was £460,897. The reduction in profit for the year, amounting to some £47,000, has been more than offset by materially reduced taxation liabilities.

As a consequence, the net profit available for distribution has been substantially increased for the year under review and, taking into account the company's satisfactory cash position, your directors have felt fully justified in recommending payment of a cash bonus of 10 per cent, in addition to a final dividend of 15 per cent on ordinary capital, both subject to income tax at the current rate.

Throughout the year both the company's factories have been fully employed. During the latter part of 1953 and up to the present time they have been working to capacity, due to renewed demand for the enormous range of fixed electrical capacitors in which your company specialises.

Turnover was slightly lower than the record figure reached in 1952. Volumetrically, however, our output was somewhat greater, but the fierce competition within the industry, which forced down the selling prices of many products, prevented the increased output being reflected in the value of net sales. This trend would appear likely to continue.

Export turnover was remarkably well maintained during 1953, and it is particularly pleasing to note that the company achieved a marked increase in sales to hard currency countries. Increased competition may, however, lead to some reduction in export business in 1954.

Our order book, which shrank considerably during 1952 and the first three-quarters of 1953, has improved materially in recent months.

It is exceedingly difficult to forecast whether or not this demand will be maintained throughout the year. I can only say that, at present, incoming inquiries and orders are being received at a satisfactory level and express the hope that the electronic industry, which we have supplied with components for so many years, will not experience any setbacks in the coming months.

CAPITAL STRUCTURE

Your directors consider that the issued capital should be increased to bring it more into line with the capital employed in the business and you are being asked to approve a resolution to increase the authorised capital to £880,000 by the creation of 600,000 new ordinary shares of 10s. each.

Your directors propose that £300,000 of the company's undivided profits at present standing to the credit of the general reserve account should be capitalised and applied in paying up in full 600,000 ordinary shares of 10s. each which would be issued credited as fully paid to existing ordinary shareholders in the proportion of one new share for each existing share held by them.

The report and accounts were adopted and the board's capitalisation and bonus issue proposals were sanctioned.

BRITISH ALUMINIUM COMPANY, LIMITED

LOWER PRICES AND HIGHER COSTS

The annual general meeting of The British Aluminium Company, Limited, was held on May 4th in London, The Rt Hon Viscount Portal of Hungerford, KG, chairman, presiding.

The chairman, in the course of his speech, said: The consolidated income for the year after tax amounted to £409,699, which compared with £684,999 for the previous year.

Last year I explained the reasons for the recession in our business then current, and these conditions have persisted throughout the year. Our semi-manufactured products have on average realised lower prices, and we have had to absorb a variety of increased costs over which we have no control, notably those for electricity, coal and transport.

It must not be forgotten that abnormal expansion took place in our industry during the war years, and we have since benefited by shortages of other materials which are now in free supply. It was therefore inevitable that at some point there should be a readjustment, accompanied by a contraction in trade.

On the whole, the world aluminium consumption is extremely buoyant. In 1953 several of the large aluminium plants built in the United States under the stimulus of the Korean War, and with very favourable financing came into production. United States production, already large, has virtually doubled since 1945. In a relatively few years these new plants will be largely amortised by favourable taxation concessions so that their cost should stand in the balance sheet at a low figure.

FUTURE PRICE UNCERTAINTY

One of our greatest difficulties has been the feeling of uncertainty as to future price trends. An inevitable result of this has been short-term purchasing of our products which caused planning difficulties in our rolling mills and a serious increase in production costs. The actual falling off in tonnage of metal sold is not very considerable, but, as has been pointed out more than once in our annual addresses, a relatively small falling off in the volume of business can produce an entirely disproportionate reduction in our profit margins.

It is difficult to make forecasts for the near future. Demand in the home market has improved, but the prospects in export markets are still obscure. So far as the long-term position is concerned, we have the greatest confidence.

Coming to the accounts, the total manufacturing and trading profit for the year amounts to £882,117, which is £1,578,874 less than the comparative figure for the previous year. If, however, you compare the total consolidated profit after taxation for the two years the adverse difference is reduced to £275,300, the net amount for this year being £409,699.

That a reduction in gross profit exceeding £1½ million makes a difference to net profit of only £275,000 is to some extent accounted for by tax adjustments in respect of previous years. Nevertheless, it affords a striking illustration of how taxation, which penalises success so heavily, can appear to alleviate the consequences of adversity in a year when much smaller profits have been earned.

We recommend a final dividend of six per cent on the ordinary stock, which, with the four per cent already paid, makes 10 per cent, less tax, for the year.

The report and accounts were adopted.

INSTITUTE OF CHARTERED ACCOUNTANTS

ANNUAL MEETING

The seventy-third annual meeting of the Institute of Chartered Accountants in England and Wales was held on May 5th in London.

Mr James Blakey, FCA, the president, in the course of his address referred to the proper use of accounts. He said that the duties of public accountants brought them into close contact with the whole range of business activities on which the national prosperity depended.

"Company accounts," he said, "are essentially stewardship accounts for the information of the shareholders." They might be more complex than those prepared under earlier Acts than the 1948 *Companies* Act, but they were much more informative. "Unfortunately, this desirable development encouraged attempts to make company accounts serve purposes for which they were not intended.

"We must see that the accounts we prepare or audit are 'true and fair' to the shareholders and this is unlikely to be what the economist would regard as 'true and fair' for his purposes. We cannot in my view satisfy the shareholders and the economist with the same document."

He referred to Recommendation XV issued by the Council of the Institute on "historical costs," saying: "We have every reason to believe that this recommendation is acceptable to the great majority of the Institute's members."

The president said that much controversy resulted from not recognising that useful conclusions could not be drawn by merely glancing only at the profit figures. "In politics and industrial relations," he said, "there is a regrettable tendency to use accounts to make 'party points' which no accountant would accept as proper conclusions to draw from the accounts."

SUPPLEMENTARY STATEMENTS

The President then referred to the need for statements supplementary to the accounts required by the Companies Act. He said: "Members of the Institute would therefore render an invaluable public service by urging the publication of supplementary statements for the benefit of employees, politicians, economists and, of course, shareholders.

"There is endless scope for issuing informative statements of this kind, but they will not strike home if they are not in the simplest possible form or if they are presented in pictorial fashion with too many trimmings and too much colour. No large figures, which are often incomprehensible, should be used, but rather a unit of £1 of product, divisible in shillings and pence between labour, materials, expenses, taxation, reserves and dividends."

He stressed the inter-relationship between labour and the shareholder and urged that statements be published showing the amount of capital assets involved in a business divided by the number of workers to give some idea of the expensive tools required to enable each worker to earn his wages.

Mr Blakey said of misconceptions about profits: "Nowadays most individual shareholdings are small and the holders far from wealthy. I regard it is a national tragedy that so much time and energy are put into this postwar haggling about dividends and profits."

BLAW KNOX LIMITED

SATISFACTORY LEVEL OF NEW ORDERS

The annual general meeting of Blaw Knox Limited was held on May 6th in London.

The following is an extract from Sir Geoffrey Burton's circulated statement:

The profit for the year, after providing for taxation, amounts to £182,838. Our trading profit is approximately the same as last year but there has been a net reduction in the provision for taxation.

On the construction machinery side of our business the volume of new orders booked in all departments was maintained at a satisfactory level, especially considering the more difficult trading conditions, and our carry-forward of uncompleted business is substantial. While this is an encouraging overall factor, it should be realised that the maintenance of a consistent level of production in all departments is essential, and in the more difficult trading conditions we are now experiencing, great efforts will need to be made to continue to secure an adequate flow of new orders.

Production in our Watford and Rochester works was well maintained, but higher production costs and the need to reduce selling prices in face of keen competition, resulted in a lower overall profit margin.

In present circumstances it is hazardous to assess the forward trends; there is unquestionably a reduced demand for the products of the company. Competition is formidable but considering the range and quality of the company's products and their wide acceptance throughout the world, I am confident of the ability and keenness of our organisation to measure up to the sterner trading conditions. The Tower department has had a satisfactory year. In addition to important orders from the British Electricity Authority and the North of Scotland Hydro Electricity Board we have secured orders for delivery to many parts of the world, including South Africa, India, British Borneo, the Gold Coast, Norway and Bahrein Island in the Persian Gulf.

Steel supplies were more satisfactory which enabled us to effect substantial deliveries during the year. The unfilled order position of this department remains satisfactory.

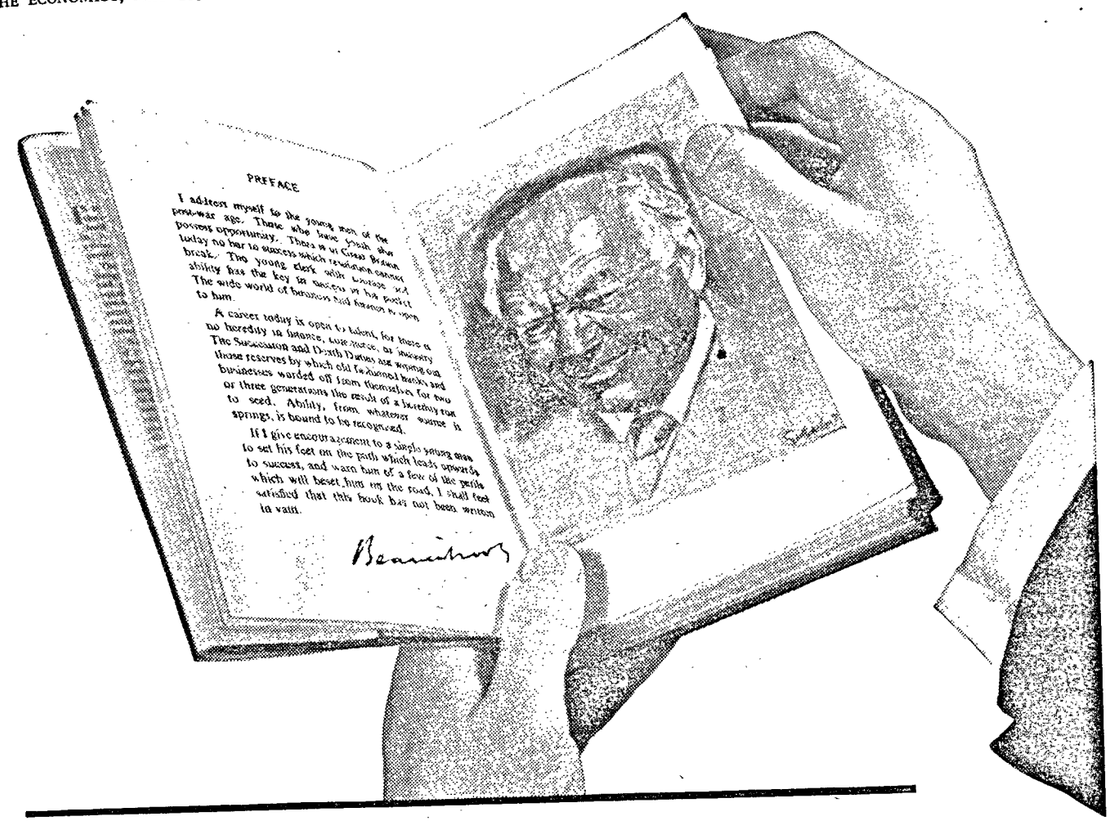
Mr Cordes Snyder, the chief executive of our associated company in the United States, which has a substantial financial interest in this company, paid us a visit during the year. The friendliest association and the closest co-operation exists between the two companies, and these exchanges of visits are of the greatest advantage to both companies.

CAPITALISATION PROPOSALS

You will recollect that in March, 1951, part of the unappropriated profit, amounting to £49,068, was capitalised and applied in paying up and issuing ordinary shares in the company. Subject to the passing of the necessary resolution, we propose repeating this procedure, and an extraordinary general meeting will be held immediately on the conclusion of the annual general meeting to give effect to the capitalisation of £49,111 of the unappropriated profit. It is my view that the issued share capital should bear a proper relation to the actual capital employed in the business, and the board's proposal is a further step along that road.

The report was adopted and the final dividend of 20 per cent, making 30 per cent, less tax, for the year, was approved.

At the subsequent extraordinary general meeting the board's capitalisation proposals were sanctioned.



If you want to know how to succeed read Lord Beaverbrook's "DON'T TRUST TO LUCK".

It is his advice to every ambitious man who wants to get to the top—the lessons Lord Beaverbrook has learned in a life of great achievement.

"DON'T TRUST TO LUCK" is the development and extension of a book called "Success" which was a best-seller in 1922.

Lord Beaverbrook writes of the money-making brain . . . the lessons of improvisation on the road to success . . . how to clinch a bargain and of learning to speak in public.

He tells how fear can be conquered . . . how to be happy . . . he tells of waiting until you are fired rather than resigning from your job!

No ambitious man can fail to profit by reading "DON'T TRUST TO LUCK". It will be a guide and an inspiration.

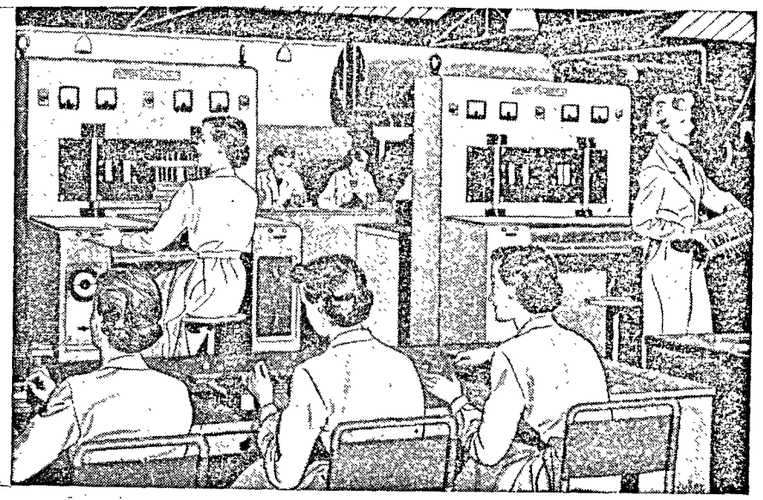
ENGLISH ELECTRIC

Electronics bring to industry benefits often as revolutionary as those created by the advent of machinery. Applied by ENGLISH ELECTRIC, electronics dramatically increase output, improve production techniques and product performance and so contribute to full employment and competitive prices. One of many examples, applicable to many kinds of factories, is the ENGLISH ELECTRIC electronic heater for metals, here illustrated at work.



bringing you

For the housewife too, ENGLISH ELECTRIC helps to make life easier in countless ways every day. It may be indirectly by enabling other manufacturers to produce more goods at more favourable prices; or it may be directly by helping to supply homes both with electricity *and* with the domestic appliances that make the best use of it. Either way ENGLISH ELECTRIC means happier homes and better living for millions of people the world over.

Queen Beyond the Seas

THE people of London will recognise the magnificence, but perhaps not the significance, of the occasion as they gather in the streets today to welcome the Queen back home. They will know and show that they are celebrating the heart-stirring final act of a triumphant progress round the world. But they may not know, indeed there would probably be a rather jealous note in their cheering if they did, that they may also be rounding off a journey into a new and thought-provoking phase in Commonwealth relations.

The world tour that ends today has differed from all previous manifestations of the Crown as a cohesive power in the deliberateness of its purpose and the breadth of its scope. In these last six months the rallying magic of royalty has been swept, like some majestic zip-fastener, round an astonishing ring of the Queen's realms and into the midst of half a dozen different sorts of national pride—a pride that was fierce because it is still struggling and rather uncertain in the West Indies, that was fiercer because it is established and rather cocksure in Australasia, that was fiercest because it is young and rather jealous in Ceylon, and that was defensive because it is troubled and has been recently hurt in Uganda. And in each case the aim of greater cohesion has been achieved. In each case, the sight of the Queen and her consort—representative at once of youth and of tradition, of the link with Britain or of new and recognised independence from it, of the unity of the Queen's realms and of their diversity—has given national pride a firmer local foundation and yet bound it more securely into the fabric of a supranational Commonwealth. As a result, while most people may remember the tour merely as a stirring pageant, the statesmen are marking it down as something more; they are marking it down as a repeatable constitutional success.

For this reason there will be pressure for more of these tours, many more of them, in the years to come. The Crown is now confirmed as the most precious crucible of Commonwealth; and, as the need for fusion within the family becomes more obvious, there is going to be a temptation for statesmen to work it cruelly hard. The task of fusion should not be underrated; the manifest economic and political advantages—to all members—of the Commonwealth connection should not be allowed to obscure the problems of race and trigger-quick sensitiveness that colonialism has sometimes quite naturally left in its wake. In these next few years all the forces of calculated self-interest should tend to keep the Commonwealth together; but most of the forces of uncalculated emotionalism—perhaps all save those that happen to be most happily reactivated as the Queen rides through the streets—may tend to pull it slowly apart. The prescription statesmen will want to adopt in these circumstances is plain. Let the Queen ride frequently forth amid the cheering of her peoples, so that the union of Commonwealth may thrive.

This is an attractive prescription—at any rate for those who do the cheering—but it carries two problems with it. The first is constitu-

tional. If and while the Queen is riding forth on more frequent and lengthy visits to her peoples overseas she cannot also fulfil the functions that are her constitutional prerogative in the United Kingdom itself. The second is personal. If periodical progresses through the dominions are to be added to the Queen's other duties, then sovereignty is going to become more than a human size job.

★

The constitutional problem should not be insoluble. Where her Majesty's functions in the United Kingdom are ceremonial or uncontroversially administrative, the country is fortunate that other members of her family are so well fitted to perform them while she is away. In so far as the supreme task of sovereignty is to be on hand to resolve sudden constitutional crises, there might be more danger in intermittent absences of the nation's undoubted Queen; for example, one shudders to think of the complications that might have arisen if the awkward decision so rightly taken by King George V in 1931 had had to be taken, equally rightly, by some distinguished *locum tenens*, such as the Queen's consort. But, in these days of air travel and cable communication, it is legitimate to recall that crises do not usually occur as suddenly as all that.

The personal problem that would arise from an increase in the Crown's role within the Commonwealth is more serious; and although any change in that role can only be gradual, the dominions and Britain should start thinking now about the ways in which the strain on the Queen might be eased. There seem to be two avenues that should be explored. First, if these progresses through the dominions are to become more frequent, they obviously must not be piled insouciantly on top of the other duties of sovereignty. They must be very carefully planned instead. After this first and inevitably rushed cavalcade, when the object has rightly been to let as many people see their Queen in as short a time as possible, future progresses should surely be taken at a more leisurely pace. The Queen should not be expected to shake as many hands in three days in Australia as she would shake in three months in Britain; she should spend three months in Australia instead, and reside there rather than travel. This general rule—that extended parades before her overseas peoples should involve fairly lengthy residence with them—need not debar shorter visits for specific ceremonies. But let these be really specific and short. When the Queen drives in state to open her Parliament in Westminster, she does not combine the occasion with a lunch at Westminster City Hall on the way; if, as in the long run seems likely, she may also fly more frequently to open her other Parliaments overseas, such ceremonies should not be greedily merged into tiring and nationwide carnivals.

But it is the second way in which the strain on the Queen might be eased that deserves most attention today: the possibility of lightening her duties in Britain itself. This country is in a privileged position; Her Majesty serves here not only as Queen but, in a sense, as her own Governor General as well. This is a privilege which it is unthinkable that Britain should ever forgo. But there is reason to believe that some of the routine duties that are attached to her office have their root not so much in traditions which it would be harmful to destroy, as in historical accidents which nobody has bothered to alter. The routine duties of the Sovereign are extraordinarily ill-defined; and the public knows very little of the real constitutional role (and constitutional limitations) of the private secretary and his subordinate administrative staff at the palace. It would be a mistake to be too precise in such definitions; the magic of Monarchy and the rude efficiency of Organisation and Methods Research will fortunately never mix. But those in close attendance on the Queen presumably know what duties Her Majesty could delegate without harm to the structure of government; and now is the time to make sure that the machinery that could bring such delegation into effect is kept under constant survey.

★

There are, in short, three contrary dangers in the present situation. The first is that Britain, as it becomes dimly aware of the need for sharing the services and symbolism of the Crown more widely with the Commonwealth, may jealously resist all change; that way lies the abandonment of imperial responsibility. The second is that, as the need becomes more obvious, Britain may thoughtlessly tend to pile these new duties on top of the Queen's present load; that way lies impossible strain on the person of Her Majesty. The third is that, after an unwilling and clumsy start, an effort might be made to be too precise about the division of an office which owes its continuing strength and adaptibility precisely to imprecision; all that need be said is that this danger is not manifest yet. Clearly, however, there is need of the British genius for improvisation and compromise, in a field where that genius has always hitherto been in fullest flower.

But if there is to be compromise, it is the United Kingdom itself which must make the first sacrifice to secure it. Let the country understand that the lady who comes home today is Elizabeth the Second, by the Grace of God Queen not only of Great Britair and Northern Ireland, but of Australia, Canada, South Africa, New Zealand, Ceylon and her other realms and territories, Head of the Commonwealth, Defender of the Faith. Let the bells, the bands, the saluting cannonade ring over London with no note of jealous possessiveness, no claim that the capital is taking back to itself a priceless possession that has been on loan. Let this country recognise its responsibility in its rejoicing, let it listen to the call which it sent out itself six months ago; for it is the other Commonwealth countries which have a right to ask of Britain today that we should not overwork their Queen.

Bluff and Reality at Geneva

IT is a wretched convention of public diplomacy as now practised that opposing sides at a conference begin negotiation by asking, respectively, for the moon and the earth. At Geneva M. Bidault has asked for the moon, by presenting the Viet Minh with stiff terms for a truce on the morrow of defeat at Dien Bien Phu, and following a statement by General Navarre that France can no longer fight such battles alone. Pham Van Dong, from his side, has asked for the earth by offering terms that would mean, sooner or later, the elimination of French influence in all three states of Vietnam, Laos and Cambodia, and their subjection to Communist control. If he had his way, Indo-China could become for China what Poland has become for Soviet Russia. It has still to be seen whether either spokesmen will show more flexibility and desire for compromise. It seems unlikely.

The Viet Minh representative has behind him the resolute and solid backing of the Russians and Chinese. Whereas M. Bidault, with Washington searching for a policy and the House of Commons turning pale at the thought of a fresh British commitment, is negotiating from weakness because he and his allies did not find in the last five years ways of creating in Indo-China a situation of political and military strength. His predicament will recur unless the issues underlying the daily news from Geneva are held steadily in mind. For we must be prepared, so far as truce terms for Indo-China are concerned, for another Panmunjom, with fighting and talking going on simultaneously. And it was during Panmunjom that so many people, bored and befuddled by the long wrangling of the generals, forgot that there were principles at stake in Korea, as there will be in Indo-China.

★

The idea is gaining ground that there can be found at Geneva, through the agility and industry of Mr Eden as mediator, some compromise between the extreme western view that there must be more Asian Verduns (with France's allies helping) and the extreme eastern view (expressed by Chou En-lai) that all western positions in Asia must be liquidated. Opinion is beginning to crystallise around the hope that there can be a pause for peacemaking in Indo-China similar to the pause in Korea, that a cease-fire line can be drawn between the areas of northern Indo-China where the Communist writ runs and those where it does not. And already the view is expressed that if such a line were to become the frontier between Vietnam and Viet Minh it would be unnecessary for the Americans and the British to decide whether they could check the offensive of the Viet Minh army. Whatever may be said about the possibilities of negotiating on the basis of partition—and it is early days to judge—it is clear that the belief that diplomacy can somehow spare the American Congress and the British Parliament a strategic decision in South East Asia is dangerous and false.

At the moment three alternatives seem to present themselves. One is that a truce is arranged approximately on French terms (they are given with the Viet Minh terms in detail on page 547) which through the disbanding of Communist guerrilla forces and the concentration of regular forces on both sides of a line, would deprive the Viet Minh of important military advantages. Such an arrangement is unlikely unless someone can convince the Communist team at Geneva that the alternative to accepting these terms is continued fighting, with allied intervention giving General Navarre the support he has publicly demanded. If that card is to be played it must have Anglo-American backing. And if the terms were accepted Britain, the United States and other interested powers would have to be ready to enforce their observance.

★

Another alternative is that something like the eight-point terms of Mr Dong should be accepted. Skilfully though these are worded, and reasonable though they may seem to those who have forgotten the Communist meanings of phrases like "free elections" and "unified governments," they open the way to a train of events that would engulf the opponents of Communism in Vietnam, Laos and Cambodia in the way that they were engulfed six years ago in Czechoslovakia. If there were a real intention of preventing such a tragic outcome American and British policy would have to be ready with means as well as words.

A third alternative—though it is one that nobody has formally proposed—is to partition Vietnam, leaving a victorious Ho Chi-minh ruling a buffer state between China and the three southern states. Those states, even if French forces remained, would be vulnerable to political and military pressure from a movement that presents itself as representing national feeling throughout Indo-China. If they were given complete independence by a French withdrawal it would still be somebody's responsibility to see that these free Asian states did not live in fear of another Korea.

There may be other alternatives, yet to be revealed by negotiation at Geneva, by the fertile mind of Mr Nehru or by the hints of Mr Molotov. But in one way or another they are bound all to raise the same questions: Who will fight, if necessary, to maintain the freedom of these three states? Who will demonstrate to Asia that "liberation" is possible without Communist support followed by Communist domination? Who will insist that the power of the Chinese

state shall come no closer to Burma, Malaya and Siam? From Dien Bien Phu to Bangkok and Rangoon is less than 600 miles—the distance from Prague to Paris.

Merely to say that a stand will be made at sometime or other is not sufficient. The bluff has been tried by Mr Dulles and it has ceased to work. It is likewise obvious that neither the United States nor Britain is prepared at present to promise or plan military action on its own. In neither country has public opinion been prepared for such a contingency. It is for such reasons —some of them good and some of them bad—that such hopes have been pinned to a pact from which might spring a defence organisation for South East Asia. For a pact has this advantage in a foreign minister's eyes: that in a crisis public opinion faces the question: Do we or do we not honour our word? It is not necessary for parliament and people to consider, more or less at pistol point, whether their vital interests are involved or not. A defence organisation has this advantage, that it will have plans for meeting the military commitment that can be put rapidly into effect. It is not necessary for the chairman of the American Chiefs of Staff to fly to London in order to argue with his British colleagues about the effectiveness of carrier-borne aircraft against land forces. It is these things above all that the North Atlantic Treaty and Nato itself have achieved for the security of Europe: military readiness based on political resolution and a clear conscience.

Is any such thing possible in South East Asia? Between the non-Asian nations, perhaps; that is to say, between the United States, Britain, France, Australia, New Zealand. For they have long been consulting among themselves about the danger they now face, but without (as our Washington Correspondent points out on page 533) taking firm decisions about what they would do. But which Asian governments would join fully and resolutely in such an arrangement, in the kind of Seato that has been discussed? Siam, almost certainly. The Philippines perhaps. Burma, almost certainly not. And even if those nations could be counted in, they would not represent either politically or militarily a considerable weight. To have real prestige, to achieve the scope and political stature of Nato, this Asian organisation would have to include India and, if possible, Pakistan. To put the dilemma in its crudest terms: a white man's Seato would be an effective fighting body, but it would not be an effective political body. And military resistance must have a firm political basis.

But here the dilemma becomes insoluble without India's co-operation. If there is to be a Seato with teeth in it (teeth like Nato's) it is almost certain that India and those governments that followed Mr Nehru's lead at the recent Colombo conference of South East Asian nations will not join it. If Seato is to have few or no teeth, then Asian nations might be persuaded to associate themselves with it, but rather in the manner that Burma hovers on the fringes of the Commonwealth. There would be a certain friendship, a certain community of interests, and a certain community of fear—that is all. It would be better than nothing; it might even make China and the Vietminh pause to think. But it would not have the power or the will to do what the United Nations did in Korea. And it is still not clear how South East Asia can be preserved from Communist domination unless at some point that power and that will are exercised.

The Frontier in Palestine

MAY is the month of harvest in Palestine, and reapers are at work on both sides of the border-line between Jew and Arab. Annually, harvest is a classic time of "incidents," when hungry Arabs trespass after extra sheaves and Jewish guards are too quick on the trigger at sight of farmers gathering the last ounce nearer than usual to the frontier line. This year, tempers are especially high because the UN machinery for compromise and settlement is out of order.

Jordan, backed by its fellow Arabs, has spurned the Secretary-General's invitation to talks held under Article XII of the Armistice Agreement. Israel which, in the words of its own best newspaper last week, "sees an enemy in everyone who does not identify himself with our attitude," has boycotted the Israel-Jordan Mixed Armistice Commission ever since that body returned a verdict of "not proven" against Jordan in the case of the Scorpion Pass bus murders of March 17th. Meantime, a futile discussion on the problem as a whole is moving at a snail's pace in the Security Council. The best that can be said of the proceedings there is that the Arabs, whose mouthpiece is Lebanon, have not walked out of the debate as they threatened to do. The worst is that no good can come of all the talk because both Jew and Arab have long ceased to think it important or binding, and because too few of those engaged in it are in a position to implement their words by action. Practically speaking, the main deterrents to fighting on the frontier are Jewish fear of losing American aid, British influence in Jordan, and the Anglo-Franco-American Declaration of May, 1950, which proclaimed the great powers' "unalterable opposition" to any violation of frontier or armistice lines.

Lately, there has arisen a new difficulty to prevent the western powers from wielding these deterrents as effectively as they hoped to do. Two aspects of their policy that used to be compatible now clash. Their two major objectives in the Middle East are to build up a common

front of defence against Russia and to bring about a permanent settlement in Palestine. At first glance, the aims would seem to dovetail: peace in Palestine ought to produce security behind their anti-Soviet front-line. But, not long ago, their original pattern of defence in the cold war collapsed and had to be adjusted. They were getting nowhere with their idea of a Middle East Defence Organisation, in which they were to lease bases from willing allies, and they therefore swung into an alternative course. The United States government began offering unconditional sale of arms to western Asians whom they thought likely to resist Russian aggression.

★

The new system was inaugurated in February with the American agreement to supply arms to Pakistan, and was in April extended to Iraq. Both these states have rich assets to defend, live at no distance from the Soviet border, and are aware of the threat of Soviet expansion in Asia. But when unconditional American military aid to Iraq was welcomed by the other Arab states (as it was by all except Egypt) and when it is extended, as is now likely, to Lebanon and Saudi Arabia, it is the new access of strength against Israel rather than the increased security against Russia that Arabs welcome. Therefore the western powers, when they give such aid, run the risk of undoing with their left hand the good they have done themselves with their right. Their action frightens Israel, and it encourages many Arabs, who see the world only in terms of black and white, to reason that America has "changed sides" and that they can, therefore, afford to be more intransigent about Israel. Thus a piece of American policy that is sound in its general Asian context serves to heighten tension in one locality.

The western allies are not the only people whose actions in Palestine are at cross purposes. The Arabs used to be able to maintain a simple theme, which was antagonism to western "imperialism" and to its product, Israel. But some of them, notably Iraq but also Nasser's Egypt, are simultaneously fearful of Communism. Anti-Communism and anti-westernism are an ill-matched pair of concepts, and there is evidence that some Arabs are beginning to see this, to rouse themselves from six years of make-believe that Israel does not exist, and to recognise the far greater menace to independence that is at work in South-eastern Asia.

Clear-sighted Iraqis are in no doubt on the point. For old time's sake, they cannot plump, as Pakistan has done, for alliance with Turkey, but they now know that they must rate defence of their oil as more important than dreams of crushing Israel. Even broadcasts and speeches from Egypt—which until the Canal Zone question is settled is bound to regard the "struggle against imperialism" as its highest priority—are at sixes and sevens between the themes of "anti-Communism" and "anti-imperialism." At Arab League meetings, schemes against Israel still have priority; but at the Moslem or western Asian conference, now proposed by Sir Zafrullah Khan, the wider view is bound to intrude.

For economic and financial reasons Israel needs peace far more than does any Arab state except Jordan. Logically, therefore, a moment when Arab thoughts on priorities are faltering would seem to be one at which to refrain from exacerbating the conflict on the frontier. But unfortunately Israel, too, is torn by conflicting counsels. It has been living on its nerves for six years; its homes are never free from night fears of forays by hungry, armed Arabs. Opinion there now consists of a smaller group of sober-heads, led by Mr Sharett, who think that American support is its least expendable asset and that it had best try for the peace it wants by peaceful means, and of a larger group, fathered by Mr Ben Gurion, that thinks grenades and mortar fire are the only language that Arabs understand. Army attacks on villages, such as those on Qibya in October and Nahalin in March, are the product of this latter train of thought; they are perpetrated by young men maddened by the insecurity in which their folks dwell, but who live in a box, and hear few or no rumblings from the outside world except the sabre rattlings of the Arab League. The average Israeli today is totally unaware that, since Iraq became wealthy and has oil to defend against plans laid in Moscow, he has a chance of sinking to second place on its list of potential adversaries.

★

Greatly though both Israel and Jordan need peace, there is not the slightest sign that either is capable of stretching forth an unarmed hand. If tempers are to abate, they must be damped through measures taken by third parties. Naturally, Soviet Russia is interested in keeping them high, and has given Mr Vyshinsky instructions to keep the pot boiling in the Security Council; but there are signs that both Foreign Office and State Department see the need for other action. Both have spoken up; Mr Eden, answering a question in the House of Commons on March 30th, gave a timely reminder that the Anglo-Jordanian alliance is not a blank cheque, but a promise of help in war "subject to the duty of the parties to seek peaceful settlement of their disputes." On April 9th Mr Byroade of the State Department, speaking at Dayton, Ohio, was categorical in a broader context:—

> To the Israelis, I say they should drop the attitude of the conqueror and the conviction that force and a policy of retaliatory killings is the only policy that their neighbours will understand. . . .
>
> To the Arabs, I say you should accept this state of Israel as an accomplished fact. I say further that you are deliberately attempting to maintain a state of affairs delicately suspended between peace and war—while at present desiring neither. This is a most dangerous policy —and one which world opinion will increasingly condemn if you continue to resist any move to obtain at least a less dangerous *modus vivendi* with your neighbour.

(Ill advisedly, he last week undid much of his own

good work by uttering some much less warrantable criticisms of Israel to an ill-chosen audience of anti-Zionist Jews in Philadelphia.)

But—as experience under the mandate proved—words, however stern, have never been enough to keep Jew and Arab apart when tempers are on edge. Nor—as UN experience is proving now—are corps of unarmed observers any more successful at the job. However great their numbers, they reach the spot only after the blood has been spilt. To supply armed international police is more than the average UN member is ready to pay for upholding his partition verdict. The three western powers, if they want to prove their "unalterable opposition" to solutions won by fighting, as well as to mitigate the unfortunate effects in Palestine of their policy of selling arms to free Asia, need to devise some robot method of keeping the marauders of both sides away from the line.

They have to weigh, for example, such ideas as an electric fence of lethal voltage, arc- and neon-lit. Of course, such a step would arouse furious protest from all those who prefer to keep matters fluid on the chance of a coup that would work out to their advantage. But in this respect it would be no different from any other step taken over Palestine. It would have the merits of pinpointing instantly the evidence of any tampering with the wire, of enabling frontier civilians to enjoy quiet nights, and of relieving two governments from spending on defence large sums that both need for development. It would also enable the world to sort the sheep from the goats—to distinguish those who genuinely want peace from those who prefer hazard and a chance to fight. The job, though seldom done outside Russia, entails no technical difficulties. Is it likely that the cost of a wire curtain 525 miles long would be greater than that of the Korean war?

Propaganda for Parties

FIFTEEN months ago the Labour party announced that it intended to launch a new weekly newspaper of its own, which would express and explain the official party line. Very little has been heard of this project since, but the latest Bevanite crisis should add urgency to the intention; the new paper is expected to appear on the bookstalls some time this year. The attitude of the Labour leaders towards the two chief independent left-wing weeklies already in existence is not unlike that of the Duke of Wellington to his troops: "They may not frighten the enemy, but by God they frighten me."

Although the Labour Party owns 49 per cent of the *Daily Herald* and the Co-operative Press is controlling owner of the Sunday newspaper *Reynolds News*, the eventual appearance of this weekly will be something of a new development in the propagandist activities of the two main parties in this country. The new paper's financial backing is expected to come exclusively from the Labour Party and the TUC, and by this token alone it is unlikely to stray far from the box-edged path of Transport House orthodoxy. Hitherto the central offices of the parties have been mainly concerned with pumping propaganda into the outer limbs of their party organisations rather than with assaulting the bookstalls direct. But beneath the surface they have played an increasing part in mass-producing much of the spurious knowledgeability of modern politics. Their ant-like industry deserves investigation.

Both the Conservative and Labour parties have large and efficient departments (and the Liberals an appropriately small and more harassed one) whose main concern is the production and issuing of booklets, pamphlets, leaflets and posters which advertise the party line. The propagandists' first task, apart from the publication of definitive statements of party policy, is to service the candidate and the platform speaker. Their heaviest and most valuable weapon here is undoubtedly the speakers' handbook. Both the main parties try to keep this up to date, if possible annually; in the meantime weekend orators are fed with a fortnightly issue of political notes. The handbooks make dreary reading, but they also make efficient speeches very easy to compile. Apart from all the stock answers to stock questions, and the topical facts and statistics, the handbooks contain a careful compendium of the *gaffes* that have been uttered by politicians of the other side. It is surprising that so many politicians continue to be so garrulous, and even more surprising that so many garrulous men continue to be politicians.

In addition to providing candidates with speakers' handbooks, the professional propagandists at the central offices may help with the preparation of election addresses, to which the local man can add the necessary local touch; and it is, of course, at election time that posters and pamphlets reach the individual constituencies at full flood. The Labour party produced no fewer than thirteen separate leaflets for the 1951 election; the main check upon these is that everything distributed free of charge has to be marked down by the candidate as an election expense.

Occasional literature of the cheap hand-out type flows from the central offices between elections as well as during them. Typical of these is the attractive occasional broadsheet produced by the Conservatives called *Popular Pictorial* (priced at 1½d.) of which over 200,000 copies are run off the presses at each issue; the Labour party counters with a fetching glossy called—oddly enough—the *People's Pictorial* (priced at 3d.). The aim of both broadsheets is to hit the eye; and an argument asserted is an argument proved. There is also, of course, a proliferation of more tabloid products and hard-hitting broadsheets, which give variants of all the usual bread-and-margarine arguments of the day. Perhaps more important, both parties syndicate political articles to constituency magazines (and, in the Labour party's case, trade union papers) through a special press service. Although it is hard to establish reliable—or meaningful—figures of readership, both parties can claim a large (though rather perfunctory) audience for these syndicated features. The Conservatives estimate that their local sales reach more than 800,000 readers a month, and the Labour party and the trade unions between them must reach quite double that figure—although it is fair to add that many trade union magazines confine themselves fairly strictly to industrial and non-partisan information.

*

For both the parties the regular monthly magazines are stronger stuff. These are not ordinarily visible on the counters of bookstalls (although the Labour monthly is purveyed through newsagents); their main market lies among the party organisers and devotees. The Conservative monthly, which has lately changed its title and its style, is called *Onward*; it has reached a circulation of 45,000 and hopes for many more. It costs 4d., sports a glossy cover which is often studiously non-political, and seasons its propaganda with articles about television and theatre programmes, adventure stories and the like; seven pages of popular appeal to eleven of politics make up a typical issue. The equivalent Labour monthly, *Fact*, is a very different affair. In appearance it is old-fashioned, unpretentious, almost dowdy. This is typical, perhaps, of the nonconformist conscience of the Labour party and its dislike of show. The cover again escapes obvious identification, but the contents would deceive no one. There are usually some twenty-four close pages of news, information and argument to fortify the faithful. *Fact* provides the party leaders with an obvious platform for their cause, but on really controversial issues space is sometimes provided for dissenting argument. *Fact* costs 6d. and sells only about half as many copies as *Onward*. But it finds natural allies in the monthly organs of the trade union and co-operative movements. These both have substantial circulations, and with minor variations toe the orthodox party line. The Labour party also produces a special monthly for its women members and another for its youth movement, while the Conservatives provide features for these two groups in *Onward*.

*

All these publications are essentially newsy. They make a point of discussing politics from the practical angle of party agents and organisers, and of acting as a forum for party education in the history and the personalities of the movement; but the general policy arguments and statistics deployed in them follow closely upon the arguments and the statistics used in the House of Commons. This is not surprising, since both the articles and the speeches often reflect a common (but never to be disclosed) origin in the work of the research departments at central office. The written word also encourages its own variant of the spot-the-quotation game. An apt quotation from an independent newspaper will cap any argument; *The Economist*, be it said, often provides the *coup-de-grâce* for both sides.

The central offices also produce more serious pamphlets, some of which make a real effort to achieve an impression of impartiality. Educational pamphlets and regular factual guides rarely sell more than 10,000 copies, and sixpence seems to be about the limit of the buyers' enthusiasm. Their importance far outruns their circulation, for no party can afford to be labelled the stupid party indefinitely. Since they are designed primarily for use in discussion groups, they can result in a genuinely useful cross-fertilisation of ideas. But without the backing of a strong party machine efforts of this sort do not get very far. If good pamphlets won votes, the Liberals would still be well to the fore in the political race.

In theory, party literature pays for itself; and examples can be cited of publications that have been wound up because they failed financially. But most political journals are only superficially self-supporting. Editorial staffs are officials whose salaries do not have to be paid for out of receipts; most contributions are offered free of charge or for a purely token fee; and distribution is mainly through non-commercial channels. Costs of production therefore amount to little more than the price of materials, printing and transport. *Onward* seems to be an exception to many of these rules. Because of its popular character it is in demand for advertising space and as a result is in the unusual position of being able to break more than even.

It is difficult to imagine any intelligent person reading most propaganda either for instruction or for fun; the appeal is rather to a sense of loyalty. The constituency worker feels that he is not forgotten so long as he can receive his monthly *communiqué* from headquarters. In meeting this need the new type of professional propagandist has helped to knit his party together, has given an interest in politics to many people who would otherwise have only the foggiest ideas about the issues involved, and has both backed up and toned down fiery emotions by the provision of some solid and useful information. He has reduced the art of making a tolerable political speech to the low-grade skill of picking pre-fabricated pieces out of the speakers' handbooks. There is, therefore, nothing really dangerous in his trade, no nasty flavour that need attach to the title of "professional propagandist." The gravest charge—or is it the greatest achievement?—that can be laid at his door is that he has enabled rather more ordinarily unimaginative people to become professional politicians and has made politics itself rather more dull.

Notes of the Week

Bank Rate Reduced

It was a peculiar set of circumstances which led to the reduction of the Bank rate to 3 per cent on Thursday. The logic of the monetary policy followed by Mr Butler in the past two years has been that decisions of this kind should be taken by the Bank of England rather than by the Treasury; and this return to tradition has meant that all the traditional pointers obeyed by the Bank have come back into fashion too. Nearly—but not quite—all of these pointers are of a kind that should impel the Old Lady in the direction in which Mr Butler should want his general economic policy to go. When foreign funds are flowing out of the country, the Bank's barometer suggests that Bank rate should go up; and thus exert the brake on internal economic activity which Britain then generally needs. When internal economic activity is sluggish because savings are high, the Bank is induced by these traditional pointers to put Bank rate down; and this gives a desirable stimulus to internal spending or real investment at the right moment.

But there is one set of circumstances in which the pointers of an "automatic" monetary policy and of a Keynesian economic policy are not in such happy alignment, when they may point accusingly at one another instead. And, to some extent, it is these circumstances that seem to have arisen now. There is no reason to suppose that spending in Britain needs to be stimulated; there is no recession in business activity, unemployment is very low and is still going down. But for an accumulation of technical reasons—such as the low level of interest rates in America (where they have been experiencing a recession)—foreign funds have been flowing into London. The Bank has reacted in the time-honoured and technically proper way, by putting Bank rate down. But even—indeed perhaps especially—in the City of London itself the welcome to this traditional sign of strength should be cautious, if not crabbed. Nobody will gain in the long run if, for a series of very good technical reasons, Britain proves to have given a stimulus to spending which, for a series of equally good economic reasons, it cannot really afford.

After the Fall of Dien Bien Phu

First-aid and flimsy bandages will not be enough to heal the hurt inflicted on France by the fall of Dien Bien Phu. The wound has penetrated deep below the surface of party politics. The gallant but tragic last days of the siege have only strengthened popular resentment; mourning is now mixed with anger. Throughout the clamour one question is heard: Who are the guilty men? What guarantee is there that they will not bring about an even more tragic national disaster? The deputies cannot be blind to this new mood, and it is this that renders more than critical the position of M. Laniel's cabinet. Last week he obtained a respite from a reluctant Assembly. Now he has to ask it again for a probationary period, and as *The Economist* goes to press the National Assembly seems in no mood to let him get away with vague promises.

Some 70 years ago a small reverse in Indo-China enabled young Clemenceau to upset the "guilty government." Will M. Laniel be able to survive this much bigger defeat? One thing seems certain: with popular passion so directly involved, a conspiracy of silence will prove no shield. Insults were hurled this week in the Assembly at his Minister of Defence, but M. Laniel did not jump to his rescue. He merely proposed the setting up of a special commission, excluding the Communists, to investigate past sins. But the country apparently wants the dirty linen accumulated over years to be washed now in public, in open parliamentary session.

★

The government, however, has even more urgent questions to answer. Paris seems convinced that decisions can no longer be postponed, that the time of improvisation is over. Is the government willing and capable to internationalise the conflict? How far is it willing to go to find a compromise with the Viet Minh and what does it intend to do if the enemy's terms are unacceptable? M. Bidault may argue from Geneva that to lay your cards on the table at the beginning of the game is contrary to diplomatic canons. Mistrustful Paris, however, wants the answers quickly. It argues that this is no moment for the classical game and diplomatic niceties.

Against this new assault M. Laniel has so far only resorted to the defensive tactics he used last week. But for the Geneva conference he would certainly be doomed. Few deputies, however, would like to add the responsibility for a failure in Geneva to the long black list of the French Assembly. Furthermore, M. Laniel can claim that his opponents have no alternative policy and no coherent majority to back it. Finally, he can brandish the threat of dissolution in face of a recalcitrant Assembly. Were it not for the timing few people would shed tears over the present Assembly, but a political crisis in France at this moment would be a major international disaster. Still, M. Laniel must realise that by hiding his head in the sand he will not avoid the storm sweeping through France.

During this week's debate M. Mitterand, a former minister, issued the clearest challenge to the government. He claimed that France is now faced with so fateful a choice that neither a special commission nor the present government itself has enough authority to decide it; hence parliament should be asked to clinch the issue. Unfortunately, there is much truth in M. Mitterand's appreciation of governmental credit, but that of the Assembly is not much higher. The impotent government is merely a mirror of a divided Assembly. Most of the blame for M. Bidault's indecision and the governmental paralysis lies with this *chambre introuvable.*

Mr Eden Pins Things Down

The fact that the Geneva conference is, theoretically at least, always in closed session does not seem to discourage most of the speakers from addressing the world at large just as if they were facing the radio microphones and newsreel cameras of the United Nations Assembly. The Communist delegates have been much the worst offenders, but they have not been alone in wasting precious time by tedious repetition of familiar accusations and by dragging wholly irrelevant topics into a discussion that was already complex enough. Against this background, Mr Eden's brief and brisk intervention on Wednesday was a refreshing reminder of what a conference of the powers is really meant to do.

But it was also a good deal more than a mere refresher. It was the first attempt made during the talks on Indo-China to pick out the points on which the opposing parties seemed to be within reach of agreement. Mr Eden directed himself primarily to the military arrangements needed to bring about a cease-fire; but in a situation as fluid as that in Indo-China, it is clear that the future political structure of the country will be largely determined by the positions in which the contending armies end up. Agreement on military matters is thus an essential first step to a political settlement, and once the military positions have been stabilised there will be obvious difficulties about reshaping the political picture in any way that involves a second reshuffle of armed men. The dividing lines across Europe today are an inescapable reminder of this decisive military influence on political settlements.

★

It must be hoped that Mr Eden's five questions (recorded, with the other proceeding at Geneva, on page 547) will get the prompt and constructive answers they deserve, both from the Communists and from the government of Vietnam, whose foreign minister, Mr Dinh, had previously outlined a set of terms that implied little enthusiasm for a compromise. If, as Mr Dinh forecast, Vietnam is to become a fully sovereign state, vested with absolute freedom of policy, within a matter of days, and if its government agrees with the rebel Viet Minh only on one point—that neither will be content with anything less than complete ultimate control of a united Vietnam—then it begins to look as if the major powers can do little to promote a settlement. The object lesson of Korea, bedevilled by two governments' pretensions to authority over the whole country, has not apparently been learnt; and an Indo-China left to its own devices would simply be left to a ding-dong struggle between irreconcilables.

The Two Asias

At Geneva on Tuesday, Mr Molotov expounded once more the now familiar Communist thesis that all western attempts to help defend Asia are inherently anti-Asian, and that true security for Asia, as for Europe, can be obtained only through agreements between the nations of the continent itself. It has already become obvious that China, "the greatest power in Asia," would dominate a continent thus reorganised, just as Russia would dominate the Europe that Mr Molotov envisaged at Berlin. And at first sight Chou En-lai's vision of Asia may seem more plausible than Mr Molotov's vision of Europe; there is much talk nowadays of "the Asian point of view," and there is indeed an emotional basis for this concept in the widespread suspicion of everything western. But in reality the Chou plan for Asia faces much the same difficulty as the Molotov plan for Europe. Asia, like Europe, is already divided.

The basic division is not between anti-western and pro-western nations. It is, like the division in Europe, between Communist and free nations. It has long been half-hidden by memories of common experiences in the past; but there are now signs that free Asia is coming to recognise its reality and its meaning. The Communists have not needed to dig trenches and fix electrified barbed-wire along their borders, as their comrades in Europe have done; nature has provided them with the Himalayas and the mountains of South East Asia. But they have shut their subjects off from their fellow Asians just as effectively—witness Tibet. Indian efforts to maintain press correspondents in Pekin have been frustrated; entry into China has been granted only to shepherded visitors; exit from China is possible only for the party's faithful servants.

It is easy to understand the anguish of such leaders of free Asia as Mr Nehru as they recognise that Peking has raised these barriers to their hopes of a new Asian unity. The bases of Indian policy, in particular, will doubtless continue for some time to include the hope that the new rulers of China will pay some heed to the voices of fellow Asians; but they will no longer be dominated by it.

Strong Lead for Labour?

It seems that the Labour National Executive is to be the chosen hammer for cracking the Bevanite nut. The Executive is to hold a special meeting next Tuesday, nominally to discuss "organisation" but in fact to debate how far minorities in the party should be free to campaign against decisions reached by majority vote. The answer sought by the leaders is "Not very far"; and the Executive, with its preponderance of trade union votes, will presumably give it.

Any such decision will offer a clear cut lead to the Parliamentary party, which—if left on its own—might otherwise fall back on a compromise no more effective than the one it reached after Morecambe. It was knowledge of this attitude that led some MPs to attempt to call a meeting of the Parliamentary party this week, so that it might hold

its own discussion about the rights of minorities first. By a coincidence, which the Bevanites find highly suspicious, the party leaders discovered that no room would be available for such a meeting until next Wednesday, the day after the Executive's meeting. There is a distinct flavour of Tammany Hall about this accommodation shortage.

This delay does not mean that Mr Morrison is personally anxious to by-pass the charge that his recent attack on Mr Bevan in *Socialist Commentary* infringed the hopeful post-Morecambe resolution of the Parliamentary party, which called on all Labour MPs to refrain from criticising one another " in the House, in the Press or on the platform." Mr Morrison, indeed, seems in fighting mood; he can claim that he has merely stepped over a line on which the Bevanites have been treading so agilely, so consistently and for so long that they have reduced the resolution to a farce. Now the farce is apparently to be abandoned in favour of strong arm methods; it is reported that the Executive will threaten expulsion from the party to minorities who do not toe the official Labour line. If so, the coming week could be a significant one in British political history. The intention is that Transport House should no longer hold up an umbrella over two distinct parties, proclaiming two different political philosophies. The danger is that Mr Attlee may then walk abroad in the field of foreign policy with the umbrella folded underneath his arm; everybody knows who he would look like then.

No Reichstag

THE debate on the guillotining of the Television Bill provided the expected perfunctory canter over familiar ground. For all Mr Morrison's amiable but preposterous talk about the Reichstag, the Government's immediate justification for using the guillotine is incontestable. After thirteen and a quarter hours of the committee stage, the House has still not finished with the first of the seventeen clauses and three schedules; over two hundred amendments have already been tabled, yet these cover only the first five clauses. Labour MPs may not have filibustered in the sense of talking too long on each amendment, but they know that by tabling so many amendments they have deliberately tried to smother the Bill, rather than to improve or ordinarily oppose it.

After the guillotining the Bill is to be completed in another seven days—five for the rest of the committee stage and two for report and third reading. With Tory, as well as Labour, back-benchers pressing important amendments, this may prove none too much time; but in all conscience it should be ample for a Bill of this size. Any measure of its kind which cannot be discussed adequately in a total of ten days from second to third reading would have to be untidier than even this Bill is.

As Mr. Morrison was quick to point out, this is the sixth time the Conservatives have used the guillotine in two and a half years; Labour used it only three times in six years. In one sense, the Conservatives must carry blame for this comparison: they have shown a misguided penchant for bringing on controversial legislation late in the session. But, as the Rents Bill showed, an Opposition sufficiently determined can always provoke a timetable, however promptly a Bill has appeared. The real import of Mr Morrison's figures is that the present Opposition happens to have more of this negative brand of determination than its more dilettante predecessor.

Spies in Kensington

THE Foreign Office has accused two Soviet air attachés in London of espionage, and has asked that they should leave Britain at once. Beside the recent lurid events in Australia and Western Germany, this drama in Kensington (where the two diplomats lived) is almost insipid. There must always be some question where the duties of an attaché end and the activities of a spy begin. An air attaché who requests, through the proper channels, that he should be allowed to visit an aircraft factory is sticking strictly to his last; an attaché who tries to discover what is happening in that factory by offering bribes to workers in it is equally obviously guilty of espionage. Between these extremes there is a wide and confused no-man's-land; it is certain that Majors Gudkov and Pupyshev had at least reached the limit of that no-man's-land, and probably that they had stepped right out of it.

It has been reliably reported in London that the discovery of these two spies was not the result of any revelations by Mr Petrov in Australia or Mr Khoklov in Western Germany (in other words, they were MI5's own catch), and that there is no reason to believe that atomic secrets were involved. Several other things have been less reliably—though more picturesquely—reported as well. There is little doubt that there is a Soviet espionage system in Britain, as there is in most other major countries, and that its activities are sometimes as clumsy as they are grotesque. But newspaper readers should judge all reported details of spy stories by the simple test of whether any responsible source could possibly have emitted them; if the answer is that anybody who relayed them could only have been irresponsible, then the details—though not the existence and dangers of Soviet espionage itself—should be treated with something more cautious than reserve.

A Zhukov Revival

A FULLY-FLEDGED compliment from the Soviet Union to its wartime allies is something to be noted, especially when it comes from Marshal Zhukov. The occasion, the ninth anniversary of VE Day, has not for a long time been used for such courtesy, which should be acknowledged regardless of its motives. Indeed, the Moscow directive hitherto has seemed to be that the Soviet Union should be represented as having crushed Nazi Germany single-handed; whereas now tribute is paid not only to American, British and French heroism and sacrifice but also to President Eisenhower and Lord Montgomery. Nor is it tucked away on a back page; it is splashed over four columns of *Pravda*, the party's chief daily newspaper. For this relief from the men who use their pens to poison Russia's relations with the outside world—much thanks.

The tribute follows an assiduous courtship of the French (it is said that Moscow especially enjoyed the Comédie Française in *Tartuffe*) and some semi-official pats on the back for Sir Winston Churchill. And it is significant that *Pravda* gave the greatest prominence to the wartime hero and conqueror of Berlin. It was Zhukov who worked together with General Eisenhower and Field-Marshal Montgomery in the closing stages of the war, and it may be that the cordiality of their contacts was something of a liability for the Soviet Marshal when the cold war began. Be that as it may, Stalin, suspicious of any budding Bonaparte, quickly removed the Soviet Union's leading soldier from the centre of the stage. His return to the limelight came only after Stalin's death.

The Marshal's present prominence has significance on the home front. What he said, it is true, was about foreign policy; but he also took pains to emphasise that an army is powerless unless there is political solidarity behind it. He may well have been alluding to an agreement on their future relations between the party and the army that was reached either after Stalin's death or after Beria's fall. The Soviet Army, or at least its most important spokesmen, may be satisfied with what has been gained in recent struggles in the Kremlin and is therefore content to lend its powerful voice to the official chorus of good will.

A Lesson From the Siege

WHY did the garrison of Dien Bien Phu refuse to surrender? There have been few examples, even in two world wars, of heroism as great as that shown by General de Castries and his men, and certainly none greater. The General himself is justifiably reputed to be fearless and single-minded. But it is hardly enough to believe that his own attitude was alone sufficient to inspire such fanatical defence against such odds. Was it, then, that the backbone of his force consisted of the Foreign Legion, of professional soldiers, and of westerners who may have believed that to surrender was to be put to death anyway? Probably all these factors played some part, perhaps a big part. But they still do not add up to a full and satisfactory answer. Nor do they account for the fact that many of General de Castries's soldiers were none of these things. They, like their attackers, were Vietnamese.

The British are better than most people at doggedly regarding defeat as victory, at seeing Dunkirk only as a great deliverance. But there is a certain general logic in the perversity of their instinct all the same. Defeat can have two salutary results for the defeated. It can lead to a military withdrawal in order to fight again another day. And it can so stir the emotions that an entirely new energy is thrown into the battle. Can either of these be said to follow from the fall of Dien Bien Phu? And were they in the minds of the defenders during the latter period of their siege? So far there has been no evidence that any hard-boiled calculation of that kind holds true, or that the defenders thought it would. Although the stand at Dien Bien Phu must have convinced at least some people in Asia that the Communists will never have a walk-over, the result of its fall looks like being a psychological disaster in both Saigon and Paris.

It is fair to assume, therefore, that some Vietnamese at Dien Bien Phu fought for what they believed in, and that that could never be Communism. They, and perhaps some of their French comrades, resisted the Viet Minh loudspeakers urging them to desert because they saw in their own cause the only way in which they could achieve and retain the independence of free men. If so, the stand at Dien Bien Phu was not in vain. Amid the disillusionment of confusion and defeat—of which Paris is now the centre—the lesson of the siege stands out as perhaps the most heartening challenge since the war began.

The Top-Secret State

A WEEK in which the House of Commons received an official report that the Soviet and satellite armed strength, confronting Europe, had risen to six million men, may seem an odd occasion for reopening talks on disarmament. But nowadays, most fortunately, few people interpret

Slayer of Enterprise

Russia must . . . be regarded as decidedly anti-commercial and illiberal in her spirit, and her tariff is one of the most prohibitive in the world. Vast, therefore, as are her resources, and rich and varied as are the products of her extensive dominions, these would, beyond all question, be rendered far more promptly and largely available, both to herself and Europe, were her territories under any other Government than that which now weighs upon them at once as a nightmare and a corruption. The countries that border on the Black Sea ought to be among the most prosperous, and their commerce about the most extensive and varied in the world. The Crimea and the steppes that debouche on the Sea of Asof are rich in corn and wine, of which both the amount and the quality might be indefinitely improved; Bessarabia and the Ukraine, of which Odessa is the port, already furnish vast quantities of wheat, capable of enormous augmentation; Bulgaria and Wallachia could supply in addition almost unlimited treasures of hides, tallow, wool, hemp, and grain; Hungaria and Transylvania, under happier auspices, would send down the Danube countless cargoes of mineral and animal productions; while nearly the whole southern bank of the upper portion of that great river is clothed with trackless forests of the finest timber. All these would be available for Europe, and should be made to ensure the prosperity both of the countries which supply them, and the countries which purchase them. But hitherto Russia has laid her paralysing hand upon all this wealth. Her despotism kills enterprise in her own dominions, and her jealousy thwarts it in every State which could possibly become a rival. . . . We must look at once for a remedy for this state of things and for the reward of our exertions, in such a series of well-contrived operations (of which we may accept the bombardment of Odessa as the signal and the first-fruits) as shall wrest the shores of the Black Sea from the Power which at present holds them and misuses them, and transfer them to their former owners.

The Economist

May 13, 1854

disarmament as meaning a one-sided act of faith. The second world war traced out in blood the lesson that the only kind of disarmament that promotes peace is the two-sided kind. Now, moreover, the phenomenon of the top-secret state has complicated the problem. Disarmament, like justice, must be seen to be done ; otherwise every nation that pledged itself to disarm and honestly fulfilled its pledge would be an easy victim for the threats of a power that had piled up its guns and bombs behind a curtain of silence. For nine years, throughout the tangled web of postwar discussions on disarmament, the western governments—and with them the great majority of all nations—have clung to these simple but essential axioms.

There is, unfortunately, little reason to suppose that the talks that began this week at Lancaster House in London will bring general, genuine disarmament much nearer. That they are being held at all is the result of a tardy and grudging Soviet acceptance of a proposal made by the United Nations Assembly last November. The Assembly asked, in a resolution backed by almost all nations except the Soviet group, that the powers principally involved should discuss disarmament, and specifically atomic and hydrogen bombs, in private. Only after the Berlin conference, at which Mr Dulles further explained the Eisenhower plan for an international atomic pool, did Mr Molotov agree to the meeting that has now opened.

The Communist governments will have to make some startling changes in their present policy before the road can be opened to that abolition of nuclear weapons which they profess to seek. For the western powers, top-secrecy is an uncomfortable and, every free citizen hopes, a temporary necessity. For the Communists, it is the principle on which their whole political system is founded. Yet it must be modified if there is to be real disarmament.

Net Over Nairobi

THE danger signal has gone up in Kenya that Mau Mau may have begun to spread beyond the Kikuyu to the Kamba tribe. There were two bad incidents in the Kamba reserve last Saturday. The police seem to think, however, that these may have been no more than secondary effects of the clean sweep of the Nairobi underworld, which the army—in conjunction with the civil authorities—has been conducting since the peace talks so tragically broke down. It is estimated that the Kikuyu population of the city had swollen, before the sweep began, to over 50,000, many of whom have clearly been up to no good. Nairobi is not only the point of infection with other tribes ; it is also the home of Mau Mau's most important supply and intelligence organisations. There have been previous attempts to stamp the trouble out, but the present operation is intended as a sweep to end all sweeps.

General Erskine has said that in some areas as many as 60 per cent of those examined are being held for further investigations ; and it is known that, so far, some 24,000 men have been detained. Many women are also being rounded up, for Mau Mau seems to have gained a terrible grip on the female Kikuyu. Strenuous attempts are being made by screening teams to divide the guilty from the innocent, and the latter are being allowed to return to their lawful occupations with new and simplified identification papers. Detainees are being sent to labour camps.

Meanwhile, Mr Vasey, Kenya's Member for Finance, is shortly to set out on his second visit to Britain in six months, in search of further financial assistance to meet the mounting cost of the emergency. In his recent budget speech he announced steep increases in local taxation, which will add nearly £2 million to the colony's diminutive revenue, but which will still leave him with an estimated deficit of £8 million. It is not generally recognised that the Kenya government has to pay all the extra costs of British troops and air forces over and above those usual for forces stationed in Britain on a peacetime basis. Yet it has little control over expensive new importations like jet fighters. It is only reasonable that Britain should contribute something towards paying for General Erskine's increasingly expensive tune. There are many anxieties that have been aroused in this country by recent developments in Kenya beside which mounting expense is a very small molehill indeed.

Engineers Against Extremists

THE Communists suffered an important defeat last week —and the forces working for moderation in the trade unions won an important victory—when the annual conference of the Amalgamated Engineering Union discussed the question of yet another wage demand. About a fifth of the delegates at this conference were Communists (who work like beavers both on ordinary union business and on propagandist activities in the AEU's local branches). They launched a fierce attack on the executive for accepting last month's settlement, and urged that a claim should immediately be made for another 10 per cent, which would give the balance of the 15 per cent wage increase for which the engineering and shipbuilding unions had been fighting for so long. The moderates replied that this could only lead to a strike—which, of course, was precisely what the Communists wanted.

Fortunately, the rest of the union did not want a strike ; and the conference accepted the alternative proposal to apply for a revision of the wages structure. Although the union hopes that in the end this may yield increases of more than 10 per cent for some workers, no timetable has been set ; and it is generally recognised that months of negotiation will be necessary. The employers' strategy last year, of categorically refusing what they ultimately conceded, may have taught the unions never to take a flat No for an answer ; but clearly it has had the effect of postponing not only the wage increase in question but also the application for the next one. There were even signs last week that some engineering workers recognise that wage increases might price them out of jobs in competitive world markets.

Moderation also prevailed in the AEU's decision not to demand the expulsion of the National Union of General and Municipal Workers from the engineering and shipbuilding confederation, as a reprisal for its refusal to order its members to join the 24-hour strike on December 2nd. Nor did the conference fall for an extraordinary motion that people who are paid for holidays should be obliged to take them (some workers have recently chosen to stay on to earn bonuses). But on questions of foreign policy the

Left reigned supreme ; the AEU unanimously, if somewhat inconsequently, decided that the working class should agitate against the hydrogen bomb and that German rearmament should be opposed. These repeated emotional revolts over Germany at union conferences, which succeed partly because the moderates do not want to appear to be resisting the left-wingers all the time, must be worrying the Labour leadership.

The Capital of Wales

AFTER some years of dissension, the Welsh local authorities have now agreed that Cardiff should be regarded as the capital of Wales. The bulk of the country's population is concentrated on the South Wales coalfield ; and Carnarvon and other cities with stronger historical or cultural claims have therefore had to yield pride of place to the logic of economic facts. But the agreement will not make it any easier for the inhabitants of North and Central Wales to visit their capital ; and poor communications will probably continue to cause many Welsh conferences to be held on the foreign soil of London or Shrewsbury.

The practical consequences of Cardiff's new title will not be considerable ; the city will simply be confirmed in its present position as a centre of regional administration. But the choice has been made at a time when the campaign for the creation of a separate Welsh Parliament is reaching a new pitch of intensity. The new campaign is being led by Lady Megan Lloyd-George ; and it has the active support of a number of Welsh Labour MPs, despite the disapproval of party headquarters.

This is delicate ground. The Welsh economy, with its dependence on high-cost coal production and marginal hill farming, would seem bound to suffer heavily from even a partial severance of public finances ; it would certainly be the loser from contracting out of national schemes for the social services. In educational and cultural matters Wales does warrant special treatment, but this it already receives up to a point. There may be a case for urging that this special treatment should be extended ; and also for saying that local government in Wales should be reorganised so as to include the whole country within one or two regional councils. If a clear majority of the Welsh people really wants to press on towards further devolution then—and this is perhaps the most important point to emphasise at this time—English politicians have no real right to resist them. But Welsh MPs should tell their constituents that they will stand convicted of a strange sort of cultural jingoism if their choice really does lie that way.

Pie in Australia's Sky

WITH the federal general election on May 29th in sight, the leaders of the main Australian parties have been clarifying their party's policies. Though the Petrov affair is certain to be a major factor, both sides are ostensibly playing the game in resisting the temptation of making capital out of it. Instead, such purely domestic issues as economic policy, the consolidation of the welfare state, and wages, are to the fore. The Prime Minister, Mr Menzies, is content on the whole to rest on the coalition parties' record of achievement though promising concessions to pensioners, and a subsidy to the gold-mines. But the Labour party leader, Dr Evatt, beat all records in his promises to the voters.

If he returns to office he proposes to abolish altogether the means test for old-age pensioners, increase the rates of pensions and other allowances, introduce farm price supports on the American pattern, further assist house ownership, and reorganise the defence programme. Yet Dr Evatt says in the same breath he will reduce taxation, give incentives to encourage modernisation of plant in industry, and repeal part of the sales tax. The prescription for this miracle is deficit finance, which, as Dr Evatt plaintively asserts, the Menzies government has avoided for the past four years.

Though Australia's economic position has improved out of recognition in the past eighteen months, and its foreign currency reserves continue to climb, it would be less than prudent to think that everything in the garden is lovely. The improvement has, in fact, been due to a combination of good luck—in the shape of better terms of trade—and the severe fiscal and monetary policies made effective by Mr Menzies's government. Australia, in keeping with other sterling area countries, has, moreover, been lucky in escaping comparatively lightly from the worst of the American recession. But there are still many perils ahead. There is a surplus of wheat—which price supports could only magnify—yet to be sold in a buyers' market; the problem of costs in secondary industry which, without additional tariff protection, is becoming increasingly uncompetitive ; and the ever present, and now only thinly concealed, threat of inflation.

Having given away the equivalent of £A118 million in tax reliefs in the recent budget, Mr Menzies's government can rightly claim to have taken the appropriate steps to lessen the burden of taxation while giving incentives to greater output. It would be most unwise at the present stage to do more. Dr Evatt—if he wins—may yet regret his impetuosity.

Economics of Legal Aid

THE third annual report of the Law Society on the operation and finance of the legal aid scheme has now been published. Although the figures given in it do not go beyond March 31, 1953, they paint a clearer picture than hitherto of how the scheme is working out. About 30,000 people are given aid in the year, and three-quarters of the cases are still matrimonial disputes. Most of the divorces are undefended, and about two-thirds of the other cases are successful ; this is not an unreasonable record, and it suggests that the scheme is not being widely abused.

The organisation recovered some £1,760,000 in damages and £400,000 in costs in the year, and the charge on public funds was some £900,000 ; the assisted persons themselves contributed £700,000 towards their costs. Adminis-

trative expenses were approximately £600,000. There must be few other organisations concerned with the social services that can handle so many cases at such a low cost for each individual case. It is obvious that the scheme is still dependent upon a great deal of unpaid work from the legal profession, particularly from those who serve on the committees that administer it throughout the country.

The Advisory Committee, whose report accompanies that of the Law Society, returns to the charge that the scheme now in operation is only a part of that contemplated by the Act of 1949. Assistance is available only in the superior courts, not in the county court or before magistrates ; and there has still been no move to bring into operation any general scheme for legal advice centres to supplement—or precede—the giving of aid in litigation. The committee points out that the voluntary legal advice bureaux are gradually disappearing. Some are still aided by grants from local authorities, but others have closed their doors altogether. The committee very sensibly urges that some public aid should be given, at least as a temporary measure, to those that still exist. There is an economic, as well as a social argument, for this. Some of the weaker cases which are now given aid, and which cast a burden on public funds when they fail, might never be started if the applicant was given good advice before the stage at which court proceedings become inevitable.

Caveat Emptor?

THE Opposition fired some heavy, if rather scattered, guns last Thursday when it urged the Government to be more rigid in its enforcement of the new Merchandise Marks Act. Miss Elaine Burton, opening the debate, also discussed the inadequacy of the standard textile specifications succeeding the utility scheme, the delay in framing them, and the apparent apathy of the Board of Trade towards their development. She followed this criticism with several instances of allegedly misleading advertisements and inadequate or inaccurate description on which, she claimed, official action was overdue. Mr Rhodes, the former Labour Parliamentary Secretary to the Board of Trade, who seconded the motion, was more cautious about standard specifications, though he regarded the difficulty in framing these as an added reason for pushing forward and prodding the trades into co-operation ; he pleaded, too, for consumer education as part of the school curriculum. Later speakers turned from textiles to patent medicines, and from merely deficient quantity to allegations of a quackery which would recall—if true—the exploits of that Jeff Peters whom O. Henry immortalised fifty years ago. (Mr Peters, it will be remembered, sold rural housewives a special sand guaranteed to prevent kerosene lamps from exploding—providing they were kept perfectly clean. Clean lamps did not explode ; the sand provided a happy sense of security ; the housewives, so Mr Peters claimed, got their money's worth.)

There is a strong case for saying that the Government should do more to help the consumer to buy with open eyes ; *caveat emptor* is a maxim for a simpler world. But there is more room for debate about how help to the consumer should be provided. "Kite marks" and standard specifications have their uses, but also, for many products, their dangers ; they tend to narrow and inappropriately fix the range of choice. Any habit of giving undue credence to the declarations of producers' trade associations about the poor quality of the products of firms outside their ring would be exceedingly dangerous, and it is surprising that some Labour members did not underline this. But legislation demanding accurate descriptions of content, such as many other countries find workable, are quite another matter. And a readiness to crack down on deliberate offenders, on any latter-day Jeff Peterses who flourish not by supplying cheap goods to people who want cheap goods, but by flagrant misrepresentation, is the minimum that can be demanded on the consumers' behalf.

Despite Mr Strauss's defence of the Government—and despite the admitted difficulty of securing convictions even under the strengthened Act—the impression remains that the Board of Trade is leaving too much of the consumers' defence to such bodies as the Retail Trading Standards Association. If the British law of libel permitted a counterpart to America's Consumer Research Inc, this passiveness would matter less. As things are, an essential element is lacking for the satisfactory working of that private-enterprise economy in whose name Miss Burton's motion was voted down.

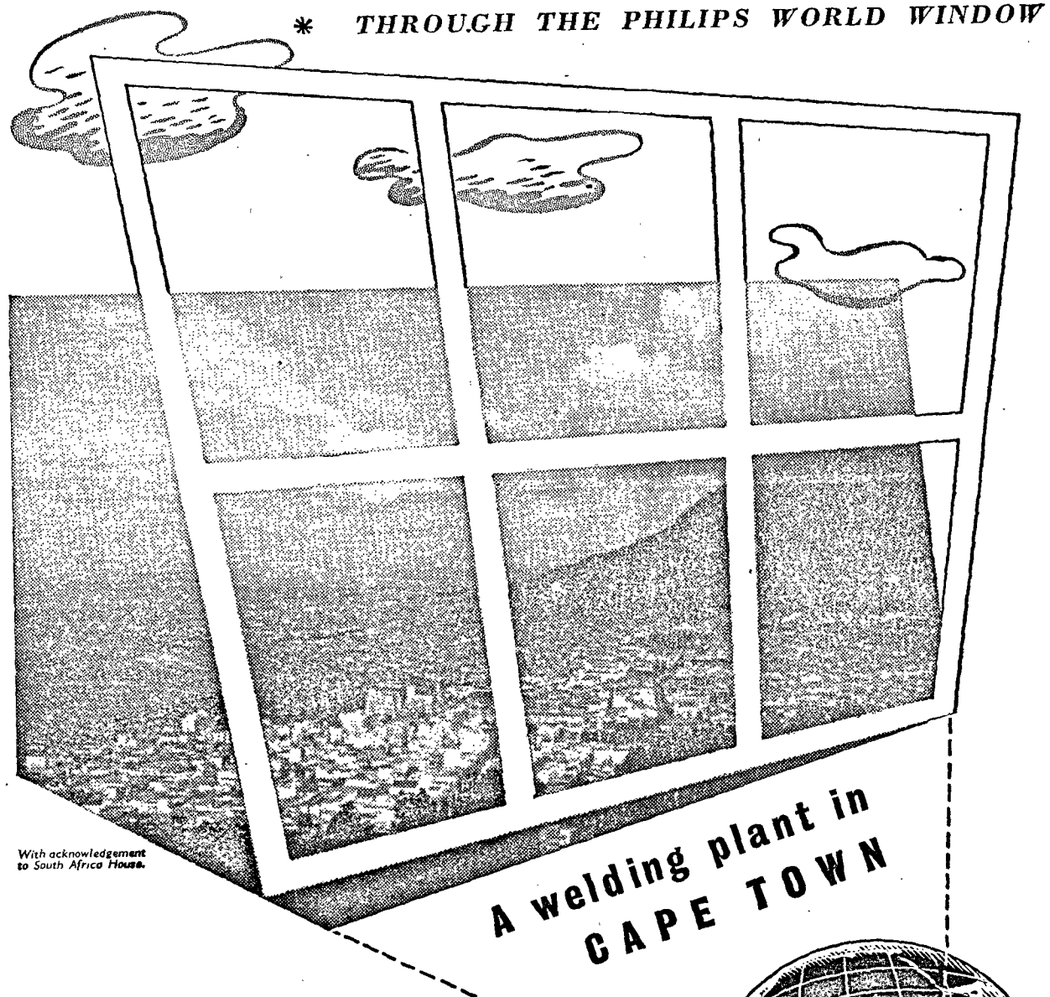
Developments in Development

ALTHOUGH the Colonial Development Corporation again ran a deficit last year—of well over £1 million—it amounted to only a third of that in the year before ; and the long process of closing down uneconomic ventures seems gradually to be coming to an end. Seven more schemes were abandoned during the year, compared with eight in 1952. Two years ago Lord Reith expected quicker results ; but, as the new annual report is at pains to point out, it would be foolish to be panicked into indiscriminate cutting-back just because too much was attempted in earlier years, before Lord Reith's stewardship began.

The legacy of past indiscretions is indeed formidable. Last July the Government said that it would introduce legislation to allow the corporation to write off losses on abandoned schemes on which over £6 million has already been lost ; if badly over-capitalised ventures are taken into account the sum is closer to £8 million, and new losses may yet emerge. The corporation is frank about its record ; it says, for example, that its works division has been "high on the list of discreditable failures," and announces that this has now been wound up.

The important thing is that strict financial discipline seems at last to be giving a clearer guide to future policies ; the report agrees that "new projects should show a likelihood of being financially self-supporting at least." In the main, the corporation's money will continue to be used as risk capital, and private enterprise will be associated with schemes wherever possible. It is noteworthy that when the corporation's projects are analysed according to their stage of development a clear profit is shown on those that have reached the stage of being fully operational. At best, this suggests that the long pull towards financial stability may soon be over ; at worst, it means that the corporation is now carrying cut the controlled experiment with which it should have contented itself from its inception.

* THROUGH THE PHILIPS WORLD WINDOW



With acknowledgement to South Africa House.

A welding plant in CAPE TOWN

THE famous Philips emblem — a sign behind which stands over half a century of scientific and engineering knowledge — guides people in every corner of the globe in need of electrical equipment. And if you happen to live in Cape Town, for example, and require a welding plant, you can quickly acquire one bearing the name of Philips.

Indeed, Philips may be able to attend to your requirements on the spot because, in addition to stores selling Philips products, you will, in many parts of the world, also find the Philips factory that builds them.

PHILIPS

SERVE THE ENTIRE WORLD

Wherever you may be in the world a Philips local organisation will always supply you on the spot.

ELECTRONIC TUBES • INCANDESCENT, FLUORESCENT, MERCURY AND SODIUM LAMPS • RADIO AND TELEVISION RECEIVERS • MEASURING APPARATUS • ELECTRIC DRY SHAVERS • HOUSEHOLD APPLIANCES • MEDICAL APPARATUS • H.F. GENERATORS • WELDING ELECTRODES AND WELDING PLANTS • CINEMA EQUIPMENT • RADIO AND TELEVISION TRANSMITTERS • TELECOMMUNICATION EQUIPMENT • AUTOMATIC AND LINE TELEPHONY INSTALLATIONS • RADAR INSTALLATIONS • DIAMOND TOOLS • INDUSTRIAL RECTIFIERS • PUBLIC ADDRESS INSTALLATIONS IMAGE AMPLIFIERS • TAPE RECORDERS.

Republicans Without Taft

THE TAFT STORY.
By William S. White.
Harper & Brothers, New York. 288 pages. $3.50.

MR WHITE has been investigating the Senate of the United States on behalf of the *New York Times* ever since the end of the war. Nobody had a better opportunity to watch and, as this book proves, to understand Senator Robert Taft of Ohio during the years when his influence was at its greatest. It has become the fashion to disparage "journalists' books," but this is one in the best sense of the phrase. It is the work of a trained reporter and a sensitive interpreter.

It is not, however, despite its title, "The Taft Story"—not the whole of it—but only that part known personally to Mr White. True, he has prowled about Cincinnati and talked with those who have known the Taft family for generations (the Tafts are to Cincinnati what the Chamberlains were to Birmingham fifty years ago), and he has recognised the "minor bloodless virtues" of the aristocracy of that "sedate, withdrawn and rather ingrown city" in which the Senator spent his early years. But at the end of 52 pages he plunges into the Congressional elections of 1946, and the rest of the book is devoted to the six and a half years in which Mr Taft managed perceptibly to blunt the effectiveness of American policy without ever succeeding in changing its direction.

Mr White is undoubtedly right in ascribing the rigid Republicanism of a man who was otherwise very much of an individualist to the memory of what quarrels within the party and the deviationism of Theodore Roosevelt had done to his father in 1912. Because of this memory Mr Taft, who was an intellectual and educated in the East—at Yale and the Harvard Law School—tolerated, and became the acknowledged leader of, the Middle Western Republicans in Congress who usually suspect the products of eastern universities and who distrusted the intellect long before Senator McCarthy began to equate the possession of one with treason. They thought, as Mr White says, that, "because there was one fixed constant in him—his institutional concern for the Republican party—his ideas and notions were fixed." So they were bewildered when he sponsored a public housing Bill or dismissed their more intolerant suggestions when he was drafting the Labour Relations Act which bears his name.

The pathetic failure of the Senator's attempts to win his party's Presidential nomination—an honour which should, he felt, have come automatically to someone known widely as "Mr Republican"—are described with understanding. Mr White, like many another correspondent who would have been disturbed had Mr Taft ever reached the White House, was obviously moved to sympathy, both at Philadelphia in 1948 and Chicago in 1952, as he watched the Taft organisation stumble uncomprehendingly to defeat. His machine was modelled on his father's and was driven by an assorted group of local political hacks. It was rightly called a "steam roller," but the age of steam was over and it was no match for Mr Dewey's streamlined Diesel locomotive.

In one chapter Mr White tries to find out why Mr Taft was so hesitant about American intervention in Europe and so advanced at times about American intervention in Asia. The answer, he thinks, lies in the preoccupation of the Mid-Western members of the party with the Pacific—probably for no better reason than that the Democrats were interested in Europe—and his belief that a Republican party without the dominance of the Mid-West would be "like an army without infantry." This would explain the reason he once gave for not belonging to the Foreign Relations Committee—that too much knowledge of the facts might affect his ability to oppose the Administration's policies. And for institutional reasons he had to accept the prejudices of those who were so far inferior to him intellectually.

Mr White does not speculate about what the Republican party might have been had Mr Taft followed Senator Vandenberg into the world and left the isolationists without a respectable leader. But he does ask two questions to which the answers, when we know them, will be important: what will be the ultimate effect of his death on the Eisenhower Administration and the type of Republican party Mr Eisenhower represents? And what will be the ultimate shape of Taft's Republican party without Taft? The deliberate choice as his successor of the Californian Senator Knowland, who was, he thought, a genuine Republican and who was neutral at Chicago because the California delegation stuck to Governor Warren, is proof that he wanted to provide a bridge between the two wings of the party. But Mr Knowland is proving a frail bridge and would look even frailer if there were men on either side of the calibre of Mr Taft and Mr Vandenberg. Mr White ends by suggesting that, while the Senator's death has left the Administration some complex problems, it has left the Mid-Western Republicans insoluble ones because the Eisenhower-Dewey Republican party can exist on the basis of varying leadership but "the Taft Republicans are disembodied without him."

The Failure of Weimar

GESCHICHTE DER WEIMARER REPUBLIK: Vol. I.
By Erich Eyck.
Eugen Rentsch Verlag, Zürich. 472 pages, DM. 17.50.

THE Weimar Republic failed because it was alien to the temperament and tradition of the majority of the German people, whose dissatisfaction and unrest kept a volcano smouldering in the heart of Europe until, intensified and directed by National Socialism, it spilled over and engulfed the Continent.

Dr Eyck, with rare lucidity of style, and writing from the liberal standpoint of a German scholar who watched developments at close quarters but has been living in England for many years, now supplements his books on Bismarck and William II with a vivid political history of the Weimar Republic. This first volume analyses only the first six years, until the death of President Ebert and the election of Hindenburg as his successor. Dr Eyck's preliminary chapter on the last months of the war presents an appalling picture of the political ineptitude of the two generals Hindenburg and Ludendorff who, incapable of understanding the situation as it existed outside the confines of the battlefields, yet imposing their will on the statesmen, made the collapse of the monarchy inevitable and bore the ultimate responsibility for the extent of the catastrophe. Their behaviour throughout the last two years of the war and the subsequent intrigues of the Reichswehr generals explode beyond a shadow of a doubt the myth that the German Army held aloof from politics.

Throughout the existence of the republic there was a sound core of opinion that supported the Weimar Constitution, but the German political system up to 1918 had made it difficult, if not impossible, for leaders of stature to emerge among the members of the Reichstag. The tabulation of election results during the years that stretched between the Armistice and the appointment of Hitler as Chancellor reveal the crumbling away of the moderate if heterogeneous electorate and the swelling majorities of the extremists both to the right and to the left. During these first six years the external and internal difficulties of the Reich were sufficient to dismay the ablest of statesmen. The problem of reparations (Dr Eyck charges Keynes with unwittingly confirming the Germans in their belief that they had been cheated in this matter by the Allies) and the complete collapse of the currency consequent upon the passive resistance to the French and Belgian

occupation of the Ruhr were, however, overcome; and the Republic could have gone from strength to strength if the whole situation had not been vitiated by the mentality and outlook of the German people as a whole. The spirit of the German nation, wrote Bethmann Hollweg in 1915, had been "poisoned during the past twenty-five years by rodomontade," and Stresemann said to Lord D'Abernon when discussing the unpopularity of President Ebert, "The truth is the German people cannot stand a President in a high hat. They think he looks peculiar at a review. They must have a military uniform with plenty of orders."

Organised in political parties which refused to subordinate their personal interests to the national cause, such a people could not reconcile itself to defeat. It sought what consolation it might in indulging its propensity to myth-making. The army had been stabbed in the back by left-wing traitors, the national morale had been sapped by the Jews, all their troubles were due to the dictated Treaty of Versailles. The myth-maker grasped at the symbol ready to hand in the figure of Hindenburg, the *Generalfeldmarschall*, steady as a rock and garbed in the uniform of the old German Army, on whom they could focus all their longings for a return to the glorious days of the Hohenzollern Empire. But Dr Eyck shows that the whole nation was not blind to the danger. Hindenburg was elected by only a narrow majority. His candidature had seemed a master stroke of the reactionary politicians, but by choosing a Hohenzollern general to take the place of the democratic Ebert, the German people had regressed farther than they knew. They had taken an essential step on the way back to tribal primitivism.

Lord Wavell's Campaigns

THE MEDITERRANEAN AND THE MIDDLE EAST: Volume I. *The Early Successes Against Italy.*
By Major-General I. S. O. Playfair and others.
Her Majesty's Stationery Office. 531 pages. 35s.

THIS volume of the official history of the war, which is to be the first of a series of six dealing with the war in the Mediterranean and Middle East, is primarily the story of Lord Wavell's swift, daring and decisive campaigns in the Western Desert and Abyssinia in 1940-41. Yet it might well, from Lord Wavell's point of view, have borne the sub-title "Triumph and Tragedy." After recounting the battles, from Sidi Barrani to Amba Alagi, which won him praise from Rommel as the only British desert commander with a touch of genius, it closes in the looming shadow of the disastrous Greek expedition, into which Wavell was drawn against his will and against his judgment, and which was to be the prelude to his dismissal from the Middle East.

It is surely one of the saddest facts of the war that Sir Winston Churchill, who had never met Wavell until 1940, seemed unable to establish with this laconic, resolute commander a really close and easy working relationship. This showed itself only too plainly over Greece. One can appreciate the Prime Minister's desire not only to aid the Greeks, but to make use of the invaluable bridgehead on the Continent which their resistance in Albania had provided. Yet the resources were not available in the Middle East to do this and still hold Egypt, and it was Wavell's tragedy that in the end he wearied of trying to get London to see this fact. In the upshot he was left with much of the blame for not having prevented the Greek expedition, and with his days in the Middle East numbered. When he left Cairo, however, the desert armies lost the one British commander who might have matched Rommel in open warfare, and have matched him a year earlier than Alamein.

This volume does not probe deeply into these controversial issues. Indeed its weakness is that it is too much an account, too little a critique. But it is a vivid, straightforward, well-written account, presenting an excellent picture of those great days when Britain stood alone in the Middle East as much as in these islands, when in the desert and in the Abyssinian hills its forces plucked out of the nettle not only security, but opportunity and hope.

Economist in the House

STOCK MARKET ECONOMICS.
By M. S. Rix.
Pitman. 295 pages. 25s.

THE Stock Exchange deals in expectations. They can be as precise as the actuary's calculation of a net redemption yield to the nearest penny. They can be as imprecise as a hunch that something is happening in the stock of the Channel Tunnel Company. This book has to jump about from the precise to the imprecise in the same way; and it ends abruptly in a note on "special situations and selectivity" without any formal conclusion.

Miss Rix, in fact, has looked at the stock market through a prism, not through a microscope. All the colours of the spectrum are examined with care and the reader is presented with a mass of separate, though interrelated, rays of exposition and comment. The exposition is clear, though occasionally logic is lost in loose phrasing, as when Miss Rix suggests:

> it is possible for funds to reach the Stock Exchange without coming out of current savings at all. Assets of other kinds may be sold to buy marketable securities, or, very exceptionally, consumption may be reduced in order to make an extra purchase of securities.

It is difficult to see what this is meant to mean.

More serious imprecision mars her calculations about the value of stock exchange securities. Miss Rix notes that about half the private assets assessed for death duties are securities; she estimates (almost certainly underestimates) privately held national wealth at £25,000 million; and—after noting cursorily that not all the securities assessed for death duties are marketable—she suggests that about £12,000 million of the securities quoted on the London Stock Exchange may therefore be held by persons, and the other £13,000 million-odd by institutional investors. There are surely two major errors here. Something like one-third—not something like one-twenty-fifth—of the securities in the death duties sample seem likely to be non-quoted securities (national savings certificates, defence bonds, private company's shares, etc.); and many of the securities quoted in London are held abroad. Indeed a major fault of Miss Rix's book lies in her failure to emphasise that so large a proportion of the securities quoted in London are securities of companies operating abroad, and partly owned by overseas investors; the South Africans do own some Kaffirs.

Despite these faults, the comment throughout is liberal and sensible; it is a virtue, rather than a fault, that not all will agree with Miss Rix's scattered opinions. At the end, however, there remains a disappointing feeling of a lack of unity. Perhaps this is the fault of the subject and not of the writer. The Stock Exchange is an untidy place to look at, and it is an untidy place to understand. By examining the organisation and the functions of the Stock Exchange, by relating them to investment decisions and risk taking, and by analysing speculation and the other (far more important) forces which determine the course of stock market prices, Miss Rix has done something to make it a tidier place both for the initiated and the untrained observer. She has written what she set out to write—a standard text book. As that, and in the main, her book is a success.

Masters and Men

AN INTRODUCTION TO THE STUDY OF INDUSTRIAL RELATIONS.
By J. Henry Richardson.
Allen and Unwin. 442 pages. 30s.

IN his new work Mr Richardson covers the whole field of industrial relations. He is well qualified to write an encyclopedia on this subject, because not only is he Montague Burton Professor of Industrial Relations at Leeds University, ut he was on the staff of the International Labour Office for nine years and is a member of several wage boards. He gives a short and very selective bibliography of recent publications, which numbers 128 books and reports.

Some industrialists in this country are beginning to wonder whether personnel management has not been overdone, and there are signs that more attention is being paid to the training of foremen in human relations, rather than increasing the size of the personnel department. It is unlikely that Mr Richardson would agree with this, but he does emphasise the need for close co-operation with line management. He notes that the "hail fellow well met type" has been replaced by persons with natural dignity of manner, a sense of humour and ability to gain the confidence of workers and management.

On the vexed question of time study he quotes America's Congress of Industrial Relations as saying

> With Union protection and our demand for better production, efficiency and scientific management can be placed at the services of labour. The time study itself is not injurious if properly handled. It is a technique, an instrument—just like a gauge or a caliper.

This attitude of mind on the part of American unions and their acquiescence in evaluating jobs has made it possible for many American factories engaged on mass production to abandon piecework and bonus incentive schemes, with the result of a considerable saving in overheads and a reduction in union unrest.

Dr Richardson devotes a chapter to profit sharing and co-partnership, a subject of some political interest at the present time. He notes that although some existing schemes have worked successfully for fifty years or more, the "death rate" has been high. He regards these schemes as much less effective than systems of piecework or payment by results in their effect on productivity, as the payments are too remote and infrequent to affect day-to-day work.

Dealing with a national wages policy, he traces the gradual development of national wages rates from local and district rates, and remarks that during the Second World War most governments applied some sort of wages policy, mainly designed to keep inflation within limits. He agrees that, in theory, it would be possible for a national authority to fix wages for unskilled workers throughout all industries and then fix "plus rates" for semi-skilled and skilled workers. This would work in a totalitarian country, or in a country where the industrial structure is simple, or where employers and workers are not sufficiently organised for effective collective bargaining. In a well-organised industrial democracy, enforcement of unpopular decisions by a central authority would be impracticable.

Eighty-four pages of this book are devoted to trade unions: organisation, structure and government, the closed shop, legal position, political action and so on. But it is odd that Mr Richardson has been able to allot seven pages only to employers' organisations. He explains this by reminding his readers of the privacy with which these bodies conduct their affairs. Their defensive and conservative attitudes are in strong contrast with the publicity in which the trade unions conduct their business. As Mr Richardson rightly remarks, their development and activities are as significant in industrial relations as those of the trade unions. Nevertheless, he does not mention the British Employers' Confederation, although this body is strongly represented on the National Joint Advisory Council to the Minister of Labour, the National Production Council of the Chancellor of the Exchequer, the British Productivity Council and the International Labour Office Conferences. Might it not be as well for the next wave of research workers to turn their attention to this virgin field instead of to the somewhat overworked subjects of trade unionism and joint consultation?

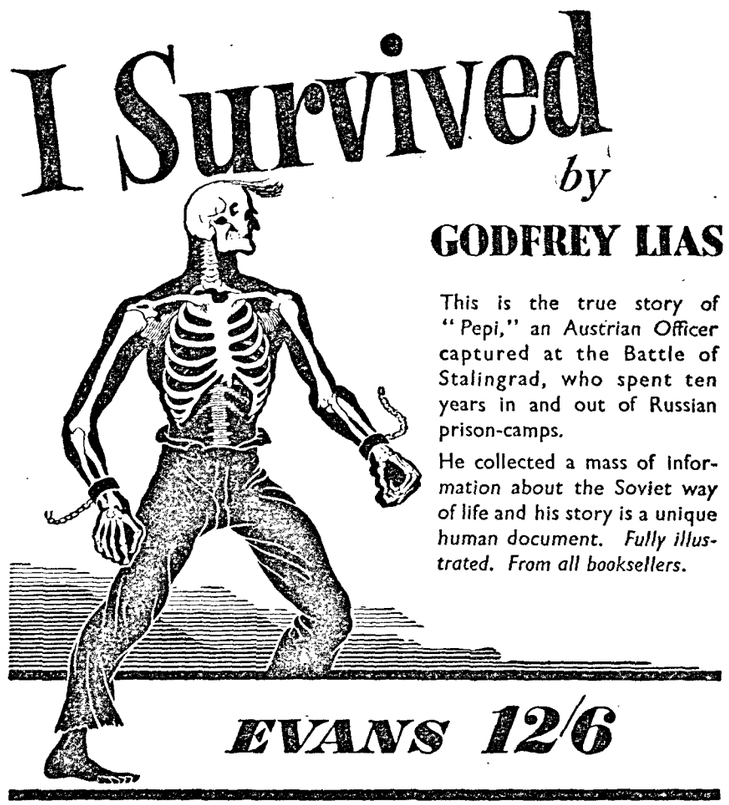
Green Pastures

DEVON.
By W. G. Hoskins.
Collins. 620 pages. 2 gns.

EVERY year that passes makes it more difficult to catch and record the authentic flavour of English country life. Here and there in counties like Devon old men can still be found to tell rambling anecdotes of life as it was in the old days, and (for the benefit of B.B.C. recording vans) to give cracked-voiced recitals of once popular local work-songs (very different affairs from the sophisticated versions given in the song books). But they are the last of their kind. It is the more important that we should get down a comprehensive and scholarly panorama of English country life while there is still time—before the havoc wrought by radio, bus and cinema finally obliterates the boundary between local history and antiquarianism.

On form to date, the survey which is being edited by Professor Simmons shows every sign of filling this need. Professor Hoskins' book is the second of the series. He tells us that he spent five years tramping Devon and visited each single hamlet and village. His book therefore carries the confident stamp of familiarity with every nook and cranny. It is full of zestful flashes of description. It is comprehensive. It is true to fact and atmosphere. It is also a prize example of the art, comparatively new to England, of organic history. The author has tried to fuse within the compass of one volume all the interrelated aspects of trade and politics, of land, industry and architecture. The result might well have been a mess. Instead, Professor Hoskins has given us the real inwardness of Devon.

The history of Devon is really the history of its cloth trade. Until the end of the fourteenth century, Devon was a sleepy backwater. But by the reign of the first Elizabeth the county had reached a pinnacle of importance. Its great men, with their broad country accents, were thronging the court. In population it was the second or third county of England. It was the base against Spain and the centre for adventure and buccaneering in the west. All this was made possible by the busy mills that brought wealth and trade. The wars of the eighteenth century and the York-



shire steam mills of the nineteenth killed the prosperity, and Devon has gone back to its sleepy corner.

Few places in the world can have relapsed into so comfortable a middle age. Devon has survived as a county of green fields, holiday resorts and retired professional persons. The thick crop of perpendicular churches with their wealth of carved screens (those that have survived the atrocities of our grandfathers) are the only landmark of former wealth. Professor Hoskins writes of Devon's architecture and its variety of building materials with obvious knowledge and pleasure. But one question he does not seem to have asked himself: Where are all the great country houses one might have expected? Some great houses exist and many smaller ones, but these hardly match the county's wealth or the magnificence of other comparable parts of England. Did even the Devonian, when he had the chance, tend to salt his money away in more amusing places?

Restatement of Belief

THE WESTERN DILEMMA.
By Alan Gordon Smith.
Longmans. 186 pages. 11s. 6d.

EXPOSING his dilemma in an introductory chapter Mr Smith defines western civilisation as an amalgam of pagan and Christian heritages which are at odds with one another but are not intrinsically incompatible. Since it is the Christian component that is now threatened and called in question, he addresses himself to the question whether Christianity is true. If it is not, it will die away and, whatever else results, the West will be different; if on the other hand it is true, then it is extremely important to reaffirm and reassert this truth. What follows is divided into two parts called Belief in Reason and Reason in Belief. In the first part Mr Smith sets out to establish belief in reason, to restore reason to a lost throne, to insist that truth can be known: "it is impossible to believe that Christianity is true without first showing that something can be true." The "insane" root of the trouble is Descartes' severance of mind from body, and the substance of this part of the book is a vigorous attack on Idealism and Positivism, at the conclusion of which Mr Smith arrives at a conception of the physical universe as a process of becoming, caused by a continuous creative principle which is outside this process and timeless. Whether you call it God or not, Mr Smith does not care. What is important for his argument is the assertion that it is a deduced logical necessity.

The main argument of the second half of the book is that the rational explanation of the historical evidence points convincingly to the truth of Christian, and in particular of Roman Catholic, beliefs. Mr Smith thinks it most improbable that natural laws not yet discovered will ever suffice to explain all the strange facts in our experience; *per contra* he claims that these facts are most adequately explained upon the rationally inferred Christian hypothesis. Mr Smith writes clearly and sometimes eloquently. His appeal is to the head, but it is perhaps unlikely to secure a response except from those who already share his faith and dispositions.

Shorter Notices

THE LITERATURE OF THE UNITED STATES.
By Marcus Cunliffe.
Penguin. 384 pages. 3s. 6d.

This "Penguin" is admirable in every way. It divides the American writers into major and minor prophets. It is in tune with the present period in attaching to Melville and Walt Whitman an importance that would have been unthinkable in the formal society of sixty years ago. At the same time the author is exhaustive in his curiosity about the moderns, such as William Faulkner. A lively book like this, full of an eagerness to explain, make clear and vindicate, reminds us once more what boundless treasures of literature the Colossus of the West has already amassed. It is a curious reflection that while the literature produced by coloured writers has been so varied in its accomplishment none of it has yet been great in the way that Melville and Mark Twain in their different ways are great.

Letters to the Editor

Romance by the Jar

SIR—Two comments on the above article in your issue of April 10th may not be out of place.

The first relates to the possible influence of the new Merchandise Marks Act on the advertising of cosmetics. In this connection it is interesting to note that in 1939 cosmetics were included in the definition of drugs in the Canadian food and drugs legislation, and accordingly the misleading labelling and advertising of cosmetics became an offence. The Canadian Food and Drugs Act of 1953, however, now deals separately with foods, drugs, cosmetics and therapeutic devices in this respect, and though identical provisions as to deception still apply to foods, drugs and devices, they no longer applies to cosmetics. As Mr R. E. Curran, QC, remarks,

> It is not felt that the public is actually deceived by the glamorous and exaggerated advertising which is ordinarily associated with cosmetics, and a cosmetic which does not at least promise to restore the appearance of youth or perhaps to improve on nature is the exception rather than the rule.

It remains to be seen whether British courts will come to share this realistic view. Should they do so, our manufacturers will have little to fear from the new Merchandise Marks Act.

Secondly, it is questionable whether the suggested labelling of cosmetics which contain active and potentially dangerous medicaments such as sex hormones, in accordance with the requirements of the Medicine and Pharmacy Act, would afford any real protection to the user. There seems little merit in a label statement that a cosmetic contains hormones, particularly when the information may only follow careful scrutiny of the label, unless the reader is aware also of the health hazard in the use of such products. This would certainly not be common knowledge, and it is therefore to be hoped that any report from the Medical Research Council will appreciate this and err, if anything, on the side of caution. Here again the example of Canadian legislation might be examined with advantage. The sale of such products is there dealt with by special regulations which ensure that before sale they must be demonstrably free from any systemic effect, and that on sale they must comply with special labelling regulations which include a declaration of the hormone potency and proper directions for use.

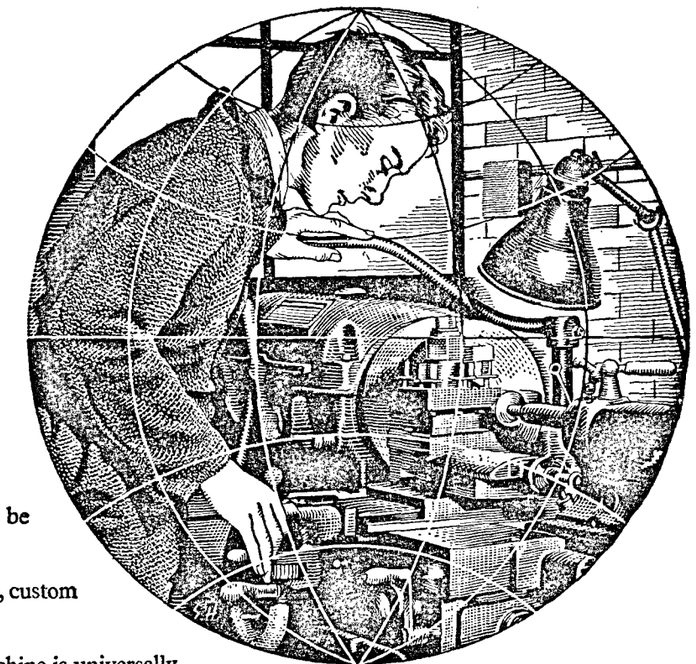
In this country cosmetics are still outside the law applying to foods and drugs, and the aggrieved purchaser's remedy lies in a civil action. It might well be asked whether the opportunity ought not to have been taken in the Food and Drugs (Amendment) Bill, now before Parliament, to follow these developments in Canadian (and United States) legislation, so as to make "foods and drugs authorities" here, who administer and enforce this legislation, responsible in like manner for protecting the public from hidden dangers on the cosmetic front.—Yours faithfully,

Purley CHARLES A. ADAMS

Travel Agents

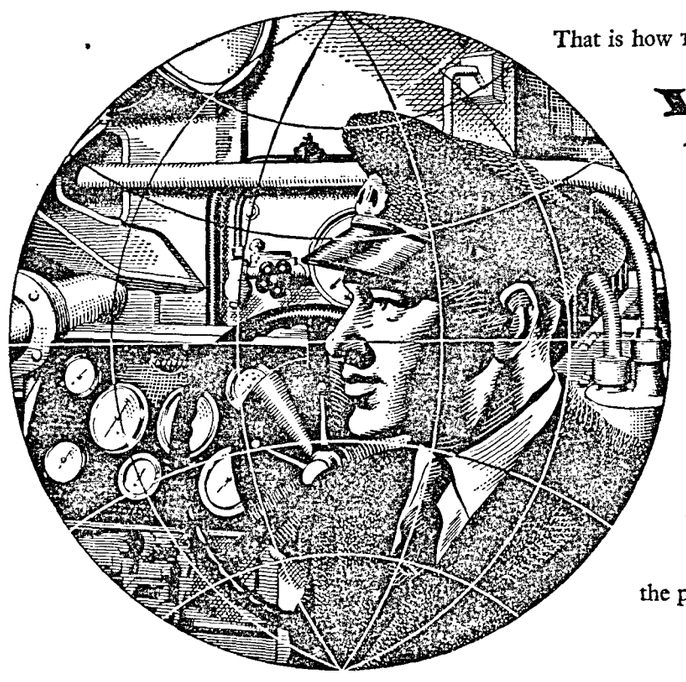
SIR—There are more than 550 travel offices throughout Britain which maintain the highest standards of service demanded by membership of this Association. Our agents are confident that Mr Mackenzie's experience is very exceptional. Yet his warning should be heeded. We therefore appeal to all who use the services of a travel agency (*a*) to deal only with a well-established and reputable agency and (*b*) to check quotations thoroughly to ensure that they cover exactly what is required before travelling.—Yours faithfully,

A. R. COLMER
Association of British Travel Agents, Ltd., W.1.



Worlds apart

Here are the makers of machines, there the users. Between the two there may be oceans, vast distances, barriers of language, custom and mode of life. But the voice of the machine is universally understood, nowhere better than in ships at sea, where propulsion and generation depend on diesel power.



That is how THE BRUSH GROUP plays its part in bringing

Worlds together

Through its world-wide service organisation, information passes from maker to user and from user to maker—a fruitful two-way traffic that has, over the years, built up world-wide confidence in the products of THE BRUSH GROUP.

Every day some 11,000 travellers arrive in New York by air. When their plane wings in over lower Manhattan, this dramatic, bird's-eye view of the city's financial centre is spread out before them.

Here is the head office of the Chase National Bank where businessmen and bankers from abroad are welcomed every day.

At Chase these visitors find officials who are familiar with trade developments and business methods in foreign markets as well as in all parts of the United States. They also find in New York a network of Chase branches whose staffs are in touch with the diverse business interests and enterprises of the city.

Chase stands first in loans to American industry, and for many years has also been number one in correspondent bank relationships. Almost half of the banks in the States which maintain banking connections in New York have selected the Chase National as depository.

If you do business in the States, why don't you talk to the people at Chase?

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Inquest on Indo-China

Washington, D.C.

WHATEVER it was that happened to American foreign policy in the last three weeks—whether it was a "defeat," as so many correspondents both in Washington and in Geneva called it, a kind of "rolling readjustment," as Mr Dulles seemed to suggest when he got back from Europe, or a descent from an untenable oratorical position—it was something that should make the Administration overhaul its machinery both for making policy and for communicating with its allies. The first task is to repair, as quickly as possible, the damage that has been done, and all the help the allies can give will be needed to do that, but something else of the same kind will happen again unless the lessons of the Indo-Chinese crisis are learned.

Over the past year there has been a steady stream of articles explaining how the National Security Council is at last being properly used as the supreme policy-making body of the government. But the present muddle has shown that it is not in fact working properly. Again and again, during the last few weeks, it has been said that the council had made the decision that the fall of Indo-China would mean the fall of the whole of South-east Asia and that this could not be allowed to happen. Information about this decision usually seems to have come from the Department of Defence and, in particular, from the men close to Admiral Radford, chairman of the Joint Chiefs of Staff. It was taken for granted that they knew what they were talking about and Mr Walter Lippmann, in commenting on the decision, pointed out that it was only the expression of an objective and that there was no indication that it had been translated into policies. When the test came it turned out that there were no policies because, as it was also discovered, there had been no decision.

There were, it is understood, two papers, one produced by the Joint Chiefs of Staff and one by the State Department, asserting respectively that the defence of Indo-China was essential to that of South-east Asia and that there was no possible compromise which would prevent the eventual fall of Indo-China. It seems that neither paper was ever accepted, or rejected, as a decision of the National Security Council—or for that matter, questioned. But they seem to have been accepted by the Vice-President and by Admiral Radford and they were the justification of a number of statements which made the country, and the world, think that a policy of intervention had been decided on.

The President himself never said anything decisive on the subject. On one occasion he said that South-east Asia was of the most transcendent importance and on another that he could conceive of no greater tragedy than for the United States to get heavily involved there. But nobody inquired of him whether he thought that the transcendent importance of the region justified taking the risk of so great a tragedy. And he continued to say that the United States would not be involved except by a decision of Congress. When the moment for action came, therefore, there was no action because there was no decision on which to base it.

★

The repairs to the machinery of the National Security Council, however, can be undertaken without great difficulty once it is realised how opinions can develop into attitudes and then, unofficially and imperceptibly, into policies. This happens when officials who would like to argue against an opinion popular in Republican congressional circles—to give an example from the present case, the opinion that no solution in Indo-China is possible without the complete defeat of the Viet Minh—are inhibited by fear that they might be reported to Senator McCarthy. The machinery for communicating and co-operating with the allies will take longer to get back into working order because in Congress there are many who refuse to allow it to work, while, at the same time, they demand that it start working immediately under exclusively American management.

Senator Knowland is never as happy as when he is accusing the British government of contemplating a "Far Eastern Munich," but he seems to have forgotten not only what the Prime Minister and Mr Eden thought in 1938 but also the views of his family's newspaper, the *Oakland Tribune*, at that time. Mr Knowland was then assistant to his father, the owner of the paper, which gave "the highest praise" to Mr Chamberlain when he first decided to fly to Germany to meet Hitler. A few days later it said:

> To those responsible for today's conference at Munich too much credit cannot be accorded. . . . It may be necessary for sacrifices to be made in certain quarters but when the alternatives are countless human lives and the destruction of untold millions in property values, such sacrifices are worthwhile. This is an eventful day in world history.

The Senator is no less positive today than he was sixteen years ago, and it is to a great extent his opinions, and those of other influential Senators, which have encouraged the Administration in what has been called its policy of "getting domestic political kudos out of appearing to dominate our allies." Time and again since he came to office Mr Dulles has scared those allies by his public statements designed for domestic consumption and then soothed their governments by what he had to say in private. This time

the system did not work, partly because there was not enough time between its two stages and partly because he seems to have been almost as disconcerting in private as he had been in public.

This time, also, the allies had no forewarning of what American policy on Indo-China was because there had never been, during the whole crisis, a decision on it which could be communicated to them. The Administration could not mobilise the western alliance at short notice because the machinery which had been used so often since the end of the war had been allowed to rust. Mutual trust had given way to something very like mutual suspicion under the barrage of unexplained, but alarming, policy slogans. It is true, as the President said last week, that before Mr Dulles made his speech of March 29th, " our principal allies were advised in advance "—a few hours in advance—but advising is not consulting and "our principal allies," not to mention some other countries, had grown used to being consulted before the announcement of policies, such as that of " united action," in which they would presumably be involved.

The result was that the Administration was taken by surprise when the French asked for help from American aircraft. Many people in Washington had been afraid that, encouraged by the legend that Mr Dulles had bluffed the Chinese into signing the Korean armistice by dropping hints in India which he presumed would be passed on to Peking, the Administration was trying another and bigger bluff and that the enemy would call it. Some of these people are now commenting rather bitterly that they had never expected it to be called by the French. But there is no reason to believe that the French thought they were calling a bluff and plenty of reason to believe that they were taking the Administration at its word or, at least, Admiral Radford at his. Somebody, as Mr Lippmann said, blundered.

Old Guard *versus* New Blood

FROM A CORRESPONDENT IN OHIO

THE death of Senator Taft last July left an even bigger void in the Republican party of Ohio than it did in the Congress in Washington. Last week, in the primary election at which they picked their candidate for the senatorial contest next November, the Republicans of Ohio chose Representative George Bender as the man who will try to fill this void. Whether he can succeed is at best doubtful. The undistinguished Mr Bender is a veteran politician of the old school, who is now serving his seventh two-year term in the House of Representatives. There his outstanding achievement has been to rectify a legal oversight under which Ohio was not admitted to the Union when it became a state 150 years ago, and his main concern at present is to unearth racketeers in trade unions. The country knows Mr Bender only as Mr Taft's cheer-leader at the Republican National Convention in 1952, where his hoarse voice and incessant ringing of a school bell were unforgettably impressed upon television audiences.

Mr Bender had the backing of President Eisenhower's Secretary of the Treasury and of other leading bankers and industrialists in Cleveland, Ohio's largest city, where he has been for many years the Republican political boss. He was endorsed by most of the official Republican organisations in the state and as a result his opponent, Mr William Saxbe, never had a real chance in the primary election even though he fought a vigorous campaign. Mr Saxbe had the support of several big city newspapers, but was handicapped, in a party with a strong sense of discipline, by lack of organisation and by being virtually unknown, even though he is Speaker of the House in the Ohio State Legislature. A hard-working young man from the little town of Mechanicsburg, he is now serving his fourth two-year term in the State Legislature, where he has distinguished himself by waging war on lobbyists. Mr Saxbe is as representative of the newer blood in the mid western Republican party as is Mr Bender of the old guard.

★

The contest was one of personalities, not of issues : there were no differences of policy between the two men. Both promised to stand squarely behind the President and his programme at home and abroad (Mr Bender's " 100 per cent pro-Eisenhower " position is unusual, though not unique, among mid western Republicans). Both attacked the Democrats for " tolerating subversives in government," yet both embraced what seems to be emerging as the view of McCarthyism held by the majority of Republicans—that the Wisconsin Senator did a good job of rooting out Communists under the Truman Administration but that, because of his methods, he is now doing harm.

Mr Saxbe described his opponent succinctly as " a political hack," arguing that Mr Bender could not be elected to the US Senate because he lacked all appeal to Ohio's considerable body of independent voters. Not only independents, but many Republicans have been saying that they " won't vote for Boss Bender to fill Bob Taft's shoes," and Mr Bender's inability to inspire enthusiasm even among party regulars was demonstrated by the light vote in the primary election. It was significant that during the campaign, even though Mr Bender made much of a tribute paid to him by the late Senator Taft for " loyalty and devotion," a young member of the Senator's law firm was Mr Saxbe's manager in Cincinnati. And the Senator's son, who is this year following in his father's footsteps by running for election to the Ohio Legislature, publicly endorsed Mr Bender's rival. Many others who did the same believe that Mr Bender typifies the " old guardism " that they hold responsible for Senator Taft's failure to win the presidential nomination in 1952.

This Republican primary was, in fact, a feud between the old guard and the young bloods in the Grand Old Party. The old guard won, as it usually does in the GOP, but the standard bearer of the young bloods, Mr Saxbe, made a very creditable showing. He received 188,750 votes, to Mr Bender's 254,000. For a first time out, and against the state organisation, that performance was impressive enough to suggest that, if Mr Bender is defeated in November, Mr Saxbe may be his party's nominee at the next senatorial election in 1956.

Meanwhile the young bloods, and some of their elders too, have to decide whether to support a political boss who, they feel, misrepresents the party of Lincoln, Eisenhower and even Bob Taft, or to sit on their voting hands in November, at the risk of seeing Ohio send a Democrat to Washington. Their sentiments, ranging from apathy to disgust, at the result of the primary are shared by many of the political independents and former Democrats who in 1952 formed a group, " Citizens for Eisenhower," which has been revived for this year's congressional campaign. The independent voters hold the balance of power in Ohio, a politically doubtful state where about 40 per cent of the voters are normally Democratic and 35 per cent Republican and which more often than not elects a Democratic Governor and Republic Senators.

★

This explains why Mr Saxbe would probably have made a better showing than will Representative Bender in the election race that is beginning, a race which may well decide which party will control the now evenly balanced US Senate in Washington for the next two years. The Democratic nominee, the incumbent Senator, Mr Thomas Burke, owes his present interim appointment to Mr Frank Lausche, an open admirer of Robert Taft for many years, who is now running for a fifth term as Ohio's Democratic Governor. Like Governor Lausche, Senator Burke is a middle-of-the-roader and has been cultivating an independent following in Ohio. His motto is: " Be Americans first, and Democrats and Republicans second."

Anticipating his opponent's argument that more Republicans are needed in Washington to support the Administration's programme, Mr Burke points out that Republican disunity in Congress has held up many important measures. His current attitude towards the November election was summed up by the late political commentator, Mark Sullivan: " Two things will decide the outcome—the state of employment and the price of wheat on Election Day." Neither criterion is clear as yet, and meanwhile the Senator is being careful not to exaggerate the importance of the business recession for political advantage. He does not think the country is sliding into a depression, but " from a super-boom into just a boom " ; however, " a mere boom won't satisfy the voters in '54 ". On foreign policy Mr Burke, like both Mr Bender and Mr Saxbe, is vigorously opposed to sending any American troops to Indo-China. Also like them, he has said nothing to encourage the " new isolationism " in Ohio, which is less a fixed public opinion than an emotional reaction to the losses in Korea and to foreign press criticism of America and Americans.

Seaway In, Taft-Hartley Out

THE only person in Washington, or for that matter in Ottawa, who has shown any reaction more marked than relief at the congressional approval which has at long last been given to the St Lawrence Seaway project is the President himself. He after all came fresh to a controversy that after fifty years had developed a middle-aged spread ; it was his enthusiasm, together with the impetus of the midwestern steel industry's need for iron ore from Labrador and of the knowledge that Canada was in any case going ahead on its own, that finally pushed the legislation past the railway lobbyists and east coast port interests that have repeatedly blocked it.

While the House of Representatives was giving the President the seaway he wanted, the Senate was denying him the amendments to the Taft-Hartley Labour Act which he also wanted, although apparently in this case not enough to bring the necessary pressure to bear on Congress. The Senate, by 50 votes to 42, with the four remaining members paired, sent the amending Bill back to committee and thus almost certainly killed the legislation for this session, without even paying the President the compliment of debating his proposals. The committee had refused to consider any amendments other than those he had recommended, which clung firmly to he middle of the road and aroused no enthusiasm on either side. This refusal was the official reason given by the Democrats for their unanimous vote—the first, it is said, in over twenty years—for recommittal.

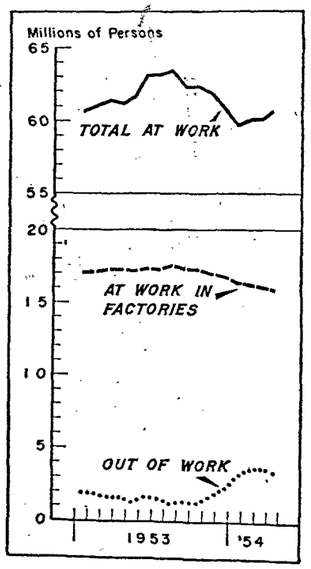
But there was nothing unanimous about the real reasons for this unanimity. The northern liberals, who represent urban areas with heavy labour votes, thought that the Bill as it stood was anti-labour and that if it were debated, especially if it got as far as the House, amendments even more unfavourable to the trade unions would be added. Such amendments would have been welcomed by the conservative southern Democrats who found the committee's recommendations too kind to labour. But these Southerners were turned against the Bill by an amendment sponsored by the two Senators from New York, the Republican Mr Ives and the Democratic Mr Lehman, which would have prevented racial discrimination in employment.

It has in fact been suggested that this amendment was a parliamentary manœuvre undertaken for the express purpose of making it certain that the Bill would be sent back to committee. There are indeed many Republicans who are happy that they were not forced to vote on some of the clauses ; it would have been difficult to take sides publicly without offending either the businessmen who may contribute to campaign funds next November or the trade unionists who may vote Republican then. But the Democrats will be able to argue that the Republicans have not kept their promise to amend the Taft-Hartley Act. And the President has been given an ominous warning of what happens to his programme when he fails to give a strong lead and when the Democrats bring themselves to unite in opposing him.

In Field, Not Factory

THE recent growth of confidence in the economic prospects for the rest of this year culminated, if anything so restrained can be said to culminate, in a report last week to the Secretary of Commerce from his Business Advisory Council that from now on a gradual recovery was to be expected. At the same time, it was announced that unemployment had declined substantially, for the first time since last summer, in April and had continued to do so since then. The crucial month, as regards these figures, will be June, when the civilian labour force, which has been growing slowly all this year, will be swollen by the young people leaving school and college. Meanwhile, however, last week's statistics at first sight seemed to take the point out of this week's full employment conference, sponsored by the Congress of Industrial Organisations, to demand that the Administration stem the " drift into depression " by increasing tax concessions, minimum wages, welfare benefits and spending on public works.

On closer examination, however, the latest employment figures were not so reassuring. For the first time the Census Bureau, which covers all types of workers by surveying sample households, the Bureau of Labour Statistics, which deals with wage earners in non-agricultural work by means of reports from employers, and the Bureau of Employment Security, which surveys insured workers only, issued their figures simultaneously. From these it could be seen that the fall in unemployment in the month was purely seasonal: 200,000 more people were working on farms and 100,000 more in building, both activities that bloom in the spring, while retail shops had taken on about 140,000 additional sales clerks for the Easter trade. But the number of men in mines had gone down by 23,000, and of those employed in manufacturing by about 250,000; more than half of these had been laid off by factories making durable goods, output of which does not normally decline at this time of year. These indications that the downward trend of employment was in fact continuing confirmed the leaders of the industrial trade unionists and of the miners in their belief that no economic recovery was in sight and that the government should come to the rescue of their members.



Only about one out of four workers is employed in manufacturing or mining, but they are concentrated in certain areas where the effect of the present unemployment is felt much more severely than over the country as a whole. The latest assessment, at the end of April, put 35 large labour markets and 56 smaller ones, nearly all of them around New England textile towns, Michigan automobile centres or West Virginian coal mines, in the category of having a substantial labour surplus. This means that over 6 per cent, in many cases very much over, of the labour force is out of work. In March unemployment in the country as a whole was very near the dangerous 6 per cent, but in April it dropped to 5.4 per cent.

Democrats on the Offensive

OPTIMISM and unity prevailed among the Democrats who gathered last week in Washington and later in New York for their most important party conferences since the 1952 convention at Chicago. After attending the National Committee meetings, the $100-a-plate Jefferson-Jackson dinner, the celebration of Mr Truman's 70th birthday, and the panel discussions on political issues, Democratic leaders concluded that the trend which began with unexpected victories in elections in Wisconsin and New Jersey last autumn will culminate in the capture by their party of a majority of seats in the House of Representatives, and perhaps even in the Senate, in next November's general election. Evidence for these hopes of victory, which even to unbiased observers seem for the moment to be justified, is provided by public opinion polls in various states, which have recorded a decided drop in the popularity of the Eisenhower Administration, and by recent Democratic victories in local elections in districts which are traditionally Republican.

But the optimism of the Democrats was based even more on the divisions over foreign and domestic policy within the Republican party, especially between the administrative and congressional branches; these are being publicly revealed by the battle between Senator McCarthy and the Army, by the slow progress of the President's legislative programme, and by the arguments over what action should be taken in Indo-China. Among the national issues on which the Democrats have chosen to launch their campaign against the Republicans next November are the Administration's farm policy, under which agricultural price supports would be lowered; its tax programme, providing exemptions for dividends and profits rather than relief for those in low income groups; its public power "give away," favouring private rather than federal development and distribution of hydro-electricity, and its "new look" foreign policy. On Indo-China, the Democrats have been taking a strong stand against the Administration, thus ending, at least temporarily, the bipartisanship which they have supported during the past eighteen months. Democratic leaders from both Senate and House joined Mr Truman in scathing criticism; even Senator Lyndon Johnson, of Texas, who has been charged by his colleagues with being too cautious in his approach to the Administration, dared to take part, now that he is virtually certain of no serious contest for his seat.

Party morale has also recently been strengthened by the complete solidarity of the Democrats in the Senate against the amendments to the Taft-Hartley Act, by the close co-operation between northern and southern Democrats in the congressional arguments over farm price supports and income tax concessions, and by the overwhelming victory of the liberal Senator Sparkman over his conservative southern opponent in the Democratic primary election in Alabama. As they take the offensive in a full-scale attack upon what Representative Rayburn, appropriating a Republican slogan of 1952, described as "the biggest mess that Washington has ever witnessed," the Democrats are not only confident but more united than they have been for years.

Butter Embarrassment

THE Administration's desperation at its steadily mounting stocks of butter—which now total some 360 million pounds—has forced it to brave the anger of the American housewife and offer the butter for sale to foreign buyers at world market prices; the domestic retail price of butter now varies between 63 and 69 cents a pound compared with a probable export price of 47 cents. Great prominence has

SUPER COMFORT, SUPER SPEED, SUPER LUXURY

Now you can fly to Canada by *TCA*

SUPER Constellation

THE ONLY *SUPER* CONSTELLATION SERVICE TO CANADA FROM LONDON OR GLASGOW

Now you can fly overnight to Canada by one of the world's finest aircraft—TCA *Super* Constellation. Aboard TCA *Super* Constellations you can travel *either* First Class in exceptional privacy and luxury, *or* Tourist Class in spacious and extremely comfortable surroundings. London to Montreal four evenings a week. Daily service from June 15. Consult your Travel Agent for full details of these new TCA *Super* Constellation services.

Club Lounge for First Class Passengers

FIRST CLASS ACCOMMODATION
Most luxurious ever provided for the air traveller. Fully-reclining Siesta seats. Separate Club Lounge. Sumptuous appointments. Fine food, superb wines. Special staff to answer your every nod.

TOURIST ACCOMMODATION
A new standard in comfort at the lowest fares. Two cabins, lots of elbow room. Specially designed, deep-cushioned seats. Complimentary meals. Bar service at reasonable prices.

The Quality Cigarette

[3P 121]

"This South African Sherry is better than ever!

Yes, it's remarkable how they manage to keep on shipping finer and finer wine year after year.

How do they do it?

Simply by taking infinite care and not trying to hurry the job. These lovely South African sherries we are enjoying in this country now are the reward of the infinite patience displayed back through the years by those Wine Farmers at the Cape.

You seem to know a great deal about it!

You remember I went to South Africa last year. I happened to meet a man who took me round the wonderful Wineries there where millions of gallons were being matured for the British market.

How long do they mature them?

The best wines are kept seven years at least before they are shipped. The South African Wine Farmers are determined—in spite of the demands from all over the world—to hold back and let the good stuff mature properly. You see their climate and soil are simply ideal for wine-growing, but it is necessary not only to produce lovely wine but, if you establish a name and reputation, to provide for keeping up the quality over the years.

These South African people certainly keep on improving their wines—especially their sherry. It's a credit to them.

That's what comes of selecting and maturing and waiting and keeping on doing that, and the longer it goes on the better the quality becomes.

I must say this is one of the finest Sherries I've ever tasted.

Well, keep on drinking the best South African Sherries and you will find the quality will astonish you."

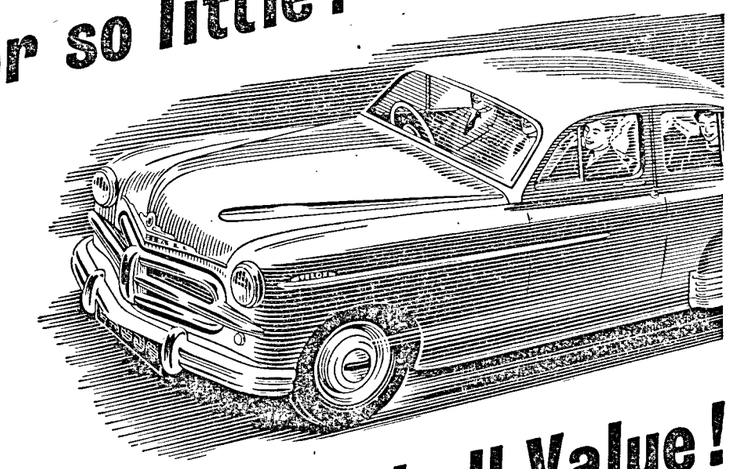
(LONDON) LIMITED

SAWFA

So far...for so little!



28 m.p.g. on the Velox? 33 m.p.g. on the Wyvern? No manufacturer can determine what figures an owner will get. The answer depends on traffic conditions, hills, average speeds—and the driver. But within these variables one constant stands out. The new Vauxhalls, with their brilliant "square" engines, take you farther on less fuel than other cars of similar size and power.★

They are spacious five to six seaters, and combine economy, speed and safe performance. Ask your Vauxhall dealer for a demonstration run.

• • •

★*In R.A.C. observed petrol consumption tests the Velox achieved 28.6 m.p.g. at an* average *speed of 40.8 m.p.h.; the Wyvern 33.4 m.p.g. at an* average *speed of 30.5 m.p.h.*

That's Vauxhall Value!

THE 6-CYLINDER VELOX
Maximum speed of 80 m.p.h., spacious 5/6 seater. Length 14 ft. 4 ins. turning circle 38 ft., £535 plus £224.0.10 P.T.

THE 4-CYLINDER WYVERN
Same size body and same modern styling as the Velox. Maximum speed of 70 m.p.h. £495 plus £207.7.6 P.T.

Vauxhall Motors Ltd · Luton · Beds

USE ALL THE POWER YOU PAID FOR

Nothing put into petrol can give your engine more power than the maker originally built there. But you can use all the power he meant your car to have. The difference when you do is a revelation.

Shell with I·C·A has already worked this change in millions of cars. Many motorists have been surprised by the improvement. This is because they never realised how their cars were being held back by engine deposits, which cause pre-ignition and plug failure. The I·C·A in Shell—and Shell only—makes these deposits harmless: it prevents both pre-ignition and the plug failure. In these two ways it releases the engine's full smooth power.

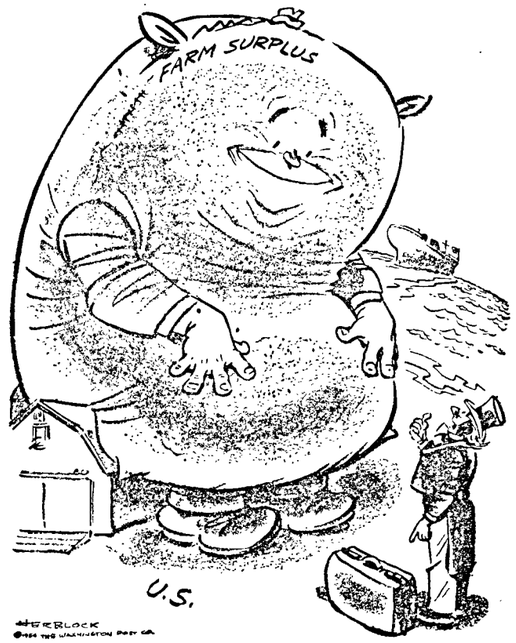
SHELL
WITH
I C A

Try the two tankful test **First** fill up with Shell with I·C·A (Ignition Control Additive). Do not expect an immediate improvement, but **Second** fill up with Shell again. This will give I·C·A a chance to work on the deposits already in your cylinders. The time I·C·A takes to work varies from car to car. (It depends on the type of engine and the state it's in.) But you'll know when the process is finished, for you'll notice the improvement in your car.

IT'S A REVELATION

been given to the proposed sale of 40 million pounds of butter to the United Kingdom, although from the British end the deal appears to be still at a very nebulous stage. The Soviet Union has already shown interest in buying American butter, but these offers have been turned down; the official attitude to purchasers from other countries behind the "Iron Curtain" is less definite. The Agriculture Department is concerned that an aggressive selling policy on its part may be interpreted elsewhere as "dumping," and is anxious, for diplomatic reasons, to dispose of this surplus—which is equivalent to more than one-third of total world butter exports in one year—in a way that will not significantly upset the pattern of trade.

How Would You Like to Be a Good-will Ambassador?



This move, which marks the beginning of a more extensive policy of unleashing US surpluses on world markets, follows the failure so far to devise any system within the framework of the present farm price support laws either of disposing of the government-owned surplus of butter on the domestic market or of preventing it from growing in size day by day. Government economists have been working overtime to evolve a scheme for selling the butter to the public at cut rates which would offend neither the farmer, the trader, the taxpayer, nor Congress. Two possible schemes emerged but Mr Benson, the Secretary of Agriculture, has now rejected both of them on the grounds that they would upset the market structure and would be very costly to implement. Meanwhile, the reduction in the government support price for butter on April 1st, which brought down the retail price by 10 to 15 cents a pound, has scarcely touched the housewife's loyalty to its cheaper competitor—margarine. And Mr Benson's warning that butter stocks may double in the next twelve months suggests that he expects little help from the domestic consumer.

The immediate problem is to end the current rate of accumulation of stocks. Unperturbed by the lag in domestic consumption, farmers so far have gone on expanding milk production in spite of the cut in the support price. Mr Benson is now considering a system of subsidy payments to milk, butter and cheese producers, which would allow the retail price of butter to drop to a point at which the public would take up the whole of the output, while at the same time maintaining prices to the farmer. Members of Congress from the dairy states, who fought the lowering of the support price in April and whose farmer constituents feel that they have been unfairly treated, will certainly need some placating if they are to be restrained from further attempts to push the support price up again.

Communists and the Unions

Washington, D.C.

THE request of Mr Brownell, the Attorney General, for special legislation to deal with Communist-dominated trade unions may provide for the National Labour Relations Board an avenue of escape from a situation of some embarrassment. The board is a quasi-judicial body which hears allegations of "unfair labour practices" brought against each other by unions and employers, and conducts elections among workers to decide which trade union, if any, should represent them. In order that the protection of the board should not be available to Communist-led unions, the Taft-Hartley law established that a "non-Communist affidavit" would be required on the part of all officers before a union could be recognised as a "certified bargaining representative." Unfortunately, while two unions that were certainly not Communist—one of them being that of Mr John L. Lewis's mineworkers—refused on principle to let their leaders take the oath, the eleven unions that were expelled from the Congress of Industrial Organisations as being Communist-led all complied with the letter of the law. The Communist leaders either nominally stepped down from their offices in the union, or nominally resigned from the Communist party.

The attempt of the board to secure for itself the right to examine the authenticity of these affidavits has been denied by the Courts, but under the legislation proposed by Mr Brownell a union could be forced to testify before the Subversive Activities Control Board in order to determine whether or not it was Communist-led. Any union found guilty would be debarred from the services of the National Labour Relations Board, and no employer would be required to bargain with it. Meanwhile, the board has been helped by the conviction of Mr Ben Gold, the president of the Fur and Leather Workers' Union, for falsely swearing by affidavit that he was not a Communist, and has challenged his union to "show cause" why it should remain certified. In addition, the board has been upheld in the courts in its decision to make its own investigation of the affidavit filed by Mr Maurice Travis, the Mine, Mill and Smelter Workers' secretary-treasurer, on the exceptional grounds that he had issued a statement on resigning from the Communist party proclaiming his intention of going on working for the party's purposes.

Apart from these two unions with which the Board is at present involved, only two other strong Communist-dominated unions have survived out of the original eleven.

One of these is Mr Harry Bridges' International Longshoremen's and Warehousemen's Union, very powerful on the west coast and in Hawaii. The second, the United Electrical Workers' Union, is faced with the possibility of a defection of its largest local branch, at the General Electric plant in Schenectady, to the appropriate CIO union. The board is at present debarred by court decisions from helping the CIO in its attempts to attract back into the non-Communist fold the members of expelled unions. Elections at the Anaconda Copper Company's plant at Butte, Montana, resulted in a resounding defeat for the CIO when workers voted in favour of the left-wing Mine, Mill and Smelter Workers' Union. In the case of the General Electric plant, however, elections, if arranged, are expected to result in a victory for the anti-Communists.

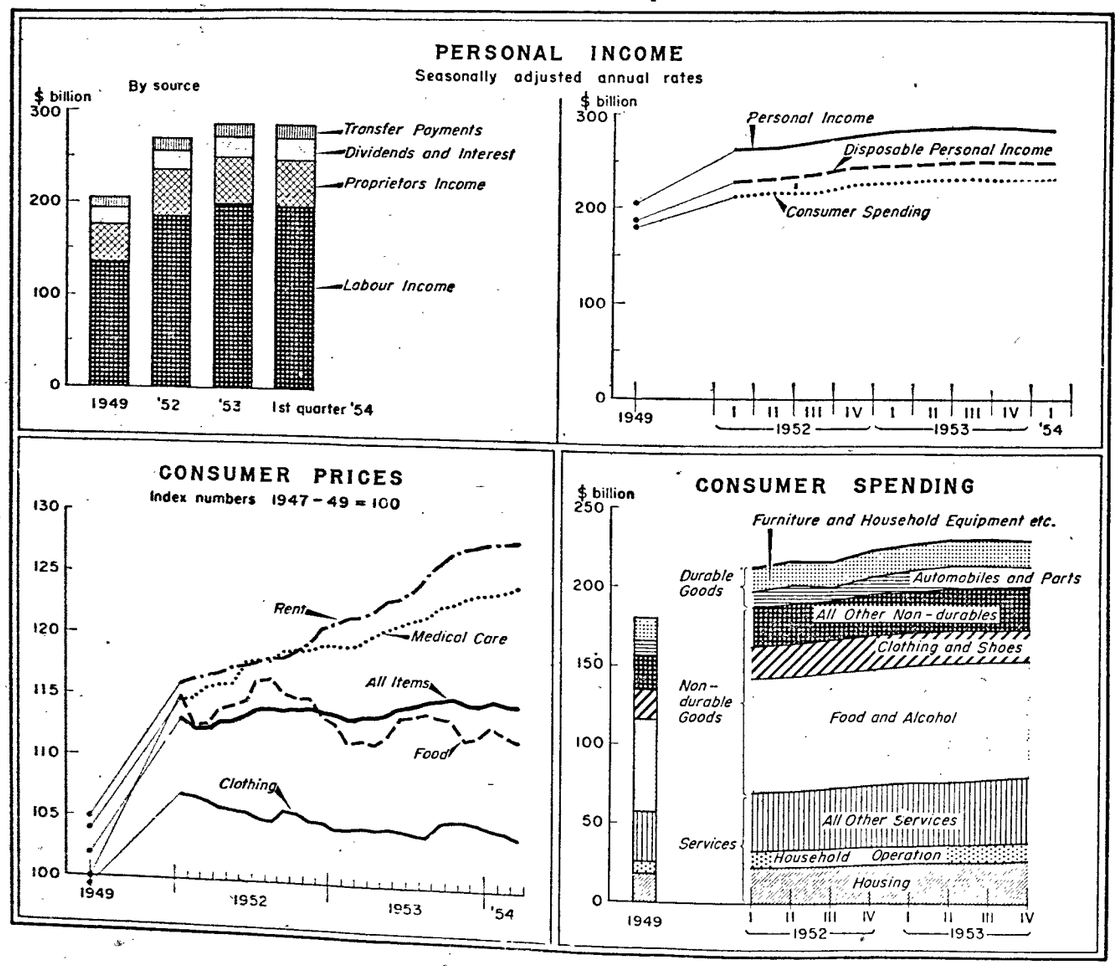
SHORTER NOTES

After serving for over thirteen years as congressional "watchdog of the Treasury," Mr Lindsay Warren, the US Comptroller-General, has voluntarily relinquished the last two years of his term of office. Since Mr Warren has been responsible for scrutinising the expenditure of public funds, the government has recovered almost one billion dollars spent illegally or erroneously. The Comptroller-General, the head of the General Accounting Office, is appointed by the President, but is responsible to, and can only be removed by, Congress.

★

Major crimes committed in the United States, according to the latest report from the Federal Bureau of Investigation, are increasing at a faster rate—the ratio is 4 to 1—than the growth of population. Last year's total of over two million crimes was the highest on record, representing a 6 per cent increase over the 1952 figure and a 20 per cent rise since 1950. Of the major crimes listed by the report, murder was the only one to decrease in 1953, while others—robberies, burglaries, larceny, assault and rape—led the individual increases. Although the rise in rural crimes was greater than that in towns, New York City recorded the largest number of crimes, with larceny its chief offence, and other cities as well reported a high rate of crimes—as much as 25 per cent—committed by juvenile offenders.

What Americans Spend



harvests and health

The snake was an ancient symbol of Time and the turning year, with its earth-seasons of spring planting, summer growth, autumn harvest and winter sleep. And the snake of Æsculapius has, since classical times, been a symbol of healing.

Agriculture to produce man's food, and medicine to care for his health . . .

The improvement of crops has been the main business of Fisons for a hundred years and more, almost since the science and production of chemical fertilizers began. And, in recent years, Fisons have struck roots in the field of chemicals for medicine. Fisons today contribute to the harvests and health of the world.

"Only rubber can save this reservoir"

In the north-east of England, near Sunderland, beneath the surface soil but above the subterranean galleries of the coal mines, is a reservoir larger in area than two football grounds.

Designed for a total capacity of 24,000,000 gallons, this vast reservoir was built in two stages. Even before the second chamber was completed the first began to leak. Subsidence, the curse of mining districts, had caused the concrete of the walls and floor to crack. The precious water flooded out, took with it supporting soil and created cavities beneath the reservoir floor.

Caulking was tried and found a failure. Nothing could be found to plug the ever recurring cracks. What then — abandon the reservoir or rebuild at a cost of £500,000? Neither. Over the leaking floors, up the walls and round the pillars like a giant jacket has been fitted a continuous sheet of rubber — 100 tons of it.

This tremendous task, now completed in one of the two chambers, saving thousands of pounds and safeguarding a vital water supply, has been carried out by Dunlop General Rubber Goods Division in co-operation with the Sunderland and South Shields Water Company. Even for Dunlop — and for rubber — this is an exceptional undertaking. That it is possible at all is due to the experience and resources of a Company which has been contributing to the betterment of mankind for nearly 66 years.

The World Overseas

Nasser Woos the People

FROM OUR CORRESPONDENT IN CAIRO

LIEUT.-COLONEL GAMAL ABDEL NASSER, Prime Minister of Egypt and its undisputed leader, is preaching the simple but profound truth that the living standards of the workers and peasants of Egypt cannot be raised without the development of the country's capital resources. He has with one hand destroyed the democratic institutions of the country and with the other clenched a fist in the face of Communism. His revolutionary tribunal, having just seized by its own rough justice the newspapers and presses of Mahmoud Aboul Fath, Egypt's richest newspaper proprietor, is now turning its attention to Abdul Kher Neguib, the fellow-travelling editor of *Gomhour el-Misri*. He sees his enemies to the right and the left, and his potential friends in the mass of common people.

It is tempting to detect in this policy a repetition of fascist doctrines in which a subdued and supine people were told, not asked, what was good for them. As he calls for co-operation to raise the nation from the depths of its shame and servility, Nasser comes close again to the justification other dictators have given for the use and abuse of power. What is so far lacking to make the comparison real is the deification of The State and the temperament of Fascism. Colonel Nasser is not, at heart, a dictator; he exerts power where he must or, at least, where he believes he must. The weakness of his regime and the lack of confidence in its stability derive from its refusal to plan and apply the military power by which he and his group rule the country. Inevitably his empiricism has inflicted injustices upon some people. It is difficult for the outsider to see what some in prison have done worse than some at large. By what measure of justice, for example, is Ibrahim Abdel Hadi, who risked his own life to rescue the country from the tyranny of terrorist gangs, still condemned to prison, while sycophants who battened on the nation's corruption enjoy their freedom? Yet, on the whole, repression in Egypt has been modest in scale, because the will to rule by force has been acquired with reluctance.

The March crisis revealed additional enemies whose subjugation gives the regime a more dictatorial air; but this reaction to opposition was not sensibly different from the regime's past behaviour. It secured from President Neguib the subservience to the Council of Revolution which he had refused in February. It convinced Nasser that he must strike against the thinly veiled enmity of sections of the press. It led him to purge those sections of the cavalry which had been the most unwilling adherents throughout the eight years of the Free Officers' movement. The real change, however, was not the elimination of further enemies but the positive attempt to secure friends.

The March crisis brought Colonel Nasser to two conclusions which he had been approaching gradually. In the first place, he decided that those who enjoyed the political privilege of the old regime could not in the foreseeable future be persuaded to support him. Secondly, he saw that the developing chaos of March was exploited by subversive groups which he identified with the Communists. It may well be that he also clarified his views about the Moslem Brotherhood which he concluded he could leave aside since it was a movement opposed to the luxury of the rich and the ideology of Communism, although his decision to release the Brotherhood leaders may have been purely tactical. He turned to the workers' syndicates, the peasants and the rank and file of the government service whose allegiance, being uncommitted to any great extent, he believed he could win. Colonel Nasser had been worried for some months about the widening gap between the Council of Revolution and the people; he decided to fill it with the inert mass which in the past had been voiceless. This was not the evolution of an ideology. He merely turned to those who could be his friends and with whom his sympathies really lie.

Some Break with Austerity

There is no doubt that The People is a more real concept to him than that abstract organism called The State; but it is equally a more difficult one to serve. It has led him and his colleagues to a partial break with the austerity policy by which Abdel Gelil el-Emary, the former finance minister, saved the budget and the foreign exchange position. He intends to relax some of the restrictions, to permit a controlled inflationary tendency, to restir the sluggish blood of Egyptian commerce.

It is impossible to judge this policy without knowing how far it is intended to go. It is announced that £E114.5 million is to be pumped into public works through the Ministry of Municipal and Rural Affairs, which has been put in the charge of Wing Commander Abdel Latif Baghdadi, one of the most successful of the officer-ministers, so that he can direct immediate spending into works which will make visible improvements in the environment of the town and village people. Travel allowances have been increased in a manner which will help a large number of middle-class travellers; and in saying that the

increases will only raise the foreign exchange cost from £E4.5 million to £E6 million, the finance minister implies that restrictions through foreign exchange control on the traveller who needs more substantial allowances will be greater. The cuts in the bonuses of government servants are being restored.

These changes are necessarily modest, for the Egyptian economy hardly permits more. To the mass of the people Colonel Nasser has had to give warning that improvements in their lot cannot be quickly accomplished ; that he is not the apostle of "red revolution." Most of his lessons in elementary economics have been given at the places where he has been distributing land under the Agrarian Reform Law of 1952. Only 17,227 acres had been distributed up to the end of 1952 but he intends to distribute another 100,000 before the end of this year. The total scheme, however, affects only 600,000 acres of Egypt's 6 million acres of arable land.

The trouble with every plan for the benefit of the workers and peasants of Egypt is that there are too many of them for the national economy at its present level. It is difficult to better their lot with or without red revolution. The danger is that, faced with the difficulty of positive improvement in the economic position of the common people, the regime will express its sympathy in legislation which will have the effect of further discouraging foreign firms. It has been stated in the press, for example, that the existing labour laws will be amended to make it impossible to discharge workers until dismissal has been approved by the courts. In view of the fact that Labour Courts can spend a year over a case, this is hardly encouraging. The Labour Laws are one of the most discouraging elements in the commercial situation of the country.

At this moment when the power of his regime seems to be confirmed, Colonel Nasser was right to make friends and influence the people. He was equally right to warn, as he has done, that miracles are impossible. He cannot counterfeit prosperity in Egypt any more than in 1952 he could cut prices at the point of the sword.

Next Step in Malaya

THE observation that the fate of Malaya depends on events in Indo-China has become so common that it is almost ignored as trite. Equally, the feeling in which many British people indulge, that Malaya is prevented by its racial divisions from being as nationalistic as other parts of Asia, has become so comfortable and traditional that it is taken for granted. What is happening in South-east Asia, however, is soon likely to provide some sharp jolts to political and military complacency. On the one hand, Communist successes in Indo-China are already beginning to bring some doubters off the fence in sympathy with Malaya's own Communists. And, on the other, a storm is undoubtedly blowing up over the establishment of the proposed new Malayan Legislative Council and the holding of elections, presumably early next year ; how much of a storm this will be will depend on the way the current negotiations with Malaya's anti-Communist leaders are handled.

These two problems, the advance of Communism and the advance towards self-government, are not always as closely linked as might be supposed ; the drive against the Communist guerrillas in the jungle has been successful enough to provide a breathing space in which constitutional development has a chance of taking place peacefully. Admittedly, in interviews with American journalists the High Commissioner, General Sir Gerald Templer, has shown that he is fully alive to the reality of the military danger ; if Communist successes in Indo-China go on growing, he is quoted as saying, the number of troops required to control the situation in Malaya might also grow very rapidly. America's new interest in South-east Asia, on the other hand, should make it possible to draw a line somewhere, and, if it does, then the main emphasis of the political problem in Malaya is likely to remain on the gradual and constitutional transfer of power rather than on violence. The fact, however, that a breathing space for gradualism has been obtained, should not blind anyone to the way in which the move towards self-government is beginning to gather momentum ; for, in the end—though no one can yet say when—a freedom of choice about their own future will become as inevitable for the people of Malaya as it did for those of India and Burma.

General Templer's Compromise

It is against this background that the latest proposals for a new Legislative Council must be judged. In a lengthy dispatch to the Colonial Secretary last month, General Templer proposed that this new Council should after all have an elected majority: and Mr Lyttelton has endorsed his proposal. The effect will be to reverse the main report of the recent Electoral Committee, which favoured retaining a slight majority of nominated members on the Legislative Council for the first four years of its life. General Templer does not, however, go as far as the minority report's suggestion of a three-fifths elected majority ; his suggestion is to have 52 elected and 46 nominated members.

Most of the Malay Rulers were in favour of the committee's suggestions that there should not be an elected majority, since they were afraid of what might happen if one party got complete power. And although they were probably thinking mainly of their own positions, there was sense in what they said ; now, however, they appear to have been talked round by the High Commissioner and his advisers. On the other hand, General Templer's latest compromise by no means satisfies the moderate though progressive nationalists of the Malay-Chinese, UMNO-MCA Alliance. They claim that, although they were represented on the Electoral Committee, they had only seven members out of 46, and they were therefore voted down ; this was done—they assert—in spite of the fact that they alone were in a position to speak for the mass of the Malays and Chinese in Malaya. Against this claim, it should be stated in fairness to the government, is the fact that the Alliance never protested when the composition of the Committee was announced ; nor is it fully agreed that the Alliance has the real backing of a majority of either Chinese or Malays.

On the government side, one cannot help wondering why General Templer has taken the line he has in going against the report at this stage. It might have been better to let sleeping dogs lie. Much of the pressure for a more rapid advance to self-government comes from certain sections of the Chinese, who have on occasion criticised the High Commissioner as a natural autocrat and a military reactionary. In reality, he was always understood to be in favour of the electoral committee going rather further than it did. And considering how unwise it may be to force the pace when the balance of difficulties is poised so delicately this latest move can hardly be condemned on the ground of unwillingness to turn idealism into practice.

That being said, the High Commissioner's action in reversing the principle of a nominated majority on the Legislative Council can nevertheless lay some claim to being a shrewd political gesture. If it is condemned by the Alliance as not going far enough, something at least was gained by its being made at all. For the British are in a more difficult position than their opponents are sometimes willing to admit. The High Commissioner is bound, under the Federation Agreement, to consult the Rulers before making recommendations to the Colonial Secretary. Moreover, he is bound to abide by the constitutional principles that govern his relations with them, when considering the wisdom of any political advance which will in effect weaken their authority, even though such a process is eventually inevitable.

The Forces Emerging

The two political forces which are now beginning to be ranged against one another in Malaya are, in fact, those, like the Administration and the Malay Rulers, who favour only a slow advance from the *status quo* and those who want to press forward more quickly towards a more democratic form of government. The UMNO-MCA Alliance, representing the latter, is at present in a reasonable but determined mood. It is reasonable in that it does not seek to act outside the constitution ; it does not demand more power for the Legislative Council—it accepts the High Commissioner's reserve powers for at least a four year period as well as his absolute control of defence, foreign relations, finance and economics ; and it does not aim at ousting British capital or severing any links with the Commonwealth. But the Alliance is quite determined that, in return for the moderation of its leadership, it shall not be asked to accept so small an elected majority on the Legislative Council that it would stand what it regards as virtually no chance of real power ; if the Colonial Secretary insists on nothing more than General Templer's compromise, then the Alliance would boycott any attempt to hold the elections, however long that might mean deferring them.

So far the UMNO-MCA Alliance is the main political group on the scene and as such it has a strong case. The new right-wing Party Negara has not yet had time to find its feet, and the remaining communal parties are all small. The Alliance prides itself, in addition, on being a genuine fusion of Malay and Chinese, the very thing that the British profess to want most. Its claim to be heard is therefore something which should not be lightly brushed aside on technical grounds—such as, for instance, that it had its chance on the electoral committee and should not now try to go over the heads of the Rulers. This is true enough and no responsible government can afford to surrender too much power until Malaya's budding politicians have had more time and experience in which to prove themselves. But if the Alliance can substantiate its claim to the leadership of the still nascent national movement, then it will have a vital role to play in the country's political future, and no good purpose will be served by letting the Communists or other extremists take the wind out of its sails. In Malaya, as elsewhere, it is a question of balancing caution with liberalism. For the first time, however, there is just beginning to be some risk of falling into the old trap of failing to recognise the strength of a genuine national movement soon enough.

A Great Italian Liberal

FROM OUR ROME CORRESPONDENT

THIS week Luigi Einaudi began his seventh year as the first President of Italy, which is the last of his present term of office. Outside the country he is perhaps better known as an eminent economist than as President of the Republic. This is due in part to his own determination to shun the limelight and partly it is a tribute to his success in smoothing the path of the new Italy's economic and political system. Presidents, like doctors, leap into the public eye only in a crisis. And it was not till the Italian parliament ran into difficulties after the elections of last June that the nation became aware of the tremendous prestige and authority which Signor Einaudi had steadily built up for the institution of president, during his five years in office. Bypassing the Christian Democrat Party machine, he nominated his disciple and fellow-Piedmontese, Signor Pella, as caretaker Prime Minister and thus steered the Italian parliament out of dangerous impasse. Another similar crisis may well put the President's statesmanship to an even severer test. No one who knows his unique combination of qualities doubts that he will be equal to the demands made upon him.

President Einaudi's achievements are the more remarkable in view of the very limited powers conferred on him by the postwar constitution. Apart from the customary formal and honorific functions, he is authorised to nominate the Prime Minister, dissolve one or both Chambers, indict new elections, authorise the presentation to parliament of draft bills, return such drafts to the government if he is unwilling to endorse them, promulgate the laws when passed by parliament and make certain appointments on his own initiative but with the concurrence of the relevant minister. But Signor Einaudi had to struggle to secure the full exercise of even these few rights.

Deputies Have to Think Again

To start with, the President was identified with the monarch whom he had replaced. The King had been a mere rubber stamp and it was subconsciously assumed that his substitute would be equally pliant. After considerable public debate and a private tussle, the President's right to appoint, for example, five judges to the Constitutional Court on his own initiative, but with the government's endorsement, was accepted. In the same way, it is now common ground that the government of a prime minister nominated by the President is fully entitled to govern, even before it has received a vote of confidence. If a weaker or less lucid figure had occupied the Quirinal, the outcome of the disagreement might well have been different.

Had he been so inclined, President Einaudi could easily have created for himself powers far in excess of those laid down by the constitution. As it is, he has been content to make sure of the full enjoyment of his authority within the limits roughed out in the relevant provisions of the constitution. And the house that he has built on the slim foundations that these provide is an impressive edifice. To the surprise and, at times, annoyance of Parliament, he has made use on four occasions of the power to return a draft Bill to Parliament with a message requesting deputies to think again. Technically, he exercises this function as the guardian of the constitution. In fact, his messages are used to expound his own liberal convictions. One such *exposé* drew attention to a violation of the article of the

constitution (inserted at his insistence) that fresh expenditure must be met from a new or increased source of revenue. Another message, issued last November, laid bare the dangers inherent in the levying by certain sections of the civil service of charges on the public for the execution of services to them. He pointed out that this practice is not subject to proper parliamentary control, that it makes the citizen appear to exist for the benefit of the state and not *vice versa* and that it sets up a private monopoly or privilege.

Voice in the Wilderness

It would hardly be possible to deliver a more telling blow at three of the major abuses which vitiate Italian economic life—the private cut, the authoritarian official, the tendency to regard every business or official position as a potential monopoly. But, alas, Signor Einaudi's voice has too often sounded in the wilderness. Nevertheless, his influence in detail on public affairs has been far from negligible. Every draft Bill submitted to him is carefully studied and minuted and in this task, as in others, he has at his disposal the services of a small but hand-picked staff of outstanding ability.

Much more apparent and incontestable has been the decisive influence exercised on finance and economy, through his disciples and former subordinates such as Signor Menichella, Governor of the Bank of Italy, and Signor Pella, first as Minister of Finance and subsequently as Prime Minister. These men and others like them have done little more than continue the "Einaudi line" formed when he himself became Governor of the Bank of Italy at the end of 1944 and, in 1947, Minister of the Budget. By restricting credit, dismantling a large part of foreign exchange control, liberalising imports, trying to balance the budget and encouraging saving, he laid the foundations for Italy's remarkable economic recovery. It may be contended that, in a country with the millstone of the undeveloped South hanging round its neck, stability and freedom are not enough. But they are certainly three-quarters of the problem.

When President Einaudi retires to his model farm in Piedmont in a year's time, his departure will mark the end of the last link with the great days of liberal pre-fascist Italy. And the forces of integrity, simplicity and love of liberty, already gravely weakened in this country, will suffer a further and, it may be, irreplaceable loss.

Middle-Class Minister

FROM A CORRESPONDENT IN BELGIUM

FOR the first time in the history of this country—perhaps in all parliamentary history—the new Belgian government which appeared before parliament last week included a Minister of the Middle Classes. It is his task to defend the special interests of self-employed persons, artisans and medium-sized commercial and industrial enterprises, which account for about 650,000 working persons and 14 per cent of the national income. By adding the liberal professions and others, this number would be increased to 850,000 persons who, with their families, represent a quarter of the population. There was already a "Minister for Economic Affairs and the Middle Classes"; but the classes in question still considered themselves neglected by the authorities.

Their desire seems to have been stimulated by the belief that the Ministers of Agriculture and of Labour represented special classes of society, whereas the Minister of Economic Affairs was concerned more with large-scale industry or the mass of consumers than with small businesses and self-employed persons. This insistence on distributing ministries according to classes is obviously a threat to the planning of policies to serve the general interest; and only the pressure of electoral interests has necessitated the creation of this new ministry. In the last elections the victory of the Socialists, in alliance with the Liberals, was largely due to a swing of the floating middle-class vote in their favour.

This can be explained by the development of the Socialist Party, which since 1945 has stopped calling itself the "Belgian workers' party" and has worked hard to gain adherents in the middle classes. In the recent election campaign its attitude on any economic and social questions that might disturb these classes was conspicuously moderate. Nothing was said about class war or about planning; but much was said about grants in aid for education, about the period of military service, and about social security. These are all questions which interest middle-class people in Belgium.

The Liberals, who have seen their supporters dwindling in recent years, seized the opportunity offered by their alliance with the Socialists to draw the attention of the middle classes to their own efforts for them. It was at their insistence that the new ministry was created and given to a Liberal, a chocolate and biscuit manufacturer and mayor of Koekelberg, a suburb of Brussels.

Discontented Taxpayers

On the other hand, the Christian Social Party this time found the middle-class vote deserting it. The rifts within the party, notably in Antwerp and Brussels, were caused by middle-class elements. They were due to the Christian Social government's increasing trend towards the centre and the left, and also to the loss of popularity which affects every government in power. The middle classes resent state intervention more than anyone else, and have always provided a floating mass of discontented taxpayers. The same trend was seen in other countries after the appearance of authoritarian parties, and it showed itself in Belgium in 1936, when the Rexists won 21 seats in parliament.

A special cause of discontent among the middle classes has been the stricter, and retrospective, fiscal system introduced in 1953 by the Christian Social Minister of Finance. A law introducing compulsory pension schemes for independent workers was also badly received because it limited the freedom of those affected. The deductions needed to make the scheme financially sound are considerable and penalise those who are better off.

Yet the record of measures adopted in recent years to help the middle classes is impressive. In 1951 the tax rates for wage earners were conceded to these special classes, in spite of the risks of fraud; they had to be paid as earned, but they represented a reduction of 20 per cent. To protect the small shopkeeper against the big stores that have grown so rapidly in recent years, a law passed in 1937 restricted the growth of these giants and was renewed in 1953. And the general application—not yet achieved—of a single turnover tax is meant to restore fair competition between the big integrated concerns and the small shopkeeper, who has hitherto been threatened with a double or even triple imposition of turnover taxes.

Other measures have been taken to ensure the representation of the middle classes in the consultative councils of the government, and to develop professional training, for lack of which many small businesses have failed. There is now a scheme to regulate entry into the professions more strictly, and an "Institute of Economic and Social Studies for the Middle Classes" is already doing excellent work. Credit has been made easier by state guarantees; legal protection has been given to business tenants; electricity charges have been reduced; and the family allowances given to independent workers since 1937 have been improved. The questions of Sunday work and the closing hours of retail shops are also being studied.

Efforts to improve methods of distribution have run into serious difficulties. It is reckoned that Belgium has one retail shop for every 29 people, against one for every 63 in France, 89 in Britain, and 102 in the United States. There are said to be twice as many butchers in Belgium as there are in Holland, and four times as many grocers, for a smaller population. There is plenty of rationalisation still to be done here.

However, a Liberal minister, representing the middle classes, will have to rely on very liberal and flexible methods to solve these problems. The new government's declaration of policy insists on the need for independent workers to co-operate in restoring health to their sector of the economy. The programme includes simplification of taxes (but no reduction), a reform of the recently introduced pension schemes, protection of commercial property, security of employment, easier access to professional training and to credit —all for the middle classes. But in most respects the creation of this new ministry is above all intended to give psychological satisfaction to the middle-class Belgian, who traditionally distrusts state interference in economic life, whether it concerns taxation, price control, other controls, or public enterprises.

Thyssens Forge Ahead

THE Thyssen steelworks at Hamborn in the Ruhr have made a spectacularly rapid recovery and will soon be comparable to the great Margam plant in Britain. Thyssens, before the war the largest steelworks in Europe, were for a long time the centre of sharp controversy between the Germans and the Allies. The works, which have been separated from the *Vereinigte Stahlwerke* vertical trust by Allied law, were left after the dismantlement with a large iron production and a steel capacity that was supposed to be limited to 117,000 tons a year. The Germans carried on an unremitting campaign for the right to build a continuous strip mill at the works, and to have a large enough steel output to feed it. Where the capital was to come from was never revealed but those knowing the methods by which German recovery has been financed were in no doubt that the funds would be forthcoming.

Thyssens have now issued a report which make the old days of dismantlement and restrictions seem extremely remote and futile. About half of an investment programme of DM400 million (£33 million) has been completed, and funds are assured—mostly by means of long-term credits—for almost all of the rest of the expansion and modernisation project. The programme will bring Thyssens crude steel capacity up to 1.4 million tons, and present capacity is already 1 million tons a year. This is only the first stage, and the report states that a further increase in crude steel capacity to 2.4 million tons is possible without much greater investment. The work hitherto has been done extraordinarily cheaply, by British standards, presumably because the foundations still remained after destruction by bombing and dismantlement.

The present stage includes the erection of a complete continuous strip mill. The broad hot mill will be in operation at the end of this year, and the cold mill will be finished in 1955. A capacity of 1.1 million tons of rolled steel has been planned to match the initial capacity of 1.4 million tons of crude steel. All the new plant, of course, incorporates the latest improvements. And the company's board declares that the prospects of profits are not unfavourable, once the present stage of the investment programme is completed. Now that the *Vereinigte Stahlwerke* is split up, Thyssens are selling two-thirds of their rolled products to other works, mostly under long-term contract.

Journal of Geneva—III

MAY 6th. A Chinese spokesman said that China would demand that the "resistance governments" in Laos and Cambodia be represented at the Indo-China talks. A French spokesman said that this was unacceptable.

May 7th. The news of the fall of Dien Bien Phu overshadowed the conference, at which no plenary session was held.

May 8th. The Indo-China talks opened; it had been agreed that Mr Eden and Mr Molotov would take the chair alternately. Britain, France, the United States, the Soviet Union, China, Vietnam, Laos, Cambodia and the Viet Minh were represented.

M. Bidault accused the Communists of open aggression, and said that this was not a war for Indo-Chinese independence, which France had already granted. He presented a set of peace proposals based on these points:

French Terms

1. Withdrawal of the two armies into zones to be fixed by the conference. (M. Bidault drew attention to M. Laniel's suggestion, made on March 5th, that a demilitarised zone should be set up between the Viet Minh forces and the Red River delta.)
2. Disarming and disbanding of irregular forces.
3. Withdrawal of all Viet Minh forces from Laos and Cambodia.
4. Immediate release of prisoners of war and interned civilians.
5. Immediate ending of hostilities.
6. International supervision of the above arrangements.
7. All states represented at the conference to guarantee the agreement, and to have the right to act jointly or individually in the event of any violation of the terms.

The Viet Minh delegate, Pham Van Dong, then proposed that the conference should invite representatives of the Laotian and Cambodian "resistance governments." Mr

Bedell Smith, for the United States, opposed this, and added that if the conference could not agree to reject the proposal it should leave it to the four sponsoring powers. Chou En-lai and Mr Molotov backed Mr Dong's proposal, and argued that in any case judgment on it was a matter not for four powers but for five (including China). The delegates of Cambodia and Laos derided the claims of the "resistance governments" to represent anybody, as did M. Bidault, and Mr Eden also rejected Mr Dong's proposal.

May 9th (Sunday). No activity.

May 10th. Mr Molotov presided over the Indo-China talks. Mr Dong spoke first. After saying that the Viet Minh would now permit evacuation of seriously wounded French prisoners from Dien Bien Phu (an offer which M. Bidault at once accepted) Mr Dong gave a long account of events in Indo-China since prewar days. He asserted that the United States had intervened as early as 1946, always with the aim of ousting France and making Indo-China an American colony. He rejected M. Bidault's peace proposals, and put forward the Viet Minh terms as follows:

Viet Minh Terms

1. French recognition of the independence of Vietnam, "Pathet Lao" (Laos) and "Khmer" (Cambodia).
2. Withdrawal of foreign troops from all three states within an agreed time limit. Pending withdrawal, French troops to be assembled at agreed points and to abstain from intervention in local administrations there.
3. Elections in all three states, organised by commissions formed by "the governments of both sides in each state." For the time being these governments would administer their respective areas as defined by agreement.
4. "Vietnam, Pathet Lao and Khmer" would examine the question of entry into the French Union.
5. They would recognise French economic and cultural interests.
6. No prosecution of "collaborators" on either side.
7. An exchange of prisoners.
8. A cease-fire to precede these arrangements; no further entry of troops or arms into Indo-China; supervision of the agreement by joint commissions formed by the belligerents.

The Cambodian and Laotian delegates both refuted Mr Dong's claims as regards "resistance governments" in their territories, declared that it was not a case of civil war but of foreign invasion, and put forward proposals for a settlement broadly corresponding to those of M. Bidault.

Mr Eden rebutted Mr Dong's accusations against the United States, and supported M. Bidault's proposals. A simple cease-fire would be impracticable; what was wanted was a specific armistice with provisions for control and guarantees for enforcement. Mr Bedell Smith said that the United States would go on helping the three Associated States to assure their independence. He could not express a judgment on the French proposal for guarantees until it was clearer what the obligations of the guarantors would be, but he welcomed M. Bidault's proposals as a basis for discussion.

May 11th. The plenary session was devoted to Korea, but Mr Molotov, in a speech supporting Nam Il's proposals, ranged over China's claims to great-power privileges and concluded with an attack on military plans aimed against "the peoples of South-east Asia." The only security for Asia was a collective security of Asian states. Mr Molotov also demanded the dropping of EDC.

M. Spaak, for Belgium, said that the Communists were wasting time with their dividing tactics. Duly supervised elections were the only solution for Korea. He recalled witnessing the "death of collective security" in Geneva before the second world war, and said that in Korea "we have nothing to defend except principles, but they are vital principles on which depend the fate of peace and the world itself."

Mr Pyun, the South Korean foreign minister, appealed to the Communists to let down the barriers in Korea. "Let them vote in the North as they are doing in the South."

May 12th.—Mr Dinh, foreign minister of Vietnam, strongly opposed any idea of partitioning his country, even provisionally. He disclosed the terms of the two treaties envisaged in the Franco-Vietnamese declaration of April 28th; the first recognising Vietnam's absolute sovereignty, the second providing for free co-operation between the two countries. Thus, said Mr Dinh, Vietnamese independence would be achieved within a few days. The Vietnamese proposals for a settlement were as follows:

Vietnamese Terms

1. Recognition of Bao Dai's government as sole representative of Vietnam.
2. Only one Vietnamese army to remain; but Viet Minh troops could be fitted into it by action under international control.
3. Free elections, supervised by Uno, throughout Vietnam, as soon as the Security Council judges order and freedom to exist.
4. A representative government then to be set up, under the aegis of Bao Dai as chief of state.
5. No reprisals against collaborators with the Viet Minh.
6. International guarantee of Vietnam's integrity.
7. Economic aid from friendly nations.

Mr Dinh said the Vietnamese would consider any plan that provided sound guarantees of peace.

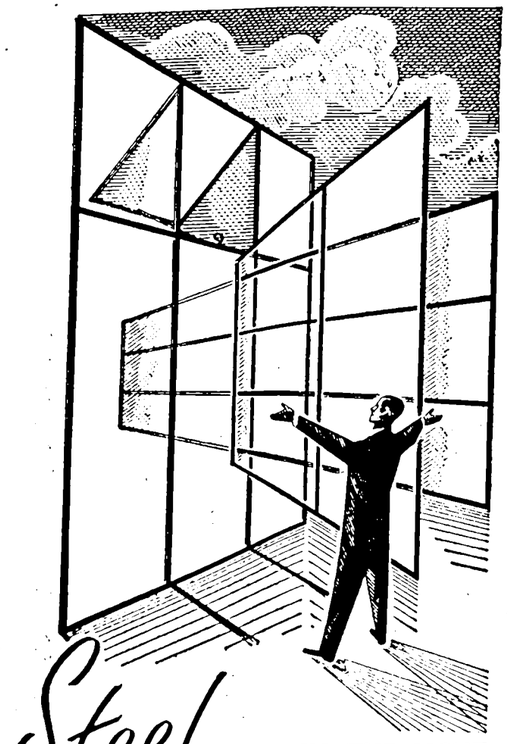
Chou En-lai, in a speech which in other respects closely resembled those of Mr Molotov and Mr Dong, said that Chinese intervention in Indo-China was mere fiction and slander.

Mr Eden, in an attempt to narrow down the practical problem of restoring peace in Indo-China, asked five questions:

1. Was it agreed that all troops be concentrated in limited areas?
2. Was it agreed that Laos and Cambodia be treated differently from Vietnam, and that Viet Minh troops be withdrawn from them?
3. Who should define the armies' concentration areas—the commanders in the field, subject to reference to the conference?
4. Was it agreed that irregulars be disarmed when the regular forces had been concentrated?
5. Was it agreed that there should be international supervision, and what form should it take?

Mr Eden said that both Britain and the Colombo group of Asian powers favoured the use of UN machinery to implement a settlement; an agreed panel of UN members could be set up to assist.

Mr Bedell Smith and M. Bidault welcomed Mr Eden's questions and hoped for early answers to them.



Steel LETS IN THE LIGHT

Over 190,000 of the 318,779 houses built in Britain last year had steel frame windows, and hardly a school or a factory is built today without them. These windows are slim, long lasting, inexpensive; they let in the maximum amount of sun and light.

The steel for the frames is rolled into small intricate sections from 30 foot billets in up-to-date rolling mills.

Not only at home, but overseas, steel windows are being used more and more. Windows made of British steel now go to seventy-five different countries, including the United States and Canada.

STEEL is at your service

Don't bother about a banquet

In the hundreds of times the lifeboat crews put out to sea, it is only once in a while, when the tide of events lifts routine courage to epic heroism, that their exploits hit the headlines. At other times, their swift-moving, ever-responsive reliability is taken for granted. In the motoring world, Ford reliability is accepted as inevitable and understood. The highlights are front page news (as for instance, when the Consul won the Tulip Rally, and the Zephyr swept to exciting victory at Monte Carlo, and the New Anglia made so dazzling a debut by taking the first six places in its class at the R.A.C. International Rally) but the excellence of any Ford product is normally expected from Ford. It does its duty well because it has been built in the Ford tradition—Ford's unique resources, resulting in lower prices for the purchaser, and unique after-sales Service.

"FIRST APPEARANCE OF MR. SAMUEL WELLER", says the title of this illustration in *Pickwick Papers*. And such is the artistry of 'Phiz' that we know Sam would be the kind of man Mr. Pickwick found him to be—cheerful, cheeky, a willing servant and a true friend.

'Phiz', born Hablôt Knight Browne, illustrated ten novels by Dickens between 1836 and 1859. He modelled his pseudonym on 'Boz', the nom-de-plume under which Dickens published his first major work at the age of twenty-five.

It can be said of all the classic figures in literature, whose names are as familiar as our own, that without paper they could never have lived. Nor, indeed, would these famous characters have given delight to so many people all over the world had not the paper-maker made it possible to produce inexpensive editions in vast quantities.

Wherever words are read, they are read by the hundred million on paper made by Bowaters.

THE BUSINESS WORLD

Investment in Chemicals

THE massive expansion of the chemical industry over the last few years is not easy to demonstrate. It cannot be measured like so many extra tons of steel or millions of barrels of oil; it cannot be expressed in terms that catch the public imagination like the booming output of cars or aircraft. The procession of major chemical companies to the market for fresh capital during the past five years is one outward sign of growth, but leaves out the large sums ploughed back into the industry. The Association of British Chemical Manufacturers has recently calculated that the capital employed in the industry has risen from £230.6 million in 1948 to £406.8 million at the end of 1952; but figures of capital employed, again, are notoriously difficult to interpret. This comparison was made by the association on the basis of replies to a questionnaire that was sent out in 1949 and again last year; the results of the second survey were published in March, 234 companies having made returns last year as against 272 in 1949. This report does, indeed, give a figure that should be the best yardstick of all, turnover. This is estimated to have increased from £323 million in 1948 to some £520 million by 1952. Allowing for a 25 per cent increase in prices this implies a 60 per cent increase in volume in the four years. Even this figure, however, is based upon a very conservative definition of chemicals, and values them at fairly early stages in their roundabout journey towards the consumer.

The expansion set on foot at the end of the war is expected to cost the industry about £229 million, excluding projects sanctioned or proposed since the questionnaires were completed in mid-1953. The original estimate in 1948 was £191 million; and £83 million had actually been spent by the end of 1952. These sets of figures cannot, however, be directly compared; plant and construction costs rose sharply during the interval between the two reports, in addition, certain projects were abandoned and new ones added as work progressed. About 40 per cent of the 1948 schemes had been completed by the end of 1952, and a further 34 per cent were in hand; by now, the huge job may be three-quarters done. This might leave £50-80 million still to be spent under the original programme—apart from plans made after the questionnaire had been sent in.

How much money has been spent is perhaps less significant than who has spent it and where. The ABCM report gives some interesting details of the expenditure in each of the main branches of chemical production (partly summarised in the table on page 552), but does not name the companies concerned. By far the biggest spender, inevitably, is Imperial Chemical Industries, which is probably responsible for half the output of the industry and half its new investment, too. ICI has spent £146.5 million on capital construction between 1945 and 1953 (though not all on chemical products as defined by the association). Credit for being the second largest producer is divided between Distillers and Monsanto. Monsanto Chemicals, which has trebled its capital since the war and put up new plant to the value of £6.5 million, with a further £2.5 million in hand to finance current expansion. Distillers has gone into partnership with Anglo-Iranian in the £7 million British Petroleum Chemicals venture, which includes two-thirds of the £1.8 million capital of its Forth Chemicals subsidiary, shared with Monsanto. Shell chemicals has invested £6 million in the Stanlow petroleum chemicals plant, and the detergent plant put up during the war represents at least another million pounds. Albright and Wilson, frequently classed as the

fifth biggest producer in the industry since the completion of its new detergent factory, has spent £3.7 million since the war.

Most of the big spending has gone to increase capacity for heavy organic chemicals and their associated industries. Nearly £43 million had been earmarked for this group ; 60 per cent of the original work was finished by 1952, and nearly £30 million worth of plant was still under construction. These " basic " plants should not really be considered apart from the production of plastics and synthetic resins, which use them as the starting point for further synthesis. Investment in these associated materials, which include ICI's nylon Polymer and terylene plants, was originally scheduled at some £22 million ; with the projects 67 per cent complete, £18 million worth of work remained in hand.

CAPITAL EXPANSION

	Estimated cost 1948	*Percentage completed by end 1952*	*Percentage still under construction*	Estimated total cost of work in hand
	£'000s	%	%	£'000s

Source : Association of British Chemical Manufacturers.

This high rate of progress is in sharp contrast to the slower advance of investment in bulk chemical capacity. Take sulphuric acid : of the original plans, expected in 1948 to cost £11 million, only 30 per cent had been completed by the end of 1952. It was originally planned to spend some £40 million to expand the production of alkalis, planned to cost nearly £40 million ; only 34 per cent had been completed by the end of 1952. Despite discrepancies in the two surveys, it is clear that work has been pushed ahead on the organic chemical field and, by comparison, held back in the traditional bulk chemicals.

The explanation lies in the different rates of return on investment in the two fields. The newly discovered chemical products, plastics, textiles, solvents and detergents, give a high rate of return on investment, and under normal conditions the expanding companies would naturally put most of their money into making these. But an increase in the output of these highly refined, new and exciting products automatically increases demand for certain less exotic bulk chemicals that figure in their production—chlorine, caustic soda, sulphuric acid and the like.

Current market prices for many bulk chemicals are based upon production costs of much written-down capacity, and have not risen to a level that would make new investment attractive. Companies that have previously supplied large tonnages of bulk chemicals to other producers, therefore, have begun to divert a growing proportion of those supplies to their own new organic chemical plants ; and those that formerly relied on purchasing from other producers are being obliged to make bulk-chemicals themselves.

★

These changes are having a noticeable effect upon the structure of the industry. Its growth since the war has had a clearly defined objective, to make the country independent of imported chemicals. With one striking exception, synthetic rubber, this object has largely been achieved, and almost as an incidental the country has developed a substantial export trade. Parallel with this move towards national self-sufficiency in chemicals, there has been a trend towards greater self-sufficiency among the major chemical companies themselves.

The petroleum gases needed for the newer chemicals afford interesting examples of this tendency. ICI has obtained these gases by erecting its own oil cracker ; Shell Chemicals works up gases from its own refinery ; Distillers has gone into partnership with an oil company, Anglo-Iranian. These arrangements over supplies of petroleum gases, again, partly explains the hiatus that surrounds synthetic rubber. Production of general-purpose synthetic rubber in this country is strategically desirable but not economically attractive, and is strongly opposed by the Colonial Office, but a special-duty rubber such as butyl is a border-line case. Production might become economically feasible if the necessary tonnage of butylene, one of the petroleum gases, were available. The Esso refinery at Fawley is the only potential source of butylene in Britain big enough to form the basis of butyl rubber production, and Esso also owns the butyl patents. But it may be more attractive for Esso to confine its butyl experiments to France, where the government might support a syndicated project, and to reserve the Fawley butylene for aviation spirit.

These questions of bulk chemical supplies may have a significant effect upon the further expansion of chemical capacity. For, in spite of the ambitious scale of many of the latest projects, all the indications are of a fresh round of investment in new plant, if the industry is to do no more than maintain its present share of the world market. A high proportion of the immense new

tonnage of chemicals finds its way into the consumer market, and comparatively little into the heavy industries ; so the industry can take the rising rate of domestic consumption as a guide to general demand if not demand for individual chemical products. It would not be surprising to find that the capital expenditure facing the industry in the next few years is nearer £100-120 million than the £50-80 million possibly remaining under the 1948 plan. This further expenditure, moreover, must include considerable investment in capacity for bulk chemicals ; and these chemicals may offer a somewhat lower rate of return on such investment than has been earned from the more elaborate and more profitable materials that have been dominant in the industry's current expansion.

But even if that should reduce the very adequate cover for the companies' present dividends, it should hardly prove a problem to finance a further large programme of capital construction for one of Britain's big and prosperous industries. That is the very task that London's financial machine was best designed to tackle and it has so far tackled it easily. For the seven companies named in the accompanying table alone, over £120 million of new capital has been found since the war. The figure does not represent the whole of the new capital resources which those companies have employed, for they have also ploughed back large sums of shareholders' money, still less does it represent the whole of the new money which the chemical industry has raised.

Disasters occur in all industries ; the affair of Petro-Chemicals is still fresh in investors' minds and the fate of some millions of investment poured into that venture still hangs in the balance. But, in general, the chemical industry can make a sufficiently seductive appeal to investors. The City institutions, among which the insurance companies are prominent, have played a large part in the post-war financing of the chemical industry—witness the private placing of Monsanto's £5 million loan stock, the private placing by Morgan Grenfell of the Laporte Debenture and the decision of

	New Money Raised Since the War	Year ends	Price	Div. %	Times Covered	Yield per cent
	£ mn.					£ s. d.

British Oxygen (£1)	10·2	Dec. 31	58/6	15	2·1	5 2 7

ICI to raise £30 million by a 4 per cent unsecured loan stock, evidently pitched as to terms so as to appeal to the investors of pension funds. That is a spring of savings for investment which will not run dry. The worst that could happen would be that the terms became stiffer if the demand for new money increased. But there is no sign of that yet. The leading companies continue to raise the bulk of their needs cheaply, and small but useful pickings for the equity holders arise from time to time.

Commodities Thrive on Recession

COMMODITY prices have broken the rules: they have risen steadily in face of the recession in the United States, the largest consuming country. The rise began last November, long before the slide in American production showed any signs of levelling out, and it has gathered momentum since. At the end of last month *The Economist* commodity price indicator reached 109.2 (1952=100), its highest point for two years. There is no clear-cut explanation of this perverse strength of prices ; a number of factors have played a part:

1. The effects of the recession have not spread throughout the American economy, nor—contrary to the experience of 1948/49—have they spread to Europe, which is still enjoying a dollar surplus and where production is still increasing.

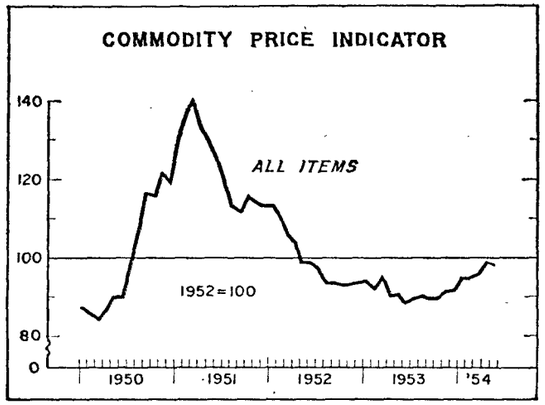
2. The coming of the recession had been so long expected, and the post-Korean decline in markets so [illegible] recurrences, and consumers' stocks were already [illegible] above those ru[illegible] liable to respond quickly to even [illegible] those in New Yc[illegible] drop in supplies.

[illegible]ved, that private a fractio[illegible]ends to feed on itself, because [illegible]ence prices were [illegible]all rise in demand or

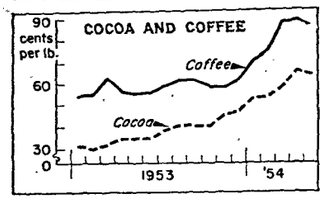
3. Once begun, a revival t[illegible]m prices encourage buyin[illegible]

4. Businessmen now appear to be more confident that the recession really is no more than an inventory adjustment, which will correct itself in time.

5. Fears that the war in Indo-China might become another Korea, threatening to cut off the West from Asian supplies, have lately strengthened several markets.

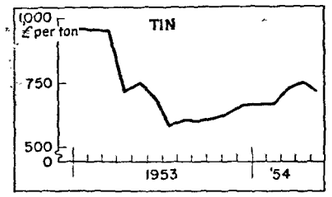


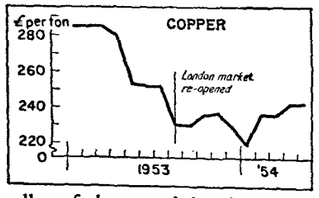
This helps to explain the firmness of commodity prices as a whole; it does not explain either the extent or the unevenness of their recovery. The reasons for that lie in the behaviour of individual commodities.

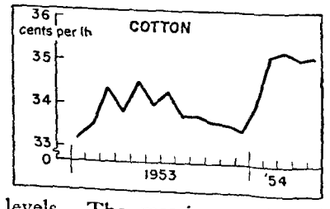


Coffee, cocoa and **tea** have soared to their highest prices in history. Production of all three has either dropped this season or failed to respond to the growth in world consumption. Coffee and cocoa have since fallen from their peaks but tea has not. Prices are likely to remain relatively high, barring an exceptional increase in the next season's crops or an exceptionally strong consumer resistance.

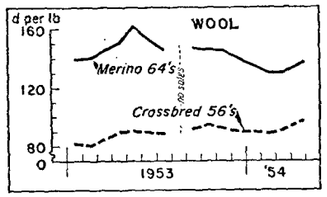
Among the other leading commodities, **tin** has recovered strongly. The immediate threat of surplus has disappeared. The American Government is buying another 20,000 tons from Indonesia, and may buy a further quantity from Bolivia to bolster its neighbour's ailing economy. A narrow market has magnified the improved prospects of an International Tin Agreement and the fears of worse conflict in Indo-China. The strength of **copper** prices is the despair of consumers. Statistical weakness has been countered by the withholding of Chilean stocks, the refilling of private supply pipelines to Britain, and reductions in American production. Of Chile's large surplus of nearly 200,000 tons, half has been bought for the American stockpile, and Chile is not yet an eager seller of the remaining half, nor of its current production. American consumption is now picking up, and supplies of electrolytic copper are generally tight. The brunt of the American recession fell on **lead** and **zinc**; but recently prices have more than recovered, thanks to the drastic reduction in American production of these metals, some improvement in demand and the announcement of an expanded buying programme, concentrating on domestic materials, for the American stockpile.



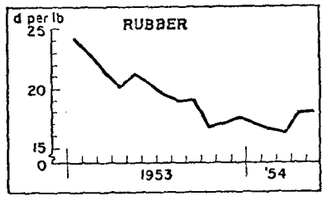




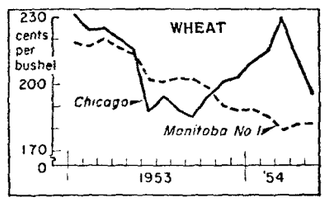
World consumption of raw **cotton** is rising to near-boom levels. The massive surplus of American cotton has been taken off the market by support operations; supplies of outside growths are no more than adequate; supplies of long-stapled cotton are low. The recovery in prices has been relatively largest in outside and long-stapled growths. Dominion **wool** prices eased in the first half of the season but rose in the second half; Russia's decision to buy no more Australian wool came at a time of strong markets and had no effect. This season's Dominion wool clips have sold more rapidly than was generally realised, and the manufacturing industries will probably need all the wool that remains until the new clips become available. Among the non-apparel fibres, prices of raw **jute** are fluctuating freely, but on a high level. Crop restriction in Pakistan, unless undermined by unusually favourable growing weather from now on, should sustain prices.



Prices of **rubber** have rallied in the past two months, partly owing to speculative buying, for rubber is one of the commodities most susceptible to any worsening of the Indo-China situation. This buying has now subsided, and prices are lower. But basically the market seems to be reasonably firm at present. Natural rubber is winning an increasing share of total American consumption. Production is showing a seasonal decline; the current rate of surplus has apparently been exaggerated by double-counting of a part of Indonesian exports, and the Rubber Study Group's estimate of the total surplus in 1954 is unexpectedly low.



In contrast to the general trend, prices of **wheat, sugar** and certain **edible oils** and fats are stagnant or falling. Wheat prices have drifted downwards for most of the past eighteen months. The recent strength of Chicago wheat futures lay in the American support operations and was a purely local phenomenon. The enormous North American surpluses are in strong official hands, but the elevators are bulging and those hands will have to be even stronger when the new crops are harvested this summer. Stocks in the four main exporting countries at the end of this season, allowing for a reasonable carry-over, will probably be sufficient to meet world demand next season, without touching the new crops. Prices of raw **sugar** in the "free" market have remained just above the minimum indications are of cents in the International Sugar Agreement, if the industry existence of the agreement has its present share of the effect of the surplus; so has portion of the immense new



hold for the time being the greater part of its export quota. Prices of **copra, coconut oil, palm kernels** and **palm kernel oil** have recovered slightly from their sharp fall, but are still vulnerable. Supplies of copra are ample, palm kernels are in surplus, and the American Government is now an active seller of its huge stock of cottonseed oil. Its recent decision to offer its large stock of butter for export at the world price is a further threat to prices of other edible oils and fats.

Provided that America rolls out of its rolling adjustment, the prospect for commodities as a whole should continue to be set fair. The rebuilding of stocks should have some way to go when the end of the recession encourages businessmen to hold normal stocks again. But the extent of any further rise will depend greatly on whether American production simply ceases to fall, or whether—and how far—it recovers.

It cannot be long before the rise in commodity prices begins to affect the terms of trade of Britain and other industrial countries. A small reversal of the long movement in Britain's favour could do little, if any, harm. The higher cost of imports would tend to be offset by the increased purchasing power of primary producing countries, some of which, such as Australia, are Britain's largest customers and the dollar earnings of the sterling area as a whole may not suffer. So far the rise in prices has benefited the so-called sterling commodities slightly more than the dollar commodities. But any hopeful conclusion rests on two main assumptions: that the American recession does not go much further; and that the American Government will hold its huge surpluses off the market. The first assumption is reasonable but no certainty. The second is a matter for serious concern, for American eagerness to unload surpluses of agricultural commodities is already apparent. Such action would have to be weighed against the American decision to expand its strategic purchases of industrial materials. At this juncture, no one can tell whether the United States will take away with one hand more than it gives with the other.

Business Notes

Flexible Bank Rate

After the disappointment of their expectations of ten days ago, many people in the City were taken rather by surprise by the news on Thursday of a reduction of Bank rate from 3½ to 3 per cent. It had been argued, indeed, that the "obvious" occasion for a change had passed. The previous week's denial of any intention to widen the scope for fluctuation of exchange rates had had its intended effect of reducing the strength of the buying pressure upon sterling; the sterling-dollar rate had slipped back a little from its upper limit; and at last Friday's tender for Treasury bills applications had fallen sharply from the peak reached a fortnight ago, while the discount rate was maintained at the lower level of 2 1/32nd per cent then established.

The authorities have obviously taken the view, however, that the underlying forces that had been pushing sterling up and pulling London money rates down were still operating. The tide of funds, as an article in *The Economist* last week explained in some detail, has been flowing strongly towards London; and although the exaggeration of this movement in response to the rumours of sterling appreciation had subsided, there was clearly a possibility of its recurrence so long as London money rates were kept much above those ruling in overseas centres—and especially above those in New York (where the Treasury bill rate this week, despite a fractional rise, was still only 0.825 per cent). By reducing Bank rate in response to an easing that had already occurred in market rates, the authorities are therefore reacting in the classical way, by allowing natural forces to exert themselves in the market-place unless there are compelling reasons of high policy for resisting them.

This latest move is, therefore, the clearest demonstration yet given that monetary policy now seeks to be genuinely flexible. It is, indeed, the first normal reduction of Bank rate since use of the orthodox monetary regulators was revived in 1951. Last September's reduction from 4 to 3½ per cent, it will be recalled, was officially described as an "adjustment," because its primary purpose was to "unify" the Bank rate with the special rate at which the Bank had granted seven-day loans against Treasury bills; the unification was then achieved by reducing Bank rate but not the special rate (which thereupon ceased to have any separate existence). The objective then was purely technical, in the sense of getting rid of an anomaly; this latest move is also technical, but only in the classical sense of keeping a due relationship between market rate and Bank rate.

For this reason the authorities have had to run the risk—and perhaps a greater one than was run last September—that their move would be construed as a "green light" to the business world that all danger is past. The falling trend of unemployment and the still rising trend of production plainly show that the economy is in no need of a monetary stimulus, and any new surge of demand or of speculative activity would be dangerous. But the more clearly it is understood that money policy really is flexible,

and that Bank rate can be moved as often as necessary in either direction, the less will be the risk of such misunderstandings. The authorities evidently considered that, if policy is to develop in this fashion, there was no justification in present circumstances for rating this risk so high as to let it outweigh the case for technical alignment.

Impact on Money Rates

WHEN this issue of *The Economist* went to press, within a few hours of the Bank rate announcement, the impact upon the pattern of market rates was still not fully discernible. The dominant rates are those allowed by the clearing banks on deposit balances (at 21 days' notice) and charged by them for call loans to the discount market against the security of Treasury bills. These rates, which last September were reduced by only ¼ per cent (because the Bank rate reduction was not a "normal" one) have this time been reduced by the full ½ per cent, from 1¾ to 1¼ per cent. Rates for clearing bank call loans secured against commercial bills and short bonds have been reduced correspondingly, to 1½ and 1⅜ per cent respectively. The effect upon discount rates had not been tested by the close of business on Thursday; it will be determined by the outcome of yesterday's Treasury bill tender.

The consequences for normal commercial borrowers from the banks will necessarily be less clear-cut; although, since 1951, charges for bank loans and overdrafts have once again become linked to Bank rate, the agreements with customers are subject to a varying range of minimum rates. The best generalisation that can be made is that the principal direct beneficiaries will be the major commercial and industrial borrowers from the banks—borrowers whose loans were running at rates between 4 and 4½ per cent, subject to minimum charges of 3½-4 per cent. Such borrowers, and also the nationalised industries, will generally secure a reduction of ¼-½ per cent, but most personal borrowers and many small businesses are already being charged at the minimum rates fixed by their agreements. In most of these cases, therefore, there will be no automatic reductions, but pressure upon the banks for rate concessions will no doubt increase still further. The Building Societies' Association, as on some previous occasions of Bank rate change, promptly issued a statement drawing attention to the fact that their lending rates have no direct link with short money rates.

Share Markets Advance

THE reduction in Bank rate, though a tactical surprise to the stock markets, had often been foreseen. On each occasion Stock Exchange prices had moved up, never falling all the way back again when hopes were deferred. Therefore, the event produced, at first impact, only a moderate Stock Exchange rise. At noon on Thursday an immediate upswing of prices carried gilt-edged up nearly a point with proportionate advances through the industrial market. But the close of business on Thursday showed that the rise had not been wholly maintained. The biggest advance was of ⅞ in 4 per cent Consols which closed at 96$\frac{13}{16}$. War Loan 3½ per cent rose ⅜ to 87⅝. Leading industrials advanced but still closed below the highest of the day. Fords rose 7½d. to 60s. 4½d., ICI 9d. to 61s. Nearly all sections of the market moved ahead but nowhere was the advance spectacular. A new high point was reached by the *Financial Times* index of industrial equities, which rose from 147.4 on Wednesday to 149.4 on Thursday. The Government security index rose from 102.97 to 103.49. As investors become accustomed to the new level of money rates the market should develop a new trend, but on the first day Stock Exchange people did not know what the charge for loans to them would be.

The event must at least be favourable to potential borrowers. And since there remains a formidable volume of gilt-edged and industrial borrowing to be done it must be favourable to a long waiting list of corporations, Commonwealth countries, public boards and industrial companies. Particularly fortunate are the applicants to those issues now in progress the terms of which were fixed before the Bank rate cut. Lists for the Trinidad 4 per cent issue closed yesterday before the announcement, applicants for up to £10,000 receiving full allotment, and the larger applicants about two-thirds of their requirements. They can now look for a premium where before a small discount was feared. An issue of one million 6½ per cent £1 Redeemable Preference shares of Cyril Lord, the textile firm, to be made at par on Wednesday also finds its prospects improved.

£8¾ Million Steel Sale

ANOTHER round of selling of the nationalised steel undertakings has begun. Guest, Keen and Nettlefolds, in a complicated transaction, is buying back the bulk, but not the whole, of its former steel assets for the equivalent of £8,768,759. The group is buying all the shares of Guest Keen Baldwins Iron and Steel Company including not only the 57 per cent formerly owned but also the minority interest previously held by Richard Thomas and Baldwins. It is also buying the whole of Guest, Keen (South Wales), which will be made a subsidiary of Guest Keen Baldwins. The name of Baldwins will then disappear from the title. Excluded from the deal are two of the former Guest, Keen subsidiaries, the small Brymbo Steel Works, and John Lysaght's Scunthorpe Works (with which however a long-term agreement covering maximum and minimum tonnages has been made) as well as the 6,386,328 £1 ordinary shares of Steel Company of Wales formerly owned by Guest Keen Baldwins.

The accountancy of the operation is complicated, but the answer is simple, and it shows that the Iron and Steel Realisation Agency will again probably end with a profit. The Government investment in the assets which have been involved in the transaction was compensation stock to the value of £17 million. The sum to be paid by Guest Keen Baldwins is £8.8 million consisting of £8.3 million cash or the equivalent and the cancellation of a loan of £500,000, due from the Agency to Guest Keen Baldwins. The Corporation holds a debenture of £7½ million, 50 per cent paid up, in Guest, Keen Baldwins; it is a 4½ per cent debenture dated 1970-84 with a good sinking fund and will eventually be sold to institutions who will no doubt be willing to pay at least the par value of £3¾ million for it. Thus the Agency will receive upwards of £12½ million and can write down the 6,386,328 Steel of Wales shares from their compensation price of 25s. to around 14s. That should make the risk of loss small.

Thus one of the greatest obstacles to a resumption of the sales of iron and steel companies to the public has been removed. City interests felt strongly that the two big private deals ought to be concluded before the Iron and Steel Holding and Realisation Agency, of which Sir John Morison is chairman, asked the public—which had burnt its fingers in United Steel and Lancashire Steel—to come in again. By implication the other private deal, the resale to Vickers and Cammell Laird and Company of English Steel Corporation, is still distant. Mr. J. C. Mather, chairman of Cammell Laird, recently expressed his disappointment at the lack of progress. But buoyant share markets dangle the opportunity and Sir John Morison would be most reluctant to let time slip away until the autumn. His plans for the re-sale of several of the big companies, particularly of Stewarts and Lloyds, are well advanced. It can also be argued that as a yardstick for increasing the basis on which to sell a big company to the public a private sale, however big, is of little value; the advantages of integration between a big engineering unit like Vickers, and a big steel company like English Steel are difficult to evaluate. What the Agency wanted from Vickers, Cammell Laird and Guest, Keen and Nettlefolds was not a measure with which to gauge the right offer price for Stewart and Lloyds, but a gesture of confidence.

Pricing Steel Offers

A DECISION to go ahead with another steel offer to the public, with Stewarts and Lloyds as the most probable starter, is therefore possible. It would oblige Sir John Morison to solve several knotty problems. The table shows that the shares of both United Steel and Lancashire Steel still stand below the price at which they were first sold to the public and that the indicated equity dividend yield is now around 7½ per cent. Since dealings in both shares have recently shrunk to a vanishing point, he may feel that even now the market puts no measure on the price at which investors will buy a steel equity in the light of Labour's re-nationalisation threat. If the choice does fall on Stewarts and Lloyds he must also allow for the fact that he is choosing a share that traditionally sold on a lower yield basis than the average for the industry; the yield before nationalisation was nearly 1 per cent less than on United Steel.

To fix the price is no easy task. What can be said with certainty is that some of the expedients of the past should now be abandoned. The usefulness of allowing applicants to offer a wide selection of British Government stocks in payment is doubtful and its introduction makes the operation cumbersome. Probably the Agency would be glad enough to dispense with the option to tender gilt-edged altogether, but since the law is considered not to permit that course it may be decided, as with Lancashire Steel, to limit the offer to a single stock, the Treasury 3½ per cent 1979/81 stock. It may be assumed, too, that the device of making underwriters support their underwriting with firm applications for a like amount of stock will be discontinued. It has the effect of developing all the buying power on the day of the issue and leaving the market friendless

Share	Offer Price	Indicated Yield at Offer Price	Lowest Price	Present Price	Indicated Yield at Present Price
		£ s. d.			£ s. d.
United Steel £1 Ord.	25/-	7 4 0	22/-	24/6	7 6 11
Lancashire Steel £1 Ord.	22/-	7 5 5	19/6	20/9	7 14 3
Lancashire Steel £1 5½% Pref.	21/-	5 9 6	20/3	20/7½	5 11 6

afterwards. It may well happen that the lessons of the past will lead Sir John Morison to be more conservative rather than more liberal in the pricing of his next issue. The problem is not so much to make the offer successful as to ensure that the shares enjoy a good market afterwards. Sir John may, therefore, find that the right solution is to offer not on the promise of an enormous dividend but on the basis of a dividend that could and probably would be increased from time to time, leaving the long-term investor something for which to go.

Recovery in Exports Maintained

THE recovery in British exports in March was maintained last month. April had 24 working days, three fewer than March. So that although the preliminary figures show that exports fell by £21.4 million to £225 million fob, and

re-exports by £3.7 million to £8 million, the daily rate of total shipments was £9.7 million, slightly higher than in March. The value of exports, excluding re-exports, was about the same as the monthly average in the first quarter. Imports in April fell by £14.6 million to £284 million cif, but showed the usual seasonal rise on a working day basis, and the gross visible trade deficit rose by £10.5 million to £51.1 million.

Exports to North America rose by £1 million to £25.1 million, and were 12 per cent above the monthly average in the first quarter. Shipments to the United States dropped by £700,000 to £12.2 million, but were slightly higher per working day. Shipments to Canada rose sharply by £1.7 million to £12.9 million. Much of this increase, if not all, may have been seasonal, reflecting the reopening of the St Lawrence river

Britain's EPU Debts

THE main result of last week's meeting of the OEEC Council in Paris was the agreement to prolong the European Payments Union for another year, an agreement made possible by new arrangements to lighten the burden carried by the Union in the form of accumulations of long standing debts. The main initiative in the repayment of such debts is being taken by Britain, which has undertaken to withdraw from EPU one half of its present overdraft of about £180 million. The amount to be repaid outside EPU will thus be £90 million, and one quarter of this, or £22½ million, will be made available immediately in gold. The remaining £67½ million will be funded and repaid on terms and over periods that will have to be agreed with the individual creditor countries. These bilateral negotiations between the EPU debtor and creditor countries will begin in Paris in the near future and are due to be completed before the end of this month. The most important of these negotiations will be those between Britain and Germany. The funding and repayment arrangements in this case will be attuned to the terms agreed last year for the repayment of the German postwar debt to the British Government.

Although the details of these repayments remain to be worked out, some attention has been given to the complicated problem of adjusting EPU accountancy to this process. According to the normal EPU procedure, a reduction in the cumulative debit or credit positions of members involves a payment in gold to the debtor and a corresponding payment by the creditor—provided that the member's position had passed beyond the first "tranche" of his quota. Therefore, when Britain reduces its accumulated deficit by withdrawing part of its debt to EPU, it would under the normal rule be entitled to receive gold from the Union; similarly, if the German credit position is reduced by the same operation, Germany would hand over a proportionate amount of gold to EPU. But gold payments of this kind would be contrary to the spirit of the exercise of debt withdrawal; they are to be avoided on this occasion by a new and complicated principle known in EPU circles as that of the "sandwich tranche." Under this new procedure the gold payments that would otherwise be due are to be postponed until such time as the member countries concerned have completely reversed their position with EPU.

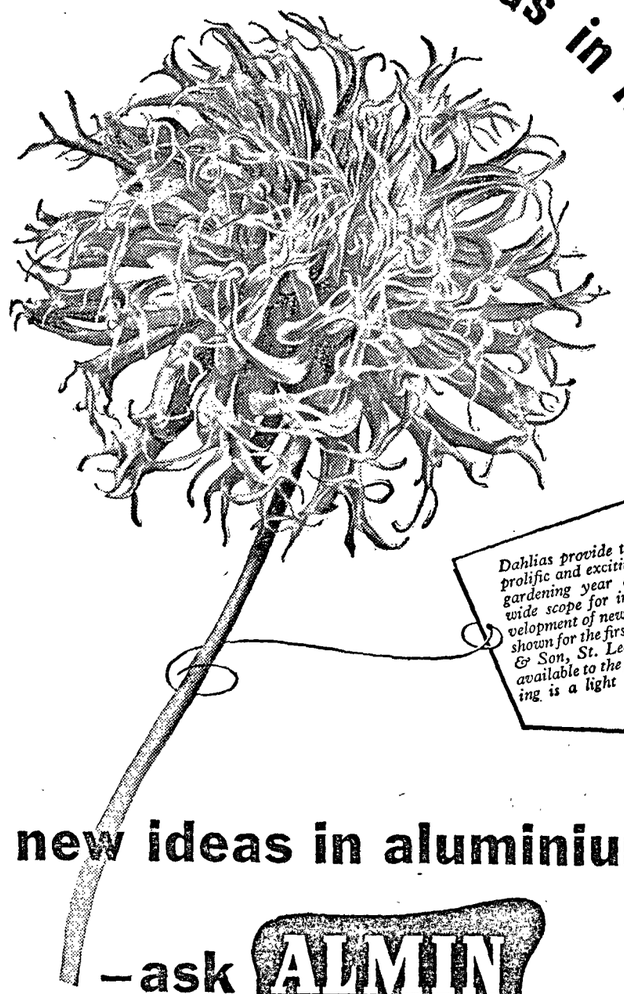
Thus, the gold to which Britain would have been entitled on reducing its debit position will be receivable only when Britain comes to occupy the same "tranche" on the credit side as that from which it is now being pulled down on the debit side. This will considerably complicate EPU accountancy, but it will make the most of the effect of the funding of long-outstanding debts upon the credit balances and overdrafts of member countries with EPU. The credit facilities available to members of EPU will not be permanently reduced as a result of the funding of these long-standing debts. The members' drawing rights will be reconstituted to the extent that cash payments are made under the funding schemes.

When Convertibility Comes

LAST week's meeting of the OEEC Council of Ministers also considered the report of the Managing Board of EPU upon the problems that any move to convertibility by European countries would raise for the future of the Union. The Council does not appear to have been entirely satisfied with the contents of the report, since it decided to set up a ministerial group, under the chairmanship of the British Chancellor of the Exchequer, "to examine the different problems which will arise if a number of member countries re-establish convertibility." This is precisely the question that was intended to be answered by the Managing Board, but the answer does not emerge with any great clarity from the report, which has now been made public. The report opens by differentiating between "full" and "limited" convertibility. It defines the first as absolute or complete convertibility, involving freedom of payments to residents as well as non-residents, absence of quantitative import restrictions and of exchange controls either on current or capital transactions, and including, also, fixity of par rates of exchange. "Limited" convertibility obviously comprises an infinite variety of shades of grey, but the board has chosen the term to describe a system under which balances in the currency in question acquired by non-residents *after* the date of its introduction would be freely convertible into gold, dollars or any other currency. Under "limited" convertibility, the authorities would retain exchange control over the transactions of residents, could continue to apply quantitative restrictions on imports "in accordance with internationally agreed rules," and would retain the right to allow the rate of exchange between their currencies and those of other countries to vary. The report comes to the general conclusion that, whatever type of convertibility is chosen, if one or two of the more important members of the Union embark on it, there will be an end of EPU as it has functioned in the past.

In its more general comments on the impact of convertibility on the economies of EPU countries, the view of the Managing Board is that "a move to convertibility of either type is likely to involve some important readjustments both for those countries which make the move and for those which do not, but that the net result would probably be an improvement in the general economic situations not only of the countries which make the move but also, though probably to a lesser extent, of those who do not." The

New Ideas in Horticulture



Dahlias provide the public with the most prolific and exciting colour displays of the gardening year and offer horticulturists wide scope for inventiveness and the development of new ideas. Here is "Tangle", shown for the first time by James Stredwick & Son, St. Leonards-on-Sea, and made available to the public last year. Its colouring is a light apricot shading to cream.

Board expresses its desire to see the move to convertibility maintained, but it shows a strong desire to save from dissolution the kind of co-operative machinery that has been set up within OEEC.

BOAC's Solid Profit

It has become customary for the air corporations to give details of their financial results long before their full accounts appears, and the preliminary results for British Overseas Airways Corporation in 1953-54 were published this week. In spite of the disastrous disappearance of the Comet over Elba, in January, and the grounding of the Comet fleet that followed it, this appears to have been BOAC's best year so far. After paying interest of £933,050 from its operating profits, the corporation was left with a net surplus of slightly over £1 million, compared with a deficit of £838,664 in the previous year. The clue to the improvement lies in a fractional decline in operating costs; in pence per ton-mile these fell by ½d. from 40.1 pence to 39.6 pence. In total figures, revenue rose from £36.2 million to £37.7 million, while expenditure dropped from £36.1 million to £35.7 million. The actual load factor, the proportion of aircraft space filled with paying passengers, stayed unchanged at 64.5 per cent, a little too low for comfort.

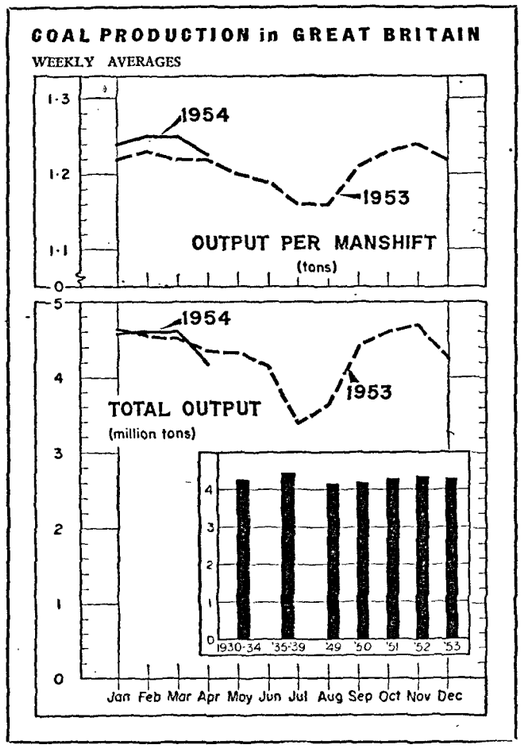
To a greater degree than ever, the corporation's financial future turns on the Comet. All seven remaining in service have been grounded, but in September, the more ambitious Comet II services were expected to start. The corporation is already finding it difficult to fill the gap left by its grounded aircraft; it is being brought home in a peculiarly ironic way just how many more miles the fast-flying Comets had been able to cover than piston-engined aircraft. Canadair IVs, not the most modern of machines, are being switched from the South American routes, where they were serving as stopgaps for the Comet II, to Africa and the Far East, and associated companies in Africa and Australia are lending other aircraft to BOAC. Some of the Hermes will be de-cocooned—just when the engineers had agreed to service them for sale to the independent operators—and put back into BOAC livery; these are high-cost aircraft and will not help the coming year's financial out-turn. Until there is some indication of the time likely to be taken by the Comet investigations, it will not be clear whether BOAC can get by on these makeshift arrangements or whether it will have to buy stopgap aircraft, pending delivery of the Britannias.

Colour TV in Black and White

A DEMONSTRATION of colour television given in London this week by Marconi's Wireless Telegraph Company was not—nominally—intended to press the claims of any one particular colour system so much as to show in a subtle way that Marconi will be capable of providing any system chosen. What the company chose to demonstrate was the basic colour system that has been approved in the United States (which was sponsored by the Radio Corporation of America) modified for British standards and embellished with a number of technical refinements by Marconi's own engineers.

The first difficulty is one of space in the ether. Colour television, based on a red, a green and a blue signal, normally needs three times the band-width of a black-and-white picture; 15 megacycles against five. Space on the frequency bands fit for television is not unlimited, and there is not room for a service needing 15 megacycles per station. The RCA colour system has achieved the near-miracle of compressing the three colour signals into as little as 5 megacycles, the same amount of space now used for black-and-white services, at the expense of some deterioration in the quality of the colour. It has also met the second practical problem, that of transmitting a colour service that can be picked up in black-and-white by existing monochrome receivers. The quality of the black-and-white reception on this "compatible" system is variable. Marconi engineers have suggested that if the band-width is increased from 5 to 7½ megacycles, defects in the black-and-white picture are corrected. Both systems were demonstrated, the 5 and the 7½ megacycle, with colour and monochrome receivers working simultaneously from each; but the vast difference between the colour picture and its poor shadow of a black-and-white equivalent made it visually impossible to detect these minor nuances in the quality of the two monochrome pictures fed from the slightly different colour systems.

It is the first time that a "compatible" colour system has been seen in this country; while the Radio Corporation of



America does not grant exclusive licences for any of its patents, the existence of a cross-licensing agreement between Marconi and RCA undoubtedly smoothed the path for the demonstration, which was based in part on the use of RCA cathode tubes. There still remains, however, the third practical difficulty, the cost of colour receivers. Estimates of retail price are still somewhere in the impossible region of three times the price of a standard television set. Only further development in tube design can bring these prices down to a level that makes a colour service practical.

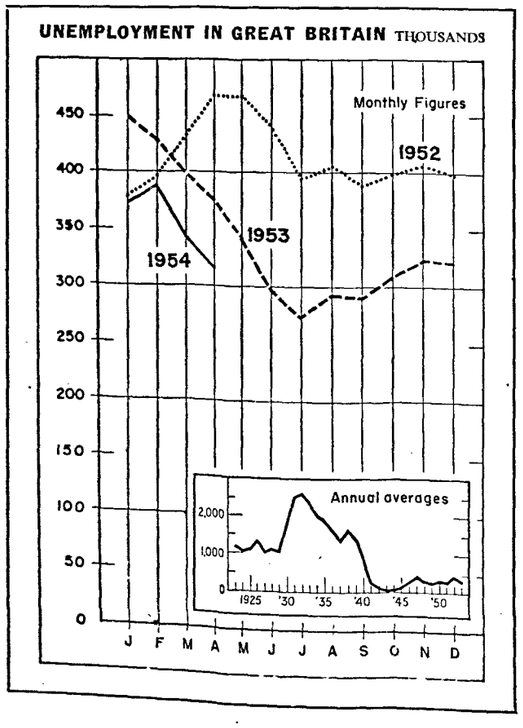
ICFC and Investment

THIS country is now reasonably well supplied with special financial institutions designed to help out industry, if for some reason the normal machinery of the capital market is not available. While Lord Bruce, presiding over Finance Corporation for Industry, cares for the giants in trouble, Lord Piercy presides over Industrial and Commercial Finance Corporation, set up by the English and Scottish banks to look after the fortunes of those who are not yet big enough to come forward with a public issue. Lord Piercy's review and the Corporation's report again give a clear and comprehensive picture of what is going on in the small capital market. The point in that review that may puzzle the investor, as it puzzles Lord Piercy himself, is that for a fairy god-mother his volume of business is remarkably small.

In the year ended March 31st the volume of business he transacted was only £4 million—a fair recovery from the figure of under £3 million in the previous year but well below the figure of over £6 million reached in earlier years. After allowing for repayments of advances, for the corporation's cautious provisions for doubtful debts and for commitments that have not yet resulted in actual advances, the addition to loans and investments outstanding is again smaller at £1.5 million compared with £2.6 million in 1952-53. Surely there is room for more and faster capital investment in small and medium sized industry.

This is not merely the result of a more stringent combing out of applicants. The number of applicants fell from 634 in 1950-51 to 364 last year. Lord Piercy attributes the decline partly to the rise of competition in his field by old and new institutions. One of the new institutions indeed lives under the same roof. "Edith," one of the companies designed to help owners of private businesses to raise money for death duties, covers part of the field which otherwise ICFC might have covered. Thus good steps have been made towards covering the notorious "Macmillan gap." But that is not the whole story. The actual desire by manufacturing industry for investment seems low. It is naturally still too early to see how far the new investment allowances will help to increase it, but Lord Piercy doubts whether they will be sufficient.

The banks who are Lord Piercy's shareholders are not averse from receiving increased dividends. This year he raises the maiden dividend of a year ago from 4 per cent to 5 per cent. But he will not make a habit of dividend increases. The intention is to stabilise at the new level. For an institution in which profit earning is not the main consideration ICFC has done well. The gross income for the year is up from £1,602,192 to £1,891,013. After raising the provision for doubtful debts from £100,000 to £250,000, meeting the loan interest of £624,913 compared with £539,079 and the tax charge the net profit rose from £417,931 to £466,492.



Propping Up "Free" Sugar

THE International Sugar Agreement, which embraces the "free" market comprising less than half the world trade in sugar, has now formally come into force. When the International Sugar Council met in London last week the total votes of the exporting countries which had ratified the agreement by May 1st were 15 short of the minimum of 750. Nevertheless, the countries which had ratified decided to bring the agreement into effect, as they were entitled to do under article 41, particularly as they knew that West Germany was on the point of ratifying. West Germany has now ratified and the members of the agreement are:

Importers: West Germany, Japan, Portugal, United Kingdom, United States (Canada, Greece and the Lebanon intend to ratify).

Exporters: Australia, Cuba, Czechoslovakia, Dominican Republic, Formosa, Haiti, Hungary, Mexico, Netherlands, Philippines, Poland, South Africa, USSR (Belgium, Brazil and France are in the process of ratification).

The agreement is thus more representative of the world sugar trade than either of its two predecessors, and is the only postwar commodity scheme to include representatives of the Soviet bloc. Among the exporting countries of consequence, only Indonesia, Peru and East Germany remain outside. On the importing side, the only important non-members are India, which hopes to become an exporter, and mainland China, potentially a large importer.

At the beginning of the year the council reduced the effective export quotas by 15 per cent to 3,930,000 metric tons in 1954, and has now reduced them further by the remaining 5 per cent that lay within its power, to 3,709,000 tons. It also recommended that exporters should export in the first eight months of the year 75 per cent (2,948,000 tons) of their initial quotas, compared with 80 per cent laid down in the agreement. The council has wisely resumed its prewar practice of publishing its estimates of the requirements of the free market. The new estimates amount to a total of 3,864,000 tons in 1954, which is practically the same as the previous total, although the requirements of a few countries, such as Britain and India, have changed significantly. When allowance is made for the likely exports of non-member countries, the existing quotas are still too high. But at this early stage of the agreement, the council could not be expected to agree to lower the basic quotas, nor to lower the agreement's existing minimum and maximum prices of 3.25 and 4.35 cents per lb, f.a.s. Cuba. It also considers that the outlook for the 1954/55 European beet sugar crop is poor, and will re-examine the situation at its next meeting not later than September 8th. By then more will be known about the European crop A very high yield such as last year's is normally followed by a much smaller yield, which would tend to reduce exports from Europe later this year, and increase imports of cane sugar into Europe next year.

Employing the Disabled

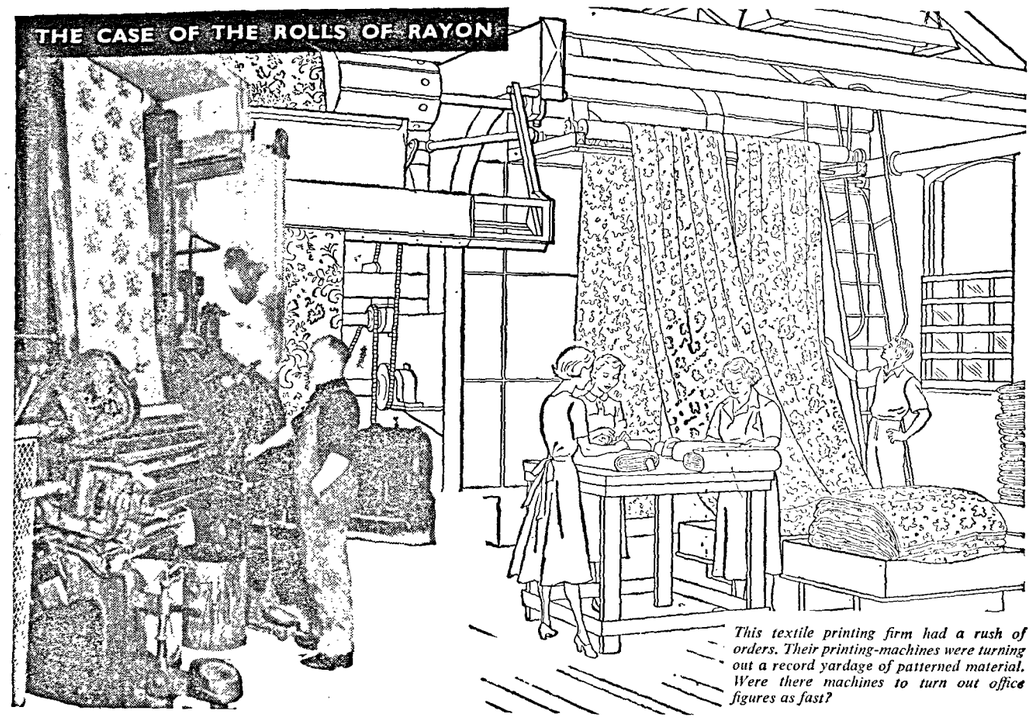
THERE are roughly 850,000 people on the Disabled Persons Register of the Ministry of Labour, and at present all but 6½ per cent of them are in employment. That rate of unemployment compares with less than 2 per cent for able-bodied people; even so, it may appear as reasonably full employment for the disabled—until it is realised that the Ministry's Register leaves out a wide fringe of disabled people who cannot work in open industry, many of them not maimed, but housebound through chronic illness. Sir Harry Platt has recently argued that some central body should be set up to co-ordinate the present multiplicity of services that affect employment or welfare of disabled people—a view that has already been urged upon the Piercy Committee, which was set up last year to study existing arrangements. The primary disadvantage that arises from the independence of the services provided by the Ministries of Health, Education, Labour, the local authorities, and the many voluntary organisations concerned, is simply that nobody really knows the dimensions of the problem.

About half a million of the men and women on the Register have found jobs under the "standard quota" scheme by which companies employing more than twenty people are obliged to reserve 3 per cent of their jobs for disabled people. A further 60,000 are employed by Government departments, and some 4,000 have jobs generally reserved for them, such as lift and car park attendants. These are in "open industry"; it is the people who could work only under "sheltered conditions" or in their own homes, who are at present neither catered for adequately nor even fully counted under the employment service. The Remploy organisation provides jobs under sheltered conditions for about 6,000 people in its 90 small factories, and employs a small number of outworkers in their own homes, while one or two commercial companies have experimented with employing outworkers. Another 5,000 or so places have been filled in sheltered workshops run by local authorities and voluntary organisations. But the Ministry of Labour knows of 5,000 more severely handicapped men and women who want sheltered work but cannot get it, while some of the voluntary organisations that have given evidence before the Piercy Committee argue that there are many others, not on the Register, but at present living on public relief in institutions or their own homes, who could be made economically and socially useful. The problem is in part one of definition and even of diagnosis—at some point it may hinge on a medical opinion about any individual—but it is also one of economics, and of cost to the community.

Rehabilitation or Jobs?

THE Remploy organisation runs its factories mainly in competition in the open market, though public authorities have powers to give it preferential treatment in allotting supply contracts, and have recently been urged by the Treasury to use these powers. Since its workers are more or less seriously disabled, its competitive ability is not always great; but these commercial principles have limited the extent to which it can seek out disabled people in remote places and provide them with work—often hopelessly uneconomic—to do at home. It is, moreover, concerned with providing "sheltered employment" not with rehabilitation; though some 600 people have graduated from its workshops into "open industry" in the last seven years, it has never been organised as a corridor between complete infirmity and work in the ordinary factory. Some witnesses before the Piercy Committee have argued that it has consequently been precluded from discovering all the disabled people who could possibly do useful work; and that the over-many authorities concerned with employing disabled people have put insufficient emphasis on the possibilities of rehabilitation. Certain workshops in this country are successful examples of an alternative approach—in which rehabilitation, under medical supervision, is the ruling principle.

Both Remploy and its critics have often sought to find out "the full cost of disablement" to the economy; this might well, on the one hand, offset the losses that Remploy has had to report, or on the other justify extra expenditure in bringing more disabled people back towards commercial employment. Adequate data for an estimate, at present, simply do not exist. The facilities for rehabilitation and training, which at present can handle some 14,000 people a year, cost some £13 a week for each trainee—against which might be set the equally high cost of beds in hospitals and institutions, plus large sums in public assistance to the disabled and chronically sick. There are indica-



This textile printing firm had a rush of orders. Their printing-machines were turning out a record yardage of patterned material. Were there machines to turn out office figures as fast?

"Finished"—
but the office work was only starting . . .

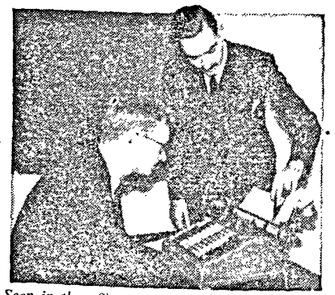
Flaxall Products Limited, of Belfast, Northern Ireland, have become a thriving business since the end of the war. Their main business is printing and finishing textiles—especially rayon and the famous Irish linen.

But production in their offices, they found, was not keeping pace with production at their Carrickfergus factory. Bookkeeping was being done by hand, and monthly statements frequently went out late. Control over an increasing volume of postings to Sales, Purchases, and Nominal Ledgers was becoming more difficult every day.

Not wishing to engage more office staff. Flaxall put the problem to Burroughs.

After investigation, Burroughs suggested that the firm should install one of their electrically-operated Desk Bookkeeping Machines to handle all Ledger work, Statements (and Purchase Tax computations), and some Commodity Analysis. This course was adopted.

Result: With this Burroughs machine at work, Flaxall Products Limited have solved their bookkeeping problem without adding any new office staff. Now, their monthly statements go out on the dot, and their accountant can control all figure-work without being directly involved in its production.



Seen in the offices of Flaxall Products Ltd. is Mr. T. R. W. Dark, the Chief Accountant. With him is Mr. B. McM. Thomas, the Burroughs man who installed their Burroughs Desk Model Bookkeeper—the machine that helped to solve the Case of the Rolls of Rayon.

What about you?

If your business could benefit from faster, accurate figuring, call in Burroughs. They can offer advice on all the latest systems, for Burroughs market the world's broadest line of modern record-keeping machines: Adding, Calculating, Accounting, Billing and Statistical Machines, and Microfilming Equipment. Remember, once you have any Burroughs machine, Burroughs Service *guarantees* its efficiency in operation.

Call Burroughs *today*. Burroughs Adding Machine Limited, Avon House, 356-366 Oxford Street, London, W.1. Sales and Service Offices in principal cities round the world.

FOR EXPERT ADVICE ON BUSINESS FIGURING CALL IN Burroughs

LONDON TIN CORPORATION is the giant of the tin mining industry; its interests are spread through Malaya and Nigeria; they spread out into Australia and Nyasaland. It is also an investment company, drawing its income from its holdings in numerous tin mining companies and from the earnings of the management companies of the Anglo-Oriental group. The holding company's earnings therefore tend to reflect the fortunes of the tin mining industry with a substantial time lag. The directors strive to cut down that lag by giving a preliminary estimate of profits (which is always correct to within a few pounds) well in advance of the full accounts, and by declaring the only dividend in the form of an interim well ahead of the meeting. The preliminary figures now announced are therefore a preview of accounts due about September. But they reflect dividends declared by the operating companies in the year ended April 30th which themselves naturally spring from earlier profits.

Even bearing in mind that the present earnings spring mainly from the period of high tin prices the figures are encouraging. The profit before tax showed only a modest fall at £1,198,000 compared with £1,358,000 and the net figure after tax actually a small increase at £480,000 compared with £448,893. The future seems to have few terrors for the board, who possibly take a rosy view of the prospect of the international tin agreement coming into force. They have properly decided to distribute almost the whole profit. (In this group the operating companies naturally make proper provision for the future, and there would be little justification for duplicating reserves in the parent's accounts.) The dividend is up from 22 per cent to 24 per cent and will absorb £477,607 of the estimated net profit. Tin mining is none the less a speculative business and at 6s. 4½d. the 4s. ordinary shares yield a little over 15 per cent.

★

WIGGINS, TEAPE. Recovery in the paper manufacturing industry has been general. The Wiggins, Teape group have shared in it to the full. Its gross profit for 1953 was more than doubled, and although much of the additional earnings were absorbed in tax and in higher pension provisions shareholders still receive an increase in dividends from the equivalent of just over 12½ per cent to 17½ per cent. As the offer to shareholders of Thomas Owen which Wiggins, Teape is just in the process of absorbing does not expire until June 30th of this year the present results do not reflect the projected broadening of the basis of the company's business. The history of the company indicates that though its fortunes have fluctuated widely, recovery, when it comes, tends to be sharp.

	Years to Dec. 31, 1952 £	1953 £

LONDON STOCK EXCHANGE

Next Account begins: May 19th.
Next Contango Day: May 19th.
Next Settlement Day: May 25th.

Up to noon on Thursday it had not been a week of big movement in the stock markets. Gilt-edged had held their own. The *Financial Times* index on Wednesday was 102.97 compared with 103.09 a week earlier. Industrial equities moved forward to a new peak of 147.4 on Wednesday compared with 146.2 a week earlier. But the movement had been slow and in general the markets firm, with little excitement. With the fall in the Bank rate an immediate upward adjustment in active dealings took place. Long-dated gilt-edged rose almost a point, and industrial and other groups showed advances.

Gilt-edged dropped back early in the week when the success of the Birmingham Corporation Loan was followed quickly—perhaps a shade too quickly—by the announcement of a £4,245,000 Trinidad Government loan of 4 per cent dated 1973/76 at 99½. The price was well calculated to the market and the effective amount offered for subscription in the United Kingdom was £3,200,000, but the interval had been so small that the premium which might have been expected on the Birmingham loan failed to develop. The gilt-edged market, however, remained basically firm and by Wednesday was showing signs of a further advance.

In a dull foreign bond market the Austrian 4½ per cent 1934/59 stock rallied following the formal debt offer, and insurance shares have been a consistently firm market through the week as the flow of good financial results rolled in. Prudential "A" reached 40¾ on Wednesday, a rise of 1¼ on the week.

The industrial market as a whole has remained persistently firm with advancing prices. On balance United Drapery have gained 9d. on the week at 59s. 9d. xd, Gussies 9d. to 75s. 6d. Rises have been well spread through the heavy engineering and motor groups.

(1) Petroleum production in Canada in 1938 includes natural gasoline. Annual figures of electricity production in Australia are for 12 months ended June 30th of year stated and for New Zealand 12 months beginning April 1st; monthly figures for New Zealand represent about 87 per cent of total generation. (2) Copper and tin refer to metal production. (3) General trade (including re-exports) except for Canada, which is special trade only. Imports are c.i.f. except for Australia, Canada and S. Africa which are f.o.b.; exports are f.o.b. Trade for India and Pakistan includes that going by land; annual figures for India are for 12 months beginning April 1st of year stated and for Australia and Pakistan 12 months ended June 30th. (4) Gold and foreign exchange holdings are those of the government and central bank; only figures for Australia include holdings of commercial banks. Cost of living for Pakistan is based on 12 months ended March, 1949, as 100; for S. Africa and S. Rhodesia relates to Europeans only and for S. Africa includes direct taxes. Annual figures for Australia are for year ending June 30th. (5) Average of fourth quarter.

Financial Statistics

EXCHEQUER RETURNS

For the week ended May 8th, there was an "above-line" surplus (after allowing for Sinking Funds) of £45,703,000 compared with a surplus of £5,823,000 in the previous week and a surplus of £18,646,000 in the corresponding period of last year, bringing the cumulative deficit to £15,120,000 (£7,930,000 in 1953-54). Net expenditure "below-line" absorbed £9,356,000, raising the total cumulative deficit to £34,507,000 (£38,336,000 in 1953-54).

THE MONEY MARKET

BANK rate was reduced from 3½ to 3 per cent on Thursday and the clearing banks subsequently announced corresponding reductions in their deposit allowances and short loan rates. The clearing banks' and discount houses' deposit rates are thus down to 1¼ per cent; and the banks' rates on call money to 1¼ per cent against Treasury bills, to 1½ per cent against bank bills and to 1⅝ per cent against bonds. Outside banks also appear to have reduced their lending rates by ½ per cent, to 1½ per cent. Discount rates on fine trade bills are reduced down to ½ per cent, and rates on bank bills by ¼-⅜ per cent. The new rate structure is set out below.

In the preceding week the surplus of credit in Lombard Street disappeared. But the acute stringency that developed on Thursday of last week and again on Monday was relieved by substantial official purchases of bills, both directly and through the banks.

Applications for the increased offer of £240 million of Treasury bills at last week's tender dropped back sharply from their record level of £437.5 million to £405.6 million. The market maintained its bid at £99 9s. 9d. and received a slightly higher allotment (42 per cent against 38½ per cent in the preceding week).

The gold market has had another quiet week. Prices at the fixings remained between 248s. 11d. and 249s.

The Bank return shows that bankers' deposits fell by £4.9 million to £270.6 million.

ISSUE OF

1,000,000 6½ per cent. Redeemable Cumulative Preference Shares of £1 each at 20/- per share

Redeemable at 22/6d. per share between 30 June 1979 and 30 June 1984.

The list of Applications for the shares will open at 10 a.m. on Wednesday, 19 May, 1954, and close on the same day.

Firm applications have been received from sub-Underwriters for 350,000 Preference Shares which will be allotted in full.

The full prospectus will show *inter alia* that:

1. **BUSINESS:** The Company and subsidiaries form a group which has been built up during the past eight years by Mr. Cyril Lord, with the assistance of Mr. W. H. McMillan, who are 42 and 43 years of age respectively, and who between them own the whole Ordinary Share capital of the Company. The Group is engaged in the spinning and weaving of cotton and rayon and other synthetic fibres, and is considered to be one of the most efficient and up-to-date in the textile industry. Total manufacturing units comprise 490,000 spinning spindles and 1,600 weaving looms. Since 1946, some £800,000 has been spent on new plant. The Company has additional retail outlets through 23 retail fabric shops.

2. **ASSETS: £2,424,965, sufficient to cover nominal amount of Preference Shares now being issued, together with the minimum premium of 2/6d. per share, over TWO TIMES.**

3. **PROFITS, (less losses, before taxation).**

Period or Year ended 31 December (1)	Cyril Lord Limited (2)	Subsidiary Companies (3)	Combined Profits so far as they concerned Cyril Lord Limited (4)
	£	£	£
1945 (from 23 June)	381	59,603	381
1946	15,443	188,016	15,443
1947	25,310	285,391	25,310
1948	44,860	437,842	44,860
1949	45,488	451,943	102,628
1950	64,001	666,050	208,747
1951	100,414	654,830	234,201
1952	142,360	555,465	566,174
11 months ended 30 November, 1953	137,281	439,818	516,901

Such of the profits shown in column (3) as are not included in column (4) are attributable to the respective periods during which the subsidiary companies were not owned by the Company.

Annual average of combined profits so far as they concern the Company as shown in column (4) above after deducting additional depreciation for the 3 years and 11 months ended 30 November, 1953, was £363,545, sufficient to cover the gross amount required for the dividend on the present issue of Preference Shares (£92,857) **NEARLY FOUR TIMES.**

In the absence of unforeseen circumstances, the Directors consider that after providing for additional depreciation but before providing for taxation, the profits of the Group, for the year ending 30 November, 1954, should substantially exceed the average profits for the 3 years and 11 months ended 30 November, 1953, of £363,545 per annum.

COMPANY MEETINGS

CANADIAN PACIFIC RAILWAY COMPANY

ANOTHER YEAR OF NATIONAL PROGRESS

IMPRESSIVE STRENGTH AND GREAT POTENTIALITIES

THE RAILWAY'S VITAL ROLE

MR W. A. MATHER ON RATES AND COSTS

The seventy-third annual general meeting of the Canadian Pacific Railway Company was held on May 5th at Montreal, Mr George A. Walker, QC, chairman of the company, presiding.

Mr W. A. Mather, the president, addressing the meeting, said:

We are meeting at a time of some uncertainty in business outlook. We are hopeful, however, that, before the year has progressed much further, the steady expansion of the Canadian economy, which has been so manifest in recent years, will be resumed.

PROBLEM OF RISING COSTS

1953 was for Canada another year of progress, one in which the productive capacity of the nation was again expanded and in which it produced a record volume of goods and services. Official figures show, however, that while the increase in the national output amounted to about 4 per cent there was an increase of 8 per cent in labour income. The comparable figures for 1952 showed rises in that year of 6 per cent in the national output and 12 per cent in labour income. Thus, for the second successive year the rise in national output has lagged behind the increase in wages and salaries. This trend towards an increasingly high cost economy poses serious problems for all of us. Unless halted, it could aggravate still further the deterioration in market conditions reflected in the worsening trade balances of recent months.

Perhaps the most significant and perplexing problem on the trade front is the marketing of the 1953 grain crop. Export sales in the first part of the year were satisfactory, but subsequently declined drastically. As a result, stocks of grain available for export are taxing all available storage facilities, although the crop in 1953 was not as large as in 1952. The reduction in the volume of grain moving to foreign markets was reflected in a decrease of 3.6 per cent in the grain traffic of your railway in 1953. Marketing problems were also manifest in some manufacturing industries. Export sales have declined, while imports from other countries have increased. There is reason to believe that the difficulties experienced by Canadian manufacturers are not unrelated to the fact that labour costs have continued to outstrip the increase in productivity. With the postwar backlog of demand now largely filled, competition for the consumers' dollar has increased.

INCREASING COMPETITION

In short, we have returned to the condition of a buyer's market—one in which the normal interplay of costs and prices should, over a period of time, strengthen and invigorate our economy in relation to the rest of the world. Increasing competition, while affecting many domestic markets, has been particularly noticeable in its effect on our foreign sales. Canada ranks third among the trading nations of the world. Hence, it is most important to the maintenance of a high level of employment in Canada and of a steady volume of traffic for your railway and steamships that our international trade remain at a high level. When Canadian labour costs, and therefore Canadian prices, tend to be high, our competitive position in world markets deteriorates and our prosperity suffers. Only by constant scrutiny of our prices can we ensure that the standard of living which we seek will not be so high as to prove self-defeating by pricing Canadian goods out of world markets. Experience has shown that inasmuch as competition promotes economical and efficient production, it is healthy for both consumer and producer.

Competition, however, presents a challenge to both management and labour to strive together for low cost by increasing output, improving the quality of product, and examining closely price and wage levels. Non-productive, make-work projects and similar devices offer no substitute for efficient and economical production in bringing about a high level of employment and economic well-being. Canadian industry, as a result of the large capital investments made in the postwar years, is well equipped with modern tools and machinery to meet and to take advantage of the challenge of competition. I am confident that with a realisation of the nature of the problem, the inherent good sense of Canadians will ensure that this challenge will be met vigorously and effectively.

The potentialities of Canada cannot fail to impress even the most timorous. Throughout the length and breadth of this vast country there is abundant evidence of the strength of our economy—sound and impressive strength that justifies optimism on the part of all Canadians as to the future. Possibly the greatest strength lies in the growth of our population. Last year, the number of people in Canada increased by 381,000, bringing the total to over 15 million—each an individual with needs and desires, who must be fed and clothed and for whom the goods and services required for modern living must be produced. The resulting expansion in our domestic market and in our productive capacity are major factors in maintaining the buoyancy of our economy.

WEALTH OF NATURAL RESOURCES

One of the best known of our basic strengths is the wealth of our natural resources. As has been frequently said, this country is witnessing a great surge of mineral development not only of the basic and familiar metals but also of the new materials of the jet and the atomic age. Among the more spectacular of the present and proposed developments are iron ore in Labrador; nickel, lead and zinc in the Yukon, the North-West Territories and the Maritimes; copper and titanium in Quebec; uranium in Ontario and Saskatchewan; and asbestos and tungsten in British Columbia. Much of the productive forest area, which accounts for about one-third of the total land area of the ten provinces, is yet untouched. Recent progress in forest management encourages the hope that these lands will prove capable of a far greater productivity than was once thought probable.

These developments broaden the foundation of our industrial potential—a potential that is becoming all the more impressive since it is accompanied by the discovery and development of various additional sources of energy. Not many years ago there were some who, looking only at the traditional source of industrial power—coal—considered that the industrial potential of Canada was limited by the geographic location of its vast coal reserves. Today, with a growing realisation of our reserves of water power, improved transmission methods, oil and natural gas and, for eventual development, nuclear energy, our sources of power are considered not as a limiting factor to our industrial potential but rather as one of the major forces in the expansion of the economy.

OIL RESERVES

Reserves of oil are now estimated at 3 billion barrels, establishing Western Canada as one of the important oilbearing regions of the world. The rich potential of new and expanding fields leads us confidently to expect a considerable increase in proven reserves as exploration and discovery move northward and eastward across the prairies. Since the discovery of the Leduc Field early in 1947, one billion dollars has been spent on oil exploration and development. Additional large sums have been invested is refinery and pipeline facilities. As new facilities come into operation, the flow of oil from established fields will steadily increase.

Average daily production of crude oil rose to 282,000 barrels per day in 1953. This amounts to one-third more than in 1952, and almost ten times more than in 1946. The availability of oil and its products is transforming the economy of parts of our Western Provinces. Chemical and other industries have already been established there and are stimulating the general industrial expansion of areas previously predominantly agricultural. Moreover, the export of natural gas from Western Canada will bring a new source of energy to Central Canada.

The potential of our hydro-electric power has recently been estimated at 65 million horse-power. Over one-fifth of this is at present developed—equivalent to approximately one horse-power per head of population. The many hydro-electric projects under construction or being planned assure a substantial increase in installed capacity. Those along the St. Lawrence alone will provide Canada with an increase of some 3 million horse-power.

Our growing population, the development of our natural wealth, and our industrial expansion are transforming our economy from one dependent on a few basic commodities to one of broad diversification. Today the number of people employed in agriculture is about the same as it was fifty years ago, while the number of those employed in other occupations has roughly tripled. Today, the industrial labour force accounts for almost 84 per cent of the working population of Canada—a truly impressive proportion when compared with that of 89 per cent for the United States. Particularly impressive in this respect is the change that has occurred in the prairie provinces, where, in the seven years since World War 2, the industrial labour force has risen from 50 per cent to 62 per cent.

EVIDENCE OF CONFIDENCE

Equally important for the continuing progress of the economy are sound and adequate financial institutions and transportation facilities. Canada is renowned for the strength of its banking system and soundness of its fiscal and monetary policies—factors which favourably impress investors and encourage them to make long-term investments in Canadian enterprises. Continuing and widespread confidence in the future strength, soundness and growth of Canada is clearly reflected in the all-time high capital investment planned for 1954. The latest official appraisal indicates probable capital expenditure amounting to $5.8 billion, about 3 per cent more than last year and equivalent to about 23½ per cent of estimated gross national product.

In this development, your railway is playing a vital part by carrying raw materials to industry and by helping producers get their products to market quickly and economically. As a result of some $430 million spent since World War 2 on additions and betterments to your railway properties, the capacity of your railway and its efficiency in operation and service are greater than ever before. Through the application of technological and improved operating techniques, your railway is constantly striving to increase the effectiveness with which it employs men and materials in order that it may produce more units of transportation at less cost.

The largest single factor in achieving efficient and low cost operation has been the substitution of diesel for steam power on certain lines of your railway. Some $70 million already spent on diesel locomotives and facilities is reducing operating expenses by about $12 million per annum. While experience indicates that the greatest savings in any programme of improvement are usually achieved from initial installations, nevertheless, room exists for further substantial economies from the substitution of diesel for steam power.

INCREASED EFFICIENCY

The statistical record shows striking evidence of the strides towards increased efficiency made possible by the capital expenditures undertaken. While total traffic volume in 1953 exceeded that of 25 years ago by almost one half, there was a reduction of almost 10 per cent in the required number of man hours. Operation of longer trains, together with greater average capacity of freight cars and increased train speeds, resulted in the attainment last year of a new high in the number of gross ton miles per freight train hour. Increases in wage costs and materials prices have been such, however, that, notwithstanding improved efficiency and high traffic volume, the financial results of your railway have worsened to the extent that the level of net earnings has been reduced to almost half of that of 25 years ago.

Clearly the low earnings reflect the need for modification of restrictions to permit adjustment of the rate structure to meet changed conditions. Since the original freight rate structure and methods of regulation were designed, competition in many forms has become most keen. Meanwhile, the railways have been handicapped in meeting that competition by the continuation of restrictions originally designed for the monopoly conditions which existed in the nineteenth century, and by the effects of perpetuating monopoly thinking into new restrictions. The time is long past due, not only from the standpoint of the welfare of the railways, but also in the vital interest of the country as a whole, for the railways to be permitted the greatest possible freedom in pricing their services.

A BURDENSOME RESTRICTION

The most burdensome restriction is that which requires the continuance by the railways of the reduced level of rates on Western Grain established in 1898 and 1899 under the terms of the Crowsnest Pass Agreement of 1897. That Agreement originally provided for a lower scale of rates on grain moving eastbound to Fort William and on certain commodities moving westbound to Western Canada from Eastern Canada. These rates were increased during the years 1918-1922 to enable the railways to meet increased costs resulting from World War 1. Upon removal of these increases, the railways filed tariffs in respect of the westbound commodities which applied the Crowsnest Pass rates only between points on your railway in existence at the time the Agreement was made.

The Board of Transport Commissioners set aside these tariffs, but the Supreme Court of Canada, in 1925, decided that the railways had correctly interpreted the Crowsnest Agreement. Parliament, which was in session when the judgment was announced, promptly enacted legislation the effect of which was to apply the Crowsnest Pass level of rates to all grain and flour moving eastbound from all points on all lines of railway west of Fort William whenever constructed but leaving to the board full power to deal with the westbound rates. These grain rates fixed at the level of 1899 are still in force.

Moreover, in 1927, under an Order of the Board, the rates on export grain moving to Pacific ports were lowered to the same level as those for grain moving to Fort William. It is pertinent to compare the conditions thus created with the terms of the original agreement. Last year one-third of the total freight traffic of your railway moved at these low rates. The rail charges amount to only 12 cents a bushel from an average shipping point such as Regina, 775 miles distant from Fort William.

NEED FOR LARGER REVENUE

In 1899, the average hourly wage rate of all employees was 18 cents, new rail was $22.32 per ton and the price of a new box car was about $600. By 1953, the average hourly wage, at $1.59, was more than eight times the 1899 rate, new rail, at $101.36 per ton, was more than five times, and a new box car, at $6,700, was more than eleven times the prices in 1899. These are burdensome increases and explain the need of the railways for increased revenue. Even though the efficiency of railways has greatly improved during the past fifty years, some general advances in rates were inevitable.

In sharp contrast to the rate increases granted on other traffic, the Crowsnest Pass rates have remained at their old level. In consequence they have become grossly unfair to the railways and to the shippers of other commodities. By contrast, the rates on grain in the United States, south of the border, are approximately three times those for comparable distances in Western Canada. Because the net earnings of your railway tended to be buoyant in years of good crops, some assume that this proves that grain rates in western Canada are profitable to your company. The net achieved in those years cannot, however, be attributed to the movement of grain. It resulted, rather, from the general stimulation of the economy of the country flowing from the prospect and realisation of a large crop. When the rainfall in late June and early July gave promise of good crops, there was a movement to Western Canada of agricultural implements, general merchandise and other commodities, the purchase of which had been delayed pending indication of the size of the crop. As cash and credit accrued to Western Canadians, business conditions improved and traffic for your railway increased. Canada has reaped large grain crops in recent years, but the growing burden of low grain rates, because of the mounting costs of wages and materials, has been the major factor in depressing railway net in relation to gross earnings to unprecedented low levels.

NO SPECIAL PRIVILEGES SOUGHT

It is believed, in view of all the altered conditions to which I have referred, that a change in Government policy directed to a lifting of the restrictions on grain rates by whatever action may be deemed to be expedient, would effect an improvement not only in railway net earnings but in the economy as a whole. The restrictions imposed on the railways have hindered the effective meeting of competition and have been indirectly responsible for the diversion to less economical means of transportation of much high-grade traffic that could best be moved by rail. This has resulted in loss of earnings for the railways. It has also increased the overall outlay for transportation for the country as a whole because the agencies handling the diverted traffic have costs greater than those of rail transport.

Your directors do not seek any special privileges for your railway. They ask only that the transportation policy within which, by statute or regulation, your railway is required to operate, should be appropriate to the conditions of today. It is encouraging to note the growing public appreciation of the difficulties which the present rate structure is imposing upon the railways. Given an opportunity to compete freely and fairly, your directors are confident that your railway, because of its high standard of service, its efficiency and its low cost relative to competing forms of transportation, will recapture and retain such traffic as can most advantageously be moved by rail, and that its returns will be attractive to investors.

REPLACEMENTS

An urgent postwar duty of your directors was the replacement of worn-out freight equipment, provision for movement of the mounting volume of freight traffic and the securing of economies to be derived from Diesel operations. These considerations have had a first claim on the financial resources of your company. Thus, there has been long delay in giving attention to the needs of your passenger service and of attracting back to the railway an important segment of traffic to which it has been beyond the financial resources of your company to do full justice. Delivery is expected next month from the Budd Company of the first units of an order which by the summer of 1955 will provide for a full complement of ultra-modern transcontinental passenger equipment. This equipment, to be constructed of stainless steel both for pleasing appearance and economical maintenance, will incorporate the latest features of comfort and convenience. Sky-view "scenic-domes" will permit the traveller to enjoy more fully the incomparable Canadian scenery.

For the operation of these smooth-riding streamlined trains, delivery is already being received of a fleet of new Diesel-electric locomotives, some of which will operate over the entire 5,700-mile round-trip between Montreal and Vancouver. Equipment released from present transcontinental service will permit improvement of service elsewhere on the system.

THE CURRENT YEAR

Net earnings from railway operations for the first quarter this year were down $1.6 million. The decline was the result of a decrease of some 13 per cent in traffic volume. Your traffic officers are hopeful that in the remaining months of the year traffic volume will move closer to that for the corresponding period of last year. Every effort is being made, through the attainment of the highest possible level of efficiency, to improve net earnings. Continuing the curtailment in maintenance expenditures put into effect last year, there will be no maintenance work undertaken beyond that required for pressing repairs and safe operation.

Little prospect exists for an increase in other income for 1954. Ocean cargo rates remain depressed and it appears unlikely that there will be any improvement in the volume of freight carried by your ocean steamships. Dividend income from your holdings of capital stock of the Consolidated Mining and Smelting Company of Canada, Limited, is unlikely to improve unless there is a recovery from existing low prices of lead and zinc. The prospect for increased receipts from petroleum rents, royalties and reservation fees continues favourable, although the rate of increase may not be as great as has prevailed in the last few years.

FURTHER PROGRESS ENVISAGED

The development of both Canada and your railway have been along sound lines; their productive capacity and their overall strengths are now greater than ever before. I see no reason why, providing rail transport is relieved of restrictive regulation which impairs its ability to meet competition, your company should not continue to go forward with Canada.

Your directors show their continuing confidence in the outlook for your company by again planning for a large capital expenditure programme in 1954, involving appropriations which total $75 million. These are listed in the annual report which is now before you for your approval.

The report and accounts were adopted.

THE BRITISH XYLONITE COMPANY LIMITED

INCREASED TURNOVER AND PROFIT

DIVIDEND RAISED TO 10 PER CENT

MR C. F. MERRIAM ON THE OUTLOOK

The annual general meeting of The British Xylonite Company Limited, will be held in London on May 31st.

The following is the statement by the chairman, Mr C. F. Merriam, circulated with the report and accounts:

The forecast which I made a year ago, that the manufacturing divisions of the parent company and the subsidiaries could look forward with confidence, has been fulfilled. The total turnover of the group increased by about 10 per cent, while the consolidated net profit of the parent company is £160,000 compared with £86,000 for 1952. This considerable improvement has been achieved in spite of the fact that BX Plastics contributed little to the result, being still in a period of consolidation.

DIVISIONS

The manufacturing divisions of the parent company, Halex, Cascelloid and Scintillex, which are engaged in making a wide variety of consumer goods, increased their turnover and profits. They have up-to-date equipment and make use of many modern processes and the newer plastic materials. Halex is best known for its long-established range of Halex toilet brushes and the rapidly increasing sales of Bex household goods. Although Cascelloid's main interest is in Palitoy dolls and toys, it has recently developed transparent and flexible packaging and the manufacture of Cascalite corrugated sheet for the glazing of industrial and other buildings. Each year Scintillex increases its sales in a range of fashion and fancy goods.

SUBSIDIARY AND ASSOCIATED COMPANIES

BX Plastics is still engaged in transferring plant from Dundee to Brantham, as well as installing some large new units there. These major schemes of development are nearing completion and in due course will strengthen the company's leading position in the field of thermoplastics. In spite of some recovery in the tonnage of plastics and chemicals produced and sold, the results of trading during 1953 were disappointing, and only during the latter part of the year reached a profitable basis. Owing to reductions in prices of raw materials, there was a substantial amount to be written off the value of stock.

The move from Dundee will be completed this year, and when all the units of plant (new and transferred) are on a full production basis, BX Plastic's factory at Brantham will contain some of the finest equipment in the country for manipulating plastic materials, such as calenders for polyvinyl chloride sheeting, both rigid and flexible, and extruders for rigid vinyl tubes and Saran mono- and multi-filaments.

The research department was responsible for the design of a polystyrene polymerisation plant which was completed in 1953, and Bextrene polystyrene moulding powder of excellent quality is now in full production.

The Expanded Rubber Company, which makes "Onazote" thermal insulation material and "Rubazote" light-density expanded rubber with many varied uses, has had a check in the very satisfactory progress made since the war, but even so the result is good. The sales trend is, however, downwards as a result of reduction in Government orders.

Bexford Limited, an associated company, whose factory adjoins the Brantham Works, has had another excellent year and is planning to increase its production, which will involve an additional building.

ACCOUNTS

Considerable alterations have taken place in the reserves shown in the consolidated balance sheet. These are explained in the notes printed at the end of the published accounts. The substantial increase in fixed assets in the consolidated balance sheet reflects the heavy capital expenditure undertaken during the year, mainly by BX Plastics. As a consequence, there is a decrease in net current assets, which, however, are still substantial, amounting to over £2,600,000.

The combined trading profits for the year amount to £823,000, against £529,000 for 1952. Income from trade investments, which was substantial last year, does not appear at all this year. This does not represent a loss of revenue, but an adjustment of the trading arrangements with an associated company whereby we receive a substantial benefit incorporated in the combined trading profits instead of by way of investment income. The profit for the group, before taxation, amounted to £429,000, compared with £236,000 in 1952, the consolidated net profit, after tax, being £178,000, against £75,000 last year.

Dividend.—In view of the improved results, the directors have recommended the payment of a final dividend of 8 per cent on the ordinary stock, making a total of 10 per cent for the year. This compares with a total of 8 per cent for 1952.

CAPITAL EXPENDITURE

Heavy capital expenditure has always been a feature of our business, and has been more than ever necessary since the war. BX Plastics, in particular, being manufacturers of plastic materials, find it essential to keep up to date with the latest discoveries and developments, and this is likely to continue in the future.

The Vogue Manufacturing Company.—As already announced in the press, The Vogue Manufacturing Company, Limited, of Melton Mowbray, has been acquired as from May 1, 1954. This development will strengthen our competitive position in the brush and toy trades.

THE FUTURE

Apart from the anticipated reduction in turnover and profits of the Expanded Rubber Company, and provided nothing unforeseen occurs, we can look forward to improved results for 1954, especially as we should have a better contribution from BX Plastics. However, with the new plants only gradually increasing production during 1954 we cannot reap the full benefit of the large capital expenditure of recent years until 1955.

Although we have been able to show an improved financial result, this has been anything but easy to achieve, and we must be grateful to the managements, staffs, and employees for their strenuous efforts and willing co-operation.

THE NORTHERN ASSURANCE COMPANY, LIMITED

118th ANNUAL GENERAL MEETING

STATEMENT BY THE CHAIRMAN THE RT HON LORD GLENCONNER

The one hundred and eighteenth annual general meeting of the Northern Assurance Company, Limited, will be held on June 2nd in Aberdeen.

The following is an extract from the statement by the chairman, the Rt Hon Lord Glenconner, which has been circulated with the report and accounts:

It is on effective administration, capable of speedy decision and providing efficient service, that the continuity and expansion of the group's world-wide business depends. You will be glad to know that further headway has been made in the policy of consolidating the company's administration, and that 1953 has been a year of real progress, as the results before you show.

In this connection, at the annual general meeting last year one board of directors, known as the General Court, was set up in place of the separate London and Aberdeen boards which had previously shared the responsibility for the conduct of the company's affairs. The new articles of association then adopted were the first step in this reorganisation; the second step was to secure an amendment of the Northern Assurance Act of 1908. The Bill to amend the Act was approved by the shareholders at the extraordinary general meeting held on February 10th last and it received the Royal Assent on March 26th.

As the chairman's statement foreshadowed last year, a new board has been set up at the Aberdeen Head Office to preserve the special connections with our business there.

SCOTTISH REGIONAL OFFICE

I feel sure, too, that you would like to know of another development in the company's plans for providing improved service to the public. A regional office for Scotland has been opened in Glasgow to provide specialist services, covering the whole of Scotland, for accident claims and for the development and handling of engineering insurance, life assurance, and pensions business. This office is under the general supervision of the manager for Scotland, and it includes on its staff experts in these subjects who are at the service of our clients and connections in Scotland. This development in Scotland may well lead to setting up similar regional offices in other areas.

RISE IN INVESTMENT VALUES

The total resources of the Northern group now stand at £58,170,761 compared with £54,628,991 at the end of 1952. They are principally secured by our holdings of Stock Exchange securities, the book value of which last year expanded from £36,111,015 to £40,032,907. The past year was marked by a rise in investment values, and the modest increase in dividends paid by a number of industrial companies has given the group a better return on its important holdings of industrial ordinary shares.

PROGRESS OF THE LIFE DEPARTMENT

Among the achievements of the past year, both of the parent company and its associates, the progress of the life department was again outstanding. New life sums assured last year by the Northern group reached £16,731,239 compared with £13,032,774 in 1952. This increase of 23 per cent is remarkable, as for the life offices as a whole last year's increase in new business was about 6 per cent. We have, indeed, every reason to feel satisfied with the share of life assurance business that we have succeeded in obtaining in the last two years, and it lays the foundation for a satisfactory expansion of premium income in the years ahead. The integration of the Northern and the London and Scottish life business has led to increased efficiency, and it is gratifying that the life business contribution by the London and Scottish connections shows an appreciable increase over 1952.

PENSIONS DEPARTMENT

The pensions department has fully justified our expectations and is handling a most satisfactory volume of group pension schemes. It has also been preparing itself against the day when the Government may accept the Millard Tucker Report.

FIRE ACCOUNT

Our general insurance business ranges across the free world. The fire account showed a modest increase in premiums and a satisfactory profit. Results in the United States were somewhat less favourable than in 1952, but 1953 was a year of widespread hurricanes and we were involved, with many other insurers, in the destruction by fire of the General Motors' plant at Livonia last August, one of the biggest single losses in insurance history. On the other hand our fire experience in Australia, Canada and South Africa was very good. In these circumstances last year's total fire profit of £685,642 compares well with the profit of £727,183 for 1952, and the profit ratio was only a fraction below 8 per cent.

ACCIDENT DEPARTMENT

Results in the accident department have for some years been dominated by motor insurance which is highly competitive and inadequately remunerative. Last year we secured a 10 per cent increase in accident premiums, and after providing on our usual conservative basis for a reserve of 50 per cent of the year's premiums to cover unexpired risks, the accident account shows a profit of £99,389, whereas in 1952 there had been a loss of £153,086. This is a more welcome result; it marks a further improvement in motor business, but there is still some way to go before the return that we and other insurers obtain on motor insurance can be considered satisfactory.

MARINE ACCOUNT

Marine insurance yields its final results only after a period of time and the lower profit transfer of £296,494 in the latest year reflects the less favourable results that emerged from the 1951 account. The marine fund now stands at just over £8 million. Last year's marine account was affected by the incidence of large losses in the early months, and last October the force of international competition led to the abandoning of the attempt to secure a 10 per cent surcharge on premiums to offset the continuing increase in the cost of ship repairs. Cargo rates, again, are falling and in many cases they must be reckoned inadequate.

THE YEAR'S RESULTS

The departmental transfers I have enumerated above total £1,081,525 as compared with the 1952 underwriting profits of £1,008,474. Together with other transfers and with the gross investment income on the shareholders' funds of £937,366 (against £801,845 in 1952) and after providing £142,332 for loss on exchange, the Northern group's trading profit is £1,908,642, compared with £1,837,644 in 1952.

Taxation at home and abroad has fallen somewhat less heavily on the past year's accounts; we are providing £1,064,295 compared with £1,303,974 in 1952, but even this absorbs 56 per cent of the profit, leaving £844,347 net. £400,000 has been set aside out of the past year's net profit to the contingency reserve; the group's resources and responsibilities are growing at a rapid rate and it is our first duty to ensure an adequate cushion of security for the protection of our policy holders and for the general support of our business.

DIVIDEND INCREASE

By long established practice, shareholders derive their dividends chiefly from the investment income of the non-life funds. I have mentioned last year's satisfactory expansion in the gross income of these funds before tax; the net investment income of the shareholders' funds, after deducting taxation, rose from £395,586 in 1952 to £448,799 last year.

The decision of your directors to recommend a final dividend of 11s. 6d. on the ordinary shares, making a total distribution of 20s. per share, takes this into account and recognises that shareholders, as proprietors, are entitled to benefit from the growth of the company and its prosperity. A 2s. step in the dividend is larger than in recent years, but it is well justified by the progress made in 1953. The increased ordinary dividend carried with it a further dividend on the 6 per cent participating preference shares of 9s. 10.209d. per share, payable with the usual half-yearly dividend on July 1st next. In this connection, and because the interim dividend has to be considered at a time when the results for the full year are not available, I would mention that your directors, in future, only intend to recommend an increase in the interim dividend in so far as they deem it desirable to effect a balance between the interim and the final dividends.

WIDOWS AND ORPHANS' FUND EXTENDED

Ten years ago, the company set up a widows and orphans' fund for the benefit of the home staff, and this was extended last year to the staff in South Africa. The directors have agreed that the fund should now be extended to the company's branches in Canada, Australia, New Zealand, India and Pakistan To cover the initial liability of the new entrants to the fund, a lump sum contribution of £12,500 is needed from the company, to which your agreement will be sought.

Further, the actuary recommended after his valuation of the fund at March 31, 1953, that the company should make an annual contribution to the fund, so that the benefits could be brought into line with present-day needs, and your directors agreed to this course.

COMMERCIAL UNION ASSURANCE COMPANY, LIMITED

YEAR OF PROGRESS AND ACHIEVEMENT

LIEUT COL JOHN LESLIE'S REVIEW

The annual general meeting of Commercial Union Assurance Company, Limited, will be held on May 31st in London.

The following is an extract from the review by the chairman, Lieutenant Colonel John Leslie, DSO, MC, DL, which has been circulated with the report and accounts:

The gradual process of readjustment, which became apparent in 1952, has continued during the past year and the inflation in values to which we had become accustomed during the postwar era is no longer a predominant feature of world trading. In many instances prices and values have receded, but from a general point of view we have entered upon what may be regarded as a period of greater stability. This is a very welcome development and although the growth of our premium income has necessarily been slower, it does, in fact, reflect a more real expansion of our business rather than enhanced values and increased rates.

In spite of these changing circumstances, we can, I feel, look back upon another year of progress and achievement in 1953 and it is particularly gratifying to record that for the first time in the company's history the net premium income in the fire, accident, and marine departments has exceeded £50 million. Furthermore, as we shall see when we come to examine the departmental accounts later in this review, our operations through each of the main sections of our business were conducted upon a profitable basis.

FIRE DEPARTMENT

The net premium income was £22,054,866 (£21,771,090 in 1952). The fire fund now amounts to £19,488,254. At home the premium income advanced, but once again the rate of increase was smaller, due to the circumstances I have already described. Unhappily there is no sign of any abatement in the fire wastage in the United Kingdom, and no review of last year's working would be complete without a reference to the East Coast floodings, which occurred at the end of January. The total claim payments by us as a result of this disaster represented a substantial figure.

It is, however, overseas that our business has once again shown a welcome expansion, notably in the United States, Australia, Canada, New Zealand and South Africa.

ACCIDENT DEPARTMENT

The net premium income was £25,960,426 (£23,764,785 in 1952). The accident fund now amounts to £17,007,300 or 65.51 per cent of the premium income.

Business at home has again shown expansion, but the rate of progress, as was to be expected, has not been so rapid as in the two previous years.

The difficulties connected with the transaction of motor business in recent years have again been much in evidence. References to the number of accidents, the high level of repairs costs, and growing third party payments are all too familiar, and these and other difficulties continue to be very real factors calling for the exercise of underwriting skill.

The immense wastage of human life and limb by road and industrial casualties is a matter of the greatest concern. The adoption of every practicable form of accident prevention on the roads and in the factory should be the aim of all, motorist, pedestrian, employer, and workman alike. Much is being done to bring about a higher standard in safety measures in many quarters and insurers are making their full contribution.

In the Commonwealth and overseas field generally substantial progress has been made in the expansion of our business, and with satisfactory results, but the rate of increase of our premium income was not so marked as was the case in 1952 or, indeed, in most of the postwar years. This is due partly to the stabilising of values, but also to the fact that in most of these territories the increases in rates for motor business, necessitated in recent years by the heavy claims experienced, had already been applied by the end of 1952.

MARINE DEPARTMENT

The net premium income was £2,377,672 (£2,786,921 in 1952). The marine fund now stands at £3,921,263 or 164.92 per cent of the premium income.

There has been a decrease in our premium income from hull insurance, and this is due to a combination of two factors, namely, reduced rates and lower values. In some cases, where there is a satisfactory record over past years, a reduction in premiums can be justified, but there are other instances where intensified competition has given rise to rates which have been so reduced as to become, in our judgment, inadequate, and this has caused us to decline participation in the insurance of a number of fleets.

Our cargo premium income again shows a slight fall from the previous year. It is pleasing, however, to record that there has been a gradual increase in trade within the sterling area due to the lifting of import restrictions.

LIFE DEPARTMENT

Once again a record figure was reached for net sums assured retained at the company's own risk. The gross sums assured for 1953 totalled £18,473,819 compared with £17,677,560, and this is the first time that a figure of £18 million has been exceeded. The fall in the number of policies issued is not significant, since it mainly reflects our adoption of the modern practice of issuing a master policy to cover the whole membership for each life assurance and pension scheme. During the year the life fund increased by £2,556,351 to £46,761,740.

The net premium income in respect of life assurance contracts was £4,697,690 (1952, £4,421,824), and in addition we received £799,147 as single and annual premiums for various types of annuity contract.

PROFIT AND LOSS ACCOUNT AND BALANCE SHEET

The directors recommend a final dividend of 6s. 6d. per £1 unit of stock, making with the interim dividend of 5s. paid in November last a total for the year of 11s. 6d. per £1 unit of stock—an increase of 1s. 6d.

The directors have decided to apply to the Stock Exchange for quotations of stock in 5s. units instead of £1 units.

THE MANGANESE BRONZE AND BRASS COMPANY

NEW OVERSEAS INVESTMENT

The fifty-fifth ordinary annual general meeting of The Manganese Bronze and Brass Company Limited was held on May 7th in London, Mr J. C. Colquhoun, MBE (chairman and managing director), presiding.

The following is an extract from his circulated statement: The profit for the year before providing for taxation and dividends, amounts to £337,277 after charging £85,164 for depreciation. The comparable profit figure for the previous year was our all time record of £439,029. Provision for taxation amounts to £214,000 against £303,000 for the previous year. The amount available for distribution therefore is £123,277, or £12,752 less than a year ago.

Your directors recommend a final dividend of 6d. per share on the ordinary shares making 9d. per share for the year and a bonus of 1½d. per share, making a total of 10½d. (same) for the year.

SUBSIDIARY COMPANY: The amount shown in the balance sheet under this heading relates to an investment in Paxol Limited, a newly formed Canadian subsidiary at St. Thomas, Ontario, in which your company owns a controlling interest in association with the Clevite Corporation of USA. This subsidiary will shortly be producing bearings and other parts made from metal powders for the Canadian market. Your directors felt well justified in initiating this venture.

MARINE PROPELLER ACTIVITIES

The marine propeller side of your business at Birkenhead again had a satisfactory year with about the same volume of work as in the previous year. Orders in hand, which represented some 20 months' work at the beginning of the year, now represent 16 months' work. Thereafter it may be that there will be less work available. The inflow of orders into UK shipyards (in gross tons), as reported by "The Shipbuilding Conference," has dropped from 4 million in 1951 to little more than ½ million in 1953. Orders in hand are reported as 5½ million tons, but it is wrong to assume that this means three or four years' output for all shipyards. Large tankers constitute well over 50 per cent of the total order book and only tanker building firms have contracts to keep them busy for several years ahead.

The year is noteworthy for the number of very large propellers made principally for large tankers. Most of these propellers have been to our "Scimitar" design. The tonnage of propellers made in our new "Nikalium" alloy has again increased. The development of this alloy represents an important step forward and we expect a continuing increase in the demand for this superior material.

HANDFORD WORKS, IPSWICH: The demand for our special alloys, and in particular aluminium bronze, showed an increase.

ELTON PARK WORKS, IPSWICH: Your works manufacturing "Oilite" self-lubricating bearings and other parts made from metal powders, experienced a falling off in demand with severe competition to secure the work available with a consequent reduction in profit margins. The volume of orders booked in the last two quarters, however, showed an encouraging revival.

In regard to the prospects, our experience of 1954 to date indicates no improvement over 1953 and it is impossible to say at the moment that profits will not recede still further from the peak year of 1952

The report was adopted.

INNS & COMPANY

INCREASED TURNOVER AND PROFIT

The nineteenth annual general meeting of Inns & Company, Limited, was held on May 7th in London.

Mr Walter Wallace (joint managing director), who presided, said: The accounts for the year ended December 31, 1953, show a trading profit of £433,076 and a net profit of £352,273 for the year, being increases of £122,892 and £109,583 respectively on the figures for the preceding year. These satisfactory results have been produced by large increases in turnover, to which all departments have contributed.

I would like to add here that so far, for the year 1954, the business of all departments is running satisfactorily and compares well with that for the year under review.

Shareholders will note with pleasure that the reserves total a sum of £292,102, which is just under £50,000 more than the aggregate figure in last year's accounts.

The balance at bank and cash in hand is £202,868, and is one of the satisfactory features of the strong asset position of your company.

We are all aware of the heavy burden which taxation lays upon industrial undertakings, and I think it right that I should point out to you that the amount set aside for taxation in these accounts is £247,000, representing 70 per cent of the net profit of the company. The excess profits levy finishes with these accounts, viz., December 31, 1953, and a sum of £50,000 for that tax is provided in the accounts.

The company were grateful to the Chancellor for the small relief contained in last year's Budget in respect of sand and gravel pits. Your board regret that in spite of the strong and clear recommendations of the Millard Tucker Committee in their report, the Chancellor has not yet granted adequate and proper relief from all forms of national taxation in respect of wasting assets. The matter does not, however, appear to have passed entirely out of the official mind, as the current Finance Bill, by Clause 21, provides that cemeteries and crematoria are to be allowed the cost of land used up.

The directors propose that the final dividend on the ordinary shares be increased from 10 per cent, which has been paid for some years past, to 12½ per cent, actual, less income tax, and that there will also be a bonus on the ordinary shares of 5 per cent, actual, less tax.

The report and accounts were unanimously adopted and the dividend and bonus as recommended were approved.

BRITISH-AMERICAN TOBACCO

RECORD SALES

MR D. M. OPPENHEIM'S SPEECH

The fifty-first annual general meeting of the British-American Tobacco Company, Limited, was held on May 7th in London.

Mr D. M. Oppenheim, chairman, in the course of his speech, said:

We welcome movements towards a freer system of trade and towards greater freedom of currencies, all of which assist the growth of international trade and commerce. These trends are of direct interest to your company, which by its very nature largely depends for its prosperity on the free flow of international trade and particularly the free convertibility of currencies. There is a long way to go, but the trends are at present in the right direction.

Some countries, although recognising the need for foreign private capital, continue to maintain company and other laws which are not encouraging; or impose quite unrealistic and unacceptable conditions. They also subject existing investment to discriminatory treatment and impose limitations on or hindrances to remittances of earnings and repatriation of capital, thereby failing to create the necessary atmosphere of confidence. Whilst investors must clearly be prepared to further the proper aspirations of the country in question and subject themselves to the laws thereof, governments who seek investors must be realistic in creating the conditions and the sense of security without which no adequate volume of investment is likely to flow into their countries either from here or from the United States of America.

BURDEN OF TAXATION

Furthermore, both at home and abroad the burden of taxation is a major deterrent. Substantial relief from taxation would constitute the healthiest and most enduring encouragement and incentive to investment.

At home, the Chancellor of the Exchequer has stressed the need for creating a balance of trade surplus which will enable this country to make a worthy contribution to overseas development. But the level of taxation is very frustrating to efforts exerted to both these ends. Considerable progress has been made in recent years in relieving double taxation and full unilateral relief is now allowed in this country. Although this is valuable, the fundamental problem of double taxation remains unsolved; income and profits arising abroad to residents of the United Kingdom still pay the full rate of United Kingdom tax, even if such income and profits are not remitted here.

I think the ultimate solution may well be for each country—and this country in particular—to exclude entirely from charge to income and profits tax income which falls within the jurisdiction of other countries.

OVERSEAS INVESTMENTS

The annual accounts of your company over the years since the war bear witness to the very considerable extent to which, both directly and through its subsidiary companies, it has contributed to the furtherance of the policy of increasing overseas investment in the Commonwealth and elsewhere.

It is, of course, true that not the whole of that investment has been voluntary; the need, in more recent years, for adequate reserves to counter the effects of inflation on company finances, coupled with the compulsory retention of profits due to lack of remittance facilities in some countries, has made reinvestment unavoidable. Nevertheless, a comparison of the group's total investment in fixed assets alone between 1949 and 1953 shows an increase by the equivalent of £26 million of investment in improved and enlarged productive capacity, mainly overseas, to meet the increasing demand for the products of the group.

In certain of our overseas markets there has been an easing during the year of import restrictions in conformity with the general trend towards liberalisation of world trade, and one would hope eventually to see a complete abolition of such restrictions.

THE PATTERN OF TRADE

On the other hand, certain factors may have a more permanent effect on the pattern of trade. Such are: costs of production, which continue to increase, and a tendency on the part of smokers overseas to switch to a lower price class of cigarette, usually of local manufacture, with a consequent reduction in the consumption of the higher priced product exported by your company from this country. This tendency is particularly evident in countries where there has been a measure of disinflation. Such switches in demand regrettably cause some redundancy of labour and plant in our export factories here. Against this there arise increasing demands on the manufacturing and financial resources of our associated companies overseas.

I am happy to report that the total volume of sales of the group for the twelve months to September 30, 1953, reached a new record and for the first six months of the current year has continued to expand. On the evidence of results to date, I feel you can safely assume that the final figures for the current year should be at least as favourable as those for the year which we have had under review at this meeting.

The report and accounts were adopted.

HAMBROS BANK LIMITED

Expansion in Activities

Mr. R. Olaf Hambro's Statement

The FORTY-SECOND ANNUAL GENERAL MEETING of Hambros Bank Ltd. will be held on Thursday, 3rd June, 1954, at the offices of the Bank, 41, Bishopsgate, London, E.C.2.

The following is the statement of the Chairman, Mr. R. Olaf Hambro, circulated with the report and accounts for the year to March, 31st, 1954:

RELAXATION OF CONTROLS

In my statement last year I referred to a noticeable but gradual release of controls by the Government and during the year under review further relaxations from Exchange regulations have been made. It must be the hope of all of us that this year it will be possible for this country further to release the individual from the remaining controls which prevent him from freely using his own money, thereby approaching what has become to be known generally as convertibility which is only another name for freedom. It is, to my mind, remarkable that people all over the world who have had their money blocked here for years should be willing to trust London again. It does seem, however, that this is what they are willing, or at any rate, inclined to do, which shows great faith in this country. We all, of course, agree that the controls imposed on us were necessary after the war but the danger of these is that they build up a machine with officials who get used to the machinery and are loath to give it up. One way or another, if London is to resume its world financial position, which it can still do, all restrictions must be gradually removed.

RISE IN ACCEPTANCES

The past year, in spite of my foregoing remarks, has seen an increased expansion in the activities of the Bank. The rise in Acceptances is fairly spread over the countries in which we mostly operate which, as is well known, are Norway, Sweden, Denmark and Finland, also our old connections in Southern Europe, particularly Italy, Greece and Portugal. There has also been a rise in demands at home for advances against produce, both for export and import, which is reflected in the rise in Loans and Advances. The Balance Sheet generally shows expansion in all directions and the liquidity remains in the strong position which it has shown in past years.

Turning to the Profit and Loss Account, the net profit figure comparable to that of March, 1953, is £424,708, against £396,452. This is very satisfactory and shows the increase in the activity of the Bank.

The combined Statement of our Subsidiaries consists primarily of Hambros Investment Trust, together with the Executor and Nominee companies. The valuation of Hambros Investment Trust stands at the very considerable figure of £750,000 above the value in our Balance Sheet.

A NEW INVESTMENT

A new investment has been added during the year by the creation of a Canadian Trust Company known as Locana Corporation Ltd., in which we have participated with Messrs. Harrisons & Crosfield Ltd. and others, and to the Board of which we have appointed Mr. Jocelyn Hambro.

Owing to the recession in America the Hambro Trading Company of America Inc. has had to reduce further its activities as the difficulty in selling British goods in the U.S A. increases.

Last year I referred to certain changes in the management, and I would like to congratulate the Managers on the smooth working of the new arrangement and also, through them, the whole staff, who once again, during a very active year, have done excellent work and given that service which is proof of their continued loyalty to the Bank.

ATLAS ASSURANCE COMPANY LIMITED

CAPITALISATION OF RESERVES

The annual general meeting of the Atlas Assurance Company Limited will be held on June 3rd in London.

The following are extracts from the statement to shareholders by the chairman, Mr Rudolph E. F. de Trafford, OBE, which has been circulated with the report, accounts and balance sheets for the year ended December 31, 1953:

In the course of my review of our 1952 accounts, I referred to our having provided for possible losses in connection with exchange. Since then a further deterioration in the overseas currency principally concerned has necessitated some additional adjustments which have affected our fire, accident and marine revenue accounts, and also the profit and loss account.

FIRE ACCOUNT

In dealing with the 1952 accounts, I referred to the slowing down in the rate of expansion of our premium income which, it seemed to me, might be indicative of a deceleration of the inflationary trend. On the face of it, events appear to have lent some support to this view. Our premium income for 1953, at £5,832,505, is nearly £220,000 lower than the corresponding figure in 1952.

Losses by fire have, in the natural order of things, continued but it would be happier and more profitable for everybody, leaving insurance companies right out of it, if the general rate of burning—the funeral pyre of so much endeavour—could at least be checked in its pace.

After setting up the customary provision for unexpired risks at the close of the year, there is an underwriting profit of £586,918. This is some £60,000 less than the 1952 figure, but this does not in all the circumstances occasion surprise.

ACCIDENT ACCOUNT

Premium income, at £2,576,148, rose by £103,202. Much of this increase comes from higher rates for motor insurance in various parts of the world but, with the ever-increasing cost of repairs and the high level of Court awards in the case of third party damages, it seems doubtful whether rates are, even now, generally adequate. Our experience from other classes of accident business, however, has on the whole been favourable and the underwriting profit emerging amounts to the welcome figure of £196,855.

MARINE, AVIATION AND TRANSIT ACCOUNT

Our premium income for the year 1953 amounted to £759,133, as compared with £807,042 in 1952. Chiefly responsible for this drop in premium income is the continuing downward trend of cargo rates due to intense competition for a reduced volume of business, owing to lower commodity prices, in an expanding—if not overexpanded—marine insurance market.

Claims paid in 1953 at £521,918 were less by £19,716 than those paid in 1952 and, after transferring £100,000 to the profit and loss account, the balance of the marine, aviation and transit insurance fund at the close of 1953 amounted to £1,273,130.

LIFE DEPARTMENT

Our life assurance and annuity fund increased substantially and now amounts to more than £25 million.

The sums assured under new assurances were £5,039,709, after deduction of reassurances, as compared with £6,279,435 for the previous year. Deferred annuities amounted to £387,759 per annum against £549,206 per annum in 1952.

The fall in the amount of new business is principally due to a smaller volume of new staff scheme business which in the preceding two years had shown a very marked expansion.

The expense ratio shows a further fall from 12.0 per cent in 1952 to 11.6 per cent in 1953.

The gross rate of interest earned increased by 4s. 6d. per cent to £4 17s. per cent while the net rate fell by 5s. 9d. per cent to £3 15s. 10d. per cent. The fall in the net rate is due to the unequal incidence of income tax over the two years.

An interim bonus has been declared for the year 1954 at the rate of 35s. per cent per annum calculated on the sum assured and existing bonuses.

PROFIT AND LOSS ACCOUNT

You will notice that United Kingdom taxation, other than income tax on our investment income, appears as a credit. There are three factors responsible for this unusual position: lower taxable profits, coupled with a recovery in respect of excess profits levy; the effect of double tax relief flowing from a change in the basis of taxation relating to certain of our overseas business, and tax relief in connection with exchange losses.

It will be seen that the account has been charged with a loss on exchange of £148,514 which includes £90,000 written off overseas investments, the sterling value of which has been affected by currency depreciation.

APPROPRIATION ACCOUNT

The balance brought down from the profit and loss account amounts to £536,976. In anticipation of the changes in the company's capital to which I refer below, £440,000 has been transferred to general reserve.

THE COMPANY'S CAPITAL

Accompanying our accounts is a notice convening an extraordinary general meeting at which resolutions will be submitted relating to the subdivision of the company's shares, now of £5 each (£1 5s. paid), into five shares of £1 each, and the capitalisation of £550,000 of the reserves of the company for the purpose of paying up 5s. of the uncalled liability on each of the subdivided shares, making the amount paid up thereon 10s. per share. Our ultimate aim is, I may say, to extinguish this liability altogether.

STAFF

I am sure you will wish me to express our appreciation of work well done to all members of our staff, both overseas and in this country, whether they serve directly the "Atlas" or are more immediately associated with one or other of our subsidiary companies, and so serve us indirectly. All of them are part of the "Atlas" family upholding the "Atlas" tradition, a tradition of fair dealing with all people—a tradition second to none.

G. & J. WEIR LIMITED

A RECORD ACHIEVEMENT

The sixtieth annual general meeting of G. & J. Weir Limited will be held on June 7th at Glasgow.

The following is an extract from the circulated statement by the chairman, The Rt Hon Viscount Weir of Eastwood, GCB, LLD, for 1953:

My annual report deals with the performance of your company during the great Coronation Year of our beloved young Queen. It is, therefore, particularly gratifying and appropriate that I am able to submit a record achievement by our group.

The consolidated profit, after depreciation and all other charges, including taxation, amounts to £804,269, of which £312,894 (an increase of £122,808) has been retained in the accounts of the subsidiary companies, leaving the net profit of the parent company at £491,375, which is £111,063 more than last year. To this net profit is added the sum of £25,000, being the provision now no longer required against the initial loss in the starting up of a subsidiary company. The balance brought forward from last year is £223,566, giving an available balance of £739,941.

Since the company was made public in 1946 the value of the group's output has increased from an index figure of 100 to 456 and we anticipate further growth in 1954. The capital employed has naturally increased substantially and latterly most of it has been secured through our increased bank borrowing powers. We have spent large sums on new buildings, plant and equipment and on development of our products. Consequently our trading surplus has grown substantially and, in spite of the penal rate and form of taxation, our net profit has also risen.

PERFORMANCE SUMMARISED

To sum up our performance for 1953 the following data will be of interest to our stockholders:

Group output has increased by	50 per cent
Group taxation has increased by	90 per cent
Group net profit has increased by	30 per cent
Group retention of profits has increased by	40 per cent
Group dividend distribution has increased by	25 per cent

Turning now to our proposed dividend, your board have given this their very careful attention. As you have seen, we propose a final distribution of 16 per cent, to bring the total for the year up to 21 per cent. In making this proposal we have sought to strike an even balance between the restraint which the Chancellor has asked us to exercise, the legitimate claims of stockholders, and the necessity of ploughing back a proper proportion of our earnings.

After reviewing the performance of the individual firms in the group during the past year, the statement concluded:

It would appear that subject to the incidence of unforeseen eventualities, 1954 should be a better year overall than 1953. Looking still further ahead, however, I find it necessary to sound a note of caution. Although our order book is still large, and although we have substantially increased our rate of output, the maintenance of this will turn very largely on our ability to match it with increased sales. To secure these will be a difficult task and could be made still more difficult by any reduction in our competitive ability, or a general recession in the world demand for the type of capital goods manufactured by your engineering group.

AFRICAN AND EUROPEAN INVESTMENT COMPANY

(Incorporated in the Union of South Africa)

MR R. B. HAGART'S REVIEW

The following are extracts from the statement by the chairman, Mr R. B. Hagart, circulated with the annual report and accounts for 1953:

ACCOUNTS

The profit earned during the year ended December 31, 1953, was £855,194, as compared with £929,344 in 1952 and £856,531 in 1951. Taxation provision amounted to £126,000. The general reserve was improved to £3,350,000 by the transfer of £300,000 and dividends of 6 per cent on the preference capital, and 2s. 6d. per stock unit on the ordinary capital were maintained. The balance sheet shows reserves and unappropriated profits amounting to £3,585,622.

NEW ORDINARY SHARE ISSUES

As a result of favourable share market conditions, the financial position of the company has improved materially since the end of 1953, and available funds are now adequate for carrying out the investment policy of the company and for normal operating purposes. In these circumstances your board had to consider financial needs only in relation to moneys borrowed by the company in the form of £1,700,000 4½ per cent notes and the loan of £2 million. It is clear that these funds are required for permanent investment in the business of the company, and your board decided that immediate steps should be taken to raise new capital for the repayment of the whole of the indebtedness.

Accordingly, stockholders were advised by circular dated April 12, 1954, that they were to be offered subscription rights for 780,000 new ordinary shares in the company at 45s. per share in the ratio of three new ordinary shares for every ten stock units held, and that the board had accepted an offer by the Anglo American Corporation of South Africa, Limited, to subscribe for 800,000 new ordinary shares at 50s. per share.

The proceeds of these issues will enable the company to discharge the whole of the note and loan liabilities amounting to £3,700,000.

ORANGE FREE STATE INTERESTS

Your company has a very considerable stake in the Orange Free State goldfield, particularly in Welkom Gold Mining Company Limited, President Steyn Gold Mining Company Limited and President Brand Gold Mining Company Limited.

The progress of these companies over the last twelve months, especially President Steyn and President Brand, has been more than encouraging and the company can look forward with confidence to a satisfactory dividend income from these sources in the future.

WELKOM GOLD MINING COMPANY LIMITED

Gold production during the year 1953 totalled 148,540 oz, as against 106,116 oz in 1952, and revenue from sales of gold increased from £1,350,092 to £1,860,745.

The working profit was £146,882 and the debit balance on the appropriation account was reduced from £207,487 to £94,653 at the end of 1953. In arriving at the working profit a proportion of general mine expenses and the cost of excess development, totalling in all £325,418, and a sum of £182,611, being interest charges on loans raised to finance capital expenditure (other than on the uranium project) were charged to capital account.

PRESIDENT STEYN GOLD MINING COMPANY LIMITED

Gold production was officially commenced at the beginning of April, 1954. Underground development results on this property have been uniformly better than borehole indications, and the high percentage of payability in reef exposures at both shafts is encouraging.

Up to the end of March, 1954, the results of development on Basal Reef were, in total:

Footage on reef, 19,542 feet.
Footage sampled, 19,230 feet.
Footage payable, 16,375 feet.
Percentage payable, 85.15 per cent.

Average value of payable footage, 541 inch-dwts.

PRESIDENT BRAND GOLD MINING COMPANY LIMITED

During 1953 and the first quarter of 1954 development results on this mine have been very encouraging. Of 4,250 feet sampled to December 31, 1953, 4,170 feet, or 98.12 per cent, proved payable, averaging 111.32 dwts over 13.10 inches, equal to 1,458 inch-dwts. Over the first quarter of the current year 3,140 feet were sampled and averaged 98.57 per cent payable at an average value of 136.97 dwts over 11.89 inches, equal to 1,629 inch-dwts.

Subject to the development programme continuing according to schedule, the mine should reach production stage on a small scale before the end of 1954.

COAL AND ASBESTOS INTERESTS

The principal bituminous coal producers in which we are directly or indirectly interested include:

Amalgamated Collieries of South Africa Limited, Blesbok Colliery Limited, The Coronation Collieries Limited, Natal Coal Exploration Company Limited, The Newcastle-Platberg Colliery Limited, New Largo Colliery Limited, South African Coal Estates (Witbank) Limited, Springbok Colliery Limited, Vierfontein Colliery (Proprietary) Limited, Vryheid Coronation Limited.

In the anthracite field we have a large holding in Natal Anthracite Colliery Limited, which is developing a steady inland and export business.

The asbestos market has suffered a severe recession in both price and volume, and there are no signs yet of any favourable turn.

Royalties received from Amosa Limited were satisfactory in 1953, but were considerably lower than the 1952 figure. Other asbestos interests include Munnik Myburgh Chrysotile Asbestos Limited, which is experiencing great difficulties, and Rhodesia Monteleo Asbestos Limited, which suspended operations in November last.

The company will celebrate its 50th anniversary this year. It has had an eventful but, on the whole, successful history, and your board believes that there is reason to be optimistic about the future.

DOMINION STEEL AND COAL

INCREASING EFFICIENCY

The annual general meeting of the Dominion Steel and Coal Corporation, Limited, was held on May 7th at Montreal.

Mr L. A. Forsyth, QC, the president, said: Net earnings for the year ended December 31, 1953, after providing for estimated taxes and depreciation of $5,254,017.90, an increase of $524,071.29, amount to $3,867,714.97—lower by $330,160.73. However, when the larger depreciation figure for 1953 is taken into account, retainable funds from the latter year's operations exceed those of 1952 by $193,910.56. In terms of earnings, after taxes, per share of capital outstanding, these profits represent $1.86 as against $2.02 for the preceding fiscal year.

Profits of the corporation arising from operations during the year 1953, before interest, taxes and depreciation, were $12,890,685.12, while miscellaneous income (including $491,664.51 derived from sale of fixed assets) provided $1,024,946.20. The total revenue figure $13,915,631.32 exceeds the corresponding figure in 1952 by $380,293.33. The net working capital of the corporation, which at December 31, 1952, amounted to $28,176,631.56, increased by $2,754,001.11 and, as at December 31, 1953, stood at $30,930,632.67.

Regular quarterly dividends at the rate of 25 cents per share on the outstanding ordinary shares of the corporation were declared during 1953, in a total amount of $2,079,666. Since the close of 1953 one quarterly dividend of 25 cents per share has been declared and paid.

Ingot Production: At the Sydney steel plant production of steel ingots for 1953 was lower by 1.6 per cent than in 1952, while steel production from the electric furnaces in the Montreal plant was reduced by 19.9 per cent.

Modernisation and Improvement of Plant: At the Sydney steel plant our subsidiary, Dominion Iron and Steel Limited, has completed the rail finishing mill, the blooming mill and the new coke ovens. There are now operating in this plant two high carbon wire-drawing machines, a billet mill hot bed and a turbo blower. Our most significant achievement is the completion of our programme for increased production at the mines of Dominion Wabana Ore Limited.

CURRENT OUTLOOK

Developments in late 1953 and early 1954 have been not too reassuring. The decline in business which has developed during the past five months has compelled us to revise our operating programme, particularly in the plant at Sydney. Steel operations have declined with us to a level slightly higher than obtains in the United States.

There are some indications of improvement in demand which should relieve the situation; but one cannot say that the trend toward better market conditions has as yet developed as rapidly or to such a degree as had been hoped.

I feel that our policy of concentrating upon improved operating efficiency rather than upon expansion of production has been justified, and will enable us to meet unfavourable conditions, marketwise, with greater confidence.

I am certain that the resources of this corporation in the skill and capacity of its personnel, as well as in material assets, will ensure that under any conditions which come to pass we will make the best of it.

The report and accounts were adopted.

KEMSLEY NEWSPAPERS LIMITED

VISCOUNT KEMSLEY'S ANNUAL REVIEW

The thirtieth annual general meeting of Kemsley Newspapers Limited will be held on May 27, 1954, at Kemsley House, London. The following is an extract from the statement of the chairman, the Viscount Kemsley, circulated with the report and accounts for the year ended December 31, 1953, to be submitted to the meeting:

In the closing paragraph of my statement on the accounts for the year 1952 I indicated that unless there were substantial decreases in newsprint and other costs during 1953 the trading result for that year could not be expected to show any marked improvement over 1952. As matters have turned out there has been little change during 1953 in the price of newsprint which at the beginning of the year was £54 a ton, was reduced by £1 a ton on March 1st and fixed at £52 10s. a ton on June 28th. On the other hand our employees were awarded a cost-of-living increase at the end of April and in considering this important element of our cost it should be appreciated that 1953 carried for the first time a full year's charge for the two wages increases awarded at the beginning of May and November, 1952.

The trading profits and sundry income of the group amounted to £1,335,000 in 1953 as compared with £1,461,000 for 1952. This amount was clearly affected by the special factors to which I have referred.

After adding to the trading profits the investment income and the items of special income shown separately in the consolidated profit and loss acount and deducting debenture interest the earnings of the group for 1953 amounted to £1,452,000 before allowing for taxation as compared with £1,434,000 in 1952.

THE NET PROFIT

Once more I refer to the charge on the earnings accruing to the ordinary stockholders of the distributed profits tax levied on the dividends paid to preference shareholders. Some alleviation of this most unfair burden, which for your company was no less than £102,000 in 1953, should have been granted before now. Successive Budgets have been passed without reference to the anomaly and there seems to be no prospect of any remedy.

After providing for taxation and deducting profits (£16,000) attributable to outside shareholders of subsidiaries there is left a balance of £600,000 which is our company's proportion of the net profit of the group for the year. In 1952 £253,000 was released from earlier provisions for taxation mainly as a result of the substantial agreement of the group's liability for excess profits tax. During 1953 complete agreement has been reached and it has been found possible to release a balance of £68,000. It should be noted incidentally that the agreement of this liability has necessitated an adjustment to the excess profits tax postwar refund account which is shown in the balance sheet under the heading of capital reserves.

After adding this taxation credit and deducting £4,500 in respect of profits retained in the subsidiaries there remains a balance of £664,000 representing the net profit of Kemsley Newspapers Limited.

Your directors conclude that in all the circumstances as they exist today, the right course is to repeat the rate of final dividend, namely 5 per cent, making 10 per cent for the year. They have transferred the sum of £250,000 to general reserve and after these appropriations the balance carried forward on profit and loss account is slightly increased to £326,000.

Newsprint is still not free and almost alone among the industries of the country ours still has to work within important restrictions.

I had hoped that before now control would be at an end and that we should be free to order as much newsprint as we required. The attitude of the Government has not been wholly sympathetic and it is difficult to appreciate why the small amount of additional exchange necessary to give freedom to newspapers is accorded such a low priority in Treasury calculations.

"THE SUNDAY TIMES"

The record of our publications is one of progress during the year. In particular this is evident in the *Sunday Times* on which once more I am able to make a favourable report. This newspaper has during the year taken the initiative in many important and interesting directions. I recognise that contemporary conditions are changing and that, particularly amongst the younger men and women a new spirit of inquiry and interest is abroad. To that spirit the *Sunday Times* has responded and has broadened its appeal without relaxing for one moment its determination to be above all accurate, authoritative and fair. In the result its circulation during 1953 has increased by nearly 50,000. In 1954 the rate of increase so far is even greater. Recently the selling price has been reduced from 4d. to 3½d., as was stated in the issue of April 4th, in order "that the paper may be available to an even wider public." As was then said also, "A gratifying feature of the increased circulation is the growing number of younger as well as older people seeking a Sunday paper which discusses contemporary problems in a frank and balanced manner."

During the year, it appeared that a balance of advantage lay in printing and publishing the *Sunday Graphic* in London rather than in Manchester. Arrangements were made accordingly and to that fact can, I am sure, be attributed much of the encouraging progress of the circulation of the *Sunday Graphic*.

"DAILY DISPATCH"

In Manchester, where competition is, I think, keener than in any other area, the degree to which both the *Daily Dispatch* and the *Evening Chronicle* have improved their positions is most gratifying.

The *Daily Dispatch* has a circulation much higher than that of any morning paper published wholly outside London. A great area like Lancashire and the north-west requires a popular morning newspaper designed to serve its special requirements and the *Daily Dispatch* fills this role. The *Evening Chronicle*, which covers Manchester and an important area beyond, has undoubtedly during the year increased its popularity among women and the younger generation. Its extended appeal has had a favourable influence on its circulation.

The present year has opened encouragingly. The abandonment of controls and rationing has brought back many organisations into the field of advertising and the prospect at the moment is good. Nevertheless, it would be rash as yet to interpret the outlook as "set fair." As Mr Butler indicated in his Budget speech, while there is no evidence of a serious recession in the United States and while we appear to be insulated to a greater extent than seemed possible a year or two ago from trans-Atlantic influences, it is necessary for us to keep our weather eye open. We must, therefore, not let confidence overcome our caution. With that proviso I view the affairs of your company for the present year with a greater degree of optimism than I have been able to do in recent years.

PARKINSON & COWAN LIMITED

INCREASED DIVIDEND

SIR GEORGE JESSEL'S ADDRESS

The fifty-fourth annual general meeting of Parkinson & Cowan Limited was held on May 7th, in London.

Sir George Jessel, Bt, MC, the chairman, in the course of his address, said: In my speech at the last annual general meeting I did not hold out expectation that 1953 would show substantial improvement over 1952, which the shareholders will remember as a recession year in our industry. My forecast proved substantially correct in respect of our trading profits, which were £330,000, against £350,000 for 1952. Our consolidated net profit at £145,000 (£75,000 last year) has benefited from taxation adjustments which have resulted from the partial execution of our policy to wind up subsidiary companies.

Having paid our normal preference dividend, absorbing £19,000, your directors recommend a dividend of 9 per cent on our ordinary capital, an increase of 2 per cent on the 1952 distribution. This recommendation has been made in the light of several factors. Firstly, the improvement in trading which started in the autumn of last year is well maintained at this date. Secondly, the company's finances and prospects seem to us to justify this step. Thirdly, and not the least, we think that the proprietors of the company are entitled to expect a measure of protection against the diminishing value of money. As our balance sheet shows, your directors have sought to make this company a safe investment; they also seek within the same confines of prudence to make it a remunerative one.

The remainder of the consolidated net profit amounting to £89,000 is suggested to be disposed as follows:

Although no less than £118,000 is charged in these accounts against depreciation, we propose to create a fixed assets replacement reserve and to credit thereto an initial sum of £50,000.

During the year we acquired the remaining half-interest in our previously jointly owned South African company. This action converted this company into a wholly owned subsidiary; consequently we took into our consolidated accounts some accumulated losses and wrote down our investment in that subsidiary by £18,000. This action contained an element of anomaly because our other overseas investments had a market value some £70,000 higher than their book value. It seemed rational, therefore, to adjust the valuation of these other investments upwards by, roughly, a corresponding amount. This explains the item of £20,000 credited to capital reserve. After this operation our overseas investments remain at a market value £50,000 above their balance-sheet valuation.

VALUE OF EQUITY

Shareholders will note that the book value of each £1 ordinary stock, excluding goodwill, now stands at 36s., compared with 28s. 5d. in 1949.

CONSOLIDATED BALANCE SHEET

Apart from the matters already touched upon, there remain a few items worthy of note. Stocks have been reduced by £111,000 odd and cash is down by £30,000. Net fixed assets have increased by £70,000 and this reflects our policy in continuously improving the quality of our mechanical equipment.

PROSPECTS FOR 1954

The year started with nearly all our factories in high activity and operating at a sound level of profit. Our leather interests, which suffered a severe setback in the last two years, remain a source of anxiety. Our gas, water, and electricity meter companies are doing well. Our gas-appliance factory is very active and production of paraffin-burning goods is brisk. It is not easy to forecast future trends, but so far as I can see we should enjoy a good year in 1954.

The report and accounts were adopted.

The retiring directors, Mr R. Connor and Mr C. H. Pearson, were re-elected, and the chairman concluded with a tribute to the managing director, Mr H. P. Barker, and to the staff and workpeople. Two hundred and forty of the latter have served the company for more than twenty years.

THE BRITISH OXYGEN COMPANY, LIMITED

INCREASED PROFITS

MR J. S. HUTCHISON ON THE OUTLOOK

The sixty-eighth annual general meeting of The British Oxygen Company, Limited, was held on May 13th in London.

Mr J. S. Hutchison, chairman of the company, in the course of his speech, said:

The consolidated profit after depreciation at £4,324,975, shows an increase for 1953 of £349,883. The increase came from extended sales of industrial gases in Great Britain, from generally increased business overseas and from improved earnings in the chemicals division, all offset by less favourable experience in the equipment and electric welding fields.

DEPRECIATION

Depreciation for the year is increased by no less than £405,000 to the high figure of £2,007,312, and this is a result of new production plant installation on a considerable scale during the last year or two so that we should be able to meet the steadily increasing demands for our products in Great Britain and overseas. This process will continue, and accordingly the new investment allowances proposed in the Budget are of considerable moment to us and offer practical assistance in our position of high capital investment in plant and equipment which results in depreciation charges which are heavy in proportion to our other costs of operation.

INVESTMENT ALLOWANCES

We are strong believers in the need for the most up-to-date factories, machines and equipment and our group expenditure on these items in the past five years has been no less than £19 million. In the same five years we have paid in all forms of direct taxation several million pounds more than would have been payable on the basis of prewar taxation and that means that to fill that gap we have had to seek extra share capital, which must be attracted by a fair profit earned on it and a reasonable dividend paid on it. Anyone can see how much easier it would have been for us to avoid the new capital and its dividend charge and instead to use on the improvement and extension of productive resources the cash which went in extra taxation. All can appreciate therefore the burden under which industry in Britain has struggled since the war to get itself up-to-date and equipped as it should be and at present-day costs.

There can be no doubt whatever that improvement in our productive resources lies at the root of our ability as a nation to compete and is essential to our future prosperity. This clear recognition by the Chancellor of our laggard position and his limited but very practical assistance in this year's Budget may represent the birth of a new political outlook in this vital matter of allowing industry the means to progress. I hope earnestly that we may look forward to an extension in following years of these principles as the means of securing and safeguarding for the nation, before it is too late, the industrial income which pays all our wages and salaries and is the basis of all the Government's taxation income and therefore of the social services and all the other services taxation provides. Industrialists will very much welcome the new investment allowances and I hope will see to it that the public understands properly the willingness of industry to extend and modernise its productive resources given the means to do so.

INCREASED HOME SALES AND REDUCED PRICES

Once again our forward planning and laying down in Great Britain of large additional oxygen production plants has been no more than sufficient to enable us to meet the demands made upon us. Increased oxygen sales are to an extent in quantities which entail most favourable prices to customers and are met entirely from new production plants built at today's costs and bearing, therefore, the heavy depreciation charges to which I have referred. The conjunction of these factors of sale at keen prices and production at new plant cost, operating in regard to an important extension of sales volume, has left for us but a modest profit increase in relation to that volume.

On January 1, 1954, we reduced prices of liquid oxygen and dissolved acetylene, and it is our hope that this step on our part, which we took despite increasing costs, will be seen as an effective contribution to that increase of industrial production which must be the foundation of future employment and prosperity. It is unfortunate that the intractable trinity of coal, transport and electricity should so persistently frustrate other efforts towards cost restraint.

PROSPECTS

Industry generally is finished now with the phases of long scarcity and eventual quick surplus which characterised the immediate postwar years, and I look upon the present phase as one which for considerable sections of industry may be characterised by the introduction on a wide scale of new methods and new products and their consolidation in the market. This changing scene offers increased opportunity for development, but development takes time for its application and time for the benefits to be felt.

Earnings cannot always go forward by substantial amounts year after year and although this may be a year rather of consolidation and of gathering strength for the next stride, my confidence in the outlook is unabated. Trading results in 1954 so far are encouraging and I do not consider that you will have reason to be disappointed with the report we submit to you next year.

ILLUSTRATED NEWSPAPERS

SATISFACTORY RESULTS

The twenty-eighth annual general meeting of Illustrated Newspapers Limited was held on May 7th in London.

Major H. Davenport Price, MC, JP (the chairman), presided and in the course of his speech said: The profit on trading is £543,486, which sum is increased by other income to £565,086. There falls to be deducted £71,010 in respect of interest on debentures, directors' fees and emoluments and depreciation, leaving a profit before taxation of £494,076. Taxation reduces this sum to £230,300 and there is a further deduction in respect of the proportion of profits attributable to outside shareholders. The resulting figure of £217,352 is the net profit for the year attributable to Illustrated Newspapers Limited, which is an increase of £35,604 over the comparable figure for last year.

Current liabilities and provisions for the group amount to £633,469, which figure is covered nearly three times by current assets, which shows a strong liquid position.

The results must, under the circumstances, be considered satisfactory. There has been a further rise in the cost of production, and the fall in the price of paper has been very small in the case of the high quality paper used by us. On the other hand we benefited from the special numbers issued in connection with the Coronation. These numbers had a very large sale.

Our trade papers, *The Drapers' Record* and *Men's Wear*, again had a very successful year, and our other subsidiary companies did their part in contributing to the year's profits. The report was adopted.

GOLD COAST SELECTION TRUST

Major-General W. W. Richards, CB, CBE, MC, chairman, presided on May 6th at the twenty-fourth annual general meeting of Gold Coast Selection Trust, Limited, in London. The following is an extract from his circulated statement:

We have had another successful year. Income from dividends amounted to £106,753 and profit on the sale of investments £3,715. The results of the year's operations, including the surplus on the purchase and sale of leases, showed a profit of £140,524. In November the directors declared an interim dividend of 15 per cent, less tax, an increase of 2½ per cent on the previous year.

Our portfolio of investments is mainly represented by shares in mining companies operating in West Africa, including Amalgamated Banket Areas, Ariston Gold Mines, Bremang Gold Dredging, Gold Coast Main Reef, Marlu Gold Mining and Ankobra River Power.

Practically the whole of the world output of columbite is mined in Nigeria. The limited supply of this material caused a bonus price to be paid for columbite, raising it to over £2,000 per short ton. Several companies in which we are interested produce columbite, which is yielding very satisfactory profits. Development programmes are progressing well and the 1954 outputs should show considerable increases over 1953.

The report was adopted and the name of the company was changed to Western Selection and Development Company, Limited.

The chairman announced the payment of an interim dividend of 7½ per cent, less tax, on account of the financial year ending September 30, 1954, payable on May 30th.

PHŒNIX ASSURANCE COMPANY

NEW RECORDS ESTABLISHED

COLONEL THE HON J. J. ASTOR'S REVIEW

The one hundred and seventy-second annual general meeting of Phœnix Assurance Company, Limited, will be held on June 2nd at Phœnix House, King William Street, London, E.C.4.

The following are extracts from the statement by the chairman, Colonel the Hon J. J. Astor, on the directors' report and statement of accounts for the year ended December 31, 1953: We have had the pleasure of appointing to the board Lord Reith, who comes to us with a high reputation and wide experience. We welcome his assistance.

No doubt you will recall with pleasure the honour conferred on two members of the board in the Coronation Honours. I refer to our managing director, Sir Edward Ferguson, whose knighthood was accorded to him in recognition of his services to the insurance industry as chairman of the British Insurance Association and to Sir Dingwall Bateson who was similarly honoured for his services as president of the Law Society. We offer them both our congratulations on this fitting tribute to their success in these highly important offices.

Our operations in 1953 resulted in a further strengthening of our already strong financial position. In keeping with the general trend there has been some slackening of the rate of progress in total premiums in the fire, accident and marine departments, but nevertheless they show a satisfactory advance and again establish a new record. The profits earned on both the fire and accident revenue accounts are also impressive and from all our underwriting activities £1,615,000 is brought into the profit and loss account.

FIRE AND ACCIDENT DEPARTMENTS

Turning specifically to the fire department, it has once again produced a very satisfactory profit—£919,000. The postwar expansion of aggregate premiums received an expected check.

The heavy flood and windstorm experience has resulted in the claims ratio in this department being higher than in previous years, but the comparatively small increase in premiums calls for only a modest addition to our provision for unexpired risks, even on our 50 per cent basis. Added together, the ratio of the claims and the additional provision for unexpired risks to premiums is about the same as in preceding years.

In the accident department total premiums show an increase of 6.6 per cent on those for 1952.

The sum of £490,000 transferred to profit and loss account represents a great improvement on the results we have reported in recent years in this department. This more satisfying state of affairs is due to the changing situation in motor insurance, which constitutes the largest single section of our accident account. The substantial losses which we incurred on motor business over the past decade have largely negatived the profits made on other classes of risk, but there are now grounds for hoping that improving motor results will enable us to reap the full benefit of our underwriting in these other sections. It is important, however, to add that we are still a long way from obtaining a reasonable return on moter insurance.

LIFE DEPARTMENT

The life department completed business for new sums assured of £6,731,000 net of reassurances, which was again a record for the company. An indication of the growth in this department is the increase in the life assurance fund during the year by £1,747,000 to £31,209,000 after transferring £55,000 to the profit and loss account.

The gross rate of interest earned on the life funds in 1953 was £4 14s. 4d. per cent and the corresponding net rate £3 7s. per cent. Both these rates are 2s. 9d. per cent greater than those of the previous year.

MARINE DEPARTMENT

The transfer from the marine department of £150,000, although smaller than in recent years, may be regarded as satisfactory. This result has been achieved by conservative underwriting of a difficult account and after due provision of ample reserves to meet outstanding claims. Although the fund is slightly less, it represents 165 per cent of the premium income, as compared with 149 per cent last year. At present marine insurance is suffering from a position where the market can too easily absorb the volume of business on offer. The resultant competition is likely to have harmful results, for too little regard is paid to the delay and heavy expense in the presentation and settlement of claims, which in due course must demonstrate that unduly competitive rates and conditions are uneconomic.

Keen competition characterises the quest for cargo business, and one hears of accounts changing hands at rates which, according to past experience, cannot possibly be expected to show a profit and which a prudent underwriter should avoid. A period of abnormally low casualties may temporarily seem to justify rate reductions, but the time must come when it will be found that many rates have fallen to uneconomic levels.

THE ACCOUNTS

Turning our attention to the profit and loss account, the aggregate profits transferred from the revenue accounts have already been mentioned. In addition, I would emphasise the further and important increase of £100,000 in gross interest, dividends and rents earned on our funds dispersed all over the world.

On the other side of the account, as well as providing £100,000 for foreign exchange, we have increased the annual allocation to pensions account by £50,000. The amount provided for taxation is less than in the previous year despite the larger revenue profits, and this is mainly due to adjustments in computing our liability for the excess profits levy.

The profit for the year to be carried down to the appropriation account amounts to £949,000, and with the proposed dividend remaining at the rate to which it was increased last year, we have been able to augment the balance on profit and loss account to £2,149,000, thus improving our free reserves by no less than £479,000.

Referring to the consolidated balance sheet, while the increases in the various groups of assets are fairly well spread throughout the list, the main additions are £1,142,000 in debentures, £450,000 in ordinary shares, and £396,000 in properties. I am pleased to state that the excess of market values of our invested funds over the figures at which they stand in our balance sheets has been substantially increased by the favourable movement in market prices over the past year.

CROFTS ENGINEERS (HOLDINGS)

CAPITALISATION PROPOSALS

SIR ARTHUR CROFT ON THE RECORD RESULTS

The sixth annual general meeting of Crofts Engineers (Holdings), Limited, was held on May 7th at Bradford, Sir Arthur Croft (the chairman) presiding.

The following is an extract from the chairman's circulated statement: The profits of the group have slightly increased, so that once again the figures constitute a record, and I am sure that you will agree that the position in which we find ourselves is very satisfactory.

The trading profit amounts to £679,795 against the previous year's figure of £661,476, and, after providing for taxation of £376,557 we are left with an amount of £303,238, which represents the net profit of the group. The directors propose the same final dividend as last year—namely, 25 per cent on the ordinary shares (absorbing £55,000), making a total distribution of 40 per cent, less income-tax, for the year.

CAPITALISATION OF RESERVES

In order to bring the issued capital of the company more into line with the capital permanently employed, the shareholders will be asked to approve the capitalisation of £400,000 from the general reserves of the group by the application of that sum in paying up in full 1,600,000 shares of 5s. each for distribution to the ordinary shareholders in the proportion of one new share for each share already held.

An increase in the net value of the fixed assets of £110,041 will be noted and the cash position has been further strengthened. We have been able, during 1953, to put into effect our planned extensions and rearrangements and re-equipment of departments, both at Thornbury and Dudley Hill, which I referred to last year. New buildings have been erected at Dudley Hill, giving us an extra floor space of 64,260 sq. ft.

A tremendous amount of effort has been put into this work in order to complete the extensions in as short a time as possible, and the new buildings are fully occupied and have already proved their value. The whole of our present schemes will be completed by the end of June next.

PROSPECTS

During 1953 trading conditions became more difficult, and there was a substantial reduction in our order book, I am pleased, however, to report that conditions have in recent months shown an improvement, with a satisfactory increase in incoming business, and the outlook is now encouraging.

Last year I informed you that we were going all out to secure trade, and the results already achieved show we are on the right lines. Your directors are continually exploring fresh avenues for the expansion of our activities, and we are very much alive in all markets. I cannot attempt to forecast what the future will be, but I have no doubt of our ability to obtain our fair share of the business that is available in the world markets.

In general, the labour position is good, and the supply of materials is much easier.

I have referred in previous reports to the building up of a direct export trade, and this policy has shown excellent results in 1953. Both Crofts Canada Limited and Britenco Limited, Canada, have had a successful year's trading. Our South African subsidiary has also had successful trading results, even though the market out there has been somewhat depressed during 1953.

The report was adopted.

At a subsequent extraordinary general meeting the capitalisation proposals were approved.

THE SCOTTISH UNION AND NATIONAL INSURANCE COMPANY

INCREASED BUSINESS IN LIFE, FIRE AND ACCIDENT DEPARTMENTS

INCREASED INTERIM LIFE BONUS

INCREASED DIVIDEND

MR HUGH WATSON'S REVIEW

The one hundred and twenty-ninth annual general meeting of the company was held on May 12th in Edinburgh.

The following is an extract from the statement by the chairman, Mr Hugh Watson, DKS, circulated with the report and accounts for 1953:

A new record figure of just over £5,400,000 (after deducting amounts reassured) was attained in the Life Department despite a reduction in the new sums assured in connection with group life and pension schemes. In 1952, £270,000 was transferred to investment reserve account and this sum has been transferred back into the life and annuity account during 1953.

Although the next quinquennial valuation of the life business is not due until the end of 1955 an examination of the position at the end of 1953 discloses a healthy state of affairs. The directors have decided to increase the rate of interim bonus payable in respect of claims arising during the current year under with profits policies (effected in the United Kingdom and the Republic of Ireland) from 30s. per cent to 36s. per cent in respect of each year's premium paid or assumed paid since December 31, 1950.

The premium income in the fire department for the year 1953 exceeded £5,500,000 and was a new record for the company. The claims experience was not so favourable as it was in 1952, but a profit of £117,426 was transferred to the profit and loss account.

The premium income in the accident and general account increased to £1,742,026, which was a new record for the company, and the sum of £68,585 was transferred to the profit and loss account. Although the motor account cannot yet be considered satisfactory, it has shown a considerable improvement as compared with 1952.

The conduct of business in the marine department does not prove any easier and it is no exaggeration to say that 1953 has been another difficult year. It has, however, been possible to transfer £100,000 to the profit and loss account, whilst still keeping the underwriting fund at a prudent level.

The year 1953 saw a continued return of confidence in British investment markets. A reduction in bank rate and the decline in market yields on fixed-interest securities marked the sounder position. The market value of the company's portfolio was again substantially above the book value. The investment policy was again directed towards increasing the interest in ordinary shares and mortgages.

Since the close of the year, an offer, which had since been accepted, was made to purchase the shares of the Scottish-National Key Registry and Assurance Association Limited.

The directors felt that the strength of the company and the adequacy of its reserves justified an increase in the dividend, and accordingly recommended an increase to 8s. on the "A" shares of the company and 30s. on the "B" shares, which will absorb a sum of £132,000, leaving a balance of £487,086 to be carried forward.

After paying tribute to the services rendered by the executive officers and the staffs of the company and its associated companies and to local directors and agents throughout the world, the chairman concluded "I would like to express to my colleagues on the board and to the management my appreciation of the generous support which they have accorded to me during the time I have had the honour to act as chairman of the board."

The report and accounts were adopted.

CALEDONIAN INSURANCE COMPANY

149th ANNUAL GENERAL MEETING HELD ON MAY 13, 1954

STATEMENT BY THE CHAIRMAN, MR MAURICE CRICHTON, CA

LIFE DEPARTMENT

Our net new life assurances for the year, including group life assurance business, amounted to the record total of £3,038,221 as against £2,996,216 for 1952. Deferred annuities amounting to £157,090 per annum were issued as compared with £200,580 per annum for the previous year.

The premium income now exceeds £1 million and at £1,026,461 shows an increase of £48,959. The net interest income increased by £26,543 to £390,443 and the net rate of interest earned on the fund was £3 10s. 11d. per cent as against £3 9s. 5d. per cent a year ago.

Mortality experience for the year was favourable and the expense ratio has improved, and was 16.1 per cent as compared with 16.7 per cent in our last accounts.

The year 1953 was the last year of another triennium and the results of the actuarial valuation are set out in the report. As has already been announced in the press, reversionary bonuses have been declared for the three years ended December 31, 1953. Ordinary participating whole life assurances receive 42s. per cent per annum and endowment assurances receive 40s. per cent per annum both calculated on the sum assured. At our last triennial valuation the corresponding bonus rates were 32s. and 30s. per cent per annum. Reversionary bonuses have also been declared in respect of all other classes of participating policies.

Interim bonuses for the year 1954 will be granted at the same rates.

Our with-profit policy holders will, I am sure, be gratified by the substantial additions to their policies, and we can thoroughly recommend a "Caledonian" with-profits policy as a very good investment.

The improved bonuses, as will have been noted, are declared after strengthening our valuation and, after providing for the bonuses, our carry forward shows a substantial increase. Our investments have been carefully reviewed and I can say that the margin between the market values of our Stock Exchange securities and the values at which they appear in the balance sheet has been substantially increased during the year. These results justify our looking to the future with confidence.

The recommendations involve such far-reaching changes in existing legislation that it was hardly to be expected that effect could be given to them in this year's Budget. We have given much thought to the Report, particularly to the Committee's recommendations of the Millard Tucker Report for directors and self-employed persons, and if at a later date the Committee's proposals are implemented we shall be able to give advice and service to all our connections.

FIRE DEPARTMENT

The premium income for 1953 was £3,187,349, an increase of £5,550 over the figure for 1952.

Our fire underwriting at home and overseas was again very satisfactory, but results in the United States of America and Canada were not so good as had been hoped. In the United States our figures were adversely affected by the disastrous fire last August at the Livonia Plant of the General Motors Corporation. This was the largest fire which has happened in connection with any single risk, and a great number of insurers were interested. Following a reduction in the amount of long-term business, and consequently in the reserve required, the additional provision has been reduced by £50,000. The sum of £269,150 has been transferred to the profit and loss account.

ACCIDENT DEPARTMENT

The premium income was £3,510,289, a record for the company, and an increase of £369,243 over the record figure for 1952.

There has been a steady growth year by year in the accident department premium income, and at the figure of £3,510,289 it has for the first time exceeded the income in the fire department.

Serious losses were sustained as a result of the flooding in the eastern coastal areas of Great Britain in January, 1953, and underwriting in the motor department throughout the world continued to be difficult. I am pleased to say, however, that the account has improved, although the margin of profit is small.

The sum of £33,636 has been transferred to the profit and loss account.

MARINE DEPARTMENT

The fund at £874,585 represents 201 per cent of the premium income, which compares with the percentage 175.4 for 1952. The sum of £50,000 has been transferred to the profit and loss account.

TOTAL PREMIUM INCOME

The total premium income for all departments was £8,159,261, the corresponding figure for 1952 having been £7,812,559.

PROFIT AND LOSS AND APPROPRIATION ACCOUNTS

The amount of interest, dividends and rents (less tax) not carried to other accounts was £149,736.

The balance for the year transferred to the appropriation account was £282,246 after providing for taxation and for bad and doubtful debts.

The directors' recommendations for dealing with the surplus are stated in the report.

MAPLE & CO., LTD.

EFFECTS OF POLITICAL REACTIONS

MR H. S. WHARTON ON BURDEN OF PURCHASE TAX

The sixty-fourth annual general meeting of Maple & Company, Limited, was held on May 7th in London, Mr H. S. Wharton (president of the company), presiding.

The following is an extract from his circulated statement: During the past year we have felt the effects of political reactions. In the first quarter the public wishing to buy furniture, etc., was confused by the uncertainty as to whether the Chancellor of the Exchequer would reduce purchase tax and so lower retail prices. Then came the Coronation, when unlike the general stores which benefited, we found the vast number of visitors to England and particularly to London, for the time being, anything but furniture minded. However, from June onwards business improved consistently, not only in London but at all our branches as well, and the autumn returns were very satisfactory.

Exports: Our contribution in this most important section has been fully maintained, and the inquiries now being dealt with are even more considerable than a year ago.

CONTRACTS—MAPLE-MARTYN ORGANISATION

During the past year we have completed successfully the various shipping orders and large contracts which were mentioned as being in hand in the last statement. Other contracts of note which we have received during the year have included the Saudi Arabian Legation in London, three large contracts in metal and stone for the American Battlements Commission, the new Anatomy Building for the University College of London, contracts for the National Provincial, Midland, Barclays and Lloyds Banks, several church contracts for fibrous plaster and metal work and the furnishing and decoration of many cinemas and hotels. Contrary to some articles which recently appeared in the press, our orders for ships are most satisfactory, and we have on the books today for 1954 and 1955 delivery, large joinery, decorating and furnishing contracts for new liners for the P. & O. Company, the Shaw Savill Company, the Pacific Steam Navigation Company and the Cunard Steamship Company.

THE ACCOUNTS

It is proposed to increase the general reserve by £126,483, £100,000 of which is released from a provisional liability for excess profits tax, mainly in respect of the 20 per cent postwar refund. Liquid assets show a further reduction, the group stocks in particular showing a decrease of £300,000 on the previous year due largely to our new central buying policy and to reductions in purchase tax. There was some improvement in the cash position. Current liabilities are again substantially reduced, trade creditors showing a decrease of over £150,000, reflecting again in some measure the purchase tax reductions in last year's budget.

PRESIDENT'S ADDITIONAL REMARKS

Addressing the meeting the President said: Since my statement for the past year went to press we have purchased the old-established business of Mark Rowe, Ltd., of Exeter. This company has recently built on its old site very fine premises situated on what is known as "The Golden Half Mile" in the High Street, which we hope officially to open early in June. Your directors are confident that this purchase will prove very advantageous to your company and is admirably situated. In addition it has freehold factories and depositories which were undamaged by enemy action.

Last year we mentioned the repercussions of purchase tax on the furniture and allied trades. Within the past fortnight it was stated in the House of Commons that the total revenue from purchase tax on furniture amounted to only £3 million. I hope the Chancellor of the Exchequer will bear this in mind in his next budget and relieve the public and the retail trade of this burden. What is the use of having subsidised housing if at the same time you have purchase tax levied on furniture, carpets and fabrics. It is quite incongruous, and surely nine years after the end of the war is time enough to get such an anomaly straightened out. Last year we told you that the alteration in purchase tax would cost us £20,000, which money we were compelled to lose unjustly, and it is high time that the Customs and Excise Department abstained from soaking the distributive trades for payments for which they should in no way be responsible.

In conclusion, the increase in the number of our patrons, and sales, is progressing satisfactorily, and I see no reason to doubt that I shall have a more satisfactory statement to make to you in a year's time.

The report and accounts were adopted and the ordinary stock dividend of 8½ per cent, less tax, was approved.

NORTH BRITISH & MERCANTILE INSURANCE

COMPANY'S POSITION OF STRENGTH

The hundred and forty-fourth annual general meeting of the North British & Mercantile Insurance Company Limited was held on May 6, 1954, at the Registered Office of the company, 64 Princes Street, Edinburgh.

The Rt Hon Lord Brand, CMG, DCL (chairman of the general court of directors), presided.

The chairman said: I should like first of all to say that I am sure all shareholders will joint with the directors in wishing a long life full of happiness to Mr Lansdowne, our general manager, who retires at the end of June. Mr Lansdowns will have served more than forty-five years with the company, starting, as you may imagine, at an early age not very high up in the scale and finishing right at the top. He has deserved very well of the company and personally I have greatly appreciated the opportunity to co-operate with him in the last five years of his service in the company as general manager.

The shareholders will also want me, I know, to congratulate Mr Harman on succeeding to the general managership and to wish him all success. Mr Harman knows all about insurance, having been thirty-eight years with the company.

We have unfortunately suffered a great loss in the sudden death of Mr Campbell, our manager in Canada, in a terrible motor accident. Mr Campbell and Mrs Campbell were motoring to their home in the country with their elder daughter. Mr Campbell and his daughter were killed instantaneously through an accident, for which he bore no blame, and could not escape. I know you will extend your deep sympathy to Mrs Campbell. I had the opportunity of spending a month with Mr Campbell two years ago, travelling right through Canada. I learnt then to appreciate his many qualities, which were very great indeed. We have suffered a grievous loss.

The board has appointed Mr Dyer, Mr Campbell's deputy, to succeed him and we wish him all good fortune.

POSITION OF STRENGTH

I have little to add this year to my statement which all shareholders will have received. 1953 was a good year but so far as underwriting profits are concerned not quite so good as 1952. Loss by fire continued to take a heavy and increasing toll, particularly in the United States.

You will already know that your directors decided not to increase the dividend. The total interest received was larger this year than last but it is necessary to remember that tax on distributed profits at 22½ per cent is an additional heavy burden which now costs us over £224,000 per annum.

Our company has very widespread interests and has built up its very strong position by the policy of encouraging its associated companies in other countries, particularly in the United States, Canada and Australia, to build up year by year their resources out of their profits, though these profits are, of course, included in our figure for total underwriting profits. This policy means that our strength continues to increase from year to year

We look forward with confidence to 1954, though the future developments of the economy of the United States, on which so much depends, are not altogether certain. Perhaps insurance does not suffer so much from booms and slumps as many other trades, but we could hardly expect not to be affected by adverse developments. There is good reason, however, to think these may not occur. Our own country has progressed satisfactorily during the last two years.

NEED FOR SOUND INTERNAL POLICY

Our Government's policy, which is directed towards strengthening the currency framework, is a wise one. We have had good fortune in the last two years in that the price paid for our imports has fallen much more than the price obtained for our exports. But we cannot look for equal good fortune in future years, and even so the surplus on our balance of payments is not large enough both to increase our reserves, to provide capital for the sterling area and to pay our debts without, at the same time, incurring further external liabilities. We must produce more and export more. In other words we must not consume at home the whole of any increased production. We require therefore a sound internal policy, as has been so clearly set forth in the Chancellor of the Exchequer's budget speech and in the "Economic Survey" recently published by the Government.

We are still a good way from reaching the desired objective of having a really strong free currency so that we can feel assured that our economy is built on durable foundations able to meet all shocks. Our greatest danger is that we shall find our costs too high to meet the severe and continued competition we must expect, not only from American industry, but more particularly from industry in Germany, Japan, Switzerland and other countries. Since our people are as intelligent and efficient as any others, there is no inherent reason why this danger should not be overcome, if they are well led both on the employers' side and by their own trade union chiefs and if, as it is at present, the Government's internal economic policy is directed to the right ends.

On the motion of the chairman, seconded by the Hon Arthur O. Crichton, the report and accounts were approved and adopted.

Proceedings terminated with a cordial vote of thanks to the chairman and directors proposed by Mr J. A. Yeaman, WS.

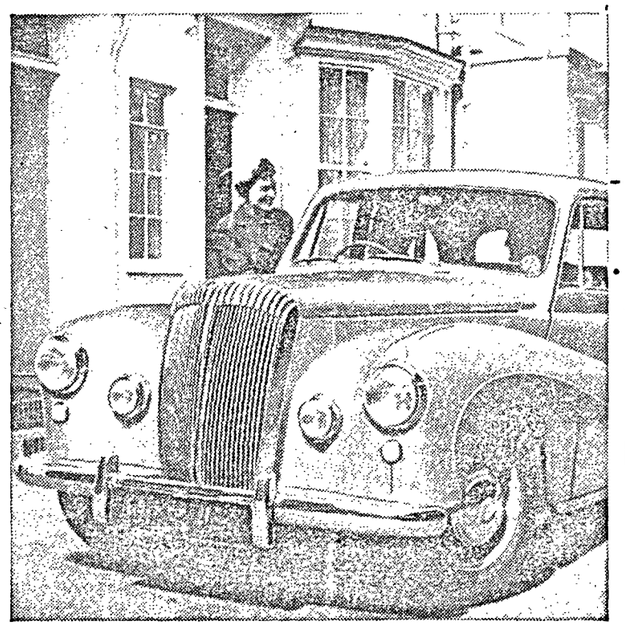
Looking for a car that has EVERYTHING?

HERE'S A BRILLIANT COMBINATION OF PERFORMANCE, COMFORT, LOOKS AND ECONOMY

The remarkable Daimler 'Conquest' Saloon continues to establish itself more and more firmly as the car for the motorist who wants the best of both worlds . . . who does not want to sacrifice comfort for performance, good looks for ease of handling, or any of these virtues in the cause of economy.

Luxurious comfort, spaciousness and silence have always been the Daimler tradition. The 'Conquest' gives you all these and much more. Here is a capacity for speed and acceleration that is really remarkable. Here is ease of handling such as is only possible with the exclusive Daimler preselector fluid transmission. With such features as automatic chassis lubrication to save you money in maintenance costs and time 'off the road', the 'Conquest' is the finest combination of motoring qualities on the medium price market today.

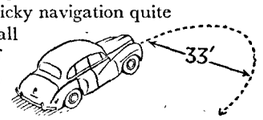
For full particulars and for the name of your nearest Dealer write to Bureau 58, The Daimler Company Ltd., Coventry.



Test the 'CONQUEST' today for all these points:

Performance. The 'Conquest' can accelerate from 0-30 in 5 secs.!—then soar rapidly to a smooth 80-plus. Cruising at 70.

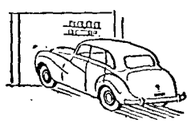
Ease of Handling. Preselector fluid transmission makes the most tricky navigation quite effortless. The small turning circle of 33′ adds greatly to manœuvrability.



Comfort. Roomy, comfortable and luxuriously appointed. The luggage boot is large. *Laminated* torsion bars in the independent front suspension give the smoothest riding and steadiest cornering imaginable.

Economy. Automatic lubrication of steering and suspension reduces maintenance costs. Water-heated induction achieves quicker warming-up and saves fuel.

Easy parking and garaging. An elegant and dignified car, the 'Conquest' is yet compact and easy to park and garage. Overall dimensions: Length 14′ 9″, width 5′ 5½″, height 5′ 3½″.



Price £1066 plus £445.5.10 purchase tax.

If Mr Eden Fails

IS it fair that the cartoonists should give Mr Eden, as they have begun to do, the morning coat, winged collar and umbrella of the late Neville Chamberlain? Is it a tortuous and protracted act of appeasement that is going forward in Geneva? And have the whispered comparisons with Munich and 1938 that are now being heard any justice or relevance? The answer, for the moment, is clearly and firmly, No. The danger and temptation of appeasement may lie ahead, but they have not yet shown themselves clearly.

The Foreign Secretary is trying to stop a war that has already gone on for seven years; he is not trying at any cost to prevent a war breaking out. He faces in Chou En-lai a statesman both ruthless and shrewd, whose troops have already been challenged and held on the Korean battlefield, not a man who has been twice or thrice appeased already. He is trying, not to surrender a democratic state, but to arrange a cease-fire around which some fragments of a political settlement might crystallise. If this is appeasement—and the word has a good as well as a bad sense—*then it began in* Berlin, when the foreign ministers (including Mr Dulles) agreed that there should be a conference at Geneva to seek an alternative to war in Korea and Indo-China. And if the British Foreign Secretary finds himself alone in using the conference to seek bases of agreement and to exercise patience and restraint, then he can console himself with this thought: if his efforts fail, then public opinion in the free world—in Asia as well as in the countries of the Atlantic alliance—will rally with greater confidence and an easier conscience behind whatever measures will be necessary to resist the violent pretensions of revolutionary China and the Vietminh. It is now clear that this had to be done, not only in Britain, but also in the United States, before the threat of intervention could be either sincere or effective. President Eisenhower realised this a little sooner than Mr Dulles, and Sir Winston Churchill realised it sooner than President Eisenhower.

But there should be no misunderstanding on this point in the Communist camp. Gradually, after the confusion and recrimination of the last three weeks, a clear moral basis for western policy in South East Asia is beginning to form. The issues are being simplified. The sudden end of American threats of joint action began the process; it was continued by British insistence on trying to make the Geneva conference succeed; and now it is being taken a step further by the contest in secret session between M. Bidault, the Vietminh and China. The Communist delegates are being given time and opportunity to show just how unreasonable they can be; the genuine desire of the Indo-Chinese to be free of France is being sharply distinguished from the Communist hope of controlling them when they become free; the world is watching Ho Chi-Minh's troops exploiting success and advancing on Hanoi while his delegates haggle in Geneva. People who have been impatient and angry—often with good reason—at French policy towards Vietnam, Laos and Cambodia are now learning how

difficult it is to make concessions under the greedy pressure of Communist tactics. Critics in Britain (who so often remember success in India and forget failure in Ireland) are beginning to see what role force may yet have to play in the pacification of Indo-China. In brief, people are being prepared for the kind of commitment they would not have considered three weeks ago.

All this and more is being gained by negotiation. Indeed, it may be that forty-eight hours of silence on Indo-China by the State Department, together with Sir Winston Churchill's guarded but emphatic assurance on Tuesday that he will " examine the possibility of establishing a system of collective security in South East Asia and the western Pacific within the framework of the United Nations " as soon as " the outcome of the Geneva conference is clearer " may have more effect on the Communists than an explicit warning that would divide American, British and French public opinion and start another furious public debate.

At the same time it is becoming clearer that American second thoughts and British first thoughts about what to do after Dien Bien Phu are not, after all, so far apart. President Eisenhower is seeking the moral and political support of Congress for the intervention that may yet prove necessary by insisting on four points: first, that any action taken shall be under United Nations auspices ; second, that America's allies with interests in South East Asia shall act with it ; thirdly, that any military operations shall be under an allied supreme commander ; and lastly that France shall give complete independence to the three states of Indo-China, even the right to leave the French Union. He has even been reported as saying that no nation shall be given a security guarantee if it does not want one. Add to this his tacit acceptance of the British position—that there shall be no commitment to a pact or to military action until it is seen whether Geneva can succeed or not—and it is difficult to see any major feature of American policy to which British public opinion can fairly object. This is not a programme to save " colonialism " (it takes a Bevanite to believe that American opinion would agree to fight for such a cause) but a policy to ensure that liberation in Asia does not mean subjection to Communist rule and Chinese hegemony.

INDEX

The Index to *The Economist* is published quarterly. The subscription rate is 5/- a year; single copies are priced at 2/- each. The Index to Volume CLXX (January to March 1954) is now available from :

The Publisher, 22 Ryder St., St. James's, London, S.W.1

Unfortunately—as the French have been desperately pointing out—it shares with Sir Winston's declaration of policy the weakness of being almost too clear cut, too deliberate, and too much above the struggle. The situation that is likely to arise in Geneva is not the one that the American President and the British Prime Minister seem to expect. It is most unlikely that the Communists will bring about a sudden and quick breakdown of negotiations, or that they will let themselves be manœuvred into a position where they can be clearly held responsible for failure. They, far more than Mr Molotov in Berlin, have time on their side ; for the fighting in Indo-China is developing in their favour. Suppose that the French suffer further defeats, that demoralisation spreads in the Vietnam forces, that the Communists in any of the three states achieve some spectacular success—what happens then ? If the French hold fast to the terms they are now offering the elated Communists, it is they who will be accused of wrecking the conference. And their position will, indeed, be precarious unless their allies back them with some assurance of help, or unless they themselves reinforce their position with fresh troops and supplies from France and North Africa. It is for this contingency—for a situation in which there is haggling at Geneva over details while Vietnam is being overrun—that Washington and London appear to have no plan. And it is then that the danger will arise for France and its friends of being asked to choose quickly between appeasement and the kind of extempore action that Mr Dulles and Admiral Radford had in mind three weeks ago.

★

Two deductions are clear, but they will not be popular. One is that the five-power staff talks should be quickly started, and conducted with realism, urgency and the utmost secrecy. If such a thing is possible in Washington, there should be no " leakages." It is useless to postpone military planning until a defence organisation can be created. The other deduction is that Mr Eden should make it clear that he will not persist indefinitely in his personal effort to mediate. If he sees no prospect of success within a reasonable time he should follow Mr Dulles's example and return home ; for he will be needed here to explain to the public the grave issues that are coming up and, as the Prime Minister said on Tuesday, " to put his own proportion " on events at Geneva. Having shown great patience he has won the power to achieve something by showing impatience. In his present course he is taking risks with Anglo-American understanding that can be justified only if he can bring a truce nearer. At the point where those risks are no longer balanced by a genuine hope of Communist concessions, it is time for the Foreign Secretary to face the House of Commons and to tell the world where vital British interests in South East Asia begin and end, and what must be done in company with other nations to defend them.

Three Per Cent Paradox?

"DO I contradict myself ? " asked Walt Whitman in one of his more thoughtful passages. " Very well then, I contradict myself." And, very wisely, he went on doing so. To the outside observer, there must seem to be some of the same spirit about last week's reduction in Bank rate to 3 per cent. Five weeks after Mr Butler's carry-on budget, the Bank of England has hoisted the traditional go-ahead signal to the British economy ; but it has explained that the signal does not mean what everybody normally takes it to mean. Instead the stated reason for the change is a purely technical (but, to post-war Britons, no less remarkable) one: the Bank actually wants to prevent dollars of a particular kind from flowing into its reserve. There is room for debate about this ; and—if only to allow the Old Lady her traditional last word—it may be more judicious and less bewildering if the economic and technical case against the authorities' action is considered first.

The economic case for uneasiness about last week's decision hinges primarily on the so-called " green light " effect of a reduction in Bank rate: on the belief that it is bound to do something to stimulate spending in Britain. In this instance, admittedly, the effect should not be very great. The Stock Exchange's reception of the news has been so cautious that there should not be any spurt in new issues ; nor are investors likely to feel so much richer that they will want to increase their consumption. But there is one respect in which the change might conceivably be significant. Now that some bank borrowing rates have been cut, some business men might have an incentive to borrow more in order to lay in stocks, especially as many feel that imported raw materials are more likely to become dearer than cheaper before the end of the year. By no stretch of technical paradox can the reduction be called a psychological force in favour of greater restraint.

Yet both the internal and external economic prospect suggest that slightly greater restraint in spending may be desirable in the next few months. Internally, as Mr Butler explained in his budget speech last month, British demand seems to be rising at or above the maximum rate that available resources can allow if inflation is to be avoided ; the prescription—it was not an unduly conservative prescription—chosen in the budget was to leave well alone. Externally, across the Atlantic, most economists—including British Government economists—think that the American recession is grinding to a halt. They think, in other words, that America may soon be exuding a mildly reflationary instead of a mildly deflationary pressure into the outside world. This judgment, of course, may still be wrong. The reduction in American unemployment since the end of March has not been significant. It has been wholly due to greater seasonal activity in building and farming, together with the enrolment of more shop assistants for the Easter rush ; unemployment in American manufacturing industries has continued to increase. But hopes are rising, and so—more practically if equally uncertainly—are commodity prices. Most of those who have to make a guess are saying that by next autumn the prolonged period of undramatic falls in American production and other business indices may be over ; and a period of undramatic rises may have begun.

If the year-long fall in American production soon comes to a halt or even reverses itself, then the year-long American policy of pushing down internal interest rates (in order to stimulate spending) may come to a halt or even reverse itself, too. And this consideration, the critics are pointing out, throws doubt upon the technical as well as upon the economic reasons for the Bank of England's action last week. Those technical reasons were primarily a response to the fall in American interest rates since June, 1953. As a result of that fall, and by the beginning of this month, money invested in short-term American government securities earned only about half as much in interest as money invested in short-term British government securities. Americans and other foreigners who buy these short-term sterling securities with dollars are not prevented by the British exchange control from repatriating their money. It is not surprising therefore that there has recently been a flow of short-term funds across the Atlantic ; and it was mainly in order to check this flow that Bank rate was reduced last week.

Even when the " economic " argument (about the undesirability of stimulating spending in Britain) is laid on one side, therefore, there are two criticisms that can be levelled against this purely technical reason for reducing Bank rate. The first is that the decision may be badly timed ; it will be rather odd if Britain has started to push interest rates down just before America starts to edge them up. The second and more important criticism is that Britain cannot yet afford to turn any dollars away, even these speculative dollars that are liable to flow out again as suddenly as they have flowed in. Why not put this hard, though hot, currency in a contingent reserve—in the hope, even if not in the belief, that some of it may permanently stick ?

★

These are the arguments that can be and are being advanced against the Bank of England's action. They add up to approximately half of the story that should be laid before the British public today. The contrary arguments, which the authorities have found slightly the weightier, rest on three main contentions. First, the Bank rejects the idea that dollars can be earmarked

to meet any potential reclamation of hot money, because it would never have any accurate way of measuring how large this earmarked reserve should be. It is also afraid that any sudden future run on these funds, by causing a sharp apparent drop in its gold reserve, might lend wings to more stable foreign money invested here. One contingency in which the authorities would obviously be very anxious to avoid even an apparent run on the reserves would be on the morrow of any declaration of sterling convertibility. It is not entirely fanciful to interpret the Bank's present eagerness to avoid holding hot money as another straw in a rising wind of rumour: it is becoming increasingly possible that some consideration may be being given to a further advance towards sterling convertibility later this year.

The authorities' second "technical" argument is that last week's decision was necessary in order to bring Bank rate into closer alignment with the pattern of interest rates that had already been established by market forces. Just before last week's announcement, the ruling Treasury bill rate in London was nearly 1½ per cent below Bank rate; now it is little more than 1¼ per cent below it. One of the ways in which the Bank of England's wonderfully flexible system of monetary management works is by stabbing an occasional painful scalpel into the discount market, by forcing it to discount at the very unprofitable Bank rate Treasury or other bills that it had taken up at the lower and more profitable market rates. In the last few weeks before the Bank rate change any stab from this scalpel would have felt like a blow from a blunt hatchet, which is not a wonderfully flexible nor yet a very easy weapon for the Bank of England to use.

The final argument in favour of the Bank rate change rests on Whitmanism pure and simple. Some people believe that there is positive advantage if the Old Lady of Threadneedle Street sometimes appears to contradict the Old Man of the Treasury, because this does at least show that the Old Lady has a role of her own. Control over monetary and Bank rate policy, in this view, should be indisputably delegated to the Bank. It can only exercise that control if it responds more or less automatically to the pressure of market interest rates and to the inward or outward flow of foreign funds; there is a limit to the extent to which it should compete with the Treasury in "taking a view" about pressures that have not yet been exerted. Moreover, by moving swiftly forward when foreign funds have been flowing in, the Bank has set a precedent for moving equally swiftly backward if foreign funds should ever start to flow out again. There may even be some element of *sauter pour mieux reculer* about the latest change.

These are complicated arguments, but the ordinary man can draw one simple conclusion from them. It is clear that there was no political or "prestige" reason behind this technical reduction in Bank rate. If the decision proves to have been wrong, it will be because the consequential effects on internal spending or on the flow of foreign money have been wrongly estimated. And, if so, the Bank of England will find it much easier than would any department of the Government to put its engines into reverse. The most logical assessment of the economic situation—the one now apparently made by the British authorities—is that a period of relatively quiet weather lies ahead, on which this "technical" reduction in Bank rate should not have much effect; in this case, the real import of last week's change is that the Old Lady's finger is now laid actively on the trigger, which is no bad thing. The minority of economists who believe that bleaker weather is in prospect can be left to draw the logical conclusion that Bank rate may soon go up again; they need not fear that last week's reduction means that the Bank of England's guard has been lowered.

Muzhik and Commissar

ONE might think that the eyes of the Kremlin since the death of Stalin had been almost permanently fixed on the Soviet countryside. There have been innumerable decrees affecting agriculture, many important meetings, and a great deal of propaganda. Twice within six months the first secretary of the Party, Nikita Khrushchev, has issued grim diagnoses of the state of affairs in the farms and villages, and on each occasion he prescribed a new and drastic remedy. First came the offer of new incentives and after that the conquest of new land. Even important international events have been overshadowed in the Soviet press by this campaign for higher output from agriculture; and some observers have concluded that, just as Napoleon feared nothing in the world save a hungry Paris, the Kremlin's only nightmare is one in which peasants are angry and townsmen are hungry. If that were so, it would mean that what Mr Molotov says abroad is deeply affected by the reports his colleagues receive from the rural front. How far is this true?

It is as easy to exaggerate as it is to underrate the extent of the present crisis in Soviet agriculture. Despite the giant strides made in industrialisation, some 130 million Soviet citizens still live in the country, and it would be a foolish government that took no account of their mood. Furthermore, the whole new programme of benefits for the consumer, on which the new regime has staked its reputation, depends greatly on larger output of foodstuffs and agricultural raw materials. Yet it is well to remember that the problem is not new: it was inherited from Stalin by Malenkov and his colleagues. The inability of agriculture to keep pace with industry and to satisfy the growing nation's needs was a well-known feature of the Stalinist economy. All

Khrushchev's "revelations" about shortages of stock, feeding-stuffs and vegetables were known to students of Soviet affairs. But whereas they had in the past to sift the evidence with the help of a magnifying glass, and disentangle admissions of scarcity from a mass of meaningless percentages or propagandist reports about, say, a model farm in the Kuban, the Russians have lately decided to let more be known about the seamy side of their economy. Indiscriminate use of the magnifying glass can now give a distorted picture.

The "crisis" has been from the first inherent in the regime's inability to plan in the countryside as completely as it did in the towns. The peasant has a knack of spoiling blueprints, as Communist governments in Eastern Europe have been learning. By tremendous efforts the Soviet Union has become the world's second industrial power; but the balance sheet of large-scale collective farming is not so impressive. With well over half the population working in the countryside it has not been possible either to improve rapidly the urban population's standard of living or to find exportable surpluses of any importance. Numbers of livestock are no greater than they were in Tsarist days, and grain production has scarcely kept pace with the growth of population.

★

Agriculture, it is true, is less capable than industry of rapid expansion and spectacular recovery from such major calamities as Stalin's ruthless collectivisation and the German invasion. It is also true that the Soviet planners, preoccupied with industrialisation, could not spare all the necessary resources for agricultural development. None the less, the Soviet leaders clearly expected higher dividends from what they have invested in the countryside. Lenin declared in the early days of the revolution:

> If we could supply 100,000 first-class tractors, provide them with petrol and drivers (you know full well that for the moment this is pure fancy) then the middle peasant would be in favour of the commune.

But even the foresight of that great strategist could be at fault. The Soviet Union has now some 1,300,000 tractors, plenty of petrol, millions of drivers and mechanics—but the peasant's love of property is still very much alive and causes the Kremlin much anxiety. Uprooted from the soil and turned into a factory worker, the Russian *muzhik* fitted quickly into the new social pattern. But, when left on the land, he has clung desperately to the tiny plot left to him after collectivisation and has accepted the new system only grudgingly. Tractors and combines have failed to transform the human being in the village.

The ultimate aim of Soviet leaders has been, and still is, to bridge the gap between town and country, to mechanise agricultural work, and to change peasants into workers. But even Stalin realised, after the cruel ordeal of forced collectivisation, that no more offensives should be launched without watching the temper of the country and consulting the international barometer. Since then the advance towards a socialist agriculture has been much more cautious. In 1951, it is true, a big step forward was taken, when the number of collective farms was reduced to less than 100,000 and their average size was roughly trebled. This was done in order to establish tighter control as well as more rational exploitation. But further steps in the same direction—including the establishment of "agrotowns"—were postponed, when it was seen that the peasants were taking fright at the idea that the last vestiges of their private property would be swallowed up.

Stalin must have realised quite well that he was bequeathing to his heirs an unsolved rural problem. His *Economic Problems,* published in 1952, dwelt on the contradictions in Soviet society resulting from collective property in the country and state ownership in the towns. He pleaded for cautious treatment, and advocated a gradual removal of this contradiction by switching over from trade to barter in the exchanges between town and country. But his death created more immediate problems, and it is difficult to establish what has since happened in the Soviet countryside. Did the Russian peasant, following tradition, expect great bounties after the death of a Tsar? Did the liberal phase through which the new regime passed produce a relaxation of discipline? Or was the pressure of peasant discontent so strong that the lid had to be lifted? Whatever the truth of the matter, the new rulers found food supplies dwindling just when they were promising better times to the consumer.

Their first remedy was applied last September. The same Khrushchev who had been threatening the private

property of the peasants now urged them to grow more on their private plots and to fatten their stock. Tax burdens were lifted and higher prices offered both to collective farms and to individual farmers for scarce foodstuffs. Then, early this year, Khrushchev faced the public with another confession and another appeal. The Soviet Union, he said, lacks grain to feed its stock, to provide more bread and to furnish exports. Crop rotation, too extravagantly applied, had led to a reduction in the area under cultivation, and had brought no compensation in the shape of higher yields. A remedy must be sought by using immediately every available scrap of waste land, particularly by the conquest of virgin soil

in distant Kazakhstan and Siberia. Within two years 13 million hectares of new land are to be brought under cultivation, to provide nearly 20 million tons of additional grain. An immense drive was at once launched—and is still going on—to send hundreds of thousands of young Communists as pioneers into the inhospitable eastern lands. They are to be supplied with 120,000 tractors—more than Lenin dreamt of for the whole nation in 1917.

The blasts of propaganda, the extraordinary mobilisation, the use of shock troops and shock tactics—these are all signs of a mood of emergency, almost of panic, at headquarters. The Kremlin is clearly anxious to carry out rapidly its ambitious agricultural programme, and this concern must influence the shaping of its foreign policy. Nor can the effort to increase food production be taken in isolation. It is only a part, though a vital part, of Malenkov's wider plan to improve the consumer's lot, of which expansion of light industry is another feature. The time of reckoning for the planners is near, because Malenkov's "big upsurge" was promised for next year, or the year after. Stalin's successors it must be remembered, promised the Russian people relaxation at home and *détente* abroad, and these two objectives are interdependent. The new rulers may need a breather, for consolidation and review. But if clouds gather on the international horizon they must be expected to turn back, however reluctantly, in Stalin's footsteps, to tighten the screw on the peasants and to use his methods of extracting food surpluses. In this respect it is true to say that the reports received from Khrushchev influence the instructions sent to Molotov The commissar who goes abroad has the *muzhik* looking over his shoulder.

Crofters in Travail

WEST and north of a line drawn from Greenock to Inverness lie the crofting counties of Scotland. This region contains one-sixth of the land area of Great Britain, but no more than 286,000 people, fewer than live in the borough of Wandsworth. Many of these people are crofters, and pursue a life that is unique in the British Isles. They live in small communities or "townships," which are scattered throughout the western Highlands and Islands, and are separated from each other by long stretches of mountains and sea. Their basic pursuit is agriculture, but agriculture practised on a small scale and under hard conditions of soil and climate. The typical croft is a holding of less than 50 acres (90 per cent of the holdings in the region are of this sort); and its cultivation is coupled with grazing rights on the common lands of the township. The crofter is a man of many skills, who traditionally has earned his living by combining farming with fishing or some rural craft such as weaving. Many crofters leave their homes for long periods to serve in the merchant marine; relatively few are able to live by farming alone.

The crofters' problems have recently been examined in the report of a Commission of Enquiry.* It has a depressing story to tell. The exodus from the Highlands and Islands has gone on steadily ever since the clearances of the early nineteenth century, but it has been more pronounced in the distinctively crofting areas. Some parts of the Highlands (notably towns such as Inverness and Oban) have gained in population since the 1930s, and some rural areas (such as the island of Lewis) are still healthy and vigorous. But these are exceptions to the general picture of decay and dereliction; in most crofting townships depopulation has continued, sometimes at an accelerated pace, in the last twenty years.

Government guarantees and subsidies to agriculture have not stopped this decline. The crofters' agricultural income is mainly derived from sales of store cattle and sheep. The long-term tendency has been to substitute sheep for cattle, because sheep are less trouble to tend and feed. Even in the exceptional conditions since 1939 there has been a further fall in the tillage area, and thus less winter keep is available for cattle. Except in the Orkneys, there has been little response to the profitable new openings for production of pigs and eggs.

The Government has already given the crofting communities a certain amount of special protection and aid. Under an Act passed as long ago as 1886, the crofter enjoys virtual security of tenure and can bequeath his croft to a member of his family. He pays a very small rent and hardly any rates; but he has had the benefit of handsome housing subsidies, and housing conditions have been greatly improved. Until recently, hardly one croft in a hundred had a supply of electricity; but now the North of Scotland Hydro-Electric Board has an obligation to apply its profits to supplying the Highlands with cheap electricity, and is rapidly doing so. Although many black spots still remain—in particular the sorry state of water supplies—there have therefore been real improvements in crofters' living standards in recent years.

But these improvements have not availed to stop the process of decline. In part, the crofters are succumbing to economic forces beyond their control. The chief of these is inaccessibility. Communications are poor, and freight charges are extremely (probably unduly) high. Marketing is difficult and costly, and this has so far restricted many promising lines of specialisation—such as the catching of lobsters and the growing of strawberries and other fruits in the mild climate of the western isles. The declining population, however, militates against any improvement in transport.

When a community falls below a certain size it enters on a vicious spiral of decline. One of the most sombre factors in the crofting communities is the high proportion of aged people; for instance, in one crofting estate in Sutherland, 110 out of 154 resident crofters are said to be over 55 years old. There are also many absentee tenants, who regard their crofts as holiday homes or as refuges to which they can return from the cities in the event of an industrial depression. The Commission noted that these conditions create an air of apathy and inertia. A number of townships, particularly on the North-West coast of the mainland, are on the verge of extinction. Their survival sometimes turns on the willingness of the Government to provide a grant for road improvement. Special grants are available for this purpose; but since some counties insist on the road being macadamized, at a cost of £1,000 to £2,000 a mile, such expenditure on a dying community cannot lightly be authorised.

★

So much for the reasons for decline. What, now, of the remedies that can be sought? The Commission of Enquiry was convinced that some relief is necessary. It pointed out that the crofters' freedom and independence have an intrinsic value which is of special importance in a predominantly urban civilization; and that the crofters, with their seafaring tradition, provide valuable recruits for the merchant marine and navy. Social reasons apart, Britain is too poor in natural resources to let so large a region fall into decay. Nevertheless, it would be wrong to adopt a purely sentimental approach to the problem and to prop up these communities by endless small doles of Government charity. The basic need is to revive and enlarge the general economy of the Highlands and to fit into it a crofting system that has been put on a more economic basis.

Such a policy would involve facing some hard facts. The basic problem is that the decline of inshore fishing and other auxiliary occupations—only partly offset by the development of the tourist trade—means that crofters will need to rely more than in the past upon agriculture for a living; but that they will not be able to do this so long as their holdings are so small and poorly equipped. About three-quarters of the crofts are at present described as part-time or small-time holdings. The only solution to this problem is an amalgamation of crofts into units worked as whole-time farms.

The application of this principle—the gradual replacement of the smallholding population by farmers operating on a normal scale—would run into numerous difficulties. It would mean that the crofting economy would lose much of its traditional character, and that the communal features of the system would tend to disappear. It would entail initially a displacement of some crofters, although they would be offered resettlement in areas that are at present largely derelict. It would involve interference with entrenched interests and changes in the law. The crofters' very security of tenure has partly produced the problem; for it has enabled absentee tenants to hang on to their holdings to the detriment of the local economy. When a croft does fall vacant, the landlord may seize his rare opportunity for a profitable disposal to some outside interest. Again the township regulations which control co-operative activities like grazing tend to penalise the crofter with initiative. In many townships the lay-out of the crofts is anachronistic and uneconomic. Finally, the most awkward problem of all is that of land ownership. Since the state, *faute de mieux*, would have to reorganise the holdings and provide the necessary capital and credit for any energetic new schemes, there would seem to be no real alternative to some extension of public ownership, which already operates in a large part of Skye.

The Commission was understandably wary in its proposals about this. It suggested only that some public authority should be given a general control over lettings and some powers to reorganise holdings; it believed that the authority should carry out its delicate functions only with the agreement of the crofters and (so far as possible) of the landlords. There may be a need to strike a balance between these gentle (and therefore probably ineffective) pressures on the one hand, and that authoritarian disregard of property and settlement rights into which a more effective policy could so easily lapse.

If agriculture in the Highlands could be put on a whole-time and economic basis in this way, other government aid to these people should take the form of helping to sponsor the growth of alternative rather than supplementary activities. The most hopeful of these seems to be forestry. The Forestry Commission intends eventually to plant an enormous area in Scotland, but so far it has done very little planting on the western and northern seaboard; if such planting would involve a departure from the strictly commercial considerations on which the Forestry Commissioners have rightly concentrated hitherto, then some grant might be considered.

The Commission of Enquiry also proposed that a new public body should be appointed by the Secretary of State to take special responsibility for the improvement of crofting conditions. The situation is serious enough to warrant this action; but there would be dangers, as well as advantages, in isolating the problems of the crofters in this way. The real need is for the development of a concerted—and initially subsidised, but eventually economic—policy for the Highlands and Islands by all the public authorities concerned. With less than 300,000 people in the area, the cost of special aid to Britain's own largest underdeveloped area should not be great. The expense will only become formidable if doles and special privileges are dribbled out to these people, without giving them any incentive to grasp the commercial possibilities open to them. There is a romance in the present economic pattern of the Highlands, but it is the romance of the fey.

* Cmd. 9091, HMSO. Edinburgh, 3s. 6d.

Notes of the Week

Who Corrals Whom?

THE Labour Party's discussions on internal discipline this week fell some way short of the orderly corralling of the Bevanites planned by the right wing. The strategy for the week was clear enough: on Tuesday the National Executive was to toss the lasso over Mr Bevan's shoulders, and on Wednesday the Parliamentary Party was to pull it tight. As expected, the Executive played its part. It passed a resolution that simply re-stated the doctrine of collective responsibility for its members, but specifically added that any breach would be "dealt with" by the Executive at its next meeting. If this means anything at all, the six Bevanites on the Executive (including Mr Bevan himself) will now be disciplined if they refuse to support the policies agreed by the majority; after a few ineffective public rebukes, that discipline would presumably have to take the form of expulsion from the Executive or the party.

This was a clear enough lead for the Parliamentary Party but, again as expected, that body havered and hummed. Mr Attlee announced that the Shadow Cabinet considered that the post-Morecambe resolution banning personal attacks was still in force, and that anyone breaking it would be "dealt with" (the phrase must have struck a chord). But after Mr Attlee had spoken, Labour MPs gave themselves over to what the official communique called "a full and frank discussion"; this means a discussion in which some members were rowdily forthright while others were soothingly inconclusive. In the end, the meeting was adjourned without any decision being taken. The Shadow Cabinet's threat now presumably hangs formally over each member—including those on the editorial board of *Tribune*—but it has not been specifically re-endorsed by the party as a whole; nor does anybody know whether the much more important decision about collective responsibility in the Executive will apply to the vital issue of German rearmament.

For the German problem, a possible escape clause has been prepared; a majority decision of the Executive need not be binding on its members if the Executive should "otherwise decide." Next week it will consider whether it should "otherwise decide" about German rearmament. If it does, then the weakness of the whole disciplinary operation will be underlined. The most dangerous manœuvre that Mr Bevan will then face will be an extension of the present attempt to isolate him. Mr Wilson's adherence to the Shadow Cabinet opened up this possibility; and it may be significant that the Bevanite vote was split on the Executive this week, although not on a major issue. But Mr Bevan may draw comfort from this week's evidence that Mr Attlee is still not sure whether a wholehearted right wing offensive, either on personalities or policies, would open or close the left wing ranks.

Footplate Folly

THE railwaymen were fortunate enough to enjoy a good deal of public sympathy in their recent struggle for a wage increase. The unofficial strike of engine drivers and firemen of the Western Region is their quickest possible means of throwing that sympathy away. Twice in the past three years the railway unions have been granted a wage increase on the condition that they should co-operate in raising productivity—the last time as recently as January; and discussions between them and the Transport Commission are at present going on. One of the chief ways of raising productivity is to work more "lodging turns"—by which the footplate men, having driven their train to some distant destination, spend the night there and drive another train back next day. Lodging turns were accepted without demur before the war; they were discontinued during it because of air raids and rationing problems, but were then re-introduced in a modified form and provoked widespread resistance in 1949.

The unions have agreed to some extension of this system, subject to certain conditions about the men's accommodation and so on, as a deliberate *quid pro quo* in the wages settlement. They have recognised that the inevitable disruption of family life, involved in the need to spend a few more nights away from home, is an inconvenience that their craftsmen must accept, if the principles that were supposed to underlie last January's wages settlement are to be honestly carried out. If the reply that is now to be given to the union leaders and to the Transport Commission is that this obligation will not be honoured, indeed that (as some of the strikers' spokesmen have said) no compulsory lodging turns will be worked at all, then the public will know where the railwaymen stand. They will stand for more pay and less productivity; and with that false principle, when the next bout of wage bargaining begins, there can be no compromise.

Why the West?

THE footplate men who are now on strike cannot complain of discrimination. The new arrangements for lodging turns in the Western Region were fully agreed by the unions, and are no more—indeed they are less—than are already being worked in other regions. They make no unreasonable demands and there is no question of any redundancy in consequence. Yet the men of the Western Region—including those who live in the west, who had come to be regarded as among the steadiest of British railwaymen, as well as those who work near London and are known to be Communist-infiltrated—will have none of the plan. So far they have resisted all the efforts of their leaders and of the Transport Commission to make them see sense.

So far, too, the strike has not spread to other regions, and there is good hope that it will not do so. The footplate men have been rightly pressing for increased differentials, to give them back some of the advantage over unskilled men that they lost in recent years. It is therefore a sorry commentary on the intelligence of some of them that they should do their best to make the railways insolvent by spending half their working day sitting as passengers in long-distance trains.

In Secret Session

THERE is a bitter and pessimistic atmosphere in Geneva which promises little progress or success. A period of secrecy may help, but there is no escaping the fact that the protagonists are already at deadlock on a matter of principle. The Communists are insisting, with Soviet backing, that the guerrilla forces and subversive organisations in Laos and Cambodia should be treated as resistance movements and candidates for political recognition. The French insist—quite correctly—that they are part of the Vietminh irregular armed forces and make their disbandment a condition of calling a cease-fire. The French are asking the Vietminh to give up an important military asset; the Communists are asking the French to make rebellion and terrorism respectable. It is difficult to see what compromise is possible here.

The point of principle has implications far beyond Indo-China. It would take no great effort of money and propaganda and organisation to create "resistance movements" in Siam and Burma which could be claimed by Chou En-lai and Mr Molotov as their natural and legitimate allies. The fact that "colonialism" does not exist in either of those free Asian countries would hardly be a deterrent. People there—and, of course, in Malaya—will be watching to see whether the western powers accept the claim that the red flag can be hoisted wherever a red army is in striking distance.

Next Target—Hanoi

WHILE statesmen talk at Geneva or sulk on the sidelines, men go on fighting in the Red River delta. The French Union forces now look like having to continue with an unseasonable war in the rain, instead of enjoying a lull from May to October. Reports from Tongking suggest that Hanoi itself may shortly become a second, and intrinsically much more important, Dien Bien Phu. The troops that hold the delta have been seriously weakened by the recent effort to sustain Dien Bien Phu and by the loss of so many men. The Vietminh, by contrast, stimulated by their successes, are massing in increasing strength for what looks like an attempt to smash the French army for good and all in northern Indo-China. Even if this effort does not fully succeed, there is some danger that the pressure will be enough to bring the political crisis in Vietnam itself to a head; Bao Dai, there is reason to believe, might be overthrown by a domestic *coup d'état*. So far from there being any vestige of an offensive Navarre Plan left, the French are in fact on the defensive in a situation that is gradually becoming desperate.

This is the background not only to the wider aspects of the Indo-China problem but also to local developments. These are now being reviewed by a special military team of three: General Ely, the French Chief of Staff; General Salan, the former Commander in Indo-China; and General Pelissier, Assistant Chief of Air Staff. They are to report back to the French Committee of National Defence as soon as possible on the most urgent requirements of the expeditionary corps, and on how it can best be regrouped to meet the biggest crisis of the campaign.

The most ominous event since Dien Bien Phu fell has been the failure of the attempt to arrange for the evacuation of the fortress's wounded. It is ominous both for the Communists' cool and clever ability to turn the situation to good account under the guise of humanitarianism, and for the way the French command appears to have fallen into a trap. By obtaining what looked like indefinite immunity from air attack for Highway 41, which leads from Dien Bien Phu to Hanoi, the Vietminh were able to make a good start in moving troops and equipment up to the delta; in return, they had done no more than promise to release such wounded as the French could collect, while themselves scarcely lifting a finger to help. General Navarre has been right to cancel this arrangement, however bitter the price.

Chinese Aid for Trade

LAST Saturday the counsellor of Peking's delegation at Geneva, Mr Lei Jen-min, saw fit to call a press conference at which he explained China's desire for foreign trade, and described economic developments in his country since the revolution. That the Chinese should want to talk economics in public is no surprise to anyone who has studied the development of the Peking government's policies. It has, in fact, long been clear that if there was any trace of an Achilles heel in the Sino-Soviet alliance it was in the question of foreign (non-Communist) economic aid. An article in *The Economist* six weeks ago suggested the folly of the West, throwing away its one remaining trump card by prematurely relaxing the strategic controls on exports, whether to the Soviet bloc or to China. But, unfortunately, there are signs that this simple lesson has not been absorbed. Already the control on rubber shipments to the Soviet Union and the east European satellites has been relaxed, while the embargo for China remains. And now there is a rumour that a first slice of items removed from the restricted list, as a result of the current review by COCOM (the consultative body that co-ordinates the controls), is soon to be announced, probably while the Geneva meeting is still going on. This is a capital error of tactics. The Russians

may excel at chess; the Hungarians—regrettably—at football; but the West, at least, still has its Culbertsons.

It may, of course, have dawned on the Chinese that if they sincerely want trade with the West—certainly the need is there—it is better to use the front door rather than the back-gate in East Berlin. The negotiations between British firms and the Chinese Export-Import Corporation in East Berlin appear to have run a dismal course. Mr Lei Jen-min was understandably evasive when asked whether China's long-term policy was self-sufficiency, for it was only recently that an article in the official "People's Daily" repeated the need for complete control over foreign trade "to prevent the imperialist countries from creating economic disturbance in the China market."

Paying for Parliament

THERE is now a tacit understanding that some improvement is coming in MPs' pay, and the only point at issue is the precise form it should take. There is still some backbench Conservative opposition to any change; in fact a majority of Conservative MPs feel this way. But, on a free vote, sufficient of them are likely to vote with Labour in favour of an increase. In last week's debate Mr Butler therefore drew attention to the more obvious alternatives to the straight £500 salary increase that was proposed by the Select Committee but is disliked by the Government. These alternatives are set out below.

Armed with Mr Butler's ideas, backbench enthusiasts have been spending the past week working out some firm proposal to put up in the second debate, which is due to be provided out of Opposition time next week. As *The Economist* went to press, it was announced that they had put down a motion asking, after all, for a straight salary increase.

The most important point is that the method chosen should not merely be a means of pulling wool over the electorate's eyes. As Mr Butler pointed out, a lump sum expense allowance would not be very different from a salary increase; and any expense allowance, particularly a subsistence allowance, would have the advantage that it would direct the extra money to where it is most needed. The Chancellor might have added that to tax-paying MPs such proposals could also be more profitable. The Government should reconsider whether these advantages really outweigh the disadvantages of departing from the stark simplicity of a straight salary increase. Whatever means MPs may choose for improving their position, they must tell the public exactly how much it costs; there should be no hint of MPs trying to smuggle extra money up the back stairs.

Local Elections Run to Form

THERE is no great political significance to be derived from the results in last week's local elections in England and Wales. As was explained in *The Economist* on May 8th, it was a foregone conclusion that Labour would score some substantial net gains. The seats contested last week had last been filled in May, 1951, when the Gallup Poll showed that 49 per cent of those who expressed a political opinion favoured the Conservatives and only 40 per cent favoured Labour. The latest Gallup Poll has suggested that political opinion is now fairly evenly divided, as it was at the time of the general election in the autumn of 1951.

In the event—and it is surprising that the Conservatives have not made more of this—the votes cast in most parts of the country, when compared with last year, seem to show that Labour fared slightly worse than this recorded swing in opinion had suggested was likely. But its gains in seats have inevitably been substantial. According to the Conservatives, Labour won 1,438 of the 3,521 seats at issue in the boroughs last week, representing a net gain of between 409 and 430 seats. It will be seen that Labour's foothold in the councils is thus still much smaller than its hold on the loyalties of nearly half the country's voters should warrant. This leeway was even more marked just after the war; it is largely because Labour made up some of this in subsequent years, rather than because of the size of last week's successes, that it now holds more seats in the boroughs than ever before, more even than in its previous peak year of 1946.

LABOUR NET GAINS IN SEATS
(England and Wales only)

	Boroughs	Urban Districts	Rural Districts
According to:			
Labour Estimates	+430	+201	
Conservative Estimates	+409	+135	N.A.
Press Association	+414	N.A.	N.A.

The Conservatives also report that Labour won 819 of the 2,469 seats at issue in the urban district councils last week. They concede that this represents 135 net Labour gains; when the results in the 1,500 contests for seats on rural district councils are added in, Labour claims that its total net gains on district councils amounted to 201 seats. Labour party figures show that there was a change of control in some 17 of the 395 borough councils as a result of the elections; in fourteen councils control swung to Labour, but it lost control in three others. There were some 450 urban district councils for which elections were held last week; Labour figures show that it gained control in eighteen of them and lost control in two others.

Proposals for MPs' Pay

THE Select Committee on MPs' expenses recommended that the present salary should be raised from £1,000 to £1,500 and that MPs should have a non-contributory pensions scheme. The Government does not favour either proposal, but it recognises that many members are in financial difficulties. In last week's debate Mr Butler therefore outlined the following possible alternatives to a salary increase:

1. A sum—say between £100 and £500 a year—might be provided against which each MP would draw (free of tax) reimbursement of necessary expenses, on showing that he had actually incurred the expenses claimed. These expenses might or might not be limited to certain defined classes, such as secretarial and postage expenses. Mr Butler said the effect of such a scheme might not be very different from a salary increase, but the House might think it more defensible.

2. MPs might be provided with various services in kind, without charge, such as through a pool of secretaries. Mr Butler, however, did not favour this proposal. He said it would be extravagant, since it would have to provide for peak demand; the secretaries would be unemployed during Parliamentary recesses. He also pointed out that there were accommodation difficulties.

3. MPs might be given free postage, telephones and telegrams, over and above what is already provided. Mr Butler felt; however, that this would present "awkward problems of control"; he did not think it would be "reasonable for the taxpayer to pay for a member to send perhaps scores or hundreds of telegrams to his constituents giving hot news of his achievements in the House."

4. A subsistence allowance, of the order of £2 a night, might be paid to those MPs who live out of London when they are at the House, and to those who live in London when they are in their out-of-town constituencies. Mr Butler dwelt at length on this proposal, and appeared to prefer it to the others. He also pointed out that, at present, expenses incurred by MPs are claimed and allowed for tax relief against their Parliamentary salaries. All the forms of expenses he proposed would be tax free; on the other hand, the amounts claimed for tax relief against salaries would have to be correspondingly reduced, so that a poorer MP would "get a much greater benefit from this suggestion than a richer man who would really not get very much out of it."

5. On pensions, Mr Butler wisely indicated that he would much rather discuss the problem of aged members in the context of the Members' Fund than of a non-contributory pensions scheme; he reported that the Fund has a capital of £78,000, and draws an income from capital and subscriptions of £9,800.

No Miracle for Mr Macmillan

MR MACMILLAN'S hope that the local authorities' associations might miraculously agree among themselves on some scheme of local government reform—which everybody agrees is necessary but for which no entrenched interest is willing to make sacrifices—has been finally and completely dashed. The Association of Municipal Corporations has emphatically rejected the tentative suggestions put forward by the other four local authority associations. In its view, those suggestions "merely provide for the aggrandisement of county councils at the expense of the boroughs." The association's own plan, which has been brought out of its drawers and dusted up, mainly pivots on the opposite principle: that the all-purpose (or county borough) form of government should be extended at the expense of the counties. Thus the rival associations are hopelessly at loggerheads.

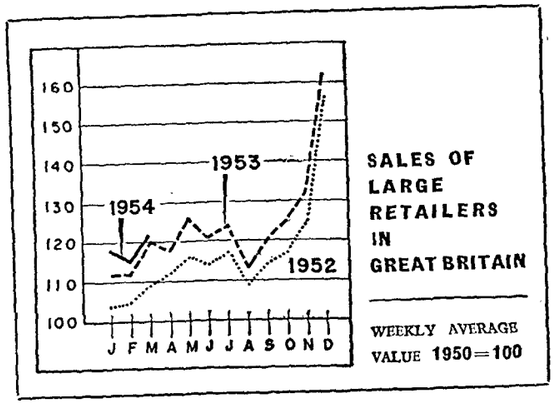
This renewal of this old impasse may be a blessing in disguise, if the Government will now recognise that no forced compromise of such conflicting views could yield a plan worth having. But there are points of value in the views of each side that Mr Macmillan might usefully incorporate in a plan of his own. Thus many county boroughs have an undeniable case for large boundary extensions since the present severance of suburbs from cities is expensive as well as irrational; but it may be equally desirable that other county boroughs should surrender some at least of their present autonomy. The union of some urban with some rural districts is another measure that is winning increasing support in local government circles—except among the interests that would be displaced. The promotion of regional authorities for the larger conurbations is another sound suggestion, so long as it is not treated simply as an extension of county government.

These are merely pointers to the shape that a plan of reform might take. It is encouraging that the Association of Municipal Corporations should explicitly request Mr Macmillan to produce a plan, and should indicate its confidence in the fairness of the result. If the other local authority associations take the same view, the Minister should feel free to go full steam ahead.

Pigeon-Hole for EDC

THE prospects that the treaty for a European Defence Community will be ratified by France are now worse than they have ever been. With a majority of only two votes, M. Laniel can hardly afford to raise an issue likely to lose him the remnants of Gaullist support. The Gaullists have made it plain that they would not hesitate to make the government tumble if EDC is at stake and so the EDC treaty must go back into its pigeon-hole. Originally the French Assembly was to decide last Tuesday whether its preconditions have been fulfilled and, if so, set a final date for the ratification debate. With the Gaullists holding a pistol at his head, with the Socialists in opposition and as yet undecided, with M. Bidault in Geneva and plenty of other things to worry about, M. Laniel must have welcomed the fact that the Saar problem was not yet settled. This provided him with a formal excuse to put the "great debate" off to the Greek Kalends.

It is significant that last week M. Robert Schuman,



whose very name is a symbol of European unity, declared that the European army should not be identified with the European idea. True, he subsequently stated that too much has been read into his words. But in Paris this is taken as a sign that some Christian Democrats (MRP), seeing little hope of ratification, do not want to prejudice their future alignments. If the MRP is really preparing safety belts, the EDC ship must clearly be showing a list.

At the same time, the idea has been revived in Paris of using EDC in the bargain with the East. France, it is argued, has few military cards in Geneva, the Americans are unwilling to lend trumps, yet France should offer something to Russia and China so that they would exercise restraint on the Vietminh. What better bait for Russia than the abandonment of EDC? But at this stage the Russians are likely to counter any such offer with an axiom from La Fontaine, that "you should not sell the skin of a bear before you have killed it."

Spies Who are Spied On

THE life of a Soviet secret agent is one of the least enviable in the world. He makes a perpetual nerve-racking progress between fear of detection by security officers of the country in which he is working and fear of failure to satisfy his superiors in Moscow. It may be suspected that the agent is often more afraid of the latter than of the former; for he not only spies on others but is himself spied upon. His every action, almost his every word, is reported back to Moscow; his slightest slip is noted and criticised.

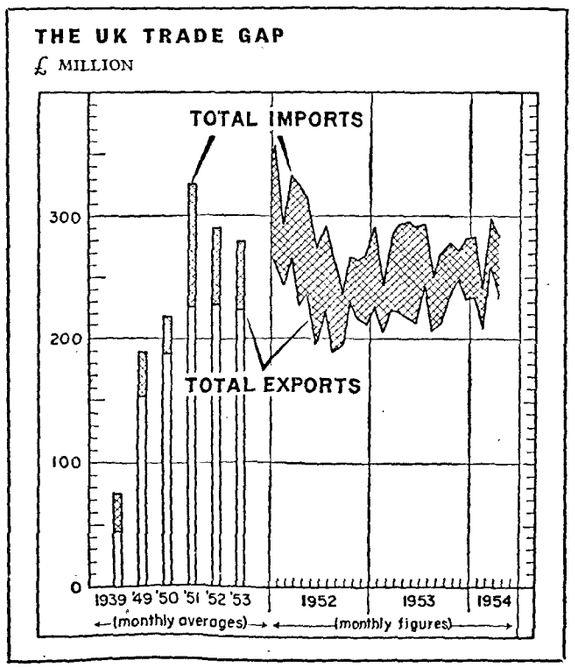
The opening stage of the Australian Royal Commission on the Petrov case has thrown a vivid light on the hazards and mortifications of a Soviet agent's life. They have also revealed much—and as the inquiry proceeds they will reveal a great deal more—of the methods used by the MVD to recruit agents and acquire information in foreign countries. There is, for instance, the avoidance of Communist party members, because their known affiliations make them both dangerous as contacts and poor sources of confidential information. There is the sordid search for discreditable details about the private lives of informants so that pressure can be exerted on them when necessary. There are the plans to bring Russian agents into the country for "illegal work," probably because of the dearth of suitable Australian recruits.

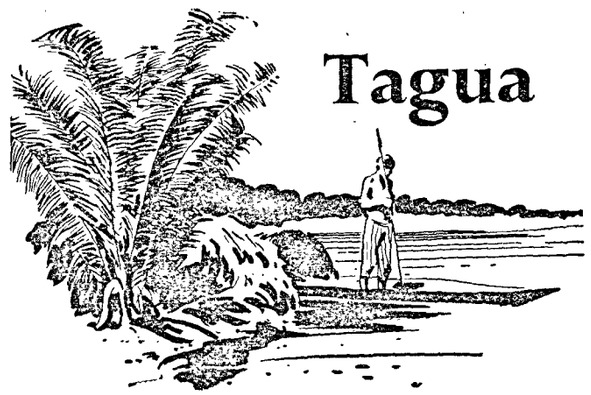
Perhaps the most striking and sinister of the revelations now being made in Canberra is the evidence of the grim long-term persistence of the MVD's activities. Russian spokesmen may talk persuasively about "peaceful co-existence"; they may try to prove their good intentions by joining Unesco or contributing towards the Technical Aid programme. But all the time the MVD proceeds on the tacit assumption that sometime war is inevitable. Why else was Petrov directed last June to get on with the organisation of a fifth column in Australia? It is difficult to imagine that Australia can represent much of a threat to the Soviet empire, and if a country so far from the Soviet Union merits so much attention from the MVD, what must be going on in countries nearer to the Soviet frontiers?

A Kite Over Bonn

DR ADENAUER is finding it difficult to hold in check the political associates and industrial personalities who want Western Germany to have personal and semi-official links with the Communist world. One of his cabinet ministers has been active in setting up in Bonn the *Gesamtdeutsche Aktion*, a society for cultural, commercial and social contacts with the eastern zone of Germany. Then, after Whitsun, most of the *Ost-Ausschuss* of German business men will visit Moscow for commercial purposes, and a private party will visit Peking. And now Herr Pfleiderer, a Free Democrat member of the Bundestag and former career diplomat with special knowledge of Russian affairs, has made public proposals of his own.

He suggests that members of parliament should visit the Soviet Union to make contact with the Red Cross authorities and religious organisations; that the Federal Republic should have semi-official representation and trade missions in Eastern Europe; and that some link should be established between Bonn and Moscow. Herr Pfleiderer takes care to insist that he has in mind no "Rapallo policy" of collaboration with the Russians, and that there can be no question of recognising the East German Communist regime. But these reservations and assurances of loyalty to Germany's western policy may merely strengthen the suspicion that Herr Pfleiderer is flying a kite of which the string is held in more authoritative hands. It is interesting that quarters close to the Chancellor have been discouraging the speculation aroused by Dr Adenauer's recent remark, during a speech in Hamburg, that the possibilities of diplomatic contacts with the Soviet Union would be examined in due course. It is believed that Herr Pfleiderer has some influence when eastern questions are being discussed, and that he might play a role of some importance in German foreign policy of the future.





Tagua

In the torrid coastal region of Ecuador there grows a palm fern — the tagua. The nuts of the tagua, when dried and cut, yield a material closely resembling ivory, which can be carved and polished to make buttons, collar studs and many other useful and decorative articles. Tagua nuts are shipped to European markets from the port of Guayaquil. Here, as in most other important commercial centres in Latin America, a branch of the Bank of London and South America has long been established.

From Guayaquil, and from the Bank's 55 other branches in South and Central America, come regular reports on local produce markets, economic conditions, and changes in trading regulations and exchange control. Summaries of these reports are published in the Bank's *Fortnightly Review*, an invaluable guide for all who wish to enter Latin American markets, whether as buyers or sellers. We shall be glad to send you a specimen copy on application to:—

Men you trust —and why

A national newspaper recently referred to the "rocklike solidity and soundness" of British life assurance. Right enough, but when you deal with a Life Office you not only trust its integrity — you trust its sagacity.

The favourable premium rates and impressive bonus payments maintained over the years are made possible by the skill and knowledge of those responsible for British life assurance *investment*.

These experts have no political interests to serve, nor have they any interest in gaining control over sections of industry. Their guiding principle is, and always will be, *the security and benefit of the policyholder*.

then let's leave

Life Assurance

in tried and trusted hands!

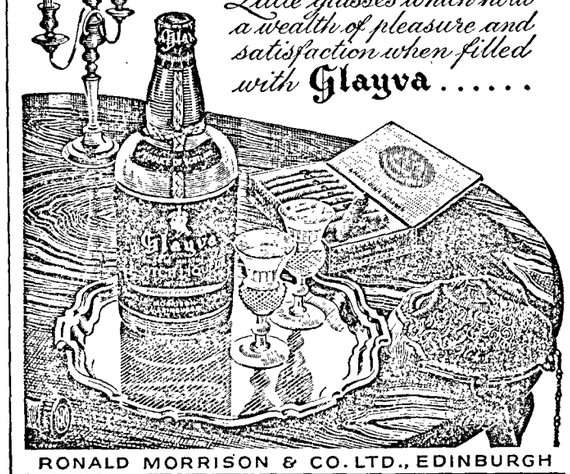
Glayva

Scotch Liqueur

Little glasses which hold a wealth of pleasure and satisfaction when filled with Glayva .....



RONALD MORRISON & CO. LTD., EDINBURGH

There is little doubt that this trend has support from German industrialists and among their spokesmen in parliament. It is even represented in the present cabinet. However much it may be regretted, it is, in present circumstances, to be expected. The Chancellor's policy for association with Western Europe seems to be threatened with collapse; neither Britain nor the United States has indicated what are the alternatives; and France presents the spectacle of an unwilling and irresolute partner. If the French Assembly wants to see the end of the Adenauer line and German foreign policy taking shape under Herr Pfleiderer's influence it is going the right way about it.

Hosannas at Harringay

MR BILLY GRAHAM, the American evangelist, ends his campaign in London this Saturday with a mass meeting at Wembley. Night after night since March 1st Harringay Arena has been packed out and thousands of disappointed people have fought to gain admission, to be finally organised in overflow meetings outside. Altogether, according to Mr Graham, over 1,300,000 people have attended his meetings, and many more heard them relayed to towns all over the country. Some 28,000 of these "made decisions for Christ," which means that they came forward in token of their wish to accept religion. Some may have been unstable exhibitionists, but others were plainly converts in a surprisingly genuine sense.

What is the secret of this success? Clearly, publicity and stage management have had much to do with it. The choir leader with his trumpet, the fruity baritone with his soulful song, the jokes and bonhomie, all play their part. The appeal is to emotion which, as every dictator knows, will snowball its way through a crowd. Yet Mr Graham does not produce mass hysteria, although he is certainly dramatic, as he lunges about the stage taking by turns the principal roles in the Fall of Adam and Eve. His power lies chiefly in his simplicity—aided, perhaps, by the fact that he looks like a film hero, speaks with a film hero's accent, and in a place popularly associated with dog racing. This is comfortably familiar ground for the audience he is seeking, many of whom may have hardly set foot inside church.

Mr Graham's aim, however, is to get people to go to church, whether nonconformist or Church of England (he is a Southern Baptist himself). The Church has therefore had to accept him as an asset; indeed, the Archbishop of Canterbury is to speak at his final rally. Anglican parsons will shudder at the thought that they should emulate his technique, even if they could. But although they rightly preserve the intellectual tradition that has always been theirs, they can hardly ignore the fact that it is Mr Graham who seems to be on the wavelength.

Scholarship Stakes

ACCORDING to an analysis published in *The Times Educational Supplement* of May 14th, twenty different schools each won ten or more scholarships to Oxford and Cambridge in 1953-54; fifteen of them had also won ten or more scholarships in the year before. The table is set down below, but must be accompanied by all the usual warnings. There are many kinds of university award—more than two-thirds of all students at universities receive help of some kind. Although the table deals mainly with open scholarships and exhibitions to the two senior universities—that is, with the most difficult and most eagerly sought prizes—there are some closed scholarships to them (i.e., those which are limited to certain kinds of candidate or sometimes to a single school) that may distort the results.

Another problem is that the performance of the different schools can only fairly be judged in relation to their size. For this reason, a column has been added to the table showing the number of boys in each school (mainly from the latest edition of the *Public Schools Yearbook*). Even this is not entirely satisfactory, because in some of the grammar schools an unduly large proportion of boys leave before they reach the sixth form. It should also be noted that some of the biggest grammar schools traditionally skim off the cream of intellectual talent in their areas.

SCHOOLS WHICH WON 10 OR MORE SCHOLARSHIPS OR EXHIBITIONS AT OXFORD AND CAMBRIDGE IN 1953–54

	No. of boys	Oxford	Cambridge	Total
1. Manchester G. S. (1)	1,400	19	17	36
2. Bristol G. S. (12)	1,101	10	10	20
3. St. Paul's (4)	650	11	8	19
4. Winchester (2)	500	13	6	19
5. King Edward's, Birmingham (9)	680	6	12	18
6. Eton (3)	1,160	6	11	17
7. Westminster (16)	380	9	6	15
8. Christ's Hospital (10)	830	5	9	14
9. Clifton (7)	574	3	11	14
10. King's School, Canterbury (14)	650	10	4	14
11. Kingswood	450	5	8	13
12. Marlborough (5)	760	4	9	13
13. Harrow (13)	550	7	5	12
14. Charterhouse (18)	622	8	3	11
15. King Edward VII, Sheffield	...	5	6	11
16. Merchant Taylor's	650	6	5	11
17. Ampleforth (15)	420	7	3	10
18. Radley	440	4	6	10
19. Rugby (6)	675	3	7	10
20. Shrewsbury	...	6	4	10

Figures in brackets show position last year.

By subjects, the largest number of scholarships fell to the natural sciences, which claimed 211. But with mathematics (105) the science side was thin compared with the combined weight of scholarships in classics, history, English, and modern languages, which go to make up the rest of the 906 awards.

Belgium Cuts National Service

BELGIUM'S reduction of national service from 21 to 18 months will agitate quite a number of Labour pundits at Westminster. Britain, from having been one of the last countries in Europe to have conscription, is now among those which go in for it the most thoroughly. Equally, from having been regarded before the war as a matter which did not affect Britain as it affected other countries, national

service is now fast becoming a keen political issue. One reason for this is that the British conscript does a longer period of service than most others, and during it he is liable to be sent to fight on a real—and sometimes grim—battlefield; even the hard-pressed French still do not send national servicemen to Indo-China. Of the other members of Nato, Greece and Turkey have a straightforward full two years' call-up like Britain. Young Frenchmen serve for eighteen months; in Italy the term is in practice sixteen months, in Holland twenty months, in Norway and Luxemburg a year, and in Portugal little over six months. Canada has no national service; even in wartime the subject is political dynamite. In the United States, while many thousands have been called to the colours for long and arduous periods, there is a selectivity about the call-up which leads to exemptions that would never be tolerated in other countries.

Admittedly, the length of the British service is due in part to Britain's world role as well as to the defence needs of Europe. But this does not cloud the fact that the consequent size and quality of this country's contribution to the Nato forces gives Britain a moral claim to call for stouter efforts from its European allies.

In the field of Nato organisation itself, there is a special and important problem. There, the argument of all-for-one and one-for-all should be applied, so far as the political and economic conditions of each member country allow. And even if the ideal of a standard length of military service throughout Nato is unattainable, a very great deal more should be done to achieve it than is being done at present. One of Nato's main tasks, even if it is one of the most difficult, is to see that the burden of defence is shared equitably and that the means of defence are standardised. Another is specifically to build up Europe's first reserves for war. On both counts, General Gruenther and the Standing Group should now put advice to governments on manpower planning in the top priority list.

The Adamjee Riots

LAST weekend a storm broke in East Bengal. Two hundred people were killed and even more injured at Narayanganj, near Dacca, in the worst riots since Pakistan came into being nearly seven years ago. They took place at the Adamjee jute mills, as a result of a minor chain of incidents involving friction between Bengalis and non-Bengalis. After blood had been shed, troops were called out, a curfew was imposed, and the Ministers of Labour and Defence flew out to East Pakistan from the seat of the central government at Karachi.

After the political events of recent months this serious incident comes as no surprise. It follows the landslide last month in the provincial elections, in which the Muslim League—the party that had created Pakistan—was swept from power by a hotch-potch United Front under two leaders who were prime ministers of Bengal in the days of the British, the elderly Mr Suhrawardy and Fazlul Haq; they fought the election on a campaign of Bengal for the Bengalis. And although the result technically affects only the provincial legislature of East Pakistan, in practice its causes and political effects are of profound importance for all Pakistan. They mean, on the one hand, that the authority of the central government has now received a blow which makes nonsense of its recent efforts to secure a passage for the proposed constitution. On the other hand, Pakistan must think again, not only about the role of religion in the state, but also about the possibilities of loose federation instead of the present unity.

One thing that ought to be said with emphasis is that Mr Mohammed Ali, the Prime Minister, and other ministers at the centre, do their own cause no good by laying the blame for all that has happened at the door of the Communists. That is a feeble excuse which has been used far too often when things have gone wrong in Pakistan, and there is hardly a shred of evidence to support it. Naturally the Communists are delighted to help magnify any discontent that already exists. But the root of it is the place of the Bengali in the new state, and unless this problem can be solved Pakistan is in for trouble.

Over Denmark's Head

UNIDENTIFIED aircraft have plagued Scandinavia in recent weeks much as flies arrive with summer. In some cases there has been a strong presumption as to their nationality; at least one of those observed on the Norwegian coast appears to have been American, and the aircraft that crossed the Swedish frontier from the direction of Finland were, with good reason, taken to be Russian. But there is still no authoritative explanation of the extensive night flights over Danish territory that took place at the end of April. The citizens of Copenhagen were rightly disturbed by this new reminder of the exposed position of their city, which is within less than fifteen minutes' flying time from the Soviet air bases in Eastern Germany. They were even more disturbed to learn that Denmark's unfinished radar system had failed to detect the intruding aircraft, which cruised freely for several hours, that no action had been taken by the Danish air force, and that the head of Copenhagen's air defences had learnt of the affair only from the wireless news next morning. This is the kind of thing that happened in 1940.

The weaknesses of the Danish air force and its urgent need for reorganisation—described in *The Economist* on April 3rd—had already led the government to seek expert advice from Nato. The Defence Minister, Hr Rasmus Hansen, has now issued new orders which, it is hoped, will ensure that fighter aircraft get into the air without delay the next time the country's borders are violated. But Danish critics have been prompt to point out that orders alone will not remedy lack of fighters and of radar. Hr Hedtoft's Social-Democratic government, which on its recent return to power declared itself firmly but not permanently opposed to the basing of allied air units in Denmark, might now be under pressure to reopen that question if it were clearly established that the intruding aircraft were of Communist origin.

This, however, seems uncertain. Soviet manœuvres have apparently been taking place in the Baltic, and indeed have led to the first firing on Danish fishermen by Russian naval vessels. But anti-Soviet leaflets, issued by the "NTS" organisation and printed in Russian and German, have lately been scattered over Denmark; and although these might have come from balloons carried by a strong east wind, many Danes are inclined to link them with the mysterious night flights. Whether there is a link or not, clumsy "clandestine" activities of this kind make it more difficult to appraise the situation and to muster public support for the measures that Denmark, in its exceptionally exposed position, should take.

Some Economic Terms

The following is a fourth selection of contributions for the proposed English-Doubletalk dictionary of modern economic terms:

Backward area, an area more backward than other backward areas

Under-developed area, a country too proud to admit that it is backward, but not too proud to beg.

Vital sector of the free world perimeter, a country too proud to beg, but not too humble to blackmail

Bank Rate, increase in, a ramp which pleases Mr Butler's friends on the stock exchange by putting more money into the pockets of moneylenders

Bank Rate, reduction in, a ramp which pleases Mr Butler's friends on the stock exchange by putting more money into the pockets of shareholders

Public service television, a programme advertising Mr Maurice Winnick

Commercial television, a programme advertising other entrepreneurs.

The New Edwardians

LONDON has for some time been familiar with the sight of gangs of youths dressed in Edwardian clothes—velvet collar, long jacket, bootlace tie, fancy waistcoat and sidewhiskers. They are to be seen lounging in the streets of south-east London or "creeping" round the floor of such dance halls as will admit them. They are also sometimes to be seen indulging in more nefarious activities; a gang of 37 were recently interviewed by the police after disturbances at St. Mary Cray, in Kent, and Scotland Yard has had several other reports of dangerous hooliganism in this fancy dress.

There have been some learned explanations of this unpleasant phenomenon. In a letter to the *British Medical Journal* Dr Margaret Lowenfeld, the psychologist, has suggested that our modern civilisation takes no account of the driving need of the adolescent—particularly the male adolescent—for emotional adherence to a group with a ritual; hence the adoption of the Edwardian uniform and the creeping antics on the dance floor. There will also be less learned memories of long-standing dress rituals at public schools; and of the hooliganism that can sometimes occur on special end-of-term railway trains. National Service also has certainly had something to do with the teddy-boy trouble. It makes the years between the ages of fifteen and eighteen an interval in which it seems hardly worthwhile to start seriously on a career. Meanwhile, the youth can earn good wages on his temporary job—good enough to spend anything from £10 to £30 on his fancy suit.

The real problem, however, is merely the familiar one of adolescent hooliganism. This problem is far too serious for it to be sensible to divert too much attention to the unfamiliar dress in which the hooligans now sometimes appear. Indeed that dress has at least one lighter aspect. This is the repercussion that recent publicity has had on the elegant young men around St. James's, who affect a rather similar Edwardian dress except that they crown it with a bowler hat tipped well over the eyes. Some very good clothes are likely to be given away in the near future.

Tests for Oxford

Although the Bill . . . for the Reform of the University of Oxford is the only measure which has been able to divide with the war either public or parliamentary attention, we have not felt called upon to discuss it. . . . There is, however, one question—and a most momentous one—of *principle*, connected with the measure, which unfortunately is not touched upon in the Bill itself, but which is to be brought under the consideration of the House as soon as the separate clauses have passed through committee. . . . We allude to the proposal for the removal of those "religious tests" by which . . . every youth who desires to avail himself of the advantages of that great national academy is compelled to declare his solemn belief in a whole series of scholastic propositions. . . . These tests . . . share with the oaths which keep Jews out of Parliament the unenviable honour of being the last relics of a narrow bigotry which once pervaded all our institutions. They are what Colonel Sibthorp is in politics, what the pig-tail still occasionally seen dangling behind some venerable head is in fashion—the lingering *souvenir* of prejudices and fancies long since obsolete and passed away. They are retained in the place of all others where they ought to have been first abolished—in an institution of which the boasted province and theoretical duty are to lead and educate the country. They are retained in that which claims to be pre-eminently the NATIONAL seminary and seat of learning, with a view of excluding half the nation from entering within its gates. . . . The University authorities are fond of maintaining—and even maintain it with much contemptuous insolence sometimes—that no man can be thoroughly or perfectly educated who has not had a University career. Yet they insist upon an arbitrary rule which excludes, and is intended to exclude, and is useless and nonsensical if it does not exclude, from that career one-half the young men of England, and which would exclude the majority of the other half, if their consciences were not either naturally torpid, or drugged into sleep by sophistry, or silenced by the whispers of self-interest.

Self-Judgment of Salomon

THE ANSWERS OF ERNST VON SALOMON.
Translated from the German by Constantine Fitzgibbon.
Putnam. 558 pages. 35s.

THE *Fragebogen*, the denazification questionnaire with its 131 headings, will long remain a monument to the stupidity of the Allies' good intentions in the re-education of Germany. It has presented a perfect target for a writer with the skill and wit of Ernst von Salomon. Out of his answers to its stern but inept questioning he has made an autobiographical, highly personal and immensely readable account of the years between the two German defeats of 1918 and 1945.

Herr von Salomon draws a picture of himself as equally clever and unpleasant: each quality is used to re-inforce the impression made by the other. Part of his stock-in-trade is a brazen and ironical frankness. Instead of attempting to deny or apologise for what happened in Germany and German-occupied Europe, he mocks the pretensions of the victors to set themselves up in judgment: his concluding account of his eighteen months in an American detention camp helped to sell a quarter of a million copies of his book when it was published in Germany in 1951. Instead of evading responsibility, he openly proclaims his indifference, and answers moral indignation with a succession of rude gestures felicitously conveyed in cynical and unmistakable language.

This is at least a refreshing change after so much solemn talk of guilt and repentance. No doubt it accurately reflects an important section of German opinion. As Mr Goronwy Rees remarks, in his admirable introduction, this is a cautionary tale to be pondered over by all who have to deal with present-day Germany. But in elaborating the political moral to be drawn from the book, it is a pity to see Herr von Salomon too often taken at face value.

For all his pride in his Prussian origins, his Freikorps service and his part in the murder of Rathenau, Ernst von Salomon seems a poor representative of the "dynamic" and "heroic" attitudes he admires. His early years in prison as a martyr of the nationalist cause gave him credentials which he exploited to the full, but once out of prison he never lifted a finger to serve any cause but his own. For the Nazis he had nothing but contempt and never joined the Party. With the remnant of the old-fashioned nationalists represented by the Ehrhardt Brigade he preserved a few links of sentiment, but took good care never to get involved again in their futile intrigues. He pours scorn on the anti-Nazi opposition, but when the fate of Germany was being decided on the battlefield he retired to a hide-out in Bavaria and continued to occupy himself with writing film scenarios. All this, no doubt, was highly intelligent behaviour on the part of a detached observer, but it is hardly in keeping with those Prussian and nationalist ideals to which at other times the author expresses so nostalgic an attachment.

Herr von Salomon is uneasily aware of this conflict, despite his bold attempts to shrug it off with a display of cynical bravado. But the sleight of hand is too obvious. His true affiliation—on the evidence of this autobiography—is not with the traditions of the Prussian Officer Corps, or even of the Freikorps, but with the type of intellectual who contrives his own survival under any regime. Not all of them however make so profitable or so entertaining a display of their own lack of shame.

The Top of the Union

POWER IN TRADE UNIONS: *A Study of their Organisation in Great Britain.*
By V. L. Allen.
Longmans. 334 pages. 25s.

WHILE the place of the British trade unions in social history has long been secure, it is only recently that their expanded membership, increased economic and political influence and apparent social indispensability have stimulated a widespread inquisitiveness about their everyday behaviour—and a steady trickle of more or less specialised studies to provide some of the answers. The supply of such studies is likely to increase, as most universities now make provision for the study of industrial relations and many organise extra-mural classes on trade union problems. The author of "Power in Trade Unions" is, in fact, an extra-mural staff tutor in this subject.

The longest and undoubtedly the most useful part of the book is Part II; its theme is trade union government in the highly restricted sense of "national leadership" as provided for in union constitutions. Here the author has broken new ground—and heavy soil at that. He has analysed the constitutions of 127 unions (comprising all but about one per cent of the TUC-affiliated membership in 1952) in order to show, for each union, the character of the supreme policy-making body and the degree to which it is intended to be representative; the nature, size and life-span of the executive; and the provisions for electing (or appointing) and dismissing the general secretary. So inclusive a framework would be of interest in itself, even if it were no more than a framework; but it is amplified with subsidiary tables, and with appropriate explanatory chapters on policy making, on the powers and functions of executive bodies, and on trade union leaders.

Not only are these chapters written with knowledge and generally with common sense, but the author's fourteen years as a lay member of the Amalgamated Society of Woodworkers give him the essential quality that some of his recent predecessors have conspicuously lacked, a genuine "feel" for what he is describing.

But while the book has certain solid merits, it also has its faults. There are weaknesses of construction: some of the wider questions raised in the opening sixty-odd pages of Part I on "Trade Unions and the Democratic Principle" seem of dubious relevance to the 180 pages of Part II; Part I has a summary and conclusions while Part II (and with it the book proper) ends abruptly; and the appendices, though containing some interesting material, are as long as Part I and could have been compressed and, in part, incorporated in the text.

Moreover, where the author makes incursions into the borderlands of political theory, the book also suffers from an occasional woolliness of thought and expression. Thus in discussing the danger of pressure groups in a democratic state, he takes Mr Sturmthal to task for having failed to distinguish between "pressure groups, which are in reality concentrations of economic power," and "voluntary societies." He believes that "to ensure the effective working of the state democratic mechanism, steps must be taken to remove concentrations of economic power from the hands of minority groups. The right to form voluntary societies, on the other hand, is a fundamental democratic right. . . ."

It emerges that Mr Allen's chief anxiety is confined to trade unions with compulsory membership ("trade unions which are compulsory organisations are private concentrations of economic power"); and in such cases he considers Parliamentary intervention justified to supervise the working of union constitutions. But is the Amalgamated Engineering Union, where membership is voluntary, less of a pressure group and less of a concentration of economic power than the National Union of Mineworkers, where membership is compulsory in some districts? Mr Allen dislikes compulsory membership—although this has been a trade union objective from earliest times—because members can no longer express disapproval of their leaders by leaving their union (although, of course, there are other means of defying union authority). His point would have been more cogent without the introduction of overtones.

However, despite the narrow limits of its conception, its faults of construction, and its occasional lapses, the book remains a useful contribution to knowledge about trade unions. It is the first full-scale analysis of their constitutions and the first attempt to deal with the problem of the upper levels of union government; and, while a comprehensive study of trade union power politics has still to be written, Mr Allen deserves the honours of a pioneer in his chosen field.

A Journalist Remembers

LIFE SO FAR.
By Wilson Harris.
Jonathan Cape. 321 pages. 21*s*.

MR WILSON HARRIS, at the age of seventy, has behind him a distinguished and varied career. He had a sober upbringing in a middle-class family at Plymouth; he went up to Cambridge to study classics and was President of the Union; he became a schoolmaster and then joined the staff of the *Daily News*; he was leader-writer and then correspondent at the Paris Peace Conference and the numerous international conferences that followed; for twelve years he attended the meetings of the League of Nations; for twenty-one years he was editor of the *Spectator* and for nearly five Independent MP for Cambridge University. His work has taken him much to Europe and sometimes to America and he has met a host of notable people.

Of his childhood he writes not very much but enough to give a vivid picture of the late Victorian household—serious, intelligent and charitable but lacking any knowledge of the arts. The method that he follows for the rest of his life-story might be called *pointilliste*. From a remarkable storehouse of memory—he says he has kept only the briefest of diaries—he has assembled a mass of anecdotes, conversations and brief life histories of the people he has met. Story follows story; from chapter to chapter the flood of names, mostly notable, increases. The method, which could so easily flag, is sustained with great energy; and the reader, though he cannot help feeling that the level of experience recounted is somewhat superficial, presently finds that he has been given a very good idea of period. Lloyd George, Baldwin, Ramsay McDonald, Benes, even Mussolini and Hitler, appear with the scores of politicians and journalists. There is also some straight description of facts and policies—of papers as well as countries. Through all this the Zeitgeist clearly emerges.

Later, however, one discovers another side to the author. He had a Quaker upbringing; he belonged to religious societies at Cambridge; he lived for a time at Toynbee Hall. In the last chapter he turns to a discussion of belief and a consideration of death. Quite a different personality emerges—perhaps the personality of the undergraduate who used to walk about the courts discussing Wordsworth. The successes he has recounted, the disappointments which he laments a little, all the acquaintances and the daily business give place to a religious statement. It does not seem that the two sides to the writer's character have irked one another. He does not, as so many do, complain that worldly interests have turned him from more important things. He states calmly: "For me journalism has been a large part of my life. But a man's life should be something more than his profession." Some readers may wish that he could have included a little more in the strain of his last chapter.

Banking Centenary

REALMS OF SILVER: *One Hundred Years of Banking in the East*
By Sir Compton Mackenzie.
Routledge & Kegan Paul. 352 pages. 25*s*.

A CENTENARY whose background is a struggle for survival in the East, with insurrection, flood, fire and earthquake added to the ordinary risks of misjudgment, ought to yield an exciting story. This narrative is concerned in general with exchange banking east of Suez and in particular with the activities over a hundred years of the Chartered Bank of India, Australia and China. Some of it is indeed lively. Yet the writing (despite the distinction of its author) and the arrangement of the material is disappointing. This is less true of the first half of the book, dealing for the most part with the establishment of the bank's offices in the several areas in which it came to operate—India, China, Burma, Japan, the Straits Settlements, Indonesia and the Philippines (but not in Australia owing to the strength of local opposition). Later in the book, however, the interplay of detail becomes somewhat confusing.

The prime mover in establishing the Chartered Bank was James Wilson, the founder of *The Economist*. But his energies were soon to be diverted to other fields. Although he was able to help the bank over some early stiles, by virtue of his political influence, his direct association with the new institution was brief. The bank's Royal Charter was granted in December, 1853, despite the opposition of the East India Company. Yet it was 1858 before the new venture really got started and opened its first branches in India. In those days outposts of empire—financial as well as political—had to be relatively self-sufficient; and each branch then operated as a more or less separate entity on the basis of its own working capital, the employment of which in exchange or local business was controlled by the local "agent" (or manager). Success or failure thus depended very much on his personal judgment. Management at a distance was inevitably management by delegation and the choice of men of ability and character a prime necessity. The only real check on local activities was the peripatetic inspector, who provided the essential link between London and its far-flung agencies. Only when communications improved with the opening of the Suez Canal and the coming of the telegraph did the organisation become more closely knit.

It is interesting to trace the ways in which speedier communications modified the techniques of exchange banking, leading to shorter usances, narrower exchange margins and generally more efficient methods of financing trade. Much of the background to the story of the bank during the latter part of the nineteenth century is told in terms of the progressive fall in the value of silver, the basis of the currency in most of the lands in which the bank traded. Hence the title chosen for the book. Silver was eventually dethroned, but currency deals continued to be an essential part of an exchange bank's activities; and it was only latterly that the emphasis shifted away from bullion transactions and exchange arbitrage to less exciting though probably more fundamental banking pursuits. A crucial change in policy came with the opening of up-country branches towards the turn of the century. Previously, the bank had confined itself to the ports. Now it began to develop domestic as well as exchange banking and to contribute more directly to the development of the economies which it served. Reading these pages, one cannot help but feel that the bank has had at various times quite a considerable amount of luck, but that alone would not have ensured its survival. Virtue in the guise of caution and sound banking precept has been rewarded, and the bank can today proudly assert its claim to strength and prestige throughout the East and in the City of London.

A Rare History

RUSSIA: A HISTORY AND AN INTERPRETATION (2 Volumes).
Michael T. Florinsky.
Macmillan of New York. 1,585 pages. 5 guineas.

THE history, and historians, of Russia have suffered from various misfortunes. Up to the end of the 19th century Russian historians were frustrated by censorship, at least in a very large part of their field of study. By 1917 Russian historical studies had at last reached a high level, when a new obscurantism descended upon historians. For a few years, it is true, valuable new work was done in some little explored fields, especially in the history of industrial labour. But by the 1930s the Stalinist straitjacket had been tightly fitted into place. For the last hundred years Russia has not lacked first-class minds in the historical field. It has plenty today. They do what they can, and in the publication of documentary material this is quite a lot. Interpretation is another matter. Here, too, some splendid work from time to time appears, but it sees the light of day not so much because of its inherent merit as because it fits the political purposes of the party bosses at the moment.

Outside Russia the study of Russian history has been and is impeded both by the language barrier and by the impossibility of visiting Russia to study archives. Non-Russians thus possess greater freedom to interpret, but less material on which to base their interpretations—though the best western libraries contain a great deal of Russian material. Hitherto Germany has produced the largest number of distinguished scholars in this field. Britain had the late B. H. Sumner, and the United States has Professor Robinson, the historian of the Russian peasant problem.

In these peculiar circumstances, great importance was bound to attach to exiled Russian historians living in the free world. In the first generation, now passed, there were Milyukov and Kizevetter. In the generation that is now growing old there are Professors Karpovich and Vernadsky, working in America, whose many-volumed history, of which the first parts have appeared, will probably be the best survey yet done. To this generation belongs Professor Florinsky.

His book is very long and very expensive. The vastness of the subject, and the present conditions of the book trade make this inevitable. But it is clearly written and presented; it is based on decades of study of a wealth of sources—including Soviet sources; and its judgments are as reliable as any single man's can be. In recent years a number of bad short histories of Russia have been written, on both sides of the Atlantic. This is a good book; in fact it is probably the best and most up-to-date single survey of the subject at present available. It can be strongly recommended to libraries and to students. Those who really wish to understand something about Russia, who wish to build a foundation for the understanding of the modern world, would do well to read it. Those who expect historians to give them ready-made formulæ and to spare them the labour of learning any facts can spare themselves the trouble of opening the book. But if he loses their custom, Professor Florinsky will have lost nothing.

It is quite impossible to summarise the contents of so large a book on so large a subject. Perhaps one point may be made. The author is refreshingly free from either of the two tendencies that have bedevilled so much Russian history—whether written by Russians or by foreigners. On the one hand he is free from the slightest trace of Russian chauvinism. He does not glorify Russian imperial conquests, and he does not fall down in obeisance to the "greatness" of such tyrants as Ivan the Terrible or Peter. On the other hand he is also free from the contempt (whether friendly or hostile) of so many western writers for the Russian people ("poor barbarians, incapable of enjoying, or even of desiring freedom"). His work is permeated by an unpretentious and sincere spirit of human understanding.

The Far North

HALIBUT SCHOONER.
By Lyman R. Ellsworth.
Thames and Hudson. 242 pages. 15*s*.

ICEBOUND SUMMER.
By Sally Carrighar.
Michael Joseph. 269 pages. 15*s*.

WHAT the West meant to his forebears the Far North now means to the adventurous North American. Canada's Arctic territory is hard of access. But Alaska borders on an ocean that is navigable for the greater part of the year. Thus different sorts and conditions of men have left their mark on Alaska since the Russians pioneered it in the days of the Muscovy Company. Along its rugged shores are townships many of which go back to the days of the Russians. Some were boom towns of the eighties and nineties and the graves of Gold Rush hopes. Some are of this century and the base of the fisherman and the prospector. In the last decade bulldozers and explosive have cleared long pathways for the heavy bombers of the American Air Force to come and go, and settlement has grown up round them. For Alaska is no longer just a place for hardy pioneers to seek their fortunes, but an area of vital strategic significance to the free world. Human habitation is along the coast of the cold seas that run north to the Bering Straits. The vast jumble of mountains and the little known hinterland are as empty as ever of men.

"Halibut Schooner" is the reminiscence of a writer whose style is as rugged as his surroundings. His terse descriptions of fishing for black cod in the icy turbulence of the winter seas, beneath the great capes, gives the reader a vision—though not a clear one—of a hard life. But the author is also hungry for any crumb of information on the history of the country and eager to see all its mysteries. He describes a sortie from the sea into that strange volcanic valley, knee deep in lava ash, called The Valley of Ten Thousand Smokes. The life he describes on the schooner is almost that of the Vikings and almost as hard. It is therefore not irrelevant that the skipper of his little vessel and the central figure of the tale should be, like so many of his kind, a Norwegian.

"Icebound Summer" gives a view of the country through entirely different eyes. It deals with the animal world in which men are only incidents, appearing as predators and taking their place in the poise of the balance of nature. It is a book that makes one intensely inquisitive about the authoress. We are told that she spent three summers in that crisp Northern stillness. She has set out, unconsciously, as many have done before her, to write another "Jungle Book." No one is ever likely to succeed in doing so, for it took Kipling's genius to give half-human character to the animals without making a travesty of nature. But this book approaches it, and the magnificent illustrations blend with the writer's vision. No one can say exactly

why, in the Arctic's short brittle summer, creatures of the sea and the air and the land should hasten so far to the North to renew their species, as if that barren fairyland were a Mecca, as if there were virtue in the reaching of it. The writer describes the balance of the animal pyramid with real understanding. Some of the chapters, such as that on the baby seal, are beautiful pieces of writing. A literature of the Far North, America's last frontier, is coming into being. This book should have a place in it.

The Italian Revolution

CAVOUR AND GARIBALDI, 1860.
By D. Mack Smith.
Cambridge University Press. 470 pages. 45s.

FOR forty years Dr Trevelyan has been left in command of the field he conquered with his studies of Garibaldi in action; and the interests of younger historians have shifted away from liberal idealists towards the study of power in politics and the means by which it is applied. It is remarkable to see, in a modern study of the seven agitated months in which southern and northern Italy became united, how Cavour—popularly regarded as a modern Machiavelli—was often at a loss and often outmanœuvred by the events on which the "idealist" Garibaldi sometimes had a grip that any "realist" might envy.

Mr Mack Smith has produced, by intense study, a book that takes the reader right inside the Italian political world of 1860, "a study in revolutionary politics during a civil war" which must have been as hard to write as it is agreeable to read. He moves easily through the complicated maze of minor personalities, and writes nothing down which he has not fully considered. His book does not pretend to give a full analysis of the nature of the risings Garibaldi led in the kingdom of the Two Sicilies—the last Bourbon king is kept off-stage; the social structure of his regime is not discussed; one might almost believe that Mazzini went to Naples for his health. Nor is much said about the parliamentary scene in the background at Turin. But the central theme of the relations between Garibaldi and Cavour is developed with assurance and skill.

Cavour does not emerge with much credit. "Like all the moderate liberals as a class," Mr Mack Smith observes, "he sometimes proved to be not quite versatile or reckless enough to make a good revolutionary"; so far indeed from taking this dangerous if exalted path, Cavour boasted in the end to the senate at Turin that "his policy had been essentially conservative and not revolutionary." Yet he seized every advantage that the genuine revolutionaries could be made to bring to the little kingdom of which he was prime minister, in the ambition, eventually fulfilled, of becoming first prime minister of a united Italian kingdom. Garibaldi, utterly devoid of ambition, comes out more honourably; never pretending to be clever, he yet had a shrewd, instinctive "feel" for what was significant, and for what could and could not be done. And he comes alive in his melancholy remark, at the end of the story, to the Cavourian admiral who had neither helped nor hindered him:

> this is what happens, Persano, they just treat men like oranges, pressing out the juice to the last drop, and throwing the peel away into a corner.

Letters to the Editor

Doneraile Fair

SIR—In your issue of May 8th, Mr W. J. Gleeson in replying to the criticism that "charges of intolerance [in Northern Ireland] are always framed in the vaguest possible terms and therefore difficult to refute" gives as his one example of such intolerance the conditions which prevail in this University. The evidence which he offers in support of his charge is this: the University, he says, "serves an area with a 34 per cent nationalist minority" and draws 20 per cent of its students from that minority, but only 6.4 per cent of its staff belong to the minority. The assumption underlying this argument is that universities recruit their staff merely or, at least, mainly from the districts in which they are situated, or even from their own graduates, and that therefore if there were no discrimination, the religious and political composition of the staff should be roughly proportionate to that of the community in which a university is situated.

Like most British universities, Queen's appoints persons to its staff for their academic qualifications, their ability and attainments in teaching and research. It does not inquire into their religious or political convictions. The present staff of this University has been recruited from Ireland, North and South, from England, Scotland and Wales, from Australia, New Zealand and South Africa, from France, Germany and Spain; in short, from wherever the person best qualified for the particular post happened to be; for the world of scholarship knows no frontiers. For example, of the eighty members of the Faculty of Arts less than one-quarter are Irish; the rest are drawn from all parts of the English-speaking world and beyond. In the same way our own graduates occupy important posts in most, if not in all, of the universities of these islands and of many beyond the seas.

During the past two days I have asked several of my colleagues, some of them members of the academic staff, some lay members of the governing body, some senior administrative officials, some Roman Catholics and some not, whether they could tell me the religious denomination of some members of the staff, or whether or not they were Roman Catholics. In some cases not one of them could say with certainty, and they could say even less as to whether or not their political sympathies were with the nationalist minority. And so I, who examined their qualifications and interviewed them before they were appointed, do not know and can discover no way in which I can find out what faith they profess, or whether they profess any, or what their political sympathies are, if they have any, short of asking them. And yet Mr Gleeson professes to have precise and detailed information about these matters. He does not give the source of his information, but, in some cases in which it is easy to check his figures, they are not even approximately correct. For example, he says that there are six readers in the University and that none of them belongs to the minority. Neither statement is true. There are, in fact, at present twenty-two readers, and while I do not know the religious denomination, still less the political affiliation of all of them, I know that one of them is a Roman Catholic priest.—Yours faithfully,

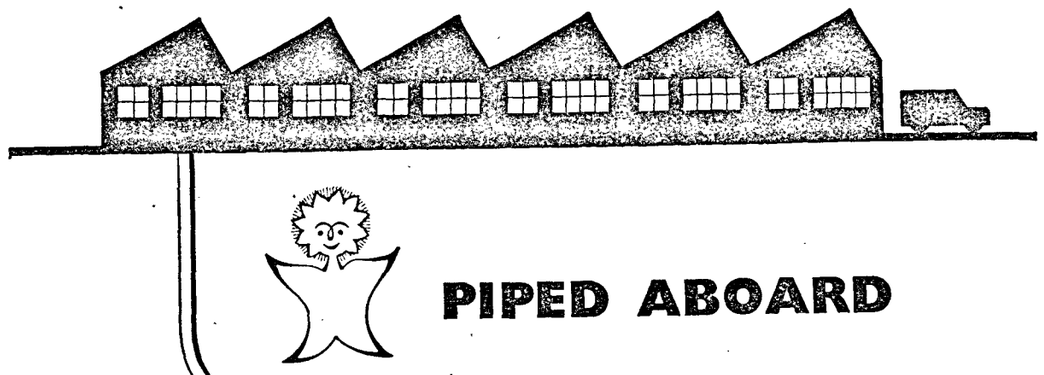
A. MACBEATH
The Queen's University of Belfast

Propaganda for Parties

SIR—On reading the article "Propaganda for Parties," in your issue of May 15th, I was surprised that you omitted any reference to the *Liberal News*. Launched some eight years ago and published each Friday, price 3d., the *Liberal News* has a circulation of 20,000 copies weekly. Neither the Tory nor Socialist party has produced a comparable publication.

A second publication warranting mention is *Ahead*, which circulates widely amongst undergraduates. Price 4d., it is a monthly magazine jointly published by the Young Liberals and Union of University Liberal Societies.—Yours faithfully,

Bolton LYNDON H. JONES



PIPED ABOARD

Does your fuel bill show a true picture? Or do you have to reckon with other factors, such as the problem of specialised equipment for handling and storage and men to look after it? Gas is stored for you. It comes to you piped all the way, from the holder to the point in the works where it is required. You pay for the gas you use and what you pay is the true cost of your fuel. There are no extras. This is well worth pondering when you consider other advantages of gas — its cleanliness and flexibility, for example, its constant calorific value, the ease with which it is controlled, how quickly it reaches full heat. There are good, economical reasons for the popularity of gas. It serves over 4,000 industrial processes.

Gas Counsel

YOUR best advocate for gas is the Industrial Gas Engineer. You can call on him for free advice and his services are backed by the accumulated experience of the whole Gas Industry through the Gas Council's Industrial Gas Development Committee. If you would like advice about gas, get your secretary to fill in these details (or pin this advertisement to your letter heading) **and send to your Area Gas Board or to the Gas Council, 1 Grosvenor Place, London, S.W.1.**

In Suva, in Colombo, in Auckland, Wellington, Dunedin, Christchurch, in Sydney, Brisbane, Melbourne, Adelaide and Perth, much of the newsprint used by the principal newspapers is supplied from Britain by the Reed Paper Group.

Reading history as it happens

To-day, even in the more remote corners of the earth, history can be read while in the making. Through their newspapers, peoples of every race and tongue watch events shaping the future and share the inspiration of unforgettable occasions. Newsprint, made by great machines in vast quantities, has in these recent months enabled Her Majesty's subjects throughout the Commonwealth—indeed throughout the world—to follow every step of the Queen's memorable journey.

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Restoring Bipartisanship

Washington, D.C.

IN the nine years since the end of the war the increasing part played by "bipartisanship" in the evolution of American foreign policy has been pointed out time and again as one of the sources of contemporary American strength and as evidence of the capacity for growth and maturity that exists within the American body politic. But as Mr Dulles returned from Geneva at the beginning of May, after the collapse of his attempt to impose a "tough" policy upon Britain and France before the Far Eastern conference opened, it looked as if bipartisanship were breaking up, and as if foreign policy would become the dominant political issue of this election year. The fact that bipartisanship has been restored, for the time being at least, is due not so much to anything done by the present incumbent of the White House, as to the good sense and good advice of a mild-mannered, eupeptic private citizen from Kansas City, ex-President Harry Truman.

For the five weeks or so before the Geneva conference began, when the Administration was sowing the seeds of wild confusion both in the nation and around the world by talk of "massive retaliation" and calls for "united action" in Indo-China, by asserting through the mouth of Senator Knowland that American troops would never be sent there and hinting through that of Vice-President Nixon that they might be, when the President was speaking first of Indo-China as a "transcendent interest" and then of finding a "*modus vivendi*," when the air was being clouded by comparisons with rows of dominoes and corks in bottles, the Democracts were silent. In part this was the silence of bewilderment, in part it was a result of a conscious political calculation that an opportunity was developing which they might use to hang the same kind of albatross around the necks of the Republicans over Indo-China as the Republicans had hung round Democratic necks over the loss of China and the Korean war.

But after Mr Dulles had briefed the Senate Foreign Relations Committee on his return from Geneva, and after it had become clear to everyone in Washington that the United States had not been prevented from creating a united front at Geneva by the indifference of the British, but had had to accept the possibility of a negotiated settlement in Indo-China because the Administration had never agreed on any alternative policy, something like a spontaneous bellow of anger rose from the Democratic leaders. The virulent attack began when Mr Truman spoke of the unwisdom of insulting "our allies and friends who helped us win the second world war" and continued for a week, mainly taking the line that bipartisan support could unfortunately not be developed for a foreign policy that did not seem to exist. Senator Lehman, always prepared to tread where angels fear to, even suggested that Mr Dean Acheson should be made a consultant to Mr Dulles.

It was as if the Administration's obvious fumbling over Indo-China had touched some release mechanism in the Democrats in Congress. It not only contributed to their growing sense of self-confidence by showing that the Republicans were as fallible in Far Eastern policy as the Democrats themselves had been, but it also released their pent-up anger at the recent smug gloating of some members of the party in power over their vanquished colleagues. Senator McCarthy's "twenty years of treason," and its more sophisticated versions, and the repeated claims that the Republicans have a magic formula for the conduct of foreign affairs have alternately infuriated and exasperated the Democrats.

*

While President Eisenhower and Mr Dulles at their press conferences last week dealt only with the superficial aspect of "bipartisanship," giving examples of the occasions on which Democratic leaders in Congress had been briefed by the Administration, it was left to Mr Knowland, the Republican leader in the Senate, to try to remedy one of the deeper causes of Democratic anger. In the Senate on May 11th he said:

> Neither of our great political parties has a monopoly on patriotism. . . . Let us, here and now, Republicans and Democrats alike, recognise the fact that there is only one group that can properly be charged with being "the party of treason" and that is the Communist Party and the underground conspirators.

This olive branch brought an appropriate response from Senator Lyndon Johnson, the Democratic leader, who promised the maximum of bipartisan co-operation in the future.

The flare-up of partisan anger might have been attributed merely to the bad manners of Republicans and the bad nerves created by the Indo-Chinese situation, had not Mr Truman, in a speech on May 10th, drawn attention to the essential conditions of a bipartisan foreign policy and, by implication, to the failure of the present Administration to fulfil them. In the first place, he said, the responsibility for the conduct of foreign affairs

> rests squarely upon the Administration in power, and in the very nature of things cannot be discharged by anyone else. More specifically it rests and must rest where the Constitution places it—with the President of the United States. Not with either or both parties in the Congress,

nor with the Congress at all. . . . The second point I want to make is that in order to have a bipartisan foreign policy there must be a will to co-operate. . . . If the President wishes a bipartisan foreign policy it is his responsibility to make one possible. It is his responsibility not to allow it to be made impossible. . . . The third point I want to make is that if a bipartisan foreign policy must rest upon a spirit of mutual trust, it springs from the firm and consistent leadership in the formulation and execution of foreign policy.

Mr Truman has never been a man particularly noted for his academic detachment where American policy is concerned, but the events of the past three weeks have underlined the accuracy of his observation. Much of the confusion in recent United States foreign policy has been due to two factors—on the one hand to a multiplicity of voices and to the difficulty of knowing who among the Republican leaders was enunciating policy and who was blowing his own horn, and on the other to the failure of the President to settle on a firm and definite course in Indo-China. By saying in advance that he would consult Congress, the President seems to have denied himself irrevocably the power to take swift and decisive military action should the situation deteriorate catastrophically. Mr Truman's second point has been graphically illustrated by the divisions of recent weeks and by the lengths to which a man as insensitive as Senator Knowland has felt it necessary to go in order to heal them.

★

The President and Mr Dulles seem to have misjudged the problem of bipartisanship as they have, for the same reasons, misjudged the nature of the alliance. The demands of foreign policy are almost invariably in conflict with the direct interest of the voters whose concerns Senators and Representatives have been sent to Congress to promote. Therefore good relations between the Secretary of State and members of Congress depend not merely on exposing them to the doubts and worries that accompany the formulation of policy, but on giving them fair warning of policies that the Administration has decided upon and on helping the legislators to find reasons why they should put the national or international interest before their party or local interest.

This was a point that was always stressed by Senator Vandenberg, the great Republican architect of a bipartisan foreign policy in the immediate postwar years. It is not wise for the Secretary of State to feel that he has fulfilled his duty in consulting Congress if he merely dumps his worries upon its members, as was clearly shown by comments coming out of the Senate Foreign Relations Committee after Mr Dulles had done just this last week. Mr Vandenberg in his *Diaries* continually expressed his dislike of "crisis diplomacy," the sudden shift in tactics or strategy which left him faced with the unpleasant alternatives of weakening the international authority of the Administration by criticising it, or of looking foolish to his constituents. Exactly the same steady and gradual evolution towards a firm decision and the same absence of sudden demands for unexpected action that is necessary if allies are to be kept in concert is also necessary when dealing with Senators, especially those of the opposing party. The events of the past three weeks, including the bewilderment of all but the diehards on either side in Congress whether or not to agree to American military intervention in Indo-China, should emphasise to Mr Dulles that "united action" begins at home.

Separation Is Not Equality

THIS week the Supreme Court put what appears to be the keystone into the archway of decisions which it has been building to protect Negroes from racial segregation. In the series of judgments condemning discrimination in voting rights, in housing, in higher education and elsewhere, which it has been delivering with increasing frequency since the war, the Court had already come close to saying that segregation was unconstitutional, but it had never actually departed from its basic interpretation of the Fourteenth Amendment, made in 1896, which permitted separate facilities to be provided for Negroes, if they were of the same quality as those offered to Whites. But last Monday, ruling on a group of cases concerned with segregation in primary and secondary schools supported by public funds in four states and the District of Columbia, the Court ruled, unequivocally and with unexpected unanimity, that to insist that Negroes must be educated in separate schools, however good, deprived the children of the minority race of opportunities equal to those of children of the majority, and was therefore unconstitutional.

This decision strikes at the root of racial prejudice. It is often argued today that, with the great improvement in the economic status of the average Negro, he suffers most severely from, and resents most strongly, the discrimination in housing which may prevent him from bringing up his family in the decent surroundings which he could afford. Moreover, many, maybe most, Negroes in the South hesitate to let their children fight their racial battles for them and prefer to send their children to separate schools, provided that their education does not suffer as a result. Not only, however, does the Supreme Court decision mean that such segregation now becomes a matter of choice, not of legal necessity, but it also means, or should mean, that both races will take their first lessons in the responsibilities of good citizenship together. The effect on the superiority complexes of the white children should be as satisfactory as the Court expects it to be on the inferiority complexes of the coloured ones.

In delivering the judgment in his first important case the new Chief Justice, Mr Warren, emphasised the fundamental part which public education now plays in American life, a development which, in his view, has made it irrelevant to consider whether or not the Fourteenth Amendment was originally meant to apply to free schools. But the Court is well aware that once the principle that "separate educational facilities are inherently unequal" has been laid down, it becomes very relevant to consider how this principle is to be put into practice in the 17 states, with 9 million White and nearly 3 million Negro children, where segregation is required either by law or by constitution. The Justices, who have taken two years and two hearings to decide the principle, will hear arguments again in the autumn on the questions of whether segregation in public education should be abolished forthwith or by degrees, and whether this should be done through decrees issued by the Supreme Court itself, or be left to local courts. Counsel for the Negroes will argue, as they have done before, for the immediate and detailed application of the principle by the Supreme Court, while counsel for at least some of the four states involved, South Carolina, for example, will argue for as gradual and as general an adjustment as possible—and will then take advantage of every legal loophole to delay the transition still further.

Between these two extremes, however, there is certainly a case for the cautious application of this courageous decision, for it will eventually change the whole social pattern of the South. Already during the two years that the cases have been pending the knowledge that, even if the Court permitted separate facilities, it would insist that they must be equal, has brought a great increase in spending on, and a marked improvement in, Negro schools in many southern states, and also a growing realisation that the end of segregation can only be a question of time. If the Court allows too short a time, the result will be not only chaos in southern schools but an emotional reaction which could build up an overwhelming wave of prejudice against Negro children. So far the calm with which the decision has been received, by Negroes and Southerners alike, is remarkable. On second, or third, thoughts even the extremists in Georgia and South Carolina, states which have prepared to close their free schools rather than admit Negroes to them, may decide to accept the inevitable, as Virginia, Texas and other southern states seem resigned to doing. In Topeka, Kansas, one of the places directly involved in the Supreme Court's ruling, segregation (which is permitted but not required in Kansas and three other states) was in fact abolished while the case was still under consideration. The President, always critical of racial discrimination, is urging officials in the District of Columbia to set a good example by doing the same at once.

★

The Supreme Court's careful lack of haste also has political advantages. Just as its refusal to be hurried two years ago removed a possible complication from the presidential election campaign, so its insistence on taking its time now means that the congressional elections will probably be over before it issues its decrees for enforcement. These are likely to run even more counter than does the decision

The Declaration of Independence, adopted in 1776:—. . . We hold these truths to be self-evident, that all men are created equal. . . .

The Fourteenth Amendment to the Constitution, ratified in 1868:—. . . No state shall deny to any person within its jurisdiction the equal protection of the laws. . . .

In Plessy v. Ferguson, in 1896, a case dealing with transportation, the Supreme Court ruled that racial segregation was not unconstitutional as long as the separate facilities provided for the two races were equal.

In its judgment of May 17, 1954, *the Court concluded*:—. . . In the field of public education the doctrine of "separate but equal" has no place. Separate educational facilities are inherently unequal. Therefore we conclude that the plaintiffs . . . are, by reason of the segregation complained of, deprived of the equal protection of the laws guaranteed by the Fourteenth Amendment. . . .

itself to the doctrine of greater liberty for state governments which is the Republicans', and the President's, chief claim to popularity in the South. Education is one of the fields almost entirely reserved to the states and Southerners are protesting that the Supreme Court has no right to interfere in it.

They are also protesting that it has no right to reverse its 1896 interpretation of the Fourteenth Amendment, but the importance of this week's decision lies perhaps as much in the Court's demonstration of its willingness to keep the Constitution up-to-date as it does in the new guarantees of equality given to Negroes. Whether or not Justice Warren's political good sense had anything to do with the postponment of the detailed decrees until the autumn, his liberal humanity and his practical experience of young people certainly lie behind the Court's readiness to make modern psychological knowledge, unknown in the last century, a factor in its decision that today segregation retards the educational and mental growth of Negro children.

But not a single Justice dissented from this historic judgment which develops the Constitution by the evolution that makes revolution unnecessary. The Supreme Court, with its clear and progressive agreement, provided welcome relief from the dissension, confusion and reaction that have of late characterised the other two branches of the government.

Face to Face with the President

THE long-drawn-out hearings on the argument between Mr McCarthy and the Army have at last brought the Senator face to face with the President. This is where both men should have been long ago, in the opinion of the many observers who have recognised that underneath the confused controversy lies a clear challenge to the independence of the executive branch of the government. On Monday Mr Eisenhower himself finally recognised this also, and ordered members of the executive to refuse to testify at congressional hearings on confidential meetings. The order had become necessary because Senator McCarthy was insisting that it was essential for the enquiry to be told what had been said at a private meeting in January between the Attorney-General and other officials of the Administration, at which plans for curbing the Senator were thought to have been made.

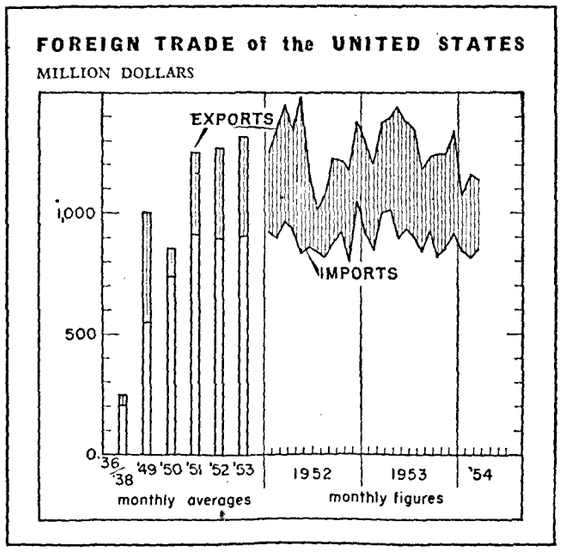
The President's refusal, backed up with 26 historical precedents, was based on the administrative necessity of complete candour and secrecy being observed when officials take advice, and on the constitutional separation of powers. Since Senator McCarthy insisted that he could not show the motives behind the Army's charges against himself and his staff unless he could know what happened at the January meeting, the hearings were adjourned for a week to try to find some way round the collision. So far the President and the Senator are bowing fairly politely to each other, with Mr McCarthy asking that someone should explain to Mr Eisenhower "what this is all about," but neither appears to have any intention of stepping aside. The President has, however, volunteered that the meeting in January was held to decide whether the Senator should be given access to the private records of the Army's Loyalty Board.

The result has been to postpone, perhaps for ever, the cross-examination of Mr McCarthy. The Republicans on the committee had already been trying to take the hearings out of the public eye, on the excuse that this would hurry them up, but had been frustrated by the hardly surprising refusal of Mr Stevens, the Secretary of the Army, to let the other principals in the case get out of sharing his ordeal by headline and television. The Democrats have, however, been suggesting that the hearings may never be resumed and that the President has in fact used his constitutional authority to save his party's skin. This Mr Eisenhower indignantly denies. His purpose, he insists, is to get the hearings "back on the rails" from which they have been side-tracked by extraneous issues. The President does not think that all the facts have yet been brought out, and he is most anxious that they should be, speedily and conclusively. After that, he hopes, and most Americans will agree with him, that the country will be able to get back to important business.

Tussle over Tariffs

SCISSORS have unexpectedly cut into the newspapers with the decision of President Eisenhower—a suitable send-off for World Trade Week—to reject the recommendation of the Tariff Commission for a 100 per cent increase in duties on certain types of scissors, shears and manicure instruments; the industry had applied to the commission for relief on the ground that its prosperity was threatened by foreign imports. In refusing to comply with the commission's findings, the President has retained intact his record for turning down all such requests for higher tariffs, and has dealt another blow to the protectionist elements in Congress. The President has also to make a similar decision with regard to the groundfish fillets trade which claims it is being ruined by excessive imports from Canada and Iceland. More significant than either of these is the renewed attempt of the domestic watch industry to gain further tariff protection, since the treatment of the imported Swiss watch has become, both at home and abroad, a test case of American sincerity in advocating freer world trade.

While the Administration has stuck firmly to the principle of liberalisation in face of strong opposition from the more conservative elements of its own party, it now seems certain that it will fail to get the main part of its programme through Congress this year. The Bill, introduced by Representative Kean, to secure a three-year extension of the Reciprocal Trade Agreements Act (which expires on June 12th) and to give the President tariff-cutting powers on the lines recommended by the Randall Commission, has had a bad reception in Congress. Over such a controversial issue as this the November elections loom unusually large, and the Administration is expected to postpone the struggle. Moreover, neither the President nor Congress now have time to fight out their differences at this session and the President therefore will probably have to content himself with, at the best, a one-year extension to the Act.



Again, on the issue of east-west trade, the Administration is sailing boldly into the winds of public disapproval. Mr Stassen, the Foreign Operations Administrator, has made it abundantly clear—in the fourth semi-annual report on the Battle Act—that American policy, while maintaining a strict embargo on all shipments of "strategic" items and on all trade with Communist China, is shifting its emphasis towards an expanded trade in non-strategic goods with the Soviet bloc. This change in policy certainly owes much to the nagging of America's European allies, who have long been insisting that they must turn eastward for a satisfactory pattern of trade. Now it has been pointed out that US non-military exports have been falling at a time when those of Britain and Western Germany have been rising, and that America, too, may need to exploit new markets in the Soviet bloc.

Political Currents

THIS week's primary election in Oregon explains why the Secretary of the Interior, Mr McKay, chose last week as the time, and Portland, Oregon, as the place, to try and refute the accusation that the Republican Administration is strangling the development of the hydro-electric and irrigation projects on which the growth and prosperity of the west depend. In that area such charges will be heard more often during the coming election campaign, and will contribute more to its current, than any others. Mr McKay's main answer is that, now the Korean war is over, his department is abandoning the policy of "no new starts" which he inherited from his Democratic predecessor. The political effect of his answer has, however, been weakened by the unfortunate choice, for one of his first new starts, of a site on the Upper Colorado River at Echo Park. This dam, which has already been approved by a House committee, would flood one of the most beautiful of the nation's scenic wonders, and Mr McKay's proposal has therefore aroused the violent opposition of just those groups which might otherwise have been mollified by it.

In Oregon itself, Mr McKay hopes to go ahead with the John Day project on the Columbia River, in co-operation with local public and private utility companies. He suggested that they might put up some 60 per cent of the cost of the dam and be repaid in electricity delivered over a period of fifty years. This would be an outstanding example of that partnership between federal, local and private power authorities which is the Eisenhower Administration's contribution to the problem of hydro-electric development. The partnership idea is said to appeal so much to the private companies that they are using all their influence to ensure that the Republicans have a satisfactory majority in the next Congress. Such a majority might also find time to take away some of the tax concessions and other competitive advantages which the federal power authorities still enjoy.

The desire to do nothing to embarrass a Republican Senator, Mr Cooper, who will have a hard fight in Kentucky next November, and his belief that Mr Gordon Clapp, the head of the Tennessee Valley Authority, which impinges on Kentucky, is unenthusiastic about this partnership idea, seems to explain why Mr Clapp's term does not seem to be going to be extended by the President. Mr Clapp is a career servant of the independent authority and a non-political appointee; moreover, he has the confidence of members of both parties. But he wants the authority to supplement its hydro-electric capacity with steam-generating plants so that it can meet both growing commercial demands for power and the huge requirements of the atomic energy installations that the government is building in its area. The President, however, refused to recommend to Congress that it grant funds for this TVA project, and now two private utility companies are offering to construct the necessary generators.

Rubber Deadline

New York

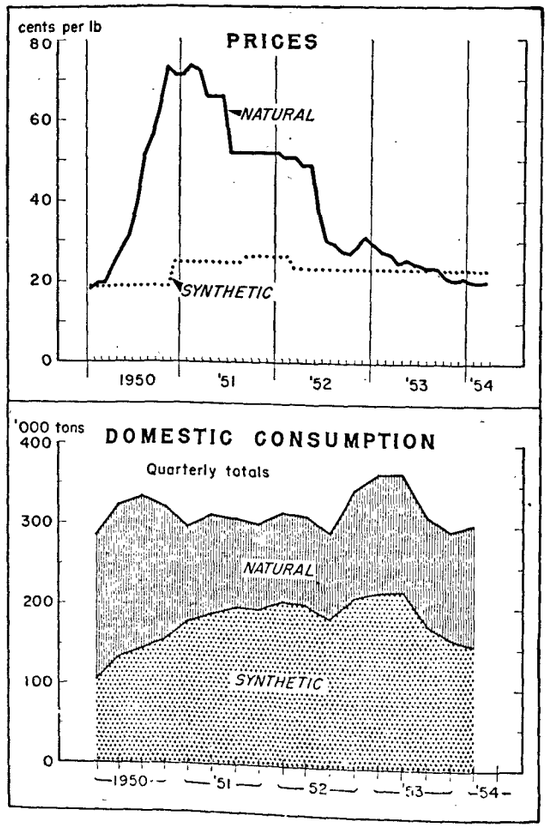
PRIVATE enterprise is falling in with the government's desire to rid itself of the synthetic rubber business by showing "considerable interest" in the acquisition of the 27 plants which are up for sale. Less than a week remains in which bids can be made to the Rubber Producing Facilities Disposal Commission, although there will be a further "negotiating period" of seven months before the commission's proposals are presented to Congress for approval. Congress can, of course, delay and even effectively veto the entire disposal programme; the Democrats, if they return in greater numbers in November, might oppose the scheme as "another Republican give-away," although the sale of the plants which the government built to meet the critical wartime shortage of rubber was originally proposed, in very similar terms, during Mr Truman's Administration.

The disposal plan includes both those plants producing the two chief raw materials—butadiene and styrene—and those which fabricate the final product. In addition two plants producing butyl rubber will be sold. While the commission is unlikely to find purchasers for all of its high cost units (some of which have already been shut down), it is expected to be able to secure for the majority of its plants the "full, fair value" on which Congress insists. What is not clear is whether the commission will be able simultaneously to fulfil the other criterion set in the disposal scheme—the creation of a competitive industry in which no firm has unreasonable control over any stage of production, and in which small rubber users are assured of supplies. This task is complicated by the large scale necessary if a synthetic rubber plant is to operate efficiently, and by the already preponderant position held by the "Big Five" companies in the rubber fabricating industry. To ensure competition, the commission is allowed to accept second best bids, or even lower ones, and to force the highest bidders to accept other than their first choice of plant.

Total rubber consumption in the United States during the first quarter of this year was 17 per cent below that of the same period of 1953, owing partly to the decline in industrial activity. Moreover, of the reduced total, synthetic's share fell to 51 per cent in March, 1954, compared with 60 per cent a year ago. The Reconstruction Finance Corporation, which is still in charge of synthetic rubber production, plans to cut back output to only 102,000 tons for the period May to July—when the industry will be operating at less than half capacity. Nevertheless longer term prospects seem favourable, and it is thought that by 1960 an increase in synthetic capacity will be required to keep pace with world rubber demand. It is also admitted that, although there have been many reports of radically new and cheaper processes in the experimental stage, the government's ten-year-old plants are not now, and are unlikely quickly to become, technologically obsolete.

If the industry does reach private hands before the end of 1955, as some of the more optimistic rubber manufacturers hope, the price of synthetic rubber is unlikely to remain fixed at 23 cents a pound. Much depends, of course, on the structure of the industry which eventually emerges, and on the amount paid for the more desirable plants. If operations under private ownership are concentrated in the most efficient plants—and costs, according to the commission, vary from 14.3 to 33.7 cents a pound between plants—the burden of the highest cost facilities which helped to swell the government's average costs would be avoided. On the other hand, the government has had certain advantages, notably cheap supplies of styrene and exemption from taxation, which private industry would not enjoy. Private firms are also likely to have to spend more on selling, transport, advertising and research.

On balance, therefore, the odds are in favour of a rise in the price of synthetic rubber when private industry takes over. But in the long run the price of synthetic rubber will almost certainly fall. Growing demand will enable existing plants to operate nearer to their most efficient rate; and the introduction of new technical processes will bring further economies. Moreover, private industry will no doubt increase the production of the cheaper "oil-extended" cold rubber—which already accounts for over 20 per cent of production and sells for under 18 cents a pound—to the maximum consistent with the maintenance of quality. Output of synthetic rubber is likely, then, not only to meet any future increase in world rubber consumption, but also to make further inroads into the market now held by natural rubber.



SHORTER NOTES

The Treasury's new issue of $4\frac{3}{4}$-year notes at $1\frac{7}{8}$ per cent was more than four times over-subscribed, but only $2.2 billion worth of cash was accepted, just enough to meet the government's needs between now and the end of the fiscal year in June. In addition almost $3 billion of the new notes were allotted to investors in exchange for certificates which mature on June 1st. Nearly $4 billion worth of the alternative refunding offer, one-year certificates at $1\frac{1}{8}$ per cent, was taken up.

*

Governor Dewey has advised New Yorkers to kill two birds with one stone and avoid paying high prices for coffee by "switching to milk," which is cheaper and more nourishing. The suggestion appeals to the state's dairy farmers, who are concerned about their surplus of milk, but to the thousands of city workers who are engaged in the importation and distribution of coffee the suggestion seems like a threat to their livelihoods, and to coffee-growing Latin Americans a blow at hemispheric solidarity.

BUSINESS RESEARCH FOR AMERICANS

Our American representatives, in New York and California, are fully equipped to tell American businessmen about our services. Export, import, investment, finance, are all matters on which we are able to carry out investigations almost anywhere in the world.

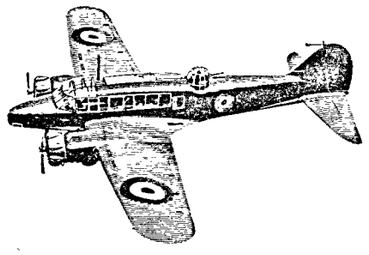
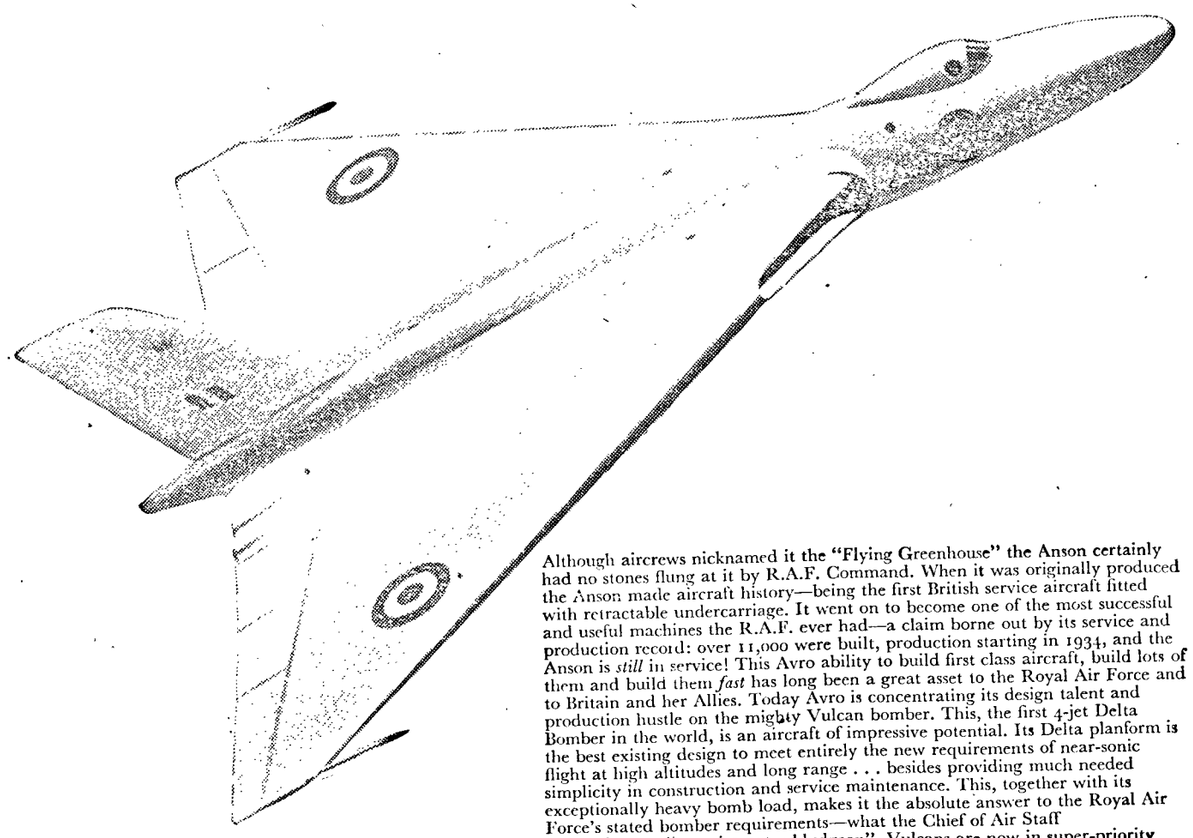
"BOMBS AWAY" — the story of an R.A.F. Bomber NO. 3 IN A SERIES ON THE AVRO VULCAN

The Greenhouse...



that lasted 20 years



Although aircrews nicknamed it the "Flying Greenhouse" the Anson certainly had no stones flung at it by R.A.F. Command. When it was originally produced the Anson made aircraft history—being the first British service aircraft fitted with retractable undercarriage. It went on to become one of the most successful and useful machines the R.A.F. ever had—a claim borne out by its service and production record: over 11,000 were built, production starting in 1934, and the Anson is *still* in service! This Avro ability to build first class aircraft, build lots of them and build them *fast* has long been a great asset to the Royal Air Force and to Britain and her Allies. Today Avro is concentrating its design talent and production hustle on the mighty Vulcan bomber. This, the first 4-jet Delta Bomber in the world, is an aircraft of impressive potential. Its Delta planform is the best existing design to meet entirely the new requirements of near-sonic flight at high altitudes and long range . . . besides providing much needed simplicity in construction and service maintenance. This, together with its exceptionally heavy bomb load, makes it the absolute answer to the Royal Air Force's stated bomber requirements—what the Chief of Air Staff summed up as "a rapier not a bludgeon". Vulcans are now in super-priority production for the Royal Air Force.

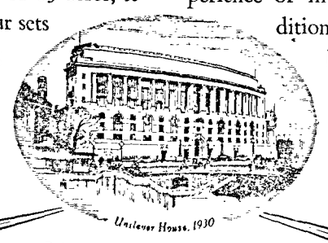
THE STRUCTURE OF BRITISH PROSPERITY

Electricity

The electrical industry is an essential part of the framework of the nation's prosperity. This is an artist's impression of the Ince Power Station for the British Electricity Authority. Covering an area of 65 acres, it will, when complete, have four sets of generators each producing 60 MW of power. No less than 17,915 cubic yards of reinforced concrete have gone into its building. For contracting work on this scale, Cubitts possess the necessary experience of modern technique—and a tradition of fine workmanship going back for 130 years.



Now, as in the past

After the Korsah Inquiry

FROM OUR CORRESPONDENT IN THE GOLD COAST

THE latest Order in Council concerning constitutional advance in the Gold Coast—issued on April 29th—brings the country to virtual independence. General elections will be held on June 15th, and thereafter an all-African cabinet will preside over the nation's affairs. The new phase must, inevitably, prove a testing time for the territory and its leaders. Men who three years ago had no experience in government will have left their apprenticeship behind them. The capacity and integrity of the new regime will be judged by their performance. Equally, it is a testing time for the relationship of goodwill and confidence that has been built up between African Ministers and their British colleagues by patient work in the Gold Coast itself and is now the chief link connecting the new independent community with the old metropolitan power. Unlike many of Britain's dependencies, the Gold Coast is economically more than self-sufficient, commanding both a favourable dollar and a favourable sterling balance in its foreign trade and also capital reserves far in excess of any immediate development programme. The decision to remain within the Commonwealth family will, therefore, be a matter of choice, not necessity. Choice is likely to depend, above all, on the maintenance of goodwill.

It is because the new constitutional framework will provide this test both of African ability and of British acceptability that more than usual interest attaches to the recently published report of the Korsah Commission upon allegations of corruption in the Gold Coast. No single factor would more quickly undermine confidence in the new government than the belief that its members were open to bribery. Nor could Africans fail to be extremely sensitive to the manner in which allegations against their good name were reported and commented upon in British circles. In fact, it is not too much to say that behind the immediate issue of possible corruption has lain the long term question whether the whole Gold Coast experiment can succeed.

The crisis opened on November 25, 1953, with the resignation of Mr J. A. Braimah, Minister of Communications and Works. He admitted to having accepted £2,000 from a contractor, Mr Kassardjian, but made a number of charges against his colleagues. Some were specific, for instance, that the Prime Minister had received his car as a bribe and that, on another occasion, had accepted £40,000 to influence him in the allotting of contracts. Altogether, the charges created the impression that the acceptance of bribes was general among influential members of the Government and of the Convention People's Party.

In any circumstances, such accusations would have been exceedingly grave. They were rendered more serious by the scale of money being spent in the Gold Coast upon capital development—some £70 million over five years since 1951. Most disturbing of all was their possible bearing upon the even greater sums that would be spent in the future when such projects as the Port of Tema (estimated at £10 million) and the vast Volta Scheme (of well over £100 million) came into consideration. Venal ministers and unscrupulous contractors could hardly be exposed to temptations of such magnitude without undermining the public morality of the whole community. The cabinet, therefore, decided unanimously to appoint a Public Commission of Inquiry into the allegations of corruption in the manner of the Lynskey Tribunal set up in Britain to investigate similar charges of ministerial misconduct in 1948. The Commission began its work on December 7th last year. The inquiry came to an end on March 2nd and the Report was made public on April 27th.

It can be said at once that the findings of the Korsah Commission do not bear out in any way the widespread suspicion of corruption current in the Gold Coast at the time of its appointment. Nor does it confirm any of the major allegations made by Mr Braimah. That he himself had been guilty of misconduct is established. But the Prime Minister, Dr Nkrumah, is cleared of any trace of suspicion after exhaustive inquiries both into his personal financial position and into the manner in which tenders are let to contractors in the Gold Coast. The accusation of general corruption among Ministers has been reduced to one of minor peculation by one Ministerial Secretary—Mr Ohene Djan. The charges against another Secretary, Mr Atta Mensah, are declared to be unproven. The conduct of the Chief Government Whip, Mr Krobo Edusei, while not actually stigmatised as corrupt, is held to be " below any acceptable standard for men in the public service and is strongly to be deprecated." Otherwise, the integrity of the entire cabinet was vindicated by this full-scale inquiry conducted with all the care and with the strict judicial procedures of an official inquiry in Britain—and incidentally assisted by British legal and police officers. It should be noted, too, that Djan and Mensah, tried before the Chief Justice, were sentenced to two years' imprisonment for accepting bribes to the value of about £150 and that Edusei was dismissed from office on the day the Report reached the public.

It is thus reasonable to conclude that a group of new and

relatively inexperienced African Ministers, with absolute control over the expenditure of very large sums of public money, have, with marginal exceptions, resisted the temptation to seek personal enrichment. But if the Africans have come reasonably well through the ordeal, the same can hardly be said of the contractors involved. The three most concerned with the charges of corruption—Messrs Rentzos, Tranakides, and Kassardjian—are all exposed as having sought to place temptation in the way of the Ministers. And lest reputable contractors in Western Europe should take comfort from the nationality of the three firms, the inquiry also made clear that German and Italian firms were interested in ingratiating themselves with African Ministers, and that one respectable Dutch firm appointed as its Gold Coast liaison officer a man of very dubious and even criminal reputation. Worst of all—from the standpoint of that vital link of goodwill between the Gold Coast and Britain—this same man was for a short time paid a considerable retainer by an important British firm to act for them in the Gold Coast, while another British citizen, alleging that he represented a British group of engineering firms, offered the Minister of Commerce and Industry the sum of £300,000 in return for the Tema Harbour contract.

Prejudice in Fleet Street

Yet it may well be that the real damage done to British-Gold Coast relations must be laid at the door not of the contractors, but of certain sections of the British press. The Africans learnt with chagrin the extent to which in the early stages of the inquiry their guilt was taken as a foregone conclusion, and every scrap of suspicion or hearsay taken as positive proof that an African Minister is, almost by definition, corrupt and venal. Headlines such as "Playboy Prime Minister Pays for Cadillac in Pound Notes" with its English connotation of black market and tax dodging aroused anger and resentment in a country whose major transactions are normally conducted in bank notes, and during an inquiry which cleared the Prime Minister of all impropriety in this transaction. Equal damage was done by the presence in Accra of at least one British reporter who made no secret of the fact that he had been sent there "to get at the dirt" and "to blow the Gold Coast wide open." Africans observed the political affiliations of the newspapers in which they were most violently fore-judged and drew one conclusion—that a powerful section of British opinion detested the whole experiment of African self-government and was eager to seize any opportunity to undermine or destroy it. They argued that newspapers which were ready to pass over with indifference the most strident evidence of venality in Middle Eastern or Latin American countries could only have a hostile political motive in giving major headlines to the unproven, and finally unprovable, charges of relatively minor speculation in the Gold Coast.

The inquiry is now a thing of the past. It has not weakened Dr Nkrumah and his party. On the contrary, it has probably deprived the Opposition of the slogan of "government corruption" which they were hoping to use effectively in the June elections. It is to these elections that the attention of the entire country is now turned and there is at least the likelihood that in the excitement of the campaign, the suspicions aroused by the reporting of the inquiry will be forgotten.

Bullfight in the Palais Bourbon

M. LANIEL must by now have become used to debates on whether to debate, to votes of confidence and last minute survivals. But last week's performance, with suspense kept up until the counting of the last vote, was a dramatic illustration of the dilemma facing a divided and impotent French assembly, torn between the desire to change and the fear of a lengthy crisis while the Geneva conference is in progress. Sensing that the country was finally waking up to the realities of Indo-China, egged on by the fall of Dien Bien Phu, many deputies were asking for blood. On the other hand, conscious of their inability to muster an alternative majority, they could not deliver a final blow. Thus, the debate in the National Assembly was not unlike a bullfight in which the rules do not allow the bull to be killed.

The blows were fast and furious. The proceedings were inaugurated briefly by the Prime Minister himself. M. Laniel pleaded with the deputies not to open a debate now, not to show France's cards to its opponents at the conference table and in the battle-field. He also made a half-hearted attempt to hand the whole question over to a parliamentary commission. But the deputies were not to be thwarted. The attack started immediately, and was waged with great indignation and with weapons taken from the arsenal of history: Clemenceau was evoked, tumbling Ferry over Indo-China; responsibilities for the defeat of 1870 were brought in; and even the old parliamentary battle-cry "*se soumettre ou se démettre*" (to accept or to resign) was raised again.

The gloves were off. A Gaullist deputy taunted M. Pleven, the Minister of Defence:

> Do you think it decent . . . to remain at the head of an army after it has suffered, with a glory which is its own, a defeat which is only yours.

M. de Chambrun, a near-Communist, was scarcely more charitable with M. Bidault:

> Theatrical gestures, acts of nervosity, personal conceptions—these are not the attributes of a wise negotiator.

Yet another deputy urged the government not to base its policy merely on the wish to keep ministerial portfolios.

But the hero of the day was clearly M. François Mitterand, a former member of the cabinet, who had resigned over Morocco. Like M. Mendès-France nearly a year ago, M. Mitterand this time alone emerged with laurels from an otherwise undignified affair. In a closely reasoned speech he underlined the gravity of the decisions now facing France, whether it opts for peace or for war. A commission of inquiry, he argued, has not sufficient authority to make this choice nor has the present government:

> To negotiate peace or to conduct war, while the destiny of the nation is at stake, you need the fervent backing of all the people. Can you claim to get it? . . . from now onwards it is no longer up to you, executive power, but up to us to decide. . . .

After this eloquent plea for government by assembly (Does the ghost of Montesquieu still haunt the Palais Bourbon?), M. Laniel's intervention came as an anti-climax. He merely stated that he was not convinced and once again begged the deputies not to weaken the prestige of the government. During the day's interruption, prescribed by the constitution before a vote of confidence, even M. Laniel's friends deplored, to quote *Le Monde*, this "policy named silence." As a deputy put it, M. Laniel had to cross the sound barrier and much depended on what he said after the resumption of the session.

M. Laniel Scrambles Through

At last, on the Thursday, M. Laniel finally delivered a lengthy speech. True, he did not outline clearly the government's policy for the future; his whole purpose was to avoid any commitments. But, at least, he covered ministers and generals with the shield of collective responsibility. He also hinted that not one but eighteen governments had had their fingers in the Indo-Chinese pie and that few would emerge with clean hands from an inquest. When he sat down it was clear that he had possibly placated some waverers, but had failed to carry the Assembly with him. The Gaullists disliked his appeal to the spirit of *Résistance*; many thought that "surprise" was a poor explanation for Dien Bien Phu. M. Laniel's "strength," however, could be measured when his critics rose again to speak. They were united in their dislikes but had no coherent policy to offer. Some wanted more toughness; others more appeasement. The legislature offered no more prospects of cohesion than the executive. The assembly did not, and probably could not, come up to M. Mitterand's expectations.

But by then interest had shifted into the lobbies, where frantic last-minute counts left plenty of scope for bookmakers. The fate of M. Laniel was in the hands of his "friends," of Gaullists and Radicals, who are members of the governmental coalition. Twelve more Radicals than in the previous week withdrew their support; among the Gaullists, the partisans of an immediate change turned from a minority to a majority. The Palais Bourbon echoed with recriminations, with threats of resignation from both cabinet and party. With two votes left to count there was a deadlock. There were rumours that some Radicals nearly lost the match by not playing the game and that two Gaullists changed sides at the very last minute. When M. Laniel finally scrambled through with a majority of two, his jest—that he had got one more vote than he needed—had a hollow ring. Nobody has any illusions about this vote of confidence. Next time the matadors may well deliver the *coup de grâce*.

Threat of Dissolution

During the debate there was much speculation whether if defeated M. Laniel would appeal to the electorate. The constitution (Art. 51) provides the right of dissolution if twice within 18 months the National Assembly, by an absolute majority, has defeated a government either by withdrawing its confidence or by passing a vote of censure. (The last crisis was in May, 1953, less than 18 months ago.) The dissolution must be proclaimed by a decree of the President of the Republic.

These provisions do not apply before the expiration of the first 18 months of the Legislature, but the present Assembly was elected in 1951. Defeated by an absolute majority M. Laniel would have the right to ask for dissolution.

Test of Strength in Luxemburg

FROM OUR SPECIAL CORRESPONDENT

THE highly controversial subject of cartels is now squarely before the European Coal and Steel Community. Last week in Strasbourg, M. Monnet, the President of the High Authority, included in his report to the common assembly of the community a carefully worded passage on the coal-selling agencies of Germany, Belgium and France. He stated categorically that the present sales arrangement in the Ruhr (where the six selling agencies are, in fact controlled by a single organisation known as GEORG) was not consistent with the treaty; and that certain activities of the Belgian sales agency (COBECHAR) did not conform to the treaty. Since the French coal industry is nationalised, the French sales agency (ATIC) will be dealt with under other provisions of the treaty; but M. Monnet made it clear that he intended to discuss with the French government the regulations governing its operations.

Although M. Monnet has now taken a first step from which there is no retreat, he is proceeding gingerly and is doing his best to avoid an outright attack on the cartels or a premature test of strength. In particular, the High Authority is anxious to forestall opposition from the governments and the trade unions. It hopes to find a way of eliminating the restrictive features of the present arrangements while at the same time meeting the legitimate worries of those who fear that a change in the existing arrangements will lead to waste, instability, unemployment, and a less favourable competitive position *vis-à-vis* the nationalised Polish and British coal industries.

Whether it will be possible to avoid an outright struggle with the most strongly entrenched cartels remains to be seen. The discussions with the organisations, the governments, and the trade unions are expected to be finished by October. It should then be clear whether the High Authority will make an effort to create a genuinely competitive market; or whether it will settle for a regulated market with the abuses (and advantages), of both competition and monopoly, controlled; or whether it will throw up the sponge and leave it to GEORG.

The Dutch Go to Law

The High Authority's recent action in setting maximum prices for coal produced in the Ruhr, the Nord and the Pas-de-Calais regions is closely linked with the cartel question. Under the treaty establishing the community, the High Authority may set maximum prices for coal in certain carefully defined situations; maximum prices by basin were set for all coal when the common market was opened a year ago. Since that time, supplies of coal have continued to increase, United States coal has been selling in Europe at less than the maximum European price, and stocks have been piling up at the mines. It was generally assumed that, when the maximum prices came up for review this spring, the High Authority would find that they were no longer required. Instead, although some freedom was permitted, new maximum prices (only slightly lower than the old ones) were set for three of the most important coal-producing regions. The decision of the High Authority was reached by a close vote and much

conflicting advice was received during the preliminary discussions with the consultative committee and the council of ministers. The real reason for the decision to continue setting maximum prices in the three areas was that, unless the High Authority set the price, the cartels would do so.

The Dutch have been particularly outspoken in their criticism of the High Authority's decision. Not only did they feel that the elimination of the maximum price would lead to a general reduction in the price of coal, but they also argued that it was inconsistent with the spirit of the treaty for the High Authority to have taken action under a general provision of the treaty to offset a situation which it had the power, and obligation, to correct directly, since the fixing of prices by agreement among enterprises is expressly forbidden by article 65 of the treaty. The Dutch would appear to have a strong case, although the High Authority may well have done the wrong thing from the right motives.

The merits of the case apart, the situation is providing an interesting experiment in the workings of a supra-national democracy, with the interplay of checks and balances that is familiar at the national level. Not only have the Dutch, Italian and other delegates, at the session of the common assembly which is concluding the weekend, questioned the High Authority, but the Dutch have submitted the case to the court of justice of the community. Since the court has the power to annul a decision of the High Authority, its decision will have more importance for this particular problem than will the debate in the assembly. For the long term, the fact that the assembly is increasingly concerning itself with the functioning of the community may well be the more important constitutional development, particularly if, as is hoped in Luxemburg, it is in the near future to be directly elected rather than appointed by the parliaments of the six countries.

Britain's Stock in Bonn

THERE is no doubt that his recent visit to Bonn was a personal triumph for Mr Butler. He impressed everyone with his grip of the economic problems that concern both countries, and he revealed to the astonished German officials precisely the same brand of dynamic attitude that has been the core of Professor Erhard's philosophy. Not the least of his achievements in the short visit was the establishment of a friendly personal understanding with the German Minister of Economic Affairs.

Mr Butler, too, was more than satisfied. Contrary to his expectations he found the Germans willing to compromise on such problems as the bilateral European Payments Union (EPU) debt and the vexed question of export subsidies; but he might have been surprised by the extent to which his German counterparts' hands were tied. Indeed, in spite of the amicable and highly successful talks, it might eventually turn out that less was in fact achieved than at first seemed likely.

The German press, which can usually rely on getting more than a little inside information, was on this occasion taken aback by the uninhibited success stories printed in British papers. It appears that Bonn officials were reluctant to be forthcoming about the actual details agreed on with the British, for some of the German concessions are likely to prove embarrassing. For instance, though there is now a good chance that an agreed formula for settling outstanding British debts in the EPU will be worked out, there is still widespread resentment that German pressure to get some hardening of the Union has been unsuccessful. And the tacit agreement accepted by the Germans to allow the export subsidy law to lapse when it runs out in 1955, was certain to create an uproar in German industrial circles if over-publicised. Thus Professor Erhard and the Bonn officials were inclined to play down the achievements of the Bonn meeting. There may be some unpleasant surprises to come later in the Bundestag, and when the powerful industrial groups realise what has happened.

If the meeting did no more it certainly cleared the air. Only recently at the height of the EPU crisis the German press—with semi-official inspiration—was carrying on an anti-British campaign; but Mr Butler now appears to have mollified them. It was, however, the convertibility question that outshone all others. There seems now to be agreement between the British and the Germans that prior consultation will take place before either side takes any major step. As the Germans are convinced that convertibility will come within the next twelve months, and that as a result EPU is almost bound to be liquidated, the problem of its renewal, and changes in its structure, are no longer of major interest.

Paraguay Under Pressure

BY A CORRESPONDENT

LANDLOCKED Paraguay, one thousand miles upstream from the South Atlantic, is a luxuriant country where revolutions grow as readily as mangoes and manioc. The revolution a fortnight ago was surprising only in one respect —the lateness of its coming. Despite the customary pressures upon them from Argentina, the United States and Brazil, none of the competing groups of local politicians and military officers had staged a *coup d'état* for many months. The calm had been economically beneficial, but it was unnatural.

Paraguay, with a population of about 1,400,000, is the most secluded of all the South American republics. Because of its remoteness, the number of Spaniards who settled in Asunción was relatively small, so that today there is an exceptionally high percentage of Guaraní Indian blood in the race. In their isolation, the Paraguayans—a kindly and courageous people—have preserved their own indigenous Guaraní language, legends and customs. Spanish is the official language, in which the businessmen conduct their affairs; but, as a Brazilian writer has remarked, "It is in Guaraní that the Paraguayans love, hate and fight. In this tongue they shout on the football fields and whisper their declarations of love in the dark corners of the patios of their old colonial houses."

The isolation, geographical in origin, has been aggravated by events: since the declaration of independence from Spain in 1811, communication with the outside world has been interrupted for long periods through the action of local dictators or as the result of civil wars, wars against surrounding states, and blockades by Argentina, which dominates Paraguay's life-line, the Paraná-Plata river system. The economy, of course, has suffered. In general, agriculture is still primitive. The staple diet is maize and manioc (an edible root, the source of tapioca). Wheat is imported from Argentina to feed the towns, and live cattle have to be brought from Argentina to the meat-packing plants, as the local herds are insufficient. The principal exports at the present time are cotton, timber and quebracho extracts used in tanning.

Although so backward and so remote, Paraguay is of strategic importance in South American power politics and is therefore constantly subject to interference from outside. Originally this territory was used by the Spaniards as a Jesuit outpost against the Portuguese, who pressed southwards from Brazil. Today, Paraguay is embedded between the hinterlands of Brazil and Argentina, traditionally rival nations, and effectively obstructs Bolivia's access to the great waterways that lead to the Atlantic Ocean. During the Second World War modern means of transport and the latest ideas of hemispheric defence gave the Paraguayans a new neighbour, the United States. The North Americans, fearful of Argentina's intentions and anxious to have a strategic base on the borders of that country, supplied lend-lease goods, money and "know-how" to Paraguay. They improved the airport at Asunción, built highways, and gave much-needed assistance in the development of agriculture, cattle-raising, forestry and the health services. Brazil, too, offered loans and, like the United States, went out of its way to win the country's friendship.

The wartime dictator of Paraguay, Higinio Morínigo, astutely extracted every possible benefit from this situation while managing to remain on the best of terms with the military officers at Buenos Aires; he was mindful always of his country's dependence on Argentine transport and commercial finance. When Morínigo was finally ejected by a military clique in 1948, he went into exile in Argentina; there he still remains, awaiting the day when General Perón will help him to return to the pink presidential palace at Asunción. The Argentine president, for his part, has shown exceptional solicitude for the upstream republic during the past twelve months. In August, 1953, he persauded President Chaves (who was overthrown a fortnight ago) to joint the Argentine-Chilean pact of "economic union," as a result of which Paraguay has already received substantial financial and technical assistance and a steady flow of Argentine consumer goods at a specially favourable rate of exchange.

This competition between Argentina, Brazil and the United States for predominance in Paraguay is reflected, of course, in internal affairs and is one of the causes of disagreement within the Colorado Party, which is the only political party permitted. The latest revolution was a conflict between the two main Colorado factions, and, significantly, the fighting occurred at police headquarters, where an Argentine mission has been engaged in reorganising the Paraguayan police force on military lines. But, in the last resort, governments are made and unmade by the Army. The strong man at present is General Alfredo Stroessner, who is commander-in-chief of the armed forces. Stroessner's principal aim is to maintain order, and it seems that he acted rapidly and decisively on May 5-6th when he prevented the fighting from spreading and simply replaced one Colorado president by another—while nominating his own friends to several ministerial posts.

German Trade With China

A RECENT gathering of the East Asian Union in Hamburg, attended by 700 guests and representatives of the Federal Government, symbolised the intense interest that the Germans have in developing their trade with China. Vice-Chancellor Blücher declared that it was insupportable that German exports to the Eastern bloc should have stiffer restrictions imposed on them than on others, and that every embargo lost its justification if it hindered international agreement. He was speaking for the whole of the German trading world. It is generally believed that the "market with 500 million customers" should be fostered, or China will either produce its own consumer goods, or buy them through countries of the Communist bloc on which the Western embargo does not rest so heavily. The Germans feel little political sentiment in the matter. Their views were expressed at the Hamburg banquet by the Social-Democrat, Herr Kaisen, who said that the Federal Republic had particularly good prospects in East Asia because it did not pursue any political aims.

In fact, the picture of Federal Germany's trade with China is very rosy in contrast with the course of exchanges with Soviet Russia. In 1953 there was a spectacular increase in German exports to over nine times the 1952 figure. The result is that Germany has now regained its prewar share in the China market. Moreover, exports to Hongkong last year soared by 70 per cent, and it is no secret that a large proportion finds its way to the Chinese mainland, legally or illegally. Watches for the wrists of the Chinese accounted for the biggest increase in last year's flow to Hongkong.

The Chinese are still only fifth in the list of Germany's East Asian customers, with Indonesia leading, but they are still moving up. Germany's main direct exports are, in order of importance: iron and steel products (nearly 32 per cent), precision and optical manufactures, electrotechnical goods, pharmaceutical products and chemicals.

On the import side, there has not been so great an increase, though German purchases from China went up 90 per cent in 1953 compared with the previous year. China supplied a great deal more soya beans than before, as well as resins and commercial oil-bearing products. Soya beans, it may be recalled, were much sought after by Germany before the war.

The statistics do not give a complete picture of German trade with the Chinese, as there is a considerable flow of goods through third countries. It has been realised by the Germans, for instance, that the list of banned goods for export to Poland is not so long as the restrictions imposed

on exports to China ; and there is no doubt that some of the alleged sales to Poland find their way to the Far East.

The Germans' biggest disappointment in their postwar dealings with the Chinese state trading organisations has been over delivery and payment terms. In spite of the efforts of the "old China Hands" in Hamburg, the good old days have not returned when the German exporter could be sure of receiving his money as soon as he had shipped his goods. The Chinese, it is found, have imposed very stiff conditions on exporters. They pay only on delivery and are liable to refuse to accept goods and confiscate money deposited as "performance bond" on the grounds that the deliveries do not come up to contract standard. As the Germans have no representatives to look after their interests at the Chinese customs, they are helpless to protest.

The Communists, it is realised, are playing off the different European traders against each other, now that the British firms have been ousted. For this reason, the Germans have become aware of the advantages of dealing with Hongkong rather than direct with Peking. At one time, the Chinese induced the Bonn authorities to give instructions that Hongkong was to be cut out of German-Chinese trade, but the German exporters quickly had that mistake put right. Until the recent extension of the transferable account area there was an advantage in trading through Hongkong, rather than direct with Peking, because the latter's sterling transfers required approval from the Bank of England. But now that China has been reclassified into the transferable account area, direct dealings are likely to increase and settlements cleared through the European Payments Union. Ordinarily, the Chinese only paid for their most valuable imports in Swiss francs or in dollars. In general, it may be said that the City now again has a hand in a large part of Germany's trade with China. Though they recognise the advantages of this, it is not altogether to the Germans' liking, since they would prefer the British not to know too much about their business.

Prospects for Peking Picnics

The latest move towards regularising direct German trade with China has come from commercial and banking circles, who are campaigning for the government to sign a trade and payments agreement with Peking. It has been pointed out that at present 60 per cent of German deliveries to China and over 90 per cent of imports from that quarter pass *via* third countries. In one way, the Germans have a closer contact with the Chinese than the British. This is due to the fact that the Chinese Export-Import Corporation, as well as a trade mission, has its European offices in East Berlin, as an open and visible sign that Chinese trade is part and parcel of the Communist trading bloc. But the Germans, on the other hand, have not yet been on "Peking picnics" like their British competitors. It will not be long before they do.

In the meantime, eyes are on the Geneva conference. Only the experts have realised that the Chinse purchases are limited to the amount they can sell, and that the world demand for the main Chinese exports has greatly decreased. The Germans have been impressed by the reports spread by the Chinese that, if the embargo were lifted, China could export 1.5 or 2 billion dollars' worth of goods a year ; a claim which, however, many experts believe should be treated with scepticism in view of China's limited capacity to export and its preoccupation in trading with its European Communist partners.

Journal of Geneva—IV

MAY 13th. Mr Eden punctured the Communists' claims to be sole champions of Asian aspirations by pointing to Britain's record of advancement in Asia. He then put forward five principles on which a Korean settlement should be based:

1. Elections for an all-Korea government.
2. These to take account of South Korea's larger population.
3. Elections to be universal, secret, and genuinely free.
4. Supervision by UN members drawn from an agreed panel.
5. Foreign troops to withdraw once security is restored.

Given agreement on these principles, said Mr Eden, details could be worked out in restricted sessions. As to the Communist proposals, they could never in practice lead to the goal, professed by all, of a united, free and democratic Korea.

M. Bidault also emphasised two principles for Korea: (*a*) any joint representative organs should reflect the balance of population between South and North ; (*b*) neutral observers, with adequate powers of control, should verify the elections. The United Nations was the best body to choose the observers.

May 14th. Mr Eden saw Chou En-lai and then Mr Molotov, and discussed the desirability of restricted sessions. It was agreed to begin restricted sessions on Indo-China on May 17th.

At the plenary session, Mr Molotov repeated at length the Communist version of events in Indo-China. He then conceded one point, by agreeing to the idea of a supervisory commission of neutral nations ; but as regards the right of nations guaranteeing a settlement to intervene if it was violated, he maintained that no such intervention should be allowed unless all the guarantors agreed to it.

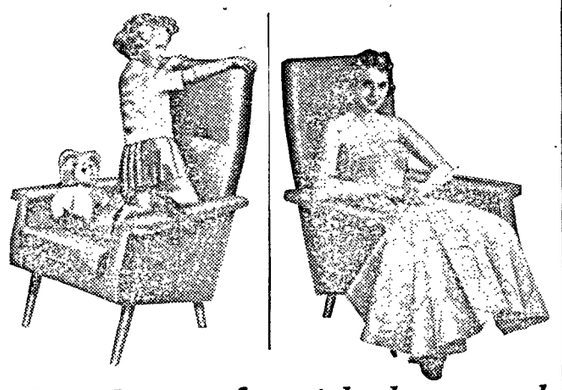
M. Bidault, replying to the Viet Minh proposals of May 10th, said that as regards Laos and Cambodia the only problem was the withdrawal of Viet Minh forces ; France was quite ready to withdraw its own forces. A cease-fire could thus take place very quickly in Laos and Cambodia. As to Vietnam, to seek a political settlement before an armistice would postpone the ending of hostilities. Once peace was restored, France would not keep troops in the country against its legal government's wishes. M. Bidault pressed for international supervision of an armistice, and answered Mr Eden's five questions of May 12th affirmatively.

May 15th and 16th. Private consultations were the only activity over the weekend.

May 17th. The first restricted session on Indo-China was held. Britain, France, United States, Soviet Union, China, Vietnam, Laos, Cambodia and the Viet Minh were represented. Evacuation of wounded from Dien Bien Phu was discussed as well as the general problem of Indo-China.

May 18th and 19th. On both days restricted sessions on Indo-China were held, at which the main problem discussed was whether or not Laos and Cambodia should be treated separately from Vietnam. No progress was made.

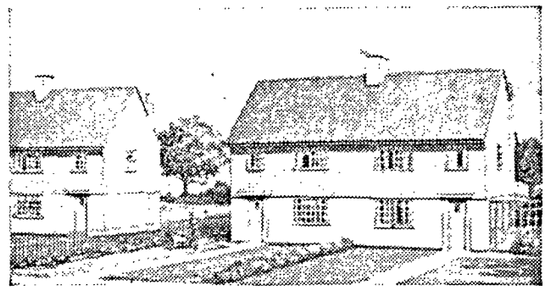
Leather upholstery



takes the rough—with the smooth

. . . nothing looks and wears so well or gives more comfort than leather

"YOUR FURNITURE AND YOUR COMFORT" is the title of a booklet which tells more of the colourful leathers which are now available for the upholstery of modern and traditional furniture for the home, the boardroom, the office, clubs and hotels. *Write to:* The Dressed Hide Leather Publicity Committee, Leather Trade House, Barter Street, London, W.C.1.



The BIG Yellow 'CATS'

ARE PURRING BEFORE THE HEARTH

Before new hearths and homes can arise, row upon row, Caterpillar earth-movers must get to work. On building sites up and down the country, where soon there will be houses, hospitals, offices, schools and factories, you can see the distinctive yellow of the 'Cats' (world-famous nickname for these world-famous machines) and hear the powerful, purposeful throb of their engines. These are busy times for the 'Cats', speedily doing the spadework for Britain's building developments.

Tunnelling in Peru

Riveting in Scotland

Atlas-Copco puts compressed air to work for the world

If you could talk to the contractors responsible for Peru's most important tunnelling schemes they would tell you that their pneumatic equipment is supplied almost entirely by Atlas-Copco. And in Peru's largest copper mine you would learn that Atlas-Copco tools have increased output by 50%. Go then to Scotland, and you would see Atlas-Copco riveters and chipping hammers in shipyards, Atlas-Copco stone-breakers in quarries.

As in Scotland and Peru, so in almost every part of the world—Atlas-Copco is on the job wherever compressed air is working hardest. Atlas-Copco provides equipment for every conceivable application of compressed air. Add to this, the servicing and delivery facilities of allied companies* in 37 countries, and you realise why Atlas-Copco are among the world's leading compressed air specialists.

* *Atlas-Copco embraces companies trading under the names Atlas, Atlas Diesel, Atlas Polar, Atlas-Copco, Copco, Delfos and Sampa. Enquiries in the U.K. should be addressed to* THE ATLAS DIESEL COMPANY LTD., *Beresford Avenue, Wembley, Middlesex.*

THE BUSINESS WORLD

Coal Threatens the Boom

TO say that coal is the only basic material that is still as scarce as ever might mean only that the British economy is continuing to use all the energy it can get. In 1954, unfortunately, it may mean rather more. This is the fashionable time of year for forecasting coal crises that eventually never happen ; even so, there is a real danger that later this year it may take cuts in exports, dangerously heavy drawings upon stocks, or substantial imports of coal to sustain the expansion of output flourishing in other British industries.

The coal budget, after nearly five months of the year, is uglier than it has been since 1950-51. These months have quite upset the industry's hope—which was inherently reasonable—of a 2½ per cent increase in output from the mines this year, furnishing an extra five million tons. Both mined and opencast output, so far, are slightly lower than at this time last year, and coal stocks in the hands of the industry and its customers are two million tons lower. The weather has been slightly colder—which may have cost three-quarters of a million tons more coal to keep the country warm—and industry generally seems to have been achieving about 7½ per cent more production while using about 5 per cent more coal. Since the beginning of the winter, about six million tons have been drawn out of coal stocks.

Consumption, therefore, may have risen somewhat more than was expected ; the five million tons of extra output for which the National Coal Board is paying in advance in miners' wages have shown no signs of materialising at all. This may well set the board and the National Union of Mineworkers talking over their so-called output drive. It is not as if the increase needed to come wholly from the miners' extra efforts ; some part of it might surely have been expected as the first belated returns from the £200 million that the board has invested in the mines since nationalisation, even though the official spokesmen are now arguing that no "major returns" can be expected until 1956.

There is still time for some increase. Productivity at the coal face has already shown an improvement, and coal output will automatically benefit because there will be no Coronation this year ; but it would be optimistic to hope that deep-mined output, which was 212½ million tons last year, will exceed 214-216 million tons in 1954. With perhaps 12 million tons from the opencast workings total deliveries of coal this year might reach say 228 million tons. Consumption and stock figures always contain some ambiguity, and the recent abolition of records of coal used by industrial consumers who take less than 1,000 tons a year will blur the statistics further ; but consumption in Britain and Northern Ireland may have been about 210 million tons last year, while exports and bunkers totalled 16.6 million tons. The difference last year was made up by drawing upon total stocks and incidentally by importing 600,000 tons of large coal from the Continent.

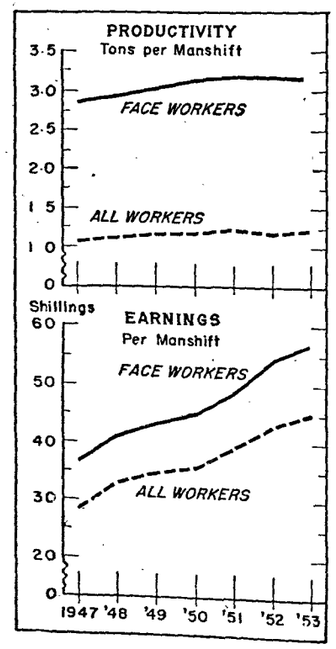
At their present rate of increase, consumers in the United Kingdom alone might well demand 213-215 million tons this year, virtually as much as is mined. Bunkers may fall a little, but at present the industry is exporting as much coal as last year. That might bring demand up to 230 million tons ; and at such a rate, it is doubtful whether stocks could safely be brought down from their level at the end of 1953. Some imports, mainly of large coals, are still coming in under the winter programme, but the Minister of Fuel and Power recently told Parliament that he had not as yet authorised any further imports. If only as an insurance, he may soon need to do so.

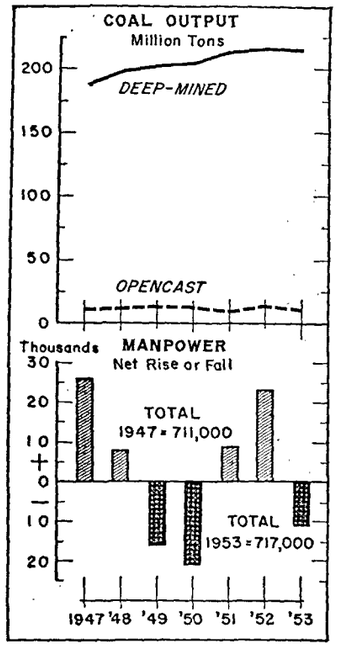
Anxiety over current production, as usual, overshadowed the National Coal Board's accounting for

1953 when it published its annual report this week. The Board has indeed cut the text of its report by nearly half, which is welcome, though that emphasises the need for some other means of telling the public about the industry's major problems and policies. Financially, it may be noted, the board last year was almost wholly successful in performing the tight-rope act that its constitution enjoins ; it broke almost exactly even.

This performance—which at present appears unlikely to be repeated in 1954—means that the board's profits over its wide range of activities and products were roughly equal to the provisions it made for taxation, losses on imports, and interest payable mainly to the former coalowners. Over the year, the board made £20.3 million profit from its collieries—1s. 11d. a ton—£2 million from opencast coal, and £1.6 million from the coke ovens it owns ; it lost a net £400,000 on "other activities," mainly on account of heavy losses on the 141,000 miners' houses that it owns. It set aside £5 million for income tax (the Inland Revenue have not yet agreed the board's liabilities for tax in any year since nationalisation, and large sums are in dispute) covered a loss of just over £1 million, or about £2 a ton, on imported coal, and provided £16.5 million for interest and interim income payable to the Minister of Fuel and Power, which left it a net surplus of £400,000. Its total turnover was some £682 million.

Last year the industry did manage to invest more money in reconstructing the mines : it spent £64.3 million on capital account during 1953, compared with £48.6 million, and only about £1 million of the increase was attributable to increased prices. Some £52 million went into the collieries, £5 million into coke ovens, and £7 million on other works, apart from £17 million upon new housing programmes for the miners. To finance this investment—which the board still considers too low, compared with the arrears under its long-term plan for reconstruction of the industry — it borrowed nearly £42 million from the Ministry of Fuel and Power, and funded £40 million as permanent advances ; for the moment, it seems, its years of self-financing are over. The limit to investment in coal has usually been set by the need to keep day-to-day output at a peak and the shortage of adequately trained planning staff. The industry is now getting some of the good mining engineers it needs, though not enough, and enlisting the aid of civil engineers from outside in progressing its construction.





The report, therefore, spells out apparently impressive progress along many parallel lines—towards today's inadequate supplies of coal. It is hardly surprising that Sir Hubert Houldsworth should describe much of the board's effort, in the short run, as "invisible." This continued and unhappy experience is leading the National Coal Board towards self-examination—of which a directive defining the chain of responsibility, and giving further weight to the area general managers, was last year's most tangible evidence. No conclusions have yet been recorded by the outside group of experts in large-scale administration who were asked at the end of last year to survey its internal organisation, though the report contains details of changes in the marketing departments—"looking forward to the day when the Government will wish to bring to an end their control of supplies and abolish the restrictions on the purchase of house coal." It may eventually face further scrutiny—from the proposed new Select Committee on nationalised industries, if not from the commission of inquiry that the Conservative backbenchers will once again this autumn be badgering the Minister to appoint.

Whether or not wholly effective management of this heterogeneous industry under a single ownership is possible, it has clearly not been achieved in the first seven years of nationalisation. The board has developed adequate techniques—in itself no easy task—for discovering, in more and more detail, what is going on in the industry, and it has come some of the way towards understanding why. But it cannot be said as yet to have developed adequate methods of controlling what goes on in this most intractable of industries. Indeed, over part of its field of responsibility, any similarity between the best-laid of Coal Board plans and what actually happens in the industry still seems largely coincidental.

ICI in a New Age

THE first Lord Melchett was a financier of vision, but when, in 1926, he welded four companies—Brunner Mond, Nobel Industries, United Alkali, and British Dyestuffs—into Imperial Chemical Industries, even he could hardly have visualised the ICI of this generation. He made a great combine for those days—a £56 million merger. Today ICI is an army with 107,000 employees in this country alone, disposing total assets of over £439 million, trading in over £280 million worth of goods a year, and earning a trading profit of over £35 million. It is now proposing to keep the troops happy with a co-partnership scheme calculated to cost around £1 million a year gross—say £400,000 a year, after tax. It may be surmised that the founder would have approved if he had seen.

He believed in size. Those were the days when "rationalisation" was the catch word. Mere size, it was claimed, bred efficiency. By employing the best and therefore the most expensive management, the best technicians, the best accountants, and the best tax experts, and spreading their activities over bigger and yet bigger units, management could be made both first-rate and cheap per unit of capital ; borrowing would be cheap and price cutting could be applied where the competitive shoe pinched without endangering the whole enterprise. Today the doctrine of the late twenties no longer seems an eternal truth. The small owner-managed business holds its own in many fields ; the mergers of a generation ago comprised both failures and successes. ICI (though it has known its difficulties) is among the outstanding successes, and 1953 was its best year in turnover, though not in profits.

Gross sales revenue rose by £5.6 million to the record figure of £281.9 million, trading profits by £7.7 million to £35.9 million, and net consolidated profits, after tax,

£ Mn.

* Not including £30 million 4½ per cent Loan Stock issued at par since the end of 1953.

by £4.1 million to £17.6 million, thus partly making up for the drop in 1952. The 250,000 shareholders benefit ; their dividend goes up from 13 per cent to 15 per cent, before giving effect to the proposed one for one scrip bonus. The ordinary and preference dividends together take up a mere £6.7 million, leaving a net sum of about £11 million to help to pay for the group's ever-growing capital expenditure programme.

Moreover, the group has fulfilled the main thesis of the rationalisers : it has met competition with low prices and high turnover. The prices which the group paid for its raw materials have risen since the war by more than the Board of Trade index of wholesale prices. The home market selling prices of the group rose by much less than the Board of Trade index. The comparison points towards better productivity and cost reduction.

	ICI Purchasing Price Index	Board of Trade Wholesale Price Index	ICI Home Sales Price Index
1938	100	100	100
1948	251	216	145
1953	366	323	190

In export markets increased competition now has to be faced. Germany, other European countries including those of Eastern Europe and, to a less extent, Japan, are named as sources of increased competition.

The founder of the group would have approved the new plan to give the workers a share in its equity. He was among the most forward industrialists of his day in seeking to carry organised labour along with him ; it was the Mond-Turner Conference of 1928-29 that brought progressive management and moderate trade unionism together for the first time to heal the wounds of 1926. In Lord Melchett's day, indeed, ICI tried a scheme for inducing the employees to buy the ordinary shares, but it was a failure. Sales were at advantageous prices and on the instalment plan, but in the crisis of the early thirties share prices broke, and the buyers had no incentive to complete their instalments. The co-partnership plan that the directors now propose is very different. It will bring into co-partnership about 75,000 permanent employees of ICI in this country at a cost of £1 million a year gross (allowable for tax as an expense of trading) and will involve at present rates of profits and dividend the issue of about 500,000 Ordinary shares for the employees each year.

The scheme comes into effect after the proposed 100 per cent share bonus. Therefore it is based on a presumptive 7½ per cent dividend if profits remain unchanged. It is limited to employees of roughly 2½ years' standing and over 21 years of age. They will receive one per cent of their gross annual salary for each one per cent by which the ordinary dividend exceeds 5 per cent. That sum, after deduction of tax at the individual's appropriate rate, is to be invested in new ordinary shares at the market price (with the shares now standing

at 61s. 3d. xd the prospective ex bonus price is a little over 30s.). The shares will go into the hands of trustees and dividends will accumulate for the purchase of further shares. But as soon as any employee has 25 shares standing to his credit they can be transferred to his own name and become freely marketable, without so much as a black look at the man who chooses to sell. The annual issue of 500,000 shares to employees would in time confer upon them a substantial interest in the company, but not one that is ever likely to wield control, for there will be £190 million of Ordinary capital in issue when the scheme begins. The scheme carries one self-denying ordinance. Employees on engagements longer than three months are excluded. Those in higher management already have a bonus scheme, though they are not alone in that, for over 43 per cent of all the operatives are on some form of payment by results. There would also be a surtax problem for the over £2,000-a-year man. The scheme is no part of the contract of employment, and the board retains full power to amend or end it. This is a necessary protection; if, for example, the company were again to make a 100 per cent scrip issue, halving the indicated percentage dividend, the whole basis would have to be re-calculated.

All this comes on the top of existing pension and welfare schemes, which cost the company £4.5 million in 1953. Mr Albu could hardly have asked more, for the scheme gives almost exactly what Mr Gaitskell and he have recently been demanding. Organised labour, which was being consulted yesterday, should be delighted. And the nationalisation of chemicals may have a poor appeal for 75,000 employee stockholders.

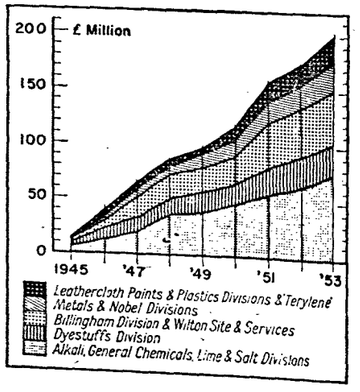
Equity shareholders, however, may hesitate when they study the co-partnership plan in conjunction with the plans for the reorganisation of the preference capital. The circulars covering the plan for exchanging each five 7 per cent preference stock units of £1 into seven 5 per cent units explain that it is intended in the future to increase the proportion of preference to ordinary capital. It may, therefore, happen that the company will raise preference capital from the public and ordinary capital from the employees. That would hardly amount to a serious ground for complaint. To raise funds by prior charges, either preference capital as is contemplated or loan stock as was recently done, gears up the equity to the advantage of the ordinary stockholders.

The future can hold no turning back from the road to rapid expansion on which ICI has embarked. The accompanying graphs show wide differences between the authorisations of capital expenditure which the board has approved and the actual spending to date. That comparison alone promises that capital expenditure will continue high for years ahead. And capital authorisations are not the whole story, for expenditure contemplated as distinct from approved is even bigger. Already since the end of 1953, of which the present accounts tell the story, ICI has issued £30 million of 4½ per cent loan stock, and has continued rapidly with its widely dispersed capital plans, including a decision to build a second oil cracker at Wilton, which in three years' time will double the group's capacity to produce petroleum chemicals.

Big plans are laid for expansion in each of the company's main divisions. But ICI makes products that by no stretch of the imagination can be called chemicals. Table salt is a chemical, but a zip fastener is not. Therefore, though the group's figures appear to represent half the British chemical industry, the company's share of British chemical industry proper is less than half. But it is predominant in that industry which itself is growing fast. The growth of ICI's fixed assets has been unbroken over the past eight years and is still gathering momentum. Though the company has lived through a generation, there is no sign that it is losing its vigour. A yield of something less than 5 per cent on ICI ordinary, now at 61s. 6d., puts it among the growth stocks, but not necessarily at an excessive premium.

Capital Expenditure: Promise and Fulfilment

Cumulative Authorisations

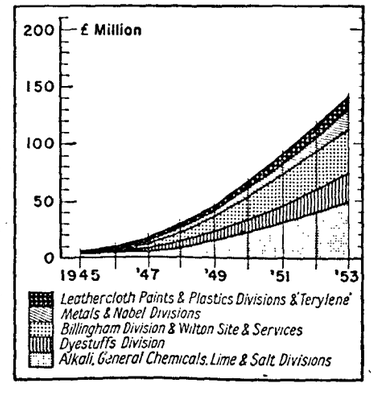


Since the war, ICI has been able to expend on capital account far less quickly than it wished. Actual expenditure is shown in the right hand chart. Additional working capital requirements are excluded as is a sum of £17 million spent on buying former government factories. Including those factories and the additional working capital and stocks the expenditure was £213 million composed thus:—

	£ million
New plant and additions	163
Additional working capital	25
New investment overseas	25
Total	213

The money excludes the £30 million of recently issued notes.

Cumulative Expenditure



Business Notes

Signal for Profit-Taking

THE monetary authorities should be well satisfied with the City's reaction to last week's reduction of Bank rate. In so far as any response from the City alone—as distinct from the business world as a whole—could confirm the wisdom of the Bank rate decision, its behaviour this week has done so. The danger that was run was that the easing of official policy would give an undue boost to confidence, already running high, and might lead to a revival of inflationary pressures. But the stock markets, at least, have not read the Bank's message in this way. As a subsequent note more fully explains, the speculators that had lately invaded the gilt-edged market read it as a signal not for new buying but for profit-taking—which on Monday produced a salutary shake-out. And City opinion generally is certainly not disposed to expect the next change in Bank rate to be more likely to be a reduction to 2½ per cent than an increase to 4 per cent—despite the fact that some other significant rates have been reduced. The Agricultural Mortgage Corporation has cut its charge for new loans from 5 to 4½ per cent. This rate is, of course, keyed to the long-term market; but another rate that is similarly regulated, that of the Public Works Loan Board, is at present merely being "watched" by the authorities.

The sober first response from financial circles does not prove that harmful repercussions will not later be seen in the economy as a whole; but, so far as it goes, it is distinctly reassuring. It is, of course, also still uncertain whether the easing of London money rates will achieve its object of preventing any undue revival of strong speculative demands for sterling. The tide of "genuine" demand still flows towards London and is, indeed, seasonally swollen; so long as it persists there is always the possibility that too much speculation may swim with it. The sterling-dollar rate, after its slight relapse ten days ago, did rise momentarily this week to its top limit again, while the premium quotation for the forward dollar has narrowed a little further. In banking circles the possibility of new moves to widen the transferability of sterling and the "programme" for convertibility have become inexhaustible topics for gossip; and in such circumstances rumours akin to those of a few weeks ago could easily take wing anew. The monetary authorities may need all their vigilance and technical skill if they are to keep the monetary steering-gear firmly in their own hands.

Stresses in Lombard Street

IN the money market, similarly and for the same reasons, the system of rates has still not settled down to any clearly maintainable pattern. The basic structure of call money rates—which, despite "flexibility," still rests upon the fixed rates of the clearing banks—has remained unchanged during the past week, with the rate for short money against Treasury bills at 1¼ per cent. But the bill rates erected on this new foundation look a little shaky. At last week's Treasury bill tender the discount market tendered at the equivalent of about 1$\frac{23}{32}$ per cent, compared with just under 2$\frac{1}{16}$ per cent in the previous week, and it is this rate that has determined market rates subsequently—but with the clearing banks trying to obtain shorter bills from the market at 1$\frac{1}{8}$ per cent and the market holding out for a rate $\frac{1}{32}$ per cent better than that. Moreover, the new rate of 1¾ per cent for three months' fine bank bills—now keenly competitive with bank advances in some types of business—is only $\frac{1}{32}$ per cent above the Treasury bill tender rate; that is a rational relationship, but it contrasts with the difference of ¼ per cent maintained by the clearing banks between their charges for call loans against the two types of paper. Finally, it is noteworthy that non-market tenderers paid appreciably more for their bills than did the discount houses.

Here, then, are three sources of stress within the market; and, in addition, it may still experience stress from outside. The New York Treasury bill rate did not fall further at last Monday's tender there, so that the gross margin between London and New York rates has been reduced from nearly 1¼ per cent to a little over ⅞ per cent. But the narrowing of the cost of obtaining forward exchange cover has meant that the net profit offered by covered arbitrage between the two types of Treasury bills has fallen less noticeably, and this week has still been almost ½ per cent. There is still a possibility, therefore, of a further easing of London rates. The authorities might be wise to arrest any perceptible movement of this kind; and such an intention might, indeed, be read into the fact that on Wednesday money supplies so tightened as to force the discount market to go to the Bank for 7-day loans. The argument that was probably right when Bank rate was about to drop from 3½ per cent—that it was more important to check the pressure upon sterling than to avoid the risk of overstimulating domestic confidence—is not equally sound now that Bank rate is at 3 per cent. It would be most undesirable to allow any such slip in bill rates as might start the City talking about a Bank rate of 2½ per cent.

Shake-out in the Markets

IT is not surprising that the sequel to the Bank rate reduction was a fall in the markets. The move had been so long expected that it would have been a miracle if the event had not found some speculators waiting to get out. The speculation turned out to be where it was

expected—in the long-dated gilt-edged stocks—and there is no suggestion that foreign money was involved. After a brief rise on Thursday afternoon and Friday morning last week, the gilt-edged market reacted. The speculators sold or tried to sell. The big regular institutional investors took a step down the ladder and stood waiting with their mouths open. To a modest extent the industrial share market copied the gilt-edged pattern. There was a minor setback to the beginning of the week unaccompanied by any sign of real weakness.

The surprising fact is that the fall was not sharper than about one point from the top in gilt-edged and that by the middle of this week it appeared to be over. With the start of the new Stock Exchange account good buying of industrials developed; gilt-edged turned upwards at the same time. The recovery went further on Thursday, the *Financial Times* industrial index reaching a new record of 150.4, a rise of 0.7 on that day. Apparently the attack of indigestion was ended. The recovery was the more noteworthy in that the authorities responsible for planning gilt-edged issues gave the market no respite. Naturally they attempted nothing large, but small issues continued. Hull came to market on Monday with an issue that was clearly adjusted to the stiffest terms the market could have been expected to stomach—£1½ million of 3¾ per cent stock 1973-75 at £98 10s. flanked by an offer of conversion to holders of £1 million 4½ per cent stock 1952-72. The terms, fixed after the Bank rate decision, were similar to the recent Birmingham offer except for a slightly longer date. The market was in unresponsive mood and Hull does not quite enjoy the status of Birmingham, but since only £500,000 of new money was really involved a calculated risk was taken. Simultaneously with the Hull offer, the City of Bloemfontein offered conversion to holders of its £763,000 4 per cent stock 1954 into a similar amount of new 4½ per cent stock 1964-66 at 98½. In the industrial market, the stream of issues flowed on and investors showed their willingness to co-operate by oversubscribing the £1 million 6½ per cent Cyril Lord Preference issue more than 12 times.

Cotton Exchange at Work Again

LAST Tuesday the floor of the Liverpool Cotton Exchange came into its own again. The "temporary" offices built there during the war had been cleared away, and the wrought-iron "ring" put back in the well of the shallow, circular steps. Facing it stood the high marking board, with the prices of New York futures on the left, New Orleans prices on the right, and in the centre, under "Liverpool" a blank space. The old market bell rang out, and pandemonium broke loose as bids and offers were shouted across the ring. Up came the opening price of 31.65d. a lb for October-November delivery, and the news of Liverpool futures was again flashed round the world. Thus began the first day's trading in cotton futures for thirteen years. It may be the busiest day for a few weeks. Until August 31st, Lancashire spinners have in the cover scheme of the Raw Cotton Commission, an alternative means of insuring against the risk of price fluctuations. The speed at which spinners transfer to the market the hedges now placed with the Commission will depend partly on the behaviour of the market in relation to New York futures, and partly on their ability to take advantage of favourable opportunities. Trading should receive a fillip when the Yarn Spinners' Association decides that its members' selling margins should be based on the Liverpool market, instead of the Commission's New York index, as now.

The last thirteen years have not favoured the operation of futures markets. The marketing of most of the world's cotton crops has become subject to arbitrary government intervention and control, and the burden of financing stock has increased fourfold. To provide a strong contract, the market authorities have introduced initially a contract against which only United States cotton is tenderable. This cannot be as full a hedge for outside growths as for United States cotton, and it will be of little use to users of long-staple cotton. The introduction of a long staple contract will probably have to await the resumption of futures trading in Alexandria, which may begin in the 1955-56 season. But spinners should console themselves with the thought that no better cover is available to their competitors. These and other difficulties should not be allowed to obscure the real and potential importance of reopening the Liverpool exchange. It restores freedom to the last of Britain's major commodity markets. The risks of trading and hedging in raw cotton will properly be transferred from the taxpayer to private industry. In time, the Liverpool market should again exert an influence on world cotton prices, and offer Lancashire a satisfactory hedging medium and an adequate spot stock. It should also contribute to the country's invisible exports through the services it will render to foreign operators. One of the most encouraging auguries for the market's success is the determination of both merchants and spinners to make it work.

Stagnation in Wheat Futures

IF the difficulties of the Liverpool wheat futures market are less complex than those of the cotton exchange, they may still last longer. Trading has been negligible since the market opened on December 1st and it is not increasing. The reasons are not hard to find. The world market in wheat is much less free than in raw cotton. There are plenty of free buyers, but no free sellers. Exports of the four main exporting countries are handled by government agencies. The price policies of these single sellers are only marginally responsive to the ordinary commercial considerations of supply and demand. In consequence there is a mere mockery of a free world price, and the Liverpool futures market can exert no real influence. Prices of futures seem to represent what traders think prices ought to be as much as what they think they will be; and those prices are usually 30s. or more below the actual cost of wheat. The business transacted appears to be almost wholly speculative, and there is little enough of that. The value of the minimum quantity that can be traded, which is about £5,000, requires a deposit that may well deter speculators.

Because the market is narrow, fluctuations are sharp, and traders may have to take a price appreciably different from the previous quotation to sell or close out a contract. Merchants and brokers are naturally reluctant to advise their clients to use such a market, and so begins a vicious circle. Other segments of this circle are that in offering wheat on a price-to-be fixed basis the Canadian and Australian Wheat Boards have reduced considerably the need for hedging. Wheat shipped from the St. Lawrence, for example, can be fixed at the Canadian price ruling up to seven days after loading, which gives the merchant grace to re-sell a shipment that he might otherwise have hedged. Britain's imported supplies are still predominantly Canadian, for the large percentage of soft English wheat that has to be used must be mixed with the hard Manitoba wheats. And for the last nine months, the millers have drawn a large part of their requirements of imported wheat from the government's stocks. In the next few months, however, business in futures may show some increase. The disposal of government stocks, a free market in domestic wheat, and the probability of more competition at home and abroad, should encourage futures trading and help to narrow the gap between actual and futures prices. But it is difficult to see how the market can again function fully until the main exporting countries adopt more flexible selling policies. That day still seems distant. Nevertheless, the Liverpool corn trade was no doubt right to reopen the market, so that the machinery could at least be kept ticking over. Had they delayed much longer it might never have been reopened.

Skill Grows Scarcer

THE latest comparison that can be made between unemployment in the British economy and demand for extra labour is for mid-March, when there were some 327,000 people out of work (including 60,000 married women), and 288,000 vacancies unfilled on the employment exchange books. By the middle of April, unemployment had declined to 317,000; according to reports from the regions, the shortage of labour may well have increased.

This indication of an industrial boom suits other impressions that range ahead of the statistics. In some engineering industries where slack was evident a few months ago, more companies are talking of improved business; the length of orderbooks may not be what it was a few years ago, but that was a condition that had its discomforts, too. Delivery dates are now fairly competitive with one's foreign competitors; but it is doubtful whether in general they are still declining. With freer supplies of almost all industrial materials, the pressure today is on skilled labour, which is becoming increasingly scarce. This is partly a normal consequence of working to fuller capacity; but it may also be connected with a longer-term trend towards higher investment per man in a number of industries. With flat rate increases in wages and "rises for the lower-paid workers," the unskilled worker is becoming more expensive to employ. The narrowing differentials for skill may make it more worthwhile than before to employ semi-automatic or automatic equipment that requires a high quality of operative to mind it but gives correspondingly higher rates of output. In most industries, this is still only a trend to be reckoned with in the near future—which means better training; already, some major companies are beginning to direct their advertising not only to selling goods but to attracting their customers' sons.

Anglo-Iranian's New Peak

AT the outset of his statement to Anglo-Iranian stockholders, Sir William Fraser promises that when a settlement is reached about AIOC's interests in Iran, the board will make "all such adjustments as may be entailed thereby in the form and contents of these accounts." The stock market has interpreted these words in no formal way; it sees in them the expectation of a capital structure matched to Anglo-Iranian's assets, a dividend policy more closely linked with earnings, perhaps a new name better describing what the company is and does, and (it may be hoped) some clearer segregation of its activities that would for ever rule out misconceptions about the group either in the Middle East or at home.

The condition of a settlement is the crux. This week the representatives of the consortium that have been negotiating for a settlement in Teheran have returned to London; evidently the bargaining has been hard and the Iranian side are not yet prepared to give anything away that could be construed as weakening their claims over the industry. This is a check, rather than a stalemate but it is evident that the

way towards final agreement is still far from easy. But this did not restrict the progress of Anglo-Iranian ordinary which reached a new high level of 12⅛ on Wednesday, a level that looks forward to something well beyond the 42½ per cent distribution for last year. There are, indeed, plenty of contingent credits that may be gathered in compensation from Iran if a settlement is reached ; entrance money from the other seven members of the consortium if it is able to start ; and a potential £20 million credit if the Inland Revenue would accord double tax relief for the tax that AIOC has been paying to Kuwait. And there is the prospect that within a year the group's main programme of capital expenditure will be completed, considerably reducing its financial requirements.

Again, the various emergency measures that had to be taken to make good the loss of Abadan will cease to be necessary. Last year, AIOC reduced its hiring of refinery capacity from 3 to 2¼ million tons, and its purchases of refined products from 7 to 6½ million tons. This followed the commissioning of the Kent refinery ; thanks to remarkable progress at Aden the new refinery there will be "on stream" in August, four months ahead of time, and by the spring of next year the new refinery at Krinana in Western Australia should be in operation.

Terms of Trade Turn

ALTHOUGH the recent spate of praise for British exports has perhaps been overdone, a comparison of British trade between the first four months of 1954 and 1953 does show a considerable improvement. Thanks to stability in the value of imports and a rise in exports, the trade deficit fell by £15 million a month to an average of £42.6 million,

UNITED KINGDOM TRADE
(£ million—monthly averages of calendar months)

Rest of world	*15*	*15*	*13*	*9*	*13*

and the deficit with the dollar area fell by £3 million a month, or ·20 per cent. The average monthly value of exports, excluding re-exports, in the first four months of this year was £14·5 million fob, or 7 per cent above that of the same period of last year. This improvement, however, was mainly in exports to the sterling area, which were 10 per cent higher, and it owes much to the gradual reopening of the Australian and New Zealand markets. Exports to the dollar area were only 4 per cent lower than in the same period of 1953, despite a fall of 10 per cent in shipments to North America. Exports to the OEEC area rose by 5 per cent and to the rest of the world by 14 per cent.

Imports in January to April, at £276 million a month, were no higher than in the corresponding period of last year, a rise in volume having been concealed by the fall in prices. The prolonged improvement in Britain's terms of trade may now be ending. The recent recovery in commodity prices has at last been reflected in the index of import prices. A rise of two points to 98 (1953 equals 100) in this index in April, coupled with stability of the index of export prices, resulted in an adverse rise of two points to 99 in the terms of trade. This was mainly due to a higher index for food and beverages, reflecting the advance in prices of cocoa and tea and a seasonal increase in prices of fresh fruit and vegetables. Although the import total in the first four months of this year was unchanged, imports from the dollar area fell by over £4.5 million a month, or 10 per cent, compared with the same period of last year, partly owing to smaller arrivals of wheat and barley. Imports from the sterling area showed a largely seasonal rise of over £3 million a month, or 2 per cent.

Abadan and After

HENCE, Anglo-Iranian will soon be in a position to supply refined petroleum products more exclusively from its own resources, for by the end of next year its total refining capacity should reach 30 million tons. Last year's 14 per cent increase in sales, from about 32 million tons to about 37 million tons, owed more to increased sales of crude oil than to an increased sale of refined products ; and the chairman's statement does not conceal that trading conditions last year were far from easy.

Anglo-Iranian's problems may not be over ; but the tremendous efforts that have been made to replace Iranian crude oil and Abadan's refined products are bearing sound fruit. Its crude oil production last year was 32 million tons —about the same output that Iran alone produced in 1950 when the group's whole production was 42 million tons. Its refinery throughput will soon catch up with the 32 million long tons processed in 1950 when Abadan was at full pitch. Its tanker fleet has increased by 200,000 tons dw since 1950 (though significantly by only three ships) and the 1,921,000 tons of tanker capacity—under eight years old, on the average—stand in the books at a written down value of under £3 10s. a ton and would cost nearly twenty times as much to build.

There is, indeed, no "special situation" in the London market that is nearly so special as Anglo-Iranian. The present price is looking well ahead and for nervy mortals it may seem giddily high. But if the "ifs" turn out well, Anglo-Iranian may indeed prove to be too low, and the present temper of the market betrays no anxiety that they will not

Dunlop's Record Turnover

IN volume the Dunlop Rubber Company's turnover reached a record last year. In value it did not ; the money turnover was £243 million compared with £250 million in 1952, and with a record figure of £284 million in 1951. Since then inflation has been washed out of the price of rubber with consequent reductions in Dunlop's selling prices and scaling down of its inventories. The group figure of inventories at December 31st was £45·7 million, a reduction of £5.2 million on the year, and of no less than £15½ million in two years. That and increased competition are the main factors which have held group profits below the level of the peak years of 1950 and 1951. Group profits last year being £15.5 million, a substantial recovery on the 1952 figure of £13.1 million but still much below the 1951 peak of £17.9 million.

The effects of inflation can therefore be seen as an interruption of the group's steady progress. Doubtless the directors feel that the American rubber manufacturers, with the advantage of unfluctuating prices over a large part of their raw material, have a competitive advantage, though there is no sign that as yet the Dunlop directors wish to go further than build a pilot synthetic plant at which the know-how over all types of synthetic rubber (including GRS) will be picked up. They have one word of good cheer for the shareholders ; they will break with practice by considering an interim dividend next December.

Standards and Quality

LITTLE discernible progress seems to have been made during more than two years of discussion at the British Standards Institution towards drafting of minimum quality standards for the consumer goods that were formally covered by the utility schemes. When the President of the Board of Trade first told the House of Commons of the scheme, during the Budget debate of 1952, the intention appeared to be that voluntary minimum standards would be quickly worked out by the BSI and the industries concerned ; as a guide to consumers, goods meeting the standard would be licensed to carry the Institution's identifying Kite mark. Apart from a set of definition (net standards) promised and prepared by the wool industry, the only trade that has successfully completed its quota of standards is the furniture industry ; this week the BSI demonstrated the method worked out for testing the quality of upholstered furniture, the last and most difficult of the furniture standards to be worked out. It would be wrong to suggest that the standards have proved popular in the furniture industry. Fewer than 200 out of a total of nearly 3,000 manufacturers have applied for licenses to use the Kite mark, but this handful controls at least two-thirds of the industry's manufacturing capacity.

In the textile industries, far less has been done. The Women's Advisory Committee of the BSI complains in its third annual report that where some individual standards have been agreed upon, it has not been decided to mark the finished garment ; this appears to defeat the whole object of the scheme. The reason for the textile industries' very obvious reluctance to do anything about putting minimum standards into practice lies in the extreme difficulty of drafting standards of any value. There is not much difficulty in showing that furniture that cannot stand up to a minimum of ordinary use (which can easily be imitated mechanically on test apparatus) is worthless and should not be made, but there is no such dividing line in textile goods. There are practical arguments against introducing a standard marking scheme that might only have the effect of misleading consumers into believing that goods are a great deal better than the minimum standard prescribed. Yet considerable political pressure is being brought to bear on the textile industries to produce some kind of results to justify the undertakings given in 1952. The value to the public of so-called quality standards produced under such pressure may be doubtful.

Helicopters Ahoy!

MOST of the 100 twin-engined helicopters that the Ministry of Supply has ordered from the Bristol Aeroplane Company will be delivered to the Navy for anti-submarine work. They must be some of the strangest machines to have been seen aboard an aircraft carrier ; a banana-shaped fuselage crowned at either end with a drooping rotor, a pair of half-grown wings, and a corgi's undercarriage. In flight, with its nose slightly higher than its tail, this helicopter bears a striking resemblance to Alice's bread-and-butter fly, but its outrageous appearance belies its true function as one of the deadliest of the new anti-submarine weapons in the Navy's arsenal. A helicopter can fly lower and slower over the waves than any conventional aircraft, and one as big as the Bristol 173 (the civil version can take 16 passengers and a stewardess) is able to carry a very considerable quantity of underwater search equipment. Its ability to fly in any direction—up, down, sideways or backwards, at any speed from hovering to a spanking 150 m.p.h.—gives the detecting apparatus that it carries the chance to work to the best possible advantage, and to pin-point an enemy submarine in a way that is hardly possible with the airborne search methods now in use.

The Navy is known to attach great importance to these new techniques in anti-submarine warfare. It expects their introduction to result in a sharp improvement in the efficiency of anti-submarine operations, but this is not the end. From a strategic point of view, the emergence of an anti-submarine helicopter means that convoys may no longer be dependent on aircraft carriers, costing £15 million apiece, for protection against submarines in mid-ocean. At a pinch, even a big helicopter like the 173, nearly 30 ft. long, might operate from the modified deck of a merchant ship. The submarine is the most serious threat that a convoy faces ; the second real danger, from high-flying long-range atom bombers, may have an answer in the new Supermarine fighter, a machine of tremendous power that made its first flight a week or so ago. Meanwhile, the Ministry of Supply is stepping up the pace of helicopter development ; in this coming financial year, about £2.5 million is

expected to be spent compared with £1.3 million last year and barely £500,000 the year before. This compares with total development contracts with industry of nearly £100 million this year. With these two new weapons, the Navy's prospects are better than they have been for a long time.

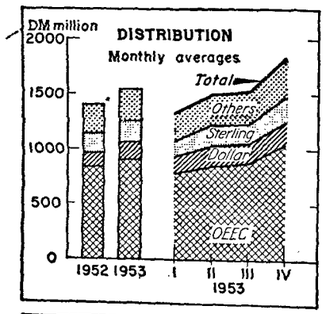
Anglo-Argentine Talks—New Style

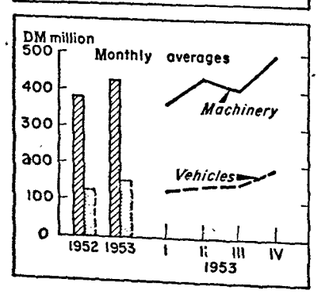
A FUNDAMENTAL new appraisal of Anglo-Argentine economic relations began this week with the arrival in London of the Argentine ministers for Foreign and Economic Affairs. Dr Remorino and Dr Gomez Morales are guests of the British until Wednesday next and, since this is London and not Buenos Aires, it is possible to hope that the crowded agenda that faces them will be successfully dealt with in the short period at their disposal. The Argentine ministers have not come to negotiate the details of new trade and payments agreements but rather to take their bearings in the new drift of economic philosophies and policies in Britain. It is important that they should do so, for on June 30th next the whole basis on which commercial and payments relations between the two countries has rested during the past five years will be withdrawn. That basis is the five-year trade and payments agreement signed in Buenos Aires in 1949 after much travail. The basic agreement has been supplemented by annual protocols, but all these instruments expire at the end of next month. They provided, among other things, for a meat contract governing quantities, qualities and prices, for annual "estimates" of the total trade between the two countries, for mutual undertakings to license trade in "less essentials" and for a sterling payments agreement with a clause requiring dollar settlements when Argentina had accumulated sterling to the extent of £20 million.

There can now be no repetition of the meat contracts since the trade in meat in Britain is returning to private enterprise. Nor can the British Government guarantee the purchase of specific quantities of cereals or other materials. When meat imports are decontrolled as much as 95 per cent of Argentina's exports to the United Kingdom will be free from restrictions or government bulk trading. The sterling markets will be wide open to Argentine produce—provided prices and qualities are right. Fashion in Britain has also moved against the bilateralism so beloved in Argentina. The two Argentine ministers will already have listened to much good liberal doctrine from the Chancellor of the Exchequer and the President of the Board of Trade. They will have been told that the United Kingdom has taken the opportunity provided by easier supplies to move away from bilateralism and that the experience really confirms that it is to everyone's advantage to buy in the cheapest market, without attaching conditions to purchase. If these concepts are to apply to Anglo-Argentine trade in the future, some new and hard thinking will have to be done in Buenos Aires At the same time it is to be hoped that the Argentine ministers are being given cause for hard thinking on another vital subject—on the importance for Argentine credit of allowing a resumption of financial remittances from their country and of a settlement of the British claims in respect of bonded debt and the expropriated British utility companies.

US Aid for Natural Rubber?

THE Rubber Study Group's low estimate of the surplus of natural rubber in 1954 surprised the market, and the spot price has risen by ¾d. to about 1s. 7d. a lb. In the communiqué published after its meeting in Colombo, the



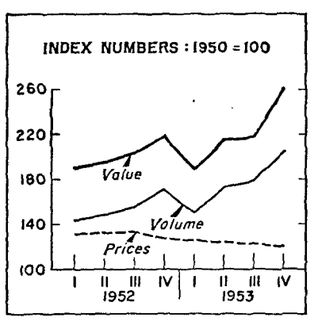


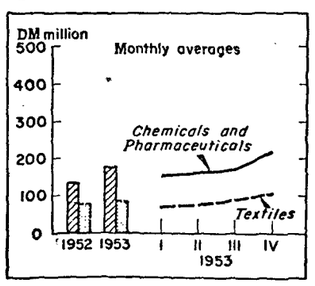
Rise in German Exports

THE recovery in West German exports quickened during 1953, reaching a postwar peak in the fourth quarter. For 1953 as a whole the value of exports rose by 9 per cent to DM18,500 million (£1,580 million); the rise in volume was as much as 16 per cent, for export prices were reduced by an average of 6 per cent. In contrast, British exports in 1953 were the same in value as in 1952, at £2,580 million; the volume was 3 per cent higher and the average value 3 per cent lower.

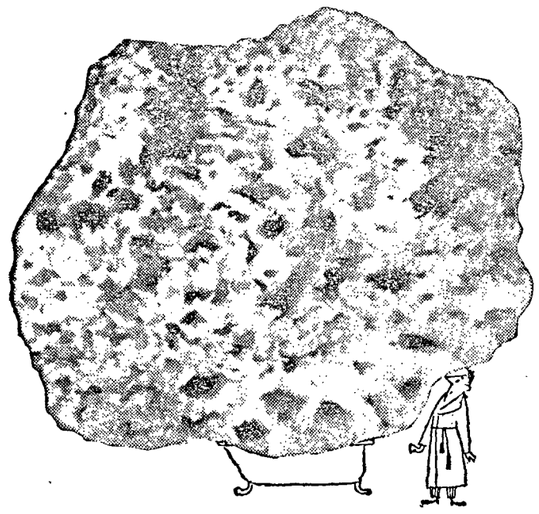
A Board of Trade analysis shows that German exports to the OEEC area rose by 10 per cent in 1953 and to the dollar area by 26 per cent. Exports to the sterling area were 5 per cent lower, but only because sales to Britain fell by 17 per cent; shipments to the rest of the sterling area rose by 23 per cent. Exports to non-dollar South American countries were only 3 per cent lower, thanks to a swift recovery in exports to Brazil.

All commodity groups except iron and steel and non-ferrous metals made substantial gains on 1952. Outstanding increases were shown by electrical machinery and apparatus, exports of which rose by 17 per cent to DM1,240 million, and by motor vehicles which increased by 23 per cent to DM1,210 million.





We suggest that you throw out the sponge



We suggest that the linings of many furnaces are, in effect, sponges — heat sponges: they soak up heat that should go into the charge. On batch-type furnaces this is not only a waste of fuel but a waste of time and quite unnecessary. It can pay very handsomely to get rid of this heat sponge. And it can be done very simply — by using M.I. bricks for the lining instead of ordinary refractories: they require only a fraction of the heat (and fuel) to bring them up to the same working temperature.

M.I. refractories are low heat-storage hot-face insulators which can be used as direct furnace lining up to 1540°C (2800°F). They may be used in either new or existing furnaces. Either way they permit faster throughputs and lower fuel consumption, whilst with new furnaces the whole structure is lightened, with savings in steel, foundations and floor space.

MORGAN Refractories

are worth far more than they cost

FOR NEW IDEAS ✳

ON BUSINESS SAFETY

At any hour, any day or night, fire may strike at the nerve centre of your business — at the irreplaceable records and documents, the loss of which means business paralysis. You cannot insure against such a disaster, you *can* prevent it. Call in the Man from Remington Rand and he will suggest the plan and equipment to provide night and day safety for your business records.

✳*REMINGTON SAFE PRODUCTS* are monolithically constructed with an insulation which never deteriorates. They provide point-of-use protection for business records through the intense heats and impacts incidental to the severest fires. Safe Cabinets are certified to withstand fire rising to 2,000°F, up to three hours; Safetifile 60, fire rising to 1,700°F, for at least one hour. Do they sound like the answer to your fire-risk worries? Let us prove that they are.

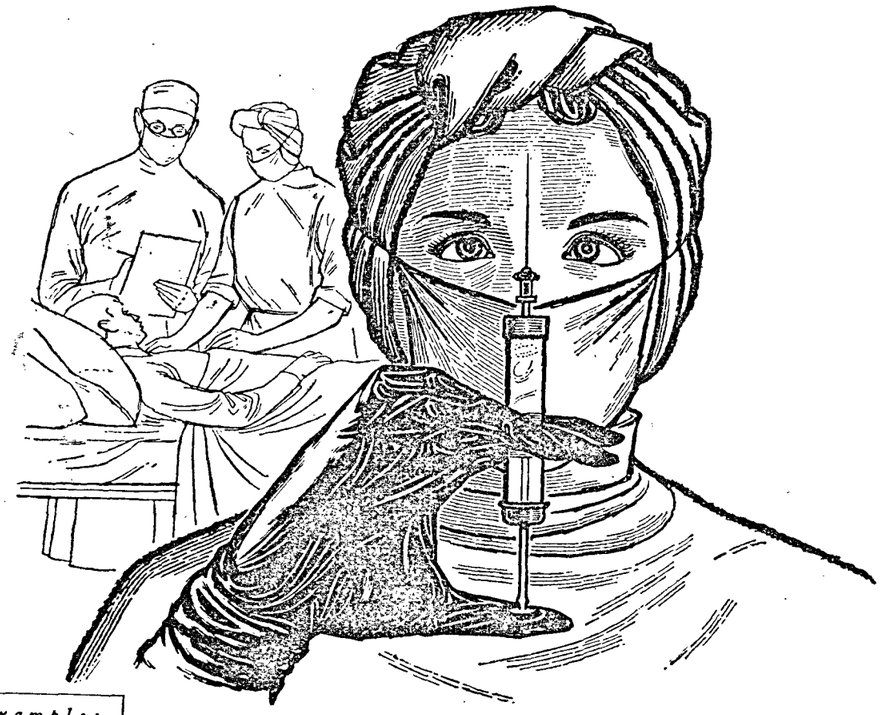
Starch does surprising things

IN SUCH SURPRISING PLACES



Example:

STARCH IN DRUG MANUFACTURE

The characteristically versatile services that starch performs for the medical world may be suggested by a few examples chosen at random. Glucose made from starch is a medicament in its own right. Its most dramatic use is as a shock preventative during surgical operations. For that purpose glucose is injected directly into the blood stream, where it instantly provides the energy needed for resisting shock. (The quick energy of glucose is also available to the general public in the form of tablets such as Brown & Polson's 'Dextrosol'.) Edible starches are commonly used as a coating for pills and as a binding agent for tablets. They serve these purposes well: they are harmless, neutral in flavour, and cheap.

Different products of the starch industry contribute to the growth of the organisms that produce the modern anti-biotic drugs, penicillin and streptomycin. In the commercial production of penicillin, the mould Penicillium notatum is grown on a medium which contains corn steep liquor—the liquid that maize has been steeped in before the wet milling process used in starch manufacture. Cultures of Actinomyces griseus, the organism that produces streptomycin, are grown in a medium which contains dextrose—a sugar produced by the hydrolysis of starch.

Corn Products Company Limited, the Industrial Division of Brown & Polson, produce 200,000 tons of starch products a year: more than 400 different products, which are helping more than 80 different industries to reduce production costs, to make better products, or even to make products that could not otherwise be made at all. We have spent more than 100 years in building up this large and varied business. We have learnt a lot about the industrial uses of starch products, and our advice is freely at your disposal.

CAN STARCH HELP YOU?

When you read in these advertisements how starch products are helping other industries you may see new possibilities of turning them to account in your own business. We shall be glad to discuss them with you.

CORN PRODUCTS COMPANY LIMITED

THE INDUSTRIAL DIVISION OF

Brown & Polson

WELLINGTON HOUSE, 125/130 STRAND, LONDON, W.C.2

Study Group estimated that world production would fall by 20,000 tons to 1,705,000 tons in 1954, and that consumption would rise by 83,000 tons to 1,680,000 tons, leaving an apparent surplus of only 25,000 tons. Even if the surplus proves to be twice as great as this figure, supply and demand should still be balanced, for the United States is expected to buy a last instalment of 30,000 tons this year for its strategic stock, and the British stock may absorb another 20,000 tons or so. World stocks in commercial hands are more than ample, for they amounted at the end of February to about 880,000 tons, representing more than six months' consumption. With eight months of this year still to go, all estimates of supply and demand must be treated cautiously; but although some details of the Study Group's forecast may be questioned, the figures provide confirmation that no burdensome addition to stocks is likely this year.

The prescription of the study group on measures to assist the natural rubber industry is the mixture as before. Stabilisation of price remains the general desire, but disagreement remains on methods. An accelerated rate of replanting, more research and a higher price of American synthetic rubber are again recommended. In one respect, however, the communiqué breaks new ground. After noting the revised rotation policy for the American strategic stock of natural rubber, which appears to be a distinct improvement on the former practice, and the American government's decision that it has no ground for altering its present price policy for GR-S, the communiqué states:

> The United States was prepared to give sympathetic consideration to specific proposals directed to increased effort by producers to plant or replant with high-yielding strains, to reduce costs, and otherwise to improve the efficiency of production and marketing. It was recognised that such measures could enhance the competitive position of natural rubber producers, but only in the long term.

This can only mean that the American government is prepared to provide finance, presumably under Point IV or similar technical aid programmes, for approved projects of that kind. This might well meet a real need. At present prices and rates of taxation, the estates most in need of replanting are least able to afford it, and even companies of high status could not raise finance in London except at penal rates. Smallholdings are even more in need of replanting, and the assistance that can be provided by their governments is evidently limited. Loans by the United States for this and other purposes would no doubt raise many complications, but the possibility that they might be forthcoming is to be welcomed and should be explored.

Barren Crop-Drying

SOME 75 loans to farmers or companies in the crop-drying business, the Select Committee on Estimates was told last month, have been made by the Ministry of Agriculture; the £335,000 that it has lent to British Field Products, Limited, a £500,000 company formed for this purpose in 1949, seems to have been its unluckiest. The Ministry's object, as set out late in 1952, was

> an expansion in the production and utilisation of grass by all sound economic methods, including artificial drying.

The method of assistance that it chose seems to have deserved neither adjective.

The company was formed to pioneer the drying of grass on a factory scale, and to produce a compound feeding-stuff based upon the mixture of cereals with lucerne grown by farmers under long-term contracts and dried in five to ten drying plants. Only one plant was in fact built; the company made a loss in its first year of commercial production, and increased output in the next season on the assumption that the subsidy of imported feeding stuffs would be ended. The subsidy was not lifted at that time, and the company had to ask for further assistance. It again showed losses in 1952-53 and 1953-54; an agreement has now been reached by which its debt to the Ministry has been written down in a company reconstruction to £170,000 of preference shares, which give the Minister certain rights of veto on borrowing and capital expenditure.

The Select Committee was not concerned with the whole history of the Ministry's support of this company, but only with the latest chapter. Late in 1953 the company, left with heavy stocks of feeding stuffs, proposed to sell them at prices as much as £6 a ton lower than the £26-£28 a ton "recommended" by the crop-driers' association. The association protested to the minister; the British Field Products was prevailed on to withdraw its offers at cut prices, on certain guarantees against future losses being given by the Ministry. Demand did not recover during the winter season; in February, with the agreement of the Ministry, the company was allowed to sell off its stocks at yet lower prices, which will probably cost the Ministry some £35,000 under its guarantee (about £7 a ton upon 5,000 tons of feeding stuff). The remainder of the industry, whose price had thus been indirectly supported until January but "broken" afterwards, objected both to the eventual sales at cut price and the guarantee that partly protected British Field Products against its loss on these sales. The Select Committee comments that the guarantee arrangement really amounted to a subsidy to the industry as a whole, given without prior Parliamentary approval. They recommend that no more public money should be invested in British Field Products, and that no actual or implied obligation should be accepted by the Minister towards the farmers with whom it has long-term contracts.

Option Dealing Discussions

THE stormy days of real controversy on policy within the London Stock Exchange seem to have passed, and the storm cock of those days, Sir John Braithwaite, has become a much respected chairman carrying out a policy of which the great majority of the members approve. It is not that Sir John has lost his faith either in publicity for the Stock Exchange or in raising gradually the professional status of stock broking and jobbing; it is rather that those ideals are now generally accepted. Tuesday's annual meeting passed peacefully with only one flicker of a new problem. This week a petition has been lodged with the Council asking for the restoration of option dealing. It was signed by 4 jobbing firms and 7 members—not

figures in themselves that suggest an urgent demand for options—and is to be considered in due course.

More than 50,000 visitors entered the new public gallery in the first six months. The accounts for the year to March 24th show a surplus of £43,349 against a deficit of £7,853 in the previous year and the chairman, seldom very cheerful about finance, feels that with the help of the increased subscriptions the accounts should approximately balance this year. After the new rating assessment comes into operation in 1956, a new financial problem may arise. With a decline of only 37 to 3,540 in the membership last year Sir John hopes that the falling tendency has been "somewhat arrested."

Towards Choice of Fuels?

SINCE the beginning of this year the power stations have sent out nearly 10 per cent more electricity than at this time last year, and the gas works have made about 4 per cent more gas. The weather has been colder; the British (soon to become Central) Electricity Authority, which amends its figures for temperature and standard working days, estimates that in the first quarter its sales of power showed a corrected rise of some 8-9 per cent. These sales of unrestricted fuels have been paralleled by a rise in coal consumption, still rationed to the householder and "allocated" to the bigger industrial consumers, of about 2 million tons or about 2½ per cent. Industrial consumers of less than 1,000 tons of coal a year were last week freed of any obligation to report their consumption or stock to the Ministry of Fuel and Power; and the National Coal Board, in its annual report this week (discussed on page 637) recorded a re-organisation of its marketing department in preparation for the time when all restrictions on coal sales may be lifted.

Today's prospects for the next fuel winter may not make this the most suitable time to announce how one intends at some future date to sell unlimited coal. But it is a reminder that domestic fuel consumption, at any rate, is still "distorted" by choice between rationed and unrationed fuels. It still seems to be assumed that householders, given the chance, would buy perhaps 5 million tons more coal a year; but whether the years of restriction and the purchase of many appliances that generally work best on smokeless fuels have bred in them new preferences for cleaner fuels is quite unknown. The Coal Board, in another section of its report, comments sensibly that it is quite unrealistic to hope that all the raw coal used in open grates—some 35 million tons a year—could "within the foreseeable future" be replaced by smokeless fuels. New methods of making smokeless solid fuels to supplement coke and the small output of anthracite are known, but at present prices, production would be uneconomic; if the consumer wants cleaner warmth, he will have to pay for it.

Air Traffic in 1953

WORLD air traffic, according to preliminary estimates prepared by the International Civil Aviation Organisation, increased 14 per cent in 1953. The total (excluding Russia and China) rose from 2,910 million to 3,320 million ton-miles, with passenger traffic making up more than three-quarters of the total. The financial results of the airlines do not show the same improvement; ICAO calculates that total revenue was just a nose ahead of expenditure. Receipts appear to have risen 13 per cent to $2,383 million, while expenditure shot up nearly 16 per cent, to $2,356 million. The financial health of air transport has been deteriorating rapidly since 1951. The first postwar year in which it broke even was 1950, when receipts were 2.7 per cent higher than costs. The next year showed an operating profit of 6 per cent, since when the ratio of revenue to costs has declined steadily until last year it was a bare 1.1 per cent higher.

ICAO makes no attempt to identify the reason for this deterioration; most airlines would attribute it to the world wide introduction of tourist fares which certainly stimulated passenger traffic but not, perhaps, sufficiently to offset the effects of a 25 per cent reduction in fares. Another clue lies in the extra capacity put into the air. Many new aircraft came into operation in 1953, and more had their seating modified to take a large number of tourist passengers. It seems that in spite of a 16 per cent increase in the number of passengers carried, the aircraft were on average no fuller than the year before. It may, therefore, be only a matter of time before traffic catches up with this new capacity. The average load factor was fractionally lower (59.3 per cent compared with 59.8 per cent in 1952) and it is surprising, on this showing, that the airlines as a whole managed to break even on their operating costs. The figures are close enough to suggest that not many airlines can have been able to show a profit after meeting all charges, and British Overseas Airways Corporation's net surplus of £1 million on its 1953-54 operations, although admittedly calculated over a slightly different period, looks a very much more impressive achievement when it is seen against this not too encouraging background.

SHORTER NOTES

J. and P. Coats announce a final dividend of 10 per cent, making 15 per cent, for 1953, compared with 12½. The ordinary stock advanced 3s. 9d. to 62s. 3d.

★

One of the fruits of last year's decision by the Treasury to withdraw the ban on new issues of over £50,000 by trust companies is a big capital offer by a unit trust. Bank Insurance Trust Corporation is offering for sale 500,000 consolidated units of Bank Insurance and Investment Trust Securities at 16s. per unit. The units are offered to a yield of £4 11s. per cent and the offer is to close on or before May 25th.

★

In the article "Profits from the Liners" in the issue of May 1st it was incorrectly stated that the total of 5¼ million seagoing passengers to and from Britain last year was about 20 per cent higher than in 1947; it was about 40 per cent higher.

THE FARMER.

and the Balance of Power

Britain today has more electricity than she has ever had before. In the past six years, 40 new power stations have been brought into operation and power supply has increased by 50 per cent. At the same time, the demand for electricity is greater than it has ever been.

Electricity on the farms means more production from our existing resources and labour, and less reliance on imported food. Electricity on the farms means more home comforts for those who work on the land. Electricity on the farms contributes to a balanced load on the power stations.

If electricity were more widely used by farms, factories, shops, homes, offices and for street lighting — this would keep the generating plant more fully loaded. The demands on the power stations coming from these different classes of consumers would be diversified. That is to say the loads would not occur simultaneously but, in the main, at different times of the day — and continuous full output from the generating plant would reduce the cost of electricity.

Company Notes

DE BEERS. Throughout the post-war years the profits of Sir Ernest Oppenheimer's diamond empire have been buoyant; the fruits of inflation have been turned into gems on the fingers of the fortunate, and stockpiling plus industrial re-equipment has held up the demand for industrial diamonds. Neither the fact that the group profit of De Beers Consolidated Mines fell in 1953 from £26.9 million to £25.0 million nor the cautious review of the chairman, which indicates that the demand for industrial stones may fall further this year, should cause investors to lose their perspective. The De Beers group continues to enjoy high prosperity; Sir Ernest Oppenheimer expects 1954 to be "another satisfactory year."

Far more than the fate of the De Beers shareholders hangs on the fulfilment of that promise. De Beers millions have become the fountain from which much of South Africa's industrial and mining development outside the diamond industry has been irrigated. The development of the goldfields of the Orange Free State, of the South African coal mines, of its chemical industry and of a host of smaller industries would have been far more difficult had Sir Ernest not boldly taken the decision to use De Beers money outside the diamond industry.

	Years to Dec. 31, 1952	1953
Consolidated earnings:—	£	£
Total revenue	33,432,277	31,386,424

8s. deferred shares at 89s. 0d. yield £11 4s. 9d. per cent.
(a) Includes £6,614,388 credit adjustment of diamond stocks value from £1 nominal to cost.

That process has continued. Loans to other companies on December 31st amounted to £20.6 million compared with £14.4 million a year earlier, investments from £14.6 million to £18.7 million. These loans are not to the subsidiary diamond mining companies. Consolidated Diamond Mines of South West Africa shows hardly a change in its debts to the holding company which are just under £30,000. The lame duck of the group, Premier (Transvaal) Diamond Mining Company, still owing its preference shareholders arrears from 1932 now amounting to £2,150,000, is paying off the debt. It made a profit of £967,603 compared with £1,354,465, and got its debt to the parent down from £995,662 to £156,994. Sir Ernest expects the end of the debt repayment to come this year after which a process of building up the trading and emergency funds by £900,000 to £1 million must come before shareholders get anything. Preference dividends from Premier may still be far away, but the holding company attaches a value to the preference shares. During the year it bought at £4 10s. 10d. per share a further 445 shares from the small outside holding of these 250 per cent shares which now carry 5,500 per cent of accumulated arrears.

De Beers Industrial Corporation, which with ICI shares control of African Explosives and Chemical Industries, has taken a small additional loan from the holding company. The outstanding loan is up from £2.4 million to £2.6 million. But publicly raised capital is doing the development job for African Explosives. The answer must be that through De Beers Investment Trust the finances of the group are still pouring out to develop the gold and coal resources of South Africa. They can continue to pour out for the group still holds cash and call money of £11.4 millions compared with £15.9 millions a year ago, and the diamond market continues to show an excellent demand for gem stones. For industrial diamonds the demand is less good and Sir Ernest Oppenheimer discloses that the spurt in sales in the first quarter of this year was due to an unexpected revival of stockpile demand.

★

UNITED MOLASSES. This company has two strings to its bow; it is a ship-owning group with a stake in Sugar Line now building six ships for the bulk transport of sugar. It owns the capital of Anchor Line with three passenger liners and five cargo liners; and it owns Athel Line and Tankers Limited with tanker fleets of 148,537 tons. Some of the tankers fortunately have been put on long-term charter to the oil companies. The future is thus wrapped up with the fortunes of shipping from the difficult end of the business right through to the remunerative oil charters.

United Molasses is also a commodity trading group whose fortunes are always closely linked with molasses, and therefore with the economics of the sugar cane. The commodity must compete on price for its two main outlets—animal feeding stuffs and the distillation of alcohol. Last year the group suffered setbacks both in shipping and in molasses. The chairman, Mr G. W. Scott, tells shareholders that the wide fluctuations in price of molasses limited the expansion of the feed trade, while distillers, particularly in the United States, found it paid them to change over to synthetic alcohol. In shipping the group shared with other shipowners the effects of the decline in freights. A fall in gross earnings before depreciation from £7.2 million to £4.9 million and in net profits after tax from £2.1 million to £1.3 million was the result.

It must distress shareholders to learn from their chairman that the prospects this year are for a further decline in the gross profit. Mr Scott is budgeting for increased sales of molasses both in the United States and in this country. Since early this year consumption by distillers has shown marked improvement. As a trader, not a producer, the group's interest is in steady and fairly low molasses prices to foster the outlet for feed and discourage the building of more synthetic alcohol plants. That at the moment is what the market is providing. But that improved outlook is offset by the absence of any sign of improvement in the shipping business. Shareholders may still draw modest comfort from the fact that the chairman's warning is of a decline only in the gross profit; the absence of any mention of the net profit may be significant. Molasses was a heavy EPL payer. In 1953 it provided £326,450 for EPL compared with £825,000 in 1952. So if the fall in the gross profit is no greater than £326,000 this year net earnings would be unaffected. Moreover, with six new ships and one coaster building the group is one of the main beneficiaries of the new investment allowance.

	Years to Dec. 31, 1952	1953
Consolidated earnings:—	£	£
Trading profit	7,103,914	4,652,740
Depreciation	1,021,189	939,078
Taxation	4,217,422	2,752,207
Net profit	*2,121,815*	*1,288,182*
Ordinary dividends	635,212	708,507
Ordinary dividends (per cent)	20·06 (gross)	21·97 (gross)
General reserve	1,160,000	500,000
Added to carry forward	190,355	*Dr. 11,413*

Reserves	11,065,559	12,263,891
Future tax	3,118,651	2,337,894
Ordinary capital	5,863,500	5,863,500

10s. ordinary stock units at 34s. 9d. xd yield £6 6s. 6d. per cent.

Mr Scott considers that profits will still be sufficient to cover "normal dividend requirements." There may be some doubt about what the group's normal dividend is. Stockholders will probably assume that their chairman is foreshadowing the maintenance of last year's total distribution of 1s. 2½d. tax free per 10s. unit (21.97 per cent gross) but without the special distribution of 4d. per share from capital reserve. The chairman may well permit himself such modest hopes; the net cost of the ordinary and preference dividends together is only £749,000. The net profit after tax even in 1933 was £1.3 million, and the group maintains a formidable strength. Cash short loans and tax certificates stand at £7.6 million and British Government securities are worth a further £6.5 million. The heavy cost

of the shipbuilding programme doubtless compels the maintenance of high liquidity.

★

UNITED DRAPERY. The ordinary share capital of Prices Trust was acquired by United Drapery Stores last year. At the date of the balance sheet (January 30th) 97.9 per cent was held at a cost of £4,686,851. The full accounts now show more of how the investment has been progressing. The chairman, Sir Brian Mountain, discloses that, of the purchase consideration, £967,500 has been deferred until July 31, 1955. Secondly, the unaudited accounts of Prices Trust, for the 7 months ended January 30, have been aggregated with the results of the group's results and set beside the same figures excluding Prices Trust. The results show that in those 7 months Prices earned, before tax, £227,035, bringing the group total up to £2,828,619. After tax the net figure attributable to the parent was £68,064 from Prices Trust, bringing the group total up to £918,013. The figures indicate some recovery in the earnings of Prices Trust from the previous lean period and together with United Drapery Stores' own favourable results they lead the chairman to report of the whole group: "Turnover since the beginning of February again shows an increase over the corresponding period last year." Provided that economic conditions do not change materially for the worse he expects the company's progress to continue.

★

INTERNATIONAL PAINTS (HOLDINGS). An unexpected free scrip issue is announced by International Paints which proposes a one for three bonus in 4s. ordinary shares. The bonus decision does not mark any rise in profits. The dividend for 1953, for which the new bonus shares do not rank, has been only maintained with a final payment of 14 per cent again making 20 per cent for the year. Profits were rather less than maintained. The group profit before tax was £1,376,045 compared with £1,437,324, though the net sum attributable to the parent company showed a modest increase at £574,723

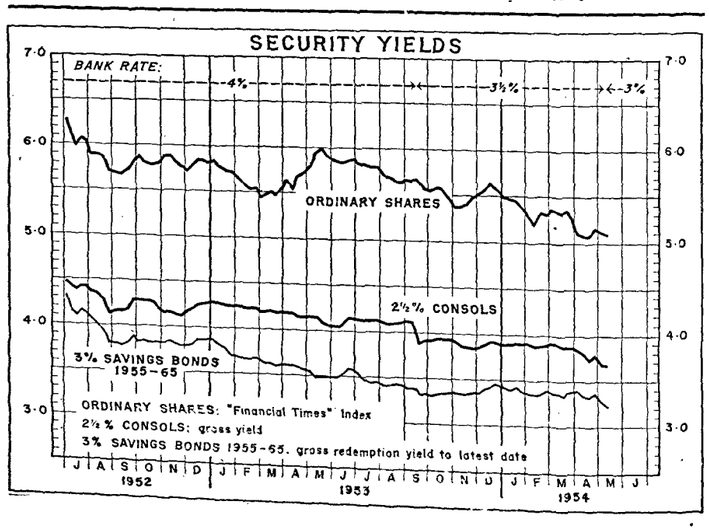
	Years to Dec. 31, 1952	1953
	£	£
Group profit before tax	1,437,324	1,376,045
Taxation	539,627	513,742 (a)
Net profit	*632,788*	*631,063*
Attributable to holding company	528,731	574,723
Preference dividends	6,450	6,600
Ordinary dividends	173,980	176,385
Ordinary dividends (per cent)	20	20†

4s. ordinary shares at 18s. 3d. yield £4 7s. 8d. per cent.
(a) After deducting £7,050 for adjustment of taxation relating to previous years.
† Also proposed scrip issue of one for three.

compared with £528,731. Earnings of the Brazilian subsidiary have been brought in at the free market rate of exchange of Cr$ 150 to the £. The 20 per cent dividend was approximately three times covered by last year's earnings, so that shareholders will naturally hope that the rate of distribution will not be proportionately reduced after the bonus issue.

★

MARKS AND SPENCER. The full accounts of Marks and Spencer for the year to March 31 throw a little further light on the advance of this progressive multiple group which has already announced dividends amounting to 65 per cent before giving effect to the 100 per cent share bonus, compared with 50 per cent. During the past year the company has added nearly £1.8 million to its properties and equipment which stand at £13.4 million compared with £11.6 million; its stocks have grown with expanding trade to £7.8 million compared with £5.8 million. The gross income before depreciation has risen to £10 million compared with £8.5 million.



LONDON STOCK EXCHANGE

Next Account begins: June 9th.
Next Contango Day: June 9th.
Next Settlement Day: May 25th.

THE main feature on the Stock Exchange was a reaction in the gilt-edged market after the bank rate reduction had revealed a speculative position. Declines were substantial at the beginning of the week. War Loan 3½ per cent touched 87⅜ on Monday a full point lower than the price just after the bank rate announcement, Consols 2½ per cent reached 67⅛, also a fall of a point in the same period. But by Wednesday it was clear that prices were again moving gradually upwards. The *Financial Times* index of Government securities at 103.04 showed a modest advance of 0.07 on the week though it remained lower than it was just after the bank rate announcement.

Industrial securities have tended to copy the movements of gilt edged but without such pronounced weakness early in the week. The industrial index reached a new peak of 149.9 on Friday of last week since when it has remained slightly below that level. The new account then opened strongly on Wednesday. The stores group went particularly well: Gussies rose 2s. 3d. on Wednesday, House of Fraser 2s. to 80s. 6d. and United Drapery 1s. 9d. to 64s.

With the start of the new account the arrangements recently worked out for the resumption of dealings in German Dawes bonds took effect. Holders may now lodge non-British tranches of the loan for transmission to overseas agents. There are now no less than 15 types of Dawes scrip in the market; the unassented bonds, the assented bonds and the funding scrip have each been subdivided into their British, French, Belgian, Dutch and Swiss tranches. Although dealings have been suspended for 6 weeks the resumption did not find any accumulation of selling orders and the British assented stock which opened at 80 rose to 83½.

With the arrival in this country of the $13,236,000 resulting from the Manila Railway sale Manila stocks advanced. The "A" debenture rose 3 points to 144, the ordinary being firm at 8s. 9d. J. & P. Coats rose 3s. 9d. to 62s. 3d. on Friday on the increased dividend and scrip issue.

(1) Relates only to prices in capital cities for Austria, France, Greece and Turkey. Cost of living in Paris based on 1949=100, and in Western Germany on July–December, 1948=100. (2) Index numbers of unit value which compare the current average value of trade with its value in 1948; they are influenced by changes in the composition of trade as well as price movements. Index numbers for Germany based on 1950. (3) Notes only for France and Austria. (4) Holdings of the government and central bank at end of period · figures for Greece are gold reserves only.

Financial Statistics

EXCHEQUER RETURNS

For the week ended May 15th, there was an "above-line" surplus (after allowing for Sinking Funds) of £893,000 compared with a surplus of £45,703,000 in the previous week and a deficit of £18,293,000 in the corresponding period of last year, bringing the cumulative deficit to £14,227,000 (£26,223,000 in 1953-54). Net expenditure "below-line" absorbed £7,822,000, raising the total cumulative deficit to £42,136,000 (£72,213,000 in 1953-54).

THE MONEY MARKET

At the Treasury bill tender following the reduction in Bank rate on Friday of last week the average rate of discount fell by 6s. 9d. to £1 14s. 1.75d. per cent per annum, its lowest level since early March, 1952. The market increased its bid from £99 9s. 9d. to £99 11s. 5d., involving a reduction in its rate of discount by 11/32 per cent. As the total offer was up by £20 million to £260 million and applications fell by £15 million to £391.7 million, the market's allotment rose from 42 to 50 per cent. At yesterday's tender the offer was again increased, to £270 million.

In Lombard Street the basic pattern of money rates remained stable after the adjustments made on Thursday week. The banks' buying rates for July and August Treasury bills after the Treasury bill tender were generally 1 21/32 per cent. Credit was in fairly short supply during the week covered by the Bank return. On Thursday and Friday of last week the authorities made small purchases of bills, directly and through the banks, but on Wednesday no such relief was given and a number of houses were forced to seek 7-day loans at the Bank at 3 per cent.

In the gold market the range of prices continued to hover round 249s. though on Wednesday the price at the fixing dropped to 248s. 10½d. Business was slightly more active than in the preceding two weeks.

The Bank return shows a reflux of notes of £3.1 million. For the fourth successive week there was a fall in bankers' deposits —of £3.2 million, bringing them to £267.4 million.

COMPANY MEETINGS

ANGLO-IRANIAN OIL COMPANY

MAIN PROGRAMME OF CAPITAL EXPENDITURE SHOULD BE COMPLETED DURING 1955

FORMATION OF CONSORTIUM TO NEGOTIATE SETTLEMENT OF IRANIAN DISPUTE

EXPLORATION ACTIVITIES FURTHER EXTENDED

TOTAL SALES IN 1953 INCREASED BY 14% TO 37 MILLION TONS

SIR WILLIAM FRASER'S STATEMENT

The forty-fifth annual general meeting of the Anglo-Iranian Oil Company, Limited, will be held on June 10th at Britannic House, Finsbury Circus, London, E.C.

The following is the statement by the chairman, Sir William Fraser, CBE, LLD, which has been circulated to stockholders with the report and accounts for the year ended December 31, 1953:

Since the last annual general meeting Field-Marshal Viscount Alanbrooke, who has been an ex-officio director since 1946, has retired from the board; we shall much miss the wise counsel and wide experience of so valued and distinguished a colleague. Her Majesty's Treasury has appointed to succeed him Sir Gordon Munro, whom we welcome to the board.

In January last we sent to all stockholders a booklet of about a hundred photographs illustrating the wide range of the company's activities during 1953. This booklet, which was also distributed to the company's staff and business associates, was so well received that we propose to issue it annually in future at each year end, and consequently fewer photographs than usual are included in this statement. As with the showings of the company's films arranged in 1952, we feel stockholders will appreciate this further source of information about the company's operations.

BALANCE SHEET AND PROFIT AND LOSS ACCOUNT

The accounts for 1953 have been prepared in the same form as those for the previous year. Assets and liabilities representing the company's interests in Iran remain included in these accounts at substantially the same figure as for 1951 and 1952. When a settlement regarding those interests is concluded with the Iranian Government, it is your Board's intention to make all such adjustments as may be entailed thereby in the form and contents of these accounts.

Consolidated trading profit and other income for 1953 was £43,827,585 after provision of £20,056,243 for depreciation on fixed assets, allied companies and other trade investments and oil exploration interests. The gross consolidated profit thus totalled £63,883,828, comparing with £61,260,584 for 1952 when depreciation and other write-offs totalling £14,198,946 were provided.

The increase in depreciation of £5,857,297 is largely due to the reintroduction for taxation purposes of initial allowances as from April, 1953.

Income from subsidiary and allied companies is greatly increased this year, but last year's figures were abnormally low.

A new item appearing in the profit and loss account is interest on the debenture stock issued in January, 1953. The discount on and expenses of this issue have been completely written off.

Our claim for relief from United Kingdom taxation in respect of Kuwait taxation has still not been agreed by the Inland Revenue authorities. In view of the uncertain position we have again provisionally treated Kuwait taxation as a charge against trading profits for all purposes. Kuwait tax for 1952 amounted to £26,822,157, and for 1953 £30,748,542. Should our claim ultimately be accepted the net increase in the group's tax-paid profits to the end of 1953 could approximate £20 million.

The item of cost of land, oil wells, pipelines, refineries, etc., in the consolidated balance sheet shows an increase of £57,867,311, almost entirely due to expenditure on our refineries in the United Kingdom, Aden and Western Australia, as itemised below.

In the Anglo-Iranian Oil Company Limited's own balance sheet the item land, refinery, tank installation, etc., shows little change in the cost figure at £124,635,508, although the depreciation figure at £67,156,888 shows a reduction of £4,033,961. This is mainly because although expenditure on our Aden refinery has been added to the cost figure, our Kent refinery has been transferred at written-down value to a subsidiary company, a transfer whose effects disappear on consolidation. Similarly the increase from £58,954,999 to £100,180,423 in advances to subsidiary companies is due chiefly to this transfer of expenditure on Kent refinery and to expenditure on our Western Australia refinery. In the consolidated balance sheet the whole of this refinery expenditure is included in the heading land, oil wells, pipe-lines, refineries, etc., and does not show as investment in subsidiary companies.

In the consolidated balance sheet, tankers and auxiliary vessels stand at the net figure of £11,295,910 compared with £12,056,676 last year. Although capital expenditure on tankers during the year amounted to £8,529,522, this is more than offset by the depreciation of £8,524,382 provided and the book profit on the sale of certain vessels during the year.

Shares in subsidiary companies show an increase of £5,105,763, chiefly due to the capitalisation of advances to certain of our marketing subsidiaries. It will be noted that in total our investment under the heading of subsidiary and allied companies is practically unchanged from last year's figure.

CAPITAL EXPENDITURE

Total capital expenditure during 1953 was just under £75 million, financed by the proceeds of the debenture issue, retained profits and reduction of net current assets. This capital expenditure included the following main items:

	£
Aden Refinery	26,500,000
Kent Refinery	14,600,000
Kwinana (W. Australia) Refinery	10,700,000
Other UK Refineries	4,300,000
Tankers	8,500,000
Oil Exploration Interests ...	4,500,000
Marketing Interests	4,000,000
	£73,100,000

Capital expenditure in 1954 continues to be heavy, being of the order of £60 million. As at present foreseen, our main programme of capital expenditure should be completed during 1955, making our requirements thereafter considerably smaller than in the past few years.

After providing £19,342,232 for taxation on profits, the amount available for reserves and dividends is £24,382,850 compared with £25,165,966 for 1952. Your directors are of the opinion that there is no need to increase the preference stock reserve which already stands at £10 million; they have placed £14 million to general reserve and have recommended a final dividend on the ordinary stock of 25 per cent, and in addition a cash bonus of 2s. 6d. per £1 stock unit, both less income tax. The total distribution for the year approximates 7 per cent on the ordinary stock plus general reserve.

THE COMPANY'S INTERESTS IN IRAN

A year ago in my statement to stockholders I summarised the course of events in 1952 and early 1953 regarding the company's interests in Iran. At that time the Iranian Government had rejected the latest proposals for a settlement of the dispute which had been submitted through the good offices of the United States Ambassador in Tehran. There then seemed no immediate prospect of reaching agreement with the Iranian Government, either for arrangements to enable large scale activity of the industry to be restored, or for the assessment and payment of compensation to the company.

As stockholders will be aware, there was a change of government in Iran during August, 1953. It was thereafter the aim of Her Majesty's Government to secure the resumption of diplomatic relations, which the former Iranian Government had severed in October, 1952.

With a view to exploring on a tentative and hypothetical basis the problems involved if and when Iranian oil should again flow into its traditional markets, I sent invitations early in December, 1953, to the principals of seven other major oil companies to join with us in talks in London. These companies comprised five American companies, namely Standard Oil (New Jersey), Socony-Vacuum Oil, Standard Oil of California, Gulf Oil and Texas, together with Royal Dutch-Shell and the Compagnie Française des Pétroles. Each company is concerned with the production and marketing of Middle East oil on a large scale and can in consequence contribute constructively to a solution of the Iranian problem as a whole and to the restoration of Iranian oil to the world markets.

The invitations were accepted, and principals of all seven companies assembled here for talks during December. There was a general desire that the Anglo-Iranian Oil Company should find itself able to resolve the Iranian oil problem on its own, but all the companies were prepared to join in discussions with a view to the provisional formation of a "consortium" of companies which would endeavour to conclude an agreement with the Iranian Government, if that should prove to be a more acceptable alternative.

In the meantime, in a joint communiqué on December 5, 1953, Her Majesty's Government and the Iranian Government had announced the resumption of diplomatic relations; the communiqué went on to state that the two Governments would proceed at the earliest mutually agreed moment to negotiate a settlement of the oil dispute which had recently clouded relations between them. Mr D. Wright left London shortly afterwards to take up the appointment of Her Majesty's Chargé d'Affaires at Tehran, and there followed discussions on the oil problem between him and Iranian ministers. These discussions indicated that the best chance of reaching a solution lay in the formation of a Consortium of companies, and the Iranian Government itself expressed a wish to seek a solution on such a basis rather than through a single company.

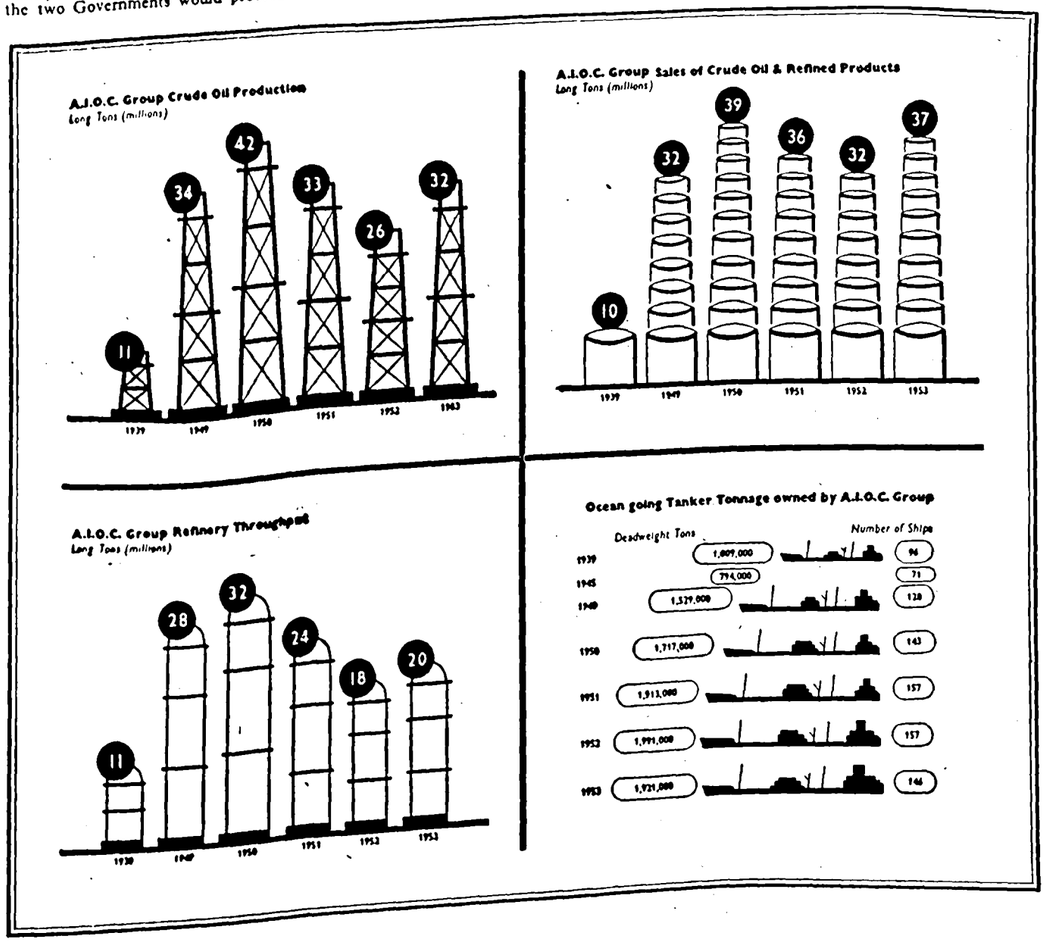
The Iranian Government was therefore informed by Her Majesty's Chargé d'Affaires in January of this year that it had been decided that the Anglo-Iranian Oil Company would resume its talks with the same seven companies in order to see whether it was feasible to form a Consortium, in which the Anglo-Iranian Oil Company would have an appropriate share.

Accordingly, talks with representatives of the companies began on February 1, 1954, the principals of the companies participating at a later stage. There took place an examination both of proposals to be submitted by the Consortium to the Iranian Government, and also of the arrangements which would apply between the companies comprising the Consortium. In the course of the discussions a technical mission representing the companies visited South Iran at the invitation of the Iranian Government. The companies thus had the benefit of up-to-date technical reports on the condition of the plant and equipment at the oilfields and refinery.

FORMATION OF CONSORTIUM

On April 9th an understanding was reached between the companies with regard to a basis for the provisional formation of a Consortium. The composition of the Consortium would be as follows: Anglo-Iranian Oil Company, with a 40 per cent share; the five United States companies, Standard Oil (New Jersey), Socony-Vacuum Oil, Standard Oil of California, Gulf Oil and Texas, with an interest aggregating 40 per cent; Royal Dutch-Shell with 14 per cent and the Compagnie Française des Pétroles with 6 per cent. The Consortium would not be established until there is an agreement with the Iranian Government which is acceptable to all the companies participating.

Throughout the period of these inter-company talks there had been close consultation between the company and Her Majesty's Government, and between Her Majesty's Government and the United States Government. On the same day as the understanding between the companies was reached the two Governments instructed their Ambassadors in Tehran to inform the Iranian Government with regard to the provisional arrangements which had been made, and to state that representatives of the Consortium could leave for Tehran for negotiations as soon as the Iranian Government was ready to receive



them. The Iranian Government immediately issued an invitation and a delegation of three negotiators, consisting of Mr Orville Harden of Standard Oil (New Jersey), Mr J. H. Loudon of Royal Dutch-Shell, and Mr H. E. Snow of the Anglo-Iranian Oil Company, left London on April 10th. Mr J. M. Pattinson and members of this and the other companies' staffs have accompanied the delegation to Tehran.

Parallel with the negotiations between the Consortium delegation and the Iranian Government, negotiations with regard to the compensation to be paid to the Anglo-Iranian Oil Company by the Iranian Government are being conducted by Her Majesty's Ambassador, who arrived at Tehran in March. It had been agreed that this question, with which the other members of the Consortium are not directly concerned, should be dealt with separately.

The two sets of negotiations are now in progress and I will not comment further at this stage. Any developments between now and the annual general meeting will be reported to you on that occasion.

Pending a satisfactory conclusion to these negotiations, Her Majesty's Government, on their own behalf and on that of the company, have of course reserved their full legal rights. The company has continued with all necessary legal action to protect its rights in oil cargoes derived from the area of the company's operations in Iran, and exported overseas. The legal proceedings referred to in my statement of a year ago have undergone a number of adjournments. In Nairobi the appeal from the judgment of the Supreme Court at Aden has not yet been heard, and there have been no decisions as yet on the merits of the company's suits before the courts in Italy and Japan over the ownership of the various cargoes which have been shipped from Iran to those countries.

PRODUCTION AND EXPLORATION

Crude oil production in Kuwait, Iraq, and Qatar was again substantially increased during 1953, when our offtake from those sources totalled some 32,200,000 tons, compared with 25,600,000 tons in 1952.

Kuwait was again our major source of supply in 1953, our offtake being 23,316,000 tons, compared with 19,820,000 tons in 1952. Production began in February, 1953, from the northerly extension of the Burgan field at Magwa, where there were 22 producing wells by the end of 1953, 13 wells having been completed during the year. Oil has also been proved and development drilling is proceeding at Ahmadi in a subsidiary structure east of the main Burgan field. Tanker loading facilities at Kuwait have been increased by the laying of submarine lines to three new buoy berths.

Our offtake from the Iraq Petroleum Company's production was 6,780,000 tons, compared with 4,295,000 tons in 1952, the increase being due to the use throughout 1953 of the new 30-inch pipeline to the Mediterranean from Kirkuk commissioned in April, 1952.

From the Mosul Petroleum Company's Ain Zalah field we received 295,000 tons, compared with 38,000 tons in 1952. Exploration in this area has proved oil at Butmah, whose potentialities are now being assessed.

Development of the Basrah Petroleum Company's Zubair field continued and our offtake was 744,000 tons, compared with 547,000 tons in 1952. A new field discovered at Rumaila is being actively developed.

From Quatar we obtained 1,018,000 tons, compared with 775,000 tons in 1952.

The Khanaqin Oil Company produced 520,000 tons, which were sold to the Iraq Government in accordance with our agreement, from the Naft Khanch field in north-east Iraq. This compares with 492,000 tons in 1952. Wells are now being drilled at Chia Surkh and Naft Khanch to enable the deep oil prospects of these structures to be evaluated.

In the United Kingdom our crude oil production was 54,600 tons compared with 55,400 tons in 1952 ; a new small oilfield was discovered at Plungar in Leicestershire at the end of the year. We have agreed with the Gas Council to explore on their behalf for natural gas in the United Kingdom. This is to be a large-scale exploration spread over a five-year period at an estimated cost of £1,000,000, the work to be carried out for the Gas Council by our subsidiary, the D'Arcy Exploration Company which, as well as wide experience in other parts of the world, has a unique knowledge of geological and drilling conditions in the United Kingdom. We are glad to be associated with the Gas Council in this search for natural gas supplies which, if successful, will be of considerable importance to the national economy. Survey work commenced in November last, and drilling began at Cousland in Scotland early this year.

In Scotland, production of shale-oil in 1953 was 104,000 tons, 2,500 tons less than in 1952. Costs of supplies, such as coal and pitwood, increased again during 1953 and prices obtained for products decreased. The shale industry thus continued to operate at a loss during 1953. In mid-October the excise duty on hydrocarbon oils produced from United Kingdom sources was reduced by 6d. per gallon, making the excise duty 1s. 3d. per gallon compared with the duty of 2s. 6d. per gallon on imported oils. This relieved the exceedingly difficult situation which the shale-oil industry was facing when I addressed you last year, and has enabled wages to be increased.

Our range of exploration activities in other parts of the world has been further extended. In Papua, where our joint undertaking with Australian and American interests continues to progress, a test well at Omati has encountered an interesting show of high-pressure gas at 13,743 feet ; this is believed to be the deepest so far drilled in the southern hemisphere. Another well is being drilled at Omati, and the northern delta area at Kuru, one of the most promising locations indicated by geological and geophysical surveys, is to be test-drilled in the near future.

In Australia, the Frome-Broken Hill Company, in which we are associated with Australian and American interests, has resumed its search for oil.

In Canada, we have acquired an interest in the Triad Oil Company which has well spread holdings in the proved or potential oil-bearing areas of Western Canada.

In Africa, extensive surveys and drilling have continued in Nigeria in partnership with the Royal Dutch-Shell Group. Oil of good quality was located and an intensified drilling programme is in hand to define the importance of this discovery. In East Africa, we are also working in co-operation with the Royal Dutch-Shell Group, and surveys have been carried out on the mainland and in Zanzibar Protectorate ; a suitable site for a first test well has been located on Mafia Island in Tanganyika and drilling will shortly begin.

In Trinidad, where we hold a one-third interest in Trinidad Northern Areas Limited, a well drilled on the mainland was unsuccessful. Test drilling underwater in the Gulf of Paria is being undertaken this year.

In Sicily, geological and geophysical surveys have been completed and a test well started at Vittoria in September has reached below 7,000 feet, with some indications of potential oil production.

Exploration of the two marine areas off the Trucial Coast in the Persian Gulf which I mentioned last year began in February, 1954.

REFINING

Our total refinery throughput during 1953, at 20 million tons, was 2 million tons greater than in 1952. With the new Aden refinery coming into commission this summer, and Kwinana refinery early next year, as well as expected increases in capacity of some of our existing refineries as mentioned below, our total refining capacity by the end of next year should be some 30 million tons, as anticipated in my statement to you last year. Parallel with this expansion in refining capacity, our refining operations and the quality of products are being continuously improved by the installation of new plant, some of which is described below, in a constant effort to achieve the most efficient and competitive production.

In Great Britain, our refinery throughput in 1953 was 9,327,000 tons against 6,788,000 tons in 1952.

This large increase was due to the coming into operation in February of the new Kent refinery, which processed 2,792,000 tons in 1953. Installation of new plant at this refinery proceeded satisfactorily, the catalytic cracking plant coming into service in October and the kerosine plant in December last, while the lubricating oil plant comes into production this month.

Llandarcy refined 3,883,000 tons against 4,254,000 tons in 1952, the decrease being due to reduction of the abnormal throughput at which this refinery had been working since our operations at Abadan ceased and pending the commissioning of Kent refinery. Throughput at Grangemouth was 2,493,000 tons against 2,375,000 tons in 1952. Catalytic cracking plants were commissioned early in 1953 at Llandarcy and Grangemouth, and good progress is being made with the installation of a platforming unit at Llandarcy and a catalytic polymerisation plant at Grangemouth.

At Pumpherston refinery, which processes Scottish shale-oil and crude petroleum produced in the United Kingdom, throughput was unchanged at 159,000 tons.

BRITISH PETROLEUM CHEMICALS LIMITED

Good results have been obtained from the Grangemouth plant of British Petroleum Chemicals, Limited, now a major supplier of alcohols for industrial purposes. Production of ethyl alcohol, a vital raw material for the chemical industry, now represents a significant proportion of the total United Kingdom supply. The adjacent plant of Forth Chemicals, Limited, for the production of monomeric styrene was brought into commission during the year and has operated most satisfactorily. Forth Chemicals, Limited, has decided to double the capacity of this plant. It is gratifying that our entry, with partners, into the field of synthetic petroleum base chemicals is proceeding so well.

In Belgium, the refinery at Antwerp which we own jointly with the Petrofina Company processed 1,787,000 tons, against 1,718,000 tons in 1952. It is intended to increase the capacity of this refinery to 2,700,000 tons during the next twelve months, and catalytic cracking and polymerisation plants are being installed.

In France, throughput of the Lavera and Dunkirk refineries of Société Générale des Huiles de Pétrole BP totalled 3,927,000 tons, against 3,758,000 tons in 1952.

In Germany, our Hamburg refinery processed 705,000 tons, against 663,000 tons in 1952. During 1954 this refinery's capacity will increase to 1,250,000 tons on completion of the additional plant mentioned last year. At the Oelwerke Julius Schindler refinery throughput was 195,000 tons, against 177,000 tons in 1952.

In Italy, the Marghera (Venice) refinery of Industria Raffinazione Olii Minerali, which we own jointly with Azienda Generale Italiana Petroli, refined 1,381,000 tons of crude oil, against 1,170,000 tons in 1952. A catalytic polymerisation unit and a lubricating oil plant were commissioned during 1953.

In Israel, the refinery at Haifa continued working at about one-quarter of its capacity, the 1953 throughput being 860,000 tons for local consumption.

The Kuwait refinery processed 1,427,000 tons, an increase of 155,000 tons over 1952.

In Australia, at Laverton (Melbourne) refinery throughput was 165,000 tons, against 161,000 tons in 1952. At Kwinana in Western Australia good progress is being made with the construction of our new 3 million tons capacity refinery, which is expected to be in operation in the spring of 1955.

At Aden the construction of our new 5 million tons capacity refinery is ahead of schedule, and is to come into operation in August this year. This is about four months in advance of our best expectations, and represents a remarkable feat of successful planning and construction by our team of staff and contractors.

SEA TRANSPORT

The British Tanker Company's fleet, at this time last year, numbered 151 ships totalling 1,934,000 deadweight tons. Since then 16 old ships totalling 161,000 deadweight tons have been disposed of, and seven ships (two of 32,000 and five of 16,000 deadweight tons) totalling 144,000 deadweight tons have been added to the fleet, making its present total 142 ships of 1,917,000 deadweight tons. The fleet is thus slightly smaller both in number of vessels and total tonnage, but this is more than offset by its increased proportion of larger, faster and newer ships. These three factors combine to enable the present fleet to carry a larger total tonnage more economically than ever before, a trend which will continue as new large vessels come into service and old small ones are disposed of. The 28,000 and 32,000 ton tankers, employed mainly in carrying crude oil from the Middle East to our refineries, are proving particularly efficient and economic in operation.

Now under construction or on order we have 20 ships totalling 474,000 deadweight tons, including ten of 32,000 tons. Four of the ten 16,000 ton ships ordered by the Lowland Tanker Company for our service are now in commission ; two are expected to be commissioned later this year and the remaining four next year.

In addition to our own fleet we continue to have over 2 million deadweight tons of tanker shipping on charter.

The written down value of the British Tanker Company's fleet in service at December 31, 1953, was £3 9s. 4d. per deadweight ton, and the average age per deadweight ton of the vessels was just under eight years. While the cost per deadweight ton of building tankers varies according to the size of the vessel, an average figure is of the order of £65.

DISTRIBUTION AND SALES

World demand for petroleum products (excluding the Iron Curtain countries) increased by about 5 per cent in 1953, a similar rate to that experienced in the preceding year. In the Eastern Hemisphere the increase in consumption was about 8 per cent, only fractionally less than in the preceding year ; this represented some 10 million tons of oil products and was more than covered by increases in crude oil production capacity, notably in Kuwait and Iraq, and by expansion in refinery capacity which during the year was augmented to the extent of 24 million tons per annum.

1953 was our second full year without supplies from Iran. As reported in my statement last year, although the Anglo-Iranian Group's sales of over 32 million tons of crude oil and products in 1952 were 3 million tons below those for 1951, our position had been improving and in the second half of 1952 sales were at a higher level than in the first half and some 11 per cent above those for the second half of 1951. This improvement continued, with the result that the Group's sales of crude oil and products in 1953 increased by 4½ million tons, or just over 14 per cent, compared with 1952, and totalled just under 37 million tons. This increase occurred mainly in crude oil sales ; sales of refined products increased by rather over 1 million tons, and were supplied to a greater extent from our own resources. Although we had, in order to meet our marketing requirements, to continue both to hire refinery capacity and to purchase large quantities of products, we were able, aided by the commissioning of the Kent refinery, to reduce the hiring of refinery capacity from 3 to 2½ million tons and purchases from 7 to 6½ million tons.

In the summer of 1953 there occurred the first general rise in the level of crude oil prices since 1947. Prices in the world market for the main products were adjusted initially to reflect the full extent of the increase in crude oil costs to the refiner, but there was a recession over the latter months of the year in motor spirit prices. The fall in tanker freight rates in the latter half of 1952, to which I referred in my last statement, continued throughout 1953 but in a much sharper degree, and these lower freight charges were appropriately translated into reduced selling prices in our markets. The level to which tanker freights had fallen by the end of 1953 was, however, so low that further reductions in the selling prices of products from this direction can scarcely be expected. Indeed, it would be more realistic to expect some recovery in freight charges before a point of equilibrium is reached, for the freight rates current towards the end of last year had dropped to a point at which the economic operation of the volume of tanker tonnage necessary for the world's oil trade would not be practicable for any sustained period at today's cost of construction and maintenance.

In Australia considerable further progress has been made with improving and expanding the distribution and marketing facilities of The Commonwealth Oil Refineries Limited, a wholly owned Anglo-Iranian subsidiary since our purchase of the Australian Government's shareholding as reported last year. The company is thus enabled to share in the Commonwealth's growing petroleum business sales by COR during 1953 showing a very satisfactory increase.

Both in Australia and New Zealand we are still confronted with the problem, mentioned below, of economic supply because of our lack of refinery capacity East of Suez. Also the petroleum industry, particularly in Australia, suffers from a price control system which permits little or no allowance for the considerable increase in internal costs brought about by higher commodity prices and wages ; the official cost-of-living index in Australia showed an increase of over 50 per cent between 1949 and 1953, without any corresponding increase being recognised in petroleum distribution costs.

SEVERE COMPETITION IN ALL MARKETS

As forecast last year, severe competition has been experienced in all our markets, and trading conditions have been far from easy. Particularly was this so in our Continental markets where to the pressures caused by a surplus of refining capacity has been added the new factor of a resumption of exports of Russian and Rumanian oil. It is, therefore, satisfactory to record an overall increase in sales by our Continental subsidiary and associated companies of 10 per cent compared with 1952.

In India, Pakistan, and in our other outlets in East and South Africa, the Rhodesias, Egypt and the Sudan, etc., our trading position has been maintained or improved upon.

Our aviation spirit business is still dependent on purchased supplies, and sales were at approximately the same level as in 1952. The market for aviation turbine fuels continued to expand, and despite highly competitive conditions our sales were increased. The BP Aviation Service continues to supply in whole or in part the aviation fuel requirements of a number of the major international air lines, of non-scheduled operators and private operators. The efficient servicing of participants in the United Kingdom to New Zealand Air Race by our airfield fuelling organisation materially contributed to the low times recorded.

The BP International Oil Bunkering Service has again met the extensive requirements of an important part of world shipping and it is most gratifying that shipowners have continued to support the company and our associates. Bunkering facilities have been improved and developed to ensure an even better BP service to shipping.

In view of our increasing production of lubricating oils, I am glad to say that our business both in automotive and industrial grades is expanding most satisfactorily. BP Energol lubricants were introduced during the year into Australia, New Zealand, Sweden and Norway, and by mid-1954 our lubricating oil will be available in all countries where we have general marketing interests.

In the United Kingdom the total inland consumption of petroleum products showed a welcome upward trend during 1953 as a result of the improvement in general industrial activity, and was particularly marked in the case of fuel oils. Motor spirit consumption showed some expansion despite the effects mentioned below of its present heavy taxation : the increasing demand for premier grades has been well maintained. The public were quick to recognise the advantages which premier grades offered, and in the highly competitive market for the motorist's custom BP Super continues to do well. An increasing number of motorists are also recognising the virtues of BP Energol motor oils. Burning-oil sales have also been well maintained, and it would appear that the higher heating standards which the public demand today are being very satisfactorily met by the use of kerosene, in which the position of our marketing company Shell-Mex and BP, is very strong.

Marketing conditions in the early months of the present year have remained highly competitive. We are still suffering from the handicap of having to supply our Eastern markets uneconomically due to our lack of refining capacity east of Suez and the excessively long hauls in which we are thereby involved. The commissioning of Aden refinery later this year and Kwinana refinery early in 1955 will rectify this position.

There is coming more into evidence the problem of maintaining in the Eastern Hemisphere the necessary balance between the proportions in which the main refined products are needed and the proportions in which they

can be produced from crude oil. This problem is aggravated by the very high rates of duty so frequently imposed by Governments on motor spirit, often representing more than half the price paid by the consumer, so that consumption of motor spirit is being arbitrarily retarded and the use of diesel oil as road vehicle fuel is being artificially accelerated beyond the rate of development which the basic economy of the compression ignition engine would normally warrant.

RESEARCH

Particular attention is given in our research and development establishments to anticipating the changes in market demands for quantity and quality occasioned by improvements in engines and equipment using petroleum products. This also entails intensive research work on the new types of refinery plant required to meet these changing requirements.

No effort has been spared to maintain the outstanding quality of our premium grade motor spirit, BP Super, whose performance has been further developed in the interests of users and engine manufacturers alike. The Products Section of Sunbury Research Station, where all products are subjected to critical examination for performance and quality, has been further enlarged.

New and improved methods of analysing the complex hydro-carbon mixtures dealt with in refining and in the petrochemical field are being continually developed. Last year the further application of X-rays and the use of radio-active isotopes have made possible great advances in laboratory techniques. One example is a new apparatus which will greatly speed up the checking of tens of thousands of samples which have to be examined in each of our refineries every year.

Crude oil availability and quality have occupied a major part of our research programme. The problems connected with the discovery and development of new sources of crude oil are the particular province of our research centre at Kirklington Hall, where the application of entirely new techniques in seismic work is being studied. Research on the provision of instruments for obtaining electrical measurements in bore-holes and on the interpretation of such measurements has been carried on with successful results. Samples of all crude oils available to us are specially analysed at Sunbury to assess their suitability for use in our various refineries and crude oil markets. Where applicable these assays are followed by comprehensive pilot plant studies on larger samples. For this purpose pilot plants, reproducing every process used in our refineries are maintained at our research station.

PERSONNEL

Throughout 1953, the Company has continued to enjoy most loyal and efficient service from all groups of its personnel in the many and widespread spheres of its activities.

The various training schemes which the Company operates provide its employees with the fullest opportunities for their advancement. At the same time these schemes aim at ensuring for our operations a continuous supply of well-qualified and experienced personnel.

The year has been marked by a growing rate of expansion in our operations, and the many problems and additional work which have arisen have been tackled with zest and enthusiasm by all concerned. You will, I feel sure, wish me to thank on your behalf all the Company's employees, whether at home, afloat or overseas, for their excellent and devoted work during the year.

THE BRUSH GROUP LIMITED

(Formerly The Brush Electrical Engineering Company Limited)

RISING WAGES *v.* COMPETITIVE ABILITY

SIR RONALD W. MATTHEWS ON IMPROVED TREND OF TRADING

The sixty-fifth annual general meeting of The Brush Electrical Engineering Company, Limited, was held on May 20th, at Winchester House, Old Broad Street, London, E.C.2.

Sir Ronald W. Matthews, DL, MInstT (the chairman), presided.

The following is an extract from his circulated statement:

You are aware that your board has for some time past been seriously concerned at the continued shortage of available working capital and has constantly reviewed various methods of raising further permanent capital. As a step in this direction £940,000 of new capital was raised in September as 6 per cent cumulative convertible redeemable preference stock.

The net proceeds of this issue together with substantial reductions in stocks and work in progress have enabled us to achieve a reduction in bank borrowings, trade liabilities and other indebtedness. With the general improvement in the balance sheet and having regard to the not unsatisfactory trading position of the company your directors have felt justified in recommending the payment of a dividend at the rate of six per cent, less income tax, on the ordinary stock.

The year under review has been a period of keen price competition both at home and particularly in the overseas markets. A fall in turnover has been inevitable but the rate of gross profit earned on this reduced turnover by the group's English factories was almost the same as in 1952.

CHANGE OF NAME TO THE BRUSH GROUP LIMITED

You will no doubt have observed that during recent months we have adopted for group publicity purposes the title "The Brush Group." The significance of the former title the "BRUSH ABOE GROUP" was frequently misunderstood and your board has considered it desirable that a simpler title should be adopted. The board are now recommending that the name of the company should be changed to "THE BRUSH GROUP LIMITED." Assuming this is agreed, the title of the Brush Electrical Engineering Company, Limited, will be immediately passed to a subsidiary company which we shall employ to manage the Loughborough Works on behalf of the parent company.

We shall thus have The Brush Group Limited as the parent company, Brush Electrical Engineering Company, Limited, carrying on business on the electrical side, and the engine companies carrying on business under their own names as they do at present. No transfer of assets is involved in this arrangement.

The present policy of the board is to consolidate the structure of the group and to make the fullest possible use of our existing manufacturing facilities, which we consider to be fully adequate for our business.

Stockholders have no doubt noticed the recent announcement in the press that Associated British Engineering Limited has sold its substantial holding of Brush Stock to Thomas Tilling Limited. Your board welcome this association with an undertaking with such a distinguished history and wide repute.

The statement then reviews the group's widespread manufacturing interests, comprising the Loughborough factory, Brush Bagnall Traction, Limited, Hopkinson Electric Company, Limited, Petters Limited, J. and H. McLaren, Limited, the National Gas and Oil Engine Company, Mirrlees Bickerton & Day, Limited and Vivian Engine Works, Limited.

SALES

The statement continues: We have faced keener competition throughout the world. Nevertheless the net intake of new orders both for the home and export markets exceeded the figures of 1952 and the year closed with an improved trend which has been maintained during the first quarter of 1954. But we have not yet reached the position where our order intake is equal to our production and we have to face a situation in which not only price but short and punctual deliveries are an essential condition of success; and the continued upward trend of wages is threatening our ability to compete on price especially with our German competitors. Such a trend can only be justified by increased effort, for which we shall always be ready to provide appropriate incentives, and by economies in production to which contribution must be and is in fact being made at all levels in our organisation.

Our overseas sales force has been strengthened by the appointment of additional representatives in various parts of the world, and the establishment of branch offices in India, Pakistan and Venezuela. Your managing director, Mr Miles Beevor, visited India and Canada, two of our most important markets, during the year obtaining first-hand knowledge of the conditions prevailing in those countries.

It is evident that there is a large and rapidly expanding market in Canada for group products and our organisation in that country is being developed, to derive the maximum benefit. We are well aware that pro-British sentiment is not enough to secure business for us. We must prove to the customer, whatever his country, first that our products are "up-to-date" and efficient; secondly that they comply with his requirements rather than with what we think he should want; thirdly that they will be delivered on time; and fourthly that if need arises prompt and efficient service will be forthcoming on the spot. If we are to overcome competition both at home and abroad it is on these four points that we must stake our reputation.

One of your directors, Mr S. A. Lane, visited Moscow on two occasions recently and booked orders (subject to export licences) for a total of five million pounds.

We have entered the new year with a not unhealthy order book, and with satisfactory prospects in most of our traditional markets and others that we are vigorously assaulting. The urge towards the development of the backward areas of the world grows stronger day by day, and The Brush Group is in every way armed to play its full part in that essential task. Our sales organisation is healthy and alert, our factories well managed and excellently equipped.

The report and accounts were adopted, and the proposed change of name to "THE BRUSH GROUP LIMITED" was approved.

A full copy of the statement is available on written request to Duke's Court, Duke Street, St. James's, S.W.1.

THE PRUDENTIAL ASSURANCE COMPANY LIMITED

RECORD VOLUME OF NEW OVERSEAS LIFE BUSINESS

In the course of his remarks at the annual general meeting, Mr E. J. W. Borrajo, MBE, AIA, deputy-chairman of the company, said:

You will, I know, share my regret that our chairman, Sir Frank Morgan, is unable, through illness, to preside at our meeting today. He is, I am glad to say, progressing satisfactorily but it is particularly disappointing, to him and to us, that he should not be with us at the first annual meeting since his election as chairman of the company.

ORDINARY BRANCH

In the ordinary branch the number of life assurance policies issued at home and overseas during 1953, including new group life assurance policies, was 141,000, assuring sums of £120 million. The total sums assured, including bonuses, under policies in force at the end of the year exceeded £908 million.

Out of the surplus for the year 1953 a sum of over £6,750,000 has been allocated to policyholders and the directors have declared for with-profit policies issued in the United Kingdom (other than group pension policies) a reversionary bonus at the rate of £1 18s. per £100 sum assured—an increase of 4s. per cent over the rate for 1952.

The with-profit group pension system which we introduced in 1951 continues to make progress. Though this system has been operating for so short a time it is already justifying our belief that it is an intrinsically cheap method of providing pensions. When to this is added its flexibility and the fact that it relieves the employer of administrative and financial worry, it is evident that the system deserves the most careful consideration of all employers who are making pension arrangements. For this class of business the directors have again declared a compound reversionary bonus pension on deferred pensions at the rate of £1 10s. per cent, whilst the special final bonus pension, added when pensions are entered upon, has this year been increased to £12 10s. per cent.

MILLARD TUCKER REPORT

It is a disturbing feature of our national life today that high rates of taxation are deflecting the energies of many people from productive work: action can rarely be taken in the business field without careful examination of the impact of taxation.

Among the most complicated and troublesome taxation problems are those relating to the various forms of provision for retirement and it was therefore with a feeling of relief that the life assurance world heard of the appointment of the second Millard Tucker Committee in 1951. The problem before the Committee was formidable, as will be realised by all those who have read the valuable report which was recently published.

It was understandable in the circumstances, but nevertheless disappointing, that the Chancellor of the Exchequer, in the Finance Bill, was not able to propose the implementation of any of the recommendations. I cannot emphasise too strongly the unsatisfactory nature of the present position, which should surely be remedied at the first opportunity. The existing and already over-complicated situation is now beset by the worst complication of all—uncertainty. Not only are all pension schemes, whether they be private schemes or insured schemes, in a state of suspense but the great number of self-employed persons and employees with no pension rights or inadequate retirement benefits are in a position of uncertainty as to the best form in which to make their own arrangements.

I would, however, stress the fact that an ordinary endowment assurance contract gives valuable protection for dependants and would for many such persons be preferable even if the recommendations of the Millard Tucker Committee were implemented. The relief of income tax on assurance premiums is valuable and the lump sums at retirement are, of course, completely free of tax.

OVERSEAS LIFE BUSINESS

A record volume of new business has again been written by our overseas branches. Over 45,000 policies were issued in 1953 assuring sums of £51 million, which is some 42 per cent of the total written in the ordinary branch.

At the end of 1929 our overseas life assurance business amounted to only 8,000 policies assuring a sum, including bonuses, of less than £2 million. The corresponding figures for all overseas territories at the end of last year were 360,000 policies assuring over £300 million. This amount is more than the sum assured in the whole of the ordinary branch as recently as 1942. The annual premium income in respect of our overseas life business now exceeds £10 million.

From the outset it has been our policy in each territory to maintain Prudential traditions and principles but to adapt our methods to local practice and thus to meet the varying needs of the different communities. When we started business in the various overseas territories we determined our premium rates having regard to local conditions such as interest and mortality rates, expenses and taxation. During the early years of our development abroad we declared the same rate of bonus in all territories as in the United Kingdom, because the trends of the overseas surpluses were not sufficiently stable to justify us in differentiating bonuses. But with the growth of the business significant divergencies in surplus earnings have, as we anticipated, become apparent and the different rates of bonus declared in the various territories reflect these divergencies. The policy which we have followed enables us to keep our business in each territory on a self-supporting basis and to quote premiums and declare bonuses appropriate to local conditions.

Our largest expansion has occurred in Canada, Australasia and South Africa, and over 85 per cent of our existing overseas life business was written by the branches established in these territories. All of them have had to compete with long-established and prosperous local companies.

We began transacting life business in Canada in 1930 and have made outstanding progress there. The new business sums assured written in 1953 amounted to over £17 million, which is the largest figure for any of our overseas branches, and the sums assured and bonuses under policies in force amount to over £105 million.

Our operations in Australia and New Zealand started in 1931. We now have large organisations in both these countries, with representatives in all the principal cities and towns and with policies assuring over £90 million.

In the Union of South Africa we began the transaction of life business in 1932, when our office in Johannesburg was opened. We have also developed in East Africa, the Rhodesias and Nyasaland, and our South African branch now assures sums of over £75 million. A distinctive feature of this branch is the success which has followed the introduction of group pension business on a with-profit basis.

The remainder of our overseas life business was written in the Middle and Near East, the territories where we transact business being India, Pakistan, Ceylon, Malaya, Egypt, the Sudan, Cyprus and Malta. The total sum assured and bonus is now approaching £40 million.

The progress we have already achieved has been most noteworthy and a sure foundation has been laid for still greater achievements. The potentialities of the Commonwealth countries in which we are operating are boundless and we are proud of the part we are playing in their economic development. This contribution to a vigorous and progressive development would not have been possible except through private enterprise, not only because private enterprise provides an essential flexibility but also because it is hardly conceivable that a nationalised undertaking, even if it were able to enter the overseas insurance market, could maintain its position there and gain the confidence of the insuring public.

INDUSTRIAL BRANCH

In the industrial branch the new business was slightly less than in the preceding year, the new sums assured being £78 million compared with £78,300,000. The average sum assured per policy issued was £58, which is more than double the corresponding figure for the year 1939. Over 70 per cent of the new premium income was derived from endowment assurances.

The total sums assured and bonuses in force now exceed £1,000 million. The premium income of £44 million last year is a further indication of the magnitude of this branch, and you may like to know that the Man from the Prudential collects over 30 per cent of all the industrial assurance premiums paid in the United Kingdom.

The trend of expenses in this branch showed a further and more marked improvement. They amounted to 29.05 per cent of the premiums, as compared with 29.50 per cent for the preceding year and 29.60 per cent for the year 1951. These, I would emphasise, are "all-in" expense ratios, which include the industrial branch share of staff pension scheme costs and outdoor staff bonus.

Out of the surplus for the year 1953 a sum of over £8,300,000 has been allocated to policyholders and the directors have declared a reversionary bonus at the rate of £1 10s. per cent on all participating policies. This is an increase of 2s. per cent over the rate for the previous year.

Bonuses paid last year on claims by death and maturity added, on the average, over 19 per cent to the original sums assured.

APPORTIONMENT OF PROFITS IN THE LIFE BRANCHES

The distributable surpluses in the life branches again showed substantial increases over those for the previous year. As a result your directors were able to make a further increase in the proportion of these surpluses allocated to the policyholders and at the

same time to increase the amount allotted to the shareholders. In each of the life branches the policyholders' allocation for the year 1953 is approximately 91.2 per cent of the distributable surplus and the shareholders' allocation is approximately 8.8 per cent.

You will not, I am sure, have failed to note the increases in the rates of reversionary bonus declared over the last few years. In recent years we have been emerging from the straitened conditions of the war and of the immediate postwar period, and as a result the growth of the distributable surpluses has been abnormally rapid.

GENERAL BRANCH

Our general branch business has shown gratifying expansion during 1953, the premium income increasing by over £900,000 to nearly £12 million. In addition, premiums of £1,800,000 were obtained by our American subsidiary, and of the £13,800,000 total some £8 million was derived from overseas sources. Our general branch premium income has more than trebled since 1945, an expansion even more striking than our progress in the ordinary branch.

In addressing you last year, Sir George Barstow referred to the outstanding service our local staff were able to give to those of our policyholders who sustained losses in the East Coast floods in February. You will be interested to know that over 3,500 claims were handled in this connection and claim payments were £300,000.

The accounts chiefly affected by these exceptional claims were the fire and miscellaneous accounts, but other factors have been favourable so that, despite the flood losses, the net outcome has been satisfactory. There has been a welcome improvement in the motor account, due mainly to a better claims experience overseas. The sickness and accident account, although less favourable than in 1952, has shown a satisfactory profit. Our gross interest earnings have increased by £65,000.

The net surplus after provision for taxes and excluding the amount brought forward has increased from £448,000 in 1952 to £514,000. Of this surplus the directors have transferred £100,000 to the general branch contingency fund and £250,000 to the additional reserve fund.

The net dividend on the B shares has been increased to 2s. 6d. The sum set aside for this purpose together with the corresponding provision from this branch for dividends to A shareholders is again more than covered by the interest on our general branch funds after deduction of taxes.

The figures of our American subsidiary, The Prudential Insurance Company of Great Britain located in New York, are annexed to the accounts before you. The results of that company's operations in 1953 have again been profitable and the premium income has increased by £100,000. A dividend of 10 per cent was paid for the last four years and has again been declared in 1954.

INVESTMENTS

The financial crises which have recurred with such depressing regularity in postwar years were fortunately absent in 1953, and industrial production not only recovered from the setback in 1952 but attained a higher level than in 1951, our previous best year.

The Government has been able to permit a progressive relaxation of controls, thus introducing a healthier element of competition into many industries. There has been a steady, if unspectacular, improvement in our economic position which has been reflected in the continued growth of our gold and dollar reserves. In spite of this improvement, however, we are still far from earning the surplus of £300 million which the Chancellor has indicated is necessary if we are to re-establish a sound economy. It is therefore clearly most important that we should aim at a further substantial increase in our exports. In the face of the strong foreign competition now developing this will prove an arduous task, and one of the factors upon which its fulfilment depends is the allocation of a sufficient proportion of our national resources to new capital investment. The present high level of company taxation unfortunately acts as a deterrent to such capital investment, and therefore the recent provisions for investment allowances are to be welcomed as a helpful contribution to the problem.

Our company is at all times ready and willing to play its part in providing finance for undertakings which are expanding on sound and progressive lines. Such investments properly selected are in the interests of our policyholders and at the same time advantageous to the national economy. It has been our experience that there have not been sufficient investments of this character available to absorb the funds at our disposal, and this may well be an indication that too little is being done towards the re-equipment and modernisation of British industry. This shortage of suitable outlets in the industrial field is reflected in the increase in our holdings of British Government Securities during the year by over £14 million. Nevertheless we have increased our holding of ordinary shares by nearly £8 million. This follows a similar increase in 1952 and brings the total amount invested in this class of security to a figure of £83 million.

I hope that these remarks provide an adequate answer to the suggestion frequently made that we are unwilling to finance industry to a sufficient extent, particularly in the form of equity capital. On the other hand, it has been suggested that our large holdings of ordinary shares may give us an undesirable measure of control over British industry. It is our policy to steer a middle course between our readiness to invest in industry and our desire to avoid holding a large proportion of the equity capital of individual companies.

WIDESPREAD PORTFOLIO

Although our total investment in ordinary shares is substantial, our portfolio embraces a very large number of companies. Such a wide distribution achieves our wish to avoid unduly large individual holdings and at the same time provides a greater measure of security than can be obtained by the investment of very large sums in a relatively small number of concerns.

Some facts about our holdings in this country may be of general interest. We have shares in the equity of nearly 1,100 United Kingdom companies. Our average holding, on the basis of market values, is less than 2½ per cent. At the lower end of the percentages which compose this average will be found our holdings in the biggest of the country's industrial undertakings where even a very small percentage of the equity represents a large cash investment.

At the other end there are only 14 companies in which our holding exceeds 25 per cent. There are six industrial companies in this group and they are comparatively small concerns; the remaining eight are investment and finance companies which have widely spread investments and which also follow the policy of avoiding control of individual companies. Of these 14 companies there are only two in which we own a controlling interest; one is our wholly owned subsidiary Prudential Nominees Ltd., which exists in the main for the purpose of holding the investments of our trustee and executor business and of our staff pension scheme, and the other is the North Central Wagon and Finance Co. Ltd., a public company whose ordinary capital is quoted on the Stock Exchange and of which we hold 57.7 per cent. To complete the picture of our subsidiary interests I should perhaps mention that outside the United Kingdom we own two insurance companies which operate our business in the USA and Finland, and certain of our real property investments overseas are for the sake of convenience held in the form of companies which we control. Lest it be thought that our nominee company is used for our investment holdings, I reiterate the statement made four years ago, namely, that it is not our practice to conceal our interests by holding stocks and shares in the name of nominees and that the extent and nature of our interests can be ascertained by reference to the share registers of the companies concerned.

Let me repeat that it is our clear and definite policy not to acquire such large proportionate holdings in industrial companies that we might be called upon to intervene in matters of management and direction, and the figures I have given you regarding our portfolio demonstrate that we have given practical effect to this policy.

VITAL FACTOR IN MAINTENANCE OF HEALTHY CAPITAL MARKET

Our funds represent reserves which are required to meet the obligations under our insurance contracts. It must therefore be our aim, as has been previously stated on so many occasions, to invest our funds with a view to producing the best return for our policyholders. The very real competition which exists between the many offices seeking to achieve this aim is a vital factor in maintaining a healthy capital market, thereby enabling the intending borrower to raise money on fair and equitable terms. I do not claim perfection for the system on which the capital market is based but it has been built up and adapted over many years and works remarkably well.

The introduction of state control of the investments of insurance companies would, by removing this competitive element, seriously interfere with the smooth working of the market to the disadvantage of those desiring to raise fresh capital. More serious still would be the effect upon the prospects of the policyholders. In my view it is quite clear that state control of life assurance investments would result in subordinating the policyholders' interests to political considerations.

During last year there was a further drop in interest rates resulting in a rise in the market values of the securities in our portfolio. These show a substantial appreciation above the value at which they stand in our published accounts.

Despite this fall in interest rates we are still benefiting from the higher yields which have been obtainable on new investments in recent years. This, combined with improved dividends on existing securities, has been the main factor contributing to an increase of more than 5s. per cent in the gross rate of interest earned in each of the life branches during 1953.

STAFF

I come now to the staff. To all grades, both at home and overseas, I express our appreciation of the manner in which, in widely differing spheres, they have served the company during the past year.

Upon its staff, individually and collectively, the Prudential depends for the upholding of its worldwide prestige; the quality of the thousands of men and women employed by the company is reflected in its reputation, which never stood higher than it does today.

THE BURMAH OIL COMPANY LIMITED

IMPROVED COMMUNICATIONS RESULT IN INCREASED SALES

FORMATION OF NEW BURMESE OPERATING COMPANIES

SIR KENNETH HARPER ON WIDESPREAD ASIAN INTERESTS

The fifty-second annual general meeting of the Burmah Oil Company, Limited, will be held on June 11th in the Merchants Hall, 30, George Square, Glasgow.

The following statement by the chairman, Sir Kenneth B. Harper, has been circulated with the directors' report and accounts for the year ended December 31, 1953:

The total trade in 1953 in petroleum products in Burma, India and Pakistan, though failing to maintain the promise of expansion indicated earlier in the year, showed a small overall increase in volume over 1952, but returns in general were lower. Our Group's trading profit, after charging the cost of exploration in both India and Pakistan, was £5,365,530, or £99,142 down on that for the previous year.

Investment income at £3,581,912 is £273,092 higher than last year, due to the increased dividends received from Anglo-Iranian and Shell and from our trade investments. The steady rise each year in dividends from the latter is the result of the considerable finance which we have been providing recently as our share of the cost of expanding the marketing facilities of our Associates in India and Pakistan.

No dividend has been taken in from The Tinplate Company of India Limited, as declaration and payment were delayed beyond December 31st last. I refer you to Note No. 4 on the accounts.

The income from all sources was £8,948,924. Of this amount £1,235,783 has been provided for depreciation, emoluments to directors amounted to £36,025, while taxation absorbed £4,424,792, leaving a net income for the year under review of £3,252,324 (£2,871,838 in 1952), which together with the carry forward from 1952 of £596,047 resulted in an available surplus of £3,848,371.

DIVIDEND

Out of this sum your board has allocated £1,100,000 to general reserve and has recommended a final dividend on the ordinary stock of 15 per cent which, with the interim dividend of 2½ per cent paid on November 6, 1953, makes a total of 17½ per cent for the year. After providing for these dividends and the dividends on the preference stocks the balance of profit remaining to be carried forward to 1954 is £596,411.

You will remember that when presenting the 1951 accounts to you I indicated that we then had a heavy capital expenditure programme ahead of us. The parent company's balance sheet now before you shows the measure and shape of this investment during 1953, namely an increase of £2,582,011 in net advances to our subsidiary companies, mainly to finance additions to plant and increased working capital requirements, and an increase of £3,554,398 in trade investments, representing your company's share of the capital requirements of our associates the Burmah-Shell marketing companies in India and Pakistan and Burmah-Shell Refineries Limited at Bombay. To meet this finance it was necessary to draw on our holding of Government securities to an amount of £4,750,000.

We should begin in 1955-56 to reap the benefit of transferring funds from Government securities, with their relatively low interest rates, to employment in the operational and more remunerative field. Before the end of 1955 the Bombay refinery should be in full operation and sales of Sui gas by Pakistan Petroleum, Limited, should have begun.

The consolidated balance sheet reflects the increase in advances to our subsidiaries referred to above. Fixed assets are up by £1,082,513, the financing of debtors absorbed a further £1,380,675, and creditors were reduced by £1,617,492. On the other hand there was a reduction in financing stocks of products and stores of £1,309,042. The addition to fixed assets comprises a further expansion of Assam Oil Company facilities at Digboi, further additions to construction work in progress at the new installation of our Pakistan Trading subsidiary at Chittagong and final amounts which became payable on completion and successful sea trials of two new tankers, *Burmah Star* and *Burmah Sapphire*.

TRADING

The effect of the improvement in communications in Burma to which I refer later was to increase total sales of petroleum products by 11 per cent over 1952 figures. During 1953 indigenous production supplied about 36 per cent of the petroleum products sold in Burma, the balance being imported. The previous year's percentage was 32.

In the group's markets elsewhere the year's progress was not so satisfactory. In Assam the market was affected by the recession in the tea industry and Assam Oil Company's sales showed an increase of barely 1 per cent over the previous year. The trade was picking up again in the second half of the year.

In the rest of India and Pakistan recovery from the setback in trade which occurred in 1952 was slower than had been expected, but over the year the total volume of trade of our subsidiaries and associates increased by 4 per cent.

Motor spirit trade fell in both India and Pakistan, largely as a result, particularly in Pakistan, of high duties on this essential commodity. We accordingly welcome, as a move in the right direction, a reduction of the motor spirit duty in the recent Pakistan Budget from the crippling rate of Rs. 2 (4s. 4d.) to the still high rate of Rs. 1½ (3s. 3d.) per gallon. In Pakistan there were also restrictions on the imports of motor vehicles, tyres and spare parts, while in India trade was influenced by uncertainties about nationalisation of transport.

The long term potentialities of the India and Pakistan markets for petroleum products must be very great, but until these restrictions are eased or removed the development of motor transport will be handicapped.

BURMA

Many stockholders will remember the large part Burma used to play in the group's operations to produce and refine crude oil. Until we acquired control of Assam Oil Company, Limited, in 1921, practically the whole of our production of crude oil came from Burma and three-quarters of it was still being produced in Burma when in 1942 the Japanese enemy overran the country and we had to deny them our oil by "scorching" the oilfields and refinery. After the war we started to rehabilitate the plant and facilities, but had to suspend this work in 1948 when the new independent Burmese Government lost to insurgents the control of a large part of their country, including the territory through which the main pipeline ran from the oilfields to the refinery near Rangoon. Since then our operating companies have produced and refined at the oilfields the relatively small quantities of indigenous oil which they have been able to market in the prevailing state of communications.

It is now over five years since the insurgent troubles broke out and progress in regaining control of the country has been disappointingly slow. It is the more satisfactory to be able to report that a distinct improvement became noticeable in 1953. The rebellion is by no means over but road, rail and river communications were maintained last year with less interference by insurgents and our Burma Trading subsidiary was able slightly to extend the distribution of products.

Ever since 1948, at the request of the Government of the Union of Burma, we, in conjunction with the Indo-Burma Petroleum Company, Limited, and the British Burmah Petroleum Company, Limited, have been negotiating an agreement with the Government to continue to develop the oilfields in association with them and I have reported to you year by year the slow progress towards completion of these negotiations. I am glad now to be able to inform you that an agreement was signed on behalf of the Union Government and the three oil companies on January 12, 1954, and that a new Company—The Burma Oil Company (1954) Limited—is in process of taking over the three oil companies' oilfields and refinery assets and operations as from January 1, 1954.

The capital of this new Company all of which is being issued to the three oil companies in the form of vendors' shares is the "kyat" equivalent of £15 million. The Union Government are acquiring a one-third interest from the companies for cash. The first payment of £2,500,000 has been received and the balance of £2,500,000 is payable by instalments or in one sum at the Government's option. The Government also have the option of buying for cash any increased holding they may wish to acquire after their holding to date has been fully paid up. We look forward to a happy partnership with the Union Government, in mutual interest and mutual trust, and we wish the new Company every success.

There has been no progress in the long outstanding matter of our denial claims against the Burmese Government under the Defence of Burma Act of 1940. We hope some advance will be made this year with the preliminary legal issue of that Government's liability under the Act, leaving the quantitative claims to be considered later.

INDIA

Last year I told you about the promising new oil well at Nahorkatiya, a few miles west of Digboi. The second well at Nahorkatiya has recently found good production three-quarters of a mile away from the first, and more wells are being drilled to prove the extent of the oil pools. Until we know the

results of these I would rather not attempt an estimate either of the additional potential production available or of the economic rate of extraction, but there is no reason to modify the cautious optimism I expressed last year. Unfortunately, Nahorkatiya, being at the extreme eastern side of India, is inconveniently placed for supplying the market, and oil from this source will be at a disadvantage compared with imported oil in the matter of internal freight charges.

Assam Oil Company's seismic, gravity and aero-magnetic surveys of the Assam Valley, which were intensified when oil was found at Nahorkatiya, are now well advanced, but it is too early yet to say what, if any, possible new structures will be disclosed.

The two million-ton refinery which is being built on Trombay Island at Bombay by Burmah-Shell Refineries, Limited, financed jointly by your Company and Shell, has made good progress and is expected to come on stream early in 1955.

PAKISTAN

Test wells in two areas of East Pakistan were abandoned during the year, after failing to find oil. On the evidence of these wells our advisers rate the prospects of the areas as poor.

In West Pakistan, results of further drilling on the Balkassar field in the Punjab have been disappointing. The limestone structure covers an area of some 20 sq. miles, but fissuring in the limestone seems to be restricted to a very small part of the structure.

No. 1 well at Zin, the second anticline to be tested in the group of structures, of which Sui was the first, has indicated a large volume of gas-bearing limestone but no oil. The gas is at such low pressure as to be of no commercial value.

A seismic survey of the third area in the group, at Uch, has just started.

A year ago I reported to you the discovery of a major natural gas field at Sui. After the second well had been completed, the gas reserves were estimated at 2¼ billion (English style) cu. ft. The third well is nearing completion, and has indicated that this estimate will have to be increased. The second and third wells are eight miles apart, with the first well between them.

Plans to utilise this gas have gone ahead with the enthusiastic help of the Pakistan Government. The Sui Gas Transmission Company, Limited, has been formed to take delivery of the gas from Pakistan Petroleum Limited at Sui for transmission to major consuming centres. The Transmission Company will lay a 350-mile pipeline from Sui to Karachi at a cost of about £9 million, and it is expected to be in operation by the middle of 1955. We hope this source of plentiful and cheap fuel will prove of immense benefit to Pakistan and a good investment for your Company. Our Pakistan Trading subsidiary has been appointed managing agents of Sui Gas Transmission Company.

The equity of the rupee equivalent of £4 million in the Transmission Company has been subscribed by Pakistan Industrial Development Corporation (a State concern), the Pakistan public, the Commonwealth Development Finance Company, Limited, and The Burmah Oil Company, Limited, the first two named holding 51 per cent equally between them and the latter two Companies equal shares of the remaining 49 per cent. Application has also been made by the Transmission Company for a loan from the International Bank for Reconstruction and Development for the balance of its capital requirements.

Your Company thus has a dual interest in this project, namely, 24½ per cent in the Transmission Company and 70 per cent in the producing company, Pakistan Petroleum, Limited.

PETROLEUM CONCESSIONS

A feature of the times in the three countries in which our Group operates is that in each of them the Government has the statutory right or obligation to prescribe conditions to the effect that prospecting licences or mining leases will be granted only to citizens of the country or to companies incorporated in the country, and in the latter case to require the licensee or lessee to associate national capital in the enterprise to such extent as may be prescribed at the time of issue. In Burma we have the Government as a one-third partner in the new company, The Burma Oil Company (1954) Limited. In India, 25 per cent is the holding of Indian capital which we are advised is to be prescribed in the case of one area in which we are interested. In Pakistan, 30 per cent of the capital of Pakistan Petroleum Limited is held by the Government and the Pakistan public.

While from several points of view we welcome the association of national capital in such enterprises as ours, we would rather in some respects that the financial stake were held by the public than by the Government. Governments come and go, but the public remains, and oil ventures are long-term propositions. But it is one thing to prescribe that the public shall subscribe and quite another thing to attract them to do so. In the case of Pakistan Petroleum Limited, after the list had been kept open for three months to allow time for the public to take up their prescribed 30 per cent, they had actually applied for less than 1 per cent and the Government subsequently decided to take up the balance. In the case of the Sui Gas Transmission Company, which is not a speculative prospecting venture but an undertaking expected to show a good and reasonably safe return, the public issue was oversubscribed five times in a few hours. The difference is interesting and instructive. The public have the money but are not prepared to take the kind of long-term risk which your Company and other British companies have taken for many years past, sometimes successfully and more often not. I feel sure the implications have not been lost upon the interested Governments.

LABOUR

In the field of labour relations I am glad to say there were no serious stoppages during 1953 in India, Pakistan or Burma. In Burma and India, however, there were the same difficulties as in recent years with excessive litigation arising from the predominant part played by Industrial Courts.

TANKERS

The second and third of our new "Burmah" class tankers came into commission in August and September, 1953. All three are giving excellent service. They are specially designed for our trade in India and Pakistan to carry several grades of bulk as well as packed oil and to meet the shallow river drafts encountered at Calcutta and Chittagong. Unfortunately the drafts at these ports have been allowed to deteriorate during recent years, but as the result of the representations made to the respective Port Commissioners we are hopeful that every effort will be made to effect improvement.

Full advantage of our experience of tropical waters has been taken in designing the accommodation for officers and crews in these new ships

With tanker freight rates depressed throughout the year the fleet was able to contribute only a bare profit to the Group's earnings. There is already a surplus of world tanker tonnage and it is increasing faster than the rate of world consumption of petroleum products. The immediate outlook for a stronger freight market is therefore not encouraging.

STAFF

It is a pleasure to express the board's appreciation of the good work done and the spirit prevailing among managements and staffs in all spheres of our Group's operations, at home and overseas.

MARIEVALE CONSOLIDATED MINES, LIMITED

RECORD TONNAGE MILLED

Mr P. M. Anderson, chairman of the company, in addressing members at the annual general meeting held at Johannesburg on May 7, 1954, said that owing to a shortage of labour it was not possible to take full advantage of the increase in milling capacity to which he had referred the previous year. Nevertheless the tonnage milled in 1953 increased by 26,000 tons to the record figure of 749,000 tons. The average yield was 0.12 dwt. lower at 4.89 dwt. and, because of this and the lower price received for gold, the working revenue declined slightly to £2,300,774. Working costs rose by 1s. 5d. per ton milled so that the working profit of £824,187 showed a decrease of £123,662 as compared with the previous year. The rise in working costs was due to further increases in the cost of labour, stores and power.

Provision for taxation absorbed £362,806 and the net profit was £450,525, being £55,305 less than in 1952. Two dividends totalling 1s. 9d. per share, being an increase of 1d. per share, were declared and absorbed £393,750, and the balance carried forward was £465,430.

DEVELOPMENT

The development footage driven totalled 32,909 feet. Of the 18,864 feet on the Main Reef Horizon 12,300 feet were on reef and sampled disclosing 6,850 feet or 56 per cent payable averaging 25.6 dwt. over 14 inches. 14,045 feet were driven on the Kimberley Reef Horizon and 6,805 feet were on reef and sampled of which 1,740 feet or 26 per cent was payable averaging 16.2 dwt. over 15 inches.

The ore reserve, recalculated as at December 31, 1953, increased by 100,000 tons to 3,600,000 tons, averaging 5.5 dwt. over an estimated stoping width of 47 inches, the value being unchanged and the width being one inch more.

The company won one of the Safety Shields for 1953 presented by the Prevention of Accident Committee of the Transvaal and Orange Free State Chamber of Mines which reflected great credit on all concerned.

During the first quarter of 1954, the ore milled was 188,000 tons and the working profit amounted to £202,689. In development work 4,431 feet were driven on Main Reef of which 2,860 feet were on reef and sampled, disclosing 1,445 feet or 51 per cent payable, averaging 29.0 dwt. over 10 inches. On the Kimberley Reef Horizon 4,005 feet were driven and, of the 1,675 feet on reef and sampled, 305 feet or 18 per cent was payable, averaging 15.7 dwt. over 11 inches.

The reports and accounts were adopted. The appointment to the board of Mr P. H. Anderson was confirmed. The retiring directors, Messrs P. M. Anderson, C. B. Anderson and J. S. Walker were re-elected.

NEWTON, CHAMBERS AND COMPANY, LIMITED

CAPITAL SCHEME OF ARRANGEMENT APPROVED

SIR SAMUEL ROBERTS ON THE YEAR'S ACHIEVEMENTS

PROFIT AND TAXATION

The seventy-second annual general meeting of Newton, Chambers and Company, Limited, was held on May 13th at Thorncliffe, near Sheffield, Sir Harold West, CIMechE, FIIA (managing director), presiding in the absence of the chairman, Sir Samuel Roberts, Bt.

The following is an extract from the chairman's circulated statement:

The gross profit for the year was £726,057 compared with £671,973 for the previous year. This profit has been made after charging £93,703 as an addition to the reserve for replacement of fixed assets. That reserve now stands at £667,895.

The net profit amounts to £145,175 against £152,696 in 1952 and after including profits of earlier years (£18,115) the profit available for distribution is £163,290 compared with £179,331 in the previous year. This slight reduction is accounted for by an increased charge for taxation of £61,605, making it necessary to provide £580,882 against £519,277 previously.

As I have pointed out before, the amount set aside for the replacement of fixed assets is not allowed as a deduction when the taxable profits are computed; as a result almost 80 per cent of the year's profit will be paid to the Exchequer as income tax, profits tax and excess profits levy.

Your directors have proposed to allocate the profit as follows:

Employees Profit Share.—The substantial increase in the gross trading profit for the year is the result of successful management and excellent works co-operation. Therefore £30,235 has been provided in the accounts as a profit share bonus for all employees. This was distributed last Christmas, the fourth distribution of its kind.

Dividend.—Your directors recommend a final dividend of 20 per cent, making 30 per cent for the year. This represents only 6.4 per cent on the capital actually employed in the company. In these times when the company's production facilities are fully and profitably employed it is no more than bare justice that the shareholders should benefit by this modest increase.

WORKING CAPITAL

Current liabilities at £1,961,333 show an increase of £159,154 and include liability for taxation which, as a result of the higher profits earned, has increased by £211,686. Current assets at £3,474,530 now exceed current liabilities by £1,513,197 —a still further improvement on the satisfactory position disclosed by previous accounts.

CAPITAL EXPENDITURE

During the year expenditure on works, plant and machinery amounted to £133,952. A large part was in connection with the re-equipment of the excavator works and the addition of a second mechanised foundry unit in the light castings department. At the date of the accounts we were committed to further capital expenditure of £191,533.

After referring briefly to the progress of the trading and service departments, the statement continued:

THORNCLIFFE COAL DISTILLATION *LIMITED*

In June last year the claim of Thorncliffe Coal Distillation Limited, for compensation in respect of the assets vested in the National Coal Board was at last settled on terms which can be regarded as satisfactory, and a meeting was held on October 8th last at which the voluntary winding up of this subsidiary was approved. Since that date distributions have been made to the shareholders amounting to 24s. for each £1 preference share (together with a sum equivalent to arrears of interest) and 21s. for each 1s. ordinary share. In addition a final payment of 1s. 8.85d. for each 1s. share will shortly be made to the ordinary shareholders.

N. C. THORNCLIFFE COLLIERIES LIMITED

The negotiations with the District Valuation Board appointed under the Coal Industry Nationalisation Act 1946 in connection with the colliery company's claim for compensation have been completed, but the amount this subsidiary company will eventually receive cannot be known until all other claims on the global sum allocated to the Yorkshire district have been settled. Final settlement of all claims will be delayed for many months. I am of the opinion that the assets of this company when realised will not differ very much from the amount of £650,000 standing in the balance sheet.

SHARE CAPITAL

In view of the great expansion of the company's trading in recent years your directors have felt it desirable to bring the share capital more into line with the capital employed in the undertaking. The claim for compensation in respect of the nationalised assets of Thorncliffe Coal Distillation, Limited, was settled during the year, but N. C. Thorncliffe Collieries, Limited, which is a wholly owned subsidiary, must still await the settlement of the district claims. Your directors feel that a considerably overdue reconstruction of the parent company's capital should no longer be delayed.

It is proposed, as set out in the scheme of arrangement, to convert the preference shares into ordinary shares and to increase the issued share capital of the company to £2 million by the creation of an additional 1,200,000 ordinary shares of £1 each. These shares will be issued as fully paid up by capitalising certain reserves; £1,141,860 will be transferred from the investment reserve and £58,140 from the amount standing to the credit of the profit and loss account.

It will be noted that in the accompanying balance sheet the investment reserve stands at only £716,136, but it has since been increased to £1,260,364 by the profit arising out of compensation realised to date in respect of the company's holding in Thorncliffe Coal Distillation, Limited, and by a surplus arising out of a recent revaluation of the company's trade investments.

I would point out that the issue, if approved by the shareholders, will be made without encroaching on the company's general reserve, which will still stand at £800,000 in addition to an investment reserve of £113,865 and a reserve for replacement of fixed assets of £667,895.

GENERAL

The board have decided to concentrate the trading operations of the company into three production divisions under three assistant managing directors: Mr P. J. C. Bovill (chemicals division), Mr S. C. Tyrrell (excavator division), and Mr K. E. Walker (engineering division, comprising the heavy construction and light castings departments).

The board have approved a "good service" gratuities scheme whereby workpeople with more than 10 years' service will, on retirement, receive a gratuity to be determined by length of service.

For part of the year our managing director, Sir Harold West, held the office of Master Cutler of the Company of Cutlers in Hallamshire, the 315th of the line, and the directors wish to congratulate Sir Harold and Lady West (as Mistress Cutler) on a most successful year of office.

MANAGING DIRECTOR'S REMARKS

Proposing the adoption of the directors' report and accounts, the managing director, *Sir Harold West, in the course of his speech* said: I have to tell you with great regret that Sir Samuel Roberts, our chairman, is suffering from a severe attack of bronchitis and that his doctor will not allow him to travel to Thorncliffe today.

I know what a great disappointment this is to Sir Samuel, as he has been intimately interested in the scheme of financial reconstruction which we are putting before the shareholders this afternoon. I am sure the shareholders will wish me to send Sir Samuel our best wishes for a speedy recovery.

Sir Samuel's statement speaks for itself and tells shareholders of many of the happenings and developments of the past year. He refers to the settlement of the valuation on the voluntary liquidation of Thorncliffe Coal Distillation Limited, which was this company's most valuable investment.

The quotation "The difficult we can do at once, the impossible may take a little longer," became our watchword from 1947 onwards, and within three years we had replaced, by the development of our other business, the very substantial sales turnover we had lost through the nationalisation of our collieries. This I dare claim as a very considerable achievement.

Thorncliffe, however, must operate as a community, and in its relations with staff and workpeople must continue to develop a sense of loyalty to the company for the good of all who look to this organisation for employment.

Our developments and production in the past ten years would have been greatly restricted were it not for our apprentice training schemes and our business training college for girls. Our bread cast upon the waters many years ago has resulted in your company now having a higher percentage of young people under thirty years of age in its employment than any other similar organisation in this part of the country.

The report was adopted.

At subsequent separate class meetings of the holders of ordinary and preference shares and at an extraordinary general meeting the board's scheme of arrangement and capitalisation proposals were sanctioned.

THE GROOTVLEI PROPRIETARY MINES,

STRONG ORE RESERVE POSITION

Mr P. M. Anderson, the chairman of the company, in addressing members at the annual general meeting held at Johannesburg on May 6, 1954, said that an important feature of the year's work was the decrease of 113,000 tons in the ore milled, which was due entirely to the continued shortage of labour, particularly for work underground. This decrease not only had the effect of substantially reducing the revenue, but also had some effect in increasing the cost per ton milled owing to the incidence of fixed overhead charges on the smaller tonnage produced.

He said that there was a small decrease of 0.07 dwt in the yield per ton milled and the average price received for gold sold during the year was 1s. 10d. per ounce fine less than in 1952. In addition the premium received for gold sold at enhanced prices declined by nearly £77,000. Working costs were mainly affected by increased costs of labour, stores and power. The net effect of all these factors was a reduction in revenue of 1s. 10d. per ton and an increase in working costs of 2s. per ton, so that the working profit of £2,788,510 showed a reduction of 3s. 10d. per ton milled as compared with the previous year.

Provision for taxation amounted to £1,439,173 and the net profit was £269,560 lower at £1,346,917. Two dividends totalling 2s. 3d. per unit of stock, or 3d. less than in 1952, were declared, absorbing £1,286,867. The balance unappropriated was £606,203.

In view of the shortage of native labour and the strong ore reserve position, the curtailment of development was continued. The footage driven was 8,654 feet less at 41,191 feet. 34,115 feet were on reef and sampled and 15,230 feet, or 45 per cent, proved payable, averaging 13.2 dwt over 16 inches.

The re-calculated ore reserves remained unchanged at 16 million tons, averaging 4.6 dwt over an estimated stoping width of 47.5 inches.

During the first quarter of 1954 the ore milled was 522,000 tons and the working profit £618,102. Development footage totalled 6,360 feet, and of the 4,035 feet sampled, 1,120 feet, or 28 per cent, proved payable, averaging 12.5 dwt. over 17 inches.

IMPROVED LABOUR SUPPLY

Since the end of 1953 there had been a material improvement in the native labour supply, but it had not so far been possible to take full advantage of this, owing to a shortage of European labour for supervision.

A member asked a number of questions, mainly regarding the values obtained from the Kimberley Reef on various parts of the company's property. In reply, the chairman stated that he could not supply the answers to these detailed questions immediately, but that the question of exploiting the Kimberley Reef was kept constantly under review. So far, however, there had not been any indication of values that would affect the mine.

The reports and accounts were adopted, the appointment of Mr H. C. Koch to the board was confirmed, and the retiring directors, Messrs H. C. Koch and H. F. Oppenheimer, were re-elected.

J. BIBBY & SONS LIMITED

GENERAL IMPROVEMENT IN TRADING

MR H. P. BIBBY'S REVIEW

The fortieth annual general meeting of J. Bibby & Sons Limited was held on May 14th at the registered office of the Company, 21 King Edward Street, Liverpool, Mr H. P. Bibby, JP (chairman of the company), presiding.

The secretary (Mr Angus Morrice, FACCA) read the notice convening the meeting and Mr E. T. Denton, FCA, of Messrs Edward Denton and Son, the auditors, read the report of his firm.

The following is the chairman's review, which had been circulated with the report and accounts for the year ended December 31, 1953; and was taken as read:

Board of Directors.—The directors have elected Mr H. H. Bibby and Mr H. Morton Bibby to the board and you will be invited to confirm their election at the annual general meeting. I feel sure that the two new directors will prove a source of strength to the board.

Mr J. P. Bibby, who for some years has been vice-chairman of the company, has asked to be relieved of this office and it gives me great pleasure to express to him the thanks of the board for his services in this capacity. Mr H. Mason Bibby has been invited to succeed him as vice-chairman and I am pleased to say that he has accepted this office.

A MARKED IMPROVEMENT

Accounts.—The consolidated profit and loss account is very satisfactory and represents a marked improvement compared with the past few years. The main advance has been in the profits of the parent company, but our subsidiary companies, Henry Cooke and Company (1932) Limited and Twyford Mill Limited, have made a good contribution to the total. The accounting date of the latter company has been altered to coincide with that of the remainder of the group and consequently their profits cover a period of a year and a half: the additional amount thus brought in is not, however, a material one. The accounts also include adjusted Ministry of Food processing allowances for previous years amounting to £62,987.

We have slightly rearranged the form of our profit and loss account, which we believe shows the position more clearly. We have again thought it prudent to provide in the accounts for the rising cost of replacement of fixed assets, and the amount for the year is £200,000. We think it is important to apply in our own profit and loss account the principle for which industry is contending: that provision should be made for maintaining the physical as distinct from the money value of a company's assets by appropriate deductions from trading profits, leaving only as net profit an amount which is truly free for appropriation.

BURDEN OF TAXATION

Despite the fact that there was no liability to excess profits levy, taxation accounted for the very substantial sum of £768,502, and while little fresh can be said about the burden which such a figure imposes, the proportion which it bears to the total profit will be observed.

Two small subsidiaries which were acquired as a result of the purchase of Twyford Mill Limited and Joseph Thorley Limited were liquidated during the year. The activities of neither of these companies were complementary to our main business and one of them had ceased to operate prior to its acquisition.

THE YEAR'S TRADING

The accounts reflect a general improvement in all our trading. Subsidies on animal foods were removed on April 1st last year, the industry was completely decontrolled at the end of July, and there has been a substantial increase in trade during the year. Our seed crushing and oil refining departments, which remained under the control of the Ministry of Food throughout the year, were rather more remunerative and the soap section, while still meeting with very strong competition, showed some improvement.

While it is gratifying to be able to record such a satisfactory outcome of the year's trading, it should be borne in mind that competition in the future is likely to be intensified and it may not be possible to maintain profits at the present level. For this reason it has been thought advisable to retain the larger part of our earnings in the business and to recommend a modest increase in the dividend on the ordinary shares from 5 per cent to 6½ per cent for the year.

SUBSIDIARY COMPANIES

Reference has already been made to these companies, but I add the following additional information.

Henry Cooke and Company (1932) Limited maintained their level of profit during the year and the new plant which I referred to in my last review will come into operation in 1954. This will allow for greater variety in the manufacture of paper and give an increase in output.

The integration of the seed sales of Twyford Mill Limited with the animal foods organisation has borne some fruit during the year, and an increased profit has come from this source: we hope for further progress in the future.

Our third subsidiary, Joseph Thorley Limited, is still in the process of reorganisation and we hope that as a result it will become a profitable member of the group. We are continuing to modernise their cattle food factory at King's Cross and to re-equip the Wandsworth premises on the south side of the Thames as a new factory.

PROSPECT

In my last review I suggested that the partial decontrol of the sale of compound cooking fat was probable during 1953, but as events have turned out this has been postponed till May of the current year, when, together with seed crushing and oil refining, compound cooking fat will be free and our well-known product "Trex" will be on the market again; our plans are well in hand for making the most of the return of this familiar domestic cooking fat and we are convinced that "Trex" will regain its former popularity with the housewife.

The return of seed crushing and oil refining to free enterprise is to be welcomed, but will pose a few problems. Fresh markets will need to be found for our crude and refined oils which since 1939 have been the sole property of the Ministry of Food, and a large amount of money will be required to finance this side of the business.

A change of this nature must inevitably bring with it a little anxiety in the process, but we are convinced that in the long run it will be good for the industry.

INCREASED SALES OF ANIMAL FOODS

As I have stated in a previous paragraph, sales of animal foods showed a very satisfactory increase during the year, and the indications are that there may be a moderate further growth during 1954: these sales represent in value about half our total product.

Members will be aware that the farming community is itself facing a difficult time in passing from a long-continued period in which the Ministry of Food bought all their products at agreed prices, into a quite different situation of freer trading whose exact form is not yet fully defined for the future. I think, however, that it will be agreed that a large agricultural output is a sheer strategic necessity for this country in the present uneasy state of the world, and that a prosperous agricultural community is a social asset we cannot dispense with.

It must therefore be the duty of whatever government is in power to ensure these ends by the formulation of long-term policy for agriculture which, while being fair to the consumer, gives the farmer the support he needs so that he can play his proper part in the economy of the nation.

PERSONNEL

This review would not be complete without a very sincere tribute to all those who serve the company, wherever they may be, whose hard work and loyal co-operation make the success of the enterprise possible.

The report and accounts were adopted and a final dividend of 4 per cent, less income tax, on the ordinary shares, making 6½ per cent, less income tax, for the year, was approved.

The retiring directors, Mr H. P. Bibby, JP, Mr J. W. Bibby, BA, Mr H. Mason Bibby, MEng, MIMechE, Mr C. L. Bibby, MA, BSc, FRIC, and Mr Maurice Scholes, BEng, MIMechE, were re-elected; and the remuneration of the auditors, Messrs Edward Denton and Son, having been fixed, the proceedings terminated.

DE BEERS CONSOLIDATED MINES, LIMITED

(Incorporated in the Union of South Africa)

A SUCCESSFUL YEAR

PROSPECTS OF THE DIAMOND TRADE

SIR ERNEST OPPENHEIMER'S STATEMENT

The sixty-sixth annual general meeting of De Beers Consolidated Mines, Limited (incorporated in the Union of South Africa), will be held on June 9th in Kimberley.

The following are extracts from the statement by the chairman, Sir Ernest Oppenheimer, DCL, circulated with the report and accounts for the year ended December 31, 1953:

CONSOLIDATED ACCOUNTS

The consolidated balance sheet and consolidated profit and loss account are consolidations of the individual accounts of the following companies:

De Beers Consolidated Mines, Limited, The Consolidated Diamond Mines of South West Africa, Limited. Premier (Transvaal) Diamond Mining Company, Limited. The Diamond Corporation, Limited. De Beers Investment Trust, Limited. De Beers Industrial Corporation, Limited. Griqualand West Diamond Mining Company (Dutoitspan Mine), Limited. The South West Finance Corporation, Limited. H.L.G. Limited. Marmora Mines, Limited, and New Jagersfontein Mining and Exploration Company, Limited.

The consolidated profit and loss account shows that the group profit for the year, after providing £6,661,969 for taxation, was £18,354,829 in which the outside or minority shareholders have an interest to the extent of £1,600,043, including their proportion of dividends declared by subsidiary companies, leaving a balance of £16,754,786 attributable to your company as its share of the profits. To this sum has been added an amount of £16,924,616, being the unappropriated balance at December 31, 1952, after allowing for an adjustment in respect of minority interests, giving a total available for appropriation applicable to your company of £33,679,402. Out of this amount, £4,522,155 has been transferred to reserve, and £8,964,038 has been declared in dividends, leaving an unappropriated balance of £20,193,209 (representing an increase for the year of £3,056,796) of which £7,474,432 is in your company's own accounts and £12,718,777 is your company's interest in the unappropriated balances in the accounts of its subsidiary companies.

The consolidated balance sheet shows total assets of £114,528,056. This includes the sum of £15,236,135, being the net excess of cost of investments in subsidiary companies over their nominal value, less amounts written off and after adjustment on consolidation. This latter sum is more than covered by capital reserves on the other side of the balance sheet totalling £38,248,535. Current assets, loans to other companies, and investments total £75,818,855 and exceed all liabilities to the public by £57,271,572. The remaining items in the consolidated balance sheet do not call for comment.

Your company has had a successful year. The group has financial reserves which, together with the £15 million capital resources of the trading companies, afford solid protection under all foreseeable contingencies.

REVIEW OF THE DIAMOND TRADE

I now pass on to a review of the diamond market during 1953. At £43,336,000, gem sales were £2,400,000 less than in 1952. I wish to stress that this drop was not due to any falling off in demand, but was occasioned solely by the fact that less diamonds were available although all producers were working to full capacity.

Gem stocks held by all producers and the Diamond Corporation, Limited, are at an irreducible minimum. It is, therefore, evident that future sales of gem diamonds are entirely dependent on current production. From this it follows that the value of gem diamonds to be sold in 1954, assuming present price levels, is likely to be somewhat lower than last year.

On the industrial side of our business, there was a marked falling off in 1953. This was due, in part, to the cessation of stockpiling purchases by the United States Government, but also occasioned by the decline in demand for industrial diamonds. An active research is being conducted with the object of widening the industrial market.

The sales of industrial diamonds for the first quarter of 1954 at £4,500,000 were better than during the relevant period in 1953. This, however, can be misleading, as the increase was due to unexpected sales for stockpiling. Present indications are that we can expect total sales of industrial diamonds in 1954 to be somewhat less than they were the previous year.

There are at present no signs of any falling off in the demand for gem diamonds, and unless there is a severe recession in the United States, 1954 should be another satisfactory year. Whilst the United States is still our principal customer, recently there has been a welcome development in that cut diamonds are being exported by manufacturers in various centres to countries other than the United States. We shall watch this new development with close interest as its expansion can only be of benefit to us.

INVESTMENTS OUTSIDE THE DIAMOND INDUSTRY

I now wish to comment on our principal investments in enterprises not connected with the diamond industry.

Your company's shareholding in De Beers Industrial Corporation, Limited, remains unchanged at 3,587,434 ordinary shares, which is 71¾ per cent of the issued ordinary share capital. The principal asset of the Corporation is its 50 per cent holding in the equity share capital of African Explosives and Chemical Industries, Limited.

De Beers Industrial Corporation had a successful year and maintained its dividend of 10 per cent in spite of the fact that the dividend income received from its holding in African Explosives and Chemical Industries was reduced.

Once African Explosives and Chemical Industries, Limited, reach their full scope, coupled with the expansion by other companies in which De Beers Industrial Corporation, Limited, are interested, we can anticipate that the dividends receivable by our company from De Beers Industrial Corporation will increase.

De Beers Investment Trust, Limited, incorporated towards the end of 1952, has completed its first year of business. The greater part of the Trust Company's assets is by way of loans, at satisfactory rates of interest, to companies operating principally in the Orange Free State and the West Rand, which loans carry valuable conversion rights.

The market value of the Trust Company's investments per March 31, 1954, reflects an appreciation of no less than £3,750,000 over cost.

The Trust Company is now firmly established on a sound basis according to a pattern which indicates that it will thrive and expand, at the same time contributing to the development of Southern Africa. A cause for sober optimism is that it is certain that the Trust Company in due course will be a substantial contributor to the revenue of the parent company, such revenue being derived from sources other than the diamond industry.

DARWINS

NOTABLE EXPANSION DEVELOPMENTS

The twenty-fifth annual general meeting of Darwins Limited was held on May 18th at Sheffield, Mr F. Thompson-Schwab (the chairman) presiding.

The following is an extract from his circulated statement:

My closing words to shareholders at our last annual meeting referred to increasing competition and a decrease in demand for some of our products. That was in May, 1953. Subsequent to the meeting competition became even more intense, and with the likelihood later in the year of falling prices demand suffered a serious decline in certain of our standard lines.

During the year there were also severe reductions in the prices of certain raw materials. At an early stage your board had taken the view that some raw materials, such as tungsten, were likely to be subject to continuing price reductions and had therefore reduced stocks to an absolute minimum.

During the year there were twelve successive reductions in the price of tungsten from a high of 27s. 6d. per lb. to a low of 13s. per lb. The effect of these reductions has been that we have had to absorb a considerable loss during the year in the tool steel department.

Increased competition has come from many sources, both in this country and overseas. I have already told you that sales of some of our standard lines had fallen by quite a considerable extent. On the other hand, another standard line, Magnets, has increased in sales and we have exported in quantity to a number of hard currency countries. The outlook in that direction is very promising indeed.

The year in question has been notable for two major items of expansion. The first was at the Andrews Toledo Works, where we completed on December 18, 1953, the installation of an Electric Arc Furnace of the most modern type. This is now working well and gives the promise of economies in production as well as giving us a greater range of finished steels.

NEW ACQUISITION

By a coincidence, the starting-up of the Arc Furnace coincided with the acquisition by the company of the entire share capital of The Sheffield Forge and Rolling Mills Company, Limited.

Our experience since the date of acquisition confirms your board's view that the Sheffield Forge Company should prove a profitable addition to the Darwins' group of companies.

The present capital structure of Darwins now consists of 450,000 Six per cent cumulative preference shares of £1 each and 1,460,000 ordinary shares of 10s. each, giving a total capital of £1,180,000. I am sure that you will share my satisfaction that we have no debentures or charges on our assets.

So far as the current year is concerned, there are signs that the downward trend of demand which showed itself during 1953 and continued into the beginning of 1954 has been arrested.

I turn now to the appropriation of the profits. After taxation, which absorbs no less than £123,000 out of a total of £240,000, the amount which is available is £117,000 which together with the amount brought forward from last year totals £155,000. Of this sum £83,000 is retained in the Sheffield Forge accounts, dividends paid, or proposed, total £57,000 and we are left with a final balance to carry forward of just under £15,000.

The report was adopted.

ASSOCIATED FISHERIES

MR W. A. BENNETT'S SPEECH

At the annual general meeting of Associated Fisheries, Limited, on May 14th, the chairman, Mr W. A. Bennett, said that the very definite decrease in the demand for fish became even more pronounced during the current year. Markets were frequently oversupplied and an unusually high proportion of good quality landings were left unsold, the company's unwelcome share exceeding 4,000 tons or 6 per cent of its total catch. Since price controls on fish ceased in April, 1950, the consumption of fish had been appreciably affected by variations in the supply of other protein foods, especially meat and eggs. They have a very distinct advantage over fish in competing for a share of the housewife's expenditure as their prices are heavily subsidised. Meat "subsidy" paid by the Exchequer was £39 million and for "support" price of eggs £24 million. Only by comparing these "subsidies" with the landed value of all fish caught in 1953 by the whole British fishing fleets, which was £41 million, can the degree of "unfair" competition faced by the fish industry be realised. The group turnover exceed £6 million, and after covering all costs and depreciation the profit remaining out of every 20s. turnover was practically 1s. of which taxation will absorb 7d. and net dividends 2¼d, leaving only 2¼d retained to assist in meeting increased replacement cost of assets. Current results show an improvement on last year's, but there is no real evidence of a sustained increase in sales. The directors are not unduly depressed as the company has a sound organisation, well financed, well staffed, and imbued with a grim determination to surmount all obstacles.

HUMPHREYS LIMITED

(Building and Civil Engineering Contractors)

HAMPERING EFFECT OF GOVERNMENT RESTRICTIONS

The SIXTY-SECOND ANNUAL GENERAL MEETING of Humphreys Limited, will be held on June 9, 1954, in London.

The following is an extract from the statement by the chairman, Mr. A. V. Bridgland, which has been circulated with the report and accounts:

The trading profit for the year is £57,440, an increase of £4,705 over last year, to which has to be added interest, dividends and miscellaneous revenue to give a total of £77,462. The two principal items against this are bank interest of £17,099, showing a rise of £14,378 and a taxation charge of £25,100, leaving a net profit of £26,481 for the year, an increase of £1,986 over last year. We have in the appropriation account provided for an increase in dividend of 1 per cent, making a final dividend of 7 per cent on the Ordinary shares, and we have transferred a further £25,000 to general reserve.

The accounts of R. H. Morris (Pty.), Limited, cover a period of fifteen months and show a profit of £8,115. Generally, during the period under review this subsidiary has had to contend with a difficult time, as South Africa was feeling very much the effect of a restricted influx of overseas capital, but the position today is, I feel, one that is turning in favour of a resumption of investment of capital from outside sources and the prospects are certainly brighter.

As to National Quarries (Pty.), Limited, in which between R. H. Morris (Pty.), Limited, and ourselves we have a 51 per cent holding, you will see that its cash position is good, but that its trading profit last year was reduced.

HINDRANCE TO CHEAPER BUILDING

Reverting now to home affairs, I regret to have to say that the vexed question of building licences still hampers all our activities in this country. Licences are becoming a little easier to obtain, but it is still a moot point whether the system of controlling building by licence has achieved its object. When we are urged to increase both the production and the efficiency of our type of business, it becomes difficult to appreciate the motives of such exhortation while the system of building licences is maintained.

Planning has been the hardest worked term in use since the war ceased. So far as building operations are concerned, we have had to suffer the effect of Ministry after Ministry, public authority after public authority, intervening in and upsetting the smooth progress necessary for the initiation of new projects. No rebuilding or development plan should take at the outside more than six months to pass all the authorities, yet we know that some have taken years to get through, with a consequent loss to client, architect and builder and eventually the tenants. We believe that with these delays and restrictions alone, building costs have gone up by as much as 20 per cent, yet still we are asked by the Government of the day to improve the efficiency of our industry or else they will have to intervene. It might well be asked why they cannot reverse the criticism, and look to themselves first as possibly the greatest hindrance to cheaper building that exists today.

It is a crying need of the industry to be relieved of these fetters as quickly as possible. In South Africa one can erect a building much more quickly than in England, and it is an indisputable fact that with greater freedom greater production arises. Can the Government disprove this? If they cannot, they decry their own political slogan of "freeing the people."

Finally, we have a large order book for the future, and our prospects are good if we are allowed to carry out our orders.

ANALYSIS OF PROFIT

	£
Earned profit before taxation	51,581
Less taxation	25,100
Net profit after taxation	26,481
Appropriated as follows:—	
Preference dividend net	3,025
Ordinary dividend net	12,100
Balance retained	11,356
	26,481
Preference Shareholders:—	
Issued capital	£100,000
Gross dividend covered by taxable profits	9 times
Capital covered by net assets	4·8 times
Ordinary Shareholders:—	
Issued capital	£200,000
Gross rate of dividend paid	11%
Gross rate earned on present capital excluding Reserves	21%
Net assets attributable to each 5s. Ordinary Share	9s. 7d.

THE VULCAN FOUNDRY, LIMITED

IMPROVED RESULTS IN DIFFICULT YEAR

VISCOUNT BRIDGEMAN ON THE OUTLOOK

The ninety-first annual general meeting of The Vulcan Foundry, Limited, was held on May 13th in London. The Rt Hon The Viscount Bridgeman, CB, DSO, MC (the chairman), presiding.

The following is an extract from his circulated statement:

Stockholders will be glad to see from the directors' report and accounts that operating profit has risen by £162,568 to £384,604, and net profit by £84,453 to £161,710.

£55,000 has been appropriated to general reserve, £50,000 to reserve for replacement of plant and machinery, and £10,000 has been placed to the Welfare Fund for the employees, who will thus participate in the year's improved results, in addition of course to the usual incentive payments directly related to production.

Your directors propose a dividend for the year of 9 per cent, plus a bonus of 2 per cent, making 11 per cent in all for 1953, as against 7 per cent for 1952.

TRADING ACTIVITIES

The increased profit, due to the higher volume and value of goods invoiced is in its turn due to an appreciable improvement in deliveries of steel, which I mentioned last year.

The year 1953 cannot be described as easy. The most difficult problem was that of the large order of 24 steam locomotives for Iran and although the political situation made it uncertain till early in 1954 whether delivery could be made or payment be forthcoming, the order was completed and the locomotives held pending shipment. To this factor the increase in the figure of debtors is largely due.

This, and the large amount due from the Argentine at the end of 1952, now received, contributed to our need for bank overdrafts which have, however, been appreciably reduced since the end of the year.

Besides the Iranian order, steam locomotives have been built for Victoria and Iraq, spare boilers sent to many parts and electric and diesel locomotives, built as before in conjunction with The English Electric Company and The Drewry Car Company, have gone to New Zealand, Queensland, Spain, Brazil and elsewhere.

PRODUCTION IMPAIRED BY STEEL PLATE SHORTAGE

As the year proceeded, steel deliveries improved generally, but our difficulties are by no means ended, especially as to steel plate. This latter shortage has for two years created a bottleneck which has gravely impaired the company's production and that of our subsidiary, Robert Stephenson & Hawthorns Limited. We have done everything possible to bring the position to the notice of those in authority, but though the position has improved we are left with its unfortunate consequences. Deliveries are running late and British locomotive manufacturers are being blamed for broken promises, which have been prejudicial to our chances when tendering for new work. In addition, the deliveries we could offer, which were already unfavourable in comparison with those of German, Japanese and other foreign competitors owing to the size of our order book, were further protracted by the effects of the steel shortage. Moreover, for the first time since 1939, the problem of manufacturing at competitive cost has become a serious one. Our competitors have also been able to quote lower prices, in some cases 10 per cent below ours, whereas until recent months our prices were some 15 per cent below those of German manufacturers.

How far these were "sacrifice" prices quoted so as to re-enter the market at any cost, and how far they were assisted by favourable financial terms from foreign Governments and banks concerned is a matter for inquiry. But the fact remains that valuable orders from countries which have been traditional British markets have gone elsewhere, as in the case of Indian Government Railways, where, out of roughly 650 locomotives ordered in 1953, not one order came to the United Kingdom.

Loss of orders will automatically improve the delivery which can be quoted in future, but the price factor remains to be mastered. To do so will need the greatest efforts of all concerned. If one takes into account not only the wages paid by the company, but also the wage element in the cost of steel and other materials purchased, it will be seen that a high proportion of the cost of a locomotive represents wages and that there is danger in increases in this direction, unless accompanied by greater productivity. Indeed, the prospect of such rises makes it difficult to quote the fixed price terms which nowadays are generally called for.

CHANGED TRADING CONDITIONS

The conditions for obtaining orders have radically changed since the war, and orders from countries like India and the Argentine which used to be negotiated in London must now be sought in the countries themselves. Our arrangements for overseas representation are, I hope, abreast of the times. The company's own representatives have during the year been to Australia, India, Pakistan, Turkey, Jugoslavia and the Middle East.

The private buyer of main line locomotives is almost extinct and virtually the whole of our business is now with Governments. Once again I gladly acknowledge the help we receive from the Board of Trade and Export Credits Guarantee Department. None the less under present conditions we may need even more help if we are to cover the political and economic risks which are inseparable from a business like ours and which must be taken if we are to hold our markets.

Few industries export so high a proportion of their product and home orders are essential to give a stability which the export trade by itself does not afford. It is regrettable that this stabilising influence, which is so invaluable to our foreign competitors, has for many years been denied to the locomotive industry in this country.

REASONABLY HEALTHY ORDER BOOK

Meanwhile our order book is still reasonably healthy, and the most noteworthy order received in 1953 was one for 46 steam locomotives for the East African Railways and Harbours.

Planned production for 1954 includes steam locomotives for Bolivia, Chile, India, Nigeria and Victoria, electric and diesel locomotives for Brazil, British Guiana, New Zealand, India, Spain and Tasmania, and spare boilers for Rhodesia, South Africa, India and Ceylon.

CHAIRMAN'S ADDITIONAL REMARKS

Since I circulated my statement I am pleased to report that satisfactory arrangements have been made to ship the 24 locomotives to Iran and they leave almost at once.

The report and accounts were adopted.

BEYER, PEACOCK & COMPANY, LIMITED

(Locomotive Builders and General Engineers)

CENTENARY YEAR

MR HAROLD WILMOT ON THE OUTLOOK

The annual general meeting of Beyer, Peacock & Company, Limited, was held on May 19th in London, Mr Harold Wilmot, CBE (chairman and managing director) presiding.

The following is an extract from his circulated review:

The consolidated balance sheet shows a liquid balance of £2,108,476 as compared with £1,191,676 at the end of the previous year. It is, perhaps, not inappropriate that in the hundredth year of trading total sales and total gross profits should both have reached new record high levels.

Beyer, Peacock locomotives still enjoy an unrivalled reputation throughout the world. It continues to be our ambition that the name of the company shall be synonymous with all that is best in design, materials, and craftsmanship. Competition is getting keener and in my opinion will continue to do so for some time. We believe, however, that apart from some convulsion in world economy, a steadfast devotion to our engineering ideals, coupled with unremitting zeal in the study of our customers' operating conditions and requirements, will ensure an adequate flow of high grade business to our company. Present locomotive orders will provide continuity of production at present load for over two years.

During the year under review considerable progress was made by our subsidiary companies.

At the end of the hundredth year of trading, shareholders may like to know that the board has had a professional valuation of all the land, buildings, plant, and machinery belonging to the group. In the consolidated balance sheet these assets, exclusive of loose tools, etc., etc., stand at £1,471,015 gross, less depreciation reserves of £563,797, that is £907,218 net. The valuation recently completed shows a figure at December 31, 1953, of £2,301,397 as compared with the foregoing net amount.

RIGHTS ISSUE WELL RECEIVED

As foreshadowed in last year's report, your board considered it appropriate to make a rights issue of ordinary shares. This issue, made in September, was well received by shareholders and was considerably oversubscribed. 566,667 ordinary £1 shares were issued at a price of 27s. 6d., bringing the total capitalisation of the company to £1,500,000 — £1,200,000 ordinary and £300,000 preference. In an endeavour to preserve some measure of equity as between old and new shareholdings an interim dividend of 4 per cent was paid prior to the new issue. This early date for an interim dividend is not likely to be repeated.

For reasons which were stated in my last review, the board now consider it appropriate further to increase the authorised capital of

the company for which purpose a resolution has been included in the notice calling the annual general meeting.

HISTORY REVIEWED

There are a few important dates in our company's history. The founding of the partnership of Charles Frederick Beyer, Richard Peacock and Henry Robertson in 1854, the formation of the public limited liability company in 1902, the invention of the Garratt-type of locomotive articulation in 1907, armament production during the war period of 1914-18, the grouping of British Railways, in 1923, the great depression of 1931-34, the period of expansion (new products by subsidiary undertakings) 1932-53, the second world war 1939-45, the nationalisation of British Railways in 1948, our association with Metropolitan-Vickers Electrical Company, Limited, on electric and diesel-electric locomotives from 1950 to date. Through it all we have preserved a certain character—the spirit of industrial adventure and a devotion to quality in design and workmanship. In common with most old companies we have had our patches of glory and our periods of frustration and eclipse.

At the close of our century, the company is at least as strong as ever in its history. This is the result of the continued support of shareholders who have provided the necessary risk capital, and of the devoted and competent service of the company's employees of all grades. We therefore face our second hundred years in good heart, with firm resolve, and with justifiable confidence.

The report and accounts were adopted and the proposed final dividend of 3½ per cent, plus a bonus of 8½ per cent, making 16 per cent, less tax, for the year, were approved, and the resolution increasing the capital was sanctioned.

GEDULD PROPRIETARY MINES, LIMITED

PROBLEM OF LABOUR SHORTAGE

Mr P. M. Anderson, the chairman of the company, in addressing members at the annual general meeting held at Johannesburg on May 6, 1954, stated that operations were hampered by a shortage of native labour throughout the year under review and, towards the end of the year, by a shortage of European miners. Because of this it was impossible to maintain production at the former rate and the tonnage milled at 1,125,000 tons was lower by 128,000 tons. Accordingly, though the average yield improved by 0.29 dwt to 3.19 dwt per ton so that revenue per ton milled rose by 3s., the lower price received for gold and the decrease in output resulted in the total working revenue declining by £68,278 to £2,264,228.

He stated that, owing to increased costs of labour, stores and power and the higher incidence of overhead charges on the lower tonnage, working costs rose by 4s. 1d. per ton milled and the working profit at £361,890 was £106,843 less than in 1952.

The continual rise in the cost structure in recent years had rendered unpayable considerable tonnages of ore remaining in the mine, and it had therefore become necessary to restrict the mining of marginal ore. While this policy, by increasing the average yield had helped to offset the fall in profits, it would inevitably result in the shortening of the remaining life of the mine.

THE ACCOUNTS

After taking into account the other items detailed in the profit and loss account and after providing £91,324 for taxation, the net profit from mining operations was £252,214. To this must be added income from investments amounting to £622,284, or £104,502 less than in 1952, so that the total profit for the year was £874,498. These investments comprised principally the company's holdings in East Geduld Mines and in Grootvlei Proprietary Mines.

Two dividends totalling £839,992 or 11s. 6d. per share, being a decrease of 1s. per share, were declared. After making provision for the other items detailed in the appropriation account, including £34,564 for capital expenditure, the balance carried forward was £327,685.

Development footage driven on Black Reef was 13,805 feet and, of the 10,085 feet on reef and sampled, 2,635 feet or 26 per cent proved payable averaging 4.0 dwt over 57 inches.

The ore reserve recalculated as at December 31, 1953, showed a decrease of 600,000 tons to 2,500,000 tons, the value being unchanged at 3.40 dwt and the estimated stoping width at 53 inches being one inch more.

During the first quarter of 1954 the ore milled amounted to 266,000 tons and the working profit was £73,180. Development work on Black Reef totalled 2,746 feet of which 2,515 feet were on reef and sampled disclosing 170 feet or 7 per cent payable with an average value of 4.8 dwt over 72 inches.

The reports and accounts were adopted, the appointment of Mr C. B. Anderson as a director of the company was confirmed and the retiring directors, Messrs W. M. Frames and M. W. Richards were re-elected.

MOSS' EMPIRES

A STRONG POSITION

The annual general meeting of Moss' Empires, Limited, was held on May 20th in London.

Mr Prince Littler (the chairman) in the course of his speech, said: The profit on trading after charging renewals of furnishings has decreased by nearly £80,000, of which about £12,000 is accounted for by an additional charge for furnishing renewals. The decrease is regrettable. It is no doubt accounted for to a considerable extent by the large number of television sets which have been purchased throughout the country. This has had the effect of reducing attendances at places of entertainment such as theatres and cinemas. Live entertainment has suffered rather less than cinemas. Business also suffered as a result of the Coronation festivities.

Fortunately the decrease in the trading has been offset by a lower charge for taxation on the profits of 1953—just under £40,000—by an increase in dividends and interest, by profit on purchases of debenture stocks and by a surplus on the sale of a trade investment. The result is that the profit of the year is £1,100 more than in 1952. Further, there was a net credit of £9,348 to profit and loss from other sundry sources. An interim ordinary dividend of 7½ per cent was paid in August last and the proposed final dividend is 10 per cent, less tax, leaving £36,454 to be carried forward against £21,893 (as adjusted) brought in.

When one turns to the consolidated balance sheet and profit and loss account, I am glad to say that these again show a strong financial position. The consolidated balance sheet discloses fixed assets of £2,497,765, as against £2,456,670 in the preceding year, an increase of over £40,000. The consolidated profit and loss account shows a profit for the year of £147,341, as compared with £123,221 an increase of over £24,000.

The report and accounts were adopted.

UNITED PREMIER OIL AND CAKE COMPANY

CAPITALISATION AND BONUS ISSUE PROPOSALS

The thirty-fifth annual general meeting of United Premier Oil and Cake Company, Limited, was held on May 17th in London, Sir Eric Mieville, GCIE, KCVO, CSI, CMG, the chairman, presiding.

The following is an extract from his circulated statement:

The group's profit on trading, before charging depreciation and taxation, for the year ended December 31, 1953, amounted to just over £640,000. This amount exceeds the previous year's earnings by £40,000 and is only £6,500 short of the group's record earnings in 1951.

A further substantial sum was expended during 1953, as in previous years, on the group's fixed assets. We propose to continue with the programme of modernisation begun in 1946, which is proving its value in the increased efficiency and profit-earning capacity of our factories.

The group's working capital, being the excess of current assets over current liabilities, as at December 31, 1953, had attained the substantial figure of approximately £1,150,000. Of this amount, £285,000 was held in the form of cash; bank overdrafts have been eliminated. In June, 1954, trading in all oilseeds will become free and we shall no longer act as agents for the Ministry of Food, crushing these commodities for a fixed remuneration. We shall, therefore, from that date have to carry and finance stocks of these items ourselves and we are glad to have what we estimate will be sufficient cash and bank facilities available for this purpose.

We welcome the resumption of free trading in this large section of our business, although it will inevitably introduce uncertainties which did not exist when we were acting for the Ministry. The prospects do not cause us alarm, but in both our trading and financial policies we shall proceed with caution.

We now recommend, as on this occasion last year, a final dividend of 9d. per stock unit (less tax), making a total of 1s. per stock unit (less tax), being a distribution of 20 per cent on the ordinary share capital.

CAPITALISATION PROPOSALS

Your directors have decided to recommend the capitalisation of £85,000 of the company's reserves by an issue to shareholders of 17 new ordinary shares for every 63 ordinary stock units of 5s. each held on April 15, 1954. The shares will be credited as fully paid and then converted into ordinary stock units of 5s. each, ranking pari passu in all respects with the existing ordinary stock of the company. By this operation the issued share capital of the company will be increased to £1,150,000. The group's reserves will remain in excess of £900,000, so that the real capital employed in the business is still substantially greater than the issued share capital.

It is the board's present intention to declare an interim dividend of 3d. per stock unit (less tax) in the autumn, but the amount of the final dividend for 1954 cannot, of course, be determined until the results of the present year's working are known. The board hope, however, to be able to recommend the maintenance of the 20 per cent rate of dividend on the share capital as increased by this capitalisation of reserves.

The report and accounts were unanimously adopted and the board's capitalisation and bonus issue proposals were sanctioned.

THE EVER READY COMPANY (GREAT BRITAIN), LIMITED

MANUFACTURERS OF DRY BATTERIES

MR E. N. ROWBOTHAM'S STATEMENT

The annual general meeting of The Ever Ready Company (Great Britain) Limited will be held on Thursday, June 10, 1954, at the Head Office, Hercules Place, Holloway, London, N.7.

The following is the statement of the chairman, Mr E. N. Rowbotham, which has been circulated with the report and accounts for the year ended February 28, 1954:

INCREASED PROFIT AND DIVIDEND

I am gratified to be able to report to you that for the first time in the history of the company the net profit, before tax, has exceeded £1 million. The net profit for the year ended February 28, 1954, is £1,076,992, compared with £847,625, an increase compared with last year of £229,367.

Unfortunately, I have to record the melancholy fact that the taxation charged in the year's accounts also constitutes a record in the history of the company at £670,185, compared with £499,362, an increase of no less than £170,823.

There is, therefore, left available to stockholders only £58,544 out of the increase in the net profit, before tax, of £229,367, making the total net profit, after charging tax, £406,807, compared with £348,263 last year.

Your directors consider that the results fully justify the restoration of the 5 per cent cut in the final dividend, which increasing taxation forced them to make in 1950. Fortunately, the excess profits levy ended on December 31st last and, therefore, the taxes payable by the company next year, while still very heavy, should not be so formidable as this year.

CAPITALISATION OF RESERVES

The board have had under consideration for some time the advisability of bringing the issued ordinary share capital of the company more into line with the company's asset position, which has steadily improved year by year. The directors' report refers to the arrangements which we propose to make to capitalise a portion of the company's reserves. My letter to stockholders on this subject, which accompanies this report, sets out in full detail the arrangements we propose to make. I shall not comment further here, save to emphasise that stockholders must not assume that on the issued ordinary capital being increased by the amount of the proposed issue, the total amount of dividend paid on the ordinary stock will be necessarily increased. Future dividends must depend on the course of future trading and also on the need for further capital expansion which may arise from time to time.

SALES EXPANSION

In spite of the difficulties which still exist regarding import quotas and foreign exchange, the company's export turnover again shows a substantial increase over last year.

At the same time, home sales have been well maintained in general, and there has been a marked increase in sales of the company's "Alldry" battery-operated radio receivers. Although the small reduction in purchase tax from 66⅔ per cent to 50 per cent last year was disappointing, the demand for our "Alldry" radio receivers since has exceeded our expectations. We have had difficulty in meeting the demand for several months past, but we have recently increased our radio set production facilities, and the position should improve in the near future.

Recent technical improvements in our portable "Alldry" radio receivers and batteries have reduced the cost of listening to less than ¼d. per hour, which is below that of prewar years. The life of our torch and cycle lamp batteries has also been increased.

It would seem clear that the reductions in selling prices which we were able to make last year have contributed materially to the expansion of our business and profits, and we have recently taken a step further by reducing the prices of batteries used in hearing-aid equipment. The use of hearing-aids is becoming more and more widespread and batteries for these appliances now contribute a noticeable addition to our turnover.

The current trading year has started satisfactorily and gives us reason to think that sales will be well maintained both on the home and overseas markets.

STRONG FINANCIAL POSITION

The consolidated balance sheet shows that the company's financial position remains strong. The surplus of current assets over current and deferred liabilities (including the deferred liability for future taxation) has increased from £554,374 to £630,897. Stock-in-trade is again lower at £1,285,545 mainly due to lower prices of raw materials, and trade debtors are reduced from £814,478 to £700,426. We have taken advantage of the considerable increase in the available cash balance to pay off an additional instalment of the deferred liability for obligations to employees' pension funds in respect of past service. This deferred liability which amounted to £361,630 in 1952 is now reduced to £226,108.

In addition we have purchased £400,000 tax reserve certificates in order to set aside the cash necessary for the payment of taxes.

After providing for taxation and the recommended higher rate of dividend we have allocated £160,000 to reserves and the carry forward remains the same.

Our subsidiary company which deals with battery and other chemicals has had a successful year's trading in spite of difficult competitive conditions and has contributed substantially to the year's results.

We have extended the production facilities in our engineering subsidiary during the year. This company has expanded considerably since joining the group and has produced steadily improved results.

The subsidiaries in Germany have again carried on a satisfactory though comparatively small business. General conditions in Germany have improved during the year, and the board are actively considering plans for the expansion of our business in that country.

TRIBUTE TO STAFF

I take this opportunity of expressing the directors' appreciation of the willing and efficient services rendered by the staff and all concerned in the company's business. In recognition of their loyalty your directors decided to present 183 inscribed gold watches to long service employees who have completed twenty-five years' continuous service with the company.

THE BRITISH VACUUM CLEANER AND ENGINEERING COMPANY

SUBSTANTIAL CURRENT TRADING IMPROVEMENT

The fiftieth ordinary general meeting of The British Vacuum Cleaner and Engineering Company Limited was held on May 14th at Goblin Works, Leatherhead.

Mr J. J. Hambidge (chairman and joint managing director), in the course of his speech, reminded shareholders of the warning contained in his address last year that the current year's results would inevitably be affected by rising costs and the unfavourable trading conditions then ruling—the overall experience of electrical appliance manufacturers—largely as a result of the combined application of double purchase tax and consumer credit restrictions on the home market and the continuance of import regulations of many overseas countries as affecting the export market.

Mr Hambidge added that his warning, based on the first half of the year under review, proved not to be unfounded and was reflected in the accounts presented. As a result of the heavy setback in sales which had been experienced, and the impact of this on their liquid resources, it had at that time become vitally necessary to cut back production to a lower corresponding level.

In the latter part of the year a considerable improvement in their order book took place, both in home and overseas markets, but unhappily in the few remaining months left before the close of the financial year it proved impossible to effectively and sufficiently gear up production to meet the suddenly expanded order book in the changed conditions resulting partly from some relief on purchase tax.

Mr Hambidge continued: Troubles seldom come singly, and our industrial section would have produced better results fully in line with our budgetary forecast of the section but for virtual default of important customers in connection with two very large-scale contracts that we were carrying out in Australia. These we were, without warning, compelled to suspend and, as a result, added enormously to our difficulties and gave major and added emphasis to the financial stringency. This stringency was later relieved to some extent by property realisation.

Your directors have entered into negotiations with the well-known firm of John Thompson Ltd., of Wolverhampton, whereby they are acquiring our shareholding in the subsidiary company—B.V.C. Industrial Constructions Limited. The financial outcome will enable the directors progressively to expand development of Goblin Home Appliances on a very much wider and more effective scale than has hitherto been possible.

Arising from the sale of the freehold interest in the latter half of the last financial year, the overall financial position shows a very marked improvement.

THE OUTLOOK

I am very glad to tell you that there has been substantial improvement in the first half of the current financial year to date. Vacuum cleaner sales show a very substantial increase over those of the same period last year—in fact, more than twice the number, and our washing machine sales have taken a great move forward almost commensurate

VAN DYK CONSOLIDATED MINES

POLICY OF MORE SELECTIVE MINING

Mr P. M. Anderson, the chairman of the company, in addressing members at the annual general meeting held in Johannesburg on May 7, 1954, said that operations were hampered throughout the year by a shortage of European and native labour and by underground fires in April and July. Because of this and because of the diversion of a portion of available labour to increased secondary development, the tonnage milled declined by 224,000 tons to 1,022,000 tons. Accordingly, in spite of a slight increase in yield, the total output was some 14,000 ounces lower, which, combined with the lower price received for gold, caused the working revenue to decline by £221,753 to £2,127,897.

He stated that mainly owing to increased costs of labour, stores and power and the higher incidence of overhead charges on the lower tonnage, working costs rose by 6s. 4d. per ton milled and absorbed £2,093,345, so that the working profit for the year was £34,552. After taking into account £56,334 recovered under insurance policies in respect of the fires, together with other items of revenue and expenditure detailed in the profit and loss account, a net profit of £80,672 was carried to appropriation account. Capital expenditure absorbed £30,190 and a balance of £162,750 was carried forward.

DEVELOPMENT

Development footage totalled 40,975 feet and of the 22,260 feet on reef and sampled, 5,880 or 26 per cent proved payable, averaging 10.4 dwt over 22 inches, equivalent to 229 inch-dwt. Rather more than half the total footage developed was in the No. 5 Shaft area, and of the 7,200 feet on reef and sampled, 2,055 feet or 29 per cent was payable averaging 9.3 dwt over 23 inches, equivalent to 215 inch-dwt.

The ore reserve tonnage decreased by 200,000 tons to 1,300,000 tons, averaging 3.7 dwt over 42 inches, the value being 0.2 dwt higher and the estimated stoping width one inch more than in the previous year. The No. 5 Shaft area accounted for approximately 20 per cent of the total ore reserve tonnage.

CURRENT RESULTS

To counteract the decline in the grade of ore mined that had taken place over a period of years, the mine had recently followed a policy of more selective mining, resulting in an improvement in the yield. The cost of the increased secondary development required, coupled with the higher incidence of standing charges on the reduced tonnage had, however, been heavy and profits had continued to be low. Thus, the results for the first quarter of 1954 show a tonnage milled of 234,000 tons with a yield of 3·48 dwt. and a working profit of £7,750.

Of the current tonnage milled, approximately 10 per cent was coming from the stopes in the No. 5 Shaft area. The severe faulting and folding of the reef and the erratic gold values in this area, referred to at the previous annual general meeting, had continued throughout the year.

In conclusion, the chairman stated that at the present level of costs and the present price of gold, the mine was making only small profits and he could not hold out any promise of improvement unless the mine was fortunate enough to obtain much better development results than so far disclosed in the No. 5 Shaft area.

In reply to a question by a member, the chairman stated that the value obtained in borehole R.N.1, the position of which was shown in the plan of the underground workings circulated to members with the annual report, was 3.4 dwt. over a width of 11 inches. This borehole, which intersected the reef at a borehole depth of 7,400 feet, or a vertical depth of approximately 6,600 feet, was sunk by the company's predecessors, Reef Nigel Exploration Gold Mining Company, Limited.

The reports and accounts were adopted and the retiring directors, Messrs B. Elkin and W. M. Frames, were re-elected.

ST. HELENA GOLD MINES

HIGHER TONNAGE AND YIELD

MR P. M. ANDERSON ON PLANT EXPANSION PROPOSALS

Mr P. M. Anderson, the chairman of the company, in addressing members at the annual general meeting held at Johannesburg on May 6, 1954, said that the tonnage milled in 1953 was 799,000 tons, which was 201,000 tons higher than in the previous year, and the yield improved slightly to 4.06 dwt. As a result of the higher tonnage, the charge per ton for development was substantially lower and that for overhead expenses somewhat reduced, so that, in spite of increases in the cost of labour, stores and power, working costs at 42s. 9d. per ton milled were 3s. 9d. per ton lower than in 1952.

The working profit for the year increased by £207,061 to £330,348 and, after taking into account the items detailed in the profit and loss account, the net profit was £261,535. After making provision for the various items detailed in the appropriation account, the carry forward was increased by £96,805 to £105,164.

Net expenditure on fixed assets during the year totalled £225,808, including £163,795 in respect of development footage in excess of that charged to working costs, and was financed out of capital funds in hand.

DEVELOPMENT

Mainly as a result of the shortage of labour, the total development footage at 57,966 feet was somewhat lower than in 1952. Of the 25,665 feet on Basal Reef and sampled, 13,560 feet, or 53 per cent, proved payable with an average value of 10.5 dwt over 31 inches, equivalent to 325 inch-dwt. Though the footage sampled was slightly lower than in the previous year, the percentage payability showed a distinct improvement and there was also an increase in the inch-dwts of the payable footage. These improvements were partly due to the good results obtained from development work in the northern portion of the mine.

The ore reserve, recalculated as at December 31, 1953, was 2 million tons, averaging 5.3 dwt over an estimated stoping width of 51 inches, representing an increase of 750,000 tons, the value being unchanged, and the estimated stoping width being one inch more.

INCREASED SCALE OF OPERATIONS

During the first quarter of 1954, the scale of milling operations continued to increase and the yield per ton milled rose to 4.38 dwt. The ore milled totalled 230,000 tons and the working profit was £148,914. 12,181 feet were driven of which 4,605 feet were on Basal Reef and sampled, disclosing 3,000 feet or 65 per cent payable, averaging 18.2 dwt over 28 inches, equivalent to 509 inch-dwt.

It had been found that the milling section of the reduction plant was capable of exceeding its designed capacity of 80,000 tons per month and that, with slight extensions to the cyanide section, which work was now in hand, the plant should be capable of treating slightly more than 100,000 tons per month.

PLANT EXPANSION

In concluding, Mr Anderson said that the profitable exploitation of the company's large lease area would call fairly soon for an additional vertical shaft, to be followed, in due course, by a further expansion of milling capacity. But, before deciding on the location of this shaft, further information was needed about reef depths and geological structure to the east of the present workings and, accordingly, a programme of diamond drilling from surface was in progress which would take some time to complete. The method of financing the shaft would be decided in due course.

The reports and accounts were adopted and the retiring directors, Messrs P. M. Anderson, S. R. Fleischer and H. C. Koch, were re-elected.

ORIENT STEAM NAVIGATION COMPANY

AIR/SEA TRANSPORT RELATIONSHIP

MR A. I. ANDERSON'S VIEW

At the fifty-fourth annual general meeting of Orient Steam Navigation Company, Limited, held in London on May 14th, Mr A. I. Anderson (the chairman) said that the working profit was £747,576—an improvement of £156,905 on last year's figure. The directors recommended a dividend of 4 per cent free of tax.

There had been a slight increase in the amount set aside for depreciation, but this, though adequate in relation to first cost, did not provide enough for full replacement. Unfortunately all operating costs except oil fuel had continued to rise.

Since the last meeting, *Orsova* had been delivered and the new Pacific service inaugurated. Particular tribute was due to the staff both ashore and afloat for the hard work and hard thinking they had put into these major new ventures.

Mr Anderson welcomed the new investment allowance as a first step towards admitting the principle of allowing shipowners to set aside more than the first cost of a ship before having to pay taxes on so-called "profits." He pointed out, however, that the allowance was only small in relation to postwar increases in building costs and that no ship already paid for would benefit from it. Thus while it lessened it did not remove the danger that the tax-gatherer would continue depriving the industry of sums which were essential for future replacement, if its future efficiency was to be maintained.

Speaking of the relationship of air and sea transport, Mr Anderson said that if both developed on economic lines, they should be more complementary than competitive. The one catered for speed and the other for comfort. Some of the new traffic created by air travelled partly by sea, to the benefit of both forms of transport. However, the assistance in one form or another that civil aviation was getting from the taxpayer must not be forgotten, particularly when some of the taxes were obtained at the risk of doing serious damage to the future of shipping. He felt that before long this danger must be recognised by all Governments and that when the two forms of transport were left alone to find their own economic places in the world's transport system, each would have much to gain from the other's progress.

The report was adopted.

AUTOMATIC TELEPHONE AND ELECTRIC CO.

NOTABLE CONTRIBUTION TO EXPORT DRIVE

The annual general meeting of the Automatic Telephone and Electric Company Limited will be held on June 9th in Liverpool.

The following is an extract from the circulated statement of the chairman, Sir Alexander Roger, KCIE:

The profit of the parent company at £1,086,591 shows an increase of £236,021 over 1952. Taxation at £603,700 absorbs £140,632 more than in the previous year, and represents 55 per cent of the trading profit. The net profit for the year available for appropriation is £95,389 higher at £482,891. In spite of increasingly serious competition in overseas markets and other adverse factors, the results of the year's trading are satisfactory.

Sales of telephone equipment have again been limited by Treasury restriction on Post Office capital expenditure. This policy is depriving the country of a telephone service adequate to its need, and is also denying hundreds of thousands of would-be subscribers facilities for the better transaction of their business and private affairs.

Sales of telephone equipment overseas, although showing some reduction on 1952, have been maintained at a satisfactory level and the industry in general has fought hard to make a notable contribution to British exports.

It is vital at this stage in our export trade position that we can look forward to a period of stability—where our efforts to reduce production costs are not nullified by incessant wage claims.

EXPERT TOOL AND CASE HARDENING

ESTABLISHMENT OF LONDON SELLING ORGANISATION

The thirty-third ordinary general meeting of The Expert Tool and Case Hardening Company Limited was held on May 19th in London, Mr A. H. Redfern (the chairman) presiding.

The following is an extract from his circulated statement: The net profits, before taxation, amount to £127,261, as compared with £166,288. Taxation absorbs £72,500, leaving a disposable surplus of £54,761, as compared with £62,888 in 1952.

After providing for a final dividend of 16¼ per cent (making 27½ per cent for the year), the preference dividend, and appropriating £20,000 to general reserve, the balance of undistributed profits carried forward amounts to £42,859, compared with £34,612. Total capital and revenue reserves (not including the reserve for future taxation) now amount to £189,619, against an issued ordinary share capital of £160,000.

Your directors have had under consideration for some time the establishment of a central selling organisation in London, which would distribute the products of some of your subsidiary companies and also those of other manufacturers. A wholly owned subsidiary company, Adams, Ashmore and Company, Limited, has been formed for this purpose since the date of the balance sheet.

Now about the current year, the steps being taken by your directors to increase output have not yet become wholly effective, but the policy being adopted will, I feel confident, have a favourable effect on future results. The report was adopted.

B.I.C.C.

SATISFACTORY RESULTS

The ninth annual general meeting of British Insulated Callender's Cables, Limited, will be held on June 10th in Liverpool.

The following is an extract from the circulated statement of the chairman, Sir Alexander Roger, KCIE:

In my statement last year I expressed the opinion that trading conditions in 1952 had been exceptionally favourable and the drop in 1953 trading profit of £1,178,002 to £8,344,074 was not unexpected by us. Under all the circumstances we consider the results, which are more in line with the normal year 1951, to be satisfactory.

The main features of the profit and loss account are that the fall in trading profit has been more than offset by the decreased charge for taxation and the increased special receipts leaving net available profit from the year £533,901 higher at £3,998,336.

Your directors have had fully in mind the claims of stockholders for an increased distribution. Thus, while continuing to strengthen reserves by transferring £500,000 to reserve for replacement of fixed assets, and £1 million to general reserve; and by adding £322,346 to the balance carried forward on profit and loss account, they propose to pay a total dividend for the year of 10 per cent less income tax (of which 2½ per cent, less income tax, has already been paid as an interim dividend last January) and to make a special distribution of 2½ per cent free of income tax out of capital profits earned on the realisation of investments and properties in 1953 and earlier years.

As the balance sheet shows, the position of the group is a very strong one, reserves now exceeding the issued capital and total assets amounting to over £62 million.

For our production people 1953 has not been an easy year.

In certain of our activities the group has enjoyed a good load factor with all its benefits, but in others the load has been erratic with all its consequent problems.

Technically, I believe that in our industry we are as efficient as anyone in the world and we are spending large sums each year to remain so. From the cost angle much can be done by the introduction of new plant and processes, but the full benefits can only finally be obtained by overall efficiency and hard work. Your board are all in favour of higher salaries and higher wages, provided, and it is a most important proviso, they are accompanied by higher efficiency and increased output.

Although there has been a welcome increase in the intake of orders since last autumn, there is no doubt that the days of having long order books are over, and that we are back to the prewar position in many of our products with delivery and price becoming of increasing importance.

The relinquishment of Government controls over most of our raw materials, and the growing freedom we therefore enjoy, are a help and challenge to us all in the group to achieve greater productivity, even higher efficiency and lower costs. They must remain our foremost objectives.

Conditions from the short-term aspect may not be easy—they rarely are! But I have confidence in the future of this group with its wide spread of interests both in products and in territories; with its active research and technical activities; with its fine factories constantly being improved; and above all with its enthusiastic, competent and loyal team of men and women.

Also issued with the accounts was a tribute from the board of directors to Sir Alexander Roger on the occasion of his retirement as chairman and director of the company.

JOHNSON & PHILLIPS

STRONG LIQUID POSITION

The forty-ninth annual general meeting of this company was held on May 20th in London.

Mr G. Leslie Wates, JP, Comp. IEE, chairman and joint managing director, in the course of his speech, said: The trading balance for the year 1953 is just over £600,000 and is less than last year's trading balance by approximately £100,000. This difference in the trading balance is entirely accounted for by our rubber cable business.

The introduction of lower selling prices automatically caused falls in the value of the cables we had in stock, both at home and abroad, the whole of which has been borne in the current trading account.

The other departments, namely, the paper cable department and the engineering departments manufacturing switchgear, transformers and capacitors, have done well, and in the aggregate have increased their sales, and their gross and net profit, over those of the previous year. Our capacitor department is being completely overhauled and is already beginning to show good results.

Our current assets amount to £4,399,889 whereas the current liabilities to creditors and others are only £1,331,667, thus showing an excess of £3,068,222.

Although the dividend is at the rate of 15 per cent on the nominal value of the ordinary shares, by reason of the reserves and the credit balance on profit and loss account, the dividend gross, expressed in terms of percentage on the capital of the shareholders employed in the business is only 6.15 per cent, and after tax, only 3.37 per cent is actually paid to shareholders.

The report and accounts were adopted.

SAN FRANCISCO MINES OF MEXICO

The forty-first annual general meeting of San Francisco Mines of Mexico Limited was held on May 18th in London.

Mr C. E. Temperley, OBE, MC (the chairman), presided and in the course of his speech said: Compared with the previous year the proceeds from the sale of our production fell by £2,754,000; our tax bill fell by £2,368,000 and our costs rose by £330,000. The end-effect of these changes was that the net profit for the year fell by £715,000 to £255,000.

The increased amount of unilateral relief granted by the UK Finance Act of 1953 enabled us to transfer back to appropriation account nearly £400,000 of previous provision for taxation now no longer required. Your directors recommend a dividend of 2s. per unit out of operating profit and a bonus of 2s. out of tax provision no longer required.

From a technical point of view, operations at the mine were entirely satisfactory. Underground development at our two mines continued to show satisfactory results.

For several years your company enjoyed high metal prices and earned handsome profits. Metal prices rise and fall like the tide. The tide has now ebbed and at present prices our earnings are comparatively small. It has been the board's policy to build up and maintain a strong cash position and our finances are very strong indeed. It is impossible to predict the duration of present conditions, but I am confident that when the tide does turn your company will be in excellent shape to resume its prosperous journey without difficulty or delay.

The report was adopted.

CITY OF BLOEMFONTEIN

FOUR PER CENT INSCRIBED STOCK 1954

NOTICE IS HEREBY GIVEN that the books of the City of Bloemfontein 4 per cent Inscribed Stock 1954 will be finally closed for transfers at the close of business on Tuesday, June 8, 1954.

For Barclays Bank (Dominion, Colonial and Overseas)
(Registrars of the above Stock).
G. A. D. HARRISON,
Manager.

Circus Place,
London Wall, E.C.2.

AVELING-BARFORD LIMITED

NOTICE IS HEREBY GIVEN that the Transfer Books of the 5½ per cent Cumulative Preference Stock, the 5 per cent Second Cumulative Preference Stock, the Ordinary Stock and the "A" Ordinary Stock will be closed from Tuesday, May 25, 1954, to Tuesday, June 8, 1954, both days inclusive.

By Order of the Board,
H. C. RYAN, Secretary.

Invicta Works, Grantham.
May 18, 1954.

HER MAJESTY'S COLONIAL SERVICE

Statistician (CDE 63/7/03) in the Department of Agriculture, Kenya, to advise on the design of field and other experiments conducted by the Department including sampling, investigations and surveys, and to assist in the statistical analysis of results.

The appointment will be on two years' probation for permanent and pensionable employment. Salary on scale £550 to £1,320, plus a temporary variable and non-pensionable allowance which is at present 35 per cent of salary with £350 a year maximum. When quarters provided, rental will be charged at 10 per cent of salary furnished or 7½ per cent unfurnished (maximum of £150). Free passages for officer, wife and family up to cost of three adult passages. Income tax at local rates which are much lower than in United Kingdom. Generous home leave.

Qualifications required are a good degree in Mathematics or Statistics with some post-graduate training in statistics, and preferably a diploma in statistics; some experience of, or training in, statistical methods as applied to agricultural field experiments is essential.

Intending applicants, who should be between 21 and 40 years old, should write to the Director of Recruitment (Colonial Service), Colonial Office, Sanctuary Buildings, Great Smith Street, London, S.W.1, stating briefly personal particulars and qualifications and quoting above reference.

THE NATIONAL INSTITUTE OF ECONOMIC AND SOCIAL RESEARCH invites applications from economists for two vacancies on its research staff to work in the field of capital formation, particularly (i) on the statistical and economic analysis of data on the sources and uses of funds of public companies, now being compiled at the Institute from published accounting material; (ii) on experimental work using available material (including firms' records) for the measurement of the growth of industrial capital in real terms in the postwar period.

The two vacancies are for (i) a Research Associate Grade I or special appointment of higher grade, salary in the range of £950-£1,600 p.a. according to qualifications and experience; (ii) a Research Associate Grade II, salary in the range of £600-£950 p.a. F.S.S.U. or equivalent provision and family allowance scheme available. Good academic qualifications and research experience are essential. One at least of the two vacancies will be filled by an economic statistician. Both appointments would be for two years in the first instance, with possibilities of extension. The Institute would welcome applications from candidates already in other posts who are in a position to arrange for leave of absence without pay, or secondment, for the necessary period; a part-time appointment would be considered in the case of an exceptional candidate. Where such an arrangement would involve an applicant in abnormal expenses (e.g. of removal of household or maintenance of a home in his existing area of domicile) the Institute would be prepared to consider making a grant toward such expenses.

Applications, marked "Confidential," should include full details of qualifications and experience, the names and addresses of two referees, and should reach the Secretary, 2 Dean Trench Street, London, S.W.1, by May 31, 1954.

MARKET ANALYST required to form Investment Research department in CITY MERCHANT BANK. Thorough previous experience Stock Market Research essential. Candidates must be used to working independently and should preferably be aged 35-45. Salary £1,500/£2,000, with excellent future prospects.—Write Box "MY/57" c/o 95 Bishopsgate, E.C.2.

A YOUNG CHARTERED ACCOUNTANT, aged 26 to 28 years, is required by a well-known Industrial Company to train for a position of responsibility in which initiative and drive will lead to early promotion and lucrative employment. A University degree would be a good additional qualification but not essential. This is a unique opportunity for a young man to prepare himself for an appointment with the widest scope and interest. An adequate salary covers the training period, with ultimate prospects of earning up to £3,000 per annum.—Please send details of qualifications and experience to Box No. 557.

A £9,000,000 turnover group of factories has been started and brought to satisfactory and profitable operation by manager in his thirties.

He will be available in 3-6 months. General administrative and technical experience, Britain and the United States. £3,500 minimum salary or will consider share option in suitable company.—Box 562.

GERMAN economic student (21) desires stay in England or Commonwealth; willing to teach or work.—Box 560.

ACCOUNTANT A.C.W.A. (34) seeks better post. Chief Accountant public company. Seven years' experience costing factory and building industry, budgetary control, financial accounts. Overseas war service. Captain R.A.S.C. Highest references.—Box 558.

JOURNALIST, under 35, with mature judgment on foreign affairs, knowledge of news sources, and experience in handling copy, wanted for important editorial post in London involving both reporting and comment. Good salary and prospects for an outstanding man.—Box No. JU-093, 10 Hertford Street, W.1.

ACCOUNTANT/OFFICE MANAGER with keen interest in all forms of mechanised accounting and special flair for punched-card technique seeks employment where there is scope for these or other progressive methods and ideas.—Box 561.

CHARTERED ACCOUNTANT required to open Continental office for London Chartered Accountants. Good knowledge German and French essential. Salary by arrangement.—Box 559.

THE POLYTECHNIC, 309, REGENT STREET, W.1.

SESSION 1954/55

Enrolment can now be made for the following full-time courses:
(1) General Certificate of Education Advanced Level; Preliminary and Final B.Sc.(Econ.); and B.Sc.(Sociology) of London University.
(2) Commercial Administration.
(3) General Secretarial Studies.
(4) Professional Course for Accountants.
(5) Professional Course for Statisticians.

Inquiries and applications to the Head of the School of Commerce, from whom a prospectus can be obtained.

UNIVERSITY COLLEGE OF SOUTH WALES AND MONMOUTHSHIRE

Applications are invited for the post of Research Assistant in the Department of Industrial Relations. Applicants should have an Honours Degree in Economics and previous research experience would be an advantage. Salary £450 per annum. The post is for one year, and may be renewed for a further two years. Six copies of application, with the names of three referees, should be sent to the undersigned, not later than June 26, 1954.

(Signed) E. R. EVANS, Registrar,
Cathays Park, Cardiff.

May, 1954.

UNIVERSITY COLLEGE OF SOUTH WALES AND MONMOUTHSHIRE

Applications are invited for the post of Assistant Lecturer in the Department of Industrial Relations. Commencing salary £450 per annum. Six copies of applications, with the names of three referees, should be sent to the undersigned (from whom further particulars may be obtained) not later than June 26, 1954.

(Signed) E. R. EVANS, Registrar,
Cathays Park, Cardiff.

May, 1954.

LONDONDERRY: MAGEE UNIVERSITY COLLEGE

APPLICATIONS are invited for an Assistant Lectureship in the departments of Mathematics and Economics for three years from October 1, 1954. Salary £500, rising by annual increments of £50 to £600, with the usual children's allowances and FSSU benefits. Applicants should possess adequate qualification in mathematics, but should be interested mainly in economics and social science.

Three copies of applications, which should include two testimonials and the names of two referees, should reach the Secretary of the Trustees, Magee University College, Londonderry, Northern Ireland, not later than June 12th. Fuller information, if desired, may be obtained from the Secretary.

HOME OFFICE: CHILDREN'S DEPARTMENT AND PROBATION INSPECTORATES. The Civil Service Commissioners invite applications for pensionable posts as Inspectors Grade II in the Children's Department Inspectorate, in London and Provinces, and in the Probation Inspectorate in London.

The Children's Department Inspectors' duties include the inspection in England and Wales of arrangements for boarding out children with foster parents, of children's homes and nurseries and of approved schools and remand homes, and assistance in training workers in child care.

The Probation Inspectors' duties include inspection of probation work in England and Wales, advice on individual cases and assistance in the training of entrants to the Probation Service.

Age preferably at least 28 on April 1, 1954. Candidates must have a wide experience of social conditions in this country and an understanding of behaviour problems. They should normally have had practical experience of family case work. Preference will be given to candidates who hold a University degree or a diploma or certificate in social or domestic science or institutional management or who have taken other recognised training in social or educational work.

Salary scales (London) (including Extra Duty Allowance where payable): Men, £872-£1,126; women, £729-£985.

Particulars and application forms from Secretary, Civil Service Commission, 6 Burlington Gardens, London, W.1, quoting No. 4328/54. Application forms to be returned by June 3, 1954.

MINISTRY OF EDUCATION requires, for England only, HM INSPECTORS (men and women). Preferably under 50. Good educational qualifications and experience in Adult Education desirable. Qualifications in Economics, Philosophy and Psychology particularly desirable.

Posts permanent and pensionable. Inclusive salary: *London* £1,075 by 12 increments to £1,625 (men); £970 by 11 increments to £1,438 (women). *Elsewhere* slightly less. A few posts carry £100 allowance. Appointments may exceptionally be made above the minimum. Higher posts filled by promotion.

Application form from the Secretary (Inspectors' Section), Ministry of Education, Curzon Street, London, W.1. Closing date June 15th.

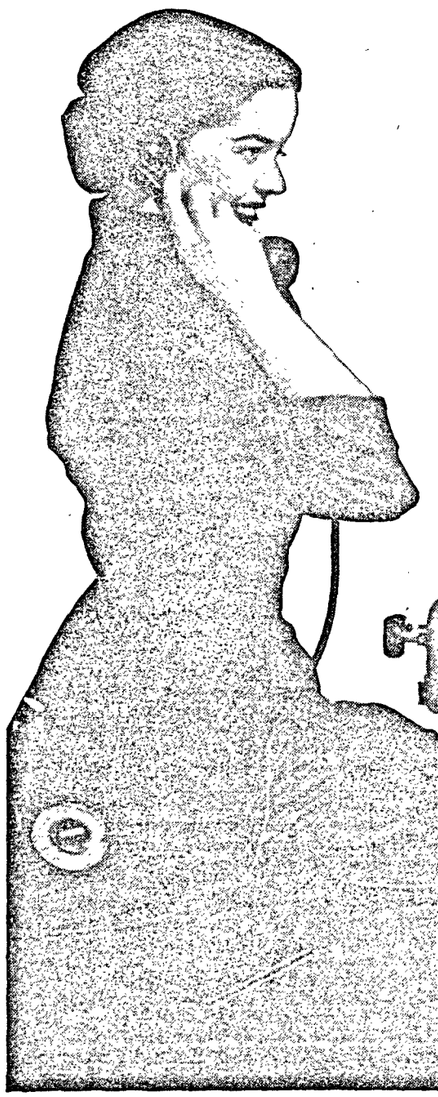
PROGRESSIVE BUSINESS MEN'S FORUM—a Symposium on "GENEVA—PROSPECTS OF PEACE IN ASIA." Speakers: Mr Dingle Foot, QC, Mr Emrys Hughes, MP, Mr Niall Macpherson, MP, Mr Woodrow Wyatt, MP. On THURSDAY, MAY 27th, CORA HOTEL, Upper Woburn Place, WC1, at 7.45 p.m. Visitors 3s. 6d.—MAYFAIR 4215 for reservations.

STATISTICIANS in the HOME CIVIL SERVICE.—The Civil Service Commissioners invite applications for posts of Assistant Statistician in Government Departments. Selection will be by interview in London in late July. Age at least 20½ and under 24 on August 1, 1954, with extension for service in HM Forces and approved post-graduate statistical experience. Candidates may be mathematical or economic statisticians; they must have a First or Second Class Honours Degree (II (i) where the Second Class is divided) with statistics as the principal subject or a substantial part of the final examination, or a post-graduate University Diploma or higher Degree in Statistics. Those so qualifying this summer will be eligible. Starting emoluments in London, including Extra Duty Allowance (where payable), between £507 and £669 (men) or £588 (women), according to periods of National Service and post-graduate experience, rising to £923 (men) and £810 (women). Promotion prospects to £1,570 (men) and £1,395 (women), with possibility of later increases to £2,100 (men) and £1,950 (women). Particulars and application forms from the Secretary, Civil Service Commission, Burlington Gardens, London, W1, quoting No. 96/54. Completed application forms must reach him by July 3, 1954.

CHEMIST, Ph.D.; young, energetic, experienced research, development, production, management, business aptitude, administrative ability, technical/non-technical post, possibility eventual directorship. London area.—Box 563.

Today's best answer—

to rising accounting costs



FOUR YEARS AGO there were no Burroughs Sensimatic Accounting Machines. Today, Sensimatics are used in thousands of businesses, large and small—doing every type of accounting work . . . faster . . . more automatically . . . with greater ease . . . at lower cost.

The machine's versatility makes striking economies possible. In a large office, *all* Sensimatics can be switched simultaneously to one kind of work; in a small office, *one* Sensimatic can be used for every job.

Burroughs offer five series of Sensimatics—one of the many styles will exactly suit your particular needs.

Call Burroughs *today*. Burroughs Adding Machine Limited, Avon House, 356-366 Oxford Street, London, W.1—branches in principal cities.

Permanence

Our remote ancestors built with rocks so huge, rough-hewn and heavy that legend attributes their bridges and defences to the giants called Cyclopes.

Built by manpower alone, these massive constructions have survived the assaults of time and weather. Today civil engineers use aluminium and its alloys because these materials provide structural strength, durability and resistance to exposure; but, unlike the Cyclopean stones, they combine these qualities with exceptional lightness.

The British Aluminium Co. Ltd.

The story of the Crittall window that had two baths

A Crittall steel window had two baths. The first was in molten zinc at 860° Fahrenheit, to give it a positively rust-proofed, galvanized surface. The window was then placed on the roof of Fulham Gas Works for twenty months, followed by another twelve months in the steam and fumes of the coke-quenching sprays. The second bath, at the end of the thirty-two months, was just to remove the accumulated quarter-inch thick layer of corrosive deposits. Was the Crittall Window any the worse for this trying experience? No, not a bit! Its tough galvanized surface was still as intact and corrosion-proof as the very day the window was made. That is why Crittall rust-proofed windows, with the very smallest outlay for ordinary, sensible maintenance, will outlast any building they are called upon to grace and protect.

Here is a letter and its envelope written several thousand years ago on the banks of the Euphrates. The message was inscribed in wet clay which was then left to dry, and later covered with another layer of clay to carry the address. The letter was opened by breaking the envelope as if cracking a nut from its shell.

Ingenious—yes—but cumbersome and antiquated. A far cry indeed from letters of today, quickly written on a typewriter—a typewriter, to be precise, which is smooth, light to the touch, responsive, handy, comfortably carried—written, in a word, on the Lettera 22.

Asia's Hour

WHEN a camel advertising a local circus lurched through the draughty streets of Geneva a few days ago, hardly a soul stopped to stare. In the past month, Calvin's city has come to take the exotic for granted. Admittedly, it has accustomed itself to a floating Far Eastern population since the first days of the League of Nations, and even in May, 1954, a Vietnamese encountered in a Geneva bus may prove to be attending the World Health Assembly. But Asia has never before stepped so dramatically across the Alps. Of the score of delegations at the present Geneva conference, nine are from the Far East; and the citizens, blinking at the unfamiliar flags of states ranging from Cambodia to North Korea, rub elbows in their narrow streets with Indonesians, Japanese, Pakistanis and other Asians who are present as journalists, unofficial observers, pleaders of causes or waiters in the wings.

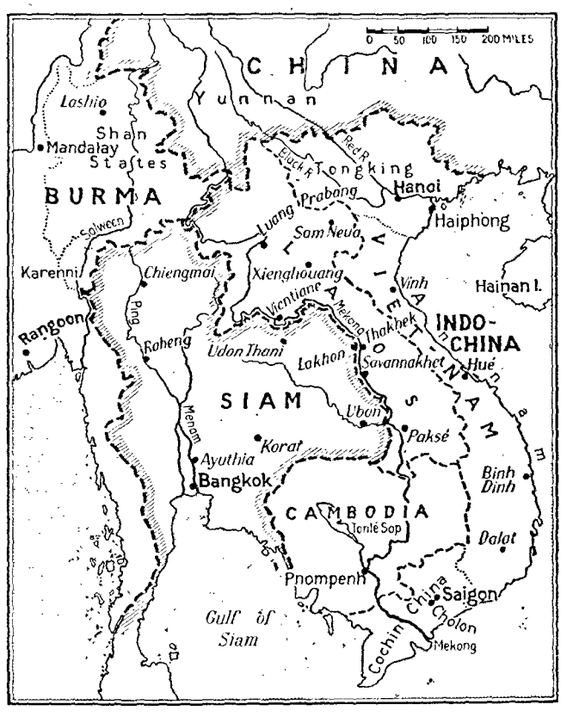
But this is Asia's hour in a deeper sense. The proceedings at Geneva have now reached a point at which the future course of events in the Far East, and perhaps in the larger world, waits upon decisions that must be taken—and taken soon—in Peking and in Delhi, in Seoul and Pyongyang, in Saigon and in Ho Chi Minh's jungle capital in Tonking. Nearly all the western governments' cards have been laid on the table, face upward, and with an hourglass alongside them as a polite but clear reminder that in this kind of fateful game there must be a limit to the intervals between rounds. France has committed itself to Indo-Chinese independence; Mr Eden has held open, for several crucial weeks, a door that successive gusts from various directions threatened to slam shut; and Mr Dulles has shown great restraint in extremely provoking circumstances. The mistakes the western nations have made in the past cannot be wholly blotted out of the record; but through the bitter month of crisis and confusion that is now ending patience and firmness have survived to emerge this week, still in partnership, into a slightly milder atmosphere.

The barometer at Geneva, after oscillating wildly, almost daily, between hopes and fears, seems indeed to have steadied somewhat. It is not by any means set fair; but it is a sounder guide to political reality now than when it was veering from storm to sunshine and back again. The evaporation of some of the inflated hopes of recent weeks has contributed as much to this new steadiness as has the failure of several threatened storms to materialise. Mr Krishna Menon's arrival and his round of quiet and cautious talks have dispelled the widely prevalent idea that Delhi was sending him to Geneva equipped with a miraculous key that would unlock all doors. The "Molotov plan," announced with fanfares a week ago, is now seen in its proper proportions, as a sensible procedural formula but nothing more. And the concessions made on both sides as regards Korea are generally recognised as quite inadequate to remove the basic obstacles to the reunification of that country.

The clearing of the air has made it easier to identify and concentrate

upon the hard core of the Indo-China problem. This is now plainly seen to be the question of partition. However, unfortunately for clarity, in the circumstances of the Geneva conference, partition seems to be an unspeakable word. In Vietnam, two rival governments each assert an authority over the whole state which neither in fact can exercise ; and even in Cambodia and Laos, the Communists have put forward the claims of their " resistance governments " to be considered on equal terms with the recognised administrations. According to the latest reports available, however, the Viet Minh have not only accepted the argument that military regrouping must be the first step towards a settlement, but have also carried it a little further towards its logical consequence—which is effective partition—by urging that the reshuffle should take account of economic factors. This is progress indeed. A few weeks ago, it was being proclaimed that Vietnamese territorial unity was of paramount importance, which implied that the bloodshed must go on until one side or the other was totally liquidated. Now, sanity is gaining ground.

But there is still much ground to be covered. The crucial point that has been at issue for the past week concerns Cambodia and Laos, not Vietnam. Outside the Communist camp, few people are prepared to take seriously Pham Van Dong's claim that in each of these two smaller states a wholly indigenous " liberation movement," associated with the Viet Minh, but drawing all its strength from Cambodian or Laotian sources, has effective control over enough territory and population to entitle it to the status of a government. The evidence for this claim is flimsy indeed ; the best the Communist press could do to establish the existence of a Laotian " people's army " was to produce a photograph of eight men with a flag, and on the other side of the ledger it is an ascertainable fact that several former leaders of Laotian resistance to France are now in Geneva as members of the Laotian government's delegation. Any independent examination on the spot would quickly reveal, first, that most Cambodians and Laotians have no wish to exchange their nascent independence for Communist rule ; and, secondly, that even in the jungle areas and isolated valleys in the two states over which the red flag waves, invading columns from Vietnam have played a much more decisive part than the local guerrilla bands.



To grant the Viet Minh a permanent tenure in these states would therefore be a disastrous concession. If independent Communist administrations are, in effect, to be tolerated by Laos and Cambodia, why not by Siam, by Burma, by India or East Pakistan ? Indeed, once the Communists were comfortably established in the two states, they would no longer be confronted with any natural barriers to a further expansion. Geography has provided one such barrier in the thickly forested mountains that shut northern Vietnam off from the rest of Indo-China ; but between Laos, Cambodia and Siam there is no similar obstacle, and once Siam was penetrated the cork would be well and truly out of the South East Asian bottle.

Negotiation on this vital issue is still possible. Although the Communists have pressed their demands on Laos and Cambodia publicly and forcefully, they have left themselves an open avenue of retreat. The two shadowy " resistance governments " have never been formally recognised by Peking, by Moscow, or even by Ho Chi Minh ; their two heads, Souvanouvong and Son Ngoc Minh, could at any moment be converted into " unpersons " by the well - oiled propaganda machine. The Communists are in a position to retire gracefully ; they can even withdraw the Viet Minh troops from the two states without ever admitting that they had been there. Their antagonists at Geneva may be able to smooth this path of retreat ; but they themselves can hardly give way on a point involving such obvious moral issues, any more than they could in Korea. The hour of decision is Asia's, not the West's.

But it is not only Communist Asia that must now take a fateful choice. The nations of free Asia also face an urgent decision. Are they, by inaction, to give the impression that they are indifferent to the fate of two newly free Asian states ? If they are ready to see Laos and Cambodia crumbled into satellites of Peking, what of Siam and Burma ? It is not known what passed between Mr Menon and Mr Chou En-lai during their long talk in Geneva this week ; but it is obvious enough that at this crucial moment, a clear intimation to the Communist bloc that free Asia is at last alive to its own danger might turn the scales.

Change is Whose Ally ?

LAST week the Conservative Political Centre brought out a booklet with quite the best title of any political publication since the war. The title is " Change is Our Ally "* ; and under this strangely unconservative device ten Tory backbenchers have expressed their forthright abhorrence of the prewar Conservative policies of molly-coddling monopolies, sponsoring rationalisation and rushing to the rescue of any industry that had been rendered uneconomic by technical progress abroad. Their views do not, of course, carry the weight of official party policy, but are merely offered " for discussion and judgment "; and some of their proposals for the future, which are reviewed in more detail on page 696 of this issue, are admittedly more cautious than their condemnation of the past. This is a booklet written by ten politicians with praiseworthily liberal leanings, but also with an obvious desire to hold on to their seats.

Nevertheless, its publication is a significant event. Nine of the back-benchers concerned are under the age of fifty ; and it is reasonable to suppose that by the late 1960s at least two or three of them will hold very important positions in the Conservative hierarchy. Their work goes some way to suggest that the Government back benches now contain some hard-thinking young men who have done very well intellectually out of the last peace. If so, as their influence matures, a new prospect will open before the Conservative Party. Hitherto the party's basic instinct has been to resist all forces making for economic change, although this instinct has been tempered by the fear that the electorate might consider this very unprogressive. The new band of young Tories instinctively understand that it is in the country's interests that they should welcome and encourage the forces making for economic change, although this instinct is tempered by the fear that the electorate might find this very uncomfortable. The change in attitudes could not be more complete, even if the change in policies may lag some way behind it.

The new leaven should clearly be welcomed by all who hold radical opinions. But should it also be welcomed by those whose main objective is to keep the Conservatives in—and the Socialists out of—office in as many Parliaments as possible throughout the second half of this century ? This is the question that will trouble those whose control over the early development of Tory policy is likely to be decisive ; it is also—as the caution underlying many of the proposals in " Change is Our Ally " shows—the question that is worrying the back bench authors themselves. The question demands an answer from those who must declare an interest in the adoption by the Conservatives of a progressive policy, who believe indeed that those who should declare such an interest are the British people at large.

The fears of the party managers can be understood only when it is recognised that the proposals in " Change is Our Ally " are not a logical development of the slow postwar progress towards Tory Reform that has been associated with the name of Mr Butler ; indeed, in many ways they represent a sharp break from it. Butlerism has involved the Conservatives in the abandonment of certain traditional attitudes, but only those that had clearly become unpopular. The party has thrown off most of its previous attachment to privilege, some of its previous objections to the social services, and all of its previous objections to Keynesian finance. But it has done so not out of courage but out of funk. In the process, the Butlerites have annoyed nobody except Sir Waldron Smithers, and the party managers can feel fairly safe that he will not react by voting Labour.

★

The philosophy of " Change is Our Ally " must seem a different proposition. Its implementation would annoy very many people very considerably, at any rate in the short term. The workers and capitalists in such declining industries as cotton textiles, the farmers, the big and little monopolists, would all be hurt far more by a policy that welcomed economic change than the honeyed words of this booklet might lead them at first reading to believe. Labour would be given some new catchwords, and it would certainly gain some new recruits. The Conservative Party, in short, would lose the support of some middle-class conservatives, and it would have to try to make up for this by gaining the support of progressives in all classes instead.

This is the disruptive challenge of " Change is Our Ally " ; and it is understandable that some party tacticians should argue fearfully that disruption means decay. But, before they do so, they should consider carefully what is their alternative. The most obvious alternative, presumably, is to rely on the simple common bond that wins the party nine-tenths of its present votes : to stand as a rallying point for the majority of the country which does not believe in Socialism. The main objection to this policy is a peculiar but increasingly insistent one : it lies in the dawning realisation that the leaders of the Labour party do not believe in Socialism either. In the second half of this century a conservative party may not look like an alternative to Labour ; it may merely look like the same thing, but with too many rich men attached.

* " Change is Our Ally," edited by Enoch Powell and Angus Maude. Joint authors : Robert Carr, Richard Fort, Viscount Lambton, Gilbert Longden, Angus Maude, David Ormsby-Gore, Enoch Powell, John Rodgers, J. E. S. Simon, John Vaughan-Morgan. Published by the Conservative Political Centre. 1s. 6d. 104 pages.

The transformation of the Labour party into a conservative party is already far advanced, not because Mr Attlee and Mr Morrison are conservative men (as 1931 showed, they are not), but because of the remorseless pressure of events. In their hearts the Labour leaders now recognise that the redistribution of the national income in favour of the working class has gone as far as (though they dare not say further than) is consistent with the operation of normal economic incentives; their basic instinct in this field is now the very conservative one of defending the new *status quo*. As for Labour's belief in public ownership, that has now degenerated into a desperate and equally conservative search for industries in which they feel that nationalisation should not make very much difference; probably the only industry that will be brought under public ownership in Labour's next tenure of office is water, which is not likely to scare even Bournemouth very much.

★

If this does prove to be the political pattern of the next half century, if the electorate is merely to be offered an unexciting choice between a Labour party that is conservative in fact and a Tory party that is conservative in theory as well, on which side will the political pendulum most frequently dangle? The probability is surely that, except when there is some clear superiority in the calibre or experience of the leaders of the so-called right, the electors would more frequently choose Labour; there would always be a suspicion that some preference for privilege was attached to the professedly conservative side.

There are, of course, many other possible twists of the political wheel for which the Conservatives may feel they should prepare. But, in any event, the most profitable course for the young Tories must surely be to stand by their new, though cautiously fired, guns. If Labour breaks away from the instinctive conservatism which now wins it most of its trade union votes, it will not be a very dangerous party to contend with at the polls (in fact, it may not remain as one party at all); and in this case the young Tories should find that the progressive policy in which they now believe is a luxury that they can then afford. If Labour recognises that its real attraction to its mass of inactive supporters is now security rather than Socialism, it is likely to become an increasingly conservative party; and the only alternative which the Tories could put up to that would be to become an increasingly progressive one. For these reasons last week's publication, which is in direct succession from the "One Nation" pamphlet produced by the same group of backbenchers in 1950, should and may play as important a part in moulding future Conservative political opinion as the Fabian Essays did in moulding Socialist political opinion in a by-gone age. The real need, now that some Tories have recognised that change is their ally, is that a united party should mobilise it as their co-belligerent.

Brave Answer to Malan

A NEW constitutional crisis threatens to divide and disrupt the Union of South Africa. Once again Dr Malan has decided to do battle on the representation in parliament of the Coloured voters (which, in South Africa, does not mean Negroes). Within the next few days a joint sitting of both houses, as required by the constitution, will be asked to root out the last shred of democratic privilege enjoyed and exercised by a paltry few thousand citizens, mostly honest, hard-working, politically unambitious people who, in the arbitrary judgment of the petty official issuing the newly invented identity card, have a coloured skin. Yet the mere 48,000 coloured people who actually use their vote—a recent Select Committee estimated that 100,000 more are entitled to do so—in practice cannot sway the decision in any but a few constituencies; in any case many of them, because of their language and Afrikaans affiliations, would vote for the Nationalists.

It is not, therefore, on practical grounds that Dr Malan pursues his vendetta; it is a question of prejudice and of dogma. A common electoral roll for whites, coloureds and blacks is anathema to a party which preaches *apartheid*, the policy of separate political, social and economic facilities for each separate racial group. Moreover, since the fight was of the Nationalist cabinet's own choosing, anything but outright victory on this issue would sully the honour of the leaders in the eyes of the party's faithful. But everything points to another deadlock in parliament; the government will surely fail, though only by a few votes, to get the required two-thirds majority, notwithstanding the compromise proposed this week by a section of the Coloured community themselves. Why, then, does Dr Malan persist in this frustrating and damaging course? What is the future of this unhappy country?

For political purposes the issue of the Coloured voters has up to now served Dr Malan well. He has succeeded by his manœuvres in breaking apart the once united front opposed to him. Many of the members who sit on the opposition side—indeed, probably a majority of all white South Africans—agree with him when he takes steps to preserve the European's political and economic privileges. But many people object to the tactics the government has employed. And many more are disturbed when Dr Malan, thwarted by the entrenched clauses of the 1909 constitution and the steadfast independence of the courts, has threatened unconstitutional action. His tactic of driving wedges into the opposition has, up to the present, been made easy by the absence in the United Party of a constructive alternative native policy. Indeed, its present leaders might well blame Smuts for their predicament, for it was only the power of his personality that made the lack of a policy appear the inevitable path of wisdom.

Without Smuts, the United Party, split from end to end, has turned against itself. Soon after the crushing defeat in the elections of April last year two splinter parties, the Liberal Party and the Union Federal Party, came into existence, and have since been gathering lively, if not yet effective support. More recently, five United Party right-wingers hived off and now form, with two other fellow travellers, an independent group sitting in splendid isolation on the edge of their opposition benches, ready at the drop of a handkerchief to climb on to the Nationalist ox-wagon.

But Dr Malan's splitting operation may now be yielding diminishing returns. The United Party, shorn of its most reactionary elements, is at last beginning to grapple with the hard necessity of thinking out an alternative policy. At present it has gone no further than admitting, as if it were not always obvious, that economic integration of the African is an accomplished and irreversible fact. Until now, for fear of an untimely reaction among their fast dwindling supporters in the country districts, Mr Strauss and his lieutenants have not plucked up the courage to say that political integration—which means direct representation in parliament for Africans and Indians as well as Coloureds—must follow. Nevertheless this liberal conclusion is slowly but surely gaining support. Even if the United Party has to face further desertions, as a consequence it will in the long run be a stronger and more effective force.

★

It might be said, therefore, that time runs in Dr Malan's favour, since he need only wait for more dead wood to fall off the freshly sprouting United Party branch. But this is to ignore one of the most important and least understood factors in the South African situation. Whatever the malicious and frequently uninformed critics in sections of the British press may say, there is a spirit of latent liberalism in the hearts of South Africans, whether of British or of Afrikaans descent. While it is true that an ill-defined but ever-present fear grips the white South African whenever he thinks of the native problem, thereby conditioning him emotionally to accepted *apartheid* doctrines, it mingles with a guilty conscience. Both sections of the white population have in fact a liberal tradition. The Afrikaner looks back on a never-ending "trek" to freedom from the shackles of domination; the old Boer republics were models of democratic control and the burgers never hesitated to dismiss any of their leaders at the first sign of authoritarianism. And all the great figures in South African political history—none more liberal than the late Jan Hofmeyr—were Afrikaners. The English South Africans have an equally liberal heritage. Naturally circumstances have dimmed the fire—it is hard to be a true-blue idealist when there are six Africans to every white man—but the flame is still alight.

Dr Malan and his henchmen understand the real character of the Afrikaner and, despite the appearance of unbreakable solidarity in the Nationalist ranks, they are filled with foreboding. They realise that the Afrikaner in his heart cherishes freedom, loathes authoritarianism, and respects above all the principled teachings of his Calvinistic creed. That is why, for the past two years, Dr Malan has been baulked by the constitution and the courts; it is the reason for the endless congresses of the Dutch Reformed Church, where learned theologians wrestle with their consciences and dissect the scriptures to see if they yield any moral justification for the policy of *apartheid*. And it explains Dr Malan's plaintive defence of the policies of his government in his now famous reply to the American missionary, Mr Piersma.

★

It is, therefore, one of the most hopeful signs in an otherwise gloomy picture that at last the opposition parties have faced reality. At the national congress of the United Party in November a new policy based on the response to a questionnaire recently circulated to the constituencies will be thrashed out. In working towards a liberal policy the United Party is certain to lose a proportion of its supporters, though party allegiance in South Africa is often deeply rooted—a man is born and dies a "Smuts man"—and is not easily swayed by actual policies. In return for this loss, the United Party might regain some of the support that has been transferred, because of its lack of a firm native policy, to the two new smaller parties. But the greatest gain will be on the moral plane. For the white South African is not innately reactionary; his difficulty is that he has never been shown, except by a small and unimportant group of intellectuals, or by the Communists, the facts of a liberal and severely practical alternative.

What those facts are or could be has now to be decided by the United Party and presented in a form that reasonable white men can understand and discuss. It will be argued that there can be no real compromise between the white man's fear of African predominance and his conscientious desire to be fair to the Africans; but it is precisely the purpose of statesmanship to find such a compromise. That it should be found is vitally important not only for the Union and for Africa, but also for the whole future of a Commonwealth in which men of colour outnumber men of white skin by six to one.

The Derby in Danger

ACCORDING to the Royal Commission that gave Britain's gambling habits some years of fascinated but so far largely unrewarded attention, half the population is about to have a bet on the Derby. According to some gloomy prophets in the racing world there may not always be people willing to enter horses in the Derby, or any other major race, for them to bet on. The sport is kept in being today only because there is still a supply of sufficiently rich men who are ready to pay through the nose for the fun of owning racehorses, together with some others who hope to finance themselves in this pastime by bringing off occasional betting coups.

The threat to racing is not immediate, but the economics of ownership already deserve attention. One owner in next week's Derby will pick up a £17,059 first prize and see his horse become worth £200,000 as a stallion—a value that he can capitalise without losing a penny to Mr Butler. The owners of a few good horses can make huge sums ; the Aga Khan recently collected £325,000 in a single year from Tulyar. But racing is largely a matter of " winner take all," and simple arithmetic suggests that the average owner may now be losing more than £500 a year per horse.

To keep a horse in training for the best races costs well over £1,000 a year ; the training and keep of even the humblest animal will not leave much change out of £700 a year. Yet last year 4,505 horses competed for a total prize money (for second and third places, as well as first) of £1,479,817—an average of £328 a horse. Nor did all this stay with the owners. Tradition decrees that when an owner wins a race he should give presents to his trainer and his jockey ; the usual tip is 10 per cent apiece of the prize money. The average owner, therefore, cannot in practice expect prize money to cover more than a third of the cost of keeping his horses in training, let alone to contribute anything towards recovery of their initial purchase price. This initial capital outlay may eventually be recouped by sales for stud ; but this involves an element of almost blind chance. Most owners buy their horses as yearlings : that is, six to nine months before they will first see a racecourse and at a time when future growth is as difficult to foresee as with small humans.

Economic pressure is having an even clearer effect on the types of horses that new owners are willing to buy than on the numbers of horses that old owners are able to run. An owner not exclusively interested in winning the Derby can pick up some astonishing bargains ; last year one of the biggest betting coups since the war was landed with a horse bought for 35 guineas. But an owner wanting to win the best races must buy the best blood, and that comes very expensive : invariably four figures, sometimes five. And every racing season proves that a number of horses bred in the purple would be more useful pulling milk floats.

Again, reversing the human order of things, female racehorses are a rather less chancy proposition than males. They may not be able to earn so much on the racecourse, but if they are well bred they retain their capital value for breeding purposes. Their brothers, however well bred, are not often wanted as stallions if they have failed on the course. Many an aristocratic colt, bought for £5,000 or so as a yearling, has had to be sold for £500 two years later, possibly to turn up later in the 3.30 at Kuala Lumpur.

Another differentiation in the economics of racing has its significance for the minor export trade (it is largely a dollar trade) that is attracted to the British breeding industry. Foreign buyers have recently been coming over to Britain in gratifying numbers, but they are chiefly interested in the well-bred middle-distance type of horse—four-legged Bannisters, as it were. With racing so costly, British owners tend to be more interested in the sprinting type, which costs less, gives a much quicker return if good, and can be more quickly discarded if bad. It was the British breeders' wartime emphasis on the type that allowed the French to gain their postwar dominance in our best races. The balance has lately been corrected, but depends very much on a band of wealthy men who are still willing to pay out a lot of money for the chance of leading in the Derby winner. That band is necessarily dwindling.

★

Such, then, is the threat to racing. Can anything be done to remove it ? There is no serious body of horsey opinion which believes that training or jockey bills can be cut. Trainers' expenses have risen by more than their charges ; many now depend for a livelihood on their ten per cent of prize money and often on betting gains. A few jockeys make the salaries of film stars ; but the basic riding fee of five guineas, plus two guineas for a winner, does not give an excessive income to the average rider, doomed to finish at the back of the field far more often than at the front.

Instead, the owners have two complaints to make against the racecourses : the inadequacy of the prize money available and, more bitterly, the size of the fees they have to pay to enter their horses in any race. The Aga Khan once disclosed that entry fees cost him £20,000 a year ; his many entries for this year's Derby —of which none will now actually be running—will cost him over £700. Of the £20,070 that will go to the owners of the first three horses in the Derby, the racecourse authorities will subscribe only £4,250. The rest will have been provided by the owners of the 400 original entries. So many owners will be subscribing so much because the entries for the Derby close eighteen months before the race is run, at a time when many a later goose still looks a bit of a swan. The ultimate refinement of this system of making owners gamble among themselves is called a Produce Race, for which horses are actually entered before they are born, in the names of their mothers. Even Eton insists on its entries being live.

The racecourses, for their part, claim that they cannot afford to put up more prize money or cut entry fees under present conditions. One reason for their poverty may be that there are too many courses ; perhaps some should be closed down and there should be more frequent meetings at those that remain. Even after such trimming of overheads, however, the courses could not really make racing economic unless they found other means of recouping themselves. One of their complaints is that entertainment tax is so high that they must charge 25s. for their best accommodation, compared with little more than 10s. in the United States. Another is that profits from the Tote —which are ploughed back to help racing—are subject to income tax ; they argue that this is contrary to Parliament's original intention when the Tote was set up. But these are long-standing, and by now almost subsidiary, grouses. The racing world's real hopes today are pinned to a much more fundamental and controversial proposal : the legalisation of off-the-course cash betting, under some form of central control that would allow a levy to be drawn from it to help finance racing.

★

At present, betting through the Tote and through bookmakers on the course amounts to some £75 million a year ; it helps racing, by various means (such as licence fees and the ploughing back of Tote profits), to the tune of perhaps £1 million a year. Yet the volume of this on-the-course cash betting is only about half the amount wagered with bookmakers off the course, which was estimated by the Royal Commission at between £145 million and £170 million a year. A levy of one per cent on this would enable the racecourses to double present prize money, or else to take some effective steps to attract more people through their turnstiles ; there is certainly room for increasing the attractiveness of most courses, for their restaurant accommodation and so on falls far short of the standards set in France. But obviously there can be no talk of such a levy while much of this £145 to £170 million represents furtive " street-corner " wagers that are illegal in the present state of the law.

This widespread evasion of the law is not surprising. Off-the-course betting in England and Wales is legal only if it is transacted on credit, but cash betting on horses already exists for the bookmaker who cares to open an office in Scotland. There can be no respect for a law that allows the punter to send a postal order with his bet if he addresses it to Glasgow, but runs him in if he sends it to someone in London. The Royal Commission of 1951 recommended that this confusion should be ended by legalising cash betting with bookmakers in England and Wales and also—a much more controversial proposal—by legalising betting shops. Some racing men would prefer off-the-course cash betting to be made legal for the Tote only, but they also have various suggestions whereby racing might derive a levy from cash betting with bookmakers and in betting shops, subject to some official control.

It seems very unlikely that the Government will be prodded into taking action, at least in this Parliament. In particular, there would be widespread opposition to the Royal Commission's proposal of legalising betting shops, especially from the Churches and from the bookmakers ; the thought of a bookmaker picking up a Bishop in his Bentley on the way to a protest meeting is one to make any organised political party blanch. But Mr Mulley's recent private member's Bill will legalise cash betting for football pools. Perhaps it has set a precedent in the mind of some adventurous backbench MP, who may be moved to initiate a similar private member's Bill for racing and earn himself a statue at Tattenham Corner. For, whatever other opposition the emancipator of off-the-course betting might face, he would certainly be cheered from Epsom grandstand: the racing world is searching eagerly for some way to make it possible for this huge branch of the betting industry to contribute towards the sport on which it has grown so fat.

Wealth Through Minerals

Gold was found in California before it was found in Australia, and the finding it in the former led to its being found in the latter. More, too, seems found there every succeeding month. Far from the appetite being satiated by this success, it has only been whetted. It grows by what it feeds on. . . . The stimulus has extended to other pursuits. Other metals are required, and great quantities of copper have been found at the Cape of Good Hope. Mining operations have been extended in almost every part of the world. Far from the sources of wealth being exhausted, they are only beginning to open up ; and, far from having no other and similar opportunity of extending our commerce as in the last year, the probabilities are that many more similar opportunities will arise. There is more likelihood of our not having hands enough and means enough to improve all the successive opportunities thrown in our way—(as, in fact, we have not had seamen enough and ships enough to carry on all the increase of trade that has arisen, and are obliged to borrow largely of other people, with whom we accordingly share our advantages)—than that no more such opportunities should occur, and no other such an impulse should be given to trade. California and Australia have only awakened the latent desires of the bulk of mankind to find out new paths to wealth by industry, and steadily to follow them ; and nothing exposes the Czar to such universal and hearty execrations as the diversion from these pursuits caused by his untimely aggression. We do not regard the great increase of our trade in 1853 as likely to be followed by checks to further progress or comparative stagnation. On the contrary, it seems rather the commencement of a much greater increase and a more rapid progress than have ever yet been the lot of any old and long-peopled country.

The Economist

May 27, 1854

Notes of the Week

Mr Attlee Turns Mendicant

SOMEWHAT late in the argument over German rearmament, the Labour leaders have decided that they must throw away the stick they have been ineffectually waving and fall back on methods of persuasion. It is a curious commentary on present Labour psychology that only as a last resort do the leaders decide to stage a national campaign of exposition. Their first thought, on being faced with awkward opposition to official policy, was to reach for the rules book. Last week, they persuaded the National Executive to reaffirm that its members should accept the doctrine of collective responsibility and support all decisions reached by majority vote; but they knew that, so far as German rearmament was concerned, this was shutting the stable door when the horse was half-way down the road. It would have needed a very strong leadership to bring the horse back again; and this week the executive acknowledged that the party has not got a strong leadership by exempting German rearmament from last week's resolution. Mr Attlee felt that he had no alternative; he must turn mendicant.

This mendicancy is to take the form of a series of regional Labour conferences, which will be addressed by the leading supporters of the official policy in the executive and in Parliament. In addition, a pamphlet explaining the case for accepting German rearmament within EDC is to be issued as soon as possible. The leaders have been prodded into this unaccustomed activity by the fear that the opponents of German rearmament might make enough headway to defeat the executive at the annual party conference in October. In his less worthy moments Mr Attlee may hope that by then the French will have rejected EDC and so relieved the executive of all embarrassment. But the executive dare not gamble on the French; in case EDC is ratified or is at least still a possibility in October, a majority must be assured for the official policy. Despite the pile-up of some union votes on the wrong side—at least partly due to Communist inspiration—an anxious counting of heads still suggests that this majority should be attained. But it will be a very close thing.

Retreat to China

IT is fear of seeing more recruits won over to the Bevanite wing of his party that has prompted Mr Attlee to waive the doctrine of collective executive responsibility for support of German rearmament, to explain soothingly that some Labour members have a conscientious objection to any tenderness towards the people who were killing British boys between 1939 and 1945. It is the same fear that has led him this week into a second and even weaker-minded decision: to go out to China with Mr Bevan and six other members of the executive in August and September, at the invitation of a body called the Chinese People's Institute of Foreign Affairs, to shake hands with the people who were killing British soldiers in Korea between 1950 and 1953.

The real objection to this visit is not, of course, the emotional one; it is as silly to base relations with China on emotional jingoism as it is to use it as a basis for relations with Germany. The real objection is that the visit will be misinterpreted abroad, especially—and inevitably—in America. The Americans will think that this visit is a sign that Labour wants to align itself more closely with the Chinese Communists; few people can be expected to understand that Mr Attlee's principal purpose in making the journey is to prevent this from happening. Mr Bevan would have gone to China in any event; this week's decision means that he will have Mr Attlee in front of him, and that he will be carefully encircled by such staunch anti-Bevanites as Dr Summerskill and Mr Sam Watson. Mr Bevan will come back and say that the Chinese are really agrarian reformers. Mr Attlee will come back and say—after a few polite acknowledgments to his hosts—that they are a little more reprehensible than that; he will add that he and the majority of the delegation know what they are talking about just as much as Mr Bevan does, because they were in China too. His philosophy of leadership is now to run along reprovingly behind his most rebellious supporters, even to the other end of the world and even in the middle of the Geneva conference.

M. Bidault Watches the Clock

FRENCH hopes of a settlement in Geneva have risen, and with them the stock of France's foreign minister. On a flying visit to Paris on Wednesday, M. Bidault was assured of the cabinet's full support for his conduct of the negotiations, and was greeted by the press in less hostile terms than before. But he has little time—two weeks at the most—to take advantage of this mood. The National Assembly has once again asserted its claim to sit in almost permanent judgment on the affairs of Indo-China; it will resume its scrutiny next Tuesday, and it is only thanks to public holidays and party congresses that the government can expect a moment to breathe. Should M. Bidault fail to present any tangible results after Whitsun, M. Laniel's cabinet will face yet another crisis.

French politicians must be aware that they are on the eve of historic events. The parties are trying to determine their positions. The Socialists and the MRP (M. Bidault's party) are holding their congresses this week; the Communists are soon to open their assizes; and other deputies too are seeking to feel the pulse of the country and of their own parties' rank and file. Foreign policy can no longer be dismissed to the bottom of the agenda. France, which for so many years has managed to delay so many decisions, has now to shape and crystallize its policy in haste and under pressure from an impatient Assembly, a bewildered American ally and a triumphant General Giap.

The latest news from Indo-China gives M. Bidault little scope for diplomatic niceties. He has the unenviable task of producing a coherent policy on a basis of conflicting diplomatic and strategic interests. It is generally assumed in Paris that General Ely, the French chief of staff, who is just back from Indo-China, has recommended the shortening of defence lines, the concentration of French Union forces and the creation of mobile units. Strategically this is obvious good sense; but it would greatly weaken M. Bidault's position at Geneva at the very moment when he has to begin negotiating with the Viet Minh about a territorial regrouping of the forces of both sides. To give land away without compensation is maddening for a diplomat; but to hold on to exposed outposts is courting military disasters. The quicker a decision is reached in Geneva, the better for France.

M. Mollet to the Rescue

THE whips are on this week in the French Socialist party. For M. Guy Mollet is trying to mobilise badly needed reinforcements for the forces in parliament which favour the European Defence Community. At a time when it is not even certain whether its opponents can be brought to a pitched battle over ratification of the treaty, the secretary of the party is making a bid to impose discipline in the ranks and to compel the "rebels" to toe the line or quit. Backed by the battalions of the big federations, like those of the north and the Pas-de-Calais, M. Mollet is likely to win at the special congress that is being held this week to determine the party's attitude towards EDC. Will he dare to bully the recalcitrants into submission?

His difficulty lies in the fact that the opponents of the EDC treaty, although outnumbered on the executive, have a small majority in the Socialist parliamentary group and show no signs of abandoning their position. Indeed, only recently these 58 deputies (there are 106 Socialist MPs in an Assembly of 627 members) issued a violent pamphlet against the "clerical and reactionary Little Europe." Quoting the example set by their Belgian colleagues, they claim the right to vote freely. M. Mollet retorts that on such an issue the individual deputy must bow to the collective will of the party. Yet against so many "rebels" the threat of expulsion, recommended by one federation, is unlikely to carry much weight.

If M. Mollet succeeds in moving over 50 deputies from one camp to the other, this will greatly affect the balance of parliamentary forces in the battle of the EDC, though even then the margin would be a narrow one. But the Socialist rebels may well join with other opponents of the treaty in order to prevent even the staging of a ratification debate; they will try to prevent it from ever crossing the hurdle of "preconditions." Moreover the opponents of EDC may find a temporary ally in the government. For M. Laniel, under suspended sentence by the Chamber, cannot afford to antagonise its Gaullist members. As long as the issue in Indo-China dominates the Parliamentary scene there is little chance of a direct battle over EDC, and the Socialist trial of strength is merely an interesting pointer to future possibilities.

Free Vote for More Pay

HAVING asked the House of Commons to give it a lead on MPs' pay, the Government cannot now complain if it finds the lead rather unpalatable. Once the Labour party had ranged itself solidly and sensibly behind the idea of a straight salary increase of £500 a year, it was clear that it would win the day; and the Government did not help its own cause by advancing an alternative that was at best vague and at worst deceitful. The idea of an expense allowance has some logic behind it; extra money can be funnelled with precision into the fields of expenditure that are causing the trouble. But there was little precision about the form of blanket expense allowance proposed in a Tory backbench amendment and supported by Mr Butler; this looked suspiciously like a £500 salary increase under a less unpopular name. Indeed, Mr Butler in the earlier debate had conceded that it would not be very different from a salary increase in practice, but had opined that it might be more "defensible."

Although MPs were voting amid unaccustomed freedom from party restraints, the House divided mainly on party lines, with Labour unanimously in favour of the £500 rise and most Tories opposed to any increase or at the most preferring the alternative. The scales were decisively tilted by 33 Tories who voted with Labour, and by a greater number of Tory abstentions. The proposal for an expense allowance was defeated by 276 to 205; the £500 salary increase was then approved by 280 to 166. After so decisive a verdict the Government can hardly refuse to bring forward the necessary Supplementary Estimate, but there could then still be a final round of argument. Some Tories have already put down a motion, urging the postponement of the rise until the needs of those with "prior claims"—presumably pensioners—have first been met. But there is no reason to believe that a new vote will produce a different result; and, unless the House wishes to add to the already considerable and embarrassing publicity given to its financial affairs, it would be well advised to treat Monday's decision as final.

During the debate Mr Butler gave a welcome promise to bring in legislation, apparently early next session, to improve the lot of junior ministers. Theirs is the most urgent case of all. Mr Butler gave no details, but the logical course would be to let all ministers retain their full salaries as MPs; after all, they still have to do all the work. In the case of parliamentary secretaries this would, after the rise, give them £3,000 a year instead of £2,000.

Unexploited Bomb

SIR WINSTON CHURCHILL has wisely and magnanimously called off his followers from hounding Mr Attlee further about the 1948 agreement with President Truman on atomic matters. The controversy has never had much relevance to the problems of the day; whatever agreement might have existed over the atom bomb, the Americans—if they were really as explosive allies as some Labour backbenchers think they are—could claim that it did not cover hydrogen bombs as well.

The argument about the atomic agreements began in the unhappy debate on April 5th, at the height of the hysteria aroused by the publication of details and photographs of the first hydrogen bomb tests. Sir Winston was being viciously attacked from the Left for not exercising sufficient control over American policy. With full justification, but unfortunately with astonishing clumsiness, he sought to defend himself by publishing the agreement he reached with President Roosevelt at Quebec in 1943. This bound each country not to drop the atom bomb without the agreement of the other. Sir Winston pointed out that while Labour was in office the Quebec agreement disappeared, and with it the veto. Later in that debate Mr Eden offered to seek publication of the 1948 agreement if Mr Attlee approved. Mr Attlee has made no move, even though the offer has been repeated; and some backbench Tories have been working hard to embarrass him, with this week's (now cancelled) debate on the subject as the intended culmination.

The clue to Mr Attlee's reticence is that publication of the 1948 agreement would tell only one side of the story, and a side that would be unfair to the record of the Labour government. It is now no secret that the 1948 agreement contained no veto, but that at the time President Truman gave a personal pledge that the United States would continue to work in the spirit of Quebec. This is confirmed by Mr Truman's own reaction to the disclosures of April 5; he said he thought the Quebec terms were still in force. The truth is that under vastly different circumstances both Sir Winston and Mr Attlee managed to keep a hand on the bomb; the Tories should stop showing Bevanite tendencies by complaining that Mr Attlee failed to get his pledge set down in writing.

Ten Thoughtful Men

THE broad significance of "Change is Our Ally," the new pamphlet produced by the "One Nation" group of ten Tory backbenchers, is discussed in an article on an earlier page. The best point in the pamphlet is its clear recognition that the development of Britain's control-minded and partly-nationalised economy has been partly the Tories' own fault. It has been a logical consequence of the mistaken switch in economic policy that took place between the wars. Up to 1914, the intervention of the state in economic affairs had been intended to protect the public, or a section of it, against industry; after 1918—through schemes of rationalisation, statutory monopoly, and import quotas—that intervention was usually designed to protect industry, or some sections of it, against economic change. The ten backbenchers pat their party on the back for its measures of de-control since it came back to office in 1951 (with surprising emphasis on the new Town and Country Planning Act), but insist that "the work of the last two and a half years has been only a beginning."

Unfortunately, however, this reference to "a beginning" is also the end of the most clear-cut part of the pamphlet. The rest is rather like the curate's egg, though with more good parts than bad. The authors wisely pin their main hopes for Tory action against monopolies on to the investigation now being made by the Monopolies Commission into generalised arrangements for exclusive dealing and collective boycotts; they "consider that agreements to be defined in the light of that report should be declared unlawful unless registered with the Board of Trade." In agricultural policy they insist that "both subsidy and protection (except for protection against subsidised and otherwise unfair foreign competition) must be regarded as essentially transitional," and they express a wise preference for direct subsidies and increases in the rents of good farm land. Similarly, they are in favour of the "so-called liberalisation of trade," but state that such a policy "does not exclude self-defence against deliberate manipulations of price by exporting countries, nor the calculated protection of specific industries under specific conditions." There are almost as many loopholes as good intentions here.

There remains the problem of the nationalised industries, which the authors can propose to reform with a clear Conservative conscience. There is a wise plea for an economic price policy in the fuel industries, and a controversial statement that nationalised industries should not always be able to raise capital by issues of gilt-edged; the authors "believe that, if and when Treasury backing is considered necessary for the issue of a nationalised industry, it should be given separately and specifically on the authority of Parliament." Their main recipe for management of the nationalised industries, however, is that of decentralisation, a recipe that is sometimes spoiled by becoming a fetish; it might be wise for Tories to remember that some of the now senior people on whom decentralised powers would be devolved, especially in the coal industry, would be people recruited in the 1920s and 1930s—when the industries that have subsequently been nationalised were not always well placed to skim off the cream of whatever agricultural or engineering talent was available for hire.

Correcting the Record

IT has been painfully apparent in recent weeks that ther are differences of policy towards South East Asi between London and Washington—though the differenc are far smaller than anyone might suppose by reading t headlines of "quarrel" and "crisis." Much of the emoti generated has been due to allegations made in Washingt —notably by the columnists, Messrs Joseph and Stew Alsop—of a specific breach of faith by the Brit Government. It is said that when, as a result Mr Dulles's visit to London before the Geneva confere

opened, Mr Eden agreed to examine the possibility of a Nato-type of defence organisation for South East Asia, he agreed to do so at once, but that Sir Winston Churchill and the Cabinet overruled him and insisted on delay until after the Geneva Conference. As a subsidiary to this, it is alleged that the British "vetoed" an intention to send naval aircraft to the aid of Dien Bien Phu which the Americans were otherwise ready to carry out.

It is important to get the record straight. Other journalists in Washington disagree rather flatly with the Alsops. For example, the careful Washington correspondent of the *Manchester Guardian* reported on Thursday: "It can now be stated with authority that France's request . . . was rejected by the United States on its own judgment and responsibility," and the State Department is quoted as regarding the difference of opinion over what was decided in London as an "honest misunderstanding." Mr James Reston, of the *New York Times*, has written that

> the report that the British "vetoed" American intervention is just about as inaccurate as the old legend that they prevented Mr Stimson from intervening against the Japanese in 1931.

The explanation of these divergences of testimony from reporters with an enviable reputation for accuracy is probably the familiar Washington one of inter-departmental differences. The Alsops are known to be close to the Defence Department, and Admiral Radford wanted to let his carrier-borne aircraft loose at Dien Bien Phu. Mr Reston and the *Manchester Guardian* correspondent reflect the State Department view. The official attitude in London is that there is no foundation whatever for any accusation of a breach of good faith; the communiqué that was issued after Mr Dulles's visit was very carefully drafted by the officials of both sides and meant exactly what it said. Nor has it ever been believed in London that the Americans were ready to intervene at Dien Bien Phu even if the British had agreed.

Korea's Stalemate

TO judge by most comment, the world has very nearly forgotten that the powers originally met together at Geneva to solve the problem of Korea as well as that of Indo-China. Indeed, few foresaw at Berlin that, by the time the Geneva conference could assemble, the French military situation in Tonking would have got as bad as it has. Admittedly, little progress has been made on Korea, and Indo-China must remain the first priority until the fighting stops. But considering that for many months the attention of the world was focused on the Korean war, while no one except those directly concerned was willing to give Indo-China a second thought, it is strange that so little public concern should now be shown about the fate of Korea. This complacency could be shattered at any moment by a fresh flare-up of South Korean intransigence or a shift in Communist tactics. Neither can be ruled out and either might lead to a renewal of the Korean war, with the serious possibility that the fighting could not again be confined to the peninsula itself. On paper, President Syngman Rhee still stands committed to no more than ninety days of negotiations at Geneva; after that he reserves his freedom of action.

The main reason, on the other hand, for so widely ignoring the Korean issue at Geneva is that, although almost no progress has been made on it and little can at present be foreseen, few people seriously anticipate a basic change in the attitude of either side. Like the disputes in Kashmir and on the frontiers of Israel, the one in Korea may therefore drift on indefinitely without a formal settlement. The Canadians have already acted on the assumption that no more progress on Korea will be made at Geneva; since they are not involved in the Indo-China talks, they have sent most of their delegation home.

The Korean negotiations in Geneva have in fact got no further than the basic question of elections. Are they to be held in both North and South Korea? Who will supervise them? And what will happen about foreign troops? Not only is there no agreed plan among the non-Communist nations, but Chou En-lai and General Nam Il have so strongly opposed either the United Nations as a supervisory body or a so-called neutral nations commission with any effective power, that the prospects of a solution can hardly be rated any higher than they are in Germany—with the difference that instead of the welcome genius of Dr Adenauer the West has to deal on its own side with the intractability of Dr Syngman Rhee. Perhaps the most noteworthy development in the current Korean situation has been the gains by the opposition in the recent elections to Mr Rhee's parliament.

Geneva Through Russian Eyes

SOVIET commentators find Geneva an easier assignment than Berlin. Though scores of Soviet, Chinese and other Communist correspondents have gathered in Calvin's city, it is the western press that provides the Russians with their best ammunition. Wild outbursts in American, French and other newspapers have made their task of selection an easy one. With scissors and paste alone it is possible to present a picture of the United States disgusted with the British and bullying the French; of Britain alarmed by American recklessness; and of France driven purposelessly to its doom. Added to this is the image of India treading "the path of negotiation and reasonable settlement." The Soviet public thus gets a favourable impression of a conference where the West stands divided while the united Communist bloc has the backing of all the peoples of Asia.

Soviet comment is more guarded on the prospects of the conference. On the one hand, the reader is cheered every second day by an announcement that Molotov's or Chou En-lai's proposals have opened new vistas for a peaceful settlement. On the other, the United States is consistently depicted as trying, with some success, to sabotage the conference. Franco-American staff talks or efforts to build up a South East Asian bloc are described as desperate attempts by imperialists to prevent a peaceful solution. Thus the average Russian finds in his paper both an optimistic note and a pessimistic antidote.

The western press is also taken to task for consciously distorting the proceedings at Geneva. But the Russians themselves are not above suspicion on this score. While quoting large chunks of speeches by western representatives —on an average, Geneva accounts for about one quarter of

all the space in Moscow's slender newspapers—Soviet sub-editors often subtly remove the "undesirable" passages. Thus, for example, Mr Eden's main speech on the Korean question was reported at some length by Tass, the Soviet news agency, but the passages criticising the Communist proposals were either deleted or summarised out of shape. Yet, on the whole, the much publicised rifts in the western alliance have given Soviet journalists a rare opportunity for relatively straight reporting.

The Footplateman's Home

A CRUCIAL stage has been reached, as *The Economist* goes to press, in the dispute over railwaymen's "lodging turns." Footplatemen of the eastern and north-eastern regions are meeting at York to decide whether they should join the unofficial strike of the men of the western region. In both these regions the proportion of lodging turns to all turns has been lower than in the west (whereas in the London Midland and the Scottish regions it has been higher); but an effort is shortly due to be made to increase them. In the meantime the strike in the western region is having its inevitable effect on industry. Some factories in the west country have begun to run out of raw materials. Steel plants in South Wales cannot deliver their products, and coal is piling up so fast at the pits that they may have to close.

At its annual conference this week, the Associated Society of Locomotive Engineers and Firemen, the union to which most of the strikers belong, instructed its unwilling executive to negotiate for the total abolition of lodging turns. It seems likely that the strikers' leaders may advise a return to work on the understanding that such an approach is made. Yet any such approach will present a serious challenge to the Transport Commission.

The number of lodging turns worked now is minute compared with those worked before the war. In a week in February, 1939, 5.65 per cent of all turns worked on the old Great Western Railway were lodging turns. In the corresponding week of 1953 instances of lodging turns were only 0.31 per cent of all turns worked, and since then only 21 more have been added. On an average, men on these long-distance trains are away from home about one night in ten; and there is a roster so that if they have to be away two or three nights in one week there is an interval before they are away again. This is inconvenience, but it is not hardship. Nor is there any substance in complaints about the expense, for there is extra pay, according to mileage, for long journeys, as well as a lodging allowance; and the price of a bed at railway hostels, although most of these are well-equipped and comfortable, is only 1s.

The opposition to more lodging turns is not actively shared by the guards and waiters who are affected by them. It seems to be strongest among the younger footplatemen who have never worked them before. (The practice was suspended during the war so that men could be at home in air raids, and the recent small extension of the system has affected some classes of railway traffic that have been free since then.) However anxious the Transport Commission is to reach a settlement, it should see little scope for compromise: there should be no increase in the number of long-distance trains that are stopped midway, so that their crews can step down and travel home as passengers. As this wastes time, money and manpower—and as it is diametrically opposed to the principles of increased productivity on which the Christmas wage settlement was based—it must be reckoned too high a price to pay for the footplatemen's love of home.

Screening the News

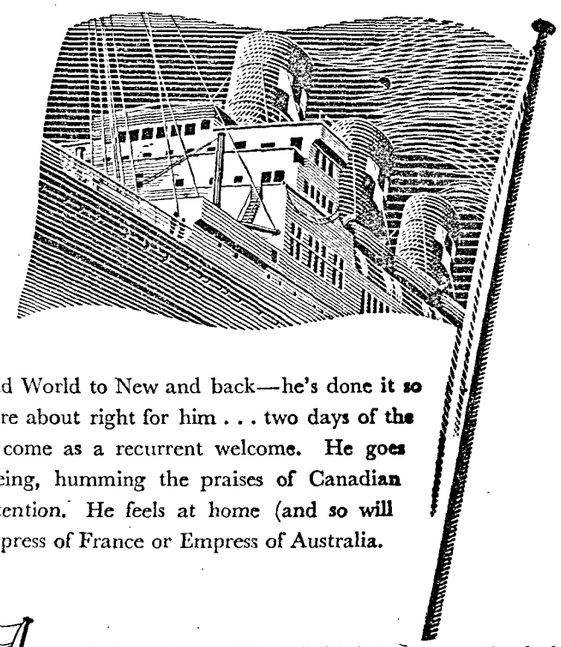
LAST week's television debate in the House of Commons saw a confrontation of two equally mistaken attitudes to the way news and controversial views should be presented on the screen. As the Bill stands, the Independent Television Authority's functions are limited to seeing that the news is presented "with due accuracy and impartiality." It can produce these programmes itself if it wants to, but it is equally entitled to leave the production to the contractors who will be responsible for most of the ordinary commercial programmes. The Labour party, on the theory that these Tory-minded businessmen would be continuously seeking to dig a dagger in its back, wanted to make it compulsory for the ITA itself to produce all news programmes, as well as all "items dealing with matters of political or industrial controversy or relating to current public policy."

In fact, as one Conservative backbencher pointed out, the real trouble with the Bill is that it is so restrictive that it is unlikely that any interesting news or original views will be presented at all. The continuous concern of each contractor will not be to dig a dagger in anybody's back; it will be to avoid producing anything that might lead anybody from either side to protest that his licence ought to be endorsed. Programmes that intervened in British politics as effectively as Mr Edward Murrow's famous attack on McCarthyism intervened in American politics will be virtually impossible under this Bill; they would be equally impossible under the system proposed in Labour's defeated amendment. And this is a serious limitation on freedom of controversy in a democracy, more serious than most uncritical admirers of the monolithic tradition that British broadcasting has inherited from the BBC have yet understood.

No Decision in Ireland

THE results of the Irish general election were very much as had been expected. On balance, Mr Costello's *Fine Gael* won five new seats (with some near misses), and Mr de Valera's *Fianna Fail* lost seven and with them the hope of retaining office. Labour gained four seats and will be in a strong position in the new *Dail*. The other groups remained much as they were. After two years of high taxation and increased costs of living, the Government was expected to lose in Dublin, and four of the seats it lost were in the capital. The importance of Dublin as a maker and un-maker of governments continues to grow. But

How to cross the Atlantic



The knowing man knows his way from Old World to New and back—he's done it so often. Four and a half days of Atlantic horizons are about right for him . . . two days of the riverside scenery of the lovely St. Lawrence come as a recurrent welcome. He goes ashore at Quebec or Montreal full of well-being, humming the praises of Canadian Pacific menus and general care and attention. He feels at home (and so will you) in the Empress of Scotland, Empress of France or Empress of Australia.

asbestos cat

Only an inhabitant of the lower regions could possibly have any use for an Asbestos Cat. But if our export department received an order for one, they would scarcely turn a hair. Seriously, the uses of Asbestos in industry are growing at a fantastic rate.

Apart from its first great natural property, the fibrous structure of asbestos renders it easily adaptable to many uses, often in combination with other materials. It can be spun, woven and moulded. We, ourselves, turn it into many products. Amongst these are Caposite and Caposil, both Preformed and Plastic heat insulations, also Capasco Moulded Brake Linings and Asbestolux Incombustible Building Board. It is available as yarn or cloth, as mattresses for locomotive boilers and also has its uses in those transports of delight, the jet liners.

Asbestos may solve some problem that's proving a bit of a headache in your branch of industry. If you think so, consult the people who know best about Asbestos . . .

Sherries of Distinction

Is your desk too tight at the knees?

That, sir, is what comes of buying it off the peg. It really doesn't fit, does it? At Catesbys however we tailor desks and chairs to fit the individual's size, shape and personality. If you are an ample Administrator or a towering Tycoon get on to Peter Catesby right away and be fitted out smartly with the uncommonly comfortable desk your magnificence deserves. We are happy to supply made-to-measure desks for the choosey few, no matter what part of the world they're in.

TOTTENHAM COURT ROAD · LONDON · W.1 · MUSEUM 7777

it still restricts its choice to the two large parties; of the thirty seats in the area (which is the most industrialised in the Republic) Labour holds only four even now.

The election has not therefore produced a decisive result. The only clear judgment expressed by the electorate was its refusal to return those independent deputies who unexpectedly voted Mr de Valera into office after the last election in 1951. Of the four whose action was particularly condemned at the time, three have been defeated; the survivor is engaged in a postponed election. Nevertheless it is a long time since *Fianna Fail* lost, while *Fine Gael* won, so many seats. Mr Costello's party has also received a significant reinforcement of young deputies.

Mr de Valera has accepted defeat, and interest now attaches to the party meetings, which will be held before the new *Dail* assembles on June 2nd. Mr Costello will almost certainly become Prime Minister with the support of the smaller parties that oppose Mr de Valera; but it is not yet clear whether, as in 1948, these smaller parties will all join in the government. Mr MacBride's party appears to be willing to give general, if conditional, support, but shows

POSITION OF IRISH PARTIES

	After 1951 election	At dissolution	Now
Fianna Fail (de Valera)	68	71	64
Fine Gael (Costello)	40	44	49
Labour	15	14	18
Farmers	6	7	5
Clann na Poblachta (MacBride)	2	2	3
Independents	13	6	5

Note.—Three seats remain to be filled in Wicklow where polling was postponed through the death of a candidate. At the dissolution they were held as follows: Fianna Fail, 1; Fine Gael, 1; Labour, 1.

signs of wishing to remain outside in the hope (not obviously justified) that it will gain votes by avoiding direct responsibility. There are some in the Labour party, though not among its parliamentary leaders, who are known to have similar views. If these views prevail (which, at the moment, seems unlikely) no doubt *Fine Gael* will try to go it alone. Should this happen, it would, in the long run, assist the electors to think of *Fine Gael* as able to provide on its own an alternative government to *Fianna Fail*. But it would not remove the anomaly that the main difference between the two major parties still rests on the differing attitudes they adopted in the troubles of long ago.

Towards a Balkan Military Pact

SOMETHING of a storm in a teacup has arisen over the extension of the Balkan Pact into a full-scale military alliance. Last month, after Marshal Tito's visit to Ankara, his foreign minister announced that Jugoslavia and Turkey were prepared to take this step if Greece agreed. Last week, Field-Marshal Papagos, the Greek Prime Minister, stated that he had always fully supported the conclusion of a military alliance between the three Balkan pact

partners. This has provoked indignant reactions from the Italians who are convinced that Marshal Tito—who is to visit Athens early next month—is hurrying Greece and Turkey into a military alliance because he thinks this will improve his chances of getting a satisfactory settlement of the Trieste dispute.

There may well be some foundation for the Italians' indignation on this score; but if they go on to complain—as they are reported to be doing—that the proposed Balkan military pact may be directed against themselves and is therefore contrary to Greece and Turkey's obligations under the North Atlantic Treaty, then they are clearly barking up the wrong tree. Field-Marshal Papagos has categorically stated that the obligations of automatic military assistance to be accepted by the signatories of the Balkan pact would not be valid in the event of a clash between Jugoslavia and Italy. He has also compared the proposed alliance with the United States' agreement with Spain and Turkey's with Pakistan. The analogy is not a true one because neither of the latter agreements contains any obligation of automatic military assistance. But the fact remains that the Atlantic Council can have no valid legal objection to the proposed tripartite military agreement.

On the contrary, Nato is bound to welcome this alliance. Jugoslavia is geographically and strategically, if not politically, part of Nato's south-east flank, and it is to the advantage of all members of the organisation—and particularly of Italy—that there should be cut-and-dried arrangements for its defence. Only in this way can the measures of mutual aid which have already been worked out in private by the general staffs of Greece, Turkey and Jugoslavia have their maximum deterrent effect. What is unfortunate and regrettable is the way in which old quarrels and ulterior motives are being allowed to intrude upon what should be a straightforward matter of defence planning against a common danger.

162484

See-Saw in North Africa

JUST as six months ago in Tunisia, so now in Morocco the French government is hoping to undo the ill effect of an over arbitrary Resident-General by appointing a tried civil servant in his place. In Tunisia M. Voizard, a former administrator of the French zone of Austria, lately succeeded M. de Hautecloque, who once earned fame and opprobrium by arresting the members of the first all-Tunisian cabinet; in Morocco M. Francois Lacoste, a Quai d'Orsay official, is this week appointed successor to General Guillaume, who was instrumental in deposing the ex-Sultan last August.

When M. Voizard took up his post, he did so with no instructions other than to calm tempers so as to pave the way for reforms. At the outset, he succeeded so well with the first half of this assignment that he created an illusion in Paris—the illusion that a mere change of personnel can appease North African nationalism. The evidence points the other way. Certainly the departure of an unpopular individual can produce a momentary lessening of tension; but in both territories there is now so deep an antipathy to every measure that carries any hint of a French stake in sovereignty that the nationalists are in an all-or-nothing

mood. In Tunisia they do not wish to hold the proposed elections for a Tunisian Assembly in which Frenchmen will sit. In Morocco they regard as retrograde all recent decrees instituting Franco-Moroccan management at cabinet and municipal level, which they hold to have been signed by a puppet Sultan. Yardsticks of their discontent are the current bomb outrages in Morocco and the fuss which Tunisians are making over the transfer of their leader, M. Bourguiba, from detention on a Mediterranean islet to one off the coast of Brittany. (This removal from a warm to a cold climate is regarded in Paris as a mark of clemency.)

M. Voizard is in Paris seeking fresh instructions and, without them, his initial success will be vain and M. Lacoste's task an impossible one. Yet in framing them M. Laniel's cabinet comes up against two formidable difficulties. First, it is a coalition and not all its members are agreed that moderation is the right corrective to the present behaviour of the Tunisian and Moroccan nationalists. Secondly, two separate ministries are responsible for French North Africa—the Foreign Office for Morocco and Tunisia and the Ministry of the Interior for Algeria—and both are subject to the pull and counterpull of pressure groups in bewildering variety. Past failure to reconcile conflicting interests has led to a policy that sways from repression at one moment to hasty concessions at another, with intervening lulls during which officials on the spot have more than once taken matters into their own hands. At a moment when every North African nationalist is taking heart at the news from Indo-China, new men can do nothing lasting unless they get an unequivocal directive from Paris.

Ceylon's Rubber Again

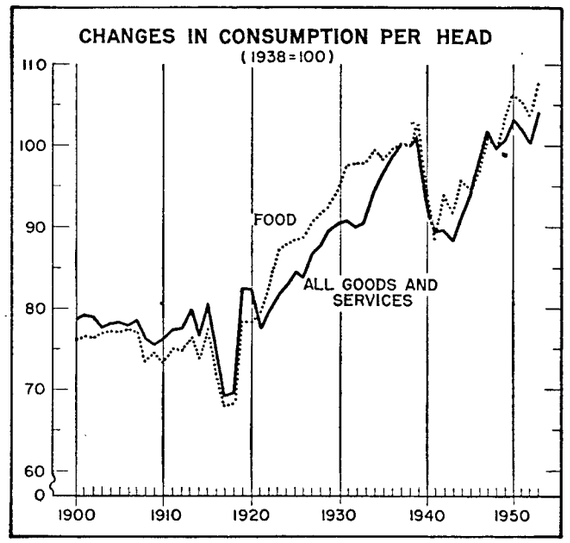
It has been officially denied in Colombo that the Americans had raised the question of Ceylon's trade pact with China in connection with a possible allocation of dollar aid. But it is interesting that the government, shortly after the controversy burst, announced the names of the delegation that will shortly go to Peking to discuss the annual renewal of the rubber-rice agreement.

There is far less optimism in Ceylon this year than hitherto about the terms of renewal. On the one hand, as was evident last year, the Chinese are likely to jib at the price for rubber, which at 32 pence per pound under the present agreement is nearly double the price on the free markets. Moreover, China's own requirements must be more than covered by the large quantities already shipped, and it must be unprofitable—to say the least—to transport it across the 2,000 miles of trans-Siberian railways in part payment to the Russians and East Europeans for capital goods and other supplies (rubber has for the first time actually been mentioned as a Chinese export in the recent trade agreement with Czechoslovakia). On the other hand rice is now one of the world's surplus commodities. Not only has Burma agreed to supply Ceylon with rice on advantageous terms, but India is now seeking markets for a surplus said to amount to 600,000 tons. In addition, Ceylon's own home production has been rising steadily, while China, never a rice exporter before the Ceylon agreement, has now returned to its former pattern with a contract to buy rice from Burma.

Communist propaganda in South-East Asia has always made the most of the Ceylon deal, especially because of the unfortunate disagreement between the then head of the American Mutual Security Agency and the Ceylon government. It would be unwise for America to put pressure on the Ceylonese to break what has to them been a profitable commercial arrangement. It would be wiser to let them discover for themselves the hard facts of trading with Communists.

Consumers of Old

The latest volume in a series on consumer expenditure shows how the British public spent its money in the first twenty years of this century.* In 1900, personal expenditure averaged £40 for every man, woman and child in the country; by the time the first world war broke out the figure had risen to £45. But prices went up nearly as much during these years and, as the accompanying chart shows, the actual quantity of goods and services obtained showed practically no increase in this time. The years before the first world war, therefore, contributed little to the improvement in living standards in this century; the same is true of the years since the last war. It was in the much maligned 1920s and 1930s that consumption climbed so steadily and so steeply.



The new figures confirm that food has taken about one-third of total spending in most peacetime years; food consumption has kept fairly steadily in step with total consumption. Perhaps the most striking feature of this new set of estimates is the decline in alcohol consumption, which, although it was accelerated between the wars, had already started in the early years of the century. For the last twenty years people have, on the average, been drinking less than one-half of what they did in 1900. This is partly due to the fact that the price of drink has risen twice as much as prices in general in the fifty years. But the cost of smoking has risen even more sharply, yet tobacco consumption per head is today about two and a half times what it was in 1900.

* Consumers' Expenditure in the United Kingdom, 1900-1919. By A. R. Prest. Assisted by A. A. Adams. *Cambridge University Press.* £2 2s. (Previous volume in this series discussed in *The Economist* of February 27, 1954.)

Britain Tours for Trade

The report, published this week, of the British industrial delegation which visited Burma in March is a model of prudent yet compelling writing. It provides an effective outline of Burma's ambitious programme of industrial rehabilitation and development, and of the genuine opportunities this offers to British manufacturers. The delegation, led by Lord Burghley, the former well-known athlete, included four other businessmen, and, in its own words, "before leaving London we hardly grasped the full significance of the task which the (Burmese) government had undertaken." In round terms the programme involves a capital investment of 7,500 million kyats (about £560 million) by the end of 1960; even if not fully achieved in practice, it implies the intention to develop power, railways, mines, ports, waterways, telecommunications and new industry on a scale never previously seen in Burma.

The prudence of the report lies in the discretion with which its authors have skated over some of the more important facts about their actual discussions with the Burmese and the views that they formed. They found, for instance, that the Burmese appeared genuinely keen to place a good proportion of their orders in Britain, that not nearly as many contracts had already been signed as had been expected, and that the limitations of available finance had been frankly calculated; although Burma has sterling balances of around £65 million, these will not buy the earth. At the same time, the delegation felt bound to point out the genuine perils of trying to seek too much self-sufficiency too quickly. There is, for instance, a danger that expensive equipment may in some cases be ruined through sheer lack of skilled attention; that Burma may overreach itself by trying to set up a steel rolling mill or start a shipbuilding industry; that if too many Burmese are substituted for British local agents the new agencies will be quite unable to provide the proper after-sales service; and above all that, if Burma lets its staple exports like rice and teak decline, then it will not be able to pay for the industrial imports it wants.

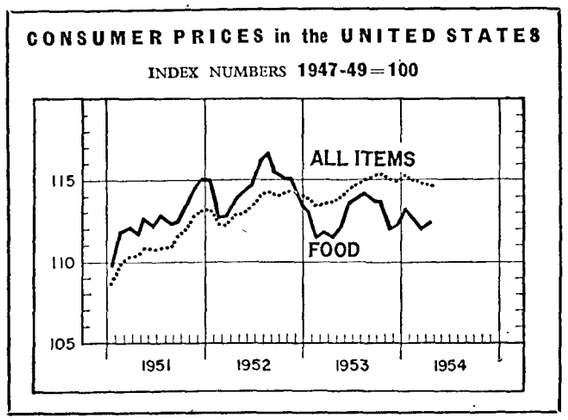
★

Another report published this week has been that of the much bigger delegation which went to the Middle East last November and December. Led by Sir Edward Benthall, the mission was invited to report upon all matters that "would help in developing goodwill and trade between the United Kingdom and the countries visited." The new significance of the Middle East as a market for British goods is that it now owns half the oil reserves of the world; Iraq, Kuwait and Saudi Arabia each earn between £50 million and £60 million a year from oil revenue, and they each have important development plans. But if the British are to compete effectively in this market, the two main needs are the same as those in Burma—to be competitive in terms of price and of delivery dates. The idea that quality alone will sell, or that the British have any monopoly on quality, is as dead as the dodo.

Strain on Uniscan

Of the various arrangements within the western community which reinforce the OEEC and Nato and strengthen the ties between their member countries, much is heard of the Coal and Steel Community, something is heard of Benelux, but practically nothing is ever heard, or said, about Uniscan. This is unfortunate, and particularly so because the close relationship between Britain and Scandinavia is one of the few international arrangements which virtually no one opposes. Although Uniscan has no regular international staff and amounts to little more than consultation between the British, Swedish, Norwegian, Danish and Icelandic governments, the fact that these periodic discussions of common economic problems are now becoming a habit is a step in the right direction. Where there is so plain a community of interest, more should be done. Uniscan can play a particularly useful role as a link with neutral Sweden. For all Scandinavians, closer co-operation with that large country with which they have the greatest community of interest is just plain sense.

The type of informal, yet close, co-operation which Uniscan represents is a form of relationship which is in the purest British tradition. But it only works if all the partners feel that all the problems in which they have a genuine interest are, in fact, being discussed. It cannot survive many episodes such as occurred at the last meeting, when the British, although exploring fully with their neighbours many aspects of the EPU impasse, apparently thought it unnecessary to mention that they proposed to offer their principal EPU creditors £35 million in partial settlement of outstanding debts. Had the Scandinavians been informed in London, rather than left to read of the offer in the newspapers immediately on returning to their capitals, the British might have enjoyed somewhat more Scandinavian support in the subsequent OEEC discussions.



Books & Publications

Spacious Heritage

THE EUROPEAN INHERITANCE.
Edited by Sir Ernest Barker, Sir George Clark and Professor P. Vaucher.
Oxford University Press. 1,424 pages. 5 guineas.

IN 1943 the Ministers of Education of eight Allied Governments then in London appointed a Books Committee to arrange for the supply of literature to their countries when liberated. "The European Inheritance" is one of the fruits of this project. "A work of History objective in character," it was planned for the use of sixth-formers and first-year undergraduates. The editors say that it is a history of European Man, and his influence on the *rest of mankind*, set down as justly and dispassionately as possible. The work is in three volumes, with seven chronological parts, from the earliest prehistory to AD 1950.

Whether or not Europe will be interested in this inheritance, British schools and *universities* ought to be. The work is not faultless: it suffers from a tendency, perhaps inevitable, to avoid drawing any conclusion that could possibly offend a political or religious *susceptibility*. Its judgments grow progressively more polite as it gets farther from the Roman Empire. No partisan is likely to be provoked by Professor Ganshof's "Middle Ages"; and occasionally an impatient reader might be tempted to exclaim "Coulton (or Belloc) thou should'st be living at this hour." But such impatience is, perhaps, unfair. Sixth-formers and undergraduates must learn to seek, sift and arrange evidence and base conclusions on it; and this will presumably be practised under tutors *able* to suggest which sections are likely to yield the most useful material and how it should be treated—though even the tutors may regret the absence of sectional bibliographies. There is a pleasing variety of well-chosen plates, documents and maps.

The "Prehistory" of Professor Gordon Childe, and the "Greece and Rome" of Dr Tarn; the "Early Modern Period" of Sir George Clark; and Mr Geoffrey Bruun's "Nineteenth Century" include narrative-writing that is just and dispassionate without being obscure or dull. But in parts of the medieval section the student may need the skill of an historical water-diviner to discover the *main* stream: much interesting matter is there, however, for those who can find and use it. Moreover, the indexing is efficient; and it is in most sections easy to pick up the threads of topics not treated continuously—for example when tracing economic progress or regression, which, incidentally, is discussed with unusual clarity in "Prehistory" and, as one would expect, with satisfying sureness of touch by Sir George Clark in the "Early Modern Period."

"The Nineteenth Century" and the period 1914-50 are, as they should be, truly complementary: the story of the years 1815-1915 not only leads up to the First World War, but helps to explain the events between the wars and their catastrophic sequel. The treatment of the fanatical ideologies of the nineteen-twenties is full and fair; and their spiritual ancestry is traced back into the nineteenth century or earlier, and related to contemporary trends in literature and art. But Professor Vaucher's views in "The Revolution and Napoleon" seem somewhat restricted by the natural frontiers of the French historical mentality: his men of '93 seem to be inspired by sedate if distant visions of the Third Republic, hard hats and umbrellas, rather than by Rousseau, pikes and caps of liberty; while his Napoleon, an enlightened (or Rousseauite) dictator who "went wrong," is left unconnected with any of the later dictatorships that his transient *successes* inspired.

Sir Ernest Barker's "Review and Epilogue" is history written philosophically in the grand (or should one say "Greats"?) manner; he is for the non-university reader a history and a moral tutor combined. This is superb historiography. It is more than a summary; it is a judgment—but not without hope, for Sir Ernest recalls the reader's attention to Professor C. H. Dodd's earlier section on Christianity and stresses the immortal hope, as well as the duty, that should inspire the heirs to the European Heritage to face any challenge.

Imperial Inflation

ROMAN IMPERIAL MONEY.
By Michael Grant.
Nelson. 334 pages. 50s.

ADAM SMITH'S remark about a great empire and little minds does not explain the decline and fall of the Western Roman empire. From disparate racial stocks it produced an extraordinary run of good to great minds, from the principate to soldiers and lawyers. Few of its leaders died in their beds; fewer, like Diocletian, had the sense to retire while the going was good. Its wide communications remain the trunk lines of Western Europe's highways; its provinces the chief ecclesiastical divisions of the Roman Church; and much of its law the basis of commercial and international systems to-day. Yet it was administered for four centuries without the printed word or any of the modern means of public and private communication. Modern numismatists have rightly seen in its beautiful coinage not only a means of exchange but also a means of publicity and propaganda, spreading by frequent strikings both the appeal to the magic of the Roman name and its great past, and the latest news or message from headquarters. In this handsome, illuminating and perceptive volume Professor Michael Grant provides both the general reader and the expert with a valuable compendium of observations upon the relations between these coinages and the events from Augustus to Constantine. His text is easy and absorbing to read, carefully documented, accompanied by stimulating footnotes, 22 pages of source-notes, a model index, glossary of Latin terms, chronology, and 41 lovely collotype plates beside numerous reproductions in the text. This is indeed scholarship for the plain educated man. Not for nothing is its author Professor of Humanity at Edinburgh.

It is hard to do justice to such a work in short compass. For economists, historians and students of society the lessons drawn from the coinage by the author have a discomfiting aptness today. The pressure upon economic resources of defence, costly public administration and what can be called "social capital works" as well as the rudimentary "welfare state services" was scarcely *interrupted* through the centuries after the death of Augustus. There were short terms of peace and prosperity. But the pressures were always there; and the remorseless tale of debasement, inflation and devaluation regularly unfolds, though the beauty of the coins remains unimpaired. Every convulsion in the Empire brings, at intervals, some new coin bearing its appeal to the Golden Age of Augustus or, later, to that of the Antonines. The old symbols are there, but the new situation tells its tale in the composition and value of the coin itself. The taxes went up and up, as that value came down and down. Citizens of the municipalities had to be compelled by law to undertake public offices, onerous because on them rested responsibility for making good deficiencies in tax-yields. Men consulted the oracles whether they should flee their homes and public duties, and a Greek term for such "flight" became a byword. The first utter collapse of the currency and exchange system came as early as the beginning of the second half of the third century, and not even Diocletian's reforms and his famous edict fixing prices for everything could thereafter stop the rot. Within twenty years of his retirement Constantine took the course of Empire eastward, and the West began to dissolve. Much of the economic *malaise* due to monetary disturbances—and in its turn causing

them—formed that matrix of social heartsearching within which the Christian church grew and ultimately prospered.

Only those who read this book will appreciate how much of all this has been clearly interpreted from current coin. The plates themselves are worth careful study: they are the national gallery of a culture and a civilisation. Here are Nero as the prototype of Napoleon, Augustus with Cæsarean profile, Britannia (of our pennies) at the time of Hadrian, Galba as a model for Mussolini, and exquisite vignettes of symbolic ships and sailors, ploughmen and soldiers, gods and mortals, temples and beasts. Here are the records of wars and usurpations, of challenges and responses, of protracted effort against a relentless tide. Here, too, are the origins, in inflation, of our own £ s. d. In his last chapters the author discusses the circumstances of the final debasement, and observes that the vast imperial effort always outran its resources. He seems to have been led by an invisible hand to promote an end that was never part of his intention: to provide required reading for modern politicians.

The Liberal Trinity

FREEDOM, LOYALTY, DISSENT.
By H. S. Commager.
Oxford University Press. 99 pages. 8s. 6d.

"I KNOW not how it is, sister, but the older I get the more I find that no one is right but me and thee, and sometimes I am troubled about thee." At a time when the United States seems as if it had been settled exclusively by descendants of Benjamin Franklin's famous Quaker sisters, it is good to hear the authentic accents of American liberalism ringing out with the eloquence and passion that Professor Commager commands. This is a heartening and timely book. Both American and British readers will benefit from a reaffirmation of the liberal doctrine of the Trinity—that Freedom, Loyalty and Dissent are not contradictory but complementary. British readers will, in addition, receive a useful reminder that not all of Senator McCarthy's critics live outside the borders of the United States.

Mr Commager's little book is built around the pragmatic argument that freedom is necessary, in the sense that American society simply cannot function without it. Pungently, with illustrations drawn from the American past and the diversities of the American present, it drives home the moral that experiment and criticism have been the great creative forces in American society, and that to reject them in the interests of security or loyalty is to barter mother's milk for hemlock. Of course this argument will cut no ice with those who have in fact rejected the American tradition it appeals to, who are prepared to trade progress for uniformity, and who in the name of anti-Communism would convert the USA into a facsimile of the USSR. But at least it prevents Fourth of July propaganda serving as a cloak for such designs. To see how necessary a job this is and how well Mr Commager does it, the reader need only look at his brilliant debunking of Guilt by Association.

The book's success in this demonstration tempts one to ask for more. Although Mr Commager is writing here as a self-confessed pleader, a counsel for the defence, he ought not to be content with getting his client off. He is not only a pleader, he is also a historian, and a historian ought to ask himself how his client came to be in the dock in the first place. Why is it that so soon after its great victories under the New Deal, and at this peak point of American power, American liberalism finds itself on trial for its life? Has it merely been framed? If so, from what American roots have these un-American prosecutors sprung? Or has some weakness of its own betrayed it into the hands of its enemies? Professor Commager unhesitatingly rejects the hypothesis that this weakness may have been the pragmatic tradition itself. But if not that, was there something else? Was there not a deep-seated confusion among American liberals themselves, not only in the forties, but also in the thirties, when the seeds of much bitter fruit were lightheartedly sown? Such questions do not weaken the validity of Professor Commager's current defence of the accused. But a proper answer to them might help to keep him out of court in the future.

Malayan Mixture

MALAYA: COMMUNIST OR FREE?
By Victor Purcell.
Gollancz. 288 pages. 15s.

THIS able and contentious book is a curious mixture. It includes, on the one hand, a great deal of hard factual information about Malaya, presented with great clarity by a man who spent over twenty years there. On the other, his interpretation of the facts, while often shrewd and refreshing, at times gives the impression of running off the rails in order to fit into his personal feud with General Sir Gerald Templer. This feud developed in 1952 when Mr Purcell revisited Malaya and was, to use his own word, "shocked" by the authoritarianism that he found there. One result of this shock, however, was that he wrote the present volume, and anyone who is interested enough in the subject to read it must not blame the author too much for his point of view. History alone can say whether he or General Templer is nearer being right.

Issued under the auspices of the Institute of Pacific Relations—which takes no responsibility for the opinions expressed by the author—this book is a political survey of modern Malaya. It starts, that is, with a brief historical background, and then sets out the development of events since Malaya's occupation by the Japanese and the resumption of British rule in 1945. This includes a useful round by round account of the emergency, an outline of the political and economic problems which it has brought in its train, and chapters on Communist policy and propaganda, inter-communal relations, education, Malayan nationalism and Asian consciousness, the trade unions, and the steps being taken towards self-government.

Nobody can accuse Mr Purcell of not knowing his subject. He himself left the Malayan Civil Service in 1946, after holding appointments as Protector of Chinese and Director-General of Information, but he has been back there since, first on behalf of the United Nations in 1947, and then again in 1950 and 1952. He is a Chinese scholar and also speaks Malay. Since 1949, he has been Lecturer in Far Eastern History at Cambridge. With the distinction of his evident authority, Mr Purcell is therefore entitled to respect for his view that Malaya has been "deprived of the evolutionary steps towards democratic government" for far too long. It is indeed fair comment that the lack of any pressure for political change before the war meant not only the petrification of a feudal Malay Society, in which the growing Chinese community had no political rights, but a smug British attitude that locally ignored the professed general aim of educating colonial territories towards self-government. "It needed," says Mr Purcell, "the catalyst of the Japanese invasion to cause the solution to precipitate."

The criticism, nevertheless, of what has developed into Mr Purcell's special plea for the Chinese is that to go too fast now does not make up for going too slow before. Since he finished his book, even his arch-enemy, the High Commissioner, has come out in favour of a small elected majority on the new Legislative Council. And while it is true enough that this may yet prove a belated and perhaps inadequate step, there is still insufficient evidence to suggest that Mr Purcell's alternatives "Communist or Free" are the only ones. For some years at least so-called freedom would be no more than a stepping-stone to Communism. The real alternative, so long as the emergency lasts, is for the government to combine a gradual but genuine political emancipation with the establishment of personal security. Few would agree with Mr Purcell that General Templer has failed to make a real inroad on this problem, even if he has done so by methods peculiarly his own.

Studies in Redistribution

INCOME REDISTRIBUTION AND SOCIAL POLICY.
Edited by Alan T. Peacock.
Jonathan Cape. 290 pages. 25s.

THIS is a scrappy book. The bulk of it consists of four studies of the redistribution of incomes through public finance in Denmark, France, Great Britain and the United States. These follow more or less closely T. Barna's treatment in his work "The Redistribution of Incomes through Public Finance in 1937." They are preceded by two

theoretical essays. The first by H. G. Johnson considers the effect of redistribution on economic activity. It is meticulous and well worked out; but, to use one of Mr Johnson's favourite words, it is purely taxonomic, that is, it classifies the possibilities without a hint on which may apply in the real world. The second, by D. Berry, is a competent eclectic discussion of the bearing of welfare economics on redistribution; but it is too allusive to make the matter clear to anyone not already enlightened. The connection of these two essays with the main subject of the book is little more than nominal. After the four main regional studies there is a very slight discussion of social policy in underdeveloped territories by T. B. Lim.

Of the four main studies the longest—it occupies a third of the book—and the best is that on the United States by A. H. Conrad. Though of great interest to the ardent student of redistribution, the demands made on the rapid or uninitiated reader are excessive. The style is flat, and there is no adequate summary; moreover, the subject seems to have made the author, or editor, dizzy, for the appendices and tables are redistributed throughout the text in a thoroughly regressive manner. The editor's contribution on Great Britain partly brings Barna up-to-date, though many of his allocations are still based on Mr Barna's researches and guesses. Unlike Mr Barna he limits himself to the redistributive effect of the social services, though this creates almost as many problems as it evades. The pioneering study on France by George Rottier and Jean Albert follows similar lines. It is clear, interesting and well written. But inevitably, from lack of statistics, the conclusions are even less firmly based than in the case of the United States and Great Britain. The study on Denmark by Messrs K. Lemberg, N. Ussing, and F. Zeuthen, another pioneering effort, is still more hazardous and impressionistic.

Redistribution is a rather unsatisfactory subject, abounding in conceptual, theoretical and statistical problems. The book would have been more satisfactory if at least the common difficulties had been dealt with in a separate essay, and comparisons made between the solutions and assumptions adopted by the various authors. The point of binding the separate studies together should have been to bring out similarities and differences in the facts, the problems and the treatment of them. This is left almost entirely to the reader.

Hero Worship

LORD NELSON
By Carola Oman.
Collins. (Brief Lives). 158 pages. 7s. 6d.

"I WILL be a hero, and confiding in Providence, I will brave every danger." Thus the seventeen-year-old officer on recovery from an attack of malaria, and thus he continues throughout his career—"Westminster Abbey or Glorious Victory."

No man ever pursued fame as relentlessly as Nelson, and to no man has it been granted in fuller measure. Miss Oman was the obvious choice for a biographer in this admirable series, because no living writer has immersed himself so deeply in the immense documentation of the subject. Her present volume is a scale model of the Nelson monument which she erected to her hero a few years ago. She adopts a *pointilliste* technique of a conglomeration of details to give a vivid picture of a lovable personality. The scale of her miniature leaves her no space to relate the figure to its dramatic background, but what is more unfortunate is that Nelson's character as the greatest of sea officers remains obscure. She shows (largely by implication) how he started a new conception of the art of leadership; but she does not bring out the brilliance of his tactics or the calculated risks which only a completely fearless and original commander could take. It is significant that many of her battle plans, which are somewhat deceptive, are taken from that hoary old piece of jingoism, "Sea Kings of Britain."

It is the man, not the officer, who engages Miss Oman's attention. No one can blame her for falling under the spell of such a strong and attractive personality, but it means that his less desirable qualities—his vanity, petulance and, on occasion, insubordination—are played down. As for his love life, one can only echo the parting shot of his wife (who gets short shrift at the hands of those who annually toast the Immortal Memory): "I am sick of hearing of dear Lady Hamilton."

Poetry from Theology

GEORGE HERBERT: His Religion and Art.
By Joseph H. Summers.
Chatto and Windus. 247 pages. 21s.

GEORGE HERBERT'S poetry, although it can never have lacked pious readers, was for long held in very little critical regard. Seldom discussed in the eighteenth century, it was revived in the nineteenth as pleasing minor verse, characterised by a quaintness that delightfully reflected the idiosyncrasy of the poet's mind and a decorum that reassuringly recalled his aristocratic breeding. Thus J. H. Shorthouse, although he believed Keble to be a finer poet, admitted Herbert of the company that "showed the English people what a fine gentleman who was also a Christian and a Churchman might be." In the present century the revived interest in Donne brought Herbert into more sophisticated notice; but for long the notion of his quaintness was unchallenged, and Professor Empson indeed with a brilliant persuasiveness showed him to be not so much quaint as rum. Then came a decisive change. Learning, in the person of Professor Rosemond Tuve, amusingly if rather elaborately bowed Mr Empson out. The uninformed reader today may find Herbert's poetry perplexing, and the ingenious critic may come to his assistance with a clever new species of rhetorical analysis that delves for ambiguities in every line. But for Herbert's first readers, steeped in the Bible, in the hieroglyphic view of the universe, in typology, in the lore of emblems, the poet would seldom seem to be leaving familiar and comprehensible ground.

Professor Summers, continuing this labour of scholarly rehabilitation, sets Herbert's poetry in a yet wider context of theology and devotion. Is sanctity of life a method of achieving salvation, or is it a gift of God which gives assurance that salvation is already achieved, or can it even be on occasion the response to Satan's most dangerous temptation, the temptation to believe that one can *deserve* God's grace? Has not God disposed the Children of Israel into twelve tribes in purposeful anticipation, so that they constitute a "type" of the twelve Disciples? The key to Herbert's poetry lies in our realising an intellectual climate in which such questions are at once supremely important and entirely familiar. A just awareness of this climate is an authentic and valuable gift of scholarship, and Mr Summers shows himself a perceptive critic. It is only in a few places that he may be felt to overstate his case. It is certainly true that the primary purpose of Herbert's poetry "was not what we understand by self-expression." But the injunction that we should "conceive of *The Temple* as the symbolic record, written by a poet, of a 'typical' Christian life within the Church" will strike rather coldly upon the ears of some who believe that they know and love the vicar of Bemerton.

Books Received

THE TRIPLE STREAM: *Four Centuries of English, French and German Literature, 1531-1930.*
By Antony Brett-James. *Bowes and Bowes.* 188 pages. 17s. 6d.

This handlist is designed to help the student of literature. It gives in parallel columns the names of the important literary works published in England, France and Germany year by year from 1531 to 1930. It also shows for each country the dates of the births and deaths of their prominent writers.

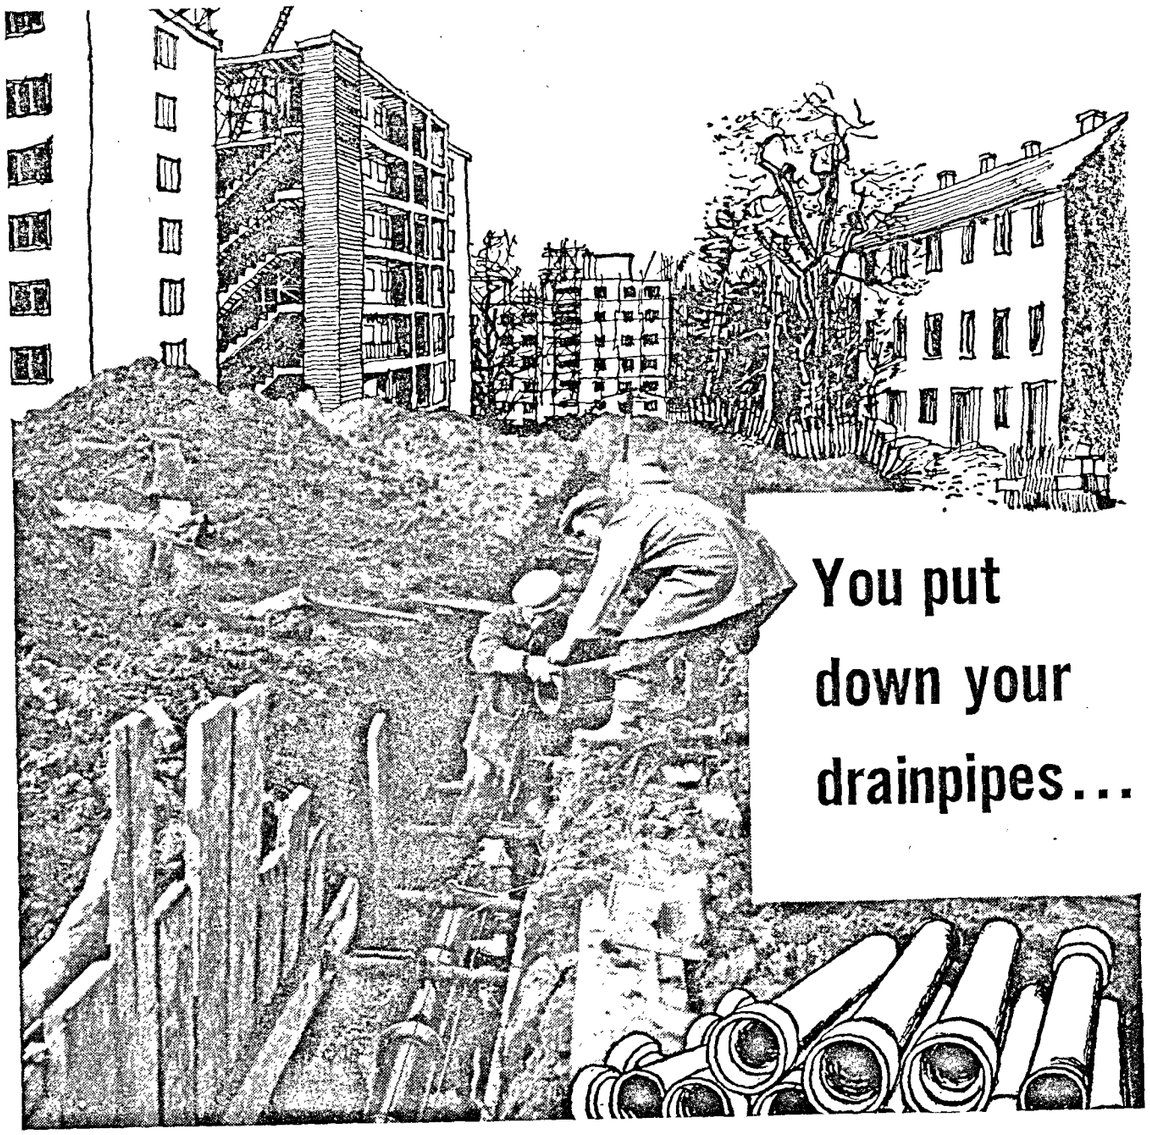
1954 BLACK MARKET YEAR BOOK.
By Franz Pick. *Pick's World Currency Report, New York.* 220 pages. $25.00.

FISHERIES YEAR BOOK AND DIRECTORY, 1953-54.
Edited by H. F. Tysser. *British-Continental Trade Press.* 441 pages. £1.

THE HOSPITALS YEAR BOOK, 1953-54.
Edited by J. F. Milne. *The Institute of Hospital Administrators.* 1,088 pages 5 guineas.

UNITED NATIONS STATISTICAL YEAR BOOK, 1953.
Her Majesty's Stationery Office. 578 pages. Clothbound 55s. Paperbound 45s.

STATISTICAL SUMMARY OF THE MINERAL INDUSTRY: *Production, Exports, and Imports, 1946-52.*
Colonial Geological Surveys. Mineral Resources Division. *Her Majesty's Stationery Office.* 347 pages. 27s. 6d.

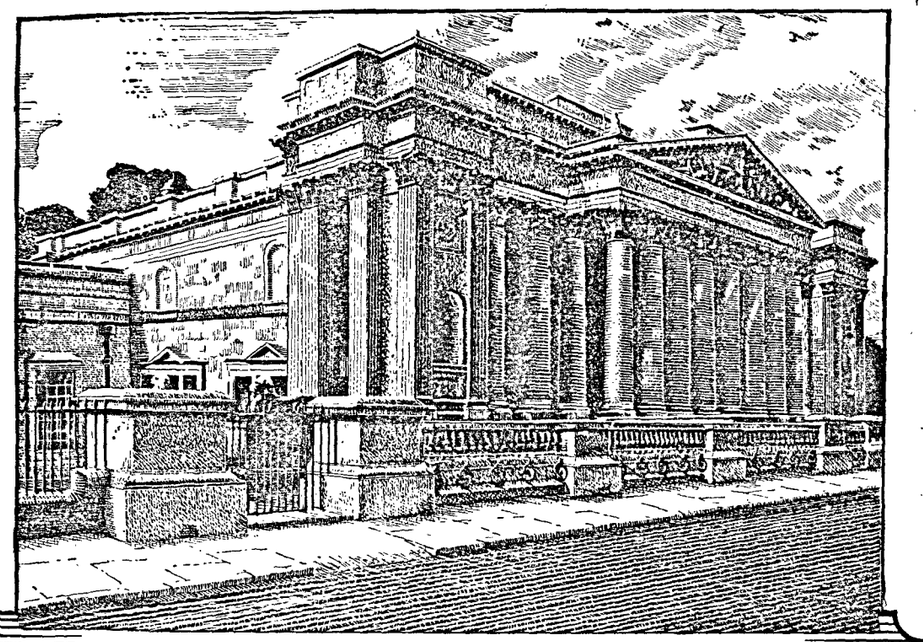


If you never want to have to dig them up again put down

You fill in the trenches, put down rubble and hardcore on the top, then concrete over. Over your drainpipes stands a factory—or a main road—or a new housing estate. You never want to have to take those drainpipes up again, whatever happens.
And anything might happen. You don't know what new development there might be in five or ten or fifty years from now. You don't know what might be going into those pipes.
If your pipes are salt-glazed vitrified clay pipes, they can stay down for centuries, doing their job. Vitrified acid-resisting salt-glazed clay pipes have perfectly smooth hard surfaces which never corrode into that first slight roughness which can start a blockage. They can take anything that's coming to them.

Salt Glazed VITRIFIED CLAY pipes and conduits

NATIONAL SALT GLAZED PIPE MANUFACTURERS' ASSOCIATION



It shall not burn

At last, nuclear knowledge brings to every building, office and industrial enterprise, a sure and certain means of fire prevention which is now available to all.

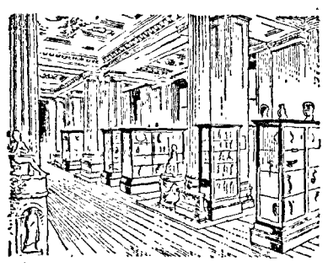
TE CUSTOS URBIS MINERVA

WHAT DOES IT DO?
Minerva instantly detects the first trace of smoke from any smouldering material.

HOW DOES IT WORK?
The activating source of the detector is a particle of radio-active material with a theoretical life of more than a thousand years. No current is consumed while the detector is on guard. The entry of smoke triggers the detector.

HOW IS IT INSTALLED?
Each detector is no larger than an electric light bulb and can be fitted as simply.
Only one is required in a room or for every 1,000 sq. ft. of floor area.

WHAT DOES IT COST?
Only the cost of the simple wiring—the detectors and signal equipment are hired to the user by the makers at a low annual fee which includes servicing and free replacements.



Approved and adopted by the Admiralty and Air Ministry, and already installed by many hundreds of industrial and Government organisations throughout Europe, including leading shipping and airline companies.

FIRE DETECTION SYSTEM

Manufactured by The Minerva Detector Company Ltd., Richmond, Surrey, England

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Ploughing McCarthy's Furrow

Washington, D.C.

WHEN its regular counsel, Mr Roy Cohn, goes on the witness stand the Permanent Investigating Subcommittee of the Senate will at long last be hearing the second half of the controversy between its officials and those of the Army. Public interest, which had been flagging during the legal quibbles and the military details, is quickening at the prospect of Mr Cohn and Senator McCarthy being subjected to the same kind of ruthless cross-examination that the Army's witnesses have endured for twenty days. All parties concerned have now agreed that the monitored telephone conversations between Army officials and representatives of the committee, which the Army evidently thinks will provide most conclusive proof of its case, may go into the record. At the same time, by a vote on purely party lines, the committee has dismissed the charges against its staff director, Mr Carr, and against Mr Hensel, the Assistant Secretary of Defence. Most observers considered that Senator McCarthy made the greatest mistake of his career in bringing allegations against the personal integrity of Mr Hensel, who is reputed to be much tougher than the Senator's other opponents. But the Senator has now used President Eisenhower's insistence on preserving the confidential character of policy discussions within the higher ranks of the executive as an excuse to drop these allegations.

After a week's adjournment had failed to alter the President's stand on this point of principle, the committee returned to its invidious task last Monday, irretrievably committed to "ploughing the long furrow to the bitter end," in the metaphor of its temporary chairman, Senator Mundt. Mr Stevens, the Secretary of the Army, testified that the sole responsibility for bringing the Army's charges was his. The fact that another whole day was then spent in wrangling over whether Mr Stevens and his counsel, Mr Adams, were the sole "conspirators" against Senator McCarthy or whether the Attorney General and the members of the President's staff in the White House were privy to the "plot" showed how far the committee had fallen victim to its own fiction.

From the first day of the hearings Mr Mundt and Mr Ray Jenkins, the committee's special counsel, have humoured Senator McCarthy's preposterous contention that his dispute is with individuals and not with the Department of the Army, going so far as to refer to "the so-called Army charges." But this flies in the face of reality, because it is quite apparent that all of the actions by Mr Stevens that are now being questioned were taken in the course of his official duty, and as Secretary of the Army he officially represents a piece of that executive power which under the Constitution is entrusted to the President.

However, if the attempt to distinguish between Mr Stevens and the Secretary of the Army had not been made, the identity of the Army's adversary would have become apparent: the Permanent Investigating Subcommittee of the Senate, rather than its chairman, chief counsel and staff director, Messrs McCarthy, Cohn and Carr, as individuals. But the weakness of the committee's position in this dispute —a weakness that makes the fiction necessary—is that the members of the committee are also the judges. Only in so far as they contributed to the exceptional power available to Senator McCarthy and the committee's staff by failing over a long period to keep in touch with what was being done in the committee's name can the Republican members be said to approach the incidents under review with detachment. Even so the judges have had to be sworn in as witnesses in respect of one of the Senator's specific charges. The Democrats' claim to a splendid innocence in this internal Republican dispute is possible because they left the committee for several months in protest against the chairman's methods.

★

Undoubtedly President Eisenhower and his Attorney General have been relying, as one of their main claims for popular approval in the November elections, on the argument that they have introduced a new and more efficient system of security among government servants. The President made a special plea for trust in his judgment on this subject when he sent his first message to Congress on taking office. He said then:

> Confident of your understanding and co-operation I know that the primary responsibility for keeping out the disloyal and the dangerous rests squarely upon the executive branch. When this branch so conducts itself as to require policing by another branch of the government it invites its own disorder and confusion. I am determined to meet this responsibility of the executive.

No such congressional co-operation was forthcoming from the Permanent Investigating Subcommittee under Senator McCarthy's chairmanship and the President's foreboding of "confusion and disorder" was amply fulfilled. An executive order with fresh definitions of "security risks" and new machinery for dealing with employees of the federal government about whom there was "derogatory information" came into effect at the end of last May. Only two months

later Senator McCarthy began a full-scale investigation of the security arrangements at the Army's radar laboratories at Fort Monmouth, where the problem is especially complicated because civilian scientists are working under a military command. The uneasy task given to Mr Stevens and Mr Adams was to interpret the President's insistence that the initiative and power of discretion in matters of internal security must rest solely with the executive in the light of his general injunction to show exceptional courtesy to committees of Congress. Once in October and again in January Mr Adams felt he had reached a working arrangement with the Senator but on both occasions the understanding broke down.

And on both occasions, as Mr Adams has been telling the investigating committee, he felt the determining force was Mr Cohn, the committee's young counsel, in a vindictive frame of mind because of the Army's failure to make suitable provision for the well-being of his friend, Private Schine, the committee's former consultant who has been conscripted. Mr Adams has cited Mr Cohn's violent threats and the advice given by Mr Carr, the committee's staff director, that if the Army would do something for Mr Schine the worst of its troubles would be over. In a memorandum released by the Senator, however, Mr Carr is shown complaining that Mr Adams was using the famous private as a "hostage" to "blackmail" the committee into giving up its investigation.

In his formal charges and still more in his cross-examination, Senator McCarthy has carried the inquiry far beyond these detailed disputes. He claims that Mr Adams's release of information to the press about Private Schine was simply the last of a long series of frantic attempts to "cover up" the group of senior officers and civilians in the Army Department who, from sinister motives or "incredible laxity," had failed to enforce the old loyalty and security arrangements under the previous Administration and who were still in a position to obstruct the enforcement of the new regulations.

★

The logical conclusion of Senator McCarthy's position is inescapable: that the Republican Administration is just as inefficient as its Democratic predecessor was alleged by Republicans to be, that the President is not entitled to a fair trial for his new security system because the executive branch as such cannot be trusted to operate such a system, and that the sole valid criterion in this delicate field is the Senator's judgment. This extreme claim on behalf of the legislative branch might in other circumstances arouse a congressional cheer, but many Senators are becoming painfully aware that such a claim does them no good in the country when it is put forward by a committee chairman who is displaying his irresponsibility in the sight of all two or three times every day.

In these circumstances it is not surprising that the Republicans should be revising their estimate of the part to be played by Senator McCarthy in the November election campaign. Party leaders in several states have already refused to have him as a speaker. They will be fortified by an analysis made for the Public Affairs Institute by the electoral statistician, Dr Louis Bean. This shows that in the eleven states where the Senator intervened in 1952 on behalf of Republicans the Democratic candidates made a better showing than did their colleagues elsewhere.

Guns for Guatemala

THE United States, which is not prepared to defend colonialism even in Indo-China, last week found itself forced to defy colonialism on its own doorstep. What is widely regarded as direct evidence that, in the words of Senator Wiley, "the Communist conspiracy is intervening directly" in the western hemisphere was provided by the shipment of 2,000 tons of arms from behind the iron curtain to Guatemala. They are thought to be of Czech manufacture and were valued at $10 million and listed as optical and laboratory equipment; they were delivered in great secrecy at dead of night, under the supervision of the Defence Minister, at a Guatemalan port by a Swedish ship, chartered by a British firm, and routed via Dakar from Stettin in Poland. This shipment, declared Mr Dulles, put Guatemala, already the most heavily armed of all the Central American states, into a position to dominate the area and even perhaps, as he admitted in reply to a somewhat hypothetical question, to threaten the Panama Canal. Coming after recent interference in the affairs of neighbouring Honduras and Nicaragua and ever-growing intransigence when dealing with American firms, this latest Guatemalan development leaves little doubt that the Communists are trying to convert the foothold which they have won through their infiltration of that government into a stranglehold on the rest of Central America.

★

The immediate reaction of the United States has been to step up deliveries of arms, at the request of Nicaragua and Honduras, under the mutual assistance pacts with those countries; the one with Honduras has just been signed. So far the two countries have received only $60,000 worth of military equipment apiece and nothing approaching the size of the Guatemalan purchase is contemplated; but an airlift for arms to Central America is now being operated from the United States. Consideration is being given to the invocation of the Rio Pact, and a first test may also be at hand for the anti-Communist resolution approved at Caracas last March. But the final decision as to whether the peace of the Americas may be endangered by Gautemala is carefully being left to the Latin American countries themselves, for already, in spite of their mounting uneasiness, the United States denunciation of the Guatemalan purchase has aroused the usual resentment against United States interference.

There may even be enough sympathy for Guatemala, as a result of this interference, to prevent any resolution of condemnation getting the necessary two-thirds majority in the Organisation of American States. This sympathy springs also from Guatemala's excuse, that the needs of its national defence forced it to buy its arms from behind the iron curtain, because the United States refused to sell weapons, or to allow its allies to sell them, to Guatemala in view of the "obvious uncertainty" of how they would be used. Furthermore, the garland of guns with which the present Guatemalan government has decorated the national pride has, from all reports, brought it a great access of popularity, especially in the Army where previously the strongest opposition to Communist infiltration was to be found.

Splitting the AEC

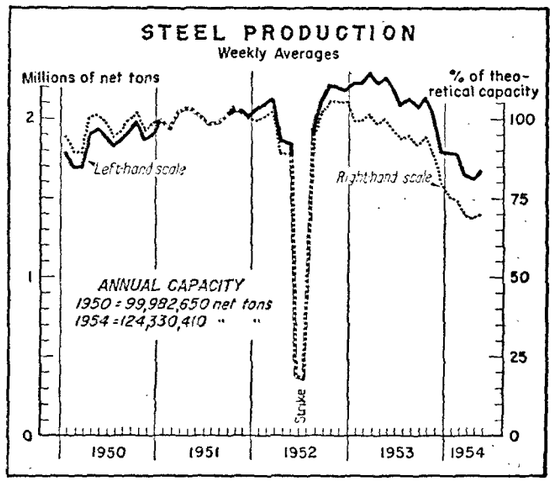
A QUESTION at the President's press conference last week brought into the open a division which has been gradually developing within the Atomic Energy Commission but which has been concealed from the general view by the habitual veil of nuclear security. President Eisenhower, in answering a question on the proposed increase of power for the commission's chairman, illuminated the cause of the division by going out of his way to praise Admiral Strauss, the present chairman. Mr Eisenhower places so much confidence in Admiral Strauss that he has become the President's confidential adviser on atomic matters; this is not part of his official duties as chairman and it has given him an advantage, which is personal, not statutory, over the other four commissioners. All five are supposed to participate equally in all decisions but, according to well-founded reports, his colleagues feel that Admiral Strauss is not consulting them as fully as he should on policy matters. These rivalries have been accentuated by the Admiral's zeal for secrecy which, it is said, has prevented him from being absolutely frank with the other commissioners and from telling the American people as much about nuclear developments as, in his colleagues' view, they should be told.

This split has unfortunately, in a commission that is supposed to be non-partisan, broken on political lines, with the three commissioners appointed by Mr Truman dividing against Admiral Strauss and the other Eisenhower appointee, Mr Campbell. And the situation has now come to a head for two reasons. First, the inquiry into the loyalty of Dr Robert Oppenheimer, the atomic expert, has been completed and Admiral Strauss must soon decide on the case, with or without asking the advice of the other commissioners; the main allegation against Dr Oppenheimer is that he delayed the development of the hydrogen bomb, a development on which Admiral Strauss finally insisted. Secondly, the amendments to the Atomic Energy Act, now being considered by Congress, include one designating the chairman as "principal officer" of the commission. Democrats argue that, if the commission can come so near to splitting wide open under a chairman of the undoubted ability and integrity of Admiral Strauss, then there would be a danger that it might disintegrate altogether if a less high-principled chairman were given more authority by law. On the other hand, it was Mr David Lilienthal, the first chairman of the commission, no Republican and no friend of the Admiral, who originally recommended changes in the composition of the commission which would have gone much further than the "one-man rule" provided for in the present Bill.

Steel Surprise

THE United Steelworkers of America, under the leadership of Mr David McDonald, have unexpectedly chosen this year of economic readjustment to place before the steel companies a programme of demands which is more extensive than any the industry has yet faced. In addition to higher hourly wage rates, the trade union—which is seeking to establish for 600,000 of its members new contracts to replace those which expire on June 30th—is demanding a guaranteed annual wage, greatly extended pension and insurance schemes, more paid holidays, longer vacations, and compulsory union membership for all employees.

While organised labour is not noted for restraint, it had been confidently expected that this year the steel workers would press their employers more gently. Neither of the traditional props to wage claims—a rising cost of living



and rising profits—applies today where the steel industry is concerned. On the contrary, with slackened demand from makers of durable consumer goods and with manufacturers in general reducing their inventories, the mills have this spring been operating at around 69 per cent of capacity in contrast to the position a year ago when they were working at full pressure. Over the last year—as the accompanying chart shows—the capacity of the industry has continued to increase while production has been falling. As a result, unemployment is considerable. The unions claim that 190,000 of their members are out of work and a further 257,000 are not working a full 40-hour week; figures put out by employers are well below these. However, the latest production figures give more ground for hope and steel companies, while expecting no great change in the market in the next few months, consider that the long decline is "flattening out." Of immediate interest is the possibility that the current wage demands will touch off a period of increased buying by manufacturers as a safeguard against a possible strike or price increases.

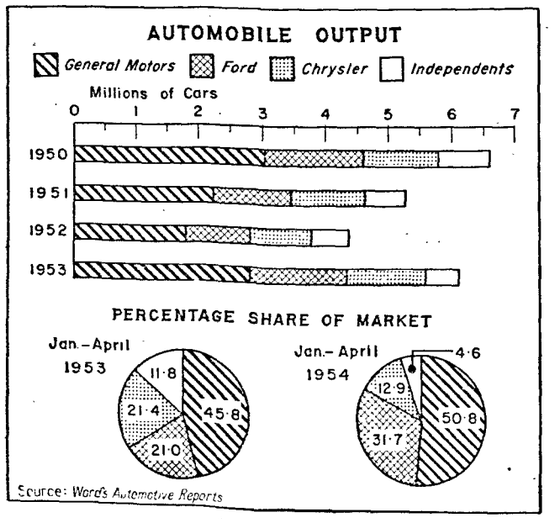
The pattern of this year's awards to the whole industry—and an indication of general industrial wage movements—hinges largely on the outcome of the present negotiations with the United States Steel Corporation. Mr McDonald is certainly anxious to get as much as he can for his members both to build up his own prestige—which has been growing steadily since he succeeded Mr Phillip Murray as head of the union eighteen months ago—and to score off his aggressive rival, Mr Walter Reuther, who is the present head of the Congress of Industrial Organisations. Nevertheless, despite its extravagant demands, the union can hardly expect in practice to repeat its success of last year, when it won an hourly increase of 8½ cents, and Mr McDonald has repeatedly declared that he is anxious to avoid a repetition of the 1952 strike.

Competitive Monopoly?

New York.

"WHERE it appears . . . that there may be danger of a serious shrinkage in the number of competitors engaged in a basic industry the Department [of Justice] believes that the causes are worth examination." This is the reason, according to the Attorney General, why his staff has begun a comprehensive anti-trust investigation of the automobile industry—an investigation which will embrace not only the operations of the automobile manufacturers themselves, but also those of the suppliers of parts, of the distributors of replacement parts and of dealers.

Paradoxically it is the intensity of competition between the automobile manufacturers, rather than the lack of it, that has encouraged this investigation. Last year, when over 6 million cars were made, the General Motors Corporation, the Goliath of the industry, made 46 per cent of the total; the Ford Motor Company, which began its production "blitz" in July, made another 25 per cent. This year, when even the most optimistic manufacturer expects no more than 5.5 million cars to be sold, General Motors is keeping its production schedules slightly above 1953 rates, while Ford's output so far has exceeded last year's by no less than 37 per cent. The heart of the struggle is for the prestige and advertising advantage of making the nation's best-selling car—a neck and neck contest between Ford's namesake model and General Motors' Chevrolet.



This fierce but apparently wholesome rivalry has had the most damaging effect on the sales and production of the Chrysler Corporation—the smallest of the "big three"—and on the four remaining independents: the American Motors Corporation (formed this year by the merger of the Hudson and Nash-Kelvinator companies); the Studebaker Corporation; the Packard Motor Company, Inc.; and the Kaiser Motors Corporation (formed last year by the merger of the Kaiser-Frazer and Willys-Overland companies). Chrysler's production has fallen by 44 per cent from last year and the independents, whose misfortunes are even greater, have cut their combined output by 64 per cent. The question now is whether this decline of the independents will continue until General Motors and Ford—and possibly Chrysler—monopolise the market. Ford is reported to have set its sights at 35 per cent of 1954 automobile sales and the president of General Motors expects his company to secure at least 48 per cent, leaving a mere 17 per cent for Chrysler and the independents combined; Chrysler alone had hoped earlier in the year to regain its traditional 25 per cent of the market.

These changes in the structure of the industry must, however, be considered in the light of the rapidly changing technology of automobile production. To survive at all in what has become for the first time since the war a buyers' market for automobiles, all makers must cut costs of production, and must do so in the face of the five cents an hour "annual improvement" provision in their wage contracts with the United Automobile Workers' union. A solution is being sought, perhaps more desperately than ever before in the industry, by applying the traditional remedies of more mechanisation, standardisation and integration. Mechanisation—promoted to the exalted status of "automation"—now consists essentially in the use of bigger and faster machine tools. The best-known examples of the trend towards more automatic operation are to be found in the new foundries, body-stamping plant and engine plants of the Ford Motor Company; but General Motors, Chrysler and Packard are now adopting similar methods. Integration of manufacturing facilities has taken two forms: mergers between the smaller automobile manufacturers, in order to standardise purchases and production, and to spread the heavy overhead cost of expensive machine tools over a larger output; and the trend toward the manufacture of more parts by the automobile companies themselves in place of purchases from outside suppliers. This integration, which is being accomplished partly by erecting new plants and partly by buying up former suppliers, permits not only greater standardisation and cheaper production of parts but also closer programming of the successive stages of production.

By these means, which imply a continued increase in the proportion of overhead to direct costs, the industry is succeeding in reducing its costs per unit of output. But the price of success, in terms of capital outlay on the new tools, is greater than at any time in the postwar period. This expense applies not only to the initial adoption of more automatic methods, but also the cost of retooling for the periodic introduction of new models. General Motors, for example, spent $350 million on special tools, dies, jigs and fixtures to bring its new 1954 models to the market; while only one of these had a completely new engine, three were restyled, and two "face-lifted." Chrysler's 1953 model changes were reported to have cost $200 million. So great is the capital outlay now required that even General Motors, which plans to spend $1 billion over the next two years, had to borrow $300 million from the market in December. Chrysler has borrowed $250 million in order to stay in the running, and has spent $73 million on the purchase of the Briggs Company's body works.

★

It is in this environment that the prospects of the independents must be considered. The first quarter results of all companies with the exception of Ford and General Motors have been universally depressing, with all but Chrysler showing a net loss. Those who expect a swift demise of the independents point to the two mergers which have already taken place as evidence of financial weakness. In addition it is pointed out that the cost of "automation" and retooling becomes prohibitive unless it can be spread over a large volume of production, and that in at least two departments —the engine shop and the body stamping plant—the independents' volume is too small. The optimist, however, claims that mergers provide a solution to financial and production difficulties and confidently predicts that further mergers will give the independents the strength they need. Moreover the minimum scale of output necessary to secure the most efficient utilisation of "automation" is in dispute. The Packard Motor Company, which produced only 81,000 cars last year, is installing a highly automatic engine production line which, it claims, "should be fundamentally more efficient than lines of many of the larger companies." In the body stamping plant the chief problem of a small company has always been the high cost of dies which, though capable of producing up to a million pieces, may be needed for only 100,000 or less. Here the solution is thought to lie in introducing the much cheaper plastic dies, some of which are reported to have a life of 100,000 stampings.

In the struggle for market position, the small firm cannot afford, like Ford and General Motors, to maintain a substantial reserve capacity for the "big year" and may consequently lose position permanently when that year comes; with fewer models it is also more vulnerable during the periodic shut-down for model changes. In addition it is at a disadvantage in the important field of distribution where the big companies are able to bring more pressure to bear on dealers and to meet the latter's fluctuating demands more satisfactorily.

But one peculiarity of the American automobile market may, in the long run, tell decisively in the independents' favour. The intense competition between Ford and General Motors has not been, in the main, one of straight retail price-cutting. It is significant that the largest number of sales are made, not of the cheaper "stripped down" models, but of considerably more expensive versions, resplendent in automatic transmissions, power steering, power brakes, air conditioning units and other attractive accessories. The customer no longer wants "plain vanilla" and the key to the market is not price but prestige, as is shown by the ever-growing backlog of orders for the most expensive of the major models, General Motors' Cadillac. The appeal is above all one of style, and it is in this respect, in providing for the customer who wants a "different" car, that the independents, like their overseas counterparts, can play an important role in the American market. Traditionally the independents have been the innovators both in design and engineering, and by concentrating on style they should be able to sell enough cars at prices that will cover the cost of small scale production. Moreover, with the introduction of more plastic body parts and plastic dies, they may even be able to offer more frequent changes in style than their larger competitors.

Constitution in the Air

WITH the Supreme Court's historic declaration that separate schools for Negro children are unconstitutional and the deadlock between the President and Senator McCarthy over the separation of powers, the Washington air is full of constitutional controversy. The wind that is blowing some of the dust away from popular comprehension of this basic American document arose early this year with the prolonged debate on the Bricker amendment, which tried to put legislative limits on the President's treaty-making powers but was eventually turned down.

Last week, however, the Senate rejected a constitutional amendment that the President himself wanted. On the grounds that "a man old enough to fight is old enough to vote," he had requested that the voting age be lowered to 18. The amendment was favoured by only 34 Senators, not enough to give the measure the necessary two-thirds majority over its 24 opponents. Georgia is the only state that now permits voting at 18, instead of 21, but the opposition, which came mostly from the southern champions of states' rights, was led by Senator Russell of Georgia. He and others objected not so much to the principle of lowering the voting age as to the federal government "degrading the power of the states" by infringing on their constitutional right to determine voting qualifications.

The Senate at least did not waste much of its legislative time, now becoming very precious, either on hearing evidence on, or debating, this question and it wasted even less on a measure which it has actually approved, and which would safeguard the sanctity of the Supreme Court against any repetition of President Roosevelt's "court packing" plan. After less than three hours' discussion, the shortest constitutional debate on record, the Senate accepted this constitutional amendment limiting the size of the Supreme Court to its present membership of nine Justices, a number now fixed by ordinary legislation, not by constitutional mandate. It does not, however, seem likely that this proposal will in the near future obtain the approval of two-thirds of the members of the House of Representatives and three-fourths of the 48 State Legislatures, the numbers necessary for the ratification of a constitutional amendment.

A variety of other constitutional amendments that are being considered by the Senate Judiciary Committee include voting rights for the residents of the District of Columbia, the abolition of the poll tax, an increase in the term of members of the House of Representatives from two to four, the nomination of the President by direct primary elections, the limitation of the income tax to 25 per cent, and acknowledgment of "the authority and law of Jesus Christ" in the Constitution. But of the several thousand amendments introduced in the 165 years since the Constitution was first adopted, only 22 have survived the complicated process of ratification and it seems improbable that even this year's gale of enthusiasm for constitutional matters will bring many additions to the number.

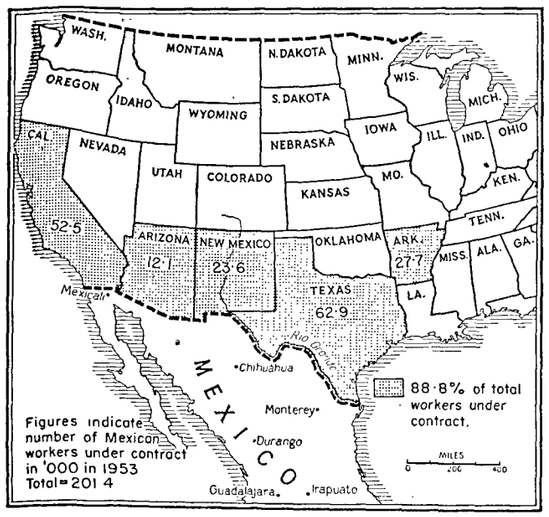
Cheap Labour from Mexico

FROM A CORRESPONDENT IN TEXAS

THE annual flood of Mexican agricultural workers into the Southwestern United States represents one of the largest seasonal migrations in the world. Some of these labourers cross the frontier under contract; others enter the country illegally and remain until discovered and returned to Mexico. In 1953, 201,380 came into the United States under contract and, according to the conservative estimates of the Department of Labour, a net number of 150,000 crossed illegally. Of the latter, a large proportion

were apprehended at the border and returned to Mexico ; on many occasions an individual or family will make several unsuccessful attempts, thus swelling the statistics of numbers returned to Mexico.

The migrant worker is known as a "bracero" (from the Spanish "brazo," or arm) and is one who works with his arms. The labourer who enters illegally is called a "wetback" because he traditionally swims the Rio Grande (which has lately been so dry that the name is losing its meaning). Of the total entering under contract in 1953 nearly 89 per cent worked in five states ; but the remaining 11 per cent spread themselves over a further 20 states, and were to be found as far afield as Michigan (2,568 of them) and Montana (2,258). More than one-half of these migrants went to the cotton fields, while large numbers went to the market gardens of the Lower Rio Grande Valley and California, to the beet fields of Colorado, to the hop fields of Washington and to the cherry orchards of Michigan.



The influx of Mexican labour into the western end of the American cotton belt today is an echo of the importation of Negro slave labour into the eastern and central portions more than a century ago. It is not, of course, slave labour which comes in from Mexico ; but the tendency to exploit cheap labour persists. The whole problem of braceros and wetbacks is a new symptom of an old malady which has played a dominant part in the economic and social development of the South. The problem centres round the fact that cotton has always been essentially a cheap-labour industry because, as an export crop, it has to compete with cotton grown in other, low-wage-paying countries. The complete mechanisation of cotton growing would, of course, introduce radical changes.

The present contract movement stems from a long history of straggling and usually illegal migration across the border to the farms and ranches of Texas, New Mexico, Arizona and California. It took definite legal shape with the increased demand for agricultural labour in the United States in the last war. Migration is now regulated by the two governments under Public Law 78. Negotiations with the Mexican government over the recent renewal of the Act nearly broke down and Congress threatened to recruit the labour at the border without the approval of the Mexican government.

Under existing arrangements, the American employer wishing to hire Mexican nationals must present his case to his state employment agency, which considers whether there is adequate domestic labour before granting his request. Moreover, the employer guarantees to pay wages comparable to those received by domestic labour in his area, and to provide comparable working and living conditions. Immigration officials now assume responsibility for the return to Mexico of the "skips," the colloquial term for Mexicans who jump contract, hoping to remain in the United States without citizenship. The contract may run for from six weeks to six months, may be renewed for another six months and, for as many as 10 per cent of the total number of workers, may be again extended by six months with the approval of the Mexican government. Mexican labourers are assembled at recruiting stations throughout that country at such centres as Mexicali, Monterey, Chihuahua, Durango, Irapuato and Guadalajara. While most of the wetbacks come from Northern Mexico, a large proportion of the contract workers come from the central and southern regions of the country.

The Mexican migrant worker is an inflammable subject in American domestic politics as well as in relations between the two governments. Organised US labour is usually opposed to his employment on the two rather different grounds that he is exploited by his employers and that he depresses wage rates in the area. Over the last two or three years fair treatment has certainly been accorded those Mexicans who enter under contract. On the other hand there has been considerable exploitation of the wetback, but it is only fair to point out that, while he may be given low pay and poor working conditions compared with domestic labour, he still comes back for more because they compare very favourably with what he could get on the opposite bank of the Rio Grande. It is true, however, that the existence of this large body of seasonal workers does hold down domestic agricultural wages and hinders attempts to organise domestic farm workers.

At present both countries gain economically from the seasonal migration. Mexico has a large excess of agricultural labour and is well aware of the relief that this movement provides; it also brings millions of US dollars into the country. In the long run the United States will probably not need to supplement its agricultural labour force and Mexico may, through industrialisation, be able to utilise the labour of its citizens inside the country.

SHORTER NOTE

As had been expected President Eisenhower has abandoned for this session the heart of his foreign trade programme and has contented himself with a request to Congress for a one-year extension of the Reciprocal Trade Agreements Act. The official excuse that Congress has not sufficient time to consider the full measure rings somewhat hollow in view of the time that has elapsed since the Randall Commission made its report. In practice the President has been forced to abandon his position by the strong and growing protectionist elements in Congress, which oppose even the one-year extension of the Act and have introduced a bill (sponsored by Rep. Oakley Hunter) which would divest the President of even his present powers in this field.

The World Overseas

Seato and the Commonwealth

UNREASONABLE haste and false hopes are doing damage to the conception of collective security for South East Asia. When people talk of a South East Asian Treaty Organisation (Seato) as an Asian version of Nato they beg almost every question of importance that is raised by the proposal discussed some weeks ago between Mr Dulles and Mr Eden. They overlook the effect on the Commonwealth of creating a new regional organisation ; they forget the circumstances in which Nato was created and the time that it took ; they underrate the importance of the fact that there is no colour or racial problem to disrupt the relations between Nato members in the way that a Seato might be disrupted.

It is now forgotten that the highly successful integrated organisation of Nato, both for military and political purposes, was based in 1949 on the already existing organisation of Western Union. This had been created in the preceding two years by Britain, France and the Low Countries, working independently of the United States. It provided Nato with the fruits of two years of detailed planning and made possible the swift and relatively painless accession of the United States, Canada and other states to a North Atlantic Treaty Organisation Similar preparations have not been made in South East Asia, even though the British and the French on the one hand, and the Americans, Australians and New Zealanders on the other, have been in regular military and political consultation for some time. Seato has to start very nearly from scratch.

The parallel between what is proposed for South East Asia and what actually exists in Western Europe seems to have been pressed too far in recent weeks. Nato is and will probably remain unique. South East Asia, like Western Europe, consists of a number of territories adjacent to the Communist sphere ; but the parallel stops there. The distinguishing factors are three.

1. The territories of South East Asia are not all independent and few, if any, have the self-confidence needed to enter into an alliance with the United States without feeling embarrassed and behaving awkwardly.
2. Whereas the United States and Western Europe share a common culture and traditions, Asians, British and Americans do not.
3. The United States and Western Europe shared, and still share, a common overriding fear of Soviet domination. The peoples and statesmen of South East Asia do not yet believe that they should be worrying more about Communist aggression than anything else.
4. In the Nato area defence can be built around first-class land powers like France and Germany, with considerable forces on the spot. No such nucleus exists in South East Asia unless India provides it. Such a nucleus might be found in Japan ; but it has not yet been suggested that Japan should be a member of Seato.

These are difficulties that might, in time, be overcome ; but they must be recognised as obstacles to the kind of quick carpentering that some advocates of Seato have in mind. If they can be overcome, there remains the question of how the Commonwealth would be affected by the emergence of such an organisation.

At first sight Seato seems to offer much that the Commonwealth needs. British interests have long called for some international arrangement that would treat South East Asia as a whole, engage the United States in that area and, in particular, provide diplomatic and, if ever necessary, military support in Malaya. Until recently these aspirations came to nothing because the United States put Europe first, was not ready for larger commitments, and was in any case nervous of the charge of supporting colonialism. Nobody, moreover, wanted to tread on Indian toes. All that happened was the formation of the Anzus pact, which did nothing for Malaya and created (or recognised) a special relation between the United States and the Australasian dominions, from which Great Britain and the rest of the Commonwealth was excluded. The idea of a wider arrangement disappeared into a pigeon-hole until Mr Dulles's last visit to London, when it suddenly revived.

Such an arrangement would have to be constructed upon principles quite different from those upon which the Commonwealth reposes. Seato would take its place among those modern international organisations which are formal and precise, and which are run by a group of permanent committees. Further, it would be essentially a regional organisation with regional commitments. Such commitments are natural in a time of emergency, but they cut across the Commonwealth idea ; for the Commonwealth is neither formal nor compact, but informal and dispersed. Seato would be as tight as the Commonwealth is loose. Which sort of organisation is better suited to the times and so the more likely to flourish ?

Informality demands simplicity and simplicity demands a minimum of members. But the Commonwealth's members have increased and are increasing and the new members are not like the old ones. This makes for complication, and complication breeds formality and regulations. The Commonwealth now has founder members of (mostly) British race, new members of different race and associate members or budding partners of yet different race. Moreover this multiplication inevitably introduces greater possibilities of conflict. The Commonwealth has long operated

upon the unexpressed principle that its members had no serious conflicting interests and this still remains true among most of the older members such as Britain and Australia. But with other members it is different. For example, both Dr Malan and Mr Nehru say and do things which imperil the Commonwealth, although each has an interest in the security of the Indian Ocean. Dr Malan's is the more serious threat, for his policies run up against the Commonwealth's traditional self-government-to-dominion line of development. Mr Nehru's threat is less fundamental and arises out of circumstances, not out of dogma. His obsession with Asian nationalism becomes a source of conflict in the Commonwealth only when it threatens Commonwealth unity towards issues raised by the cold war.

Thus the thorniest issues of the day—communism, racism and nationalism—criss-cross within the Commonwealth. The future of the Commonwealth as at present conceived depends to no small extent on the exorcising of racism and the reconciling of European attitudes to communism with Asian views on nationalism. These problems could not be suppressed in Seato if it were created. Indeed, it would bring them into sharper prominence.

A European Saar?—I

THE van Naters plan for "Europeanising" the Saar is potentially the most valuable piece of work yet undertaken by the Council of Europe. The Council's Committee on General Affairs, whose rapporteur is Mr Van der Goes van Naters, began to draft the plan nearly two years ago when it first became obvious that a Franco-German settlement of the Saar problem was essential if there were to be a lasting rapprochement between the two nations and if the idea of European political federation were to go forward.

The Saar, a small and highly industrialised enclave wedged between Luxemburg, Germany and Lorraine, is part of the ancient Franco-German dispute over the Rhine frontier. Historically and ethnologically, Germany has the stronger claim to the area, but the Saar's most important economic ties are with Lorraine, which provides its steel works with 90-100 per cent of their iron ore. Essentially, the Saar is part of the great coal-steel triangle, embracing Belgium, Luxemburg, the Ruhr, and eastern France, which forms the basis of the European coal-steel community. It would be difficult to find a corner of the world more suited on economic grounds to some form of internationalisation. At the moment, the Saar is a member of the French customs, foreign exchange and monetary area, and its foreign relations are in practice controlled from Paris; but in all other matters it is virtually autonomous.

The crux of the problem is this. While France and Germany see eye-to-eye on the principle of "Europeanisation" for the Saar, until now neither has quite accepted the other's definition of the term. The dilemma is admirably summed up in a passage from the report that accompanies the van Naters plan. Quoting from another recent study, the report says:

> The basic reason for the failure of the plan for Europeanisation of the Saar as it was discussed (between M. Schuman and Dr Adenauer, July-October, 1952), is the fact that the very concept of Europeanisation concealed an equivocation and that, under cover of this, both sides sought to pursue essentially nationalist aims. In German eyes the Europeanisation proposed by France seemed only a device for separating the Saar definitely from Germany and a disguise for continued French economic hegemony.
>
> In French eyes, Germany seemed to accept Europeanisation only as a means: (1) to reserve the future, and, while waiting, seek to influence Saar opinion, and (2) to ensure forthwith German economic penetration in the Saar.

What the van Naters plan has done most successfully is to narrow the area of contention and to define the issues at stake, both for the negotiators and the general public. In its present form it includes first, recommendations for a European Statute of the Saar and second, a draft resolution dealing with the ban that the Saar government has imposed on the pro-German political parties. All of these recommendations carry special weight inasmuch as France and Germany have taken them as the basis for their current talks on the Saar.

National Susceptibilities

Broadly speaking, the clauses that make up the European Statute for the Saar, as proposed by the van Naters committee, fall into two categories—political and economic. Of these the political are the least open to controversy. In this sphere the main questions that confronted the constitution-makers were (1) How can the Saar be "Europeanised" politically before the European community comes into existence. (2) How is the issue of permanence to be treated. France, apprehensive lest the Germans once again upset the *status quo*, naturally seeks a guarantee that a European solution will be permanent. Germany, on the other hand, fears that to accept the solution as permanent would afford a dangerous precedent for similar dismemberment of the Oder-Neisse territories when a final peace-treaty is negotiated. Over and above these national suspicions and susceptibilities is the legal fact that the West German government cannot bind in advance a united Germany that may emerge in the future. (3) How and at what point are the Saarlanders themselves to be consulted.

To meet the first point the committee suggests that until the European Political Executive comes into being, "the interests of the Saar in external and defence questions shall be entrusted to a European Commissioner," who will be appointed by the committee of ministers of the Council of Europe (The High Authority of the coal-steel community will also be consulted) and will be responsible to it. In this connection the ministers will take decisions by a two-thirds vote, thus giving France and Germany an equal voice but no veto.

The European Commissioner is not to be a citizen of France, Germany or the Saar. He will be assisted by a deputy, also appointed by the ministers, and by a five-member advisory board made up of parliamentarians—not civil servants—from the member states of the Council of Europe. The board will include one German and one French citizen and probably also an American member.

Anxious Saarlanders have been assured that the Commissioner will have no power to intervene in their domestic affairs—all that will occur is the "transfer of the exercise of Saar external sovereignty from France to the European Commissioner." The inherent weakness of this solution is acknowledged by the Committee itself:

> Relations between the European Commissioner and the Saar government will develop . . . harmoniously . . . provided there is a will to co-operate on all sides. This in turn will hinge upon making the right choice for the post of European Commissioner; upon this the success or failure of the whole European solution will largely depend.

In order to ensure the greatest possible degree of permanence for the European Statute, the committee proposes that it be guaranteed by Britain and the United States as well as by the French and West German governments. The first three nations should also undertake to support this solution as final during negotiations for a peace treaty, and all four guarantor states should ratify the Statute. As the draughtsmen point out, they have devised the best written formula within their power, but the firmest guarantee "will be provided by the establishment of the European political community; in other words, the continuing political will of France and Germany to work together."

On the question of consulting the Saar itself, the committee makes this proposal. The Statute, together with any necessary amendments to the Saar constitution should be submitted to a free referendum, but only when the clauses have first been agreed by France and Germany and also by an international conference. The voting members of this conference will be the six nations who plan to create a European community, the Saar, the United Kingdom and the United States, and the High Authority of the coal-steel community. Most people expect that the Saarlanders themselves would return an overwhelming "yes" to the offer of Europeanisation; but even so, the committee felt that the Saarlanders should be allowed to vote on an issue that directly concerns their own future.

(To be concluded)

Uganda Outlook

FROM A SPECIAL CORRESPONDENT IN KAMPALA

THE authorities in Uganda are beginning to indulge very cautious hopes that the Baganda are having second thoughts about electing a new Kabaka. Though nobody quite sees how it can come about, there are some indications that the Baganda are tired of the deadlock, and are finding that the romance of "the king over the water" is beginning to pall.

The stature of Mr Kavuma, the Katikkiro, who is both Prime Minister and one of the three regents, has risen considerably in the last few months, since, without in any way departing from his loyalty to his Kabaka, he has ignored threats of assassination and steadily continued the task of administering Buganda. During the Queen's visit he frankly told Her Majesty in his speech of welcome that the Baganda were grieved that they could not welcome her with their Kabaka as they would have wished; and this, which produced some raised eyebrows among the distinguished assemblage of Europeans, showed that the Katikkiro is no man of straw: but he is no revolutionary either. In the vernacular press a significant campaign is being carried on against those who, it is alleged, wish to consider the possibility of electing a new Kabaka.

But it is difficult to see how any such move could gather strength enough to carry the Lukiko so long as the Kabaka stands firm on his rights in England, and the High Court case, which turns on the right of the administration to act in the Kabaka's name in the election or nomination of members to the Lukiko, is still undecided. It will come before the High Court this summer, and in logic it is bound to go to the Privy Council. For if the administration lost, it would have to appeal, and the Baganda leaders have intimated that they also will appeal, and this would, in fact, keep the Kabaka issue alive for another year or more. It will, however, probably cost the Buganda taxpayer £20,000, and some profess to think this may lose the Kabaka appreciable goodwill.

It cannot be said, however, that the way is yet clear even to make a start with Sir Keith Hancock's mission. Of the original ten members selected from a list of some forty or more runners up, balloted for by the Lukiko, the Governor, Sir Andrew Cohen, disallowed two—Dr Ralph Bunche, who is an American citizen and can know little of the issues, and Dr Kalibala, who is a Muganda, but has for long lived in the United States and is not noted for his qualities of conciliation and practical political sense. The Governor suggested, but did not order, that these two should be replaced by two Saza (divisional or county) chiefs; whereupon three of the original team—the three who had visited London to urge the Kabaka's return—resigned, thus leaving a gap of five in the original committee.

The Governor's Difficulties

The question now turns on whether five reserves from the Lukiko list shall be moved into the negotiating team, or whether, after receiving Sir Keith's highly conciliatory letter, the three who resigned will return to the team, leaving only two to be moved up—for it seems unlikely that the Governor's suggestions will be approved. The one idea of both Sir Andrew and Mr Lyttelton is to get the discussions started; and that, of course, is enough to make the politicians on the other side see endless reasons for suspicion and prevarication. But there certainly is a Baganda element which sees such manœuvres as positively damaging to the tribe.

Unfortunately, the administration seems at the moment to have little of the initiative. It is playing a waiting game, hoping that reason will prevail. Perhaps it will—and perhaps the local press will overreach itself. But in general Africans respond best to a lead, and rightly or wrongly, they look to the Governor for that. Sir Andrew's position is therefore a difficult one, and is not made any easier by the assertions of, for example, members of the unofficial community that over the whole affair, he and his staff have done "the right thing in the wrongest possible way." But few of these critics make it clear what *they* would have done when the Kabaka showed beyond doubt that he intended a head-on clash with not only the Governor but the Colonial Office and the British Parliament. Sir Andrew certainly did more to try to keep the Kabaka on the throne than any African will ever admit, or than most other observers in the Protectorate would consider desirable.

Meanwhile, the position in Buganda is difficult. The story that the Kabaka will come back is assiduously spread. This frightens those who might like to find a replacement. Threats and intimidation are the normal stock-in-trade of African politics and are being freely used to make everyone toe the Kabaka line. In effect this means that the Baganda intend to force their views on Britain. Any suggestion that this is unrealistic is scouted—and ends in references to the Sudan, the Gold Coast, India, *et al.* But the damage done by the endless uncertainty is considerable, and the only gainers from it are the extremists. Yet even they are not a strong group, and their only real weapons are the injured

pride of the Baganda (which should not be underestimated), a scurrilous press campaign, and a certain amount of guidance from abroad. If the sensible men on both sides could get together, the problems might not prove as difficult as is often feared.

One thing, however, should be stated. Whatever may emerge from the Hancock mission, it would be premature to assume that it will be a blueprint for a "constitutional monarchy" such as is supposed to be its real purpose in left circles in Britain. There is little sign that such a development is yet desired by the mass of the Baganda. This fact will make the integration of Buganda in a unitary or federal Uganda state no easy task; and that is why the Hancock mission is so important and can be so creative.

Insoluble Trieste

FROM OUR ROME CORRESPONDENT

As seen from here, the Trieste problem still looks a long way from being solved. In spite of the patient efforts of the British and Americans during the past few months, none of the information which has so far leaked out about their proposals sounds very promising. These represent the first stage of a long drawn out attempt at mediation between Italy and Jugoslavia, by establishing in private negotiation, first with one side and then with the other, the minimum terms on which they could conceivably agree to a settlement. So far the emphasis has been put on the Jugoslav position, and it is expected that, under Anglo-American auspices, the outcome of the discussions will be submitted to Rome as a basis for further negotiation.

The supposed outline of the present proposals, to be submitted possibly early next month, is basically a partition, Zone A to Italy, and Zone B to Jugoslavia. It is reported, however, that Marshal Tito is prepared to abandon his earlier claim for an outlet to the sea in Zone A together with a corridor linking it to Jugoslavia; on the other hand, he is now asking for a rectification of the zonal frontier in his favour, in such a way as to weaken the defence ring of hills round the port. Even more important he wants a new port to be constructed in Zone B at Capodistria with American help. There would also be provision for the protection of the Slovene majority in Zone A.

The Italian attitude, however, is clear. Italy missed the boat in 1948-9, when Marshal Tito was weak and isolated and when the Allies underwrote Italy's claim to the whole of the Free Territory; and therefore reluctantly accepted the offer of October 8th last—that is Zone A. But the Italian Parliament added a rider, which amounted to a face saving gesture, that Italy's claim to the return of Zone B still stood. Although since then, nationalist excitement over Trieste has subsided, no government, least of all a relatively weak one like the Scelba administration, could survive a solution less favourable than October 8th, even if it were presented as a provisional one; a final solution would have to be much more attractive.

This in fact is the officially stated position of the Italian government; it would accordingly reject the latest terms out of hand. The impasse is particularly regrettable since the Palazzo Chigi has been pursuing a line of studied moderation, which has been reflected in the official press, and since even the nationalist Right is anxious not to make trouble. The Italian restraint is all the more remarkable since it exposes the government to a flanking attack from the Communists, posing as extreme chauvinists, and since the Jugoslavs are still preventing inhabitants of Zone B from crossing the frontier to Trieste where many of them are employed except as refugees.

Moreover, it is widely believed that time is not working in favour of the Italians. In spite of the attempt in the interwar years to make up for the loss of Atlantic traffic by the creation of new industries in Trieste there is an obvious clash between nationalist feeling and economic interest. The Italian government tries to counter this pull by making heavy contributions to the Zone's finances—over £3 million to balance the city's budget. But Zone A is really kept afloat by Allied subsidies and the presence of the Allied garrison. Business men moreover are not obliged to submit to the delays imposed by Roman bureaucracy, and although the Italians have promised huge new investments once the city is handed back to them the feeling in favour of independence is growing.

But the original solution—the creation of a united Free Territory—is now out of the question. Marshal Tito has for all practical purposes annexed Zone B. Italy for its part must have at least the town and port of Trieste. Yet the new port at Capodistria, if approved, would mean the end of the traffic through Trieste. The only way out might be for the new port to be kept within reasonable limits and for its construction to be staggered over a number of years so as to give Italy time to digest the absorption of Zone A. There would also have to be guarantees by the Jugoslavs not to hamper traffic between Central Europe and Trieste. Unfortunately, the chances of agreement even on such a compromise are slight.

Myth of Cheap Japanese Labour

FROM OUR TOKYO CORRESPONDENT

ALL indications point to a bitter and violent labour showdown in Japan, which will involve unemployment and legislative attacks on the Labour Standards Law, imposed during the vanished Occupation. Slick references to "rationalisation," "modernisation" and "streamlining" mean in the long run, of course, fewer hands and lighter payrolls for industry if not for the individual. Because of obsolescent equipment, over-employment and inefficient methods, the myth of Japanese "cheap labour" is an unfortunate one for the West to cherish.

The per-caput wage rate, while considerably lower than the western rate, is not the entire pay-off; a better test is labour productivity and labour cost per unit of output, and judged by this Japan does not come out so well. The real cost of labour in Japan is now substantially higher than it was before the war, because—as employers angrily and increasingly complain—of the post-defeat rise in welfare payments, shorter working hours, overtime, compensation and similar democratic refinements. The difficulties of such basic industries as coal-mining and electric power, eloquently explain Japan's economic plight.

Labour productivity in Japanese coal-mining today is only 56 per cent of the prewar average. The Japanese miner's wage is only one-tenth the American miner's and one-third the British miner's wage. But Japan's man-per-month output of coal (according to the Labour Ministry's most recent figures) was about 10 tons, compared with 111 tons and 27

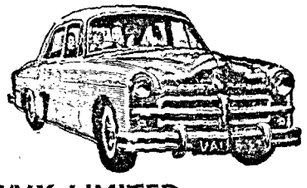
WHEN YOU VISIT SCOTLAND

travel as you please

Only by car can you get close to the Scottish scene. Only by car do you have time to see it and thrill to it. Set your own pace, turn north, south, east or west as you will. A wealth of history and romance is to be found along the byways of this beautiful land—but you must travel by car.

First move then, in your See Scotland plan is to reserve an S.M.T. Self-drive Hire Car.

The S.M.T. fleet consists of up-to-date 5/6 seaters which you can hire for as long as you wish. Up to six people can travel as cheaply as one. No connections to worry about, no set time-table. Just come and go as you please.



S.M.T. **SELF-DRIVE HIRE SERVICE**

tons for the United States and Britain, respectively. In the field of electric power, Japan's labour force averages 15 men per 1,000 kw. of generated power, or about four times the manpower needed for American electric power production. This means that Japanese power output per head is less than one-fourth the American figure ; thus, despite the far higher American individual pay-level, the labour cost for each kilowatt is only 1.14 yen in the United States and 1.18 yen in Japan.

Man-hour requirements for smelting one ton of pig iron in Japan are double British and seven times American requirements. In steel ingot production, the man-month output (1952) was more than 14 tons in the United States, seven tons in Britain and less than four tons in Japan. Low textile wages compensate for relative inefficiency (compared with the United States) in productivity. Average man-hour production of cotton piece goods for Japan's "Big Ten" cotton mills—again, according to the Labour Ministry—was 7.3 lb (in 21 gauge yarn), contrasted with 15.3 lb in the United States and 5.2 lb. in Britain. The labour cost per pound in Japan was, therefore, only 1.8 cents, in the United States 8.6 cents, in Britain 7.5 cents.

The problem of obsolescent equipment in Japan is considerable. In its last report to the World Bank, the Ministry of International Trade and Industry asserted that the percentage of plant facilities which had been in operation for more than 20 years was as follows:

	Percentage of obsolescent equipment	Percentage of this still in active operation
Caustic soda	60	33
Portland cement	80	80
Machine tools	35	24
Thermal electric power...	80	20
Hydro-electric power....	80	41
Open hearth steel.....	36	31

Ambitious rationalisation programmes are under way in the iron and steel, coal-mining and electric power industries, but they are now being re-examined in the light of the so-called "austerity" budget, which is based on a theoretical cut of up to seven per cent in costs, and it appears certain that progress will be slowed up as government aid contracts.

The showdown with the unions cannot indefinitely be postponed or evaded. The employers are demanding a freezing of wages and abandonment of the western "luxuries" granted to workers under the Occupation Labour Standards Law. In the coal-mining industry, for instance, the owners protest that mine staffs are uneconomically swollen because the daily working hours have been shortened from 10 to 8½ ; that because minors and women can no longer work underground, the ratio of underground to surface workers has altered "undesirably" from the prewar proportion of 7-to-3 to 6-to-4 ; and that overtime, compensation and annual leave provisions are "unrealistic."

As one Japanese coal-owner said in Osaka: "We Japanese cannot afford these labour generosities and indulgences which your wealthy and highly mechanised western industry so easily supports and encourages. After all, Japan lost the war and the people must expect some hardships as the price of defeat. That is only reasonable—and truly democratic." Other industries claim in the same way that the generosities of the Labour Standards Law have imposed the following reduction in working time per month per worker: Cement, 30 per cent ; paper, 40 per cent ; ammonium sulphate, 20 per cent ; rubber, 20 per cent. This is the chief reason, they contend, why the output per man-month remains so often below the prewar level.

The evidence suggests that the strangely quiescent Communist Party is awaiting the inevitable clash over these standards. If—rather, when—they are lowered, the West may have real cause to brood over Japanese cheap labour.

Money on the Wing

NO section of economic analysis is more shoddily served with statistics than the international flow of private capital. The United Nations Department of Economic Affairs has done a service by bringing together statistics covering the flow of capital from Britain, the United States, Canada, the Netherlands, Switzerland, and Belgium in the period 1946-52. Even though the basic statistics are sketchy and often conjectural, some interesting conclusions emerge. But in arriving at the total for one important component of the flow of private capital, namely the reinvestment abroad of profits made by foreign-owned business enterprises, the UN experts had to resort to pure guesswork.

A few clear trends stand out. The relative smallness of the postwar flow of private capital, averaging $1.5 billion a year, compares unfavourably with that of the 1920s. Another interesting tendency is the relative growth of the United States as a creditor on private account, compared with the decline of Britain and other European countries. This trend might, indeed, have gone further had it not been for American foreign economic assistance. In Europe, only Switzerland has sustained a creditor position.

Most of the foreign capital has been absorbed by the relatively developed regions of the world, such as Australia,

TREND OF OUTWARD CAPITAL MOVEMENTS, 1946–1952

Country	Unit	1946	1947	1948	1949	1950	1951	1952
USA.....	Million dollars	362	1,197	1,329	1,232	1,562	1,715	1,849
Britain...	Million pounds	—111	332	183	254	134	311	155
Switzerland	Million Swiss francs	—	55	50	54	212	50	247
France...	Billion French francs	—	0·2	0·4	52	69	96	106
Belgium..	Billion Belgian francs	—11·2	—10·8	—4·5	—0·8	5·0	1·4	2·1

(Minus sign indicates inward capital movement.)

South Africa, and parts of Latin America, and hardly any went to the really underdeveloped regions of Africa and South East Asia. It also appears that overseas territories continued to get most of their private capital requirements from their parent metropolitan countries, even though many of these former creditor countries found it increasingly hard to finance their foreign investment.

A high proportion of private funds leaving Britain and America went into petroleum investments in the Middle East and Latin America; but mining also continued to absorb a large amount. Manufacturing industries, according to the UN report, are now drawing a greater share of private international capital ; but most of it is directed to the developed countries such as Australia and very little to manufacturing in the true underdeveloped areas. Public

utilities, in the past a favourite object of private investment, are now almost neglected, mainly because of the policies of governments in the overseas countries.

A marked change has appeared in the type of foreign investment encountered in the capital markets since the war. Nowadays one of the biggest elements in foreign investment is the reinvestment abroad of undistributed profits of foreign branches. Both the floating of foreign government bonds and the issue of shares and debentures of foreign business enterprises on capital markets abroad have declined ; but the authors of the report believe that there is scope for reviving sales of foreign government bonds overseas. With the return of some of London's prewar glory as a capital market their optimism may well be justified.

Journal of Geneva—V

MAY 20th. A day of private meetings at the highest level.

May 21st. The fourth restricted session on Indo-China. Mr Molotov proposed that the conference should consider the following five points for an armistice in each of the three Associated States: (*a*) a cease-fire ; (*b*) grouping of forces on each side into certain zones ; (*c*) measures to prevent reinforcement after a cease-fire ; (*d*) methods to control these arrangements ; (*e*) the form of international guarantee for any settlement reached.

It was reported that the meeting was largely taken up with an inconclusive discussion of the French and Viet Minh armistice proposals. The Viet Minh continued to refuse to accept the French contention that Viet Minh forces must be withdrawn altogether from Laos and Cambodia, and that only in Vietnam should there be a regrouping of regular units on each side under international supervision.

May 22nd. A plenary session on Korea was held. Mr Chou En-lai said that a United Nations commission to observe elections in Korea could not be accepted because the UN was a belligerent ; he proposed instead a neutral nations commission composed of countries that did not take part in the Korean war.

General Nam Il, Foreign Minister of North Korea (whose proposals for Korea were summarised in *The Economist* of May 1st, page 386), maintained that the all-Korean national assembly would be elected on the basis of proportional representation, but he implied that the all-Korean commission set up to prepare and carry through the elections would not ; it would be appointed by the two existing legislative assemblies and would also include "representatives of the largest democratic social organisations" ; he denied that this meant only Communist organisations.

Mr Pyun, the South Korean Foreign Minister, put forward a 14-point unification plan which can be summarised as follows:

(*a*) Free elections under United Nations supervision in both North and South Korea within six months of the adoption of this proposal.

(*b*) Complete freedom of speech and movement for all candidates and their assistants and families, as well as for all UN personnel supervising the elections.

(*c*) The elections to be by secret ballot on the basis of universal adult suffrage.

(*d*) Representation in the new legislature to be in direct proportion to the population of the whole of Korea in accordance with a census to be taken under UN supervision.

(*e*) The all-Korea legislature to be convened in Seoul immediately after the elections.

(*f*) The new legislature is to decide the following questions: (*a*) whether the President of united Korea is to be newly elected or not ; (*b*) whether any amendments should be made to the existing constitution of South Korea, which shall otherwise remain effective ; (*c*) the disbandment of military units.

(*g*) The Chinese Communist troops are to complete their withdrawal from Korea one month before the election date.

(*h*) The phased withdrawal of UN troops may be begun before the elections, but must not be completed before effective control over the whole of Korea is achieved by the United Government of Korea and certified by the United Nations.

(*i*) The integrity and independence of a united Korea is to be guaranteed by the United Nations.

May 23rd. A day of informal contacts.

May 24th. The fifth restricted session on Indo-China. It was understood that M. Bidault proposed that two other points, covering the disarming of irregular forces and the immediate liberation of prisoners, should be added to the five points put forward by Mr Molotov on May 21st. Mr Molotov proposed that the conference should concern itself with the political aspects of a settlement. This was opposed by the western delegates, who stuck to their view that a cease-fire should be discussed first.

At a press conference, Mr Pyun, the South Korean Foreign Minister, strongly opposed the Communist proposal that the Korean elections should be supervised by a neutral commission ; he recalled the way in which the Czech and Polish delegates on the neutral armistice commission had used their veto. He also maintained that elections in the north could not be free unless the Chinese troops were withdrawn.

May 25th. The sixth restricted session on Indo-China. It is understood that Mr Eden put forward "package proposals" to be accepted *in toto*. It is believed that the first proposal was for cease-fire discussions and that if one was agreed in any of the three Associated States, it should be put into force whether or not a cease-fire was also agreed in the other states. The other proposals included a regrouping of troops on either side, the transfer of troops from one area to another and the disarmament of irregular forces.

May 26th. A day of private contacts during which it was learned that on the previous day Mr Pham Van Dong, the Viet Minh Foreign Minister, had put forward some important proposals. According to a Tass statement these suggest a form of partition for Vietnam, and appear to imply that the Communists are willing to consider separate treatment for Laos and Cambodia. They included:—

(1) A complete and simultaneous cease-fire throughout the whole of Indo-China, to be preceded by a complete cessation of reinforcements and deliveries into Indo-China.

(2) A withdrawal of the regular forces into zones ; the basic principles for these would be decided by the conference, and the technical details would be studied on the spot in each of the three states.

(3) In defining the areas to be occupied by each side, account should be taken of their size, population and economic and strategic value ; they should be economically and politically viable and should enjoy full sovereignty, including their own territorial waters.

(4) Mixed commissions of representatives of both sides would supervise the armistice arrangements under the general supervision of a neutral nations commission.

Sulphuric acid

No. 3 IN A SERIES ON RESEARCH & DEVELOPMENT

The uncertainty and dollar cost of sulphur supplies have given prominence to pyrites, anhydrite and spent oxide as raw materials for sulphuric acid. Simon-Carves are developing highly efficient pyrites-roasting techniques in conjunction with Swedish and German specialists ; plants using these techniques are already in use in Britain and under construction in Australia and South Africa. They are building two huge anhydrite plants in Britain with chemical engineering know-how provided by ICI and licensed to Simon-Carves throughout the world. They are also building the first two plants in Britain to use the Kachkaroff tower process of making sulphuric acid from spent oxide, which is produced in large amounts at gasworks but has not so far been found usable alone in orthodox "contact" plants.

Tougher Going in Oil

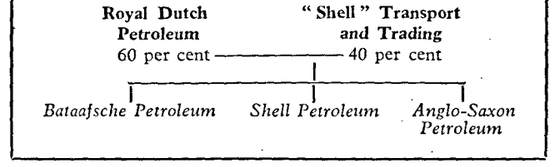
WHEN the oil industry records, as it had to record last year, that market conditions were becoming increasingly competitive, it speaks in a relative kind of way. "Trading conditions," said the Anglo-Iranian report last week, "have been far from easy." The admirable "Survey of Activities" of the Royal Dutch-Shell group of companies strikes much the same note:

> Increased supplies of oil products as compared with the growth in demand inevitably resulted in the year being one of increasing competition. The supply-demand relationship of all products in 1953 was more nearly balanced than at any time since the end of the war.

Neither group was guilty of the oilman's blackest sin, which is failure to advance; indeed Anglo-Iranian increased its sales of crude oil and refined products from something above 32 million tons to nearly 37 million tons. But this was a rebound from the setback inflicted by the troubles in Iran and something of a special case; and it had its reaction on the Royal Dutch-Shell group's sales which, no longer boosted by exceptional supplies to meet the loss of Iranian oil, showed last year a relatively modest expansion overall, and an actual fall in the offtake of Venezuelan crude which persisted until the last quarter of the year.

This is a distinct change compared with the striding 10 per cent advances that the industry made for so many years after the war. That was an abnormal period of catching up with demand. Does last year's rate of increase of 5 per cent or so set a more normal pace? And if so is there any likelihood of a certain letting-up in the rate of exploration and development of crude oil and its products before another five years have passed? The world certainly has an abundance of oil; and Sir Frederick Godber, in his statement to the members of "Shell" Transport and Trading, makes two statements that have not been heard from the industry for the best part of twenty years. There is, he declares, now in the world an excess of potential production and refinery capacity; and last year both were in excess of immediate needs, causing available supplies to exceed demand. But throughout the world, oil companies were engaged last year in capital expenditures that must have involved more than £1,000 million, and making all allowance for the urge to expansion that is its engaging characteristic, the industry is not so lost in dreamy figures that it contemplates sums of this order in a spirit of gaiety. Indeed,

The Royal Dutch-Shell Group consists of three main parent operating companies; their operations and investments in other companies provide practically the whole income of the two parent holding companies, which participate 3 : 2. Common policy is secured by identical managing directors for the three parent operating companies.



it has the healthy instinct of wanting a prompt and satisfactory return on the money it spends. Towards last year's new oil investment, Anglo-Iranian's contribution approached £75 million, and the Royal Dutch-Shell group's totalled £220 million.

Here, indeed, is the problem of bigness—and keeping big. Royal Dutch-Shell, despite the adverse changes that it had to marry with favourable factors last year, achieved the towering total of £1,700.7 million of group sales—£5 million a day apart from small change. It spent on operating costs, purchases of oil and royalties nearly a billion pounds, collected excise

duties for governments across the world at a rate of a million a day, and set aside nearly £150 million for depreciation and depletion. Its balance of profit, at this stage of the account, shows a mere fall of £7 million to £226.9 million, and it may be significant that taxes on profits have fallen by more than twice that sum to £83.1 million; a world-wide group can hardly be blamed for lightening its tax burdens if it can. In the end, the group's net income amounts to £130.4 million, against £125.6 million in 1952.

It is a large sum; but a lot has to be done with it. Last year's capital expenditure was £220 million, of which £148 million was found from depreciation and other capital write-offs; another £7 million had to be found for investments. Thus about £80 million had to come from last year's retained profits to carry the group's capital programme; and while a good deal of the balance of profit fed a healthy improvement in the group's cash holding, these resources "are by no means too liberal" for meeting accumulated tax

liabilities and future capital commitments. On this latter point, Sir Frederick Godber's observations deserve study:

> Heavy capital expenditure is inescapable if we are to maintain our business in strength and progress. The weight of capital requirements in the international oil business is now such that these have, in the conventional sense, outgrown the money markets of the world and in the main can only be met by the generation and retention of funds out of earnings. . . . Capital expenditures on the last three years have amounted in total to £572 million and in the coming years at any rate they will continue to be of these dimensions.

It is at this very point that the threat of increasing competition in the oil industry, and of a further rise in costs, makes its impact. So far as United Kingdom companies are concerned, they have to carry in addition the disadvantage of enjoying no tax allowances for depletion, such as American and Canadian companies are granted.

It has never been the oil industry's habit to take merely a twelve-month view. Oilfields take longer to prove and refineries to build. But one of its major investment operations has caught up with current demand. This is the building of new tanker fleets—not yet finished, for there are giants still on the stocks. The tanker freight market last year was in a state of depression, and there has been little recovery. Sir Frederick's conclusion is that the prospect in the tanker freight market for the remainder of this year does not encourage

* A barrel equals 35 Imperial or 42 US gallons. According to the specific gravity of the crude oil, one metric ton varies from 6·5 to 7·5 barrels.

optimism, and that stability can only come from a revision of ideas about the economic life of old tankers, which became unduly long when freights were unduly high. More drastic scrapping must be the answer.

On closer analysis, it is evident that the extreme lowness of freight rates lay at the bottom of the industry's difficulties last year. Last summer, world prices of crude oil increased, and the increases, after a brief testing period, "stuck." But the actual level of prices of

petroleum products in many markets has been falling—in fuel oils particularly; evidently the freight component in costs has fallen to a greater extent than the rise in costs of crude oil production and processing. On the short-term outlook, there seems no reason to expect a radical improvement; the major groups known to the British investor are fighting for markets in a more determined way than at any time since the thirties. Russian oil—in small quantities—is coming back into Western markets, at a moment when the balance of supply and demand is very nicely adjusted. In the gasoline market, there is the worldwide battle of the additives and the cutting of lower-grade petrol prices in this country. High duties on gasoline and diesel fuel are distorting the relative demand for the two products in a manner that is inconvenient to an industry that has been concentrating great effort on the production of high-grade gasoline; the encouragement that the excise gives to the use of diesel power has upset the expected balance of refinery production in this country to such an extent that a considerable import of the "middle distillates" is required to meet the demand, at a sizeable cost in dollars.

But the thrust and expansion continues, and oil would not be oil if it did not. Anglo-Iranian is completing refineries at Aden and Kwinana in Western Australia; Shell is building one jointly with Burmah Oil at Bombay and has completed (that is never quite the word for a refinery) the first stage at Geelong, near Melbourne. Petroleum chemicals are a major industry in their own right; the Royal Dutch-Shell group is extending its new chemicals plant at Pernis in Holland to add insecticides to its present production of solvents and "Epikote" resins. New distillation units, cat. crackers, lubricating oil plants (Anglo-Iranian has one now coming into production at its Kent refinery), sulphur recovery plants, synthetic detergents plants—each of these would appear to be a major project in itself were it not for the fact that the horizons of the oil industry are so vast that such plants are lost in its universal bigness.

The oil investor has counted on growth from Shell, and on the resolving of Anglo-Iranian's troubles in Iran. Does the emergence of tougher conditions in oil change these views? It ought to make the Iranians more realistic and the consortium more determined in the negotiations for the resumption of operations in Iran. These are temporarily suspended so that the negotiators for the consortium can consult their principals, probably in London next week; both sides have so far been unbending, but on the present prospect for the oil industry the consortium certainly has the better reason. Discussions on compensation to Anglo-Iranian are also temporarily suspended, though there is no reason to suppose that the company's case has been ineffectively put, or brushed aside. There is the foundation for agreement on both matters, given good sense on both sides and a skilful playing of the consortium's strong hand. Therein lies the eventual justification, as many investors will hope, for paying up to £12 10s. for Anglo-Iranian.

As for "Shell" Transport and Trading, growth was disappointed by last year's merely maintained dividend, but appeased by the proposed one-in-five scrip issue on which—in the market's solid view—the existing rate of dividend should be maintained in a year's time. On that calculation the prospective return of over 5½ per cent does not overrate the attractions of the shares. But it might be dangerous to expect too much too quickly. For the longer-term investor, "Shell" chooses itself; but the shorter-term operator should keep in mind the warnings of the chairman's statement, with its emphasis on keener markets and astronomic capital requirements.

Putting Copper on its Feet

THE stage of transition from public to private trading in copper came to an end this week, when the Government broker, who has supplied prompt metal to the London market since it reopened last August, withdrew. To what extent has the market succeeded in fulfilling its traditional functions during this inevitably difficult period, and what are the prospects ahead? Has it provided:

(*a*) a source of supply for consumers and an outlet for producers;
(*b*) a representative price established in free dealings;
(*c*) a hedge against forward commitments or against stocks?

To the first question the answer is Yes. In all the metals in which the London Metal Exchange deals, a buyer is always able to buy and a seller to sell. But this answer needs qualification. Consumers have not obtained on the market the grade of copper—electrolytic or high conductivity fire refined wirebars—tenderable against the contract price. Producers and their selling agents have preferred instead to exercise their option to tender the lower grades, paying the appropriate discounts on the contract price. Hence a consumer who required the best material—for example electrolytic wirebars—had to arrange a swap with a producer's agent, and pay a small premium for what he wanted. If a swap could not be obtained, his broker could purchase from the Government broker, who also charged a premium.

Hence the short answer to the second question is that the standard price does not represent the actual price of electrolytic or high conductivity fire refined wirebars to consumers. Electrolytic cathodes are the material nearest to the contract price; the official discount for cathodes is £3 a ton, but sellers have been able to obtain the full contract price outside the market. The London

price is the best indicator of the trend of world copper prices. But the fact that electrolytic copper, which accounts for the bulk of demand, cannot be bought at the standard price is one of the main criticisms of the market among British consumers.

A revision of the copper contract to meet this and other criticisms is now being considered by the Metal Exchange committee. Widely different opinions about the possible solutions to this particular problem are held in the trade, and some dealers and merchants doubt whether any solution is yet possible. They argue, with some force, that as long as electrolytic copper is scarce, producers will continue to reserve it for the customers with whom they have direct long-term contracts. In any futures market, the grades tendered are those least in demand. In fairness, too much should not be made of this weakness of the contract. The system does work; premiums for the wanted grades hold steady; and consumers know the true price.

A more fundamental criticism is that in copper, as in most post-war markets, the basis is narrow and therefore highly sensitive to marginal changes in supply or demand. In the three years 1936 to 1938 the turnover in copper on the London market amounted to an average of nearly 550,000 tons a year. Consumption of copper in Britain was then running at about 270,000 tons a year and world consumption at about 2 million tons a year. In the nine months since the market reopened, turnover has been running at a rate of 225,000 tons a year—half the prewar level—although consumption of copper in Britain has risen by one-fifth, and in the world as a whole by one-third.

The narrowness of the market is the result partly of changes that look permanent and partly of factors that should prove temporary. The United States has changed from a net exporter of copper into a net importer, so that much less American copper now flows to London. The long years of control and of inflation—copper is six times its prewar price—have eroded the resources of the market and particularly those of the smaller firms. It has also thinned the ranks of speculators, who are in any case officially discouraged from "excessive" dealing. Hence dealings tend to be concentrated among a handful of big firms, and the market lacks the breadth that the smaller dealers and the speculators helped to impart to it before the war.

Of temporary significance is the fact that the market reopened when a sharp fall in copper prices was widely anticipated. Consumers bought from hand-to-mouth and consumption was falling in this country, in America and elsewhere. The Government broker was standing behind the market so that consumers had no urgent need to brush up rusty techniques of forward covering. The filling of pipelines to private industry has also taken longer than was expected and kept supplies light. Moreover, producers now sell more of their output direct to consumers than before the war, though they do so at the market price, and consumers hold relatively smaller stocks than before the war. Whether these two tendencies will diminish in time is problematical. After years of control consumers become accustomed to working on small stocks, with their supplies allocated direct from government; they are not eager, and some may be unable, to hold prewar stocks at postwar prices.

Another reason for the modest turnover is that the new contract is not sufficiently attractive to consumers. It was necessarily an experiment, and the Metal Exchange was understandably anxious to attract metal to the market. It now finds itself charged with showing undue consideration to producers. Apart from the option to deliver one of several grades (the need for which is admitted), the seller also has the option of delivering ex-ship London, ex-quay Liverpool, or from a United Kingdom smelter or an approved warehouse. The uncertainty of the delivery point discourages buyers, and as producers wish to avoid, whenever possible, the cost of storage, this contributes to the shortage of warehouse warrants—the paper chips—that are the real basis of a free market. In the last nine months the market's official stocks have averaged less than 2,000 tons a week. The inconvertibility of sterling has perhaps been exaggerated as a restrictive influence on the market, for sterling is already convertible through the market in the sense that dollar metal can be bought for sterling by non-residents. Exchange control restrictions in Continental countries are more to blame. But full convertibility ought to encourage non-dollar sources of copper to offer more metal in London.

It would be optimistic to expect that turnover on the London market will soon approach, let alone exceed, the prewar volume; but some increase is almost certain, particularly if forward copper again commands a premium. The market has not provided a satisfactory selling hedge for holders of stocks because three months' metal has until recently been at the large discount of £10 a ton. The holder of an excess stock could only justify hedging if he believed that prices would fall sharply, and even then it would be an expensive form of cover. But to the manufacturer who sold his goods forward without first obtaining his raw material, the hedge was satisfactory. The purchase of forward copper at £230 against a sale of copper products based on a cash price of £240 left a prospective profit which outweighed the cost of exchanging the tendered metal for the exact grade required. British manufacturers seem to have been strangely reluctant to make full use of the forward contract, and their policy of buying hand-to-mouth at the spot price has helped to perpetuate the discount on forward copper. German industrialists, on the other hand, appear to have taken full advantage of the discount.

In recent weeks the discount has narrowed to about £3 a ton, reflecting greater confidence in the prospect for copper prices—and an increased willingness to buy forward—and the easing of spot supplies. In copper, as in the other metals, if forward prices were to command a premium, most of the market's problems should be solved. Hedge sellers and buyers could both cover against the risk of fluctuations in price; and provided that the premium offset the cost of storage and finance, it would assist merchants to hold adequate stocks. There is, however, a limit to a market's ability to hold stock, and at present prices this limit is likely to be lower than before the war.

Despite its problems, the verdict on this transitional period in copper trading is that the Metal Exchange has been largely successful in re-establishing itself, as it has with the other metals—tin, lead and zinc. It could not hope to have become in ten brief months as effective as before the war; but it is a workable market, and the only international market. It could be more active and more broadly based if producers and consumers strove to make it so. Such a market would best serve the real interests of both sides of the industry. And the Bank of England, which has done so much to promote the commodity markets, might perhaps reflect whether it is now possible to go one stage further and allow the much maligned but economically valuable speculator to show if he can again play his part.

Business Notes

Investors Think Again

GILT-EDGED markets have moved downwards though with several interruptions; there were, as always, good reasons: trouble in the Far East, and the unresolved tangle at Geneva. The difference is that when the glittering prize of a reduction in Bank rate was still dangled before investors, they were able to take troubles in their stride. Now they are more inclined to turn and look nervously back. Country investors who still have profits on gilt-edged bought before the Bank rate reduction sell. Institutional investors who still have ample funds to invest are not so eager that they cannot wait a few days.

Another significant change has developed in the fortnight since the Bank rate change—a distinct crowding of investment buying into the medium and fairly long-dated gilt-edged stocks at the expense of the dateless stocks. It has been on the dateless stocks, Consols 2½ per cent, War Loan 3½ per cent and "Daltons" that the falls have been proportionately heavy. Among the medium dates there has been little decline. This suggests that the big institutions, who make the running in the gilt-edged market, have taken the first steps towards putting up their guard. By no means does it imply that the "bull market" on the Stock Exchange is necessarily over, but it does suggest that some investors—probably some of the more influential—have begun to ponder that very question.

Stock	Net Prices			Percentage Rise or Fall on Week
	May 19	May 21	May 26	
Undated:				
Consols 2½%	67 1/16	66 25/32	65 7/8	−1·77
War 3½%	87 27/32	87 11/16	87 1/32	−0·93

Edith Comes Out

"EDITH," the Estate Duties Investment Trust, has had a large number of callers in its year as a débutante in the capital market. Edith was formed, under the auspices of the Industrial and Commercial Finance Corporation and with the backing of insurance companies and investment trusts, to take an interest in private companies when continuity of ownership and management was threatened by the swing of the death duties axe. In the year to March 31st, it received 135 applications and did business with 22 of them; about ten of these cases came through ICFC. It

The behaviour of the industrial share market has been more decisive than that of the gilt-edged section. There was a distinct pause, and some setbacks followed by quick recoveries. Investors have as yet shown no inclination to "sell in May and go away." Shares still react favourably and sharply to good figures as the spate of scrip issues in the past week has shown. Gradually during the first half of this week the *Financial Times* index of fixed interest securities lost a little ground, but it recovered on Thursday to reach 114.89 compared with the recent peak of 115.09 on Friday of last week. Thursday's recovery brought the index of industrial equities to 151.7, a new peak and a net rise of 1.3 in the week.

called up £500,000 of its authorised share capital of £1 million and invested £386,837 in unquoted securities and £42,942 in quoted stocks. Since the end of the financial year it has done business in another five cases, called up another £250,000 of its capital, and has brought its investment portfolio up to £558,925 with commitments to invest £233,172 more. The investments cover a diversity of trades, with the emphasis on textile and engineering concerns. Moreover, Edith has placed another £302,000 of its customers' shares with its own shareholders, taking itself only a part of the shares offered. In all, it has handled about £1 million—a spritely beginning for a company described by its chairman, Lord Piercy, as a "modest girl."

Edith is modest in a different sense; by its very nature it is interested only in minority shareholdings. Its limit is a 50 per cent holding in a customer's equity and it will consider holdings as small as 10 per cent. The average holding is about 20 per cent. Usually it has not invested more than about £65,000 in any one company and on one occasion it invested only £9,000. Where it has been asked to invest more than £65,000—once it dealt with a £200,000 offer—it has passed shares on to the institutions which are its own shareholders. These institutions have been more willing to invest in the unquoted securities of private companies because they know that Edith can keep a friendly, watchful eye on the business.

Although Edith has taken up a few participating preference shares, it has usually used the device of the non-voting preferred ordinary share, assuring itself of a reasonable yield on its investment while leaving control of the family business undisturbed; these shares are convertible into straightforward equities if the company seeks a stock exchange quotation. Most of the investments taken up by Edith have been in companies arranging to meet future death duty liabilities and not where the duty has already been assessed. But, as yet, Edith has not been able to arrange an investment in a "controlled" company, coming under the provisions of Section 55 of the 1940 Finance Act. Once, however, the present Finance Bill is passed it may be able to make such an investment, for its valuation of shares will be recognised as the estate duty value under the proposed amendment that the value to be applied can be that arrived at in a sale between a willing buyer and seller within three years of the death of the "controlling" shareholder. Thus, the concessions on death duties may add to, rather than subtract from, Edith's business.

Omo Detergens

No group of products has been more aggressively advertised since the war than the household washing powders, soap and synthetic detergents. Branded margarine may challenge them this summer in column-inches and in what advertising agents call "above the line" appropriations. But "below the line"—that is, in the realm of coupons and free packets and two packets for the price of one—the washing powders seem likely to remain unrivalled. In launching its latest detergent, "Omo," throughout the nation, Unilever proposes to begin by giving a free packet to every household in the country—which means about 15 million packets, and at retail prices might cost over a million pounds.

Omo is blue—though washing, one may be sure, as white as white—and may perhaps fairly be called a reply to the blue detergent powder Daz, made by Thomas Hedley Ltd., of Newcastle. This subsidiary of the Cincinnati firm Proctor and Gamble numbers Tide and Oxydol among its products; it is recorded as having spent about £1,150,000 on press advertising alone last year, and in the last quarter its household washing products accounted for some 45 per cent of all expenditure on the press advertising of such goods. Hedley's is generally credited with the largest share of the synthetic detergent field, and believed to outpace Unilever in this field as its parent company has outpaced Lever Brothers in the United States. It is a private company; but this year, for the first time, it made public its annual statement of accounts which reveals the rewards of this commercial prowess.

The statement showed an operating profit of £2,438,000 for the year ended June 30, 1953, which may be compared with figures of £385,000 for 1951-52 and of £1,704,000 for 1950-51. The sharply reduced figure for 1951-52 was partly due to abnormally high costs of raw materials; but it resulted mainly from "a deliberate decision to spend heavily on the company's development"—from which some benefits were reaped in 1952-53. The balance sheet does indeed suggest that Hedley's has been spending substantially on new plant; but the "development" mentioned above may include the very heavy costs of initial sales promotion to launch its new products on a mass market. One unexpected change of generalship in the detergent war occurred late last week: Mr Robert Craig Wood, managing director of Hedley's, who commanded it in its successful campaigns against Unilever, left the company, having declined the offer of "an equivalent post" in the parent company in Cincinnati.

Raw Cotton Agreement?

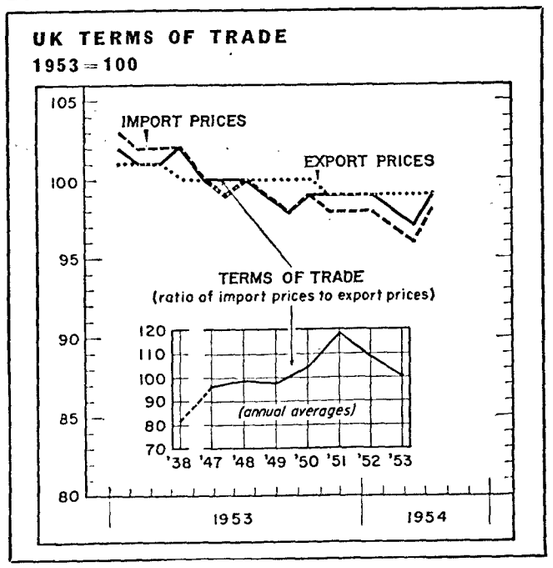
The International Cotton Advisory Committee will again take up the thorny subject of an international marketing agreement for raw cotton when it meets in Sao Paulo on June 7th. Last November, after examining the standing committee's report on various schemes, the ICAC decided that this was not the time to consider negotiating an agreement. But it appointed three independent experts to suggest what type of agreement would be technically the most practicable. It is understood that the expert's report, which will be before the meeting, favours a quota-cum-buffer stock scheme. Such an agreement would evidently become effective only when conditions of surplus or scarcity had moved prices outside an agreed range. When a surplus arose, exporting countries would be guaranteed a share of the available market; and when cotton became scarce, importing countries would be guaranteed a share of available supplies. The technical problems of this or any other type of agreement are formidable, partly because cotton is produced in many grades and qualities. But even if those problems could be solved, it remains doubtful whether an agreement would be in the best interests of producers and

cotton textile manufacturers. Stability can be bought at too high a price.

Raw cotton is in direct competition with other fibres. Under an agreement, prices would tend to be less responsive to this competition, and consumption might suffer. Restriction of production, which would be necessary if the buffer stocks were not to grow to alarming size, would tend to have the same effect—by discouraging the development of more efficient sources of supply—just as it can be argued that the American support operations have already diminished the competitive power of cotton. When the market price of United States cotton falls to the support level the surplus is absorbed into the government buffer stock. This checks the fall not only in prices of US cotton, but also of outside growths and long-staple cotton too. Admittedly the existence of this stock checks the rise in price when demand increases. The acreage controls placed on the 1954 cotton crop in America will restrict output in the new low-cost cotton growing states such as California, as well as in the high-cost states. It may therefore be just as well that a number of countries are opposed to a cotton agreement at present. The United States, for example, is hoping to expand, not restrict, its exports. Britain, having just returned to a free market in raw cotton, does not favour interference with that market. And the European cotton textile industries announced their opposition to an agreement at their conference at Buxton last week.

Money Rates Settling Down

Bill rates in Lombard Street now seem to be settling down at around the new level established immediately after the reduction of Bank rate, when the market's tender basis for Treasury bills was adjusted from a little under 2⅛ per cent to 1$\frac{23}{32}$ per cent. Ten days ago the market was developing a softer undertone, but the threatened weakening of rates did not materialise. At last week's Treasury bill offering the discount houses tendered at the same price as before and "outside" institutions—some of whom had previously paid more than was necessary—evidently came into line or abstained from tendering, with the result that the average rate of discount for the whole allotment rose slightly, from £1 14s. 1.75d. to £1 14s. 3.24d. per cent.



This steadying of the rate was directly attributable to a tightening of short loan supplies in the preceding few days, partly in consequence of the needs of "outside" lenders to find the funds to pay for the substantial volume of bills allotted to them on May 14th. On one occasion, as noted here last week, the pressure forced discount houses to seek marginal supplies for the balancing of their daily book by borrowing from the Bank of England at the "penal" terms—3 per cent for a week. Whether the authorities would have deliberately contrived this stringency if circumstances had not played into their hands cannot be surely guessed; but the steadying effects upon market rates must have been welcomed.

In this past week, the tender rate in New York for American Treasury bills has dropped further, to only 0.718 per cent—almost exactly 1 per cent below the London rate and its lowest point since July, 1947. Moreover, the cost of selling dollars forward in order to cover the exchange risk on a switch of funds to London has fallen further, so that the scope for arbitrage has widened. In the circumcumstances, it is perhaps significant that credit conditions in the short loan market in London have remained difficult, although not so difficult as to drive the discount market into the Bank again. Meanwhile, the renewed flurry of buying pressure on sterling—caused by a brief revival of rumours about the sterling rate—has subsided. The middle sterling-dollar rate, which had again come within a "turn" of the limit of $2.82, has slipped back to 2.81\frac{13}{16}$.

Coryton Refinery Completed

The Queen Mother sailed down the Thames on Thursday to open the Vacuum Oil Company's new refinery at Coryton, the fourth major refinery to be completed in this country since the war. Vacuum's flying horse has been fretting under starter's orders since branded petrols came back on to the British market fifteen months ago. Until the refinery was completed and the catalytic cracking unit came on stream, Vacuum has been importing high octane motor spirit for blending into premium petrols in order to keep the new trade-mark in the public eye. With the ending of these expedients, the flying horse takes his proper place beside the other fauna, flora and crustacea of the oil industry.

Although it has cost £15 million to build, and took three and a half years in the building, Coryton is only a medium-sized refinery; its capacity is roughly a million tons of crude oil a year, compared with the 6 million ton throughput of a giant like the Esso Petroleum Company's refinery at Fawley, the biggest in Europe. This is, perhaps, because it was originally planned as a refinery for producing lubricating oils. The Vacuum Oil Company has always specialised in lubricants, and indeed sold nothing else in this country until Coryton began to come on stream.

The company is of mixed Anglo-American parentage. It was originally the British subsidiary of the American Socony-Vacuum company; in 1950 this company went into partnership with Powell Duffryn Ltd., which already owned an oil storage business on the Coryton site, and the refinery project there was put in hand. Its main purpose was to provide a non-dollar source of lubricating feed-stock with proportionately less emphasis on other oil products. Only later was it decided to add a catalytic cracking unit to the refinery and go into the production and marketing of high octane premium petrols. There is plenty of room for expansion if Vacuum fights its way successfully into the national petrol market. But expansion will involve a lot of money. Since 1948 the capital investment in the company has risen from £2 million to £22 million—a good proportion contributed from Powell Duffryn's compensation for the coal-mines it used to own.

Chess Masters at EPU

DISCUSSIONS have begun in Paris this week on the terms for funding and repaying Britain's EPU debts to the creditor countries concerned. These are bilateral negotiations conducted simultaneously with Germany, the Netherlands, Switzerland and Belgium. The British negotiators are giving an exhibition recalling that of a chess master playing simultaneous games from board to board. There is here the difference, however, that although the games are bilateral, some attempt has to be made to mould the results into a similar pattern. The discussions concern one half of the £180 million overdraft that Britain had outstanding with EPU when agreement was reached in Paris to withdraw long outstanding credits and debits from the Union and settle them by direct arrangements between creditors and debtors. Of the £90 million to be funded, by far the greater part—over £40 million—is due to Germany. Britain has already agreed to make a downpayment in gold equal to one quarter of the amount to be funded, i.e., £22½ million. The balance of £67½ million will be repayable over a period of not less than three and not more than seven years. Discussions are still proceeding to fix the precise term of the repayment period. Another point at issue is whether or not any interest payment should be made on this funded debt. The British spokesmen asked for a waiver of interest on the ground that the greater part of this money is owing to Germany and that Germany has been excused all interest payment on the inter-governmental postwar debt owing to Britain, in accordance with the 1953 external debt settlement. This argument does not, however, apply to the amount owing by Britain to the other creditors; for this reason, it may be that a modest concession will have to be made.

Ships or Dividends

IT was almost a foregone conclusion that sooner or later the shareholders of Peninsular and Oriental Steam Navigation Company would ask for more and find themselves at variance with their chairman. Sir William Crawford Currie and his fellow directors run a dividend policy which commands the respect, but not necessarily the assent, of its victims. He believes that the historical cost type of depreciation is nonsense, and that any system which does not replace ship with ship, taking up the inflation of costs in its stride, has not done its work. At the same time, as he made clear at the meeting last Wednesday, his faith in the ultimate future of shipping is undimmed. Therefore he continues to build ships notwithstanding the present high costs and modest prospective earnings. He builds them largely with the shareholders' highly taxed funds, and the amount which the deferred shareholders receive, even with last year's 22 per cent dividend, is a small fraction of the Group's earnings.

But at Wednesday's meeting the dissenting shareholders showed that they, too, could produce strong arguments. The opposition claimed that the net assets of the group had been raised by this ultra-conservative policy to over £200 million (say £25 per deferred stock unit standing in the market at 76s. 3d.) and that shareholders were getting only a return of around 1 per cent on the true capital employed. Fortunately a serious breach was avoided through the chairman's wise gesture in agreeing to receive the dissentient shareholders, including, it is expected, Sir Harold Gillett, the accountant, though not as an official deputation.

Whether such a meeting can bridge the gap between Sir William's conservative principles and shareholders' more liberal hopes is an open question. But it can be argued that even now P and O's cautious chairman is not wholly true to his own tenets. He strives to set aside each year out of taxed and untaxed money enough to maintain the replacement value of the fleets. Since the war he has never quite succeeded; last year even if he had paid no deferred dividend he would not, on his own showing, have ploughed back enough. Yet he paid 22 per cent. Nil is the figure which on his own strictest logic he should have paid.

Implementing Monopoly Reports

THE Minister of Supply's statement in Parliament last week that if the Cable Makers' Association and the Covered Conductors' Association will promise to alter some of their trading practices by the end of this year "it will not be necessary to make an order under Section 10 of the Monopolies Act" suggests that discussions with the industry over nearly two years have so far been fruitless. This power to make orders prohibiting practices held to be restrictive has only been used once—in respect of dental goods—since the Monopolies Commission was set up. Naturally, it has been a potent weapon in reserve for any minister seeking to persuade an industry to abandon such practices voluntarily; but so far its power has generally been used in private.

The Monopolies Commission signed a report in April, 1952, declaring that conditions of monopoly existed in the supply of insulated electric wires and cables, and it was published in July of that year. The Ministry then opened discussions with the industry about the Commission's recommendations that a number of collective trading arrangements, including the fixing of common prices for cables and conductors, the division of the market by percentage quotas, and exclusive dealing arrangements with wholesalers and other buyers, should be brought to an end. The Ministry is now seeking "voluntary" acceptance of these recommendations, with two exceptions; one that might require the publication of prices negotiated with the British Electricity Authority, and a second concerning prices charged for telephone cable to buyers other than the General Post Office. So far, the two trade associations concerned have made no public statement.

There is one other industry with which the Government is now discussing action on a Monopolies Commission report—calico printing. The master calico printers expressed their attachment to their present price and quota system during the inquiry, and their bitter opposition to the Commission's criticism of these when its report was published. One of the trades unions concerned, which frigidly informed the Commission, through the medium of the TUC, that they had no evidence to give, has now echoed the employers. At its annual council meeting a fortnight ago, Mr Ernest Gardner, the union's president, criticised the recommendations that the pricing system should be ended; and he declared "We have no intention of quietly going back to the days of cut-throat competition." Mr. W. L. Heywood, general secretary of the union, later explained that this was the considered view of the union. He may have done so with some slight embarrassment. For Mr Heywood is himself a member of the Monopolies Commission, though he did not sign the report on calico printing.

"Pru" Down the Middle

THE insurance companies can be forgiven for a certain sensitivity to attacks on their investment policies. One band of critics argues that they do not provide as much risk capital for British industry as they could; another attacks them on the ground that their shareholdings give the insurance companies an undesirable measure of influence over the policy of industry. Last week, Mr E. J. W. Borrajo, the deputy chairman of the Prudential Assurance Company, devoted part of his address to answering these self-cancelling attacks.

After adding about £8 million last year to its holdings, the "Pru" has an equity portfolio of about £83 million, with an equity interest in nearly 1,100 British companies. But the average shareholding is less than 2½ per cent of the market capitalisation of each company. The average holding in the giants of industry, though it represents a large cash investment, is even smaller. In only 14 companies has the "Pru" an equity holding of more than 25 per cent and eight of these are investment and finance companies, which themselves have widely spread portfolios. Only two companies are controlled by the "Pru"; the first is the wholly owned subsidiary, Prudential Nominees Ltd., and the other is North Central Wagon and Finance Company, Ltd., in which the "Pru" has a 57.7 per cent interest, suggesting an interesting relationship between insurance money and hire purchase finance. The figures themselves answer the critics. Mr Borrajo could have added that the insurance companies are the most passive of shareholders, exercising their votes only in extremity to protect the class rights of the shares they hold.

Does the opposite criticism bear examination? Mr Borrajo thinks not; he points out:

> Our company is at all times ready and willing to play its part in providing finance for undertakings which are expanding on sound and progressive lines. Such investments properly selected are in the interests of our policyholders and at the same time advantageous to the national economy. It has been our experience that there have not been sufficient investments of this character available to absorb the funds at our disposal and this may well be an indication that too little is being done towards the re-equipment and modernisation of British industry.

As Stock Exchange people well know and as the statements made at the general meetings of the Sun Insurance Office and Provincial Insurance Company confirm, the funds for investment are still flowing strongly into the insurance offices, and out again into the security markets. Most of the offices would share Mr Borrajo's pleasure if there were an increase in the supply of high-class equities; it is certainly not their fault that their existing scale of buying is draining the market dry.

Argentinians to Think Again?

THE official communique issued at the end of the London discussions between British and Argentine ministers was more revealing in its omissions than in its content. Between its lines it was easy to see that the "educative" purposes of these talks were not wholly achieved. The main intent had been to explain to the Argentine ministers "the change to multilateral policies which the United Kingdom had made in the past few years." The explanations were fully given, and it is stated that there was "full appreciation on both sides." But how little the real implications of the lesson went home can be deduced from the statement that British exports to Argentina "should be assured of a continuing market on equal terms with those of other countries, in so far as Argentine sterling earnings permit." Argentina's continued hankering after bilateralism, and failure to comprehend the precepts of multilateralism, could not be more clearly implied. The Argentine ministers can, however, now be in no doubt about the setting in which they must frame their 1954-55 programme of exports to the United Kingdom. Their meat, cereals, linseed oil and other traditional produce will find a ready market here provided they are of the right quality and the right price—provided, in other words, they can be sold in free markets in which the buyers will be swayed by no considerations, economic or political, extraneous to the bargain on hand.

Both sides expressed the desire "to raise trade to the highest level possible and to frame any future agreement on this basis." The details of that agreement will be considered in the near future, when the Argentine officials who accompanied the two ministers return from the visit to Germany on which they embarked after leaving London. The mood in which they return may depend on the response they have received in Bonn to the bilateral invitations they will certainly have made to German ministers and officials. The communique issued after the London talks made no reference to the payments arrangements that will apply to

Argentine-sterling trade after June 30th. Argentina is now in the list of transferable account countries, but it has the special privilege that any sterling it may accumulate over and above £20 million is convertible into gold or dollars. There is no reason why that privilege should be continued. Argentina's sterling balances are in any case well below this ceiling. The talks in London also included discussions on the possibility of the resumption of financial remittances from Argentina. The fact that no comment on these discussions is made in the communiqué suggests that the strong representations that must have been made by the British representatives have so far fallen on deaf ears.

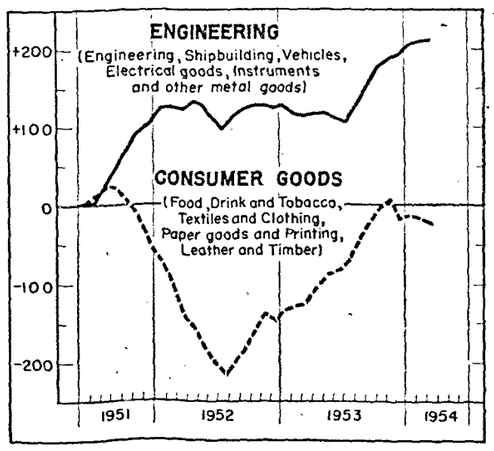
New Peaks in Cocoa

THIS month the price of cocoa has bounded to fresh peaks with what must seem to manufacturers a painful and monotonous regularity. The latest peak in London has not been held, but the present price of about 535s. a cwt for Accra cocoa for nearby shipment is still 50s. higher than at the beginning of the month. July futures are 57s. higher at about 532s. a cwt, and December futures are 45s. higher at about 467s. Prices have almost doubled since the season began on October 1st. The earlier advance in prices has clearly failed to discount the world shortage of cocoa. The period of acute shortage has now arrived. The marketing boards in British West Africa, the source of about one-third of the world's cocoa, sold their last supplies from the 1953/54 main crops this month, and only about 10,000 tons of the mid crops will be available until supplies from the 1954/54 main crops begin to arrive in London in December. The first estimates of the new West African crop will not be known until September, and after their experience this season, private dealers are understandably reluctant to sell these crops forward. The intermediate crop in Brazil, the second largest producing country, should be well above average at about 1.2 million bags (of 60 kilos), but this may provide little, if any, check to prices. The prospects for this crop have been known for some time, and the bulk of it is already sold forward.

World production in the 1953/54 crop year is estimated by Gill and Duffus to have fallen by 60,000 tons to 720,000 tons, whereas world consumption of cocoa beans in 1953 is estimated at the record figure of some 810,000 tons. Although some savings have been made, particularly in America, by increasing the use of substitutes and economising in chocolate coatings, world consumption is still high, and stocks have been reduced to minimum levels. Failing a substantial increase in the main West African and Brazilian crops, consumption will have to be checked by higher prices of cocoa products. Prices of products are still well below replacement costs of raw cocoa, and the use of substitutes, at least in the short term, is limited. The price at which supply and demand will be equated is conjectural, but it may prove to be somewhat less than 500s. a cwt. Although an increase in plantings in British West Africa cannot relieve the existing shortage, it is to be hoped that the governments will pay the farmers more for their crops next season. This would at least help to expand future production, and might help to moderate the search for substitutes. There is now a clear danger that the prospective long-term growth in world demand may be halted.

CHANGES IN EMPLOYMENT in GREAT BRITAIN

INCREASES OR DECREASES SINCE JUNE 1951 [THOUSANDS]



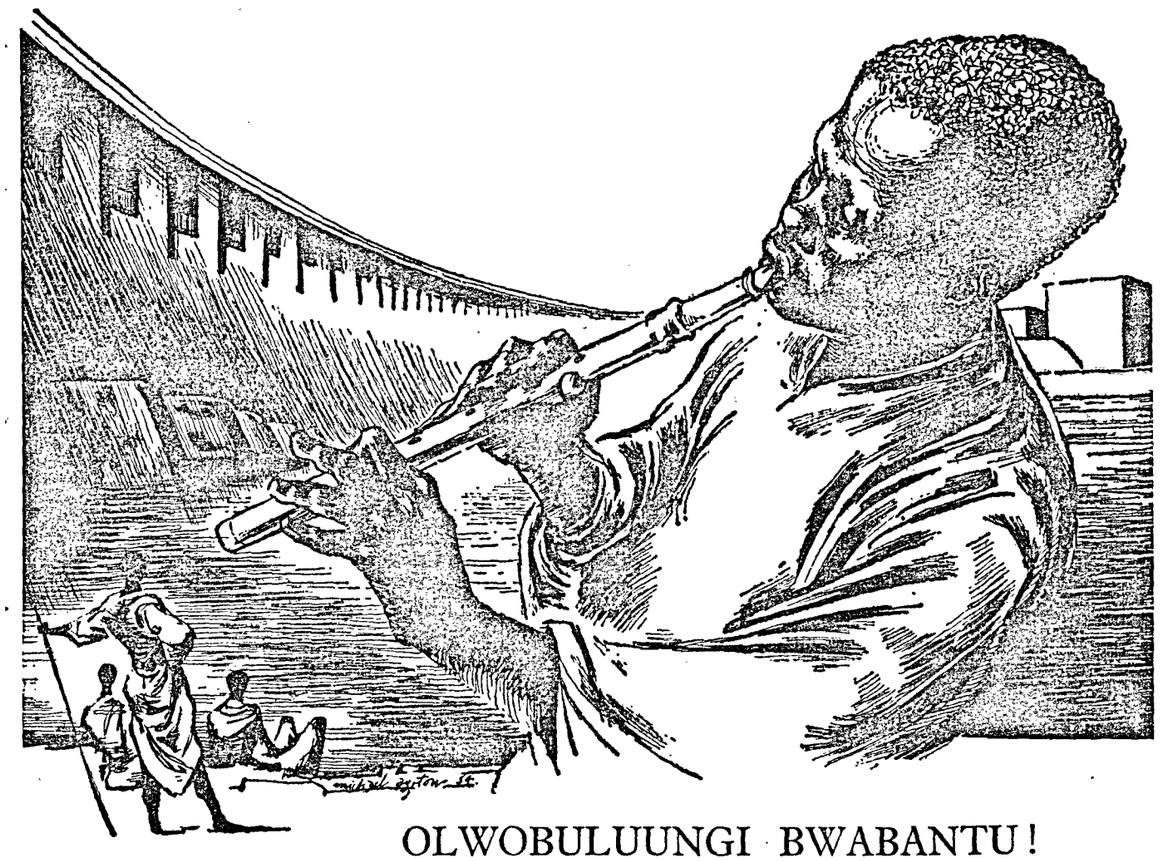
Butyl Rubber from Fawley?

THIS week the Esso Petroleum Company was still unwilling to confirm a report that it intends to make butyl synthetic rubber at its Fawley refinery ; such a project, it said coyly, was "a serious possibility," but no decision had yet been taken. Esso, the American parent group, might produce this general-purpose synthetic rubber at Fawley, in France, or in Germany ; it has just opened a new refinery at Hamburg. Fawley is certainly the most significant source of butylene in this country for this synthetic rubber, but there are other profitable uses for this petroleum gas, including aviation spirit.

There are, moreover, politics in the decision. The rubber industry would be glad to have a British source of general-purpose synthetic rubber, as well as the more specialised types that are to be produced by ICI, Monsanto, and Dunlop, but the Colonial Office, looking to the interests of the natural rubber producers, is strongly opposed. Elsewhere in Europe, particularly in France, there is no such division of government interests ; indeed, the group might secure specific government assistance for production of butyl rubber there.

Hudson's Bay and Oil

THE Governor and Company of Adventurers of England Trading into Hudson's Bay may be the oldest English company, but it is growing alongside the Canadian economy, which is vigorous and young. Therefore, it shows a youth-



OLWOBULUUNGI BWABANTU!

FOR OVER FOUR YEARS Mukasa has watched the great dam being built at Owen Falls, to make more electricity for Uganda.

Mukasa has seen much good come from electric power.

In this new hydro-electric scheme he sees a brighter future for his people. "Electricity," says Mukasa, is *olwobuluungi bwabantu*—"for the benefit of Man".

Her Majesty the Queen, homeward bound on her world tour, recently opened the Owen Falls dam. The six 16,770-kVA waterwheel alternators, which make the electricity, are being supplied by one of the nine famous British companies that together make up A.E.I.

A.E.I. (Associated Electrical Industries) make everything electrical from a turbine to a torch bulb.

AEI

for everything electrical

Associated Electrical Industries are a family of companies:

The British Thomson-Houston Co. Ltd.
Metropolitan-Vickers Electrical Co. Ltd.
The Edison Swan Electric Co. Ltd.
Ferguson Pailin Ltd.
The Hotpoint Electric Appliance Co. Ltd.

What's your line on STEEL

CATHODE RAY TUBES in many of the latest television receivers are made with walls of steel. Very special steel. To this steel the glass screen on which the TV picture appears can actually be joined in perfect fusion.

And the advantages of these steel-welded tubes? They are easier to produce and therefore cheaper. They are stronger, safer to use, lighter in weight and easier to handle. All thanks to steel.

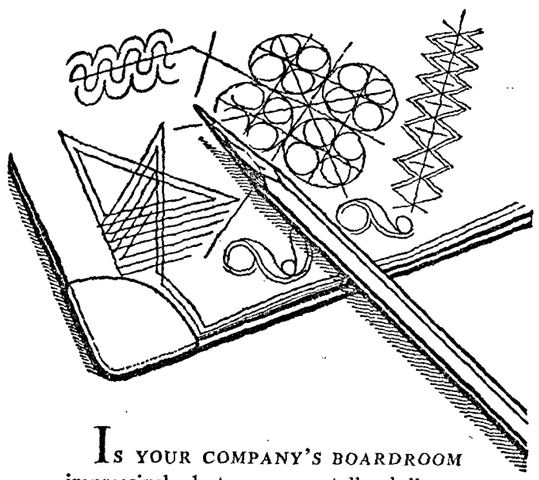
Many special steels have been developed in recent years. Steel is now not only the toughest and cheapest of metals; continuous research has made it one of the most versatile.

In six years since 1947 production of alloy and high speed steels has risen from 623,000 tons to 1,066,000 tons; an increase of over 70%.

STEEL is at your service

THE BRITISH IRON AND STEEL FEDERATION S.73

Are you bored in the boardroom?



IS YOUR COMPANY'S BOARDROOM impressively but monumentally dull—a room still sacred to the memory of an august founder? Or is it a pleasant place in which to meet—a background for clear thinking, and brisk discussion?

This surely is what it should be—a room which reflects the Company's present day character and outlook.

Our design studio has many such boardrooms to its credit, as well as furnishing schemes for whole office blocks, hotels and ships. But you will find us just as helpful if you are looking for a desk to suit an executive.

If you would like to see what we can do, tell your secretary to write for our new booklet, *Furniture for Special Needs*—better still, visit our new Contracts Showroom and look round for yourself.

HEAL'S CONTRACTS LTD

TELEPHONE MUSEUM 1666

ful resilience tinged with good fortune. At the annual meeting last Friday, the Governor, Mr W. J. Keswick, announced that one of the two wells being drilled south of Sturgeon Lake, 250 miles north-west of Edmonton, has just struck 35 per cent gravity oil. The well is in a Crown reservation of 100,000 acres, in which Hudson's Bay Oil and Gas Company has a one-third interest. It lies three and a half miles from the original Amerdad find, and in Mr Keswick's view may eventually prove an important addition to the assets of Hudson's Bay Oil and Gas Company. Speculators must hold their breath, for the results of the second of these two wells is due within a week or two.

This is the latest addition to the Hudson's Bay Company's important interests in Canada's oil and natural gas resources. Hudson's Bay Oil and Gas Company holds rights over 11,350,000 acres including 4,460,000 acres of Hudson's Bay company lands. It has an output at this stage of no more than 5,000 barrels a day though it has invested $\$11\frac{3}{4}$ million. Hudson's Bay itself has a one-quarter interest in the oil and gas company—an investment of £$1\frac{1}{4}$ million, the senior partner being Continental Oil Company of Delaware. Rightly Mr Keswick warns Hudson's Bay shareholders that these interests in Canadian oil will mature only gradually and that in the meantime expenditure on oil continues to exceed oil income in the ratio of two to one. But he reaffirms his faith in ultimate success.

Were it not for oil and natural gas Hudson's Bay shareholders might feel that their immediate prospects, though sound, were more than fully discounted. Some Canadian shareholders last year evidently took that view. The proportion of Canadian held shares fell from 17 per cent to 11.31 per cent while the British resident proportion rose from 67 to 75.54. Mr Keswick's statement puts a premium on oil prospects again and the rise of over 7s. to 123s. this week leaves the yield on the £1 ordinary shares around 2.8 per cent.

Tax Gatherer and the Public

AT an appropriate moment, while the Finance Bill is under discussion, the Institute of Directors has scored a tactical victory over the tax collecting machine. An excessively zealous questionnaire into directors' expenses has brought an expression of regret from the Financial Secretary to the Treasury. The questionnaire, ranging over the field of directors' expenses, travel, and firms' cars, included this question: "(12) Entertainment: (a) Type of people entertained, (b) Nature of entertainment, (c) Reason for entertainment." Despite the obvious chagrin of Mr Emrys Hughes and Mr Douglas Jay, the disappearance of this type of inquisition will be widely welcomed by many who have no sympathy for tax evasion.

The retail distributors, too, have criticisms, one against the Finance Bill and the other against the local authorities. There will be much sympathy with their feeling that the Estate Duty concession which reduces the duties on industrial premises, as on agricultural land, by 45 per cent should be extended to retail premises. As at present drafted the concession applies to department stores only in respect of machinery and plant, which may well mean only on the lift installation and the boiler. Retailers reluctantly admit that they expect stores to be deprived of the investment allowances since that allowance is designed to stimulate industrial investment and exports. They see no reason why the limitation should be extended to the estate duty provisions, designed to prevent breaking of family owned businesses, for family businesses still flourish in the retail trades. A series of amendments has been tabled by a group of Conservative members led by Mr Ralph Assheton seeking to sweep away the restriction in the broadest terms. They wish to strike out the word industrial and to include premises "owned or let for the purpose of selling the products of the business."

The Retail Distributors' Association is also at grips with the local tax collectors in Liverpool and Sheffield. Although the Local Government Act of 1948 transferred the job of rating valuation from the local authorities to the Department of Inland Revenue two local authorities have decided to proceed with comprehensive revaluations. Liverpool was part way through its revaluation when the 1948 Act came into force. It decided to complete the job in the centre of the City and as a result brought into effect new and substantially higher assessments in the business area of the City. Stores there had to face increased assessments which under the 1948 Act would have come into force in 1956 at earliest. The Courts upheld Liverpool and now Sheffield has followed suit with a revaluation in the centre of its City limited to shops, offices and banks. Rates are levied on the increased assessments as from April, 1953, which would not have taken effect until 1956. The Minister of Housing and Local Government (Mr Macmillan) in reply to a question has said that he deprecated any such action on the part of the local authorities in advance of revaluation, but that he had no powers except to advise.

Award for Thomas W. Ward

THE first British "Oscar" for a company report, represented by a pair of silver wall sconces, has been given to Thomas W. Ward. Six months ago *The Accountant* decided to make one or more awards a year to public companies "in relation to the form and contents of their report and accounts." After nearly 500 reports had been sifted the panel of judges, headed by Mr Montagu Gedge, QC, decided to give the award to Thomas W. Ward for its report for the year to June 30, 1953.

The judges, though they set store by the full disclosure of information, have not disclosed the detailed standards that they themselves applied. But they must have had two tests in mind: how well the intricate accounting details required by the 1948 Act were displayed for the benefit of the expert, and how smoothly the report succeeded in giving the innocent shareholder a clear and fair picture of the company's activities. These are subjective tests and judgments made by reference to them would not invariably agree. Thomas W. Ward has attained a remarkably high standard; it has backed up a tidy set of balance sheet and profit and loss accounts with statistical tables including more information than the law requires. Its industrial activities were fully covered in a lengthy statement by the chairman, issued with the accounts. It published turnover figures; it drew

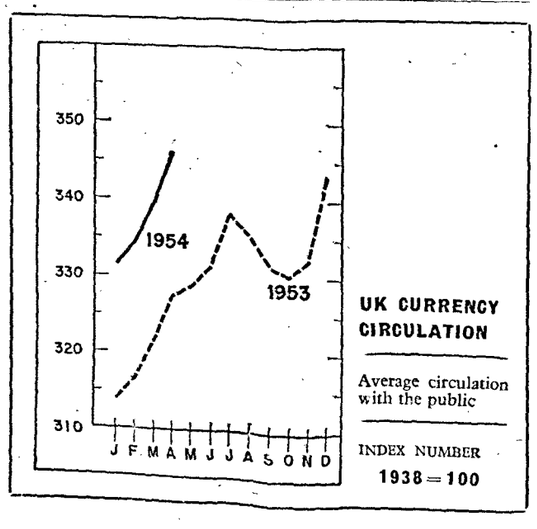
attention to important accounting ratios in its statistical summaries ; and it issued a gross trading account, showing the breakdown of the parent company's sales.

Such practices are now increasingly common in the better British company accounts and the judges cannot have had an easy decision. One of the factors that may have tilted the balance is that Thomas W. Ward, with a business which covers far more than shipbreaking and embraces a host of subsidiary companies both at home and overseas, had a difficult task in licking the multitude of accounting digits into shape. Its shareholders have been treated with the courtesy and candour which is their due as owners of the business. Congratulations are due to *The Accountant* for initiating a competition which helps to strengthen the links between companies and their owners and to Thomas W. Ward for showing how well this can be done.

Ford's Farming System

THE Ford Motor Company has opened a new farm mechanisation training centre at Boreham in Essex, as part of a wider scheme to build up a "Ford farming system" in competition to the rival "Ferguson system." There is a growing tendency to design a range of implements to suit a specific tractor, which may create difficulties for the farmer who does not want to standardise on one range but usually ensures that the purchase of a manufacturer's tractor will sooner or later be followed by the purchase of associated implements. The boldest experiment of this kind has been built round the light Ferguson tractor, where the implements designed for the Ferguson tractor and no other have been sold to farmers as the "Ferguson system." Ford, selling a medium tractor, has throughout kept one eye on the farmer who buys machinery piecemeal and expects his tractor to pull the lot; although the company also makes basic machinery like ploughs and cultivators, it has been careful not to overstress the dependence of Ford tractors on Ford implements. The implement manufacturers who have designed machinery to suit the Fordson tractors have likewise been anxious to avoid the impression that their equipment would work on no other.

The training centre provides one way in which the company can develop the idea of a Ford system of farm mechanisation without overstressing the interdependence of the tractors and their approved range of implements. The Boreham centre will take 20 students at a time, and instruct them in the rudiments of mechanised farming—based on Ford tractors and Ford approved implements. The effects of the indoctrination will be most valuable when the students come from overseas. Ferguson already run a centre of this kind, and Ford has also given training, although on a less elaborate scale than will now be possible. Farm machinery has become a major business, with British farmers alone spending £300 million a year on tractors and implements. Ford, producing more than 200 tractors a day, has a strong stake in the market, and in spite of the difference in power, the Fordson's most serious rival remains the Ferguson tractor, being turned out at the rate of 250 a day.



The Value of Weight

A METAL that is roughly one and a half times as heavy as the same quantity of lead would not at first sight be expected to find its main applications within the aircraft industry. But the "Heavy Alloy" of which the General Electric Company has just begun full scale production at Wembley is used extensively in aircraft primarily because of this property. It goes into the "mass balances" contained within the control surfaces that make possible quick response to the controls of the aircraft, into certain instruments, and into the braking systems of the undercarriage—all points at which the maximum density is required to fit weight into limited physical dimensions.

The "heavy alloy" is largely composed of tungsten, and its specific gravity is not far below gold and platinum, and far greater than that of lead. It was first developed in the GEC research laboratories as a protective material superior to lead in absorbing the gamma radiation emitted by radium or radio-active cobalt in medical use. It is used, for example, in heavy "collars" for treating cancer of the larynx. The value of its great mass for small size brought it into the field of instrumentation, aircraft control, and other applications where balance is of surpassing importance, such as high speed photography. It is produced by sintering a mixture of tungsten, nickel, and other powders at white heat, a process that reduces its volume by nearly a fifth, and raises its specific gravity from about that of lead to half as much again. The company is developing a new series of alloys that have even higher densities without any loss in tensile strength.

69 Crystal Balls

THE professional economists who are annually invited by the Royal Statistical Society to record their forecasts of economic trends were this year given until after the budget to reply, and asked if they cared to go into rather more detail. Of the 108 economists in the academic and

Can YOU make the grade with her?

Why? Because she is one of the millions of young people who are looking ahead, forming brand habits and deciding on the things to buy now and in the years to come. Although she is discerning, she is open to persuasion and if your advertisements make the grade with her now you are sowing the seeds of your future prosperity.

By approaching the problems of our time so realistically and presenting the news in a vital, up-to-the-minute style, the Daily Mirror appeals outstandingly to the vigorous, "keen to get on" younger generation. With the biggest daily sale on earth (it exceeds 4,600,000) it offers you the most powerful mass market coverage in the history of daily newspapers at the lowest square inch per thousand rate of all national dailies. business world who were circularised, 69 completed forecasts of the course of industrial output, exports, unemployment, consumers' expenditure, and retail prices, as in earlier years; and 28 of them also essayed a forecast of the "Changes in Real Demand and Supplies" estimates that appear each year in the Economic Survey, which necessitated guessing how the additional resources available in the economy will be used.

These detailed forecasts are perhaps the only ones that might have been affected significantly by Mr Butler's "no-change" budget, with its attempted stimulus to investment. In the opinion of these 28 economists, it may be worth noting, only about 30 per cent of the additional resources they believe should be available will go into fixed investment this year; in real terms, about three-quarters as much as went into investment from the extra resources available in 1953. Of the 41 economists who chanced their arms upon the development of the terms of trade this year, 20 thought there would be little change from the level of the last quarter of 1953; six believed that the terms would continue to move in Britain's favour, and 15 that they would move against Britain. On last year's guesses, incidentally, the economic forecasters as a group were fairly near the mark on exports, unemployment, and retail prices; they were too pessimistic by half on industrial production, and guessing before the last year's budget, they markedly underestimated the rise in personal consumption.

	Actual 1953	Forecasts for 1954	
		Average	Range
Index of industrial production...	120·0	124·0	118—132
Index of volume of exports.....	98·1	99·4	95—104
Unemployment as percentage of number of insured employees..	1·6	1·6	1·3—2·0
Personal expenditure on consumers' goods and services (percentage change over previous year)	+3·9*	+2·5	−2·0—+9·0
Interim index of retail prices.....	140·0	142·1	138—145

* This is the change in personal expenditure on consumers' goods in 1953 compared with 1952 (at 1948 prices).

Banging the Savings Drum

THE National Savings Movement is to revive the device of the annual savings campaign—complete with drummed and beflagged processions, civic receptions, competitive local targets and "weeks." At the National Savings Assembly at Llandudno last week Lord Mackintosh passed the word down to the battalions of organisers and savings workers to get busy for the great occasion and to use all their ingenuity to make a big splash. The public campaign, timed for October to March next, will be opened by the Duke of Edinburgh at a Rally of the Movement in the Festival Hall. Its target will not be expressed in volume of savings but in number of savers, and the aim will be to recruit 2 million "new savers"—people who secure a new holder's card for certificates, buy defence bonds for the first time, or open a new savings deposit account.

At first glance, this return to the noisy propaganda methods of the past may seem a little surprising, for the Savings Movement, like other repositories of personal savings, has been looking a good deal healthier lately. National savings showed a net credit of £24 million in 1953-54, whereas in 1952-53 they had been in net debit to the extent of £27 million; and in the first seven weeks of the current fiscal year they also improved upon the previous year's performance. Lord Mackintosh attributes this change of trend primarily to the "renewed stability of the pound"—that is, the relative stability of prices during the past year—to the fact that the wartime arrears of consumer demand have now been overtaken, and to the waning of the disturbance caused by the tax probe into savings accounts.

The conditions for personal saving last year were certainly the most propitious since the war, but it cannot be assumed that they will not deteriorate. Any reversal of the recent strongly favourable trend of the terms of trade would endanger the stability of domestic prices and the margin for saving that wage-earners seem to have found last year (when wages rose faster than prices). The National Savings Movement shows good psychological judgment in seizing this moment for a new drive, especially as the improvement has given new zest to its workers. But it is to be hoped that the campaign will not rest too much on the target-seeking frenzy of earlier years. Big sums of "savings" collected in a few campaign weeks are of no real value if the ensuing weeks are lean ones. It is the genuine habit of saving that matters. It is well, therefore, that the emphasis is to be on new savers rather than new money.

Plant for Russia

DURING the six months to May 15th, British exporters applied for licences to sell more than £32 million worth of machine tools, electrical equipment and metals to Russia and China; nearly £4 million were allowed, though this total covered certain goods for which licences are not required. This announcement, in a written Parliamentary answer last week, was not particularly informative. It did not show the value of applications separately for Russia and China—which many businessmen, and the existing strategic controls, approach differently. At face value, too, it may over-emphasise the contrast between the licences applied for and the number granted. Both the time taken to handle applications and the possibility that some exporters may apply in respect of goods for which they do not hold entirely firm orders may also blur this comparison.

With the review now going on in Paris of the existing strategic controls on exports to countries behind the Iron Curtain, and the hints that some relaxations on specific products such as machine tools may be made in advance of the general review, industrialists are understandably anxious not to miss the large orders that can be obtained, comparatively simply if not easily, from Russia and the satellites. A state purchasing organisation, after a week's discussions, may produce a bulk order of a size that would take many separate negotiations with private buyers. A group of British textile machinery companies last week announced orders for machinery worth £7 million for delivery over two years, and

various machine-tools companies have secured orders that will take a significant proportion of their output if they pass the controls. An order for three fish factory ships worth £4 million, however, has been turned down by the control authorities here; these vessels, the Admiralty held, could be converted into submarine depot ships.

SHORTER NOTES

The use of closed circuit television, which enables the top officials in the central office of a corporation to address their local staffs privately, is rapidly replacing the old business gatherings and conventions that have played so large a part in the social life and expense accounts of American businessmen. The prospects are that there will be fewer business conferences involving the time and expense of salesmen and dealers travelling great distances to a central meeting place, and more reliance upon the newer, and cheaper, method of holding conferences by means of private television transmissions; already more meetings of this sort were held this year than in all of 1953. The company using the private TV circuit for sales talks gains by the assurance of secrecy from snooping competitors; the local salesman loses by the elimination of the travel expense account.

★

Turner and Newall, the asbestos manufacturers, has declared an interim dividend of 5 per cent on an ordinary capital of £10,944,718; a year ago the interim divide was 2½ per cent and it was followed by a final dividend o. 15 per cent. The interim payment is being increased "so as to represent a higher proportion of the annual distribution to ordinary holders" and it does not imply that the full year's payments will be any higher than those made in 1952-53. The directors add that the volume of business handled by the overseas subsidiaries continues to contract and this contraction has been only partly offset by improved trading conditions at home.

Company Notes

ROLLS-ROYCE. The £1 ordinary stock units of Rolls-Royce were moving up long before the preliminary announcement was issued; after its publication they jumped ahead by 4s. 6d. to 85s.—a fitting response to unexpectedly good results. The ordinary dividend has been raised from 15 to 17½ per cent, confounding the pessimists who thought that the company would do no more than maintain the 15 per cent rate for a full year on the capital as increased in 1952 by a "rights" issue. The directors have also decided upon a 50 per cent scrip issue of shares,

	Years to Dec. 31, 1952	1953

Added to undistributed profits	189,783	230,771

£1 ordinary stock at 85s. yields £4 2s. per cent.

which in these days is usually interpreted as a hint of more liberal distributions.

Behind the dividend lies a remarkable advance in trading profits—from £1,925,295 to £3,099,869, which must spring largely from the company's aero engine division. Moreover, the announcement that the board is contemplating the issue of more capital in the shape of a debenture stock suggests that the end of the present expansionist phase is not yet in sight from the windows of the boardroom. And, even if trading profits remain throughout this year at their 1953 level, equity shareholders will receive considerable benefits from the demise of EPL. That tax took £660,000, compared with £250,000, from profits last year. Investors have not been slow in discounting these factors; at the current price of 85s. the £1 ordinary stock units offer a yield of 4½ per cent.

★

J. & P. COATS and LANCASHIRE COTTON. Has J. & P. Coats, the cotton thread manufacturers, finally broken with its tradition of financial conservatism? As briefly reported in *The Economist* last week the company has announced an ordinary dividend of 15 per cent, compared with 12½ per cent paid regularly since 1946. The company is also to capitalise £14,750,000 from reserves to make a 100 per cent free scrip issue of ordinary shares. The net gain of 3s. 3d. to 61s. 9d. in the price of the £1 ordinary stock units suggests that the balance of opinion was that a change of heart had taken place in the boardroom. That point, however, should not be given excessive weight, for the stock market these days welcomes almost indiscriminately every scrip bonus by marking up the shares. On the same day, for instance, the ordinary shares of Lancashire Cotton put on 2s. 9d. to 59s. 3d. when the company announced a 100 per cent scrip issue. Investors chose to ignore the directors' warning that this proposal carried with it no implication as to future rates of dividend—in 1952-53 the rate was 20 per cent, including a 5 per cent Coronation bonus dividend—and that dividends "will continue to be decided in the light of circumstances prevailing at the time."

Investors did not ponder long over the implications of the two scrip issues, but they must have been a little perplexed by some of the details of the preliminary statement issued by J. & P. Coats. This statement shows that profits in 1953 totalled £4½ million, after charging a loss on exchange of £4.2 million; in the previous year profits were returned at £4.6 million, after nearly £5.7 million had been written off stocks. The previous year's stock loss was due to Egyptian cotton; the 1953 exchange loss arose in the South American subsidiaries and was foshadowed by the chairman a year ag. The rise in the charge for foreign taxation from £687,195 to £2,173,584 is quite unexpected and so far unexplained. The provision for British taxes has risen much more gently, from £842,769 to £1,746,652. Shareholders will have to wait for the full report for the explanation. No Oscar for immaculate accounting is yet due to the taciturn Scots who manage J. & P. Coats. The yield of 4.9 per cent, as offered currently by the J. & P. Coats equity, seems to carry the implication that shareholders expect a genuine change from the ultra conservative policies of the past.

★

HOUSE OF FRASER. The preliminary statement of the House of Fraser, the Scottish group of drapery stores which jostled vigorously forward last year when it bought out Binns of Sunderland and Newcastle, is a confusing document. The directors propose that £564,464 should be capitalised from reserves to make a 100 per cent free scrip issue of 5s. ordinary shares. These shares rank for the final dividend of 30 per cent declared for the year to January 31st last. In October an interim dividend of 20 per cent was paid on a capital of £564,464 and in 1952-53 the full year's dividend was 80 per cent on a capital of £268,793. In effect, the ordinary dividend has thus been raised from 19 to 40 per cent on the basis of an equity capital of £1,128,928. The maze of share bonuses is completed by the announcement that a further scrip issue, on the basis of one new share for every 50 shares then held, will be made in October; these shares do not rank for the latest dividend. Investors, however, can safely ignore this tiny issue in making their yield calculations.

The 5s. ordinary stock units of the House of Fraser have been well in the fore of the boom in department store equities and with an active speculative stock such as this it was not surprising that the sudden increase in the dividend led to a rise of only 3s. This gain was almost completely lost in the next day of dealing when the stock units were quoted at 80s. 6d., offering a yield of 4.8 per cent, which is low enough for a group whose rise has been meteoric and may go ther, but whose staying power has still be tested.

The profit figures are almost as confusing as the dividend and share bonus details. The "trading profit of constituent stores for the year ended January 31, 1954" totalled £1,554,061, compared with a profit of £960,114 in 1952-53. This phrase seems to be a not very explicit way of saying that profits in 1953-54 included those earned by Binns Ltd., while those in 1952-53 did not. There is, in fact, no yardstick to measure how far profits have actually risen. But after deducting pre-acquisition profits of £181,206 and other expenses, the group's gross profit was £1,226,775, compared with £605,209. Taxation has risen from £335,112 to £703,012, leaving a net profit "attributable to members" of £477,649, compared with £260,153. It is to be hoped that e full report will show the figures, both with and without the Binns earnings.

★

EVER READY. Yet another company to follow the fashion of increasing the ordinary dividend and announcing at the same time a scrip issue is Ever Ready. Years of inflation have created disparities between issued ordinary capital and the capital actually employed. The company's issued ordinary capital is £1,010,402, while its revenue reserves total £1,779,384. From these reserves the directors propose to capitalise £505,201 to make a 50 per cent free scrip issue. At the same time the ordinary dividend has been raised from 35 to 40 per cent, thus restoring the cut made in 1950. A further proprosal turning the 7 per cent cumulative participating preference stock units into 10 per cent cumulative non-participating preference stock units hardly affects the rights of the equity shareholder. There is only £200,000 of the preference capital in issue, and for years the preference stock has received an additional 3 per cent dividend, representing their maximum participating right.

	Years to Feb. 28, 1953	1954

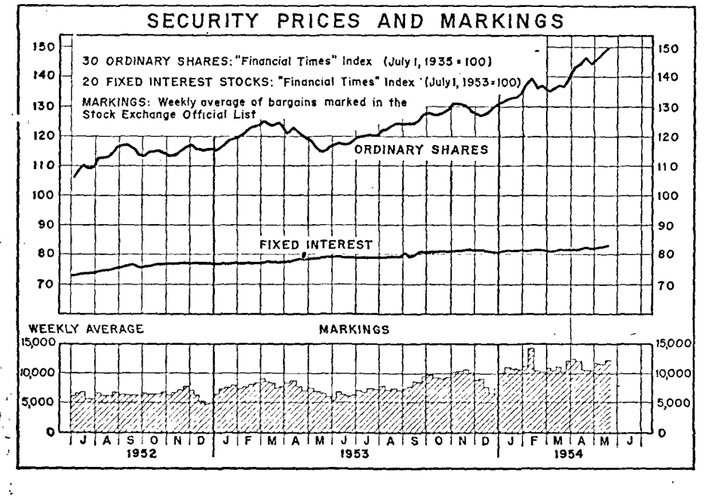
Reserves	1,619,866	1,779,384
Ordinary capital	1,010,402	1,010,402

5s. ordinary stock at 35s. yields £5 14s. per cent.

Two facts seem to lie behind the decision to raise the dividend. First, the group's liquid resources have been reinforced, following a reduction in stocks and debtors. Secondly, trading profits have risen from £940,742 to £1,181,866. The increase both in sales and profits owes much to last year's reduction in the selling prices of batteries; the chairman believes that sales will be well maintained this year. He gives shareholders the customary warning that a scrip issue does not necessarily imply an increase in dividends, but there is a source from which dividends could be increased if the directors are so minded. Last year the group had to provide £142,000, over a quarter of the net profit of £406,807, for EPL.



LONDON STOCK EXCHANGE

Next Account begins: June 9th.
Next Contango Day: June 9th.
Next Settlement Day: June 15th.

THE main feature of the markets this week was the decline in gilt-edged prices after the week-end. The heaviest losses were made by the undated stocks, with old Consols losing ⅞ on Monday and another ½ of a point on Tuesday; proportionately, the medium and longer dated issues did not fall so heavily. Gilt-edged prices, however, began to edge up again later in the week, but the gains which were reported were quite slight. The weakness in the gilt-edged market unsettled industrial equities, but these stocks, too, turned a little firmer on Wednesday.

The foreign market was generally dull until Wednesday, when Japanese stocks were marked up on reports that particulars of the bonds had been filed in New York as a prelude to dealings in the sterling issues on Wall Street. Anglo-Argentine Tramway debentures were marked down as investors were disappointed with the outcome of the trade talks.

Net losses in the industrial market were slight and on Wednesday engineering, aircraft and store shares led a rally in prices. The biggest movements in prices took place in those stocks that were affected by particular announcements. Hudson's Bay, for instance, put on 5s. to 120s. on Monday on further consideration of the chairman's remarks about the company's oil interests. On the same day, Hawthorne Leslie gained 5s. 9d. to 39s. on the proposed share bonus and Meux's Brewery gained 2s. to 45s. 6d. on renewed suggestions of a "take-over." On Wednesday, Siemens lost 3s. to 40s. following the reduction in profits. Leading the rally in engineering shares Vickers gained 9d. to 62s. 6d. on the prospect of a large American order for Viscount aircraft, while Hawker Siddeley made a good gain on buying in anticipation of the interim dividend. In the oil market the outstanding movement was in Anglo-Iranian, which continued to climb up so that in early dealings on Thursday it was quoted at 12½. After a period of dullness, OFS issues in the Kaffir market staged a brisk rally on Wednesday.

Financial Statistics

EXCHEQUER RETURNS

For the week ended May 22nd, there was an "above-line" deficit (after allowing for Sinking Funds) of £27,707,000 compared with a surplus of £893,000 in the previous week and a deficit of £19,298,000 in the corresponding period of last year, bringing the cumulative deficit to £41,933,000 (£45,522,000 in 1953-54). Net expenditure "below-line" absorbed £1,511,000, raising the total cumulative deficit to £71,353,000 (£94,488,000 in 1953-54).

THE MONEY MARKET

CREDIT conditions in Lombard Street continued fairly tight in the week covered by the Bank return. The authorities came to the aid of the market on every day except Friday and Tuesday; but their purchases, made mainly indirectly through the banks, were on a limited scale and money remained generally short. The banks were able to secure August bills at 1 11/16 per cent (compared with 1 31/32 per cent in the previous week); and on Wednesday a number of houses only just avoided Bank borrowing at the penal rate.

At last Friday's Treasury bill tender the market maintained its bid at £99 11s. 5d. per cent. Applications rose by £9 million to £400.7 million, but the offer was up by £10 million, to £270 million, and the market's allotment rose from 50 to 54 per cent—its best since early April. The average rate of discount rose by 1½d. to £1 14s. 3.24d. per cent. The offer at yesterday's tender remained at £270 million, so that the excess of new bills over matching maturities will fall from £30 million to £20 million next week.

Business in the gold market was generally quiet throughout the week. But on Tuesday demands from the Continent became more active and the price rose by 1d. to 248s. 10d.

The Bank return shows a renewed outflow of notes into circulation of £3.6 million. Public accounts declined by £5.4 million and other accounts increased by £1.2 million, but other items in the banking department were practically unchanged.

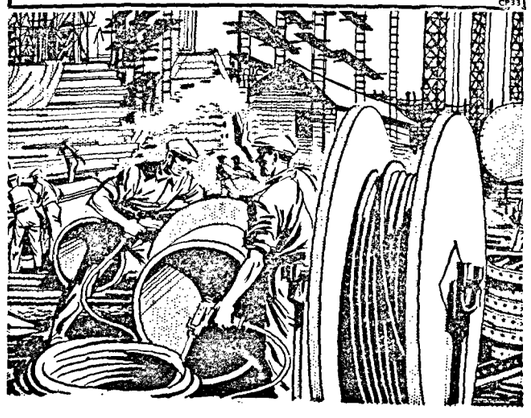
MONEY AT WORK

IN BRITISH INDUSTRY

The regular calls of the Home Service Insurance Man provide much-needed capital for investment in industry and commerce

Issued by the Industrial Life Offices

CP33



The Chartered Bank of India, Australia and China was incorporated in England by Royal Charter on 29th December, 1853, and during the ensuing century its system of Branches has been progressively extended to most centres of commercial importance throughout Southern and South Eastern Asia and the Far East. At all these Branches a complete banking service is available and, in particular, facilities are provided for the financing of international trade in co-operation with the Bank's offices in London, Manchester and Liverpool, its Agencies in New York and Hamburg, and a world-wide range of Banking correspondents.

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

Head Office: 38 Bishopsgate, London, E.C.2.

'Realms of Silver,' Sir Compton Mackenzie's history of the Bank, has been published by Routledge & Kegan Paul. Copies of the book may be ordered through any bookseller at a cost of 25/-

THE BANK THAT CONDUCTS THE LARGEST BANKING BUSINESS IN NEW ZEALAND

Since its establishment nearly 100 years ago, the Bank of New Zealand has kept pace with the country's development. Information supplied by over 325 Branches and Agencies provides current data on all aspects of commerce and industry, which is freely available to all with present or projected interests in the Dominion.

You are invited to contact the London Office or the Head Office

BANK OF NEW ZEALAND

(Incorporated with limited liability in New Zealand)

COMPANY MEETINGS

THE UNION-CASTLE MAIL STEAMSHIP COMPANY

CONSERVATION OF RESOURCES TO MEET FUTURE CONTINGENCIES ESSENTIAL

DIFFICULTY OF MEETING RISING EXPENSES FROM INELASTIC RATE STRUCTURE

FUTURE BUILDING: LEVEL OF FIXED PRICES SORELY NEEDED

REPLACEMENT—LARGEST PROBLEM CONFRONTING INDUSTRY

SIR GEORGE P. CHRISTOPHER ON SITUATION VIBRANT WITH POTENTIALITIES

The annual general meeting of The Union-Castle *Mail* Steamship Company, Limited, was held on May 27th at Winchester House, Old Broad Street, London, E.C., Sir George P. Christopher (chairman and managing director) presiding.

Sir Russell Kettle, FCA, having read the report of the auditors,

The chairman said: It is exactly a year since first I addressed you as chairman, and I fully realise that what was then a promissory note on the future now becomes a matter of giving account of our trusteeship in the twelve months that have passed.

ACCOUNTS

The accounts have been in your hands for some time and, assuming they may be taken as read, I suggest it will perhaps be sufficient for me to confine myself to some of the salient features.

Taking then the Union-Castle Company's profit and loss account, you will have noted that provision has been made for depreciation of the fleet on the basis of 5 per cent on its first cost, and cost of improvements during the year, plus the equivalent of income tax relief in respect of initial allowances on expenditure on new tonnage, absorbing in all £1,527,018. The initial allowances were much less than those in 1952 because of smaller shipbuilding instalments and this accounts for the lesser total of depreciation than that in the previous year. Estimated taxation absorbs £1,003,592, the increase in this respect over the 1952 figure being in large measure due to the lesser saving of tax on the smaller initial allowances already referred to. The net profit, after including income from investments, interest and a balance of provisions made in previous years no longer required, amounts to £1,114,146, representing a moderate increase of £103,257 over 1952.

Turning to the way in which we propose to deal with this amount, plus the balance brought forward from 1952, I shall speak at greater length in a later part of this address about the £1,500,000 which we have transferred to fleet replacement account, partly out of 1953 profits and partly from the amount brought forward from previous years.

DIVIDEND

In regard to the dividend on the ordinary stock, we gave the closest consideration to the case for and against an increase. The points in favour of a larger payment will easily present themselves to you, and they were potently in our minds. The main reason actuating us in proposing no increase was the necessity for a considerable conservation of our resources in order to meet the growing need for the ultimate renewal of various units of our fleet. A year ago, I expressed the hope that, by keeping the dividend at a reasonable level, there would be a better prospect of our being able to maintain it at that level. We are pursuing that policy in respect of the past year's accounts, and I would like to think we have the understanding support of stockholders in this decision. I feel we must have regard to the long-term interests of the company and, therefore, of the stockholders. The future will call for measures requiring the utmost financial strength, and the payment of future dividends will depend upon the building up of the means whereby those payments can be earned. Your board is very conscious of its responsibilities in this respect and our conception of these obligations leads us to the belief that prudence and forbearance at the present time are more likely to be rewarded than a disregard of these considerations through a less prudent course in these days.

EARNINGS AND RUNNING COSTS

The company's gross freight earnings were almost identical with those of 1952, but passenger earnings showed a slight drop. It is not easy to make a clear analysis of the fluctuations from time to time in our operations either as regards passengers or cargo, as so many things influence the general position. We can only maintain our organisation in the best possible fettle to deal effectively with our obligations and, for the rest, repose an unshaken faith in the prosperity and strength of the great African countries it is our privilege to serve. In this respect, we are in the peculiar position of being concerned with no other trades than those to and from South, Central and East Africa which, throughout a century of history, first the Union and the Castle companies separately, and latterly the Union-Castle Company, have held as their sole objective. It is thus true to say that not only is our whole duty devoted to those services but our well-being is bound up with that of those countries.

The following percentage division of our voyage operational expenditure in 1953 under the main headings is of interest:

Passenger and Cargo Expenses	28 per cent
Crew Wages and Victualling	22 per cent
Repairs, Renewals, Deck, Engine and Stewards' Stores, and Insurance ...	22 per cent
Fuel	21 per cent
Port Charges	7 per cent

It is also interesting to note that last year a total of over £1,775,000 was expended in the Union of South Africa.

Oil fuel is the only major item showing a reduction in price from the abnormally high level to which it had soared, but it still represents a heavy percentage of our running expenses.

I shall be referring later to the costs of replacement, with their bearing upon the running of a fleet. These costs should be reflected in the current levels of freight rates but in our case these levels, so far as South Africa is concerned, are determined not so much by economic circumstances as by the decisions of the Union Government, under agreements which have operated for very many years but upon which the tremendous impact of economic changes in recent years has not by any means been fully adjusted. In saying this, all I have in mind is to give expression to a hope that the South African authorities will make it possible for us to continue to meet their needs as we would wish to do and, with this in view, to consider the ways and means by which alone that service can be rendered in the future as it has been in the past. I further venture to hope that what I have to say in this speech will at least be regarded as a straightforward endeavour to set forth the shipping position. Conference rates of freight to and from South Africa, which have had no general increase since July, 1951, are just over twice the prewar level. On the other hand, the major running costs of one of our representative mail ships, consisting of crew costs, stores, insurance, repairs and renewals, fuel and port charges, totalled in 1953 nearly four times those under the same headings and for the same ship in 1938. These figures illustrate the way in which the increase in inescapable costs has out-stripped the rise in freight rates and indicate the seriousness of the problem of meeting rising expenses from traffic based on an inelastic rate structure. This, moreover, takes no account whatever of the magnitude of the problem of replacement.

GENERAL

A great deal is said nowadays from a wide field of varying opinions about the profits of industrial concerns. It seems to me that it will not be amiss for this opportunity to be taken to emphasise certain considerations deserving some attention. It should be made clear to whose who, from one angle or another, take a critical view of the size of the trading profits of a company, that the real proof of the position lies in two factors, first, the preservation of the existing tools of the trade and, secondly, the resources built up out of accumulated profits to provide for their renewal, and thus for the continued progress of the venture. The first of these factors—in our case the company's ships—represents the very sinews of our trading facilities, for only by their maintenance and upkeep can the company have the power to face its current calls and fulfil its vocations. The second represents the wherewithal from which, apart from fresh capital issues, the company is alone able to meet the ever-present, indeed the ever-growing, need for

periodical renewals of its fleet. No matter what form a company's balance sheet may take—and the modern tendency, quite rightly, is for more and more to be disclosed therein—there is, generally speaking, one pivotal point and that is the available liquid resources after allowing for known liabilities. Assuming the distribution to shareholders has not been unreasonably high over the years, and there is much more criticism for too little done in this than too much, anyone looking at the position with a discerning eye has a fairly clear picture of what there is in the coffers and in hand to provide for the likely needs of rejuvenation. In the present circumstances of the Union-Castle Company, the overriding consideration must be the strength or otherwise of this liquid position inevitably required for replacement. Therefore, I would respectfully commend to anyone judging the earnings of this company, the consideration of what they have really amounted to in the form of the existing fleet which has been paid for and the resources left with which to replace ships as and when the need arises.

DEPRECIATION AND REPLACEMENT COSTS

Let me now turn to the question of depreciation with its vast importance to any industrial concern, and to none in the same imperative degree as to shipping. Our tax law, until now, has only allowed as a charge depreciation provisions based upon and limited to the historic cost of the ships. In times of little or easily assimilated fluctuations in first costs, such provisions can, of course, be said to have been all that prudence called for. For a number of years, however, the position has been very different from that. Without burdening you with a lot of figures, it is sufficient for my purpose to take two units from the opposite ends of the Union-Castle fleet to illustrate that difference and the problem to which it gives rise. To replace our *Carnarvon Castle* (built in 1926) when this becomes necessary, with a ship meeting the increased needs of modern passenger and cargo services, will call for an expenditure in excess of four times as much as her first cost at today's level of shipbuilding prices. The other illustration is really a repetition of what I said a year ago. Were it necessary to replace *Edinburgh Castle*, the latest built of our mail ships, it would cost today somewhere about double her actual cost five years ago. The moral is clearly that, even with this comparatively modern ship, depreciation on her actual cost makes inadequate provision for renewal, whereas in the case of *Carnarvon Castle* the sums set aside on the cost basis represent a woefully insufficient allowance to provide for her replacement, and this applies in proportionate measure to all the other units of our fleet of twenty-seven ships.

Having regard to the unprecedented rise in the costs of replacement, a rise far surpassing the most prescient forecasts anyone could have made when most of the ships were built, it is quite obvious that no level of profits can be regarded as unwarranted if it has not been sufficient to permit the making of adequate provisions to bridge the chasm between first costs and replacement costs. It should hardly be necessary for me to add that the profits made by the Union-Castle Company over the years have not been of such a nature. Had anything like such provisions been made, there would have been no net profits at all.

FUTURE BUILDING

A year ago I said that the board, after a careful review of the position, had come to the conclusion that for the time being a halt must be called to any further shipbuilding programme. There has been no notable change since then. Were this company in the position of being able to hold its hand indefinitely in the matter of renewing its fleet, I would tell you that the self-denying ordinance announced last year must continue until costs or freights or both change. On neither of these scores is there any more justification for embarking upon a shipbuilding commitment now than there was then. At today's building prices and level of earnings a new mail vessel would not make sufficient to cover her depreciation and interest on capital outlay. However, assuming those with whom we trade and those great interests in Africa which we have served so long look to us for further co-operation, on terms making it possible for us to continue to serve them, there must come a time when a progressive policy is called for. In saying this, nobody must jump to the conclusion that I am implying we have made any decisions to embark upon new building. Much careful thought will have to be given to the matter.

There is a tendency for certain elements interested in the building of ships to assume that shipowners have talked insincerely about this question of costs in order to depress wages. With all the earnestness within me I would say to any inclined to hold such a view, that the placing of such orders as shipowners may feel it imperative to place should not be regarded as a sign that those responsible are happy in doing so. Shipowners are appreciative of the incentive to industry generally which the United Kingdom Government have included in this year's Budget by way of the investment allowances. These will be very helpful but what is sorely needed is a level of fixed prices, at which shipowners can feel justified in adopting farseeing decisions. It is up to the shipbuilders, their sub-contractors, and the trades unions concerned to get together in some way, which it is not for me to suggest, to see how by co-operation and by increased efforts shipbuilding costs can be more nearly equated to resources and prospects.

Replacement is the largest problem facing shipping at the present time and it is vibrant with potentialities, not only for shipping, shipbuilding and the workers in all the trades ancillary thereto, but for the national interests on the widest scale. Shipowners are by no means unaware of these considerations although they must be forgiven if they doubt whether all the other interests are so keenly alive to them. It is scarcely fair to assume that shipowners are the only people who should be expected to shoulder the burden of the costs. And yet, shipbuilders and their sub-contractors never seem to think it strange that, while they themselves feel unable to face fixed prices, shipowners have to take all the risks of building contracts subject to incalculable rises and thereafter to run the risk of trading the unprecedentedly expensive ships on equally unpredictable markets. Moreover, labour also must take more interest and responsibility in what can be achieved in the matter of reducing costs and improving deliveries by recognising the call for greater production.

FLEET REPLACEMENT ACCOUNT

So far as the Union-Castle Company is concerned, nothing is more obvious than the need to bring up our fleet replacement account to such proportions as may be possible towards closing the gap to which I have referred. It is with this in mind that the board has decided to make an immediate substantial transfer to this account and to register the intention of continuing this policy insofar as it may be possible so to do.

GROUP ACCOUNTS

Turning for a moment to the consolidated accounts, the net profit of the group at £1,255,524 is slightly down by £75,725. Reduced profits of the King Line justified the warning I gave a year ago, and a smaller dividend has accordingly been paid to the parent company. While grain stocks in Australia, Canada and the United States are abundant, all the consuming countries would appear to have been comparatively well supplied. There has, in consequence, been a much lesser demand for ships to carry grain cargoes, which normally make an important contribution to the business of tonnage such as the King Line ships. They are, however, in able hands and I have every confidence in their competent running.

THE OUTLOOK

Without daring to enter the realms of prophecy the signs seem to point to the continued development of the great African Continent with which the destinies of this company have been linked for so long. When the present difficulties are resolved, difficulties shared in varying forms by the whole world, the solution of which is bound to come sooner or later, surely there can be no doubt about the recompense in store for the faith and enterprise manifested by those entrusted with the Continent's wellbeing. It is our ambition that this company may continue to be numbered among those privileged to have a share in the consummation of these hopes.

SEA-AIR COMBINATIONS

Stockholders may have wondered at not seeing the Union-Castle Company included among the established shipping companies which have embarked upon investments in air freight concerns. Your directors gave close attention to this project but decided against any commitment in that uncertain and expensive field. They took the view that shipping presented quite sufficient difficulties in the way of outlay on the tools of the trade without incurring additional obligations in another element of transport. Moreover, they did not feel any confidence in the preconceptions of possible future Governments as between free, controlled or nationalised air transport. They were also unconvinced that international considerations would not bring to naught, or minor worth, free ventures even in the limited sphere of operations presently open to so-called private air enterprise. We wish nothing but well to those shipping companies which have ventured their money on this arm of transport. We hope they will be justified of their courage, but for your company we feel the sea is our medium and that we should confine our attention to that.

"TAKE-OVER" BIDS

Without wishing to join in any sort of controversy as to the rights or wrongs of the modern tendency known as the "take-over" bid, I would draw attention to two of its aspects. If stockholders consider the boards of their companies display insufficient progressiveness, they surely have at their hands the more ordinary means of making their views felt. It cannot be in the best interests of industry that boards should be constantly forced to look over their shoulders for the spectre of the "take-over" bidder and be tempted to adopt measures which they would otherwise consider imprudent. Then there is the effect these rumours are likely to have upon staffs with the sword hanging over their heads. I am not suggesting that any of them have suffered up to now, but whenever such rumours get about staffs never know what may be the effect upon themselves of any change in control, and this cannot be good. Your company has not escaped the publicity to which this phenomenon, new in its modern application, has given rise. The excitement engendered over Union-Castle stock last autumn proved to be unfounded, although some people obviously listened to the "take-over" stories which abounded.

STAFF

I wish to pay a special tribute of gratitude to the staff of this company, ashore and afloat, in this country and in Africa. I have made very great and special demands upon them in the past year, the significance of which it was not easy for them to estimate. Changes have been made in many spheres and in one of the most important departments of our organisation, namely the general amenities of our passenger services, a searching examination is still in the course of fulfilment. This has all been accepted in the right team spirit. The company's interests have been put first by everyone and it is a pleasure to me to bear witness to a support without which my task would have been inestimably more difficult.

No chairman could possibly desire greater support or more constructive guidance than has been accorded to me by my colleagues on the board throughout the past year, for which I am very grateful.

It was with deep regret that we heard of the death on September 12, 1953, of the Duke of Abercorn, who had been a member of the company's board for more than thirty-two years. His loss after so long an association with the company was keenly felt by all his fellow directors. To fill the vacancy which thus arose, Mr Stanley Barr was co-opted to the board. Mr Barr retired from the position of general manager of the company in February this year after more than fifty years' loyal service, and the knowledge and experience which he has gained over that long period are of inestimable help. In accordance with the articles of association, Mr Barr retires at this meeting and offers himself for re-election.

The report and accounts were adopted and the retiring directors were re-elected.

The proceedings terminated with a vote of thanks to the chairman and directors.

THE YORKSHIRE INSURANCE COMPANY

RECORD ACHIEVEMENTS

LORD MIDDLETON'S SPEECH

The one hundred and thirtieth annual general meeting of The Yorkshire Insurance Company Limited was held on May 25th at York.

The Rt Hon Lord Middleton, MC, the chairman, in the course of his speech, said:

The year 1953 was a good one for us; we are able to report a record achievement in several departments. Never have we issued in any year so many new life policies. Never have we had so large a net life, fire or accident income. Never have all our funds—life, fire, accident or marine—stood higher and, most important of all—for stability must keep pace with progress—never have our reserves been stronger than today.

The transfers from our various departments, together with the net interest income on our non-life funds and the profit of our trustee company, yield a total of £1,055,000. The provision for home and overseas taxation, whilst still heavy, imposes a less severe strain than in the previous year.

Bearing in mind the substantial uplift that was made in the dividend last year, the directors recommend that on this occasion it shall remain unchanged. This absorbs £132,000, which leaves a sum of £268,000, as compared with £267,000 at the beginning of the year. Our total assets have risen from £46½ million a year ago to over £49 million. I can say with confidence that we have both at home and abroad an excellent portfolio of securities. The report was adopted.

ANGLO-NEWFOUNDLAND DEVELOPMENT COMPANY

(Inc. in Newfoundland)

PROGRAMME OF REHABILITATION CONTINUED

EFFORTS TO ENHANCE GROUP'S COMPETITIVE POSITION

MR ELLIOTT M. LITTLE'S REVIEW

The ordinary general meeting of Anglo-Newfoundland Development Company, Limited, was held on May 26th at the offices of the company, Grand Falls, Province of Newfoundland, Mr Elliott M. Little (the President) presiding.

The following is an extract from the statement by the President which had been circulated with the report and accounts for the year ended December 31, 1953:

Despite severe operating difficulties created by extraordinary weather conditions early in 1953, and loss of production due to demands by our customers for sizes not well suited to our manufacturing facilities, the earnings from our newsprint operations were substantially the same as the previous year. The drastic drop in base metal prices accounted for the greatly reduced earnings from our mining interests and no immediate relief in this direction is expected.

The drop in pulp prices during 1952 and which continued into 1953 was the inevitable result of the inordinately high prices of the year 1951. These wide variations in pulp prices are in the interest of neither the seller nor the buyer.

ANGLO-NEWFOUNDLAND DEVELOPMENT COMPANY, LIMITED

The company continued its programme of rehabilitation during the year. The conversion of the Bishop's Falls Groundwood Mill to a hydro-electric plant was completed and this unit brought into full operation during October. Meanwhile, the additional automatic grinders required to provide sufficient groundwood capacity at Grand Falls were installed. The capital expenditure programme for next year consists mainly of improvements to the wood handling system and the completion of other projects in hand.

The demand for newsprint continues good and the company's contract or order position is satisfactory.

In 1953 this company, with twenty-three other international firms and corporations, became a member of a syndicate which formed a corporation under the laws of Newfoundland, called "British Newfoundland Corporation Limited." The purpose of this corporation is to promote the industrial and economic development of Newfoundland's Mineral, Water Power and Forest resources. It is felt that this venture will be of some future benefit to your company, which has committed itself to subscribe for 52,100 common shares of one Canadian dollar per share, of which 21,000 shares were called in 1953. Further commitments in connection with the activities of this corporation may be assumed from time to time.

GASPESIA SULPHITE COMPANY, LIMITED

The bleaching plant, referred to in last year's statement, came into production in August, 1953, the total expenditure on this installation amounting to $3,076,107 as of December 31, 1953.

During the year, 54,176 tons of unbleached sulphite pulp and 14,426 tons of bleached sulphite pulp were produced, as against 65,142 tons of unbleached sulphite pulp in the previous year.

Pulp prices continued to fall through 1953. The price of unbleached sulphite dropped $5 per ton on January 1, 1953, and there was a further reduction of $10 on May 1st. Bleached sulphite pulp is selling at $20 per ton differential over unbleached pulp, and whilst this differential barely covers the increased cost of bleaching, a steadier demand will prevail in the bleached pulp market.

We were successful in our efforts to reduce the cost of production almost to the same extent as the reduction in pulp prices.

TERRA NOVA PROPERTIES LIMITED—BUCHANS MINE

Operations were continuous throughout the year and ore mined and milled was 346,000 short tons, an increase of 12,000 tons over the tonnage treated in 1952. Average grade of ore mined was slightly lower than the 1952 average, but this decrease was negligible compared to the decrease in metal prices. These low metal prices were responsible for the great reduction in revenue in 1953.

Ore reserves as of December 31, 1953, were estimated to contain 5,084,000 tons of assured and probable ore. The increase of established reserves was made possible by underground drill hole intersections in the outlying Rothermere R4 orebody, which have confirmed ore that was previously indicated only by surface drill holes. A small tonnage, consisting of remnants of lower grade ore in the old sections of the mine, is also available for extraction.

Mine development for the year totalled 6,737 feet, with 88 per cent of this work being done in the Rothermere mine, for opening up stoping areas above No. 9 level and exploring the R4 orebody on No. 13 level. Development in the Rothermere mine will continue next year.

Production estimate for 1954 calls for approximately the same tonnage and grade as that obtained during 1953.

MONTMORENCY SHIPPING LIMITED

Reference has been made above to the abnormal weather conditions experienced in 1953, which resulted also in an ice blockade of our winter shipping port. In consequence of unavoidable shipping delays, coupled with a general fall in the market, the earnings of this subsidiary company were adversely affected. The parent company's delivery costs did not, however, suffer seriously thereby.

CONSOLIDATED POSITION

The consolidated profit, after depreciation and taxes, of $2,935,986, is equivalent to 53 cents per stock unit, compared with $4,348,598, or 79 cents per stock unit for the previous year. Your company's fixed assets continue to be well maintained and all avenues of improvement to enhance the group's competitive position are being vigorously followed.

The report and accounts were adopted.

CEREBOS LIMITED

ANOTHER YEAR OF PROGRESS

W. ARNOLD INNES'S STATEMENT

The fiftieth annual general meeting of Cerebos Limited was held on May 27, 1954, at Cerebos House, London, N.W.10.

Mr W. Arnold Innes, the chairman, presided.

The following is his review which has been circulated with the report and accounts for the year ended December 31, 1953:

I have pleasure in presenting the report of the directors and the accounts for the year 1953. This was another year of real progress in all sections of the business.

ACCOUNTS, DIVIDEND AND TAXATION

The consolidated balance sheet with the comparative figures for the previous year clearly sets out the position of the company and its subsidiaries as at December 31, 1953, but a few comments thereon may be of assistance to stockholders.

The value of the fixed assets of the group in the form of land, buildings, plant and equipment (after setting aside adequate sums for depreciation), the goodwill and trade investment items now amounts to £3,088,850—an increase of £648,552 on last year's figures.

In my review of the accounts for the year 1951 I reported that we had purchased 50 per cent of the equity shares of Scott (Midlothian) Limited. The purchase of the remainder of these shares was effected just after the turn of their financial year which ended on August 31, 1953, and the assets and liabilities of the "Scott" group of companies as at that date have therefore been incorporated for the first time in the consolidated balance sheet of Cerebos Limited, as have also those of our newly acquired Australian interests. The increase in the value of the fixed assets is therefore attributable to the broadening of our trading activities by these acquisitions and also to expenditure on the reconstruction and re-equipment of our Greatham and Middlewich factories.

This increase in capital outlay is naturally reflected in the nett current assets position, which at £1,216,444 shows a reduction of £76,510.

The holding in gilt-edged securities, which last year was written down to the prevailing market value, has since then appreciated by £38,196 to £563,721. For the purpose of the balance sheet, however, the increase in the market worth has not been taken into account.

Reserves and surplus, including the sum set aside in cover of future taxation, stand at £2,111,769 against £1,691,152 for the previous year—an increase of £420,617.

The net trading profit of the group for the year is £1,358,560—an increase of £254,419 over the figure for 1952. The estimated liability for taxation arising therefrom, including Excess Profits Levy of £100,000, amounts to £875,001. The nett profit of the group for the year, after making full provision for taxation, therefore amounts to £483,559, and to this falls to be added £241,331 brought forward, making a total sum available of £721,618.

As will be seen from the directors' report, it is recommended that the sum of £150,000 be transferred to general reserve, increasing the amount standing to the credit of that account to £500,000, and that a final dividend of 18¾ per cent be paid, which, together with the interim dividend of 6¼ per cent paid in November last, makes a total dividend for the year of 25 per cent, leaving £296,618 to be carried forward.

You will be happy to observe that we have been able to maintain the dividend at the higher rate established last year. Taxation continues to absorb the major portion of our profits, and our liquid resources must be conserved in order to meet capital commitments. We are indeed grateful for recent concessions in taxation, but continued excessive taxation cannot do otherwise than restrict the development of industry through the attrition of liquid resources.

HOME SALES, MARKETING AND ADVERTISING

Last year our sales in both tonnage and sterling were again higher than in any previous year. Today I have the satisfaction of reporting that the turnover figures for 1953 have exceeded those of 1952, in both these aspects.

This indicates clearly not only that our products have maintained their hold upon the buying public but that the number of consumers continues to increase. This is, in reality, the test of progress, because an increase in sales in an expanding market can be illusory unless it is accompanied by an improved share of the available market. It is also, I suggest, a tribute to the unfailing quality of our products.

Recent years have witnessed a considerable change in the technique of selling due to the development of market research which enables us to frame our sales and advertising policies upon the lines most calculated to produce better results year by year, whilst, at the same time, maintaining the cost of our selling operations at an economic level. To achieve success in this field it is necessary to have complete co-ordination among those responsible for marketing, selling and advertising. Each of these divisions benefits by the activities of the others, thereby ensuring the greatest possible efficiency in our sales promotion campaigns.

We have always been fortunate in the support and co-operation extended to us by our trade friends who sell our proprietary lines. We also enjoy the support of numerous industrial firms who rely on us for their bulk salt requirements. In this connection the field is very extensive as there is scarcely an industrial process in which salt is not used to a varying extent.

It gives me, therefore, much pleasure to express my appreciation of this trust and confidence which, in most cases, has continued without interruption for very many years and which we shall always do our best to merit.

EXPORT AND OVERSEAS TRADE

Taken as a whole we have no reason to be dissatisfied with our experience in overseas markets during the past year and sales again have constituted a record. This is no mean achievement as many countries which in the past have been good customers do not now buy at all, whilst many others have imposed drastic restrictions. At one time we had an extensive trade with the various South American countries but today none of them makes any contribution to our export trade. There is no sterling available to finance the import of consumer goods.

Accordingly we have concentrated upon our trade with other countries notably those within the Commonwealth and I am particularly glad to be able to give a good report of the first year's trading of Cerebos (Australia) Pty. Ltd. This company manufactures and distributes gravy powder under the trade mark "Gravox" and the sales of this product and of those proprietary lines which continue to be imported from this country have been up to our expectations. What is equally important, the first year yielded a satisfactory profit. However, we are somewhat seriously handicapped by the inadequacy of our premises in Melbourne and, therefore, the Australian company is actively engaged in a search for new premises, suitable in type and size for what we confidently expect will be a rapidly increasing business.

The local directors of Cerebos (Australia) Pty. Limited are Mr E. R. Mead, formerly our manager in Australia, Mr K. R. Clements and Mr J. G. Vaughan.

It is also pleasing to record that our Canadian sales have benefited from the visit last year of one of our senior sales executives. After covering the Dominion from Montreal to Vancouver, he has given an encouraging report on future prospects and we are confident that our sales to this important market will continue to progress, thereby increasing if only to a modest extent the country's dollar income.

As it may not be generally known that the Cerebos group exports substantial quantities of salt in bulk, I would like briefly to refer to this trade; it is one of the oldest in the world as long before the Christian era the Chinese sent their junks to Red Sea ports to load solar salt, a trade which still exists having changed but little through the centuries. As long ago as 1749 the sea carriage of salt was sufficiently important to be mentioned in Lloyd's policies of insurance and it is interesting to recall that soon afterwards, in 1757 to be precise, our subsidiary company, Henry Seddon & Sons, Limited was established. This company, which will shortly celebrate its bicentenary, has had a long and successful career; it is still one of the major English salt exporting companies being particularly prominent in the important West African trade.

As other markets have yielded satisfactory results, and provided the present restrictions upon trading imposed by many countries are gradually eased, we can look forward to a substantial increase in our overseas sales. The future trend is however unpredictable. I will only say that we are well placed to trade with any country willing to accept and to pay for our products.

PRODUCTION

Good progress continues to be made with the development schemes at our various factories. Greatham has now been fully modernised and mechanisation has brought it to a high degree of efficiency. Work at our principal Middlewich factory still continues and it is fully anticipated that the new vacuum plant will be in operation there during the course of the current year. Other modernisation schemes are in hand and we anticipate that the whole of the work should be completed by about the end of next year.

The increasing demand for our products has meant that the maintenance of steady production in greater volume has been essential. The factories have met the demand well. Reconstruction and development have been skilfully carried out without interference to greater production.

Costs have remained fairly steady and I am pleased to be able to report that during 1953 we have been able to avoid any increase in the retail selling prices of any of our products. Recent increases in wages, carriage charges and fuel prices, however, will undoubtedly contribute to an upward tendency to costs during the current year and to what extent this can be offset by increased tonnage turnover remains to be seen.

During the year under review supplies of raw and packing materials have presented few abnormal difficulties.

We have recently purchased additional freehold land at Greatham and the acquisition therewith of the mineral rights will ensure our vital supplies at Greatham for as far into the future as we consider necessary in the interests of the company.

DISTRIBUTION

The expansion of our commercial fleet referred to last year has advanced rapidly and two further main depots have been secured.

The acquisition of the Scott business has, of course, introduced a new factor but one which tends rather to simplify our problems than otherwise. Scott's also have a substantial commercial fleet and the process of integration is proceeding smoothly. Savings are already being made.

All our products sold to the retail grocery trade in Great Britain, with the exception of some of the remoter parts of Scotland, are now delivered by road transport. To achieve this we have increased our own transport fleet and in areas which we cannot serve ourselves we have employed contractors, who are working well on our behalf. This results in a quicker delivery service as well as ensuring that our goods arrive at their destination in good condition.

SUBSIDIARY COMPANIES

Once more I am pleased to report that all our subsidiary companies have experienced a successful year's trading and have made a valuable contribution to the results of the group. The extensive range of products of these companies continues to ensure that our business is very broadly based.

We are well satisfied with the progress and development of Scott (Midlothian) Limited and its subsidiary companies and it is indeed gratifying to report that Scott's position, as the largest suppliers of porridge oats in the British Isles, remains unimpaired.

I am glad to say that the directors of the various companies comprising the "Scott" group have agreed to remain in office and consequently we welcome to our counsels Mr R. F. Shepherd, WS, Sir William Y. Darling CBE, MC, DL, LLD, MP, Mr William Thyne, Mr Angus Wallace and Mr T. G. Waterlow, CBE.

In Eire, the board of Cerebos (Ireland) Limited has been reorganised and the directors resident in that country are Colonel W. B. P. Bradish, Mr Roger Greene and Sir George Mahon, Bart.

STAFF AND EMPLOYEES

On behalf of the board I would like to express gratitude for the devoted efforts of all our employees, both home and overseas, without which such excellent results could not have been achieved. We have always attached great importance to the question of happy relations with our employees and every encouragement is given to young people to equip themselves for managerial posts within the group.

In conclusion, I would like to express my warm appreciation and thanks to my colleagues on the boards of Cerebos Limited and its subsidiary companies for all the support and co-operation they have given me during the past year.

The report and accounts were adopted.

Mr L. H. McRobert, CBE, TD, DL, ACA, the director retiring by rotation, was re-elected.

The proceedings terminated with a vote of thanks to the chairman.

CROWN MINES, LIMITED

At the annual general meeting held in Johannesburg on May 10, 1954, the chairman, Mr W. M. Frames, in the course of his remarks, said:

As you know, the extent and profitability of the operations of the gold mining industry were adversely affected in 1953 by an acute shortage of non-European labour, an increase in working costs and declines in both the determined price of gold and the additional revenue from sales at enhanced prices. Considered against this background and in relation to the position at the mine outlined to you by the chairman last year, the results obtained by your company for the year under review can be considered satisfactory. A small decline in the tonnage hoisted was more than offset by an increase in the tonnage of low grade ore drawn from surface dumps. Due to the low cost of the latter and to the reduced expenditure on incline shaft sinking and development, working costs decreased by 8d. a ton milled. On the other hand, the lower yield and the fall in the amount received per ounce of gold caused the revenue to decline by 1s. a ton and as a result the working profit at £604,933 was lower by £43,740.

MINING OPERATIONS

In general, operations at the mine proceeded according to expectations. The tonnage added to the reserves on the Main Reef Leader in the bottom levels was only about two-thirds of the corresponding amount in the previous year. In the eastern section, development, which has virtually been completed, added only a very small tonnage to the reserve. In the central section some useful tonnage was developed but it is unlikely that any significant blocks remain to be opened up in this section. It will therefore become necessary to draw some ore from shaft pillars in the near future in order to maintain production from these sections. About 75 per cent of the ore developed during 1953 in the bottom levels was located in the western section where normal development operations in depth are continuing and although values and percentage of payability are satisfactory there are indications that development is entering a poorer zone. Under existing conditions it appears likely that operations at the mine may continue on the present scale for about another three years after which there will be a gradual decline over the remaining period of the mine's life. Surface dumps, which provided a welcome supplementary tonnage and profit in 1953, are sufficient to last for several years at the present rate of consumption.

Since the close of the year there has been a marked increase in the supply of non-European labour, which now promises to show a substantial improvement over the previous year. On the other hand, the shortage in underground European labour has become more acute and we are concerned about the effects it may have on future operations.

In reply to a question by a shareholder, the chairman stated that certain claims on Bird and Kimberley reefs, which were inaccessible to this company, were being contributed on a royalty basis by Consolidated Main Reef Mines and Estate, Limited.

The report and accounts were adopted.

BRITISH PAINTS (HOLDINGS)

LEVEL OF TRADING MAINTAINED

The twenty-fourth annual ordinary general meeting of British Paints (Holdings), Limited, was held on May 27th at Newcastle-upon-Tyne, Mr J. W. Adamson (the chairman) presiding.

The following is an extract from his circulated statement:

Trading during 1953 was maintained at about the same level as the previous year. The year started badly, but it was pleasing to see a good recovery after the first three months, and especially after the 1953 Budget announcement, which only goes to show the reductions in taxation were responsible for part of the improvement in trade. I am sure that further reductions in taxation by the Chancellor over the next year or two will be the surest way to aid industry generally, and given free access to raw materials every manufacturer will be able to increase trade, both at home and for export.

Paint sales are practically level with last year, and the fall in our raw materials division sales began to retrieve itself after the fifth month of 1953. Your factories everywhere are ready to cope with any increase in sales which may take place.

Your company's overseas factories are becoming established so that it will not be long before all these sturdy offshoots begin their contribution towards the income of their parent.

FIERCE FOREIGN COMPETITION

No effort has been spared in planning for the future by your board and management. From the National point of view, let us not close our eyes to the fierce competition from our foreign competitors, who are working like Trojans from sunrise to sunset to retrieve their lost markets and, at the same time, are encroaching on ours. When we had a sellers' market labour demanded a reduction in working hours, and in most industries there was a reduction from 47 hours to 44 hours per week, without any reduction in pay. Today we need those lost hours, and it would be a magnificent gesture by labour today to give those hours back to the Nation without any increase in pay, for we can no longer afford to revel in the apparent luxury of a five-day week. We must export to live and I doubt if we can keep on increasing our exports much further without our men and women working more hours a day to increase production as they are doing in Germany and Japan, to mention only two countries.

How can we reduce paint prices when titanium oxide is being freely exported to overseas countries? It is "penny wise and pound foolish" of our Government to cause shortages of this important raw material to obtain a few extra dollars. Likewise it is wrong for them to allow this material to be exported to countries who are now buying at £47 per ton less than they used to, while, at the same time, the Government are granting import licences to home consumers for American titanium oxide, for which they have to pay an additional £70 per ton. This, together with the shortages, is bound to affect our export trade.

Of the profit of the group £698,876, taxation takes £394,121. Your directors have decided to pay a final dividend of 20 per cent, less tax, making 25 per cent for 1953 on the ordinary stock.

Current assets exceed current liabilities by £2,480,820.

The report was adopted.

GALLAHER LIMITED

(Tobacco, Cigarette and Snuff Manufacturers)

INCREASED TRADING PROFIT

RECORD TURNOVER

SATISFACTORY DEMAND FOR COMPANY'S PRODUCTS

SIR EDWARD DE STEIN'S STATEMENT

The fifty-eighth annual ordinary general meeting of Gallaher Limited was held on May 26th at Winchester House, Old Broad Street, London, E.C., Sir Edward de Stein (chairman of the company) presiding.

The secretary (Mr George Iliff, ACA) read the notice convening the meeting and the report of the auditors.

The following is the statement by the chairman which has been circulated with the report and accounts for the year ended December 31, 1953, and was taken as read:

You will recall that we took over control of the Cope and Lloyd businesses in January, 1953—the beginning of the year under review. Since then Lloyd's factory in London has been equipped with modern plant and machinery and the layout of the factory has been re-organised. While this work was going on the output from the factory was maintained and its productive capacity considerably increased thus enabling us to widen the distribution of Lloyd's brands in 1954.

REORGANISATION OF CIGAR MANUFACTURING SUBSIDIARY

Some reorganisation of our cigar-manufacturing subsidiary—J. R. Freeman & Son Limited—has also taken place during the year. In the course of making the new arrangements it became clear that the cigar-importing business handled by the associated companies of J. R. Freeman & Son Limited could not be satisfactorily managed as part of the Gallaher Group and that it would be in the interest of the Group if it were disposed of. It has, therefore, been sold. It was purchased by Mr R. J. Freeman and he has consequently resigned from the board of your company.

The integration of the Cope-Lloyd business with the parent company and the reorganisation of J. R. Freeman & Son Limited have resulted in considerable economies, largely arising out of the amalgamation of the sales organisation which is now handling all the group's brands. This will have the effect of spreading our overheads and improving the efficiency of operation with benefit both to employees and stockholders. We are also in the process of completely mechanising the records side of our selling organisation which should produce further economies and improved service to the distributive trade.

TRADING RESULTS

Accounts.—I would now like to refer to the principal features of our accounts for the year to December 31, 1953. You will see in the consolidated profit and loss account that the trading profit for the year shows an increase over last year's figures of some £290,000. The trading results of Cope and Lloyd are included so that the results of this year are not strictly comparable with those of last year. It is satisfactory, however, that the profits of the parent company have increased this year, apart from the additional revenue derived from the inclusion of Copes. Taxation takes an extra £120,000, so that the net consolidated profit is up by £170,000.

The net profit available for appropriations and distribution amounts to £906,000, out of which we have set aside £88,500 to increase our provision for pensions payable by the group in addition to those secured under the pension schemes. We propose this year to increase the rate of distribution to ordinary stockholders from 17 per cent to 20 per cent subject, of course, to approval by stockholders, resulting in the profit and loss account carry forward being increased by £239,000 to a total of £956,000.

BALANCE SHEET FIGURES

In the consolidated balance sheet the principal changes under capital and reserves arise in issued capital and share premium account. The capital is increased by £437,500 ordinary stock issued in exchange for the issued capital of Cope, and the increase in share premium account represents the excess of the value of the net assets of the Cope business over the nominal value of the stock issued—less the expenses of the issue.

On the assets side of the balance sheet the principal points to note are the increase of almost £3 million in stock in trade, and of £1 million in debtors. The stocks and debtors of Copes are included in these figures for the first time. Another factor which contributes to the increase in stocks is that we were permitted in the autumn of last year under the United States Mutual Security Act, to purchase some dollar tobacco for sterling in addition to our normal allocation. Our stocks of dollar tobacco at December 31, 1952, were, in any event, at a lower level than they have been for several years. Debtors are higher because of the higher turnover of the group as a whole, partly arising from the Cope business and partly from the increase in the volume of business done by the parent company and its other subsidiaries. These increases have been financed by borrowing from our bankers an extra £1,600,000 and by increased acceptance credits to the value of £500,000.

CONTINUED RISE IN COSTS

General Matters.—The increased profit which we have been able to show this year has been earned on a turnover which is considerably higher than in any previous year. Costs, however, under practically all headings, particularly leaf tobacco and wages, have continued to rise during 1953, the last increase in wages being effective just ten days before the close of the financial year.

Leaf Supplies.—For the past fourteen years we have been handicapped by various forms of restrictions, and this has been the reason for my repeated references in past years to the fact that the supply of our cigarette brands has not been sufficient to meet the demand. But this year we are hopeful that there will be an improvement in leaf supplies.

Tobacco Duty.—A considerable part of the capital employed in this business is locked up in duty which we have to pay before we commence our manufacturing processes. There is, therefore, a large duty element in our factory and finished goods stocks and in our trade debtors, and this factor, while materially adding to the costs in interest charges, is also an important factor in determining our financial policy.

INCREASED DIVIDEND

Dividend.—You will expect me to make some reference to the fact that we are recommending to stockholders that the final dividend be increased from 12 per cent last year to 15 per cent this year. Apart from the small adjustment which we made in the dividend in 1952, when it was increased by ¼ per cent, the rate of dividend on the ordinary stock has remained unchanged since 1946. Having regard to the conservative policy which we have followed in the past in building up our reserves, your directors consider that the stockholders should now be able to share to a greater extent in the increasing prosperity of the company.

Engineering Subsidiary.—I think reference here should be made to the progress of our engineering subsidiary. This has been most satisfactory and the highest credit is due to its management, and in particular to Mr A. W. Gregory, its managing director. The company has now become much larger than it was when we acquired it. Although the profits have shown a substantial increase, all surpluses have been ploughed back and only a nominal dividend has been paid to the parent company. This busines, which was purchased towards the end of the war to ensure that we could re-equip our cigarette factories, will still prove its value to the group by supplying our own specialised cigarette machinery.

SATISFACTORY LEVEL OF SALES

Outlook.—Sales for the year were at a satisfactory level in all categories of the group's products. The consumer demand for hard tobaccos is diminishing, but the company has maintained its leadership for this type of tobacco. In total, sales of our other tobaccos continue to expand and the acquisition of the Cope and Lloyd business has strengthened our position in this section of the trade.

Our main cigarette brands — Senior Service, Park Drive and, in Northern Ireland, Gallaher's de Luxe—are still in short supply to the public. This is due to our being unable to obtain the necessary supplies of suitable tobacco leaf which would enable us to increase output. du Maurier, our filter-tip cigarette, has continued to show progress.

Manikin cigars and other Freeman products remain popular with the public and sales during 1953 were satisfactory.

CONSISTENT QUALITY OF COMPANY'S BRANDS

Your directors are confident that because of the consistent quality of the company's cigarette brands they will remain in high esteem by smokers, and we are hopeful that in the coming year we may be able to go further towards meeting the unsatisfied demand. The demand for the company's pipe tobaccos in 1953 was satisfactory, but now that we have increased the productive capacity of Lloyd's London factory, and have merged the selling organisations, we shall be able in 1954 to widen the distribution of these tobacco brands and we look forward to increased sales. The selling organisation has been planned over the last few years to expand the distribution of the group's products, and it is now ready to do so with confidence. The financial problems involved are now under consideration.

Until the present year we have always announced our preliminary figures during the month of March. Last year we had to issue amended figures after the Budget, because of the effect of the change in Income Tax. This year our figures were announced just under a fortnight before Budget Day. The board have decided in future to defer final consideration of the accounts and their recommendation to stockholders in regard to dividends until after Budget Day.

Director.—As the company is registered in Northern Ireland the provisions of the Companies Act, 1948, do not apply—nevertheless the directors wish to inform you that Mr Arthur Robinson, one of our colleagues, who retires under the Articles this year, is over 70 years of age. Mr Robinson, who has been associated with our "Senior Service" business since before we acquired it in 1936, has, I am pleased to say, agreed to offer himself for re-election, and we recommend his reappointment with confidence.

TRIBUTE TO MANAGEMENT, STAFF AND WORKPEOPLE

Employees.—The reorganisation of our subsidiaries has involved many problems which have added zest and interest to the work of our executives, and we hope it will also provide increased scope for their talents as well as benefits to the stockholders. I would like to express to the management, staff and workpeople in the Group, as a whole, appreciation of the zeal and loyalty which they have shown throughout the year.

The report and accounts were unanimously adopted and a final dividend of 15 per cent on the ordinary stock, making 20 per cent for the year, was approved.

The retiring directors, Mr E. J. Foord, CBE, Mr A. V. Maunder and Mr Arthur Robinson, JP, were re-elected and the auditors, Messrs Hill, Vellacott and Bailey, having been reappointed, the proceedings terminated.

BANCO DI ROMA

ROME, ITALY

The annual meeting of the Banco di Roma was held under the Chairmanship of H.E. Prof. Costantino Bresciani-Turroni on 5th April, 1954. After hearing the reports of the Board and of the auditors, the shareholders approved the balance sheet as at 31st December, 1953, the profit and loss account, and the proposals for the distribution of profits.

Profits for the year, after considerable redemption payments and appropriations, amounted to Lit. 475,429,808.

It was decided to distribute a dividend of 7% to shareholders, and to transfer Lit. 400m. to the reserve, thus bringing it up to Lit. 1,400m.

The total of assets and liabilities increased by Lit. 129,000m. and now exceeds Lit. 800,000m.

Deposits and current accounts rose by Lit. 51,000m. during the year to a total of nearly Lit. 416,000m.

Credit assistance given by the Bank to its own clients showed an increase of about Lit. 60,000m., the total of such investments reaching about Lit. 280,000m.

RAND MINES, LIMITED

GOLD MINING INDUSTRY: DISAPPOINTING RESULTS OF PRODUCING MINES

EFFECT OF SUBSTANTIALLY INCREASED WORKING COSTS

FAVOURABLE TREND IN SUPPLY OF NON-EUROPEAN LABOUR

MR W. M. FRAMES'S SPEECH

At the annual general meeting of Rand Mines, Limited, held in Johannesburg on May 14th, Mr W. M. Frames presided and, in the course of his remarks, said:

Dividend receipts, which are the chief source of revenue for your company, decreased by £125,298 and, due to this and other variations in items of revenue and expenditure, profit before taxation was lower by £148,604. After maintaining dividends at the previous year's level of 6s. per share and transferring £22,403 to exploration reserve, the unappropriated balance increased by £6,711 to £1,884,719. Although the company acquired further shares in the Harmony and Northern Lime companies, its net liquid surplus was increased by £293,641 to £1,683,056, mainly as the result of the realisation of certain other investments. In pursuance of the new Companies Act the value of investments, other than those in respect of pension fund deposits, was written up in order to maintain such shares and debentures at the lower of cost or Stock Exchange value or directors' valuation if unquoted. After taking this adjustment into account, the total of the said investments, at £6,761,221, was £789,166 higher than in 1952. The amount written back on investments, together with a net credit from sales of certain investments, formed the bulk of the amount of £1,146,303 which was added to investment reserve, raising it to £5,893,306 at December 31, 1953. Expenditure on prospecting ventures amounting to £38,608 was debited to exploration reserve which, after allowing for a transfer of £22,403 from the profit and loss account, stood at £300,000 at the end of the year.

ADVERSE TREND OF WORKING COSTS

As I have already stated, your company's chief source of revenue arises from dividends from gold mining companies. The fall in revenue therefore reflects the deterioration of the financial results of operations of the producing mines of the gold mining industry. The tonnage milled in 1953 was 1,228,500 tons less than for 1952 but a higher yield enabled the industry to increase its output by 142,928 ounces. Nevertheless, due mainly to the reduction in the additional income from sales of gold at enhanced prices and, to a lesser extent, to the lower determined price of gold, working revenue was lower by £810,176. Working costs continued their upward trend and were higher by £4,821,226; the net result of these variations being a reduction of £5,631,402 in working profits.

From the above figures it will be appreciated that the disappointing deterioration in the results of operations was due mainly to a substantial increase in working costs. This adverse trend has been characteristic of results during the past three years, and has been brought about largely by shortages of labour and by the general inflationary conditions that prevailed during the period. Commencement of operations at several new mines has added materially to the industry's total expenditure, but has made little impression on its output figures as with no expansion in the total labour force these mines were operated largely at the expense of the older mines. During the current year the pattern of results will be similar, in that further mines will reach the production stage and add to both the industry's expenditure and the overall demand for labour. There is hope, however, that the similarity may end there, and that both revenue and profits should increase satisfactorily in the second half of the year.

LABOUR

The average number of Non-Europeans in the service of the producing gold mines during 1953 was 266,333, compared with 276,280 for 1952. In the latter half of 1953, however, the seasonal decline was less severe and of shorter duration than in past years, with the result that the number of Non-Europeans in the service of the producing mines at the end of December, 1953, was 255,518, as against 248,390 at the end of December in the previous year. Since the close of last year, numbers have increased at a higher rate than usual, and by the end of April the number in the service of the producing mines totalled 292,844, which is the highest figure recorded since May, 1950.

Shareholders may be aware that the supply of Non-European labour is determined by a multiplicity of factors and that the most thorough investigations have been and are being carried out into every condition which might affect recruiting and the popularity of employment on the gold mines. Various improvements in conditions of employment were introduced during 1953, and these have undoubtedly contributed materially towards the favourable trend in the Non-European labour supply over recent months. Additional steps are being taken by the industry to encourage more Non-Europeans to seek employment on the mines and, even more important, to return again after the completion of each period of contract.

URANIUM

The uranium industry, which is already adding substantially to the revenue of the gold mines, is expanding rapidly and will play an increasingly important part in the earning of profits for the gold-mining industry and in providing valuable foreign exchange for the Union of South Africa. The many problems connected with the establishment of this new industry have been dealt with expeditiously and the speed with which it is being established reflects credit on all concerned.

REOPENING OF LONDON GOLD MARKET

The gold-mining industry welcomes the reopening, early in the current year, of the London gold market which had been closed since the outbreak of hostilities in 1939. With the re-establishment of this market the arrangements for the sale at enhanced prices of a portion of the industry's gold output for industrial and artistic purposes were discontinued. I should, however, like to make it clear that this source of additional revenue, which fell away latterly owing to the disappearance of the premium, is not lost to the industry as gold is now sold for its account by the South African Reserve Bank on the London market, or elsewhere if conditions are more favourable. Prices on the London market are not determined by the official dollar/sterling exchange rate and have, in fact, varied from 248s. 3½d. to 249s. 1d., thus providing a small but comparatively satisfactory premium over the price based on the rate of exchange.

INVESTMENT PORTFOLIO

Before concluding my remarks on the gold-mining industry, I should like to draw your attention to two facts connected with your company's investment portfolio. Amongst the new mines expected to come to production during the current year with a yield above the industry average is the Harmony mine in which your company holds a large interest. At the end of March, 1954, of 9,622 ft. of reef development, 94.7 per cent had proved payable, averaging 624 inch-dwt. The general mining conditions appear to be satisfactory and shareholders may look forward with confidence to a good return on the investment in this gold mine, which will also produce uranium. The major proportion of your company's investment is in the older mine which, as you know, last year suffered from an acute shortage of labour. Under industry arrangements new mines receive priority in the allocation of Non-European labour and, in times of shortage, the brunt is therefore borne by the older mines. Conversely, when the supply position eases, the benefit to the older mines is very pronounced. Recently, although the requirements of the new mines have increased, the expansion in the overall supply has been so marked that the underground strengths of these older mines have increased from about 70 per cent of their requirements at the end of August, 1953, to over 80 per cent at the end of April, 1954.

Your company also holds shares in companies whose various interests are coal mining, timber growing and exploitation, and the production of cement, lime and concrete and steel piping.

Although the coal output of South African collieries again reached a record level in 1953 and profits were increased due to this and the higher internal price agreed upon during 1952, the full profit potentialities were not realised owing to the country's overall shortage of transport. Until there is a marked improvement in the railway transport position it will not be possible to exploit the lucrative export trade for which guarantees of continuity in supplies of adequate quantities are essential.

The cement industry, as a result of some improvement in its allocation of railway trucks and in the supplies of coal, experienced a year of better conditions. In the latter half of the year the price control authorities permitted the industry to increase the basic price of cement by an amount sufficient to cover the higher railage rates gazetted in August,

1953. More recently, the Price Controller granted cement producers a further increase of 3d. a packet with effect from January 29, 1954.

The demand for lime has increased and will continue to increase substantially, mainly as a result of the requirements of the expanding uranium industry. The Northern Lime company, in which your company holds a large interest, is making steady progress in its preparations to exploit the extensive deposit discovered at Silverstreams in the Northern Cape Province and should commence production there in the latter half of the current year.

The forestry and sawmilling concerns in which your company is interested had a successful year and continued to expand.

As forecast last year, your directors followed a broad policy of consolidation in the direction of the affairs of the company. Investigations into various ventures were continued, and the very sound financial position of your company will enable it to take full advantage of favourable opportunities for new investment at the appropriate time.

The report and accounts were adopted.

HUDSON'S BAY COMPANY

OIL AND NATURAL GAS DEVELOPMENTS

The 285th annual general court of the Governor and Company of Adventurers of England trading into Hudson's Bay was held on May 21st in London, Mr W. J. Keswick (the Governor) presiding.

The following is an extract from his circulated statement for the year ended January 31, 1954: It was a good year for the company. The consolidated earnings before taxes were £3,061,000, or £297,000 more than last year. Net earnings after crediting £210,000 in respect of United Kingdom tax provisions no longer required were £1,531,000. The total trading dividend paid and proposed of 12½ per cent compares with 10 per cent paid last year. The distribution of 2½ per cent from the land account is unchanged.

Our retail stores set a new record both in sales and profits. Sales figures for the fur trade department were down because of a sharp fall in fur prices and the poor market.

Competition in most of the lines of merchandise dealt with by the wholesale department became more intense, which reduced the average rate of net profit.

Oil and Natural Gas: The year 1953 has been, as anticipated, an active year of exploration and development. A total of 55.3 net wells were drilled and resulted in an increase of 41 net producing wells. Of the total of 11,350,000 acres on which oil and gas rights are now held, 4,460,000 acres are Hudson's Bay Company lands.

Land Department: Collections were again excellent.

GOVERNOR'S ADDITIONAL REMARKS

The Governor, addressing the meeting, said: Ladies and Gentlemen, before moving the adoption of the accounts I would like with your permission to make a few personal observations on our activities and specifically about oil. Last year I spent two months in Canada. I wanted to see at first hand as much as I could of our great organisation which, as you know, is not managed from London, but is under the direct executive guidance of the Canadian Committee in Winnipeg. I was impressed by its skill and drive and by the work and keenness of its very large staff.

A visit to Canada is at any time exhilarating—a country of great resources and abounding confidence. At every point at which I touched the activities of the company I found a similar confidence and the willingness to work hard which confidence in the future begets. Nor is it blind confidence. The people of Canada know that there may be setbacks and hesitations in trade, but they believe also that these will be overcome, for they intend to overcome them.

As the report shows, the retail sales increased substantially. The large modern and well-equipped buildings we now possess are a great asset. Retail sales in any country reflect the general state of the economy. Ours have increased proportionately to the increase in economic activity and in some big cities I believe as much as those of our competitors. We do not seek short-lived records or transient display. There is a lot of money in our retail stores and we are guarding it and using it with the blend of courage and caution which marks our Canadian Committee and management.

It is, however, well to remember that the company's dividends in the immediate years ahead are essentially dependent as hitherto on the success of the stores and other merchandising operations. We should not become blind to this fact in the search for potential oil riches.

OIL A LONG-TERM INVESTMENT

I now turn to oil. In October the Deputy Governor and I attended the half-yearly meeting in Winnipeg to review the operations of Hudson's Bay Oil and Gas Company, Limited. We met together with the senior representatives of Continental Oil Company, the Canadian Committee and the officers of Hudson's Bay Oil and Gas Company. I went also to Alberta. I would like, therefore, to tell proprietors something of what I saw and heard, and, if I can, to share with them some of my faith in this venture.

First of all I must repeat that it is a long-term investment. It must be generally recognised that the development period of natural resources of this kind is bound to be slow and relatively costly. On the other hand, it is right to say that we shall not be spending more than we are receiving indefinitely; there comes a point when revenue begins to exceed the current rate of spending and continues to accrue in respect of past capital expenditure.

Our expenditure is still about two to one of income, or more. Until marketing facilities for both oil and gas catch up with potential productive capacity, this is likely to continue.

Estimates of oil and gas reserves, especially during the exploratory period, can be very misleading and indeed dangerous. I do not think it expedient to try to guess about them until more facts are known.

The sale of both products is governed by one overriding condition, the creation of pipelines to take the oil and the gas to the natural centres of shipment or consumption. An increasing proportion of the oil is being sold, but as yet the marketing of the valuable natural gas has hardly begun. However, a plan is in being to build a gas line from Alberta to eastern Canada—a distance of well over 2,000 miles—which will be the largest gas line in the world. It may be completed in 1957 and will be of the greatest importance to our interests. After completion a few more years will be needed to develop fully the great industrial markets of Ontario and Quebec. This meant that it will probably be 1960 before we see really substantial revenue from our gas.

As regards oil, in 1953 two new oil pipelines—the interprovincial extension from Superior in Wisconsin to Sarnia, Ontario, and the Trans Mountain from Alberta to the West Coast—were completed.

HEAVY EXPLORATION PROGRAMME

The best judgment I could make after very full discussion with the chief executives of the Continental Oil Company, of Hudson's Bay Oil and Gas Company and of your Canadian committee is that the tempo of our progress is about right—not too fast, not too slow. We have in front of us a heavy programme of planned exploration of our very large acreage. Naturally no oil company abandons acreage until it is confident there is no oil or gas to be obtained from it. It is no simple matter to carry out geological and geophysical surveys, and to drill test holes over 11 million acres; and then to sift, digest, and assess the mass of resultant data before taking decisions to develop or reject.

Last year gross exploration and development costs were about $11 million. Net producing wells were increased from 90 to 131—a net gain of 41 producing wells. The daily oil production is now around 5,000 barrels a day, which brings in a gross revenue of around $3½ million. Net prospective acreage was reduced by about 500,000 acres. As this programme progresses, our large prospective acreage should be steadily reduced. This is reducing the large exploration and development programme to the simplest terms, and I should emphasise that a tremendous amount has still to be undertaken.

PEMBINA OIL FIELD

I feel I must make specific reference to the new Pembina Oil Field, recently the subject of much speculative enthusiasm. This is the most important oil discovery in Canada since the Leduc and Redwater fields. It may well cover nearly 250,000 acres and possibly become one of the largest areas of oil production in North America.

Hudson's Bay Oil and Gas Company has substantial acreage in the Pembina area. Starting about three miles from the discovery well and running in an arc from north to south, Hudson's Bay Oil and Gas and Stanolind Oil Company on a fifty-fifty basis hold reservations from the Alberta Government totalling 190,000 acres and, as is the case with all Crown reservations, half the acreage reverts to the Alberta Government when converted to lease.

On these reservations only two wells have been completed. They are some miles apart and indicate that part of the area has some oil, but the economic value of it has not yet been determined.

Further west, ranging from twelve to forty miles from the discovery well, Hudson's Bay Oil and Gas alone has reservations totalling 300,000 acres, half of which also will revert to the Alberta Government. No exploration or drilling has been undertaken yet on this acreage, consequently I cannot give you any idea of its value.

I have no wish to underestimate the possibilities of the Pembina acreage which may add substantially to the oil reserves of Hudson's Bay Oil and Gas Company, but a lot of time and money will have to be spent before its value to that company can be assessed.

COST OF DEVELOPMENT

The most important point, which I must emphasise, is that, if exploration is successful, many millions of dollars will be required to develop production—so for some years we shall not only have to plough back all the earnings of Hudson's Bay Oil and Gas, but also provide additional capital, though this expenditure would be increasing the assets of Hudson's Bay Oil and Gas Company, Limited.

It will be seen, therefore, that we are still in the stage of exploration of our potentialities. But we have come some way in the last six years in our basic objective of making Hudson's Bay Oil and Gas Company a successful oil company for the shareholders of both the continental and of our own company. Obviously one of the first objectives must be to make it a revenue producer so that it can stand firmly on its own feet financially.

I share the opinion with the Continental Oil Company, who, let it be remembered, venture 75 per cent to our 25 per cent of the capital expenditure, that the company is not being held back in any way by lack of finances.

HOPES JUSTIFIED

I firmly believe the success of Hudson's Bay Oil and Gas has more than justified our hopes. We have partners of the highest repute in whom we have great confidence. They carry the burden of directing the company's technical affairs and have built up a first-class organisation with first-class personnel. Our aims are identical and so are our determination and faith in the future.

I believe, also, it is true to claim that your interest in this venture is now worth considerably more than your investment. While your board holds out no rosy visions for the future, it is confident that proprietors will eventually reap a return on their money which will be thought worthwhile.

Finally, I want to assure proprietors that the board intends to keep you informed of any important developments in Hudson's Bay Oil and Gas Company, Limited. We have no desire to allow your oil interests to become the subject of speculation based upon hearsay.

As last year, I give you the percentage of shares held by various nationalities on May 7, 1954, the date on which the share transfer books were closed—United Kingdom 75.54 per cent (last year 67 per cent); Canada 11.31 per cent (last year 17 per cent); others 13.15 per cent (last year 16 per cent).

LATEST NEWS

Since this speech was written and printed we have received some additional encouraging news about Hudson's Bay Oil and Gas acreage interest in the general area of the Sturgeon Lake Field two hundred and fifty miles north-west of Edmonton.

Immediately south of Sturgeon Lake Hudson's Bay Oil and Gas has a one-third interest in a Crown reservation of 100,000 acres, and two exploratory wells are being drilled at the northern end of this reservation.

One of these wells has just struck 35 per cent gravity oil in the reef. This discovery 3½ miles from the original Amerada find may eventually prove to be an important addition to the assets of the Hudson's Bay Oil and Gas. The results of our second well being drilled on this acreage should be known within a week or two.

The report and accounts were adopted.

SCHWEPPES LIMITED

STEADY INCREASE IN SALES

The fifty-seventh annual general meeting of Schweppes Limited was held on May 27th in London, The Hon R. Hanning Philipps, MBE (the chairman), presiding.

The following is an extract from his circulated statement:

In our home trade the volume of sales of Schweppes, Kia-Ora and Quinnette products have shown the same steady increase that they have shown in recent years. The home trading profit has risen from £785,316 to £1,009,884.

During the year, in order to develop the sales in this country of Pepsi-Cola, we formed a new subsidiary, The Park Bottling Company, in which Schweppes hold a substantial proportion of the share capital. This company's operations started in May in the London area and were later extended to the south coast, roughly from Brighton to Southampton. 1953 was little more than a holding operation while preparing our plans for 1954, which include the development of other areas.

I must warn shareholders that under the most favourable conditions they should not expect any material addition to profits from our investment in The Park Bottling Company for at least three or four years.

After reviewing the progress of the overseas companies, the chairman continued: During the year our Franchises in Belgium and Malta have again produced excellent results.

As forecast in my last review, Schweppes (USA) Limited completed their Franchise arrangements with the Pepsi-Cola Company of New York and full-scale marketing started on the eastern seaboard in May. After some initial difficulties the first results were decidedly encouraging. This year our joint operations will cover the more important areas of the United States from twenty main centres. We believe that the plans for opening up the United States market have been well laid and that in due course we may expect to be earning substantial profits.

Before I leave the North American Continent, I should tell you that in May this year, again in conjunction with the Pepsi-Cola Company, we shall be initiating a similar plan in Canada, and later in the year in Mexico.

In the Far East we have entered into Franchise arrangements in Hong Kong, where our products have met with a good local reception. And we are also hoping this year to begin Franchise operations in Colombo.

In Europe we shall finalise plans this year to start Franchise bottling in Switzerland and Norway.

FUTURE OUTLOOK

As regards the current year, I can only tell you that at home our sales show small increases for the first three months when compared with the same period last year; and there is good reason to think that our parent company's trading profit should at least equal the figure we have just put before you.

In the short term, there should be no need to draw profits from Schweppes (Overseas) Limited in order to pay our shareholders reasonable dividends. But in the long term, the overseas developments we are now undertaking will, we hope, produce added benefits for our shareholders as well as adding indirectly to the security of employment of our workpeople.

The report was adopted.

THE EQUITABLE LIFE ASSURANCE SOCIETY

TOTAL FUNDS EXCEED £25 MILLION

Mr J. H. Bevan, the President, was in the chair at the 192nd annual general meeting of The Equitable Life Assurance Society held on May 19th in London.

Extracts from his speech are:

I would like to say a word about my predecessor, Sir William Elderton, who last year decided to relinquish the Presidency of the Society owing, he said, to advancing years.

Sir William was appointed actuary and manager in 1913, a director in 1940, and President in 1947. He has thus served the Society so far for 41 years.

Turning to the accounts, it will be seen from the summary revenue account that the total funds now exceed £25 million, the first occasion in our history.

Claims by death at just under £280,000 were considerably lower than in 1952.

Expenses are practically unchanged at £127,000, and they represent only 6.2 per cent of the premium revenue.

On the other side of the summary revenue account, the net income from interest, dividends and rents exceeds £1 million for the first time. The rates of interest earned on the funds, both gross and net after deduction of tax, have improved.

Our new business at just over £4 million is at about the same level as for most of the years since the war.

On January 1st last we re-opened the minor profits class; this class shares in excess surplus after certain "standard" rates have been declared in the major profits class.

THE LUNUVA (CEYLON) TEA AND RUBBER

MR H. W. HORNER'S ADDRESS

The annual general meeting of The Lunuva (Ceylon) Tea and Rubber Estates, Limited, will be held on June 10th in London.

The following is an extract from the circulated statement by the chairman, Mr H. W. Horner:

Costs in Ceylon have not yet been stabilised and, although our results show an average increase in net selling price of almost 2d. a lb over 1952 upon a slightly larger crop, the difference between sale proceeds and cost of production is, by reason of higher costs, only some £42,000 more than in 1952. These results do not include the higher prices of recent months, which will be reflected in the accounts for 1954.

The profit before taxation is £185,523 against £178,438 for the previous year. The board feel that the slightly improved position and the satisfactory prospects for the near future justify a total dividend of 15 per cent and they accordingly recommend a final dividend of 11 per cent.

On present indications, our prospects for the current season show considerable improvement on last year. We estimate to produce crops similar to those of 1953 at costs not appreciably greater. The tea market remains strong and the rubber market has recently shown a welcome indication of revival.

No forward contracts have been made in respect of 1954 crops, either for tea or for rubber. Your estates are in first-class order and labour conditions throughout the year have been generally good.

ROYAL DUTCH PETROLEUM COMPANY

The Board of Directors :

J. B. AUG. KESSLER, *Chairman.* W. H. VAN LEEUWEN, J. KLOPPER, E. J. IJZERMAN, W. H. DE MONCHY, C. J. COLLOT D'ESCURY, F. Q. DEN HOLLANDER, J. LUYTEN, A. S. OPPENHEIM, M. P. L. STEENBERGHE, B. TH. W. VAN HASSELT

The Managing Directors :

J. H. LOUDON, *General Managing Director.* H. BLOEMGARTEN F. A. C. GUEPIN L. SCHEPERS

PRINCIPAL POINTS OF INTEREST IN THE ANNUAL REPORT ON 1953

The income of the Royal Dutch Petroleum Company for 1953 of fls. 165,050,109 (as against fls. 161,194,788 for 1952) makes it possible to pay a dividend of 4 per cent on the preference share capital of fls. 1,500,000 and of 16 per cent on the ordinary share capital of fls. 1,013,638,000 outstanding on 31st December, 1953; this includes an interim dividend of 4 per cent made payable on 4th February, 1954.

The Royal Dutch/Shell Group of Companies again increased its total sales during 1953 and well maintained its position in the world markets. Its production of crude oil and natural gasoline, including quantities received under long-term contracts, amounted to 617 million barrels in 1953, as against 599 million in 1952.

The average rate of throughput in its refineries amounted to over 1.7 million barrels daily, 626 million barrels per annum

The total tanker tonnage operated by Group and associated companies amounted to 6.9 million tons. Of this total, which includes period-chartered vessels, 2.5 million tons were owned. The number of large vessels in service, with carrying capacity ranging from 23,000 to 32,000 tons, amounted to 32.

The total length of long-distance pipe-lines, wholly or partly owned by the Group, was some 15,100 miles at the end of 1953.

The annual report of the Royal Dutch Petroleum Company will include, as previously, financial statements of the Royal Dutch/Shell Group of Companies.

The net income of the Group for 1953 amounted to £130 million (£125 million in 1952).

Sales proceeds and other income totalled £1,700 million (£1,616 million in 1952).

Capital expenditures for 1953 were £220 million (£188 million in 1952), representing the largest capital expenditure programme in the history of the Group.

Sales taxes, excise duties and similar levies collected and paid by the Group to Governments totalled £348 million, an increase of £45 million compared with 1952.

From the net income of £130 million dividends have been declared in respect of the year 1953 to the parent companies, viz.: Royal Dutch Petroleum Company and The "Shell" Transport and Trading Company, Limited of £22,186,010 (for 1952, £22,168,883). The balance has been retained in the business.

Copies of the full report and accounts can be obtained free of charge from N. M. Rothschild and Sons, New Court, St. Swithin's Lane, London, E.C.4.

PRESSED STEEL COMPANY LIMITED

ANOTHER SATISFACTORY YEAR

RECORD MOTOR CAR BODY OUTPUT

MAJOR ALBERT PAM'S REVIEW

The twenty-seventh annual general meeting of the Pressed Steel Company Limited was held on May 26th at Winchester House, Old Broad Street, London, E.C., Major Albert Pam, OBE, chairman, presiding.

The secretary (Mr F. E. Cairns, CA) read the notice convening the meeting and a representative of the auditors, Messrs Price Waterhouse and Company, read the report of his firm.

The following is the statement by the chairman which had been circulated with the report and accounts for the year ended December 31, 1953:

Ladies and Gentlemen, You will have seen from the report and accounts which have been in your hands for the requisite period, that your company has again had a satisfactory year. After an appropriation of £250,000 to the reserve for increased cost of replacing plant, machinery and equipment, the profit is £804,548. Adding to this the balance brought forward from last year, the total sum to be dealt with is £2,347,023, from which falls to be deducted an aggregate of £549,231, leaving £1,797,792. The directors recommend a transfer to general reserve of £500,000, and the payment of a final dividend on the ordinary stock for the year 1953 of 12½ per cent, less tax, absorbing £227,868.

PROFIT AND LOSS ACCOUNT

The profit and loss account shows that the balance from trading account has increased by over £640,000. Depreciation and obsolescence is higher by more than £200,000. Taxation has risen by over £400,000, but fortunately the item for excess profits levy of £348,000 will not occur again.

Of the total of £1,474,000 set aside for depreciation and reserves, £688,000 was actually spent during the year on new plant and equipment; the balance of £786,000 is destined for further purchases of new plant, of which approximately £650,000 was already on order at the end of 1953.

Your board intend to continue the policy of renewing and modernising our plant and equipment; this will enable us to meet the requirements of our many customers in the motor car industry, and to ensure that our important refrigerator and railway waggon divisions are fully efficient and up to date.

CAPITALISATION OF RESERVES

We are fortunate to have been able, almost since the foundation of your company, to put aside considerable sums for our expansion. We have not needed to make issues of debentures or notes, and our capital structure is extremely simple. During the past financial year we have increased the issued ordinary stock by capitalising £1,657,222 of reserves, to bring the capital of your company more in line with the real assets. The issued ordinary stock is therefore now £3,314,444, and the total issued capital is £4,633,055. In spite of this, our general reserve is £1,750,000, provision for depreciation and obsolescence £3,415,900 and our special reserve for the increased cost of replacement of plant, machinery and equipment £1,761,365, with a carry-forward into 1954 of £1,069,924.

There is unfortunately a great deal of misunderstanding with regard to the capitalisation of reserves. Many people look upon it as a distribution to shareholders, and as a benefit which companies give at the expense of the employees. This is an entirely wrong conception. The reserves which are used for this purpose are profits on which income tax and undistributed profits tax have been paid, but which have been ploughed back into the business to provide additional buildings, machinery, equipment, etc. These new assets enable the company to increase production and to employ more labour. The ploughing back of these large sums over a period of years for provision of these assets has the effect of making the actual capital employed by the company much larger than the stated capital shown in the balance sheet; this is misleading to stockholders and customers.

To put this right, the directors decide to capitalise these reserves, so that they appear in the balance sheet as capital in the form to which they have been converted, namely, buildings, plant, machinery, etc., etc. After approval by the shareholders, the directors issue new ordinary shares which are distributed to the stockholders, and the new stock then forms part of the capital of the company. But these new shares only represent a participation in the company, and the stock market price of the company's shares is automatically adjusted to represent the value of the shares in the increased capital—in the case of the recent doubling of our capital by the capitalisation of the reserves, the price of the shares on the Stock Exchange, London, was halved because there were then twice as many shares existent to participate in the assets and profits of the company, which had in no way been affected by the issue of additional shares.

BENEFIT OF AMALGAMATIONS

One of the most important events in the motor car industry during the past year, was the amalgamation of the Austin and the Morris companies; both are customers and old friends of your company. Although the range of car models may change, we do not expect that this grouping, which has already proved beneficial to the two companies concerned, will result in loss of business to us.

There has also been an announcement that talks are taking place between two other concerns which are old friends of ours, Standard and Rover. In this case too I feel sure that the amalgamation, if it should eventuate, will not only do us no harm, but may, in fact, give us increased orders.

I am convinced that these amalgamations should be welcomed and encouraged—they enable the companies concerned to concentrate on the special type of cars for which they are best suited, and to produce these at the lowest price with the greatest efficiency.

Since the absorption of Fisher & Ludlow by the British Motor Corporation, and of Briggs Motor Bodies by the Ford Company, we are the only large independent motor body builders left in the country. There have been many rumours that we too were about to be absorbed, but we have told all inquirers that they are not true. We feel that we owe a duty to the whole motor car trade to remain independent, and to put our services at their disposal for any work they may entrust to us. Your board is therefore resolved to maintain our position as suppliers to all and sundry, and to do our best to meet their demands efficiently and at the lowest possible price.

STAFF AMENITIES

During the past year we opened for the use of our staff and employees the company's new sports ground. It will prove to be a great asset for those who play, and for those who like looking on. Unfortunately, we have not yet received a licence to build a pavilion; there is a temporary structure, which in time will be replaced by a good pavilion.

The company's "25 Year Club" has this year gained 100 members, and there are now 328 members who have completed 25 years' service. Our hospitals have again rendered most useful service, and have in 1953 treated 122,405 cases of every kind. We have bought a new large X-ray apparatus, which will be useful for the diagnosis of chest and lung complaints and other purposes.

FACTORIES AT HIGH PRESSURE

During the past year our motor car body business, including pressings and assemblies, has been well maintained, and we have a number of new orders for improved models and types. Our three factories have been working at high pressure, and our output has been another record.

We have received a further order from British Railways for railway waggons, which will keep that section of our Linwood works busy for two years or more. In these works we are also building assemblies of an RAF fighter plane of very modern design and wonderful performance.

Our Theale factory too has been producing a record number of systems for our domestic Prestcold refrigerators, which have maintained their place as the most popular British-made refrigerator.

I know that you will be interested to hear that the Pressed Steel Fellowship foundation in the University of Oxford has again received great praise from those best qualified to judge the results of the research work undertaken by the Fellows. This work is all within the sphere of the physical sciences, including metallurgy; I must confess that I could not tell you what was being done because this is far above my knowledge. However, I had a letter and a long report last week from Lord Cherwell, the head of the Clarendon Laboratory, and a noted physicist, who is on the committee which controls these Pressed Steel fellowships. He states that industry benefits greatly from such fundamental research, as technologists can and do apply the results for useful industrial purposes.

THE LATE DR G. L. KELLEY

Although it is mentioned in the report, I must refer to the loss which we have all suffered by the death of Dr G. L. Kelley, who joined our company from the United States in 1931 as an expert on steel and its structure, became a director in 1940, and on the death, in 1942, of Mr. Otto Mueller, was induced by me to accept the position of managing director. I had the highest regard for his knowledge and experience, and his death was a great personal blow to me, as he and I had worked together right through the war; he was one of the most loyal and helpful of the staff of the company. He was modest to a fault, but his

opinion was accepted generally as one of our leading experts on steel, and he was held in high regard by both industry throughout the country and the University of Oxford. After his retirement from the managing directorship in 1947 he became deputy chairman of the company, so that his services continued to be available to us.

The only other matter to which I wish to refer is to ask you to allow me to thank on your behalf the management, staff, and all employees of the company for their efficient services during the past year; these have enabled the company to produce the satisfactory results which are shown in the profit and loss account.

The report and accounts were unanimously adopted; the dividend, as recommended, was approved; and the retiring directors, The Rt Hon Lord Ashburton and Mr Alex. Abel Smith, were re-elected.

RANSOMES SIMS & JEFFERIES, LIMITED

A SATISFACTORY YEAR

The seventieth annual ordinary general meeting of Ransomes Sims & Jefferies, Limited, was held on May 27th at Ipswich, Sir Reuben Hunt, chairman, presiding.

The following are extracts from his circulated statement:

The trading results of the parent company and its subsidiaries for the year to December 31, 1953, amount to £337,404.

The past year has proved a difficult one, but our turnover approximates to the level of 1952. It is, therefore, gratifying to report a satisfactory year.

Agricultural engineering is very largely geared to the wholesale price level of commodities and although in the last few months some of these have risen, thus tending to increase our order book, yet the present volume of incoming orders is insufficient to maintain our works at full capacity when all orders relating to previous years have been executed.

CHAIRMAN'S ADDITIONAL REMARKS

Addressing the meeting, the chairman said: In my comments which were circulated with our annual report, I pointed out that the gap between despatches and incoming orders was narrowing slightly, and fortunately this tendency continues. Although incoming orders are still insufficient to load the factory fully, for the first four months of this year compared with the corresponding four months of last year they are 20 per cent up. It is hoped that the better trend in incoming orders will continue, as the further rise in the wholesale price level of commodities is undoubtedly having some effect on the purchasing power of our customers.

Nevertheless, the export position is far from satisfactory. With some of our overseas market entirely closed, e.g., Argentina and Brazil, the others strictly limited by licences, quotas and tariffs, it is impossible to foresee how things will settle down. In the home market we are fairly well satisfied with the position, but in the export market, until governments are willing to promote freer trade, the position will undoubtedly remain one of difficulty and anxiety.

The recent wage award will lead to increased selling prices for some of our goods and certainly weaken our competitive power in export markets in spite of our endeavour to obtain a larger turnover. It is on this larger turnover that we must depend for any increase in our profits.

The report and accounts were adopted.

GOPENG CONSOLIDATED, LTD

The forty-first ordinary general meeting of Gopeng Consolidated, Limited, was held on May 19th at the registered office, Redruth.

Mr Donald W. Thomas (chairman) presided.

The reports and accounts for the year ended September 30, 1953, having been circulated for the prescribed time, were taken as read, as was also the chairman's statement, circulated with the reports and accounts, which was as follows:

The accounts for the financial year ended September 30, 1953, show a profit of £107,358, after payment to the Malayan Government of £52,772 for royalty on ore sales and provision of £83,708 for United Kingdom and Malayan taxation and the sum of £279 for depreciation in Malaya. The profit is considerably less than that for the previous year owing to the lower tin price prevailing throughout the period under review and to the lower yardage and average grade of the ground treated. Whilst the price of tin has appreciably risen in recent weeks the future price trend is very uncertain and will probably be considerably influenced by the results of the participation or non-participation in the proposed International Tin Agreement by the governments of a requisite number of tin producing and consuming countries. Earlier this year the Federal Legislative Council of Malaya resolved to request Her Majesty's Government to sign the agreement on behalf of the Federation.

Since the end of the financial year under review the rehabilitation account has been concluded and the accounts for the current year, when published, should be the last in which these various entries will appear.

The attention of the stockholders is drawn to the report of our managers, Messrs Osborne and Chappel, and the comparative table of mining results during the year. Owing to the low price of rubber, both the Sanglop and Moynalpy Estates showed a slight loss.

SECURITY CONDITIONS

Whilst progress has been made in the last year or so in ridding the country of Communist terrorists, there are still danger spots, and security measures in these areas continue to be necessary. Towards the end of last year. I visited Malaya, and on several occasions I was at Gopeng. Wherever I went I found nothing but cheerful optimism prevailing and a sense of certainty that, in course of time, this menace will be overcome.

Your directors wish to place on record their appreciation of the services of the general managers and the staff at our mine and the estates. I was much impressed with what I saw at the mine and, in particular, at the good work which had been put in on the deviation of a large section of the Kampar water supply pipe line, and since the close of the financial year the deviation has been successfully brought into service. The consequent reorganisation caused temporary reduction in outputs, but the benefit will be obtained from the release of a block of good ground for profitable exploitation.

With the present uncertain state of the tin market it appears that in common with the majority of mining companies, stockholders would be wise to anticipate dividends on a lower standard than has obtained during the past few years, but with the adequate financial reserve and cheap hydraulic power I consider that stockholders have every reason for confidence in the future.

The report and accounts were adopted.

BRITISH ENKA, LIMITED

GREATLY INCREASED OUTPUT AND SALES

MR A. D. CARMICHAEL ON THE SATISFACTORY RESULTS

The twenty-ninth annual general meeting of British Enka, Limited, was held on May 26th in London, Mr A. D. Carmichael, CBE (the chairman) presiding.

The following is an extract from his circulated statement:

The group working profit is £1,033,426 which compares with £289,966 for 1952. After various charges there is an operating profit of £701,592 and, after provision of £350,932 for taxation, a net profit for the year of £350,660. After adding the balance brought forward from last year, £26,976, and £9,608 provision for taxation made in previous years now no longer required, the available balance is £387,244. The directors have appropriated £100,000 for general reserve. They recommend the payment of a dividend of 10 per cent less income tax which will absorb £103,125, leaving a balance to be carried forward of £184,119.

We are the second largest viscose rayon producer in this country. Our yarns are used in a variety of trades connected with the textile industry, and we produce substantial quantities of industrial yarn for the manufacture of tyres, belting, etc. We have a wide spread of clients in many trades. During 1953, the improvement in trade which was felt in the last quarter of the preceding year, continued, and the company were able to resume normal production. Our total output and sales greatly exceeded those of the depression year of 1952 and were slightly in excess of the record year of 1951. It was nevertheless a difficult year. In certain sections of the trade, the demand was greater than we could fulfil, but in others, clients limited their purchases to their immediate requirements for very quick delivery. The crepe cloth trade, which took so much of our output in the years preceding 1952, was still very quiet. Our own stocks decreased and it is clear that our clients have very light stocks of yarn. Both on the commercial and technical side the staff have had to meet many problems. The results are a credit to them.

HIGH-GRADE QUALITY YARN

Rayon yarn production is not static, and through research and development and the study of clients' requirements, we are making special efforts to improve the already high-grade quality of the yarn we produce, and to ensure that it continues to be in every way equal to the demands made upon it by the most up-to-date processing, weaving and knitting machinery which may be installed.

With regard to the future, we expect stronger competition overseas, in yarn and fabric, and competition from synthetic fibres. We have had to meet a wage increase in 1954. There is a tendency for freights and raw materials to harden or increase in price. We are concentrating our efforts on maintaining a very high level of technical efficiency and a low cost price. By this means we hope to maintain the substantial advantage in price enjoyed by viscose rayon yarn over so many other man-made fibres. Viscose rayon yarn can be made into a very wide range of attractive, well-designed, durable articles, for which there should always be a regular demand. We shall use our endeavours to see that we secure a full measure of the available business.

The report was adopted.

THE LONDON ELECTRIC WIRE AND SMITHS

SALES RECOVERY

The forty-fifth annual general meeting of The London Electric Wire Company and Smiths, Limited, was held on May 25th in London.

Mr A. Noel Smith, chairman, in the course of his speech, said: The balance profit for the year at £1,076,520 is down by £230,590 as compared with 1952 excluding profits on realisation of investments, which are increased. Last year in his speech the chairman indicated that there was a falling demand towards the end of 1952 and the setback continued well into 1953. Towards the latter part of the year there was a slow recovery, but the volume of sales for the whole year was lower than in 1952. Apart from the demand in respect of one subsidiary, I am happy to say that the recovery has been maintained during the first few months of 1954 and I hope this trend will continue.

The charge for taxation on the 1953 profits is considerably lower than for the previous year, but it still represents approximately 50 per cent of the profits earned. After deducting taxation there remains a net profit for the year of £536,395, which is £25,815 higher than for 1952. This net profit together with the balance brought forward from the previous year leaves a sum available for reserves and dividends of £1,025,216.

An interim dividend of 5 per cent was paid last October on the £1 million ordinary stock then issued and the final dividend of 7½ per cent, which the board recommended should now be paid will bring the total dividend for the year up to the equivalent of 10 per cent on the £2 million ordinary stock now issued. Your board, in considering the question of the final dividend on the increased ordinary capital feel that they are justified in recommending a larger distribution than in previous years.

SALES

The long anticipation of a substantial fall in the price of copper resulted in our customers restricting their orders and only buying from hand to mouth. This position still persists, although since the copper market re-opened, there has been a slow but steady recovery in orders received, right up to the end of the year, and indeed, up to date. These changed conditions have had to be met by modifications in methods and outlook both in our factories and sales organisation.

In the technical field, too, the changed conditions arising from a "buyers' market" have called for a new and intensified effort.

THE FUTURE

I know that you will wish me to say something about the future, however difficult this may be under present conditions. You will like to know that all your company's factories are equipped with the most up-to-date plant and methods of manufacture and it is to achieve this position that we have spent large sums of money. The new rolling mill at our Trafford Park Works—which is one of the finest in the world—will shortly be coming into production. The mill is of new design and while capable of high outputs, has been planned with a special view to producing a rod of much better quality than has been possible in the past.

It is disheartening to find that our efforts to keep down costs of production are defeated by frequent increases in costs of services, such as coal, gas, electricity and transport. This instability in costs and its effect on selling prices makes the task of competing in overseas extremely difficult.

Increasing competition is experienced in overseas markets where we have many branches and agencies. Last year our direct sales in export markets showed a moderate increase as compared with the previous year, in spite of growing competition.

The report was adopted.

CITY DEEP LIMITED

MR N. W. S. LEWIN ON DOMESTIC PROBLEMS

At the annual general meeting held in Johannesburg on May 10, 1954, Mr N. W. S. Lewin presided and, in the course of his remarks, said:

As you are well aware, the City Deep mine is passing through a difficult period, partly on account of the general restrictive conditions that exist throughout the gold-mining industry in the shape of shortages of labour and power, partly on account of the problems which are common to the older Central Rand mines and which are associated with the extension of the mine into the ultra-deep levels, and partly because of the particular problems that are peculiar to the mine itself. I do not think it is necessary for me here to emphasise the restrictive effects of the general economic conditions under which the industry is working other than to point out that the mine's own domestic problems would be much more readily resolved had these not existed.

These domestic problems are concerned mainly with the programme of incline shaft sinking and the provision of adequate ventilation required to open up and work the new areas below a depth of 8,500 ft on which the future of the mine largely depends. Satisfactory progress is being made in this direction, but the capital expenditure entailed will, as stated on previous occasions from this chair, be a heavy drain on the financial resources of the company for some few years to come.

A CREDITABLE PERFORMANCE

Whilst much effort is being directed towards the expeditious establishment of these deep levels, good progress continues to be made in improving the operational efficiencies of the existing workings. In this connection I would draw your attention to the very creditable improvements attained by the management and recorded in the annual report before you: in spite of a decrease of about 9 per cent in the labour force compared with the previous year, the total footage developed increased from 50,880 to 58,640 ft and the tonnage milled increased from 1,851,000 to 1,922,000 tons. There was a small decrease in total working expenditure, and working costs per ton milled were lower by 2s. 1d. at 45s. 2d. On the other hand, however, there was a decrease in revenue of 3s. 6d. per ton milled, due partly to the decrease in the additional revenue derived from sales of gold at enhanced prices, and partly to a decrease of about 0.2 dwt per ton in the grade of ore sent to the mill. This decrease in the grade is attributable to several factors, but mainly arises as a result of the change over from mining in scattered areas on the resue system of stoping to concentrated mining on the open support longwall stoping system. While the latter method of stoping has certain limitations in so far as grade control is concerned, the choice is enforced by the necessity to limit pressure bursts at deep levels, and there are associated advantages in terms of improved general efficiency and ventilation.

The report and accounts were adopted.

P. & O. STEAM NAVIGATION COMPANY

REPLACEMENT PROBLEM

The one hundredth and fourteenth annual meeting of the Peninsular & Oriental Steam Navigation Company was held on May 26th in London.

Sir William Crawford Currie, GBE, chairman, in the course of his speech, said: There was a big contraction in earnings compared with 1952. This was not unexpected, as I forecast when we met a year ago, and was experienced chiefly in the bulk cargo sections of our business in which cargo liners as well as tramp ships participate. Tramp rates of freight fluctuate more violently than liner rates, and it was the tramp ships which gained most from the 1952 boom and which suffered most in the subsequent recession.

Fortunately, part of the reduction of £5½ million in net earnings was offset by a reduction in the charge for income tax. In addition, most of the excess profits levy, for which we were liable in 1952, is recoverable on the results for 1953, so that the total charge for taxation in the profit and loss account is reduced by £4 million.

The shipping industry for some years has been pressing for recognition by the Government that depreciation on historical cost will not provide for the replacement of fleets. In this inflationary age the depreciation has to be supplemented by accumulations of cash, mainly obtained out of taxed income. A system of initial allowances was introduced some few years ago to give some immediate relief. The system was welcomed, though the tax relief was no more than an interest-free loan which had to be repaid.

INVESTMENT ALLOWANCES

The inherent weakness of this system of temporary loans to industry has now been recognised by the Government and, in general, it is to be replaced by investment allowances on expenditure on new ships and plant. The effect of the new allowances will be that a sum equal to 20 per cent of the expenditure on all new ships will be allowed as a charge against taxable profits; the resultant tax saving will not have to be refunded at a later date, as is the case with initial allowances. I have seen the investment allowance described as a subsidy. It is not. It is simply a reduction in taxation. Tax relief is not a subsidy.

We are grateful to the Chancellor of the Exchequer for the new allowance; we hope that when the report of the Royal Commission on Taxation is published, it will contain proposals which will be of lasting benefit to the shipping industry and therefore to shipbuilding.

At the end of this meeting stockholders will be asked to approve two resolutions, one to increase the capital to £25 million, and the second to capitalise £6,888,777 of the reserve account and allot to deferred stockholders a 100 per cent scrip issue.

On the assumption that this meeting will pass the resolutions already referred to, the board has decided that an *ad interim* dividend of 3 per cent will be declared in the autumn for payment in November on the capital as increased. The profits of the first half of the current year have been about equal to those of the corresponding period last year, but I am unable to venture a forecast for the remainder of the year.

The report was adopted and the capital proposals were approved.

LONDON BRICK COMPANY

MR A. T. WORBOYS ON IMPORTANCE OF BRICK PRICES

The fifty-fourth annual general meeting of the London Brick Company Limited was held on May 21st in London.

Mr A. T. Worboys, CBE (the chairman), presided, and, in the course of his speech, said: The trading profit and sundry income for the year amounted to £1,940,351, as compared with £1,703,350 last year. After providing £400,000 for depreciation of fixed assets and £1,174,674 for taxation and other charges, there remains a net profit of £365,677. To this has been added £284,068, the unappropriated profits at the beginning of the year, and £133,416 for taxation adjustment in respect of previous years. This makes a balance available of £783,161.

Referring to Transformers (Watford) Limited, the manufacturing subsidiary company, the chairman said: During the year a transformer tank shop has been opened and equipped with up-to-date plant for the production of all sizes of tanks formerly purchased from outside suppliers. A considerable extension of the main assembly shop was commenced towards the end of the year and is now nearing completion.

YEAR OF CONTINUED PROGRESS

The year was one of continued progress in what has been our main effort during the postwar years, the expansion of our manufacturing capacity and the improvement of its efficiency.

It will have been evident from the financial results that in 1953 we were receiving a real weight of benefit from the extent to which that programme had been carried out. The results were record figures for the production and delivery of all our products.

We processed half a million more tons of clay than in our best pre-war year, and we did it in a shorter working week, with a smaller expenditure of manhours and of manual effort due in no small measure to increased mechanisation. Both the stockholders who have provided additional capital to finance these extensions and our employees who have operated them to such good purpose are benefiting from the results; the stockholders from the dividend proposal and the employees not only through the profit-sharing bonus scheme, which is directly related to the dividend paid to the ordinary stockholders, but also, week by week, from the considerable production bonus which frequently means an addition of 22s. to the weekly pay packet.

I think I can claim that the benefits of our progress went very much further afield. We have had a number of visits by successive Ministers of Works, whose departments are concerned in assisting the adequate production of building materials and who have always been ready to help us. We had not previously had the pleasure of seeing at our works any of the Ministers responsible for housing until Mr Harold Macmillan visited our Stewartby works last September. Writing to me afterwards he was good enough to conclude with this paragraph: "May I say again how much this year's housing programme owes to your efforts and co-operation." We are all proud of that tribute.

PRICE OF BRICKS TOO HIGH

But there is another and more general benefit for which we had hoped from our increased efficiency which has not been realised; it has not been possible as yet to make a general reduction in the price of bricks. I make no secret of our view that the price of bricks is too high, not only in the interests of economic building, but for the health of the brick industry itself. I was able to tell our stockholders a year ago that out of our increased efficiency we were then being able to absorb higher charges for transport and coal, but in July wages awards covering the whole industry and falling alike upon the just and the unjust, compelled an increase in prices. To continue the subject into this current year, the further rise of 10 per cent in rail freight charges—a formidable addition to costs in the case of so heavy a product as bricks—again lowered our hopes of a general reduction in prices. The very slight expectation that the 1954 Budget might reduce the monstrously heavy taxation upon the transport of everything from bricks to bread represented by the 2s. 6d. per gallon duty on diesel oil was not realised.

NEW WAGE DEMAND

I am sorry to have to interject at this point the news that during the past few days a new wages demand has been made upon the building materials group of industries. I say that I am sorry not because we begrudge our employees their fair share of present prosperity and, certainly, not because we have any thought of departing from our long-standing policy of being generous employers: no one can criticise our record in those directions. I regret this new demand because it suggests a disregard for the long-term welfare of all those working in the building industries.

I believe that the great proportion of our own workers are quite satisfied with our treatment of them, and that they believe with us that any policy of making hay whilst the sun shines could be disastrous for our industry.

We have been able to pass on to the building industry one real benefit of our increasing production: it is now beginning to reduce the delivery delays which we fully realise have been an additional handicap in the efficient planning of building contracts. We are still a long way from the delivery service which it was our pride to give in the pre-war days, but the position is now improving month by month.

PRODUCTION TARGET

Our present target is to produce during this current year bricks and brick equivalents—hollow blocks, electrical cable covers, agricultural pipes and the like—to a total of 2,000 million. Present indications are that we shall exceed that pleasantly rounded figure.

In addition to proceeding with the general programme of increased and more efficient production, we put in hand last autumn major extensions at two of our three hollow-block works, at Clock House in Surrey and Warboys in Huntingdonshire.

During the year we had to install additional plant to meet more nearly the heavy demand for our "Saxon" and "Tuscan" types of facing brick which we had earlier introduced as variants upon our Sandfaced brick. We took advantage of the 1953 Building Exhibition to obtain the verdict of architects and builders upon two possible versions of yet a third new type, then only in its experimental stage. This brick, golden buff in colour, could be used appropriately amongst stone buildings where the normal brick-red offends the eye. It was clear from the great interest shown at the Building Exhibition that there was a large potential demand for a brick of this sort at the price which we expect to charge. The brick will shortly be in full-scale production.

The development of this brick is an example of the great value to the company of its research and engineering departments. We have been able to deal with the whole project within the framework of the company from the basic idea to the machinery installed and ready to produce.

FUTURE PROSPECTS

To turn in conclusion to the prospects for the current year. We have no doubt whatever that there will be an over-demand for all the material that we can produce during this year when the official estimate for houses completed is higher than that for last year. It is true, to look a little further ahead, that the number of starts upon officially built houses is rather lower than at this time last year, but, on the other hand, we have clear evidence of an increase in privately built housing which will be furthered by the scheme for encouraging the would-be house buyer announced recently by the Minister of Housing. There is, also, increased activity in industrial building.

A growing proportion of private and industrial building, which is more sensitive to costs than Government and municipal construction, does underline what I have said about the importance of brick prices. Even in municipal building the size to which the financial burden upon the country is mounting must, sooner or later, enforce a stricter consideration of costs and all of us engaged in the building industry, whether representing capital, labour or management, need to bear well in mind the hard and inexorable fact that there is a limit to which the cost of building can go.

That is looking farther ahead than the needs of this review: it will be sufficient for me to say that I have no fear of your dissatisfaction with the results which I shall report to you when we meet again next year.

The report was adopted.

THE ROCK INVESTMENT COMPANY, LIMITED

FURTHER PROGRESS

The thirty-fifth annual general meeting of The Rock Investment Company, Limited, was held on May 25th in London, Mr C. W. Black, JP, MP, FRICS, FAI, chairman, presiding.

The following is an extract from his circulated statement for the year 1953:

We have made further progress in rebuilding the fortunes of your company. We have received dividends on the share capital of our wholly-owned subsidiary, The Oak Property Company Limited, at the rate of 5½ per cent on the cumulative preference shares and 13.2 per cent on the ordinary shares.

Very substantial changes have taken place in the investments of The Oak Property Company Limited and its subsidiaries. The companies were in the position of owning a number of sites acquired for the purpose of erecting parades of shop property with two floors over, but war and postwar conditions prevented these developments. Under the policy of the present Government, however, a large degree of freedom has been restored, and it is now usually possible to obtain building licences to undertake developments of this kind. In these changed conditions it would be greatly to the advantage of the company for these building schemes to be put in hand, and your directors accordingly entered into the necessary arrangements.

By December 31st last the companies were engaged in the erection of 35 shops with residential upper parts, comprising 42 flats and maisonettes, and lettings had been arranged of no less than 19 of these shops and upper parts, mainly to leading multiple traders.

The companies have, since December 31st last, undertaken further developments of a similar character.

The resources of the company are being fully employed, and a progressive policy is being pursued.

The report and accounts were adopted.

THE SEA INSURANCE COMPANY, LIMITED

YEAR OF PROGRESS

The seventy-eighth annual general meeting of The Sea Insurance Company, Limited, was held on May 25th in Liverpool. A statement by the chairman, Major A. Harold Bibby, DSO, DL, had been circulated with the report and accounts for the year ended December 31, 1953.

The chairman referred to the new form of accounts showing figures which had been consolidated with those of the subsidiary company, the Beacon Insurance Company, Limited, in all departments except those transacting life and capital redemption business.

The "Beacon" life business had been successful with net new sums assured of £5,366,086 and separate accounts were submitted for this and the capital redemption business.

In connection with the marine business, Major Bibby remarked on the value of competition, but drew attention to the prospects of unprofitable trading following the tendency to reduce rates excessively and to offer wider cover in an effort merely to maintain premium income.

Turning to the accounts, Major Bibby reported that the total premium income of the group, excluding the "Beacon" life and capital redemption business amounted to £4,130,483, an increase on last year.

The 1952 marine underwriting account had been closed after charging £562,477 to meet outstanding claims, and a credit balance of £109,549 had been transferred to profit and loss account. The "Beacon" had opened a marine account under the management of the "Sea," and for that purpose the sum of £15,000 had been provided.

The premium income of the fire department amounted to £1,215,623 and the profit of £109,765 had been transferred to profit and loss account.

The accident department premium income at £922,182 showed a substantial increase on the previous year, but the year's working had resulted in a loss of £44,623.

In the profit and loss account £155,995 had been reserved for U.K. taxation, as against £275,000 last year.

A final dividend of 15 per cent was approved, making 25 per cent for the year, the same as before. The total group assets now stand at £15,747,972 and the market value of the investments is substantially in excess of the figures shown in the balance sheet.

The accounts were adopted and Major Bibby paid tribute to the work done during the year by the company's agents at home and abroad. The meeting closed with a vote of thanks to the chairman and directors, also officers and staff of the company.

THE SOCIETY OF INCORPORATED ACCOUNTANTS

MR C. PERCY BARROWCLIFF ON NATIONAL EXPENDITURE

The annual general meeting of The Society of Incorporated Accountants was held on May 26th in London.

Mr C. Percy Barrowcliff, the President, was in the chair, and in the course of his speech said: The report of the council for 1953 shows a year of activity and achievement.

I am confident that I express the views of the vast majority of Incorporated Accountants when I say that the time for the registration of the profession is long overdue. The public are entitled to protection from unqualified practitioners in the accountancy field just as much as they are in other professional spheres. The problem is urgent and I can assure members that the Council are more than anxious to see it finally resolved within the possibilities of all present circumstances.

Profit Sharing: I have personal evidence of the beneficial effects of profit sharing schemes on the success of business and also on the relations between workers and management. In all such schemes, the necessity for capital accumulation must remain a first consideration. The ploughing back of profits is still one of the main supplies of capital for the modernisation, the natural expansion and the general financial strengthening of business. It is a matter of supreme importance that capital formation should rank as an essential claim on the profits.

On the subject of accounting in relation to fluctuating price levels, Mr Barrowcliff said: I consider it of the utmost importance that our members should in appropriate cases recommend the adoption of the replacement cost principle instead of the original cost principle.

"SCRIP ISSUE"

In certain quarters there are misconceptions about the ownership and the nature of undistributed profits. The nature of such profits is in no way altered whether they remain as undistributed profits of whether shares are issued in respect of them, except that in the latter case the profits are formally and legally frozen as capital. The procedure does not alter a shareholder's interest in the company, it merely expresses his interest in more units than before.

I therefore welcome the decision of the Stock Exchange to avoid the use of the word "bonus" in this connection, though I would personally prefer "scrip issue" to the term "capitalisation issue" now used by the Stock Exchange.

Taxation: There has already been too long a delay in grasping firmly the problem of reducing the present high rate of direct taxation with its grave repercussions on commercial and industrial prosperity and upon capital savings and incentive. The death-watch beetle eating into the fabric of national prosperity and security is undoubtedly the insidious and practically uncontrolled growth in national expenditure.

There is great need for action to bring national spending within our available means by a more effective control of national expenditure and to this end stringent limits should be set for departmental spending. It would seem fairly obvious that an independent investigation into the set-up and administration of Government departments, particularly those created or substantially enlarged in recent years, is much overdue.

SUN INSURANCE OFFICE

A MOST SUCCESSFUL YEAR

MR C. G. RANDOLPH'S REVIEW

The chairman, in his statement to shareholders, referred to the heavy loss sustained by the office through the death of the Marquess of Abergavenny, DL. The board had accepted with regret the request by the general manager, Mr J. A. Miller, DSO, that he should be allowed to retire as from June 25, 1954. He had many interests in the insurance world outside the "Sun" but it was inside the "Sun" that his retirement would be most felt. His many friends throughout the world would join in wishing Mr Miller health and every happiness in his retirement.

The board had appointed Mr S. V. Bangert general manager and secretary in his stead. Mr W. R. Stevenson had been appointed assistant general manager.

The figures for the years 1951, 1952 and 1953, in respect of the three underwriting departments, were set out for ready comparison.

	1953	1952	1951
	£	£	£
Fire	6,758,718	6,762,364	6,445,516
Accident ..	7,314,812	7,138,669	6,465,686
Marine	1,291,934	1,548,648	1,345,600
	15,365,464	15,449,681	14,256,802

FIRE BUSINESS

The reduction in the premium income amounted to £3,646.

In referring to the flood disaster on the East Coast in January, 1953, he said that, despite the many claims arising therefrom under comprehensive and other policies, the claims experience in respect of fire business in Great Britain was more favourable than it was in 1952. The general overseas business again produced a satisfactory profit but in the United States of America and in Canada the results were materially affected by wind storms and tornadoes to which reference had been made in the press on a number of occasions. As a result of the operations of the year a profit of £648,391 had been transferred to the profit and loss account.

ACCIDENT ACCOUNT

In this account the advance in premium amounted to £176,143. Motor insurance formed an increasingly large proportion of the accident business and it still remained extremely difficult to obtain year by year a margin of profit.

The transaction of employers' liability insurance continued to present its problems. In this country there had been further increases in the rates of premium for certain trades, but, while this had resulted in some improvement in the underwriting position, it had not as yet served to restore the business to a profitable basis.

There had been a general improvement in the results of the North American casualty business, a profit being obtained in both the United States of America and in Canada. The profit from the whole of the accident underwriting amounted to £536,881, or 7.34 per cent.

MARINE ACCOUNT

Marine premiums contracted by some £256,714 as compared with the previous year. This was due, in part, to unwillingness to accept business which was offered at rates that were bound to be unremunerative. The claims experience had not been unsatisfac-

tory, although losses, particularly by theft and pilferage, were still unduly high. Hull underwriting was so closely related to the cost of ship repairs that it was no easy task to estimate what profit, if any, there might be in those underwriting accounts which had not yet been finalised.

It was decided not to make a transfer to the profit and loss account in 1952, but on this occasion it was thought reasonable to transfer £100,000. After so doing the balance of the marine fund amounted to £2,053,732.

PROFIT AND LOSS ACCOUNT

The transfers from the underwriting accounts were £1,285,272. Interest, dividends and rents, less income tax, increased by £47,809 to £451,982. The provision of £250,000 for United Kingdom taxation had been made after due allowance for certain reserves for taxation relating to previous years, now no longer necessary.

The directors decided in November last to pay an interim dividend of 2s. 2d. (less income tax) per share at a cost of £143,000, and they now submitted for confirmation at the annual general meeting that a final dividend of 2s. 10d. (less income tax) per share be paid making, with the amount already declared, a total payment for the year of 5s. per share. The balance to be carried forward to the balance sheet would thereafter be £3,543,190. The market value of the investments was, in the aggregate, substantially higher than the book value, which at the close of the year stood at £17,845,335, an increase of £678,996 during 1953.

To all staff at home and overseas, and to the advisory committees, local directors and other representatives throughout the world, he extended the warmest thanks for their help in the past year.

BRITISH ROPES

TRADING PROFITS MAINTAINED

The thirty-second annual general meeting of British Ropes, Limited, was held on May 26th in London.

Mr Herbert Smith, chairman, in the course of his speech, said: The group trading profits for 1953 of £1,830,781 were maintained at virtually the same level as for the previous year, which I think may be regarded as satisfactory. The net group profits, after providing for taxation, compare very closely, namely £756,315 for 1953 against £778,984 for the previous year.

In regard to the proposal of your directors to increase the ordinary dividends for the year from 12½ per cent to 13½ per cent it was considered reasonable that the ordinary shareholders should enjoy a little of the profit which has and is now accruing from the employment in the business of the profits ploughed back in past years.

Despite the proposed increase in the ordinary dividend for the year, no less than 66 per cent of the group net profits available to the ordinary shareholders has been retained in the business for future capital and other expenditure.

For me to give you any idea of what the prospects are for your company in the coming year is more than difficult at this time. The affairs of the world are such that it is hard to foresee what the future has in store for us, but your directors are not in any way pessimistic about the future, for we believe that nobody in our line of business will do any better than we shall, and we go forward full of confidence that with normal trading conditions we shall be reasonably prosperous in the coming year.

The report and accounts were adopted.

THE RHODESIA BROKEN HILL DEVELOPMENT COMPANY LIMITED

(Incorporated in Northern Rhodesia)

SIR ERNEST OPPENHEIMER'S STATEMENT

The following are extracts from the statement by the chairman, Sir Ernest Oppenheimer, circulated with the annual report and accounts for 1953:

The profits for 1953 (£1,249,752 before providing £381,856 for taxation) are about half those of the previous year, which is, of course, a direct reflection of the much lower prices obtained for the metals produced by your company.

This reduction in profits is inevitably reflected in the dividend, which it has been necessary to reduce to half the figure paid last year.

The London Metal Exchange for lead and zinc was open throughout the year under review, and metal prices were comparatively steady at the new levels. As mining and operating conditions on the property are satisfactory, we may reasonably expect that a position of relative stability has now been reached.

Fortunately we have completed the bulk of the major capital programme of the last few years, and paid for it from the high profits of recent years, so that your directors have been able to recommend that the appropriation to capital reserve should be reduced to £200,000 for the year under review.

RECORD ZINC TONNAGE

The tonnage of zinc produced during the past year constituted a record for the mine. As regards the new lead plant, unfortunately difficulties continued to be encountered, and it was necessary, in order to avoid a large fall in production, to switch operations between the old and the new plants. While these difficulties have not yet been entirely overcome, the performance of the plant is increasingly encouraging. The ore reserves remain at a satisfactory level.

The Federation of the two Rhodesias and Nyasaland has been effected. Certain legislation has already been put on a Federal basis, in particular that relating to income tax. The company's profits are taxable under the Federal Law and under this new form of legislation a benefit has accrued to the company by reason of the granting of a depletion allowance which hitherto, under Northern Rhodesia law, was not available.

COMPANY'S RE-INCORPORATION IN RHODESIA

Arrangements have been made to re-incorporate the company in Northern Rhodesia in the early part of May, 1954. Local re-incorporation confers on the company an optional right to deduct Rhodesian income tax from dividends paid and, as certain members would benefit from such a deduction taking place whilst none would be worse off, the directors decided that the option should be applied in respect of the proposed final dividend for 1953. The deduction of Rhodesian tax does not reduce the amount of the dividend as it is merely a case of grossing it up in the first instance and then deducting the tax afterwards.

Re-incorporation of your company in Rhodesia will complete its transfer to that country, a step which is not only in your company's interest, but also in accordance with the current political development of Central Africa.

DAILY NEWS LIMITED

MR L. J. CADBURY ON A SATISFACTORY YEAR

The annual general meeting of the Daily News Limited (proprietors of the *News Chronicle* and the *Star*), was held on May 26th in London.

Mr L. J Cadbury, the chairman, who presided, said:

In submitting the directors' report and accounts for 1953, I am glad to record a satisfactory year's trading. Capital and revenue reserves have risen from £2,170,000 to £2,451,000, the increase being due to the receipt of war damage claims from the Government in respect of plant destroyed by enemy action and to the retention in the business of a very substantial amount of the year's profits.

These gains and a reduction in newsprint stocks have raised our balance at the bank and in cash to £381,000.

Our old buildings Nos. 19 to 22, Bouverie Street, which were blitzed during the war, have now been replaced by one of the most up-to-date newspaper offices in the country. It was completed at the turn of the year. Our process departments housed temporarily in an adjacent building will occupy the top floors, the middle ones will be used for much needed extra editorial and type-setting space. In the basement we have made provision for two high-speed printing machines which are under construction. They will be particularly useful in speeding up the output of the various editions of the *Star*.

During the year the average daily circulation of the *News Chronicle* was 1,358,289 and of the *Star* 1,109,183. The advertising situation on both papers has been most encouraging, and a number of important new advertisers have used our columns.

THE NEWS CHRONICLE

Editorially, the *News Chronicle* has been extremely active at home and abroad, where a great effort has been made to keep our Foreign Correspondents mobile. For instance, Vernon Bartlett, William Forrest, Stephen Barber, James Cameron, and David Walker have been constantly on the move between such places as Persia, British Guiana, Korea, and the Belgian Congo. Incidentally the visit to the last country gave us one of the most outstanding features of the year, a series of articles on Albert Schweitzer, one of the 1953 Nobel Prize winners.

During the year increasing attention has been paid to education, whilst in the City the paper's prestige has continued to be upheld by Oscar Hobson and Paul Bareau.

We have maintained our exclusive rights to the Gallup Poll of public opinion, which has been quoted widely.

On the domestic side, the *News Chronicle* Coronation House Competition should be mentioned; it attracted over 1 million entrants and competitive designs were submitted by 521 architects.

Among our publications, *New Elizabethan Homes* and the I-Spy booklets have proved great successes; over 2 million of the latter have been sold, many having been taken by schools. Over half a million children are actively engaged in the I-Spy Tribe and their number grows daily.

THE STAR

The *Star* circulation has been helped by the succession of informative and entertaining features, many of them of particular interest to women. Among them was the long cam-

paign for reform of the Mental Laws which was followed by the Prime Minister's announcement of the Royal Commission on the Law Relating to Mental Illness and Mental Deficiency. Another example was the series entitled "The Moral Challenge," to which the Bishop of London and other leaders of religious and social thought contributed.

The head of the British Trade Mission to Moscow wrote a number of articles entitled "Business Man in Moscow," which was quoted all over the world, including Moscow. A readers' letters feature has become quite famous under the title of "Bright Ideas" and in six months drew 170,000 letters.

We regret that newsprint is still one of the few remaining rationed commodities. The limitation on paging makes it difficult to deal adequately with the great volume of home and foreign news that we should like to print. We appreciate that a step has been made in increasing imports of paper and pulp from Canada and Scandinavia, but we hope the Government will see fit in the near future to remove the present restrictions altogether.

The report was adopted.

HARLAND AND WOLFF, LIMITED

LAUNCHINGS TOTAL 133,000 GROSS TONS

NEED FOR PERIOD OF WAGE STABILITY

SIR FREDERICK E. REBBECK'S REVIEW

The sixty-ninth annual general meeting of Harland and Wolff, Limited, was held, on May 26th, at the registered offices of the company, Queen's Island, Belfast. Sir Frederick E. Rebbeck, KBE, DSc, DL, chairman and managing director, presided.

The secretary, Mr F. V. Spark, CBE, ACA, read the notice convening the meeting and the report of the auditors.

The chairman said: As the statement of accounts and the directors' report have already been in your hands for some time, I propose with your permission to take them as read (agreed).

It will be seen from the accounts that after charging depreciation the gross profit before taxation is £1,712,900, but you will have noticed that in the disposal of the profits for the year, by far the largest figure is the share that goes to the Government. As you well know, income tax and profits tax take 9s. 6d. out of every £, but it is not perhaps fully realised that, in addition, for every £ received by preference and ordinary stockholders there is a further 7s. 3d. to be provided for distributed profits tax, in other words a tax on dividends paid. Accordingly, we have had to set aside for taxation no less a sum than £864,204, or over 50 per cent of the gross profits.

The consolidated net trading profit after depreciation and taxation is £848,696. During the year protracted negotiations with the authorities were brought to a satisfactory conclusion, and your company recovered taxation paid in respect of previous years amounting to £407,670. In addition, the accounts are credited with a further sum of £15,000 arising on settlement of claims under War Damage Act Part II.

These make the total amount available £1,271,366, out of which the directors propose the same dividend payment on the ordinary stock as for a number of years, together with a special bonus on the ordinary stock of 3 per cent, less income tax at 9s. in the £, and to add to the reserves and carry forward on profit and loss account a sum of £777,090 in the accounts of the parent company and £38,426 in the accounts of the subsidiary companies.

The consolidated total of reserves and undistributed profits now amounts to £5,539,528, which is very necessary for financing the business of the company.

TONNAGE LAUNCHED EXCEEDS 100,000 GROSS TONS

For the fourteenth year in succession the vessels launched from the company's works have exceeded 100,000 gross tons, the total tonnage being 133,000. During the year fourteen vessels were delivered, the most notable being the light fleet carrier *Cantaur* for Her Majesty's Navy.

In common with the industry generally, the company had some cancellations of orders, but notwithstanding these cancellations there are still sixty vessels under construction or on order, including the light fleet carrier *Bulwark* for Her Majesty's Navy, the light fleet carrier *Bonaventure* for the Royal Canadian Navy, and other naval work consisting of frigates and coastal minesweepers. The merchant work includes three large passenger liners, two cross-Channel passenger vessels, several passenger cargo vessels, large tankers for British and foreign owners, and a number of smaller tankers and other craft.

You will doubtless have seen reported in the press that Her Majesty the Queen has honoured the Shaw Savill & Albion Company and ourselves by graciously consenting to visit Belfast in August this year to name and launch the very interesting new type passenger vessel which we are building for these owners.

DIVISIONAL OPERATIONS

The Marine Engineering Division has been fully employed throughout the year in the manufacture of propelling machinery, consisting of steam turbines and Diesel machinery mainly of our two-cycle opposed piston type, but also including four-cycle engines of the poppet valve type.

The Land Engine Division has been chiefly engaged in the manufacture, for export, of four-stroke pressure charged Diesel engines.

Recent orders have also included air and gas compressors driven by Diesel engines or Gas engines of our make.

During the year the Steel Construction Division has been fully employed and has orders in hand which will keep it well occupied for some time to come.

The Electrical Division, which has been substantially increased, has been fully employed throughout the year in connection with the electrical systems on board ships, both Naval and Merchant, and in the manufacture of alternators, direct current generators and ancillary equipment, which are also manufactured for export to various parts of the world.

Once again the Repair Works at London, Liverpool and Southampton were well employed throughout the year, and as usual some important ship repair contracts have been carried out at Belfast and Glasgow. Competition from Continental ship repairers continues to be felt, due largely to the fact that their yards are able to work a three-shift system and are practically free from demarcation troubles. For this reason owners who trade to Continental ports find it advantageous to carry out more repairs on the Continent.

The Scotstoun Works have been engaged throughout the year principally on the manufacture of Turbo-Alternators for Hydro-Electric Installations at home and abroad, this work being carried out in association with the English Electric Company Limited.

During the year there was a dearth of contracts for new vessels, but we have obtained a satisfactory proportion of such orders as have been placed.

IMPORTANCE OF FIXED PRICES

There are several reasons why shipowners have become increasingly cautious in ordering new tonnage—high taxation, the high costs of ships today, the length of time taken to build them, and not least the unwillingness of shipbuilders, under the conditions prevailing today, to commit themselves to fixed prices. If we in the Shipbuilding Industry could look forward to a reasonable period of wage stability, and not be obliged to face what have become in the last few years almost annual demands for wage increases, fixed prices could be quoted without builders suffering the heavy losses which resulted from the fixed price contracts booked three or four years ago. With fixed prices shipowners would then know the exact amount of their commitments, and might well be sufficiently encouraged to take advantage of the investment allowances introduced by the recent Budget, and place orders for new vessels.

The Company's property and plant have been well maintained.

I take the opportunity to thank the members of the staff and workmen who worked well throughout the year.

The report and accounts were adopted; the proposed dividend and special bonus were approved; the retiring directors, namely, Mr J. H. McCuaig, Mr C. C. Pounder, Mr Fred V. Spark, and Dr Denis Rebbeck, were re-elected. Messrs Price Waterhouse and Company were re-appointed auditors, and their remuneration was fixed.

The meeting terminated with a unanimous vote of thanks to the chair.

E. POLLARD & CO.

The forty-second annual general meeting of E. Pollard & Company, Limited, was held on May 27th, in London.

Mr H. Edward Pollard, chairman and managing director, who presided, said:

The profits of the group for the year are £194,351, and, after providing for taxation, there remains £89,638. In April, 1954, a capital dividend of £80,000 was received from a subsidiary company, and your directors are recommending a capital dividend out of this sum at the rate of 20 per cent on the ordinary share capital. This dividend will be paid without deduction of income tax and will not be subject to income tax or surtax in the hands of the shareholders.

During 1953 the demand for all products of the group increased, although shopfitting was handicapped by licence control which continued to the end of December. All materials were eventually freed from control.

Production costs tended to rise and there were several wage increases. Competition was active, but we were able to meet this satisfactorily without price cutting.

The display side of shopfitting found a steadier demand all the year, and a satisfactory increase in turnover was obtained.

The electric passenger lifts of Hammond & Champness increased their sales and widened their field by the extension of the maintenance centres at Glasgow, Liverpool and Birmingham.

The Haskins business in steel shutters and other products for the building industry was strong and again increased on the export side.

The Morris Singer steel casements, lift doors and other sections were in strong demand. The report was adopted.

CENTRAL MINING & INVESTMENT CORPORATION

IMPROVED FINANCIAL RESULTS

The forty-ninth annual general meeting of The Central Mining & Investment Corporation Limited was held, on May 27th, in London, The Rt Hon Lord Baillieu, KBE, CMG (the chairman), presiding.

In the course of his speech the chairman said: The financial results for 1953 show an improvement on those for 1952. In that year our revenue from share transactions was small. The more favourable conditions of the past year afforded us opportunities for dealing, and we are able to bring to credit of profit and loss account an amount of £606,000. Our dividend income at £785,000 is down by about £53,000 due to the narrowing profit margins of the mines of the group.

We have transferred £500,000 to investment reserve and £107,000 to exploration reserve from the profits of the year. Our policy will be to strengthen our reserves as opportunity offers and you will note that, allowing for all movements in the reserves, there is a gain of £642,697 for the year. Our cash position is satisfactory. The board are recommending a small increase in the final dividend, bringing the total for the year to 2s. 6d. per share.

The scale of operations on the Witwatersrand was maintained in 1953 at much the same level as in 1952. Profits, however, were seriously affected by a further rise in working costs and by the fall in the price received per fine ounce of gold, and aggregate profits fell by over £5½ million. There are signs that some of the difficulties under which the mines have laboured in recent years are easing.

URANIUM

In the uranium field, four additional production plants were brought into commission during 1953. In April, the big plant at the Blyvooruitzicht mine started treatment of current and accumulated gold-slime residue and is now reporting profits. Good progress is being made with the construction of the uranium plant on the Harmony mine, which it is hoped will be in production shortly after the official start of gold milling in the latter part of this year.

In the Orange Free State steady progress was maintained in opening up the goldfield. During the year 159,706 feet of development on reef were performed on 12 mines, further disclosing the remarkable persistence of the Basal Reef throughout the area.

We are pleased with the progress and prospects of the Harmony Gold Mining Company, in which we have a substantial direct and indirect interest.

On the Central Rand, rising costs push up the pay limit and grade at depth tends to fall rather than to rise. Thus profitability becomes progressively smaller and the margin on many of the mines is now little higher than it was before the sterling devaluation of 1949.

On the Far West Rand, Blyvooruitzicht continues to be the principal contributor to the totals of group gold production and profits. It is interesting to note that the Doornfontein Gold Mining Company, which adjoins Blyvooruitzicht on the west, has recently come into production and is planning a further expansion of its milling operations.

The report was adopted.

UNIVERSITY OF CAMBRIDGE

Applications are invited for the posts of two Assistant Agricultural Economists in the School of Agriculture. Applications from candidates graduating in June will be considered. Qualifications should include a University degree in Economics or in Agriculture. Salary scales: Men: £360 x £20—£400 x £25—£600. Women: £360 x £15—£390 x £20—£490 x £25—£520. These scales attract Pay Addition of 10 per cent on the first £500 of salary and 5 per cent on the second £500. Further particulars are obtainable from the Secretary, School of Agriculture, to whom applications in writing should be sent, together with the names of not more than three referees not later than June 18, 1954.

UNIVERSITY COLLEGE OF THE WEST INDIES

GEDDES GRANT RESEARCH FELLOWSHIP

Applications are invited for the Geddes Grant Research Fellowship (value not less than £300 p.a.) tenable at the University College for one or two years. Applicants must be persons with established residence in one of the British Caribbean Colonies and must hold a degree from a recognised University. The successful applicant will be expected to undertake original work related to the life and affairs of the Caribbean area.—Applications, stating qualifications and proposed work, and naming three referees, should be received by the Registrar, University College of the West Indies, Mona, Jamaica, before June 19, 1954.

SCHOOL OF ECONOMICS, DUNDEE

Application may now be made for entry to the following courses in October, 1954.

B.Sc.(Econ.) London with Honours in Economics or Economic History or Industry and Trade.

Post-Graduate Diploma in Business Administration.

The School of Economics is to be incorporated in the University of St. Andrews within the next two years. Arrangements will be made for providing students who have not completed their courses by the time the University takes over the school with special instruction to enable them to complete their work for the London Degree.

Application forms and copies of the Calendar may be obtained from the Secretary, School of Economics, Bell Street, Dundee.

UNIVERSITY OF SYDNEY

AUSTRALIA

Applications are invited for the position of LECTURER IN ECONOMIC STATISTICS.

Salary for the Lecturer will be within the range of £A1,100-£A1,450 per annum, with annual increments of £A50. The salary is subject to deductions under the State Superannuation Act. The commencing salary will be fixed according to the qualifications and experience of the successful candidate.

Finance available for home purchase under Staff Members' Housing Scheme.

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1.

The closing date for the receipt of applications, in Australia and London, is *June* 30, 1954.

MEDIA PLANNER

This is a responsible senior post in a well-known London Advertising Agency with good prospects of development. Experience of statistical analysis and assessment of relative values of media (press and other) is essential. It is not likely that any one with less than five years' experience on the Research and planning side of an agency will be suitable.—Box 566.

ENCYCLOPAEDIA Britannica for sale, 24 vols. brand new. Cost £73 10s. Accept £50.—Box 567.

OXFORD UNIVERSITY INSTITUTE OF STATISTICS

Applications are invited for vacancies on the research staff. Candidates will be expected to undertake work in the field of applied economics, and should have a good degree in economics and statistics. Previous research experience will be an advantage, but is not essential. The appointments will be for two years in the first instance, and salaries will be fixed on the University scale, according to age and experience. The starting salary will not be less than £400 for the junior post, or more than £800 for the higher grade. Application forms obtainable from the Secretary, Institute of Statistics, St. Cross Road, Oxford. Closing date for applications June 14th.

THE UNIVERSITY OF MANCHESTER

Applications are invited for research posts in ECONOMICS, ECONOMIC STATISTICS, GOVERNMENT, SOCIAL ADMINISTRATION and SOCIAL ANTHROPOLOGY. Candidates should be graduates in any of these subjects or in Modern or Economic History. There are two grades: Grade II, salary £450-£550 per annum; Grade III, salary £350-£400 per annum.—Applications should be sent not later than June 26, 1954, to the Registrar, the University, Manchester, 13, from whom further particulars and forms of application may be obtained.

UNIVERSITY OF EDINBURGH

Applications are invited for the post of RESEARCH LECTURER in the *Social Sciences Research Centre*, tenable from October 1, 1954. The Salary scale is £600-£800 per annum, with placement according to experience and qualifications, and with superannuation benefit and family allowance where applicable.

The successful applicant will be required to pursue research in industrial structure and/or administration, and to do a limited amount of teaching in the Department of Organisation of Industry and Commerce.

Further particulars may be obtained from the undersigned, with whom applications, giving the names of two referees, should be lodged not later than June 30, 1954.

CHARLES H. STEWART, Secretary to the University.

MARKET RESEARCH DEPARTMENT

ASSISTANT MANAGER

A young man with sound knowledge of Research techniques is required by a prominent London Advertising Agency to take an executive position in their Research and Information Department. Media Analysis and comparison (not only confined to the Press) is an important part of the work, together with the handling of consumer and retailer researches. Initiative in the graphic presentation of statistical information is a valuable asset for this vacancy. The position has good prospects.—Box 565.

UNIVERSITY OF DURHAM

KING'S COLLEGE, NEWCASTLE-UPON-TYNE

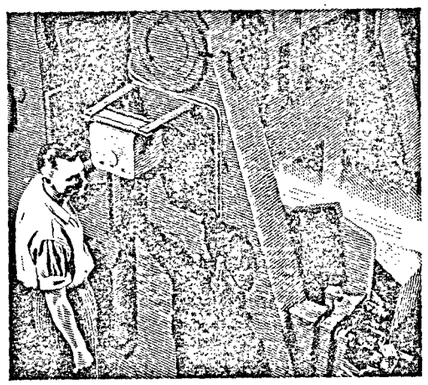
The Council of King's College invite applications for the post of Temporary Lecturer in Economics or Social Studies.

The appointment will be for a period of one year from October 1, 1954.

Applications, together with the names of three referees, should be addressed to the undersigned so as to reach him not later than June 30, 1954.

G. R. HANSON, Registrar of King's College.

FORD MOTOR COMPANY, LIMITED, Dagenham, Essex, invites applications from graduates or qualified accountants aged twenty-five to thirty-five for work on special financial and economic studies. Intelligence of high order is the main qualification. A starting salary of £900 to £1,250 will be paid, according to qualifications and experience.—Apply to Salaried Personnel Department, quoting reference GFA.



Man and Steel

A flourishing steel industry is an index of the prosperity of the country. The employment provided both directly and indirectly through the making of steel and its application to all human activities is an important factor in the well-being of the nation.

The principal business of the United Steel company is to make the best possible steel for any particular purpose, and to do this in an efficient manner by economical methods. It follows that steel makers should be free to develop their present activities and to exercise their ingenuity to add to and to improve their products.

Constant research by the Company in collaboration with many other industries anticipates new metallurgical requirements called for by progress in fresh fields of development. In this way the interests of the whole country are served and its economy enlarged.

so many projects depend on

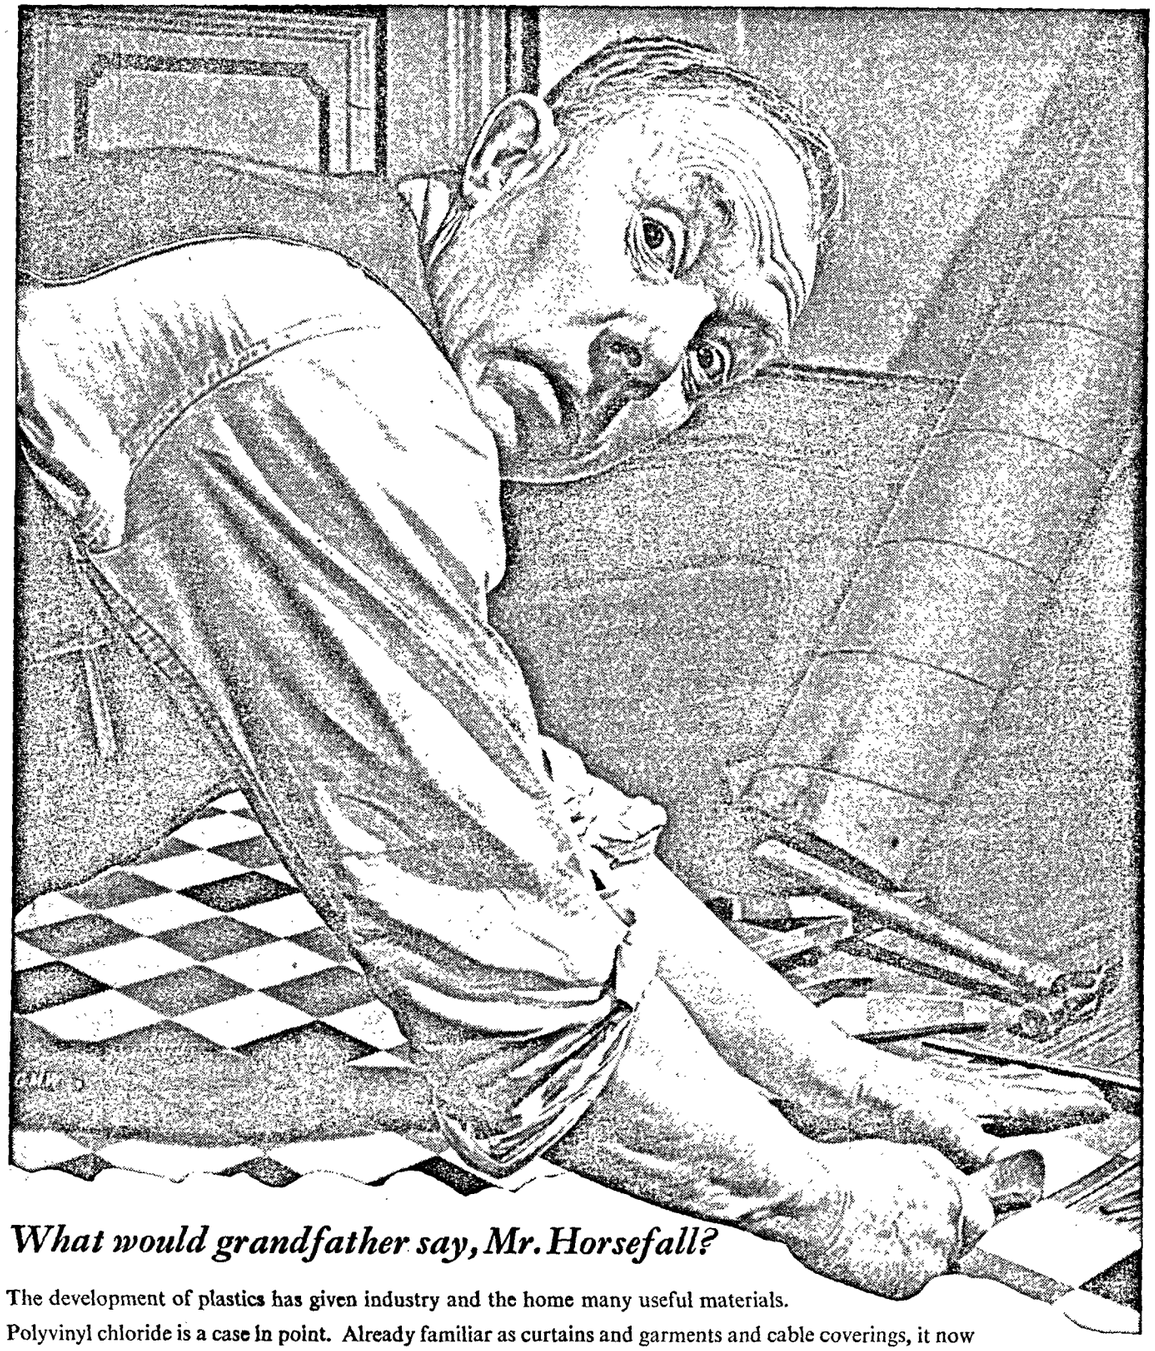
Plessey

The Plessey Company Limited
Ilford · Essex
electronics · radio and television · mechanics
hydraulics · aircraft equipment

So diverse are the interests of Plessey in the Aircraft, Radio, Television, Electrical and Mechanical Engineering industries, that it is difficult to instance any large project in these fields which does not at some vital stage depend upon the Company. The service offered to top managements in industry or Government service is unique. Expressed briefly, it is the development of an idea through to prototype stage and on to production—cheaply, efficiently and in time to meet a market.

If you have a new product in rough outline that is ripe for specialist development you cannot do better than talk it over with Plessey.

PP5h



What would grandfather say, Mr. Horsefall?

The development of plastics has given industry and the home many useful materials. Polyvinyl chloride is a case in point. Already familiar as curtains and garments and cable coverings, it now provides flexible belting for coal mines which is singularly unaffected by hard wear and tear. In an allied form it is a floor-covering material of exceptional durability. Organic Phosphorus Compounds (*for which Albright & Wilson supply the intermediate*) are often used as the plasticizers to maintain the flexibility and to make the finished plastic flame-resistant.
