THE railway row has gone on Whitsun recess. The strike may start again if the Transport Commission tries to bring in the new schedule of lodging turns on the Eastern Region on June 14th. Or the trouble may peter slowly out as a result of another dreary disengaging movement by the Transport Commission, another politically popular but industrially disastrous retreat. The commission can hardly accept the new demand of the principal footplatemen's union, that it should work towards complete abolition of all lodging turns; but it may sadly conclude that it is now hopeless to try to effect a further gradual increase in these turns. Like the White King in looking-glass land it may decide that it must send out two messengers on most journeys, one to come and one to go, one to fetch and one to carry. This is not a prescription that will allow the transport system of a hard-pressed industrial society to be economically operated; the danger is that it may come to be regarded as a political necessity, to avoid a strike.

Who is to blame for this threat of creeping catastrophe, and what can be done even at this late stage to rectify the situation? Of the three parties that have been concerned in this dispute, the public cannot lay much blame on the leaders of the Transport Commission. The commission's present chairman, General Sir Brian Robertson, came out of the army to take up his unenviable post as recently as November of last year. Within little more than a month he was subjected to strong pressure from the Cabinet (backed by the majority of public opinion in the country) to yield to a wage claim which he knew his commission could not afford. No outside observer can know whether he did or did not come near to resigning at that moment, but most people will agree that he was right to stay on and try to make a success of the formula on which the wage settlement was based. Perhaps the commission should have been more insistent, from the outset, in making clear to the men what that formula was: that the substantial immediate increases in wage rates, as well as the continuing negotiations for a reform of the whole railway wage structure, were to be bound—in honour bound—to the discussion of measures to increase productivity. The commission's defence on this point is that it had reached agreement with the unions; thereafter the public relations job with rank and file railwaymen was the union leaders' own preserve.

The union leaders, for their part, can put up the defence of honest intent and attempt. It was not a very able attempt; there was a clear failure in their public relations policy, a clear weakness in their contacts with their men—especially, perhaps, at area or district level. It is customary nowadays to blame this common lack of touch on the top-heavy constitutions of the unions, but the real and more delicate problem is that no organisational structure can be better than the officials who man it. Once again the country seems to have been brought face to face with the fact that the middle and lower ranks of paid trade union officialdom are now too often being filled by men

of honest purpose but indifferent organisational calibre; this is partly due to the welcome fact that more intelligent younger workers can now launch themselves into university careers, partly due to the ridiculously low salaries that the unions (those least magnanimous of employers) are willing to vote for their own officials, and therefore partly due to the national tragedy that there is still no trade union for trade union officials themselves. But honour must be given even where no great tribute to efficiency may be due. The leaders of the railway unions, by agreeing to a small increase in lodging turns, genuinely tried to live up to the obligation that they had accepted in the name of their members; and they have suffered personally thereby.

It was on the rock of the ordinary railwayman's resistance that these efforts came to grief. Does this mean that the most constructive course for outside commentators now is to keep on shouting at the engine drivers? There are some warning shouts that should certainly be sent up, to some railwaymen who do not realise whose tools they have been. Behind the "sympathetic" action in certain Western Region depots near London and behind the abortive attempt to call a separate strike last week-end in the North East, there were some men who were largely motivated by political considerations; there were Communists eager to follow Mr Harry Pollitt's recent dictum that "the more of these threats we can begin to organise in 1954, the better for all of us." But this does not seem to have been true of the original stoppage of Devonshire footplatemen at Newton Abbot, which struck the spark that the Communists and their allies so effectively fanned.

This stoppage, indeed, provided a case study in all that is most depressing in the present state of British industrial relations. Here were craftsmen of a very high order, from one of the soberest districts of the British Isles, genuinely attached to the main line runs (which are the only runs on which lodging turns are worked), in the middle of delicate negotiations that are aimed at re-establishing the differentials between their pay and that of less skilled workers, confronted with a change in working arrangements that had been agreed by their own elected union leaders. The proposed arrangements were not even universally unpopular; by all accounts, some of the men would have welcomed the increase in take-home pay that the new lodging turns offered, although others resented the interference with their family life. But the reaction of all was to show solidarity with those who felt a grievance, and to go on strike.

At worst, this amounts to a belief that now that railwaymen have become more prosperous the railways can afford to become less so; at best, it is a reflection of the widespread national feeling that greater productivity should never be bought at the cost of greater inconvenience to anybody, even if it leads to higher pay. This is not the claim of a hard-pressed craftsman, but of a hysteric; and the Transport Commission should recognise it as such. One cannot indefinitely humour a hysteric; if need be, after removing any genuine source of grievance, one must slap him in the face. The commission should certainly make an early announcement about how far it intends to restore differentials in the take-home pay of footplatemen; and it should tie those differentials specifically to higher productivity, by increasing the allowances for lodging turns (which are much less generous than those for most lorry drivers). But, having announced this, the commission should make it clear that the new turns must stand, as an obligation for those who want to continue to work on the main line. There will be the objection that this may lead to a major national railway strike. So it may. The alternative is to abandon—here, now and for ever—all hopes of increasing efficiency and productivity on the railway lines, of letting Britain's transport system and with it the railwaymen's own standard of living slide into slow decay.

Peace or War?

Our Ministers will . . . find themselves in this position. On the one side lies the proffer of a peace, which they cannot indeed pretend to deem satisfactory . . . but which will leave Russia baffled, checked, mortified, and with a warning which may keep her quiet for a considerable time; which will leave Turkey at all events safe from aggression for some years to come. . . . On the other hand lies a continuation of the war with the certain discountenance and the possible hostility of the German Powers;—with the prospect of a terrible struggle and a distant if not an uncertain issue; with the prospect, too, . . . that . . . its basis will be widened, its passions will be deepened, and its significance intensified; that in fact the revolutionary element and the spirit of nationality will enter on the scene of strife, and that so we may find ourselves fighting in a cause which we were not prepared to maintain, and with allies and associates whom we did not bargain for;—with the prospect moreover . . . of some disagreement with France weakening our cordiality of action, or of some dispute with America coming in to complicate our position. When the question of peace or war comes before our Ministers in this perplexing and insidious shape; . . . is it reasonable to fear that they may be led to entertain the perilous proposals, and to sacrifice future and enduring tranquillity for the sake of present and immediate peace,—to think that "sufficient to the day is the evil thereof" . . .? Yet such a decision would surely be most unworthy and unwise. It would be stultifying our enormous preparations. . . . It would be letting go our grasp of our adversary when we have him at a disadvantage. And what is worse, it would be postponing a struggle which sooner or later *must* come, to a time when we may be far worse prepared than now to meet it; when the odds may be on the other side; when France may be alienated from us; . . . when in fact we may be utterly unable to aid and save Turkey, however much we may desire it. For, be it remembered, the time when the "Eastern Question" shall come up again will be chosen by Russia, not by us—and she will not make a second mistake.

June 3, 1854

Last Week at Geneva

HOW much longer can Mr Eden play at Geneva the role of chairman, go-between and peacemaker? When he was in London a fortnight ago for consultation he let it be known that he would persist in his lonely and thankless task for a week or two—and he did not mean three weeks. That is a position from which he cannot now retreat; and it is a pledge that may have to be redeemed during the coming week. If so, if the present negotiations to redispose troops and secure a cease-fire in Indo-China turn out to be nothing more than a snail's progress towards another Panmunjom, then public opinion in the free world will confront once again the questions from which it has so often turned away. The end of talking might mean the intensification of fighting, and for this the victorious Vietminh are more ready than the French. France's allies might then have to decide quickly and firmly whether they could afford a debacle in the Red River delta or watch impassively a Dunkirk at Haiphong. It is one thing to accept Vietnam's partition; it is quite another thing to accept the rout in Asia of one's principal ally in Europe. In such circumstances even Sir Winston Churchill would have to crook his trigger finger.

It may, of course, not come to such a climax. Perhaps the Communists want to meander indefinitely somewhere between deadlock and agreement; they have everything to gain by procrastination. The Vietminh may, therefore, delay a full assault on the French perimeter around Hanoi, whether for political or military reasons; there may be a breathing-space during the rainy season from July to October. Meanwhile endless haggling could go on in Geneva between military representatives about the details of lines to be drawn, units to be moved, roads to be used, and so on. It may, in fact, become quite difficult to say at any given moment whether peace is closer or farther away. There could be just enough progress to cause people in Britain and France—if not in America—to relax, and just not enough obvious danger to make their leaders take decisions.

Already the Geneva conference is having this effect. To many Americans it is made by their newspapers to appear so futile that they ridicule the whole business without suggesting an alternative; while to many British it is made to appear by their newspapers so promising that Mr Eden is weighed down with garlands that have been thrown without any thought of what happens if he fails. This process cannot be allowed to go on indefinitely, for it is doing nothing to improve the military situation and morale of France, and is doing much to debilitate every common venture in which the western allies are engaged. Not for years has the flag of the Atlantic alliance hung so listlessly.

If the verdict next week on Geneva is that Mr Eden has failed, then it is essential that there should be no reproaches between allies. The Foreign Secretary's effort was clearly worth making; indeed, it had to be made by one western statesman once the proposal for a conference on Asia had been accepted at Berlin. Mr Dulles would be wise to be generous about this, for he has been spared some most embarrassing experiences. And if American reproaches to Britain are out of place, so are British reproaches to America. That Mr Dulles had first to bluff and then to sulk was due less to clumsiness than to the confused state of opinion in Congress and in the United States generally. If the Americans went too far in their scepticism about Geneva the British went too far in their optimism; it is a pity that staff talks about what could be done in defence of Indo-China should not have begun until this week, and that the British Prime Minister should have shown in his statement so much more concern with the uncertain views of Mr Nehru than with the determined appeals of M. Bidault. The ideal at Geneva would have been a united Anglo-Franco-American front, negotiating in all sincerity but also planning, in all seriousness, military precautions in case of a breakdown. That is still the ideal—a combination of arms and diplomacy.

★

For the moment the most important thing is that British policy should be ready, in case of failure, to keep the initiative and the lead it has taken. Mr Eden cannot turn to Mr Dulles and simply say "I have done my best; you must take over now." Someone in London should be thinking out the kind of aid to France that this country is ready and able to give, the line in South East Asia for which in the last resort it would be ready to fight, and the kind of declaration of policy that would be required in case of a collapse of French resistance in Indo-China. And someone in Washington should be thinking out what part the United States will play, what tone it will adopt, what credit it shall claim if—after all—a cease-fire is secured at Geneva. If both the major partners were thinking of alternatives, re-insuring themselves against the failure of their present policies at Geneva, and making the fact known—then the effect might be decisive for peace. Rather more humility in Mr Dulles and rather more boldness in Mr Eden is probably the right prescription for the fever that grips China and the palsy that shakes France. If it fails with the Communists it will at least help to restore confidence in official relations between the United States and Britain. These, in their present state, are a standing inducement for Communist governments to delay, manœuvre and take dangerous risks.

Cities and the Bomb

IT was a ludicrous scene in Coventry last Saturday. The civil defence exercise organised by the regional authorities, complete with loudspeaker and commentary, met a hostile demonstration of the city council, also with loudspeaker. To a descant of screaming "casualties" the rival broadcasts fought for the souls of the citizens—most of whom had decided to stay at home. But this was no laughing matter for the Home Office. Coventry's decisions to disband its civil defence committee and to stop recruiting are bound to increase the cynicism with which civil defence is widely regarded. More than one local council is talking of following Coventry's example.

They will be keeping queer company if they do. The pompous purpose of the Labour councillors of Coventry has been to "strengthen the hands of international statesmen in their efforts to ban the hydrogen bomb"; and their counter-blast to the Home Office demonstration was provoked mainly by wounded *amour propre*, because the official commentary pointed out that help for casualties would be slow in coming since "the council's attitude has deprived us of local forces." The Coventry councillors' eyes are on world politics; they think they are helping to prevent the hydrogen bomb from being dropped on anyone anywhere. There is no connection between this woolly-minded arrogance and the much more justifiable urge that many other people feel to drop a blockbuster on the different sort of woolliness now evident at the Home Office itself.

Last week, eighteen months after the first hydrogen device was exploded in the Pacific and nine months after the Russians exploded theirs, the Home Secretary made his first statement to the House of Commons about the way in which civil defence plans would have to be revised. He said nothing that any layman who is not a member of Coventry council could not have worked out for himself. It is incontrovertible, as Sir David Maxwell Fyfe explained, that local training for civil defence is as necessary as ever. The hydrogen bomb increases the area of total destruction in which nothing can be done, but it also increases the area of partial damage in which fires have to be fought, the trapped have to be rescued and the wounded succoured. The same knowledge is needed about shelter and first aid, and about the use of geiger counters (if there were any). It is nonsense to abandon local organisation. But it is also nonsense to think that it is enough.

Sir David's statement suggested two main changes of policy. One arises from the realisation that, if all but the outskirts of a town are destroyed, it is from outside that help will have to come. He declared:

> It will be necessary to place an even greater emphasis than hitherto on a mobile organisation based so far as possible outside the main areas of population but available to help them.

"An even greater emphasis than hitherto" is a curious phrase in this context. For years there has been verbal emphasis on these mobile columns, composed of rescue workers, fire fighters, ambulances and so on, which are to stand ready to converge on the scene of destruction. Yet there is still only one mobile column—or rather, half of one, an experimental affair staffed by servicemen. The first step towards establishing more was taken this week. A Bill was introduced into the House of Lords to provide that reservists of the Royal Air Force, who would not otherwise be called up for training during the period when they are liable for part time service, will be trained with the mobile columns. The system, however, is not due to begin until next summer, and will not reach its full output of 30,000 trained men a year until 1956-57.

The other main change of emphasis described in the Home Secretary's statement concerned what he delicately called "dispersal," which, he said,

> clearly has a greatly increased relative importance. The plans already made need to be revised. Particular attention must be given to the disposal of stocks and equipment and to our emergency feeding organisations, and this may involve giving other measures a lower priority.

Present plans are for the tidy evacuation of children and pregnant women—although perhaps it is not too much to hope that provision has also been made to shift the seat of government. But have the planners taken stock of the circumstances in which this dispersal is likely to take place? As soon as the hydrogen bombardment of London seems imminent, about half its inhabitants will probably try to get out. If the bomb falls, the rest—those who survive—will be fleeing from the radioactive dust. The few narrow roads leading out of London, which at present are hardly able to cope with the rush hour traffic, would be in indescribable chaos. How would the mobile columns (if they existed) get to the devastation? To spend money on enlarging the exits from big cities would have a direct bearing on civil defence, and would have peacetime advantages as well. Another need would be to provide camps and relief services on a far bigger scale than has so far been contemplated. Sir David pointed out that "with the shift of emphasis to dispersal there goes an increasing importance for the work of women in civil defence." But there seems little hope of getting them except by compulsion. The Government should consider seriously whether the time for this feminine counterpart to national service has not arrived.

The Home Secretary's last point was that changes and improvements would have to be made in organisation and control "for the purpose of giving effect to the principle of mobility." Changes are also needed for the purpose of giving effect to the principle of efficiency. Civil defence should have a recognisable head; and, to give him real status and authority, he should rank with the chiefs of staff. The "Fourth Arm of Defence" today is the preserve of nameless civil servants, the cud of countless committees. Last December sharp criticisms of its organisation were made in the report of the Select Committee on Estimates; yet six months later these criticisms are as valid as they were then. Nothing has yet been spent, for example, on capital works to ensure that the railways, and the electricity and gas industries could be kept going in wartime, and almost nothing on water supplies and sewage disposal; a mere handful of control rooms has been built.

It is true that active defence is more important than passive preparations for patching up, that guided missiles are more important than geiger counters, that the best form of defence against air attack lies in attack itself. But, as it shelters behind these truisms, the Government still gives the impression that it does not really believe in civil defence at all, that it is setting up a façade to give the population an illusion of protection. So long as this is so, the Government can expect at best the apathy with which civil defence has been regarded hitherto, and at worst the reckless kind of revolt that was staged in Coventry last week.

One Pakistan or Two?

BENGAL has long been known for its profusion of politicians and its dearth of good administrators. The recent drift towards anarchy in the eastern part of the province, the Pakistani half, is not therefore surprising. What is remarkable, however, is that the disorders should have increased so sharply since the April elections, and that the central government, over a thousand miles away in Karachi, should then have had the courage to step in as resolutely as it did last week-end. Acting without warning, Mr Ghulam Mohammad, the Governor-General of Pakistan, declared a state of emergency, dismissed the new United Front government of Mr Fazlul Huq, and replaced the Governor, Mr Chaudri Khaliquzzaman, by the former Defence Secretary, Major-General Iskander Mirza, who has been given complete powers. The new Governor, one of Pakistan's best men, has a reputation for being tough. The Legislature, the Provincial Assembly, has been indefinitely suspended.

There can be no question of treating these disorders in East Pakistan as mere labour rioting, whether the Communists have had any effective part in fomenting them or not. Not only have several hundred people been killed, but the underlying causes of trouble constitute a serious political crisis, the biggest since Pakistan came into being nearly seven years ago. They revolve round two distinct but connected themes: the complete rout of the Muslim League in the recent East Bengal provincial elections and the sudden explosion of a Bengali provincialism which had long been known to be rumbling beneath the surface. For months before, the Muslim League administration in the provincial capital of Dacca had been postponing even by-elections, for fear of being proved to have lost ground; it was inefficient and known to be unpopular, but no one expected that its defeat, when the moment came, would be so overwhelming. Out of 309 seats, it won only ten. The elections, the first to be held throughout East Bengal, were on the whole fair; and the fact that 40 per cent of the voters went to the polls was encouraging, considering that most of them were doing so for the first time.

Compared with the Muslim League, the party that had created Pakistan under the leadership of Mohammad Ali Jinnah, its United Front conquerors looked a motley group. They consisted of discontenteds and independents—of Muslims, Hindus and Socialists who enrolled themselves for the election under the banner of two former premiers of pre-partition Bengal, the 82-year-old Mr Fazlul Huq and the elderly Mr Suhrawardy. This group, fighting mainly on the platform of Bengal for the Bengalis, won on three chief counts. There was strong personal antipathy to the outgoing ministers, who had a melancholy record of ineptitude and indifference to public opinion, and a reputation for feathering their own nests that was excessive even by local standards. It was also a vote against the government at the centre, that remote, non-Bengali, overweening, central government in Karachi; even the Prime Minister of Pakistan, Mr Mohammad Ali whose reception during the campaign was mostly good—he is himself a Bengali—was driven into the position of associating himself with the provincial Muslim League and its unpopular leaders. Thus the vote was above all for a much greater measure of provincial autonomy, with control only of defence, currency and foreign affairs to be retained at the centre. The United Front had, in fact, produced a 21-point manifesto, of which the main points were that Bengali should be made one of the national languages; that the all-important jute trade should be

brought under the direct management of the East Pakistan government by nationalisation (Karachi's trade and foreign exchange policies were bitterly resented as excessively favourable to West Pakistan); and that East Pakistan should be made militarily self-sufficient, with its own ordnance factory within the province.

If these and allied measures were all put into effect, little would be left of the Pakistani state. That, indeed, must have been one of the considerations that prompted the central government to intervene so abruptly and so decisively. But such action would not have taken place when it did, if the deterioration of law and order in East Pakistan since the elections had not been so real and so rapid. Whatever the constitutional or political intentions of the various members of the new government, they had not had time to carry them very far; but they had demonstrated that, either by design or through their own lack of a sense of public responsibility, life and property were being put in increasing danger. Under new management, in fact, East Bengal had jumped from the frying pan into the fire.

The full and exact reasons for this development are still somewhat obscure. There is real discontent in Bengal, and neither of Mr Mohammad Ali's two accusations against Mr Fazlul Huq and his followers really probes far beneath the surface. He accuses Mr Huq himself of being a traitor to Pakistan, and he lays the blame for the riots and killings mainly at the door of the Communists. Mr Huq, it is true, rejected Karachi's urgent pressure for more drastic action against "subversive elements" after the Narayanganj riots a month ago. And he is recently reported to have said in Calcutta: "I do not believe in the political division of India. India to me exists as a whole." But his crime is that he was ineffective rather than wicked. There is no evidence that he actively betrayed Pakistan. No doubt some people in East Bengal—where there are several million Hindus—would like to join India. But most of the members of the United Front are not out for any such radical change as that. What they want is much greater provincial autonomy, and it is now clear that they will do almost anything to get it. They may even have deliberately allowed conditions in the province to deteriorate, with some idea in their minds that they could thus force the central government to make concessions.

★

As to the Communists, although Mr Mohammad Ali has greatly exaggerated their importance and has produced no evidence for his charges, it is reasonable to suppose that they have in fact made the most of the reigning confusion and bitterness. The opportunity would be too good for them to miss, particularly at a moment when Pakistan has committed itself more openly and more thoroughly than ever before to friendship with the West and close contact with America. But it would be a great mistake for either the government in Karachi or Pakistan's many sympathisers abroad to regard what has happened in East Bengal as primarily Communist-inspired. To take refuge in a parrot cry of that kind is to evade the problem, and to allow the situation to deteriorate to the point where Communism might in fact become the worst danger.

The real problem is the relationship to be developed between East and West Pakistan. They have little except religion to bind them together and plenty to drive them apart. From the first, the bizarre lay-out of Pakistan has looked like something that could not last, unless its two halves could find a sustained common interest in supporting a central head which only historical accident had imposed upon them. The Muslim religion hardly seemed enough to bind them together, if politics, regional nationalism and economics were driving them apart. In the beginning these forces had not time to become important; now they have, and that is the main lesson of recent events. The Bengali has always regarded himself as someone rather special; for years he smarted at the removal of the British capital from Calcutta to Delhi. Today he feels it an intolerable insult to be ruled from even further away in Karachi.

Some solution has to be found if Pakistan is not to run into further trouble. There are in fact three possibilities: that East Bengal should break away and form a separate Muslim state on its own; that it should join up with India; or that it should remain part of Pakistan. The first is by no means impossible, though it is unlikely. It is true that East Pakistan is stronger from the economic point of view than West Pakistan, since cotton is a less important foreign exchange earner than jute. But East Bengal by itself would find it hard not to be drawn eventually into India's orbit, which would be at best a disturbance of the uneasy balance between India and Pakistan, and at worst a cause of conflict. The third possibility is obviously still by far the most likely and the most desirable; together, East and West Pakistan form a bigger and more viable economic unit and a more effective international force than either could do alone. Moreover, from the point of view of both Middle Eastern and Asian politics, it would be a tragedy if Pakistan broke up just at the moment when it is beginning to play an increasingly important role. But the problem in front of Mr Mohammad Ali and his colleagues in Karachi is by no means easy to solve. Though the United Front has so far proved itself incapable of exploiting its victory at the polls in a constitutional manner, much that it stood for—though by no means all—will have to be conceded if a lasting settlement is to be achieved. For the only form that such a settlement can take is a greater measure of special autonomy for East Bengal—which should not be treated by Karachi as a province on a par with Sind or the Punjab—than any seriously considered so far. It will be the new Governor's task to lay the foundations for this major constitutional change and then withdraw.

Proof of Need

THE effect on Australian politics of Mr Menzies's narrow victory in the general election last Sunday is discussed in a Note elsewhere in this issue. But there is one feature of it that has an application in every democratic country. Dr Evatt's bid for votes turned essentially on his promise to abolish the means test for old age pensions. Many people in this country will have been surprised to learn that Australia, which has had so many years of Labour government, still has a means test. In any case, the significant thing is that the bid, though it attracted some votes, did not attract enough to serve its purpose. The means test is evidently not so unpopular in Australia that the promise to abolish it could produce a stampede.

Perhaps this will lead the world of politics to do some more thinking about means tests—about the principle, that is to say, of requiring some proof of need as one of the basic conditions of the welfare state. Hitherto there has been a tendency—certainly in this country and in greater or less degree in others—to take it for granted that a test of an individual applicant's means or needs was by definition a detestable thing that public opinion will always instinctively reject and that no minister will dare to propose save under the severest financial pressure.

But there is no inherent reason why this should be so. Perhaps in the old days, when there was a sharp distinction between "the people," who were the beneficiaries of welfare schemes, and "the rich," who paid for them, there was a certain logic in it. But those days are long since past. Nowadays everybody bears the load of taxation and knows he bears it. The welfare state is financed out of taxes that fall on the poor as well as on the rich, and if public money is wasted, it is every individual's money. It would be very strange if the average elector positively wished to be taxed in order to provide benefits for those who do not need them. Yet that is the undeniable effect of a full-grown welfare state that hands out its benefits without test of need.

Is the means test, in fact, a dog that has been given a bad name? It is true that the particular form of means test that was applied to unemployment relief in the thirties caused a great deal of individual humiliation and misery. But is the idea behind it necessarily a bad one? If the definition put upon it were a more generous one, might it not even be positively popular? After all, everyone who fills in his annual income tax return submits to a very searching enquiry into his private resources. There is no objection in principle to this means test—which is not confined to the individual but brings in his family. In the educational world, searching tests into the means of the families of scholarship winners are now universal, and though many people think they are inequitably conceived in detail, few people object to them in principle. "From each according to his means, to each according to his needs" is an old socialist principle. It would be a very odd state of affairs if one half of it were to be consecrated and the other forgotten. Indeed, the morality of the matter is surely that the two halves stand or fall together.

★

This may seem to be an abstract discussion. But it is really of urgent practical importance. It comes up, for example, every day in housing policy. Anybody who lives near a postwar housing estate is familiar with the private cars parked outside, and with the television aerials that festoon the roofs of houses and flats whose occupants pay only a half or even less of their cost. Resentment is building up (as can be seen from the local press) at the lavish benefits that are being enjoyed by people, some of whom so evidently do not need the help they get. Another immediate and practical example can be found in the pressure for an increase in the rates of old age pensions. If all pensions are to be increased, the cost will be very heavy, and if the honest course is followed of raising the money by increasing the national insurance contribution, the ordinary worker will think himself very hardly used. But the needs of the really hard cases can continue, as at present, to be dealt with much more cheaply through the mechanism of National Assistance—provided the politicians will allow the assistance means test to be applied to steadily increasing numbers of people.

Any generalised test of need should, of course, be liberal and humane. It is probably politic (though it is not strictly logical) to confine it to the individual and not to extend it to the means of his relatives. And it would certainly be wise (though again not strictly logical) to give people an absolute right to any benefit for which they have made specific contributions. But with qualifications of this order, the principle of requiring proof of need is as morally sound as it is financially imperative.

The politicians will answer that it is easy for those who do not have to face elections to be bold. But to say that is to miss the point, which lies in the question whether it really takes courage to advocate the simple principle that no one should live on the taxpayer unless he needs to. The stakes are very high. For, with the numbers of old people rising inexorably year after year, it may soon prove to be quite impossible to reconcile the welfare state with national solvency unless there is some check to expenditure on benefits that are not needed. The alternative to the needs test may well be constant inflation. And one of those who suffer most from inflation, as the last few years have shown, is the beneficiary of the state. Unconditional benefits for all mean adequate protection for none.

Notes of the Week

No More Neutrals?

It is generally agreed, at Geneva, that neutral supervisors must play a key part in the realisation of any settlement in Indo-China. The military and political situation there is so confused that the task confronting such neutrals will be even more difficult than in Korea. They may have to undertake executive responsibilities as well as mere observation; and whereas in Korea neutral supervision has been flagrantly obstructed without a resultant new outbreak of fighting, in Indo-China any such obstruction might wreck the flimsy structure of a ceasefire. Two things are therefore vital: the choice of trustworthy neutrals, and their willingness to do the job thoroughly.

Neutrals with these qualifications are almost as hard to find nowadays as bluebirds. The uncompromising lines of division that Communism has drawn across the world have left very few nations so placed that they are acceptable to all parties. In Wednesday's debate at Geneva, M. Bidault quoted Mao Tse-tung as having written that "Neutrality is only a term to deceive the peoples"; and even free Asian countries with declared policies of non-alignment are classed by Moscow as dependent or at best "semi-dependent" prisoners of imperialism. Thus Mr Gromyko, who proposed this week that Poland, Czechoslovakia, Pakistan and India should supervise an Indo-Chinese armistice, was quite logical, in his own eyes, in balancing two nations from the "sphere of British imperialism" against two from the sphere of Russia's. But this is an odd conception of neutrality.

Are neutrals of what one might call the professional type dying out altogether? The Swiss are so angry at the way their team of supervisors in Korea was both hamstrung and used as a piece of camouflage by the Communists that they are little inclined to accept any new tasks of the same kind. The South Koreans have been arguing at Geneva, and not altogether without reason, that India inclines to favour China as against Mr Rhee, and that Burma will all too easily be subjected to Chinese pressure. It is a gloomy outlook for a world in which the services of genuinely neutral nations are so badly needed.

Siam Rings a Bell

The mixed feelings aroused, in France as well as in Britain, by Siam's appeal for United Nations consideration of the danger so near to its frontiers, are easy to understand. If a heated debate takes place in the Security Council—and it may take place while this issue of *The Economist* is in the press—it is all too likely to prejudice the remaining chances of a settlement at Geneva without visibly advancing the cause of security in South East Asia. Neither the casting of another Soviet veto nor the convening of a special UN Assembly would improve the atmosphere at the moment, and few people are inclined to take seriously the Siamese hypothesis that Vietminh troops may cross the frontier openly and at an early date.

But this does not imply a lack of sympathy for Siam's position, or any criticism of its action except as regards its timing. Nothing is more important than that a small country which feels itself threatened should be able to appeal, through the United Nations, to the conscience of the world and for the assistance of all peace-loving nations. Moreover, if Siam's move appears premature, there is some justification for that in the cumbrous nature of the machinery set up by Uno in 1950 to prevent paralysis by veto. The "uniting for peace" resolution passed by the Assembly on November 3rd of that year created a fourteen-nation peace observation commission, which is still in being and has even given its muscles a little gentle exercise by taking over the work of observation along Greece's northern border. Siam has asked that the commission should send similar observers to its Mekong frontier. The Soviet Union is a member of the commission but it wields no veto there. However, the commission can enter a new field of work only if authorised to do so by the Security Council or the Assembly; and if a grant of such authority is vetoed in the council, the only remedy is to summon the Assembly.

There is, therefore, much to be said for getting through the first stages of a rather complex procedure so that quick action could be taken as soon as the danger to all South East Asia showed itself more clearly. The Siamese have made their first moves soberly and with restraint; if the whole discussion is maintained on this level, it may yet do more good than harm.

Pointsmanship at Geneva

Since Woodrow Wilson's day, Geneva has been familiar with the technique of presenting a complex policy in the simplified form of numbered points; but there has never been such an intensive bout of it as the present conference has produced. General Nam Il's six points have been countered by Mr Pyun's fourteen, and Mr Dong's eight points followed by Mr Molotov's five. Mr Eden introduced a pleasing variation by asking five questions; but M. Bidault, who built up a set of seven points by the simple process of taking Mr Molotov's five and adding two

of his own, must be credited with having given a lead towards the higher pointsmanship.

Is this the shape of the new diplomacy? It seems eminently suited to what Unesco so horribly calls "mass media of communication" although it was foreseen by Clemenceau in his comment on President Wilson's famous programme: "Quatorze? Le bon Dieu n'a que dix." Numbered points not only relieve the eye of the newspaper reader; they also give him a satisfactory, if deceptive, feeling that a tortuous problem has been dissected into intelligible slices. And they make it possible for the ordinary citizen to discuss complex situations impressively without keeping all the details in his head. "But surely you agree that Dinh's seven points are at least a reasonable basis for discussion?" is a ploy that will reduce most antagonists.

If every meeting of statesmen from now on is to take the form of a point-to-point, there will be no room for the older diplomatic methods. No settlement, in the age of fair shares, will be acceptable unless it includes a fair quota of points contributed by each party, and diplomatic communiqués will be couched in the form, "the free world is leading by three points to two."

Lords in Labour

The ten-day Whitsun recess that begins this week-end will offer the Government a final breather before what is always the most anxious period of the year so far as the legislative programme is concerned. Most Governments find themselves in time-table difficulties during June and July, and this one is proving no exception. It has learnt much since its first, disastrous session; but it still seems to have forgotten, until late in the day, that the British Parliament is a bicameral institution. In the seven weeks, at most, between the end of the Whitsun recess and the beginning of the summer recess, the House of Lords will have to deal with seven major or highly complex Bills, as well as with several minor and easier ones. Even with a Conservative Government, this is straining their Lordships' goodwill, not to mention their legislative digestion.

The most complicated measures with which the Lords have still to deal are: Housing Repairs and Rents (Scotland), Landlord and Tenant, Long Leases (Scotland), Television, Mines and Quarries, Town and Country Planning, and Town and Country Planning (Scotland). The Television Bill is perhaps the only one of these over which the Lords will cast a controversial as well as a critical eye. But they will have an important revising function to fulfil with many of the others. In particular, they are better qualified than the House of Commons to consider the minutiæ of landlord and tenant or town and country planning legislation. To attempt to rush the Lords through these technical Bills might lead to sloppily-drafted statutes, giving endless employment to lawyers but only irritation to private citizens.

Even in the House of Commons the Government will not be free of time-table worries. Several of its Bills are still in committee or awaiting the report and third reading stages; in due course all of these will presumably be amended by the Lords, and the Commons will then have to consider the amendments—a process that, on past performance, will give the Opposition opportunities for making a nuisance of itself. To lighten the load the Government has tossed overboard first the ill-conceived Industrial Organisation and Development Bill and now, for this session at least, the Teachers' Superannuation Bill. But there is not much more top-hamper to be shed; the Finance Bill must be allowed to grind its leisurely way through the machine, and the Opposition cannot be defrauded of the several Supply Days still remaining. It must be galling to the Government to know that the real cause of its difficulties is that the House has spent so much time looking at Television—about which not all Tories, perhaps not even in the Cabinet itself, are equally keen.

Mutiny for Less Pay

The one hundred and sixty-six Tory MPs who voted against any increase in their own and their opponents' pay have split into three groups. One group secretly recognises the force of the case for an increase, largely on the grounds that the present low scale of pay and high rate of expenses put some Labour members at a disadvantage and therefore offend against the principle that politics should be played like cricket. They voted against the increase mainly in order to be able to defend themselves in their constituencies, and are not eager to carry the battle further at this time. A second group has no very clear opinion about the ethics of a pay increase; but it thinks that the Government has thrown away a fine debating point by giving in to Labour pressure, instead of carrying on a popular and country-wide resistance to it. A third group genuinely believes that to increase MPs' pay now will be to resort to government by the worst sort of example, and is determined to carry on the fight to the bitter end.

The second and third of these groups have proved stronger than the Government had expected, and they have mounted a mutiny against the Prime Minister in the past week. The problem has been made more awkward by the fact that some members of the front bench may feel some sympathy with the mutineers. In addition, one mutineer, Sir John Mellor, the member for the safe Tory seat of Sutton Coldfield, has cast himself off in a small boat; he has declared that he is no longer willing to accept the leadership of the Prime Minister "who is prepared to override the objections of the majority of Conservatives" on this matter, and that he will henceforth sit as an independent Conservative without accepting the party whip. Since Sir John will almost certainly continue to vote against the Socialists on every conceivable issue, his gesture has no wide political importance. The Prime Minister made a difficult but correct decision when he determined to put this matter to a free vote of the House; he should not be deterred from his chosen course by the thunder behind and around him.

Boycott in Buganda

THE troops are out and a state of emergency has again been declared in Buganda. This bad news should not be taken to mean that the quarrel between Sir Andrew Cohen and the traditionalist forces in Buganda over the exile of the Kabaka has flared up again. The emergency has had to be declared because other elements, which care nothing for Buganda's traditional institutions, have been making every effort to exploit the confusion arising from that quarrel for their own purposes.

These elements are led by the extremist Uganda National Congress, which recently declared a boycott on the buying of all goods except bare necessities as a protest against the rustication of its leader, Mr Kiwanuka. This boycott was designed to hurt African and foreign commercial interests, but it was not fully effective until Congress began to use intimidation against people ignoring it. When this happened, the Legislative Council (including its African members) urged the Governor to take action. Sir Andrew has, in fact, delayed longer than some of the Africans themselves would have liked.

There is thus no contradiction between the declaration of the emergency and the compromise reached last week between the Governor and the three members of the Buganda delegation which is to discuss constitutional reforms with Sir Keith Hancock when he arrives in three weeks' time. The misunderstanding that had arisen over the terms of reference of the Hancock mission has been cleared up ; and the Governor has withdrawn his objection to the inclusion on the delegation of Dr Kalibari, a prominent expatriate from Uganda now working in the United States (the question of the other proposed delegate from America, Dr Ralph Bunche, has been tacitly dropped). In return, the three Buganda leaders, all of whom came to this country last year as part of the delegation that negotiated unsuccessfully for the Kabaka's return, have agreed to co-operate with the Hancock inquiry. If they stand by this decision the conference should now go forward in an atmosphere free from intimidation ; the danger is, however, that the new and unhappy train of events may exert still more pressure on even moderate Buganda politicians to compete before the public to show what good nationalists they are.

The Bomb at Lancaster House

THE five-power disarmament talks in London have now run their discreet and outwardly uneventful course for three weeks. They are likely to continue for another three. Unfortunately, however, there is no reason to interpret the quiet and courteous exchanges between Mr Malik and the western representatives at Lancaster House as a sign that any real progress is being made. The report of this United Nations sub-committee will, presumably, register once more the familiar deadlocks: Soviet insistence on dealing with nuclear weapons separately, western insistence that disarmament must apply to tanks and artillery as well as to atomic and hydrogen bombs ; Soviet rejection of effective international controls, western rejection of plausible paper plans that merely handicap the more honest nations without inhibiting the more ruthless.

For exactly six months, a faint hope of breaking the deadlocks has been kept alive. President Eisenhower's suggestion last December of an international pool of atomic energy for peaceful purposes indicated a way in which mutual distrust might be partly dissolved by practical co-operation. A long and patient effort has been made by American diplomats, in Moscow, in Washington, in Berlin and in Geneva, to lead the Russians to the brink of this pool ; but Mr Molotov has been an unwilling horse from the beginning, and now he has made it finally clear that he will not drink. Last Saturday *Pravda* devoted a major article to the Eisenhower proposals. The writer was not content with the futile charge that they " bypass the main question " —it was precisely because the proposals held out hope of bypassing the major deadlocks that the President made them —but went on to build up a weirdly distorted and sinister picture.

> . . . The attempts of US diplomacy to reduce the solution of the atomic problem to the creation of a certain international agency which would use for peaceful purposes only a certain part of the stocks of atomic materials are arousing growing distrust. . . . The US ruling circles would like to seize control of atomic research in all capitalist countries. . . . In Western Europe there has already been created an international association whose aim is to prepare the ground for a new cartel of traders in atomic death. We have in mind the so-called European Council for Nuclear Research. . . .

It will be remembered that the Russians originally turned down Mr Eisenhower's offer the moment it was made, but agreed to negotiate when they saw how bad an impression they had made on world opinion. *Pravda* has now paved the way for a new retreat by Moscow. The object of its wild charges is simply to help Mr Molotov back out of the negotiations, in which the Americans have proved maddeningly patient and generous, by making obscure suggestions that the United States is somehow to blame for the breakdown. It is not a convincing performance.

Iran Must Decide . . .

A WESTERNER who married an Iranian recently wrote of her new compatriots that though their bodies might be idle their minds were always working overtime. Imaginations spent much time laying plans but devoted even more to conjuring up the pitfalls inherent in any action taken. Thus it usually seemed safer to do nothing at all. This national predilection for letting matters take their course has for decades worked out fairly well. Some outsider—usually Britain or Russia—has always proffered a way round the next bend; more recently, the United States Government, with its successive grants-in-aid, has removed all need for decisions on, for instance, how to fill the Treasury. The Zahedi Government's chief trouble over the current oil negotiations is that there is now no room for indecision. It must take a plunge.

For weeks, Teheranis have been hoping not to have to do so. They have cherished the illusion that the British would like to see the consortium fail, so as to get a deal for London

out of its wreck, or that they would be able to discern some chink in its structure and thereafter do a deal with its American members. They cannot believe that it will remain united or firm about the two or three items that are a *sine qua non* of its return to Iran. One advantage of the present interim talks in London is that they offer a fresh chance of proving to Teheran how much the consortium is at one.

The state of the negotiations is that each side has laid upon the table certain cards that the other cannot accept. The Iranians, for instance, want what they have always wanted—a body of Iranian nationality to restore them, on demand, to their proud position at the top of the list of producing countries, and to leave all decisions, including technical ones, to the whims of an Iranian governmental body. The consortium, which must invest a very considerable sum in Iran if it is to restore the damaged industry, wants greater security for its investment: for security, it wants western control of the technical body that will be acting on behalf of the National Iranian Oil Company, and of the volume of oil produced, so that the latter can be related to the world markets available. In London, the chief topic of discussion is whether a pattern can be devised that will meet these requirements while also meeting the National Iranian Oil Company's susceptibilities. If in Teheran the same kind of pattern-cutting is afoot the prospects for settlement are fairly bright. It is there that the real decision lies.

The Glass Falls in Tunis

ANY Parisian who still cherished last week the notion that all was quiet in Tunisia has had his hopes shattered. On the night of May 26th five French settlers living in the rolling hills of the Tunisian-Algerian border were murdered by *fellaghas* or bandits. *Fellaghas*—outlaws who hold passing cars up to ransom—are a south-Tunisian institution ; but there is now evidence that the distinction between a bandit and a nationalist has grown thin. Some of the men were said to be wearing flashes labelled " Tunisian Army of Liberation " and on one corpse the police found a written note saying that the band was combating *un colonialisme dévié*.

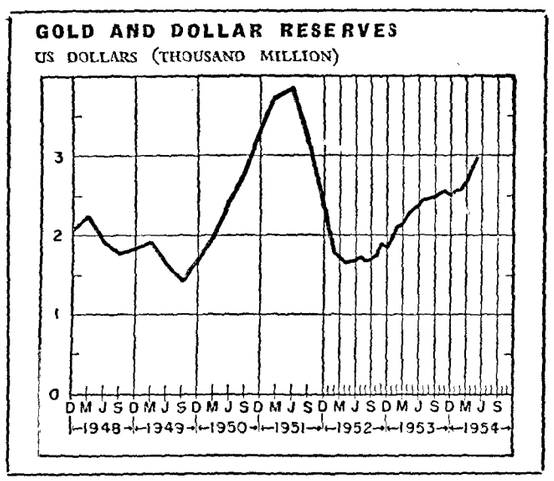
Two days later when M. Voizard, the Resident-General, returned from his mission to Paris in search of support for his policy of clemency, he was met by a crowd of angry settlers shouting that he was incompetent to protect their wives and children and had best go home. By a coincidence, a Tunisian nationalist was simultaneously attempting to murder the Tunisian Prime Minister on the ground of his being a French stooge. The moderates of both sides were under fire.

The perennial trouble in Tunisia is that middle courses please no one. This was true when M. Voizard promulgated his latest reforms in March: the settlers shouted them down because they increased the powers of the Tunisian premier and the Tunisian proportion of cabinet ministers ; the Tunisian nationalist did likewise because, though the reforms provided for an all-Tunisian advisory Assembly they flanked it, for purposes of handling the budget, with an all-French body that would join it when financial questions were under review. Tunisians saw in this proviso a surviving element of the " co-sovereignty " that they will not tolerate. Perhaps they would have felt differently had the subsequent amnesty to political prisoners been extended to include their hero, M. Bourguiba ; but all possibility of taking this bold step has been rendered remote by the fresh murders. Instead, the French settlers have asked for and received an issue of arms. Possibilities of reprisals abound, and the prospects of a settlement are more remote than ever.

Test in British Honduras

THE Colonial Office has decided to take the loyalty of the People's United Party in British Honduras at slightly above face value. In spite of the fact that the party has had affiliations with the Communist-dominated government of Guatemala, it was allowed to take part in the elections in May, in which it won eight of the nine elected seats in the new legislative assembly. Now Mr Lyttelton has decided to go ahead with the second stage of constitutional advance, by appointing four of the newly elected members to take their places on the reformed executive council alongside the three official and two nominated members. The question of whether these heady nationalists can be turned into responsible reformers will now—very wisely—be put to the test.

The ground has been carefully prepared beforehand. The PUP leaders have given the Governor an assurance that they will co-operate fully in trying to work the constitution " in a spirit of loyalty and good will." They are willing to take the oath of allegiance without reservation, and they are to visit Britain for talks with Mr Lyttelton later this year (probably in August). All this amounts to as frank a pledge of good faith as could be desired—and the PUP leaders are unlikely to be so foolish as to ignore the lesson of British Guiana. There would be little reason to worry about the political future of British Honduras (a territory, after all, with only 73,000 inhabitants) if it were not for the menacing attitudes struck by its neighbour: PUP's former allies in Guatemala, have recently been importing arms from behind the iron curtain.



Which Plan for Clydeside?

GLASGOW'S planning problems have become enmeshed in a web of complications and contradictions. Overcrowding in the older parts of the city is worse than anywhere else in Britain; in one area of 90 acres, no less than 37,000 people are herded together. One current proposal for the main redevelopment area is that the population should be rehoused in blocks of flats ten to fifteen storeys high; even so, many families in this area would have to be accommodated elsewhere. Flat construction on this scale would be exorbitantly expensive. On both financial and social grounds, it would be wiser to rebuild more modestly and to transfer a larger number of people to new communities, where they can be housed at reasonable cost.

Unfortunately, there are two barriers in the way. The first is that there is still no adequate machinery for carrying through the necessary dispersal of population and industry. The new town that is being built at East Kilbride can make only a modest contribution to the programme. There is increasing pressure to secure for Scotland the special assistance for expanding towns that the Town Development Act makes available to English local authorities; but—whether or not this measure can be adapted to Scottish conditions—its enactment would take time. The only immediate relief that Glasgow might be given is the creation of a second new town at Cumbernauld.

The other problem is that while the planners are trying to lure some people away from Glasgow, the Government is trying to lure industry to it. Clydeside is designated as a development area. As such, and with Government aid, it has attracted the great bulk of factory construction in Scotland since the war. In addition, the Secretary of State recently insisted on giving unsuitably located firms in Glasgow a greater security of tenure than the city council wanted. It is hopeless to talk about moving people out of Glasgow if their jobs are to stay behind. The authorities should becide whether they want the population of Clydeside to grow bigger or smaller; at the moment they seem to be planning that it should do both.

Mediocrity is Safer

THOSE who want to live to a ripe old age should climb some way, but not too far, in their calling. The improvement in standards of living, which used to be the reward of success, is no longer sufficient to counteract the strain of more responsible work. This, at any rate, seems to be the conclusion of the first statistical study for twenty years of comparative death rates for different social classes of the population.* In the early 1930s the risk of death declined steadily as position in the social ladder rose. Today men in the top "white collar" occupations, loosely classified as the professional classes, and those doing skilled manual work, may expect to die younger than their somewhat less skilled colleagues—although mortality is still highest among unskilled labourers.

These generalisations, of course, hide many exceptions; for instance, open air jobs seem healthier than indoor jobs in each category. Some of the other findings from this new study are illustrated opposite. Deaths recorded in 1950 are related to the numbers in each occupation, as shown by a representative sample from the 1951 census of one out of every hundred. The sample is small enough to introduce some errors, but they should not affect the broad conclusions. The lower chart shows which diseases are more prevalent among professional men, and which among unskilled workers. The figures do not compare deaths from different causes but only the number of deaths in each social class from one particular cause, expressed as a percentage of the deaths that would have been expected if occupation had no effect on mortality. Suicides, for example, were 34 per cent above the average among professional men, but 11 per cent below the average among skilled workers.

* The Registrar-General's Decennial Supplement, England and Wales, 1951. Occupational Mortality. Part I. HMSO. 7s. 6d.

Mr Menzies Scrapes Home

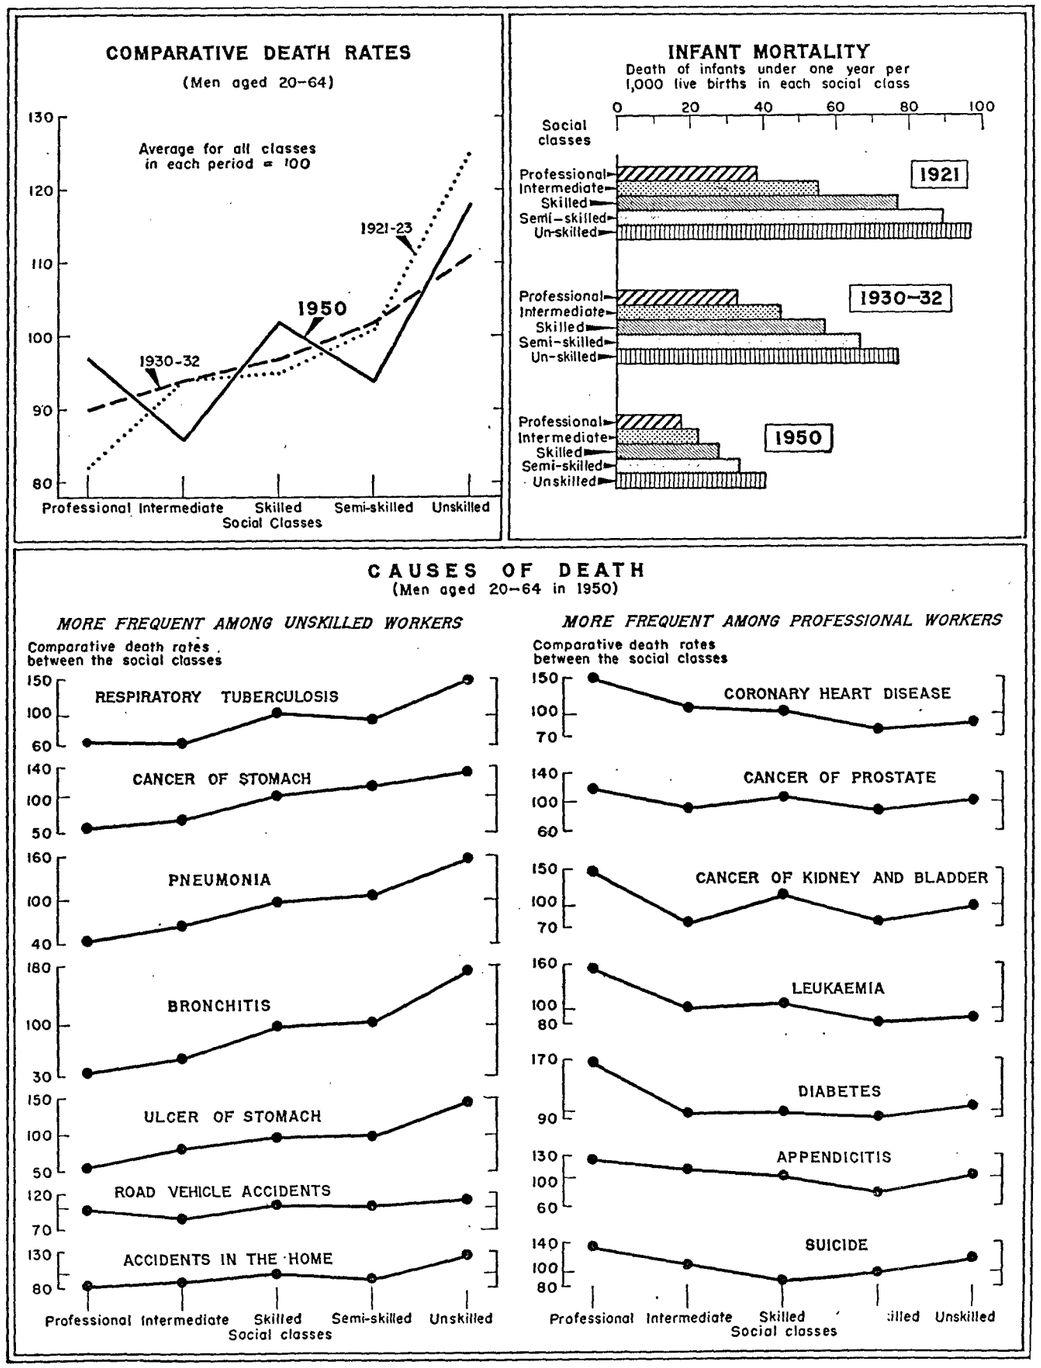
IT was generally agreed that the general election in Australia last Saturday would be a close contest, and the results have borne out this prediction. Mr Menzies has scraped home again, but only with a majority that has shrunk, according to the latest incomplete figures, from 15 to 7. In the new House of Representatives the Liberal-Country party coalition will probably have 64 seats instead of 68, while the Labour party will probably have 57 instead of 53. The Communists, who polled just over one per cent of the votes, gained no seats and lost most of their deposits.

The election campaign was a disappointing affair, in which discussion of important issues of policy, both foreign and domestic, was swamped by argument about how much the Australian citizen could get out of the state's coffers and how much he would have to contribute in return. Mr Menzies, however, has said that the election was a real test of the judgment and character of the Australian people—that is to say of their ability to see that Dr Evatt, the Labour leader, was promising far too much far too quickly when he made them magnificent offers of a bigger and better welfare state. The Prime Minister seems to think that they passed it with flying colours; in fact they have barely scraped through, for even after allowances for uncontested seats, Labour seems to have secured a majority—even though only a bare majority—of the popular vote.

*

Moreover, this issue was obscured by others that told in Mr Menzies's favour. There was the reflected glory from the immensely popular Royal Tour; there was the Petrov case, which seemed to justify all the Prime Minister's well-known fears about the Australian Communist party; there was the country's undoubted prosperity; and there was a popular budget which had included substantial cuts in taxation. In his next term of office Mr Menzies may find he has not such good cards in his hands. The Australian economy is now running on a fair tack; but it is not so long since it was contending with dangerous squalls, and it might find itself doing the same again. Next year the government will face the task of maintaining its slender majority of two in the Senate. With the latest election results before him Mr Menzies may feel it necessary

Death and the Social Classes



to woo the electors with slices of Evatt pie; but he should resist the temptation of promising more than the Australian economy can stand.

German Travel Shows the Way

GERMANS are having personally a taste of "convertibility" long before that term has acquired any meaning for the British man-in-the-street. Travellers abroad from the Federal Republic to any countries of the European Payments Union this summer find that there is practically no trace of exchange controls over them. The allowance is now so high that it is beyond the means of any but the richest family man to spend it on pleasure. It is now, for non-business travel, DM 1300 (£110), though DM 500 (£42) is reserved for winter sports. German travellers can also take DM 300 (£25) with them in cash and can bring back as much as they like. The large German surplus on the European Payments Union provides a justification for this liberality that the British cannot claim. This is true. But it must be said that the German authorities began to be generous to their citizens long before they had such a surplus. For years now the British traveller has been tolerating greater restrictions on his holiday travel than the Germans.

The spirit of "convertibility" and free trade in a new Europe has been shown by the Germans in a number of ways that might well be copied by the British. Customs examinations on trains are now almost entirely a matter of pleasant greetings from officials who have changed the old Prussian or Nazi bark for what might be called "Schumanners." The form which travellers to West Germany fill up on entering and leaving the country is extremely brief and its heading shows that it is merely used for statistics; whereas the British, like the French, still demand personal details that appear to be intended for the police. The inference is that every traveller is a potential criminal. Moreover, the Germans have not made the incredible psychological blunder of the British, who make every traveller leaving the country by air pay what seems like a fine to the government. The irritation caused, especially to Americans, by this imposition is out of all proportion to the small sum of five shillings involved. In the matter of tourism the British have few laurels to look to; but they had better guard the miserable leaves they have against unimaginative officials.

The Bulgarians Behave

ONE more step to lower tension in the Balkans has just been taken. Bulgaria has already resumed trade relations with Greece and a joint border commission has re-drawn a disputed sector of the frontier. Now, after five months of negotiation in Paris, the two countries have agreed to resume diplomatic relations; Bulgaria thus becomes the first of Russia's satellites to take this step.

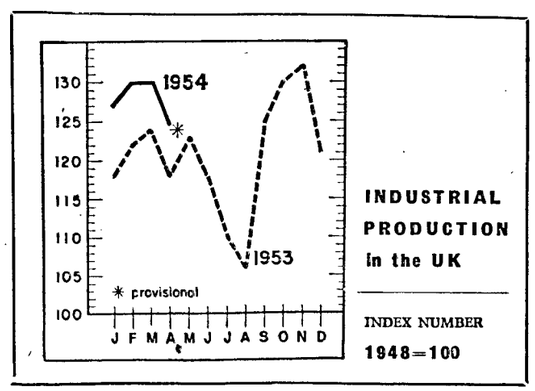
The initiative came from the Bulgarians, who would have liked—presumably as part of Moscow's "peace offensive" in the Balkans—to resume diplomatic relations without further ado. The Greeks, however, would not exchange ambassadors without first getting at least some firm assurance that their serious grievances would be removed, and have in the end won their point. The Bulgarians have professed willingness to carry out the terms of the 1947 Peace Treaty, which they have so far openly defied. Whether they will reduce their armed forces to the numbers stipulated in the treaty seems most unlikely, but in other respects they may be more sincere. At any rate, a committee of experts is to meet later this month in Paris to decide how Bulgaria is to pay Greece $45 million in reparations; and it has been agreed that other matters, such as the return to Greece of rolling stock and other property removed by the Bulgarians, shall be settled through normal diplomatic channels. The Bulgarians, moreover, have agreed to take steps through the International Red Cross to organise the return of the Greek nationals, including probably several thousand children, who were abducted to Bulgaria during the Greek civil war. That amends should be made for this outrage is of paramount importance to the Greeks.

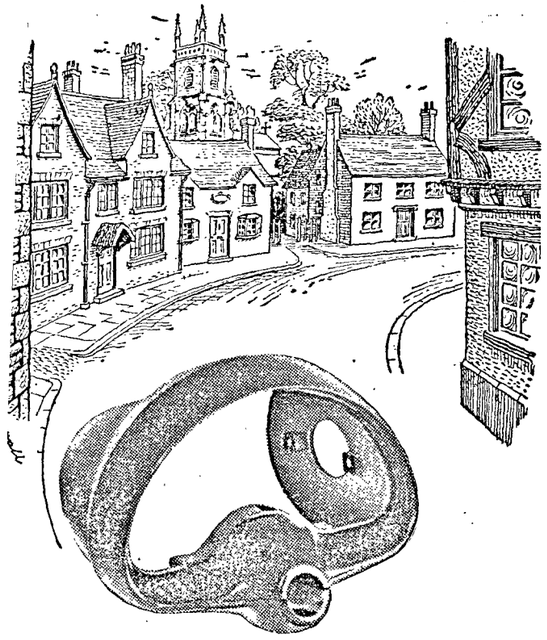
In spite of the long months of diplomatic slogging in Paris, much remains to be done before Greco-Bulgarian relations become satisfactory, from the Greek point of view. Athens has no illusions that its rapprochement with Sofia does away with the need for defence planning in the Balkans. As is pointed out in an article on p. 809, the Greeks are more convinced than they have ever been of the importance of a definite military agreement with their neighbour, Jugoslavia, and their Nato partner, Turkey.

Hold-up on Cleaner Food?

ONE of the measures outlined in the Queen's speech that has still to come before the House of Commons is the Food and Drugs Amendment Bill. This Bill, which is intended to put into effect all that has been said in recent years about the need to improve standards of cleanliness in Britain's catering establishments, had passed through all its stages in the House of Lords by the end of March. Has anything happened to delay its introduction to the House of Commons?

When Mr Crookshank was taxed on this point last week





Economy drive

In the new Anglia and Prefect, Ford Motor Company Ltd. use a BAKELITE wood-filled material for the four-part moulding which forms the instrument panel. Practical and economical, this is one of the many BAKELITE products helping the motor industry to keep down costs. Mouldings for instrument panels and dashboard components; electrical and other parts machined from laminated sheet; grommets and cable insulation sleeving made from VYBAK materials; car bodies and press tools formed from polyester resins... the applications are virtually unlimited. And new materials are constantly being produced by Bakelite Limited, the organisation that pioneered plastics, and continues to lead in research and development.

Inserting an X-ray tube into its oil-filled, ray-protective and shock-proof casing.

PROGRESS IN ELECTRONICS

IN 1895, Röntgen startled the world with the discovery of an entirely new form of radiation. Whilst engaged in the study of electric discharges in vacua, he detected an invisible ray which had the remarkable property of penetrating human tissue to present a shadow picture of bone formation on a photographic plate.

The radiations, which became known as X-rays, were at first used primarily to produce medical radiographs. In those early days such radiographs required exposure times of about fifteen minutes; but today, with the aid of modern X-ray tubes, diagnostic radiographs of extremely high definition are obtainable in less than 1/80oth second.

A significant contribution by Mullard to this outstanding progress is the rotating anode diagnostic tube. Providing a high X-ray intensity from an optically sharp point source, these tubes produce radiographs of high quality and definition in very short exposure times.

The latest Mullard achievement in this field is the development of a rotating anode tube of such high power and short exposure time that it enables motion-picture studies to be made of internal bodily functions. This tube is already proving of immense value in the diagnosis of diseases of the heart and circulatory system, as well as of the stomach and the brain.

The scope of X-ray science is continually expanding. In addition to medical radiography, X-rays are being applied to the treatment of cancer, the study of the structure of matter, the non-destructive examination of materials, and the detection of foreign particles in foods. The Mullard organisation, with its extensive research and manufacturing facilities, is contributing to further progress by the production of X-ray tubes of the highest quality.

The Schweppshire Way of Life

4 THE SCHWEXPORT DRIVE

It has been well said (Bricey: *Yarns of an Old Economist)* that exports are not exportable unless they are portable. It will not surprise many to learn that Schweppshire provides its own typically individual answer to this typical problem.

ENGLISH HERITAGE CO., LTD., (write Room D, 619 Beltane Road) gives this message from the Old World to the New. In former days the need was met by taking to pieces very old Suffolk barns and putting them together again in exact replica, with the rats' nests pasteurised, somewhere in the U.S.A., often Florida.

Occasionally, extremely ruined castles were treated in the same way. The picture shows, we hope, an advance. Rather small, light, pneumatic thirteenth century castles are put up in England and immediately taken down again. Deflated, they are shipped in

slim wrappers across the Atlantic to, say, Baltimore. Here they can be pumped up and filled, for authenticity, with genuine English air which has been flown over in canisters similar to those we employ for delivering Genuine Club Atmosphere to West 44th Street.

Dummy Countesses, family ghosts (see inset), splendid old butlers and trustworthy old gardeners in a range of six colours, can be supplied as extras. AND DO NOT FORGET our Daisies Pied made of specially treated indiarubber with genuine Warwickshire soil at the roots and packed by our subsidiary Little Hedgerow Flower Co.: AND our genuine Sussex thatch suitable for telephone booths or very low skyscrapers: or our Easy-to-Pack White Cliffs of Dover in sections made of Plastic Nuchork — can be cleaned with the wipe of a cloth.

Written by Stephen Potter, designed by Lewitt-Him.

SCHWEPPERVESCENCE LASTS THE WHOLE DRINK THROUGH

he refused to admit that any but technical considerations were responsible for the delay. Yet there is reason to suspect that when the Food and Drugs Bill is considered in the Commons it may not be granted the general welcome and smooth passage that it was given in the Lords. In preparation for its becoming law, the Ministers of Food and Health have issued proposed draft regulations for comment by the organisations representative of those who will mainly be affected. Consultation of this sort, before regulations are made, is provided for in the Food and Drugs Act of 1938—the principal measure, which the new Bill amends and strengthens. These draft regulations have not been published; but the clause in the Bill referring to food hygiene shows how far-reaching they can be. The Ministers may impose requirements for "the construction, layout, equipment, maintenance, cleanliness, ventilation, lighting, and use of premises" in which food is sold or prepared, and for "the maintenance and cleanliness of sanitary and washing facilities" and of "apparatus, furnishings and utensils" used in such premises. It is not surprising that some of the associations representing caterers and hotels and restaurants are reported to be up in arms against the regulations proposed under this clause. The Ministers, it is said, propose to tell each caterer how many sinks he must have in his kitchen; and may in consequence drive hundreds of small cafés out of business.

Most measures of preventive medicine interfere with individual liberties in the interests of the community, and it is to be hoped that the Government will not be frightened by these protests to the extent of calling off the Bill. There is certainly a danger that under the guise of hygiene the measure will be used restrictively to prevent new catering establishments and food shops from being opened; and the Catering Wages Act stands as a monument to the mistake of pursuing uniformity at the cost of common sense. But against these possible dangers should be set the known danger to health that arises from the insanitary way in which much food in Britain is prepared and sold. Neither the Ministries concerned nor the local authorities should be too tender-hearted once the Bill becomes law.

Laws to Themselves

THE tendency of Government departments to exempt themselves from rules of their own devising is one of the more vicious habits of postwar bureaucracy. A particularly bad example has just been pointed out in the annual report of the Council for the Preservation of Rural England.

In 1947 it was laid down that any land requirements of the service departments should be examined, first, by an interdepartmental committee and, secondly (if there were many objections), at a public local inquiry. After holding such an inquiry, the Government decided in 1950 that the Ministry of Supply's tank factory and testing site on Chobham Common should be dismantled within five years. Nearly four of those five years have passed; and the Ministry has now baldly stated that the establishment cannot be moved "in the foreseeable future." The excuse offered—that the cost of removal is too great—was examined and dismissed during the original proceedings. No new facts have since been produced. Decisions in these cases are final and irrevocable so far as private objectors are concerned; but a department, it seems, can coolly ignore them—and make a mockery of the whole proceedings.

Mr Costello Leans Left

As had been expected, Mr Costello has been able to form a Government in the Irish Republic with the support of the Labour and Farmers' parties. The most significant point about his new Cabinet is that he has clearly had to pay heavily for Labour support. The Labour leader, Mr Norton, is to be Minister for Industry and Commerce as well as Vice-Premier; from this post he will presumably try to industrialise Ireland as near to his heart's content as economic circumstances will allow. Since Mr Dillon, of Mr Costello's own *Fine Gael* party, returns to the Ministry of Agriculture, where he will be trying equally vehemently to expand Irish farming, these economic circumstances may pinch both men very hard. It is perhaps significant that Mr McGilligan, the able and conservative Minister of Finance in the previous Costello Government of 1948-51, has declined to return to his old post; he will be Attorney General instead, and leave the embarrassing finance portfolio to Mr Sweetman, a younger member of the *Fine Gael* party with a reputation for conservatism but a need to win his own spurs. Another newcomer is Mr Cosgrave, the son of a famous father, who will be Minister for External Affairs. Mr Sean MacBride, a former incumbent of this office, has declined a seat in the Cabinet; his small *Clann na Poblachta* party will therefore enjoy the advantages of irresponsibility, although it will give the Government general support.

More About Uniscan

THE economic secretary to the British Treasury, Mr Maudling, is now in Copenhagen for informal talks with the Danish economic ministers. From Copenhagen he will go on to Stockholm and Oslo. High on the list of questions to be discussed is the EPU problem which was also the principal subject discussed at the recent Uniscan meeting in London. The Scandinavian countries are concerned over mounting German surpluses and it is clearly to everyone's interest that any arrangement reached by Britain and Germany bilaterally, as well as the general treatment of Germany's future position in the Union, should be fully explored with the Scandinavians and receive their support. In this connection, *The Economist* was apparently in error in stating that the British failed at the last meeting of Uniscan to inform the other countries of the proposal that up to £35 million in gold might be offered in partial settlement of outstanding debts. Events were moving rapidly and some important features of the eventual proposal had not been worked out at the time of the meetings. Mr Maudling's visit should serve to clear away any misunderstanding which may have arisen from the fact that the final British proposals differed somewhat from those earlier discussed.

Books & Publications

Western Mind on Eastern Oil

OIL IN THE MIDDLE EAST.
By Stephen Hemsley Longrigg.
Oxford University Press for the Royal Institute of International Affairs. 318 pages. 25s.

THE story of twentieth century oil development in the Middle East has been—and still is—fit stuff for Hollywood. When an "eastern" is made to match the "westerns," here are the ingredients ready-made: years of frustration ending in last-moment success; rival speculators wondering whether to ogle the Sultan or the Young Turks; sudden transformations from poverty to wealth; sleek Armenians, relentless Sheikhs; and even a small quota of gas blazes to provide a pillar of fire by night and of smoke by day. Its dramatic qualities have tempted several authors into writing over-lurid books about it, and there was room for one written in Brigadier Longrigg's dispassionate tones. For the second time in six months, he has produced for Chatham House a work of reference that is essential to any good Middle Eastern library. (The first was his history of modern Iraq.)

He deals with the subject chronologically and, from the breakup of the Ottoman Empire onwards, also by countries and, roughly, in decades, so that anyone wanting to look up the effect of Rashid Ali's rebellion on Iraqi output or how many dry holes have been drilled in Israel can turn up the point without need to use the index. As a work of reference, the book is a mine of accurate information and is splendidly arranged; as a record of technical development over fifty years it could, at its length, hardly be bettered. Its appendices give full details of ownership, production, refinery location, and the nature of the oil found in each field, and it has five useful maps.

But the system of division by countries has one serious drawback. Lodged all over the book are paragraphs on subjects that are important enough to have warranted a section on their own. The reader armed with existing knowledge notices, as he goes along, that almost every topic of present or future importance gets its mention somewhere, but the student would find the wood easier to see for the trees if he had been furnished with some chapters or sections on topics that are common to several parts of the area.

To give examples: the problem of wayleaves—permits for pipe-lines to pass through lands of transit—is mentioned when Iraq baulks the idea of a pipe-line from the gulf to the Mediterranean, again when Tapline is being built, and again when Syria and Lebanon, in their jealousy of their oil-rich neighbours, seek to share the spoils by bouncing the pipeline companies into paying transit dues greater than those originally agreed. But nowhere is this important subject given a section to itself so as to make the point that, as a result of the uncertainties thus created, companies now hesitate to double their pipe lines. The possibility of trans-desert pipes to carry natural gas—at present running to waste in huge quantities—is also mentioned, but is unlinked to the thought that such investment will never be made until the lands of transit learn that the way to secure new lines and more dues is to keep old agreements.

Similarly, the differing social policies of the different companies are described country by country, but in isolation. They too need grouping because, unhappily for the companies, they are no longer isolated now that both Sheikh and labourer are paying rounds of visits and making invidious comparisons. Any book intended to show the student his way about the industry needs to make the point—here unmade—that each company which concedes a round to local pressure tends to inch the carpet from under the feet of all its neighbours. The effect of a sequence of unco-ordinated jerks can be costly for all.

The book's great merit is that in giving a picture of the industry from the western angle, it dispels some illusions that Arabs and Persians have spread. It shows how risky was the enterprise and how great the losses at the cost of which success was bought; it shows that though international rivalry as between oilmen has been great it has never been overwhelming; its picture of Middle Eastern feelings about the industry is sketchy, but it gives a deservedly creditable picture of western activity.

Brilliant Coterie

THE BLOOMSBURY GROUP.
By J. K. Johnstone.
Secker and Warburg. 393 pages. 25s.

IT must be hard to write at length about a brilliant coterie, upon which first-hand chit-chat is still abundantly available, without admitting the persuasion that one has oneself, somehow, come within the ambience and gained the right to sound the knowing note. Mr Johnstone, a young Canadian graduate who produced his book while holding a scholarship in the University of Leeds, has intelligently guarded his advantages as an outsider, making no claim to other than a student's intimacy with his subject, and writing (one feels) precisely as he would have written had he been called upon to examine the Cambridge Platonists or the Scriblerus Club. The result has little charm but considerable interest. It is a piece of careful literary history set against an adequately sketched background of ideas, together with judicious biographical information, a précis of important books, and intermittent critical appraisals, mainly appreciative in tone. One may suspect that some of the highly sophisticated persons documented and discussed might feel impatience with this honest diffusing of useful knowledge. But Mr Johnstone's pedestrian methods are more successful in distancing his scene than a work of much greater literary art might be. What does this distancing enable us to see?

Chiefly we see the importance of G. E. Moore, explaining to a talented, exclusive and essentially high-minded circle of young Cambridge men that their concern must be with the Good. Or rather (for is not ethics turning scientific at last?) it must be with good states of mind. And there is no doubt how these are to be achieved. They will come only through an unintermittent frequentation of the fields of love, friendship and aesthetic enjoyment. What doctrine could be more agreeable? Presently we see it carried with enthusiasm to town. And the history of the Bloomsbury group—Maynard Keynes, Vanessa and Clive Bell, Duncan Grant, Roger Fry, and the three major writers Lytton Strachey, Virginia Woolf and E. M. Forster—is essentially that of how Moore's doctrine fared in the face of complications unforeseen in Cambridge (for example, actual young women and real artists) and the extent to which it continued to influence the mature work of individuals of very various temperament and talent.

In the sphere of aesthetic speculation the doctrine produced confusion, for the theory of Significant Form—essentially an attempt to vindicate art in the concrete as all that Moore had claimed for it in the abstract—sees artistic constructions now as autonomous and self-contained, and now as exploiting our responses to formal relations in order to communicate some idea or vision of the very largest reference—the artist dealing (in Roger Fry's positively Shelleyan words) with "impassioned thought and feeling" and representing "the articulate soul of mankind." Upon literature Moore's influence was very varied. Lytton Strachey appears to have gained from him no more than an irresponsible attitude to knowledge. Mr Forster judiciously compounded aspects of his teaching with more ancient and prescriptive wisdom in order to form a sort of working creed for the liberal imagination. Virginia Woolf, the most important artist of the group, was perhaps most trammelled by the doctrine as it ramified through the thought of those around her. Its esotericism straitened her sympathies in a manner peculiarly disabling to a novelist, and the paradox—once more—

that a work of art is both a self-contained construction not standing for anything else and a tool for exploring "reality" appears to have had a harassing rather than a stimulating effect upon her work.

Black Mischief

ECONOMIC DEVELOPMENT AND TRIBAL CHANGE: *A study of immigrant labour in Buganda.*
Edited by Audrey I. Richards.
Heffer. 316 pages. 30s.

IN some ways Buganda bears much the same relation to Uganda as the White Highlands bear to the rest of Kenya. It is a rich country of rich landlords, the envy of surrounding tribes. But in this case the landlords are black. Other resemblances, too, make nonsense of the superficial lumping together of all blacks as the despoiled and all whites as the despoilers. Buganda is an ancient imperial power; its people inherit many of the legacies, good and bad, of their past. They are proud, independent, hospitable, traditionally conservative—so much so that they often seem to regard themselves and the British as the only respectable people in the Protectorate. Today they have to make the doubly difficult adjustment of democratising the internal structure of their tribe, and also of democratising their relationship with the other black peoples of Buganda.

Dr Richards and her colleagues are to be congratulated on producing so detailed and authoritative a study of one of Buganda's most difficult problems. Immigrant labour gets little mention in press accounts of the present crisis, but potentially, if not actually, it represents a great trouble-maker. With the abolition of slavery and the gradual emancipation of the Africans' traditional servants—their wives—the Baganda have come to rely on labourers flocking in from other less fortunate parts of Uganda and beyond—a large contingent comes from over the border of the Belgian Congo. The immigrants already number a third of all the inhabitants of Buganda. They come trekking over the long, dusty roads on foot or in crowded and ramshackle African and Indian-owned buses because there is money to be made away from the ties and obligations of kinship. They work as casual labourers for the Buganda farmers (who have a reputation for treating them well), and, in lesser numbers, on European plantations and in industry; or they raise cotton on land rented for the season. Many of them end by settling permanently. Buganda law is unusually favourable towards tenants and does not discriminate against immigrants—indeed landlords often prefer foreigners as tenants because they are more willing to perform traditional services.

But, socially, it is exceedingly difficult to become naturalised and, politically, the immigrant is still beyond the pale. The democratisation of local councils is almost certain to increase rather than diminish these latent tensions. Progress, both economic and political, is a two-edged weapon in Africa as everywhere else. Industrialisation, for example, may sound fine to the white man, but it encounters all the traditional hostility of the Buganda landlord. With his cheap labour drained off elsewhere, he will have to pay the workers higher wages—and perhaps work a little harder himself.

People who like to denigrate the British administration would find, on reading this book, that things are often more complicated than they seem. As befits a serious work of sociology, it is mainly concerned, not with judgments, but with elucidation and analysis. More work of this kind is urgently needed, for until we have made a better job of charting the still dark continent of African minds and habits, we shall continue to make silly political blunders out of sheer ignorance.

Natural History of Instability

THE FRONTIERS OF ECONOMIC KNOWLEDGE.
By Arthur F. Burns.
Princeton University Press for the National Bureau of Economic Research. 376 pages. $5.00.

THE central theme of this collection of essays is the relationship of economic growth and fluctuations; their raw material is, for the most part, the mass of factual and statistical matter accumulated and analysed under the auspices of the National Bureau of Economic Research, of which the author is Director of Research. (At present, on leave of absence, he is chairman of the President's Council of Economic Advisers.) Eight of the sixteen papers are annual reports of the Bureau, each organising an account of work in progress, or recently carried out, around a single leading idea. "Economic Research and the Keynesian Thinking of Our Time" is a salutary reminder of the unexplored complexities behind the Keynesian aggregates; it should hold much the same place in the economic literature of the mid-century as did that famous essay of Professor Clapham's, "On Empty Economic Boxes," in the 1920s. "Stepping-Stones Towards the Future" deals with the bearing of current research by the Bureau on the possibilities of economic prediction; "The Cumulation of Economic Knowledge" and "New Facts on Business Cycles" are progress reports embracing not only the work of the Bureau but that of other investigators; "Looking Forward" discusses the Bureau's programme (in the critical year 1951) in relation to such politically significant topics as the distribution of incomes, the size and structure of the federal budget, and the economic role of Government. "Wesley Mitchell and the National Bureau" is a biographical tribute to the Bureau's first chief; "The Instability of Consumer Spending" highlights its researches into the consumption function and "the

BASIL BLACKWELL
OXFORD

vertical transmission of cyclical impulses"; "Business Cycle Research and the Needs of Our Time" is a telling apologia for fundamental inquiry not limited to matters of obvious current urgency.

In Part II of the book Professor Burns hangs his material on a different set of pegs—mostly introductions to, or reviews of, books dealing with his major theme. There is the introduction to Wesley Mitchell's posthumous "What Happens During Business Cycles"; an essay on "Railroads and the Business Cycle," originally the introduction to a Bureau-sponsored study of American transportation by Dr Thor Hultgren; there is a return to Keynesian controversy, in which Professor Burns crosses swords with Professor Hansen on some basic matters of interpretation; there is a review of Professor Hicks's "Contribution to a Theory of the Trade Cycle"; there is a discussion, from the proceedings of the American Economic Association, of two papers illustrating the rival historical and econometric approaches to business cycle research; there is a technical appraisal of the work of Professor Frickey on time series; there is part of a long review of Dr Nourse's "America's Capacity to Produce"; and there is—for once without a peg—an essay on "Long Cycles in Residential Construction."

Evidently this is not a book to be reviewed in the ordinary sense. Each of these compactly written and closely reasoned papers represents, from the reviewer's point of view, virtually a book's worth of material. It must be enough to emphasise the common factor which binds them all into a manifesto of empiricism—the concern with hard factual evidence, the insistence that theory may be either working hypothesis or organising principle, but never self-sufficient explanation of what really happens—and to note that these specimens of plodding inductive method are as intellectually exciting as the most farflung speculations of abstract logicians.

Valuable Reprint

EARLY ENGLISH TRACTS ON COMMERCE.
Edited by J. R. McCulloch.
Cambridge University Press. 678 pages. 35s.

THIS collection of seventeenth century pamphlets is reprinted from that made almost exactly a century ago for the Political Economy Club by J. R. McCulloch. Believing as he did in absolute standards of truth and error and confident in the law of progress, these eight pamphlets had for him a double interest. Some illustrated the mercantilist doctrine of the balance of trade, a delusion so powerful that for its sake "treaties and alliances were entered into and set aside, fleets were sent to sea, armies were embodied, and sanguinary conflicts waged in every quarter of the globe." So long did this doctrine retain its ascendancy that, as McCulloch put it, "Even in our own times Parliament was annually congratulated on the excess of the exports over the imports." But other pamphlets were selected to show the beginnings of saner views. Sir Dudley North, the author of "Discourses upon Trade," published in 1691, is warmly acclaimed by McCulloch as "an Achilles without a heel, he has no vulnerable points, no bounties, no duties, no prohibitions."

Few historians would now read the course and causation of economic thought and changes in quite such simple terms; and yet the collection remains of great value. Inded it was this very collection that Sir William Ashley used to examine the connections between political groupings and economic theories. The pamphleteers whom McCulloch selected as forerunners of Adam Smith had one important factor in common besides the economic liberalism that McCulloch exaggerated. They were all Tories. Sir Dudley North had, after all, an Achilles heel. He was one of the best-hated Tories of the times. If for these reasons McCulloch's collection is of particular interest to the historian, it has also a wider and a more topical relevance. For these pamphlets are concerned with the familiar themes of export balances, gold reserves, exchange depreciation and the relations between interest rates and business activity. Lord Keynes wrote in 1936, "As for earlier mercantilist theory, no intelligible account was available; and we were brought up to believe that it was little better than nonsense." Intelligible accounts do now exist, and the reprint of this collection is therefore the more welcome.

Letters to the Editor

Queen Beyond the Seas

SIR—Here is an extract from a news agency message which was prominently displayed in the first column of the front page of the *Hindusthan Times* of New Delhi on May 22nd, and which received, I am told, equal publicity throughout India, Pakistan and Ceylon:—

QUEEN ACCUSED OF IDOLATROUS WORSHIP

Inverness. May 21st. The Free Presbyterian Church of Scotland has told the British Government that the Queen and the Duke of Edinburgh committed an act of "idolatrous worship" by taking off their shoes to visit Ceylon's Buddhist temple of the Tooth during their royal tour. "Had Her Majesty refused to attend this ceremony, the vast majority of her Protestant subjects would have rejoiced."

Friends of the Commonwealth in Asia may see the Free Presbyterian Church of Scotland's resolution in better perspective if it is realised that it received scant publicity here. It would be interesting to know whether the Free Presbyterian Church of Scotland thinks that the President of the Indian Republic visiting Westminster Abbey on an official occasion should remove his hat as a mark of respect to the feelings of his hosts, or would better promote Commonwealth solidarity by refusing to attend in order to demonstrate publicly his attitude towards beliefs other than his own?—Yours faithfully,

JOSSLEYN HENNESSY

Hopeman, Moray

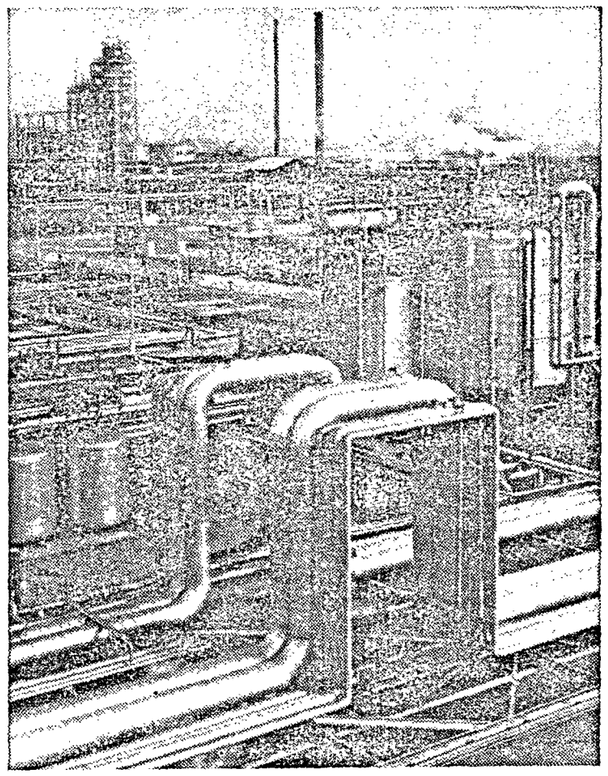
Masters and Men

SIR—In the review of my book "An Introduction to the Study of Industrial Relations," which was published in *The Economist* of May 15th, your reviewer states that the author "does not mention the British Employers' Confederation." This is incorrect. Although the purpose of my book is to discuss the general principles and problems of industrial relations, and does not attempt to describe the systems of industrial relations in Britain or in any other country, the British Employers' Confederation is mentioned five times (see index), and references are made to participation by the confederation in the work of various national advisory councils and of the International Labour Organisation.—Yours faithfully,

J. HENRY RICHARDSON

The University, Leeds

[We apologise for the error. Our reviewer writes that the five references, added together, would not cover one page out of 430. He adds, however, that this is not a criticism of the author, who explains that the lack of information regarding employers' organisations (as compared to the wealth of information concerning trade unions) is due to the secrecy with which their affairs are conducted.—Editor.]



Oil Refinery at Coryton

Civil engineering and building work for this important project has been carried out by the company for Vacuum Oil Company Limited at Coryton. Heavy concrete foundations, reinforced concrete structures, piling, roads and drainage, and the water intake works and jetty were all completed on schedule time. The water intake was constructed in reinforced concrete on the Mulberry harbour principle at Gravesend and Tilbury and floated down the Thames to the refinery.

Schools Without Segregation

Washington, D.C.

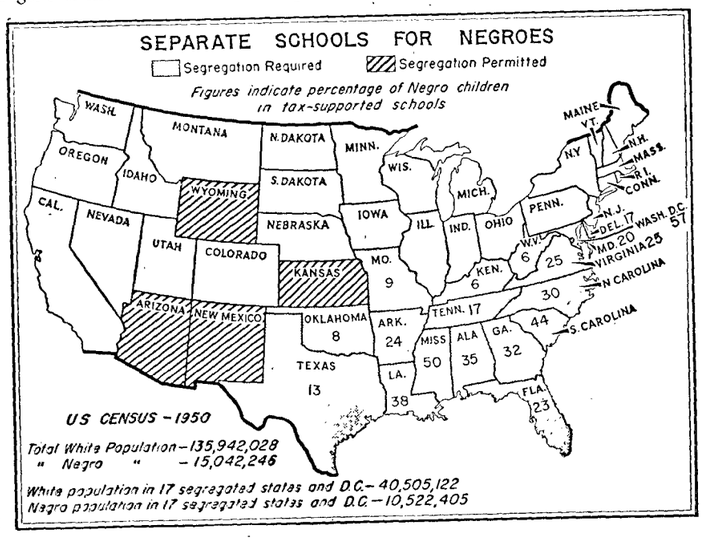
THE Supreme Court's ruling that racial segregation in tax-supported schools is in itself unconstitutional has been wholeheartedly praised, except in the southern states, both for being right in itself and for removing a serious embarrassment to American foreign policy. Particularly welcome were the unusual unanimity of the nine Justices and their sensible decision to separate the establishment of the straightforward principle—that in public education the doctrine of separate but equal facilities for Negroes has no place—and the complicated process of implementing something which upsets the educational pattern and social tradition of the South. The Court will hold further hearings in the autumn before deciding how its ruling is to be applied, but a second series of findings, issued last week, on six other cases concerned with racial discrimination in colleges and elsewhere, underlined that a basic interpretation of the Constitution had been established.

In the South this has been received with regret, but not with united bitterness. The Attorney General of Georgia aroused no great enthusiasm when he summoned the law officers of the other states where Negroes are required by law to attend separate schools to concert opposition. The nearest approach to a general mood was found in Representative Brooks Hays's weekly letter to his constituents in Arkansas; a southern Democrat who has been swimming with the current against racial prejudice, he says of the Court's argument that schools separated by the barrier of colour, however well staffed and equipped they may be, cannot by their nature be equal:

> It is a very difficult kind of reasoning for Southerners to accept. But we are a law-abiding people. We share a proper reverence for the Supreme Court of the United States . . . we can take some comfort from the fact that the Court is giving us time to work out a transition in our schools.

When, in the autumn, the Court begins to formulate the decrees that will govern that transition, the United States Attorney General, Mr Brownell, and the attorneys general of the states requiring or permitting segregation in tax-supported schools, have been invited to participate as "friends of the court" in the discussion. Mr Brownell is expected to repeat the advice he has previously given —that the lower federal courts, from which the test cases originally came, should be directed to enjoin the school boards involved to abandon segregation. If immediate action appears inequitable the lower court should have discretion to order reasonable postponement, in the first instance for a year. One of the Associate Justices of the Supreme Court, Mr Jackson, has predicted, however, a "generation of litigation" before the decision is universally applied, and even the National Association for the Advancement of Coloured People, the skilful organisation which has pressed the test cases, anticipates two or three more years of hard legal fighting on many fronts.

The main difficulty is that education is traditionally not so much a function of state as of local government and, although an increasing amount of state supervision has been exercised through strings attached to subsidies, the system is not really centralised except in West Virginia, North Carolina and Delaware. The Supreme Court's decision only applies immediately to the five school districts involved in the test cases, and there are 11,173 other districts in which segregation has been legal and usually practised. If none



of the local boards chose to co-operate individual suits would have to be brought against each one.

There is, fortunately, not much likelihood of that. Co-operation will almost certainly be forthcoming in the border states and probably in many of the others. Already, since the Court's decision, two instances have been reported from Arkansas and one from North Carolina of local school boards which are permitting Negroes to enter senior classes in the secondary schools next term. In the District of Columbia the school board is debating a plan which will mix some children next September and will put an end to all segregation in the capital by September, 1955. That state governments can help if they will, even when the local authorities have the maximum of autonomy in education, is shown by the example of New Jersey. In the southern half of this state the schools used to be segregated. However, in 1948, after the new state constitution had banned segregation in the schools, a special commission was able to bring about local compliance by persuasion, without having recourse to the courts.

*

But this example is unlikely to be followed in the states of the Deep South, the area of the old plantations, where the Negroes are numerically at their strongest, forming the majority in many counties. The most dramatic attitude of defiance has been struck by Mr Herman Talmadge, the Governor of Georgia, who declaimed: "We're not going to secede from the Union but the people of Georgia will not comply with the decision of the Court." Much the same position is being taken by South Carolina, though the pronouncements of the Governor, Mr James Byrnes, have become somewhat more moderate since his legal advisers took a closer look at his scheme for abolishing the state's system of public education altogether. Rather more faith is now being placed in the solution proposed by the Mississippi Legislature: that school boards be instructed to take "emotional factors" into account in assigning children to the appropriate schools. In some areas, too, segregation will in practice be prolonged by the careful redrawing of the boundaries of the school zones, to divide Negro residential districts from white ones even more completely than they are at present.

Outside the Deep South inertia rather than obstruction is likely to be the main cause of delay, while for many people in states like Kentucky, where the Negro population is not very large and where it is highly uneconomic to support a dual school system in thinly populated rural areas, the decision has come as a relief. The Supreme Court has taken on its broad and remote shoulders the responsibility, and the unpopularity, for doing something which the state authorities had been preparing to do for some time. In many ways Kentucky offers a good example of the gradual breaking down of prejudice and the growing recognition that the end of racial discrimination is inevitable; these are the factors that made the Supreme Court's decision possible and they have now isolated its last-ditch opponents.

Once the issue of segregation has been settled, the ground will be cleared for a general attack on one of the most serious problems of the South: the backwardness of its educational system whether for Negroes or for whites. The southern states have not been standing still in recent years: as a whole they spend a higher proportion of their lower incomes on education than do states outside the South. South Carolina, which is one of the poorest of the 48 states, ranks tenth in the percentage of income devoted to education. Particularly since Mr Byrnes has been Governor, it has been pouring money into the Negro schools in order to support its claim that separate schools can give genuine equality of education. It is said that the gap in current expenditure for white and Negro schools has been practically closed in the large cities in the South, although it still exists in a number of country districts. The gap in terms of physical plant is, however, usually much greater. But the real gap in southern education is between rural and urban schools, whichever race they are for; everywhere there are to be found country schools for white children which are inferior to the worst Negro schools in the cities.

It is the South, therefore, and above all the rural areas in the South, that would benefit primarily from the federal financial aid for school construction that Congress is always being asked to approve. But it has also been representatives of the South who have hitherto held up this approval; they feared that the northern opponents of educational segregation would be able to slip an anti-discrimination clause into the annual appropriation for school aid. Now that sentence has been declared on segregation by the Supreme Court, the Southerners may not be so suspicious of Congressmen bearing gifts.

Loyalty is Not Enough

IT is a tribute to the responsibility, thoroughness and humanity of the members of the Atomic Energy Commission's special security board that they resisted the temptation to come to a clear-cut decision at all costs on the security case of Dr Robert Oppenheimer, America's leading nuclear scientist. Much as they would have liked to use this opportunity to blow away the "uneasy mixture of fear, prejudice and arbitrary judgment" that has come to surround such enquiries, and convinced as they all were of Dr Oppenheimer's loyalty to his country, the board nevertheless regretfully decided, by a majority of two to one, that it could not recommend the restoration of Dr Oppenheimer's clearance for access to secret information. This clearance was suspended, on the President's personal order, at the end of last year. The final decision on whether it should be renewed rests with the AEC itself, but it seems unlikely that the board will be over-ruled.

The reasons why the board felt that Dr Oppenheimer's reinstatement would endanger the defence and safety of the United States, even though he had "a high degree of discretion," were that he had shown disregard for the requirements of security, a susceptibility to influence that amounted to bad judgment and incomplete candour in giving evidence, and had acted in a disturbing manner in connection with the hydrogen bomb programme. The importance which the majority members of the board attached to this last consideration is in itself disturbing: their complaint against Dr Oppenheimer seems to be that, having opposed the programme on moral as well as scientific grounds before it was definitely undertaken, he did not later go out of his way to foster enthusiasm for the hydrogen bomb among those working on it.

The threat to ethical freedom and scientific progress implied in this complaint against Dr Oppenheimer makes it hardly surprising that it was the scientific member of the board, Dr Ward Evans, who dissented from the majority decision. But he based his dissent on the fact that Dr Oppenheimer had been cleared in 1947 and that, as he had improved from a security point of view since then, he did not now deserve to be denied clearance. What has unfortunately deteriorated since 1947 is the international situation, particularly in the atomic field, and risks to security are now assessed by more stringent standards than they were then, a point for which Dr Evans does not seem to have allowed. But it may still be asked, however much one may agree with the board's decision in this case, whether those standards have not become so stringent that the basic democratic liberties are being undermined.

Resisting McCarthy

THE President is no longer an immovable object in the face of Senator McCarthy's sustained infiltration of the independence of the executive; while he still refuses to dignify the Senator by naming him, Mr Eisenhower is now moving out to counter-attack. As a result the Senator's force is looking less irresistible than it did, although he himself appears more defiantly self-confident than ever. Hardly a day of the enquiry into his controversy with the Army can pass without the Senator repeating to the television cameras his invitation to government employees to do their duty, put their loyalty to their country before their loyalty to their superior officers, and give him any information they may have about treason in executive departments.

Last week the Attorney General, on the President's authority, pointed out that

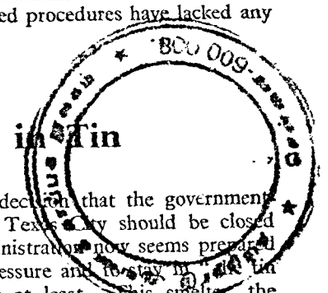
> the executive branch of the government has the sole and fundamental responsibility under the Constitution for the enforcement of our laws and presidential orders. They include those to protect the security of our nation which were carefully drawn for this purpose. That responsibility cannot be usurped by any individual who may seek to set himself above the laws of our land or override the orders of the President of the United States to federal employees.

The only acknowledgment made of this rebuke by Mr McCarthy was to include the present Administration in his famous "twenty years of treason" by extending the period to twenty-one years. He is also now trying to divert attention by returning to his charge, frustrated last year, that the Central Intelligence Agency has been penetrated by Communists. On Monday the President continued his attack at one of Columbia University's bicentennial dinners, by announcing, amid the cheers of his audience, that

> we will drive from the temple of freedom all who seek to establish over us thought control—whether they be agents of a foreign state or demagogues thirsty for personal power and public notice.

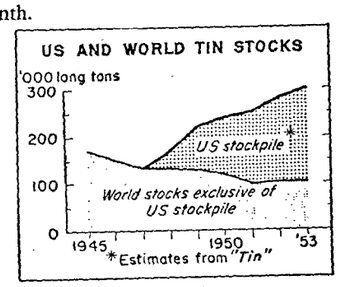
And Mr Eisenhower has now on his side followed this up with an impressive survey of the legal action taken against Communists and subversives in the sixteen months since his Administration took office.

Meanwhile the Senate, spurred on by the Democratic members and by the public reaction to a prolonged television dose of McCarthy methods, seems at last to be drawing near to effective regulation of its committee procedure. Senator Knowland, the Republican leader, has promised to back such a measure early in the next session and before long the Senate is expected to discuss, even if not to act upon, a new code that combines a number of earlier proposals. Under it witnesses at congressional hearings would be told the charges against them before they were published, at least two members would have to be present at each session, and a special committee would report to the Senate on any violations of the code. Previous recommendations for improved procedures have lacked any provision for enforcement.



Foiled in Tin

REVERSING its earlier decision that the government-owned tin smelter at Texas City should be closed down on July 1st, the Administration now seems prepared to give way to senatorial pressure and to stay in the tin business" for another year at least. This smelter, the largest of its kind in the world, was built during the war to process the low-grade ores from Bolivia and elsewhere which had previously been smelted in Europe. It is operated under an agreement with the Reconstruction Finance Corporation, which is itself finally to be wound up at the end of this month.



In the 1953 fiscal year, which ended last June, the plant's output of refined tin accounted for one-half of the total new tin made available in the United States, but its operations for the year ended in a net loss of $1,869,000. Certainly from an economic point of view the government would be well rid of this investment, even if it could only sell it at a heavy capital loss. Moreover, the United States could, it is estimated, live off its current stocks of tin for from 5 to 8 years, and in case of war it could build, in little more than a year, a new and more efficient plant to make the western hemisphere again self-sufficient. A compromise —to end operations but maintain the plant in working order—was rejected as too costly in view of the rapid deterioration that would take place in the warm sea air on the Gulf of Mexico.

The Administration's proposal to sell immediately, or lease, the $13 million plant was well received by the House of Representatives, but was foiled in the Senate by the strong opposition of Senator Lyndon Johnson of Texas, who had, of course, local as well as national interests in mind. The Senator scored a tactical success when he got the Administration's Bill referred to the Armed Services Committee, of which he is a member and which has now voted unanimously against the closing of the smelter. His arguments have been strengthened by the general concern at the deteriorating situation in South-East Asia which might threaten the free world's tin supplies. In addition, a shut-down at Texas City would have an adverse effect on Bolivian tin production, and would therefore create a difficult diplomatic situation. These political and international considerations have evidently tipped the balance against the economic ones and the smelter has already been allowed to rebuild its depleted stocks of tin ore.

Now!
The McGraw-Hill AMERICAN LETTER
Presents a New United Kingdom Edition!

Now, you can have the new United Kingdom edition of the McGraw-Hill AMERICAN LETTER—one of the world's foremost business news services—air-mailed to you from New York every second Friday.

Every fortnight it can tell you of new opportunities for selling your products in world markets—of new sources of supply for the commodities you buy abroad—of credit and monetary trends that can affect your business, and you.

Also, in every issue you will find brief descriptions of special reports issued by U.S. financial and industrial organizations—reprints of which are available for the asking.

We invite you to try the new United Kingdom edition for six months at the special introductory price of only £3 10s. This offers you a real saving over the regular annual subscription price of £11 11s. This introductory offer expires July 15th, so send no money now, but write on your business letterhead to:

Liberal Victory

IN 1950 in North Carolina the liberal invaders of the conservative Democrats' southern stronghold suffered a smashing rebuff, with the defeat of Dr Frank Graham in the primary election for the Democratic nomination for Senator, a nomination which, in that state, means victory in the general election. Dr Graham lost because the Supreme Court's verdict against the segregation of Negroes in the graduate departments of universities, coming during the campaign, gave his die-hard opponent an opportunity, which he exploited ruthlessly, to appeal to racial prejudice and the traditional southern fear of outside interference. Last week the Democrats of North Carolina were again electing a senatorial candidate and their choice lay again between a liberal, Mr Kerr Scott, who had originally sponsored Dr Graham, and a conservative, the incumbent Senator Lennon. Once again the Supreme Court intervened, with its much more far-reaching verdict against the segregation of Negroes in elementary and secondary schools, and once again the decision was exploited to the full by the right-wing candidate. But this time the liberal won.

Mr Scott, it is true, deplored the Court's ruling as sincerely as did his opponent, although less rebelliously. Moreover, Senator Lennon was little known, while Mr Scott is a famous vote-getter, who had challenged the party organisation successfully before, and a farmer who, when he was Governor, made the state spend lavishly on roads to get rural voters "out of the mud." He promised, if sent to Washington, to be more active than Senator Lennon had been in seeking antidotes for unemployment, falling farm prices and McCarthyism, all of which are anathema to the citizens of North Carolina. While all these factors certainly contributed to Mr Scott's victory, it has nevertheless provided welcome evidence not only that the South is accepting the Supreme Court's decision far more calmly than could have been expected even a few years ago, but also that the conservative Democrats are not going to be able to use the emotional reactions to that decision to turn their party's clock back in the South. One reason for this lies in the growing importance of the Negro vote there, as a result of the disappearance of poll taxes and other restrictions which discouraged Negroes from going to the polls. It is estimated that in 1940 in eleven southern states there were only 244,000 registered Negro voters, while in 1952 there were 1,130,000. And it is widely believed that Mr Scott, like Senator Sparkman in Alabama a few weeks earlier, owed his victory to Negro support.

Picnics for Shareholders

New York

IF the confidence of Mr Robert Young, supported by the war cries of his Texan friends, is borne out by the final count of votes, and if his success is upheld in the courts, Mr White and his fellow directors on the board of the New York Central Railroad will be the third major railway management to be unseated this year by the votes of dissident shareholders. To the 2,200 of the New York Central's owners, who were transported to the company's annual meeting in special trains and regaled with box lunches of fried chicken, the proceedings were more reminiscent of a political convention. Indeed, few voters have been courted as assiduously—or at such expense—as the Central's 40,000-odd shareholders. The rival campaign managers, professional solicitors of proxy votes and public relations counsels operated on budgets of which their political counterparts might well be envious.

The tactics employed in this railway battle provided a sensational example of the enhanced role of the individual shareholder in America today. Each year company meetings are better attended and new ways are devised to encourage more shareholders to come and to satisfy and entertain those who do. This year they have done better than ever; they have been treated to free colour films, seen closed-circuit television programmes of their company's operations, received token gifts of its products, or been taken on free tours of airports, luxury liners or of the firm's best plants—with, of course, free lunch and transport to the "picnic."

On the other side, there has been a marked tendency for shareholders to question more frequently, and effectively, the activities of their managements. But it would be wrong to conclude from this that widely scattered, minority shareholders can even now effectively organise their collective strength to ensure the efficiency of the management they have appointed. Successful challenges have been few, outside the railways, and although some of these have been made by shareholders who are genuinely dissatisfied, in many cases—the New York Central affair offers an example—the personal ambition or financial speculation of opportunists has provided the leadership of the insurgent group. Moreover, the pattern of revolt is often set, not by the collective action of the original shareholders, but by an outside group, which is buying its way into the company, soliciting support from the remaining shareholders in order to make its newly acquired interest a controlling one.

Foundations of Socialism?

REPRESENTATIVE CARROLL REECE'S investigation of tax-exempt charitable foundations which concern themselves with education is following the anti-intellectual and anti-international pattern set by a similar inquiry held two years ago, which however ended by commending the foundations. Now Mr Reece, who managed the Taft campaign in 1952, has a political as well as a philosophical motive for trying once again to discredit the foundations; for on their staffs are, or have been, a number of prominent supporters of President Eisenhower who were among those responsible for his nomination in 1952 and for encouraging him to pursue a liberal Republican line since then.

Mr Reece's particular targets are the "big three" among the foundations—the Ford, the Carnegie and Rockefeller funds, names not usually linked with socialism. Yet the sensational charges which the Republicans on the investigating committee and their self-styled expert witnesses are levelling at the foundations include the following: that they educated the electorate in such a way that it voted for the New Deal in 1933; that they bear some responsibility for the loss of China to the Communists; that they introduced Communist practices into the schools; that they promoted radicals who designed the federal income tax as

a "socialist plot"; that they fostered "Fabian Socialism of a kind that destroyed Great Britain"; and that they support world government, and have failed to support "pro-American" activities.

The three Republican members of the committee are receiving some unexpected support from disgruntled academicians. Many of these have long felt, but feared to say anything lest they themselves be denied a grant, that the foundations have wasted money financing "empiricism," or "comptometer compulsion," as a sociologist witness defined it; he apparently meant the type of research which relies on statistical data without due regard to such intangible factors as "devotion, honesty or patriotism."

THE FORD FOUNDATION became active after the war; its assets are $518,865,000. Its purpose is "advancement of human welfare, world peace, and the strengthening of freedom and democracy." Two of its subsidiaries are *The Fund for the Advancement of Education*, which gives grants to schools and colleges for experimental projects, management surveys, and improvement of educational methods, and *The Fund for Adult Education*, to develop adult education in the liberal arts, and to provide further training for those unable to complete their formal education.

THE CARNEGIE GROUP: *The Carnegie Corporation*, with assets of $178,861,599, was founded in 1911, for advancing knowledge and understanding among the people of the United States, Britain, and the Commonwealth and for promoting research in higher education, social science, and international relations. *The Carnegie Endowment* exists primarily to promote international understanding by research, student tours, and educational exchange. *The Carnegie Foundation* was founded to provide retirement pensions for university professors and grants for educational programmes.

THE ROCKEFELLER FOUNDATION was established in 1913 "to promote the well-being of mankind"; with assets of $350,000,000, it has given universities and other research institutions grants for the advancement of research projects in the fields of education and the physical and social sciences.

The defence of the foundations has come not from the Eisenhower Administration, but from the Democratic members of the investigating committee. They have been most forthright in their denunciation of "Republican dictatorship" in the committee proceedings, refusing to be "gavelled into submission and silence" while characters such as Senator Douglas, Mr Edward Murrow and other educational leaders are "assassinated at will," and while reactionary tax-exempt foundations, such as the notorious Facts Forum, are left unmolested.

Dockers Dig in

AFTER months of concentrated effort on the part of federal, state and local government officials and of labour leaders, to clean up and clear out the corrupt International Longshoremen's Association, the union seems to be almost as firmly entrenched on the New York waterfront as ever. The result of last week's election is still uncertain; it was the second in five months, to decide whether the ILA or the rival union established by the American Federation of Labour should bargain with the employers over the dockers' new contract which has been pending since last October. But it looks as if the AFL union has made little progress since the last vote, in which it did unexpectedly well, and as if the National Labour Relations Board may be forced to certify the ILA as still the official dock union in New York. For this election was conducted with complete orderliness, and the NLRB will have no excuse for invalidating it, as it did the last one, on the grounds that coercion and intimidation had been used to collect votes.

It seems, indeed, as if the attempt to discredit the ILA has been defeated by its own strenuousness. Longshoremen are naturally loyal; when they saw outsiders attempting to "bust" their union, they dug themselves into it, whatever its faults. When the establishment of a rival union and the invalidation of the election was followed by court injunctions against last March's long and officially unofficial strike, by the conviction of the union leaders, by the levying of bankrupting fines and by the impounding of union funds, it is not surprising that dockers reacted by voting for the union that was down. Their local branches are now coming to the financial rescue of the parent body, but when financial help is concerned there is also no objection to outside interference. Mr Harry Bridges, the west coast dock leader, has been offering dollars, and, it is suspected, Communist-flavoured advice as well, to the New York union, while Mr John L. Lewis is also taking advantage of this opening for union empire building on the waterfront.

What Price Surpluses?

THE realisation that this year's harvest is likely to exceed expectations, now that rain has fallen on the Great Plains, is cold comfort to Mr Benson, the Secretary of Agriculture, who must be praying for drought, pestilence and fire as the only sure way to reduce government-owned food and fibre stocks. He has already taken advantage of his powers to restrict acreages, and growers of wheat, maize and cotton have this year been instructed to take 30 million acres out of production—or else to forgo price support. But even with this 20 per cent cut in wheat acreages, production may exceed domestic requirements by 100 million bushels. Moreover, much of the land thus freed will merely swell the output of *alternative* crops, such as flaxseed, oats, soya-beans and barley.

It is against this background that the Eisenhower Administration has abandoned its former distaste for a two-price system and has offered butter, cheese, wheat, maize, barley, oats, rye and some other surplus items to foreign buyers at prices—in the case of grains—that are 10 to 15 cents lower than on the domestic market. The State Department, which is anxious about the political consequences, put up a strong last-minute stand against such a move; it has already received complaints from New Zealand butter interests. The Administration, while adhering to the scheme, is trying hard to prevent it from looking like dumping, or indeed from having a depressing effect on world prices.

Other channels of disposal are open to the Administration but Congress is still considering proposals for their

Waste Not, Want Not

NOT EVERY chemical experiment carried out by I.C.I. Dyestuffs Division yields a new dyestuff. Many are completely abortive, but others may yield a compound of value in other fields — for instance, as a drug, an insecticide, an insulator or a disinfectant. For that reason, samples of new compounds are sent to I.C.I.'s medical and veterinary research station at Wilmslow, Cheshire; to the Company's agricultural and plant protection stations at Jealott's Hill, Berkshire; or to other I.C.I. research establishments, where they can be tested for any worthwhile property that might be developed for the benefit of industry or agriculture.

That versatile material 'Perspex', marketed today by I.C.I.'s Plastics Division, actually evolved out of research begun by I.C.I.'s Dyestuffs and Nobel Divisions. The powerful 'Gammexane' insecticides were developed by workers at Hawthorndale on the basis of initial research in the laboratories of I.C.I.'s General Chemicals Division at Widnes. Again, 'Methoxone', the remarkable hormone compound that destroys weeds but leaves cereals and grasses unharmed, was the result of a combined research effort by Jealott's Hill and I.C.I.'s Dyestuffs Division — each of which contributed its specialised knowledge to the joint success. This cross-fertilisation of one division by another ensures that every new compound will be critically examined and, if valuable, manufactured — even though it may be of no commercial interest to the division that originally discovered it. Such a system — only possible in a large-scale organisation which covers nearly every branch of chemical research and manufacture — is one of the reasons why I.C.I. has been able to make so many of the most significant discoveries of modern times, and today holds a position of leadership in the chemical field.

Whether a power station or a cycle dynamo—nickel helps

When the new Brighton B power station is completed it will generate over 300,000 kilowatts of electric power—enough to keep about five million domestic lights burning brightly. On a different scale, but working on the same principle, the little cycle dynamo has to generate only enough electricity to enable the cyclist to see and be seen. Nickel helps both to work efficiently. In the power station it goes into steels and alloys which have to withstand great stress, corrosion and heat. In the cycle dynamo it helps to produce smaller yet more powerful permanent magnets. Throughout industry nickel goes into equipment that does the difficult jobs, helping it to perform better and last longer.

B

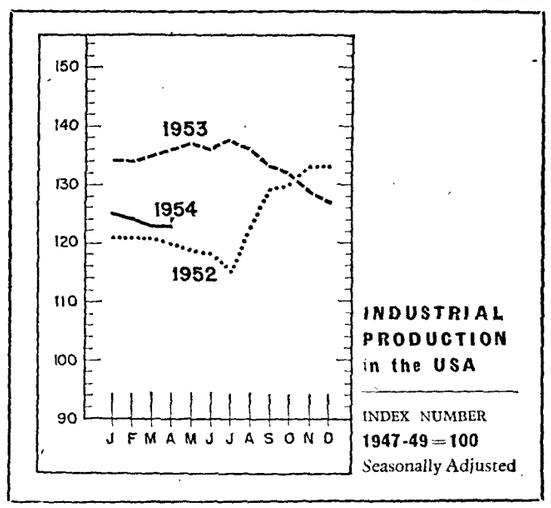
expansion. Direct barter provides one such alternative which could probably be extended—particularly with countries behind the Iron Curtain. A second outlet which might tempt European buyers is provided by a section of the Mutual Security Act, which enables the United States to sell its surpluses against non-convertible foreign currencies. Finally, it has been suggested that the President should keep $1 billion worth of foodstuffs at his elbow as "cold war" weapons, shipments of which he could dispatch—either as a sale or a gift—to meet humanitarian needs and also to confound the Communists.

Convenient Coffee

New York.

FOODS that are ready to serve or are easy and quick to prepare are always acceptable in the American kitchen and, when one of these "convenience items," as they are called by the grocery trade, also offers substantial economies, its sales are likely to soar. This is the case with "instant" coffee which is now used in one of every four cups of coffee drunk in American homes. Eventually, it is thought, more than half of all the coffee sold by grocers may be in this form.

Instant coffee, a powder to which hot water has to be added, is no novelty. Before the war, the product never captured more than 5 per cent of the market because it was usually made of coffee mixed with carbo-hydrates. The spectacular growth of sales awaited the introduction of "100 per cent pure" soluble coffee for which regular coffee is roasted, ground and brewed in the factory and then merely dehydrated; nothing is added to it and the makers claim that it loses none of its flavour in the process. Brewing it under ideal conditions, the manufacturer can extract more coffee from the roasted bean than can the housewife with her less efficient kitchen pot. For this reason and because distribution costs of the powdered product are lower, instant coffee can be marketed at prices well below those of the equivalent quantity of regular ground coffee; the higher the cost of the green coffee bean the greater the saving to the housewife.



Between November, 1953, and April, 1954, spot prices for a standard grade of coffee beans jumped from 58.5 cents to 95 cents a pound. The retail price of a pound of vacuum-packed regular ground coffee is now about $1.20, an increase since the beginning of the year of 30 cents a pound. A two ounce jar of instant coffee now sells for 65 cents, and while it may not make quite as many cups as a pound of regular coffee—a much debated point—the saving on one pound is conceded to be at least 25 per cent. Thus, while the conservative and the connoisseur alike may still disparage the flavour and aroma of instant coffee (they can if they wish buy a liquid "aroma enhancer"), sales are now 25 per cent higher than at the beginning of the year, even though total roastings for all types of coffee have declined by some 3 per cent. Instant coffee, which accounted for only 6 per cent of all coffee sold by grocers in 1948, increased its share to 20 per cent last year, now accounts for 25 per cent, and may well reach 30 per cent by the end of the year if the price of green coffee does not fall.

SHORTER NOTES

American trade unions have become serious competitors in the capitalist banking field as a result of Mr John L. Lewis's victory in the battle for control of the Hamilton National Bank, which will be merged with the National Bank of Washington dominated by the United Mine Workers since 1949. Under Mr Lewis's guidance, the UMW cash deposits and welfare funds have so increased the resources of the National Bank that it has risen from thirteenth to third place in the Capital's banking hierarchy; and with the new purchase of the Hamilton, Mr Lewis becomes the second most important banker in Washington. But the mine workers' leader may not long remain satisfied with second place, even in the financial world; already there are indications that he aspires to control of the American Security and Trust Company, which would in fact make him the leading banker in the nation's capital.

★

The House of Representatives has taken the first step toward authorising for 1954 a long delayed new census of business and manufactures, which Congress had approved in 1948 and scheduled for 1953. In spite of the evidence from the Department of Commerce that lack of up-to-date detailed statistics severely hindered business and government, in last year's economy drive Congress appropriated only $1½ million for preparation of the survey, instead of the $10 million requested for the actual count. This year's new Bill again only authorises the census in 1954; a separate Bill must still provide the money.

★

Life is being made easier, and cheaper, for the American railway traveller, who may now roll his own luggage to and from trains by means of lightweight metal luggage carts, which are being experimentally provided by the Pennsylvania and New York Central railways to supplement regular "red cap" (porter) service in their Pittsburgh and Boston stations. To obtain the metal cart, which can accommodate three or four average-size pieces of luggage, the passenger puts twenty-five cents into a coin machine and gets a refund of ten cents for returning the carrier to the racks. If the response to the new device is favourable, the carts will be available in other cities as well; it should be, if only because of the rising cost of tips.

The World Overseas

Reflections from Lake Leman

FROM OUR SPECIAL CORRESPONDENT

A SINGLE peacock lethargically patrols the gardens of the Palais des Nations at Geneva. He pays special attention to the delegates' door and, according to a popular belief supported by much eye-witness evidence, he heralds the end of each daily session with a rather anguished cry. He is not alone in having created a routine, indeed a ceremonial, for the present conference. It is already six weeks old; those members of delegations who brought only a fortnight's wardrobe have had plenty of time to meditate on their rashness; and Genevan hoteliers are fretting over the prospect that the conference will run on into the very middle of the summer season, and then leave them with empty rooms because tourists have decided to steer clear of a now crowded little city.

But meanwhile the hotels along the lake and the river Rhône remain full. There are twenty-three delegations now present, not to mention those that have also gathered for a meeting of the International Labour Organisation, and some delegates have had to take up relatively unpretentious quarters near the railway station, where the South Koreans, for instance, have settled comfortably into the Hotel des Familles. (The Viet Minh, on the other hand, although latecomers, somehow found themselves a place on the lake front, with excellent views of Mont Blanc, in the Hotel d'Angleterre.) The Americans are installed, tightly but aptly, in a modernistic hotel of steel and glass, at the approach to which the local bus company has placed a sign reading "*Arrêt provisoire*"; the symbolic relevance of this sign to current United States policy is heightened by the fact that it is held down by two heavy stones, one of which is said by observant passers-by to resemble the wrinkled face of Mr Syngman Rhee.

The Russians, apparently fearful of new defections from their staff, insisted on having a disused hotel fitted up for them to occupy in dreary isolation. Much coyer than the Chinese in this respect, they have even corralled their large team of journalists. Their Tass agency booked an office in the communal press building, presumably for prestige reasons, but it remains empty and unused except by western newspapermen occupying adjoining rooms, who occasionally work there when in need of privacy and silence. One of them was doing so a few days ago when he was startled by the sudden entry of a French Communist journalist, who addressed him enthusiastically in Russian.

Little attempt has been made to paper over the gulfs that yawn between the delegations by meaningless social gatherings. This congress does not waltz, it merely bows —perfunctorily, and at a safe distance. The embarrassments of the American delegation are well known, but the Australians feel themselves in an even odder position; while General Bedell Smith can dine with Mr Molotov, Australia, which does not recognise Communist China, North Korea or the Viet Minh, is itself invisible to Russian eyes as a result of the Petrov espionage case. Between the contending sides as a whole, personal gestures of contact (apart from those of the struggling British) are so rare that the conference at times resembles an exhibition of the more monumental school of statuary.

Active wooing is pursued only in one sector, and that is outside the conference proper. The Communists have marked down as an obvious prey the large number of Asian newspapermen who have gathered at Geneva—Indians, Indonesians, Pakistanis, Arabs, Japanese, and non-Communist but possibly susceptible Chinese and Indo-Chinese. Discreet little notices go up in the press building, inviting "all Asian journalists" to meetings called by persons unnamed. Films extolling the new China are shown, glossy pamphlets distributed, and "objective Vietnamese" deployed in the lounges to engage the unwary in conversations that lead gently round to the justice of the cause of Ho Chi Minh, Souvanouvong and Son Ngoc Minh. The Indian press is a particular target. The same men who have made it impossible for Indian newspapermen to work in Peking woo them zealously here, and not without effect. But a clear division may be seen between those journalists from free Asian countries who recognise that the Chinese government has deliberately sealed its subjects off from their Asian neighbours, and those who refuse to face this fact. The latter group, once in the majority, seem to be dwindling down to a hard Marxist core.

Any conference that lasts as long as this one breeds its own customs and rites. The most stylised events are the North Korean press conferences, at which a "spokesman" with the rapt air of an officiating priest reads out an interminable account of the day's proceedings—in Korean, which is intelligible only to those of his hearers who are already in the know—and can hardly wait for his unhappy interpreter to get through snatches of summary in English before resuming the recital of the holy words; he gives the impression, as do some priests, of being quite indifferent to the reactions, indeed to the presence, of the barbarian mob facing him. His acolytes, fidgeting with microphones, floodlights, ciné-cameras and other delightful toys in the corners of the room, all dressed in heavily double-breasted suits apparently cut from the same bale of bright blue serge, have the air of a dance band tuning up strange instruments.

What do the Genevans themselves think of it all? They are distressed by the necessity to bring so many policemen and solders into their quiet city to satisfy the Communist delegations' hunger for security; they recall regretfully how Litvinov used to stroll alone along the roads where Molotov and Chou En-lai now make quick dashes in bullet-proof cars. They look with foreboding at the dingy Soviet Dakotas that have become a semi-permanent feature at the airport. They were touched by the suffering of a Vietnamese journalist who fasted, praying for peace, in the grounds of a villa near the Palais des Nations until, after three weeks, he was removed to a local hospital. But they have come to accept the strange faces and occasional exotic costumes in their streets; and the event that excited them most of all during the first six weeks of the conference was a brief visit by the Abbé Pierre.

Greece and the Balkan Alliance

FROM A CORRESPONDENT IN ATHENS

MARSHAL TITO'S visit to Athens this week takes place in highly propitious circumstances. Not for years have responsible Greeks felt such need for rapprochement with their northern neighbour, or had such support from public opinion for their view. It is a measure of the change that has taken place that only a short time ago it was being argued in Athens that a military alliance with Turkey and Jugoslavia would need the prior consent of Nato; but by mid-May both Mr Stephanopoulos, the Foreign Minister, and General Papagos, the Prime Minister, had told the press that the alliance in question did not need Nato's consent. This does not mean that the Greek government has made up its mind to press on with a Balkan alliance without heeding the ill feeling in Rome or the reservations of several other members of the Atlantic Council. What it does mean is that Athens will do its best to bring about this alliance and will try to find the formulas needed to reconcile these new regional engagements with the interests, not to mention the susceptibilities, of all its Atlantic allies.

The reasons for the government's attitude are compelling and are being more and more clearly understood in this country. Without a Jugoslav alliance Greece's strategic line of defence must be brought far south of its actual northern frontier in order to prevent an outflanking of its defence line on its eastern side as well as on the side of the famous Monastir gap. Without the Jugoslav alliance, Bulgaria would make an excellent jumping-off point for an offensive in three directions—towards the Aegean Sea through the Stromnitsa Valley; towards Monastir and Albania; and towards the Straits; given the alliance, enemy forces in Bulgaria run the risk of being caught like rats in a trap. For Greek diplomacy, therefore, a Jugoslav alliance has long constituted a kind of dogma inspiring the statesmen in Athens throughout a series of treaties and agreements ranging from 1913 to 1938.

During the recent civil war this dogma was still constantly in the minds of the Greek leaders. As soon as Jugoslavia's break with Moscow created more favourable conditions, indirect contacts were re-established between the "democrats" of Belgrade and the "monarcho-fascists" of Athens. The Greek government did its best to encourage the patient and subtle efforts by western diplomats in Belgrade; at the same time, the Moscow leanings of leading Greek Communists like Zachariades, made Belgrade more aware of the repercussions of an eventual Communist victory in Greece, not to mention the intrigues that a "popular government" in Greece would conduct with Moscow and with its Jugoslav friends. The closing of the Greco-Jugoslav frontier in the summer of 1949, which cut off the retreat of Greek rebels into Jugoslavia, was the inevitable outcome of all these reflections and pressures. Its effect was both to hasten the end of Communist activity in Greece and to make plain to Tito's Communists the inter-dependence of Greco-Jugoslav interests. In any case, Jugoslavia could not afford to have on its southern frontier, which is exposed on the Greek side as well as on the Bulgarian and Albanian, a neighbour of whom it had doubts.

Seen from an Atlantic viewpoint, a Balkan alliance would fill a diplomatic and strategic gap, stretching from the Dinaric Alps to the Straits; and in view of Italian-Jugoslav differences, it is hard to see how the gap could be filled in any other way. But there are here discernible the clouds that could mar the atmosphere of Marshal Tito's visit to Athens. Greece cannot be impervious to Italy's reactions to its diplomacy. In 1934, during the negotiations for the

first Balkan pact, the Greek government, under pressure from the opposition, insisted on "the Italian clause," which automatically prevented the pact from being put into effect if Italy were involved in any conflict. This clause had consequences which were scarcely happy for the members of the Balkan alliance. With the new Italy, however, and in the new circumstances created by Nato, Greece's scruples with regard to Italy carry greater weight than they did.

It is fully realised in Athens that if a military Balkan pact were to come into force, it would have repercussions on the other Nato partners; although these would not be parties to a conflict started by an attack on Jugoslavia, they would inevitably find themselves involved because of Greek and Turkish participation. Therefore, for the other Nato members and notably for Italy, the conclusion of a Balkan pact would be tantamount to a guarantee of Jugoslavia's independence and this without any assumption by Jugoslavia of corresponding obligations. This difficulty is more apparent than real. For an attack on Jugoslavia would in fact represent a direct threat to Italy. The Athenians nevertheless feel some sympathy with Italian nervousness about what must appear to be a strengthening of Jugoslavia's diplomatic position in the midst of the Trieste crisis.

Marshal Tito has worked hard, and to good purpose, to

improve his positon. He has gone as far as he can along the path of military consultation with the West. He has "normalised" his diplomatic relations with the Soviet Union and with the satellites, and on January 28th openly proclaimed his desire to begin negotiations for the settlement of all differences with the countries of eastern Europe. His journey to Ankara also strengthened his diplomatic position.

These developments have undoubtedly awakened Roman suspicions about Balkan diplomatic activities; Signor Piccioni's statement of May 12th was a faithful, if somewhat immoderate expression of Italian feelings. In Athens there is a readiness to respect these feelings not only because of the niceties of good manners within the Atlantic Council, but also because the ultimate association of Italy with Balkan affairs would present several advantages for Greece.

The Greeks, who have always had the "slav peril" lurking at the back of their minds, cannot afford to neglect any means of consolidating their position; they must take all possible steps to smooth out all the longstanding problems that face them in the Adriatic. These, besides Trieste, include the Italian minorities along the Dalmatian coast, Albania, and Northern Epirus. The signature of a military pact would not in itself solve all these; they will also entail a great deal of hard work by diplomats.

The Greeks, who have experienced the Communist danger at close hand, know the need for sticking to essentials. They are therefore unlikely, during the present talks in Athens, to rate consideration for Italian susceptibilities above the military organisation of the region.

Kenya Under New Management

FROM A SPECIAL CORRESPONDENT

KENYA'S new multi-racial council of ministers is busy learning its duties, its files, its departmental know-how and—rather gingerly—the hard doctrine of collective responsibility. Mr Welwood, for example, is apparently ready to say in public that he will not let the government do this or that; but the other ministers seem resolved to act as a team and not as the representatives of communal or racial interests. Thus Mr A. B. Patel is taking a firm line with the Communist wing of the Indian Congress, and put over the big increases in taxation contained in the budget very successfully in Mombasa; Mr Havelock wryly told his constituents why he was now committed to the export tax on coffee which he had—amid their applause—opposed effectively for the past five years; Mr Ohanga is preparing to put into operation schemes of community development and rehabilitation which commit him to much that is exceedingly unpopular with Africans; while Mr Michael Blundell declares he feels a different man since he found himself committed to a policy, a job of departmental co-ordination, and a crusade to convert his own constituents to a liberal view of race relations—though opinions differ as to whether he was wise to relinquish his leadership of the European elected members.

To call Kenya's "cabinet" multi-racial, when only three out of its eleven members are in fact non-Europeans, is perhaps only literally true. African opinion is convinced that the influence of Mr Ohanga will be almost nil and there is still bitter disappointment over Mr Lyttelton's refusal to fight for two African ministers, and some resentment that any African should show himself ready to take the job, the salary and the house (in the European area) simply to be a minority of one. But Mr Ohanga may be tougher than they think; while the importance of Mr Patel's and Mr Nathoo's views can hardly be questioned. For if their resignation were forced on them the alternative would not be a different cabinet, but almost certainly a reversion to colonial rule. It is more likely that the first minister to resign will be a European.

So far as is possible the "standstill agreement" (that the white highlands policy, the common roll, multi-racial schools, etc., shall not be raised till 1960) takes the most disruptive issues out of the council's long list of political problems. But the Report of the Royal Commission on East Africa is almost certain to force the land issue back into politics, even if the hardening attitude of the Kikuyu did not. The conduct of the emergency itself, however, promises to provide the council with endless opportunities for taking highly unpopular decisions. Though some Europeans suppose that "Operation Anvil" has cut the tap-roots of the Mau Mau rebellion and that the end of the emergency can be expected sometime this year, others are less sure, especially when they see their trusted servants of 15 or 20 years standing, carted off for incarceration with terrorists and collaborators in detention camps for an indefinite (though one hopes short) period. Nor is the attitude of thousands of wives who are being sent "back" to the reserves (which quite a number have not visited for years) altogether reassuring. It is known that the women sustain Mau Mau in the forests, supplying food and stolen ammunition, and that they are teaching Mau Mau to the rising generation; or, if not Mau Mau, they are inculcating the basic idea that the white man's land (even up to Eldoret) was all stolen from the Kikuyu, and that there is no prosperity or hope for the black man in Kenya till the white man is somehow forced or starved or frozen out.

It will in any case be some months before the effects of emptying Nairobi of its Kikuyu population, and the work of the screening teams at the detention camps can be estimated in terms of the reduction of terrorist activity. Nor can the stimulus given by the Mau Mau to normal African nationalism among all the tribes in Kenya (and possibly Uganda also) be yet assessed. But many unpleasant and very expensive things remain to be done. The police force has yet to reach the greater strength in men, mechanisation and specialised training which will enable it to take over the operations of the Kenya Police Reserve, which, it may be surmised, Colonel Young, the new police commandant, would like to do. The reorganisation of the relations between the Kenya Regiment, the Kikuyu Home Guard and the British regular forces also lies ahead; the maintenance of a large British contingent for a long time seems inevitable, even if terrorism should wane.

If, however, the forest gangs survive Operation Anvil, many of the settlers will call for "greater firmness," as indeed they are already doing, though their caution about the exact meaning of this term exasperates Colonial Office officials who indeed now largely conclude that it means shooting practically at sight and dispensing with even the most elementary rules of evidence in law. Their determination that this shall not happen, however, is strengthened by the far greater sensitiveness of Kenya opinion to British opinion—partly brought about by Mr Lyttelton's blunt speaking—which has made it possible to set up a watch committee to which complaints about the security forces can be sent for investigation. And they are investigated.

More Bills than Funds

The emergency has now cost Kenya £20 million and emptied its revenue balance, making it a supplicant for British aid; but while the cost of operations (according to the Financial Secretary, Mr Vasey) is still rising, the bills for detention camps and rehabilitation centres are beginning to be made up. A camp will cost £1 million, and £500,000 a year to run; nobody knows quite how many will be needed. Mr Ohanga's department is looking at plans for the regular education of Kikuyu youth in civics and self discipline which, if they covered the whole young male population, would cost immense sums. Closer administration would involve finding hundreds of district officers, with experience or training, from Britain; the appointment of young settlers for these jobs has also started—not without some qualms on the part of the African Affairs department.

Expenditure is now running at nearly £30 million a year on a national income (including subsistence incomes) of a supposed £100 million. After raising taxation by nearly £2 million Mr Vasey has had to budget for a deficit of over £8 million. Development is going ahead fast, perhaps somewhat stimulated by the first signs of inflation, but many commercial people fear that the emergency cannot go on indefinitely without at last frightening off the capital which has hitherto come in so usefully. British aid is bound to play a large part in the agendas of ministers' meetings.

How long Mau Mau can hold out under the battering it has had can only be guessed. It is also a guess how far settler opposition will frustrate the work of the new government—for though there is plenty of denunciation, and some scurrilous writing, Kenya remains a land of individualists who find combination difficult even in opposition. The importance in Kenya of opposition leaders such as Mr Humphrey Slade and Colonel Grogan, is probably as much exaggerated in Britain, as Mr Fenner Brockway's importance in Britain is exaggerated in Kenya. But recent defections from the elected members' organisation indicates that opposition is tending to become more extreme, more personal, more bitter. It is clear that the new government, under the Governor's leadership, will need all its resources of courage and leadership.

Kenya's Council of Ministers

The Kenyan Council of Ministers consists of eight official members, including the Governor, the Deputy Governor, and the Chief Secretary; two nominated European members, Mr E. A. Vasey, Minister for Finance and Development, and Mr F. W. Cavendish-Bentinck, Agriculture; and the following six unofficial elected members:—Mr M. Blundell, European Minister without Portfolio; Mr. A. B. Patel (Indian), Asian Minister without Portfolio; Mr. W. B. Havelock, Local Government, Health and Housing; Mr L. R. Maconochie-Welwood, Forest Development, Game and Fisheries; Mr I. E. Nathoo (Moslem), Works; Mr. B. A. Ohanga (African), Community Development.

Big Business in Backward Areas

IN left-wing circles aid to backward areas is nowadays considered the highest mission in life; yet when money and technical assistance are channelled into an underdeveloped region through the agency of a business enterprise they are regarded with the darkest suspicion. In prejudiced minds the distinction is made between "exploitation" on the one hand and "selfless, disinterested aid"—to use the Communist terminology—on the other. But the distinction is false. No external aid can or should be disinterested; the donor has a duty to see that it is well used. Naturally, what is good and sensible use depends on the identity of the giver: a British or American government would want to be satisfied that, among other things, the aid strengthens the cause of democracy; the Kremlin, no doubt, calculates the gain to international Communism. Is it so reprehensible, therefore, that an international firm judges its overseas investments in terms of the contribution to its balance sheet?

Just how much of the quiet work of economic development goes on in the ordinary commercial operations of the many large international firms, was well illustrated in the recent speech of the chairman of Unilever, Sir Geoffrey Heyworth. The far-flung activities of the Unilever subsidiary, the United Africa Company, which with its 3,500 European and 101,500 African employees provides wholesale and retail merchanting services to several millions of West African customers, is an interesting and underpublicised example of the contribution to the development of an under-developed region made by a commercial firm. It illustrates, moreover, the growing understanding by business interests of their role in this vital task.

Technical Skills for Africans

Like many other firms, the United Africa Company has come to realise its role in training indigenous African labour in managerial and technical skills. Whereas in 1939 there were only thirty-nine African managers representing one-twelfth of its management staff, by 1953 there were 160, that is one-quarter of the total. Again like many other firms, the company, finding itself faced with a shortage of technically trained Africans, has steadily followed a policy of introducing European technicians into West Africa, whose function is in part to pass on to the African new skills and techniques.

In the field of social services the company, like many other firms in similar fields, has given more and more attention to the health and welfare of its African employees. Besides employing doctors and nurses, it has in the Belgian Congo a fully equipped hospital of over a thousand beds. It has also introduced contributory pension schemes and has made provision for the recreational activities of its staff.

Not the least interesting of the points made by Sir Geoffrey, because it strikes a blow at the theory of "exploitation," is the relative profitability of Unilever's African operations compared with its activities elsewhere. In recent years the net return on the average capital employed in tropical Africa has averaged 9.6 per cent, compared with 11.3 per cent over the same period in the metropolitan countries of France, Belgium and Britain. In fact, as the chequered history of the United Africa Company shows,

far from amounting to exploitation, investments in backward areas are often for very long periods of time a considerable drain on the parent company's resources. Unilever, for instance, over the past twenty-five years has sunk £35 million in Africa, and to this must be added the enormous amounts ploughed back into capital development out of profits. By these means the capital employed in the United Africa Company has grown from £16 million in 1929 to £108 million in 1954.

But United Africa's experiences are not unique. All over the world, in backward areas in Africa, Asia, Latin America and elsewhere, big and little commercial firms are playing an important role. Of course, they make up only part of the story. Money and skills are required to build roads and power stations, and provide other public services. In these private enterprise is nowadays unimportant. But the ordinary commercial firms, particularly the big ones, like Unilever, which can draw on the enormous resources of capital and technical and managerial skills, have a no less important stake.

Mr Yoshida Sets Out

FROM OUR TOKYO CORRESPONDENT

THE Japanese Prime Minister, Mr Yoshida, has chosen a Pan American Airways instead of a Japan Air Lines aircraft to begin his world tour this week. This considered and characteristic indifference to the storm of political and nationalist criticism that his preference has of course aroused is at once a measure of the Prime Minister's strength and weakness. The dogged, uncompromising leader of Japan has held power during five terms of office—uncertainly and stormily, but decisively—despite, or perhaps because of, an arrogant, *daimyo*-like disdain for public opinion. But, tt must be conceded that he does now appear to be straining his luck.

His Cabinet has been shaken by the confused and confusing uproar of bribery and corruption charges, ranging from shipbuilding to house-building, which the curious Japanese procuratorial system is now cumbersomely and inconclusively investigating. No breath of suspicion has even lightly fanned Yoshida-san's own wrinkled cheek, and there is not the slightest known evidence that could sustain a libel-free reference in a British newspaper to the involvement of any of his ministers in the lurid scandal-mongering. Yet the Japanese press is howling for the mass resignation of the government—in what circumstances and to usher in what substitute is not clear—and the general impression is that the Liberal party, under American pressure, has debauched all the nation's democratic and traditional values.

It is extremely unlikely that any honourable government heads will finally be named, much less roll, as a result of the procurators' earnest inquiries and intolerable methods. But the government's collective prestige, as well as Mr Yoshida's personal standing, have undoubtedly suffered. And the Prime Minister, recklessly or indifferently, has now given his enemies a magnificent opportunity to use his choice of an American instead of a Japanese aircraft as a symbol of his bondage and subservience to American policy.

This is why the vital importance to Japan and the West of Mr Yoshida's London visit must be considered. Britain can do much to help the western cause in Japan; especially as, rightly or wrongly, there is an impression in *Gaimusho* (Foreign Office) circles that Sir Winston Churchill personally is still hostile towards, or—worse still, perhaps—uninterested in, Japan, that he has not forgotten or forgiven Singapore, the *Prince of Wales* and the *Repulse*.

The point is that, while Mr Yoshida is perhaps no Dr Adenauer, it is as much to the interests of Britain and the United States to keep him in power as it is to keep the West German leader in power. It is difficult to see any successor—whether Mr Taketora Ogata, his tough deputy of equivocal war repute; or the ailing Mr Hatoyama; or the brilliant but embittered anti-American Mr Tanzan Ishibashi; or the unsupported Mr Mamoru Shigemitsu—who would be capable of holding together the uneasy Yoshida-disciplined conservative, or so-called Liberal, front.

The Socialist alternative is highly perilous, both on a short-term and a long-term view. The left-wing Socialists have all the irresponsibility of the Nenni group in Italy; while the right-wing of the party are unsure of anything but their desire to gain office. Any shift to the left from what, in Japan, may be politely termed a reasonably conservative administration, would merely irradiate more brightly the mirage of pacifism and neutralism which the Communists would dearly like to see rise in dizzier splendour on the volcanic sands of Japan.

What Can Britain Offer?

The advantages of any successful requests for essential loans and aid that Mr Yoshida may present to President Eisenhower are double-edged. The more impressive they are, with the Washington seal superimposed, the more surely will they endorse the growing popular conviction in Japan that the nation is being exploited as an American colony and as a bomber springboard for an atomic war.

Presuming that the recent Anglo-Japanese sterling agreement heralds, at long last, some sort of positive and intelligent British policy towards the old enemy, it may therefore be hoped that Mr Yoshida will be given not merely honourable red-carpet treatment in London, but also some gifts, in the amiable Japanese fashion, to take home with him. Such elementary gestures of British goodwill, unencumbered as they would be by the real and imaginary dollar ties that are now fatally attached to all American aid, would give him the "face" which he needs at home and which all Japan pathetically longs for. These presents could well include the withdrawal of Britain's opposition to Japan's full membership of Gatt; an invitation to Japan to join the Colombo Plan as a modest donor of technical assistance; an opportunity for Mr Yoshida to explain Japan's case to top-level gatherings of textile, pottery and other nervous sectional interests in England, and—sad and trivial though it may seem—photographs of Mr Yoshida being received and welcomed as a world leader by Sir Winston.

Britain's success in postwar national recovery has been consistently, piously and almost tediously held up as a shining example of fortitude and austerity to the Japanese people by all Japan's leaders, including Mr Yoshida. His personal visit to London provides an admirable opportunity for capitalising to mutual advantage on that reputation, for filling the unhappy and dangerous vacuum in Britain's postwar policy towards Japan, and for helping politically the one known and available Japanese leader who will help the West.

A European Saar? II.

OF all the problems that faced the van Naters Committee when it drafted a European plan for the Saar, the economic problem proved the most difficult. This is not surprising, since failure to agree on economic matters has been the rock on which periodic Franco-German talks have usually foundered. For the Germans the issue is chiefly one of principle. While they acknowledge that the Saar is of little importance to the German economy, they argue that to German opinion Europeanisation means the principle of some degree of equality for all concerned and, therefore, the new Germany ought to receive some assurance that it will gradually be permitted to share the same trading rights in the Saar as France.

For their part, French spokesmen have tended to take an "all or nothing" position, and to regard any modification of the Franco-Saar economic union as a threat to vital French interests. These are the four national interests which France fears will be jeopardised if Germany is given economic parity in the Saar:

(1) France needs the Saar in order to maintain a balance of industrial power within the coal-steel community; with the Saar added to France, the share of total resources within the community is 32 per cent for France and 45 per cent for Germany, while if the Saar formed part of Germany the proportion would be 24 per cent and 53 per cent.

(2) France takes one-third of its coal imports and one-sixth of its coke imports from the Saar.

(3) The Saar is at present a net contributor to the French foreign exchange reserves, its contribution amounting to more than 10,000 million francs annually.

(4) The Saar is an important market for French agricultural and other products.

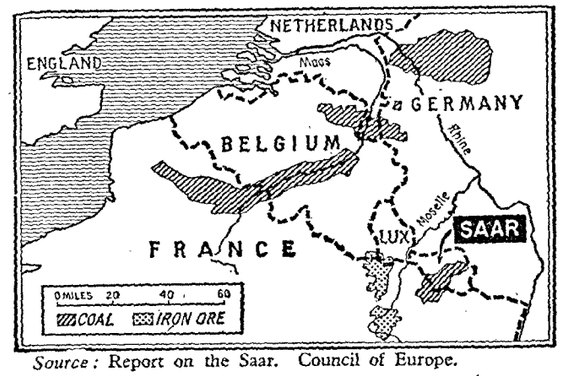
Problems of Ownership

The Saar itself favours greater freedom of trade with Germany, with one reservation; it wants some protection from German competition for its infant secondary industries. All three parties are disturbed by the possibility that an open frontier with Germany might turn the Saar into a paradise for smugglers who would use it to escape the Franco-German customs frontier.

The first principle on which the van Naters committee bases the economic section of its plan is the permanent dissociation of Saar heavy industry from the national control of Germany. Heavy industry accounts for more than one-half of the industrial production of the Saar and nearly two-thirds of its exports. The committee therefore reasons that if the plan maintains French interests fully and permanently in this vital sector, then France can hardly "expect permanently—and to the extent of 100 per cent—to maintain her present position in the remainder of the Saar economy."

Where the Saar's heavy industry is concerned, the key question is ownership—both of the coal mines and the steel works; in other important respects, such as production, marketing and conditions of investment, France is reminded that its interests are preserved by the existence of the coal-steel community. The Saar mines have long been publicly owned—either by Saarland authorities, or by Prussia or France. At present they are administered jointly by the Saar and France, but their ownership is unsettled. Of the Saar's five largest steel plants, one is controlled by the Luxemburg firm of Arbed, two others are French owned to the extent of 60 per cent, and the remaining two—Voelklingen (Roechling) and Neunkirchen—are largely German owned, but have been sequestered by the French authorities since the war. It is the future ownership of the latter two which is in question.

The van Naters plan suggests that the coal mines should be turned over to the Saar government. It is proposed that the future of the steel firms, together with the related problem of reparations, be settled by an international conference of west European powers, plus the United States. Informally, however, the committee advises some form of joint capital ownership, and Mr van Naters himself expresses the view that "in these concerns there should be Saar public ownership or joint Franco-Saar private ownership, subject to full compensation of the present shareholders."



Source: Report on the Saar. Council of Europe.

A third proposal is that the Saar should retain the French franc as its legal currency until "a currency having a European character has been created." In other words, France, which as a member of the coal-steel community has no tariff or quota handicaps to overcome in acquiring Saar coal, will also be able to pay for it without any foreign exchange difficulties.

All the remaining economic clauses have to do with the second main principle on which the committee bases its recommendations: the progressive extension to western Germany of equality with France where access to the Saar market is concerned. It is suggested that France and the Saar maintain their common market (to do otherwise would be a "retrograde" step) and that Germany, France and the Saar conclude a tripartite agreement "for the progressive establishment of corresponding relations, first for goods and services, and later for capital, between the Saar and the Federal Republic." Accordingly, all restrictions on the movement of commodities between Germany and the Saar are "in principle" to be abolished. In so far as Saar industry needs protection from German competition, "such abolition should be carried out gradually but as soon as practicable."

To prevent German goods from slipping duty-free through the Saar into France, and to overcome the reverse problem with French goods, the committee recommends that re-exports from the Saar be regulated. The precise nature of the trade controls is to be decided by the international conference. Finally, the plan calls on the conference to consider what measures are needed to ensure that no harm comes to the French balance of payments as a

result of freer trade between the Saar and Germany. Unofficially, the committee suggests that the Saar Rediscount Bank is quite capable of administering a system that will balance Saar trade or even ensure a surplus.

By writing into its plan such a wealth of safeguards the committee has shown the utmost sympathy for the fears of French and Saarlanders alike, but it is a sympathy which Mr van Naters tempers with a few hard-headed observations. There is nothing in the proposed plan, he says, that would stop the Saar from buying French agricultural products. And, moreover, "where industrial products are concerned, it would be no tragedy either for France or for the progress of European integration if there is a small experimental field where healthy competition takes the place of the hermetic protection of national industry." He concludes that since the German-Saar frontier is already open as regards coal and steel, and since these two products make up two-thirds of Saar exports, the economic problem "is one of modest dimensions." In short, none of the fears still voiced in France or the Saar are of such major significance that they should be allowed to wreck the prospect of Franco-German agreement on the Saar.

The Ban on German Parties

The final section of the plan deals with the Saar government's ban on the pro-German parties—an issue which is still the subject of bitter dispute. On the one hand, Germany maintains that the ban is a violation of political liberties. France and the pro-French Saar government, on the other hand, suspect that Germany's concern for political liberty in the Saar springs from a desire to use the pro-German parties as a spearhead for a *Heim ins Reich* movement. What would be the *raison d'être* of the parties, they ask, once a European Statute for the Saar comes into existence?

In these circumstances, the committee advocates the following middle-of-the-road solution. The Saar government should lift the ban immediately after the international conference adopts the European Statute and the referendum commission is appointed. It will be up to the international conference to decide what interval must then elapse before the Saar voters take part in the referendum on the European Statute. Meanwhile, any external attempts to influence Saar public opinion, in particular by means of subsidies to political parties, are prohibited. All of these provisions are to be guaranteed by the governments represented at the international conference. Once the European Statute is in operation, political parties may be suppressed only if they "aim to destroy democratic freedoms or to change the European Statute of the Saar by undemocratic means."

(*Concluded*)

Journal of Geneva—VI

MAY 27th. At a restricted session on Indo-China, M. Bidault put forward two principles with regard to a Vietnamese settlement:—(*a*) that no provisions for a cease-fire should be regarded as amounting to partition; and (*b*) that the decisions of the conference must guarantee the future security of the country. M. Bidault then made the following six proposals:

1. That representatives of the high commands of both sides should meet as soon as possible in Geneva to make recommendations on a cease-fire.
2. That they should examine zones for regrouping the troops on each side.
3. That they should make recommendations on this to the conference.
4. That they should agree on the basic principles on which regrouping should be arranged.
5. That they should keep in contact with the conference and seek its guidance.
6. That the conference should meanwhile study other problems.

Mr Chou En-lai made a speech in which he reiterated the proposals already put forward by Mr Molotov and of Mr Pham Van Dong of Viet Minh on May 26th. The texts of the various proposals put forward were handed over to a committee of experts composed of two members from each delegation.

May 28th. At a plenary session on Korea, six non-Communist delegates, including the American and the Australian, gave general support to the South Korean proposals put forward on May 22nd, without actually sponsoring them as the final United Nations offer.

The committee of experts on Indo-China met without reaching any agreement.

May 29th. At a restricted session on Indo-China agreement was reached on the following British proposals:—

1. Representatives of the two commands should meet immediately in Geneva and contacts should be established on the spot.
2. They should study the dispositions of forces to be made upon the cessation of hostilities; beginning with the question of regrouping areas in Vietnam.
3. They should report their findings and recommendations to the conference as soon as possible.

The preamble to this agreement speaks of a "simultaneous" cease-fire throughout the whole of Indo-China. Mr Bedell Smith afterwards issued a statement that he did not regard the British proposals as a departure from the principle that Laos and Cambodia are in a different situation from Vietnam.

Mr Molotov departed by air for Moscow, but said he would be back by June 1st.

May 30th. A day of private and informal contacts.

The High Commands Meet

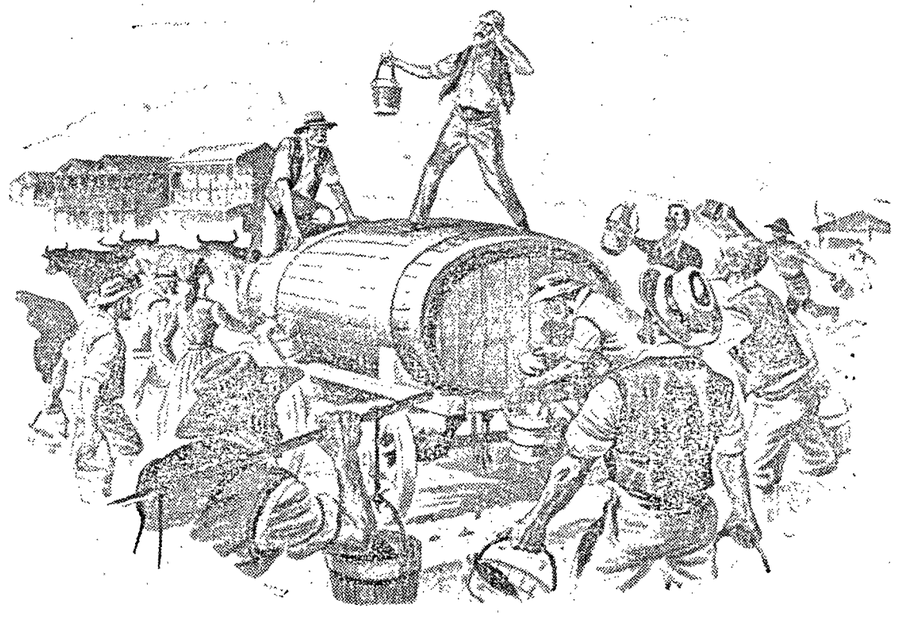
May 31st. At a restricted session on Indo-China, delegates discussed the composition, work and authority of the international commission that is to supervise the armistice. Mr Gromyko proposed that it should be composed of Polish, Czech, Indian and Pakistani representatives. Mr Bedell Smith said that the commission should be composed of "really neutral" independent states.

June 1st. Representatives of the two sides in Indo-China met and arranged for a meeting of the two commands to take place the next day; they also reached agreement on the exchange of correspondence belonging to prisoners of war.

June 2nd. This was described as a "day of hard bargaining and no progress" in the restricted session on Indo-China at which the neutral international commission was discussed. The non-Communist delegates were united in their rejection of Mr Gromyko's proposal of May 31st, but did not produce any agreed proposals of their own.

The first meeting of the high commands of the two sides took place in Geneva and discussed the question of regrouping areas in Vietnam.

The rains failed often



The fight to overcome water scarcity at Broken Hill.

The legend that there was a great sea in the heart of Australia had been handed down through generations of Aborigines. Captain Sturt, the explorer, is said to have taken with him on one expedition, a boat to sail on that sea. It could have floated, however, only on a mirage, for the desert is almost waterless. The average annual rainfall in the Broken Hill district is about nine inches and, in some years, as little as two or three inches; and the rain is evaporated almost as quickly as it falls. In the '80's and '90's, people at the Hill paid from eight to thirteen shillings for a hundred gallons of water. At times they paid a shilling for a large bucketful.

Although a water supply system constructed for the area was ready by 1892, the ever growing needs of Broken Hill showed it to be almost immediately inadequate, and water continued to be a major problem, even after the construction of two storage reservoirs.

Recently, however, largely through the initiative of the Broken Hill mining companies, the supply has been supplemented by means of a sixty-two mile pipeline from the Darling River. It is hoped that when arrangements now in hand have been completed to increase the capacity of the storage dams on the Darling, the sight of water trains in Broken Hill will be but a memory. At last there will be abundant water to meet the needs of this great industry which has brought so much prosperity to Australia and to Britain where, at Avonmouth in the west of England, there is the largest zinc smelter in Europe, processing the ores which come from Broken Hill. That smelter produces the entire output of primary zinc of the United Kingdom, as well as sulphuric acid and other related products.

Lead, Silver, Zinc

The formation of The Consolidated Zinc Corporation Limited in 1949 united the bond of common interest between Imperial Smelting Corporation Limited of Great Britain and The Zinc Corporation, Limited of Australia. The two companies have for many years been associated in the development of the non-ferrous metal production of the Commonwealth. Their activities are the mining of lead, silver and zinc ore in the Broken Hill Mines of Australia and the production of zinc metal, sulphuric acid, fluorine chemicals and zinc pigments in the United Kingdom.

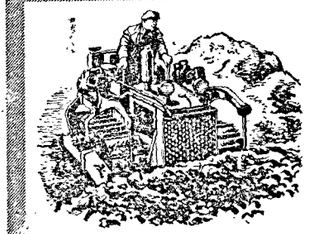
3 NEW REASONS WHY INTERNATIONAL POWER PAYS

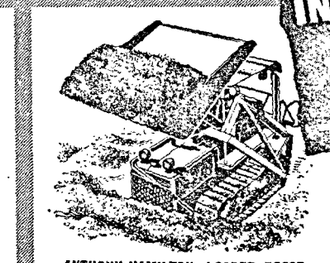
Landclearing and construction projects throughout the world have proved it... it's International Power that keeps the job moving on schedule and holds the operating costs at rock bottom.

On the big punishing tasks the spotlight is on the Big Red International TD-24, but on the smaller jobs it's the no-less-remarkable BTD-6 that steals the show. This British-built diesel crawler has astonishing power for its size, a wide range of speeds, brake-assisted steering, 3-point track suspension—virtually all the proven features of the big Internationals.

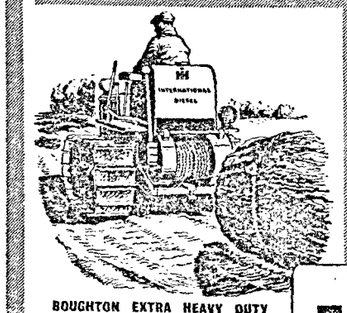
And now, to make the fullest use of the BTD-6's power and adaptability, International Harvester presents the first three items of a range of British-built allied equipment. Each has been developed expressly for this tractor, each is heavy-duty engineered to give long service under the most strenuous conditions.



HYDRAULIC BULLGRADER—*Operated by low-pressure hydraulic system with front-mounted pump. 8' 6" blade scientifically curved to minimize load resistance. Angling and tilting can be carried out by one man without the use of jacks or special tools.*



ANTHONY-HAMILTON LOADER-DOZER *Front loading . . . rear dumping. Lifts ¾ cu. yd. load from fill to dump position in seconds. One lever controls all bucket movements—raise, lower, hold and float. Special attachment, fitted in approximately 10 minutes, converts loader to a fully angling and tilting hydraulic dozer.* (MADE BY ANTHONY HOISTS LTD.)



BOUGHTON EXTRA HEAVY DUTY WINCH—*Fits snugly at rear of tractor without interfering with other allied equipment or attachments. Over- and under-winding. Power reverse. Free spooling. Entirely gear driven. Maximum line pull, 18,300 lbs. Maximum rope capacity 450 ft.*

THE BUSINESS WORLD

New Focus on Gilt-edged

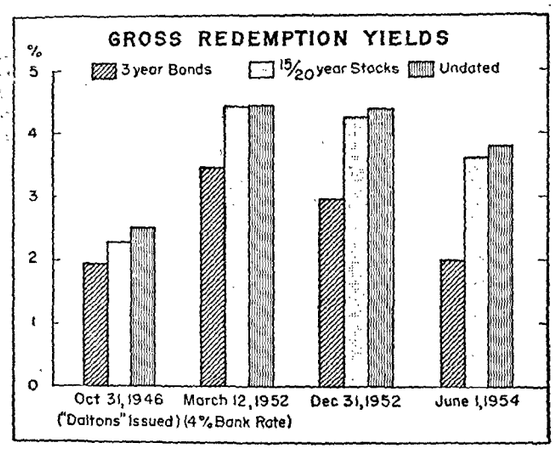
IT was all Lombard Street to a China orange that the Treasury would lose little time in launching another refinancing operation after Bank rate was reduced to 3 per cent three weeks ago. As it turns out, the answer for Lombard Street is a sourish lemon; to the discomfiture of the bond market, the authorities have called for repayment on September 2nd the £321 million of National Defence Loan, 1954-58, passing over the earlier maturing £824 million of National War Bonds, 1954-56, and ignoring the £101 million of 2¾ per cent Funding Bonds, 1952-57. They have chosen a recent favourite of the market (in the hope, now killed, that this issue might have a potential four-year life) and also an eccentric date for repayment, eleven weeks after the first option on July 15th; their action has put the market on double warning that no assumptions are safe about the tenor of a bond carrying widely ranged first option and final repayment dates, and that three months' notice to repay "at any time" from the first optional date means exactly what it says.

On both counts, the bond market has got over its initial surprise, and it has no feeling of grievance. If the action of the authorities has deflated the market, it had, after all, nothing else to complain of since the reduction in Bank rate; the mere fact that recent purchases of 3 per cent National Defence Loan have turned out to be a poorer bargain than had been hoped is in itself no reflection on the Treasury's strategy. In any event, the bulk of the issue outside the departments is probably held by the banks rather than by the discount houses, and it may well be that the banks are the principal target of the refunding issue. First, the holders of National Defence Loan are offered conversion at par on July 15th next into 2 per cent Conversion stock, repayable optionally from January 15, 1958, and finally on January 15, 1959, together with a cash payment of 13s. per £100 nominal. Secondly, a cash issue of £300 million of the same 2 per cent Conversion Stock 1958-59 will be offered at 99½. Thus the new stock, with its maximum life of just over four and a half years, is on the long side for discount market portfolios, though it is also at the shorter end of the banks' range. Conjecture therefore remains whether the banks, whose holdings may exceed £200 million of the National Defence loan, will be ready to convert and accept a leaner yield, and what other home the discount houses will find for the bulk of the £70 million or so that they are reputed to hold.

The strategy is, in one sense, clear; it is to put the shorts into closer order. Two per cent conversion will yield £2 2s. 11d. per cent to redemption over 3½ years, and £2 2s. 4d. for its full life of 4½ years. Apart from 3 per cent National Defence Loan, however, the banks are large holders of the £535 million of 1¾ per cent Serial Funding Bonds, which are due for repayment on November 14th next. This is the surviving member of a family of issues born at the time of the forcible funding of November, 1951; some of the others have been rejuvenated as Serial Funding Bonds 1955 and 1957, and their faces lifted to carry 3 per cent and 2¼ per cent interest. Is that the recipe for November next? Perhaps the banks will have seen certain advantages in switching from the 1¾ per cent Serial Funding Bonds—never precisely a favourite with them—into respectable amounts of the new 2 per cent Conversion. At a guess, the authorities might expect, say, about £150 million of conversion applications, having obtained the conventional oversubscription of £300 million of cash applications, part of which may have been effectively financed by using departmental funds to purchase 1¾ per cent Serial Fundings and a modest part, apparently, by genuine outside demand. The remaining refinanc-

ing problem later this year would then be partly resolved, and the way would be clear, if the authorities so wished, for another medium-term stock of the character of 3½ Conversion 1969, to look after the rest of the 1¾ per cent Serials. The 3½ per cent 1969 stock was issued last February in conversion of 2½ per cent National War Bonds 1952-54; it may have seemed too long for some bankers at the time it was issued, but its attractions of single date have prompted an increasing demand, which has been met at rising prices from the official "tap," particularly during the past week.

It would seem, therefore, that the bond market, having been brought somewhat sharply into line this week, should, if all goes well with this operation, have nothing alarming to fear later this year. But what of the reactions of the authorities' latest moves on the remainder of the gilt-edged market? One could



hear this week the occasional mutter that the authorities were trying to force the pace, and that this was difficult to reconcile with a flexible policy. It is doubtful indeed whether this argument holds much merit. The latest operation continues the policy, pursued since the end of 1951, of funding each maturing short-dated stock into a longer dated stock. There are signs, too, that the dates acceptable to the banks have been getting longer. At the far end of the scale, among the undated stocks, yields are close to 3¾ per cent and, lacking a Dalton with his cheap money pump, they may have some expectation, though it should not be an extravagant one, of a further fall. Therefore, attention is being concentrated increasingly on the medium-dated stocks.

Here, perhaps, it is possible to discern the renaissance of former habits in the gilt-edged market. Bank rate is at 3 per cent, with the chances perhaps of eventual rise rather than imminent further fall. The undated stocks are yielding roughly their long-term average return; the yield may go lower, but hardly dramatically so. The shorts have been trimmed to the new style Bank rate. Under such conditions the attractions of a date within 15 or 20 years are hardly to be gainsaid. The general factors in the market favour a continuation of tolerably firm conditions, in a period in which money has become naturally cheaper, and not artificially cheapened as in the Dalton era. Habits of saving are being renewed, and there is, as yet, no flood of issues to compete for funds. Firmness seems the answer, and the most that the authorities can be accused of is to have added a little influence in the scale by cutting the terms of the latest issue fairly fine.

In such circumstances, the middle range of the list should offer opportunities as the market advances and a fair degree of protection if later it should have to retreat. The accompanying chart suggests that the *echelon* of interest rates between the shorts, middles and longs is still conditioned rather by recent memories of higher interest rates than by the classical adjustments to cheapening money. There is no argument—and mercifully no likelihood—of the artificial concertina of 1946 when yield differentials were compressed to paper thinness. But there is a presumption that if interest rates continue gently to fall for some months, the relative yields of the middles should move more closely towards the shorts and somewhat further than they have already done from the longs. Other factors may emerge later; convertibility or preparations for it; a revival of industrial or public issues; a sudden dawning of the realities of the international situation—any of these could lead to a firmer trend in interest rates, even if none of them need be cast for a prompt appearance on the stage.

*

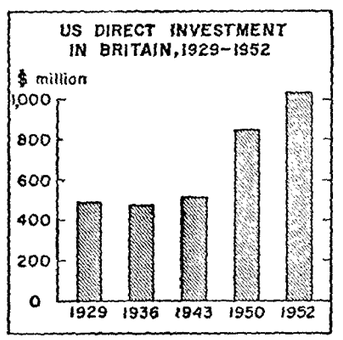
This is, perhaps, as clear an outlook as investors are entitled to expect, and they can at least fortify themselves with the presumption that the recent strength of 20 year stocks is not unwelcome to the authorities. The adjustments that have been proceeding so actively in the gilt-edged market this week have been pulling yields down into line with first dates, rather than second dates, and in this there are undoubted risks. It is disconcerting for a long-term investor who thinks that he has a stock with many years to run suddenly to find that he is clutching a short-dated bond. Three per cent Savings Bonds 1955-65 provide a neat illustration (though they are primarily of interest to the banks and not to the general investor). They have risen this week by half a point to within close range of par. Are they, then, to be regarded as a one year bond or an 11 year stock, subject after August next year to the Treasury's one-way option to repay? The embarrassment of big issues carrying such widely spread dates (2½ per cent Funding 1956-61 will in due course provide another example) will be increasingly felt by the discount houses as time goes on; they will have to employ a bifocal technique that concentrates both on what is genuinely short and at the same time can bring into view what is potentially short and yet conjecturally long. The institutions and the private investor will be concerned with dates beyond this mixed spectrum of "neither short nor necessarily long." And the present signs suggest that they are aware of the attractions of such longer dates, provided that they are not pushed out to extremes.

A Billion Dollars in Britain

ONE of the "virtually new" British exports whose rapid development since the war was recently celebrated by the Board of Trade is the dictating machine. In 1939, no more than a thousand pounds' worth of these appliances was sold overseas, and in 1948 exports totalled only £31,000. But by 1951 they had risen to £385,000 and last year they were £435,000. Dictaphone Company, Ltd., began to manufacture in Britain only since the war, but it records its own exports of dictating machines for those years as nearly 90 per cent of the small total exports in 1948, more than 60 per cent in 1951, and more than 80 per cent in 1953. It is seldom fair to attribute the development of any market to a single manufacturer, and there is at least one other significant British exporter of dictating machines; moreover, the figures may not be entirely comparable. But it seems clear that this wholly owned subsidiary of the Dictaphone Corporation of New York, the largest maker of dictating machines in the world, is responsible for the bulk of this new British export business.

As one of the first American companies to arrive in Britain since the war, and by no means one of America's giants, Dictaphone's experience contains much that is typical. Because overseas markets might be closed to it for lack of dollars, this corporation decided in 1945 to acquire its established British selling agency and build machines here to sell for sterling. It began negotiations with Government departments in the summer of 1945; by October, 1947, it had final blessing to start manufacture at Acton; its factory came into full production in 1949. It had to guarantee a minimum output and—sceptically—to try to export half of that; today it is producing four times the minimum and exporting some 70 per cent, with Canada as its largest single market. The primary reason for manufacturing outside the United States, the official delays, and the undertakings about outputs and exports, though hardly the location, would fit a large number of the American newcomers since the war. So, naturally enough, would the label of a "new British export"; many of these American branches or subsidiaries make products for which the United States dominated the world market before the war, and which Britain has begun to export in volume only since.

How many have come? The varying estimates are all American; no statistics appear to be kept in Whitehall, which is one aspect of a curious reluctance on the part of most departments to admit any special concern with the reception of intending American investors. A worldwide census of direct American investments overseas, carried out in 1950, recorded that of 650 "primary" corporations and branches in Britain, with total assets of $798.2 million, 134 were established in 1946 or later, with total assets of $49.9 million. At first sight, this figure seems to show perhaps too many companies arriving and too little capital. The assets of these "primary" companies may be compared with the total of $847 million given in the census as the total asset value of all American direct investments in the United Kingdom, a total that had increased to $1,035 million by the end of 1952 and is probably higher now. On the other hand, the census also estimated that between 1943 and 1950 American companies invested about $200 million of new capital and about $500 million of retained earnings in West European subsidiaries, and that direct investment in Britain rose by the end of 1950 to about half the total for Western Europe; from which American representatives here often infer that some $350 million of American capital has been introduced or ploughed into subsidiaries in Britain since the war.



The total amount, both arriving and ploughed back, would probably be the more significant figure, if it could be gauged accurately. The dollar shortage, plus the associated but separate phenomenon of a shift in the world's petroleum movement and marketing, has brought these new arrivals from American industry; but it has also greatly widened the manufacturing scope of American companies that had been established in Britain, for distribution or assembly, for years before the war. In the motor industry, the oil business, the pressed metal industry, and the domestic equipment industries that use its products, American companies have been British household names for years; and in chemicals, office equipment, industrial instruments, construction equipment and specialised engineering, many of the companies that have achieved leading positions since the war would fall at least into the census category of "established between 1931 and 1945." There are no adequate statistics to show clearly the ments overseas, carried out in 1950, recorded that of subsidiaries are concentrated in Britain; in 1950, about 65 per cent of the capital was in manufacturing and about 15 per cent in petroleum, which put Britain second only to Canada as a site for American manufacturing investment. Further investment by companies already here has been in response to the same trading circumstances as new investment, and it has to a considerable extent been subject to the same financial conditions and the same official scrutiny.

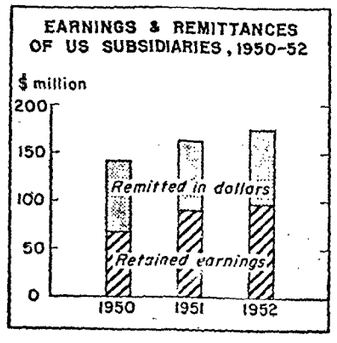
Those financial conditions, by

comparison with other countries in which Americans may invest, are hardly stringent; the scrutiny always has been and is. Current dividends require formal permission but are in fact remitted freely in dollars; and capital invested after January 1, 1950, can also be repatriated in dollars, including any capital profits, providing this was agreed when the investment was made. In fact, American companies operating in Britain have been remitting $70-80 million a year in recent years, or about half their earnings after tax; the remainder, retained in the business, has become a more significant factor in the growth of the total American investment than the investment of new capital. In 1952, indeed, while undistributed subsidiary earnings amounted to $98 million, there appears to have been a net repatriation of capital from Britain to the United States of $21 million.

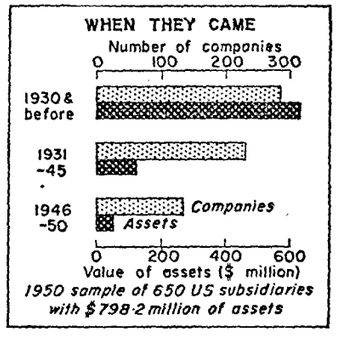
The principles upon which any proposal for new American investment in Britain is scrutinised, as set down by the Dollar Exports Council, seem reasonable:

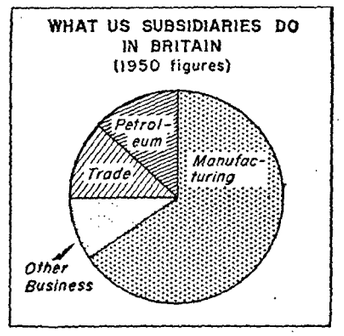
> It is necessary that the project should be of sufficient benefit to the British economy to justify such dollar expenditure (on transfer of dividends or possible repatriation of capital) either because it will earn or save hard currency, or because it is a valuable addition to the country's industrial efficiency. . . . New schemes (should) not involve unreasonable additional dollar outgoings for royalties, extra raw materials or components, payments to foreign technicians and similar charges.

Obviously, these principles leave wide fringes for official interpretation. The departments concerned are likely to be the Board of Trade and possibly some other production department, the Bank of England, working with or on behalf of the Treasury, and where British participation is desired, perhaps the Capital Issues Committee. With these the American investor is likely to be involved in tight and maybe protracted negotiation, which may touch upon his location, the structure of his subsidiary's capital, and other factors beside the output and the export possibilities or import savings of his product. Once this screening is over, the accepted investor is assured of official assistance through the thicket of regulations that he, like any British industrialist setting up a factory, has to penetrate.



A considerable majority of intending American investors, it should be said, complete this assault course quite successfully. The spirit in which it has been operated in Whitehall seems to have varied occasionally in accordance with shifting currents of political or official attitudes; the occasional complaints are not entirely from individual investors turned down and do not relate entirely to the past. Some companies, inevitably, have been frightened off—notably towards Holland. The date limit upon repatriation of investments still causes some fears that at some time in the future it might be shifted forward; moreover, dollar-saving or dollar-earning opportunities are today less easy to find. But it is fair to say that the investor will garner some good advice as well as frustration in his preliminary negotiations; and some interesting deals have been worked out in recent years, notably the arrangement by which Burroughs Adding Machine transferred the manufacture of two of its models for the American market entirely to Britain.





The contribution that these companies are making to the British economy, in technical example as well as dollars, has never been measured or sufficiently publicised by the British Government; some "Conditional Aid" counterpart money is now being spent to support a tentative survey. Nor have many of them (with notable exceptions, such as Esso at Fawley) set down their impressions and comparisons of the two industrial environments, which would be valuable. Costs are usually not easy to compare. The offshoots in Britain have a far smaller volume of output and their labour costs are a third or less of American; both factors may radically alter the production methods adopted here. Overheads for design and research may be negligible; where the company sub-contracts, it may find component costs high and will often find that parts obtainable as standard lines in America have to be made specially here. Most American executives here speak well of British labour effort and skill; but despite the advantage of lower British wage costs, few will admit to being able to bring the total manufacturing cost of their product below the American. Manufacture in Europe has considerable advantages for the control of an effective selling force in this hemisphere; and Britain is often the best European market for the product to begin with. It is often easier, too, to suit varying local needs such as electrical conditions into the shorter runs of a European factory. And Britain—in theory at least—offers no language difficulty.

Nevertheless, the one overriding reason that made high American direct investment in Britain and other industrialised countries advantageous since the war is beginning to fade. Discrimination against dollar goods is diminishing, and it is to be hoped that it will diminish more. In a growing number of markets, the American branded product from America meets its British counterpart on equal or nearly equal terms. This may already have reduced the flow of new investments to Britain; in future, any real advantages that can be offered by manufacture here, arising from cheaper skill and cheaper materials, will be weighed more carefully against the economies of volume production inside the United States. American businessmen still retain some reservations about the welcome that their capital will receive in this country. The political risks, perhaps, no longer loom so large; it may be significant that the guarantees of repatriation of dividends and capital available from American government agencies have been taken up by less than 20 companies arriving since the war. But competition for their favour, in comparison with the boosting of American factory sites or with the apparently more open arms of some other European countries, still seems less than enthusiastic here. The principles by which Britain measures potential American investment are, in the long run, the right ones for both parties. But their presentation, at least, lacks salesmanship; and the advantage of manufacturing in Britain is something that Britain now has to sell.

Business Notes

Boost for Britain

An apparently well-calculated speech on Britain's economic position came from the Chancellor of the Exchequer last week at a quarterly meeting of the National Production Advisory Council on Industry. His remarks included a most careful restatement of the Government's attitude on convertibility, following a review of the country's progress in recent months.

He summed up the record of success in the following juxtaposition: "Between July, 1953, and April, 1954, United States industrial production fell 10 per cent. Between the same dates sterling area gold and dollar reserves rose 19 per cent. If anyone in the middle of last year had forecast this combination of percentages he would have been written off as an optimist or an ignoramus—possibly both. Yet, there it is." The Chancellor offered four explanations: first, increased European demand had taken the place of falling American demand; second, the high production in the United Kingdom had not led to increased imports of dollar goods; third, US military expenditure abroad had remained high; and fourth, other countries had increased their working balances in sterling—partly "because they have been impressed by the ease with which the sterling area is riding out this patch of rough weather from America."

His references to convertibility appear as a direct answer to recent comments by Professor Erhard, who had made the move to convertibility appear a matter of early, almost immediate, probability. Mr Butler repeated the familiar three conditions for successful and lasting convertibility: sound finances within the sterling area, adequate reserves; and the adoption of sound creditor policies by creditor countries. All these, he said, remain important, "not least the third."

If or Unless?

When he turned to the country's internal position, the Chancellor described the current economic situation as one in which Britain might turn from thinking of the penalties unless it does this or that to think of the rewards if it succeeds in doing them. He was ebullient: "Why should we not aim to double our standard of living in the next twenty years, and still have our money as valuable then as now?"; though the familiar phrase "wages and dividend restraint" inevitably had to come. In the export field, Mr Butler described the past four months' record as "not quite as high as in the boom quarter at the beginning of 1952, but . . . much better balanced." At home, he had an industrial boom to boast in almost everything but coal output.

The official index of industrial production for March, revised to 130 (1948—100), the same as February, gives an increase of 5-6 per cent in the first quarter over the first quarter of 1953. The figure for April, affected by the Easter holiday, is expected to be 124-125, again 5-6 per cent up. Motor-car production, the Chancellor was able to report, is 42 per cent up this year, tractor output 21 per cent up, and commercial vehicles 6 per cent up. Figures for

machinery compare variously with output last year; but there are indications of healthy and growing business in many sections of engineering.

It is true that not all the auguries are equally inspiring. As Professor Cairncross has pointed out this week in the *London and Cambridge Economic Bulletin*,* trends in world exports of manufactured goods suggest that over the last few years, while Germany's exports have been showing a large and continuous increase, and American exports have at least paralleled the upward trend of world trade, Britain's volume of exports has failed to show any significant increase; its share, therefore, has fallen considerably. He thinks the best that Britain can hope for may be to maintain its share of trade in manufactures, with Germany and Japan gaining larger shares and America perhaps losing ground; to enjoy terms of trade as favourable as at present; and to rely on a general expansion of world trade to pay for a growing volume of imports. Some "ifs" seem to be implied in this conclusion, too; but unlike Mr Butler's, these could easily be replaced by "unless."

Banks Buy Gilts

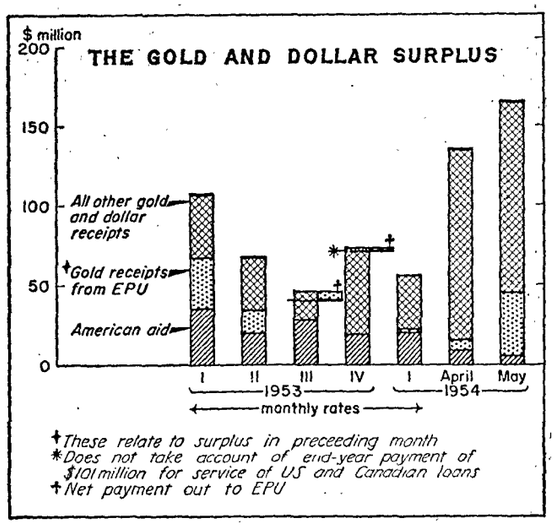
THERE is little sign, in the latest figures of the clearing banks, of the inflow of foreign funds that so significantly strengthened the gold and dollar reserves last month. In the four weeks to May 19th, net bank deposits rose by only £15.9 million, actually a notably smaller expansion than that in either the preceding (five-week) period or in the corresponding period of 1953, also of five weeks. Yet bank finance for the private sector expanded more rapidly this May than in either of those earlier periods. Advances rose by £21.2 million, bringing the increase since the beginning of the year to £86.6 million, whereas in the corresponding months of 1953 they rose by only £23.2 million—but at the end of that period they had been deflated by the repayments made by the British Electricity Authority from the first proceeds, amounting to £56 million of its public loan. The net demands of private trade, industry and personal borrowers for finance thus appear to have been only moderately greater this year than last.

This conclusion depends, however, on the assumption that one striking change this month—an expansion of bank investment portfolios by nearly £25 million—should be treated as providing finance for the public sector rather than the private. The flow of stock through the "departmental" taps during this phase of activity in the gilt edged market may justify such an assumption. And, unless it is made, the public sector would appear to have actually reduced its indebtedness to the banking system by appreciably more than the amount of its net receipts from other domestic sources — despite the strain put upon it for the financing of the current surplus on the external balance of payments, and despite the sterling sold by the Exchange Account to foreigners that were switching funds to London. Even after the banks' investment purchases have been brought into the reckoning, it appears that only a small part, if any, of these special Exchange Fun operations had to be financed on balance through the clearing banks. The conclusion seems to be that most of this finance was secured, in effect, either by sales of Treasury bills to foreign institutions or by more general departmental sales of gilt-edged.

Quite unexpectedly, therefore, there has been a tightening of the banks' liquid position. Their intake of Treasury bills was much less than the decline in their cash and call money (the make-up day was one of exceptional stringency), so that total liquid assets have dropped; their ratio to deposits fell from 33.1 to 32.9 per cent. At the same time, the substantial intake of investments—bringing their total rise since last September to £169 million, including the participation in the autumn funding operation—has raised the investment ratio to 36.4 per cent. Before the launching of the "new" monetary policy it was 25 per cent.

Heyday for the Reserves

THE inflow of foreign funds to London that took place in the last days of April and the first days of May has given a fine boost to the gold and dollar reserves of the sterling area. Those reserves rose by $135 million in April and again by $165 million in May. This rate of increase has been unequalled since the post-Korean boom. Moreover only $15 million of the increase of $300 million was derived from defence aid. Receipts from the European Payments Union amounted to $7 million in April and $39 million in May, so that the surplus with other areas came out at $119 million in April and $120 million last month—



easily records since monthly figures began to be issued in January, 1952.

It is officially estimated that about three-quarters of the "true" surplus achieved in May was earned in the first few days of the month—when the inflow of funds in response to rumours that the margin of the sterling rate was to be widened and to the increased scope for interest arbitrage necessitated heavy official purchases of dollars to prevent the sterling rate from breaking through its upper limit of $2.82. The rate of direct dollar surplus in the rest of the month, when these special factors were absent, was thus at the still respectable figure of about $30 million. The reassuring fact is that when the rumours of early May died away there was no sudden outflow of the funds that had come in. Neither the denial of the rumours nor the Bank rate change sent money out again.

Steadily this year the prospect for the sterling area gold reserves has improved despite all forebodings. The surplus with Europe, which normally declines at this time of year as the flow of tourists and purchases of fruit and vegetables begins, reached £10.8 million in May, and 50 per cent of this will be paid over in gold in the middle of this month enhancing the June gold figures. Sizable gold payments may of course be made to EPU in coming months as the British negotiations mature with the creditor members of EPU about the settlement of long standing claims. But the prospects for the current balance suggest that the autumn may see an improvement in the British position with EPU—particularly if sales of sterling area commodities to Europe continue to be as bouyant as in recent months. The gold figures in coming months are not expected to be as dramtic as those for April and May.

Stewarts and Lloyds

SIR JOHN MORISON, chairman of the Iron and Steel Realisation Agency, has decided not to let summer lethargy overtake the share markets without one more offer to the public. As foreshadowed in *The Economist* of May 15th the Agency will offer the plum of the steel equities—Stewarts and Lloyds. The offer for sale will comprise the 10 million £1 ordinary shares with an indicated 12½ per cent dividend, covered more than three times. Estimated maintainable earnings are £7 million before tax and prior charges. The price of offer will be fixed nearer to the prospectus date of June 21st. In fixing the details no one among the powerful City houses which is advising and least of all Sir John Morison himself is under any delusion another failure would be tolerable after the experience of United Steel, still at 5¼d. discount below the offer price of 25s. and of Lancashire Steel now 1s. 9d. discount below the issue price of 22s.

There is no doubt at all that the offer will be over-applied for; the very method of approaching the public with firm applications already in hand for the whole amount assures that technical over-subscription will be achieved from the start. It is again a question of what will happen afterwards. Preferential forms must go to all the former Stewarts and Lloyds shareholders. The public, if it has any faith in the City's big issuing houses, may decide to "stag" the offer. Whence will the flow of buying come when dealings start and "stags" wish to sell? In the City it is an open secret that Sir John Morison would have preferred conventional underwriting to the firm application technique had not the consortium of issuing houses persuaded him otherwise. He would also have preferred to limit public applications by making the amount payable on application large. Details are not yet completed but it seems possible that that idea, too, may be abandoned.

One other expedient can be used to simplify and expedite procedure—to limit the number of gilt-edged stocks which may be tendered instead of cash. This would shorten the number of days over which lists have to be held open and the complicated paper work which the Bank of England has to tackle on allotment. It is hoped that the Treasury will agree, as they did with Lancashire Steel, to limit the stocks to one—Treasury 1979-81 (the old steel compensation stock), and to keep the lists open a few days only.

Encouraging the Buyers

THE Iron and Steel Realisation Agency is thus faced with another offer of roughly the same form as its two previous unhappy efforts, but on which it dare not fail. The sale of 10 million £1 shares of Stewarts and Lloyds will presumably draw on something like £18 million of investors' funds. What steps can still be taken to ensure that buying power is in the market to give support?

First. It is essential to leave the investor something to go for. By choosing the blue chip of the steel equities something in that direction has been done. More has been done by basing the issue on a 12½ per cent dividend which will absorb less than a third of available earnings. The investor is left to assume that the rate can some day be raised.

Second. Since it has been agreed not to discourage the "stag" he will have to be propitiated. It may be assumed that the Agency has arranged that a reserve of buying power will stand behind the market after the issue.

Third. The Agency will do its best to limit the immediate drain on funds which might be available for investment in steel stocks. The Agency holds back for future sale the rest of the Stewarts and Lloyds capital comprising £10 million 4½ per cent unsecured loan stock, £5 million redeemable £1 preference shares and £5 million 5½ per cent £1 cumulative preference shares, all of which might have been quite acceptable to the institutions.

Do these precautions add up to success? The end of this month should provide an answer. The conclusion of another private steel sale gives further evidence of the agency's determination to push ahead. Arthur Lee and Sons announce the repurchase of Arthur Lee and Sons (Hot Rolling Mills) and Arthur Lee and Sons (Cold Strip) from the agency for £950,062. This is the same nominal sum as was paid in compensation, ignoring the loss which the parent suffered through the depreciation of its 3 per cent compensation stock. In connection with this deal Arthur Lee and Sons are arranging to issue £500,000 4¾ per cent 1974-79. The agency's advisers have evidently taken the view that the sum involved was too small to warrant postponing the issue until after the Stewarts and Lloyds offer. At least no one is any longer under the delusion that selling steel companies to the public under the renationalisation threat is easy. Nor can anyone work out the impact of that threat on Stewarts and Lloyds equity before the selling price has been announced and while the Agency itself retains the prior charges.

Lion in Retirement

THE time it has taken this Government to decide to cut the loss of public money in British Lion Film Corporation and the conviction with which the Socialist ex-Minister chiefly responsible for the loan voiced his

* London and Cambridge Economic Bulletin, in *Times Review of Industry*. June, 1954.

criticism of this belated decision in the Commons and later on the BBC are alike evidence of the obstinate fascination that British films retain for British politicians. The loan, of £1 million later increased to £3 million, was made in 1948 through the National Film Finance Company, later called a Corporation. It was the primary "matter of urgency" with which the committee set up to organise that company was charged; and it has indeed been asked whether the wider powers to finance British films in general given to the State finance company were not added to make this massive assistance to a single company look more respectable. Without the 1948 loan, British Lion's chairman said at a subsequent annual meeting, the company would have been in receivership. The Government's £3 million, of which at least £2 million is liable to be lost, has delayed this eventuality by about five and a half years.

The loan was made originally for three years, due in October, 1951. By March, 1950, the National Film Finance Corporation felt it prudent to make a provision of £500,000 against this loan, and in March, 1951, it increased this provision to £1 million. No repayment was made in 1951 or afterwards; in the Act last year that prolonged the life of the State corporation and extended its borrowing powers, it was authorised "to enter into special arrangements with respect to certain loans." It appears that the special arrangements envisaged that the loan would have been extended for a longer period with reduced interest charges and that the State corporation would have had a greater power of control over British Lion. During the negotiations, however, British Lion informed the Corporation and the Board of Trade that in the past year its losses had "assumed proportions which were beyond the hope of treatment under (this) plan." The National Film Finance Corporation, with Government approval, has now exercised its right to appoint a receiver and manager. A new company may be formed to take over its distribution activities, but British Lion will not continue to produce films; its subsidiary studio company may continue to offer facilities for independent producers to make films. "The policy issues arising out of this decision," says the NFFC in its annual report this week, "are under discussion with the Board of Trade." They may well be.

Angel on a Limb

WHATEVER the motives behind its inception, the National Film Finance Corporation has fulfilled the purposes of government and it has served the British film industry. Audiences like British films less than politicians do; even so, in five years the Corporation has financed a number of highly successful films, some of the best being made by British Lion. It can be expected today—Cinemascope perhaps apart—that of the half-dozen most successful films at the British box-office in an average year half will be British, though among the unsuccessful ones British films do far worse than American; after all, Britain sees all the feature films made here and only a selection of the larger American output. The Corporation has so far financed 262 feature films, about 60 per cent of all films made in Britain. Roughly half of those so far released have been profitable, and over the whole year's releases in 1953 the receipts recoverable may be about 13 per cent more than they cost.

"There seems to be a prospect" the Corporation therefore reports "of a small profitability from the making of films," in present circumstances. Unfortunately, this small profitability does not yield a profit to everyone concerned; and the Corporation is usually odd man out. It generally supplies "end money," the difference between the film's budget figure and what a bank will put up on the security of a distributor's guarantee that the film will be shown (which usually covers 70 per cent of the cost). If a film is unsuccessful, the whole Corporation loan is probably lost; if it succeeds, the Corporation receives only a share of the profit, and only over a long period. "Losses," the Corporation says, "cannot be avoided by those who provide the risk money"; understandably, there is no sign of outside risk money becoming available on a significant scale.

The all-party policy of milking this industry of huge amounts of Entertainments Duty at one end and dribbling money in at the other, not as an admitted subsidy to occasionally artistic endeavour but always in the pretended hope of putting the industry on a business basis, is therefore still not succeeding. The Corporation defines the industry admirably:

> Film business remains essentially show business; that is to say, subject to the fluctuations of public taste; to the creative power of the artist and the problem of successfully blending that power with commercial necessity; to the runs of good and bad luck which for no apparent reason come to a producer; and to the disproportionately great profits or losses which seem to be the result of success or failure of individual productions.

It would be difficult to conceive of a business in which it is inherently less advisable that public money should be at risk.

More Freedom for Sterling

THE Bank of England has this week appreciably relaxed the Exchange Control regulations dealing with blocked sterling and dealings in foreign currency securities. The object of the change is to bring the control of security dealing and the treatment of blocked sterling into line with the relaxations in the use of current sterling made earlier this year when non-resident sterling of nearly all types became interchangeable and the transferable account area was greatly extended. The only securities of which transfer remains restricted are those on which capital, dividends or interest are payable in Canadian or US dollars or in respect of which the holder has an option to require payment in these two currencies. Previously securities of the Belgian currency area were similarly restricted or "prescribed"; such securities may in future be purchased by residents of the sterling area outside the United Kingdom or by non-residents and paid for out of the appropriate sterling account.

Transfers of blocked sterling between non-residents may henceforth be made without formality by authorised banks but with two broad exceptions. The first is that no transfer of blocked sterling may be made to a resident of the American account area or Canada from a resident outside these countries; the second is that no transfer of blocked sterling

"Acqua alle corde!" The Obelisk in the Piazza di San Pietro in Rome was erected in 1586 with the help of 800 workmen and 140 horses. This detail from Carlo Fontana's engraving gives some idea of the splendid grandeur of the operation.
It was a close thing, so the story goes. The architect had not allowed for the enormous strain on the ropes and their consequent stretching. But, though silence was imposed under pain of death, one of the workmen—a sailor from San Remo—shouted at the critical moment: "Acqua alle corde!" And the water on the ropes, tautening them, saved the day.
These days the builder works with far more manageable materials. Some of the most versatile are made by the Building Boards Division of the Bowater Organisation. Made from compressed wood fibre, these boards are used, among a thousand other uses, as insulating materials in ceilings, as partitions in houses, as panelling in railway coaches or in ships . . . all over the world they are essential to the architect and builder of today.

may be made to a resident of the Uniscan countries—Denmark, the Faroe Islands, Greenland, Norway and Sweden. These Uniscan countries have the right to repatriate blocked sterling and their inclusion in the list of countries to which blocked sterling could be transferred would provide an open door to the withdrawal of all blocked sterling from this country. But since blocked sterling can be withdrawn and converted into any currency by way of the market for security or switch sterling (now quoted at a mere ½ per cent discount on the official rate), it may be questioned whether this elaborate re-definition of exchange control regulations is not drawing attention to restrictions that have ceased to have real significance, and that, all being well, should disappear altogether in a matter of months.

No Major Roads Ahead

Two main arguments were advanced by the Parliamentary Secretary to the Ministry of Transport when he wound up the House of Commons debate on road development last Friday week. One was off the point; the other was highly debatable. First of all, Mr Molson avoided the closely reasoned arguments of the mover, Mr Harmer Nicholls, for a limited increase on the government's present programme by seizing upon the suggestion, made not in that debate but in an earlier one, for a £500 million road loan. This Aunt Sally was fairly easy to knock over.

On the more important question—how large a road programme the civil engineering and contracting industries can now handle—Mr Molson was resolutely pessimistic. The present programme was as large as is "wise and prudent for the government to undertake now and maintain over a period of time"; anything more would impose too great a strain on the economy and draw labour away from other industries. The civil engineering contractors, it may be said, argue that a larger programme could be comfortably undertaken. Postwar pressure on the industry, in preparing housing sites, in building airfields, atomic energy plants, and other defence works, in constructing power stations, hydro-electric installations, and oil refineries, has begun to ease, and materials are no longer the problem they were. Only cement might present a serious difficulty for a realistic road programme beginning on Britain's motor roads; and the need for this might be reduced by the use of pitched stone roads topped with an asphalt carpet. Labour might be short, but this industry is used to recruiting Irish labourers to help it in peak periods and the contracting industry has undergone a high degree of mechanisation in the last ten or fifteen years. The labour force working on roads has risen this year by 7½ per cent already, and twice as much plant is now used in the civil engineering industry as before the war. The main proposal, however, is that resources should be transferred to the roads within the construction industries, not extra resources brought in; surely the priorities set in the immediate postwar years are not immutable?

Steel Prices Alter

Within the last ten days the British steel industry has increased its home prices and reduced certain export prices. The increases in home prices, which average about 2 per cent, take into account the increased costs of coal, wages, and transport. They vary from 15s. a ton for pig iron and heavy steel products down to 2s. 6d. a ton on certain re-rolled products. It appears that these prices, set by the Iron and Steel Board, have required the industry to absorb some of the increases in costs. This is presumably because the industry has no longer to bear the heavy cost of importing finished and semi-finished steel at high foreign prices and selling it at lower British prices; the levy and rebate system of this industry sometimes means that steel prices move to some extent like icebergs, above and below the surface. Last week's changes also represent some interim conclusions from the major review of the whole steel price structure that the Board is carrying out—the first since 1949; the varying increases in prices granted for heavy and light products may adjust the balance of profitability between different products. This may not be the final result of the Board's lengthy survey.

The cuts in export prices of certain steel plates bring these prices closer to Continental export prices, though those seem still to be slightly lower; the export premium on these British steel products seems to be still there, but only just. Despite the offer of abundant and now cheap Continental steel plate, there does not seem to have been any considerable import from the British industries that were recently complaining of shortage; the plate shortage is now about over, and the only product where demand still markedly exceeds output is cold-reduced steel sheet. At home, indeed, the industry is congratulating itself on a better half-year than it quite dared expect—further evidence that the engineering industries are gathering momentum.

Mr Cube Wins the Day

By a majority of one the Law Lords have upheld the ruling of the lower courts that the expenditure of £15,339 by Tate and Lyle on the advertising campaign, associated with the jaunty figure of Mr Cube, against the threatened nationalisation of the sugar industry was an expense "wholly or exclusively" laid out for the purposes of trade and was therefore an admissible deduction against profits for income tax assessments. The appeal by the Crown against this ruling in the Court of Appeal, where three judges dissented from it, was thus dismissed. The Law Lords disagreed on the nice but important legal point whether "trade" could or could not be disassociated from the company and its ownership. The majority opinion was put by Lord Morton, with Lord Asquith and Lord Reid concurring:

> If money so spent is not spent for the purposes of the company's trade, for what purposes is it spent? If the assets were seized the company could no longer carry on the trade which had been carried on by the use of those assets. Thus the money was spent to preserve the very existence of the company's trade.

Lord Morton was unconvinced by the Crown's argument that the campaign was merely a fight against a transfer of ownership; he pointed out that there was no evidence to show whether such a transfer would or would not destroy or adversely affect the company's business.

In dissenting from this view, Lord Tucker suggested that "trade" in this connection could be regarded as an entity distinct from the persons who might be carrying it

on at a particular moment. Hence he argued that the rule in this case had been misinterpreted if the money spent was for the purpose of retaining the trade in the hands of the company; he added that no evidence had been canvassed to show that a change in ownership would or might bring about an extinction of trade. Lord Keith, who also dissented from the majority view, suggested that the expenditure in question would not benefit the trade of the company by one penny, though it might benefit the company itself by ensuring that it would continue to enjoy the profits earned by the trade.

The decision that "trade" cannot be disassociated from the ownership of a company might give rise to an awkward legal quibble about similar activities of a company resisting a "take-over" bid. In practice, sums spent by directors on a campaign fighting off such a bid would be an allowable expense, as their circulars would be presenting further information about the activities of the company to their shareholders. Will this new ruling throw the gates open wider by removing the need to show that such information was being given?

Losses on State Cotton Trading

THE pith of the Raw Cotton Commission's report for the year ending August 31, 1953, was revealed by the Government during the debate on the Cotton Bill last February, when it announced that the Commission had made a loss "nearly as great" as the £25 million lost in 1951-52. The accounts now published reveal the actual loss at £22,367,000 and give its components. At the beginning of the 1952-53 year the rate of cotton consumption in Lancashire was little more than half that of a year earlier; thereafter it showed a slow but steady recovery. Prices of raw cotton, however, continued to fall, though less sharply. That year was also the first in which spinners were allowed to choose whether to buy from the Commission or privately: spinners accounting for about 30 per cent of Britain's total imports contracted out. As a result, the Commission was left with stocks larger than its remaining customers required. The Commission was instructed to draw up its accounts as if the cotton department had hedged its transactions with the cover department, so that this excess stock affected the results of both.

The cotton department lost £1,194,000, of which the Commission calculates that £804,000 represented the cost of carrying the excess stock. The cover department's total loss was £21.2 million, of which £3,755,000 was paid out to spinners and other sections of the trade, and £17,056,000 was paid to the cotton department; of this, about £3.9 million represented the loss on covering the excess stock. Calculation of the Commission's internal cover transactions is highly artificial. When the Alexandria futures market was closed in November, 1952, the Commission was obliged to base its assumed hedge payments and receipts for long-staple cotton on futures prices in New York—a purely arbitrary hedging basis for long-staple growths. Nor is New York a full hedge for prices of American-type cotton grown outside the United States. In addition, the Commission hedged as though it were a contracting-out spinner or merchant, which meant that it could only cover against movements in the basic price and not—as contracting-in spinners could—against movements in prices of particular qualities as well. The cotton department's stock valuation had therefore to be adjusted to the extent of the inadequacy of the cover. This accounting exercise did not affect the results as a whole: one department's loss was another's gain.

The loss of £22,367,000 converted the previous surplus of £11,269,000 into a deficit of £11,098,000; this is the net drain on the public purse since the Commission began trading on January 1, 1948. In 1953-54 the Commission may have less bad news for the taxpayer. At the end of last August its stocks were much more closely related to its needs, and prices have risen appreciably in the past six months. The Commission will formally cease trading on August 31st, but will supply certain cottons until the middle of next year. The final results of this experiment in state trading, which has no valid claims to repetition, will be known about the end of next year. The risks of such trading are now being returned where they properly belong; with the cotton industry and with the Liverpool market.

Fats in Abundance

WORLD consumption of oils and fats, which is a useful measuring-rod of prosperity, rose substantially last year, especially in Western Europe. Actual consumption there is estimated to have increased by 174,000 tons to 6,534,000 tons. Consumption in West Germany alone rose by 95,000 tons, and in Britain by 30,000 tons; only in Greece, Spain and Portugal did consumption fail to expand. The increase did not merely reflect the growth in population in Europe; it reflected also the improvement in economic conditions: average consumption per head, excluding the last-named countries, rose by 1.8 lb. to 52 lb. a year. Giving these estimates to the International Seed Crushers' Congress in Cannes this week, Mr J. C. A. Faure, of Unilever, forecast that consumption in Western Europe this year would rise further by 160,000 tons to 6,695,000 tons. Consumption in Britain is expected to increase by 80,000 tons following derationing last month, equivalent to 120,000 tons in a full year, and consumption in Germany by another 25,000 tons. The world supply of oils and fats is ample to meet requirements in Europe and elsewhere.

World production is expected to rise by nearly 1 million tons to a peak of 25,250,000 tons. This alone would be sufficient to provide a consumption per head in the whole world of 22.1 lb a year, almost the same as before the war, although there are now another 400 million mouths to feed. This prospective supply ignores the large surplus stocks held by governments, and the displacement of some 500,000 tons of oils and fats by synthetic detergents. Total supplies available for export may rise by some 450,000 tons to 5.9 million tons, exceeding the prewar level for the first time. The bulk of the additional supply is accounted for by the actual and prospective sales of the American government's surplus cottonseed oil, linseed oil and butter. But though Mr Faure painted a picture of plenty, he refused to look beyond his statistics. It was a matter of opinion, he pointed out, how far present supply prospects had already been discounted in current prices, and whether Russia would increase or reduce its purchases this year. He ended with a warning against any complacent assumption that world production was capable of meeting the demands of a continually increasing population, and reminded his listeners that another dollar crisis could again leave much of the world's supplies in the wrong places.

Anglo American Progress

ANGLO American Corporation of South Africa showing consolidated assets on December 31st of £68.8 million (a rise of £10.5 million in a year) is the focal point of three mining empires, over all of which Sir Ernest Oppenheimer presides. There is its gold and uranium empire consisting partly of direct investment in gold producing companies and partly in finance and investment companies like African and European Investment Company, Orange Free State Investment Trust, and West Rand Investment Trust; there is the copper-cobalt empire representing partly direct investment in the Rhodesian producing companies and partly the interests of Rhodesian Anglo American; finally there is the diamond empire, for Anglo American is an important shareholder in the companies of the De Beers group through Anglo American Investment Trust which holds around 19 per cent of De Beers deferred capital as well as a large direct and indirect holding in The Diamond Corporation.

As a whole this vast mining and financial structure prospered in 1953. Quoted investments stand in the balance sheet at £22.8 million against £21.7 million. At the end of 1953 these quoted investments showed an appreciation of no less than £13.8 million. The accounts are drawn this time in accordance with the new South African Company law and give this item of information. Another important benefit which shareholders gain from the change in the form of the accounts is a break down of the consolidated profit figure showing the proportion derived from share transactions separately for the first time. Out of total net revenue of £5,185,326 compared with £3,798,196 only £514,024 was brought in from the profits from share transactions, less amounts written off.

Fiduciary Issue Revised

THE onset of the holiday season has this week produced the customary increase in the fiduciary issue, which nowadays comprises almost the whole note issue. It has been raised by £50 million to £1,675 million, or the same as the record level reached last Christmas. The actual circulation, at £1,625 million, is however well below its Christmas peak. Last year the first summer increase in the fiduciary issue was also made in the first week in June; but then the circulation had almost reached its Christmas peak.

The pattern of the note circulation in recent weeks has indeed differed quite markedly from that shown at the same period of last year—but the dominant influence then was the Coronation. On balance the circulation rose only fractionally during the month of May, whereas last year it rose by some £16 million. On the other hand, the unseasonal fall in the public's demands for currency that took place in June of last year as an aftermath of the Coronation is not likely to be repeated this month. Although, therefore, the expansion in the circulation since the seasonal low-point of end-January has so far been smaller this year than last (at £89½ million against £94½ million) it is still too early to see whether this marks any change in the public's spending habits over the year as a whole.

Coffee Prices Rally

BRAZIL, which produces half the world's coffee, is determined to squeeze the maximum advantage out of the present shortage. The government has just issued a decree fixing the minimum basic export price for the 1954/55 crop at 87 US cents a lb fob for Santos 4 grade. This is equivalent to about 690s. a cwt fob Santos for "superior" grade, which is only 15s. below the market price of two weeks ago. Since then prices have rallied, because heavy rainfall has damaged the harvest, and "superior" is now about 730s. a cwt, compared with the peak of 800s. Colombian coffee rose in sympathy by $2.50 to $93.50 per 50 kilos fob. Whether Brazil can hold the basic minimum at the new level will depend partly on the weather, and partly on consumer resistance. The critical period for the 1955/56 crop is approaching. The cold season, when the crop is liable to frost damage, is June and July, and the flowering period, which indicates the prospective yield, is in September and October. While the promise of a large 1955-56 crop could not mitigate the existing world shortage of coffee, it could throw its shadow before the market.

It is impossible to estimate how much consumption is falling in the face of high prices, but some decline is certain. The American public, which drinks two-thirds of the world's supply, has suffered five increases in retail prices in succession, and is now being asked to pay as much as $1.35 (nearly 10s.) a lb. Even this does not fully reflect present market prices. Small wonder that buying by importers in America and Europe has been spasmodic. Cheap supplies of East African coffee bought by the Ministry of Food, and an increasing switch by private importers to the cheaper African grades, have softened the blow to British consumers. Official supplies will peter out in the autumn, and the trade will then have to pay world prices for all its supplies. An increase of 1s. or more a lb. in retail prices is probable before the end of the year.

Reviewing Fertilisers

THE report of the Anglo-American productivity team on the progress being made in the British fertiliser industry pinpoints two of the industry's major difficulties—storage space and demand. Three-quarters of the fertilisers produced during the year are sold during the three months of February, March and April, and all inducements

so far, including rebates of as high as 25s. a ton on orders placed during October, have failed to make farmers buy earlier. As the team discovered, the reason for this unnatural indifference among farmers to financial inducements was that they themselves have nowhere to store the fertiliser. It is not a product that can be left in the open and allowed to get damp, and few farmers have such good storage facilities that they can be certain it will keep in good enough condition to go through the drills without clogging. On the other hand, the fertiliser factories are hard put to find room to store up to 9 months' production as well as the raw materials for this bulky product. The team's solution, to provide encouragement to farmers to build dry buildings for storage, special bank loans were suggested, would only add one more subsidy to the already over-subsidised farming industry. The suggestion of co-operative storing by the farmers themselves, which is being discussed, seems a better solution.

As to demand, the report quotes Ministry of Agriculture estimates to show that far less fertiliser is going onto the land than experts consider necessary. But the question that fertiliser manufacturers would most like to have answered is whether the fertiliser subsidy will be ended at some future date, and what the effective level of demand is likely to become when that event takes place. If they knew, manufacturers could plan their capital investment accordingly. While they suspect that a sharp fall in demand is possible then they are not going to build the extra storage facilities needed to support current rates of output.

Raw Jute Prices Down

PRICES of raw jute in Pakistan have fallen by some £10 a ton in the past month and are back to the level of mid-March. Firsts are now about £87 10s. a ton cif Continent for June/July shipment, and mill firsts are about £102 a ton c and f UK. Demand is quiet in Europe and Calcutta because there is little export business in jute goods, and merchants in Europe are reluctant to offer at prices below replacement costs in Pakistan. American demand for hessian cloth has slackened; Australia is out of the market for sackings and the further large order from Argentina has still not materialised. The riots in East Pakistan had no effect on the market, except to strengthen the prices of afloat shipments of raw jute—owing to fears that the riots might extend to the ports. The market could be greatly influenced by any change in the weather, which has recently been favourable to the growing of the 1954/55 crops in Pakistan and India. The monsoons are now due and the rivers are already very high; this could affect the sowings that have still to be made. The crops will be late, owing to the earlier spell of dry weather, and the yields may suffer. Estimates of the new crop in Pakistan, which is the world's export crop, vary widely, but it is doubtful if it will be much larger than the previous one—privately estimated at about 4.2 million bales—despite an increase of some 25 per cent in the acreage sown.

Meanwhile arrangements for the return of raw jute to private trading in Britain should be announced this month. Private purchases are likely to begin with the new crop, except for small quantities of certain grades that may be needed before then. The mills would obtain nearly all their remaining requirements from the old crop by undertaking to buy the large stocks held by the Jute Control within a given period, at the market price. The resumption of private trading in imported jute goods is still far off. Various "appropriate measures" to safeguard the jute manufacturing industry in Dundee against competition from cheap Indian goods are being examined; it will be some time before this work is completed and longer still before the Government reaches a decision, for which legislative sanction would presumably be required.

SHORTER NOTES

Changes in the charges which the Public Works Loans Board makes for loans to the local authorities and a rearrangement of its terms of dealing with them were announced in two parliamentary answers by the Chancellor of the Exchequer and the Financial Secretary to the Treasury on Thursday. The rates charged are reduced from 4 per cent to 3½ per cent for loans of over 15 years; from 3½ per cent to 3¾ per cent for 5 to 15 year periods and from 2⅞ per cent to 2¼ per cent for less than 5 years. These rates are based not directly on Bank Rate but on the average rate which the Government itself has had to pay for borrowings of those lengths. At the same time it has been arranged that the local authorities will be allowed to borrow for periods shorter than the length of their relevant works sanctions, provided that by so doing the Government grant involved will not be increased (as it would with schools). The local authorities will, however, have to apply for sanctions for their public works and for loan promises separately in future, so as to ensure that promises and actual loans keep in step.

★

For many years a number of British companies have offered training to young engineers from overseas; there are few better ways of building goodwill among potential customers. In 1950, to extend these arrangements, the Federation of British Industries set up a scholarship scheme for these overseas students. So far, 50 scholarships have been awarded; within the next year or two the FBI hopes to increase the number of annual awards to about 120, which means that at any time there will be about 200 "FBI Scholars" in British engineering factories. The only thing lacking in this useful scheme, so far, is enough British companies; this week the FBI wrote to 1,400 engineering companies asking them to join in.

★

Oil consumption in Britain in the first quarter of this year was some 9 per cent higher than in the same three months of 1953, 5,087,821 tons against 4,670,906 tons. It is impossible to see from the Petroleum Information Bureau's figures how consumption of motor spirit changed between the two quarters, because of a change in conversion factors; but the colder weather this year caused considerable increases in the deliveries of gas, diesel and fuel oils to gasworks and also in the use of burning oil.

The book of technical data

The design and performance of electrical equipment, in both heating and resistance applications, depend largely upon the correct use of various alloys which may have widely differing properties. Information about these alloys is, we suggest, fundamental to manufacturers of electrical equipment, and this is conveniently available in detailed form in our technical data book, a copy of which may be had on application.

solidate the new issue with the existing £1,000,000 issue of 6½ per cent £1 preference shares by reducing the rate of dividend to 5½ per cent. To compensate for this reduction, existing shareholders will receive one new 5½ per cent preference share for every £5 of the old stock they hold; the capitalisation of reserves making this issue possible will mean that on a present holding of £100 the new gross income will be £6 12s., compared with the present income of £6 10s.

★

The Anglo-Portuguese Telephone Company, which in the past has looked towards the Telephone and General Trust for the day-to-day finance for its expansion programme, is to find these loans, now amounting to about £832,000, by a new issue of preference and ordinary shares. The company will offer 1,000,000 6 per cent £1 preference shares to the public and 255,000 £1 ordinary shares in a "rights" issue in the ratio of one new share for every £10 of stock held to equity shareholders. This "rights" issue may be the first in a series, as it is hoped to make similar issues when the pace of development requires new money.

★

Canada has signed the International Tin Agreement, bringing the total of consumers' votes to 261. This may encourage other independent consuming countries to join. Acceptance by nine consuming countries holding 333 votes is required. Britain, Belgium and Holland ("dependent consumers") and India had signed previously. A majority of producers' votes is almost certain. Closing date for signatures is June 30th.

Company Notes

GUEST, KEEN AND NETTLEFOLDS. Next year, thanks to the recent purchase of Guest Keen Baldwins from the Iron and Steel Realisation Agency, the accounts of Guest, Keen and Nettlefolds will have a very different appearance from those just issued. Commenting on this purchase (which was discussed in *The Economist* on May 15th), the chairman, Mr K. S. Peacock, points out that in the past it has been an "inestimable advantage" for this large group of engineering firms to control the production of the greater part of its steel requirements. Control over the quantity and quality of deliveries is much more easily ensured. The purchase has taken just over £8¼ million from net liquid resources of about £18 million; much of the remainder is earmarked for tax liabilities and future capital developments. Outstanding capital commitments are estimated at £8,450,000; this is the first time for some years that these commitments have been reduced and it is a sign that the group's development programme, on which over £16 million has been spent, will become less of a burden in the years to come. New projects, however, may be formed for the steel end of the business and it is for this reason that £3,750,000 of the debenture issue of £7,500,000 arranged with the Realisation Agency in the present capitalisation of Guest Keen Baldwins has been left uncalled.

Of the decline in trading profits from £12.4 million to £10.1 million, Mr Peacock says that trading conditions at home have varied considerably between one works and another. The important screw division worked only a four-day week for the greater part of the year, as consumers were content to live on the stocks they had built up in 1952. In view of the decline in profits and the calls that the directors knew would be made on liquid resources, it is not at all surprising that they were content to leave the dividend unchanged at 15 per cent.

Mr Peacock comments that "since the turn of the year there have been indications of a better demand in those works that have experienced the more difficult conditions, though there is a tendency to lower prices in spite of increased costs of wages, fuel and freight." Unfortunately he has to add that where the group is "interested in direct export there has been a further slackening in demand and competition has intensified."

★

GRAY'S CARPETS AND TEXTILES. Some mergers are borne of necessity; some are built by design. Gray's Carpets and Textiles was built by design, if not to a design which opinion in the textile trades would have chosen. The idea behind Ocean Trust and Mr Beddington Behrens since 1947, when the merger was made, has been to impart expert management, redeployment of capital and centralised finance to a textile group. But it happened that the companies which they were able to buy in 1947 were widely diverse both geographically and in their types of product. Much of the idea has done well. The group has led the way with quarterly earnings statements in this country, and in its early years it enjoyed high prosperity. But it often happens that its members experience widely divergent results. They did so in 1953. The carpet trade was looking up as was the worsted industry, but in Northern Ireland where the group is interested in long staple rayon and linen it has been a very different story.

None the less the recovery on the English side of the business has been sharp enough to pull up the group profits for 1953 to £58,218 compared with a loss of £291,438 in the previous year. The latest figure includes a profit of £14,100 from the sale of plant which confirms the impression that the group has been rearranging itself on the basis of experience. The dividend has been held at 10 per cent. The ill-winds of 1952 blew the company tax credits in 1953 of £77,082, and the balance to go forward is raised from £311,085 to £318,543.

★

SIEMENS BROTHERS. The directors of Siemens Brothers had little difficulty in maintaining the ordinary dividend at 10 per cent in the face of a sharp drop in trading profits as the provision for taxes fell just as steeply. Naturallly, the chairman devotes almost the whole of his statement to explaining why trading profits fell from £1,904,505 to £1,262,323. A year ago, General Sir William Morgan drew attention to a slackening in the rate of orders, particularly from Government departments, but at that time the board still felt confident—in view, for instance, of "the worldwide demand for more telephones"—that orders would pick up again. They miscalculated, for orders for the group's main products failed to increase, and competition between manufacturers grew keener, particularly in overseas markets. Siemens had to accept export orders which yielded only a slight profit, if they yielded a profit at all. At the same time wages were going up and there was a "continued shortage of orders, mainly from the nationalised undertakings, for power cables and accessories."

The company's subsidiaries also had a rough passage. At home, the profits of Siemens Electric Lamps and Supplies

£1 ordinary stock at 37s. yields £5 8s. per cent.

were adversely affected by the fall in the price and the decline in the sales of rubber-insulated wires (bringing about losses on stocks) and by the increases in the cost of manufacturing electric lamps without any corresponding increase in their price. Abroad, the Canadian company was faced with fierce competition, forcing prices down to a "barely remunerative level" and "in Australia, South Africa and India results were affected in varying degrees by national capital expenditure limitations, import restrictions and the increasing growth of local manufacture." After this tale of woe, it is not surprising that the yield of 5.4 per cent offered by the £1 ordinary stock units of Siemens at the current price of 37s. is slightly higher than that offered by the shares of many of the leading manufacturers of electric capital goods.

★

UNITED SUA BETONG and RUBBER PLANTATIONS INVESTMENT TRUST. Two views were put before investors in tea and rubber shares this week. The first was presented by Sir Eric Macfadyen, the chairman of Rubber Plantations Investment Trust. The second, setting out the views of a direct producer, was put by Sir John Hay, the chairman of United Sua Betong. Both point to the wisdom of spreading investments outside the narrow field of rubber production.

Sir John shows that the fall in the price of rubber in 1953 led to a fall of £440,000 in the sale proceeds of United Sua Betong though the volume of production was actually higher. Fortunately, he commented, profits remained unaffected because the company's tea operations showed a profit instead of a loss, because a saving was made on estate expenditure, and because a refund of the replanting cess was received. Having warned shareholders that the free scrip issue did not necessarily imply higher dividends, Sir John added that "stockholders are entitled to derive such encouragement as they may from the fact that our revenue from rubber is supplemented by the proceeds of a not insignificant tea crop and the dividends we hope to continue to receive from our shareholding in Oil Palms of Malaya, Ltd."

Sir Eric Macfadyen had a similar story to tell. At the end of March, the investment trust's portfolio had a book value of £1,874,290 or £263,038 more than the market value; the year before the portfolio showed a loss of £488,388 on the book value of £1,822,280. The break-up value of the trust's own 2s. ordinary stock units at the end of March was 2s. 0¼d. About 90 per cent of the portfolio was in equities; nearly 47 per cent of all investments was in rubber companies with another 31 per cent in tea companies and another 3 per cent in other plantation companies. The remaining investments were split almost exactly between non-plantation companies and British Government securities. The directors of the trust have now decided to give this portfolio a slight reshuffle. Conscious of the wide fluctuations in the profits of the rubber and tea companies, they "intend to include in the portfolio, in future, a greater proportion of non-plantation shares, on their investment merits, than hitherto." This change in policy will take place gradually and Sir Eric told shareholders that it did not indicate "a marked or immediate change of direction," since the trust is at the moment fully invested.

LONDON STOCK EXCHANGE

Next Account begins: June 9th.
Next Contango Day: June 9th.
Next Settlement Day: June 15th.

THE cash and conversion offer by the Treasury was the signal for more active trading as well as a re-adjustment of prices in the gilt-edged market this week. After the offer was announced a large turnover was reported; the medium and long dated stocks were marked up while the short dated stocks were marked down. A particularly heavy demand was reported for 3½ per cent Conversion stock, 1969, the market obtaining stock from official sources at rising prices. Those stocks with a wide spread of redemption dates were also in demand on suggestions that the new loan indicated that these stocks might be repaid at their earliest dates. The news that the lists for cash applications had closed at 10.30 on Thursday led to further gains in the longer dated issues.

In the foreign market interest was at first concentrated upon Japanese issues which after the week-end made gains ranging up to 3½ points on buying in anticipation of a Wall Street quotation for the sterling issues. On Tuesday, however, interest switched momentarily to German issues (which made gains of up to 2 points); later on Japanese bonds resumed their advance.

Movements in the industrial market were slight, but on Tuesday the buying of equities offering small yields gave the market a more cheerful appearance than had been apparent just before the week-end. The biggest gains were made in the motor, newspaper, paper and store groups. Tobacco shares also rallied well on the report that manufacturers had increased their cigarette output by 5 per cent. Among the engineering shares Allied Ironfounders put on 1s. 9d. to 64s. 6d. on hopes of an increased dividend. Oil shares moved rather irregularly but rubber shares were steadier; tea shares remained firm. In the mining market buying from the Continent helped to keep copper shares firm; on Wednesday "Chartered" put on 2s. to 76s. 9d. and "Tanks" 3s. 9d. to 89s. 4½d. The Kaffir market was quiet, though a few uranium issues made slight gains in response to Continental support.

(1) From August, 1953, the index has been revised to show a more representative wheat price. (2) Figures up to July, 1953, relate to delivered prices and subsequently to ex-warehouse prices of H.C. electrolytic copper. (3) The interim index of retail prices has been linked back to 1938 with the aid of calculations made by Professor R. G. D. Allen for the London and Cambridge Economic Service. (4) Annual figures are based on unit values and are influenced by changes in the composition of trade as well as price movements. (5) Surveys made twice a year: annual figures relate to October surveys.

(1) This covers mining, manufacturing, electricity and manufactured gas with the following exceptions: Denmark and Greece exclude mining; Ireland and Sweden, electricity and manufactured gas; and Austria, manufactured gas. Germany excludes West Berlin. (2) Special trade (excluding re-exports) with the exception of Ireland which covers general trade; Belgium includes Luxemburg.

Financial Statistics

EXCHEQUER RETURNS

For the week ended May 29th, there was an "above-line" surplus (after allowing for Sinking Funds) of £4,132,000 compared with a deficit of £27,707,000 in the previous week and a deficit of £349,000 in the corresponding period of last year. This reduced the cumulative deficit to £37,802,000 (£45,871,000 in 1953-54). Net expenditure "below-line" absorbed £915,000, bringing the total cumulative deficit to £68,137,000 (£100,223,000 in 1953-54).

THE MONEY MARKET

LOMBARD STREET has had another difficult week. On Thursday before the week-end credit was so short that despite moderate special purchases, made indirectly through the banks, a number of houses avoided recourse to the Bank at the penal rate only by taking night money from the clearing banks at 3 per cent; and on Monday some borrowing from the Bank did take place, although official aid was again on a considerable scale. Credit was consistently tight through the rest of the week covered by the Bank return. Only on Saturday was the market able to balance its books without special aid from the authorities. The banks' prevailing buying rate for July and August bills remained at 1 1/16 per cent.

Competition for the £270 million of Treasury bills on offer at last Friday's tender was again strong; total applications rose from the high level of £400.7 to £426.8 million. The upshot was that although the market maintained its bid at £99 11s. 5d. its allotment fell from 54 to 49 per cent. At yesterday's tender the offer remained at £270 million.

Turnover in the gold market became moderate on Monday after a quiet period. The price at the fixing rose by ½d. to 248s. 10d., and again on Tuesday to 248s. 10½d.

The Bank return shows an outflow of notes of £11.3 million; the fiduciary issue has been increased by £50 million. The week's borrowing at the Bank is reflected in an increase of £8.4 million in discounts and advances.

THE LONDON OMNIBUS

A VEHICLE OF INFORMATION

LATE IN THE 90's this double-decker steam omnibus served the public up and down the Thames Valley.

Buses come and buses go. But one London Omnibus has been serving the public for over 200 years—the "omnibus" collection of all kinds of insurance policies for all kinds of people offered by the London Assurance. Here are a few of them:

SCHOOL SUMS

When fathers start adding up school fees they are sometimes nonplussed. By taking out an Educational Policy long before school bills get really formidable, they find this problem greatly simplified.

SAFE GUARD

You may be very cautious about your valuables. Your safe may be sound, your watchdogs may bite. But even so, valuables vanish and furs fly. Sentimental value apart, the loss won't hurt so much if you have an All-Risks policy to safeguard you.

'TOP HAT' EVENINGS

Directors and senior executives, unlike those they employ, are often left to provide for the evening of their much-taxed days as best they can out of savings. The London Omnibus carries a 'Top Hat' scheme which fits almost anyone who wants a 'Top Hat'.

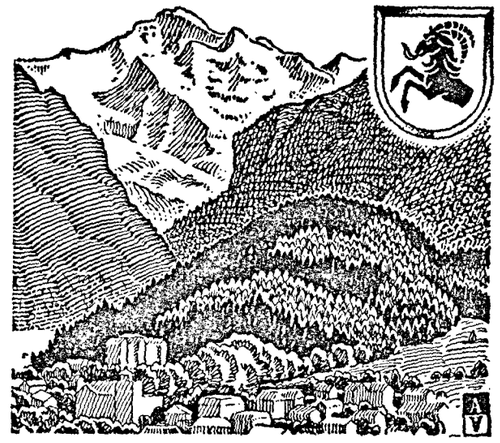
FURTHERMORE . . . .

If you would know more about any of the policies outlined here, if we can provide information about any other policies or about insurance problems generally — pray make what use of us you wish. Our address is 1 King William Street, Department V6, London, E.C.4.

THE LONDON ASSURANCE

"Very good people to deal with"

Perhaps you didn't know that INTERLAKEN



is the Gateway to the glories of the Bernese Oberland? From Interlaken you can travel comfortably by railroad, ordinary or cog-wheel, to such world famous places as Grindelwald, Mürren, Wengen, or via the Kleine Scheidegg right up to Jungfraujoch Station and Hotel, both the highest of their kind in the world (11,333 ft. above sea-level).

But everybody knows

how comforting it is, when travelling abroad, to have the address of a reliable Bank in one's possession. The Interlaken Branch of the Union Bank of Switzerland, will gladly cash your Travellers Cheques, effect payments under your Travellers Letters of Credit and be of service in any other way.

Cable Address for all Offices and Branches: BANKUNION

A misty night. Skilled hands are at work on the warehouse window. A click, and it's open.
A lorryload of carpets is stolen—and a valuable contract lost.

Adequate insurance will make good the loss—*but the advice of an insurance expert might have prevented the theft.* For the British Insurance Companies have vast experience of the methods of burglars; and it is part of their everyday service to help you to keep them out. If you have any misgivings about *your* anti-burglary precautions ring up your Insurance Company and ask their advice. It costs you nothing. It is all part of the British Insurance Service.

COMPANY MEETINGS

UNILEVER LIMITED

TWENTY-FIFTH ANNIVERSARY OF UNITED AFRICA COMPANY

VITAL ROLE IN DEVELOPMENT OF OVERSEAS TERRITORIES

REVIEW OF UAC'S GROWTH AND ACHIEVEMENT

SIR GEOFFREY HEYWORTH ON AN ADVANTAGEOUS JOINT ASSOCIATION

The annual general meeting of the members of Unilever Limited was held on May 31st at the Hall of the Chartered Insurance Institute, 20 Aldermanbury, London, E.C.2. Sir Geoffrey Heyworth presided. Addressing the meeting the chairman said:

In previous addresses I have dealt with the principal commodities produced by Unilever—margarine and detergents.

This year is the twenty-fifth anniversary of the formation of the United Africa Company and it is therefore appropriate that I should discuss the side of our business covered by its operations. This is a side which is not only of interest to our stockholders but is playing a vital part in the development of a number of overseas territories which are experiencing rapid changes and some of which are entering a new phase of their political life.

The main work of the United Africa group of companies is merchant trading in tropical West Africa, by which I mean the area from Senegal to the Belgian Congo. On the one hand it collects and markets African produce; and on the other, it purchases in world markets merchandise of every description for shipment to tropical West Africa, and ultimate sale there. It also engages in other activities, such as plantation operations, timber production, and shipping.

I do not propose to give a full description of the business operations performed by the United Africa group, nor have I time to describe fully the part it has played in the development of the African continent. My intention is to make it clear to our stockholders how this group of companies became part of Unilever, and how, adapting itself to great economic and social changes, it has developed from an ailing into a flourishing branch of our business.

THE ORIGIN OF UAC

Let us first trace briefly how the original soap and margarine companies which merged to form Unilever became connected with West Africa. The connection dates back to a period before the first world war when both soap and margarine manufacturers saw scarcity of raw materials looming ahead. Scarcity to them spelt high prices. The soapmaker thought that higher prices must not only restrict expansion, but render his existing business unprofitable. The margarine manufacturer had the bogey of butter prices always in his mind. When the price of oils and fats in general went up, butter and lard prices did not necessarily follow, so that higher prices for oils and fats were to him also a threat to the profitability of his existing business and to the continuing expansion of it.

West Africa sprang to mind as a potential source of additional supplies, as possibly, too, did the potential danger of the merchant companies who handled its produce combining to exploit scarcity. Only these two thoughts would seem to explain why in 1911 William Lever not only embarked on the bold and imaginative Belgian Congo enterprise, the Huileries du Congo Belge, but also, in the previous year, bought W. B. MacIver and Company, one of the merchant companies operating in British West Africa.

The Huileries du Congo Belge was a concessionary company, which first produced palm oil from the fruit of the wild palms, and later developed its own oil palm plantations. MacIver's in British West Africa traded in palm oil and palm kernels, but did not, and could not, embark on cultivation because the alienation of land was contrary to the Colonial Government's policy.

After the war, the world again faced a shortage of oils and fats. Fear of this shortage must have been the main reason for Lord Leverhulme's purchase in 1920 of the Niger Company. It is, however, far from clear how its ownership could have been expected to provide insurance against scarcity. Whatever the motive, Lever Brothers, by its purchase and by other moves, were heavily committed to trading operations in British, French and Belgian Africa. At the same time, the Dutch margarine manufacturers were becoming similarly engaged; their projects, though less in size, were geographically more widely spread and were not restricted to Africa.

The post-war boom collapsed almost as soon as the Niger Company had been acquired. Realisation quickly followed that a union of manufacture and raw material production provided no safeguard against trade depression, and that the idea that it could was the product of loose thinking.

The newly-acquired companies could not be operated to provide cheap raw materials for the soap pan nor for the margarine churn. It was seen only too clearly that, if the businesses were to survive at all, the services that they rendered must be priced realistically. The oils and oilseeds produced in West Africa must be sold at world prices, and merchandise, in competition with what other merchants could offer, must be sold at prices which the African was able and willing to pay. In this way only could inefficiencies be discovered and the proper method of correcting them decided upon. This practice of realistic pricing has been followed ever since. The principle of delegation of control, which both the manufacturing and the trading businesses regarded as fundamental, led to the same conclusions.

ACQUISITION OF FULL CONTROL BY UNILEVER

The Niger Company could only be nursed back slowly to solvency and profitable working, and during the process it had to lean on the more stable profits of the soap and other manufacturing sides of the Lever business. Then, in 1929, the Niger Company merged with the African and Eastern Trade Corporation, itself an amalgamation of old-established trading companies in West Africa. This brought into being the United Africa Company more or less as we know it today. Even then the difficulties did not end, because there followed the slump of 1931, which brought produce prices down to the lowest figures known in the West African trade for fifty years. It was again the manufacturing side of what was now Unilever that had to make good the losses and find most of the additional capital required, at a time when the African and Eastern shareholders were not in a position to contribute their full share. It was this support from the manufacturing side which ultimately led to the acquisition of the full control of the United Africa Company by Unilever.

So much for history; but before we leave it there is one important point which must be made. Once committed to the West African trade, the soap and margarine interests developed a faith in the future of West Africa and the West African trade. It might almost be said that they came to accept it as destiny that their businesses and West African trade were to be linked together and that this link must be developed to the advantage of both.

If further evidence is needed we have only to look at the project of the Belgian Congo plantation. Nearly 25 years had passed and £3 million of capital had been invested, before this venture gave any worthwhile financial return. It would hardly have survived to be what it is today but for its parent's more profitable manufacturing operations. Here, too, we see another example of the benefit of the association with the manufacturing businesses. The Huileries du Congo Belge was not only an operation to produce palm products but was also a great social experiment—in housing, health services and education. On this side it owed a great deal to ideas developed at Port Sunlight and in associated companies elsewhere.

A CHANGING CONTINENT

Now let me give some picture of how the United Africa Group has developed during the last 25 years. As I have said, I shall not give a full description of its business. Its main features will already be familiar to readers of our annual Review of Operations, who may also have seen the Statistical Bulletin published by the United Africa Company half-yearly since 1948.

The predominant note of my present address is *change*, the rapid change of a continent and of a business intimately connected with it. Not everyone realises that economic conditions in Tropical West Africa have developed more rapidly and changed more fundamentally in the last 25 years than in all the centuries which have gone before. One indication of that change is the fact that the total annual value of exports, after allowing for changes in the value of money, is now 3½ times what it was 25 years ago. Imports, on the same basis, show a similar

rise. This represents a rate of growth with which few parallels can be found elsewhere.

But rapidity of growth does not imply that a high level of prosperity has yet been reached by our standards. The popular conception of vast African territories with untold wealth is a delusion. Despite considerable mineral deposits, most of the area is predominantly agricultural. The soils are not rich. In Nigeria, the only territory for which national income figures exist, the *per capita* income 3 years ago was estimated at £20 a year, compared with £250 for the United Kingdom. Over the whole area of Tropical West Africa, the real *per capita* income is low by any measure.

The rapid economic expansion of these territories has been accompanied by swift changes in political and social conditions, particularly since 1945, but the methods followed are not the same throughout the area. In the Belgian Congo, which is a young colony, the Belgians have maintained their traditional attitude of paternal benevolence. In the French territories, the system of assimilation to the metropolitan country still applies. The British territories are rapidly moving towards independent status. There are thus, in the different territories of Tropical West Africa, great variations in the rate and kind of political evolution. In the sphere of social change, illiteracy is still widespread, but academic education has made great strides. Universities have been built, and the number of Africans capable of contributing to the administration of their country has increased. Similarly, the number of technically skilled Africans, although still too few, has increased. In some of the territories labour is now organised; in some, co-operative societies flourish. Certain territories have a strong indigenous press; the cultural achievements of individual Africans, particularly in the arts, have earned recognition outside Africa. Considerable progress has been made in recreations, and West Africans have won international renown in athletics. The outlook of the Africans has been broadened by sponsored travel abroad, and by the growing use and appreciation of books, the wireless and the cinema.

FLEXIBLE BUSINESS POLICY

A business can only ride such rapids in the life-stream of a continent, if it adjusts itself to changing conditions and tries to play its part in the economic development which has become necessary. In doing so it serves not only its own interests but also those of the peoples of the countries in which it operates.

WHOLESALE RATHER THAN RETAIL

The United Africa Group has adapted itself to the changing pattern of African life in various ways.

Recognising the West African's natural aptitude for retail trading, the policy of the group in the sales of merchandise has been to shift the emphasis from retail to wholesale trading. As a result the number of merchandise retail selling points in British West Africa has been reduced from 1,380 in 1939 to 930 in 1953, despite the general expansion of this highly competitive business.

PRODUCE TRADE

Again the group has adapted itself to the postwar system of marketing the produce of British West Africa through marketing boards. Although here the group is no longer a principal, but a paid agent, it must continue to exert the greatest efforts towards efficiency; faulty judgment and bad management can still be brought home to the licensed agents of the marketing boards.

It is too soon to pass final judgment on the operations of the boards. It is probably a good thing that other systems of marketing are being used in neighbouring French and Belgian territories, as this will enable comparisons to be made.

Marketing boards have the opportunity to make interesting experiments in price policy. For example, in Nigeria, the payment of premiums for higher grades of palm oil has revealed that the African producer is quick to react to a price incentive, and has brought about a remarkable improvement in the quality of the oil, lifting half the export production from the category of technical oils into the higher-priced market for edible oil.

The United Africa Group has helped to make this possible by supplying small modern oil presses suitable for the African farmer.

It is only within the lifetime of the United Africa Company that our oil palm plantations have been placed on a sound long-term economic basis. Techniques have been gradually and continuously evolved. Criteria have been established for the scientific evaluation of soils, the application of fertilisers, and selection of types. We should acknowledge the help received from Government research organisations, with which we have collaborated. The standard of specialised knowledge in the field is now such that future expansion involves much less speculation than in the past. Milling methods have also improved continuously, and the output of the group's plantations is now of the highest quality.

Similar field standards have been established for rubber plantations, and the yields now obtainable in Africa compare favourably with those of rubber estates in South East Asia.

TIMBER

Next I turn to timber. In the last twenty-five years, the extraction and export of African hardwoods have undergone a revolution. Logging and the export of logs were practised by trading companies many years ago. From logging to sawmilling was an easy step, taken by one of the predecessors of the United Africa Company in 1917. But it was not until after 1945 that the United Africa Group decided to convert logs to sawn timber on a large scale. We now have sawmills in both Nigeria and the Gold Coast, each producing about 1 million cubic feet of sawn timber annually. In Nigeria conversion has reached a more advanced form—the manufacture of veneers and plywood. These undertakings follow the now familiar pattern of development in predominantly agricultural countries: the importation of new techniques and capital; the application of mechanical processes close to the source of raw materials, with consequential economic advantages; and the safeguarding of the interests of the country, which is done in the timber concessions by means of long-term felling cycles combined with regenerative measures.

SHIPS

In the operation of its fleet of ships, the United Africa Group has adapted itself to changing conditions in three ways:

First, the number and carrying capacity of the fleet were increased as the trade expanded. From five ships in 1929, with a total cargo capacity of 18,000 tons, the fleet has expanded to nineteen ships, with a total capacity of 144,000 tons. This fleet is supplemented as necessary by chartered tonnage.

Second, the group's ships were adapted to the special nature of its cargoes. The carrying of vegetable oil in bulk, which was pioneered by Lever Brothers in 1910, was gradually extended after the setting up of bulking installations in the Belgian Congo and Nigeria in the 20s and 30s, and the group's present ocean fleet is specially designed for the carriage of palm oil in bulk.

Third, the system of operation was gradually moulded to the changing requirements of the trade. At first the fleet operated as a department of the United Africa Group, which thus played the dual role of shipper and shipowner, carrying its own goods. After the war the fleet offered its services to shippers other than the United Africa Group. Finally, in 1949, the shipping business passed under the control of a separate subsidiary company, Palm Line Limited, which operated a public service as a member of the West African Lines Conference.

SPECIALISATION

One of the main features of the United Africa Group's business policy is the development from just being general traders into being general traders and specialists, without—as in most cases of specialisation—narrowing their field of operation. On the contrary, the group's range of merchandise has widened, but at the same time their specialised knowledge of an increasing number of groups of products has deepened, and capital has been applied to the development of such specialised trades as timber and shipping, motor vehicles, technical and engineering supplies, department stores, port facilities and mineral oil distribution.

It is not easy to measure this evolution in quantitative terms, but it can be illustrated by some striking figures. Twenty-five years ago, the group's annual sales of motor vehicles and of technical and engineering supplies in tropical West Africa were of the order of £500,000; last year they reached some £15 million.

In 1929, the group's financial interest in timber was so insignificant as to escape permanent record. Now, our capital investment in the timber business in Nigeria and the Gold Coast amounts to £4½ million.

The group's department stores in Lagos and Freetown—undertakings undreamt of in 1929—represent the employment of about £1 million worth of capital; and in Lagos alone, the store sells over £1½ million worth of goods a year.

The setting up of bulk palm oil installations in Nigeria in continuation of the pioneer work of the Niger Company represents a capital value of about £½ million, divided over seven ports which lately have handled about 200,000 tons in one year. In the conduct of this business the group has not only made a valuable contribution to technical knowledge, but has in effect converted the bulk oil installations into a public service. For the installations which over the last 12 years have handled all the palm oil produced by Africans for export, are now operated by the United Africa Company as managing agents on behalf of the Palm Produce Marketing Board.

The last example which I shall give of the placing of capital at risk in a specialised trade, is that of the distribution of petroleum products. The group's total capital expenditure for the provision of the equipment and installations necessary for the handling and distribution of petrol in bulk, rather than in the traditional and now outmoded metal container, has so far amounted to £¼ million and its pace is still increasing. The importance of this branch of the trade is measured by the fact that the group's own sales of petroleum products in tropical West Africa amount to almost £13 million a year and constitute some 10 per cent of its total merchandise business there.

All this is significant in assessing the economic development of tropical West Africa and the group's part in that development.

HUMAN RELATIONS

Economic and technical developments of the kind I have mentioned were accompanied by fundamental changes in the sphere of human relations.

When the United Africa Company was formed it was still the custom in England to engage assistants for the African business on a contract specifying engagement for a single tour at a time—a relic of the system by which staff were taken on like casual workers to do so many months in Africa with no provision for leave at the end.

One of the early actions of the new company was to amend this contract so as to express the company's intention to provide permanent careers for a sound and loyal staff. A security of tenure hitherto unknown was introduced into the company's service, whereas previously a European assistant could be sent home at a moment's notice on the impulse of his immediate manager. For Africans, tenure had been still more precarious.

The life of the European in West Africa has been profoundly affected by such changes as the advent of the wife in the early 1930s, and of the children in the late 1940s. Medical responsibilities shouldered by the company today also cover these families. The physical well-being of the staff—African as well as European—has been an object of extensive care. The group's medical service in the Belgian Congo, for instance, involves the provision of well over a thousand hospital beds, with medical attention. Similarly, medical services are being developed in British West Africa. In particular, for its isolated communities in the plantations, timber concessions and in the river port of Burutu, the group provides its own medical services comprising doctors, nurses, hospitals and clinics.

An unusual aspect of staff welfare is to be seen in the Belgian Congo where for some years the group has been developing two cattle ranches with the object of providing meat to improve the diet of its employees in the plantation areas. The first of these ranches was not successful in the beginning, but by means of experiments in cross-breeding it has now turned the corner and both are likely to make a very real contribution to the health of the employees. They may even become of wider significance as an example of how to reduce the painful shortage of animal protein from which practically all tropical Africa is suffering.

TRAINING COURSES

Starting in 1946, training courses have been instituted so that most of our young men proceeding to West Africa should be equipped as well as possible for their jobs. It is obviously necessary that they should have a broad picture of the activities of the group and of how they are inter-related. The course also covers such semi-technical subjects as merchanting and accounting but a great deal of time is devoted to giving them some idea of

(i) the geography, history, and racial, social and economic systems of the countries in which they are going to serve;
(ii) the sphere of government, the trends of its policy and how it operates, and
(iii) the group's conception of the role the group should play in these surroundings.

It is particularly stressed that no quality is more essential to their personal success and to that of the group than an understanding of the African and an ability to work well with him.

In recent years a number of measures have been taken by the group to enable the African to equip himself satisfactorily for higher management or jobs of greater skill. Groups of African managers are annually brought home for training in the United Kingdom. Schools for the instruction of apprentices and technical staff have been or are being established in Burutu, Sapele, Lagos and Accra. In the Belgian Congo the group has for some years had a residential agricultural school for the training of Africans for technical positions in the plantation industry; it also maintains an engineering school to train Africans for engineering, chemistry and electrical engineering in the group's oil mills. In the trading sphere in British West Africa, where formal training is unworkable, the share of Africans in the management has gradually increased. We employed 39 African managers in 1939; 112 in 1946; and 160 in 1953. Not counting the European specialists, one-quarter of the management staff is now African, which contrasts with one-twelfth in 1939.

The gradual trend towards Africanisation of management posts forms part of the deliberate policy, common to Unilever undertakings throughout the world, of making the greatest possible use of local talent. But there is a conspicuous lack of technically trained Africans, and specialists must be recruited from abroad for highly technical tasks in such fields as engineering, saw milling and research. This is completely consistent with the conception that one of the group's major functions is to introduce new skills and techniques to countries in which they are likely to bear fruit. Consequently, the number of European specialists has increased considerably, particularly in the last 10 years; but because of the growing number of African managers in the trading departments, the number of European managers in these departments has actually decreased over the period.

PROVISION OF RETIREMENT BENEFITS

Another field in which the Group can safely claim to be in the forefront is the provision of retirement benefits, by way of pensions and gratuities, for its staff of over 100,000. All permanent staff receive benefits of one sort or another upon normal retirement from the Group's service. The conditions vary from one territory to another, but in principle the higher grades of employees are members of contributory pension funds. Other grades, for whom a pension would have little attraction, are given a lump sum gratuity on retirement, except in the Belgian Congo, where part of the lump sum takes the form of ration money. Contributory pension funds are comparatively new in Africa. The United Africa Company was among the first to introduce them in British West Africa, about ten years ago, and the fund started by the Group in the Belgian Congo this year is the first to be established there. The total assets of the pension funds for employees in Tropical West Africa now amount to £6 million.

The Group attaches great importance to the improvement of industrial relations. In the Gold Coast it is on cordial terms with a progressive and well-managed African Trade Union, and both in Nigeria and the Gold Coast the Group has for some years done its utmost to stimulate the creation and maintenance of effective joint consultation. There is now some evidence to show that this is an institution well adapted to African outlook and traditions, and that it can play an outstandingly useful part in creating that genuine co-operation between the two races which alone can achieve success.

It is now some years since the Group appointed specialist personnel managers in Africa. Today four of them are Africans. They are an integral part of each management group, and their duties are to see that the Group's standing instructions for staff management are effectively carried out, to maintain close touch with the needs and aspirations of the African staff, and to do all possible to see they are given the greatest encouragement and opportunity.

U A C'S POSITION TODAY

Looking back at the United Africa Group's history of the past twenty-five years, we see a picture of growth and achievement. Measured by the yardstick of capital employed, the business has expanded from £16 million in 1929 to £108 million in 1954. Corrected for the decreased value of money, this indicates an almost threefold expansion, which is about in line with the growth of the general economy.

If in the process the group has become a stronger and healthier business, able to stand up to keen competition both in the import and export trade, that is due to the provision of additional capital by Unilever. Over the past twenty-five years, this investment amounted to £35 million of new money. Most of the growth, however, was financed by the United Africa Company's own profits, ploughed back into the business.

It is logical that I should give some explanation to the stockholders of the parent concern of the return on the total capital invested. On the average over the last three years, which were some of the best in the African Companies' history, the net return on the group's operations in Tropical West Africa has amounted to 9.6 per cent on the average capital employed. This return is reasonable, but certainly not excessive. For comparison, the yield on the capital employed in the metropolitan countries of the Tropical West African dependencies—France, Belgium and the United Kingdom—averaged 11.3 per cent over the same three years.

U A C. AND UNILEVER

The history of our West African enterprise has, I think, both demonstrated and justified Unilever's faith in West Africa. Once committed, we have never ceased to regard our interest as permanently bound up with these territories. The concern was large enough to take a long view through bad times and good, and the potentialities of West Africa were such that on a long view the business was fundamentally sound.

I should like in conclusion to turn from this survey of the past and attempt a brief glance into the future.

The United Africa Company and Unilever contribute to each others' strength; they can continue to do so in the future. The scale, the resources and organisation of each would suffice to give assurance for their future; the two together are more than a sum of the parts. Let me illustrate this.

The underlying common interest of the two concerns is their interest in the specific sphere of oils and fats. The United Africa Group is an important producer and purchaser of these, but it would be wrong to assume that their main object should or could be to supply Unilever with cheap raw materials. On the contrary, the group has an interest in high export prices because these increase the purchasing power of the West African population, stimulate the sales of merchandise in these markets, and are of direct interest to our plantations.

On the other hand, Unilever's needs of raw materials are much greater than the quanti-

ties West Africa can supply and all Unilever's buying is done at world market prices.

Thus, the relationship between the United Africa Group and Unilever as sellers and buyers of oils and fats is strictly businesslike. But that does not mean to say that they cannot help each other. The proceeds of West African oils and fats have been increased not by charging more than world market prices, but by increasing the volume and the quality of the products. That was largely made possible by Unilever, whose margarine and soap factories have an interest in finding the most effective use of oils and fats and can give special attention to those of West African origin. They do that and as a result they have pioneered the use of palm oil in margarine, thus opening up a wide new market for an important African product. Together with the United Africa Group the Unilever businesses have brought into being the existing system of bulk handling with the attendant savings which manifest themselves in higher proceeds of African palm oil exports.

Unilever and the United Africa Group can do more fruitful research together than each could do separately, because every stage from the growing of seeds to the final use of oils can be studied in units coming under the same ultimate control.

Thus it has proved possible on the one hand to enhance the value of West African produce, on the other hand to provide Unilever factories with raw materials fully competitive in cost and quality. This is a striking justification of Lord Leverhulme's entry into the West African trade.

Another advantage which Unilever can offer is free access to all the resources of a large-scale organisation. Finance and accounting, taxation, pensions, marketing, technical and economic information have all become services in which experience is most valuable.

On the level of policy making the exchange of views and experience in connection with underdeveloped countries is useful, as both organisations have to find ways of identifying their manufacturing and trading interests with the political aspirations of the communities in which they operate.

As West Africa extends the range of its manufacturing activities, the experience of Unilever will have more and more to contribute to the solution of the United Africa Group's problems, not so much in the purely technical sphere as in the sphere of factory management and industrial relations.

On the other hand, the United Africa Group's experience of merchanting is of similar value to Unilever, most of all, perhaps, for the solution of higher management problems. Generally speaking, Unilever breeds industrialists, men who know the importance of an orderly flow of production and of careful long-term planning. The United Africa Group produces merchants—men with a quick sense of what the market requires, a desire to keep prices low enough for further expansion of sales and a wholesome fear of overhead expenses. Both types are needed in a large business, the long view and systematic planning of the industrialist, the market sense and quick response of the merchant. By drawing on both, Unilever can ensure itself of systematic and orderly development, without running the risk of ossification.

FINANCIAL ADVANTAGES

Financially speaking, there is an advantage in compensating the divergent risks of the business cycle. Working in countries which are largely dependent on the export of a few agricultural commodities, the United Africa Group is liable to serious fluctuations in turnover and profits. Unilever, as a producer of articles of daily consumption, does not benefit so much from a boom but is also less vulnerable to a depression, if profits and losses on stocks are adequately dealt with in separate reserves. In the past, the United Africa Group has found it useful to lean on Unilever in times of depression and Unilever's overall results have been favourably influenced by the group's profits in a period of boom.

In short, the concern as a whole and the territories in which it operates have benefited and are likely to benefit from the association between Unilever and the United Africa Group, and this association provides a striking example of the way economic progress can be promoted.

The chairman concluded by moving the adoption of the report and accounts.

Sir Herbert Davis, vice-chairman, seconded the resolution and it was carried unanimously.

The proposed final dividend of 9¾ per cent on the ordinary stock and a dividend of 6 per cent on the deferred stock payable on June 14, 1954, were approved, the retiring directors were re-appointed and the remuneration of the auditors, Messrs. Cooper Brothers and Company and Messrs. Price Waterhouse and Company, who had been re-appointed under the provisions of the Companies Act, 1948, was fixed.

The proceedings terminated with a vote of thanks proposed by Mr A. Carroll-Marx, who expressed on behalf of the shareholders their appreciation of the work of the directors, officers and staff of the company.

In the course of his reply the chairman said that it was the high morale of the management and staff that had produced the satisfactory results which had been placed before the meeting. He and his colleagues were proud, as directors, to be at the head of such a team.

UNILEVER N.V.

The annual general meeting of the members of Unilever N.V. was held yesterday at Museumpark, Rotterdam. Mr P. Rykens presided and made a speech in similar terms to that delivered by Sir Geoffrey Heyworth at the annual meeting of Unilever Limited, reported above.

The report and accounts for the year 1953 were adopted. The proposed final dividend of 8¾ per cent (being the equivalent of the final dividend for the same year to be paid by Unilever Limited to its ordinary stockholders calculated in accordance with the provisions of the equalisation agreement) was approved, the retiring directors were re-appointed, Mr J. A. Connel was appointed a director and the auditors, Messrs. Price Waterhouse and Company and Messrs. Cooper Brothers and Company, were re-appointed.

H.P. SAUCE LIMITED

SATISFACTORY TRADING RESULTS

SIR PATRICK HANNON'S SPEECH

The twenty-ninth annual general meeting of H.P. Sauce Limited, was held on Thursday, May 27, 1954, at the Queens Hotel, Birmingham. Sir Patrick Hannon, the chairman, presided and in the course of his speech said:

The year 1953 must be regarded as the most difficult trading year since the war. It was marked by keen competitive conditions, particularly in the home market and although a further welcome measure of relief from control and rationing was experienced with resulting lower costs in some directions, other costs, notably transport, increased. In the aggregate, the percentage of profit margin on most of the products sold by the company and its subsidiaries showed no increase, notwithstanding many measures which have resulted in economy and efficiency. In all circumstances, the trading results of the parent company, and, with one exception, of the subsidiary companies, are regarded by the board as highly satisfactory, although the trading profit of the group shows a decrease from £998,430 in 1952 to £895,565. The exception to which I have referred is Norfolk Canneries Limited, which company, in common with other companies engaged in the canning industry, suffered by the import of very large quantities of canned products from Commonwealth countries, and by the poor growing conditions experienced last summer. Your directors have, however, the greatest confidence in the vigorous and able local management of this company, and, with every hope that these conditions will prove to be exceptional and will not be repeated this year, they feel convinced that a satisfactory improvement upon the trading result of 1953 will be achieved.

The group charge for taxation is lower by £107,802 so that the net profit of the group is £4,937 higher than the previous year. Notwithstanding taxation reliefs of recent years, it will be observed that total taxation represents over 60 per cent of profits. After crediting over-provisions for taxation in 1952 (mainly due to the reduction in the standard rate of income tax) and providing for the profit of subsidiaries attributable to outside interests and the proportion of profits retained in subsidiary companies, the net profit is £299,606, an increase of £62,626 compared with last year. After payment of preference dividends and interim dividend on ordinary stock, we have an available balance of £452,519 compared with £342,063 at the end of 1952. Your directors, having given careful consideration to their recommendation to stockholders, propose a final dividend of 1s. per 5s. stock unit, less tax, making the total dividend equal to that of last year.

The overseas demand for the companies' products, both for H.P. Sauce and Lea & Perrins, continues to increase, in spite of import restrictions in many countries; and this affords us particular satisfaction today, when the country's need of export trade is still so vital to the national interest. Lea & Perrins Limited continues to advance in turnover and it provides the premier Worcester Sauce in every country in the free world. Lea & Perrins Inc., New York, has maintained its previous vitality and has shown increased profits. The weight of taxation in America is still heavy, but reductions in the current year, notably the abolition of excess profits tax, will bring welcome relief. The growth of our business in Canada has steadily advanced, both for H.P. Sauce and Lea & Perrins Sauce, under the energetic management of E. D. Smith and Sons Limited. Fletchers Sauce Company Limited maintains its long-established popularity in the north of England, and Macks (Walsall) Limited shows steady improvement. Both these companies benefit from diligent and active local management. The Albion Bottle Company occupies a high place in our Group, being very well managed and providing an excellent return of profit. In 1953, during which we acquired the minority share interest, a most satisfactory turnover was achieved.

The report and accounts were adopted and the retiring directors, Mr John T. Lewis, Mr H. G. Wright, Sir Eustace Missenden and Mr Stanley Adams, were re-elected.

In proposing resolutions for the payment of a pension of £1,250 per annum to Sir Patrick Hannon on his retirement, a tribute was paid to him for his long and devoted services to the company by Mr Stanley Adams on behalf of the board, and this was endorsed with acclamation by members present.

ABRIDGED REPORT OF THE DIRECTORS OF

ANGLO AMERICAN CORPORATION OF SOUTH AFRICA LIMITED

(Incorporated in the Union of South Africa)

FOR THE YEAR ENDED DECEMBER 31, 1953

FINANCE AND ACCOUNTS

CAPITAL

In terms of an arrangement approved by shareholders at the thirty-sixth annual general meeting, held on June 19, 1953, the issued capital of the Corporation was increased, on June 30, 1953, from £5,811,103 to £5,861,103 by the allotment to E. Oppenheimer & Son, Limited, of 100,000 ordinary shares of 10s. each at the subscription price of £5 5s. per share.

In the latter half of 1953 shareholders were advised of an offer by the Corporation to acquire from shareholders in The New Era Consolidated, Limited, their shares at the price of 35s. 3d. per share. By the end of the year 314,599 ordinary shares in the Corporation had been issued against the surrender of 1,049,043 New Era shares in terms of the offer, and the New Era Company was accordingly a subsidiary company of the Corporation at December 31, 1953.

The capital structure of the Corporation at December 31, 1953, was as follows:

	Authorised £	Issued £	In Reserve £
Ord. shares of 10s. each	4,000,000	3,639,027	360,973
Pref. shares of 10s. each	620,625	...	620,625
Six per cent prefd. stock	2,379,375	2,379,375	...
	7,000,000	6,018,402	981,598
Loan capital		4,081,633	

The offer to shareholders in New Era was finally accepted by the holders of 1,085,781 shares, which is equal to 98.7 per cent of the issued capital. In accordance with the provisions of Section 103 ter of the Union Companies Act, the New Era shares not surrendered were transferred into the name of the Corporation on February 23, 1954, against the relative share allotments and cash payments, and The New Era Consolidated, Limited, accordingly became a wholly owned subsidiary of the Corporation on that date.

Since the close of the financial year shareholders have been advised of an offer by the Corporation to shareholders in South African Mines Selection, Limited, one of the finance and investment companies of the group, to acquire their shares at the price of 20s. per share, which consideration is to be utilised in the subscription for, and satisfied by, the issue of fully paid ordinary shares in the Corporation at the price of 125s. per share.

* Represents the excess of the cost of the shares acquired in The New Era Consolidated, Limited, over the net book value of the assets appertaining to the Corporation's interest therein at December 31, 1953.

BALANCE SHEET

The book value of the Corporation's investments, excluding its interest in its subsidiary companies, amounted to £27,151,036 at the end of the year, as against £25,618,970 in 1952. Of this amount, quoted investments accounted for £22,761,707, the market value at December 31, 1953, being £36,560,945.

Current assets exceeded current liabilities at December 31, 1953, by £2,353,893. The general reserve was £18,900,000.

DIVIDENDS

Dividends on the ordinary shares totalled 6s. per share, which is the same as for the previous year.

The total dividend distribution in respect of the year ended December 31, 1953, amounts to £2,296,575.

GOLD MINES IN THE TRANSVAAL

The tonnage milled by the producing mines of the Group in the Transvaal decreased by 620,500 to 9,343,000, costs per ton milled increased by 2s. 3d. to 33s. 5d., and revenue per ton milled decreased from 48s. 9d. to 47s. 10d. The decrease of 3s. 2d. per ton in working profit from gold, together with the decrease in tonnage milled, resulted in a reduction of £1,991,774 in the total working profit from gold, silver, etc.

The gold output at 1,776,940 ounces was 119,710 ounces less than in the previous year, due mainly to the smaller tonnage milled, the average recovery per ton being approximately the same. The decrease in revenue per ton was largely due to a lower average price per ounce of gold, to some extent accounted for by fluctuations in the official price of gold in accordance with the prevailing dollar/sterling rate of exchange, but to a larger extent due to the decreased premiums received from the sale of gold for industrial and artistic uses.

Production at the uranium and acid plants at Daggafontein Mines, and Western Reefs commenced in March and September, 1953, respectively. After initial difficulties the plants operated satisfactorily, the estimated profits (subject to adjustment) from the sales of uranium and sulphuric acid at Daggafontein being £644,991, and at Western Reefs £246,645, in respect of the period ended December 31, 1953.

The total of dividends declared was £3,974,750, a decrease of £398,688. The reduction was small in relation to the decrease in total working profits, due largely to the fact that Daggafontein and Western Reefs were both able to maintain their dividends in consequence of profits from uranium production.

The shortage of European and native labour was felt by all mines during the year. The shortage of native labour was more serious during 1953 than in 1952, the number of native labourers employed on the six mines during the peak period of 1953 being 39,385, as compared with 43,600 during the peak period of 1952. At the end of the year the number employed had dropped to 36,095, compared with 37,900 in 1952; this reduction in the native labour strength is reflected in the decrease in tons milled. In the first four months of 1954 there has been an improvement in the native labour position.

GOLD MINES IN THE ORANGE FREE STATE

The Corporation has a substantial interest in Orange Free State Investment Trust, Limited, through which the major portion of its interests in the Orange Free State goldfields is held. The Corporation also has participation rights in respect of certain areas in the Orange Free State.

The following is an extract from the statement by the chairman of Orange Free State Investment Trust, Limited:

"Rapid strides have been made on the Orange Free State goldfields since the end of 1952. At that time only two mines, namely, St. Helena Gold Mines, Limited, and Welkom Gold Mining Company, Limited, were in production. Since then, four more have reached production: Freddies North Lease Area, Limited, Freddies South Lease Area, Limited, and Western Holdings, Limited, in the middle of 1953, and President Steyn Gold Mining Company, Limited, in April, 1954. Harmony Gold Mining Company, Limited, Virginia Orange Free State Gold Mining Company, Limited, and President Brand Gold Mining Company, Limited, are expected to be producing by the end of this year, making a total of nine producers out of the thirteen mines at present being established in the Orange Free State. During 1952 the total tonnage milled amounted to 1,206,000 tons, yielding 224,412 ounces of gold for a value of £2,798,125. The corresponding figures in 1953 were 2,124,000 tons milled, yielding 431,261 ounces of gold for a value of £5,358,605. The major portion of the output came from the two older producers, St. Helena and Welkom, which between them milled 1,559,000 tons, yielding 310,873 ounces of gold for a value of £3,851,603.

The national economy will be further assisted by the production of uranium. It is estimated that the uranium plant at Harmony Gold Mining Company, Limited, will be commissioned some months after the gold reduction plant commences operations in the

middle of the year. The uranium plants being erected at the Welkom and President Steyn mines are expected to be completed before the end of 1954. These two plants will initially treat the residue slimes of President Brand Gold Mining Company and President Steyn Gold Mining Company. The uranium values obtained to date at the Welkom and Western Holdings mines do not justify their slimes residues being treated, and insufficient development has been done at the Free State Geduld mine to assess whether its slimes residue will be treated.

At this stage a very small proportion of the capital invested in bringing the mines to production, in establishing the various towns and in providing the necessary ancillary services, is revenue producing. The latest figures available show that capital expenditure on the gold mines in the OFS has amounted to about £130 million and a further £15 million has been spent on providing the necessary housing facilities. The group's own contribution to these totals is nearly £80 million. This expenditure takes no account of the very considerable sum which has been spent on the establishment of townships with their ancillary services."

DIAMOND INTERESTS

The Corporation maintains its interest in the diamond industry through a large shareholding in Anglo American Investment Trust, Limited. The company's shareholdings at December 31, 1953, were in Boart Products, South Africa, Limited, De Beers Consolidated Mines, Limited, De Beers Investment Trust, Limited, The Diamond Corporation Limited, The Diamond Purchasing and Trading Company, Limited, The Diamond Trading Company, Limited, Industrial Distributors (1946) Limited. During the year, the company increased its interest in De Beers Consolidated Mines, Limited, by 117,975 deferred shares.

After taking these transactions into account, the balance sheet shows investments at £8,008,926, being an increase of £2,181,556 over the comparable figure for the previous year. The market value of these investments, taking stock exchange quotations where available and cost in other cases, was £15,636,939. The company made a profit of approximately £2,574,000 after providing for taxation, and dividends declared totalled 12s. per share.

De Beers Consolidated Mines, Limited had a satisfactory year, the net profit being £9,317,801 after providing £2 million for taxation. Dividends totalling 10s. per share on the deferred shares were declared.

NORTHERN RHODESIAN INTERESTS

The Corporation's interests in Northern Rhodesia are held through direct investments and through Rhodesian Anglo American, Limited, in Rhokana Corporation, Limited, Nchanga Consolidated Copper Mines, Limited, The Rhodesia Broken Hill Development Company, Limited, Mufulira Copper Mines, Limited, and Bancroft Mines, Limited, a new copper mining company in Northern Rhodesia.

The profit of Rhodesian Anglo American, Limited, for the year ended June 30, 1953, before taxation, was £4,346,668, compared with £4,017,754 for the previous year.

Rhokana Corporation, Limited's profit before taxation for the year ended June 30, 1953, increased from £12,116,457 in 1952 to £12,610,811 in 1953. Provision for taxation amounted to £4,219,784. Production of blister and electrolytic copper at Rhokana dropped from 82,764 long tons to 74,216 long tons in 1953, largely owing to power shortages and to interruptions by strikes.

Nchanga Consolidated Copper Mines, Limited's profit before taxation increased from £9,982,246 in 1952 to £14,042,101 for the year to March 31, 1953. Provision for taxation amounted to £5,501,076. During the financial year 93,317 long tons of blister and electrolytic copper were produced, compared with 68,816 long tons for the previous year.

Bancroft Mines, Limited, is scheduled to come into production early in 1957.

COAL INTERESTS

The Corporation's coal interests are held through the medium of African and European Investment Company, Limited, its associated company, The Vereeniging Estates, Limited, and Rhodesian Anglo American, Limited.

The principal producers are:

Amalgamated Collieries of South Africa, Limited, Blesbok Colliery, Limited, New Largo Colliery, Limited, South African Coal Estates (Witbank) Limited, Springbok Colliery, Limited, The Coronation Collieries, Limited, Vierfontein Colliery (Proprietary) Limited, Vryheid Coronation, Limited, Wankie Colliery Company, Limited.

During 1953 these companies (other than Wankie Colliery Company, Limited), together with their subsidiaries, sold 13,056,915 tons of coal, equal to 41.6 per cent of the total South African production.

Wankie Colliery Company, Limited, is the only producer of coal in the Rhodesias. In terms of a price agreement entered into with the Government of Southern Rhodesia the Company has undertaken to increase its output from the present level of 2,750,000 tons per annum to approximately 5 million tons per year by the end of 1956. Profits for the year ended August 31, 1953, were £340,016 and dividends distributed amounted to £330,938.

Copies of the full report and accounts are obtainable from the London office of the Corporation, 11 Old Jewry, London, E.C.2.

ANGLO-PORTUGUESE TELEPHONE COMPANY

YEAR OF OUTSTANDING ACHIEVEMENT

FURTHER ISSUES OF PERMANENT CAPITAL FORESHADOWED

SIR ALEXANDER ROGER ON THE CONTINUED PROGRESS AND PROSPERITY

The sixty-seventh annual general meeting of The Anglo-Portuguese Telephone Company, Limited, will be held on June 23, 1954, at Stowger House, 8, Arundel Street, London, W.C.2.

The following is the statement by the chairman and managing director, Sir Alexander Roger, KCIE, which has been circulated with the report and accounts for the year ended December 31, 1953:

ACCOUNTS

The accounts for the year ended December 31, 1953, show that the satisfactory progress of your Company continues. The Exchange Rate continued at Esc. 80.50 to the £ at which rate all conversions have been made as they have been since 1950. Total Revenue at £1,820,525 is up by £179,573, largely due to the new plants which have been installed in the past few years, enabling us to connect many new subscribers to the system.

Total Expenses are £91,215 higher at £1,604,303. Total Expenses include Renewals and Depreciation, Royalties paid to the Portuguese Government, British taxation, debenture and loan interest, debenture sinking fund instalments and the capital duties resulting from the increase of our authorised capital during the year.

The net profit of £216,222 compares with £127,864 in 1952 and it is proposed to pay a final dividend of 5 per cent on the ordinary stock which, together with the interim dividend of 3 per cent paid in November last, makes 8 per cent. for the year. It is also proposed to pay a dividend of 8 per cent on the "A" ordinary stock.

After providing £112,200 for dividends and transferring £79,013 to General Reserve, carry forward is increased to £102,323 from £77,314. We have also incorporated in general reserve, which at December 31, 1952, stood at £50,000, the existing balances of £115,000 on contingency reserve and £5,987 on excess profits' tax post-war refund. The reserve including the allocation from profits mentioned above now totals £250,000.

PROVISION FOR RENEWALS

As the result of their annual investigation of the telephone plant and equipment, the consulting engineers have once more recommended that an additional allocation be made to the normal allocation from revenue for renewals and depreciation. The provision for renewals now stands at £1,842,684 and represents about 26.5 per cent of the cost price of installed plant, which the consulting engineers state is, in their opinion, necessary and adequate.

In the opinion of your directors the replacement value of telephone plant, land and buildings is greatly in excess of the balance sheet figures.

The Company's reserves continue to be wholly invested in the business.

During 1953 £539,400 of telephone equipment was shipped from Great Britain, bringing the total shipped from 1948 to 1953 to £2,303,500. During the same six years £973,400 of equipment was purchased in Portugal, and the purchases during 1953 alone amounting to £276,000.

It will be seen, therefore, that your company's operations in Portugal play an important part in the promotion of trade both in Great Britain and in Portugal.

Your Company pays to the Portuguese Government Royalties at the rate of 7½ per cent of its annual gross earnings and in 1953 this amounted to the sum of £134,269.

GENERAL PROGRESS OF THE COMPANY

Last year I was able to state that development in 1952 in terms of stations was a record in the history of the company, 10,160 new stations having been installed during that year. During 1953 no fewer than 15,233 new stations were installed, an outstanding increase over the previous year. At the end of 1953 your company's systems in Lisbon and Oporto totalled 134,586 stations in operation and it is some measure of our achievement if we remember that at the end of 1948, only five years ago, the total number of stations was 88,459. In five years your company's systems have increased in size by over 50 per cent without permitting the grade of service to fall below that high standard which we have always maintained.

It will be evident, therefore, that 1953 was the busiest year in the history of your company and here I would like to say that in a telephone company, as indeed in every public utility, the full benefit of a year's development is not apparent at once but is enjoyed in the future when the economies inherent in long-term planning come into being. We can look back at the year under review with a sense of achievement; we can also derive satisfaction from the fact that the way has been prepared for the continued expansion of your company with modern equipment and using the most up-to-date technique.

The year saw the opening of Graca, an important main exchange in the busy north-eastern area of Lisbon, to which I referred at some length in my statement last year. Also in Lisbon a 2,600-line extension was added to Estrela automatic exchange, a new 600-line automatic exchange replacing a manual exchange was opened at Lumiar, a residential district in the north-east of the city, Almada exchange was extended and a new speaking clock designed to give a time signal accurate to one-tenth of a second was brought into service.

In Lisbon 83 per cent of the telephones are automatic and within the urban area the great majority of telephone users have at their finger tips the means of access to other subscribers in the urban area with whom they wish to speak. Much work was done during 1953 to provide extension of this facility to the extra-urban area and within a few years we hope it will be possible for subscribers connected to any automatic exchange in the Lisbon Concession area to connect themselves directly with any other subscriber connected to an automatic exchange in that area. In due course similar plans for the Oporto system will be brought into operation.

NEW AUTOMATIC EXCHANGE OPENED

In Oporto a 300-line extension was installed at Gaia Exchange, south of the River Douro, but throughout the year the main activity centred upon the new Lapa automatic exchange which by the end of the year was nearing completion and which was brought into service on March 20, 1954.

This new automatic exchange has been equipped initially for 4,000 lines and replaces the manual exchange which previously served the same area. The bringing into service of a replacement exchange of this capacity is an operation of considerable complexity and for that reason is carried out at midnight when the traffic being handled is at a minimum. On this occasion the cut-over took place smoothly and according to plan in 4 mins. 25 secs., a remarkably short space of time which reflects great credit on the administration and to the engineers in Oporto. Careful and extensive advance publicity was given to advise the subscribers in the Lapa area how to make the fullest possible use of the new facility which was being provided for them and, as always in our experience when this is done, the public responded magnificently.

An inaugural ceremony was held at the exchange and was presided over by the Civil Governor of Oporto, Dr Domingos Braga Cruz. Besides the Governor there were present the Military Governor, General Cota Morais, Eng. Mário Borges representing the local authority, the British and American Consuls, representatives of the Portuguese post office, the Institute Nacional de Trabalho, the União Nacional, the Judicial and International Police, and the port and customs authorities together with about forty other dignitaries of Oporto.

Snr. Antonio d'Oliveira Calem, CBE, who is our valued and esteemed representative director in Oporto, was unfortunately unable to be present because of ill-health and he has our good wishes for a rapid recovery.

In the course of his address the Civil Governor said "I do no more than follow in the steps of the Minister of Communications when I state publicly that The Anglo-Portuguese Telephone Company has made a great effort to meet the high demands of the two principal cities in the country in the field of telecommunications. . . . The Portuguese Post Office and the Company, in the closest collaboration, have created a friendly rivalry as to which can serve the best." The Civil Governor went on to thank the company, in the name of the government, for carrying out the task entrusted to it. He then referred to the plans for future development which the company has drawn up, saying that the company in serving its own interests would also serve the interest of the Portuguese nation.

FUTURE DEVELOPMENT

During 1953 we received 7,645 new applications for service, and at December 31, 1953, the waiting list numbered 17,545, in spite of our having installed during the year 12,120 lines and 3,113 extensions. New applications for telephone service have been reaching the company at the rate of over 1,400 each month during the early part of 1954, and although all applications do not mature through some withdrawals when service is offered, nevertheless the reduction and ultimate elimination of the waiting list is a formidable problem. The unceasing

demand, however, is an indication of the valuable service which we give to the public. It is in the interests of the Portuguese public and of our stockholders that we should use every endeavour to meet this continuing demand for service.

With this purpose in mind, I visited Portugal in June and again in October last year. The entire position was investigated thoroughly and a programme was formulated, designed to reduce the waiting list to insignificant proportions before the end of 1957. The programme, which is already in operation, provides for the addition to the system of nearly 51,000 lines within a span of four years, and will make heavy demands on all the financial, administrative and technical resources of your company and of the associated companies, Automatic Telephone and Electric Company Limited, British Insulated Callender's Cables Limited and Telephone and General Trust Limited, whose ready co-operation we have enjoyed in the past and can depend on in the future.

Your company has, in Portugal, a special school engaged upon the training of personnel to provide the increased skilled technical staff which will be needed to maintain the new telephone plant which will result from the programme.

New buildings and extensions to existing buildings have to be erected. In Lisbon alone there are no less than twelve major works of this nature in various stages of planning or construction.

PROVISION OF ADDITIONAL FINANCE

For many years, in fact for the past quarter of a century, we have looked to Telephone and General Trust Limited to provide the temporary finance for your company by means of day-to-day borrowings. The loan from the Trust, which at December 31st last was £410,354, at this date stands at £832,000. Plans are therefore almost complete for further issues of permanent capital to repay this loan and provide for further needs. At an extraordinary general meeting, to be held immediately following the annual general meeting, a resolution will be submitted, creating one million 6 per cent cumulative preference shares of £1 each. Subject to Treasury consent, we hope to offer these shortly for public subscription, with preferential consideration on allotment being given to applications from ordinary and debenture stockholders. It is also planned to offer 255,000 of the existing unissued ordinary shares by way of a rights issue to existing ordinary and "A" ordinary stockholders in the proportion of one new ordinary share for every £10 stock held. Full details of both these issues will be given as soon as possible. In the future, it is hoped to make similar rights issues to ordinary and "A" ordinary stockholders as and when further finance for normal development is required.

Our relations with the Portuguese authorities continue to be excellent, as they have always been. The future of the telephone business in Portugal appears to be full of promise and the demand for telephone service is likely to continue unabated as the result of the growing prosperity of Portugal through the increasing development of her industrial and agricultural resources.

MAINTENANCE DEPARTMENT

I should not like to leave this section devoted to the general progress of the company without referring to the heavy burden borne by our maintenance department. Modern telephone equipment consists of highly complicated and exceedingly delicate equipment and it is the responsibility of the maintenance engineers, not merely to correct faults when they occur but, by means of continuous attention to the plant, to prevent faults from arising. Continuous checks are carried out on all the equipment in every exchange in the company's network. In one of the company's automatic exchanges which is equipped for 10,000 lines there are some 26,000 selectors, meters, relay sets and similar equipment all requiring precise adjustment; the wiring of the equipment within the exchange uses about 6,500,000 metres of single wire and this multiplicity of equipment requires no less than 8 million soldered joints. This is an indication of the great number of possible sources of fault in a 10,000 line exchange and only by continuous skilled maintenance can the public be protected against the annoyance occasioned by interruptions in the telephone service.

PORTUGAL

The economic development of Portugal during the past quarter of a century has, under the wise guidance of Dr Salazar, followed a regular pattern of progress and consolidation.

In 1944 an industrialisation plan was introduced designed to prepare the way for the rapid development of the nation's resources. Upon this solid foundation is now being laid the six year development plan which was published during 1952 and to which I referred in some detail in my statement last year.

The new programme is proceeding according to plan and with increasing momentum. In its initial stage the plan concentrates on the distribution of power to the agricultural and industrial areas through the construction of a nation-wide system of hydro-electric schemes. During the year the Salamonde dam, which forms the second part of the Cavado-Rabagão scheme, was brought into service and the third stage is expected to be ready in 1954, followed by the fourth phase in 1956.

The second stage of the Zezere scheme is expected to start production of electricity during 1954. Plans are also well advanced for the harnessing of the River Douro commencing with the construction of the Picote dam.

Considerable attention is being given to the improvement of communications and there is in existence a 15-year plan for road development.

The railway system is good and is being gradually modernised and plans for electrification are well advanced.

The merchant fleet has already been greatly enlarged and modernised and now a fishing development fund has been formed to develop the fishing fleet with the most modern vessels. Much of the new construction has been carried out in the United Kingdom but the output from Portuguese yards increases steadily.

As a part of these developments, a new fishing port at Pedrouços, just outside Lisbon, came into operation during 1953.

FRUITS OF PORTUGAL'S GROWING PROGRESS

Social amenities generally are being improved; new housing estates are being erected and many fine new office buildings and factories are springing up. The health services are being extended and a new hospital school, the largest building in Portugal, was opened in Lisbon during the year. These improvements are not confined to the towns. The country districts are equally enjoying the fruits of Portugal's growing progress, through the construction of new roads and the extension of the electricity and piped water systems into areas where they were not previously available.

The agricultural and mineral resources of the country are being developed to supply their maximum output and schemes for irrigation and afforestation are coming into operation.

It has long been the policy of the Portuguese Government to carry out a large part of the country's development with the aid of private capital. This far-sighted policy is reaping a rich harvest, for a country's commerce and industry flourishes when the policy of its Government is to provide encouragement and assistance without oppressive intervention.

Dr Salazar has himself said that his country welcomes foreign capital. It is gratifying to those of us who carry on our business in Portugal that the Government has this faith in our ability and in our goodwill, and we do not forget our great responsibilities to the public which we are privileged to serve.

In the early part of 1954 a Nuclear Energy Board was established in Portugal and the necessary laboratories are being set up to conduct research into the use of nuclear energy in the fields of medicine, biology, industry, agriculture and engineering among others. It was also stated in the decree instituting the Nuclear Energy Board that it was considered essential that Portugal should, if necessary, be able to take quick action to utilise atomic energy for military defence purposes.

The traditional good trade relations between the United Kingdom and Portugal continue. The United Kingdom is still Portugal's principal supplier whilst ranking second among Portuguese export markets.

During 1953 there were slight changes in Portugal's external trading position, probably resulting from the cessation of hostilities in Korea. This was not unexpected and is by no means serious, for Portugal is in a strong position to withstand the effects of a temporary decline in exports. The reserves of gold and foreign exchange have grown steadily over the past decade and now stand at a record level.

It is not unreasonable to expect that, as the six-year development plan comes fully into operation, the resultant increased activity will offset the small decline in exports.

Lisbon continues to achieve prominence as a Trans-Atlantic terminal and in recent years many important international conferences have been held in that city.

Politically the most important event of the year was the General Election held in November last when the Government party, headed by Dr Salazar, was returned to power with an overwhelming majority.

VISITS

My visits to Portugal in 1953 enabled me to renew and sustain the close association which I and my colleagues enjoy with the Ministers of the Portuguese Government and many other influential persons in Lisbon and Oporto.

I was again most cordially received by H. E. Doctor Antonio Oliveira Salazar with whom I was able to exchange views on the part which your company is playing, and will be called upon in the future to play, in the development of Portugal.

Also during my stay I conferred with Dr Costa Leite, Minister of the Presidency, Dr Soares da Fonseca, Minister of Corporations, Colonel Salvacao Barreto, President of the Lisbon Municipality and Dr Jose Manuel da Costa, head of the Portuguese Information and Tourist Services. These meetings, which as always were conducted in an atmosphere of the utmost friendliness, provided fresh evidence of the cordiality of your company's links with the Portuguese Authorities.

During my second visit, in October, plans were formulated to speed up the elimination of the waiting list. I have referred to these plans in some detail earlier in this statement, but I would like here to reiterate that this programme of development represents an attempt to put Lisbon and Oporto in the position of having virtually no waiting list for telephone service by the end of 1957.

PERSONNEL

We are most fortunate to have as Chairman of the Portugal board Snr. Eng. Antonio Branco Cabral who, together with his colleagues and with Dr Antonio Bustorff Silva, our legal adviser, work closely in co-operation with our very able general manager, Mr R. S. Thorp and his staff.

In March, 1954, Mr A. N. Rye, who has been a director since 1936, tendered his resignation from the board, and your directors accepted this with the greatest regret. On their behalf and on my own I would like to express our appreciation of the very valuable services he has given to the company.

It is with pleasure that I acknowledge the untiring help received by the London board over so many years from their colleagues in Portugal. There is at all levels throughout your company an atmosphere of collective action towards a common end—the continued progress and prosperity of the company together with a faithful service to the public. I am sure that you will join with me in thanking my colleagues on the boards, both in London and in Portugal, the administration and workpeople in Lisbon and Oporto and the London staff for bringing us through the most progressive year in the history of your company.

NEW BROKEN HILL CONSOLIDATED

INCREASED OUTPUT AND IMPROVED EFFICIENCY

The eighteenth annual general meeting of New Broken Hill Consolidated Limited will to be held on June 23rd at 37 Dover Street, London, W.1.

The following is an extract from the circulated statement of the Chairman, Mr John R. Govett:

The profit for the year 1953, before providing for taxation, amounted to £677,922, compared with £818,780 for 1952. Due to increased output and improved efficiency of the mine, this reduction of £140,858 is relatively small having regard to the heavy fall in the prices of lead and zinc. Production of ore was 405,629 tons for 1953, compared with 239,922 for 1952, an increase of 69.1 per cent; in contrast to this, total costs for the year were £2,676,424, compared with £2,133,287 for 1952, an increase of only 25.4 per cent. The profit has been arrived at after providing £277,400 for depreciation, as against £245,600 in 1952.

The charge for taxation amounts to £264,660. This leaves a net profit for the year of £413,262, a reduction of £144,758.

The board have decided to transfer the sum of £250,000 to general reserve and recommend a final dividend of 9d. per share, making a total distribution for the year of 1s. 6d. per share, the same as for 1952.

The year 1953 has been notable for the marked increase in operating efficiency. This resulted in a production exceeding even the original long-term budget for 1955; and the consequent improvement in overall costs, coupled with the success achieved in disposing of almost the whole of our output, brought a large measure of compensation for the sharp decline in prices as compared with 1952. While in this current year we confidently anticipate a further increase in efficiency, we are nearly at the limit of tonnage and grade pending the full operation of the service shaft (scheduled for November, 1954), and the results for the year will depend mainly on the course of metal prices.

Since the development of the mine was resumed after the end of the war, our undertaking has grown to become the second largest producer of ore in the Broken Hill field, and this is an achievement of which I feel we can all be justly proud.

THE INSTITUTE OF COST AND WORKS ACCOUNTANTS

The thirty-fifth annual general meeting of the Institute of Cost and Works Accountants was held on May 29th at the Prince of Wales Hotel, Southport.

Mr Stanley J. D. Berger, MC, FCIS, director/secretary, read the notice convening the meeting and also the auditors' report.

Mr F. W. H. Saunders, FCWA, President of the Institute, in the course of his address, referring to the post-war demand for the services of qualified cost accountants, stated that against the 1,800 members and 5,000 registered students at the end of 1945, there were now 4,500 members and 12,000 registered students—a remarkable increase having regard to the high standard in examination and practical experience demanded.

The annual report, giving a résumé of the Institute activities during 1953, covering such matters as examinations, branches, regional and national conferences, summer school, research, journal, training and appointments bureau, was adopted at the conclusion of the formal business.

The investiture of the new president, Mr W. E. Harrison, FCWA, and two new vice-presidents, Mr G. Nicholson, FCWA, and Mr Ian T. Morrow, CA, FCWA, then took place.

COST OF LIVING

In the course of his presidential address the previous day, Mr Saunders said that human labour was necessarily an expensive item of cost, and that and other valuable resources must not be wasted. New management techniques demanded study, understanding and trial. Work study, incentives and budgetary control were but some of the means by which output and pay packets might be increased whilst unit costs were reduced. Joint co-operative action between employer and employee, free from restrictive practices on both sides, was surely the way to produce more goods more quickly and at lower cost.

No one would deny the great benefit to the country if it were possible to stabilise and then to reduce prices at the present time. In addition to the wage-earners, there were millions of hard-working people, sometimes misguidedly referred to as "middle-class," who had had to submit to a real standard of living much lower than they had enjoyed before the war. Then there were the pensioners, many of whom were suffering considerable hardship as a result of increases in the cost of living.

"I most strongly urge," said Mr Saunders, "that more of the benefits of increased productivity should be passed on to the consumer by reductions in selling prices."

When considering alterations in selling prices, however, it was of extreme importance that British industry should be well briefed on the likely results of a proposed course of action. Indeed, the implications of *not* taking action might be even more important.

A close study and full understanding of the incidence of costs must prevail if the situation was to be met successfully to enable us to enjoy a reasonable standard of life and full employment.

MANAGEMENT ACCOUNTANCY

There were some who professed that the outdated process of looking back was still the way to manage. But such an attitude could only restrict initiative and blind us to the possibilities of the future. Forward planning, with a confidence based upon practical knowledge of where the path would lead, was a prerequisite of success.

What more natural development could there have been than the emergence of the management accountant as a guiding force in the increasingly complex and rapidly changing industrial situation which faced us to-day?

Through its examinations and requirements of practical experience leading to the qualification of cost accountant and management accountant, the Institute was providing men of proven ability who were well able to cope with modern needs as their contribution to our national well-being. The supply of such men was admittedly inadequate, but the efforts of the Institute were vigorously directed towards their encouragement and development in increasing force.

LISBON ELECTRIC TRAMWAYS

IMPROVED OPERATIONAL EFFICIENCY

The annual general meeting of Lisbon Electric Tramways, Limited, will be held on June 23rd, in London.

The following is an extract from the circulated statement of the chairman, the Rt Hon The Lord Rathcavan:

Since the end of the war we have concentrated on catching up with arrears of maintenance and expanding in order to meet the growth of the population of the City of Lisbon. We are now in the position of being able to give outstanding service in every possible direction.

In the year 1939 the dividend to the ordinary shareholders was reduced and any improvement has been deliberately deferred until deficiencies in the service brought about by the effects of the war were rectified. No public utility in an expanding city can stand still, but I am satisfied that we have brought ourselves up to date. Accordingly, we now feel justified in increasing the distribution to shareholders and the board recommend a final dividend on the ordinary shares of 4 per cent net, making 6½ per cent net for the year.

The number of passengers carried in 1953 again shows an increase over the previous year, as also does the mileage run by our vehicles (comprising both trams and buses).

The year's operations, after providing for all charges, show a net profit of £79,249, an increase of £9,510. This profit, together with the balance brought forward from last year, gives a total of £140,586. The preference dividend and the increased ordinary dividend of 6½ per cent net for the year absorb £75,861, leaving a balance of £64,725 to carry forward to 1954.

The company now employs nearly 6,000 people, whose health and social conditions receive our constant attention. The total cost of these social services to the company during 1953 was of the order of £369,000.

UNION CORPORATION, LIMITED

MINING INDUSTRY AND OTHER INTERESTS REVIEWED

CHAIRMAN'S COMMENT ON EXPLORATION

The annual general meeting was held in Johannesburg on May 25, 1954, Viscount Bracken presiding. The chairman, in moving the adoption of the report and accounts for the past financial year, said :

Gentlemen,—The accounts of the Corporation for the year 1953, together with the directors' report are submitted for your approval.

For the first time the accounts include a consolidated balance sheet and a consolidated profit and loss account. As the figures in the consolidated accounts do not differ very materially from those in the Corporation's own accounts, I propose to limit my remarks to the latter.

DIVIDENDS AND PROFIT

Dividends received during the year fell by £107,000 to £1,593,000. This was due to a general decline in rates of dividend paid by the gold and base-metal mining companies whose shares constitute a large proportion of our portfolio. Net realised profits on investments were lower by £98,000 at £86,000 and net revenue from fees, interest and sundry receipts, after charging expenses, declined by £26,000 to £134,000. As a result of these changes the gross profit at £1,813,000 was £232,000 less than in 1952.

The net profit after taxation, on the other hand, increased by £169,000 to £1,227,000. As explained at the last annual general meeting, the changes in the United Kingdom 1953 budget which was introduced after the 1952 accounts had been closed, resulted in the amount provided for taxation in 1952, namely £818,000, being in excess of actual requirements. The favourable effect of these changes is reflected in the much smaller amount to be provided this year, namely £433,000.

Out of the net profit of £1,227,000 your directors deemed it desirable to appropriate £600,000 to exploration reserve. After deducting an amount of £229,067 expended on exploration during the year, this reserve now stands at £968,000 compared with £597,000 at the end of last year. Your directors believe this substantial increase in the reserve is fully justified by the Corporation's heavy exploration programme.

MARKET VALUES

The dividends declared for the year amount to 1s. 4d. per share, free of United Kingdom tax—or the same as for 1952. They absorb £620,000 and leave £358,000 to be carried forward to new account against £351,000 brought forward.

The quoted share and debenture holdings of the Corporation had a market value at December 31st last of £14,862,000, which was £9,351,000 in excess of the book value. The similar figure of excess of market value over book value at the end of 1952 was £11,403,000 and the decrease is, of course, mainly due to the fall in the prices of mining shares which took place during the year.

The Corporation's chief interests continue to be centred in the South African gold mining industry. Before turning to the affairs of the companies under our administration I should therefore like to review briefly the results of operations by that industry during the past year, since many of the features mentioned in the course of such a review apply equally to the individual gold mines in the Union Corporation Group.

GOLD-MINING INDUSTRY

As a result of fluctuations in the dollar/sterling exchange rate the official price received by the industry for gold sold during the year averaged approximately 247s. 2d. per ounce fine, or 1s. 10d. less than in 1952. There was, too, a further substantial reduction in the premium received on gold sold for "industrial and artistic purposes" which declined from £3,699,124 in 1952 to £1,934,421 in 1953. The price on this free market fell steadily until, towards the end of the year, it reached parity with the official gold price so that the advantage gained by offering a proportion of the output for sale in this way fell away.

On March 22nd last the London Gold Market was reopened after an interval of 15 years. Although the resumption of free dealings in gold in London may not result in any direct immediate benefit to the gold mining industry, the re-establishment of an orderly and reputable free market for gold, with a relatively low cost of dealing and with excellent facilities for storage and re-export, must be to its ultimate advantage.

A further decline in the native labour supply and the demand on the available labour by the developing mines reduced the tonnage milled by the Witwatersrand and Orange Free State mines in 1953 by approximately 2 per cent to 58,772,000 tons. Owing to the higher yield of the new producers the overall yield of the industry increased from 3.767 dwt. to 3.893 dwt., so that the total gold output increased by 140,844 ounces fine to 11,440,830 ounces fine. Of this output, the new producers, that is to say, those mines that have reached production since 1951, accounted for approximately 9 per cent.

URANIUM REVENUE

The fall in the price of gold reduced the working revenue, excluding uranium, by approximately £800,000 to £144,132,577 and, as total working costs rose by more than £4,750,000 to £107,306,956, the working profit declined by just over £5,600,000 to £36,825,621. The estimated profits from uranium declared by the first five uranium producers, amounted to approximately £1,800,000, after payment of interest. The total working profits of the industry, therefore, including uranium, amounted in round figures to £38,600,000, or nearly £4 million less than in 1952.

From this profit a little over £8 million was appropriated for capital expenditure and other items. Provision for taxation and Government's share of profit is estimated at £12,283,000, or £3,054,000 less than in 1952. Net dividends distributed to shareholders decreased by just under £1,600,000 to £18,207,830.

Working costs for the whole industry rose during 1953 by the same amount as in 1952, namely, 2s. 4d. per ton milled, and averaged 36s. 6d. per ton milled. To some extent the figures of working costs for the whole industry last year were inflated by the present high working costs of the new producing mines. But the bulk of the increase was due to further rises in the costs of labour, stores and power, and the higher incidence of standing charges on the smaller tonnage milled by the older producers. The supply position as regards stores and materials eased greatly during the year under review, so that the commodities which the mining industry requires were more freely available, and it was no longer necessary to carry such large stocks as formerly. But, with few exceptions, the cost of stores continued to increase. To a large extent this has been due to increases in the cost of transport, particularly to the increase of nearly 14 per cent in railway rates introduced in August of last year.

ORE RESERVES

The increase in costs rendered unpayable still further tonnages of marginal ore previously included in ore reserves so that, although the total development footage accomplished by the industry in 1953 was slightly higher than in 1952 this was insufficient to maintain the former level of ore reserves which declined by over 8 million tons to 167,862,000 tons. In conformity with the higher pay limit the average grade of ore reserves was 0.16 dwt. higher at 5.12 dwt.

Early this year the native labour supply showed a welcome increase and the peak figures of some 312,000 natives employed in April last is the highest figure attained in the past four years. While some of this increase may be due to normal seasonal fluctuations in the flow of native labour, it is apparent that the efforts made by the industry last year to improve the supply of native labour have proved beneficial.

In considering the results of operations by the gold mining industry during the past two years, one must remember that the industry as a whole is in a period of transition. The bringing into production of new mines in the Orange Free State and the Far West Rand and the advent of uranium production has thrown a considerable strain on the industry's resources.

NEW PROPERTIES

Thus in 1953, out of the 49 producing mines no less than eight had only been milling since 1951 and were therefore still building up a capacity. There were, in addition, 12 new properties at various stages of shaft-sinking and development. At the year end these 20 new mines absorbed between them about one-sixth of the total underground native labour strength available to the industry and probably a similar proportion of European labour. In the light of these considerations one must recognise the magnitude of the achievement of the 41 older producers in producing for the country gold worth some £130 million, in distributing to their shareholders more than £17,750,000 by way of dividends and in contributing to the State nearly £12 million by way of taxation and lease payments.

When considering the amount of taxation and lease payments made by the industry, account must be taken of the fact that, through amortisation allowances, all uranium mines are at present able to offset against profits considerable sums from capital expenditure on their uranium plants. While this new branch of the industry is expanding rapidly, profits from uranium production are still comparatively small and accordingly the bulk of the amortisation of the uranium plants is being set off against profits from gold mining.

It must be expected that during the current year a still larger proportion of the industry's resources will be absorbed by the new producing and developing mines. The new producers will, however, contribute a larger proportion of the industry's gold output and profits therefrom.

Let me now turn to the affairs of the gold mining companies under our administration and of some other companies in which we are interested.

GOLD INTERESTS

East Geduld Mines, Limited.—The ore milled in 1953 was 1,610,000 tons and the net profit was £1,760,031. Dividends totalling 3s. 6d. per unit of stock were declared and £551,079 was carried forward.

Geduld Proprietary Mines, Limited.—The ore milled was 1,125,000 tons and the working profit therefrom £361,890. Income from investments, principally from holdings in East Geduld Mines and the Grootvlei Proprietary Mines, was £622,284. The net profit was £874,498. Dividends declared totalled 11s. 6d. per share and £327,685 was carried forward.

The Grootvlei Proprietary Mines, Limited.—The tonnage milled was 2,203,000 tons and the net profit was £1,346,917. Dividends totalling 2s. 3d. per unit of stock were declared and £606,203 was carried forward.

Marievale Consolidated Mines, Limited.—The tonnage milled was a record at 749,000 tons and the net profit was £450,525. Dividends declared totalled 1s. 9d. per share and £465,430 was carried forward.

St. Helena Gold Mines, Limited.—The tonnage milled in 1953 increased to 799,000 tons and the working profit therefrom was £330,348. In development work the percentage payability showed a distinct improvement and there was also an increase in the in.-dwts. of the payable footage. The reduction plant is being expanded to a capacity of slightly more than 100,000 tons per month. The profitable exploitation of this company's large lease area will call fairly soon for an additional vertical shaft to be followed in due course by a further expansion of milling capacity.

Van Dyk Consolidated Mines, Limited.—The ore milled was 1,022,000 tons and the working profit was £34,552. Development work in No. 5 Shaft area has continued to disclose severe faulting and folding of the reef with erratic gold values. The mine is making only small profits and there is little promise of an improvement unless much better development results are obtained in the No. 5 Shaft area.

OTHER MINING INTERESTS

San Francisco Mines of Mexico, Limited.—During the year ended September 30, 1953, this company milled a record tonnage of 693,000 metric tons, despite a strike which lasted for a fortnight.

The sharp fall in world prices for lead and zinc caused a substantial reduction in revenue, while costs rose because of the considerable increase in wages. The net profit, after providing for taxes, fell from £970,000 to £255,000 but, against this, the extension of full unilateral relief from Mexican taxes granted by the United Kingdom Government enabled the company to credit its appropriation account with £400,000 previously provided for taxation now no longer required. This permitted the payment of a bonus of 2s. per unit out of the non-recurring tax credit in addition to a dividend of 2s. per unit out of the profits for the year—making a total distribution of 4s. per unit against a dividend of 6s. per unit in the previous year. In the first six months of the company's present financial year metal prices and earnings have been disappointing.

Recently the Mexican Government has devalued the peso from P.8.65 to P.12.50 to the dollar and concurrently has increased the export taxes payable on metals exported, thereby appropriating at its source the larger part of the benefit which might otherwise have accrued to the mines.

OTHER INTERESTS

Bay Hall Trust, Limited, declared a dividend of 7½ per cent, free of United Kingdom income-tax in respect of the year 1953, compared with 7 per cent, free of tax in the previous year. At the end of the year the appreciation of its holdings over book cost amounted to £450,948.

British Enka, Limited.—Improved trading conditions during 1953 enabled the company to produce at full capacity and to sell its entire output. After providing £286,000 for depreciation and £351,000 for United Kingdom taxation, the consolidated net profit of the company and its subsidiaries for the year ended December 31, 1953, was £351,000. This was a welcome recovery from the previous year when, after writing down stocks, a net loss of £95,000 was incurred. The directors have transferred £100,000 to general reserve and recommended the payment of a dividend of 10 per cent, which will absorb £103,000, leaving £184,000 to be carried forward.

South African Pulp and Paper Industries, Limited, again increased its production and sales from its Enstra Mill. For a variety of reasons our hopes for an even larger increase in output were not fulfilled. The net profit was £334,947, and dividends declared for the year amounted to 2s. per share. Good progress was made with the construction of the Tugela Mill and the first trial runs of Kraft pulp and paper are expected to take place soon.

EXPLORATION

As mentioned in the directors' report drilling operations by Capital Mining Areas, Limited, have indicated the existence of payable Kimberley Reef covering a limited area, which it is believed will prove to be sufficiently large to justify underground prospecting in due course. Drilling is being continued by Capital Mining Areas. In addition, prospecting work in the Bethal and adjoining districts of the Transvaal is being carried out by the other five exploratory companies formed in the latter part of 1952, though so far nothing of economic importance has been disclosed in the area tested by these companies.

Before finishing this review of the past year I should like to say how greatly pleased his colleagues were that Viscount Leathers was able to rejoin the board of the corporation.

In conclusion I should like to take this opportunity of expressing our thanks to the staff of the Corporation, both in South Africa and London, and to the managers, staff and employees of the companies under our administration for their loyal and efficient services during the past year.

The report and accounts were adopted and the retiring directors were re-elected. Owing to insufficient representation of capital the meeting was adjourned to June 1, 1954, at 11 a.m. for consideration of the business requiring the passing of special resolutions amending the minimum period of notice of meetings and absolving the Corporation from compliance with Section 70 quin (9) of the Companies Act.

At the adjourned meeting the special resolutions were passed.

TAYLOR WOODROW LIMITED

A SATISFACTORY YEAR'S TRADING

The annual general meeting of Taylor Woodrow Limited was held on May 28th in London, Mr Francis Taylor (chairman and managing director) presiding.

The following is an extract from his circulated review:

It has been my privilege in previous years to report the continued progress of our company, and I am very happy to advise you that 1953 has followed that satisfactory trend.

The statement then reviews the promising recent acquisitions in Canada and Iraq, and continues:

The profit on trading is £772,002, taxation takes £350,000 and after providing for depreciation, directors' fees, salaries and interest on fixed loans, we are left with a net balance of £124,000, compared with £63,691. A final dividend of 12½ per cent, less tax, is recommended, making 20 per cent for the year. In addition resolutions will be submitted at the annual general meeting to implement the directors' proposals to give to the holders of the ordinary shares, one new share for every five held.

Since competition is hardening, I will not attempt to prophesy, but your directors hope to maintain the position during the current year.

BUILDING AND CIVIL ENGINEERING

Our construction company continues to progress in virile fashion.

In the field of opencast coal, we continue at a steady pace and in 1953 we produced over half a million tons.

Among other things, this country very badly needs a major road programme. We are ready to play an important part in this, and our road surfacing subsidiary will be ready to bear its share of the work.

Our woodworking company has made good progress during the year.

Building Exports: Although we secured a good volume of business during 1953, price margins were much narrower.

We played no mean part in aiding the Government to exceed its target of 300,000 houses in 1953. The easing of the licensing situation has enabled us to re-enter the market of building houses for sale and we shall take full advantage of this wherever opportunity presents itself.

If we compare the cost and value offered to our purchasers with that of similar houses built by local authorities with a subsidy, to me it would seem clear that the way to solve the housing problem is to leave it to competent free enterprise builders experienced in that field of operations.

After reviewing the company's widespread overseas interests, the statement continues: In my frequent journeys about the world, I am becoming increasingly aware of competition from continental contractors, and it is evident that they are making bids (that are being accepted) for works at prices that we know to be well below the true value of the costs.

This, in my opinion, is made possible by help from their Governments by way of tax relief or other concessions. I hope that something will be done to allow us to compete in world markets under conditions no less favourable than those enjoyed by our foreign competitors.

The report was adopted, and the dividend and bonus issue approved.

THE DAILY MIRROR NEWSPAPERS LIMITED

LIVELY PROGRESS AT HOME AND OVERSEAS

MR CECIL H. KING'S STATEMENT

The thirty-fourth annual general meeting of The Daily Mirror Newspapers Limited was held on May 28th, at the Memorial Hall, Farringdon Street, London, E.C. Mr Cecil H. King, chairman and managing director, said :

As you will have seen from the printed accounts, the Daily Mirror company's profits before taxation are down by £176,485: after taxation are up by £46,817. We recommend that the dividend remains the same as last year. The prospects are for broadly similar results next year.

Our gross revenue from newspaper sales and from advertisements was substantially larger than last year, due to increased circulation and more pages. These satisfactory factors were counterbalanced by increased costs, particularly wages. The price per ton of newsprint dropped slightly, but our consumption of it increased. We spent more on improving the paper, and the result has been an increase in sale to a point where in South-East England we outsell our leading competitor by about three to two.

In the balance sheet, machinery and plant stand at a higher figure due to the continued equipping of our Stamford Street establishment, and newsprint stocks this February are shown to have been below last year's level.

155,000 INCREASE IN SALE

For the half-year July to December 1953, compared with the same half-year in 1952, our sales increased by 155,000: the *Daily Express* gained 40,000, and the *Daily Mail, Daily Herald* and *News Chronicle* all suffered decreases. We thought the *Daily Sketch* might prove a competitor in a small way, but this has not yet been the case. The big event in the *Mirror's* year was the Coronation issue of which we printed and sold something over 7 million copies.

A little known part of our activities is the publication of an overseas edition which consists of six consecutive *Daily Mirrors* and a *Sunday Pictorial* bound together in a yellow paper cover. The sale of this publication has tended steadily upwards over the years, and is now about 125,000. It seems to be becoming a kind of international news magazine, as I have seen regular readers of the most diverse origin—a Lebanese in West Africa: a Burmese lady in Rangoon: and an Australian who had only been in this country for a very short time twenty years ago.

NEW PLANT NEARS COMPLETION

In the past year our new plant in Stamford Street near Waterloo Station has been under construction. It has had more than its share of teething trouble but we hope will be in full production some time this year. When it is complete, it will be the finest newspaper printing plant in the world. We are also discussing a printing plant in Manchester and have acquired a suitable site. No decision on this has yet been made.

As you may know, we have for some 18 months sponsored the National Youth Orchestra of Great Britain, which has given very successful concerts at the Royal Festival Hall and at the Edinburgh Festival: also recently at Birmingham, Wolverhampton and Newcastle. In pursuance of the same policy of encouraging, where suitable, cultural activity of interest and value to the youth of this country, we launched a new literary weekly, *The London Magazine*, under the distinguished editorship of Mr John Lehmann. On past experience we had anticipated a sale of 5-10,000, but the average sale of the first three issues exceeded 20,000.

'PUBLISH AND BE DAMNED!"

The editorial director of our group, Mr Hugh Cudlipp, wrote a book "Publish and Be Damned!" to commemorate the Jubilee of the founding of the *Daily Mirror*. It received, in the main, favourable reviews from all over the world. It was amusing to notice that, though it was a best seller, it was more or less ignored by the London morning press. We rather expected some fun to be had at our expense, but newspapers as widely different as the *Sunday Times* and the *Daily Express* were suddenly stricken with total blindness and failed to notice the existence of this lively and amusing best seller.

CANADIAN PROFIT OVER 50% UP

Turning to our main interests outside the *Daily Mirror*, I have to report that our subsidiary, the Anglo-Canadian Pulp and Paper Mills Limited, had a much better year and profits were, as anticipated, more than 50 per cent up on the previous 12 months. The demand for its products—newsprint, sulphite pulp and board—continues good, and profits for the current 12 months may well be somewhat better than for 1953. The main event of 1953 was the acquisition of the shares in the Dryden Paper company for a price of about $60 each, payable partly in Anglo-Canadian common shares and partly in cash, the latter being raised by the issue of $8 million worth of Anglo-Canadian preference stock. This issue was very well received by the Canadian market. The total purchase price represented about $13 million, which was a figure big in relation to the previous price of the shares but small in proportion to the replacement cost of the assets.

The importance of this deal lies in the fact that we now have a substantial stake in the kraft paper-making business and that the mill at Dryden is capable of very large expansion by using the vast timber limits that lie all around. We are very pleased with our new acquisition and are confident that in time it will make an important contribution to the profits of our group. The profits of the Dryden company will be considerably increased this year, partly owing to greater output and partly owing to better prices for its products.

PROSPECTS IN CANADA

The future of the Anglo-Canadian company largely depends on the newsprint consumption of the United States. Substantial quantities are shipped to the UK and to Canadian consumers, but the big market is the United States, where the demand for newsprint is very strong. The Dryden company, on the other hand, while exporting some kraft pulp to the United States and to this country, depends mainly on its sale of kraft paper in the Canadian market, particularly in the Prairie Provinces. The snag about the American market for kraft pulp is that it is so volatile: the trouble about the Canadian market is that it is as yet small, and so very spread out. But the foundation of any paper undertaking in Canada is an adequate supply of pulp wood and in this respect both our Canadian companies are very well endowed indeed.

In seeking to diversify and expand our activities in Canada we picked on the Dryden Paper company as the most desirable acquisition, but many other propositions were studied and in particular we have an option on some timber limits in Northern Saskatchewan. There is plenty of good wood in the area and it is likely that oil and/or natural gas will be available there before long as cheap fuel. The development of such a property would be expensive and could only be undertaken if and when market prospects are set fair.

The total borrowing powers of the Daily Mirror company and its subsidiary companies are at present limited to the amount of the issued capital of the Daily Mirror company. I think you will all agree that there should not be anything that would adversely affect the natural development of our undertakings. It is for this reason that a proposal is being put before you for an increase in the borrowing powers of your company.

INVESTMENT IN HOME MILLS

And while on the subject of paper, perhaps I should deal with our other great paper interest—Albert E. Reed and Company in which our investment has been a great and growing one for over 30 years. Firstly, I should like to say how pleased we are that Lord Cornwallis has assumed the chairmanship of Reeds. He succeeds Sir Ralph Reed, who has retired after many years of devoted service both to the company and to the paper industry. Lord Cornwallis has important connections both in Kent, where he is Lord Lieutenant, and in the City. He has been a director of Reeds for some years and I am sure will contribute greatly to the future stability and prosperity of what is now the major British paper group.

It is well known that the paper trade of recent months has been doing well, and Reeds have announced substantially increased profits for their recently ended year. In the course of the last few months they made an offer for the shares of the Thompson and Norris Manufacturing company, which offer has been accepted. The significance of this deal is that Reeds will have a still greater stake in the packaging industry, which is one of the largest and the fastest growing sections of the paper trade.

Our Reed shares are regarded as a permanent investment, but we cannot help feeling gratified to notice that the shares in that company held by your company and by the Sunday Pictorial company have appreciated in market value by over £3 million in two years. The shares had certainly been very undervalued for a long time, and we have no doubt that the present price is well justified by the financial strength of that group.

SUCCESS OF ASSOCIATED PUBLICATIONS

And now for our interests in publications. The Sunday Pictorial company has had a good year—sales are buoyant, advertising is sold well forward and its profits are up. For the six months July-December 1953, it showed a circulation increase of 244,000 over the same period of the previous year. Its lead over its immediate competitor widened from 47,000 to 233,000.

Reveille Newspapers Limited is a company that stands in our books at a modest figure and whose ownership we share with the *Sunday Pictorial*. It is making a useful contribution to our profits, and as a result of starting *Midweek Reveille*, which had an instantaneous success, it seems likely that its profits for the current year will be higher than those for last. Our interest in this company is lumped in with other unquoted trade investments in a balance sheet total of £1,052,000, and it is clear that here, too, we have a substantial inner reserve.

INTERESTS IN AUSTRALIA

Our Australian interests are two—the Argus and Australasian Limited, and our interest in commercial radio stations in New South Wales and elsewhere. These latter continue to earn increasing profits which represent a very handsome return on our investment. The Argus and Australasian company is a much larger venture and one that has given us much anxiety. However, the trend over the last year has been of increasing sales and substantially reduced losses.

The board of the Australian company has been fortunate to secure the services of Mr Colin Bednall as managing director, and I believe that with his active and expert assistance they will speed up the return of their great newspaper to its rightful place in the Australian scene.

In West Africa we can now regard our Nigerian and Gold Coast daily papers, in conjunction with our newly-launched Sunday papers, as established profit makers. In six years the *Daily Times* of Lagos has risen from a sale of 8,000 at 1d. to one of 45,000 at 2d. It now reaches all the main centres of Nigeria each morning, and is proving its value to the communities of Nigeria in these times of rapid change in West Africa.

The *Daily Graphic* of Accra was started about 3½ years ago and we had thought originally a sale of 10,000 rising to 20,000 would be satisfactory. Actually, its sale is now 43,000 at 2d. and it is firmly established as the leading newspaper in the Gold Coast. The venture can now be considered to be through the development period and has been making profits for the last six months. It would seem likely that with the growth and expanding prosperity of the Gold Coast we shall enjoy an increasingly large return on our money.

In Freetown our little paper, the *Daily Mail*, is also making very reasonable progress, the sale having come up from 1,200 to 8,000 in the eighteen months since we took over. The erection of our new building is well advanced, and the plant shipped out a few months ago is gradually being brought into use. I am afraid the period of profitability is in the future, but West Africa is developing fast, and a population of well over two million in Sierra Leone can well sustain a profitable newspaper enterprise.

NEW HEAD OFFICE PROPOSED

Immediately after the war we bought a site on Holborn for a new head office for the company. Various efforts have been made to induce us to sell the site at a handsome profit but we have now applied for a building licence. It is our hope that with our new plant in Stamford Street, our new office and printing plant in Holborn and perhaps a plant in Manchester, we shall be as well equipped as any newspaper anywhere to cope with the future.

Such a building programme would enable us to vacate both the inadequate sites, Geraldine House and Back Hill, from which at present we get a production not contemplated when these buildings were erected and equipped.

I should like to close with an expression of thanks to all the employees, both at home and abroad, whose able services have been the foundation of your company's successful year.

The report and accounts were adopted.

UNITED SERDANG (SUMATRA) RUBBER PLANTATIONS, LIMITED

RECORD CROP

SIR ERIC MILLER'S SPEECH

The annual general meeting of this company was held on May 27th in London.

Sir Eric Miller (the chairman) in the course of his speech, said: We reopened further rubber areas as labour became more readily available, and an average of 85 per cent of the planted area was in production during the year 1952-53. The resultant crop of 13,861,964 lb was the highest in the history of the company. The fact that we turned out more than 1,000 tons of sole crepe helped to improve the average price secured for our rubber. The directors are glad to be able to recommend for the third successive year a dividend of 10 per cent, less income tax.

The net current assets of the group at August 31, 1953, were approximately £680,000—equivalent to 11½d. per 2s. unit of stock, of which about 9d. is held in the United Kingdom—so that it will be seen that we are reasonably well equipped financially to follow up any real improvement in the outlook in Indonesia.

The government there has, however, still to create the conditions in which its desire to attract foreign capital to the country is likely to find any widespread response. It remains to be seen what effect their decision to exempt enterprises established in 1954 or later from liability to the new 66⅔ per cent levy on profit and similar remittances will have. We feel that such unfair discrimination will be untenable in the long run.

In the first eight months of our current financial year our crop of palm-oil was much the same as in the corresponding period of the previous year. Our rubber crops were, however, down by about 5 per cent due to unfavourable weather, latex stealing and, above all, to the most unsatisfactory behaviour of the labourers on some of our estates where deliberate "go-slow" tactics have been pressed by subversive elements.

ATTITUDE OF LABOUR

North Sumatra possesses soil and climatic conditions which compare favourably with other parts of S.E. Asia, but it is suffering acutely from the present attitude and demands of labour. Those, like ourselves, who have done much to develop the economy of the territory naturally deplore the damaging effect of communist infiltrators amongst the workers who, had they been left to follow their natural instincts, would give much better service for the good wages they draw in cash and kind. Likewise it grieves one to see the deterioration which has overtaken the economy of Indonesia, where reserves are rapidly vanishing whilst Governmental indebtedness mounts with alarming speed.

Another Study Group Meeting has been held from which nothing particularly helpful has emerged beyond recording the narrowing margin between estimated production and consumption of natural rubber and synthetics. Today is the date by which bids have to be lodged for such of the synthetic production facilities now owned by the US Government as private enterprise may wish to acquire, but it will be some time yet before the natural rubber industry can take the measure of the competition it will have to face in the future.

The report was adopted.

BRIXTON ESTATE

The annual general meeting of Brixton Estate Limited was held on June 1st in London, Lt-Col Sir Francis Humphrys, GCMG, GCVO, the chairman, presiding.

The following is an extract from his circulated statement:

Properties: Small additions have been made to some of our properties, including improvements during reinstatement under War Damage.

Gross Income: Shows an increase of £10,300 to £146,871, and net profit, subject to tax, has risen by £6,728 to £92,318.

Net Revenue: Of this profit of £92,318, taxation takes £50,908, or over 11s. in the £, leaving a net revenue of £41,409, an increase of £5,297 over the net revenue for 1952.

Bonus Issue: During the year a bonus issue was made by issuing one new ordinary share for every three shares held.

War Damage Repairs: The reinstatement of the Office Block at our Brixton property was completed during 1953 and it is now producing revenue.

The final work under War Damage at our Brixton property should be completed during the coming twelve months.

Future Prospects: The easing of building licences should have a beneficial effect on the activities of our associated company. It is hoped that this will in due course be reflected in the increased dividends received from it.

Dividend on Ordinary Shares: Two interim dividends amounting to 15 per cent, less tax, have already been paid on £150,000 of capital, and a final dividend of 10 per cent, less tax, is now recommended on the increased ordinary capital of £200,000.

The report was adopted.

M. F. NORTH LIMITED

The forty-second annual general meeting of M. F. North Limited was held on May 31st, in London, Mr C. W. Black, JP, MP (the chairman), presiding. The following is an extract from his circulated statement:

The company's hotels enjoyed their share of the additional business which came to London by reason of the Coronation, although, as usually proves to be the case when special events of this nature take place in London, there was a compensating recession in business for periods both before and after the peak demand. Taking the year as a whole, the total receipts of the company showed a small increase over the figure for the previous year, but this was offset by additional expenditure incurred for the purpose of Coronation festivities, and also by abnormal expenditure on repairs and renewals which happened to fall due this year.

Profit on trading shows a small decline from £84,880 in 1952 to £82,947 in 1953. The amount available for taxation, reserves, and dividends amounted to £72,206, as compared with £72,590 a year ago. Your directors recommend a final dividend of 11 per cent, making 18 per cent, less income tax, for the year which represents a modest improvement as compared with previous years.

We join in the general and profound regret that it has not yet been found possible to lessen further the burden of purchase tax which falls very heavily upon our industry and by increasing the expense of hotel operation has prevented the more rapid introduction of many developments and improvements which we all desire.

Your directors face the future with confidence, and see no reason why the business of the company's hotels should not be satisfactorily maintained. The report was adopted.

NATIONAL BANK OF NEW ZEALAND

FURTHER STEADY GROWTH OF BUSINESS

SIR SYDNEY PARKES ON INDUSTRIAL CONDITIONS

The annual general meeting of The National Bank of New Zealand will be held on July 1st, in London.

The following are extracts from the circulated statement of the chairman, Sir Sydney Parkes, CBE:

In presenting the accounts for the year ended March 31, 1954, I am able to report further steady growth in the bank's business, which can be regarded as the normal development we should expect now that the exceptional factors causing heavy fluctuations in our figures last year have ceased to operate. On turning to the balance sheet you will see that deposit and current accounts at £54,572,000 show an increase of nearly £4 million. Bills payable and other liabilities at £4,603,000 show little change. On the other side of the balance sheet our liquid assets stand at £26,832,000, equal to 45 per cent of the total liabilities. Investments at £6,314,000 show an increase of £3,148,000 over the figure last year. This change is due mainly to an investment in State Advances Corporation Bonds, guaranteed by the New Zealand Government, maturing in seven years. For some time now the trading banks have been unable to invest in New Zealand Government Securities so we welcome this opportunity of investing some of our liquid funds in this way. Advances at £29,415,000 are less than last year by nearly a million pounds.

The net profit brought in after providing for taxation is £213,227, being a small decrease on the previous year. The fall in profits is chiefly attributable to a drop in the average of our lending which is greater than is reflected in the actual advance figures at the end of the last two years. It will be remembered that in the early part of the year 1952-53 our advances were unusually high in financing the heavy volume of imports during the short period that import restrictions had been lifted. Another factor influencing the profits is the continuous growth of staff costs and running expenses, which have trebled in the past eight years.

ALLOCATIONS

In dealing with the profit of £213,227, the sum of £100,000 has been allocated to contingency account and an interim dividend of 3 per cent actual, less United Kingdom income tax at 9s. in the £ was paid in January last. The directors now recommend for your approval a final dividend of 7 per cent actual, less United Kingdom income tax at 9s. in the £, making a total of 10 per cent for the year and leaving an increased amount of £135,620 to be carried forward to next year's account.

During recent years we have followed a very conservative policy in our distribution of profits so as to build up the inner reserves of the bank. It is felt that these have now reached a point where we can justifiably recommend to you the payment of a higher dividend. Also, we considered it desirable to strengthen the general reserve by the transfer of £500,000 from the contingency account so that our published reserve fund now totals £2 million and equals the amount of the paid-up capital.

During the year there has been a good increase in the number of customers on our books. New branches have been opened at Matamata and Te Puke and the agency at Tokoroa was converted into a branch. We now have 132 branches and agencies and we are constantly on the look-out for opportunities of new development.

PRIMARY INDUSTRIES

In most places of the Dominion the spring was wet and cold but the summer has been dry with drought conditions prevailing throughout the greater part of the North and South Islands. Although these conditions are not favourable to the dairy industry, it is unlikely that there will be any substantial drop in the output this season. The quantity of butter and cheese purchased for export up to February 28th was 195,600 tons, a reduction of 11,800 tons on the quantity for the same period last year. The United Kingdom Ministry of Food agreed to a price increase for this season's butter and cheese of approximately 3¾ per cent in terms of the bulk buying contract.

Export killings of meat for the first six months of the current season were 218,000 tons, an increase of 29,000 tons on the first half of last year. Schedule prices for lambs were adjusted to encourage early killing which accounted for a part of the increase, but the dry season also forced farmers who were short of feed to send some of their stock to the freezing works, and as a result mainly of this latter factor total killings for the season will be higher than last year. Before 1939 the Dominion had developed a large export trade for chilled beef, but wartime food rationing and the bulk buying of meat brought this trade to an end, all beef having then to be exported in frozen form. The return to free marketing will provide a stimulus to the export of chilled beef, and it is pleasing to learn that the shipments which have already been made to the United Kingdom on a trial basis have arrived in excellent condition and have been well reported on by the meat trade.

Wool prices have been remarkably steady during the whole of the season, with the level slightly higher than last year. In some quarters the price of wool is still considered to be too high and it may be that producers will have to face lower values in the future. There has again been a gratifying increase in the quantity of wool produced and whilst this is mainly derived from a higher sheep population it has also been assisted by research work and improved methods of animal husbandry which have resulted in a heavier and better fleece.

Wheat sowings for this season are estimated at 110,000 acres compared with 139,000 acres for 1952-53 which will mean that substantial quantities of Australian wheat will have to be imported for local consumption.

BULK BUYING CONTRACTS

The bulk buying contracts between the United Kingdom Ministry of Food and the New Zealand Government for meat and dairy produce provide for discussions between the parties to the contracts. It has been mutually decided to cancel the meat contract as from the end of September next, but no decision has yet been made concerning the contract for dairy produce. The different meat companies in the Dominion are reviving their connections in the United Kingdom so as to provide suitable means for the disposal of their products when these come to be sold on a free market through normal trade channels.

The Government have done much in recent years to promote the growth of primary production and, largely as a result of their enterprise and encouragement, approximately 40,000 acres of new land are being brought into production each year. In addition to that, scientific research, aerial top dressing and other measures designed to improve production have increased the output of existing farms. The standard of living in the Dominion is dependent on the total of its export income from primary produce which in turn depends on the volume exported and the prices obtained. There has not been a free market for butter, cheese and meat in Great Britain for many years, so there must be some uncertainty about the future of export yields until the market has been tested under conditions of freedom. If there were a material fall in world prices, which might easily be the case, it would create a difficult problem of readjustment in the high and rigid cost structure now prevailing in New Zealand.

GENERAL TRADING AND INDUSTRIAL CONDITIONS

The Dominion's net overseas funds have increased from £101.9 million at the end of March, 1953, to £129 million at the end of March, 1954. The return of overseas receipts and payments issued by the reserve bank for the calendar year 1953 showed a surplus of receipts of £26 million against a deficit of £23 million the previous year. Control of imports (except motor vehicles which are subject to a special arrangement) is still maintained by the system whereby a basic allocation of overseas exchange, representing a percentage of the 1950 importations, is granted to importers; applications in excess of the basic figure being considered individually on their merits. This system has worked smoothly but it is hoped that economic conditions will soon permit the removal of exchange restrictions.

The total advances of the trading banks at March, 1954, were £149.5 million against a total of £141 million the previous year—a striking fall from the figure of £187 million at the end of March, 1952. The Reserve Bank continues to exercise control over trading bank loans for certain purposes and this policy, together with the quantitative control being exercised through the reserve ratios, should minimise the inflationary effects which could follow further increases in the total of trading bank advances in New Zealand.

Public issues of capital are still subject to the approval of the Capital Issues Committee which may have the effect of keeping private capital investment below the level it would otherwise reach. On the other hand, local authorities have experienced little difficulty in obtaining their requirements in the market. During the year the Government made an internal issue, in two parts, of £30 million 3¾ per cent 1953 National Development Loan, repayable 1962, issued at 98½ showing a yield of £3 19s. per cent, being an increase of 19s. per cent over the last loan in 1951. The State Advances Corporation recently increased the rate of interest for new loans on existing houses by ¼ per cent but the rate for mortgages on new houses remains unaltered. Apart from this increase there has been no material change in the rate of interest on mortgage loans and no alteration in the rates on savings bank deposits. There has been no change in the trading banks' interest rates for deposits and the minimum and maximum overdraft rates remain unaltered.

In April of this year the Reserve Bank announced an increase in its re-discount rate from 1½ per cent to 3½ per cent. The rate had stood at 1½ per cent since July, 1941. As the Reserve Bank pointed out when the change was announced, the raising of "bank rate" does not carry the same implications in New Zealand as it does in London or in other countries where highly developed money markets exist. It is, however, significant to the extent that it appears to be a declaration by the Reserve Bank of the belief that higher interest rates are appropriate to the conditions ruling in the Dominion at the present time.

CONTINUED UPWARD TREND IN PRICES AND COSTS

New Zealand's secondary industries continue to expand, additional factories are being established and existing plants extended. When the statistics for 1953 are available it is expected they will show that the total output and the value of the goods produced will exceed those of any previous year. Retail trade has been satisfactory with a higher turnover, stocks being in plentiful supply. There have been no major strikes or labour stoppages during the year; but the easing in the labour market which I reported last year did not continue for long and labour in general, but particularly in the skilled occupations, is at present difficult to obtain. This shortage of labour and the continued upward trend in prices and costs reflect the inflationary pressure still existing in the Dominion, which should be curbed as quickly as possible. Despite the difficulties involved in restricting Government expenditure in an expanding economy, it seems clear that every effort must be made to avoid inflation by confining Government spending within the limits of total Government receipts from all sources. The emergence of a deficit in the public finances would clearly aggravate the inflationary tendencies which already exist and which received a further pronounced impetus during the past year from the general wage increase granted by the Arbitration Court. This increase in wages had the effect of raising internal prices, which in turn must tend to provoke further wage demands. It is clear that this situation contains the threat of a never-ending spiral of rising wages and prices, and it is to be hoped that some other method will be found of dealing with the situation.

In September last, a milestone was passed in the utilisation of the Dominion's exotic forests. The large kraft pulp and paper mill established by New Zealand Forest Products Limited, at Kinleith, came into production and a continuous flow of kraft pulp and paper is being supplied to New Zealand and Australian markets. For the calendar year 1954, it is expected that 17,500 tons of paper and 26,000 tons of pulp will be manufactured, in addition to the company's large output of timber and timber products. Work is also being pushed ahead vigorously on the erection of the large newsprint and pulp mill of the Tasman Pulp and Paper Company Limited, and the new town of Kawerau, which is being built to house the staff and workers of the mill, is rapidly taking shape. It is expected that the mill will be in operation in the early months of 1955. A New Zealand Government Loan of £10 million has been raised in London to cover part of the cost of the mill, machinery and other equipment, and arrangements have been made with the Export-Import Bank for a loan of $16 million to cover the cost of equipment required for the project from dollar sources. Local expenditure is meanwhile being covered mainly by loans from the Government but it is intended to repay a large proportion of these loans later by a public issue of debentures and shares at a suitable time.

LIMMER AND TRINIDAD LAKE ASPHALT

A RECORD FOR OVER 80 YEARS

The eighty-second annual general meeting of The Limmer and Trinidad Lake Asphalt Company, Limited, will be held on June 25th in London.

The following is an extract from the circulated statement by the chairman, The Rt Hon Lord Courtauld-Thomson, KBE, CB.

The year under review has been one of the most successful in all our long history and is a record from every point of view.

For many years there has been a consistent trend of improvement in our trading profit. This year there has been an increase of £100,000 over the previous year in our trading profit and investment income, bringing the figure to close on £550,000. This is due to an increase in our turnover.

Our trading profit is largely whittled down by taxation. We make no special complaint about this. We do, however, most strongly resent that the Government should collect in petrol and other motor and road taxation £1 million a day, and out of this £365 million annual collection for road taxation they have, in the last few years, only ploughed back little more than £30 million a year.

Apart from its road work the company is, of course, actively engaged in the building industry, where asphalt is extensively used for roofs, floors and dampcourses. In addition, we lay decorative flooring in other materials, and on this side of our business the results were extremely satisfactory.

Having regard to our strong financial position we feel justified in looking forward to the future with confidence and hope.

RUBBER PLANTATIONS INVESTMENT TRUST

The forty-fifth annual general meeting of the Rubber Plantations Investment Trust, Limited will be held on June 23rd in London.

The following is an extract from the circulated address of the chairman, Sir Eric Macfadyen:

The book cost of the Trust's investments at March 31, 1954, was £1,874,290, comparing with £1,822,280 a year ago. Mainly as a result of advantageous changes in the portfolio and improvement in its value, the market valuation of all investments came within £263,038 of book cost—an appreciably better experience than the previous year's when the depreciation was £488,388. The actual break-up value of the 2s. stock unit, at the date of the accounts, was 2s. 0½d.

The year's revenue was £129,471 which is reduced by £56,739 on account of taxation to £72,732; including the balance brought forward from the last accounts, £142,491, and after providing for the expenses of the Trust, we have £215,223 in all available. We transfer £50,000 to general reserve and we recommend the payment of a dividend of 7 per cent, which will cost £66,550 net. The balance to be carried forward will then be £98,673.

The Trust's holdings afford a representative cross section of plantation investments; rubber, tea, coffee, vegetable oils, fibres, etc., but particularly rubber and tea. We all know that the profits of the rubber and tea industries are subject to wide fluctuations, which necessarily have their effect upon the results of a Trust mainly interested in these commodities. With the object of levelling out to some extent these fluctuations by a more flexible investment policy the directors intend to include in the portfolio, in future, a greater proportion of non-plantation shares, on their investment merits, than hitherto.

GUARDIAN ASSURANCE COMPANY LIMITED

ANNUAL GENERAL MEETING—2nd JUNE, 1954.

Chairman— The Rt. Hon. Lord Blackford, D.S.O., D.L., J.P.

Extracts from the Directors' Report.

LIFE DEPARTMENT.

Net new sums assured amounted to £8,661,312 being a slight reduction on the previous year. Immediate Annuities were issued in consideration of Single premiums of £1,117,853 and Deferred Annuities for single premiums of £307,529 and annual premiums of £60,250.

The net rate of interest earned on the fund was £4.3.6% and the fund increased during the year to £23,635,639.

REDEMPTION ASSURANCE ACCOUNT.

A valuation at the end of the year revealed a surplus of £36,931 of which £25,000 has been transferred to Profit and Loss. The fund at the end of the year after the transfer was £3,673,996.

FIRE DEPARTMENT.

The net premium income increased during the year by £142,019 to £4,486,954. The loss ratio was 42.6% and after providing for unexpired risks on the usual 50% basis the surplus transferred to Profit and Loss was £648,830.

ACCIDENT AND GENERAL DEPARTMENTS.

The net premium income increased during the year by £591,381 to £5,227,172. The loss ratio was 50.6% against 55% in 1953 and after providing for unexpired risks on the usual 45% basis the surplus transferred to Profit and Loss was £545,387.

MARINE DEPARTMENT.

The net premiums amounted to £1,411,756 against £1,508,917 in the previous year. After a transfer of £210,779 to Profit and Loss the Marine Fund was £1,920,969 representing 136.1% of the premium income.

PROFIT AND LOSS.

After making full provision for taxation, including that on the Profit for the year and after transferring £400,000 to General Reserve and providing for the increased final dividend recommended by the Directors of 3/6d., less Income Tax (3/- in 1953) on each ordinary share and meeting the cost of the Preference Dividend for the year the balance carried forward was £367,283.

BALANCE SHEET.

The total assets of the Company and its subsidiaries increased during the year by £5,508,863 to £48,405,603.

ALL THE PRINCIPAL CLASSES OF INSURANCE TRANSACTED.
The Company undertakes the office of Trustee, Executor and Administrator.

Head Office: 68 KING WILLIAM STREET, LONDON, E.C.4.

CAMMELL LAIRD & COMPANY, LIMITED

SATISFACTORY YEAR DESPITE CONTINUING DIFFICULTIES

CAPITAL DIVIDEND AND SCRIP BONUS ISSUE

MODERNISATION AND DEVELOPMENT OF BIRKENHEAD SHIPYARD

MR J. C. MATHER ON NEED FOR INDUSTRIAL STABILITY

The ninetieth annual general meeting of Cammell Laird & Company, Limited, was held on June 2nd at Birkenhead, Mr J. C. Mather, JP, the chairman, presiding.

The following is the chairman's statement, which had been circulated with the report and accounts: During the year Sir Archibald Boyd, who has been associated with your company throughout his business career and for the last twenty years has been managing director of Metropolitan-Cammell Carriage and Wagon Company, Limited, was appointed to the board and will come before you for re-election.

A resolution will also be submitted for the election to the board of Mr E. Bernard Jones, who is retiring on June 30th after more than 50 years' service with the company. Mr Bernard Jones commenced his service as an apprentice with Laird Brothers, and, after holding various appointments, has been secretary, chief accountant and a local director since 1943.

Mr P. J. T. Macaulay, one of our leading engine draughtsmen, was awarded the BEM in the Coronation Honours List, and I am sure you will share our pleasure at this recognition of his services in connection with our Admiralty work.

In spite of continuing difficulties, we have again had a satisfactory year, and I would like to pay tribute to all those who have worked together to produce these results, the managing director, the management, staff and workpeople.

BALANCE SHEET

Dealing first with the assets shown in the balance sheet, you will note that the book value of our fixed assets is £113,000 higher than a year ago, additions less realisations being £224,789 and depreciation £111,740.

The increase of £40,000 in trade investments represents further and final calls on our interest in the two Tugs to which I referred last year.

Under current assets, stock-in-trade and work-in-progress show an increase of nearly £4½ million, chiefly accounted for by long term contracts: against this, instalments received are £3 million higher, making the net increase about £1½ million.

Our investments have been kept under constant review and changes have been made from time to time which, in the opinion of your board, have resulted in greater strength and flexibility and, incidentally, produced a book profit of £38,000. You will note that the market value of these investments on December 31, 1953, was £280,000 in excess of their book value.

RESERVES

Considerable progress has been made with the plans for the modernisation and development of the shipyard at Birkenhead to which I referred last year. The new welding bay is now in full production and a start will be made on the construction of a new drydock for large tankers as soon as the scheme has been approved by the authorities concerned. An extensive programme of reconstruction is essential to maintain the yard in a competitive position and further plans are receiving careful consideration.

In regard to the re-acquisition of an interest in the English Steel Corporation, to which I referred last year, I am very disappointed that I am again unable to tell you anything more definite than that negotiations with the Realisation Agency are still proceeding.

After allowing for all foreseeable commitments, your board is now satisfied that approximately £2 million of our reserves are surplus to requirements and it is therefore proposed to distribute 2s. 6d. per ordinary stock unit as a capital dividend.

Your board feels that the issued capital should be brought more into line with the capital employed in the business and subject to the consent of HM Treasury a scrip bonus issue of one 5s. share for every two ordinary stock units held, will be proposed at the annual general meeting.

The various changes in the reserves necessary to implement these proposals are explained in Note 1 to the accounts. Capital reserve has been closed, partly by transferring to capital bonus reserve the sum of £1,606,238, which with the profit on sale of securities (£38,347) and a transfer of £130,415 from general reserve, provides the sum of £1,775,000 required for the proposed scrip bonus issue. The remainder of capital reserve (£4,110,303) has been transferred to capital profit reserve, against which the proposed capital dividend of 2s. 6d. per ordinary stock unit has been charged. The payment of this capital dividend involves a profits tax charge of £355,000 (20 per cent) which has been debited to general reserve. Resolutions will be submitted at the annual general meeting to cover these proposals.

It gives your board satisfaction to be able to take this further step towards restoring the loss which shareholders suffered when the capital reconstruction took place in 1932.

PROFIT AND LOSS ACCOUNT

Trading profit is £53,000 higher at £1,142,473 after taking into account the same amount of profit on work-in-progress as last year. Income from investments is down by £35,000, mainly due to realisation of securities.

After allowing for an increase in taxation of £24,000, the net profit brought into appropriation account is only slightly higher than last year, but net profit applicable to previous years, amounting to £220,000, can now be brought into account. Adding £184,693 brought forward from 1952, and deducting the interim dividend, the available total is £966,334, and your board's recommendations for the allocation of this sum are contained in the directors' report. The dividend for the year is maintained at 15 per cent by the payment of a final dividend of 10 per cent but it is proposed that a special bonus of 4 per cent free of tax should be paid from the additional profit mentioned above. £250,000 is being transferred to capital reserve for increased replacement costs of fixed assets and £185,415 to general reserve, bringing the total of that reserve to £1,850,000.

METROPOLITAN-CAMMELL CARRIAGE AND WAGON COMPANY, LIMITED

The Metropolitan-Cammell Carriage and Wagon Company, Limited, started the year with a record order book and also achieved a new record in deliveries from their railway rolling stock factories. This was largely attributable to the greater supplies of steel which became available to enable the level of employment and greater productive efficiency to be maintained, particularly during the latter part of the year.

Over 70 per cent of the value of output was against export orders, including passenger coaches for South Africa, Rhodesia, Ceylon and Egypt. Large numbers of wagons also were shipped to Commonwealth countries and to Argentina. A new development was the completion of ten diesel electric locomotives for the New South Wales Government Railways. Whilst all these overseas railways' requirements were being fulfilled over 200 new standard steel coaches and 2,500 wagons were delivered to British Railways.

However, the value of orders received during the year was appreciably lower than the total of deliveries. This reduction in balance reflected the combined effects of a falling off in inquiries owing to decreased purchasing power, and intensified competition from European and other overseas manufacturers who have been quoting low prices and early deliveries and have also offered extended credits. Since these highly competitive conditions will continue, greater productive effort to reduce costs and further Government assistance in provision of credit facilities will be necessary to retain overseas markets.

Included in the company's production programme for the present year are a number of coaches of light alloy construction for the East African Railways, and many more passenger vehicles and freight wagons for that and other overseas territories. Manufacture of coaches and large numbers of wagons for British Railways will also continue.

In its 'bus building factory, the company completed two large contracts for "Olympic" vehicles for Argentina and continued production against contracts for 'bus bodies for London Transport Executive and other operators in this country. Following the fulfilment of the heavy postwar renewal programmes of most large public transport operators, there has been a considerable falling off in new orders. The company, however, secured a substantial share of the reduced volume of work obtainable at home and is hoping to obtain further overseas orders, though here again competition is very keen.

BIRKENHEAD SHIPYARDS

At our shipyards here in Birkenhead 1953 has proved another busy year for all departments. We launched eight ships totalling 61,750 gross tons and delivered nine ships totalling 71,973 gross tons. The main propelling machinery and boiler installations for the ships represented by this tonnage have, in the majority of cases, been built here in our works.

In addition to these merchant ship contracts your company has been busily engaged on important ship, engine, and boiler construction for the Royal Navy, and I am pleased to report that HM aircraft-carrier *Ark Royal* will shortly be undergoing builders' sea trials.

Our shiprepairing department has dealt with 152 ships during the year, and the contracts undertaken included the re-preparation of the s.s. *Gothic* for the Royal Tour, and two extensive refit jobs for the Royal Navy.

Since my last report I am pleased to say that there has been a great improvement in steel supplies, which we hope will be maintained, and this, coupled with the new welding bay, should enable us to speed up our output.

Since the Second World War we have found it difficult to obtain certain classes of skilled employees, and this is, to some extent, due to the creation of new demands for labour from additional industries that have been established in fairly close proximity to our works.

At the end of the year our order book included 14 tankers, one ore carrier, one first-class passenger/cargo liner, one passenger ship, three insulated fruit ships, one bulk sugar carrier, nine general cargo vessels and work on hand for the Admiralty. Although this programme means steady employment for about two years, we must not be complacent about the future, as we now have to compete for fewer orders in the face of extremely keen competition. During the past year we received orders for five new ships, whereas we delivered, as I have previously mentioned, nine ships.

What our industry needs is stability in order to encourage shipowners to place orders for new ships, and the unstable conditions created by continual wage demands, spasmodic strikes, bans on overtime, and trade demarcation disputes may well result eventually in empty slipways and unemployment. This can be avoided if we each pull our full weight in the task of achieving speedier and more economic production.

The report and accounts were adopted and the dividends, as recommended, were approved.

The retiring directors, Sir Archibald J. Boyd, Mr J. C. Mather, JP, and Mr F. O. John, MICE, were re-elected, and the appointment of Mr E. Bernard Jones, OBE, as a director, was confirmed.

The remuneration of the auditors, Messrs Cooper Brothers and Company, was fixed.

The special capital dividend was approved, and, the consent of HM Treasury having been obtained, the bonus issue proposals were sanctioned. The proceedings terminated with a hearty vote of thanks to the chairman, directors and staff.

B.E.T. OMNIBUS SERVICES LIMITED

MR J. S. WILLS ON PARTNERSHIP BETWEEN PRIVATE ENTERPRISE AND THE STATE

The twelfth annual general meeting of B.E.T. Omnibus Services Limited was held on May 27th, Mr. J. S. Wills, MInstT, chairman of the company, presiding.

After dealing with the report and accounts, the chairman said:

Before I refer generally to the year under review, I think I should tell you that your company's interests, hitherto confined to the passenger road transport industry in this country, have recently been extended to include an interest in passenger road transport overseas by the acquisition of a substantial, but not controlling, interest in the African Transport Company Limited, which is the parent company of a group of omnibus companies operating in Central and East Africa. This interest has been acquired on terms which will, I think, prove to be satisfactory to your company.

NEW HIGH LEVEL OF COSTS

Concerning affairs at home, I am afraid I must continue the sad but now familiar story—a new high level of costs.

Labour and fuel costs are, as you know, the two principal elements in bus operating costs and they have been primarily responsible for the enormous increases which we have had to meet during the past few years. I mentioned last year large wage increases awarded in September, 1952. Since then we have had two more. The direct result of these increases is bound to be applications to the various Licensing Authorities for permission to increase bus fares, which applications, I may add, are no more popular with the industry than they are with the travelling public.

FUEL TAX

The Chancellor of the Exchequer missed a splendid opportunity in this year's budget to halt this apparently continuous process by providing for a reduction of the fuel tax, about which I have said so much during the last few years. His decision came as a great disappointment, for earlier this year he had reduced the tax on a number of luxury goods, and it was generally and confidently expected by the industry that he would now at least reduce the 2½ per cent tax on fuel oil; the latter is surely very far removed from the luxury class, yet it is apparently taxed on the basis of what our American friends might call a luxury "super-colossal." Strangely enough, this enormous tax on fuel oil is not even shared equally amongst consumers. The road users, who consume less than 20 per cent, pay the tax for all.

This major inequity, to which I referred last year, has been recently underlined by the announcement of plans for the extension of the use of diesel-powered trains by our competitors, British Railways. It is all to the public good that our competitors should take whatever steps they can to operate more economically but it seems a somewhat Gilbertian situation—I am putting it mildly—that they should be able to do so by the extended use of a source of power which is tax free to them and subject to a tax of over 200 per cent to us. The complete abolition of the tax would best suit passengers.

SEARCH FOR GREATER EFFICIENCY

The constant search for greater efficiency and economy in bus operation has continued. New types of engines, new methods of vehicle construction, larger but lighter-weight buses, new methods of maintenance and new materials and devices of many kinds are constantly being tried. An example of an interesting device recently adopted is a new type of electrically-operated exhaust brake from which, apart from improved braking efficiency, considerable benefits are hoped for in improved tyre life and reduced maintenance and docking costs. But let no one think that this search for greater economy and efficiency was prompted by the imposition of a penal fuel tax—it has been going on since the internal combustion engine replaced the horse as the motive power of the omnibus and it cannot be expected to produce, as if by magic, the answer to the fuel tax. That rests entirely with the Chancellor of the Exchequer, and there is still time for him to produce it, if he will, before this year's Finance Bill reaches the Statute Book.

PRIVATE ENTERPRISE AND THE STATE

I concluded my address last year with some observations on the position of the provincial bus industry in the light of the relevant provisions of the Transport Act of 1947 and the amending provisions of the Transport Act of 1953. It is a matter of paramount importance, not to any particular section or sections of the community, but to the community as a whole. The question really is how the industry shall in future be owned and controlled and what shall be its relationship with the state-owned railways. The present position, which arose from the 1947 Transport Act, is that in large areas of the country road and rail passenger transport is under common ownership and control—that of the British Transport Commission. For the reasons which I mentioned last year, I do not think this is a position which ought to continue. The Report of the Thesiger Committee, appointed to review the working of the licensing system, confirms my misgivings. On the subject of the control of passenger road transport undertakings by the British Transport Commission, the Committee found, as a fact, that where the Commission's bus companies operated services in competition with the railways and there was no independent operator, the control of such competition, previously exercised by the Licensing Authorities, had largely passed to the Commission. This is surely contrary to the whole spirit of the 1953 Act.

I made special reference last year to the position of our underlying omnibus companies in which, since 1929, there had existed a road-rail partnership through joint control by this company and its predecessor on the one hand and the British Transport Commission and its predecessors, the former railway companies, on the other. This year sees the twenty-fifth anniversary of the inception of that partnership, and I think it cannot be gainsaid that, throughout the years, the system has worked smoothly and harmoniously. It should be noted that on January 1, 1948, the railways companies' interests in our companies became vested in the British Transport Commission, so that the partnership which started as one between road and rail has, since 1948, become one essentially between private enterprise and the state.

INTRUSION OF PARTY POLITICS

The only disturbing influence during the whole history of the partnership has been the intrusion into the transport industry of party political dogma. Up to the passing of the 1947 Act our railway partners, like ourselves, fought hard against the threatened nationalisation of their undertakings; after

that time, those who were left suppressed their personal convictions and loyally served their new masters.

The 1947 Act did not, however, nationalise road passenger transport; it merely provided that road passenger transport could be nationalised in certain specified circumstances; further, it gave a form of extra-legal power to the British Transport Commission to indulge in unrestricted competition on the roads with existing operators. It gives me great pleasure publicly to pay tribute to Lord Hurcomb, the former chairman of the British Transport Commission, and to his colleagues for the statesmanlike way in which they dealt with this part of their tasks. First, they acknowledged the right of the partnership companies to defend themselves against nationalisation by all the means available to them under the 1947 Act; they agreed that the mere fact that the Commission owned up to half the shares in a company could not properly be used to prevent it from fighting for its existence. Secondly, they decided it would not be right for them to use their powers of unrestricted competition. In both these decisions they were supported by Mr Barnes, the Socialist Minister of Transport, for whom, for these and other reasons, we always had considerable respect.

CONSERVATIVE PARTY'S PLEDGE

At the beginning of 1949 and several times subsequently the Conservative Party publicly pledged themselves to denationalise any road passenger transport undertakings which might become nationalised, pledges which gave an undoubted stimulus to the resistance which was later to prove so successful. In their Transport Act of 1953 they took powers to fulfil these pledges, and there are now some forty omnibus companies, in the ownership of the British Transport Commission, which fall to be dealt with. It is now up to the Government to use the powers they have taken.

During the seven years since the passing of the 1947 Nationalisation Act there have inevitably been occasions on which we and our partners have found it somewhat difficult to reconcile our duties to our varying masters and owners and to each other. Yet it is remarkable how very few those occasions have been, how very rarely we have "trodden on one another's toes"! A partnership which can successfully withstand such stresses is not lightly to be disturbed. It is a partnership, as I have said previously, between private enterprise and the state. Is there not a great deal to be said for a wide extension of this principle?

The report and accounts were adopted.

THE UNITED SUA BETONG RUBBER ESTATES

NATURAL RUBBER'S INCREASING ABILITY TO COMPETE WITH SYNTHETIC PRODUCT

SIR JOHN HAY ON RESEARCH EXPENDITURE

The forty-fifth annual general meeting of The United Sua Betong Rubber Estates, Limited, will be held on June 9th at 19 Fenchurch Street, London, E.C.3.

The following is an extract from the statement by the chairman, Sir John Hay:

It is appropriate that on the eve of the termination of General Sir Gerald Templer's office as High Commissioner for Malaya we should be able to report a definite advance in the progress towards the suppression of lawlessness and violence. His timely appointment was made little more than two years ago. The energy and resourcefulness with which he dealt with a complex and seemingly intractable problem did much to re-establish a then too rapidly declining confidence. Through our operations in Johore we are only too painfully familiar with the continuance of disturbance in that State. We are nonetheless grateful for what has been accomplished in other states, and we hope very much that those who succeed General Templer on the military side will, with the co-operation of the civil authorities, carry to a successful conclusion the difficult task which he has so far performed.

The drama of recent events in the neighbouring country of Indo-China has produced a greater awareness of the threat to the freedom and security of South East Asia from the spread of Communist aggression. None of the countries within that territory is strong enough in itself to resist successfully any large-scale attack. Only the free powers acting together could afford effective protection. Whatever may be the outcome of the Geneva conference it is much to be hoped that some agreement between the free powers in that sense will be reached, the existence of which would almost certainly ensure a curtailment of hostilities and a re-establishment of confidence in neighbouring territories. Given these conditions, the task of dealing with disorders in its own territory should be one which could be discharged effectively by the Malayan Government.

ACCOUNTS

The heavy decline which took place in the price of rubber during 1953 resulted in a fall of over £440,000 in the sale proceeds of our main crop although in volume it was greater than that of the preceding year. Happily, we are able to show a profit which reflects no such decline. The contributing factors to this satisfactory result were a substantial saving in estate expenditure, a turnover in our tea operations from loss to profit and a refund of replanting cess collected from us over the period July, 1952, to September, 1953. This cess is even and regular in its collection by Government: in its return it is irregular and uneven, thus incidentally distorting or disguising the fluctuations in our fortunes which are such a notorious feature of the rubber industry. Perhaps I should make the point that our profits are struck only after making provision for replanting, which in this instance amounts to £118,000. Although this is not customary throughout the industry, we are of the opinion that it is a proper and correct charge before the exact ascertainment of profit.

We are taking the occasion of the forthcoming annual general meeting to submit resolutions for a capital adjustment involving the issue to stockholders of one new fully paid share for each £2 stock now held. This is a course unusual in a company so largely identified with an industry whose fortunes are so precarious, but the circumstances of this particular company are in many respects unusual. Although our issued capital is expressed as £900,000, much of it was raised at a premium and the actual capital subscribed in cash was nearer to the figure of £2 million. Moreover, it has been our well-established custom to plough back into the business quite a considerable proportion of such profits as we have been able to retain. During the comparatively short period from 1948 to 1953 we have placed to reserves over £1,250,000 and the actual capital now engaged in the business is in excess of £3 million. If perchance we followed the course of putting replacement values on our estates and their equipment that sum would be very much greater. When the capital has been increased in the manner proposed, without taking any account of our liquid assets and investments our planted properties will stand in at £36 per acre, a mere fraction of replacement cost. In all these circumstances, we feel that the proposal now being made represents a modest and prudent step in capital adjustment.

It is my duty to emphasise the warning given in the directors' report, namely, that this operation carries with it no undertaking regarding future dividends. These must depend, as formerly, on our earnings and our financial position in relation to our commitments, but stockholders are entitled to derive such encouragement as they may from the fact that our revenue from rubber is supplemented by the proceeds of a not insignificant tea crop and the dividends we hope to continue to receive from our shareholding in Oil Palms of Malaya, Limited.

After reviewing the company's domestic affairs, Sir John Hay continued:

SYNTHETIC RUBBER AND SUBSTITUTES

We have become only too familiar with large-scale production of synthetic rubber in the USA and Canada. The spring announcements which were made on three successive days in March last of the planning and erection of three new plants in this country for the production of synthetic rubber and rubber substitutes served to emphasise that the trends in this direction were not to be limited to particular territories. Although we do well to heed the warning implicit in these announcements the natural rubber producer need not be too discouraged. At the present level of price natural rubber has exhibited an increased ability to compete with the synthetic product. Whereas for the year 1953 the consumption of synthetic was running at the rate of 59 per cent and natural at 41 per cent, the division between the two products is now almost exactly equal. The new plants to be erected in this country are of modest dimensions. Present plans will not materialise into production for some time yet and, even then, the volume will not be such as to be of much significance in the larger context of world production. But the comfort which may be fairly derived from these facts should not induce complacency. For the natural rubber producer there can be no relief from a continual striving for greater efficiency. We are likely to be helped in the realisation of that aim through the medium of

RESEARCH

In some quarters, however, research is being represented as a *deus ex machina* who will only emerge to perform his miracles on the payment of an arbitrarily specified sum. This emotional approach is singularly unsuited to a subject which calls for a strictly objective outlook, for cool and sober judgment in the choice of a programme, for expertness in its execution and for an integrity of mind in the diligent pursuit of knowledge. Monies devoted to research are raised mainly through the medium of a cess enforced by Government on exports of rubber, and research activities are carried on by institutes or associations located in Malaya and London. There is also a variety of forms of activity operating under the euphemism of "development." The expenditure so incurred over the period 1949/53 was over 30 million Malayan dollars—a not inconsiderable sum. Supplementing such institutional activities, research work is carried on by companies or groups of companies and financed out of their own resources. It is important that private enterprise of this enlightened character should be encouraged. Its existence acts as a spur to the endeavours of the central institutions and a check on their findings. In the realm of productive research probably the greatest progress has been made in the field of genetics, and it is significant that in that field private enterprise, relying only on its own limited means, has at least equalled the findings of the institutions, with their greater financial resources.

Attempts have been made to compare expenditure on research by the natural rubber producer with what is alleged to be spent by the rubber manufacturers of America. No informed person would seek to deny the high technical efficiency of the latter or their enlightened and progressive outlook, but the comparisons that have been made have little validity and less of the exactitude which should rightly appertain to a scientific subject. Recently, however, there has been one authoritative statement made regarding American expenditure on research. It was to the effect that as from July 1st of the current year some 4 million American dollars were being set aside for research on and development of synthetic rubber. On the basis of last year's output of synthetic rubber this would be the equivalent of .67 of a Malayan cent per lb. Far from being in excess of the rate of expenditure incurred by a company such as this, in its incidence it is actually less, despite the fact that the synthetic rubber industry, in contrast to the excessively taxed natural rubber industry, enjoys the privileged position of having at its disposal profits which are not made subject to any tax whatsoever.

Members of the board of this company are firm believers in research and are convinced of the need for its continual pursuit. My colleague, Sir Andrew McFadyean, was chairman of the committee which reported in favour of the establishment of the Rubber Producers' Research Association, and each of us continues to have some responsibility for the direction of research in different spheres. We do not believe, however, that research should be freed from financial controls which must necessarily be exercised over all expenditure if extravagance and waste are to be avoided. Experience has by now surely demonstrated that expenditure incurred on some of the items in the diversified and varied programmes adopted by the institutions and associations is not likely to be fruitful and might well be terminated in favour of some practical and more promising lines of research. With such adjustments and with the exercise of an effective financial control the view might well be accepted that the very considerable sums now being collected should be ample to meet all the costs of a well-planned, expertly executed programme of research. Efficiency in natural rubber production must in the ultimate end be expressed in lower costs. It would be ironic indeed if research, which should be the aid towards that end, should operate to an opposite conclusion. I am aware that expenditure on research is a subject which is now under examination and I should have been content to await the outcome of that were it not that there have been attempts from certain quarters to prejudge the issue.

SUNDAY PICTORIAL NEWSPAPERS (1920) LIMITED

A PROSPEROUS YEAR

MR CECIL H. KING REVIEWS THE BACKGROUND SCENE

The thirty-fourth annual general meeting of Sunday Pictorial Newspapers (1920) Limited was held on May 28th, at the Memorial Hall, Farringdon Street, London, E.C. Mr Cecil H. King, chairman and managing director, said:

The past year has been one of prosperity for your company and for nearly all its associated companies. As you have seen from the accounts, the trading profit increased and the dividend income decreased. Net profits before taxation at £895,951 were £109,526 up, and an increase of 2½ per cent in the final dividend is recommended. Factors which helped the satisfactory trading result included some reduction in the price of newsprint, and an increase in the advertisement revenue. But salaries, wages and pension payments increased, distribution costs went up, and we spent more on editorial matter and publicity. The main change in the balance sheet lies in the reduction of liquid resources to a more normal level and the increase in trade investments. You will recall our intention, of which I spoke last year, to invest some part of these resources.

FLOURISHING CIRCULATION

The circulation of the *Sunday Pictorial* is flourishing. For the second half of last year, our average sale of 5,373,000 showed an increase of 244,000 over the second half of the previous year. No other national Sunday newspaper had an increase of more than 58,000.

Our great associated newspaper, the *Daily Mirror*, has been doing well. Its circulation remains the largest of any daily newspaper in the world, and during last year the margin of its lead over the *Daily Express* increased to nearly half a million.

Reveille, of which your company and the Daily Mirror company share the ownership, continued its remarkable circulation climb last year without being seriously inconvenienced by the competition of its imitators, and its profits increased.

OVERSEAS INTERESTS

The chain of Australian commercial radio stations in which your company has an interest is proving profitable, and the overseas publishing interests are making progress. The largest of them, the Argus and Australasian company in Melbourne, is still losing money, but the rate of loss has already been substantially reduced, and energetic steps continue to be taken to improve the position. The undertakings in Nigeria and the Gold Coast have been through a period of development during which new Sunday newspapers have been successfully launched, and both companies are making a useful profit. The newspaper in Sierra Leone is in its infancy, and steady profits are still some way off.

Apart from publishing activities at home and abroad, the main investments of your company are in the paper and pulp industry. Here also all is going well. The Anglo-Canadian Pulp and Paper Mills company of Quebec ended last year with an increase of over 50 per cent in net profits, and has acquired an important stake in the kraft paper industry. At home, the Albert E. Reed company has announced increased profits for its recently ended year, and that company is also expanding into new fields. You may well feel satisfied with the prospects which these investments hold.

HOW NEWSPAPERS ARE FARING

The circulations of the Sunday newspapers generally are very healthy. There are 11 national Sunday newspapers. Of these six, including yours, have been doing well in recent years and only two have been slipping badly. The daily newspaper field has a different story to tell. Of eight national dailies, two, the *Daily Mirror* and the *Daily Telegraph*, have been doing really well: while four have been losing circulation, some of them heavily.

In spite of some talk of the need for new daily newspapers in London, the figures over the last few years suggest the exact opposite, that there are two Sunday newspapers and anything up to four dailies that have been finding life difficult.

OUTBURST OF COMPETITIONS

In Fleet Street we saw before the war frenzied competition in every field except the journalistic one—and this in spite of the fact that improvement of the product has always been far cheaper than expensive free gifts, free insurance or canvassing. Now the rules of the rationing committee do not permit of these prewar excesses, so we have seen an outburst of competitions. It may be that we shall decide to invade this field, too, in a big way. But it will probably be better to watch our competitors fritter away their money while we devote our attentions to the quality of our papers.

During the past year there did seem room for another edition of *Reveille*, which was accordingly launched in February. It was very well received by the public, and from the outset made a worthwhile contribution to our profits. This type of paper was our own invention, but it has since attracted imitators who have had a fair measure of success. However, our sales are enormously greater than those of our competitors.

NEWSPRINT RATIONING

It is likely that in the year 1955 newsprint rationing will come to an end. While some newspapers have been pressing for this for a long time, others have not. The different attitude is in part due to the fact that larger papers tend to be more profitable to newspapers with small sales, but less profitable to newspapers with large sales. If we were today to print larger papers, with our immense sales, we might make less money.

It is also possible that if all newspapers printed more pages the total sales would fall. The whole outlook is rather fluid. At present, with rationing, some newspapers, and perhaps some magazines, are carrying advertising that has overflowed from other more worthwhile media, that cannot carry all the business they are offered.

COMMERCIAL TELEVISION

There is also the possible effect of commercial television. Last year it seemed that the Government intended to introduce commercial TV in a reasonably workable form and so enable viewers to see something less dreary than the BBC programmes. However, it now appears that the Government is more afraid of Lord Halifax and his friends than of its own back-benchers, and has retreated step by step into a position where the initial losses of commercial TV are likely to be as great as ever, but the chances of subsequently recovering those losses have become more and more problematical.

The whole story has been a shocking one of ignorance and cowardice. We might still intervene in this field, but recently the outlook has not been an encouraging one.

If, however, commercial TV does develop vigorously, then it is bound to have some repercussion on newspaper advertisement revenues—particularly the revenues of the weaker newspapers.

PRINTING IN COLOUR

Another development which may lie ahead is colour. Colour in daily and Sunday newspapers is nothing new, and has been used regularly in some American papers. We have ourselves pioneered with it in Australia. It is expensive, and the plant needed for printing an appreciable amount of colour in the *Sunday Pictorial* would be formidable. Furthermore, it slows up the production of the paper to an extent which can be serious. Some papers in this country have played with colour, but the results have so far been damaging to the appearance of the paper.

As it is generally known, our papers are only printed in London, while our competitors print in Manchester as well, and some of them in Scotland too. Some of them have substantial sales in the Republic of Ireland where we do not circulate. We are unlikely to be satisfied with this position indefinitely, and may well decide to compete on equal terms with our contemporaries both in Northern England and elsewhere. Our present printing arrangements are economical, but leave us rather vulnerable to really serious competition which, so far, we have not had to encounter.

HIGH RATES OF PAY

The cost of production of a London newspaper has risen enormously and is still rising. This is partly due to wages and salaries which, compared with those in other home industries, are very high.

An editor in Fleet Street today can command anything up to £7,500 per annum and in some cases beyond; cartoonists have always been a specially favoured group and in the last 30 years several have been in the £5,000-£10,000 a year class. An important editorial executive on a national newspaper commands between £2,500 and £4,500, and a reporter or sub-editor not infrequently earns £1,250 or £1,500. Executives in other departments enjoy comparable terms. The gross weekly earnings, including overtime, of our machine managers are around £20, of oilers in our machine room around £18 10s., of our compositors from £16 to £27 10s.

On the one hand these figures mean that the bad old days of sweated industry in Fleet Street are no longer even a memory, but on the other hand they remind us of newspapers that cannot stand such a pace and have ceased publication. Further casualties, the result of the present high cost of production, can be anticipated.

TRAINING OF JOURNALISTS

In the case of the journalists, who are the most important people on a newspaper, the great recruiting ground for Fleet Street is the provincial press, where initial training is now being developed on a more systematic basis. It still seems to be true that journalists are born, not made, but organised training may help to develop natural flair where it exists.

In our newspaper we continue to employ the cream of the profession. In Geraldine House there is always room for young men and women of promise—and there is plenty of room at the top for anyone who looks like making the grade.

THE PROVINCIAL PRESS

The holier-than-thou press has continued its sniping at the gayer and more successful end of the business. The Press Council has now reduced itself to a minor joke. The provincial press continues to maintain that it has some undefined quality which renders it superior to its London contemporaries. Actually, the provincial newspapers, which were galvanised into some sort of temporary life by the Northcliffe Newspaper competition which began in the twenties, have now subsided into an uninspired drabness relieved only by the *Manchester Guardian*. It is to be hoped, in the interests of the press generally, that this newspaper will push forward with its plans to invade seriously the South of England.

FUTURE OUTLOOK

It is hard to be very informative about the future. At present everything seems set fair for your company and we have no reason to anticipate any reduction in profits in the coming year. But it is quite possible that competition will become tougher, and if it does we shall doubtless be involved in some expense in keeping our competitors in their place.

In conclusion, I would like to pay a warm tribute to the staff of your company, who, by their skill and hard work, have contributed so much to the successful results obtained.

The report and accounts were adopted.

THE BURY FELT MANUFACTURING COMPANY

ALL FACTORIES FULLY EMPLOYED

LT-COL A. BUCKLEY ON COMPETITIVE CONDITIONS

The forty-ninth annual general meeting of The Bury Felt Manufacturing Company, Limited, was held on June 3rd in Manchester, Lt-Col A. Buckley, CBE, DSO, JP (the chairman), presiding.

The following is his circulated statement: The trading profit of the group for the year ended December 31, 1953, amounts to £284,394, to which must be added investment income and sundry credits totalling £9,269. After charging directors' and auditors' remuneration £9,709, depreciation and development £23,112 (of which £20,000 is credited to reserve account as in previous years) and providing £143,882 for taxation, there remains a net profit of £116,960 as against £101,740 for 1952.

The balance brought forward on profit and loss account £147,841 together with the net profit for the year and £3,500 credited in respect of over-provision for taxation, provides an available balance of £268,301. Your directors recommend that £50,000 be transferred to general reserve and £2,000 set aside to augment the staff pension scheme. Capitalisation of £100,000 from stock depreciation reserve has been effected during the year, and your directors recommend that a dividend of 1s. 9d. per share, less income tax at 9s., be paid on the doubled ordinary capital against 3s. 3d. per share on the original ordinary capital for the previous year.

Your subsidary companies have made satisfactory profits, and a substantial dividend has been received from one of them. The results of the manufacturing subsidiary company have justified the investment, and that company continues to be well and efficiently managed.

Revenue reserves (excluding the reserve for future taxation) and surplus on profit and loss account carried forward total £631,883.

SATISFACTORY LIQUID POSITION

The liquid position is again satisfactory. Investments, tax reserve certificates and cash aggregate £683,873 compared with £654,510 a year ago.

Shareholders may feel that the substantial figure representing liquid assets is not fully employed in the business. It should be borne in mind, however, that no less than £316,768 is outstanding for present and future taxation. During the year, your directors have investigated several proposals which might have led to the remunerative employment of surplus liquid assets but none of these has been proceeded with.

The past year has been one of exceptionally severe competition, both in the home and overseas markets and your directors see no immediate prospect of any alleviation in this situation.

NEED FOR REDUCTION IN MANUFACTURING COSTS

All the company's factories continue to be fully employed. The paramount requirement today is for a reduction in manufacturing costs. Since the end of 1953, wages rates have again increased. Since 1946, coal prices have increased by approximately 45 per cent, electricity charges by 75 per cent and transport costs by 35 per cent.

The very wide field of industrial and domestic purposes for which felts are produced calls for the extensive use of specialised machinery much of which has been evolved and developed by your company. With its resources, your company should remain in the forefront of the industry and whilst its results must be affected by world conditions there appears to be reasonable hope that a not unsatisfactory year's trading during 1954 may be anticipated.

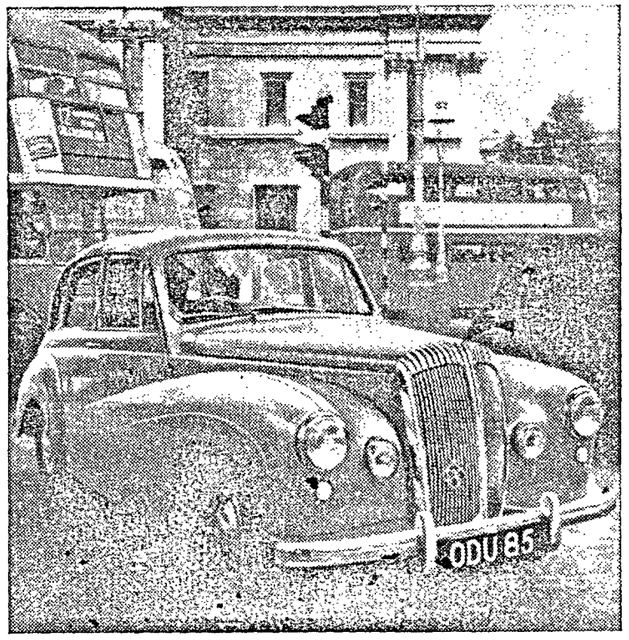
The experience and ability of the staff and employees calls for our continued appreciation.

The report and accounts were adopted.

Two outstanding cars . . .

THAT ARE BRINGING OWNERS A NEW

AND THRILLING ASPECT OF MOTORING



For detailed brochures on either of these exciting models and the address of your nearest dealer, write today to Bureau 58, The Daimler Company Ltd, Coventry.

by Daimler

BY APPOINTMENT
The Daimler Co. Limited, Motor Car Manufacturers to the late King George VI

Have you driven the Conquest or the 'Conquest Century' yet? If not, you are missing a really memorable experience. Acceleration is breath-taking. Handling, thanks to preselector fluid transmission, is the easiest you've ever known. Note how these cars corner—no roll, no sway—that's *laminated* torsion bar suspension. What you'll notice later on is the economy achieved by automatic chassis lubrication and that great petrol-saving feature—water-heated induction.

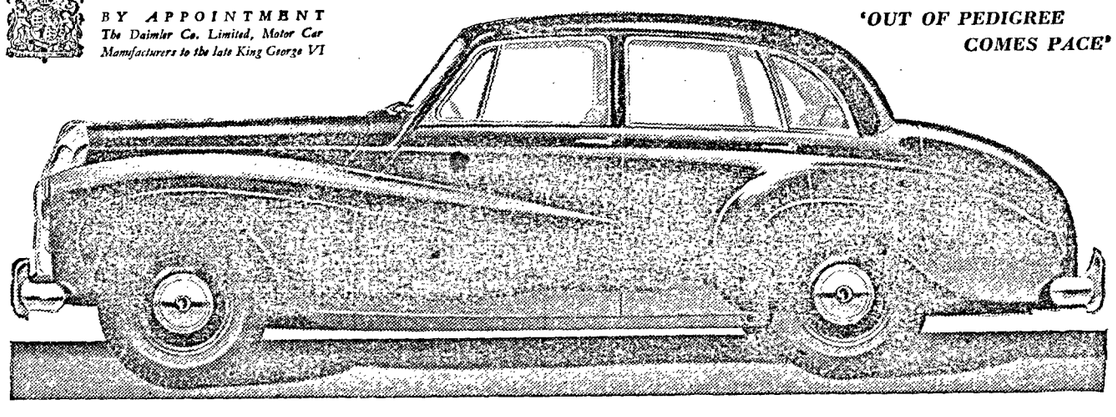
CONQUEST Saloon

The 6-cylinder O.H.V. engine develops 75 b.h.p. Over 80 m.p.h. Acceleration 0-60 in 20.4 secs. through the gears, and 10-30 in 9.7 secs. in top. Petrol from 26.5 m.p.g. at 30 to 21 m.p.g. at 60 (*Autocar* & *Motor* road test reports). Price £1066 plus £445.5.10 purchase tax.

'CONQUEST CENTURY'

The 'Century' has a special series 100 b.h.p. engine with twin carburettors. Acceleration is remarkable—60 from a standing start in 16.3 secs.! Other modifications include bigger brakes; new instrument panel with rev. counter; telescopic adjustable steering; improved seating and more leg room in rear; foam rubber upholstery; two suitcases specially designed to fit large luggage boot and included in the basic price of £1172 plus £489.9.2 purchase tax.

'OUT OF PEDIGREE COMES PACE'



THE TEN GREATEST NOVELISTS IN THE WORLD...

who are they?

A notable new series for THE SUNDAY TIMES by

SOMERSET MAUGHAM

What does Somerset Maugham, the great novelist, think of other great novelists — of Dickens and Jane Austen, of Tolstoy, Balzac and the others?

Now we know. Maugham has put it all down.

Maugham on the art of fiction is a *literary event*—wise and witty and full of that inspired commonsense which endears him to old and young alike.

Younger readers—and their elders—will find this great work, product of Maugham's long experience as novelist and critic, a balanced, brilliant, and far-ranging commentary on literature and life.

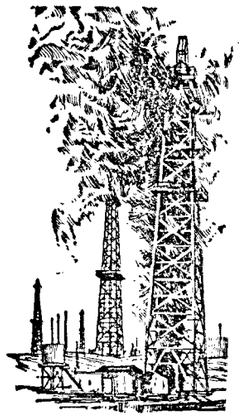
The series begins on Sunday, June 13, in the

SUNDAY TIMES

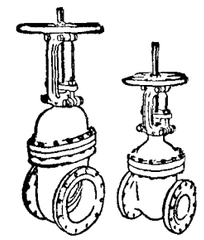
Glenfield Control

IN THE

OIL INDUSTRY



Oil valves, which control in all stages of its preparation and distribution a product that has become indispensable to man, are designed to meet conditions which are probably the most severe of any industry and accordingly a very high standard is set.



A.S.A. Class 150. A.S.A. Class 300 TO B.S.S. 1414/1949

Innumerable "Glenfield" Sluice Valves for oil are controlling the flow of oil in pipe-lines, in boosting pumping stations, in refineries and to storage tanks.

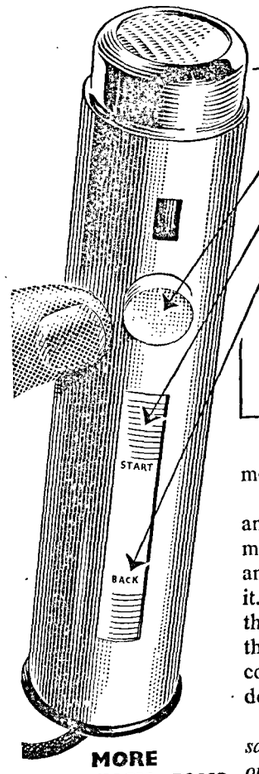
See the NEW TAPE-RITER

with finger-tip microphone control!



DICTATION QUICK AS THOUGHT!

1 PRESS TO RECORD

2 PRESS TO START OR STOP

3 PRESS TO RECAP

This remarkable new microphone puts all controls at your fingertips. Three simple movements control all dictation, correction and listening back.

Here is a revolutionary development in dictating machine design.

You can sit, stand, walk about—and still dictate. Or have the microphone right at your elbow and dictate whenever you feel like it. There is no need ever to touch the Tape-Riter during dictation; the microphone switches give you complete control, complete freedom to concentrate.

With the new Tape-Riter you can save up to 40% of the time you spend on paper-work; increase your secretary's output by up to 60%. These are facts you can hardly afford to ignore.

MORE EFFICIENCY - PLUS FEATURES

- ★ Quick-change, time-saving tape cartridge
- ★ 30 minutes recording on each tape
- ★ Crystal-clear voice reproduction
- ★ Forward/back-spacing footswitch for typists
- ★ Long-life tape can be used repeatedly

Crawen for Civic honour's

SIR JAMES BARRIE considered that a tin of Craven Tobacco was a far greater award than the freedom of the city. In 'My Lady Nicotine' he said:

"It is a Tobacco that should only be smoked by our greatest men. Were we to present a tin of it to our national heroes, instead of the freedom of the city, they would probably thank us more."

Craven Tobacco is unstinting in its service—mellow, slow-burning, deeply satisfying. Try it—every pipeful will honour you with smoking riches.

Obtainable in three fine blends

Craven Mixture 4/7 oz.
Craven Empire de luxe Mixture 4/3 oz.
Craven Empire Curly Cut 4/4 oz.

JUST AS GOOD IN 1994

You can say the same about the wood in your project if you specify Monsanto "Penta" preservatives now!

Termites hate "penta"!

If you're building, fencing or using wood in any way in *tropical* territories—or exporting goods in wood/fibreboard containers — remember to specify Monsanto "penta"! It ensures immunity from termites, saves you from costly damage and replacements.

Wood is good; it pays to protect it for the future and the Monsanto "Penta" group of preservatives can play a leading role in its preservation. They are particularly suitable for all new timber chosen for precision fabrications and long service; building joinery, vehicle bodies, wooden jigs and patterns, permanent fencing, etc. For timber already in service they counter insect attack and protect against dry rot which, alone, costs the country over £20,000,000 a year.

"Penta", the short name for pentachlorophenol, is supplied to formulators and trade users, and is produced by Monsanto in several forms, namely . . .

PERMASAN* No. 1 Monsanto's own oil solution, ready for application.
PERMASAN No. 2 Quick-drying version.
PERMASAN No. 116 New, water-repellent version.
SANTOPHEN* 20 Basic ingredient (pentachlorophenol), for solution in oil by bulk users and formulators; chemically stable, involatile, virtually insoluble in water.

"Penta", in all its forms, gives protection against dry rot, powder-post beetle, furniture beetles, long-horned beetles, etc. It is easy to apply to whole timbers by immersion or by brush or spray to wood already in service. Wood treated with "penta" is clean, unstained, does not require re-seasoning and can be painted or puttied. *Used in bulk, "penta" is cheaper and better than other comparable material!*

(*Registered Trade Mark)

"Penta" is one of Monsanto's wide range of chemicals and plastics for industry. If you have an industrial problem which chemicals might help you solve—get in touch with Monsanto today!

Next Step for Sterling

THE signs are multiplying that the Government's generalised aspirations to make sterling convertible when it proves possible are maturing into a definite intention to do so by or before next spring. There will be a meeting of European finance ministers in London next month, at which Mr Butler will be able to co-ordinate his plans with Germany and other European countries that are also eager to take the plunge. Then, in September, Mr Butler is likely to go to Washington for the annual meetings of the International Monetary Fund and the World Bank, and he will be able to discuss matters there with the Americans and with most of the finance ministers of the sterling Commonwealth. Thereafter, action may follow quickly. Or it may be delayed until or about the time that the next British budget is presented in April, 1955.

This, at any rate, is the present current of expectation in the City. The prospect is being greeted there with enthusiasm and excitement; the City assumes that, once convertibility is achieved, the road will lie open towards the cherished aim of virtually total abolition of Britain's crippling system of exchange control. The enthusiasm may be sensible, but the atmosphere in which it is being generated is not. Sterling convertibility would be only one step, and a rather narrowly technical step, towards the abolition of exchange control. Other and alternative steps—such as the removal of further import quotas and the freeing of the travel allowance—might be partially delayed thereby. It is against this technical background that convertibility needs to be examined. What exactly would it mean, and what advantages or dangers would it bring with it?

Initially, it may seem that sterling convertibility would not mean very much to very many people. The initial aim is apparently only what is called "non-resident convertibility," that is to say, a state of affairs in which non-residents (and that means foreigners resident outside the sterling area) will, in general, be allowed to convert into dollars any sterling that they earn in the future by current trade. Even for foreigners, almost every word in this definition has a restrictive significance, and for the ordinary citizens of this country, the move will have no direct effect at all; they will continue to be hemmed in by the same exchange and import restrictions as they suffer today. This sort of convertibility will also have no direct effect on British trade with America and other dollar countries; Americans who earn sterling are, of course, allowed to turn it into dollars already. It will have no direct effect on British trade with the countries of the sterling Commonwealth; they will continue to be allowed to buy dollars from the common pool in London when they want to, but will also continue to maintain a voluntary check on dollar spending in roughly the same way that Britain does. The only direct advantage from "non-resident convertibility" will accrue to the forty-odd countries of the so-called transferable account area—countries in Western Europe, southern South America, behind the Iron Curtain, and a few other countries

such as Japan. At present these countries can turn the sterling that they earn into dollars only through a series of illegal or semi-legal manœuvres and markets. After convertibility they will be able to use their sterling to buy dollars from the central pool in London, openly and above board.

The indirect consequences of the advance, however, should be much greater than this bare recital of technique would suggest. They deserve careful consideration before Britain takes the plunge. In the first place, convertibility will mean that foreign purchases from Britain and the rest of the sterling area will include just as great a "hard currency element" as imports from the dollar area; each pound that foreigners spend will then appear as a straight alternative to spending 2.80 dollars in the United States. There must be many goods that are bought from Britain instead of from the United States today precisely because they do not yet contain this "hard currency element"; and Britain must therefore expect that convertibility will waft a fresh wind of competition across its export trade.

★

Secondly, convertibility is likely to have some effect on foreigners' willingness to hold sterling. At first sight, since convertibility will be a sign of confidence, it may seem that this effect should be favourable. But, at the moment, foreigners hold sterling rather than dollars for one of three main reasons: because they are forced to do so by British exchange controls; or because interest rates are higher here than in New York and there is confidence that the sterling exchange rate will be maintained; or because foreigners need to hold a working balance in the currency in which nearly half the world's trade is transacted. The first of these three reasons will be largely washed away by convertibility. If there was widespread fear about the strains to which convertibility might subject Britain, and if British exports suffered as a result of their new hard currency element, the second and third reasons would also become less strong.

Another effect of convertibility would be the jettisoning of the various payments mechanisms that have been built up during the era of widespread inconvertibility, of which the most important is the European Payments Union. There is a temptation for some economists to exaggerate this point; when a man who has been a cripple for fifteen long years tries to walk upright, one's first thought should not be that this is a waste of his present serviceable pair of crutches. But the EPU has had useful by-products: it has provided a framework within which European countries have felt able to reduce their restrictions on imports from one another, and some of the weaker members would be harshly hit by the sudden withdrawal of the credit facilities associated with it. Arrangements should be made to continue these advantages, in some form, if convertibility is to sweep EPU away.

The final point that the British authorities should bear in mind before they attempt "convertibility for non-residents" is the most important of all. Sterling's marriage with freedom would have to be for better for worse, in sickness and in health, and not merely until the next crisis or the next Socialist government do them part. It is generally agreed that non-resident convertibility would not lead to sudden catastrophe so long as sterling stays as robust as it is now. But it is highly probable that in some future years sterling will look less robust: the terms of trade may turn adverse, or an American recession may shrivel up markets abroad, or inflation in Britain may get out of hand again. At an earlier stage, a substantial liberalisation of American import policies was laid down as one of the essential conditions for a move towards sterling convertibility. It is now quite clear that there is not going to be any liberalisation in America; but the condition appears to have been dropped. Has the Treasury perhaps been so over-impressed by the present strength of sterling that it is tending to dismiss the possibility of exchange difficulties ever again arising? That would be very foolish. Yet whenever misfortune or mismanagement of this sort has arisen in the past, foreigners have fled from sterling into dollars; and convertibility would mean that this flight would become much easier, and much more costly to the British reserves, than it has been before.

★

The British Government's plans presumably provide for bulwarks against such misfortunes. There are hopes of "stand-by" lines of dollar credit from the International Monetary Fund and (possibly) from the American Federal Reserve System, rumours of resort to a fluctuating exchange rate, and perhaps even an acceptance of the need for tougher internal economic policies in Britain and the sterling dominions in times of emergency. But before the Government attempts convertibility it should make very sure that these defences are strong enough; in fact, it would even be wise to try to inject some bipartisanship into the policy, to try to persuade its potential Socialist successors in Britain (as well, of course, as the dominion governments of many different political hues) to agree that the line can and should be held. If such approaches show that convertibility is likely to be an object of political controversy, and still more if it remains an object of economic controversy among the Government's expert advisers themselves, then delay may serve the country better than determination. For if ever any suspicion arose that any British government was likely to run away from convertibility, there would be a wild stampede of foreigners trying to turn their sterling into dollars while they still had time. Any such stampede would leave the currency and the economy in a much sorrier state than before the experiment was tried.

Nor is this a simple matter of giving a promise (the Labour Government gave it just after the war), and sticking to it. To maintain convertibility year in and year out means pursuing policies of financial self-restraint and economic vigour all the time. Hurried expedients at the last minute, when convertibility was seen to be endangered, even if they were pursued with the utmost good faith, might well be useless. Are promises by political parties not to be extravagant or unwise very reliable?

There is a danger that this may have seemed a crabbing and discouraging article. It has not been meant to be. Of course, since sterling is strong, the British Government should be encouraged to go forward as fast as prudence will allow. Of course, non-resident convertibility—and, still more, an advance towards the complete abolition of exchange control—would be a magnificently worthwhile achievement; it would bring with it those advantages of international division of labour and freer worldwide competition which economists should always recall and politicians should never forget. But this article has also sought to recall that there are many technical problems still to be solved; and politicians should not forget these either.

Above all, convertibility ought not to become a political catchword. At the moment, some politicians and officials seem not to mind how small the relaxation of exchange control is, so long as this word, with all its emotional associations of freedom and strength and achievement, can be applied. Might it not be prudent to adopt the contrary policy, to advance as far and as fast towards decontrol as circumstances allow, but to delay tying on the label "convertibility," or making any binding promises, until it is certain that they can be performed? For the label is significant in itself for only one reason: the reason that it is a label, that it marks a stage on what should be a steady and testing advance towards freedom and declares that from it there can be no retreat. There is all the difference in the world between the confidence that one is now fit enough to assault the last ridge to the peak of Everest, and an undertaking to pitch a permanent camp and live there. And it is this undertaking that will need to be given if convertibility is to be achieved.

American Aid to India

TOO little attention has been paid to Mr Dulles's brave stand last Saturday on the question of American relations with India. Testifying before the Senate Foreign Relations Committee on the mutual security programme, the Secretary of State came out in full support of a large slice of economic aid for India. He insisted that this help ought to be given whatever the disagreements on foreign policy between Washington and Delhi. It should be remembered, he said, "that among free nations there is room for diversity of views . . . [to] continue help . . . [is to] serve our enlightened self-interest." Some of Mr Dulles's recent statements about events in Asia have not increased his prestige, either at home or abroad; and many of his countrymen are scarcely likely to welcome his throwing an arm round the shoulder of a country they feel is letting them down. But the Secretary of State is right and they are wrong. For, however exasperating the Indian attitude in international matters may sometimes be, no settlement in South East Asia that ignored it would have much chance of success.

Those who have had experience of direct dealings with the Russians over the past decade, from the period before Yalta to the present day, have learned the hard way about Soviet aims and Soviet tactics. They have learned that appeasement pays no more than it did with Nazi Germany. In Asia, too, there was evidence only this week of the Communists' view that "he who is not for us is against us," when they refused at Geneva to admit that India or any other non-Communist power could be regarded as a neutral for the purpose of supervising an Indo-Chinese agreement. In the West, however, there have been two results of the experience with the Russians, one good and one bad. The good has been to bring a far greater unity and resolution to western diplomacy than it would otherwise have had. The bad has been to encourage in some quarters, particularly in the United States, an equally dogmatic assumption that to refuse to take sides in the global quarrel is in fact to play the Communist game.

If Communist ambition is to be held in check without war, a course must be steered somewhere between these two attitudes. An attempt must be made, that is, to avoid demanding from the free world a spurious diplomatic unity without any genuine basis of public support, but also to discourage neutrals who are obvious Communist targets from adopting head-in-the-sand policies which lead in the end to disaster. This problem is at its most acute in Asia. There Communism is not regarded as the menace that it is held to be in Europe; it sometimes appears to offer solutions to economic anxieties that are far more pressing than any concern about the loss of individual freedom. Indeed, many Asians feel that they have almost no freedom to lose. To them the issue of the age is the end of imperialism, not the advance of Communism.

★

In this complex of emotions and fears, the Indian and American attitudes constitute the outstanding examples of their own school of thinking. To many an Indian the Americans really are imperialists of a new kind, who seek to perpetuate in Asia the superior attitude of the white man; and nothing will convince him that the United States has itself gone through an

agonizing revolution of thought in moving from an all-embracing anti-colonialism to an all-embracing anti-Communism. The fact that the shift has been caused by facing reality is lost on the Indian, just as the American for his part fails to see that his own realism has not carried him quite far enough towards appreciating Asia's real feelings. The result is that he tends to favour policies of forceful intervention which themselves run a serious risk of promoting Communism, the very thing that he seeks to avoid. To many a citizen of the United States, on the other hand, the Indians are hopelessly lost in a sea of wishful thinking which is a danger to others as well as themselves.

At Geneva, Mr Eden has committed Britain to a policy which may be defined in this context as trying to wait for the Indians without losing touch with the Americans. If it is possible, this is obviously right. But it would be foolish not to ask what hope the Foreign Secretary really has of carrying with him some at least of the Colombo powers—India, Pakistan, Burma, Indonesia and Ceylon—into the period after the conference is over, whether it succeeds or fails. Admittedly, public opinion in Britain demands a sincere and determined effort to make a success of the Geneva conference, with or without their support. But the desire not to drive the Asian members of the Commonwealth off in dudgeon also runs very deep in London, even if there is not always agreement with their views. Seen from Britain, Mr Nehru often looks wrong in his interpretation of Communist ambitions and his assessment of Communist power. It is, however, a case of "I disagree with what you say, but I shall defend to the death your right to say it."

★

The fact is that the Indian attitude to the problem of containing Communism is changing in the right direction, but remains in practice naïve. Delhi is still dominated by the belief that, if once a cease-fire could be obtained in Indo-China, the main danger would come not from Russian or Chinese-sponsored aggression but from the Asian countries' own poverty and lack of true independence. Consequently, Indian policy is based on the intense desire for peace. Peace is essential for the development of the country's own five-year plan; and it is assumed that, unless something can be done to raise living standards both in India itself and among its neighbours, Communism will grow spontaneously. In reality, this is only half the picture. The Indian belief was shared by many in the West until experience had dispelled it. The truth, as Communist tactics have shown, is that hand-in-hand with internal unrest goes pressure from outside, and that neither half of the problem can be treated alone.

In no quarter have Indian views changed more decisively than over China. Delhi is still as anxious as ever to remain on the closest possible terms with Peking, and rightly so. But the Indian mission in the Chinese capital no longer has the ear of Mao Tse-tung or Chou En-lai, and in Delhi itself the experience of dealing with the Chinese over Tibet, in Korea, and along the north eastern frontiers has led to a new note of wary watchfulness. China has begun to give India the experience the West has long had with Russia.

To say that bluntly, however, is neither to crow nor to criticise. For Britain it is a vital factor in assessing the wisdom of risking a misunderstanding in the United States in order to achieve Asian support for stabilising the situation in Indo-China. Although the Communists will always try to exploit weakness and the countries of southern Asia are militarily weak, there can be no hope of success from any attempt to impose a solution from outside. Asia's problem cannot be solved without Asia itself; President Eisenhower has recently said as much. This being so, it is fortunate that the chances of moving forward in step with India are in fact improving, however slowly. It was for his growing recognition of this essential fact that Mr Dulles, in the overheated atmosphere of Washington, deserved most credit when he so strongly recommended American aid to India.

Her Majesty at Sydenham

This day Her Majesty will grace by her presence the opening of the Crystal Palace at Sydenham. With the most attentive regard to the welfare of her people, she is to sanction the inauguration of a splendid structure devoted to their permanent instruction and amusement. There is, however, nothing that can be called national, nothing governmental, nothing appertaining to the functions of the state, which she can be called on to preside over, but a commercial speculation of a private company, which calculates, and we hope not without good reason, on making money, by providing for the rational amusement of the multitude. Her attendance is not required by the strict line of her duties; nay, she might with propriety decline to attend, lest she might be called on to honour with her presence the inauguration of other buildings destined to a similar good purpose; but, being desirous of promoting the intellectual improvement of her people, and encouraging those rational pursuits which carry man away from what is low and unworthy, Her Majesty waives all personal considerations, and takes on herself much unnecessary trouble. . . . This [structure] is the work of private interest, which never dies, which is ever wakeful and watchful to perform services which it expects will be rewarded . . . to be successful, [it] must be engrafted on the great stem of popular life. . . . It must draw its nourishment from all the roots. It cannot flourish by being confined to any partial sectarian or class source. It must embrace all. It must neither be shut up on the Sunday nor exclude needful refreshments. It must be neither an instrument of teetotalism nor of "*bitter*" Sabbath observance. It must, like our complex community, be of all shades and colours, of all opinions, and be everything to all men. Her Majesty reigns over the wise and the unwise, the religious and the irreligious, the sanctified and the unsanctified, and she desires alike the improvement, the benefit, and the happiness of all.

The Economist

June 10, 1854

Friends Among the Germans

THERE has been heard recently in Western Germany friendly, hopeful but sometimes rather loose talk about a new era in relations with Britain. It was given a fillip by Mr Butler's visit to Bonn and by the ideas of collaboration in economic policy that were then opened up. And now a small and still frail snowball of realistic calculation and wishful thinking is rolling towards London. Little notice of it has been taken in this country, for the simple reason that few people have realised how actual the question of future Anglo-German relations has already become.

That it should be urgent and inescapable is a symptom of the grave situation in which the Federal Republic finds itself. This year was to have brought a decision about its future, but nearly six months have passed without any real progress. There was to have been either German reunion in agreement with the Russians, or else the establishment of the EDC, the European political community, and German sovereignty as accorded and defined in the Bonn conventions. Instead there is deadlock. The French continue to postpone decision on the EDC treaty and German sovereignty is still not granted because the Bonn treaty is tied to it. The occupation regime is, it is true, largely defunct, but the government's lack of freedom in foreign policy causes bitter feelings among Germans who see Britain fostering relations with the Soviet Union and China, while they can make no more than unofficial approaches to those countries.

Not only in the Socialist opposition, but even in Dr Adenauer's coalition, more and more voices are declaring that this passive role must cease. "German fate must again be taken into German hands," the politicians declaim. Men from the past like Dr Bruening and Herr Rauschning criticise the Chancellor for not being more active in the cause of unity or for not seeking a middle course between East and West. Others say that nothing will be achieved unless diplomatic relations with the Russians are established. Herr Pfleiderer on behalf of the Free Democrats, has talked with a Soviet official in East Berlin and has proposed in the Bundestag that a deputation should visit Moscow. The Social Democrats urge that technical talks should be started with the East Germans, and that the western powers should make a new approach to the Soviet Union. Britain, some think, would be less opposed than America or France to such moves.

Nor is that all. Germans, even in Herr Blank's embryonic Defence Ministry, are talking about alternative ways of creating German forces for a "coalition army" or in other forms. Indeed, in spite of Dr Adenauer's reluctance to discuss alternatives, the whole policy of western integration is being called in question. Many industrialists, who accepted the coal-steel community because the Chancellor forced them to and because they had an interest in ending Franco-German hostility, have held all along the view that it is a superbureaucracy, which must not be taken as the model for further partial integration of Europe. They demand instead complete freedom of trade and full convertibility of currencies, not a "green pool" or any other limited experiment.

In other words, German thinking about foreign policy in the broadest sense is showing all its old vigour and restlessness. If it is compelled to abandon the EDC conception, there are, broadly speaking, three other courses that it could pursue. It could go over to the Communists; or it could try to play the East off against the West (which would probably come to the same thing as the first course); or it could find another form of friendship and alliance with the West. It ought to go without saying that the last is, from the British point of view, infinitely the best. What is perhaps not quite so obvious is that, if there is to be another sort of western association for the Germans, alternative or supplementary to the legalistic ties of a "community" with France and the Low Countries, then it is almost inevitably one that requires a response, and a warm response, from Britain.

★

Any movement to seek out the bases of a lasting friendship between Britain and a free democratic Germany is, in principle, to be welcomed. But it is not to be welcomed entirely without qualifications, and there are certain preliminary reservations that ought to be made with all candour. To take first the idea of economic collaboration. German opinion tends to make three doubtful assumptions. One is that trade rivalry was one of the basic reasons why Britain was Germany's opponent in two world wars, and that therefore an economic understanding would remove all possibility of political differences. For the British the fallacy is too obvious to need refuting; but Germans have still to be persuaded that there is a fallacy. Moreover, secondly, they tend to assume that the best way of seeking economic agreements is to make cartel arrangements with this country. German industrialists cling to the idea of their prewar cartels and are proposing that they should be set up again. (Dr Erhard, it should be noted, has consistently opposed restrictive practices.) A third assumption is that the two countries should collaborate in the export of capital to underdeveloped countries—as if the British had not long and unhappy experiences of what that means. If Anglo-German relations are to be discussed realistically, the German press will have to instruct its readers in the principles of British trading policy since the war.

More dangerous and misleading are some of the

assumptions that underlie German thinking about military and political possibilities. First, it has to be made clear that the Anglo-American relationship is fundamental; there can be no question of Britain lining up with Germany to form a third force between an isolationist United States and a threatening Soviet Union. Even if the United States should turn to a peripheral strategy—which is still doubtful—the first principle of British policy will be to work with the Americans, if possible, in all matters. If there is to be an Anglo-German effort to defend Europe, to raise living standards around the frontiers of the Soviet Union, and to expand markets—which is what many Germans are proposing—that must be done in company with the United States.

Likewise, there is no question of substituting an Anglo-German *entente* for the *entente cordiale*. Too many names on too many memorials stand in the way. In this cabined corner of the world that is western Europe the days of bilateral manœuvrings are over; if there is to be a cordial and effective Anglo-German partnership it must be within the limits of an Atlantic community that embraces Europe and North America.

These things have to be said not for Dr Adenauer himself and the wiser heads around him, but for those whose thoughts are harking back in old and dangerous directions. It is a good moment to say them because the die is not yet cast against EDC and all that goes with it, and because ideas of an Anglo-German *entente* are still fresh and nebulous. There is much thinking to be done against the day when, by one means or another, the Federal Republic is a sovereign power, and it is most undesirable that all initiative and reflection should be left to the Germans. Previous attempts in the last sixty years to lay fresh foundations for Anglo-German understanding have failed because they started from false assumptions. It is important that Germans should not for the third or the fourth time seek Britain's friendship for reasons that run counter to Britain's interests and obligations. If the attempt is to be formally made—and it has not come to that yet—the British response should be cordial, quick and above all frank. As a beginning, all possible ways of collaboration in the economic field should be worked out. Fate—aided by human arrogance and stupidity—has too often got in the way of that close friendship between the British and German peoples which our Victorian grandfathers thought so natural. An opportunity to repair one of the basic mistakes of the last half-century may be at hand, and it would be as tragic for it to be let slip by indifference on the one side as by insensitiveness on the other.

Boundaries on the Move

PEOPLE who make prophecies about the date of the next general election—particularly those who expect a snap vote to be taken in the autumn or next spring—often leave an important factor out of their calculations. Parliament is not likely to be able to consider the proposals of the boundary commissions before November of this year. It is improbable that the Conservatives will wish to go to the country before these proposals are approved, because they must now know that the proposed rearrangement of constituencies is almost certain to be to their advantage. And, once the changes are put into effect, the local party organisations may ask for at least six to nine months to become acclimatised to them.

This rather startling realisation—that bodies composed of distinguished civil servants, lawyers and other independent experts have suddenly and unintentionally assumed a possibly dominant influence on so important a constitutional matter as the timing of the next election—is only one reason for looking very closely at the activities of these commissions. The other main reasons are that their activities are likely to raise an unpleasant party row at Westminster, and that they will cause considerable local political disturbance. The misfortunes arising from the present system of boundary revision will fall largely on Labour, which endorsed the system in its Act of 1949; but that is no reason why the case for revision should not be reconsidered now.

Constitutionally, the most important (although the least appreciated) issue raised in the present controversy is the possible effect of the commissioners' timetable on the timing of the general election. The Act of 1949 required the four boundary commissions (there is one each for England, Scotland, Wales and Northern Ireland) to recommend readjustments in constituency boundaries from time to time, and to make general and more sweeping reviews at intervals of not less than three and not more than seven years. In effect, this means that there has to be one general review in each Parliament with a normal life span. As the last general review took place in 1948, the commissions are legally bound to complete the general review that is now in progress before July 30, 1955. So far, they have published provisional proposals for 468 constituencies in England and Scotland; to everybody's surprise, they have suggested changes in no less than 190 of them. The commissions' proposals for the two most important remaining areas in England—London and Lancashire—will probably be published later this month. The proposals must then be considered in the light of local objections; if necessary, local inquiries have to be held.

The commissions' revised proposals will then be laid before the Home Secretary; he may modify them, if he wishes, but must eventually lay his own proposals before Parliament in the form of draft orders in council. These orders seem likely to be debated in the Commons some time in the late autumn or early winter; since more than a third of MPs will probably be personally affected by them, there should be no lack of speakers in that debate. Even if the orders are accepted without further amendment, they can hardly be brought into effect before the early months of next year. There will follow a period of redeployment of local party machines in more than a third of the constituencies in the country. It seems to be generally agreed by officials of both parties that this redeployment cannot be accomplished before October, 1955, at the earliest. In other words, the next general election is most unlikely to be held before that date.

*

The second issue in the controversy, the probable benefit to the Conservatives of the present series of proposals, cannot be accurately estimated. Rough calculations, based on tentative checks in some of the most obviously affected areas, can, however, be made—along the lines explained at the bottom of this page. Although local estimates differ, it seems probable that, if each individual elector voted in exactly the same way as he did in the general election of 1951, the proposed new boundaries should increase the Conservatives' majority by at least ten; they might increase it by twenty.

The reasons for this apparent Tory advantage do not, of course, lie in any gerrymandering by the commissions. The commissioners are merely following the rules laid down for them. One aim is to bring each constituency to within striking distance of the average British constituency of 55,650 electors. There are other guiding rules for them to follow—they must respect local government boundaries so far as is practicable, scattered country districts should have a smaller electorate than compact towns, Wales and Scotland are guaranteed a minimum number of constituencies, and Northern Ireland (which is also represented by members of its own Parliament) can have an average constituency of over 70,000 electors—but the commissioners' main job tends to be simple counting of heads.

In abiding by this rule during their present general review the commissions have found themselves making reflex actions to two main developments. First, the movement in population since the last general review in 1948 has continued to be away from the poorer "East End" districts and towards the more Tory-minded suburbs; some seats are therefore being withdrawn from the former, but comparatively few individual suburbs or county areas seem to have received a large enough influx to turn them Labour. Secondly, and more important, the Labour Government, under the impetus of a speech by Dr Dalton, created 17 additional seats that were not originally recommended by the commissions after the 1948 review; Labour believed that the commissioners had given too heavy a representation to country districts at the expense of big towns. So far as can be judged, this amendment gave Labour 12 additional seats in the 1950 election and the Tories 5, a net Labour gain from the transaction of 7; in the 1951 election, the net Labour gain was reduced to 3. The commissions, which have to abide by the written rules and not by Dr Dalton's strictures upon them, are now setting about wiping out some of these 17 seats, and are amalgamating others with surrounding and more Tory-minded suburban districts. This must result in some Labour losses.

The final grievance aroused by the commissions' proposals is the disturbance that they will cause to individual politicians and individual constituency parties. A certain amount of humbug is talked about this; an occasional shake-up of local political livers is good for a democracy's health, and the "local patriotism" that is supposed to be troubled often exists mainly in town councillors' imaginations. But some of the strains imposed are startling. The constituency of Rye was abolished in 1948, and the local party organisations disbanded; now, six years later, the commissioners propose to reinstate it, and the organisations will have to be started up again. One Labour constituency party has derived most of its income from a profitable social club; a minor readjustment of its boundaries has

The Proposals to Date

So far the commissioners have reviewed the boundaries of 468 English and Scottish constituencies. In 278 they have recommended no change. Their proposals for changes involve:

(1) The creation of 11 new seats. Of these, 7 seem likely to go Tory, and 3 to go Labour. The other will probably go Labour, but is marginal.

(2) The abolition of 3 seats. Of these, 2 will be Labour losses. The other is due to the amalgamation of Mr Mikardo's marginal Labour constituency of Reading South with the marginal Conservative constituency of Reading North (minus trimmings from each); the odds seem to be slightly against Mr Mikardo winning the new seat. The net addition of eight seats in Parliament from these proposals therefore seems most likely to lead to 7 Tory gains and 1 Labour gain.

(3) Changes in 190 constituencies, of which 99 are Labour and 91 are Conservative. It is very difficult to judge the effect of all of these, but the most usual consequence seems to be to make some safe seats (especially Labour seats) safer still and some marginal seats (again, especially Labour seats) more marginal still. One example is Bradford, which at present has three relatively safe Labour seats and one relatively safe Conservative seat; the new proposals would make one very safe Labour seat and three exceedingly marginal seats. According to the best available (though admittedly hazardous) estimates, each of these marginal seats would probably go Conservative if everyone voted as he did in the last election; but they could all go Labour if there was even a slight swing of the political pendulum towards the left.

(4) The commission's proposals for the important Lancashire and London districts have not yet been published. It seems likely that these will involve the abolition of at least two (and possibly more) Labour seats that were created in Labour's so-called "gerrymandering" operation of 1948.

moved this club into a neighbouring constituency, and the Labour candidate concerned will now probably have to do without the services of a full-time agent. The Labour seat that is abolished in Sheffield is that held by Sir Frank Soskice ; the other four Labour MPs from Sheffield must now be looking at him askance, in the fear that the party leaders may suggest that he should move over into one of their domains. There are many other awkward personal problems of this kind. They are not national tragedies, but—sometimes unnecessarily—they are inconveniences that cause bad blood.

There is probably nothing that can be done to avert the current disturbance. The Conservatives seem determined to carry out the commissions' proposals ; they feel that they are merely correcting the "gerrymandering" of which Labour was guilty when it created the seventeen new seats in 1948. Possibly there is a balance of justice on their side. But, after this reorganisation has been effected, the parties should consider again whether the 1949 Act really was wise to demand that these general reviews should be held so frequently, whether there should be such unyielding emphasis on tidy counting of heads. A major anomaly in the electoral system today is that Labour—because so many of its votes are wasted in piling up massive majorities in mining and other working-class constituencies—won 23 fewer seats than the Tories in 1951, although it secured 200,000 more votes. No system of boundary revision can rectify this anomaly ; but it is a little hard that the only system of revision that does exist—by taking account mainly of the steady efflux from working-class districts into the suburbs—seems bound to make this anomaly progressively worse.

★

The commissions' powers of making *ad hoc* changes in individual constituencies should suffice to prevent the growth of anomalies such as the old Romford constituency, which reached more than 200,000 electors at one period before the war. With this safeguard in being, it might be wiser to ensure that the general reviews took place immediately after, say, every third general election instead of in the course of each successive Parliament. This formula would have the advantage of ensuring that the reviews did not stretch into the third or fourth year of a Parliament's life, and thus did not have their present undesirable influence on the timing of subsequent general elections. There are issues of some constitutional importance, as well as of merely local inconvenience, here ; in the course of the next few months some hard things are likely to be said, which will not be to democracy's advantage.

Notes of the Week

Paralysis at Geneva

MR MOLOTOV and Chou En-lai have, between them, succeeded in turning the clock back nearly to the point at which the Geneva conference started. They insisted, this week, on dragging the Indo-China discussion out of the relative calm of restricted sessions, and used the plenary sessions of Tuesday and Wednesday (summarised on page 906), simply as a forum for propagandist diatribes. They have, in fact, reverted to their original and wholly unpromising practice of speaking, not to their fellow delegates, but over their heads. Inevitably, they drew tart retorts from Mr Bedell Smith, M. Bidault, and even Mr Eden ; but this clouding of the atmosphere of debate was not by any means the most depressing feature of the week. If symptoms of mortal paralysis are now rapidly appearing in the conference, it is primarily because the Communist negotiators have deliberately stiffened the presentation of their terms.

The Soviet and Chinese governments now appear to be explicitly and finally committed to what, in the language of an older imperialism, would have been called a "forward policy" in Indo-China. Not content with the opportunity for the Vietminh to consolidate its gains that would be provided by a cease-fire and a military regrouping, they call for broader political negotiations that would open doors for the extension of Ho Chi-minh's influence in southern Vietnam. Not content with that, they insist that the footholds the Vietminh has gained in Laos and Cambodia must be respected, and that the shadowy "resistance governments" in those two states must be granted a degree of international recognition which even the Communist nations themselves have hitherto grudged them. Finally, they reject out of hand Mr Eden's suggestion that the five "Colombo" powers would be suitable supervisors of a settlement in a neighbouring Asian area ; and Chou En-lai now at last unveils the official Communist interpretation of "neutral" supervision, which is that the "neutrals" must include Communist governments with full power of veto.

If these positions are to be maintained, there is no hope of reaching an agreed and satisfactory settlement in Indo-China, however long Mr Eden extends his efforts, and whatever new formula Mr Casey may bring from Australia, via Delhi. The Communist terms are not new ; but while the restricted sessions and private meetings at Geneva continued, there was at least a slender chance that they might be modified. After this week's speeches, that chance has dwindled to vanishing point. What, short of a *deus ex machina,* can now save the conference from becoming another, and a more intolerable, Panmunjom ?

What Hanoi Means

A GREAT temptation and a great responsibility now face Ho Chi-minh and his commander-in-chief, General Giap. Their crack divisions, flushed with costly but spectacular victory at Dien Bien Phu, are closing in on Hanoi ; and it is widely believed that if they chose to launch an all-out assault on the capital of Tonking they would stand a good chance of breaking through its defences within a few weeks. Morale has been gravely impaired on the French Union side by recent events ; the new French commander-in-chief, General Ely, has not yet had time to plan a new strategy ; and the Communists have learnt, in the past three months, how effectively their military pressure can be made to work upon the politicians in Paris. Moreover, the city of Hanoi is itself a glittering prize for a government which still lacks a suitable capital.

★

One thing, however, ought to be quite clear to the Vietminh leaders—and if it is not yet clear it should be made so. If they seek a second spectacular victory now, while the Geneva conference is still wrestling with the problem of bringing the Indo-China war to an end, they will make nonsense of the Communists' argument that only their antagonists wish to extend the war. They will strengthen the hand of the extreme interventionist faction in Washington ; and they will place Mr Eden in an impossible position at Geneva. It is unthinkable that Britain could continue to play its present restraining role if, in two or three weeks' time, the quiet of a restricted afternoon session at the Palais des Nations is broken by the news that General Giap's artillery is firing on the centre of Hanoi. If France's allies take a full-scale assault on the Red River delta as a signal that they must intervene at once in order not to be too late, the responsibility both for the extension of the fighting and for the frustration of the peacemaking effort at Geneva will rest squarely on the shoulders of Ho Chi-minh's government.

The Tories' New Need

WHEN Conservative backbenchers come back to Westminster next week they will need to pay more attention to foreign policy. For a long time the only serious challenge to the Government's diplomacy has come from the Bevanites, and has been aimed less at the Ministers concerned than at their allies on the Opposition front bench. This has absolved the average Tory backbencher from having to make any serious defence of the Government's foreign policy, and has left him free to whip himself into a frenzy over such important matters as teachers' pensions and MPs' pay. But bi-partisanship, always a delicate plant, is now threatened by Mr Attlee's tortuous wooing of the Left. If Geneva ends in deadlock and firm steps have to be taken in the East, the Tories may find themselves pushed into a straight party fight over foreign policy. For this they are ill prepared, either emotionally or intellectually.

Only two groups within the Conservative party have been taking any sustained interest in foreign affairs—the Suez group, which also propagates most of the other Beaverbrook myths, and a small clique of experts who, in or out of office, faithfully follow the Foreign Office line. There are also a few individuals whose speeches show an intelligent understanding of foreign affairs, but the average Tory backbencher seems to consider his duty done by perfunctory applause at every mention of "Mr Eden's gallant efforts for peace." In part, this apathy among the Conservatives is due to the misguided feeling that, with Sir Winston Churchill and Mr Eden as their leaders, they need not worry their heads over foreign affairs ; in part, it is due to the knowledge that they are certainly better able to staff the Foreign Office than their opponents. But isolated expertise is not enough. The need for more coherent and considered foreign policy speeches, both on the Tory back benches and on their hustings, is rising. The challenge from an irresponsibly united Labour may not come until after the party conferences in the autumn, but a disastrous end to Geneva could bring it next week.

M. Bidault on the Ropes

M. BIDAULT has found Paris no relaxation after Geneva. Indeed, the government's opponents in the French Assembly seem almost as determined to stick to their guns as are the Communist delegates at Geneva. M. Bidault, it is true, has probably benefited momentarily from the stiffening of the Communist line, and there is less tendency in France now to question his willingness to negotiate. Yet, in spite of this, his anguished appeal against being asked to conduct diplomacy on probation has not prevented the National Assembly from forcing the government to seek another vote of confidence on Indo-China. This has by now become a routine operation, though with the governmental majority dwindling rapidly each new performance may cause a real crisis.

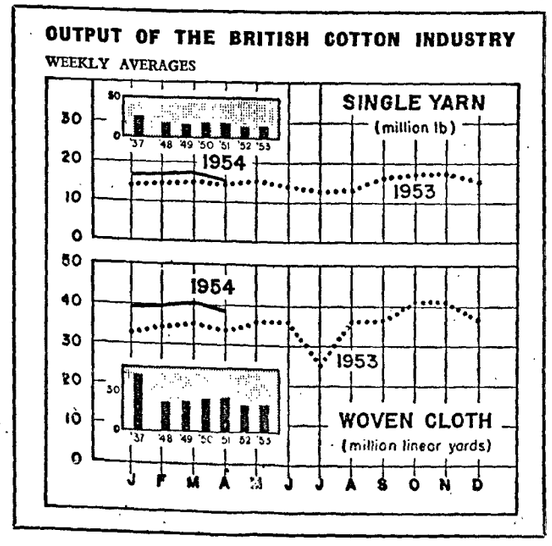
The tragedy is that a crisis at this stage would not even produce an alternative government. Many eyes were fixed on M. Mendès-France, who spoke at length after M. Bidault, but his hour has not come ; he has the brilliance but hardly the stamina for a situation of danger. He was on strong ground when criticising the past sins of French policy, but he disappointed his admirers by offering rhetoric instead of a coherent plan of action. Even if he could offer a policy, he would almost certainly find no majority to back it. This may decide the Assembly to tolerate M. Laniel's

government slightly longer, at least until its first anniversary later this month. M. Mendès-France spoke against changing men and keeping the policy, but a crisis provoked for its own sake is not to be excluded in the present mood of the Assembly. Governments have tumbled before in France to the mournful tune of *plus ça change*. . . .

Mollet *Versus* Moch

THE division over EDC is probably the chief obstacle to a regrouping of French parliamentary forces. A realignment on traditional lines is precluded as long as this issue, cutting across all allegiances, is not settled one way or another. In the current parliamentary battles many exchanges are ostensibly over Indo-China, but are in fact about EDC. This week a new step was taken in the drawn-out struggle over the ratification of the Treaty, when the Foreign Affairs Commission of the National Assembly approved a report hostile to the creation of the defence community. The approval of M. Moch's report was expected and the majority was a narrow one, but this move is significant, as all the Socialist "rebels" have voted against the treaty in defiance of their party's orders.

Two weeks ago at a special congress M. Mollet managed to issue official whips ordering Socialist MPs to vote for EDC, but the opponents of the treaty, numerous in the parliamentary group, refuse to toe the line. What sanctions will the executive take against the six recalcitrants in the commission, who include such important figures as MM. Moch, Daniel Mayer and Naegelen? This is an important test case, since less influential deputies will probably take their cue from the result of this trial of strength. In the Assembly as well as in the commission the fate of the treaty will depend largely on the Socialist vote. Thus the struggle between M. Mollet and M. Moch may prove decisive for the European Defence Community.



What Size Agriculture?

THE Opposition chose to launch the last major debate before the Whitsun recess on to the familiar topic of agriculture; and most of the argument in that debate revolved round the equally familiar question of how much food Britain should grow at home. It is a sign of the relative progress that has been made in British agricultural policy that the Minister of Agriculture did not seek to outbid the Opposition. Instead, he tried to ride two horses at once. He was anxious to claim credit for the record output achieved by British agriculture last year (which was equal to 156 per cent of the prewar figure). He insisted that the Government meant to bring about a further expansion of agriculture in general. But, in dealing with individual commodities, Sir Thomas was wary. In each case, he intimated, the level of output should depend upon the efficiency of producers, the level of world prices, and the cost of the Government guarantees; and he clearly implied that, if any guarantee cost too much, it would be restricted quantitatively, as has already been done with milk.

This sort of talk understandably leaves farmers puzzled about whether it is worth growing more food at the risk of a cut in the price guarantee. But the remedy most certainly is not to accept the facile recipe of a new "production programme" offered by the Opposition spokesmen. What exactly would this programme amount to? If farmers were offered an unlimited market at present prices, the cost to the nation would quickly prove intolerable. But if price guarantees were first cut as a necessary condition of further expansion, the Opposition would be the first to say that the farmers' "confidence" had been undermined.

Whether or not the present world surpluses will vanish in a few years' time, as some experts believe, they are facts that cannot wholly be ignored. The latest cuts in Canadian wheat prices, for instance, will add further to the large subsidies that are already being paid to ensure that British cereal producers still receive their guaranteed price. In these circumstances it is folly to ask for more production at home—unless it can be achieved at lower prices. That is in fact the direction in which Government policy is moving. Where the policy is failing is in not bringing home to the farmer the close connection that ought to exist between his degree of efficiency and his level of profits. The farmer has the idea that if he works harder the Exchequer will take the rake-off, but that if he works less the taxpayer will cushion the shock. It is a pity that Sir Thomas Dugdale did not specifically seek to disabuse him of both suppositions.

Sir Dudley North

PUBLIC opinion and naval opinion are liable to become at cross purposes in the new *cause célèbre* of Sir Dudley North. Nobody should dispute the right of the Admiralty quietly to remove an officer from a post of the highest

responsibility if it has lost confidence in him, especially in time of war. But Sir Dudley was summarily dismissed as Admiral Commanding North Atlantic in 1940 after a charge of "neglect of duty"; as five Admirals of the Fleet have pointed out, in a memorandum published this week, this sentence was the "most severe that could be given in time of war to a Flag Officer of distinction and high standing, such as might have been given for cowardice." It is not surprising that Sir Dudley should have pressed ever since for a court martial or a service enquiry to clear his name.

The charge against Sir Dudley arose out of the passage of French warships through the Straits of Gibraltar in September, 1940; they turned up at Dakar where they had an effect (in 1940 it was believed the deciding effect) in rendering abortive General de Gaulle's attempt to capture that port. Sir Dudley had not been officially informed of the Dakar project, although he probably had some unofficial knowledge of it. The orders he had been given about stopping French warships were vague and out-of-date; they had been issued at the time of the French collapse in July, 1940. There was a bad lapse by the duty officer at the Admiralty, who failed to send new instructions when it was known that the French warships had left Toulon. To the layman, it may seem that most people with political judgment might have urgently pressed the Admiralty for instructions in the early hours of the morning that the warships appeared; or else have sent the *Renown* to shadow the Frenchmen until orders came through. Sir Dudley, in agreement with other officers on the spot, did neither. Since he had earlier disapproved of the bombardment of French warships at Oran, it is not difficult to understand that some people at the Admiralty may have concluded that he was "pro-Vichy" (an emotive term at that time) and felt justified in dismissing him. The five Admirals of the Fleet, who have rallied to Sir Dudley's support, have now argued, however, that Sir Dudley was not faced by "a normal naval decision"; instead "it was a problem of what was politically required of him." They have asked the Admiralty to institute a service enquiry. In view of this backing, and in view of the inevitable suspicion that has now been aroused that some other people's responsibility for this muddle and its aftermath is being hushed up, the First Lord will make a bad mistake if he obstinately continues to refuse one.

Quotas for Bright Children

THE London County Council is not alone in thinking that at present schoolchildren are too arbitrarily and irrevocably divided into sheep and goats at the age of eleven, or that the "eleven plus" examination is an imperfect way of making a decision of such importance to the child. But few people will see the point of the changes in methods of selecting pupils for grammar schools, which the council's education committee has just approved. Hitherto, as with most local authorities, the selection has been made by committees, which judge the children by their performance in English, arithmetic and an intelligence test—supported, in the case of borderline candidates, by reports from the head teachers of primary schools, and sometimes by

interview. In future, London primary school teachers are apparently to have the principal say in the selection—although, in order to protect them from angry parents, their judgment is to be reinforced by a committee in the background. That the teachers should be consulted is right and proper, but the principles that, according to the LCC report, are to guide them will not ensure that all London's brightest children are educated in its grammar schools.

The most important—and most pernicious—feature of the new arrangements is that a quota system is to be introduced into the primary schools. Teachers will be told what their share, in relation to their school numbers, of London's grammar school places should be; if they want to exceed it they will have to seek special sanction. The danger of this system—which has been tried out, in various and modified forms, in other local authority areas before—is that bright pupils may be excluded from grammar schools because their primary school has exceeded its quota, and that the schools themselves may become less efficient because competition between them will be eliminated.

The LCC is not foolhardy enough to abolish the examination altogether—although it hopes to do so later, beginning with the comprehensive schools. Meanwhile the examination will continue, heavily disguised as the "junior leaving examination" and with its relevance to the child's fate undetermined. It is difficult to see why this change of nomenclature will improve it; or, indeed, why the rest of these confusing proposals are an improvement, unless they mean no more than that due regard should be paid to the reports of primary school teachers. If that is all they do mean, then the LCC should have said so, instead of sending a shiver down the backs of parents who happen to have sent their above-average children to above-average primary schools.

Mr Yoshida Grounded

THE disarray in Japan's domestic politics is even more alarming than had been thought. Last week, just as Mr Yoshida was preparing to leave for his visit to the United States and Europe, Socialist opposition to his government's Bill for restoring centralised control of the police (decentralised by General MacArthur) culminated in a violent riot in the House. The Speaker's chair was stormed and police had to be called in to separate the battling deputies. This agitation from the left was supposed to be directed against the danger of a return to the old military nationalism; but it was reinforced by another agitation from quarters on the right representing this same military nationalism. There Mr Yoshida is accused of humiliating his country by visiting the United States, and is threatened with assassination as a traitor in the good old Japanese fashion. Caught between two fires, and dismayed at the risk of a new political crisis overtaking his government in his absence, the Prime Minister decided at the last moment to cancel his tour.

Those who wish well to Japan's postwar parliamentary democracy must deplore the Socialists' resort to violence.

For in the long run it is they who stand to lose most by any undermining of parliamentary institutions. If democracy breaks down power will go, not to them, but to men of authoritarian attitude, either Communists or reactionaries. At the root of present discontent lies a general feeling of national humiliation, to which the omissions of British and the commissions of American policy have contributed. Japan regained sovereignty under the San Francisco treaty, but has remained excluded from all collective international deliberations, even those concerned specifically with the Far East. It is represented neither at the United Nations, nor at Geneva, nor in the discussion of a South East Asian defence pact.

In fact, Japan is as entirely isolated as the Russians could wish, save for its bilateral and dependent relationship with the United States. It is to be hoped that Mr Yoshida will still be able to make his journey and press on Washington, London and other capitals the urgent need of his government for prestige and friendship. Meanwhile, is anyone keeping Tokyo informed of what is being planned for the defence of South East Asia, where Japan's principal markets lie? If not, it is a serious omission.

China Trade Back on the Rails

ENCOURAGING progress in clearing trade channels between Britain and the mainland of China has been made in recent meetings at Geneva between representatives of British industry and commerce and Chinese Communist officials. The Federation of British Industries, the London Chamber of Commerce, and the China Association, the three bodies most closely concerned in the negotiations, are to be congratulated on discretion as well as initiative. The Peking government had been trying, with some success, to play a political game with its trade offers. Though its interests are obviously best served by direct contact with firms and individuals in this country or in Hongkong, with long experience in handling China's unique trade, it has instead tried to channel business through organisations that have a propaganda value for the Communists. Furthermore, the Chinese have sought to make East Berlin their European headquarters for all trade deals. Whether they now intend to get down to business without propaganda has yet to be proved; but by accepting an invitation to visit Britain, and by easing conditions for the firms and individuals still held virtual prisoners in China, they have shown some good will. It is also a good sign that the discussion of trade channels has not so far been linked with questions about the relaxation of the embargo on certain exports to China.

The wisdom of moving cautiously in dealing with a Communist power, even at the risk of losing business, has been demonstrated. The British showed no weakness or undignified haste and the Chinese, who understand better than anyone the importance of "face," appear to have been impressed. But there remain a number of irksome difficulties. For example, the British exporter has to wait until his goods are received and certified before he gets his money. Moreover, as Peking now boasts that 75 per cent of its foreign trade is with Communist friends, there is not much left for the West; but it is possible that the Chinese now realise how much they are losing thereby. Particularly welcome is the fact—reported by Mr Harold Wilson from his conversations with Mr Lei Jen-min, Vice-Minister of Foreign Trade—that the Chinese have at last brought their sights down. In place of the astronomical and clearly false figures that have been dangled in the past before eager British eyes, his estimate of the possible annual level of Anglo-Chinese trade is now £36 million. Though still about double of what is practicable, it is at least nearer the truth.

Keeping Back the Floods

STATISTICALLY speaking, floods as strong as those that overwhelmed the East Coast defences in January, 1953, are not likely to occur more than once in two hundred years. The committee on coastal flooding, which was set up under the chairmanship of Lord Waverley after last year's disaster, has now followed its interim report (which led to an improvement in the system of flood warnings) with a full report* that is sensibly free from panic. It says in effect that only where the value of the property to be protected warrants the expense should defences be brought up to a standard capable of holding floods of the 1953 level. Elsewhere local authorities should not be required to go further than was thought reasonable before that date; and if anyone wants protection of a higher standard he should be asked to pay for it. The committee is also satisfied that there is no major gap or overlap in the functions of the River Boards and the coast protection authorities; and that the present system whereby the costs—like the risks—are shared between the individuals affected, the local authorities in the district and the Treasury should, with certain minor modifications, continue as before.

These sensible conclusions are accompanied by an urgent warning. Few Londoners realise how lucky they were in 1953. If the flow of fresh water down the Thames had not been abnormally low, the defences of the capital might have been overwhelmed. Because of unresolved bickering between the various local government bodies, the system of responsibility for flood defence in London lags far behind that in the rest of the country; and insufficient thought has been given to the nature of the defences themselves. The committee makes the suggestion, for others to consider, that a structure might be thrown across the river with "gates" capable of being closed in the face of impending floods. There are formidable difficulties, both physical and financial, in the way of any solution; but the central government now has a clear responsibility to knock the local authorities' heads together, and if necessary to introduce legislation to remedy what seems to be a very dangerous situation.

West Indian Lament

THE plight of citrus growers in the West Indies now being aired by a trade delegation in London, provides a striking example of the way in which schemes of colonial development are apt to run aground the treacherous shoals of world trade. Since the war the production of grapefruit in the West Indies has been stimulated and aided by the British Government as a means of diversifying the islands' economy. Now, after six years, their crops have matured, but the growers complain that they cannot compete in the British market (which is inevitably their main outlet) with the crops of other countries.

In part, this is because the small-scale production in the West Indies is uneconomic; the growers have to purchase their containers in England, pay high freight charges, and cannot compete with the mechanised production and processing in the United States and Israel. But the world citrus market is also riddled with subsidies. Two principal competitors, Israel and Spain, have both indulged in discriminatory exchange rate wangles; and now the position has been complicated by the arrival in Britain of imported grapefruit from the United States under the Mutual Security scheme. In addition, American export prices to some markets are kept low by a special subsidy to citrus growers, which was passed against the wishes of the Administration. Political jobbery in California and Florida —and financial juggling in Spain and Israel—has cast its shadow over the Caribbean.

The British Government has therefore been placed in an embarrassing position. The West Indians want Britain to put up the tariff on foreign citrus fruit (which, for historical reasons, is fairly low), while continuing to allow their own fruit to come in duty free. The Government probably has no very great qualms about raising the price of grapefruit on the British breakfast table; but the West Indians' proposal would involve an increase in imperial preference margins, and thus run foul of the General Agreement on Tariffs and Trade. In view of the need to diversify the West Indian economy and of the sour state of competition in grapefruit already, this is one of the few instances in which the opponents of Gatt can put up a plausible case. It would be in the present tradition of the citrus market if the British Government found some way to wriggle round the problem, while pretending that it was not wriggling at all.

Talking to Kenyans

IT was a novel conference that was held this week in Nairobi. Representatives of many European organisations—church, commercial, agricultural and political—gathered to hear the views of members of their new government at first hand. A panel of ministers and officials, led by Mr Michael Blundell (now European Minister without Portfolio), made a sustained effort to explain, and enlist support for, their conduct of the emergency. Most remarkable of all was the unprecedented appearance of Asian ministers in defence of the Government's policies in front of a European audience.

Mr Blundell painted a generally encouraging picture of the emergency. He estimated that in the last few months 25 per cent of Mau Mau's effective strength has been destroyed. Perhaps more important, he indicated that progress was being made in bringing the troubled native reserves under closer administration; under the new arrangements there will still be only one officer to every 25,000 people, but this proportion will be about ten times greater than before the emergency. Mr Blundell later made a strong—and reasonable—plea that operational expenses incurred on the responsibility of the commander-in-chief should be charged to the United Kingdom rather than to the Kenya Government, which has no direct control over them.

The most interesting contributions came, however, from the new commissioner of police, Colonel A. E. Young, and the Asian Minister without Portfolio, Mr Patel. Colonel Young, who went to Kenya with a reputation for straight dealing, is clearly also something of a diplomat. After praising the settlers' police reserve for "doing a wonderfully gallant job," he made it clear that he was considering replacing the full-time reserve officers with regular policemen, "so that men trained for civilian jobs could return to them." The policy of thanking these emergency settler-policemen for their services, but then getting rid of them as quickly as possible, is certainly the right one; but it will not please some people in Kenya. Nor will Mr Patel's stout defence of British methods of justice in the face of demands for more summary action. While making every effort to speed up the processes of law, he was determined "not to throw away experience gained over hundreds of years." It makes a good beginning to Kenya's new experiment in polyglot government that Europeans should find themselves

confronted with their own ideals in the mouth of a responsible leader of another race.

The Nationalised Pullman

THE British Transport Commission's offer to buy the shares of the Pullman Car Company will close next week; and it seems certain that the shareholders will accept it by a massive majority. Many Conservatives are stung to the quick by this first instance under their regime of a prominent company being swallowed up by a nationalised industry, by what they regard as the destruction of the last piece of private enterprise efficiency on the railways. Shortly before the Whitsun recess the member for the Pavilion division of Brighton initiated an almost impassioned debate on the adjournment on this subject. The initiative for the sale has admittedly come from the Pullman company itself, but Mr Teeling darkly pointed out that the chairman of the company "is also chairman of Cook's and of Dean and Dawson, both of which are nationalised, and in that sense I suppose he is closely connected with the British Transport Commission." While admitting that a very large proportion of shareholders would agree to the sale, Mr Teeling had discovered that many of the shares were held by insurance companies; he accused these companies of "always playing for safety." Other shareholdings are in the name of nominees, and some people would have liked the Government to say whether the largest block of these is or is not held by some nationalised body.

In broad outline, however, it seems clear that the sale is a commercial operation, not a sinister piece of Tory Socialism. The Pullman company has been operating under a detailed agreement with the commission about routes and time schedules. This contract is due to expire in 1962; and although the commission would probably agree to an extension, it could not make this for a long period. There are certain to be many changes in the form of rolling stock and in modes of railway operation in the coming decades, and there are also likely to be some Socialist Governments. Yet any new vehicles bought by the Pullman company to streamline its fleet would have an expected life of thirty years. The alternative lay between a system under which the company would have no incentive to build any new coaches, and operation of the service within the maw of the Transport Commission. It is difficult to see how the Minister of Transport could have intervened to forbid the transaction. And, provided the commission operates the service as a commercial venture—running the coaches only on the routes that are profitable and resisting the temptation to plough back most of these profits for subsidising less economic ventures—there is no reason why standards need suffer through this socialisation by consent.

More About the Balkan Alliance

IT was to be expected that the progress of Balkan co-operation should proceed most smoothly and with the greatest diplomatic finesse when Athens became the centre of operations. At the conclusion of Marshal Tito's visit there last week it was announced that Greece, Turkey and Jugoslavia had decided to enlarge their treaty of friendship and co-operation into a military alliance at the next annual meeting of the three foreign ministers in Belgrade. With this decision and the talks leading up to it the Turkish Ambassador in Athens was fully associated; the same could not be said of the Greek Ambassador in Ankara when Marshal Tito talked with his Turkish colleagues on the same subject in April. Moreover, in the wording of the communiqué issued in Athens, which was deliberately vague about the actual date for signing the treaty, the three Balkan partners combined due attention to friendly British and American promptings that they should not wound Italian susceptibilities by too much haste, with a clear indication that they would not let this consideration hold up their defence planning indefinitely.

A novel and interesting outcome of last week's talks is the announcement that the three governments have agreed, on the suggestion of Field-Marshal Papagos, to establish a tripartite consultative assembly. All that has been decided so far is that it is to be composed of fifteen to twenty parliamentary delegates from each country and is to meet in each capital in turn; presumably opposition parties, where they exist, will have their due representation. The idea shows that the three countries are interested in something beyond their mutual defence against a common enemy; but it is easy to be cynical about assemblies with no powers except the power to talk. In the Balkans, however, periodic meetings of parliamentary delegates could, if well managed and well mannered, do a useful job. They could spread mutual understanding of each other's problems among a small but influential group of men, and for the Balkan people generally they could provide a valuable non-military symbol of regional co-operation. In addition, for the Jugoslav delegates, they could provide an illuminating insight into the ways of non-Communist parliamentarians.

Hungarian Communists Take Stock

THE third congress of the Hungarian Workers' Party has provided plenty of testimony that the "new course" introduced nearly a year ago has not proved the panacea that its authors no doubt hoped it would be. Every conceivable culprit, except the Communist bosses themselves, has been hauled over the coals for his contribution towards the "blunders and mistakes" that have marred the start of the new policy. Of course when Communists go in for criticism and self-criticism they believe in laying it on thick. All the same, Rakosi and his colleagues are plainly unhappy about the way things are going.

In particular they are worried about the failure of the farmers to solve the country's food supply problems. Yet although Rakosi stressed the "extreme importance" of the medium-peasants, his speech was not of a kind to instil into them that confidence in the intentions of the regime that is essential if agricultural production is to be increased. On the contrary, the emphasis is now again on the consolidation and development of the co-operatives. Rakosi, alarmed perhaps by the deterioration that has set in on the

What is the Board's duty to the Staff?

An enlightened board appreciates only too well its obligation to staff and senior executives. They know that with taxation at its present level no employee can hope to save enough to ensure a reasonable degree of security on retirement. They know that good staff can be attracted away by companies offering better security. Yet nothing is done to organise a properly constituted pension plan because of apparent difficulties and a knowledge that no ready-made scheme can provide a satisfactory answer.

The long experience of Arbon Langrish proves, however, that the application of specialist knowledge to individual cases can often cut right through apparent complications to provide a pensions solution which is less onerous for the firm and enables staff to work loyally without the distracting influence of a future insecure retirement.

A discussion with a member of the advisory staff of Arbon Langrish will be treated in confidence and is of course without obligation.

Independent of any insurance company Arbon Langrish have an unrestricted choice of the whole Insurance Market and provide an unbiased service.

The advice of Arbon Langrish

is available to principals, solicitors, and accountants, on all matters relating to pension plans, 'Top Hat' schemes and estate duty problems.

Stamps are a good beginning...

John is proud of his stamps. Each one is a lesson in the geography and history of our Commonwealth and Empire.

He is reminded that we in Britain share a heavy responsibility for the welfare and progress of almost 70,000,000 people living in Crown Colonies, Protectorates, Protected States or Trust Territories.

They look to us for security and leadership. That is our responsibility and our plain duty.

How do we help — we in Industry?

We help by making things that they do not yet make for themselves. Dunlop helps also by large scale buying of raw materials, by developing rubber plantations — closely linked with advanced research—and opening up the country by the provision of tyres and wheels for all types of road and air transport. And finally as local industries develop and expand Dunlop is there to serve them.

state and co-operative farms, made it quite clear that a socialist agriculture was the inevitable aim of the government.

The difficulties of the regime are all the greater because of the confusion and disarray within its own ranks. It has long been evident that the introduction of the new course provoked a violent debate within the inner councils of the party. Rakosi has apparently ridden the storm; but he still complains both of the "strong remnants of left-wing sectarianism" and of opportunist right-wing distortions of policy. It is not surprising that the new party statutes introduced last March stress the need for iron discipline. Moreover, the party organisations throughout the country, especially in the villages, have proved unequal to the task of rallying the people behind the regime; so much was confirmed in so many words by Imre Nagy, the Prime Minister. That is why he went on to announce that a new People's Independence Front was to be formed, on a broader basis than the old People's Front, to act as the link between government and people that the Communist party has so signally failed to provide.

It is quite probable that the regime is genuinely anxious to increase its popular support. It may well feel shaken by the vicissitudes of the past year and none too confident of the future; for although it can, and does, promise the workers that the next five-year plan, starting in 1956, will concentrate on improving their standard of living, it has not much, except hard work and short commons, to offer them in the meantime.

Waiting in Hospitals

THERE will be general approval for the Ministry of Health's circular to hospital authorities about long waits in out-patient departments. In the old voluntary hospitals an appointments system was virtually impossible. The doctors were unpaid and consequently not under contract to work for specified hours; many of the patients had no general practitioner and used the hospitals for minor illnesses and routine treatment.

All this was supposed to be changed by the health service. Patients would come to hospital only on the initiative of their own doctors. The consultants would be paid, and would therefore attend for fixed hours each week. The opening of out-patient departments in the former local authority hospitals would spread the work more evenly. But, in spite of this supposed rationalisation of both the supply of out-patient facilities and the demand for them, complaints of long waits seem to be more frequent than ever.

This is not altogether surprising, for it is far more exasperating to come at an appointed time and be kept waiting an hour or so than to turn up when one likes and be seen after three or four hours—a normal practice in the old days. The Ministry would, however, presumably not have sent its circular without plenty of evidence that much of the present waiting time is unnecessary. Some of it is due to bad organisation and some to unpunctuality on the part of the medical staff: there is a strong hint in the circular that some consultants take on more work than they can fit in. But the hospitals and their staffs have much to contend with. The amount of out-patient work under the health service has greatly exceeded expectations; the hospitals, however, have not been allowed to increase their accommodation or their staff to anything like the necessary extent—and will look wryly on the Ministry's suggestion that they should employ lay receptionists to keep out-patients happy. Too many cases are crowded into a session, and several are asked to arrive at the same time, not from incompetence but so that facilities shall not be wasted by the failure of patients to turn up or by the disposal of a case in a few minutes. With their present resources some hospitals will completely eliminate waiting time for out-patients on the day of their appointment only by extending the waiting time—often too long already—before an appointment can be made.

New Drift from the Land

IT is often assumed that the prosperity of agriculture since 1939 has halted the long-standing decline of the rural population. In fact, although villages in the vicinity of large towns and industrial areas have generally expanded in recent years, the population of the purely rural districts—which still cover over three-quarters of the area of Britain—has in most cases continued to decline.

The problems of these areas have recently been examined in an illuminating report by the Northumberland Rural Community Council.* Most parts of Northumberland have lost population in the last few years, and further migration will take place unless some action is taken. The number of regular farm workers, particularly young workers, is falling. This is partly the result of mechanisation, but partly too it follows from the lack of alternative occupations and of social facilities. The process is cumulative. The loss of a few passengers may mean the closing of a bus line, and a dozen children may be the deciding factor in the fate of a village school; when the buses stop and the school closes, more families move away. The report also points out that housing progress since the war has been slowest, in relation to needs, in the remoter districts of Britain.

The only real solution is the introduction of alternative occupations to agriculture. The areas in which the Forestry Commission has been active are exceptions to the general picture of decline. Apart from forestry the chief hope is to attract a few industries into the small rural towns. This is a possibility that deserves careful consideration, and perhaps financial backing, by the Government. The alternative—to ladle out numerous special subsidies to improve living conditions, including the disguised subsidy in running nationalised transport services at a loss—seems likely to be both costly and ineffective. A further fall in population will also react on agricultural production; and it seems odd to spend large sums on conserving agricultural land in the vicinity of the towns while letting land go out of use over much of the country. This is another example of the inconsistency and pointless waste in successive governments' policies for agriculture and the countryside.

Books & Publications

From Norway to Singapore

THE WAR AT SEA, 1939-1945.
Volume 1: The Defensive.
By S. W. Roskill.
Her Majesty's Stationery Office. 686 pages. 42s.

WITHIN the next ten years the Royal Navy has to be redesigned and rebuilt for the tasks of the next twenty years. What principles and calculations should rule this reconstruction is a matter of deep perplexity and keen dispute, in which memories of what was required of the navy only recently are sometimes less vivid than imaginings of what will be required of it in the future. Here in Captain Roskill's first volume—and in the two which are to follow it—is the stuff for study of the permanent factors in British maritime strategy and for a judgment of how much it should undertake on its own and how much it should rely on allies.

In this part of the narrative, which ends with the disasters in the Pacific in December, 1941, Britain is fighting virtually alone against two naval powers, each able to challenge its command of the sea with land-based aircraft as well as with surface ships and submarines. It is a most ominous story of narrow squeaks and overstrain, with the navy being diverted time and again from its proper tasks by failures on land, or handicapped by the Air Ministry's tardy understanding of the ways in which an imperial island power must keep control of the sea routes. Norway, Dunkirk, Crete, the siege of Malta, Oran, Dakar, the hunting of the *Bismarck* and the German battle-cruisers, Matapan, Singapore—and on top of all that the ceaseless battle in the Atlantic, along the coastal routes, and in the very ports and estuaries of these islands—these are Captain Roskill's themes.

He is a good narrator and gives his verdicts on the main operations with judicious boldness. Some of them, indeed, might have been sharper on the evidence that he provides; for example, he has found no explanation of why the *Prince of Wales's* mission to Singapore was not reviewed on her arrival at Cape-town as had been agreed between the First Sea Lord and the Prime Minister; nor does he direct any rebuke at those who sent this ship in pursuit of the *Bismarck* with her radar not working properly, her 14-inch armament faulty, and her ship's company not fully efficient. He might with advantage have been more outspoken in what he says of Churchillian interference in the Norwegian operations and in his review of the Cabinet's instructions for dealing with the French fleet. But this is an official history, and those who wish to praise or blame can read between the lines.

The great virtues of the book are its clarity and arrangement. Its moral is the danger of economies and complacency in peacetime, and the need to bring air power—wherever possible under naval control—to the assistance of ships. One wonders whether Bomber Command, Coastal Command and the Navy are now better co-ordinated in essential respects than they were in 1940 when

> the command which carried out reconnaissance work possessed no striking power, and the command which possessed striking power lacked the equipment and special training needed to find targets or, if the target was located, to strike with weight and accuracy.

In short, could Bomber and Coastal Commands now locate, identify and deal with the Sverdlov cruisers, if necessary?

Then there is the question of bases. Millions were spent uselessly on Singapore; but Malta, Gibraltar, Alexandria and even Scapa were quite inadequately defended. The Home and Mediterranean Fleets could never relax in their bases. Singapore is still costing money, while Portsmouth, Chatham and Devonport are being maintained as major bases within easy missile range of the continent.

One feature of this history is of special interest. Captain Roskill has had the German naval archives at his disposal to check all facts about major operations. Here, therefore, is virtually the whole truth about the U-boat war and about the sinking of the *Graf Spee* and the *Bismarck*; he is able to compare Admiralty estimates with facts about the Germans that have hitherto been secret. We know now that Hitler planned to have by 1942—his original date for starting war—13 battleships, 33 cruisers, 4 aircraft carriers, 250 U-boats and a large number of destroyers, all modern ships. Against such a force the task of the Home Fleet—which gets so little credit for its wartime exertions—would have been perhaps beyond its strength.

On two major points of dispute this volume is inconclusive, although sensational reviews have suggested the opposite. Captain Roskill is critical in several places of Admiralty control over operations at sea; but what he says against that control in the case of Norway has to be balanced against what he says in its favour in the case of the *Bismarck*, when the Admiralty's work in intelligence, co-ordination and direction was brilliant. Likewise on intelligence; it is true that the first year of operations often found the Admiralty at a loss to keep track of German warships or to estimate German intentions. But intelligence quickly improved and both the convoys and their escorts owed much to it during 1941. For a final judgment in these matters it will be necessary to see what Captain Roskill has to say in his next two volumes. It is, incidentally, a pity that the first two volumes of the war history on Grand Strategy have not come out at the same time as the campaign histories, so that the reader could keep a sense of perspective. It should be some Minister's business to see that publication is not unduly delayed by criticism, sensitivity and private interests at "a high level." If history is to be written so soon after the event, participants should be ready to accept the kicks as well as the laurels.

Divided France

DEATH OF THE FOURTH REPUBLIC.
By Ronald Matthews.
Eyre and Spottiswoode. 318 pages. 18s.

"THE France of 1953," writes Mr Matthews, "is no sort of place for those who have not safely stifled the dreams and the hopes of the Liberation." His excellent book is the tale of the reverses that befell the men of the Resistance who tried to renovate France. The premiership of M. Pinay in the spring of 1952 marks, for Mr Matthews, the death of the new regime inaugurated by the great reforms of General de Gaulle's provisional government and institutionalised in the 1946 Constitution.

The author regards the rejection of austerity and the bungling of the Indo-Chinese problem as the two greatest disasters of the period 1944-1947. In January, 1945, M. Mendès-France proposed an exchange of the note-issue; the freezing of bank accounts; measures to catch war profiteers; and a balanced budget. Instead rationing broke down; the black market flourished; there was soon a 50 per cent increase in wages; prices soared; and new money had to be printed. Inflation was thereafter to be the meat and drink of the Communists, who could make the difficult transition from patriotic resistance party to a permanent revolutionary opposition that struck blow after blow at the new Republic's heart.

What Mr Matthews calls "the Cerberus-headed government" of *laique* Socialists, Catholic MRP and fossilised Radicals, which administered France from 1948 to 1952, could do nothing but preside over industrial and agricultural stagnation saved from outright decay by large injections of American aid. This *immobilisme* could only perpetuate the divisions of the people. Its fruits abroad were an equivocal, or rather multivocal, Indo-Chinese policy, of which the one undisputed reality was a roaring trade in black market piastres; and the calamitous satrapy of General Juin at the Rabat Residency, which did more than anything

One of these is sure *to please*

Do you know the North of England?

★ Kemsley Newspapers have just published a report giving invaluable information to those who market goods in the prosperous North—the Kemsley Report on newspaper readership in the North of England.

This report is based on a survey conducted with complete impartiality by an independent research organisation, whose investigators did not know for whom they were working. The new and vital facts they discovered are now available to you.

★ Certain conclusions are inescapable. You are bound to appreciate, for instance, the importance of the Daily Dispatch—the largest-selling morning newspaper in Great Britain published wholly outside London—strongly concentrated in rich, heavily populated Lancashire and Cheshire. And 73% Daily Dispatch readers in this area read no other morning paper. The report is equally revealing about other newspapers in the North of England.

★ You should read the Kemsley Report. It is carefully arranged and produced for quick and easy digestion. You can assess its results in terms of your own marketing problems.

For facts, figures and analyses, read

else to fan the flames of Moroccan nationalism.

The author's narrative is that of an experienced, fair-minded and idealistic Englishman, who is indignant at the wrongs done by Frenchmen to Frenchmen. It is here that doubts about the proportions of his judgment sometimes arise. Mr Matthews is aware that France has been politically unsuccessful for about two hundred years; but he never seems to ask whether *any* French national state could have achieved or can achieve harmony among Frenchmen. When it comes to politics, it is innate attitudes that count, and the Gallic ones are politically destructive. Clarity is too apt to lead to anarchy (was not the Fourth Republic really pre-destroyed by the schoolmasters and professors of the Third?); *panache* to irresponsibility; refined hedonism to narrow horizons and a distaste for change. The cohesive stuff of constructive politics, the stamina-giver, is something less conscious than logic; and, in these complicated times, something less simple than the classical political sentiments. Whatever it is the French lack it.

Demographic Turning-Point

PROSPERITY AND PARENTHOOD.
By J. A. Banks.
Routledge and Kegan Paul. 240 pages. 21s.

THE International Library of Sociology and Social Reconstruction has to its credit a list of volumes possessing impressive merits of profundity, originality and scholarship. Their greatest admirers, however, would hardly attribute to them, in addition, a high entertainment value and the qualities of a good bedside book. "Prosperity and Parenthood" miraculously achieves this perfect left-and-right. It is a highly serious study—as its subtitle indicates—of "family planning among the Victorian middle classes"; a close historical and analytical examination of the almost universal thesis that rising standards of living mean smaller families. It is also a wonderful *olla podrida* of domestic and social lore, a companion to history and literature, with the charm of an old volume of *Punch* or a canvas by Frith. The life of Anthony Trollope is used as a case study; there are delectable quotations from women's magazines, annuals, domestic handbooks, and such esoteric monographs as the "History of Coaches" (1877), the cost of crinolines, the social hierarchy of the servants' hall, nursery menus, carriage harness, best bedrooms. . . . One might be reading a source-book for Miss Marghanita Laski's "Victorian Chaise-Longue," or documenting oneself on the home life of the Pontifexes.

Needless to say, entertainment is not Mr Banks's prime object; all the delectable tit-bits (though there is no mistaking the gusto with which he introduces them) have a bearing on his main theme: the evolution of the middle-class family standard and the parallel evolution of a prudential attitude to family size. One can speak of parallel evolution; it is not, he concludes, scientifically justifiable to speak of cause and effect. The "standard of living" is far too loose a concept—the standard achieved and the standard conventionally aspired to may be, for instance, very different things, and a divergence between them can be far more important than their absolute level. Moreover much depends, in this context, on the components of the standard; the fact that, as shown here, the late-Victorian middle class was taking out a larger and larger proportion of its standard in education and professional training, whose cost varied directly with the number of children, obviously strengthened their incentives to prudence. The beginnings of the emancipation of women; the first far-off rumblings of the Servant Problem; the impact of the depression of the last quarter of the century on a class whose appetite for material well-being had grown with what it fed on through a generation of rapidly mounting prosperity; all these influences worked in the same direction—and the means of family limitation were, if not precisely ready to hand, at all events not unknown after the Bradlaugh-Besant case. If it is hard to judge just what did change Victorian family habits, it is even harder to take a line through the nineteenth century to the twentieth. If the circumstances of the middle class enjoined a prudential family limitation in the mid-seventies, what do they enjoin now? Women are more emancipated than ever, servants practically non-existent, education and professional training a bigger burden on the budget, the divergence between the material lot of the bachelor and the family man or woman is wider than ever, and the slight economic chill of the 1873 depression appears negligible beside the Ice Age of today's social revolution. Yet the middle classes, astonishingly, marry a good deal younger than they did a generation ago, and produce rather more children. Any twenty-first-century successor to Mr Banks will have a very hard time indeed.

Liberal Optimist

ESSAYS WITH A PURPOSE.
By Salvador de Madariaga.
Hollis and Carter. 199 pages. 15s.

ONE would certainly not expect an author of such distinction to write without purpose. The essays have, indeed, many purposes, since they are addressed to a variety of audiences at varying times and places, with a certain amount of repetition and some contradiction that could have been avoided by more careful editing. Nevertheless there remains a constancy in bias which might fairly be called the de Madariaga climate of opinion, which epitomises what is best in the liberal spirit and balances the materialism of the Left and the nostalgia of the Right with a stimulating faith in the immense possibilities for good inherent in modern scientific discoveries.

The author believes that the modern dilemma is the reaction of human nature

COLLINS

Fire in the Ashes

EUROPE IN MID-CENTURY
By THEODORE H. WHITE

There can be few who fully understand what has been happening all over Europe since 1945. This book has been written to make intelligible to all who will read, the complex problems which have been and are being faced there, and the solutions to those problems. It is not an economic treatise, nor does it make play with vast incomprehensible figures. It seeks to translate figures into deeds and problems into human experience. For the first time it is possible to see, as a whole and in true perspective, the picture of Europe rising from the ashes of despair. 15/- *net*

Strategy for the West

By Marshal of the R.A.F. SIR JOHN SLESSOR, G.C.B., D.S.O., M.C.

In the midst of public clamour for the suppression of the H-bomb, Sir John Slessor argued on the Television programme devoted to the subject, that the H-bomb was, in fact, the greatest insurance for peace which man has yet devised. It is this conviction which underlies the strategy which he proposes for the Western World in this fascinating and confident book. 9/6 *net*

JUST PUBLISHED BY CASSELL

against the exacting claims made upon it by reason and by liberty during the nineteenth century; that political standards must recognise the primacy of man's spirit; that creative work and moral decisions can only emanate from free individuals in a free society; and that the core of freedom is enlightened choice. He shows an invigorating scorn for quantitative mass democracy which results in the extinction of the out-of-the-common man by mediocracy—a moral destruction which he finds more terrible than the threatened physical destruction of atom warfare.

As might be expected, the most satisfactory essays are about Spain. Señor de Madariaga likes to jolt us into attention by unusual premises, and begins this section by roundly stating that the discovery of America was a disaster for Spain in that the Spanish genius was thus deflected from its natural future to the south. He rapidly sketches in a geography *manqué*, with Mexico in Morocco, Colombia in Algeria, Peru in Tunisia, Chile in Egypt, Argentina in Asia Minor, and the Mediterranean a Spanish sea. The British Commonwealth is then fitted into South America with a resultant "natural harmony of world destinies" and an Anglo-Spanish alliance that "would have become the chief arch of the Western world." In a similarly provocative spirit he undermines heroics about the duel between Cross and Crescent, presenting the Cid, himself, as a soldier of fortune rather than the paladin of Christendom. Another sleight of argument manoeuvres the responsibility for the Jewish persecution and expulsion on to the Jews themselves, and refutes "time honoured ideas" by assigning to them a major role in the setting up of the Inquisition. The logic seems to be that the individualistic Spaniards could not have maintained the persecution or the Inquisition but for the influence on the Spanish blood stream of Jewish persistence.

The last essay makes merry over the British claim to be a practical people while they continue to entangle themselves in a jungle of weights and measures, remain stubbornly blind to the advantages of a Channel Tunnel, refuse to standardise the spare parts of cars with American production, and wallow in the complications of unreformed spelling.

Philosophical Pellets

AN INTRODUCTION TO POLITICAL PHILOSOPHY.
By A. R. M. Murray.
Cohen and West. 240 pages. 12s. 6d.

"IF a short and simple phrase is required to describe the essential purpose of political philosophy as commonly understood, the justification of government would seem to meet the need." So begins the final chapter of Mr Murray's short and simple "introduction." And certainly the theme developed throughout the book—the justification of government—serves as a criterion of relevance for selecting snippets from the history of political thought. It enables the author to deal briefly and clearly with the views of those thinkers from Plato to Marx who jostle for attention in countless courses on the history of political ideas; it also enables him to combine a fair amount of philosophical clarification with historical exposition. So many books on the history of political philosophy are all history and no philosophy.

Mr Murray has written a sensible, competent and singularly unexciting introduction which will serve the valuable purpose of presenting at least one philosophical problem to students in a way that does no great violence to history. But are there not enough introductions of this sort on the market? Is the bird's-eye view method the most stimulating way of introducing the imaginative discipline of philosophy? Or does the author aim only at helping students through an examination paper in a subject about which they have not enough time to get excited? The light that illuminates the familiar, well-worked landscape is the glow of the setting sun. But must the extra-mural student, to whom the book is explicitly addressed, always have to make do with the philosophical pellets of an era that is passing?

American Historian

CHARLES A. BEARD: AN APPRAISAL.
Edited by Howard K. Beale.
University of Kentucky Press. 322 pages. $4.50.

DR CHARLES BEARD was one of the very few American historians who was able both to write and to interpret historical data. As an original scholar, a man of progressive ideas and a valiant champion of free thought, he was respected by his colleagues and friends at home and abroad. To the European observer, Dr Beard was among the most distinguished of American contributors to the social sciences, his great merits being his refusal to submit to the passion for specialisation which has been one of the worst features of American scholarship, and his ability to make history and politics interesting to the ordinary reader without departing from the exacting demands of critical scholarship. In order that this appreciation might be recorded, several of his closest associates decided to prepare a series of essays which would together constitute an appraisal of his influence upon American history and political thought.

Although the authors of this volume were agreed upon the value and the significance of Dr Beard's contribution to American creative historiography, those who disagreed with the view point of several of his books, particularly the later ones on foreign policy, were more numerous than those who shared his intellectual position. Of Dr Beard's voluminous writings over nearly half a century, perhaps the most controversial are his early works on the economic interpretation of American history and his later studies of United States foreign policy.

The economic determinism of Dr Beard's early writings, if not strictly Marxist, was surely revolutionary in the view of his more orthodox and traditionalist colleagues. As Mr Max Lerner explains in his essay, he was testing out a theory which, if it proved tenable, would show that "the real dynamism of American history was the conflict of group and class interests—a conflict so profound that it operated even in the sacred area of the framing and ratification of the Constitution itself, and in the minds of the most sainted and revered men of American history." In his "Economic Interpretation of the Constitution" (1913), Dr Beard was determined to prove that the Constitution owed its character to those property owners whose economic interests were gravely threatened by the economic insecurity under the Articles of Confederation. He argued that the Fathers of the Constitution produced "an economic document based upon the concept that the fundamental private rights of property are anterior to Government, and morally beyond the reach of popular majorities." In effect, Mr Lerner says, he regarded the "*laissez-faire* mumbo jumbo" as "an effort to clothe the property interests of a plutocracy with the sanctity of a taboo."

On foreign policy issues, Dr Beard also aroused a storm of controversy: as a confirmed nationalist and isolationist, he attacked the imperialists for being out for money and markets, and the internationalists for being out to save the world. In his last writings—"Foreign Policy in the Making, 1932-1940" and "President Roosevelt and the Coming of the War, 1941"—he lost a considerable proportion of his followers by waging an unceasing but fruitless campaign to convince his public that President Roosevelt, frustrated by the economic dilemma at home, was manœuvring the country into war. It was most unfortunate that a man who had devoted the greater part of his life to furthering the cause of freedom, reform and progress should have ended such a distinguished career by championing a cause which was associated with the worst forms of reaction and isolationism. Dr Beard failed to see that the democracy and freedom which he so keenly desired were indivisible: they could not be preserved at home while they were in danger of annihilation abroad.

The Oppenheimer Decision

Washington, D.C.

THE tragedy of Dr Robert Oppenheimer, the atomic expert who has been found, by a special board of inquiry, to be "loyal," "discreet" and yet a "security risk" who should not be trusted with secret government information, seems to many in Washington to be also the tragedy of Mr Gordon Gray. Little was known of Mr Thomas Morgan, the other member of the three-man board who joined Mr Gray in signing the majority report. But Mr Gray has been in and out of Washington for some years, always ready, in the tradition of the best public servants, to accept unpleasant jobs from which those with political aspirations had fled. It was in this spirit that he undertook the thankless task of chairman of the Personnel Security Board which inquired into this case for the Atomic Energy Commission, and it was probably his courage and his insistence on facing issues that led him and his colleagues into the trap of making claims of competence, on behalf of the government and of themselves as agents of the government, in areas where man—democratic man, at least—seldom ventures.

From the beginning, the board's task was probably an impossible one because its members were being asked to review, within the terms of a presidential order, a case which was not susceptible to interpretation by such rigid standards. At one point, they asked the question: "Can a different test for security purposes be justified in the case of the brilliant technical consultant than in the case of the stenographer or clerk?" Their answer was that "such a distinction can be justified only on the ground of critical national need and that otherwise there can be but one standard for all." And they decided that, as Dr Oppenheimer's services as a consultant were used by the Atomic Energy Commission for only two and a half days in 1953, there was no longer any need to invoke the doctrine of "critical national need" in his case.

But they took no notice of the equally valid point made by the editors of the *Bulletin of Atomic Scientists* that

> it seems to us a breach of faith on the part of the government to call upon a man to assume such heavy responsibility in full knowledge of his life history and then, after he has demonstrably done his best, and given the most valuable services to the nation, to use the facts to cast aspersions on his integrity.

The board disposed of the argument that Dr Oppenheimer had been placed in "double jeopardy" by saying that this was a new kind of review, that it was the "only time that all of the available evidence regarding Dr Oppenheimer has been correlated and presented in a package" and that, since his last clearance in 1947 "new security standards and criteria" had been published.

There was also the allegation concerning his opposition to the hydrogen bomb, which the report refers to, as a further point in the "double jeopardy" argument, when it says that "viewed against the background of earlier history, the conduct of the individual subsequently to 1947 has been such as to raise questions of security risk." But, as Mr Lloyd Garrison, Dr Oppenheimer's lawyer, pointed out, all the charges about "improper action" while the critical decision about the bomb was being taken, and during the early stages of its development, were disproved.

There seems little doubt, indeed, that the decision of the majority of the board was influenced less by the allegations about the scientist's attitude to the hydrogen bomb than by the "package" of proven, and admitted, allegations about his earlier actions and associations which, the two members must have felt, could now be considered on their merits rather than dismissed on the grounds of national interest. As the Federation of American Scientists said, the board itself realised that the case was re-opened not because of any change in Dr Oppenheimer but because of a change in security regulations and in the climate of national opinion. The board may also have been influenced by the realisation that, if it were to clear Dr Oppenheimer, most other government employees who have been dismissed because of their past Communist associations would demand to have their cases re-opened.

*

Perhaps as a result of this dilemma, two new standards, not of loyalty, or even of security, but of acceptability for employment, were introduced and Dr Oppenheimer failed to meet either. The majority of the special board found that

> if Dr Oppenheimer had enthusiastically supported the thermonuclear programme either before or after the determination of national policy, the H-bomb project would have been pursued with considerably more vigour [and he] would perhaps have encouraged other leading scientists to work on the project.

And it decided that certain incidents "clearly raise the question of Dr Oppenheimer's understanding, acceptance and enthusiastic support of the security system." "He has repeatedly exercised," Mr Gray and Mr Morgan went on, "an arrogance of his own . . . which has frustrated and at times impeded the working of the system."

This is the first time that it has been suggested that every government employee or consultant must give his "enthusiastic support" to what many people consider an extremely dubious programme for ensuring the security of the United States. As Mr Garrison inquired:

> How can a scientist risk advising the government if he is told that at some later date a security board may weigh in the balance the degree of his enthusiasm for some official programme? Or that he may be held accountable for a failure to communicate to the scientific community his full acceptance of such a programme?

Mr Gray and Mr Morgan must have been worried by the implications of what they were doing because, in the introduction to their report, they discussed with mounting uneasiness the whole problem of security in a free society and expressed the hope that

> some day we may return to happier times when . . . security will cease to be a central issue, man's conduct as a citizen will be measured only in the terms of the requirements of our national society, and there will be no undue restraints upon freedom of mind and action and loyalty and security as concepts will cease to have restrictive implications.

But, while waiting for those "happier times," they must justify their claim to be able to weigh degrees of enthusiasm.

The justification is a remarkable one. They complain of Dr Oppenheimer's arrogance, but it is doubtful whether anything could be more arrogant than their assertion that "we believe that it has been demonstrated that the government can search . . . the soul of an individual whose relationship to his government is in question." This is a shocking claim to make on behalf of the State—a claim of divine prescience which even the totalitarians do not bother to put forward.

Nevertheless, the members of the board deserve sympathy for their courage in tackling a job which should never have been given to them. The Atomic Energy Commission itself still has to decide whether it should accept the board's reluctant recommendation and it surely did not require the time and energy of three distinguished men to discover whether Dr Oppenheimer was a "security risk" according to the narrow standards laid down for the screening of typists. Of course he was. The issue is whether, as a matter of national policy, Dr Oppenheimer should be employed regardless of those standards. There is only one man in the United States who could accept the responsibility for making that decision—the President.

Waiting for Allies

THE gloomy impatience in Washington at the lack of an allied policy for South East Asia springs both from the depressing reports from Indo-China and Geneva and from the approaching end of the congressional session. Members are afraid that adjournment may be delayed by another great debate on foreign policy; it seems possible that their fears may be justified, since the President has promised not to act in Indo-China *without consulting* Congress, since Congress itself is reluctant to give him a blank cheque to be used as he thinks best, and since a renewed effort to restrain Communist expansion in the area can hardly be postponed until after the November election.

At his press conference this week the Secretary of State insisted, as the President had a week earlier, that there were as yet no plans for asking Congress to authorise American intervention in Indo-China. Mr Dulles explained that the only proposals so far were for united action and that, although progress was being made, these proposals had not yet been accepted by the other interested countries. Unfortunately, this excuse may win support for those who have once more been advocating that the United States should "go it alone" in the Far East. While Mr Dulles has admitted to Senators that in an emergency this might be necessary, he stressed that it could only be a last resort and was not being considered at present. Mr Knowland, the Republican leader and Far Eastern expert in the Senate, who is pressing for an immediate decision on Indo-China, believes, probably rightly, that if the United States gave a lead, most of its allies would inevitably follow.

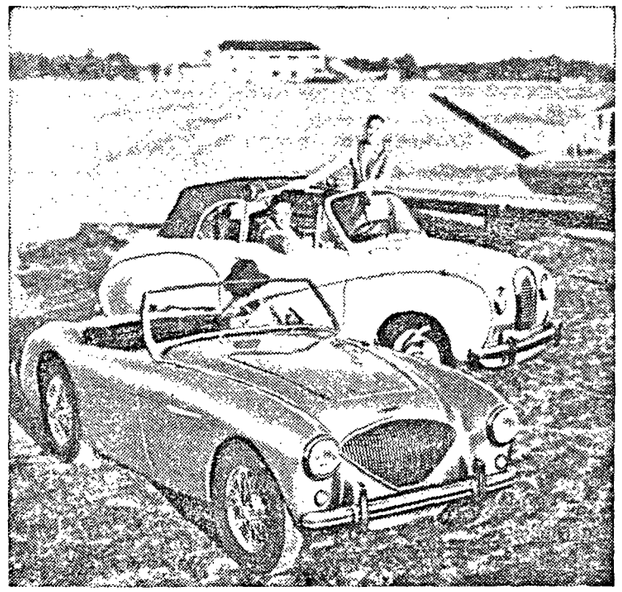
But it is partly because many of these allies suspect that such a lead might take the form of an atomic attack that agreement on united action has been difficult to reach. The military implications of such action are now being worked out at a five-power conference in Washington. It is reported, however, that there is a difference of opinion among the United States Chiefs of Staff themselves on whether naval and air operations would be adequate, something which the United States, with the help of atomic weapons, might conceivably undertake alone, or whether American troops must also be sent if the Communists are to be checked in Indo-China. The latter is hardly politically practicable at the moment and probably never would be unless full allied participation were assured.

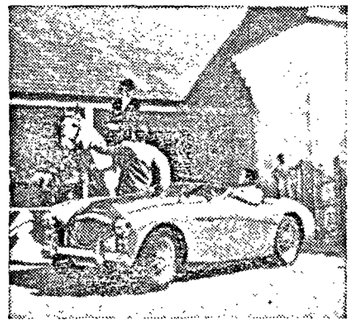
Housing Escapes

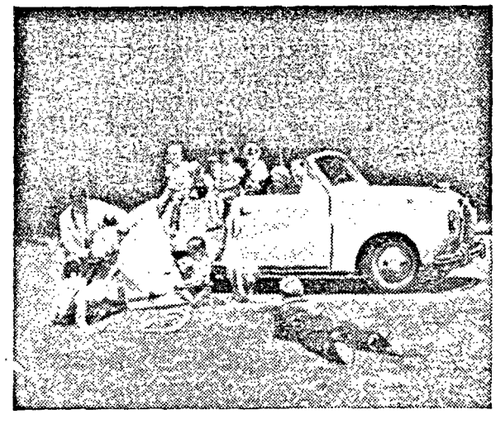
THERE was never any serious doubt that the President's housing programme would survive its journey through Congress. For he took it over, with the addition of some extra emphasis on private enterprise in building, from the Democrats on whose votes depend in practice nearly all the Administration's congressional majorities. Furthermore few Republicans would dare knock on the head a programme which supports prosperity so satisfactorily, as has been shown by the continued failure of the construction figures to decline with the rest of the economic indicators.

Nevertheless the legislation has this year faced as many perils as the heroine of a serial film. At the end of the first reel it was left by the House of Representatives without the important section authorising the federal government to participate in public housing undertakings. Experienced observers expected that these provisions would be rescued by the Senate in the second reel, as has always happened in the past. But just as this was about to be done, another threat appeared, in the form of a Supreme Court decision against racial segregation in federally-supported public housing projects. This drove Senator Maybank of South Carolina to oppose federal aid for public housing; traditionally he and other southern Democrats had been its chief advocates. Without these Democratic votes this section of the legislation, unpopular with many Republicans, seemed to be in serious danger. It was saved by the Republican leaders who rallied their party in order to give the President an important victory, and authorise the starting of 35,000 public housing units a year for four years.

launched: *an idea*







Austin of England introduced the idea of the British light car to the American market. They did this in 1948.
They did this initially through the advertising pages of The New Yorker Magazine. Very first year in the market Austin sold more than 8,500 cars.
They have been selling cars ever since.
They have been advertising in The New Yorker ever since. So, too, have many other makers of imported cars—an advertising classification in which The New Yorker leads handily as this new motoring fancy has taken hold in the United States. Afoot, on horseback, or in a motorcar, New Yorker readers are the people other people follow.
Have you an idea to launch?

sells the people other people follow

THE NEW YORKER

21 GROSVENOR ST., LONDON, W.1
GROsvenor 5248

Meanwhile, however, the rest of the housing programme had been menaced from an entirely new quarter. Serious scandals were discovered in the Federal Housing Administration; this agency is responsible for most of the loan guarantees and mortgage insurance schemes by which the government encourages private building and which the President wanted to make more liberal. Luckily, however, these scandals were bipartisan, having occurred under the previous as well as the present Administration, and therefore the matter did not become a political issue. The Housing Bill finally emerged from the Senate with various additions designed to prevent a repetition of the abuses, which the FHA itself had already dealt with drastically, but also with most, although not all, of the changes the President had asked for. Exactly how happy an ending of the housing story has will be decided in the third reel, the conference between representatives of the House and Senate, who must agree not only on the anti-scandal clauses but also on the public housing question, which will be more difficult.

Stockpiling to the Rescue

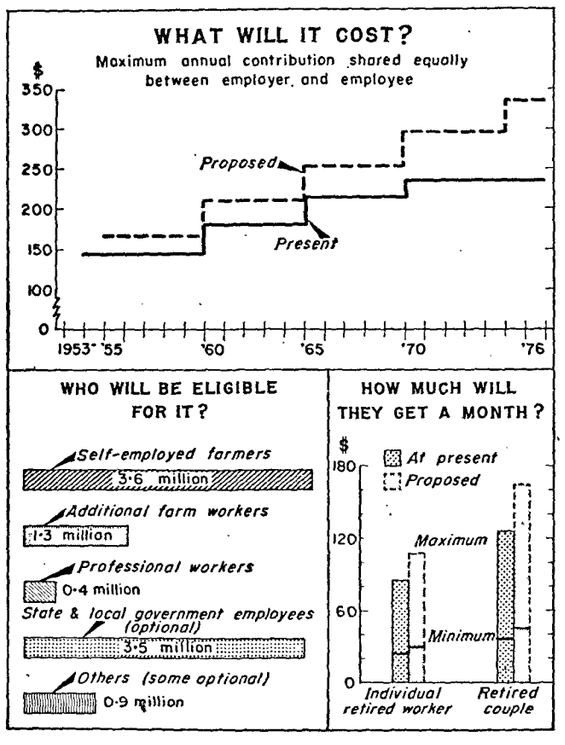
THE Administration's revised and extended stockpiling policy, outlined two months ago by President Eisenhower, is at last taking concrete shape with the announcement that the government will now enter into contracts for the purchase of lead and zinc. These two metals are among the 30 to 40 strategic materials which qualify for government support under the new programme; it conveniently combines greater preparedness for war with the rather more pressing need to "keep some kind of floor" under the domestic output of key commodities. Indeed, lead and zinc prices have rallied in recent weeks, partly in anticipation of this move and partly because domestic consumers fear a possible tariff increase later in the year. No details have yet been given of the quantities to be purchased, nor has the Administration specified the other metals and minerals which it intends to stockpile in the new fiscal year; chrome, tungsten and manganese are thought to be high on the list.

The latest semi-annual report from the Office of Defence Mobilisation, which has just been released, states that the original goal, for a stockpile worth $6.8 billion, was three-quarters of the way to realisation at the end of 1953. Under the new policy, the stockpile is expected to reach a total value of around $8.8 billion in the course of the next few years. The speed of accumulation will depend largely on the extent to which the government decides to "prop up" the markets for individual materials. While most of this spending will go to help domestic producers of minerals, the present attempt to barter surplus farm products against imports of strategic materials will also add to the stockpile; in the second half of last year such exchanges were valued at $13.8 million. Annual expenditure on the stockpile has declined steadily since the end of the Korean war, dropping from $919 million in the fiscal year 1953 to an estimated $770 million in the 1954 year ending this month. The budget for the coming year allocated $585 million for this purpose, but the Administration is now expected to ask Congress for a substantial supplementary appropriation to carry through its extended policy.

More Security for More People

IT is because they would like to copy the Democrats' record of twenty years in power that the Republicans have developed so much enthusiasm for copying, and improving on, something that they once detested as the archetype of the New Deal—the social security system for which the Democrats were responsible in 1936. The House of Representatives, with only eight dissenting votes, has just approved an important extension of the federal scheme for old age and widows' pensions, following almost exactly the recommendations of the Administration, and there is little doubt that the Senate will do the same before long. The President has, therefore, every reason to believe that he will be given a comforting slice of his legislative programme in time to put at least an extra $5 a month on the plates of some 6 million elderly voters just before they go to the polls next November. Furthermore, the new Bill would permit workers who retire officially at 65 to earn more than is allowed at present without sacrificing their insurance benefits.

About ten million additional job holders would be brought into the scheme, so that almost the entire working population would be covered by this or some other programme. The chief group still excluded would be casually employed agricultural labourers; state and local government workers can come in if they and their employers choose, and a number of other groups, such as clergymen, are included on an optional basis. But many professional workers, dentists, architects, lawyers and engineers, are obliged to join, an element of compulsion that was too much for the American Medical Association. The House agreed that doctors need not keep up with the times and left them,



and also policemen and firemen, out of the scheme. By far the largest self-employed group now to be included are the farmers; perhaps luckily for the Republican party, the election will be over before they have to start paying for their new privilege.

These pensions are financed at present by a tax on both employer and employee, of 2 per cent each, or of 3 per cent on a self-employed person, on earnings up to a maximum of $3,600 a year. To provide for the growing burden as more people become old enough to qualify for benefit payments, these taxes were already scheduled to go up gradually between 1960 and 1970; to cover the additional cost of higher benefits and increased coverage, the House Bill raises the maximum sum on which social security taxes are levied to $4,200 a year and requires a further increase in the percentage rate in 1975. In thus insisting on maintaining the insurance fund on an actuarially sound basis, with benefits related to average earnings, the House has rejected the recommendations of several business groups that pensions should be paid at a flat rate and met out of current contributions.

Depletion Allowances

New York.

THE Senate Finance Committee's discussions of the omnibus tax reform bill are providing this year's platform for the recurrent political debate on the merits of the tax relief known as "percentage depletion"—a tax allowance supposed to compensate for the gradual exhaustion, or depletion, of a natural resource. Under this method, a certain percentage of gross income is exempted from tax without reference to capital costs, in contrast to the "cost depletion" formula, which is similar to the depreciation allowance by which other businesses recover the capital cost of plant and equipment over a period. Percentage depletion has been applied mainly to the production of oil and natural gas. In the oil industry, a rate of 27½ per cent of gross income is permitted, subject to a maximum of 50 per cent of net income, and it is used whenever the benefit would exceed that derived from the normal cost depletion method.

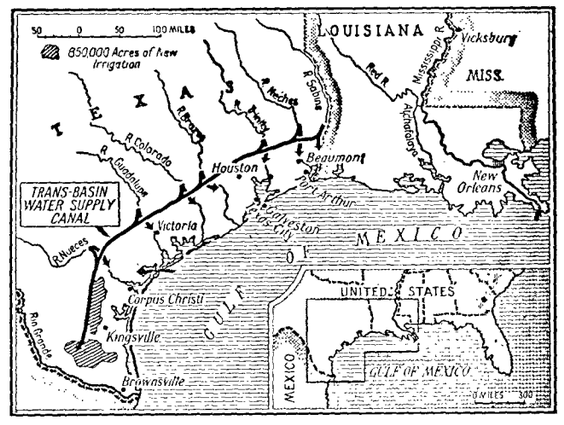
Since in this industry such tax benefits on a profitable property may be large and may continue after the entire cost of that property has been recovered, it is frequently claimed that depletion allowances have given oil producers an unfair advantage over the rest of American industry. Such comparisons, however, are misleading. For producers must replace not only their capital equipment but their wasting assets—their oil reserves—and must do so at a steadily rising cost and in the face of great uncertainties and financial risks. Out of every nine "rank wildcat" exploratory wells drilled, eight on the average are "dry holes," and only one in every 44 wells taps a really profitable field with over a million barrels of reserves. It is therefore as an incentive payment, as a reward for risk-taking, that percentage depletion must be justified. And since the essential nature of the incentive is to hold out big prizes to the successful, it is to be expected that the tax benefits will be heavily concentrated in the hands of a relatively small group of highly successful men. The reactionary political ventures of the more notorious Texan oil millionaires have been held up to scorn as the fruits of an inequitable tax system; but these men became rich in the first place not because of percentage depletion, but because they struck the most oil.

Critics, of whom Mr Truman is a notable example, admit that the device has achieved its object—the stimulation of exploration and development—although this might have been accomplished at rather less cost to the ordinary taxpayer. However, the Senate Finance Committee, instead of attacking this method of tax relief, has suggested that it be more widely applied. If these proposals are adopted, producers of some 27 minerals of strategic importance—excluding coal—will become eligible for higher depletion allowances.

Waters Over Texas

FROM A CORRESPONDENT IN DALLAS

EVEN though the unusually severe drought in Texas has now broken, there is a perennial shortage of water in this state. To meet this problem, the Bureau of Reclamation of the Department of the Interior has proposed a huge new system for spreading the state's supply of water. The main feature of the scheme would be a 450-mile canal beginning at the Sabine river on the Louisiana boundary, running parallel to the Texas coastline some sixty miles from the sea, intersecting the lower courses of the Neches, Trinity, Brazos, Colorado, Guadalupe and Nueces rivers,



and extending almost to the channel of the Rio Grande on the Mexican border. The canal, which would be approximately 200 feet wide, would flow towards the south-west at an average altitude of 50 to 75 feet above sea level, and would be fed by huge reservoirs on the intersected rivers at points a short distance above the canal. The flow would not be induced by gravity, since the channel would follow a slightly up-hill course. Some leveeing and pumping would thus be necessary at intervals.

Most of the area of the United States falls within large river basins but, in common with much of the Atlantic Seaboard, that part of Texas lying to the east of the central watershed is drained by a series of short, independent and parallel streams which together carry each year some 40 million acre-feet of water into the Gulf of Mexico; the western interior of the state is semi-desert. The new scheme would put the natural "water-works system" of Texas

under one authority, which might be an amalgamation of various independent bodies now operating.

The canal would produce a firm annual yield of 12,900,000 acre-feet. This would be achieved by a rapid turnover of water impounded in the reservoirs, plus the use of the normal flow of the streams. The main purpose of the canal would be to drain off the surplus waters in the eastern part of the state and deposit them in the semi-arid southern portion of the coastal plain between Corpus Christi and the Rio Grande, where it is proposed to irrigate 850,000 acres of "brush country" which is at present devoted to cattle and sheep ranching. This region gets only about 20 inches of rain a year, compared with an average of 55 inches along the Sabine. In addition, of course, the canal would supply water for municipal, industrial and agricultural purposes along its entire route.

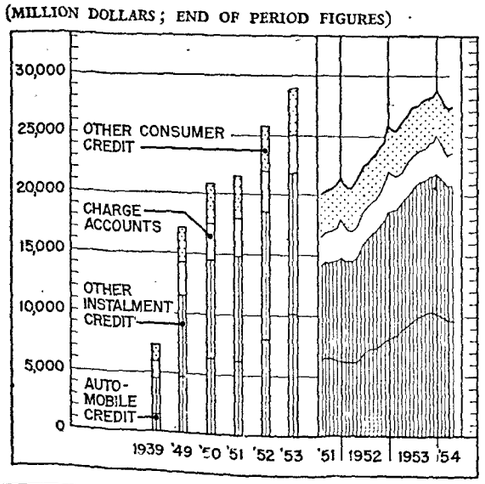
The cost of the new project, including reservoirs, the supply canal and an irrigation system, is estimated at $1,100 million, but the accompanying economic survey claimed that the resulting increase in the productivity of the region would justify a capital outlay of this size. Most of the increase in money terms would come from an expansion of the great chemical and light metal industries situated mainly in the Houston and Beaumont-Port Arthur areas. Rice production on the irrigated coastal belt from the Sabine river to Victoria would be greatly increased and the newly irrigated southern plains could produce, in this sub-tropical climate, beans, peas, spinach, tomatoes and other vegetables and citrus fruits for the winter and early spring markets. Cotton and grain sorghums could also be cultivated, and the livestock-raising industry intensified.

The execution of such a grandiose scheme would undoubtedly run into endless controversies. At a federal level, the Reclamation Bureau and the United States Army Engineers are likely to vie with each other for participation in the project. Under federal law, the Reclamation Bureau has jurisdiction where the aim is water conservation and irrigation, the Army Engineers where navigation and flood control are the principal objectives. Involved also is the delicate question of federal and state rights over the control of the waters of the rivers. Moreover, Texans from the arid interior complain that the execution of this project would jeopardise their future water supplies.

The bureau's report has been acclaimed in the Gulf region of Texas, where local engineers have suggested an even more ambitious scheme. This would extend the canal some 140 miles to the east so as to include the Atchafalaya river in Louisiana, which carries to the sea about one-quarter of the flow of the Mississippi—or more than twice the flow of the combined Texas rivers. This would be a tempting prospect for Texas, but such a scheme would almost certainly founder on inter-state rivalries.

CONSUMER CREDIT OUTSTANDING IN THE UNITED STATES

(MILLION DOLLARS; END OF PERIOD FIGURES)



No Subsidies for Substitutes

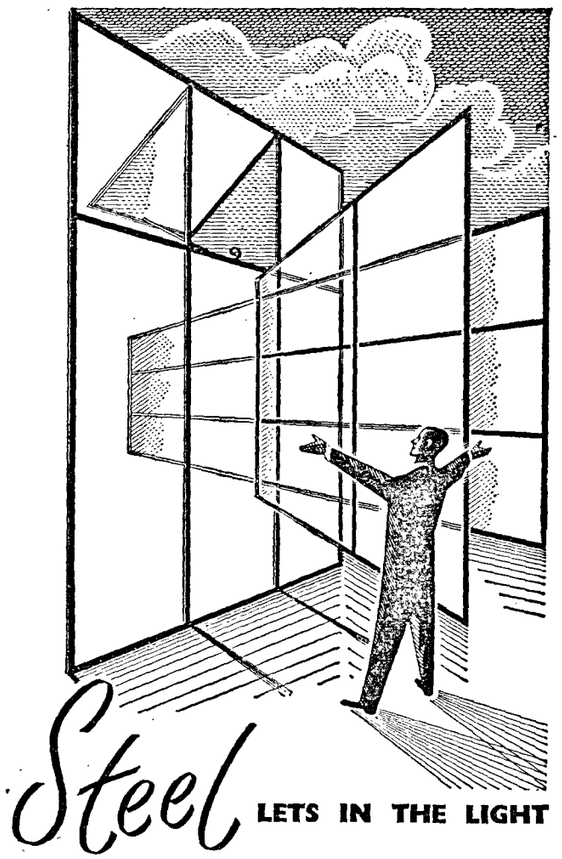
New York.

THERE is general agreement in the United States that it may be necessary, in an emergency, to supplement domestic and imported petroleum supplies by the production of synthetic liquid fuels from coal or oil shale. What is not agreed is how far the government should go in subsidising the development of these processes.

With information gleaned from the postwar investigation of German facilities, the Bureau of Mines built, at a cost of $15 million, two demonstration plants to test the two best-known methods of producing liquid fuels from coal—direct hydrogenation and gas synthesis. The Democratic Secretary of the Interior maintained that the coal hydrogenation process was ready for commercial development, and recommended government assistance to encourage private industry to construct a full scale plant. In this he was opposed by the oil industry, which has no enthusiasm for any process based on a competitive fuel, and considered his estimates of costs—particularly the credit given for the sale of by-product chemicals—wildly optimistic.

Mr McKay, the Republican Secretary of the Interior, felt that it was for private industry, not the government, to discover who was right, and that the two demonstration plants no longer justified their operating cost of $4 million a year. They were accordingly shut down, and handed over to the Army for disposal. They have been bought by the Hercules Powder Company, at a small fraction of their original cost, as part of a "package deal" for the purchase of more valuable ammonia facilities; at present the company's main interest is in the ammonia. One of the most promising developments in the chemical industry—the Union Carbide and Carbon Corporation's pilot plant in West Virginia—has indeed been in the field of coal hydrogenation, but the objective is the production not of liquid fuels, but of the more valuable aromatic chemicals. The gas synthesis method may also be improved; the Standard Oil Company of Indiana is taking an interest in it, although the raw material used is natural gas and not coal.

But while each of these private projects may contribute towards the eventual construction of an economic oil from coal plant, no such commercial development is yet in sight. The government's role will in future be confined to research in laboratories and in small-scale pilot plants, where some encouraging technical advances—notably a new and cheaper single-phase hydrogenation process—are still in the experimental stage.



Steel LETS IN THE LIGHT

Over 190,000 of the 318,779 houses built in Britain last year had steel frame windows, and hardly a school or a factory is built today without them. These windows are slim, long lasting, inexpensive; they let in the maximum amount of sun and light.

The steel for the frames is rolled into small intricate sections from 30 foot billets in up-to-date rolling mills.

Not only at home, but overseas, steel windows are being used more and more. Windows made of British steel now go to seventy-five different countries, including the United States and Canada.

The BIG Yellow 'CATS'

ARE PURRING BEFORE THE HEARTH

Before new hearths and homes can arise, row upon row, Caterpillar earth-movers must get to work. On building sites up and down the country, where soon there will be houses, hospitals, offices, schools and factories, you can see the distinctive yellow of the 'Cats' (world-famous nickname for these world-famous machines) and hear the powerful, purposeful throb of their engines. These are busy times for the 'Cats', speedily doing the spadework for Britain's building developments.

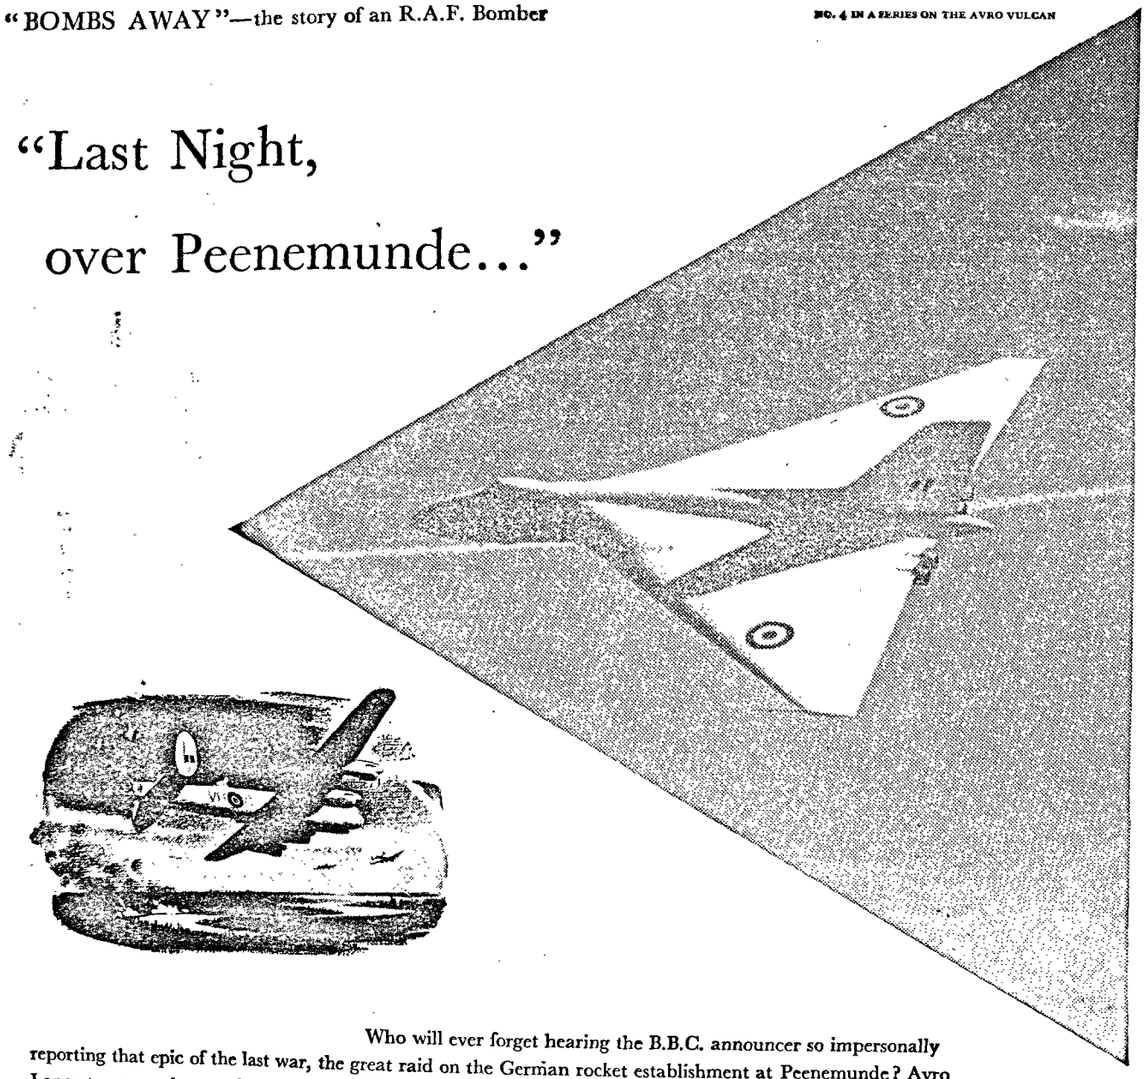
"BOMBS AWAY"—the story of an R.A.F. Bomber

NO. 4 IN A SERIES ON THE AVRO VULCAN

"Last Night, over Peenemunde..."



Who will ever forget hearing the B.B.C. announcer so impersonally reporting that epic of the last war, the great raid on the German rocket establishment at Peenemunde? Avro Lancasters were there and there in great force; as indeed they were in so many important operations—19 Lancasters took part in the epic of the Ruhr Dams and Wing Commander Guy Gibson won his Victoria Cross flying one of them in the destruction of the great Mohne Dam. The Lancaster was the R.A.F.'s most vital heavy bomber through the major part of the war. But this is not remarkable, for ever since the start of the Royal Flying Corps there has never been a year when an Avro 'plane was not in service, and the R.A.F. has long been accustomed to rely on Avro for many of its best machines. Today Avro is preparing to meet that trust yet once again. After many years of intensive design and prototype research, production is under way on the mighty Avro Vulcan. This is the first Delta Bomber in the world embodying an entirely revolutionary planform. Not only is the Delta the best design to satisfy all the new problems presented by near-sonic flight at high altitudes and long range, but it provides the long-sought advantage of aerodynamic simplicity which will greatly hasten and economise on production and ultimate service maintenance. Vulcans are now in super-priority production for the Royal Air Force.

The World Overseas

Canada Looks at the Far East

FROM OUR OTTAWA CORRESPONDENT

MR LESTER B. PEARSON, the Secretary of State for External Affairs, has reported to the Canadian House of Commons on the Geneva conference in terms of tact and delicacy which excluded most of the veiled comment on the conduct of international affairs of which he is a master. The House took a day to debate the situation at Geneva and in the Far East, and showed (as most of the press has also done) equal restraint. Neither in Parliament nor in the press has anyone provided such a neat summation of the Canadian position as appeared in a syndicated column from the United States. It is one of those columns offering advice on manners and morals, and it appeared under the heading "Brash Chum Worries Teen-ager." It set out to answer the following question from an adolescent girl: "A girl friend and I often go out together for the evening, and I enjoy her company because she is a good sport and has a wonderful personality. But it never fails that when we arrive some place where there is a crowd of people she tries to attract attention by talking loudly. This always embarrasses me. . . ."

The effect of Washington's recent handling of the Indo-China situation and the Geneva conference has been to hush most of the criticism of United States diplomacy which Canada generally feels itself privileged to express. This is the paradox of a dismay going too deep both for the luxury of light-hearted criticism and for the hope of exerting any corrective influence. Everything that most Canadians have been reading about Mr Dulles's conduct of American policy seemed to reach its apotheosis in these last three months. Canada, like the puzzled teen-ager, found it as impossible to get up and leave her chum as it was to remonstrate with her. It reached the pitch of embarrassment where there is nothing to do but sit it out in silence. The restraint of the parliamentary speeches amounted, in most cases, to a complete ignoring of the clamour of policy voices from the United States; and the angel who has charge of Canadian-American relations must have found this silence far more ominous than the usual criticism, which may be irksome but is entirely normal and healthy.

What the members of Parliament did talk about was the Commonwealth. From every party came tributes to Mr Eden's work at Geneva and to the importance of India, Pakistan and Ceylon in the whole Far Eastern picture. Mr Pearson regretted that they were not at Geneva. Mr John Diefenbaker, the Conservative opposition's spokesman on foreign affairs, said: "(Seato) will not operate unless it includes Asian members. I think that is a salient feature which must be realised." Mr M. J. Coldwell, the leader of the C.C.F. (Socialist) party, said:

> "For the western powers to enter such a pact with Australia and New Zealand (alone) would in our opinion be fatal to the democratic cause in Asia, and fatal to the peace of the world. I think," he added in one of the few direct references to the United States, "our US friends should be told that very plainly by Canada."

Replying to the debate, Mr Pearson elucidated the sentence in his opening statement which said that it is impossible to accept the principle of collective security in the Atlantic area and deny its validity in respect of other parts of the world. He said the same principle might work well in South East Asia, but he put in these conditions: "If it is carried out in the right way on the initiative of the Asian people themselves and those most directly concerned with that area." To say this, he made it very clear, was very different from saying that Canada should accept the same commitments in South East Asia as in Nato. "We would have to be careful, in view of our resources and our other commitments," said Mr Pearson, "in the extension of specific commitments beyond those which we have already undertaken."

In a formal sense, therefore, Canada has not yet ruled out the possibility of participation in Seato, if Seato ever comes into existence. But in practical terms it would mean a tremendous stretching of the limited resources of a country of 15 million people, to cover an area of only indirect importance to Canada, in conditions which seem unlikely to command general approval. If India, or even Pakistan and Ceylon, were to be parties to the treaty, Canadian interest would be aroused much more deeply: it would be easy to imagine a public demand then arising that Canada should make at least a token contribution to their security. But in the terms in which the pact has so far been discussed, it is difficult to imagine any significant public support for a Canadian effort that would necessarily be costly and would drag this country into a procedure of which it hardly even approves.

Mr Pearson evoked complete support when he said it was important to be clear about the object of "united action."

> Is it, he asked, to be against Communism as such, regardless of the means, military or otherwise, which it adopts to secure its ends in any particular Asian country? If it is, then we should realise that arrangements to achieve this end will be interpreted as a declaration of implacable

and fixed hostility, with all action short of general war, and even at the risk of such war, against Asian Communism.

The Nato conception, he said, commits its members to action "as soon as military aggression has been committed by one state against another—but not sooner."

The Pacific and the Indian Ocean are in no sense areas of traditional Canadian interest. It is within the last five years, or very little more, that Canadians have begun to feel any direct concern about them; and that concern did not start with Korea or in Korea. It started with the three Asian members of the Commonwealth. It still regards the Colombo plan and similar development projects as the most important thing the West can do in Asia. Korea intensified Canadian interest in Asia because it commanded support as a United Nations action to stop aggression. In so far as it has now become confused, through Syngman Rhee and Chiang Kai-shek and some American voices, with a crusade against Communism in Asia, Canadians simply beg to be excused. They would rather plug away at the long-range job of strengthening the democratic structure of the Asian members of the Commonwealth. When Mr Malcolm Macdonald recently entertained the Canadian Finance Minister the dinner party given for him consisted of prominent Chinese and Malayan citizens; and this precisely typified the kind of approach Canadians approve.

Strategically and politically, that is to say, Canada conceives its Pacific and Asian interests in very broad and long terms. It has very little to contribute to the defence of Australia and New Zealand, which make their own strategic arrangements with the United States and the United Kingdom. It has, perhaps, even less direct strategic interest in Malaya, which is a British concern, for Canada's support for the United Kingdom is provided in an area much nearer home for both countries. Seato may be good, but better far in most Canadian eyes is the gradual development of closer political and economic understanding between the West and the great countries of Asia which remain free. A western stampede to conclude security arrangements which arouse the disapproval of (for example and preeminently) the Asian members of the Commonwealth will get no support from here. Mr Nehru's influence is very great: Canada has no sympathy for an Asian policy which attempts to ignore it.

Iraq at the Polls

RARELY, in Middle Eastern elections, do all the parties keep going until polling day. Usually, some group or groups boycott the poll either because they anticipate loss of votes and of face, or because they expect that unfair pressure will be exercised by the government in power. It is a tribute to the Iraqi government that ran this week's general election that every party thought it sufficiently dispassionate to come to the starting post. There has been no need for martial law, and there were few disturbances until a week ago, when the so-called "peace partisans" began to hold noisy demonstrations, to throw stones at government offices and to behave in a way which, according to one newspaper, revealed them as "enemies of the peace" and "either hirelings paid by the enemies of the homeland or else so stupid that they cannot see the sun in the broad light of day."

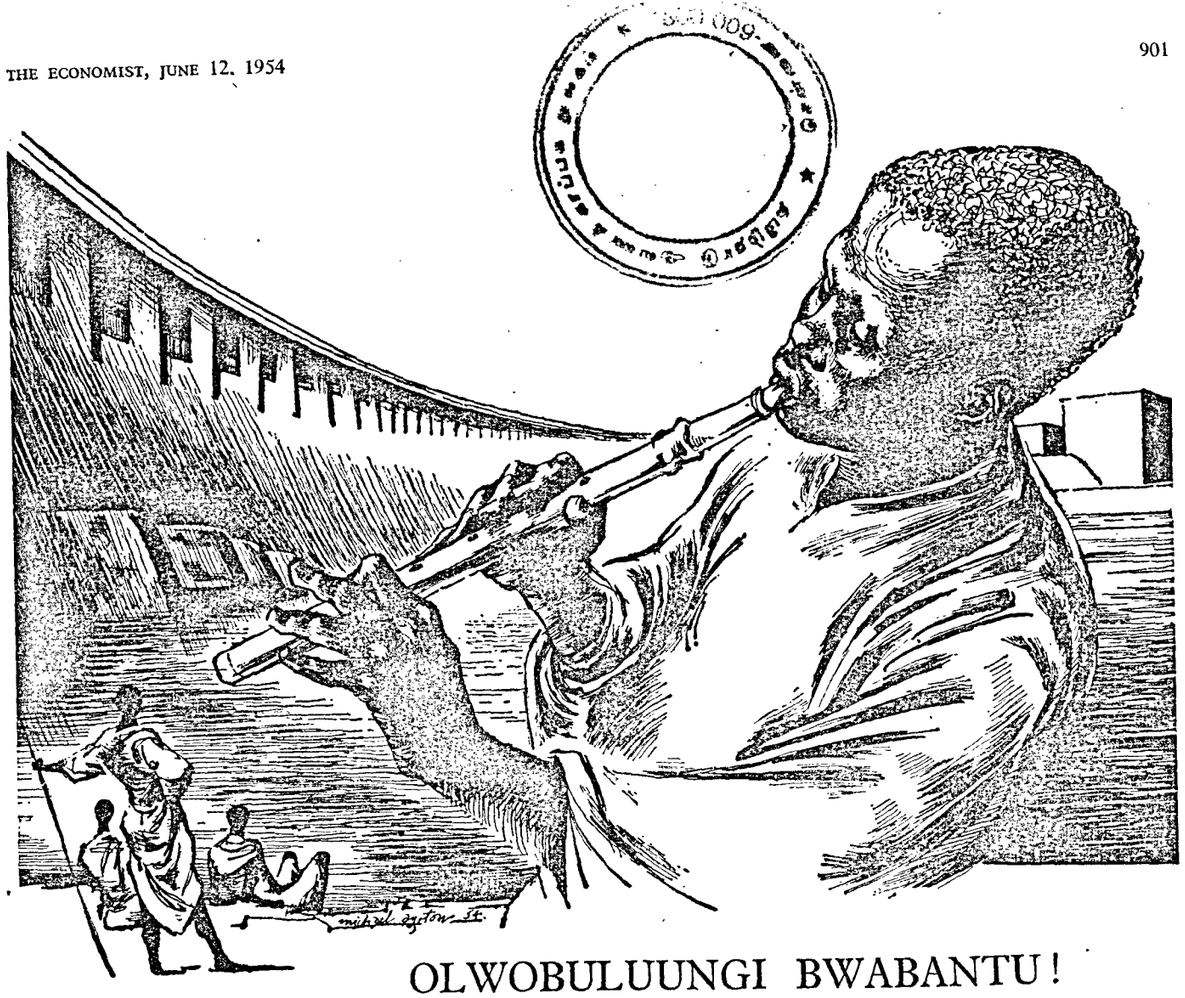
As the constituencies stand at present no election can greatly alter the complexion of the lower house. There are 135 elected deputies, of whom about twenty represent the country's three big towns of Baghdad, Basra and Mosul. In these towns, and in a very few of the smaller urban areas, it is possible for politicians without local affiliations to stand with some chance of success. In rural areas, convention ordains that a member of some local family of importance shall be returned; amongst electors who can seldom read or write such a result is easy enough to obtain. Except in the towns, therefore, interest in party successes and failures becomes a trifle academic.

Five parties stood last Thursday, and broadly speaking they fall into two classes—those whose acts are coloured by loyalty to ancient feudal interests, and those whose programme is all for breaking the feudal stranglehold, but otherwise contains no constructive notions outside the realm of glib generalities.

Feudal Rivals

The first group has as its largest component Nuri Pasha es Said's Constitutional Union Party. At the last elections in January, 1953, this party won easily because virtually everyone else had boycotted the poll on the grounds that under martial law it would not be free. Nuri's party thereafter indulged in some back seat driving. It acquiesced in the appointment of a cabinet of so-called progressive independents—alias younger men; but in effect, it held these in the hollow of its hand and broke the spirit of more than one minister who had hoped to gain its support for some modification of feudal privilege. Nuri himself is in London recovering from an operation, but his followers are fighting some 120 constituencies. Also in the first group is the Umma (Socialist) party led by Salih Jabr, divided from Nuri not by doctrine—their programmes are virtually identical—but by a clash of personalities and religious affiliations. Nuri musters the old Sunni aristocracy; Salih Jabr, who is a Shiah, commands respect amongst its Shiah counterpart. His group has put forward some 65 candidates. Both these parties are opposed to violent change; both would like to terminate the Anglo-Iraqi treaty of 1930, but both see in links with the West and the purchase of western arms the only means of defending Iraq's security and new-found wealth against covetous neighbours, not to mention Communist agitators.

The opposing group is armed with programmes that mingle pious social rallying cries with denunciations of the *status quo;* its slogans range from "no unemployment" and "better deals for the poor" to "out with all foreign interests, including the Iraq Petroleum Company." The parties concerned include the left wing National Democrats led by Kamil Chadirchi and the right wing Istiqlal or ultra-nationalist party. Calling themselves the National Front, these two groups are linked on the score of an anti-western foreign policy and have been adopted, therefore, by the so-called partisans of peace who parade under Picasso's dove. They are said to be putting 30 candidates into the field. A large number of independents, standing chiefly for rural constituencies, can usually be rallied in support of whatever party is returned in greatest strength. Their predilections will not be tested out for some time as Baghdad's somnolent months of immense heat are beginning and Parliament is unlikely to meet until November.



OLWOBULUUNGI BWABANTU!

FOR OVER FOUR YEARS Mukasa has watched the great dam being built at Owen Falls, to make more electricity for Uganda.

Mukasa has seen much good come from electric power.

In this new hydro-electric scheme he sees a brighter future for his people. "Electricity," says Mukasa, "is *olwobuluungi bwabantu*—for the benefit of Man."

Her Majesty the Queen, homeward bound on her world tour, recently opened the Owen Falls dam. The six 16,770-kVA waterwheel alternators, which make the electricity, are being supplied by one of the nine famous British companies that together make up A.E.I.

A.E.I. (Associated Electrical Industries) make everything electrical from a turbine to a torch bulb.

AEI

for everything electrical

Sunvic Controls Ltd.

The Servitude and Grandeur of French Communism

THE thirteenth congress of the French Communist party held in "red Ivry" reached its climax this week when Maurice Thorez took the rostrum. After five days of careful stock-taking and attentive listening to the official party line, the nine hundred delegates could finally give vent to their enthusiasm. Forgotten for the moment was the struggle for the succession. In front of them stood the leader, the strong "son of the people," thundering as in the old days. When he finished the audience cheered louder and longer than ever before; the cult of the individual was restored for the occasion and the principle of collective leadership cast aside.

But the image of a revived leader back at the helm was deceptive. This was the first time that Thorez had spoken in public since his return to France a year ago after two years of convalescence in the Soviet Union. Still paralysed down his right side, he left the task of making the major speech to Jacques Duclos and, like Stalin at the last Soviet congress, made only the closing speech. Clearly Thorez is not fit enough to resume full leadership, but this deceptive image of a powerful body with a thundering voice camouflaging the symptoms of illness is probably symbolic of the *servitude et grandeur* of the French Communist party.

The congress itself produced little new; its theses had been published a few weeks ago and more "criticism and self-criticism" had been allowed in the columns of *Humanité* than during the well-staged performance itself. Yet, the congress provided an opportunity of clarifying the line, of issuing precise directives and of reviewing the path travelled since its last assizes. During these four years the party has fought many a battle and it was necessary to draw some lessons particularly from the defeats of 1952. During that period, too, the French Communists evolved the new strategy of a two-pronged attack—on the national front against the EDC and on the united front in order to exercise pressure on the Socialists. Finally, the illness of Thorez and Stalin's death have intensified internal struggles. A Stalinist party is a great consumer of men and many a leader has fallen by the wayside: the veteran hero Marty, the resistance leader Tillon and more recently the chief organiser Lecoeur. Of the 1950 secretariat—the seat of supreme power—only the invalid Thorez and Jacques Duclos have kept their position.

Out of Isolation

In spite of these purges, official spokesmen could boast of strong assets in their balance-sheet. The Communist party is still the biggest, best organised, most disciplined and popular party in France. In 1951 it polled more than a quarter of the total votes cast and it has lost little, if any, of its electoral attractiveness since then. Indeed, in a recent by-election in Lecoeur's own fief and on the morrow of his disgrace the Communists managed to maintain their share of the total poll. French *patrons* and successive governments unable or unwilling to improve the workers' lot are the best electoral agents the party could have.

Successes can be claimed on the parliamentary stage as well. The untouchables of the French Chamber have partly emerged from their isolation. In the presidential election of last December, and even more in subsequent elections for offices in the Assembly, Communist votes, if not courted, were at least silently welcomed. The campaign against EDC has restored their prestige in the eyes of many nationalists; the succession of right-wing governments has rendered their votes more attractive to the opposition. This process of Communist re-emergence may have been temporarily interrupted after the fall of Dien Bien Phu, but an astute tactician like M. Duclos knows that the votes of his bloc will not be spurned in the battle against the EDC and that no left-wing alternative is possible without tacit Communist approval.

But electoral successes should not be taken as signs of perfect health. The ranks of the party are dwindling. In the wave of enthusiasm after the liberation membership reached a peak of nearly one million; last month it was scarcely more than half a million. The party is ageing; it finds it difficult to get new adherents among the young men and the women. Besides, recruitment is offset by departures, often even from among the cadres. The fellow-traveller may go on voting, but the activist is often bewildered and disgusted by the zig-zags of policy, by opportunist excesses, and by denunciation of yesterday's heroes combined with the wooing of yesterday's foes. Finally, like all other parties the Communists are suffering from the general political apathy in the country and this they can ill afford. While most parties need only electoral machines, the Communists thrive only on a permanently militant policy: but they cannot keep their troops for ever in a state of pre-revolutionary tension.

Panegyric to Opportunism

The congress has provided few remedies beyond some new tactical advice. The strategy of dual attack is to be continued. More even than the struggle against the war in Indo-China, the fight against the EDC was the chief topic. After many other spokesmen, M. Thorez confirmed, in a panegyric to opportunism, that the time of strange, unholy alliances not only with MM. Herriot or Daladier, but with any anti-EDC nationalists is not yet over. Pressure on the Socialists for united action is also to be kept up.

Disciplined troops are needed to fulfil all these tasks without desertion and the only visible sign of a change after the Lecoeur purge seems to be on the tactical level of organisation. Rightly or wrongly M. Lecoeur is accused of shifting party work from the factory cell into the local or regional unit and this process is now to be reversed. Only a quarter of total membership is now apparently grouped in factory cells. It is there, however, that the party should find its working class support and there, too, that the campaign should be carried on to attract Socialist workers. The proportion, therefore, should be raised rapidly. This, together with the drive to recruit more women and young people, seems to be the only important recommendation of the congress.

This would appear a small result after a big shake-up. Was the whole fight, then, merely an echo from the Kremlin and an act in the drama of Thorez' succession. If so, M. Duclos has scored a few points. Like Malenkov before Stalin's death, he delivered the speech on behalf of the Central Committee, thus donning the mantle of heir-apparent. He has also managed to get rid of his rivals from the secretariat: the too well-known Marty and Lecoeur who modelled himself too closely on the career of Thorez. But the leader has not yet left the stage and new

(*Continued on page* 903)

Continued from page 902

protagonists have appeared, including Billoux, whose star seems to be rising, and Servin, Lecoeur's successor as organising secretary.

The charges against Lecoeur are so comprehensive that anything can be read into them. Time alone can show what shape the struggle is going to take and what effect it will have on the general line of the party. In the meantime changes in tactics and organisation will be insufficient to regenerate the French Communist movement. Its numerical strength and greatness lie more in the material conditions of the country than in its own tactical ability, while to get rid of its Stalinist servitude it needs more than reorganisation.

Spies in the Arctic

BY A CORRESPONDENT

THE series of spy trials recently completed in northern Norway and the new spy case in northern Finland demonstrate the extent of Russian interest in the exposed and sparsely populated provinces of the Arctic, and the strength of Communist influence among the fishermen and smallholders who strive to make a livelihood there. In both Norway and Finland the Communist vote is disproportionately large in the northern provinces: over 15 per cent in Finnmark compared to 5 per cent for the whole of Norway; 33 per cent in Finnish Lapland compared to an average of 21 per cent for the whole country. The situation is much the same in the Swedish province of Norrbotten. The Lapp population in these areas need not be considered in this connection, for it is politically insignificant.

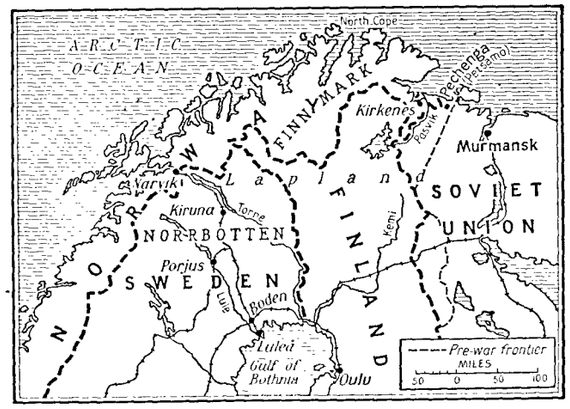
No single cause will acount for this state of affairs in northernmost Scandinavia. Extreme climatic conditions and a tradition of poverty are factors common to the three countries. In Finnish Lapland physical isolation and a conviction that the central government in Helsinki is indifferent to the welfare of the northerners certainly breed a deep resentment. On the other hand the North Norway plan, launched by the Norwegian government in 1950, is already improving economic conditions there, but it has not yet had a significant effect on the Communist vote. The people of Finnmark have also a tradition of friendly relations with the Russians. They remember the Red Army which liberated eastern Finnmark in the winter of 1944-45, and there are still memories of the so-called Pomor traders who, until the Revolution, used to come to Finnmark to barter their furs for fish. It is sometimes said that the high Communist vote represents an insurance policy: the Russians are oppressively near, and the people of Finnmark are by no means wholly convinced that the Atlantic alliance is capable of holding the 60-mile frontier along the lonely Pasvik river. By contrast, however, in the vulnerable province of Kymi in the south-east of Finland, adjoining the new Soviet frontier, the Communist vote is abnormally low—only 12 per cent.

In Communist propaganda great pains are taken to cultivate the population of the north. Moscow radio keeps up a campaign of scandalous stories, in a style reminiscent of William Joyce, directed against Nato defence works in northern Norway. Nato influence is blamed for espionage in Finland and combined with a very subtle appreciation of the Laplanders' special problems and prejudices.

Both Finnmark and Finnish Lapland have their peculiar strategic significance. Finnmark is the extreme northern flank of Nato. It lies on the Arctic air route between the Soviet Union and the United States. Radar installations here might well be immensely important. The plans of the Scandinavian Airlines System to inaugurate in the near future a regular trans-polar flight throughout the year show, if proof is needed, how easily the Arctic could become a centre of world conflict. Already it is a manœuvre area, and the passage of unidentified aircraft a few weeks ago caused considerable uneasiness.

Against this background espionage activities in northern Finland assume considerable importance. In the district of Salla, on the eastern frontier of Lapland, ten Finns were detained by the police late in May. These men, all active members of the Communist party, come from the part of Lapland that was ceded to the Soviet Union at the end of the war and whose whole population was moved across the new frontier to be resettled on new farms carved out of virgin forest. All but two are smallholders and part-time forest workers.

Strategically this is an interesting district. The peace treaty with Russia required Finland to extend the railway running from the Swedish border into Finnish Lapland, on through Salla to link up with the Murmansk railway. The control of this line means the control of Lapland. Communist strength is traditionally high in Lapland, the province where the Social Democrats—the largest party in Finland—are weakest. Here the main political battle is between the Communists and the Agrarians, both appealing to a people long-accustomed to poor living conditions and regular seasonal unemployment. It is interesting, however, that in the last general election the Agrarians made considerable gains in this area.



Few details have yet been released about the activities of the men detained in Salla, but while three of them have now been released, it is stated that there is clear evidence against six of the other seven. They are alleged to have repeatedly made illegal frontier crossings in order to deliver information to a foreign power in return for payment. This is the second major spy case in Finland in six months, and its outcome is awaited with considerable interest. There is nothing unusual about border espionage in Finland, but this new case has drawn attention to the dangers latent in the political vacuum of Lapland.

For Norwegians, on the other hand, an espionage trial is a rare event, and the case of the seven spies tried in Kirkenes last month attracted a great deal of attention in

the country. In August of last year an MVD officer, Gregori Pavlov, crossed the Pasvik river to the iron-mining town of Kirkenes and sought political asylum. He carried in the lining of his purse the code names of agents in Finnmark; their arrest followed in November.

The cases were heard last month in the little church hall of Kirkenes, with the judges presiding under a portrait of Christ, before an audience of peasants and fisherfolk crammed uneasily on wooden benches. The spies gave the impression of being naïve and clumsy rather than sinister. They had had regular assignments with MVD agents over vodka in the forest and handed over trifles of information about defence works, local personalities, ore output and the tourist traffic. Political convictions certainly played a part, but it was clear that money mattered at least as much to these simple folk. They were all found guilty, fined and given relatively light sentences varying from a few months to four years.

The court obviously took a charitable view. Norwegian observers say, however, that the reluctant behaviour of witnesses indicated that dealings of this sort in the small change of espionage are disturbingly widespread. Even in an area where no stigma has so far been attached to Communist sympathisers the revelations shocked public opinion. The fact that these men spied on their neighbours upset the northerners most of all. By no means all Communist voters in Finnmark are ideological fanatics and very few are potential traitors. It is therefore possible that next time they will go to the polls in a different frame of mind.

Spy cases occurring nearly simultaneously in Norwegian Finnmark and Finnish Lapland suggest the existence of an integrated espionage network throughout the north, perhaps including the Swedish province of Norrbotten as well. While Communism remains only a minor factor in the politics of the northern countries, persistent and insidious intrigue in the strategic areas of the sub-Arctic is a matter of no small importance.

Mr Costello's Prospects

FROM OUR CORRESPONDENT IN DUBLIN

WHEN the Dail met last week Mr Costello displaced Mr de Valera for the second time. His majority of 79 to 66, although heterogeneous, is greater than any incoming government has enjoyed for some time. It may be expected that this position will be maintained for some time. There has never been a change of government without a prior dissolution; and the result of the attempt since 1951 to govern with a majority in parliament but not in the country is not likely to encourage imitation. No party is likely to desire a new election; and any party that precipitates one is not likely to be welcomed by the electors. The new government should have elbow room at the start and its self-confidence should be increased by the summary defeat of the independents who voted it out of office in 1951.

It is composed of eight ministers from *Fine Gael*, four from Labour and one from the farmers' party. Mr MacBride has not taken office but will cheer from the touch-line. The portfolios held by the Labour party are more numerous and more important than was the case from 1948 to 1951; its leader, Mr Norton, is Vice-Premier and Minister for Industry and Commerce. This has caused some fluttering in protected dovecots but the programme issued by the government breathes heavily of devotion to free enterprise and private initiative. Investment by the state "will be supplemental to, and not in substitution for, private investment." Local authorities will regain "autonomy and effective power." Private building is to be facilitated. Agricultural co-operation is to be encouraged. The educational system is to be reviewed (and high time, too). The Irish-speaking areas, which roughly correspond to the old congested districts, are to regain the special attention which they enjoyed in the last thirty years of British rule. This is an imaginative proposal that deserves success.

Getting Down to Brass Tacks

But these admirable aspirations are not what the election was about; and the programme falters a little when it gets down to brass tacks. The cost of living is to be reduced. Social welfare benefits are to be extended. Taxation is to be reduced. Special attention is to be given to the one thing that can effect a reconciliation of these aims —the expansion of agricultural production for export; and the return of Mr Dillon to the Ministry of Agriculture gives some promise of action.

The contradiction of aims is more apparent than it may prove in practice. In recent years, employment has been stimulated by increased tariffs and by heavy state investment, chiefly in objects that yield no immediate return. Public expenditure has risen and taxation with it. Agricultural production remains virtually static and, by means of tariffs and subsidies, has been directed towards supplying the domestic market instead of the export trade. The result of all these policies together has been to drive prices beyond the reach of the consumer, thus causing the trade depression which they were intended to prevent. Agricultural production has been distorted by a subsidy on wheat-growing which leaves the price at a level fantastically high above the present world level. The economy as a whole is increasingly vulnerable to any unfavourable turn in the terms of trade.

The new government has therefore some room for manœuvre, though not much. Its political aim (with the fickle urban constituencies in mind) must be to reduce the cost of living; its economic aim is primarily to restore agriculture. No Irish government, of course, can do much to avoid a turn in prices but it can desist from making bad worse by its own actions. It remains to be seen how far this government is prepared to make changes that will be unpopular in a number of quarters. It is so situated that a display of courage may pay good returns; if it is content to continue a *Fianna Fail* policy, the electorate will sooner or later decide that policy and government should go together. But the short-term difficulties should not be underestimated; for example, an issue such as the price of milk, which did far more to upset the previous inter-party government than the much publicised controversy over the Health Bill, is directly connected with breeding policy which cannot be violently reversed.

Political strength is now more evenly balanced than at any time for twenty years. Future developments will depend on the degree to which this government as a whole, and each of the parties that comprise it, study the implications of economic policy. (For the moment, there seem to be no political issues worthy of note.) *Fianna Fail* is still an obvious alternative government. Mr de Valera is not thought likely to retire from politics; nor is it clear that his retirement would bring about the much talked of regroupment of parties. The old issue of the civil war is outmoded but American experience seems to suggest that such artificial lines may endure and that the divisions within each party may be more important than the divisions in Parliament. At present, the lines of division on matters such as investment policy, tariffs and state enterprise run through the parties rather than between them. The merit of the new government may prove to lie, over and above its welcome recognition of the primacy of agriculture, in that it provides a period in which these still half-formulated issues may become more clearly defined.

Bao Dai and the Future

BY A CORRESPONDENT

IN the battles and negotiations of the past few months, Bao Dai has often seemed a shadowy figure in the background, indifferent to the fate of the country of which he is Chief of State. He has been accused, by French politicians and British journalists, of reclining in luxury in his villa at Cannes while hundreds of his own countrymen lost their lives or liberty in the fortress of Dien Bien Phu. Such criticisms fail to acknowledge his reason for being in France at all: he went there to supervise the final stages of the Franco-Vietnamese negotiations which are gradually leading to a more satisfactory definition of Vietnamese independence, and to be at hand during the crucial exchanges of views at Geneva. There is little doubt that Bao Dai fears a "double deal" at Geneva: he is afraid that the pressure of opinion in France may force the French to sell out to the Communist bloc without waiting to negotiate an agreement that would safeguard the interests of his regime. It is known that he consented to the representation of the Vietminh at Geneva only after being told by the French that they would be invited regardless of his consent. By remaining close enough for consultation he feels he can be more useful to his country than by returning there.

As politician and statesman, Bao Dai is still dangerously underestimated in the West. His playboy phase belongs to the past. The late General de Lattre went to Vietnam expecting to meet a minor edition of ex-King Farouk. He found instead "a subtle and intelligent statesman." The former French High Commissioner to the Associated States, Jean Letourneau, said of him: "There are only two men who count in Vietnam, Ho Chi-minh and Bao Dai." Mr Malcolm MacDonald takes the same view, as indeed do most people who have had personal dealings with him. Clearly, the future of Vietnam, and particularly of Vietnamese relations with the West, will depend in considerable measure upon the role Bao Dai finds it possible to play.

The present discussions at Geneva between representatives of the rival commands suggest that the partition of Vietnam may become an accomplished fact, through the regrouping of military forces on either side. It is by no means certain that Bao Dai would consent to be the Chief of State of half his country—even a truly "independent" half. The possibility of a second "abdication" exists, for Bao Dai refused to return to Vietnam until 1949, when the French granted him what they had refused Ho Chi-minh—the unity of Vietnam, that is, the inclusion of Cochinchina in a nominally independent nation. If he did return this time to a new southern state, how much support could he count upon?

In the non-Vietminh parts of unpartitioned Vietnam he still commands considerable backing. He has the unquestioned loyalty of the four main militant sectarian communities: the Catholics in the north; and the Baodaists, Hoa Hao and Binh Xuyen in the south. Broadly speaking, the Nationalist Dai Viet, the only non-Communist party of any consequence in Vietnam, supports him. But the deciding factor in any general election or plebiscite would be the peasantry, some 80 per cent of Vietnam's 23 million inhabitants. While there is little doubt that most Vietnamese peasants are loyal to the remote and mysterious figure of the Emperor, they do not necessarily support his regime with the same steadfastness. After the early period of open terrorism in the countryside, the Vietminh has to a large extent won the support of the peasants by a land reform programme. Collectivisation, the next step, has not yet made itself felt to the same degree: for the time being, the Vietnamese peasant, knowing nothing of Marxist theory, may prefer the Vietminh to the government of Saigon. A rival land reform scheme inaugurated by the Nguyen Van Tam government has so far been less effective, partly because it was more gradual in approach, and partly because of the swaying fortunes of the war.

Rallying the Nationalists

There are limits, then, to the support the Bao Dai regime commands in the country as a whole. In a partitioned Vietnam, however, certain factors would work to redress the balance. A southern Vietnam from which the French Union Army had withdrawn would begin to look like an independent nation. The Franco-Vietnamese declaration of independence of April 28th has already rallied many Vietnamese Nationalists who showed signs of succumbing to the endemic political disease of *attentisme*. Now that two treaties (one conferring independence and the other defining Vietnam's relationship with France within the French Union) have been initialled, it is at least beginning to look as though Vietnam has achieved—one hopes not too late—an approximation to what so many Asian Nationalists believe to be the "dominion status" achieved by India and Pakistan.

At this stage, the unanimous support of such Nationalists is more important to Bao Dai than the backing of such powerful French economic interests as the rubber planters, represented by the *Syndicat des Planteurs de Caoutchouc de l'Indochine*. The political support of the peasants, equally, is more important than the support of absentee landlords. The replacement of the wealthy, land-owning prime minister Tran Van Huu by the lower middle-class police chief Nguyen Van Tam in June, 1952, was a tacit recognition of political realities by the chief of state. The eventual replacement of Tam by Bao Dai's cousin Prince Buu Loc was due less to Tam's programme than to his personal unpopularity as a former police chief and to his inability as a southerner and a French citizen to rally sufficient support in North Vietnam, the principal scene of military operations.

Economically, a southern state of Vietnam would be a going concern, though it could not hope to achieve as high a standard of living as a unified nation. The south can feed itself and still have an exportable surplus. In contrast, the congested Red River delta has to import 200,000 tons of rice a year to avoid famine. On the other hand, the south, poor in mineral resources, cannot hope to compete with the industrial potential of the north, with its rich reserves of coal and lesser ones of zinc, tin, iron and manganese. Militarily, the southern state could not hope to survive without the strongest possible guarantees by the United Nations. These guarantees would have to last long enough to enable the Vietnamese National Army to be built up to a size and efficiency that would allow it to take over, unaided, the defence of the country. Already the National Army numbers nearly 250,000 men; and independence may provide the missing spark whose absence has so far made its performances so disappointing.

Partition, however, is only one possible solution. Unification, followed by general elections and the formation of a coalition government, is another. While it is doubtful whether Bao Dai himself would be willing to repeat his 1945 experiment of trying to work with Ho Chi-minh, there are many Nationalists, unaware of, or unwilling to recognise, the Communist aims of the Vietminh, who see nothing inconsistent in a Bao Dai-Ho Chi-minh partnership. Of the two alternatives of partition and unification (with its threat of eventual Communist domination), partition may turn out to be the lesser evil. But its success would hinge upon Bao Dai's willingness to remain the titular head of a truncated nation. Easy going by nature, more democratically minded than a good many of his own followers, Bao Dai has, as General de Lattre pointed out, the assets of subtlety and intelligence. Lacking the fanatical driving force of a Ho Chi-minh, he is still the only non-Communist leader capable of uniting the many divergent political and religious tendencies in Vietnam. Any settlement that ignores him would be tantamount to handing over his country to the Vietminh.

Journal of Geneva—VII

JUNE 3rd. There was a secret meeting between representatives of the two high commands in Indo-China; and at a restricted session on Indo-China the composition and scope of the international commission to supervise the armistice was again discussed. Mr Dinh (Vietnam) rejected the proposal for a commission composed of Poland, Czechoslovakia, India and Pakistan and proposed that the United Nations should be asked to form the commission. Mr Chou En-lai said that the international commission and the mixed supervisory commission should neither control the other; that the international commission must function throughout the whole of Indo-China; and that it should not be responsible to the UN but to the nine delegations discussing Indo-China at Geneva.

June 4th. There was again a secret meeting of the two high commands, and a restricted session on Indo-China, which again discussed the supervisory commissions. The Communists maintained that the mixed commission should have real authority over the military arrangements, and the non-Communists maintained that the international commission should have authority over the mixed commission. Mr Eden took up Mr Chou En-lai's suggestion that the nine nations discussing Indo-China at Geneva should act as guarantors of the work of the international commission and proposed that the conference might set up a permanent organisation for this purpose.

June 5th. At a plenary session on Korea Mr Molotov put forward proposals for free and secret all-Korean elections which left all the contentious points open for further examination—viz., the composition and tasks of the all-Korean body to prepare the elections, the details of the pre-election withdrawal of all foreign forces, the composition of the international supervisory commission, and the question of which powers should assume what obligations to ensure the peaceful development of Korea.

June 6th. No meeting.

June 7th. Mr Molotov and M. Bidault had a meeting at which they principally discussed the composition of the international commission in Indo-China.

June 8th. In an uncompromising speech at a plenary session on Indo-China Mr Molotov suggested that the Geneva conference should discuss military and political questions at alternate sessions, and that it should begin by examining the independence of the three states, the holding of free elections and the withdrawal of foreign troops. In discussing the commissions to supervise the armistice, he made it clear that in his view most of the responsibility would rest with the mixed commission which could only function by mutual agreement, that the mixed commission would have equal status with the international commission, and that any difference within or between these bodies should be settled by the guarantors of the armistice who should be the nine states at Geneva.

Mr Eden suggested that the five Colombo Powers (India, Pakistan, Ceylon, Burma and Indonesia) were admirably suited to supervise the Indo-China armistice. He also said that the immediate tasks of the conference were (*a*) to agree on the composition and powers of the international commission; and (*b*) to agree on the special problems of Laos and Cambodia.

June 9th. At another plenary session on Indo-China, Mr Chou En-lai made a speech that was even more unpromising than Mr Molotov's on the previous day. He insisted that Communist states should serve on the international commission, that the commission should operate by veto, and that the political aspects of the Indo-China problem should be discussed at once.

The forgery that saved lives★

Normally, we should have been horrified to learn that the Rolex trade mark had been forged on inferior wrist-watches, which were then sold for fabulous sums.

In this case, we were flattered! Because, by committing this fraud, a man had helped to save many lives in the dark and perilous days of the war.

In 1942, Mr. Edward Porter (then Private Porter) was captured and incarcerated in a P.O.W. camp. Food was practically non-existent, clothing scant and medical supplies scarce. Only by selling their few treasured possessions to the guards, could the prisoners obtain money to buy, "through the wire," such food and medicines as friendly natives could provide.

It was soon discovered that the object most prized of all by the guards was a Rolex watch. Porter, whose skill with makeshift tools had become a byword, was asked by his fellow prisoners to "transform" their lesser known watches into Rolex watches. After carefully considering the extenuating circumstances, he agreed.

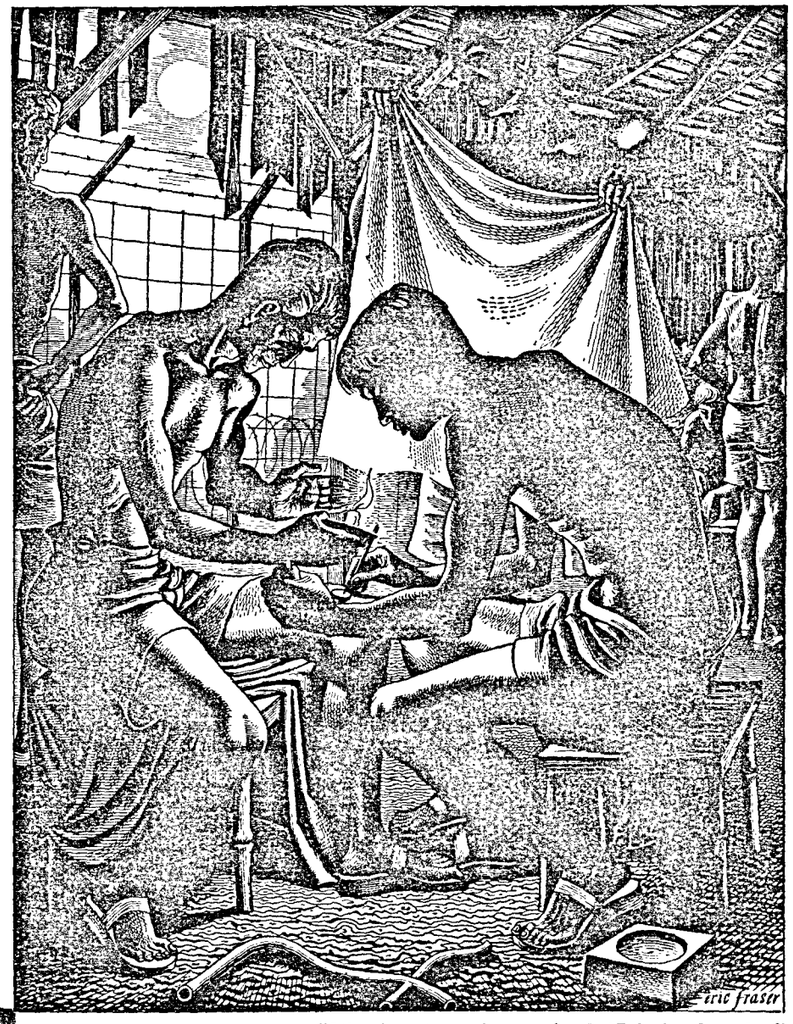
"I therefore set to work," he writes, "engraving the 'Rolex' trademark on watches of similar design, and inscribing 'Rolex' on the watch dials with indian ink, using a mapping pen."

So ignorant were the prison guards, that this simple ruse succeeded, and the money thus obtained helped save the lives of many of the stricken prisoners.

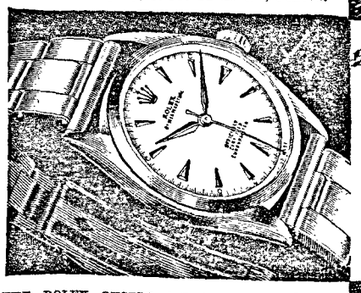
We are proud to have been of service in such an unusual fashion. But this was made possible only by the world-wide reputation of the Rolex trade mark, built up by many, many years of manufacturing the world's finest waterproof and self-winding wrist-watches.

And now, Rolex will be proud to be of service to you—to keep time for you, precisely, by night and by day, through the many years to come.

★ This is a true story, taken from a letter written by Mr. Edward W. Porter to the Rolex Watch Company. The original letter can be inspected at the offices of the Rolex Watch Company, 18 rue du Marché, Geneva.



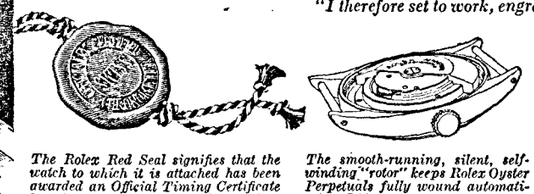
"I therefore set to work, engraving the 'Rolex' trade mark..."



THE ROLEX OYSTER PERPETUAL—*truly a monarch among watches. The astonishingly accurate movement, perfectly protected by the Oyster case, is given added precision by the self-winding mechanism. The tension on the mainspring is much more even, overwinding is impossible.*

★ ★ ★

THE ROLEX OYSTER PERPETUAL DATEJUST, *finest of a long line of masterpieces. This watch is waterproofed by the famous Oyster case, self-wound by the unique Rolex Perpetual self-winding "rotor," and it shows the date clearly and automatically, in a neat window cut in the dial.*



The Rolex Red Seal signifies that the watch to which it is attached has been awarded an Official Timing Certificate by a Swiss Government Testing Station, with the proud title of chronometer

The smooth-running, silent, self-winding "rotor" keeps Rolex Oyster Perpetuals fully wound automatically. This constantly even tension on the mainspring makes for still greater accuracy.

THE ANATOMY OF TIME

What Price Wheat?

THIS week's break in wheat prices was unexpected only in its timing and its suddenness. The cut of 10 cents a bushel in American and Canadian export prices surprised the market and brought trading in Liverpool and London for the moment to a standstill. But it was generally agreed that a fall was overdue and timely dispositions had been made accordingly ; no one in the importing countries should be badly hurt. In Britain, Government stocks have largely passed into consumption ; there will be no heavy stock losses there. The public accounts should in due course reflect a less costly bread subsidy but a more costly subsidy on home wheat. Millers have been working to a minimum stock ; they must suffer some loss, but probably the very minimum that a price fall of about 6 per cent could ever involve. Merchants have little uncovered wheat. The other exporting countries may be less happy about the results of the American initiative. The fall occurs just ahead of next week's routine meeting of the International Wheat Council, when there will be an opportunity to air views.

To judge by the cries of anguish that have been uttered there may be a tendency to blame the most important country that will not be represented—Britain—for refusing to join the agreement. Such criticism would be wide of the mark, and so would be any self-congratulation in Britain for that decision. The fall in wheat prices may possibly have been hastened, but it could not have been caused, by Britain's absence from the agreement. Subsequent events merely emphasise the foolishness of last year's squabble over whether the maximum price in the agreement should be $2.05 or $2.00 a bushel, and the correctness of the British view that these prices were unrealistically high.

If blame has to be apportioned, the United States is the chief culprit. Owing to political pressure, successive Administrations have maintained high support prices, and thus encouraged high production, long after the need disappeared. This policy also encouraged over-production in the rest of the world. As a result, the prospective carry-over and new supply in the United States is now so enormous that America alone could supply the world's imports next season. Canada has had three bumper harvests in succession, and now has one crop to spare, and Australia is desperately trying to store a record surplus. Of the four major exporting countries, only Argentina will have a moderate carry-over into 1954-55.

But Britain and other European countries are hardly in a position to adopt a holier-than-thou attitude towards the United States. They, too, have expanded production by high support prices, at the taxpayers' expense, for which strategic, foreign exchange and frankly political reasons are pleaded in justification. And Sweden, France and Turkey are exporting their own surpluses at much less than the domestic price.

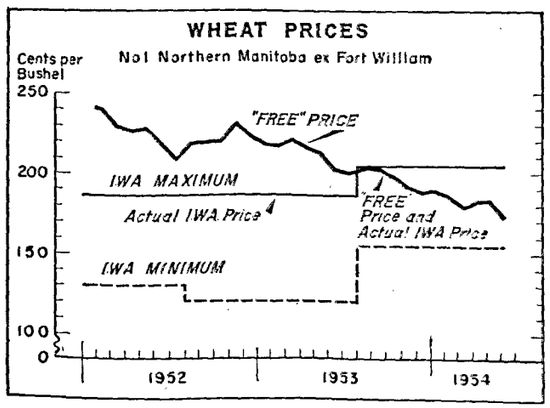
Foreign countries can justly claim, however, that the United States should not attempt to escape from its own political problems by wrecking world prices. The recent statement of the Secretary of Agriculture, Mr Benson, that America would not disrupt world prices by dumping its surplus commodities, contrasts oddly with the increase of 10 cents a bushel in the export subsidy on wheat. Nor can that be reconciled with the strict American anti-dumping act against imported goods—still less with the lectures that roving American industrialists are prone to give to Europe on the iniquities of export subsidies. The unease felt in Canada, Australia, and other countries at American price cutting reflects partly the knowledge that they cannot afford to

subsidise their own exports of commodities, nor can they give them away. Their immediate concern is how determined America will be.

In wheat at least a collapse of the market may be averted, partly because it would be to everyone's detriment, and partly because of the minimum price fixed in the wheat agreement. Critics of the agreement tend to forget that is now functioning broadly as it should, and that it was indeed designed for the situation that may be now developing. In the four years of the old agreement, the effective IWA price was always near the maximum of $1.85 a bushel (for No. 1 grade Manitoba wheat) because the "free" market price was well above that figure. Shortly after the new agreement began, the "free" price broke through the new IWA maximum of $2.05, and took the effective IWA price down with it. Since then the IWA price has moved freely within the upper and lower limits, in line with the "free" price.

Whether prices would have fluctuated as freely between the upper and lower limits had Britain signed the agreement can never be proved. The reasons for believing that they would not are partly psychological. But if Britain—the largest importer—had signified in writing a willingness to pay up to $2.05 and had not made a demonstration last year, the exporters' view might have been less sharply challenged.

If the price should fall to the new minimum of $1.55



a bushel, importing countries can be called on to take up the unused part of their quotas at that price. This would embarrass the many importing members that have taken up much less than their full quotas this season, but it is a reasonable hope that the minimum price will not be reached at least until the new season begins on August 1st. Several importing countries are believed to be preparing their 1954-55 import programmes on the assumption that they would have to take up their quotas at the minimum. Some other countries may chafe at this obligation, but they should not forget that the exporters fulfilled their side of the bargain under the old agreement. To the importing countries that may appear to have been a producers' bargain heavily weighted by the American price support policy. But the Canadian farmer was fully aware that under the old agreement he supplied wheat to Britain at prices lower than he was getting outside it.

Would a fall to the minimum price do much to relieve surpluses? Even though in countries of high economic development and high living standards the

* Broomhall's estimates.

consumption of bread grains does not rise when the price of wheat falls, there remain great areas where consumption should be more elastic, and all over the world there are possibilities of increasing consumption for animal feeding. Already after the price cut there has been a little buying of American wheat for feed. The mischief is that price support policies and marketing boards that sell centrally at fixed prices hide from the producer in all the major exporting countries (and in many of the consuming countries, too) the full and immediate effect of a change in price. The farmer's production programme tends to change when his government moves, not when the market price moves.

The postwar adjustment to conditions of plenty was bound to take time, but the latest developments are perhaps the best guarantee that the adjustment will be made. In the United States, which holds the bulk of the surplus, the 1954 wheat acreage has been cut by 20 per cent, and there is now talk in Washington of limiting the quantity of wheat per acre that each farmer can market; the aim being to counter the tendency of farmers, when acreage is restricted, to take the marginal land out of production and cultivate the rest more intensively. Such measures do not go far enough, but may become more effective in time. And it should not be forgotten that the run of good harvests in North America—the 1954 crops also promise to be good—is unlikely to continue indefinitely. In the meantime, more competitive prices should do good, both by encouraging the exporting countries to modify their production policies, and by encouraging the importing countries to question the wisdom of expanding their own production to uneconomic lengths. Ultimately it is to be hoped that the exporting countries, which now sell through single agencies, may consider whether there is not some virtue in restoring a free market mechanism. This would help to correct an approaching lack of balance between supply and demand before it is too late, and enable both sides of the trade to hedge against changes in import requirements and production that no central plans and subsidies can legislate for.

Local Authority Borrowing

IN round terms, the local authorities must now owe £3,500 million on capital account. Their borrowings since the end of the war from the Public Works Loan Board have run to well over two-thirds of this figure, and they have paid an average rate of about 3¼ per cent for them. What the board is instructed by the Treasury, from time to time, to charge for advances from the Local Loans Fund is therefore of first-class importance to the local authorities, for they are involved in heavy capital expenditures. During the past twelve months they have received Government sanction for more than £600 million of new loans, of which two-thirds will be spent on housing, a sixth on schools, and the rest on roads, water and other purposes.

It is true that the bigger local authorities are now officially encouraged to make greater use of the market, and indeed since the beginning of 1953, seven of them have made stock issues amounting in all to £32½ million. Birmingham was the first, with a redemption yield of £4 8s. 4d. per cent. Hull is the latest, and has got off more cheaply with £3 17s. per cent. This issue, and the Glasgow issue a couple of months earlier, offered yields two or three shillings per cent lower than the 4 per cent that the PWLB was charging until last Friday; yet the full cost to the borrower, including commissions, the keeping of registers and interest warrants every six months, must have exceeded the former PWLB rate. Local authorities who have come to the market with twenty-year stocks carrying a higher all-in cost than a PWLB loan must have done so solely in the hope of refinancing them at a lower rate of interest later on, whereas if they had resorted to PWLB loans they would have been compelled to pay the original rate for anything up to sixty years.

Last week's announcement covers two separate points. It brought the second reduction since the PWLB's rates were raised in February, 1952, at the stiffest phase of monetary policy:

PWLB LOANS TO LOCAL AUTHORITIES
(per cent.)

	Nov. 1951	Feb. 1952	Oct. 1953	June 1954
Not exceeding 5 years ...	2	2½	2⅝	2½
5 to 15 years	3	3½	3½	3½
Over 15 years	3¼	4¼	4	3¾

The long-term rate is thus where it stood at the end of 1951, while the two shorter-term rates are one-quarter of one per cent higher.

The second point concerns the life of PWLB loans. Borrowing from the board has hitherto been possible on one condition only—that the length of the loan was identical with the period of years for which it had been sanctioned. For example, the Ministry of Housing and Local Government sanctions local authorities to borrow for housing for sixty years. As a result of the rule, the local authorities have not been allowed to borrow money for housing from the PWLB for any shorter period, if they wanted to. The Government have now agreed in principle that loans of shorter duration than the sanction should (with certain exceptions) be allowed. But shorter loan periods also involve accelerated repayment, for the board lends only on condition that regular instalments of principal are repaid each year. The ideal (as some local treasurers discovered in 1946 and 1947) is a low rate and a long term; 2½ per cent over sixty years carried an irresistible appeal to borrow up to and beyond the hilt.

The borrowers that have come to the market in the past eighteen months have all been housing authorities—the English counties, which were regular borrowers before the war have so far stayed away. The housing authorities evidently hoped that by refunding after 15 years or so they would do better than 4¼ or 4 per cent over a term of sixty years and would avoid the need to make immediate capital repayments. But as interest rates fall towards the mean rate of 3½ per cent. over the years, the attractions of this mild speculation become correspondingly dimmer, and last week's reduction in the PWLB rate and the expectation that short-term borrowing will be permitted have put paid to any further stock issues on the part of such authorities for the present.

★

There is, however, another source of funds to which the local authorities are resorting in growing measure. These are mortgage loans, which have the double merit of satisfying the investor with a yield beyond that obtainable on gilt-edged securities and of satisfying the local authority borrower, who pays less in interest than the PWLB demands in interest and capital repayment. Many of these mortgage loans are arranged by Stock Exchange brokers marrying their institutional clients to their local authority clients. A number of specialist firms are also active in this market; one has placed business amounting to £30 million, and another reports placings of up to £5 million a month. These firms have connections with numerous lenders, including friendly societies, savings banks, building societies, insurance offices, industrial concerns and others. The business

that they have been placing with the local authorities is considerable in volume and varied in character. Local authorities evidently appreciate the flexible terms that can be negotiated for these mortgage loans; they may run to maturity before repayment is due, or they may be arranged to carry annual or half-yearly capital instalments.

The rates on these mortgage loans vary according to their life, and are evidently fixed by the lenders with an eye to the Public Works Loan Board's long-term rate. The table below attempts a rough summary of the various rates in March and now, with the PWLB rates and yields on comparably dated gilt-edged stocks for comparison:

Mortgage Loans and Rates		PWLB rate	Comparable Gilt edged yields
March—	%	%	
One month and thereafter on 7 days call	2⅜	2⅜	2½
Seven to 12 years	4	3½	3½
Twenty to sixty years (½ yearly repayments and mutual breaks)	4	4	3⅞
June—			
One month and thereafter on 7 days call	1⅞	2¼	1⅝
Seven to 12 years	3¼	3¼	2¾
Fifteen years or more, repayable at maturity	3⅛	3½	3⅝

The advantage of mortgage borrowing, it is clear, rests not so much on its cheapness (in interest alone it is sometimes dearer) as upon its convenience. The local authorities can go quite a long way in borrowing short, because they have two lines of defence against a sudden call—either to turn to the banks or to go to the lender of last resort, the PWLB. In these circumstances, the use of the short-term finance has fewer dangers for them than for the average borrower. The larger authorities, moreover, have developed the practice of using day-to-day money to finance the initial stages of new capital projects; the result is that such borrowers sometimes carry up to £2 million of expenditure temporarily at 2 per cent or less.

This is an agreeable form of borrowing for local authorities, but it has its risks. As interest rates fall, the sources of such funds may dry up, and repayment may be required. They would then have to fall back on bank overdrafts at, say, 3½ per cent and ultimately upon the PWLB or other permanent lenders. They may also reflect that before the war the board did not provide finance to the larger borrowers for the bulk of their capital expenditures. If that day were ever to return, the present contentment of local treasurers, who now can borrow short because they know that they can get money at a pinch and at a price from the PWLB, would change to dismay; for they would then be compelled to rely on stock issues, priced on what the investor demanded in a competitive market.

The Viscount's Century

THE decision, in principle, of Capital Airlines, a vigorously expanding United States operator, to replace its existing fleet of 50 Dakotas with 40 of Vickers-Armstrongs' turbo-prop Viscounts has had an electric effect on the aircraft market. Capital has signed an order for three aircraft, which will be delivered early next year (thanks to BEA, who were waiting for them) and has an option on the remaining 37. The tally of signed orders for Viscounts has now reached 99 not out, and the single for the century is certain. The remarkable feature of the deal is the size of the option. Thirty-seven Viscounts would represent several months' output, even if Vickers were to step up production to the projected hundred a year. Airlines that have been content to sit on the fence, or to discuss delivery at leisure, must now calculate on the assumption that if Capital Airlines decide to take up their option, the flow of Viscounts will come to a halt while the factories work to complete the order.

In some ways Vickers' own sales policy may have encouraged airline operators to delay their decisions as long as they could. The three British aircraft manufacturers building for the international market—Vickers, de Havilland and Bristol—have each made a bold bid to capitalise an unquestioned lead in gas-turbine aircraft by tooling up for a rate of production well ahead of actual orders. Vickers announced at the end of last year that they intended to build up the production rate of Viscounts, at present two to three a month, to seventy and eventually to a hundred a year if sufficient orders came in. This amounted to an offer to sell aircraft off the counter; and in fact the actual delivery period has not exceeded 18 months for aircraft specially modified to each airline's requirements. Meanwhile, the carrying capacity and so the profitability of the aircraft have been increasing with each successive step in the development of the Rolls-Royce Dart engines.

Time, which worked against Vickers for so long, at last seems on their side. The Viscount got off to a dishearteningly slow start. It made its first flight in July, 1948, the world's first gas turbine airliner, and got a full certificate of airworthiness in 1949. The first orders, from British European Airways and from Air France, were signed only in the following year. Until Capital Airlines appeared, the three substantial buyers were British European Airways (38), Trans-Canada Air Lines (15) and Air France (12); the rest were small orders never exceeding six and sometimes for one only and none of these buyers was an internationally important airline.

Now the Viscount has proved itself, its advantages are plain to be seen. It is the only machine of its type and class on the market designed for medium-range work. Two other possible machines suitable for stage-lengths not greatly exceeding a thousand miles have twin piston engines, and neither is new; they are Consolidated Vultee's Convair 340, and the Martin 4-0-4. The big 107 seat Breguet Provence, with four piston engines, could be called a competitor only on certain specialised routes. Another attempt may be made to re-furbish the Convair with turbo-prop engines, but earlier experiences did not appear successful, and it remains to be seen whether American manufacturers can quickly supply turbo-prop engines suitable for civil aircraft. There are several potential competitors, here and in America, for the Britannia and the Comet III—Vickers' own VC 1000 being one of them—but there is no effective competitor for the Viscount as yet visible in the sky. If it takes about seven years to bring an airliner from the drawing board into commercial operation, airlines working medium stage-lengths face a period of some years when they will buy Viscounts or little else.

THE VISCOUNT'S PERFORMANCE

By the late autumn, more powerful Dart engines will be used in the Viscount. The improvement in performance is shown by the bracketed figures.

Engines	...	Turbo-prop. 4 Rolls-Royce Darts. 1,400 shaft horse power plus 375 lbs. residual thrust (1,550 shp)
Fuel consumption	...	0.72 lbs. kerosine per shaft horse power per hour (0.67)
Length	...	81 ft. 2 in.
Span...	...	93 ft. 8 in.
Weight	...	58,500 lbs. all up (60,000 lbs.)
Payload	...	Approx. 13,320 lbs.
Seating capacity	...	40-44 1st class 47 or more tourist 80 or more, enlarged Viscount for short-range operation
Best operating range...		Medium stage lengths 600-1,200 miles
Speed	...	312 mph (328 mph)
Break-even load factor		51 per cent. of capacity } *British European Airways operating results*
Operating cost ...	...	39.4 pence per ton mile }
Price	...	£250,000 upwards
Delivery period	...	18 months
Production rate	...	2-3 a month
Production capacity...		8 a month
Total signed orders ...		99 aircraft
Under option or negotiation	...	100 aircraft approx.

Already Europe is covered with a network of Viscount services, and British European Airways have found that on some routes the introduction of the aircraft has propelled BEA's share of the traffic from one-third to over half of the total. Late in September, the first deliveries of Viscounts will be made to Trans-Canada Air Lines, and the Viscount will start to fly between Canada and the United States. When the first three aircraft are delivered to Capital Airlines early next year, they will fly along routes between New York, Washington and the densely populated industrial areas of the east, in competition with the American giants, American Airlines and Trans-World Airlines among them. Next year, too, the Viscount will be in service in South America with Venezuelan airlines.

An attempt will be made to meet this competition by using America's two outstanding piston-engined aircraft, the Super-Constellation and the Douglas DC7, along Viscount routes. But there may be difficulty in keeping the long-distance schedules flown by these aircraft to the tight time-keeping that is possible on medium and short-range services. In Europe, suggestions have been heard that the big airliners should be used in short-haul as well as long-haul work, providing room for more passengers and carrying less fuel. But there is a limit to the number of passengers that could be crammed even into their vast fuselages, and it is still questionable whether short-range operation of the trans-Atlantic giants could ever be economic.

Real competition seems likely to come from quite a different source. Many of the medium-range routes are operated by Dakotas, and there is no aircraft of the character and merits of this old veteran to replace it on the market. Perhaps 200 medium-range aircraft need to be replaced each year, but how many of the 1,500 Dakotas still in service will be replaced by Viscounts? Aircraft companies in France, Britain, Holland and the United States are working on promising ideas for a successor to the fabulous DC3. Not all medium-range services need the Viscount's performance, and success for any one of these new designs might make inroads on the orders that might otherwise have been captured by Viscounts. For the present, Vickers' main concern is with the report that a team of American examiners from the Civil Aeronautics Board will make on the Viscount when they return from this country to Washington. The action of Capital Airlines has obliged the CAB to take up once again the delicate subject of whether to accept a British certificate of airworthiness issued for a British aircraft. Because the two authorities employ different standards, a British aircraft cannot qualify without substantial modification for an American certificate of airworthiness; so unless the CAB agree to recognise the Air Registration Board's certificate for the Viscount, American operators will not be able to use the aircraft. Fast on the heels of Capital Airlines, a second American operator, Trans-Caribbean Airways, has filed a request with the CAB for permission to use Viscounts. It would be unrealistic to suppose that there will be no counter-pressure against such a move.

Business Notes

Good Sense on Export Subsidies

THE only concise and specific document to emerge from last month's discussions in Bonn between the British Chancellor of the Exchequer and the German Federal Minister for Economic Affairs is a joint statement by the two governments recording their agreement on the undesirability of artificial aids to exporters. The statement falls into three parts. The first is a declaration of the kind of framework into which competition in international trade should fall. The second is a statement of British practice on the granting of export incentives—a statement from which Britain appears to emerge white as the driven snow. The third is a promise by the Federal Government to correct at least one transgression from the path of complete rectitude in this respect.

The first part of the statement breathes the full ozone of economic liberalism. The two governments "are convinced that international trade competition should follow natural lines and develop freely." Therefore, "neither government intends to pursue any policy of providing open or concealed subsidies to exporters and they both consider that artificial measures of aid to exporters which in the result tend to distort the normal pattern of competition, should be abolished as soon as possible." The Chancellor of the Exchequer's statement of the philosophy and practice of the British Government opens with the assertion that a fundamental aspect of its economic policy has been "to restore as soon as possible the freedom of the market over as wide a range of commodities and transactions as possible." In keeping with this policy of freedom, the Chancellor gives the assurance that "there is no intention of making use of such marketing regulations and subsidies as remain for the purpose of artificially promoting the export trade." The only major limitations on complete freedom in commodity trade are those still considered necessary to prevent undue dollar expenditure.

It is contended that there is no truth in the familiar allegation that the lower price of steel that obtains in the United Kingdom than in Germany is the result of some form of subsidy. There may be differential prices quoted for export and domestic markets, but this is as true of continental countries as it is of the United Kingdom. The prices charged to domestic users in the United Kingdom cover the full cost of production of steel and give a fair return on capital. On coal, the statement is a little less convincing, pointing out merely that "the National Coal Board in the United Kingdom is under a legal obligation to pay its way without any governmental subsidy." It admits that deficits have occurred in the past and are carried on the books of the Coal Board: and these deficits have been financed through Treasury guarantees. But in fact any element of subsidy that has been present does not fall into the category of a special incentive to exporters. It is approximately analogous to the general subsidies on food or housing; such subsidies do not provide any special incentive to British manufacturers to sell in foreign, rather than home markets.

★

The kind of subsidies that are now generally agreed to be objectionable are the differential ones that specifically favour exporters. The main German scheme that offends on this score is a rebate to exporters of income tax, amounting to up to 3½ per cent of export turnover. The assurances of the Chancellor were found sufficiently convincing in Bonn to induce Dr Erhard to give notice that it was not the intention of the Federal Government to seek renewal of the law providing for these concessions when it expires at the end of 1955. The two governments have also undertaken to collaborate in their efforts to secure a general abolition of objectionable export incentive schemes by all OEEC countries. Primarily this means France, which is easily the worst offender.

Borrowing for Utilities

MARKET experts have been expecting the British Electricity Authority and the Gas Council to appear in the queue of would-be gilt-edged borrowers later this year. The Bill which has now been laid before Parliament—Gas and Electricity (Borrowing Powers) Bill—and the memorandum which accompanies it, confirm that impression. They also provide financial authority for an exceedingly ambitious electrical development programme extending from 1953 to 1960 and costing over £1,400 million. Electricity issues for which no authority yet exists will evidently have to be made at fairly frequent intervals over the next six years.

Present borrowing powers of the British Electricity Authority are £700 million and up to June 30th this year Treasury sanctions have been granted for £635 million. The present total of borrowing is presumed to be nearly up to that total which consists of £525 million of stock issues and £110 million of temporary borrowings. The Bill proposes to raise the permitted maximum to £1,400 million and from the figures published it seems that the whole of that sum may be needed by 1960. Between March, 1953, when the Authority had used up £487 million of its statutory borrowing powers and March, 1960, there is a programme of capital development estimated to cost £1,442 million of which it is hoped to provide £435 million from internal resources leaving £1,007 million to be found from external borrowings. A small part of this great total—£75 million—is provided for in the Electricity Reorganisation (Scotland) Bill.

By comparison the claims of the gas industry are modest. The Gas Council's present borrowing limit is £250 million; its present sanctions amount to £230 million and it has used about £223 million of them. It is now proposed to raise the ceiling to £450 million, which will cover part of the cost of a development programme from 1953 to 1960 involving £366 million, leaving £92 million to be found from internal resources.

Courtaulds go One Better

COURTAULDS' profit and dividend statement far surpasses the best expectations. In December, when the company announced its 100 per cent free scrip issue, the board foreshadowed a final dividend of 3⅞ per cent on the new capital of £48 million, making the equivalent of 14 per cent on the old capital for the year ended March 31st (compared with 11¼ per cent in the previous year). The preliminary statement shows that the directors have gone one per cent better than their promise with 4⅞ per cent as a final, making the full year's distribution 8 per cent equal to 16 per cent on the old capital.

The formidable weight of profits amply justifies the decision; it would not be unfair to say that it has enforced it on Courtaulds' ultra conservative board. It is hard to resist the on-rush of a trading profit of £19.0 million (compared with £10.6 million) and a net group profit of £7.6 million (compared with £5.2 million). Courtaulds' directors say they consider that "the year's trading has been marked by a general revival in home trade; the company's export trade has shown improvement in highly competitive conditions."

Courtaulds is not only a textile company, it is predominantly the producer of the textile industry's cheapest raw material —staple fibre. The whole trend of trade has been moving its way in the past year, and there will be general agreement with the board's modest assertion that the increased distribution is "justified by the improved results." As they say it the directors tuck away a further £6 million (compared with £3.8 million last year) to various reserves. That the board would revise its dividend intention was quite unforeseen in the share market. The £1 shares fell 4½d. just before the announcement to 29s. 4½d.

Rayon in Demand

THE demand for certain types of rayon has been rising steadily for several months. In the first four months of the year output reached nearly 150 million pounds compared with 136 million over the same period last year, but this increase was still insufficient to keep pace with the flow of orders for rayon staple, tyre cord and yarn for industrial uses. By contrast, the trade in continuous filament rayon is noticeably slack. The rayon industry has been less successful in finding new applications for continuous filament rayon than it has for the staple fibre.

Rayon has been swept out of some sections of its traditional markets, such as washing dress fabrics of spun rayon, and continuous filament yarn for underwear, by the determined sales drive from the cotton industry on one flank and the new synthetic fibres and the reviving silk industry on the other. There is little evidence to show that rayon has recovered from these invasions; the industry's present buoyancy is rather the result of applied research into new uses. There is an expanding market for rayon in the industrial field, and the use of rayon in suitings, either alone or blended with other fibres, is rapidly increasing. Consumption of spun dyed rayon staple is also increasing; the idea of buying the staple already dyed appears to have caught the imagination of spinners, who are mixing staples of different colours with the same abandon that an artist mixes paint pigments.

The industry has yet to find the same variety of fresh outlets for continuous filament yarn. Acetate yarn is used as the basis for what the industry calls "novelty weaves," but viscose yarn, which makes up the bulk of output, is less adaptable. The industry's output is almost equally divided between continuous filament and staple production, but there is a general feeling that its future rests with the continued expansion of staple production. The new factory that Courtaulds Limited will begin to build at Grimsby in about six months' time (which will take 2½ years to complete) will increase the industry's staple capacity by about 100 million pounds a year. Until then, staple fibre production is likely to remain some way behind demand.

Accounting Centenary

TRADE is said to follow the flag but there can be no doubt that accountancy follows trade. And where there is trade, there is the thrifty Scot. Appropriately, the oldest existing body of professional accountants in the world is the Institute of Chartered Accountants of Scotland. The Institute is the direct descendant of the Society of Accountants in Edinburgh, which was incorporated a few months before the Companies Act of 1855 put the principle of limited liability on the statute book—opening out new avenues that a host of accountants were to follow to prosperity. Next week, the Institute celebrates its first centenary.

Accounting is far older than the professional accountant himself, and older still than any organisation of accountants. Yet the creation of a professional organisation, soon to be supplemented by others, was just as important as the invention of double entry book-keeping in the commercial republics of Renaissance Italy. Ultimately, the pioneering society and kindred associations established principles and standards of accounting that were accepted by the community at large. By examinations, precept and recommendations a generally acceptable body of doctrine and techniques was formulated. The 1948 Companies Act brought full recognition to the profession when it ruled that no person could act as auditor for a company (except an exempt private company) except a member of one of the

five accountancy bodies or an accountant authorised specifically by the Board of Trade.

During the hundred years the accountant's tasks have markedly changed. Many of the earlier members of the Scottish society secured their living from bankruptcy and insolvency cases. Nowadays the accountant is more of a company doctor and less of an undertaker; the "bread and butter" of the profession is internal and external auditing. The accountant of 1853 would be perplexed—and, perhaps, a little amused—by the complex details of company and tax legislation which are now on the lips of every articled clerk. The accountant's status has also been enhanced. In professional practice his independence is secure; as a salaried employee he is now as familiar as the outside consultant; and many accountants have found through their profession a road to industrial management and policy making.

£4 Million for Rolls-Royce

DETAILS of the new capital issue foreshadowed by Rolls-Royce a fortnight ago have now been announced. The company is to meet its needs by a £4 million 4 per cent debenture stock dated 1974-84 which will be offered to the public by Lazard Brothers at £99 per cent with preferential treatment to holders of the ordinary stock and employees. Subscription lists open next Thursday and £10 per cent is payable on application. It is a shrewd financial move. It invites success because the stock is of the type that will appeal to insurance companies and other institutions. Twenty-to-thirty-year 4 per cent stocks below par and covered 3½ times on assets and nearly 13 times on earnings are not easy to pick up; the Rolls-Royce debenture should command a small premium. Moreover the effect of the issue should be to gear up the ordinary stock since the company obviously hopes to earn more than 4 per cent from the new money. This will be useful since it happens to coincide in time with the one for two ordinary share bonus recently announced.

The company is raising money primarily to finance the purchase of machine tools for its aero-engine division, a sign not only of expansion but of the expectation of continued expansion. The expansion is evident in the consolidated balance sheet as at December 31, 1953, which shows that stocks have risen from £6 million to £9.8 million and debtors from £7.9 million to £9.2 million. The company has also raised money by bills for £500,000 on its export trade in addition to increasing its overdraft by £600,000 to £1.6 million. The expectation of continuity is endorsed by the speech of the chairman, Lord Hives. "We believe," he says, "that we can foresee for some years ahead a steadily increasing demand for the company's products."

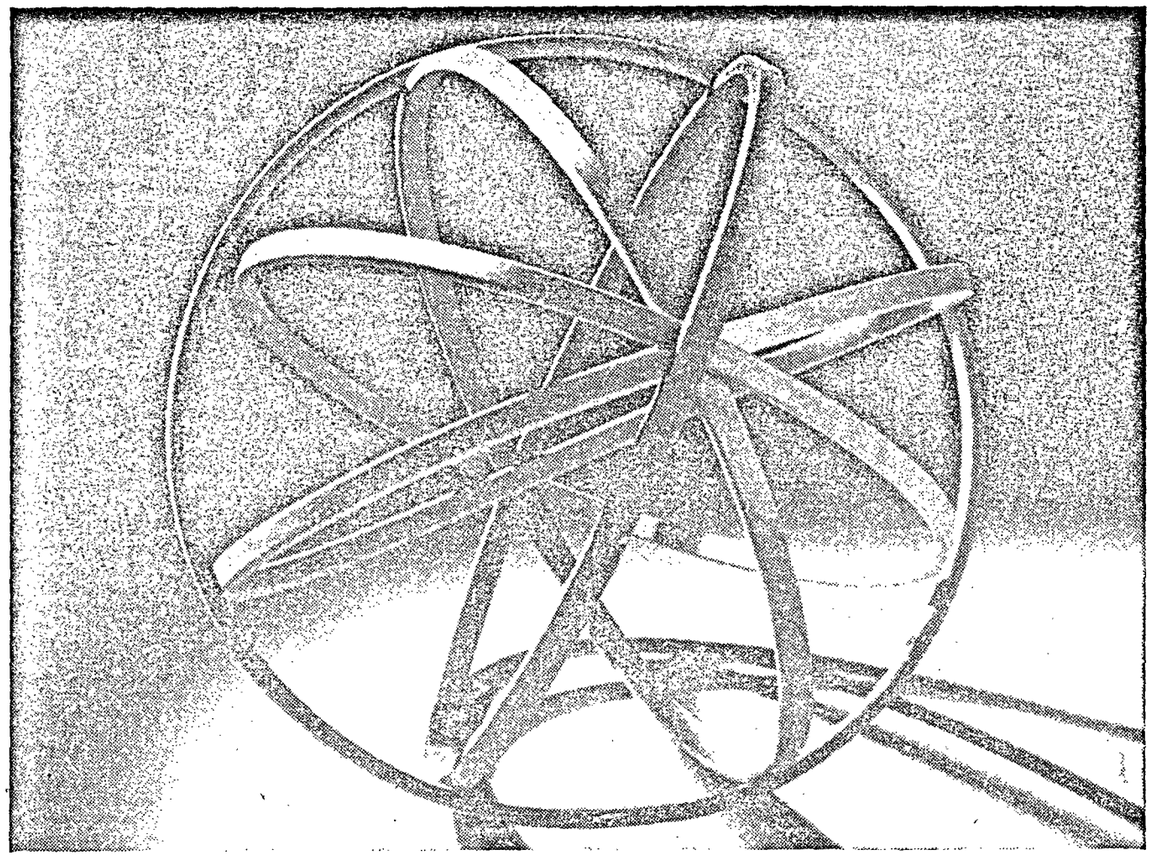
Lombard Street Springs a Surprise

THE new flexibility of money rates is nowadays producing some piquant situations in Lombard Street, piquant, that is to say, by contrast with the dullness of the long phase of pegged rates. Throughout this year "outside" competition for Treasury bills has been keeping the discount market on its toes—but, even so, the persistence of foreign and other non-market tenderers for bills has eroded the market's portfolios. At the pre-holiday tender, however, a bold thrust by the market succeeded in catching the "outsiders" very much on the wrong foot. A fortnight before, the Treasury bill rate had shown signs of sagging from the level of 1 3/32 per cent established by the market immediately after the reduction of bank rate to 3 per cent, partly because the margin offered over the clearing banks' maximum deposit rate and also the rate they normally charge to the discount market for loans against Treasury bills had widened (both these rates are now at 1¼ per cent). But a tightening of call money supplies checked this tendency, and the bill rate seemed to have settled at its new level. Last week, however, the discount houses unexpectedly raised their tender price by 4d. to £99 11s. 9d. per cent, a change that corresponded to a reduction of the discount rate by 1/16 per cent to 1 31/32 per cent, and is a substantially larger adjustment than has been made in any one week in this new phase of flexible money except after a Bank rate change. The "outside" tenderers—industrial interests as well as financial institutions—were taken unawares, and missed the bills entirely.

The background for this move was laid by the pressure upon market portfolios for some time past, both from the outside competition and from the increasing appetite for bills shown by the clearing banks in their day-to-day operations. But the immediate cause was the market's expectation that the Treasury's new bond issue would both reduce the supply of bills and further increase the demand for them. A large part of the cash that ostensibly flowed to the authorities in subscriptions for the new loan was certainly employed by the authorities in simultaneous purchases of other bonds, but a portion remained for use in cutting down new issues of Treasury bills. As the market had anticipated, only £250 million of the £270 million of bills offered at last week's tender were allotted, so that the issue fell £20 million short of the corresponding maturities, and there will be a further excess of maturities in the coming week. This tightening of the bill supply, combined with the demands of the unsatisfied non-market applicants, may put further pressure on rates, especially as the American Treasury bill rate this week dropped to only 0.616 per cent (leaving scope for a profit of some ⅛ per cent on switches to London with the forward exchange risk covered). The authorities are, however, keeping a taut rein on credit supplies in the short loan market.

Britain's Sweet Tooth

IT is more than a year since sweets came off ration, and consumption, unlike that of some other derationed commodities, rose steeply when rationing ended. That development is pin-pointed by the remarkable jump in the earnings of Cadbury Brothers, for the year ended January 2nd. In that family business, whose equity is all held by the British Cocoa and Chocolate Company, net profits after tax rose from £963,343 to £2,937,793. The rise in the gross figure was even steeper, since the tax charge increased £1,455,928 to £2,544,221. The controlling company draws a dividend of £516,341 compared with £443,040. The back-



Worlds within a world... Circles within a circle . . . Each unit is complete in itself, yet each is a part of an armillary sphere*. That is how it is with Crompton Parkinson. Our sphere is electricity. For seventy-five years the name of Crompton has been inseparable from it. The products we make create it, moderate it, measure it, control it and use it. More than half a score of independent manufacturing units, separate yet each complete in itself, work within and make up the Crompton Parkinson world. The sphere is complete.

When it comes to electrical equipment . . .

GC.G8A

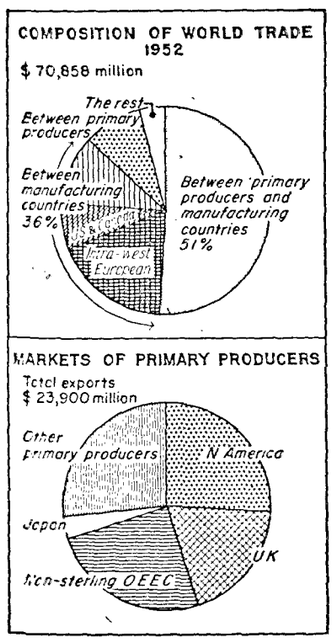
ground to these figures—the expansion of sweetmeats in this country—has recently been described in the report of The Cocoa, Chocolate and Confectionery Alliance. In the last few months before rationing ended, enough chocolate and sugar confectionery was being produced to give everyone in Britain nearly 6 oz a week. By the pre-Christmas period last year, output had risen to the equivalent of 10 oz a head weekly, and even after the seasonal decline weekly output is still 8 oz a head, 40 per cent higher than the final ration figure. Even then, Britain ate more sweets than any other country in the world ; today consumption is twice as high as anywhere else in Europe and half as much again as consumption in the United States. Many countries eat more sugar, in all its forms, but Britain remains the confectioners' best customer.

The factories were able to keep pace with retailers' needs throughout the year, except for an anxious week or two last summer, without attempting to check demand by raising prices. Sweet and chocolate prices rose, in fact, less in the first year of de-control than in the last year of rationing. The industry's sugar purchases have risen from an annual rate of about 200,000 tons a year before de-control last September to a rate of approximately 350,000 tons, and imports of milk crumb and chocolate couverture have also been stepped up. Milk supplies have doubled and nut imports have risen by a third. Only cocoa causes anxiety. Falling production and rising demand have lifted cocoa prices to the highest point they have yet reached. During 1953 retail sales of chocolate and sweets reached *£242 million*. The country is laying out more of its income than ever to satisfy its sweet tooth. Out of every pound spent on food, 1s. 4d. now goes on sweets, against 10¾d. before the war. The trade does not expect consumption to settle down before 1955 at the earliest. If more people continue to switch from the tobacco counter to the sweet counter, will the rise stop even then ?

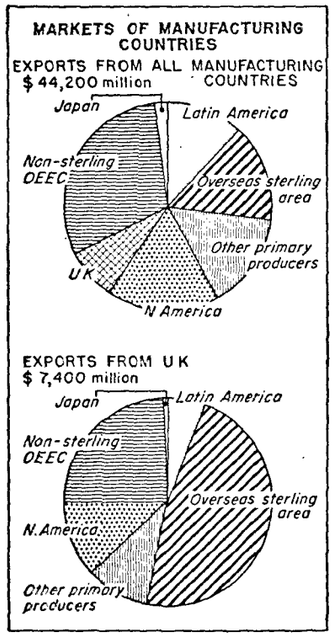
The Cup that Cheers

THE first offerings of this season's North Indian teas are meeting a strong demand at the Calcutta auctions. Prices of common qualities opened at the equivalent of 4s. 9d. a lb delivered UK, more than a penny above the closing price of old crop North Indian tea in London. This reversal of the normal relation between old and new crop prices emphasises the continuing shortage. In the past eighteen months the price of common tea has trebled, and the change round from the tea companies' losses of 1952 to the profits of 1953 has been equally dramatic. Many companies are re-entering the dividend lists and some are distributing free scrip issues. Consolidated Tea and Lands with its £2.6 million issued capital and its widely dispersed estates is an outstanding example. For the year ended November 30th a net profit before tax of £1,312,968 was earned compared with a loss of £326,391 in the previous year. The bank overdraft has been reduced from £1,467,744 to £425,710 while the cash has risen from £123,589 to £306,759. The company has announced a dividend of 10 per cent tax free compared with nil before. If this were only a flash in the pan—a single good year breaking a succession of bad ones—it would hardly be a cause for jubilation. The chairman, Mr W. H. Marr, puts last

Who Sells to Whom ?



THE interdependence of trade between the manufacturing and primary producing countries is widely accepted, but less widely understood. Trade between the two groups accounts for about half the world's trade. An analysis by the Board of Trade shows that in 1952 the manufacturing countries took over two-thirds of the total exports of primary producers, and sent two-fifths of their total exports to primary markets. The interdependence of Britain and primary producing countries (mainly the overseas sterling area) is exceptionally high. This explains why Britain is particularly exposed to a change in the terms of trade, and why an adverse movement can nevertheless favour Britain's exports and will favour the dollar earnings of the sterling area as a whole. In 1952 North America, the OEEC area and the primary producers themselves each took about one-fourth of total primary exports ; Britain alone took one-fifth, including one-third of the total exports of the overseas sterling area. Of Britain's total exports, nearly two-thirds went to the primary producing countries, and nearly half to the overseas sterling area.



year's profits in their true perspective when he calculates that the profit together with the losses of the two previous years gives an average profit for the past three years of £332,262 per annum, which is almost the same as the average of £333,447 for the last 23 years.

But Mr Marr also makes it clear that he is expecting another good return from the current year, despite the prospect of some decline in tea prices in the autumn, and a rise in costs resulting from the enforcement of the Indian Plantations Act of 1951. He feels that the real strength of the market lies in the statistics flanked by the expectation that Russia will buy tea under its new trade agreement with India. Moreover, Consolidated Tea and Lands has sold a substantial portion of its crop forward at remunerative prices. Sensible market opinion will endorse Mr Marr's hopeful estimate for this year. Perhaps the only cloud on the horizon is how much the local governments will extract by export duties. The Ceylon government has recently raised the flat rate of duty by 15 cents to 60 cents (about 10.8d.) a lb, though it is fair to add that were the duty based on the sliding scale abandoned last October the present exaction would be still higher. The Indian government, which now levies a duty of 4 annas a lb (equal to 4½d.) must also be sorely tempted to exploit the boom.

£30,000 Million in Throgmorton Street

THIS year's crop of statistics from the London Stock Exchange is fuller than any of its predecessors. It includes for the first time an analysis of the capital structure of most of Britain's public companies. This analysis, classifying company securities into loan, preference and equity stocks, is reproduced on page 924 of this issue. It throws a little more light on the ratio between nominal and market values of all securities quoted on the London Stock Exchange. In the year to March 31st last, the market value of all these securities increased from £27,130 million to £30,102 million. At the same time the number of quoted securities grew from 9,752 to 9,861 and their nominal value increased from £25,624 million to £26,653. These figures are evidence of an impressive growth, but they do not show how far the changes were due to rising prices or to new issues, either for cash or as free scrip.

The boom in the equity share markets has widened the gap between nominal and market values and in the same period the spate of scrip issues has worked the other way towards closing the gap. The new analysis of capital structure shows that the market value of all ordinary shares is £9,241 million, some £5,766 million higher than their nominal value. The nominal capital of British industry, in fact, bears little or no resemblance to the market capitalisation. Equally, market capitalisation means applying prices derived from quite small transfers of share capital to the entire share capitals of the companies concerned, although big blocks could often be neither bought nor sold at those prices. The market value of the preference shares quoted in Throgmorton Street is only £10 million higher than their nominal value of £1,485 million, while the market value of loan and debenture stocks issued by companies falls short of the nominal value of £992 million by £142 million.

The stock market, however, is dominated by British Government stocks and Government guaranteed issues largely resulting from nationalisation. At the end of last March, the market value of these stocks in the gilt-edged list was £16,019 million, about £1,382 million below their nominal value; the year before, when Bank rate was higher, their market value of £14,783 million fell short of the nominal value by £2,016 million. Such was the picture near, though not at, the crest of the market boom.

Oil Power for Copper

COPPER may be commanding a good price; the Rhodesian producers may see a surer market for their product than they dared to hope for after state trading had ended, but their troubles are not ended. The announcement from Selection Trust that Mufulira Copper Mines is installing equipment to burn limited quantities of fuel oil for both steam raising and smelting comes as a sharp reminder of the biggest of those problems—the inability of Wankie Colliery to raise as much coal as the copper industry needs and the inability of the railways to handle it. The problem is not new; there has been no sudden worsening of the outlook at Wankie since the trouble of underground faulting occurred a few months ago. Wankie's output is still expected to surmount these technical problems. Nor is any sudden deterioration in the condition of the railways the cause; the railway drivers' strike in Rhodesia did not affect the decision.

It is thought unlikely that the other copper mines will follow Mufulira's example. The company describes the expedient as being very expensive and used only as a final effort to keep the plant going. It involves boiler modification. The method can be adopted only (a) when the margin of profit on copper is high enough to cover a substantial rise in operating costs, and (b) when production would be lost if it were not done. It is because Mufulira is much wetter than other Rhodesian copper mines, and therefore requires much more power for pumping, that oil burning is justified. Wood cannot be provided by contractors in sufficient quantities to make good the coal shortage, but in two years' time hydro-electric power should be coming from the Congo and from the Kafue project. Even then hydro-electric power will be flanked by some coal burning.

Conditional Research

THE researches into various aspects of productivity that are being paid for under "Conditional Aid" from the United States to Britain are of distinctly varied promise; the Board of Trade had to assemble quickly a list of subjects on which to spend its "counterpart funds," and could not be too selective. The only condition common to most of the grants is that there should be something to show for them fairly soon. The Department of Scientific and Industrial Research, among several other bodies, has the spending of these funds. One of its committees dealing with "Human Relations in Industry" has in its first year managed to sponsor a dozen research projects with "Conditional Aid" money, some of which at least should eventually be of value; university teams are to study the effectiveness of incentive payments, industrial training and promotion, and 'human factors" affecting the introduction of new techniques in industry.

This last subject, at least, may repay all the study it can

UPHOLSTERY

For long life and comfort there's nothing like leather

"YOUR FURNITURE AND YOUR COMFORT" is the title of a booklet which tells more of the colourful leathers which are now available for the upholstery of modern and traditional furniture for the home, the boardroom, the office, clubs and hotels. *Write to:* The Dressed Hide Leather Publicity Committee, Leather Trade House, Barter Street, London, W.C.1.

"Let us take a look good and early"

Our expert advice on malleable castings will save you time and money

WHILE the job is on the board, before you're really committed to design details, let the Gloucester Foundry man take a look at it. He sees the job through the foundry specialist's eyes. His knowledge of technique both in grey iron and in blackheart malleable can lead to substantial savings in cost and time.

Gloucester Foundry is completely mechanised and has the only elevator-type electric furnace in Britain for speedy production of blackheart malleable castings. First quantities can be ready for delivery within 72 hours. How's that for service?

Up and up went the demand for their bottled beer. More orders to be analysed, more ledgers to be posted. In the offices of the famous brewers it was a case of "time, gentlemen, please."

Father William wanted them "cleared" fast

CHEERFUL SYMBOL of the great brewers, William Younger & Co. Ltd., Edinburgh, Father William had a problem. The country was drinking far more *bottled* beers. Orders from Customers and from their own houses poured in for the fifteen different lines of bottled ales and stouts they brew. With so many invoices to deal with, each with several lines to be posted and analysed, over and above the normal volume of Bulk Ale sales, the office departments were hard pressed to produce the up-to-the-minute sales figures the company needed.

Younger's asked Burroughs for suggestions, and after considering various other methods of handling this detailed analysis, they decided to install Burroughs Electric Duplex Calculators for the "analysis of ales and stouts" operation.

Then, seeking to speed their already mechanized Sales Ledger posting, they went to Burroughs again, and installed Burroughs High Speed Accounting Machines for *that* work also.

Result: Invoice checking, extension and analysis with the Burroughs Calculators now goes so smoothly that Younger's management can rely on comprehensive sales-figures in plenty of time to relate production to public demand. They find, too, that flexible Burroughs Accounting Machines can cope with a greatly increased volume of daily posting to "Bulk" Ledger or "Bottled" Ledger. Father William is a happy man!

What about you? If your business could benefit from faster, accurate figuring, call in Burroughs. They can offer advice on all the latest systems, for Burroughs market the world's broadest line of modern record-keeping machines: Adding, Calculating, Accounting, Billing and Statistical Machines, and Microfilming Equipment. Remember, once you have any Burroughs machine, Burroughs Service *guarantees* its efficiency in operation.

Seen demonstrating a Burroughs Duplex Calculator in the offices of William Younger & Co. Ltd. is Burroughs representative Mr. M. Jolly. This fast, two-answer-dials calculator is one of the machines that helped to solve the Case of the 15 Bottlenecks.

Call Burroughs *today*. Burroughs Adding Machine Limited, Avon House, 356-366 Oxford Street, London, W.1. Sales and Service Offices in principal cities round the world.

FOR EXPERT ADVICE ON BUSINESS FIGURING CALL IN **Burroughs**

get, even if some of the reports are couched in the repellent gobbledygook of the social psychologist. It is also receiving attention from the technical side in other projects sponsored by DSIR; and a new committee formed this week by the Royal Society of Arts, the British Association and the Nuffield Foundation, once again armed with a grant of conditional aid, is sponsoring some promising research into industrial innovation, studying the history of particular new equipment and techniques and the speed with which they were adopted, the effectiveness of present methods of distributing new technical information, and the factors affecting decisions to instal improved equipment.

Company Notes

J. LYONS. The non-voting "A" ordinary shareholders of J. Lyons and Company, whose activities extend beyond catering to embrace tea and coffee blending, have good reason to be disappointed with the latest dividend. Since 1948, the group's trading profits have nearly doubled and in the year to March 31st last, which included the Coronation trade, they rose once more (from £4,162,805 to £4,299,157); yet the directors throughout this period have left the ordinary dividend unchanged at 22½ per cent. This year the dividend has been declared on the former capital of £2,326,273 and one-third of the rate has been declared on the 629,069 £1 ordinary shares issued last October at 82s. 6d. each. Conservatism carried to such extremes suggests that the directors will be content to leave the rate unchanged on the enlarged capital in the current year. That was how dealers in the stock market read the company's statement, for after its publication the "A" shares were marked down 4s. 3d. to 102s. 6d., to offer the unexciting yield of 4.4 per cent.

	Years to Mar. 31, 1953	1954
Consolidated earnings:—	£	£
Trading profit	4,162,805	4,299,157
Total income	4,228,298	4,368,586
Depreciation	1,046,346	1,143,728
Taxation	1,676,674	1,550,451
Net profit	*874,740*	*932,667*
Ordinary dividends	308,242	337,340
Ordinary dividends (per cent)	22½	22½
Revenue reserves	12,003	17,611
Added to group carry forward	288,710	296,571
Cons. balance sheet:—		
Fixed assets, *less* depreciation	15,064,082	15,586,087

Reserves	11,734,689	14,172,597
Ordinary capital	2,326,273	2,955,342

£1 "A" ordinary stock at 102s. 6d. yields £4 8s. per cent.

The company's accounts certainly suggest that the directors could have afforded to be more generous than they have been. Net profits have risen from £874,740 to £932,667, and about £300,000 has been ploughed back into the business. Moreover, the new issue of shares has enabled the directors to dispense with the use of acceptance credits and to add to stocks without making any call on cash resources (which at the end of March amounted to over £1,300,000). The end of food rationing may add to the company's stock commitments and bring with it increased competition but it also opens up possibilities of expansion. The "A" ordinary shares must still be numbered among the "blue-chips." They are shares with which very little can go wrong but they cannot be put among the growth stocks while the present conservative policy is in force.

★

J. & P. COATS. The directors' report of J. & P. Coats makes some attempt to unwind the tangled skein of accounting digits conveyed in the preliminary statement which was discussed in these columns on May 29th. But the explanations are so cursory that a shareholder can be forgiven for believing that he is little the wiser. Having accepted gratefully the increase in the ordinary dividend from 12½ to 15 per cent and the promise of a free scrip issue, his principal difficulty is to decide what the profit and taxation figures imply. The trading profits of the group in 1954 are shown at £5,686,540 after charging exchange losses of £4,200,000; these losses arose in the company's South American subsidiaries. In 1952, trading profits were returned at £5,631,544 after writing down stocks (particularly of Egyptian cotton) by £5,650,000. At the same time the trading profits of the parent company have risen from £1,555,701 to £3,243,728, and this seems to be the principal reason why British taxes charged against the profits of the group as a whole have risen from £842,769 to £1,746,652.

	Years to Dec. 31, 1952	1953
Consolidated earnings:—	£	£
Trading profit	*5,631,544	†5,686,540

Ordinary Capital	14,750,000	14,750,000

£1 ordinary stock at 55s. 6d. yields £5 8s. per cent.
*After writing down stocks by £5,650,000.
†After charging exchange losses of £4,200,000.
(*a*) £500,000 had been written back from general reserve.

So far, the story is reasonably clear and the shareholder is entitled to draw the conclusion that the group, having taken the losses on stocks in 1952, enjoyed a more prosperous year at home but had to bear the weight of heavy losses on exchange abroad. The investor will also note that the company has pursued a deliberate policy of reducing stocks (especially of finished goods) and that the "further reduction in physical stocks, together with lower raw material values," has reduced the book value of the group's stocks from £45.9 million to £37 million.

The diligent shareholder then trips over the biggest stumbling block. The accounts show that foreign taxation has risen from £687,195 to £2,173,584 and that this increase has been responsible more than any other single factor for the collapse in net profits—from £2,624,868 to a paltry £3,680. Quite naturally he will turn to the directors' report for an explanation, but there he is fobbed off with the terse comment that "there has been a steep rise in the amount of foreign taxation. The increase in relation to the total of 1953 profits is to a large extent due to the effect of the exceptional exchange profits." At the annual meeting at least the chairman, Mr Robert Laidlaw, ought to furnish a full explanation. Shareholders might have been spared bewilderment if the company had followed the modern practice of circulating the chairman's statement with the accounts.

★

CANADIAN EAGLE. Canadian Eagle Oil Company's ordinary shares of no par value are a favourite with investors in the higher tax brackets. So much of the company's income comes from foreign sources covered by double taxation agreements that the effective rate of tax on the dividend is always much below the standard rate. In 1953 that great advantage was reduced. The dividend of the parent company, though it was raised from 1s. 1½d. per share to 1s. 6d. attracts tax at 66 per cent of the standard rate, compared with 49 per cent in 1952. This means approximately that the net dividend has been raised from 10½d. to 12¾d. The result must be judged satisfactory after a year in which the trading profits of the group fell from £10 million to £7.8 million.

Three factors have chiefly affected the results of this important oil shipping ally of the Shell group; the first was a sharp fall in tanker freights from the exceptionally high figures of 1952, the second inflationary conditions affecting the marketing companies in South America especially in Brazil, and the third higher crude oil prices and profits. The first two influences were adverse; only the third was favourable. However, it is the Exchequer—not the shareholder—that absorbs the reduc-

tion in gross earnings. United Kingdom tax in 1952 was £4,093,718, including £700,000 for Excess Profits Levy. In 1953 the figure was down to £1,531,920, and even that is subject to a refund of EPL of £640,000. Therefore the net profit after tax for the group actually showed an increase at £6,781,330, compared with £5,943,638.

Conveniently the report this year sets out the company's principal interests. These comprise first the three wholly owned subsidiaries, Eagle Oil and Shipping Company, Venezuelan Eagle Oil Company, and Eagle Tanker Company. Secondly, a group of oil investments held jointly with companies of the Royal Dutch-Shell group:—

Production: Shell Condor and associated Colombian companies—40 per cent interest; Compania Pertrolera La Estrella de Cuba—26.67 per cent.

Refining: Starhaven Refineries—50 per cent.

Marketing: Shell-Mex and BP—27.5 per cent; Lubricants Producers—40 per cent; Shell Eagle South America—50 per cent; Shell Companies of British Honduras, Cuba and Guatemala—each 50 per cent and Peru—40 per cent.

Property: London and National Property (owners of Shell-Mex House)—50 per cent.

The marketing companies last year handled 6,441,140 million tons of oil, a volume which has increased by 75 per cent since 1947. However, the annual rate of increase which was 23 per cent in the years immediately after the war, fell in 1952 and 1953 to around 7½ per cent.

SELECTION TRUST. Like other mining finance houses, Selection Trust catches in its net a wide range of investments. It has an interest in gold (through investments in Western Holdings and St. Helena), in copper (through American Metal, which has a substantial stake in Rhodesian Selection Trust and Roan Antelope), in base metals (through American Metal), and in diamonds (through Consolidated African Selection Trust). As most of these companies are domiciled abroad, their profits are subject only to local taxes, but as Selection Trust is domiciled in this country the income it receives from these investments has to bear the far heavier weight of British taxation.

In the year to March 31st last the income Selection Trust received from its investments fell slightly—from £1,714,061 to £1,475,385. It also earned rather less from transactions in the stock markets (for like other finance houses Selection Trust is an active dealer in those markets). The "profit on investment realisations" fell from £208,181 to £42,491. In all, its total income declined from £1,966,640 to £1,577,041 but, thanks to a reduction in the tax provision from £1,145,877 to £830,469, the directors had no difficulty in repeating an ordinary dividend of 42½ per cent. This dividend absorbs nearly £525,000, for the mining companies retain their own profits in reserves and Selection Trust distributes its net earnings almost up to the hilt. The 10s. ordinary stock units offer a yield of 11.7 per cent at the current price of 36s. 3d. xd.

LONDON STOCK EXCHANGE

Next Account begins: June 23rd.
Next Contango Day: June 23rd.
Next Settlement Day: June 15th.

AFTER the holiday week-end, the stock market opened hesitantly and then in the first dealings in the new account prices began to slip downwards. Business was restricted in almost all sectors of the market immediately after the week-end and the relapse in prices on Wall Street made for even greater caution when the new account opened. The Funds, however, remained in demand until Thursday morning when fractional losses were reported. Earlier a good demand for the medium dated issues and a few of the longer dated stocks kept prices firm; much of the demand was concentrated upon 3½ per cent Conversion, 1969, and once this stock had risen to 101⅜ some switching operations were reported. Prices of the undated stocks tended to slip back. In the foreign market German issues were dull, while Japanese loans lost heavily following the news that Mr Yoshida's visit to Europe and the United States had been cancelled. Greek bonds continued to improve on the Greek Government's decision to invite representatives of foreign bondholders to the debt settlement talks.

In the industrial market most sectors were dull though there was a little activity in new issues. Textile shares were among the worst sufferers. J. & P. Coats were marked down quite sharply after the publication of the full accounts, losing 3s. 6d. to 55s. 6d. xd. in the two days' trading to the close on Wednesday. A further loss of 1s. was reported in J. & P. Coats in early dealings on Thursday, while at the same time Fine Spinners lost 2s. 1½d. to 28s. on disappointment with the dividend. Elsewhere, the biggest losses were reported in store, electrical equipment and motor shares. Oil shares were dull. Rubber and tea remained quietly firm. At the end of the old account Kaffirs were holding their ground but prices began to fall back when the new account opened; dealings in Freddies Consolidated, the new company formed to amalgamate Freddies North and Freddies South, began at 22s. 3d. and the price touched 22s. 6d. before closing at 22s.

[1] Petroleum production in Canada in 1938 includes natural gasoline. Annual figures of electricity production in Australia are for 12 months ended June 30th of year stated and for New Zealand 12 months beginning April 1st; monthly figures for New Zealand represent about 87 per cent of total generation. [2] Copper and tin refer to metal production. [3] General trade (including re-exports) except for Canada, which is special trade only. Imports are c.i.f. except for Australia, Canada and S. Africa which are f.o.b.; exports are f.o.b. Trade for India and Pakistan includes that going by land; annual figures for India are for 12 months beginning April 1st of year stated and for Australia and Pakistan 12 months ended June 30th. [4] Gold and foreign exchange holdings are those of the government and central bank; only figures for *Australia include holdings of commercial* banks. Cost of living for Pakistan is based on 12 months ended March, 1949, as 100; for S. Africa and S. Rhodesia relates to Europeans only and for S. Africa includes direct taxes. Annual figures for Australia are for year ending June 30th. [5] Average of fourth quarter.

Financial Statistics

EXCHEQUER RETURNS

For the week ended June 5th, there was an "above-line" deficit (after allowing for Sinking Funds) of £32,642,000 compared with a surplus of £4,132,000 in the previous week and a deficit of £38,982,000 in the corresponding period of last year. This brought the cumulative deficit to £70,604,000 (£84,852,000 in 1953-54). Net expenditure "below-line" absorbed £13,832,000, bringing the total cumulative deficit to £114,771,000 (£141,140,000 in 1953-54).

THE MONEY MARKET

THE market bid at last Friday's Treasury bill tender was raised by 4d. to £99 11s. 9d. equivalent to a reduction in the discount rate of $\frac{1}{16}$ per cent, to $1\frac{31}{32}$ per cent; and commercial bill rates later fell correspondingly. The average rate of discount on all bills fell by 1s. 3.72d. to £1 12s. 11.61d. per cent. Total applications fell by £12½ million to £414.3 million, but the market correctly anticipated that receipts from the cash issue of the conversion loan would enable the Treasury to "cut the top off the tender"; in the event there was an under-allotment of £20 million. But the market's high bid secured it a considerable increase in its allotment—from 49 to 58 per cent.

Conditions in Lombard Street have been somewhat easier than in recent weeks. On Thursday of last week funds were indeed in keen demand to finance applications for the new loan, but the authorities gave considerable aid to the market, mainly in the form of purchases of bills from the banks. But in the rest of the week covered by the Bank return market supplies of credit were mostly adequate for demands, though on Tuesday small indirect official purchases were necessary.

The gold market has had a busier week. Turnover before the holiday was still only moderate, but on Tuesday demand became considerably more active. On Wednesday the price at the fixing was raised by 1d. to 248s. 11d. per fine ounce, and subsequently demand became so strong that, despite sales by the authorities, dealings took place at up to 249s. 1d.

COMPANY MEETINGS

BOOKER BROTHERS, McCONNELL AND COMPANY, LIMITED

(Colonial Merchants and Traders, Sugar Producers, Ship-owners and Rum Merchants)

TRADING DIFFICULTIES LARGELY SURMOUNTED

POLITICAL TURBULENCE INFECTING INDUSTRIAL ACTIVITY IN BRITISH GUIANA

NEED FOR FIRM RE-ESTABLISHMENT OF CONFIDENCE

COMPANY'S RESULTS A BAROMETER FOR POTENTIAL INVESTMENT

MR J. M. CAMPBELL'S STATEMENT

The fifty-fourth annual general meeting of Booker Brothers, McConnell and Company, Limited, will be held in the Library of the West India Committee, at 40 Norfolk Street, London, W.C.2, on Wednesday, June 30th, at 12 noon.

The accounts were posted to shareholders on June 4th, and the following is the statement of the chairman, Mr J. M. Campbell, circulated with the report and accounts :

For Bookers, 1953 was altogether a most anxious and difficult year. A year of falling sugar prices, of falling freight rates for our shipowning interest, and of more acutely competitive conditions for our trading companies ; all against a darkened background of political upheaval in British Guiana.

Nonetheless, from the directors' report you can see that the distributable profits for the year (including negligible capital profits) were £507,556 after providing £100,000 against Sugar Estates expenditure unavoidably deferred by strikes, compared to £612,715 in 1952, which included capital profits of £161,830 ; net Current Assets have increased by £450,000 ; we had over £600,000 in the bank at December 31st ; and it is recommended that last year's distribution to shareholders be repeated—in the form of a total ordinary dividend of 1s. 6d. per share. As the review of operations tells, our sugar crop and trading turnover were records again ; and rum sales kept pace with the year before.

These results in a hard year pay tribute to managers and staff throughout the Booker Group much more vividly than can the conventional phrases of a chairman's speech ; and tribute indeed to our labour force in British Guiana who, when the politically dictated strikes were ended, showed very clearly their wish to work and to work well, for in December, after all the political alarums and excursions, they turned out the most sugar that has ever been produced in British Guiana in that month. Every shareholder will feel a sense of personal gratitude and appreciation for the devoted endeavours of the management, staff and labour of Bookers' operating companies. Wages, salaries and other employment costs further increased by £200,000 during 1953 to reach almost £3,500,000, which I am sure you will think well earned ; even though the total dividend distribution for the year is to remain at about £200,000—a very modest return of 2¼ per cent net on the shareholders' funds used in the business. The Group policy of the improvement of housing and the development of social services and amenities continues unabated.

BRITISH GUIANA'S NEEDS

I have heard people silly enough to suggest that it might have been a good thing "politically" if Bookers had had a bad year in 1953 and had not paid a dividend. Good for whom? Not for the shareholders ; not for staff and labour whose livelihood depends on the continued financial support of shareholders and who would obviously choose to work for an efficient and prosperous business rather than a withering one ; in truth, our labour force must be feeling exasperated that they lost more than £250,000 in wages owing to futile political strikes that were none of their seeking. Certainly not for the people of British Guiana who never needed British understanding, British interest and British money more ; and who cannot expect these to be forthcoming unless confidence in British Guiana is firmly re-established. I said this recently to the Press in British Guiana ; and because many shareholders do not see the British Guiana newspapers, I quote the relevant extract from the Press report. (The whole report is reproduced with the accounts.)

"Describing his visit as a routine one, Mr Campbell said he came to hold discussions with his colleagues and friends here about all Bookers' affairs in British Guiana—discussions which he hoped would lead to Bookers' undertakings here becoming even more efficient and prosperous than they were already, thus enabling Bookers even better to fulfil their responsibilities to their shareholders, staff, labour and the people of the Colony. He also greatly looked forward to discussing ways and means of improving all-important human relations in industry and commerce in British Guiana.

"Obviously, he declared, it was very important to Bookers' shareholders, staff and labour that Bookers should be efficient and prosperous ; but it was also very important to the people of British Guiana. In this connection he remembered once hearing an English Socialist Cabinet Minister say that an unprofitable business was an enemy to the state.

PROFITABLE BUSINESS AN ASSET TO THE STATE

"A very profound truth, said Mr Campbell. A profitable business was an asset to the state, generating wealth, employment and exports ; and paying taxes, without which modern government cannot exist.

"An unprofitable business, on the other hand, destroys wealth, creates less and less employment, pays no taxes and eventually destroys itself. Any employee would choose to work for an efficient and profitable business rather than for an unprofitable one ; and he was sure that the people of the country would wish their business undertakings to prosper rather than to wither—to have businesses of which they can be proud rather than ashamed.

"But at the present time there was an even more important reason why Bookers should be seen to be a prosperous business. In the past, however much the company and others interested in the Colony had tried to publicise British Guiana, the people in England knew very little of its problems or its great potentialities. They very often did not even know where it was, mixing it up with New Guinea. Now British Guiana had suddenly leapt into most unfavourable notoriety as the first Communist country in the British Commonwealth.

"Never had British Guiana needed British understanding, British interest and British money more, but it could not be expected that these things would be forthcoming unless confidence in British Guiana was firmly re-established.

"What investor at the present time if he had a choice between investing in British Guiana and other countries of the world would choose British Guiana ?

"People would judge British Guiana not only by what they read in the Press but also on the actual results and experience of existing business concerns here, thus Bookers might be regarded as a barometer showing a favourable or unfavourable climate for business and pointing the way to potential investment.

PROFITS AND DIVIDENDS

"A great deal of nonsense, said Mr Campbell, was talked about profits. He pointed out that the dividends paid by Bookers to their shareholders, and resulting from Bookers' activities all over the world and not only in British Guiana, if distributed among the people of British Guiana every year would just about buy them a bottle of rum each ; and if distributed among the sugar workers on Bookers' estates would only result in a wages increase of the order of 5 per cent. Without dividends there could be no shareholders' money any more than there could be work without wages. Without shareholders' money there could be no business activity and no new development.

"He thought it would be well for the people of British Guiana to realise that by helping and supporting and encouraging business activity they helped themselves far more than anyone else.

QUESTION OF INVESTMENT

"Asked whether Bookers intended to invest money in new development projects in British Guiana, Mr Campbell replied that in the past Bookers had taken it for granted that what was good for British Guiana was good for Bookers and that British Guiana's lot was indivisible from Bookers' ; but, he confessed, recent events in the colony had led his colleagues and himself to consider whether they should not pause for the time being before continuing their established policy of investing new money in British Guiana whenever opportunity offered. The directors of Bookers owed a responsibility to their shareholders and their staff—the fulfilment of which was gravely imperilled by the slightest possibility of a repetition of the uncompromising threats to turn the British out of the colony which had been made by the members of the late Government. In fact, the question which he and his colleagues had been forced to ask themselves was not whether new money should be invested here but whether or not the existing investments should be maintained."

THE AIM OF POLITICAL WOLVES

It would be wrong to conceal from you that your board are worried—very worried—about the political future in British Guiana. This may bring comfort to the not entirely harmless lunatics who preach that Bookers doing badly will somehow benefit the Colony ; and to those politicians there whose highest aim seems to be to overthrow and to destroy all that is established, all that is creative and constructive, all that is good and all that is British in British Guiana, in order to achieve for themselves personal power in a social, economic and political structure utterly foreign to the Guianese and bound, I believe, to lead to their ruin.

It must not be thought that we fear Guianese nationalism. We want to see, and we are doing all we can to help to bring about, the day when Guianese are in charge of their own affairs and masters of their own fate ; but that is not to say that we must help to throw the people to a pack of political wolves who wait with slobbering jaws to strengthen themselves upon their unsuspecting prey. Nor do we seek—above all we do not seek—a "reactionary" Government in British Guiana ; we are not so complacent as to think that conditions were better in the past or could not be much better in the future. To quote from a letter which I wrote to the *New Statesman and Nation*, and which they were good enough to publish :

"British Guiana is a most imperfect place. But its imperfections are of Nature—not Britain or Bauxite or Bookers, who are doing their best in formidably difficult physical and economic conditions. The wonder is not that life in British Guiana is not Utopian, but that life and production can exist there at all. Its coastal belt lying below sea-level, a man-made environment reclaimed from the sea by great technical skills and at huge capital expense, fighting a perpetual battle against water, and for years against starvation prices for colonial produce—it is remarkable that inhabited British Guiana can support its ever-growing population at even their present standard of living, low as it is compared with more fortunate countries.

"Owing to its physical uniqueness there can be no alternative in British Guiana to large-scale planned agriculture. Destroy confidence, drive out capital and skills, and you leave nothing but swamps and starvation."

BRITAIN'S IMMENSE FUND OF GOODWILL

We would welcome a progressive Government of Guianese for Guianese, a Government able to offer leadership, generate confidence, harmonise the qualities and the aspirations of the African, Indian and other peoples there, and create the conditions in which Bookers—and other providers of the external capital and skills which British Guiana will need for many a day—could play their full part for the good of all. Such a Government, realising the physical obstacles to their country's becoming an independently viable economic unit—let alone the problems of defence—would surely regard it as being overwhelmingly in British Guiana's interest to remain within the British Commonwealth. For there is in Great Britain an immense fund of goodwill towards the people of British Guiana and of other so-called "backward" or "underdeveloped" countries ; a real desire to fulfil social and economic responsibilities towards them ; and a great eagerness to help them to progress and to develop their resources. Nowadays Colonial development need in no way be identified with Colonial domination. But Colonial peoples cannot have it both ways ; they cannot clamour to "go it alone" and, in the same breath, complain that Britain is not sufficiently assisting them with grants and loans and other enlightened and indispensable measures such as the Commonwealth Sugar Agreement. Neither, of course, can Great Britain have it both ways ; she cannot expect statesmanlike and well-disposed Governments in these territories, and fruitful markets for British exports, unless she gives ungrudgingly the economic assistance essential to raise their living standards.

Since the suspension of the constitution of British Guiana in December last, Government has been carried on by the Governor with an interim constitution consisting of an Executive and a Legislative Council on which all the Unofficial Members are nominated. We do not know how long this arrangement will last ; nor, of course, do we know what changes from the suspended constitution, if any, the Constitution Commission, now labouring, will soon recommend. But it is difficult to see what constitutional forms or devices can enable honest, truthful, progressive politicians of goodwill to woo the undiscriminating voter from the quite unattainable material promises of politicians unencumbered by the truth, who are ready to mislead and intimidate him—or her—with distortion and misrepresentation of the attitudes and actions of all save themselves.

BOARD'S POLICY

So doubt and uncertainty cloud our vision of the future in British Guiana. But it would not be the wish, or the interest, of shareholders that we should run away at the sign of trouble. Our policy must be, so long as politics do not make it economically unjustifiable and downright imprudent, to maintain our businesses in British Guiana as efficiently and profitably as we possibly can. All our staff will wish to know that shareholders wholeheartedly support this policy as long as it remains feasible. However this may be, your board are keenly aware of the need that the Group should continue to build up, in the form of profitable interests elsewhere, "hedges" against catastrophe in British Guiana should the worst come to the worst, the forces of evil prevail there, and British interests be expelled. We do not believe that this will happen, but we must guard against its happening.

BUSINESSES INEVITABLY GIRT ABOUT BY POLITICS

Friendly critics told me last year that my chairman's statement was "too political." I am afraid it is more political than ever this year. But Colonial businesses, indeed I suspect all businesses, are nowadays inevitably girt about by politics. It is with the political environment that we have to come to terms. If the Booker Group could operate in a vacuum, I could tell you that you had no cause for concern, that you could sit back and take your dividends in the knowledge that your affairs in the United Kingdom, in British Guiana, in Central Africa and everywhere we trade, were efficiently and imaginatively managed by as good a team of men and women as I believe any business can boast—men and women fulfilling with sound judgment and with enlightenment their responsibilities to shareholders, staff, labour and the community. But we cannot operate in a vacuum. The world is getting smaller and smaller, the problems of one impinge more and more upon all. I think it my duty to tell you frankly of the problems, trials and difficulties with which we, in Bookers, have to contend.

With the future of British Guiana so uncertain, let alone the future of the whole world, I hesitate to prophesy about our 1954 results ; but if the sugar crop does not suffer too badly from last year's interruption of fieldwork or from bad weather, and if political turbulence does not again acutely infect industrial activity in British Guiana, your board can hope that the financial results will continue to command your confidence in Bookers.

LICENSES AND GENERAL INSURANCE

A SUCCESSFUL YEAR

The sixty-fourth ordinary general meeting of The Licenses and General Insurance Company, Limited, was held on June 9th in London.

Mr Ronald Gilbey (the chairman), who presided, said :

The year has been a successful one ; in the life department the quiet progress of the previous years continued ; the assets of the department being increased by rather more than £200,000.

Nineteen fifty-three was a year in which the hazards of a fire department came into view, for in the early months insurance was presented with the tragedy of the east coast and Dutch floods and that surmounted ; fire outbreaks continued throughout the period of review more heavily than in previous years. However, despite these happenings, the year finishes with a quite substantial profit transfer of £58,266.

In the personal accident account an increase of income necessitates a rise in unexpired risk reserve and creates a debit to the account of £9,392, but this result is more than compensated by a real recovery in the motor account ; last year's debit therein being replaced by a useful transfer to profit and loss of £22,411.

In our miscellaneous account—in which is covered our original license business—plate glass, burglary, public liability and other accident risks, the profit transfer has been slightly increased this year at £53,685.

Turning to the profit and loss account, the final amount carried forward shows an improvement at £67,336—and this after the discharge of increased taxation and an increased dividend payment.

The assets of the company have improved this year to £5,244,611.

The report was adopted and a final dividend of 30 per cent, making 45 per cent for the year, was approved.

ASSOCIATED NEWSPAPERS, LIMITED

LORD ROTHERMERE'S STATEMENT

The forty-ninth annual general meeting of Associated Newspapers, Limited, will be held on Thursday, July 1, 1954, in the Memorial Hall, Farringdon Street, London, E.C.4. The following is from the statement by the chairman:

ACCOUNTS

It gives me great pleasure to present this year's balance sheet and accounts, for I think you will agree they reflect a most satisfactory year's trading.

The total profits of the Group before tax are £2,765,863, as to £2,091,976 from trading and £673,887 from investment income. Of the trading profit increase of £772,000 over last year, nearly 90 per cent arises from the trading of the parent company. Our income from Anglo-Newfoundland Development Company at £608,825 has only varied through exchange rate fluctuations, and our total income from this and trade and other investments is virtually the same as last year.

Overall taxation of the Group is up by £480,000, having risen from £1,221,204 to £1,703,859, although in this year we only bear Excess Profits Levy for three-quarters of the year. On account of this tax we pay £362,000, and I may say we are looking forward to omitting this item from our accounts next year.

Although current assets show an increase over last year, they also show a considerable change in make-up. In the first place, stocks of newsprint are running at a very much lower level—far lower than is normal. Whereas last year we had over 13,000 tons in stock valued at £700,000, the figure this year is only 7,400 tons valued at £390,000. This situation is only temporary and short-term Government securities amounting to £398,000 have been purchased which will be available when greater stocks of newsprint are due to be paid for. Accounts receivable have fallen from the peak figure reached last year, due mainly to the realisation of a debt left outstanding from the time when Empire Paper Mills, Limited, was sold.

The net profit of the group after taxation is up from £655,337 to £887,054, and your directors recommend the payment of a dividend of 27½ per cent for the year on the deferred shares which will absorb £425,726. Of the balance, it is proposed to transfer £400,000 to general reserve, leaving the parent company's carry forward slightly higher at £567,776.

SHARE CAPITAL

From the figure of nearly £8 million shown in the parent company's balance sheet as being the net assets of the company, it is clear that a large part of the company's reserves are permanently employed in the business. For some time this situation has had the consideration of your directors, for it is clearly desirable to relate the share capital more closely to the capital employed. It is now proposed to achieve this by capitalising sufficient reserves to enable a one-for-two scrip issue to be made on the deferred shares.

In this connection I think I should mention that the company's interest in the net assets employed in the whole group, including Anglo-Newfoundland Development Company, Limited, after eliminating goodwill and copyrights in subsidiary companies, exceeds £14 million.

THE DAILY MAIL

Turning to our actual operations in the publishing field, I will deal first with the *Daily Mail*, for that paper is, and will, of course, remain the backbone of all our newspaper enterprises. The *Daily Mail* has continued to pursue its traditional policy of producing an accurate and reliable newspaper always in modern journalistic style. This year has been notable for the further development of the *Daily Mail's* own service of foreign news, a subject of such high importance in the world today. The back page of pictures has now been consolidated as a regular feature of the *Daily Mail*, and we are increasingly proud of the influence of the "Comment" column, which has appeared on the front page since April 16, 1947.

THE EVENING NEWS

The Evening News has had yet another successful year. It is still the evening newspaper with by far the largest net sale in the world, and it maintains this position by a continuing policy of the highest journalistic standards in the presentation of news, pictures, sport and features. The position which the paper occupies in the life of the Metropolis and its family appeal are well exemplified by the generous response of its readers to appeals for worthy causes through the columns of the paper. The annual Christmas Appeal for Toys for Sick Children produced no less than 210,000 gifts this year.

THE SUNDAY DISPATCH

In the Sunday field, the *Sunday Dispatch* continued to move from success to success. This year it has established a new record, for it has increased its net sales for the sixteenth year in succession, a record equalled—to the best of my belief—by no other newspaper, morning, evening or Sunday.

THE DAILY SKETCH

You will be eagerly awaiting news of the first year's operation of the *Daily Sketch*. I am pleased to tell you that our annual net sales certificate, published in accordance with the rules of the Audit Bureau of Circulations, for the 12 months ended December, 1953, showed net sales of 801,225, which is an increase of 143,000 on the sale at the date on which we purchased the paper. The net sale has continued to rise month by month this year, and for the month of March it was in excess of 829,000 copies per day.

THE WEEKEND MAIL

Last year I told you that this entertaining, lighthearted, semi-magazine newspaper, had, in the matter of 12 months, increased its net sale from 60,000 to no less than 1,500,000 copies per week. The paper has continued to prosper and, in spite of intense competition, during one week in the month of April the sale actually passed the 2 million mark.

PROVINCIAL NEWSPAPERS

During the year our Provincial Newspapers made further headway, and the report from each registers an excellent trading position. The appearance of the newspapers themselves makes it quite clear that the journalistic traditions of editorial freedom within which they have operated so successfully through the years is being maintained.

Although it is not our policy to extend further in the provincial field, just after the close of the financial year negotiations were completed, whereby under an old agreement it became possible for us to acquire the outstanding shares in News Holdings Limited. Heretofore, we had held a 40 per cent interest in News Holdings Limited, which company owns both the *Leicester Mercury* and the *Leicester Evening Mail*. This company now becomes a wholly owned subsidiary of Associated Newspapers.

NEWSPRINT

Our newspapers are continuing to attract a vast flow of advertising, and I am obliged to say plainly that of all newspapers in the country, the impact of newsprint rationing bears most heavily upon those newspapers which come under our control. Led by the *Daily Mail*, which maintains its place as the most important newspaper advertising medium in the country, each of our papers, with possibly the exception of the *Daily Sketch*, is being hampered by the continuing short supply of our principal raw material.

THE DAILY MAIL IDEAL HOME EXHIBITION

This year, a national trade dispute, in which the exhibition was not directly involved and in the solution of which we could play no part, seriously interfered with the erection of the exhibition. However, in spite of all difficulties, the thirty-first *Daily Mail* Ideal Home Exhibition opened on time and, although the housing section was almost non-existent and the food section severely curtailed, more than eleven acres of stands were built and over a million people visited the exhibition.

ANGLO-NEWFOUNDLAND DEVELOPMENT COMPANY, LIMITED

Despite severe operating difficulties created by extraordinary weather conditions early in 1953, and loss of production due to demands by customers for sizes not well suited to manufacturing facilities, the earnings from newsprint operations were substantially the same as the previous year. The drastic drop in lead and zinc prices accounted for greatly reduced earnings from mining interests. The drop in pulp prices during 1952 and which continued into 1953 was the inevitable result of the inordinately high prices of the year 1951.

The company continued its programme of rehabilitation during the year. The demand for newsprint continues good and the company's contract or order position is very satisfactory.

COMMERCIAL TELEVISION

You will remember that last year I referred to the development of commercial television and I informed you that we had applied for a licence and that it was our intention, if one was granted, to operate a station. The Commercial Television Bill is now before Parliament, and although one cannot say in what form it will become law, I am sorry to tell you that, in my opinion, it may be so surrounded by restrictions that its operation will not be profitable either to advertisers or to programme companies.

STAFF

These results, which I think we must all agree are most satisfactory, could not, of course, have been realised but for the loyal co-operation and efficient working of all our staffs, to whom I would like to express the board's appreciation and thanks.

CENTRAL PROVINCES MANGANESE ORE

ANOTHER RECORD ACHIEVED

CONTINUANCE OF WORLD DEMAND

MR H. R. HOLMES'S REVIEW OF OPERATIONS

The forty-sixth annual general meeting of the Central Provinces Manganese Ore Company Limited was held on June 9th in London, Mr H. R. Holmes, chairman and managing director, presiding.

Mr A. Linton, MC (director and secretary), read the notice convening the meeting and the report of the auditors.

The chairman said:

Gentlemen,—Before proceeding to comment on the accounts, I would like to refer for a moment to the paragraphs in the directors' report which mention the changes in the board since the last meeting.

Mr L. H. Bartlett, who died on February 4, 1954, had a long and distinguished service with the company which he joined in the autumn of 1908. He became agent and general manager in India in 1923 and joined the board in 1947. His long and intimate knowledge of India and the mines made him a very valuable member of the board, and we very much regret the loss of his advice and help.

The vacancy on the board has been filled by the appointment of Mr W. A. Hardy, who first joined the company as a mining engineer in 1923, and subsequently became agent and general manager in India when Mr Bartlett came home in 1947. I am certain that Mr Hardy, with his long experience in India, will prove a very valuable acquisition to the board, and I shall presently ask you to confirm his appointment.

RECORD RESULTS

The report and accounts for the year ended December 31, 1953 have been in your hands for some time, and I propose, with your permission, to take them as read. (Agreed.)

In presenting these accounts, it is a source of satisfaction that the balance on trading account of £3,299,224 again constitutes a new record for the company. This figure includes £270,376 attributable to the increase in value of lower grade ore stocks. These ores have always been valued on a conservative basis but in view of the increase in prices in recent years it has become necessary to bring their valuation into line. The substantial profits achieved during the past year have been due to the continued demand for our ore in the world's markets and to the satisfactory prices prevailing.

Of the balance on trading account taxation takes the very large sum of £2,200,000, and included in this figure is £330,000 excess profits levy. In the previous year excess profits levy was shown as £425,000, but this, in fact, was an over-provision. At the time when the accounts were prepared it was thought that our liability would be at the rate of 15 per cent, whereas it ultimately was decided that we should only be subject to 10 per cent. As stockholders will know, the excess profits levy ceased to operate at the end of 1953, so that there will not be a charge under this head for the current year.

Of the total taxation, Indian taxes amount to £1,715,000 and, in addition, about £890,000 was paid by way of export duty on the ore shipped during 1953, while royalty on the ore railed amounted to £214,000, making altogether a total of more than £2,800,000 paid in India. Furthermore, the very large sums spent on railway and port charges, wages, welfare and the purchase of machinery and stores in India, all contribute considerably to the Indian economy.

On the debit side of the profit and loss account, depreciation of fixed assets, at £69,537, is much higher than the previous year's figure of £38,996. This is owing to the substantial expenditure we have made in recent years on plant and machinery, and buildings, on which we now have to provide for depreciation.

Your directors recommend that the sum of £200,000 be transferred to general reserve which will raise it to £700,000. I feel sure that you will appreciate the prudence of this allocation, which is consistent with our policy of providing from our own reserves the large sums necessary for machinery for our mechanisation programme which has so far been successful and encouraging.

CAPITALISATION PROPOSALS

As you know, at an extraordinary meeting to be held immediately after this present meeting, it is proposed to capitalise £500,000 which will thus reduce the general reserve to the sum of £200,000. Stockholders should not assume that the proposed increase in capital is any indication whatsoever of any increase in the amount to be paid by way of dividend.

An interim dividend of 1s. 9d. per unit free of tax, was paid on October 1st last, and your directors now recommend that a final dividend of 2s. 6d. per unit, free of tax, plus a bonus of 2s. 9d. per unit, free of tax, should be paid, together absorbing £700,000. This will leave £232,294 to be carried forward, as compared with £192,604 brought in.

BALANCE SHEET FEATURES

Turning to the balance sheet, you will notice that the investments and cash held on behalf of the staff benefit fund have been shown separately and not, as previously, included in current assets.

Proceeds outstanding on ore sales were £686,824 as compared with £913,784, the decrease being due to the smaller number of shipments afloat on December 31, 1953, than in the previous year.

British and Indian Government securities were £1,570,953 as compared with £1,476,483, and I am very pleased to be able to say that the large depreciation in the market value of these securities as at December 31, 1952, was almost eliminated at the end of December last year. Since then there has been further improvement in the market value, which is now higher than the cost.

DIRECTORS' VISIT TO MINES

Earlier this year two of your directors—Major Herring and Mr Hardy—visited the mines in India, and previous to this the late Mr Bartlett had also inspected the mines. All the properties were thoroughly inspected and several outstanding problems were settled. They submitted full and informative reports to the board, and it is certain that these periodic visits to the mines by members of the board are of the utmost value to the company. Generally speaking they found the mines in good condition.

Last year I referred to the heavy media separation plant which we were then installing at our Dongri Buzurg Mine to extract ore from the old dumps at that mine. The erection of this plant was completed early this year, the opening ceremony being presided over by Pandit Ravi Shankar Shukla, chief minister of the State of Madhya Pradesh, and performed by Dr S. S. Bhatnagar, FRS, Secretary, Ministry of National Resources and Scientific Research, Government of India. At the moment, however, the operation of the plant is restricted by shortage of water owing to the water table of the district being unusually low due to a succession of poor monsoons in recent years. This year's rains, however, are expected shortly when we shall be able to run the plant fully.

With regard to diamond drilling, in 1952 I informed you that the drilling plant had been transferred to our Kandri Mine. Since then three holes have been sunk, which have proved the bed at a depth of 480 ft. below plain level, and the quality of the ore bed at that depth is similar to that in the upper workings. Diamond drilling is also proceeding at our Tirodi Mines.

A wage agreement was reached between the company and the trade union during the year, and relations with our labour remain in a very satisfactory state. The health of our labour force in India continues to be good, and constant attention is being given to housing, sanitation, water and to the control of malaria.

CURRENT YEAR'S PROSPECTS

You will no doubt wish me to give you some indication of the prospects of the current year's trading. While there has, no doubt, been a falling off in the demand for low grade ores, the demand for our ore in the world's markets continues, and I think I may say that, unless something unforeseen arises, the prospects for the current year are satisfactory.

I am glad to state that our relations with the Government Authorities in Delhi and the State Government in Madhya Pradesh continue on a satisfactory basis.

TRIBUTE TO STAFF AND AGENTS

Again I have pleasure in acknowledging the excellent work of the staff, both in India and in London, and also of our shipping agents in India, Messrs James Finlay and Company, Limited. I am sure that they will appreciate the thanks of the stockholders which, with your approval, I propose to convey to them.

I now beg to move: "That the report of the directors and statement of accounts as at December 31, 1953, be and are hereby approved and adopted, and that the profits be appropriated as recommended by the directors." I will ask Major Herring to second the motion, and before putting it to

the meeting I shall be glad to deal with any questions which stockholders may wish to ask.

Major A. C. Herring, VC, ACA, seconded the resolution, which was carried unanimously.

The board's proposal of a final dividend of 2s. 6d. per unit, free of tax, and a bonus of 2s. 9d. per unit, free of tax, was also approved.

The retiring directors, Mr W. A. Hardy, ARSM, BSc, Mr A. Linton, MC, and Mr H. R. Holmes, were re-elected, and the remuneration of the auditors, Messrs W. A. Browne and Company, having been fixed, the proceedings terminated with a vote of thanks to the chairman, directors and the staff, both at home and abroad.

At a subsequent extraordinary general meeting the capitalisation proposals were approved.

THE BOWATER PAPER CORPORATION LIMITED

MEETING OF FIRST DEBENTURE STOCKHOLDERS

SIR ERIC VANSITTART BOWATER'S ADDRESS

At the meeting held in London on June 3rd, Sir Eric Vansittart Bowater, chairman of the Bowater Paper Corporation, who presided, said:

This is the first opportunity that I have had of meeting our debenture stockholders, and I extend to you all a very warm and cordial greeting. I much appreciate that so many of you have taken the trouble to turn up; I can assure you that your presence here is very welcome. It may well be that I have already had the pleasure of meeting some of you before at our annual general meetings in your capacity as shareholders in the Corporation, for the offering of the debentures you now hold was originally made in 1947 to our then existing stock and shareholders, and I am proud of the fact that more than 4,000 of them took up the stock that was then offered to them.

At the end of this meeting I hope that you will stay and join myself and my colleagues in a cup of tea, and, if you care to, that you will take the opportunity this presents of talking over with us any aspect of our affairs that may be of particular interest to you.

This meeting has been called to consider the amendments we propose to make in the terms and conditions on which the first debenture stock of the Corporation was issued, and I will endeavour to give to you as clearly and concisely as I can the reasons why we are now seeking your consent to these alterations.

IMPROVED FINANCIAL AND COMMERCIAL CONDITIONS

The stock you hold was issued in 1947 when conditions, both financial and commercial, were entirely different from those ruling to-day. Financially, we were then still in the era of cheap—I might say ultra-cheap—money, which was the policy of the Government of that day, and commercially our industry was still suffering severely from the adverse effects of the late war; indeed, in the case of our own paper mills in this country the basis of operations at that time was only some 40 per cent of our then productive capacity. How different are current conditions from those then prevailing; the money market has regained a large measure of freedom, once more it would appear that the Bank rate is being allowed to function as it was always intended that it should, and the industries in which we are engaged are operating to capacity and, in common with other industries, enjoying a substantial measure of prosperity.

It has long been my practice to have copies of my address at the annual general meeting sent to all our debenture holders. I have done this despite the fact that there is no obligation on our part to do so, because I do like those who have a stake in the Bowater Organisation to be kept as fully informed as possible. The accounts which are also sent to you will have made you aware of the strong financial position of the Bowater Organisation and of the material changes that have taken place—much I suggest to the advantage of the debenture holders—in our affairs, both financially and in productive capacity, since the debentures were first issued in 1947. You may also have noted, with, I imagine, some satisfaction, my remarks at our recent annual general meeting in regard to the very large sums of money we have spent since the war and are spending, here and overseas, in the development of all our properties; the total amount, might I be allowed to remind you, was the impressive figure of £45 million, of which no less than £21 million has been or will be provided out of our own resources. I repeat this to you today because I believe it is of importance to you and because it is an achievement of which we are all truly proud.

The Bowater Organisation, as you will know, is essentially international in character and something more than a half of its assets from which the larger part of its aggregate earnings is derived are situated overseas.

DEVELOPMENTS IN NORTH AMERICA

The development of the organisation both in the United Kingdom and overseas has in recent years been remarkable, particularly in North America where the greater part of our overseas interests lie. These interests include the important pulp and paper mills in the Canadian Province of Newfoundland owned and operated by Bowater's Newfoundland Pulp and Paper Mills Limited, and the great new pulp and paper mills now in the process of coming into operation in Tennessee in the southern United States, which are owned by Bowaters Southern Paper Corporation and were erected by that company at a cost, including working capital, of $60 million.

These interests, together with The Bowater Paper Company, Inc., the company which acts as the distributing medium for the products of the Organisation on the North American continent, are administered and controlled by us through The Bowater Corporation of North America Limited whose headquarters are in Montreal and which now owns the whole of the equity capital in the three companies to which I have just referred; the whole of the capital of the North American Corporation is, of course, in turn, owned by the parent corporation.

The financing of any further developments by those companies or the acquisition of other interests in North America would necessarily be in dollars, and clearly would best be dealt with through the medium of the North American Corporation. I do not wish to give the impression that we have any major projects of this kind under immediate contemplation, but the continued immense growth of the United States and Canada, both in population and industrially, affords to the industries in which we are engaged immeasurable opportunity for healthy and economic expansion and accordingly we envisage the possibility—indeed the likelihood—of further development and expansion in those countries; moreover, such opportunities may present themselves unexpectedly and at short notice and, in such an eventuality, we would want to be in a position to take advantage of them as and when they arise.

To assure to the North American Corporation the necessary financial freedom and flexibility to arrange for the financing of any further developments or opportunities that may arise profitably to expand its interests it is desirable that its assets, including its holding of the common stock of Bowater's Newfoundland Pulp and Paper Mills, should be free and unencumbered and accordingly we seek your consent to release that stock from the specific mortgage or charge granted in favour of the trustees for the first debenture stock that you hold.

OUTSTANDINGLY STRONG POSITION OF DEBENTURES

My colleagues and I consider that this is far from being an unreasonable proposal, particularly having in mind the nature of the information I gave you in my Circular Letter of May 15th last, and more particularly in the seventh paragraph of that letter, and the outstandingly strong position of the debentures in relation to their cover, both in respect of principal and interest, that has resulted as a consequence of the substantial sums that have been ploughed back into the business out of profits and the large amount of new capital introduced since those debentures were first issued in 1947 and, may I emphasise, the truly remarkable increase in the net assets and the greatly enhanced earning capacity of the business that has occurred since then.

In these circumstances, our debenture holders can, in my opinion, well afford to relinquish the specific charge over the common stock of Bowater's Newfoundland Pulp and Paper Mills; clearly, though it is reasonable for them to expect some consideration for doing so and, indeed, in my belief, they are entitled to such consideration, and that is why we are now offering them an additional one-half of one per cent per annum.

In some quarters I have seen the higher rate of interest we now offer described as generous—by one commentator as handsome; if this is the case, I am glad it should be so for, as I earlier said, the vast majority of subscribers to these debentures were our own stock and shareholders and I always feel that they are entitled to the most favourable consideration, more particularly perhaps, having regard to the very high degree of goodwill and loyalty they have always displayed towards the Corporation and the ready response they invariably accord to our appeals to them for additional capital for the development of our great enterprise.

I should perhaps also mention that this increased rate of interest is in future to be applied to the sinking fund contributions thereby increasing to some extent the amount of stock to be redeemed each year.

From the point of view of all concerned, the interests of the business itself are paramount and anything that might hamper its proper development or defeat or delay its growth and expansion is, I am sure you will agree, undesirable. I am convinced that sooner or later great opportunities for the further profitable development of our interests in North America will present themselves and, in my opinion, it is vital that we should be ready and able to take full advantage of such opportunities when they occur and in my view, which I believe you will share, it is also in the best interests both of the corporation and of its debenture holders that this should be so.

In conclusion may I say that it is gratifying to us in the extreme that such a very substantial number of our debenture stockholders should have seen fit to support the proposals that we are here to consider today by sending us their proxies in favour of the resolution. These proxies represent more than 59 per cent of the total debenture stock outstanding, and we regard it as a high compliment that they should in this way have again displayed their confidence in us and in our judgment.

The resolution submitted to the meeting was carried by an overwhelming majority, the result of the poll being that 1,833,198 votes were recorded in favour and 4,031 against.

INTERNATIONAL PAINTS (HOLDINGS)

TECHNICAL EFFICIENCY OF ASSOCIATE COMPANIES

The forty-sixth annual general meeting of International Paints (Holdings) Limited will be held on June 29th in London.

The following is an extract from the circulated statement by the chairman, Mr C. R. Petrie, for 1953:

The inland division of International Paints Limited, handling the home decorative and industrial sales, made gratifying progress, our "inter-light" emulsion paint finding considerable favour among specifying authorities and decorators. We have made progress especially on the industrial side and in recent months we have devoted considerable effort to the development of our superior finishes based on epoxide resins. We have long recognised the importance of technical sales service, and during the year calls made on our service staff show an ever increasing appreciation of the special facilities for after-sales supervision which we offer to all users of "International"—services which include investigations relating to plant lay-out, specifications and methods for efficient surface coating systems, colour schemes and designs, training of customers' personnel, etc.

I referred last year to the retail trade and to the marketing of "Selectatint." This tube tinting scheme was well received by decorators and the public alike, and it has already become a name well spoken of in those areas in which we have chosen to market this product. We shall continue our efforts in the retail market, although fully recognising that in better times householders and the public generally will look to the skilled painter.

ROLLS-ROYCE LIMITED

ALL BRANCHES CONTRIBUTE TO RECORD ACHIEVEMENT

LORD HIVES ON THE STEADILY INCREASING DEMAND

The forty-seventh annual general meeting of Rolls-Royce Limited, will be held, on July 7th, at the Midland Hotel, Derby.

The following is an extract from the circulated statement of the chairman, The Rt Hon Lord Hives, CH, MBE, LLD, DSc.:

The accounts reflect the increased activity which prevailed throughout 1953 in all branches of our organisation. The turnover of the group reached a new high level.

It is also satisfactory to record a further increase in our revenue from royalties; almost all of this comes from our foreign licensees.

Our capital reserves have again been increased by sums received from the sale of licences.

FUTURE CAPITAL REQUIREMENTS

The steadily increasing demand for the company's products both at home and abroad, particularly in the aero engine field, calls for a corresponding increase in working capital. In addition there must be a continuing programme of capital expenditure in order to ensure that the company's engineering facilities are kept abreast of the latest technical developments.

Your directors are therefore proceeding with plans for the issue of £4 million of 4 per cent debenture stock, redeemable 1974-84. The arrangements will include preferential treatment for existing stockholders.

Your directors have also decided to recommend that the issued capital of the company should be brought more in line with the capital employed, and to achieve this they propose an issue of shares credited as fully paid in the proportion of one share for every £2 of stock already held, thus raising the issued capital of the company to £6 million. It is considered desirable at the same time to increase the authorised capital of the company to £10 million, although there is no immediate intention of making any further issue.

GENERAL REVIEW OF 1953

The outstanding commercial achievement of the year has been the substantial increase in business done for customers other than the British Government. This business amounted to £21 million, and in exports alone our turnover rose to more than £11 million—nearly double any previous year. In addition, the level of our order book has been well maintained, and there are many promising inquiries.

AERO ENGINES.—The task of re-deploying our resources following the somewhat drastic revisions of government requirements late in 1952 was carried through smoothly and involved close co-operation with the other companies in the Avon Group—The Bristol Aeroplane Company Limited, D. Napier and Son Limited, and The Standard Motor Company Limited. Our relations with these companies have been most satisfactory, and it is gratifying to us that they have been able to manufacture our engines without serious difficulties.

In addition to the production of many marks of Avon engines, including the RA.14 with a thrust of 9,500 lb., no fewer than five other types of engine were being made in production quantities.

The Canberra aircraft, fitted with Avon engines, is now well established in squadron service with the Royal Air Force. We are building up a fund of experience on this engine which is of great value to us in our continuing development for both military and civil purposes.

The Vickers Viscount, in which our Dart engines are installed, is building up a first-class reputation with the travelling public. These aircraft have now been ordered by twelve different operators, and the world-wide interest which is being shown in this aircraft augurs well for further orders for propeller turbine engines.

The development of the Conway engine for operation over long distances has gone on steadily, and this engine is scheduled for installation in the four-engined Vickers-Armstrongs aircraft, the V.1000, which is a military transport.

We have a large stake in civil aviation both as it exists today and in future projects. The useful experience which we are accumulating on the operation of propeller turbine engines in airline operation points the way for still further development of this type of engine, and we are already well advanced in being able to offer improved specifications which we believe will be of world-wide interest to aircraft designers.

MOTOR CARS

The year has seen still further developments in the design and specification of our cars which have helped to consolidate the prestige we enjoy in the motor industry. The most important of these developments is probably the availability of the fully automatic gearbox on all models, both at home and abroad. The boxes are completely manufactured in the Crewe factory under licence from the General Motors Corporation of America.

During the Earl's Court Motor Show the Silver Dawn was made available to the home market. This model had previously been reserved for export. Being considerably lower priced than coach-built cars, and also smaller in size, it is particularly suitable for the owner-driver.

The Division continues to develop and produce the "B" range of petrol engines. Many thousands of these are now in the service of the Army and elsewhere, and are giving excellent service.

Reviewing overseas activities, Lord Hives states: It is interesting to record that our products are in use in 39 countries.

CONCLUSION

It is just 50 years ago since the first meeting between the Hon C. S. Rolls and Henry Royce which led to the formation of our company. Our history has been one of unbroken progress in technical achievement. Those of us who were privileged to know and work with these men would want to acknowledge how much of the company's success can be attributed to continuing to practise to the best of our ability the principles which we learned from them.

I have been fortunate in being able to present in this report a picture of continuing expansion, particularly in connection with our aero engine business. We believe that we can foresee for some years ahead a steadily increasing demand for the company's products.

DAVIS AND TIMMINS

CURRENT TRADING IMPROVEMENT

The fifty-fifth annual general meeting of Davis and Timmins, Limited, was held on June 8th in London.

Mr F. Le Neve Foster (chairman and managing director) presided and in the course of his speech said:

The trading profit and other credits on the consolidated profit and loss account, which include an excess profit levy refund of £16,506, amount to £145,951, as compared with a figure of £333,247 for the previous year, while the net profit, after depreciation, directors' emoluments, management services and taxation, amounts to £47,704 compared with £97,912 for the previous year.

I can say now that the results before you reflect a more favourable picture than might have been expected from the adverse conditions which we have suffered. At the end of the year there were definite signs of a return to more stable and normal conditions.

The directors recommend a final dividend of 15 per cent and a cash bonus of 5 per cent on the ordinary share capital, making with the interim of 5 per cent already paid, a total distribution of 25 per cent on the issued ordinary share capital.

On the consolidated balance sheet, fixed assets of the group show an increase of £37,053 representing in the main the additions to plant after writing off depreciation.

The total of capital and revenue reserves (excluding future income tax which we are treating as a separate item) shown in the group balance sheet is, therefore, £441,847 compared with £367,559 at the end of the previous year, a nice increase of £74,288.

The downward trend of metal prices continued during the early part of the year, but gradually prices became more stabilised and tended to rise, and a greater feeling of confidence among buyers became apparent which was evidenced by a considerable increase in orders and enquiries in the last month or two of the year.

We have continued to improve and strengthen our sales organisation and have successfully entered new fields related to our trade. Emphasis was placed upon an extensive advertising campaign for our stock products and this, coupled with greater representation in the field, was responsible for a large number of new accounts being opened during the year. We are continually planning to increase the market for our stock products. In pursuance of this policy we are now building a new depot for housing our Manchester branch, to replace our premises there which have proved inadequate to cope with the increasing business at that branch.

It is particularly gratifying that the volume of our stock sales is now running at a higher level than at any time in the long history of the company.

We have now developed an "ex stock" service which in our range of products is, I believe, both in size and efficiency, second to none in the country. The facilities for service which we are able to offer to the engineering industry are unique in the trade and now that we are in a position to give prompt deliveries from stock, we have every reason to look for a growing volume of business in this department.

I am glad to be able to report that during the last six months there has been a steady improvement in trade, and, although competition remains extremely keen, we have today a substantial order book with a record number of machines in production.

The report was adopted.

SUEZ CANAL COMPANY

FUNDAMENTAL ROLE IN WORLD ECONOMY

The annual general meeting of the Suez Canal Company was held on June 1st in Paris.

M. Francois Charles-Roux, the president, in the course of his speech said:

During the past financial year Canal traffic continued to increase. It did so in 1953 at an even greater rate than in 1952, and this applies to both the number of transits and the tonnage on which dues are assessed, but the increase has been greater on the tonnage than on the number of ships.

As it was at the end of 1953, Suez Canal traffic, totalling 12,731 transits and 92,905,439 net tons, puts our great transit port of Port Said ahead of all European and American ports and gives it the lead among the busiest.

This fact brings out forcibly the exceptional importance of the waterway in your company's concession and the fundamental part it plays in world economy. This is also an achievement in which your company may well take pride.

The larger volume of traffic has naturally brought about an increase in receipts and in expenditure. The past financial year does, in fact, show a considerable increase in receipts over the previous year and, in spite of substantially heavier expenditure, an appreciable increase in net profits as compared with 1952.

TRANSIT DUES

This last-mentioned increase in net profits is the reason why your directors decided to make a reduction in transit dues for the benefit of users of the Canal. For its own good and for yours, your company must levy only moderate transit dues and so be able to point out that these dues yield considerable receipts solely because they are paid by an increasingly large number of ships of ever larger tonnage.

Nevertheless, your board thought it advisable this time to stress the provisional nature of this reduction—as of all reductions for that matter—by specifying that the new rates were to remain in force for only one year, after which your board would consider whether to maintain or cancel the reduction. Your board took this course because it has every reason to expect to have once more to sanction extensive, and therefore costly, new works.

It goes without saying that such a large increase in transits, tonnage and draught of vessels cannot take place without repercussions on the state of the Canal. The meeting which will be held in November, 1954, by your International Advisory Works Commission will provide us with the final data we need to make up our minds on the kind of improvements demanded by present-day traffic.

If we have not raised the dividend more substantially it is, first of all, to enable us to appropriate out of the available balance, the amounts necessary to endow essential reserve and contingency funds, in the second place, to keep the dividend within the limits of distribution commonly accepted for the remuneration of capital invested in an international public utility, and, lastly, to conform with the prudent policy characteristic of the French management of big undertakings. We are, of course, regarding as an essential part of your assets the remaining fourteen years of operation guaranteed to you by the Act of Concession.

Results for the first five months of 1954 completed yesterday show an even sharper rise in traffic than in 1953, with the same feature, that is, a greater increase in tonnage than in the number of ships.

DIRECTORS' REPORT

The following are extracts from the directors' report:

The great international public service with which your company is entrusted has been discharged during the year 1953 in a very satisfactory manner.

Your board decided in April to reduce transit dues which had remained unchanged for three years. It has been made clear, however, that the new rates are to remain in force for only one year, chiefly because of large scale works which will have to be undertaken shortly.

In spite of the inevitable increase in expenditure, the financial year under review today shows a large surplus which, to follow the customary prudent policy of your company, we propose should be used, for the greater part, to constitute provision and to increase reserves, and, in a smaller measure, to raise the dividend.

The maximum authorised draught, which has remained at 34 ft. during 1953, was reached by 38 oil tankers totalling 67 transits, as against 25 vessels and 48 transits in 1952. In spite of unremitting efforts, sustained for the fifth consecutive year, the deepening of the Canal by 20 inches provided for in the 7th Programme of Improvements, is only being achieved slowly because work is hampered by the large amount of silting taking place. To lessen the effects of erosion, transit arrangements have recently been altered. We must expect to have to launch a programme of important works early next year to meet the present increase in traffic which, according to most reliable investigations, will continue for several years yet.

The volume of traffic reached new high levels in 1953. With 12,731 transits and an aggregate of 92,905,000 tons net Suez measurement, traffic has increased by 7.9 per cent as compared with the previous year, the greater part of this increase being due to oil tankers. Among the Merchant Navies of the world, the British, Liberian, Panamanian and French have contributed the most to the increase.

THE ACCOUNTS

Total receipts in 1953, including receipts in respect of past financial periods, amounted to Frs. 30,853,530,514, an increase of Frs. 2,474,048,952 over the previous year. Expenditure for the year amounted to Frs. 13,986,305,004. After deducting interest on and redemption of capital, and expenditure in respect of past financial periods, the surplus comes out at Frs. 15,447,093,252.

Transit receipts have improved by 8 per cent from one year to the other.

To the surplus of Frs. 15,447,093,252 is to be added Frs. 91,500,805 brought forward from the previous year, so that the total sum, on the distribution of which you will have to decide, amounts to Frs. 15,538,594,057.

We propose that the following appropriations be made out of this sum to the following provision accounts: depreciation and renewal of plant, Frs. 1,000 million, this amount being justified by the large orders already placed; depreciation and renewal of buildings, Frs. 300 million; insurance and contingency funds, Frs. 800 million. We also propose the allotment of Frs. 2,000 million to reserve for new works, having regard to the statement already made on a forthcoming big additional programme of improvement works; finally, we would allot Frs. 1,000 million to extraordinary reserve.

After these various allotments, a sum of Frs. 10,438,594,057 will remain available.

The distribution proposed to you, and which amounts to Frs. 10,422,535,211, would leave a balance of Frs. 16,058,846, which we again invite you to carry forward.

The proposed distribution would correspond to a gross dividend of Frs. 9,250, to which will be added, in the case of capital shares, the statutory interest for 1953, amounting to Frs. 1,429.28.

The full report, in French, will be sent on application to the company at 6 Bishopsgate, London, E.C.2.

ROLLS RAZOR LIMITED

The twenty-sixth annual general meeting of Rolls Razor Limited was held on June 4th at Cricklewood Broadway, London, N.W., Mr A. Colin Kingham, chairman and managing director, presiding.

The following is an extract from his circulated review:

During the year, sales of the Rolls Razor were lower than in 1952, nevertheless higher than in any year prior to the war. The reduced production resulted in increased costs which were further added to by wage increases which affected all our products throughout the year 1953. Price adjustments have been made in the current year to meet this situation to some extent, but since the new prices were introduced further wage increases for men and women have taken place. Unexpected costs due to research, development and promotion of the Viceroy Dry Shavers continued throughout the year, but have been written off as they occurred.

The decrease in sales of the Rolls Razor was, however, largely compensated by an increase in the sales of our Viceroy Dry Shavers which, unfortunately, did not show as high a percentage of profit.

Viceroy Electric Dry Shavers are today among the best in the world, and we are now established in an industry which is increasing rapidly and having a considerable effect on other methods of shaving. Competition is very keen for the English and World markets, and as the dry shaving habit grows it will undoubtedly become keener still.

In spite of these facts, our view is that the best and most economical shave is with the Rolls Razor used with Rolls Razor Shaving Soap, but the Viceroy Dry Shavers being made with such precision and attention to detail cause no face irritation and can be used alternately with a Rolls Razor, if desired.

Taking the long view, we have confidence in the future and our ability to continue producing the best in razors and dry shavers, with, we hope, better financial results for shareholders than in the year under review.

The engineering industry covers a vast field of men and women, the large majority of whom are not qualified engineers, and a wage increase which includes all these workers may possibly be absorbed without difficulty when applied to the construction of such things as locomotives, ships, tanks, guns, aircraft, etc., as this can probably be added to the manufacturer's original quotation, but it produces a very different effect when applied to a firm such as ours that is mainly dependent for its success on the price at which its products can be sold to the public.

The report was adopted.

POWER SECURITIES CORPORATION

SATISFACTORY RESULTS

The thirty-first annual general meeting of Power Securities Corporation, Limited, will be held on June 30th in London.

The following is an extract from the statement by the chairman, Sir Andrew M. MacTaggart, circulated with the report and accounts:

I think you will agree that the results are satisfactory. The gross profit for the year at £628,802 is some £187,000 higher than in the previous year. This larger profit has been substantially absorbed by the increase in depreciation of property and plant, approximately £44,000 over the previous year, and the increase in taxation which is some £115,000 more than in 1952.

BALFOUR, BEATTY AND COMPANY

The Corporation derives its main source of income from the engineering and construction side of the organisation through Balfour, Beatty and Company, Limited, and I am pleased to report that the volume of work on which our organisation is engaged in this country and overseas continues on an increasing level. The results of the year under review are reflected in the accounts and compare favourably with past achievements.

During the past year Balfour, Beatty was awarded a further contract, by the British Electricity Authority, for a major extension to the Staythorpe Power Station, and this work, together with the completion of the first 360,000 kW installation in that station, is proceeding satisfactorily. Carmarthen Bay Power Station, which is the other major project we have in hand for that Authority continues to make good progress. This station is a 345,000 kW installation.

Balfour, Beatty have also in hand about 2,500 miles of high- and low-tension transmission lines for the British Electricity Authority and the North of Scotland Hydro-Electric Board. On the civil engineering side in this country the Woodhead New Tunnel was brought to final completion during the past year. Various other works have been completed and a substantial amount of work is still under construction. Overseas we have a large volume of work in hand.

NEW CANADIAN COMPANY

As the result of a decision by your board to open a branch of Balfour, Beatty in Canada, I visited that country in January of this year and registered, in Toronto, Balfour, Beatty and Company (Canada) Limited, with a capital of $250,000, which has been fully subscribed by Balfour, Beatty and Company, Limited. At the same time I investigated a proposition to acquire an existing Canadian construction company known as the Russell Construction Company, and after negotiation it was acquired as a subsidiary of Balfour, Beatty and Company (Canada) Limited on behalf of this Corporation.

It is my opinion that Canada holds out for the people of this country the greatest attraction possible for almost every walk of life. Our object is to collaborate and co-operate with our Canadian friends in the great expansion projects which lie ahead.

While continuing to watch the situation closely in those areas in which we have commitments, we look ahead with confidence. Your board of directors, after giving careful consideration to all the circumstances, have felt justified in recommending an increase in the dividend on the ordinary share capital of 1 per cent, making 8 per cent for the year, which I feel sure will be welcomed.

PHILLIPS RUBBER SOLES LTD.

The 27th Annual General Meeting was held in London on 10th June, 1954, the Chairman—Mr. Peter Pettit, D.S.O.—presiding.

THE ACCOUNTS for the year ending 28th February, 1954, showed:

TRADING PROFIT £183,492 (£160,778), to which is added Reserve for Taxation not required £8,000, making £191,492.

APPROPRIATIONS:

Income Tax and Profits Tax	£102,500
Transfers to Reserves	30,778
Dividends (Net)	49,500
Added to amount carried forward	8,714
	£191,492

In the course of his address to the shareholders, the Chairman drew attention to the following points:—

- The total Reserves (including Reserve for Future Taxation) now amount to £502,568.
- Sales of PHILLIPS Soles and Heels reached a new high record during the year under review and the use of PHILLIPS Stick-a-Soles is now a national habit.
- An improved technique developed in the Company's laboratories to provide even longer wearing life has been adopted at substantial increased cost but without increase of prices to customers.
- Despite continuing difficulties in Export markets owing to restrictions, Export sales showed a further slight increase over the previous year.
- The current year has opened on the same note of expansion.

The Report was adopted and the dividend (15%—making 20% for the year) was approved.

BANK OF BRITISH WEST AFRICA

SATISFACTORY PROFIT FIGURES

LORD HARLECH'S STATEMENT

The sixtieth annual general meeting of the Bank of British West Africa Limited will be held on July 1st in London.

The following is an extract from the circulated statement by the chairman, the Rt Hon Lord Harlech, KG, GCMG.

SUBSTANTIAL EXPANSION

The balance sheet and profit and loss account are before you. Once again I am very happy to be reporting to you satisfactory profit figures, while the considerable increase in the total of our balance sheet is proof of the substantial expansion achieved.

There has been no change in the capital, which stands at £1,200,000.

A sum of £100,000 has been taken from profits and placed in the reserve fund, making the total £1,200,000, equal to the paid-up capital. In addition, £75,000 have been taken from profits and placed to contingencies.

Current deposit and other accounts at £79,435,310 show an increase of £20,661,533 by comparison with a year ago. This large increase portrays the extent to which the business of your bank has expanded in territories which are fast developing their trade and commerce on modern lines. Liabilities on acceptances, confirmed credits and other engagements on behalf of customers, at £9,646,440, show an increase of £2,015,849.

On the opposite side of the balance sheet, cash at £6,028,782 is down by £737,382. Money at call and short notice, at £25,825,000, shows a decrease of £1,175,000, and bills of exchange, principally Treasury bills, at £21,725,643, show an increase of £16,249,990, which item reflects the larger holdings of customers' funds. Our liquidity is very high : the end of March is the time when seasonal requirements of cash are falling towards their low point of the year, and we have to maintain our resources in such form as to be readily available for finance of the new crops.

Investments have been increased to £13,826,825, which compares with the somewhat low figure of £9,537,854 a year ago.

Loans, advances and other accounts at £14,430,720 are higher by £2,135,345.

DIVIDEND AGAIN 10 PER CENT

At our meeting last year it gave me pleasure to propose the raising of the final dividend to make a total of 10 per cent for the full year, and I am glad to be able to recommend the repetition of a final dividend at the rate of 7 per cent which, with the interim dividend of 3 per cent paid in November, 1953, will again make a total of 10 per cent for the year.

New branches of the bank have been opened at Berekum on the Gold Coast and at Ereko Street, Lagos, in Nigeria. We are anxious to provide banking facilities as widely as possible in the territories we serve, but the maintenance of even small offices involves heavy annual expense requiring a considerable volume of local commercial activity to support them.

Our building programme, embracing both office premises and residential accommodation for the staff proceeds apace. There is still much work to be done, but this is accepted as a necessary counterpart to our growing business.

MOVES TOWARDS SELF-GOVERNMENT

All the West African territories have moved yet further towards self-government, and ministerial and other high administrative office is being accepted with all the responsibilities that follow. The burden of public life is a heavy one and much is required of those who have undertaken it to ensure that, by sound government, the great and real advancement of recent years is continued.

The introduction of the newly designed notes of the West African Currency Board has been very well received, and there has been a further improvement in the ratio of notes to total currency in circulation, although the volume of coin is still unfortunately heavy. The distribution of the new notes coupled with the withdrawal of the old notes called for detailed organisation by us as Agents of the Currency Board, and the whole operation has been carried through smoothly and satisfactorily.

Compared with prewar years West Africa now enjoys a far higher real income from the sale of her agricultural produce and minerals, due to the high prices prevailing in world markets. As imported materials and manufactured goods have become more and more freely available so does there appear to have been a change in demand, and there is a discernible tendency for consumer purchasing to be spread more evenly throughout the year. The building of houses of concrete blocks, roofed with corrugated iron or asbestos sheeting, is taking the place of "swish" and palm leaf thatch. It does seem that the postwar demand for textiles and certain other consumer goods may have become somewhat satiated, and purchasing power has very understandably moved towards building materials.

MARKETING BOARDS

The marketing boards have done much to insulate West African economy from the worst evils of inflation, and, with the exercise of due care in the investment of their balances, there should be no difficulty in continuing to maintain a reasonably stable level of internal prices for the produce they control. It is to be hoped that when the time arrives for the boards to support local prices they will be in a position to render to West Africa as great a service in sustaining local prices as they have rendered in syphoning off excesses. One of the boards is already understood to be drawing moderately on its reserves.

While much public interest in West Africa focuses upon political advancement, education and industrialisation, the two basic problems which must concurrently receive attention are those of raising the volume of agricultural and mineral production and of improving communications of all kinds. As to production, the problem is fully appreciated at high level, and much has been done by various methods in an endeavour to raise the volume despite the slowness of results. Even a moderate increase in efficiency would add enormously to the wealth of West Africa. The improvement of communications in its various branches makes good progress ; in such wide areas vast sums have to be spent to provide services adequate by modern standards, and these make a heavy call upon the revenues of newly developing territories.

It is now sixty years since our bank was established. We can be justly proud of our record of progress.

W. T. HENLEY'S TELEGRAPH WORKS

PROGRESS DESPITE DIFFICULTIES

The seventy-fifth annual general meeting of W. T. Henley's Telegraph Works Company, Limited, was held on June 4th in London.

Sir John Dalton, AMIEE, FCIS, chairman of the company, in the course of his speech, said: The profit from trading stands at £1,228,891, which is a fall of approximately 10 per cent compared with that obtained in 1952. The net profit of £704,000, added to the balance of unappropriated profit brought forward from 1952 of £802,000, gives us the total available of £1,506,000, an increase of 8½ per cent over the total available in the previous year.

We have transferred to general reserve £400,000, making the amount of the reserve now £3,500,000. We have paid the dividend on the 4½ per cent preference stock, and an interim dividend of 2½ per cent on the ordinary stock, and we propose to pay a final dividend of 8 per cent on the ordinary stock.

Our current assets amount to £8,764,000 and current liabilities to £1,879,000. If this amount is deducted from the current assets the net current assets amount to £6,885,000, or £273,000 more than the net current assets at the end of the previous year. On the whole, I think you will agree that the balance sheet shows a very strong position and enables us to look to the future with confidence.

During 1953 there was an improvement in the position of our subsidiary, Henley's Tyre and Rubber Company Limited. With regard to Henley's (South Africa) Telegraph Works Company, Limited, our business was well maintained.

The year 1953 was difficult for the cable industry. Three factors accounted mainly for the reduced production of the industry as a whole and of your company. Firstly, the nationalised industries—and particularly the electricity supply industry—continued to live on the very large stocks which those industries had built up during the time of scarcity, and only recently have there been signs of an improvement in their demands.

Secondly, our principal raw material, copper, was price-controlled up to the beginning of August, 1953. Long notice had been given of the Government's intention to release this control and in consequence cable buyers held up orders in the expectation of a fall in price. Thirdly, a new British standard for rubber and thermoplastic cables was introduced which, again, induced buyers to live on their stocks and await developments.

Your company had to face up to these difficulties, which were not unforeseen. We extended our range of manufacture so as to offer more comprehensive designs of super tension cables and accessories as well as an improved type of low-voltage cable. Our overseas business amounted to no less than 33½ per cent of our turnover, an increase on the previous year. We have, in the face of strenuous competition both from home and overseas, been successful in obtaining many important contracts. Amongst the important contracts received in the current year the company has been entrusted with the vital land link of the Atlantic cable which will cross Newfoundland. In addition, the company recently received a one million dollar contract from the Colombian Government for the Bogota telephone system.

One of the most pleasant features of this annual report to Henley stockholders is to record, once again, the excellent and friendly spirit which prevails amongst all ranks of our large organisation.

The report and accounts were adopted.

BRITISH TIMKEN LIMITED

NEW £1 MILLION FACTORY BEGUN

MR JOHN PASCOE'S REVIEW

Mr John Pascoe, chairman and managing director, at the annual general meeting of British Timken Limited, said:

In my address last year I indicated that our turnover for 1953 might not show an increase over that for 1952, and that our profits were showing a slight decline, but were nevertheless running at a level which we might consider satisfactory.

For the year under review the group total sales were down by over 4 per cent on the previous year, and the profits of the group before tax and depreciation were £112,100 down, but as the provision for depreciation required £32,904 less, the profit before tax and after depreciation was £79,196 less than the year 1952.

Owing, however, to the varied incidence of all taxation on the various companies of the group, taxation absorbed £115,517 less, with the result that the net profit was higher than that of 1952 by £36,321, at a figure of £540,595. The proportion earned and retained in subsidiary companies was £82,180, leaving the net profit of British Timken £458,415 against £438,603 for 1952, an increase of £19,812. This increase almost equals the increased amount of dividend, after tax, we are proposing to pay to ordinary shareholders.

With the small decrease in turnover, and an increase in cost of wages and raw materials of approximately £170,000 over 1952, I think you will agree that our manufacturing efficiency and productivity has been fully maintained.

For the fourth year in succession, we are recommending an increase in the ordinary dividend, proposing to pay 8 per cent on the 2 million ordinary shares, against 10 per cent on the 1,200,000 ordinary shares existing at the end of 1952. This dividend will absorb £88,000 net and after the payment of £22,000 to the preference shareholders and placing £353,091 to general reserve (bringing that reserve to £600,000) we carry forward to 1954 accounts £166,703.

In 1953 Fischer Bearings Company Limited declared a special bonus dividend of £150,000 free of tax out of its undistributed profits at December 31, 1952. This operation I mentioned in my review in June, 1953. In the parent company's accounts this was placed to general reserve. We decided to leave the dividend on loan to our subsidiary for the development of that company's business, and subsequently we obtained Treasury sanction to issue to British Timken Limited 150,000 £1 ordinary shares in Fischer Bearings Company Limited, thus expunging the loan and increasing the capital permanently employed in that subsidiary.

Since December 31, 1953, we have purchased from the Ministry of Supply the freehold of our Duston property previously held on a long lease ; this will be reflected in our next accounts by the transfer of approximately £498,000 from leasehold to freehold properties.

We are proceeding with our expansion programme, and have commenced the erection of a new factory on a 70-acre freehold site at Daventry for the production of the larger sizes of tapered roller bearings.

Capital commitments of £550,000 shown in the accounts include a sum of £200,000 for this new development, which will ultimately involve an expenditure of approximately £1 million, a very considerable proportion of which will not be payable during the present year.

In addition to the provision of new buildings and equipment we are at all times engaged in efforts to increase productivity, i.e., output per man-hour. The technical staffs of our Organisation, our work study, development and research departments, with all the very necessary co-operation, continue to achieve gratifying results, as shown by the maintenance of our profit figure at a satisfactory level in the face of a lower turnover and increased costs of wages and raw materials, to which I have already referred.

With our accounts we enclosed a copy of a series of articles which have recently appeared in *The Financial Times*. Although we were not responsible for these articles, with the exception of that written by Mr McNicoll, and in fact there are several points with which we do not agree, nevertheless we thought the general picture it gave of the anti-friction bearing industry was of sufficient interest to warrant our drawing your attention to them.

Of particular interest is the article on a programme of research sponsored at Birmingham University by us, which records the fact that results already obtained have yielded a financial return more than covering our outlay to date.

DIRECT EXPORTS — HIGHEST RECORDED

One feature of the year 1953 was the fact that our direct exports reached the highest figure ever recorded, being 16 per cent of our total output. In addition to these direct exports, it must be remembered that a great proportion of our ordinary turnover, in our estimate at least 60 per cent, goes into the export market.

During the year sales were made to seventy-one separate countries, and personal visits to over forty of these were made by your directors and technical staff with very satisfactory results during 1953, which are continuing during the present year. In fact, our direct exports are now running at a higher rate than ever before.

During the first five months of the current year demand has been very well maintained, and our output is running at a very satisfactory level ; but I should say that our profit margins, in face of increased wage and material costs and intense competition all over the world, are showing a declining tendency. However, with our expanding capacity and extensive re-equipment, we are now able to quote much more satisfactory delivery dates, and providing there is no setback in the general trade of the country, we have good prospects of reaching a greater output than during any previous year.

In industry, whatever the achievements of the past have been, we must be ever looking forward to the future, and I am confident that the loyalty and ability of the members of our Organisation, which have served us so well in the past, will be equal to the great efforts that will be needed to maintain our continued progress.

The report and accounts were adopted.

The chairman proposed a vote of thanks to the staff of British Timken Limited, and Fischer Bearings Company Limited. They were a fine team who had constantly furthered the prestige of the companies in the engineering world. A great proportion of them had served the companies for twenty years or more. This vote was seconded by a shareholder and carried unanimously.

UNITED BRITISH OILFIELDS OF TRINIDAD

INCREASED REVENUE

The forty-first annual general meeting of the United British Oilfields of Trinidad Limited was held in London on June 8th, Sir Frederick Godber (the chairman) presiding. The following is an extract from his circulated statement for 1953 :

The total revenue for the year was £9,887,910 compared with £9,291,910 in 1952. This increase of £596,000 was largely due to the improvement in oil prices which took place during the year. The total volume sold increased but very slightly. Costs and expenses before provision for depreciation, depletion and income taxes increased by some £1,463,000

In the Ortoire area, Well BE1, which was started in February, 1952, was successfully completed in May of that year. Subsequent completions later in 1952 and during the first part of 1953 established this area as a producing field. At December 31, 1952, the information gathered was being studied, but as no definite conclusion regarding the area's prospects could then be reached, all expenditure incurred to that date was capitalised in the books of the company. The subsequent decision taken in 1953 to classify Ortoire as a producing area meant certain adjustments to this treatment, including the charging against 1953 income of operating expenses incurred since July 1, 1952. The effect of this in the 1953 profit and loss account was to charge some £284,000 for 1952 expenditure and £782,000 in respect of 1953.

While the effect of the foregoing is to reduce the net profit for 1953, the action taken is consistent with the company's usual conservative policy of charging against current revenue all operating expenses incurred in obtaining that revenue.

While we have been able to maintain output in our long-established fields, we have been unable, in these fields, to improve the slender ratio of crude oil reserves to production rate. The discovery of Ortoire was of some assistance in this regard, but unless or until our production rate can be markedly improved, the heavy strain upon the company's liquid resources will remain. This can be seen in the balance sheet where cash and Government securities show a decrease from £1,207,000 to £361,000. This reduction has continued during the current year and it has been necessary to arrange a short-term loan. However, forecasts for the remainder of the year indicate that cash generation will be adequate for requirements as at present foreseen.

Our efforts must continue largely to be devoted to the further development of Ortoire and to exploration work, inevitably costly, most of which will be in the form of our participation in the activities of Trinidad Northern Areas Limited. On behalf of that company we have already commenced the drilling of deviated wells from the shore in the Point Fortin area.

As regards the general problem of replacing depleted oil reserves in the face of today's high cost of exploration work, we find ourselves, with other British oil companies operating in Trinidad and elsewhere, confronted with the competition of companies established in countries such as the United States and Canada which enjoy special tax allowances for this purpose. So long as the special needs of the petroleum and mining industries for appropriate depletion allowances are not recognised, companies such as ours will find themselves at a disadvantage compared with competitors operating under tax jurisdictions which do recognise such needs. The report was adopted.

RIO TINTO COMPANY, LTD.

DISAPPOINTING RESULT OF SPANISH OPERATIONS

THE EARL OF BESSBOROUGH'S SPEECH

The eighty-first annual general meeting of Rio Tinto Company, Limited, was held on June 10th in London, E.C.2, The Rt Hon The Earl of Bessborough, GCMG (the chairman) presiding.

The chairman, in the course of his speech, said :

The profit carried to appropriation account is, as you will have seen, £607,213, as against £705,108 for 1952. The main reason for the decrease is the reduction in the trading profit from our Spanish operations, and I will deal with this later.

Tax authorities remain the preponderant participants in profits, and the problem I mentioned in my speech last year of how British companies, with their current incomes so depleted by taxation, are to continue to play an adequate part in exploration and development overseas seems little nearer solution.

As indicated in the directors' report, active mineral exploration of a long-term nature and of a general character is continuing in Northern Rhodesia, the Union of South Africa and Canada. In practically all these cases we have as associates well known mining houses. In Africa these associates are The British South Africa Company, Selection Trust and Tanganyika Holdings Limited, and in Canada Sogemines, which is the Canadian company associated with the Belgian Union Minière.

Your company has also set up an exploration organisation to look for uranium in Australia with offices at Darwin. We are grateful for the assistance and advice which have been given us by the Australian authorities.

In all the countries I have mentioned specific areas are being thoroughly surveyed and tested, but field work has only been in operation a short time and therefore your board has no results of importance to announce. It is satisfied, however, that the exploration organisation is sound and efficient and is working in a most economic way. You will appreciate that in mining exploration success cannot be commanded, but we are trying to deserve it.

In Scotland, in association with Siamese Tin Syndicate and Bangrin Tin Dredging Company, the old lead workings at Wanlockhead have been de-watered and the task remains of investigating whether or no an economic mining proposition exists there.

TRADING RESULTS

Turning now to the trading results shown in the profit and loss account for the year, net return on sales of produce shows a very heavy decline from £1,376,843 to £600,337. A less heavy provision for taxes has caused expenses also to show a reduction, so that the trading balance carried to revenue account, whilst considerably reduced, is £151,781, as compared with £291,730, and this after charging £44,986 for abortive expenditure on exploration and development.

The drop in net return on sales of produce in part reflects a contraction in demand for pyrites and a reduction in sales from 943,731 tons to 723,603 tons.

The situation in this respect has happily been restored, and it may be said that sales are now improving. But a large factor in the decrease of the net return on sales is a further rise in costs in Spain without a corresponding increase in the prices at which sales in Spain of the company's products are fixed, or in the rate of exchange for the foreign currency for exports, which has to be remitted to Spain. The rise in costs is the result partly of the lower tonnage sold and partly of increased labour charges.

COMPLEX SYSTEM OF LABOUR REMUNERATION

Basic rates of wages are fixed by the authorities, as well as the social services payments which the company has to meet. These payments to workmen make a formidable list. In fact, the manner in which labour is remunerated has become so complex that social services payments now exceed basic wages.

Thus, during the period under review, not only have basic wage rates been increased, involving as such a corresponding increase in social payments, but the percentage of basic wages which the company has to meet for social payments has also greatly increased.

In these circumstances, your board has for its part devoted its endeavours to maintaining and increasing efficiency of working by bringing plant and equipment on the property to a high standard. Purchases were largely made through the American loan to Spain which I mentioned in a previous speech. The programme of relaying the main line has now been completed ; sixty new 30-ton wagons and six new locomotives have been bought and these have greatly improved the facilities for, and reduced the costs of, transporting the ore to the port of Huelva.

The sub-station connecting the mines to the Sevillana Electricity Company's grid has been completed and is now in operation, and about one-quarter of the power used at the mines is being taken from that source. This has provided the opportunity of modernising the company's own electricity plant and of converting the major part of it on to high pressure steam. Work on this is expected to be completed within the next two years.

PYRITES PRODUCTION

On the pyrites production side a new concentrating plant, in which heavy media separation is partly employed, has been constructed to enable old mineral of unsaleable grade lying on the heaps to be converted to saleable pyrites. This plant is experiencing the initial problems inherent in new operations of this kind, but these are being overcome and it will provide useful additional quantities of pyrites for sale.

That the Company's operations in Spain should bring so little profit is disappointing. Nevertheless, that operations at the mines have proved able to be maintained at a high level is an indication of the very great inherent value of the property and a striking tribute to the staff and labour there.

Nevertheless, your board is of the opinion that the future holds prospects of improvement in regard to its Spanish business.

As for last year, the board recommend that the dividend on the ordinary shares be at the rate of 15 per cent, free of tax, and that a bonus of 5 per cent be paid, making a total payment for the year of 20 per cent, free of tax, on the ordinary shares.

The report and accounts were adopted and the dividend of 15 per cent, free of tax, and bonus of 5 per cent, free of tax, were approved.

The retiring directors, Monsieur Emile J. V. Laffon, Mr C. F. Byers, OBE, and The Rt Hon The Earl of Bessborough, GCMG, were re-elected and the other formal business having been duly transacted, the proceedings terminated with a vote of thanks to the chairman, directors and staff.

THE UNIVERSITY OF SOUTHAMPTON
DEPARTMENT OF ECONOMICS
Applications are invited for the post of Lecturer in Statistics. Salary within range of £550 rising annually by £50 to £1,100 per annum with F.S.S.U. and children's allowances. Initial placing on scale will be subject to experience and qualifications.—Further particulars from the Secretary and Registrar, The University, Southampton, to whom applications should be sent not later than June 30, 1954.

A SUPERVISOR (woman) is required in the Statistics Section of Mars Limited of Slough to be responsible to the Statistician for (1) the planning and processing of routine work including the control of staff; (2) building up and maintaining an information service on economic data. Applicants should be between 25-35 with previous experience in at least one of the above fields. It will be an advantage for applicants to have either a degree with an economic or mathematical bias or experience of using punched card equipment and a working knowledge of a modern language. Salary £520-£624. Non-contributory pension scheme.—Applications should be addressed to the Recruitment Officer, Mars Limited, Dundee Road, Slough, Bucks. This vacancy has been notified in accordance with the Notification of Vacancies Order, 1952.

CHARTERED ACCOUNTANT required to act as Chief Financial Executive to a major contracting company. Age 30-45. He must have a sound knowledge of management accounting techniques and be capable of advising the Board on all financial and commercial matters in connection with the company's home and overseas branches and subsidiaries. To a man of agreeable personality and outstanding ability this post offers good prospects. Salary £3,000 per annum.—Box 575.

THE Economists' Bookshop, 11-12 Clement's Inn Passage, London, W.C.2, invites you to submit lists of books on Economics, History and Social Sciences, you may wish to sell (*periodicals excluded*).

UNIVERSITY OF GLASGOW
LECTURESHIP IN MODERN ECONOMIC HISTORY AND/OR ECONOMIC DEVELOPMENT
Applications are invited for a Lectureship in Modern Economic History and/or Economic Development tenable from October 1, 1954. Salary scale: £500 to £1,100. Initial salary according to experience and qualifications. F.S.S.U. and family allowance benefits.
Applications (*six copies*) should be lodged, not later than June 30, 1954, with the undersigned, from whom further particulars may be obtained.
ROBT. T. HUTCHESON,
Secretary of University Court.

ATTENTION: BOARDS OF DIRECTORS AND PRINCIPALS
Put your worries on capable shoulders. Executive would welcome opportunity to join company with its back to the wall and steer it to prosperity. At present holding managerial position of high importance, fully experienced in complex production and commercial fields, medium and large organisations. Early forties. Strict confidence. Box 496.

FINANCE HOUSE expanding its activities requires Executive with banking and accounting experience to promote expansion. Excellent prospects for energetic man. Write fully, stating qualifications.—Box 579.

ECONOMIC DIGEST (monthly) will keep you informed of many important items you are liable to miss in the modern avalanche of articles, reports, lectures, memoranda. Free specimen copy with pleasure.—Economic Research Council, 18 South St., London, W.1.

DO you get the information you want about your business. Widely experienced commercially—chief accountant—qualified, will attend at your convenience. Initial consultation without charge. Box 580.

Part of the David Brown contribution to the Coryton Refinery

With acknowledgments to Vacuum Oil Co. Ltd.

THIS THAMES-SIDE PLANT WILL PROCESS NEARLY A MILLION TONS OF CRUDE OIL ANNUALLY

The Vacuum Oil Company's new £12,000,000 refinery at Coryton, on the Thames Estuary, will be one of the few in the world designed specially for the manufacture of high-grade lubricating oils. It will process approximately 900,000 tons of crude oil annually. To this important benefit to Britain's economy, David Brown have contributed no less than 140 sets of complex valve castings for the power plant and boiler house alone, apart from large quantities of tube supports and pump castings for most of the main refinery units, etc.

Influential people in over 100 countries keep abreast of world news through TIME magazine

Five separate editions of TIME MAGAZINE, with the same editorial content, are published in English every week. One edition circulates only in the United States. The other four—the International Editions—published simultaneously, are read by important people in over 100 countries outside the U.S.

TIME's net paid audited circulation exceeds 2,000,000 copies each week. More than 903 out of every 1,000 TIME readers hold important positions in business, government and the professions. They look upon TIME not only as the best means of keeping abreast of international news, but as an introduction to the world's foremost companies and products. People around the world can read *all* the week's important news — including your advertising news—while it is still *news*. The Advertisement Manager will be pleased to give you further information.

You can buy advertising space in just the editions you want, covering the world markets in which you are most interested.

Famous advertisers like Ford Motor Co., Limited are using this powerful International medium to develop their world markets.

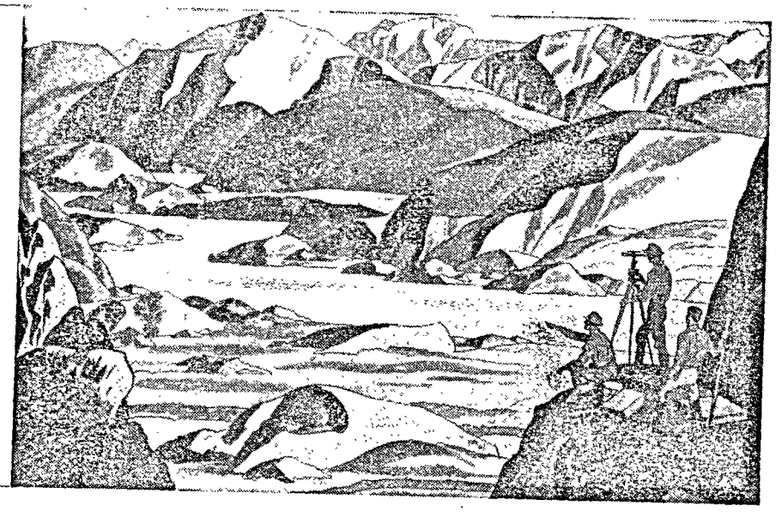
'ENGLISH ELECTRIC'

Where wildernesses are to be tamed and their latent power harnessed, ENGLISH ELECTRIC undertakes the power project as main contractors. The first surveys, the roads, the housing of labour — all these are part of the vast preparations for power installation. The world-wide ENGLISH ELECTRIC organisation provides the power, whether water, steam or diesel oil is the motive force.



bringing you

So, in any part of the world, waste land becomes productive, new communities are born, new industries are founded, through the power of electricity, generated, controlled and applied by ENGLISH ELECTRIC plant and equipment. In this, as in so many other ways, ENGLISH ELECTRIC helps to bring better living to millions.

The Dust of Geneva

IT is hard to tell whether the Geneva Conference is dead or whether a spark of life remains. But this at least is clear: that Chou En-lai's concession on Wednesday—and it is a real concession—was produced only by the ostentatious resolve of the western powers to wash their hands of Geneva and get on with their other business. Thus whether the Communists really want an agreement or not, the right conduct for the western governments is the same. Whatever the Russian and Chinese governments may now say, it is very good news indeed that Sir Winston Churchill and Mr Eden are going to Washington next week to "strengthen the bridge." For reasons that are now generally accepted—at least in this country—risks have been taken with the Anglo-American alliance; for a few weeks Britain has tried going it alone. The experiment has been disappointing—though it was not entirely fruitless—and the partnership is now to have its intimacy and confidence restored by personal contact. That should be, if it is not already, the overriding purpose, in Washington as well as in London.

The evidence that led to this decision could not be clearer. Mr Molotov and Chou En-lai destroyed by their speeches last week any illusions about their readiness to make concessions. With France faltering and Vietminh victorious why should they feel the need to compromise? The Communists seem not content to nibble off Indo-China leaf by leaf; they want and believe they can get the *fond d'artichaut*. A regrouping of forces that might have drawn a line across northern Vietnam—the first strip of an Asian iron curtain—was not enough for them; they wanted France and its allies to admit their right to meddle with threats and arms in the affairs of Laos and Cambodia. In their refusal to accept neutral and Asian supervision of the truce for which Mr Eden was working, as in their attitude to elections in Korea, the Russians showed once again that they despise and distrust impartial judgment and international control, unless these are certain to work in their favour. As for the Chinese they have offered Britain a little trade, a little civility, the equivalent in diplomacy of a tip for attention shown. But for the French there was nothing but blackmail, and for the Americans nothing but abuse.

None the less, Mr Eden was right to see what he could do by patience and mediation. In the Asian countries of the Commonwealth there is now a better, if reluctant, understanding of the threat in Indo-China and of what may be done to contain it. In the United States there has been time to reflect and to begin to distinguish bluff from genuine intention. In this country public opinion has had a six weeks' refresher course in the facts of international life, this time not in the Sudetenland but in the more distant and far more obscure Vietnam. Conscience about "colonialism" would have made cowards of many if they had not been shown once again the risks of giving way to men who had won their own power by force and seek to extend it by threats. The strategy of British policy during these past six weeks has

been right beyond much doubt, and even though it failed; but it is also true that the tactics were far too gentlemanly. By assuming the role of mediator Mr Eden may have cast doubts on his own government's purpose, and obscured its own vital interest—for Britain has very vital interests in South East Asia. By insisting on negotiating first and planning resistance second he may have weakened instead of strengthening the prospects of compromise at Geneva. But that is the worst that can be said, and even that is not certain.

★

When he returns, as he now must, the Foreign Secretary would be well advised to speak with what was once called appalling frankness. He may be tempted to mince words in order to conciliate an opposition whose leader is proposing to visit Peking later in the year, but the temptation should be resisted. For neither the House of Commons nor the British people has been made aware of the gravity of what has been learnt in Geneva, or of the risk of a French *débâcle* in the next few weeks that would surrender Tonking to the enemy and expose the whole peninsula to Communist infiltration. Mr Eden should, in particular, make it quite clear what the Geneva meeting was intended to do. It was not intended to find ways by which the Americans could be induced to admit China to the United Nations; it was not expected by any reasonable person to produce an Asian settlement. It was simply hoped to take a further step towards the pacification—and if possible the unification—of Korea, and to see whether the great powers could bring about a truce in the Indo-Chinese war.

Had it been possible to make real progress over Korea and Indo-China there would have been some hope of later and wider negotiations about the Far East as a whole. It was this hope, the hope of creating some confidence by limited agreement, that Mr Eden was pursuing. Had he succeeded, British policy would, for the moment, have looked right and American policy would have looked wrong. But instead the Communists, whether deliberately or not, have made it appear that Mr Dulles's suspicions—to say nothing of his methods—were right and that Mr Eden's hopes were wrong. If it is Communist strategy to divide the United States and Britain, a most promising opportunity has been bungled.

The Communists are now trying to retrieve the situation. They may make it possible for the talks between French and Vietminh military delegations to make some progress. The confusion in Paris and the tactics of General Giap's forces in the Red River delta may yet, in some unpredictable way, open the way to a cease-fire. But Anglo-American consultation cannot wait on such uncertainties. The next step to be taken is clear: policy will have to be concerted for defending the free world's vital interests in South East Asia. And that means that somewhere across South East Asia a line will have to be drawn beyond which further infiltration and aggression will be resisted without reserve. If we want to be sure that others will help to defend what we consider vital—Malaya is not very far away—we must also pledge ourselves. And a treaty of mutual obligation is of little value without agreement about the forces to be furnished and the places where they will be held ready.

Thereby two useful results will be ensured. First, the Communists will have been given fair warning, as they were not either in Korea or in Indo-China; secondly, the governments with interests to defend in South East Asia will be able, in case of aggression, to put to their parliaments the simple question: Do we or do we not honour our pledge? Whether it is possible to create, with the support of free Asian governments, a treaty organisation like Nato has not yet been revealed; the question may not even have been put. It may be necessary to proceed as was done seven years ago in Europe; to organise first the nations in immediate danger—Siam, Laos and Cambodia, Malaya—and then gradually to bring in the nations on the periphery. Seato must grow by stages.

Where the line in South East Asia is to be drawn is for statesmen and their military advisers to decide. It would be as dangerous to guarantee a line that is militarily indefensible as it would be to choose a military line that has no political stability behind it. For these reasons, and for these reasons only, some ground may have to be given in Indo-China. How much depends on what happens in France, and on the interpretation that is placed both by the Communists and by the allies of the United States on Mr Dulles's cautious, pessimistic and rather mysterious speech at Los Angeles.

★

But any decision to cut losses must be seen for what it is, in Asia no less than in the western world. It will mean that another small slice of humanity has been allowed to fall under cruel and intolerant rule. It will mean for hundreds of thousands of people who have worked with France and its friends, exile, denunciation, the concentration camp and death. Even those in Asia who would feel no disgust or shame at such an outcome would none the less murmur to themselves that it is not safe to be friends with the West and the white men, that sooner or later the Communists will come. This, it is true, is not the view that Mr Eden hears from Mr Nehru, who is appeasement personified; but it is the view that he will soon hear from Malaya, from Burma and from Siam.

Britain can no longer stand alone in Asia. Its vital interests there can be defended only with the help and support of allies. Already by so ostentatiously pursuing an independent policy towards China it has run the risk—clearly underlined in Mr. Dulles's Los Angeles speech—of weakening and limiting the American desire to defend South-East Asia. Indeed, the Prime Minister and the Foreign Secretary may find, when they reach Washington, that they are offered the last chance of securing American support for collective security in that region. If that chance is not taken quickly and firmly then Chou En-lai may find himself achieving, more quickly than he can ever have hoped, the chief and declared purpose of his policy—the complete removal of western power and influence from the countries south of China. It is things like these that need saying in the House of Commons, if Anglo-American policy in the next few weeks is to be effective. It is more important that Sir Winston and Mr Eden should rebuild the mutual confidence that they enjoyed with the President and the Secretary of State than that they should receive the plaudits of the Opposition. For though the assent of the Labour party, or even of one wing of it, would be helpful in reconstructing an effective policy of preserving peace, the support of the United States is absolutely essential. If by playing politics (as Mr Attlee is doing here and Senator Knowland and others in America) the crack in the relations between the two countries is allowed to widen into a real breach, there will be nothing left for any of us to do but to start saying our prayers.

What is the Public Interest?

THE Crichel Down report, which was published on Tuesday, after more than a month's delay, has rightly been treated as a document of first-class public importance, and the debate in the House of Commons that has been promised for an early date will be heated and acrimonious. This is not because of the inherent importance of the matters dealt with by Sir Andrew Clark, QC, in his lucid and forceful report, or because the Opposition are making a mountain of denunciation out of a molehill of official delinquency, but rather because it provides evidence to confirm a suspicion that has been growing on the general public for some time past—that bureaucracy in Britain has grown arrogantly careless of the rights of the subject. Certainly that has been proved in this case; and how many more such cases are there where the aggrieved individual has neither the means nor the persistence, nor the connections to force a public enquiry?

It is these wider issues that are worth discussing. Indeed, on the particular transactions with which Sir Andrew Clark was concerned, the only further comment that needs to be made in advance of the parliamentary debate is that the Minister of Agriculture has evidently not yet understood what lies behind the public indignation or perceived the danger that he is in. He persists in thinking that the only really important point at issue is to establish that there was no corruption or personal dishonesty. He tried on Tuesday to throw doubt on the verdict brought in by his own investigator. And he proposes to inflict on the erring civil servants no penalty more severe than an admonition from himself. This will hardly appease his critics.

★

The wider issues arising from this affair are themselves of differing grades of importance. In the first place, it is clear that some principles need to be laid down for the proper disposition of land that has been compulsorily acquired for a specific necessary purpose when that purpose has ceased to exist. Most people would say that, in most cases, the obviously equitable course would be to offer it for sale back to the original owners. But the Crichel Down report reveals that, in official circles, this is the one course of action that everyone unites to avoid.

At the start, Sir Andrew Clark suggests, this attitude was a reflection of the Labour party's determination not to yield back to "the private sector" any property that has ever, for any reason, been "taken into public ownership." Even for Socialists this is an excessively doctrinaire application of dogma, for it means that land is to be nationalised piecemeal, haphazard and as a by-blow of other policies. What is disturbing is to find the same attitude so deeply rooted in public officials that it has apparently become almost instinctive. This cannot be the fruit of six years of Socialist supervision alone. It seems rather to reflect a dangerously contemptuous attitude towards the rights of the private individual, which have evidently been relegated to a

What It Is About

In 1937 some 725 acres of land at Crichel Down in Dorset, forming part of three farms, was purchased, against the opposition of the owners, by the Air Ministry as a bombing range. In 1949 the Air Ministry decided that it had no further use for the land, which was transferred to the Minister of Agriculture and by him to the Land Commission. The original owners (or more accurately their successors in title) applied at various times either to buy the land back or to rent it and farm it. The Ministry nevertheless decided to equip the 725 acres as a separate farm; this involved a considerable expenditure on which no adequate return is likely to be secured. The land was therefore sold to the Commissioners of Crown Lands and let by them to a tenant who had no previous connection with the property.

Sir Andrew Clark, QC, was appointed by the Minister to inquire into these transactions and into the circumstances in which the decisions were taken. He finds that the Minister, in reaching his decision, was substantially misled as to the facts and that various other irregularities occurred. He adds that "there was no trace . . . of anything in the nature of bribery, corruption or personal dishonesty."

very low position on the mental priority list of the average bureaucrat. The more the original owner urges his claim, the more the officials allow their attitude to him to be governed by what Sir Andrew Clark calls " a feeling of irritation that any member of the public should have the temerity to oppose or even question the acts or decisions of officials of a Government or State Department." This is something new in England. Clearly, if this is the general attitude, the responsibility for seeing that justice is done cannot safely be left to the good sense of departments. Rules are needed ; and the first rule should be that, when the original necessity for taking away a person's property has disappeared, the property should be offered for sale back to its original owner unless it can be proved to the satisfaction of some independent enquiry or tribunal that some other disposition of it would better serve the public interest.

*

This is, however, only a special example of the general question of the proper relations between the citizen and the civil servant. Everyone would agree that the public interest should, where necessary, override the desires of individuals. But what is the public interest, and who shall determine it ? An enormous mass of legislation has now been built up on the assumption that every public servant has a natural affinity for the public interest and can be deemed (without further enquiry) to be acting in such a way as to ensue it. The only recognised exception is if he has been corrupted, and it is generally accepted that he very rarely is. If he is honest, then he must be acting in the public interest, for is he not subject to the orders of a minister, who is responsible to Parliament, which is responsible to the public ?

This is the theory on which it is considered safe to leave enormous powers of subsidiary legislation in the hands of the departments: "the hon. gentleman can rely on it that these powers will not be used without a most anxious concern for the public interest "—how often has not this, or the like, been said in defence of some blank legislative cheque ? This is why departments are left as final judges, not merely in matters that deeply affect private individuals, but also in matters where they are themselves parties (" an appeal shall lie to the Minister, whose decision shall be final "). They can safely be judges, for are they not by definition disinterested ? This is why government departments do not have to obey their own (or each other's) regulations: the private individual must be kept in check because nobody can be sure that he will naturally act in the public interest, but of course a government department always does. This is why government departments are allowed to crash any queue—for example why they built so many vast office buildings in London in the postwar years, before anybody else was allowed to build any—because any purpose of a government department is *ipso facto* more in the public interest than any purpose of anybody else.

The virtue of the Crichel Down report is that it exposes how false this theory is. The public official can be as stupid, as inaccurate, as wrong-headed, as selfish, as mendacious, as obstinate as if he were in private employment. Perhaps the sole responsibility of the Minister—in whose name everything is done—was a real safeguard in the days of Sir William Harcourt, who is reported to have told the officials of the Home Office when he was Secretary of State that his only function was to prevent them from being hanged from lamp-posts in Whitehall. But it is impossible nowadays for a minister even to know what is involved in the great majority of decisions for which he is responsible. If the Minister of Housing and Local Government were to reserve for himself the final decision in all cases of compulsory purchase and in all planning appeals, he would have to study and decide a score or more of complicated cases every working day—and those are not the only quasi-judicial functions that his Ministry performs. All save one or two have to be left to the machine—and for all the Minister knows, any one of them could be a Crichel Down. Moreover, even if he can master the facts, it is not easy for him to act. A minister is a very lonely man in his department. It takes great assurance and energy to go against the policy formulated by so formidable a hierachy and supported by such impressive documentation as an official file.

*

The " new despotism," in short, is not an exaggeration, it is a reality. It is a despotism that is practised by the most conscientious, incorruptible and industrious tyrants that the world has ever seen. But tyrants they still are, for they are ready to ride roughshod over the individual subject whenever their departmental convenience (which they honestly believe to be the public interest) requires it. And the remedy is to be found along the same lines that our ancestors found it long ago, in the right of every subject to appeal to his peers. The analogy, of course, could never be more than a rough one. No one would suggest that there should be appeals to the courts, and trials by jury, at every turn—life is too short, and many of the matters at issue are not susceptible to legal determination. But every subject who has a quarrel with the crown has a right to know that his case will, at some stage, be submitted to som wholly independent person for an impartial opinion.

Is that an unreasonable principle ? It is, in economic matters, a very novel one, and the departments will say it would impossibly complicate the performance of their duties. But after what happened at Crichel Down (which no private citizen will believe was a unique case, save in that it was exposed) can it possibly be said that such a principle is not necessary ? Yet if Parliament wants to see movement in this direction, it will have to be fought for by private members, who will have to break down the dependence of ministers on their departments. They have a chance to start on Sir Thomas Dugdale.

Crisis Without Purpose

THE circumstances in which the National Assembly turned M. Laniel out of office at the end of last week were wholly deplorable. Futile impatience, sheer contempt for parliamentary institutions, personal ambition and disregard for the national interest all played their part side by side with genuine indignation, stubborn patriotism and a vague desire to make a fresh start. Yet the result is likely to be largely negative ; for there is no sign that France's parliamentarians will do more than find a new pilot to follow the old Laniel-Bidault course. It is as if drivers in a London traffic jam left their cars in a rage, combined to remove the policeman on point duty, and then attempted to force their cars on, only to find that their selfishness and impatience towards one another made it necessary to send for another policeman. The London traffic problem would remain, just as the problem of parliamentary government in France remains, intractable and frightening, just short of anarchy.

M. Laniel's coalition government had been for months in a state of persistent and barely camouflaged crisis, held together only by the absence of any alternative policy or majority. This deterrent—the fear of a lengthy crisis that would demonstrate France's weakness —has now ceased to deter. The three hundred odd deputies who dismissed M. Laniel had little in common save their desire to be rid of him ; and in that emotion alone there is no basis for a new coalition. It would be foolish to expect that a new and clear policy for Asia, Africa and Europe will be forged in the heated debates that will now be staged. It would be wiser to reckon that roughly the same team of ministers will be asked, after a period of confusion and anguish, to pick up the threads of policy where they now lie.

This is no new experience for France and its allies, for it was in just this way that the late government came into office a year ago. The Assembly, tired of M. Pinay's right-wing coalition, experimented briefly with alternatives and then chose the almost unknown M. Laniel, but only after the longest interregnum in the history of the Fourth Republic. What was generally regarded as a caretaker government was nearly swept from power by a wave of strikes ; but it managed to survive further labour troubles, thanks to a measure of economic recovery. Time and again it looked like breaking up on questions of foreign policy, but it held together largely because of the general desire that the voice of France should be heard in successive conferences, at Bermuda, at Berlin and finally at Geneva.

It was the depression moving in from Geneva that caused the storm to break in Paris last week. With hopes of a negotiated agreement fading, the Gaullist and Radical critics of M. Laniel saw no further reason for pulling their punches. Moreover, the fall of Dien Bien Phu and the apparent hopelessness of the campaign in Indo-China evoked intense and bitter emotions. How could the storm be resisted by a group of men who had never agreed on a clear policy for North Africa or Indo-China, and who had agreed only to disagree about German rearmament ? Arch enemies of the EDC, the Gaullists, sat at the same table with its stubborn supporters, the MRP. In such a coalition the price of stability is immobility. But it is a price that cannot be paid for ever. The Vietminh offensive, the Geneva conference, and American and German impatience over EDC made decisions more and more necessary, and more and more difficult.

Unfortunately, M. Laniel's fall does not mean that a government of decision can now be formed. The contradictions are no less deep and complex among his opponents than among his supporters. Even the particular groups that brought him down—the Gaullists

A GUIDE TO THE FRENCH PARLIAMENT

M. Laniel's coalition was originally based on all the parties, except the Communists and Socialists.

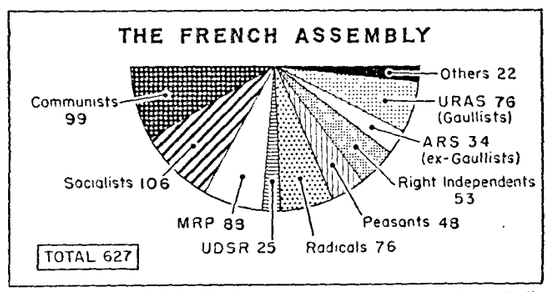
COMMUNISTS : Nobody as yet wants their support, but they play an important negative role. Firm opponents of EDC.

SOCIALISTS (SFIO) : enjoy opposition; reluctant to enter government ; officially pledged to EDC, but half the deputies against it.

MOUVEMENT RÉPUBLICAIN POPULAIRE (MRP): Christian Democrats; control postwar foreign policy (Both MM. Schuman and Bidault belong to it) and will oppose any government intending to change its course. Staunch supporters of EDC.

RADICALS : loose coalition ; wide gap between its left-wing (M. Mendes-France) and right-wing. In present crisis votes evenly divided for and against M. Laniel. Divided also on EDC, though probably majority in favour. Traditionally anti-clerical.

UNION DÉMOCRATIQUE ET SOCIALISTE DE LA RÉSISTANCE (UDSR) : Similar to above ; equally divided.



PEASANTS AND INDEPENDENTS : Chief supporters of M. Pinay's and then M. Laniel's governments ; opposed to any shifts to the left ; majority in favour of EDC.

ACTION RÉPUBLICAINE ET SOCIALE (ARS) : dissident Gaullists, broke with the Rally on entering the Pinay coalition. Anti-EDC, but keen on preserving right-wing coalition.

UNION RÉPUBLICAINE ET D'ACTION SOCIALE (URAS) : remnants of De Gaulle's Rally. Violently opposed to EDC.

and the left-wing Radicals—have nothing else in common. M. Mendès-France, the leader of the latter group, stands for conciliation and concessions in Indo-China and for reform in North Africa. The Gaullists, on the other hand, appear to favour a tougher attitude on both fronts. Then there is the long-standing division over the EDC and policy towards Germany. And, last but not least, there is the fact that the Communists stand beyond the pale of cabinet-making.

★

Thus Gaul is divided not into three but into at least six parts, each subdivided into groups and particles combining in different ways according to circumstances. Only a cataclysm could weld them together ; not even the shock of Dien Bien Phu has sufficed. It may need further disasters in the Red River delta or the despatch of conscripts oversea to awaken the people to realities and to create a mood in which their deputies will take basic decisions. But this will, in the most favourable circumstances, take time. France must still be treated, as has been argued so often in these pages, as the convalescent ally. But it is a question of how long the friends of France can wait, of what decisions are taken now, and of the way in which the will of the French people should express itself. Dr Adenauer and the State Department may yet stay patient for a few months—not longer—while a decision on EDC is sought. But will the forces of General Giap in the Red River delta hold up their offensive while the Palais Bourbon makes up its mind ? Is Hanoi to be allowed to fall or not ?

In theory, parliament might vote for war *à outrance* or for withdrawal of the expeditionary force. In fact, the majority would probably back M. Bidault's middle-way policy of seeing what can be got by hard bargaining ; some of those who opposed M. Laniel spoke approvingly of his foreign minister's conduct at Geneva. But in the immediate future it will be a caretaker government and a wavering assembly that will have to decide whether to send conscripts abroad, whether to accept internationalisation of the war, whether to appease the Vietminh, whether to accept the partition of Vietnam. Answers cannot be long delayed ; what has to be decided is whether they shall be grudging, last-minute, half-hearted answers, with no national resolve behind them, or whether they shall be freely given, carefully pondered decisions that friends and enemies will recognise as the will of the French people.

At first sight, it looks as if the quickest possible formation of another stop-gap government and another spell of office (without much power) for M. Bidault are the best possible solutions. But the decisions that France faces are so fundamental that the foreign observer cannot help asking this question: is it not time that the almighty but impotent Assembly of the Fourth Republic sought a new mandate and asked the electorate for a historic judgment ? Such an appeal, it is true, would for a time paralyse the country and its policy ; but policy is already close to paralysis. It would mean delay on vital matters ; but there will be delay in any event. The result of the appeal might shake the Atlantic alliance to its foundations, but the cracks are there already. In short, the risks of having an election are no worse than those of not having an election. France's allies have no right to tell the French people, which is fully sovereign, what it ought to do. They have perhaps acquired the right to insist that the sovereign be consulted.

There is, unluckily, very little chance of this being done. The decisive and distasteful fact is that, though the free world may be wringing its hands over the appalling incompetence of the French constitution, the deputies themselves like it. Few of them want an election, and the odds are that the traditional allegiances of French voters and the power of party machines would still prevent the people from giving a clear verdict on the things that matter. Unfortunately it looks as if the collapse of government in France will have to get much worse still before the politicians will be forced to remember their patriotism ; and the most that France's allies can do is to see to it, if they can, that the shocks yet to come are not mortal.

Mr Macaulay's Essays

Our periodical literature stifles every other by its exuberant growth, except the few tall trees which spring from amongst it, and the roots of which it nourishes and protects. From the time of leaving college, the student is obliged to attend so much to the topics of the day that his mind is formed on them. Even the Fellows . . . have now little in common with those who ignore the world, and are as much taken up by its cares or its frivolities as the man of business or the man of fashion. . . . As our best writers have descended from catering for courts to providing for the literary public, so we may expect, as information is diffused, to find them adapting themselves to the multitude. . . . In this class of writers, Mr Macaulay occupies the first place. Possessing less original thought and less reflective philosophy than Burke . . . his works contain fewer passages of general wisdom, applicable at all times, than those of his predecessor. . . . With an unmusical voice and rather a vulgar presence, he always fixed attention, and the Commons, who fled when Burke rose, flocked to the house to hear Macaulay. His predominating characteristic, in relation to other writers and speakers, is common sense. He never goes away from his subject. He is never discursive, and never shoots wide of the mark or misses his aim. If he be always fully up to the knowledge of his party, and always prepared to support its views with the most powerful arguments and the most appropriate illustrations, he is never ahead of it. His services to humanity are confined to setting the past in a brilliant frame. He is not inventive. He has advanced no species of knowledge. He has illustrated a prodigious number of old truths, but not discovered new ones. Of all the old principles of his party—religious toleration, moderate reform, respect for the constitution—he has been the most eloquent expounder and defender of the day ; but he has not gone beyond them. . . . He belongs to Old, not to Young England.

Sanity About Wages

THE decision by the Agricultural Wages Board for England and Wales to reject *in toto* the farm workers' claim for higher wages will have important consequences both for agriculture and the whole economy. It is in its way a momentous decision. This is the first time since its inception in 1939 that the Board—or rather the independent members who hold the balance in its deliberations—has sent the workers' representatives empty away. Its decision marks the end of a long spiral of awards that has raised the minimum wage of the adult farm worker from 34s. 10d. to £6 a week.

The workers' representatives had asked for a further "substantial increase" above this figure. Had their claim been met, it would have set off a new series of wage demands in related occupations. Conventionally other rural workers, such as road menders, receive wages which are slightly above those of farm workers. Moreover, the repercussions of the agricultural award would have spread throughout the whole economy. Farm workers are still the largest group near the bottom of the wages ladder. Any step which they take up it is a signal to all the other main groups of workers to do the same. A fresh increase in farm wages would have given a strong impetus to the growing rumbles of industrial discontent.

There is no reason to suppose that the eyes of the Agricultural Wages Board were fixed upon these broader issues. It had reason enough, within the narrower context of agricultural policy, to reject out of hand the workers' claim. The cold wind of realism is blowing at last through agriculture. The farmers' representatives were emphatic that the Government's last price award has left them without the means to pay higher wages. The farmers may well be wrong in thinking that they face an immediate fall in profits ; but they have been left in no doubt that the continuation of agricultural prosperity will depend on strenuous efforts to improve efficiency and to get down costs. The Government is relying on these developments to cut down the annual cost of its agricultural guarantees. It would seem a hopeless augury for the success of this policy to lead off with a big increase in prime costs.

But, however sensible or obvious the Board's decision may seem, the farm workers' claims raise questions of great importance for future policy. The workers' case rests on two hypotheses. The first is that agricultural workers ought to be paid as much as industrial workers. In support of this position, it can be said that productivity per head in agriculture has increased considerably over the last fifteen years and by a much larger amount than in most industries. Agricultural labour is more mechanised and requires a more specialised knowledge and skill than it used to do. The hours worked are longer than in industry. Why should farm workers remain the poor relations of their industrial brethren ?

The second hypothesis is that to pay higher wages is the only way of stopping the drift from the land into the towns and that it is very much in the national interest that this migration should be halted. There can be no denying that the rural exodus, which has been a persistent feature of national life over the last century, is once again in full swing. In the last five years agriculture has lost about 75,000 regular workers. At present the process is being accelerated, and the remoter rural areas in particular are being denuded of population. It is claimed that any further expansion of agricultural output (or even, in many areas, the maintenance of present production) will be rendered impossible under these circumstances.

★

These arguments deserve to be taken seriously. The nation is pledged to a policy of agricultural expansion. Questions of pure justice apart, it cannot wish its large investment in agriculture to go to seed through lack of the necessary manpower. Yet even on this assumption the workers' case is far from convincing. British agriculture is at present producing 56 per cent more food than before the war with roughly the same labour force. This is in itself a striking achievement. It has been brought about by a considerable increase in mechanisation and capital investment, accompanied by improved techniques. Part at least of the loss of labour in recent years has been the result of these developments, and a falling labour force has been quite consistent with an expanding level of production.

Moreover, a rise in wages cuts both ways in its effect on agricultural employment. Until recently its main effect was to encourage a more intensive utilisation of the available labour, thus causing an increase both in output per head and in total farm output. But the limits of this policy have been reached. The small size of most British farms restricts the economic possibilities of mechanisation. Farmers now seem more likely to react to higher wages by sacking one of their men than by buying more machines.

Thus it is by no means certain that higher wages are a suitable specific for rural emigration. They might encourage more men to stay on the land ; but they would also discourage farmers—at least for the time being—from employing them. In any case, the drift from the land is due to many other factors. The pull of industrial full employment—backed by the much superior social facilities and public services of urban areas—appears to operate as an irresistible magnet. To offset this urban pull through the offer of higher wages (supposing this could be done without defeating its end through increases all round) would be a hopelessly expensive procedure. Not another ten shillings a week

but several pounds might have to be paid out before the tide was reversed.

Yet the relative difference between agricultural and industrial earnings is much less than it was before the war. A gap of about £2 a week is not considerable when the lower costs of rural living are taken into the account. This improvement in the farm workers' position is a reflection of his higher productivity; and further improvement can be soundly based only if it springs from the same cause. To set off a wage competition with industrial workers could do little to help the countryside, but a great deal to wreck the national economy.

Perhaps the decision of the Agricultural Wages Board will open a saner era in wages bargaining. Ever since the war the emphasis has been on raising the minimum wages of the least skilled workers in every industry. This approach, besides its inflationary dangers, has had a most mischievous effect upon production. The wage differentials, which determine the rewards available for extra skill or extra effort, have been narrowed. The morale and the enterprise of the more skilled workers have consequently suffered. Out of a mistaken loyalty to the cause of workers' solidarity, they have supported the claims put forward by the mass unions on behalf of their less skilled fellows, and have then resented the consequent narrowing of their own premium value.

There have recently been suggestions that the Trades Union Congress might be amenable to a reimposition of the "wage freeze"—in return, presumably, for an undertaking by the Government to stabilise the cost of living. The idea is not likely to come to anything; but it is indicative of the static and negative state of mind that is still prevalent in industrial relations. In itself a wage freeze has nothing to commend it; it is only of value as an alternative to a wage stampede. It creates a situation in which everyone must wait upon the hindmost and no rewards can be given or incentives offered to those who would earn them.

There is no doubt where the emphasis of wages policy needs to be thrown at the present time. It is in holding the line against further general increases in minimum wages, while allowing particular groups of skilled workers to claim a higher reward for good cause shown. This policy is as necessary for agriculture as for industry. The chances of recruiting workers of scarce or specialised skill (such as shepherds) are improved by the refusal to grant an all-round wage increase. Farmers can better afford to pay such men the additional wage they deserve. If this same spirit can be generalised, then the prospects for the national economy will be considerably improved.

Notes of the Week

Visit to Washington

THE visit of Sir Winston Churchill and Mr Eden to Washington next weekend will be in the nature of a rescue operation, the need for which has become increasingly apparent since the early days of the Geneva conference blew some sizeable holes in Anglo-American policy. President Eisenhower's invitation apparently dates from that period, although it was not possible to arrange the trip until the Geneva conference was sufficiently embalmed to free Mr Eden.

But it is not only shattered policies that Sir Winston and the President will be trying to rescue; there has been something of a crisis of confidence, even of friendship, between the two Governments. This seems to have been tacitly recognised by the President, for he has placed the talks on as personal and informal a basis as Sir Winston could wish. It is the general air of transatlantic back-biting, more than any policy disagreement, that has been causing concern at Westminster. All are agreed that the Geneva conference was necessary and Mr Eden's efforts well worth while; but except, presumably, for the lunatic left, all shades of British opinion recognise that Anglo-American accord must be the basis for any wider international arrangements, let alone for a move towards a meeting of heads of states.

Parliamentary pressure for such a meeting, however, is only temporarily in abeyance. When Sir Winston announced the Washington trip to the House of Commons, Mr Attlee pointedly recalled the motion passed by the House at the end of the so-called "hydrogen bomb" debate on April 5. This motion, sponsored by the Opposition but not opposed by the Tories, specifically called for an immediate British initiative for a meeting of heads of states. It was unthinkable that the Government should not approve such a proposal after Sir Winston's speech of May 11 last year, and the best it could do was to accept the motion leaving itself some latitude about the timing. Even this was not conceded by the Labour party, but the Government claimed it nevertheless. So long as the Geneva conference dragged on there was a perfect excuse for inaction, and even now Geneva is dying, Mr Attlee is not so much the slave of his backbenchers as to be unable to leave Sir Winston free from nagging, at least until after the visit to Washington. But when Sir Winston gets back he will be closely questioned on whether he raised the issue with the President. Sir Winston himself is an enthusiast for the idea; but he is also enough of a realist to know that the reforging of the Atlantic link must come first and that this may need more than a convivial weekend on the banks of the Potomac.

Chou En-lai Bids Last

IT cannot be certain until next week whether the Geneva conference can be saved or merely given a little longer to breathe. Until Chou En-lai made his last-minute proposals on Wednesday it looked as if it was dying, and the specialists were preparing to leave. Now it is possible—though hardly probable—that real negotiation will be still going on in Geneva while M. Bidault is busy in Paris and British Ministers are busy in Washington. This would suit the Communist book, which has always favoured long tests of patience and the wearing down of opponents in subcommittee.

If the Communists will really admit that Laos and Cambodia are independent states in which the Vietminh movement has no claim to recognition; that the conditions for a cease-fire there should be different from what they are in Vietnam; that they are entitled to defend themselves provided that no French or American bases are maintained there—then something substantial will have been gained. But Mr Eden cannot overlook the possibility that these hints of conciliation by Chou En-lai are merely designed to frustrate any American attempt to get Laos and Cambodia into the defence organisation that will be discussed in Washington. They may mean no more than that the Communists are willing to wait for Laos and Cambodia if they can get Tonking now. There is no ground for premature optimism.

Questions for Mr Malik

THE Soviet Ambassador in London, in a letter which appears on page 966, takes issue with *The Economist* for having given a "misleading impression" of the Soviet position on the major questions involved in disarmament. Mr Malik does not specify the points which he regards as inaccurate; but it may be deduced that his complaint is chiefly directed at two phrases used in our issue of June 5th. These were "Soviet insistence on dealing with nuclear weapons separately," and "Soviet rejection of effective international controls."

These two phrases would seem, despite Mr Malik's criticism, to sum up the basic negative factors in the Soviet position. The first point—separate treatment for nuclear weapons—appears to be confirmed, not contradicted, by the Soviet statements to which the Ambassador draws attention. Thus, the Soviet proposal laid before the United Nations Assembly last September called for immediate prohibition of nuclear weapons, but relegated "conventional" disarmament to a slower time-table. As to the second point, it is true that all Soviet statements accept the need for strict international controls in principle; but in practice the present government in Moscow, like its predecessor, still jibs at the degree of international supervision of atomic and other establishments which the majority of nations regard as an essential minimum.

Thus, if Mr Malik is to maintain his position, there are certain questions that must be answered.

First, is the Soviet Government now ready to accept the principle that any genuine disarmament system must cover all kinds of armaments, and ensure that their reduction is properly balanced?

Second, will it accept a programme for the mutual disclosure of all armed forces and armaments, with adequate means for verification?

Third, will it agree to a system of international controls so watertight that no government would be able to cover up a violation of the agreed plan, either by wielding a veto or by refusing access or information to the international inspectorate?

All these points have been accepted by the great majority of nations; notably, they were brought together in the UN Assembly's resolution of January 11, 1952, which was opposed only by the Soviet bloc. Can Mr Malik show that there has been any essential change in his government's position since that date? If not, it appears that the statements made in *The Economist* were correct.

Candidates for Treasurer

MR ARTHUR GREENWOOD had not been very active in Labour leadership for some years. Nevertheless, his death deprives the party of one of the few remaining bridges between its warring factions. Even the Bevanites' championship of him in last year's tussle for the treasurership of the party did not really shake his almost unique status as an elder statesman uncommitted either to themselves or to their opponents. Who should succeed him as treasurer has thus become a new point at issue within the party. Last year Mr Greenwood was opposed from the right—some of the unions did not consider him sufficiently militant against the Bevanites; but he could not be labelled, whereas it is difficult to name any successor who would not be clearly for or against the Bevanites. The right-wing unions, in fact, are making no bones about it. They are proposing to put up Mr Gaitskell, Mr Bevan's *bête noire*, for the job. The idea is to groom him for the leadership of the party after Mr Attlee—with a possible interregnum by Mr Morrison, in spite of the annoyance he caused some of his union supporters last year by his last-minute withdrawal from the contest for the treasurership.

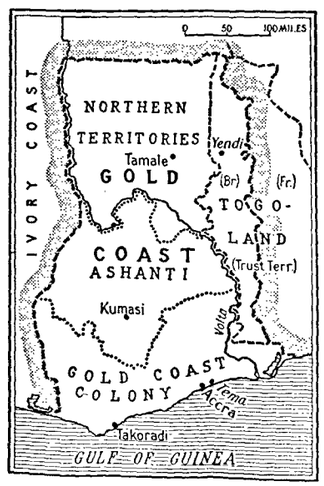
The Bevanites naturally regard the sponsoring of Mr Gaitskell as a fresh affront, and it is likely that Mr Bevan himself will stand for treasurership. This would be a bold but dangerous move for him. The union block votes would almost certainly keep him out, and, as he could not stand at the same time for his usual place in the constituency section, he would then find himself off the National Executive altogether. Even without any suicide dives by Mr Bevan, the mere addition of Mr Gaitskell to the executive would materially strengthen the anti-Bevanite forces on it; they are strong in numbers but a little thin in intellectual power.

One of the unions expected to back Mr Gaitskell is Mr Arthur Deakin's Transport and General Workers' Union. In the Birthday Honours Mr Deakin was made a Privy Councillor and no doubt he will be called a Tory stooge for his pains. As it happens, however, the Government has provided him with a chance of demonstrating that his sense of responsibility does not impair his independent spirit. The latest report on the disposal of the Road Haulage Executive's assets offer some useful ammunition to all the opponents of denationalisation, among whom Mr Deakin is one of the most prominent. Labour leaders who recognise the dangers of more nationalisation can yet show themselves good socialists to their rank and file by urging the folly and failure of denationalisation.

Dr Nkrumah Returned

THE most satisfactory outcome of the Gold Coast elections is undoubtedly the comfortable working majority achieved by Dr Nkrumah and his Convention People's Party. He himself and his Ministers have exercised genuine authority for the last three years, and in the course of their administration they have learnt much that is essential to effective government. Had they been superseded by an untried Opposition, the Gold Coast as a whole would have suffered a considerable setback.

Yet the scale of the Opposition vote is an important factor. It is, on the one hand, a clear indication of the measure of fairness and responsibility with which the elections were conducted. The Convention People's Party has not become, and has not tried to become, a "monolithic" political organisation. It is, on the other, a very obvious pointer to the type of Opposition that is likely to provide Dr Nkrumah and his colleagues with their main political problems. In broad terms, one can say that the political opposition as such has collapsed. The party of Dr Danquah, which attempted to oppose the CPP on its own ground of policy and national leadership, has suffered a debacle, and the new Assembly will be intellectually the poorer for the absence of such middle-class leaders as Dr Danquah himself and Mr William Afori Ata. But what one must call the regional or even quasi-nationalist opposition is strong. The Northern People's Party has a clear majority in the Northern Territories. The CPP has signally failed in its attempt to win all the Trans-Volta Togoland seats, and this implies a victory for the Togolanders who put the unification of Togoland before any closer association with an independent Gold Coast.



The Northern Territories are not separatist. Their party will press in the main for greater governmental concern with the problems of poverty and under-development in the North. The Togoland situation is less clear and could, in effect, lead to a strengthening of the demand for an eventually independent Togoland. The election results mean that Dr Nkrumah has no serious rivals in the field of policy. But he may have a delicate task ahead in holding together the separate partners in the Gold Coast—the Colony, Ashanti, the Northern Territories and British Togoland—in a workable union.

Rail Clash Postponed?

NEW lodging turns were introduced on Monday in the Eastern region of British railways without any opposition from the footplatemen concerned. But it remains to be seen whether any of them will be on strike on Sunday. On that day the Sunday token strikes, resolved upon last week by unofficial delegates from the Eastern and North Eastern regions, are due to begin, and to continue until lodging turns are abolished altogether.

The militancy that inspired this resolution has since become a good deal dimmer. Several local meetings of footplatemen in the North Eastern and Eastern regions have decided not to take part in the strike. But the reason is not that the men are more amenable. It is merely that the words of their union leaders seem to have had some effect. Mr Baty, for instance, the secretary of the Associated Society of Locomotive Engineers and Firemen, urged the folly of strikes at this particular time; for his executive, in reluctant obedience to the instructions of the recent annual conference, is seeking to discuss with the Transport Commission the total abolition of lodging turns. It may at last be occurring to the men that they are undermining their leaders' ability to speak for them with authority.

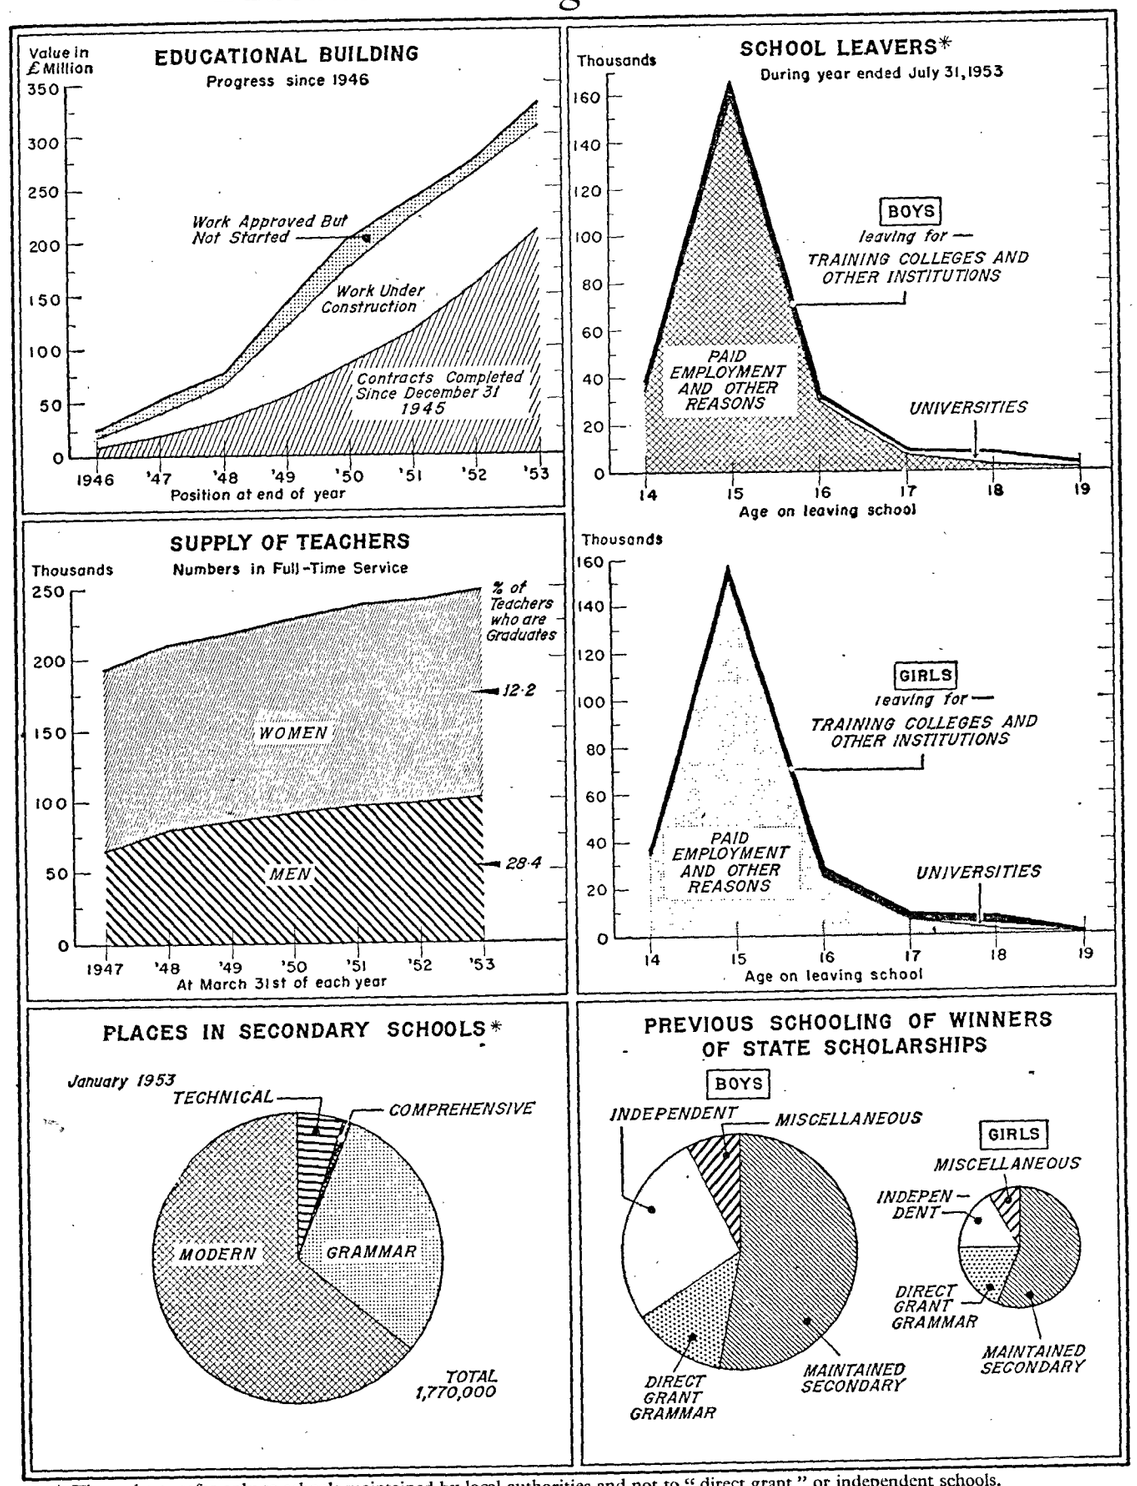
The commission has agreed to meet the unions, although no date has yet been fixed. Once it has rejected, as it must, the demand for the total abolition of lodging turns the militancy in the regions will probably revive. The Transport Commission and also the union leaders (who see the need for the new schedules) may yet have to face the gravest challenge to their authority.

From Malaya to Morocco

THE current of fear and expectation runs far and wide from Indo-China. The shocks are felt in British Malaya, in French Morocco and in independent Indonesia. There and in other countries, they galvanise people and events in a way that calls in question existing policies and, above all, existing timetables for action.

The crumbling of the French position to the north of them is bound to make many Malayans, Malay and Indian

Education in England and Wales



* These charts refer only to schools maintained by local authorities and not to "direct grant" or independent schools.

as well as Chinese, secretly examine their allegiances. It is, after all, not so long ago that Japanese bombers from bases in Indo-China sunk the *Repulse* and *Prince of Wales* and so sounded the knell of Singapore. It is true that nothing dramatic or sudden is likely to occur in the territory, for Sir Gerald Templer, whose two years of office as High Commissioner have just ended, has left it much more secure internally and far better prepared for steady political growth than he found it. But the seeds of a new and rather headstrong Malayan nationalism are showing themselves for the first time in the latest manœuvres of the UMNO-MCA (Malay-Chinese) Alliance, and this movement seems almost certain to gather momentum during the next year or two. Just how fast and how far it will go depends in part on what happens in neighbouring territories.

The success of any movement like the Alliance must depend on the degree of trust that can be placed in British pledges. Do the British genuinely intend to give Malaya fully representative self-government at the earliest reasonable moment? And how soon can that really be? These are the simple and fundamental questions that will be asked. For the present, the Alliance has probably overplayed its hand in refusing to participate in the first federal elections, proposed for next year. It says that Mr Lyttelton, the Colonial Secretary, has not accepted all the demands put forward since its two special representatives, Tungku Abdul Rahman and Mr T. H. Tan, returned from London in May. In substance, after minor but valuable concessions by Mr Lyttelton, these now amount to demands for a wider franchise than formal Federal citizenship; a three-fifths instead of a bare majority of elected members in the Legislative Council during the coming four-year period, and a Royal Commission to look further into the question. Mr Lyttelton has gone quite as far as could reasonably be expected at this stage and, while standing firm on the present arrangements, has asked the High Commissioner to think about a Royal Commission.

A general election will be held in Malaya next year for the first time, and few who understand what an advance this is can fairly cavil at it. But it is not clear to the average citizen of Malaya that this is really intended to be a first step toward a transfer of power. There is a danger that his awakening impatience may be exploited by political gangsters both at home and abroad.

Indonesia Drifts

THE world is apt to forget Indonesia. For the immediate future, it is true, its strategic importance can be exaggerated, so long as the Communist powers in the Far East are relatively weak in the air and at sea. But this vast archipelago, inhabited by more people than there are on the whole mainland of South East Asia, lies at the crossroads of the communications between Australia and the Orient, and between the Indian and Pacific Oceans. By capturing it the Communists would win a most important success. What are the chances? The Indonesians themselves, by no means as united either geographically or politically as the façade of their young state would suggest, have watched very closely the fall of Dien Bien Phu and the abortive meetings at Geneva. Now, while their main desire is to

avoid entanglements and to remain neutral, many of them are seriously afraid that they will fall victim either to Communist pressure from within or to American "imperialism" from without.

It is an open secret that the coalition cabinet of Dr Ali Sastroamidjojo depends not only on its two main elements, the Nationalists (PNI) and the Greater Indonesian Union Party (PIR), but also on Communist support. Neither party has particularly flourishing backing in the country at large, and both want to avoid the long-promised elections, which would almost certainly reduce their representation in parliament. Hence their willingness to flirt with the Communists. There are, however, growing signs of stress within the

cabinet, and the more moderate members of both parties are beginning to realise that the Communists are dangerous allies. They exercise a growing influence on policy and cannot be shaken off.

The Indonesian Communist Party (PKI), with a membership of 100,000 and commanding about 30 seats in parliament, knows that it can bring the government down at any moment. But, having infiltrated the Nationalist party, and arguing that any alternative government would be based on the right-wing Muslim and Socialist groups, the Communists prefer for the moment to go on holding the present position. At their Congress in March, they re-emphasised the two-pronged policy of "partial collaboration" with the government and of a simultaneous "remobilisation and reorganisation of the masses, especially the workers and peasants"; much of this is done through the trade union organisation, SOBSI, which has been deeply penetrated by the party. Indonesia is in a dangerous position and no help can be expected from Djakarta in organising South East Asian defence. At best, the traditional Indonesian indecisiveness will allow the present drift to continue.

New Broom for Morocco

IT was hard luck on the new French Resident-General in Morocco, M. Francis Lacoste, that he should step ashore to take up his new duties in a week so inauspicious for France. But although he had no government at his back and therefore no set policy, he made a brave showing in the inaugural speech which he delivered at Rabat on

Monday. Its tone was decisive, it contained allusions designed to mollify everyone, and it was thought adequate by the many moderates, Moroccan and Jewish as well as French, among his hearers. To the nationalist he uttered the prized words "future independence"; to the French resident he undertook that "all the elements in the population" would play a part in its new legislative institutions; he promised tribal leaders that he would uphold their authority; to those who have been lately walking in uneasy fear of terrorism he undertook that he would exercise his authority to deal relentlessly with terrorists.

He aired the familiar theory that terrorism is "a virus of external origin"; yet he must know that, no matter what its origin, it has spread in conditions that are France's sole responsibility—in the disagreement and indecision which Frenchmen and French cabinets display about North Africa, and in the fillip given to local dissidents by French policy in Indo-China. The proof of his capacity to develop his opening gambit will come only when he takes his first practical steps. Meantime he is beset with handicaps of which the worst are a black-and-tan mood among certain French residents and, of course, uncertainty about the kind of backing he will get from future French cabinets. Without sustained effort from Paris, no Resident-General can make good, however great his personal capacity; the sensitivity of North Africa to cabinet upheavals in Paris is this week well illustrated by the resignation of all the Nationalists in the Tunisian cabinet at news of M. Laniel's departure.

Mission to Buganda

IN spite of all the troubles and disturbances that have lately afflicted Buganda, it now looks as though the constitutional discussions expected to take place between Sir Keith Hancock and the delegation from the Lukiko—Buganda's parliament—will begin as planned. The Lukiko, which has now met again after a recess, has not, as some feared, chosen to use the Governor's dispute with the Uganda National Congress and the imposition of a state of emergency as an excuse for sidestepping this one constructive approach to the present impasse. As a result, there is now nothing to stop the arrival of Sir Keith Hancock next Tuesday.

The credit for this more favourable turn of events cannot be assigned to any one person. In the first place, Mr Kavuma, the senior regent of Buganda's chief minister, has given the Governor consistently firm support in his attempts to end the boycott of goods and the accompanying terrorism through which the Uganda National Congress seemed at one time to be on the verge of throwing the country into turmoil. The Congress has not called the boycott off, and in some parts of the country it undoubtedly has popular support, but the strong action of the chiefs and the police has greatly reduced its political effect.

Mr Mulira, one of the members of the delegation which came to London last November, who was recently appointed adviser in this country to the Kabaka, also played a part. After consulting with Sir Keith Hancock in this country he flew back to Buganda in an attempt to persuade the Lukiko not to wreck the forthcoming talks, which he

now intends to join. He took with him a message from the exiled Kabaka—whose word is still effective in most of Buganda—in which he asked the Lukiko to participate in the talks. That the Kabaka should now adopt so constructive an attitude is very much to his credit.

Reforming the Lunacy Laws

ONE of the most intractable questions facing the Royal Commission on mental illness and mental deficiency occupied a large part of the first day of its public sittings. How can certification be avoided in the case of patients who need hospital treatment but who refuse to receive it?

The witnesses on this first day came from the Ministry of Health and the Board of Control, and their evidence, together with a joint memorandum they had presented to the commission, has now been published (HMSO, 3s.). Their approach to the question of certification starts from the general principle that hospital treatment for mental illness should be as freely available for those willing to receive it as hospital treatment for other forms of illness. In the witnesses' view many people are put off going into a mental hospital because of the formalities involved even for voluntary patients, which stamp them as something different from general hospital cases. If these formalities were abolished, the witnesses thought that more people would be willing to receive treatment. They also proposed that the procedures for unwilling patients should be considered afresh and reduced to the minimum necessary to provide essential safeguards. Under the present law, a patient has to be certified before he can be treated against his will. What the commission and the witnesses discussed at length was whether he should be forcibly treated first, and only certified if at the end of a certain period, say twelve months, he had not recovered and still refused to become a voluntary patient. In other words, to begin with he would be restrained on the advice of a doctor instead of on a judicial order.

Treatment as a temporary patient already exists for those whose illness prevents them from expressing willingness or unwillingness to enter hospital. If it were extended to unwilling patients on the lines suggested, a great deal of certification would be avoided and many relatives' feelings spared in consequence. But the proposal needs very careful consideration before it is adopted. The process of certification is after all designed as a protection against unnecessary detention, and sometimes those taking part in the first day's discussion seemed to be more concerned with a patient's relatives than with his own rights.

Patriotic Prodders in Germany

HERR KAISER, Minister for All-German Affairs, has now launched his "Indivisible Germany" committee, which consists of 126 leading figures in various professions and parties. Its aim is to start a popular movement that

will prod the West Germans into taking an active interest in their compatriots on the other side of the zonal frontier, and in ways and means of achieving German unity. Herr Kaiser and his associates are rightly worried by the evidence that the East Germans are becoming estranged from the west, which shows so little interest in them. It will be an excellent thing if something is done to keep the Easterners in touch with life in a free democracy ; but that is as far as the "Indivisible Germany Committee" should go. To whip up nationalist feeling in the West can do nothing but harm. Given the circumstances, which show little hope of reuniting Germany in freedom with Soviet consent, it is a blessing that the west Germans have hitherto allowed negotiations to be conducted by allied statesmen and Dr Adenauer without making demonstrations and popular demands based on unrealistic wishes. The very title used by the new committee—*Volksbewegung*—has a sinister ring, particularly when it is noted that its manifesto mentions the territories east of the Oder-Neisse as well as the Soviet Zone.

Another move pointing to trouble has been made this week in Bonn. Dr Ehlers, speaker of the *Bundestag* and leading Protestant member of the Christian-Democratic party, has cast his deciding vote in favour of holding the coming Federal presidential election in Berlin. This move is unwise for several reasons. It increases French suspicions ; it undermines the authority of the Federal Government in Bonn, and it conflicts with the status of Berlin as an enclave which is still theoretically under four-power control. Only while this status is maintained can the western powers claim the right to occupy their sectors of the city. Dr Adenauer and his closest supporters doubtless see the point of these objections, but they cannot be expected to go on record as opponents of an apparently patriotic gesture.

"Five Minutes After Britain"

THE confusion that has long existed about Germany's policy on convertibility is being cleared away, in the course of preparations for the meeting of OEEC ministers in London next month. For a long time it was not understood in Britain what the Germans mean by the word—a great deal more than Mr Butler aims at for sterling. They are not interested in giving only to foreigners the right to convert their D-marks. They want Germans to be able to move their capital out of the country if they wish. The British idea of limited convertibility for non-residents only is therefore rejected. But that does not mean they intend to adopt exclusively the other example of partial convertibility—the Swiss type. Herr Abs gave a warning that this would be a disaster for German exports. No country, he has pointed out, is so balance-of-payments-conscious as the Swiss. Here, too, German aims have been misconstrued abroad, as some of the steps that have actually been taken to lift exchange controls have tended to make the D-mark a second Swiss franc.

The Germans' actual policy can be simply stated. It rests on the conclusion that the D-mark is already ripe for full convertibility, but that the final plunge cannot be taken yet. They aim at continuing their step-by-step progress towards both types of convertibility—British and Swiss. They will do so now in consultation with other nations, including the weaker brethren. Their banking authorities are fully aware of the dangers, and will avoid any move that might involve placing a large proportion of imports under fresh quota restrictions. The Germans are committed to continued liberalisation. But they see that American policy will decide the fate of convertible European currencies, and they will not take the last steps to complete freedom until they have some greater assurance than exists at present that German exports will be able to meet American competition in the days to come.

Many of the past doubts about German policy have been due to the fact that Dr Erhard, the Minister of Economics, has represented his country at the meetings of the OEEC and the European Payments Union, and has received much more publicity than the authorities of the *Bank deutscher Laender*, in whose hands the future of the Deutschemark actually lies. The impetuous minister gave the impression abroad that Germany was about to "go it alone" and free the D-mark from all controls in one bold stroke. His policy and his criticism of the EPU were not shared by the guardians of the D-mark, though the difference between them was only one of degree and not of principle. Though there was never any danger of Germany taking precipitate action, it is all to the good if Dr Erhard himself now accepts the convertibility slogan of Herr Abs—"five minutes after Great Britain."

A *new* reference book

THE OXFORD ECONOMIC ATLAS OF THE WORLD

Compiled by The Economist Intelligence Unit and the Clarendon Press Cartographic Department

World maps show by accurately plotted symbols the distribution of some 120 major commodities. The index covers the world, country by country, giving the essential information about each. Maps and index are complementary and interlocking. Diagrams, map notes and explanatory text help to make this Atlas an indispensable possession.

Geographers, economists and students will need this new work of reference. For all engaged in international trade, industry and agriculture it will provide basic information about world economics.

112 pages of coloured maps 150 pages of index

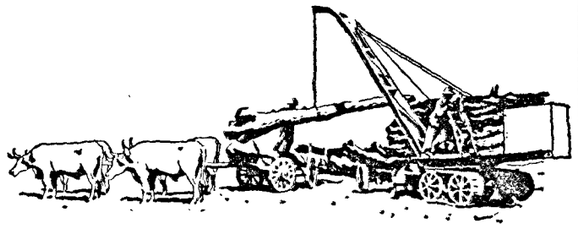
OXFORD UNIVERSITY PRESS



Quebracho

Glance down the lists of Britain's imports from Latin America and you will find quebracho extract. The quebracho itself is a tall hardwood tree which grows in the northern forests of Argentina, taking a full century to reach maturity. Its extract, a valuable tanning agent, is shipped to world markets from Buenos Aires, where the Bank of London and South America has long been established. You will find quebracho mentioned from time to time in the Argentine section of the Bank's *Fortnightly Review*.

This publication is an invaluable guide for all who wish to enter Latin American markets, whether as buyers or as sellers, for it summarizes the latest reports on trading trends, import regulations and exchange control received from our 53 branches in South and Central America. We shall be glad to send you a specimen copy, on application to :—

Your savings are at work

No money that lies idle can bring a return. Your savings in Life Assurance are invested . . . productively invested. The very premium rates offered you and the bonuses paid depend upon the skill of the Life Offices in putting your money to good use.

Their guiding principle is *the security and benefit of the policyholder.*

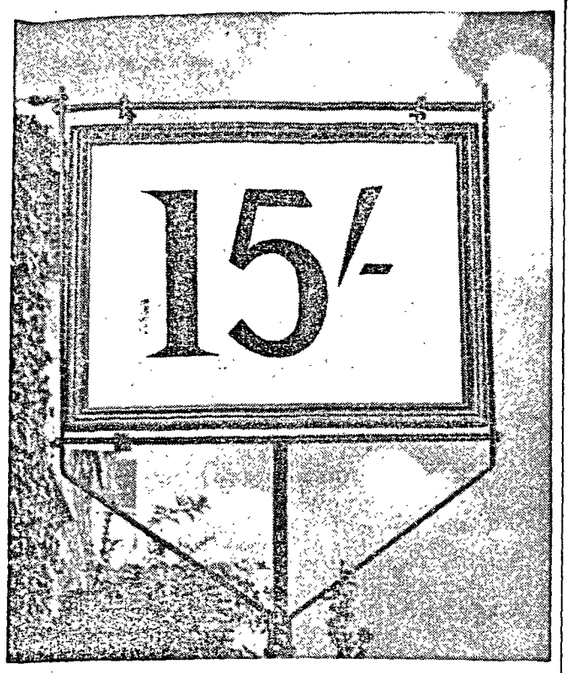
Not surprisingly, that principle leads them to a wide range of sound investments, including worthwhile business enterprises on the prosperity of which, directly or indirectly, your own job may quite likely depend.

Then let's leave

Life Assurance

in tried and trusted hands!

ISSUED BY THE LIFE OFFICES' ASSOCIATION LONDON



One way of saying it

VISITORS TO THE 'Three Crowns' enjoy the landlord's pleasant pun. Ford 'Five-Star' is another meaningful abbreviation, familiar to motorists and the world in general. 'Five-Star' indicates a general standard of excellence and is applied to Ford cars because they possess all the qualities which combine to give the greatest all-round satisfaction to owners. Each model is the lowest price in its class. The consistently reliable performance of cars in the 'Five-Star' range continues to be proved in International Rallies. Ford sets the fashion in appearance and, more important than ever, the famous Ford Service with its low fixed charges is unique. The blue and white sign of the Ford Dealer is everywhere to be seen. Ford cars and Ford service together mean 'Five-Star' Motoring.

Malan Defeated

IT is no surprise that Dr Malan's Bill, which would have removed some 48,000 Coloured Voters from the common electoral roll, failed to get the required two-thirds majority vote in parliament. The Bill was doomed as soon as it became clear that only some seven defections from the Opposition could be mustered to support it. Not even the last-minute compromise offered by the government, which would have left enfranchised those Coloureds whose names were on the existing roll, could do more than entice the six rebels (one was absent) into the Nationalists' lobby. The United party, though shrivelled in numbers, stood firm.

The Nationalists bullheaded determination to push the issue through to the end, even though defeat was certain, may prove to be a serious mistake. For the United party has, since taking up its firmer stand, been gathering much moral, and some voting, strength. The recent by-election at Standerton—the seat that Smuts lost in the 1948 landslide—was, as everybody expected, won by the Nationalists; but though their majority was increased, the swing, even by their own admission, was disappointingly small. Standerton is virtually one hundred per cent Afrikaner. As Mr Strauss observed, the real loser was the United party rebel group, for an impressive number of *platteland* Afrikaners turned out to vote against Malanism.

Unpleasant surprises may yet be in store for Dr Malan in the coming provincial elections. He is hoping for a clear-cut vote of confidence which will give him courage to renew his assault on the constitution. He may be disappointed.

Egypto-Saudi Front

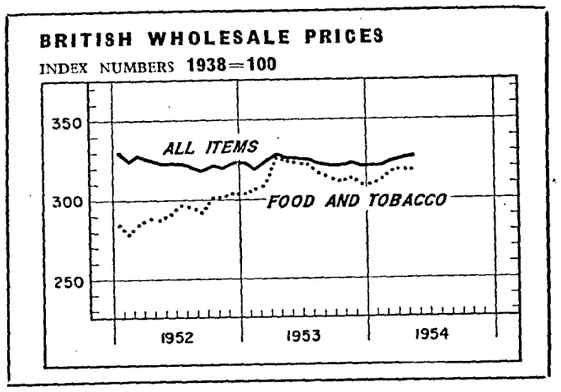
LAST week Major Salah Salem of the Egyptian *junta* visited Saudi Arabia and, while there, agreed with King Saud that their two countries would in some way pool their defence resources. Any working arrangement for such sharing necessarily entails some surrender of sovereignty; the very idea of a pool is therefore surprising in the case of two countries so wedded to their sovereignty as the Middle East's two leading oligarchies. Major Salem admitted, on his return to Cairo, that the agreement was so far only verbal; no practical plans had been laid. None need necessarily follow, for it is clear that the principal purpose of his statement was to vaunt Arab solidarity and by so doing to ward off the inclination shown by other Arab League members—notably Iraq and Lebanon—to buy arms from the West. In Egyptian eyes the path they are treading leads straight to alignment with the Turco-Pakistani pact. Not only Iraq and Lebanon, but also Jordan and Syria are being accused by Cairo radio of "deserting the cause of Arabism."

Egyptian and Saudi objections to Arab links with the Turco-Pakistani pact spring from different motives—both of them parochial. Egypt thinks that any bargain struck by an Arab state with the West weakens Egyptian bargaining power *vis-à-vis* Britain on the Canal Zone issue. The Saudis are concerned only about Iraq, which, for traditional and dynastic reasons, they do not wish to see converted by western aid into a well-armed power. The Middle East, always a great place for anomalies, has seldom produced one better than the sight of two regimes with everything to lose by the advance of Communism combining to thwart the extension of an anti-Communist front.

The Treasures of Chatsworth

THE Chatsworth estate, with its famous and now unique private collection of art, may yet be saved for the nation from sale and dispersal. The estate is only the latest of a long line of famous properties that have been ruined by the present crippling burden of taxation; but the sudden death of the late Duke of Devonshire in 1950 made the case a particularly harsh one. Owing to a flaw in the legal arrangements, the trustees were saddled, by a court ruling, with the full 80 per cent duty liable on the shares of the company which technically ran the estate, rather than with the reduced rate—about half—which is allowed as a concession to owners of agricultural land as such, and which can be paid off on an instalment basis. The trustees have now decided to drop their appeal against this decision, and, instead, negotiations are afoot with the Treasury direct. As a result, the property, and the collection, may be taken by the nation as part of the settlement.

It is now common form that everything possible should be done to stop the gradual destruction of Britain's heritage of historic houses. Probably the best, and—in terms of work done—the most economic, course would be to allow preferential tax treatment to the owners, if they put their own houses in order. But if the Treasury fights shy of being presented with so blank, and undemocratic, a cheque, it should at least make use of such powers as it possesses to preserve these heirlooms itself. Under the 1946 Finance Act it has authority to accept property in payment for death duties, and this sanction was extended by the 1953 Act to allow objects—such as the old library, the statues, drawings and pictures at Chatsworth—to be included in this payment in kind. This extension to its power has not yet been used, and art lovers everywhere would welcome a decision that Chatsworth, which has already suffered heavily from bad luck, should set the first precedent.



Letters to the Editor

The Bomb at Lancaster House

SIR—Referring to the article in your issue of June 5th, I wish to draw your attention to the fact that in it there is some inaccuracy leading to a distortion of the position of the Soviet Union regarding the question of the prohibition of all types of weapons of mass destruction, of the reduction of conventional weapons, and of the establishment of strict international control over the implementation of this prohibition and reduction.

I am enclosing herewith for your attention and for a possible publication of necessary corrections a copy of the draft resolution submitted to the United Nations Assembly by the Soviet Union on September 21, 1953, and the text of the Soviet Government's statement of December 21st concerning President Eisenhower's speech of December 8, 1953.—Yours faithfully, Y. MALIK,
Ambassador of the USSR

London, W.8

[This letter is the subject of a Note of the Week on page 957. The documents to which Mr Malik draws attention are, unfortunately, too long to be reproduced here; but both were, of course, published on the dates cited and are available to the general public.—EDITOR.]

New Peaks in Cocoa

SIR—In your business note "New Peaks in Cocoa" in the issue of May 29 you suggest that the cocoa farmers of the Gold Coast might be encouraged to produce more cocoa if they received a larger share of the present very high world price for cocoa.

There are, however, a number of difficulties which could well develop from such a decision. It is not certain whether cocoa farmers in the Gold Coast would automatically increase production in return for the prospects of higher income. They might even produce less. Even today, without the proposed increase, there is a tendency for less work to be done as a result of the farmer's present income, which, by Gold Coast standards, is high.

While the gain to the economy is thus uncertain, other disadvantages seem almost inevitable. Larger monetary incomes unmatched by a quick expansion in output tends to inflation which the Gold Coast, unlike so many other primary producing countries, has so far been able to avoid. If the gap were filled by greatly increased imports of consumer goods, it would almost certainly be necessary to cut back imports of capital goods essential for the strengthening and expansion of the whole economy. The balance of the cocoa price which is not paid to the farmer is now being used to finance the Gold Coast basic development plan. When the need to create more capital in Britain has been so strongly advocated in *The Economist*, it would appear somewhat inconsistent to advocate steps which must weaken the capacity to save in the Gold Coast, where the need for capital is even greater than in the mature British economy.—Yours faithfully,

YOUR ACCRA CORRESPONDENT

Next Step for Sterling

SIR—In your article of June 12 you show clearly some of the dangers of premature convertibility, even if it were limited to non-residents. May I mention one further reason for caution?

If sterling were made convertible for non-residents there might well be growing pressure for similar privileges for residents. If we were to allow foreigners with sterling to draw freely on the gold and dollar pool in London, then why, it would be argued, should an Australian or a Briton or an Indian not draw on them freely as well to buy dollar manufactures, to travel in North America or to transfer part of his capital to Canada? Should not charity begin at home?

If this is a real danger, sterling should not be made convertible for non-residents until we are strong enough to stand the strain both of such convertibility and of a substantial extra measure of "convertibility" for residents as well.—Yours faithfully,

DONALD MACDOUGALL
Nuffield College, Oxford

Choosing America's Leaders

PRESIDENTIAL NOMINATING POLITICS IN 1952. Five volumes.
Edited by Paul David, Malcolm Moos and Ralph Goldman.
Johns Hopkins Press, Baltimore. 1,630 pages. $17.50.

THE hundred and fourteen anti-masonic delegates who met in Convention at Baltimore in September, 1831, and nominated candidates for the Presidency and Vice-Presidency of the United States, may not have succeeded in their immediate objective of getting their men elected, but they certainly inaugurated an American institution of enduring potency. With every subsequent leap year the nominating conventions of America's major parties have attracted a steadily mounting share of public attention, until in 1952 the gaze of the whole free world (and many a peeping Tom behind the Iron Curtain too) stared down upon the "International Amphitheatre" in Chicago.

Yet for all the millions of words of reporting and analysis that presidential conventions have evoked, little scholarly effort has been devoted to discovering exactly what precedes these gatherings and what shapes their conclusions. These crowds of perspiring delegates who select America's leaders—where do they come from, what are they like, what do they do? The American Political Science Association thought that 1952 was a good year in which to ask these questions, and with the aid of members in the forty-eight states and $70,000 from American research foundations set about finding some answers. Their conclusions fill five tightly compressed volumes, the first giving "The National Story" and the other four dealing successively with the delegations from each region of the United States, the North-east, the South, the Middle West and the far West.

One rises from a first perusal of these volumes with a fresh, overpowering awareness of the complexity of the American political process. On a British reader, at least, their first effect is to produce a sobering realisation of how irrelevant to the vast and sprawling complexities of American democracy are the neat and tidy patterns of our own party contests—patterns that are proffered quadrennially for American imitation by eager exporters of the British way of strife. No two of the forty-eight states that are analysed here (to say nothing of Alaska, Hawaii and Puerto Rico) go through the same motions of selection and direction of their delegates, and seldom, if ever, are these motions simple or swift. In Tuscaloosa the Republican county convention "met in a dentist's waiting room" and 25 Republicans were present; in Illinois "about 6,000 persons . . . attended the gathering in the Springfield National Guard Armory, although 3,150 was the maximum official convention membership." In Vermont "Mrs Cora Robinson, a milliner of Barre, received the nod of the leaders after her husband mentioned to the county committee-woman that his wife wished to attend the convention"; in Illinois two Taft supporters were elected "largely because Colonel McCormick called in every one of the ward committee-men . . . and told them that under no circumstances were these two to lose." In Delaware the Republican state convention "had the atmosphere of an orderly and sedate social function"; in Texas the "general atmosphere" of the Democratic "Loyalist" convention "was a unique mixture of a western religious camp meeting . . . a labour union picnic, and a Tammany Hall clambake without the clams."

The essentially confederate—one might almost say pre-federate—structure of the American parties is vividly brought out in these reports. State rights, whatever their fate in the national governmental process, are a living reality in the American party system. The result is a diversity that defies generalisation. When the editors of the report come to tabulate their conclusions there is not much they can say that is of universal applicability. They state the arguments for and against a national presidential primary with a clarity and completeness greater than can be found elsewhere, but they do not feel called upon to advocate it as a necessary reform. Indeed, in the main they agree with their colleagues who reported on the delegations at the state levels, that for the most part the state delegations pretty well represented at Chicago the sentiments of their party members back home; and this despite the fact that the delegates were often chosen by undemocratic and even arbitrary processes, and that a factor in their selection was often their ability to pay their own expenses.

In part, of course, this is just a particular manifestation of the pervasively middle-class character of American politics. But it is also a tribute to the continuing skill of the American politician, even at the lower levels, in translating the imperfectly formulated preferences of his constituents into acceptable candidacies. One thing does emerge pretty clearly; this politician is no longer, as he once was, the professional political machine-minder. Although the inquiry was surprisingly unsuccessful in getting comprehensive information of a "Who's Who" kind on the delegates, its findings do demonstrate that the amateur, that is, the part-time politician, is far more numerous than he used to be, and that when he turns to a professional for leadership and guidance, that professional is now more likely to be an advertising expert or a public relations man than the old-style Tammany boss. Politics have become too important to be left to the politicians.

The report, clear and illuminating on the convention proceedings themselves, has oddly little to say about their most novel feature, their tele-visibility. Indeed both press and radio, considering their enormous role in the politics of a convention year, are rather lightly treated in these compendious pages. But there is generous compensation in the wealth of particulars about "straight" politics. Here can be read, in fact-studded detail, the political face of the "new" South, from the Mississippi negro chairman with $500 in cash under his coat to the Texas oilmen backing their fancy with millions. In Wyoming there is the politics of conservation, in Nevada the battle between McCarran and Hank Greenspun, in Massachusetts the irrepressible Curley, in Wisconsin a Democratic Party that actually collects membership dues. All the rich fauna and flora of 1952, much of it going to be still vital and potent two years from now, has been rescued here from oblivion. The sum total is a notable achievement and one that its sponsors should not hesitate to repeat in 1956.

Battle of the Bookkeepers

ENGLISH ACCOUNTANCY, 1800-1954.
By Nicholas A. H. Stacey.
Gee. 312 pages. 25s.

A HISTORY OF THE CHARTERED ACCOUNTANTS OF SCOTLAND.
The Institute of Chartered Accountants of Scotland. 183 pages.

THE publication of Mr Stacey's book happily coincides with the centenary of the Institute of Chartered Accountants of Scotland, the oldest existing organisation of accountants in the world. The history of this organisation is ably told in a book issued by the Institute itself. This is frankly a commemorative volume. Mr Stacey, on the other hand, has not written a book merely to celebrate an occasion, even though much of its text is occupied with the often vexed relationships of the various professional organisations. He is too severe a critic of the profession, though a friendly one, to be its panegyrist. As he is not afraid of grinding his axes (accounting research and the lack of unity within the profession are two of them) his narrative seems at times to be rather long-winded; and by concentrating on institutional history he has neglected the development of accounting techniques. For all that, he has written a sober piece of economic history and, as accountancy is linked throughout with the changing economic and social conditions of industrial Britain, he deserves an audience wider than the ranks of the profession itself.

Long before the principle of limited liability was given full recognition in this country, Sir Walter Scott's nephew ignored his uncle's advice and "went for a soldier," instead of becoming an accountant. Yet if he had chosen the ledger, he would have found enough battles being fought. Mr Stacey is largely concerned with these struggles, particularly the dissensions within the profession. The need for adequate training and qualifications was recognised quite early in the history of British accounting, and as the profession grew in numbers so too did the number of professional organisations multiply. Every time the establishment of a register of "qualified" accountants was mooted, a fresh crop of these organisations sprouted. Some of them were of dubious origin, not requiring their members to put their abilities to a test in an examination; though many of them tightened up their standards of entry and qualification later on, a few of them deserved the criticisms that the older organisations poured upon them. When, however, the new organisation filled an obvious gap in the growing profession—as, for example, by providing suitable qualifications without forcing the entrant to take out articles—then the derision with which the well-established organisations greeted them could politely be put down to innate conservatism and less politely to a desire to establish and maintain an effective monopoly in the more remunerative branches of the profession.

Other struggles were going on at the same time. There was the growing demand for more informative accounts from public companies. Here the pressure came from outside the profession. (A reviewer in these columns can perhaps be excused for noticing the part played in this struggle by the late Lord Stamp and by *The Economist* itself.) For

far too long the accountant was content to be the servant of the entrepreneur by refusing to recognise the divorce that had taken place between capital and management. It took the Royal Mail case and the 1948 Companies Act to set matters to right—and, even now, there is more that could be done. Research, standard cost accounting, management accounting, changing money values and the growing preponderance in the profession of the non-practising accountant are among the problems that will be fought over in the future. It is a tribute to the profession that these issues are very much alive and to Mr Stacey that he has set them squarely before his readers. Implicitly, he offers a challenge to the profession. In the past, it has been conservative and slow in reacting to the pressure of events. Need it always remain so? In the future, the accountant could become the servant of bureaucracy. Or should he be its mentor?

"Van's Genius"

THE IMAGINATION OF VANBRUGH AND HIS FELLOW ARTISTS.
By Laurence Whistler.
Batsford. 284 pages. 73s. 6d.

> Van's genius, without thought or lecture,
> Is hugely turn'd to architecture.

THE couplet is from Swift's satirical verses ridiculing the house which Vanbrugh built for himself in Whitehall. Is hugeness in domestic building destined to occupy a relatively short period of architectural history? Hatfield House, Blenheim Palace, and the larger Adam houses, are spanned only by some 170 years. A different cult of hugeness built the 80,000 tons Atlantic queens, which cannot reign for more than a limited number of years and may have no successors.

Mr Whistler, poet, architectural historian and exquisite engraver of glasses, has obviously found a most congenial theme in versatile Vanbrugh. His "Sir John Vanbrugh, Architect and Dramatist, 1664-1726," published in 1938, delightfully portrayed the architect, the playwright who created one of the Restoration Comedy's most memorable characters—Lord Foppington in *The Relapse*—the Captain of Marines, and the fine gentleman of the Kit-Cat Club. This book, presenting newly discovered material in the shape of Vanbrugh letters and recently identified drawings in the Victoria and Albert Museum, traces Vanbrugh's development as an architect in relation to his associates, Wren, Hawksmoor and Gibbs, together with such collaborating garden designers as Wise, Switzer and Bridgeman.

Mr Whistler steers the reader through the stages of Vanbrugh's progress on the mighty mansions of Castle Howard, Blenheim and Seaton Delaval, without neglecting his smaller projects. The 140 illustrations include splendid photographs, plans, and early engravings. An age intoxicated with the thrills of building vast houses lives again in some of the letters quoted. Writing on December 25, 1699, to Lord Manchester, a fellow member of the Kit-Cat Club and afterwards his patron at Kimbolton, Vanbrugh is full of his work for Lord Carlisle at Castle Howard:

> I have been this summer at my Ld Carlisle's, and seen most of the great houses in the north, as Ld Nottings: Duke of Leeds, Chattesworth, etc. I stay'd at Chattesworth four or five days the Duke being there. I shew'd him all my Ld Carlisle's designs, which he said was quite another thing, than what he imagin'd from the character yr Ldship gave him on't; . . .

Discussing Kimbolton's recent adaptation as a school, Mr Whistler, a Stoic, makes this revealing comment: "Some have enquired whether schoolboys derive special benefit from algebra under a gilded ceiling, or from *Coriolanus* between the columns. To have spent five years at Stowe is to know the answer to that question."

Woman Regent

MARGARET OF AUSTRIA.
By Jane de Iongh. *Translated from the Dutch by M. D. Herter Norton.*
Cape. 218 pages. 18s.

THE sixteenth century is the great age of women rulers. Hapsburg, Medici and Guise, Tudor and Stewart—each provided at least one example of a woman of forceful temperament and physical endurance with a strong interest in politics, who for good or evil was the unquestionable ruler of part of Western Europe. It would be curious to speculate why this should never have happened before, nor ever have happened since. It was one of the unexpected outcomes of the dynastic principle, when women profited by their freedom from the accidents of battle and their relative freedom from the accidents of the chase—relative only, as witness the premature death of Margaret of Austria's mother, the Burgundian heiress Mary.

Margaret of Austria herself, married in childhood to Charles VIII of France and then repudiated for the sake of the annexation of Brittany, was successively and briefly the wife of a Spanish and a Savoyard prince. She was widowed for the second time at the age of 24, and only at that point began her historical existence as regent of the Netherlands, first on behalf of her father, the Emperor Maximilian, and then on behalf of her nephew Charles V. The period is one that lends itself to the personal and intimate biography of which this is an example, for it was then that the personal letters of sovereigns for the first time enable one to make out their personalities, and it was then that the genius of the portrait painter was at its highest. The illustrations in this book are revealing; one could have wished for more of them. It would also have been a help to all but the expert reader to have had a map of the Netherlands. For in so far as the work suggests the historical theme, it is that of the attempt to keep the Burgundian-Netherlandish inheritance as a political unit and prevent it from being the pawn of either the German, Spanish or French ruler. If the enterprise had succeeded, the history of Europe would have been very different. That it failed was not, the author suggests, the fault of the Regent Margaret. This is a pleasant book, but not a deep one.

The Church on the Plains

THE CHURCH IN ENGLAND, 597-1688.
By S. C. Carpenter.
John Murray. 521 pages. 40s.

THIS book is a view of the Church of England from a highish but liberal Anglican: not uncritical (though he does believe that Gregory the Great made a pun about angels), widely read, humane, serene; a man liberal in the best sense, knowing his George Eliot and his Browning as well as he knows his Keble and his Hooker; a man with the tolerance and friendliness, though without the quaintness of style, of Thomas Fuller, who is one of his heroes.

For a cleric who has been Master of the Temple and an eminent upholder of the Christian social movement, he is markedly attached to the country rather than the town, the villager rather than the courtier, the quiet parochial priest rather than the episcopal defender of ecclesiastical polity. The men who warm his heart are the country parsons, especially if they are poets like George Herbert. One feels that he likes everyone with a mellow and unsentimental affection—he admires Campion on the right and Ridley on the left as much as he admires the Hookers and Lauds with whom he is himself in agreement. But he cannot quite bring himself to like the Puritans or to reveal to the reader the deep roots of their strength.

In truth there are few mountains and valleys in this story—even through the Reformation the car is driven without anything more perturbing than a lurch and a bump from the uneven surface. Even though he makes Archbishop Whitgift hang one more Puritan than he really did, you feel somehow that it does not much matter. You sympathise but mildly with the Rector of Stockley Pomeroy, who had to leap out of the window in his shirt and hide for three days and nights in a furze-bush. The reader will not be moved except in rare passages like the account of Cranmer's trial and burning. Nor will he understand any more than he did before of the passions and the lusts of humanity, the enthusiasms and fanaticisms secular or religious, the pendulum and the profundity of philosophical and theological thought. But he will enjoy a book that is sane, pleasant, entertaining, and permeated by a gentle and humorous pride in the venerable institution that it describes.

This is the profile of a bank

MOST OF THE TIME marble and steel disguise it. But after a visit or two to *any* bank you begin to see its true profile.

It may be the face of a teller, a file clerk, a loan officer or — the president. Whoever it is, this much is certain — the profile of a bank is always the *face* of the man or woman in the bank you know best.

Why?

Because banks are people. Tellers' cages, vaults, iron gates — all the familiar symbols of banks — are nothing more than tools used by human hands to get the job done.

Yes — banks are people. More to the point, they are conscientious professionals who see banking as a career rather than just another way to earn a living.

To Mr. and Mrs. America this says, "Your money (along with your country's financial tradition) is in good hands."

It also means that the business of putting money to work — banking's basic function — is administered by responsible professionals with a keen sense of trade competition, and a highly developed awareness of customer service.

These people *are* America's banks. Bank buildings, however simple or ornate, are only their workshops. It is their *humanness* that transforms facades of marble and steel into faces of friendliness and warmth.

Chase National Bank is proud of the part it is playing in American progress.

Fission and Fusion in Congress

Washington, D.C.

THE leaders of the "Citizens for Eisenhower" movement met in Washington last week to decide how best they could persuade Democrats and independents who voted for Mr Eisenhower in 1952 that his policies will be furthered if they vote for Republican candidates for Congress next November. President Eisenhower himself made an urgent plea for Republicans already in Congress to provide some substance for this argument before July 31st, on which date they are hoping to wind up the session and dig into the grass roots. He demanded that they get on with the "progressive, dynamic" programme without which, he once said, the Republican party "does not deserve to remain in power." His remedy was for "less political fission and more political fusion," and nowhere does it need to be applied more than in the higher ranks of his party in Congress.

It is fission, not fusion, that characterises the attitude of Mr Daniel Reed, chairman of the Ways and Means Committee of the House of Representatives, towards the President's foreign trade policies, of Mr Clifford Hope, chairman of the Agriculture Committee, towards his farm policies, and of Mr Leo Allen, chairman of the Rules Committee, towards his wish to continue a limited programme of public housing for families with very low incomes. Mr Allen has parted from the President on public housing to such an extent that he issued instructions to the delegates from the House who are trying to reconcile their Housing Bill with the different version passed by the Senate that on no account were they to move an inch from the House's resolve to abolish the public housing programme altogether. Mr Hope, with the backing of his committee, gave advice which the President paraphrased in his speech to the Citizens when he explained that

> the sensible thing to do, I have been told, over and over, was to close my eyes to the damage the present farm programme does to our farmers and the rest of our people—and do this job of correction next year.

To this advice Mr Eisenhower replied in words that most of his admirers would like to see him use more often.

> In this matter I am completely unmoved by arguments as to what constitutes good or winning politics. And may I remark that though I have not been in this political business very long I know that what is right for America is politically right.

It does not, however, seem that Mr Eisenhower has given this kind of answer to Mr Reed, even though the President was saying as late as March that "if we fail in our trade policy, we may fail in all." Whereas the President has repudiated Mr Hope's reaction to his "dynamic" policy for agriculture—that no more be said of it until the election is over—he has endorsed the "compromise" whereby Mr Reed, who would really much prefer to be introducing fresh protective tariffs, has sponsored a Bill continuing the present Reciprocal Trade Agreements Act for another year. Little, if anything, further in the way of legislation implementing the Randall report on foreign economic policy is to come this year.

There is of course at least one essential difference between farm policy and trade policy. The basic principle of the President's farm policy—that agricultural price supports should be flexible and not high and rigid—is already part of the law and will automatically be applied next year if the law is not amended. If Congress decides to amend the law in a way that is unacceptable to the President, he can veto the Bill and thus automatically get what he wants, provided Congress does not over-rule the veto. The President holds no such strategic position in regard to legislation on foreign trade, but while the Democrats expect to gain electoral advantage from the President's determination on his farm policy, they are also hoping to make profit out of his retreat on trade policy. By giving way on so many other things Mr Eisenhower calls attention to his stand on agricultural prices, yet because this is so isolated an instance he will probably fail to reap the benefit of having rejected political advice in favour of economic principles.

*

The Democrats' position on trade was made clear last week by a well-planned demonstration on the floor of the Senate. Mr Gore of Tennessee, a fellow townsman of Mr Cordell Hull, the originator of the policy of reciprocal trade agreements, called attention to the Randall report and President Eisenhower's former insistence on the urgency of taking action on it. He was endorsed by practically the whole Democratic membership of the Senate including the minority leader, Senator Lyndon Johnson, who is in the unusual situation for a minority leader of commanding a majority of one, and Senator Wayne Morse who is in a position to increase that majority to two. Their enthusiasm for the President's views on trade, they intimated, was such that they would move to incorporate his proposals on the subject into the next Bill reported out by the Senate Finance Committee, since tariffs are a tax matter. The Bill in question is likely to be the monumental measure

codifying the innumerable laws affecting the internal revenue.

The full circle of this irony has been completed by the fact that the President's closest advisers, to judge from the speeches of two of them, have evidently decided that, as the electorate cannot be given much of the President's programme on account, the Democrats must be blamed for this failure. This thesis can, in practice, be supported by only two instances when measures were defeated because the Democrats voted together as a party; on both occasions, however, the two wings fused for opposite reasons. Statehood for Hawaii is now a lost cause for this year because it was tied in the Senate to a Bill giving statehood to Alaska which the House will not accept. Some Democrats wanted both states in the Union, some wanted neither, while the Taft-Hartley Labour Act will also not be amended because northern Democrats wanted to insert a clause against racial discrimination and southern Democrats wanted to avoid such a clause at all costs.

Although these are the principal measures that have been lost in voting, many more items on the programme will be lost because lack of enthusiasm for them in the appropriate committee or in the Rules Committee will prevent them ever being voted on at all. It would, however, be a mistake to exaggerate this sluggishness. It is true that only one major piece of legislation—the Bill authorising the United States to participate in building the St Lawrence Seaway—has passed into law. But the Appropriations Bills are ahead of schedule and a number of other measures are progressing sufficiently well to make it seem probable that they will be passed before the session ends.

These include, besides the Atomic Energy Bill and the technical tax revision Bill, two main classes of legislation. There is what the President's script writers have called "a potent package of protection against subversives," Bills dealing with wire-tapping, keeping Communists out of defence plants and so on. Secondly, there is a group of welfare Bills, covering housing, unemployment insurance and old-age pensions. These build closely on existing models and, if passed, they at least will provide good examples of fusion instead of fission in politics. By tidying up and extending the coverage of existing social security schemes the Republicans in Congress will in effect be ratifying those achievements of the New Deal which the Citizens who voted for Eisenhower had no intention of repudiating.

California on Party Lines

FROM A CORRESPONDENT IN SAN FRANCISCO

LAST week seems to have seen the end of the most unusual of California's many extraordinary political customs, the habit by which registered Democrats, while outnumbering the Republicans in the state by three to two, have persisted in nominating Republicans as their candidates for state and national office. This paradox was the outcome of California's unique cross-filing system; this permits members of any party to run as candidates, not only for their own party's nomination but also for the nominations of any or all other parties, in the primary elections in which voters choose their party's candidates for the offices to be contested in general elections.

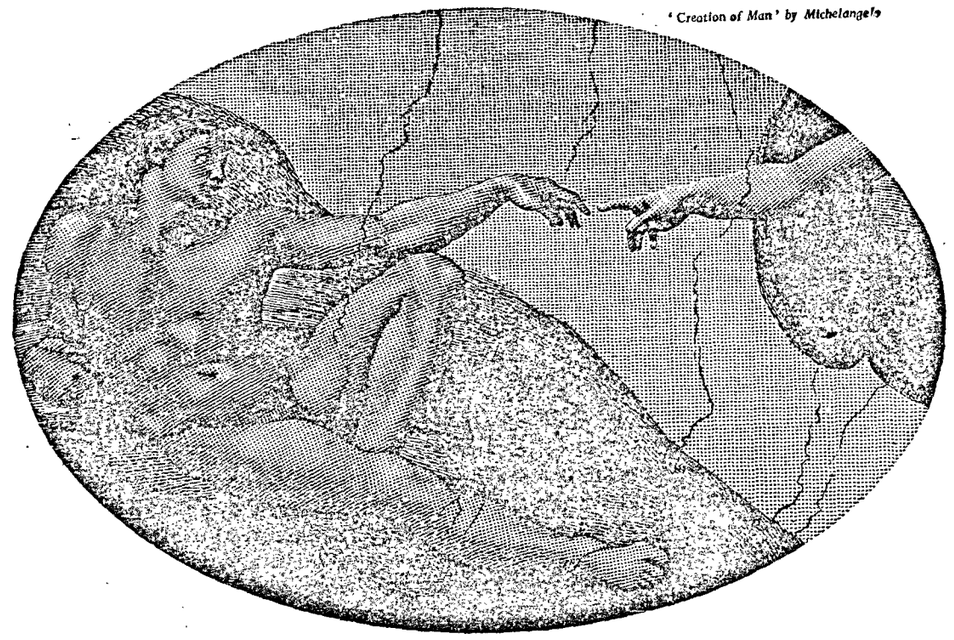
In 1952 an attempt was made to abolish this right of candidates to file their names on both party ballots, but in the end it was required only that the names should be accompanied by party labels. In last week's primary, for the first time since these elections were instituted in 1913 in order to break the hold of the party bosses on California, Democrats voting for Republicans who had cross-filed did so with their eyes open. Many of them still did it, but nevertheless a full list of Democrats won their party's nomination. In November Californian voters will have a choice between a Republican and a Democrat for Governor and Lieutenant-Governor, for US Senator, for all but four of the state's thirty congressional seats, and for all state officials except the Attorney-Generalship; for that post Mr Edmund Brown, the only Democrat now in office in California, was renominated by both parties. In 1950, the last non-presidential election year, about 90 of the 140 contests were decided in the primary elections in June, as the result of one candidate securing both nominations; this year all but ten will still be at stake in November.

★

It is plain, from this first test of the new voting regulations, that they are dividing California on clear-cut party lines and that the whole non-partisan pattern of the state is changing. It is a pattern that flourished particularly during Mr Warren's eleven years as Governor, for he drew his support from Democrats and independents as much as from Republicans, and that began to break as soon as he went to the Supreme Court and was succeeded by the present Governor, Mr Goodwin Knight. Mr Knight had been the leader of the right wing Republicans in California, who never ceased to complain about Mr Warren's indifference to party concerns. Mr Knight opposed his predecessor's social welfare and budget policies and since he took office he has had no qualms about dipping into the state's reserve funds to meet current needs. He may not be the extreme reactionary some Republicans would like, but he is conservative enough to please the oil and public utility interests, the American Medical Association and almost the entire press of California.

Against this formidable coalition and the rollicking, joke-cracking good humour of the new Governor, the Democrats put up a disciple of Mr Warren, Mr Richard Graves, personable but not colourful, an administrator rather than a politician. He was picked, almost in desperation, by a few conservative Democrats, and only rejoined the Democratic party just in time to enter for the nomination this spring. He therefore began without united support, or even wide acquaintance, within his party, without funds to match the $1 million which Mr Knight is reported to have spent on his primary campaign, and without the help of any major newspaper. His running-mate, Mr Roybal, the Democratic candidate for Lieutenant-Governor, was equally obscure, being well-known only to the Mexican-American colony in Los Angeles, but he at least was the choice of the left-of-centre elements in the party.

These two virtual unknowns polled very nearly one million votes each, while Mr Yorty, the Democratic Congressman who is running against the Republican Senator Kuchel, polled some 700,000 Democratic votes against Mr Kuchel's 400,000; Mr Kuchel, however, did well in the Republican primary. Finally, the two Democratic candidates who were officially repudiated by the Democratic



'Creation of Man' by Michelangelo

Life is a privilege

RALPH WALDO EMERSON (1803-1882)

Life is a dream, a jest, a burden, we have been told; it has even been called 'a long headache in a noisy street'. It can be all these things; and it can be more. Life, for anyone, is first of all an opportunity; to dream if we wish, or to create; to plod along, or to soar; to complain, or to serve.

The lives of organisations can be as various as those of individuals. Some follow placidly in the steps of centuries; others must ceaselessly advance if they are to survive at all. But in the industrial world of to-day, there is no such choice of philosophy: each industry must constantly be seeking new methods, new tasks, and new markets.

Life is a guess, a trial, a challenge.

Life is a privilege.

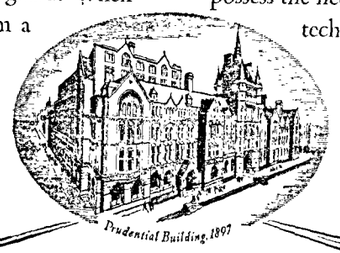
THE STRUCTURE OF BRITISH PROSPERITY

Exchange

Building is an essential part of the framework of a nation's prosperity. The steel-framed office block shown in this artist's impression is to be built in St. Paul's Precincts for the Bank of England. When completed it will rise from a sub-basement depth of 30 feet to a maximum of eleven floors above the pavement. There will be a centre court for car parking with garage space in the basement. For structural engineering on such a scale, Cubitts possess the necessary experience of modern technique — and a tradition of fine workmanship going back for 130 years.



Now, as in the past

National Committee, Mr James Roosevelt, because of his marital difficulties, and Mr Robert Condon, because the Atomic Energy Commission had cast doubts on his reliability, both won Democratic nominations for congressional seats easily. Local factors played a part in each case and the family name helped Mr Roosevelt, but it was essentially the party designation on the ballot which pulled Mr Condon through.

This signal that party labels have now a new significance in California, a state which sends to Congress a delegation second in size only to New York, acted as a warning to the Republicans, in a year in which they cannot afford to lose a single seat in either House, and as a call to arms to the Democrats for a contest that suddenly looks hopeful. The question for Californian Democrats is whether their party can now reconcile its conservative and radical elements sufficiently to capitalise in November on its numerical superiority and the prestige of its triumphs in last week's primary elections.

Showing Up McCarthy

THIS week is expected to bring the end of the public hearings on the controversy between Senator McCarthy and the Army, over whether the Senator attempted to get preferential treatment for Private Schine or the Army attempted to get the Senator to relax his investigations. But there is no expectation that the report of the committee of inquiry, when it eventually appears, will end the controversy. For out of the weeks of conflicting evidence and flat denials, which would seem to give the Department of Justice grounds for perjury charges should it wish to bring them, it emerges fairly clearly that, while each side tried to bring pressure to bear on the other, neither went so far as the other has alleged.

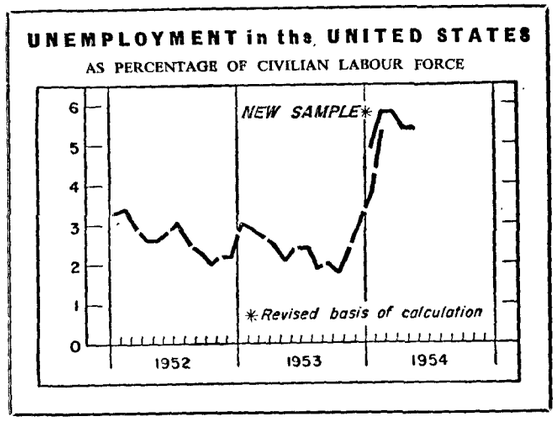
The Republican members of the committee are insisting on closing the hearings over the protests of the Democrats, who have no wish to end this public display of the differences within the Republican party. But, rather surprisingly, since it would mean another similar display, the Democrats have so far given little encouragement to the efforts of the Republican Senator Flanders, who wants to bring about a show-down in the Senate on Mr McCarthy by showing up his financial irregularities. These were investigated by a Senate committee in 1952 and Mr Flanders, long one of the most outspoken Republican critics of Mr McCarthy, is now accusing him of being in contempt of the Senate because he refused to answer the committee's searching questions. Mr Flanders has challenged the Senate to remove Mr McCarthy from his committee chairmanships, something that has not been done for thirty years, if he does not purge himself of his contempt by answering the questions by the beginning of July.

If Mr Flanders persists, and he is a persistent man, weeks of argument could delay the Senate's adjournment and make the passage of what remains of the President's legislative programme even less certain that it is at present. This is the official reason given by Senator Knowland, the Republican leader, for trying to curb Mr Flanders. If the Democrats were to support Mr Flanders, however, a debate could hardly be avoided, since they are in the majority. But they evidently fear that the result might be a public repudiation of Mr McCarthy by the Republican party and that such a repudiation would be to the advantage of the Republicans in the coming election. If these Democratic fears are justified, as from public opinion polls and other reports they seem to be, then the weeks of public hearings which have thus weakened Mr McCarthy's influence will have been worth while.

Exports Before Imports

A NEW Bill now before Congress goes some way to meet the complaints of the business world that the Export-Import Bank, under the strict tutelage of the Treasury, is failing to give manufacturers and exporters the support which it is intended to provide for foreign trade. Under the new measure, which has been toned down to meet objections from the Treasury and to gain presidential support, the lending authority of the Bank will be raised by $500 million to a ceiling of $5 billion. Since the Bank still holds $1.2 billion of untapped lending authority, the supplement is seen mainly as a stimulus to a bolder policy. Moreover, the Bill reverses the reorganisation plan introduced only a year ago, and gives back to the Bank at least the semblance of independence from the Treasury. The National Advisory Council, which is composed of Cabinet members, will hand over much of its present authority to fix the Bank's policies to a bipartisan board of directors, though its invisible hand will be retained in a "co-ordinating capacity." The Bill does not, however, resolve the controversial question of whether the Export-Import Bank should, as exporters wish, provide long-term development loans, or whether, as the Treasury thinks, this field should be reserved to the World Bank.

In giving enthusiastic support to the encouragement of exports through the Export-Import Bank, the President hopes, no doubt, to dispel the idea that he is retreating on the foreign trade front. But on the other wing of that front, the import side, Congress has engineered further delay by postponing its hearings on the Administration's legislation for liberalising trade policies until next January. It is small comfort that the House has granted a stop-gap extension of one year for the Reciprocal Trade Agreements Act and, although the Act has now expired, it will probably be some weeks before the Senate finds time for the measure. Those Congressmen who tried unsuccessfully to extract from the



President a *quid pro quo*—that he would not in practice utilise the extension in his authority to negotiate new agreements—apparently had the proposed trade pact with Japan in mind. On the other hand, the Bill extending for another eighteen months duty-free trade between the United States and the Philippines is unlikely to encounter much opposition.

It was perhaps inevitable that, as domestic unemployment grew, it should influence foreign trade policies. In what is called the "Eisenhower" interpretation of the "Buy American" Act, the President is expected to offer to domestic firms, in areas where unemployment is heavy, a small but useful margin over foreign bids for government contracts. And in a proposed amendment to his foreign aid Bill, the President is directed to consider "areas of labour surplus" at home when commissioning off-shore purchases, to ensure that the strategic importance of overseas contracts outweighs any adverse effects on the domestic economy.

Gas War Between the States?

BEFORE adjourning for the summer, the Supreme Court reaffirmed in detail its earlier decision on the Phillips Petroleum case and thus dropped into the lap of the Federal Power Commission some 2,300 producers of natural gas who do not want to be there any more than the commission wants the responsibility of looking after them. The Court, by a majority of 5 to 3, ruled that the FPC was wrong in claiming that it had no jurisdiction over the rates at which the Phillips company, and by inference all other independent companies, sells the natural gas it produces to the interstate pipeline companies which transmit gas to the ultimate consumers. The dissenting Justices, who included Mr Douglas, not usually to be found on the businessmen's side of a decision, argued that this was a strained interpretation of the Natural Gas Act of 1938, and extended federal interference into a regulatory field which the Act had intended should be reserved for the states.

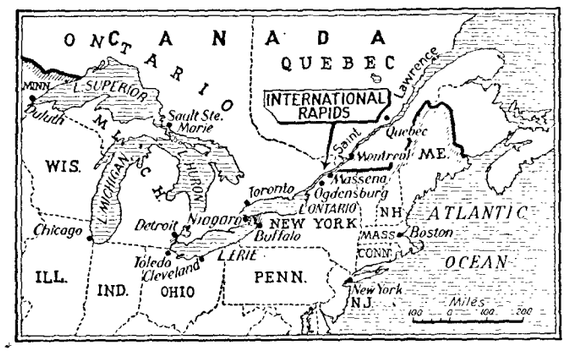
This view is of course being echoed by the natural gas producers themselves and by the representatives of the states—Texas, Oklahoma, New Mexico and Louisiana—where most of the gas is found. They argue that the ruling could hamper state conservation practices and also discourage the production of natural gas, so that in the end an Act designed to protect consumers might in fact force them to pay more. There is inevitably talk of legislation to reverse the ruling, and it is unlikely that President Eisenhower would veto such a Bill as President Truman once did. But there is no prospect of Congress finding time for anything so controversial at this session, and by next year it may seem less necessary.

For by next year the FPC may have made up its mind whether or not the Phillips company is overcharging for gas and thus exploiting consumers in the states served by the pipelines it supplies with gas. The case just decided by the Supreme Court began when cities in Wisconsin and Michigan appealed to the FPC for relief, but whether they will now get such relief is doubtful. For recent FPC decisions have been allowing price increases on a scale which seems more reasonable to gas prdoucers in the south than to consumers in the north.

Clear Sailing for the Seaway

IN its final batch of decisions, the Supreme Court has upheld the right of the New York Power Authority to develop, in conjunction with the Province of Ontario, the hydro-electric resources of the St Lawrence river. It has also indirectly removed the last obstacle to American participation in the second part of the original St Lawrence project—the construction of a channel for ocean-going vessels. Since both these schemes apply to the International Rapids section of the river, near Massena, the series of dams required for the power development will greatly reduce the cost of the seaway. This fact, together with President Eisenhower's strong support for the undertaking on grounds of national security, proved useful weapons in Congress. However, it was the fact that Canada was prepared to go ahead with the task single-handed that finally overcame the fifty years of intransigent opposition from private interests.

The question now is whether Canada, which has already spent $500 million on the St Lawrence channel and whose commitments under the proposed joint programme leave it to foot a bill more than twice the size of the US contribution, will accept this belated gesture from its southern neighbour. The temptation to monopolise both the glory and the revenue—and at the same time to keep clear of American customs procedures—is strong, though it is unlikely for political reasons to prevail.



As it now stands, the new American law authorises the expenditure of $105 million by a St Lawrence Seaway Development Corporation, which is to be directed and supervised by the Secretary of Defence. The approved scheme, which is expected to be self-liquidating, is less ambitious than the original and expenditure will be concentrated on a 46-mile stretch of the waterway along the New York State boundary, where two lateral canals and three locks are to be constructed to increase the depth of the channel from 14 to the required 27 feet. In conjunction with Canadian plans, this will enable ocean-going vessels to reach Toledo; the present Act does not cover the deepening of the 21-foot channels which now link the three more distant Great Lakes. Until Congress authorises additional money, larger vessels will not be able to reach Chicago and the other ports on these lakes when fully laden.

The seaway should bring great commercial gains to Canada and the Middle West—and to Europe, which will get the benefit of lower freight charges for wheat and other supplies. It will also have considerable strategic value, since it will enable iron ore from Labrador and elsewhere to be shipped straight to the steel industries of the middle west, as replacement for the diminishing supplies from Minnesota. The eastern and southern ports are busy calculating their expected losses from the diversion of trade; at least they will have six to ten years' grace before full advantage can be taken of the seaway.

Union Realignments

THE unofficial truce between the two big trade union groups, the American Federation of Labor and the Congress of Industrial Organisations, has at last become official, with the signature of the long-talked-of no-raiding pact by 94 trade unions, representing over 10 million organised workers and more than half the members of each group. The signatories undertake not to try to recruit workers represented by another signatory—that is, the AFL unions agree not to raid the membership of the CIO unions and *vice versa*. Such competition, fostering a bitterness which has made negotiation difficult, has been one of the main obstacles to a merger between the two groups, and the no-raiding truce is expected to continue until a full agreement to unite has been reached.

Most of the unions which refused to sign are small and specialised, and unlikely to interfere with each other, but there are two notable exceptions, one from each group, the CIO's steelworkers and the AFL's teamsters, or lorry-drivers, each with over a million members. The truce is the achievement of the new heads of the two groups, Mr Reuther of the CIO and Mr Meany of the AFL; Mr Reuther's chief rival is the steelworkers' president, Mr McDonald, and Mr Meany's is Mr Beck of the teamsters. Mr McDonald and Mr Beck are both more interested in the immediate gains to be made by increasing their membership and by bargaining directly with employers than in the political influence for which Mr Reuther and Mr Meany are working, and neither Mr McDonald nor Mr Beck has any objection to keeping his rival guessing.

This is an approach which also appeals to the great independent of the trade unions, Mr John L. Lewis, and these three men have recently been meeting in circumstances of well-publicised mystification that gave rise to reports that a third labour group was in the making. However, the link between them does not seem to be anything more than a convenience, to be maintained only as long as it furthers their personal ambitions and the interests of the members of their individual unions. It shows, nevertheless, that it is still premature to talk of a united labour movement in America.

Petition by Lobby

WASHINGTON lobbyists, the paid agents employed by pressure groups to try to guide legislation into channels favourable to their clients, have constitutional authority for their activities in the First Amendment, which guarantees citizens the right "to petition the government for a redress of grievances." Last year, a Federal District Court decided that this right was violated by Congress's attempt—in the Federal Lobbying Act of 1946—to ensure that citizens should be aware of what the lobbyists were doing in their name. However, the Supreme Court has now reversed that decision, defending the right of Congress to seek "disclosures of direct pressures, exerted by lobbyists themselves or through their hirelings," as a valid exercise of its power of self-protection.

Unfortunately, the decision of the Supreme Court is not likely to have much effect upon the application of a law described in Mr Justice Jackson's dissenting opinion as "so mischievously vague that the government charged with its enforcement does not understand it." While the 1946 Act requires that individuals or organisations receiving funds for the purpose of influencing legislation must inform Congress of their identity and expenses, its application is limited to lobbying in the very restricted sense of "direct communication with members of Congress on pending or proposed federal legislation," and no adequate means of enforcement is provided.

Since the enactment of the law, over 2,500 individuals and organisations have registered as lobbyists, reporting an annual expenditure, in 1953, of over $4 million. However, this record falls far short of the estimated billion dollar business of lobbying at the "grass roots," by such undivulged means as disseminating propaganda, labelled as "facts," through the press and wireless, encouraging mass campaigns of letter-writing and telegraphing, and stimulating "spontaneous" local delegations to Washington. To counter such insidious violations of the regulations regarding publicity and registration will require more than the Supreme Court's efforts to confer constitutionality upon the existing Act; as the three dissenting Justices insisted, it will not be achieved without a complete revision of the lobbying legislation, a task which properly belongs to Congress and not to the Courts.

SHORTER NOTES

The government's Rubber Producing Facilities Disposal Commission has received 75 bids, submitted by private companies, for the sale of its 27 synthetic rubber plants. Between now and next January, when the results of the sales must be reported to Congress, the commission will be negotiating contracts based on the bids received, with due consideration being given to price, competitive aspects, financial responsibility and national security.

★

Mr Robert R. Young has at last won his long and expensive struggle for control of the New York Central Railroad by a margin of over a million votes, thus ending the eighty-five year rule of the Vanderbilt and Morgan families. The Texas financier, who spent during the course of his campaign hundreds of thousands of dollars on advertising, posting reprints of the advertisements, and other methods of soliciting the votes of shareholders, will not realise much profit from his annual salary of $1 a year as chairman but he has promised to increase dividends and improve the railway's services; he is putting in his own nominee as president and chief executive officer with the responsibility for carrying out this promise.

Leadership in the New China—I

The Men at the Top

EVERY revolution brings to the front in public life numbers of individuals who were previously little or not at all known, even to specialists on the affairs of the country concerned. In China, however, the leaders of the Communist regime have not appeared on the stage quite as suddenly as they did in Russia in 1917 or in other East European countries in 1944-45, for a local Communist government with its own army and administration had existed in China for over twenty years before the establishment of the Central People's Government in Peking in 1949. Some of its leaders were known through visits of journalists to the area of its rule, and through contacts during General Marshall's mediation. Nevertheless the victory of the Communists in the civil war and their assumption of control over all spheres of Chinese national life have brought to high position many personalities whose previous careers have been obscure and unnoticed.

The break with the past has been very sharp. Some figures from the previous regime who have made their peace with the Communists still hold offices, often of considerable nominal dignity; but, apart from a few who have probably been secret adherents of the Communist cause for a long time, they are carefully excluded from power or influence, and all positions that matter are held firmly in the hands of the dominant revolutionary party.

In considering the leadership of the new China it is convenient to distinguish the general political control from the more specialised leadership in the military, economic, and cultural-propagandist fields. These spheres cannot, however, be entirely separated, for what may be regarded as the general political leadership is found represented in key positions of authority in the specialised fields in order to ensure the unity of command. The political structure of Communist China is characterised, to an even greater degree than is normal in Communist countries, by a splitting-up and diversification of the functions of the state so as to leave the party as the sole unifying and co-ordinating factor. This is all the more necessary in China because the Central People's Government is still nominally a coalition of parties and it is essential that any political body which includes non-Communists should be kept weak and incoherent.

The highest authority in the People's Republic is the Politburo of the Central Committee of the Chinese Communist Party (the CCP). The Politburo has at present eleven members, of whom one, Chang Wen-t'ien, being Ambassador in Moscow, is normally abroad. Five of the eleven are concurrently members of the Central Committee Secretariat, six of them members of the People's Revolutionary Military Council, three of them members of the State Planning Committee and three of them members of the Government Administration Council (which corresponds to what is usually meant by "the Government" in a Western country). The distribution is shown below:

	CCP Central Committee		People's Revolutionary Military Council	State Planning Committee	Government Administration Council
	Politburo	Secretariat			
1	Mao Tse-tung	Mao Tse-tung	Mao Tse-tung	...	...
2	Liu Shao-ch'i	Liu Shao-ch'i	Liu Shao-ch'i	...	...
3	Chou En-lai	Chou En-lai	Chou En-lai	...	Chou En-lai
4	Chu Teh	Chu Teh	Chu Teh	...	...
5	Ch'en Yun	Ch'en Yun	...	Ch'en Yun	Ch'en Yun
6	Kao Kang	...	Kao Kang	...	...
7	Lin Po-ch'u	...	...	...	...
8	Tung Pi-wu	...	...	...	Tung Pi-wu
9	P'eng Chen	...	...	P'eng Chen	...
10	Chang Wen-t'ien	...	...	...	...
11	P'eng Teh-huai	...	P'eng Teh-huai	P'eng Teh-huai	...

Mao Tse-tung is in addition chairman of the Central People's Government Council, a position which makes him the formal head of the state. The People's Government Council, with a total of 63 members (including all the members of the CCP Politburo) is supposed to be the highest organ of government and to have under it the following five bodies:—

(1) The Government Administration Council;
(2) The People's Revolutionary Military Council;
(3) The State Planning Committee;
(4) The Supreme People's Court;
(5) The Office of the People's Procurator-General.

The six vice-chairmen of the People's Government Council include three non-Communists—Sung Ch'ing-ling, the widow of Sun Yat-sen; Li Ch'i-shen, the formerly powerful general who broke away from the Kuomintang; and Chang Lan, leader of the so-called Democratic League. The People's Government Council, however, is too unwieldy to be an effective political body and such activity as it is allowed to have is guided by its secretary-general, Lin Po-ch'u, a member of the CCP Politburo.

The four members of the Politburo who are concurrently members of both the Secretariat and the People's Revolutionary Military Council—that is to say, Mao Tse-tung, Liu Shao-ch'i, Chou En-lai and Chu Teh—must be reckoned at present the top rank of the Communist leader-

ship. Of these four Chu Teh, at the age of 68, is the oldest and Liu Shao-ch'i is the youngest—though his age is variously given by different authorities as 56, 54 and 49. Chu Teh, who also holds the post of Commander-in-Chief of the People's Liberation Army, is primarily a soldier ; the other three are civilians, in so far as the term is applicable to professionals of violent revolution who have spent a large part of their lives waging civil war.

Of Mao Tse-tung himself it need only be said that his position of supreme leadership appears to remain unchallenged, but that the evidence indicates that his health is precarious and it is doubtful whether he now keeps a tight grip on the party machine. In the event of his demise or complete incapacity, Liu seems to be the most likely successor to his authority on account of his concentration on the organisation and discipline of the party. Chou's functions as "Prime Minister" and Minister for Foreign Affairs enable him to cut a more impressive figure on the world stage, but they involve distraction from the work which qualifies the party boss.

Both Mao and Liu come from peasant "kulak" stock in the province of Hunan, and although Liu has not always been on Mao's side in party controversies, their common rural-provincial background probably helps them to work together. Liu, however, unlike Mao, studied in the Soviet Union. Neither Mao nor Liu have any acquaintance with Western Europe or America, but Chou, the ex-Parisian, is entirely at home in western company and is obviously cut out for the task of conducting Communist China's foreign relations outside the Soviet bloc. In the foreign field Liu confines himself to being President of the Sino-Soviet Friendship Association and a vice-chairman of the World Federation of Trade Unions.

Proconsul in Mukden

Outside the Big Four of Chinese Communism the most important figure is probably Kao Kang, who is in a strong position not only because of his posts at the centre (Politburo and People's Revolutionary Military Council), but also because of his influence and connections in the most important of China's five super-provincial administrative regions (outside North China, which is directly under the control of the central government). Kao Kang organised the underground work for the Communists in Manchuria during the war against Japan and since the Communist conquest he has been chairman of the North-East Administrative Committee with headquarters in Mukden (now called Shenyang).

The industrial primacy of Manchuria, its "advanced" political character—moves towards collectivisation in agriculture have gone further there than anywhere else in China—as well as its special relation to the Soviet Union, all combine to make Mukden a place second only to Peking for the determination of political power in China. The Communist party has set its face resolutely against the provincial semi-independence and "war-lordism" of the old days, but China is a very large country with communications not yet adequate for a modern state, and a recent speech by Liu Shao-ch'i indicated some anxiety in Peking at the tendency of Communist proconsuls to develop into local monarchs. Kao Kang is the strongest of the national leaders who also have regional power, and though there have been rumours of his removal from the Manchurian scene, these have not so far been confirmed.

(To be continued)

Cloud in Iraq's Bright Sky

WHEN as many as five parties go to the polls in Iraq, some clashes and allegations of falsification of results are bound to occur. This time voting had to be conducted afresh in Basra (4 seats), Mosul (3 seats) and the holy Shiah town of Nejef (2 seats), and all the losing parties have lodged protests about "government interference" with the urns. But the adjustments achieved by re-polling in no way alter the final result ; this shows that Nuri Pasha's party is still in the lead, but much less decidedly so than in the old Parliament and that the number of independents is greater than in the previous house.

This slight change of pattern gives a faint indication of the extent to which a younger generation now questions the feudal stranglehold of the *ancien régime* of landowners upon parliament. But it does not alter the complexion of the House as a whole. As was pointed out in *The Economist* last week, no such change can come about quickly in a country which adopts a democratic system while it is still both backward and predominantly rural. The town constituencies that contain Iraq's small but growing middle class are for the present swamped by peasant constituencies, and there is no immediate end to their frustration and despondency unless the landlord class opens its eyes to the importance of feathering other nests besides its own.

This situation is classic. It is, of course, to be found in other countries, but in Iraq there is this difference: the Iraqi parliament, now richly endowed with income from oil, controls huge funds that must, if they are spent wisely, be spent on Iraq's main assets ; these lie in the field of agriculture, for they are *lebensraum,* plentiful water and soil that is most fertile if properly drained. Thus a parliament perennially composed chiefly of landowners controls huge sums that are bound largely to be spent on betterment of the land.

The social discontent that is inherent in this situation is mitigated in countries where land taxation matches land values, or where the system of land tenure is as fair to the poor man as to the rich. But in Iraq neither of these conditions prevail. What is more, any attempt to move towards them is baulked by a parliament, the majority of whose members will not tolerate changes in their feudal privileges. Iraq today is endowed with only a few leaders possessed of sufficient character to force change through, and these tend to be elders who prefer not to end the feudal heyday to which their cronies are accustomed. Younger and more liberal men who perceive the importance of taxing land and giving more of the nation a stake in its prosperity all topple, or throw in their hand, at thought of the fatal resistance they are going to encounter in parliament. Unless someone mates the driving force of the one group with the ideas of the other, resistance to feudalism must, in time, swell to revolutionary dimensions.

Nationalism in Ruhr Elections

WEST GERMAN politicians are manœuvring into position for the *Land* elections that are being held this summer. North-Rhine Westphalia is the most important *Land* to go to the polls containing as it does Federal Germany's industrial heart, the Ruhr. Special efforts are

Starch does surprising things

IN SUCH SURPRISING PLACES

Example:

GLUCOSE IN JAM PRESERVING

It is not always easy for jam manufacturers to make jams that contain enough soluble solids to be satisfactory in quality, yet are not too sweet for their customers' taste and will not crystallize during storage. Liquid glucose, which is made from starch, helps jam manufacturers to solve these problems. It provides abundant food energy but is not as sweet as cane or beet sugar (sucrose). When liquid glucose is used in jam making to replace some of the sucrose it reduces excessive sweetness without reducing food value; it brings out the natural flavour of the fruit; it helps the jam to set; and it prevents crystallization. Corn Products Company Limited, the Industrial Division of Brown & Polson, manufacture considerable quantities of liquid glucose for this purpose. Brown & Polson Industrial Division produce 200,000 tons of starch products a year: more than 400 different products, which are helping more than 80 different industries to reduce production costs, to make better products, or even to make products that could not otherwise be made at all. We have spent more than 100 years in the building of this large and varied business. We have learnt a lot about the industrial uses of starch products, and our advice is freely at your disposal.

CAN STARCH HELP YOU?

When you read in these advertisements how starch products are helping other industries you may see new possibilities of turning them to account in your own business. We shall be glad to discuss them with you.

WELLINGTON HOUSE, 125/130 STRAND, LONDON, W.C.2

being made by the parties to win the elections there on June 27th. At present Dr Adenauer's party, under the left-wing Christian-Democrat, Dr Arnold, has an absolute majority, with the Catholic *Centrum*. The government is therefore in Catholic hands, a matter of particular irritation to the anti-clerical Free Democratic Party (FDP) which is fighting strongly for a place in the Ruhr sun.

Opposition to Catholicism in civil life is now a dominating factor in German politics everywhere. But the electorate in North Rhine-Westphalia is so largely Catholic—with a Protestant enclave in the Ruhr itself—that the religious issue will probably be avoided by the other party leaders. Attacks on the Christian-Democrats' economic policy also have to be lightly treated for two reasons—all the main groups except the Social-Democratic Party (SPD) have helped to shape it, and it has been very successful. Even the SPD prefers not to fight on labour or economic issues.

So the leaders outside the Christian-Democratic camp have taken to beating the nationalist drum, and the question of German relations with Russia has come to the fore. The Free Democrats have taken the lead in demanding that direct contacts with Moscow should be made without delay, in order to conclude a trade pact and to break the deadlock on German reunification. Dr Pfleiderer, a member of the FDP and a former diplomat with experience of Russia, has made himself famous by proposing in the *Bundestag* that a deputation of members should go to the Soviet capital. He himself saw a deputy of the Soviet ambassador in East Berlin during the four-power conference, and has official Soviet approval for the proposed trip. Dr Pfleiderer has been supported by his party chief, Dr Dehler, and is known to have the approval of some influential politicians in Dr Adenauer's own party, not all of whom think the Chancellor is sufficiently anxious for German unity.

The Chancellor's Dilemma

By this public move, the FDP has put Dr Adenauer in an awkward position. He has had to declare rather feebly that he, too, is in favour of German sovereignty and diplomatic relations with Moscow, but in good time and in the right way. The Chancellor no doubt has his eye on the autumn, when he is going to Washington. His visit will almost certainly include talks on means of giving Germany the rights that were accorded in the Bonn convention but which have never been implemented because that treaty was bound up with the European Defence Community. Dr Adenauer will not want to offend Washington in the meantime ; and it is perhaps for this reason that a big deputation from the Eastern Committee of the German Federation of Industries has postponed its intended trip to Moscow for trade talks. In the Ruhr, this check will not help Christian-Democrat chances.

It is hard to estimate the effect of the blow to Dr Adenauer's position in North Rhine-Westphalia that was recently delivered by Dr Brüning. Wide publicity was given to Dr Brüning's lecture to industrialists of the Rhine-Ruhr Club, in which this Catholic ex-Chancellor attacked "the Bonn government" for being dictatorial and rigid in its foreign policy. Forgetting that the fate of President Benes finally exploded the theory that any country can form a "bridge between east and west," Dr Brüning said that Germany would become a mediator between the two blocs, and that the German treaties with Russia in the 1920s should be studied now. He also forecast an American slump and advised his listeners to work up trade with Russia.

In the Ruhr, the Free Democratic policy of making contact with Moscow will find support among many industrialists who are determined to explore all possibilities of trade with the Communist world, and feel they have been left at the starting-post by the British. The FDP already has a considerable following among the non-Catholic industrialists on account of its opposition to state socialism and the ambitions of the trade unions. This party is, indeed, a strongly right-wing organisation, in the Ruhr. Its local joint chairman in that area is Herr Middelhauve, who triumphantly survived the criticism levelled at him at the time of the Naumann affair.

Wooing Ex-Officers

The Free Democratic party is also acting as champion of German rights in connection with the Saar and rearmament. Its leaders have threatened to leave the Bonn coalition if Dr Adenauer finally abandons Germany's claim to the Saar ; and it is putting up a plan for a European coalition army to take the place of the EDC. For years past, the party has made a special effort to win the professional ex-officers, and it has largely succeeded.

Dr Pfleiderer's initiative brought a statement from the Socialist leader, Herr Ollenhauer, who hastened to repeat that his party favoured direct dealings with the Russians, and that the east and west Germans must come together for technical talks. Such proposals are not intended to involve the west Germans in recognising the Communist German State but the Communists are using them for this end. Mr Molotov has ostentatiously given the East German premier Herr Grotewohl, the role of interceding in Moscow for the Pfleiderer plan. In East Berlin, both Dr Pfleiderer and Herr Ollenhauer have been praised.

The ordinary voters in the *Land* elections may not be swayed by arguments in high quarters. It is quite likely that they will simply express their relative content with their present and still increasing prosperity by voting, as before, mainly for the Christian-Democrats. But the elections are again serving to show that Federal Germany is tragically short of sound and sensible political leaders. It would be hard to find west German politicians or ex-generals of consciously evil intent ; but the country has more than the normal proportion of men with good intentions who are unable to see the dangerous consequences of their policy.

Belgium's Coal Problems

FROM A CORRESPONDENT

THE problem of the marginal Belgian coal mines with low productivity and high labour costs which posed particular difficulties at the time the Schuman Plan was being negotiated has now come to the fore again. The piling-up of stocks at the pit head and the threatened closing of mines in the Borinage are only fresh symptoms of the same old basic problem of a high-cost industry which has plagued the Belgian government for a long time, and has now become the concern not only of the Belgians but of the Coal and Steel Community.

In the treaty establishing the community, special provisions were included to help the Belgian and Italian coal

(*Continued on page* 983)

(*Continued from page* 982)

mines to adjust, during a five-year transitional period, to the lower cost situation prevailing elsewhere in the community. The most important of these special arrangements is a compensation scheme. A perequation levy is collected from coal sold by countries where the average costs of production are lower than the weighted average of the community and the proceeds of the levy used, in the case of Belgium, to subsidise the price of high-cost Belgian coal both in the Belgian market and in the community. As a result of these special provisions, the immediate effects of the Schuman Plan have been to benefit both coal consumers and coal producers. After the opening of the common market, Belgian exports to the five other members of the community increased substantially. Prices have been reduced by an average of 29 Belgian francs per ton sold and the average profit margin has, in most cases, remained unchanged. But the basic objective of reducing the cost of production of Belgian coal to the level prevailing in the community is far from met and the fact that funds which are badly needed for investment have to be used to finance unwanted stocks serves to accentuate the problem.

Freedom for Private Initiative

Except for a brief period after World War II when the Belgian government applied, without much success, a far reaching system of state intervention, complete with price regulation, subsidies and inter-mine compensations, the attempts of the Belgian government to solve the problem of the marginal mines have conformed to the prevailing liberal economic policy. To avoid budgetary deficits, state subsidies have been kept to a minimum and the maximum amount of freedom has been left to private initiative in the hope of attracting private capital. An ambitious re-equipment and rationalisation programme was undertaken in 1949 and almost all the direct Marshall Plan aid received by Belgium was devoted to re-equipment of the mines. The tapping of coal gas on an industrial scale was also begun and developed to the point where 11 per cent of the total gas supplied to the public was gas taken off in working the mines, thus making the mines safer and substantially improving the receipts of some of the collieries. For a time these measures seemed to be bringing results, except in some of the poorest mines in the Borinage region. Production regained the prewar level. A number of unproductive pits were closed, others were amalgamated. Output underground increased from 926 to 1,042 kilograms.

But about two years ago output ceased to improve. An ambitious five-year modernisation programme was therefore undertaken at the time Belgium joined the coal and steel community, in order to put the industry in a position to meet the competition of the rest of the community at the end of the transitional period. A total investment of 12,900 million Belgian francs was planned for the five-year period 1952-1957. However, during 1953 the new investment target was not met.

The most dramatic evidence of the continuing difficulties of the Belgian coal industry was the abrupt announcement in December, 1953, by a division of the large Cockerill iron and steel company that it intended shutting down certain pits in the Borinage, thus throwing several thousand Belgian and Italian miners out of work. Other marginal mines in the same area were also threatened. Early this year the High Authority, at the request of the Belgian government, authorised special subsidies for three mining enterprises in the Borinage coal field which together produce some 2,760,000 tons. These special provisions are of a temporary character to allow the mines to be worked while the whole future of the Belgian coal industry, and the fate of the Borinage mines in particular, are examined. In collaboration with the Belgian government a special committee of independent experts has been appointed to review the rationalisation programmes of the marginal Borinage mines.

Advantages of Schuman Plan

This study, together with a more general study by the staff of the High Authority on the effects of the compensation scheme and the additional steps required to make it possible to integrate the Belgian mines into the common market at the end of the transitional period, should be concluded within the next few weeks. It seems probable that some of the least efficient mines will in the end have to be shut down, but the High Authority may be counted on, as it has said, in its Second General Report to the Common Assembly, "to draw the maximum profit from the grace afforded by the transitional period" and in co-operation with the Belgian government and the collieries to make a concerted drive to bring down costs.

The creation of the coal and steel community should make the solution of the problem of Belgium's marginal mines easier, as well as more imperative. When the Belgians could count with any certainty only on their own coal production it would have been impossible for any Belgian government to acquiesce in the shutting down of mines producing a substantial tonnage of coal and it was defensible to pay a kind of insurance premium in the form of heavy government subsidies to keep the mines in production. Now the problem can be looked at in the larger framework of the community and a decision made as to whether the supply situation of the area as a whole requires the continuation of large subsidies. The costs of production of the marginal mines will now be compared not only with the relatively high cost Belgian industry but with production elsewhere in the community as well. The existence of the common market undoubtedly makes the closing of some mines more probable in the long run, but it should also mean lower prices to the Belgian steel industry and the Belgian consumer, and, eventually, more stable conditions of employment.

NOTES FROM NEW ZEALAND

These notes are contributed by our correspondent in Wellington

Election Prospects

PRELIMINARY moves for New Zealand's general election in November are now developing. Both of the two major political parties, National and Labour, have virtually completed their selection of candidates and are in the process of announcing them piecemeal. A third party will take the field under the social credit banner and has announced that it will contest all of the 80 seats for the

House of Representatives. It is likely to prove more of a diversion than a major political factor. The Communists will also put a number of candidates forward, but the political climate for them is likely to be even less favourable than it has been in the past.

The New Zealand Labour Party has just concluded its annual conference which is always preceded by the annual assembly of the Federation of Labour, New Zealand's equivalent of the British TUC. Both conferences endorsed the leadership of Mr Walter Nash, the former Labour Minister of Finance, as leader of the parliamentary Labour party. This endorsement was by no means so enthusiastic or so unanimous as it was represented to be for there is an impression in certain Labour circles that Mr Nash, in his 72nd year, has age against him ; but both the federation and the party recognised that there was no alternative leader likely to command the same electoral support.

The most obvious development at both of these conferences was the growing influence of the trades union section of the party as represented by the Federation of Labour. It was almost entirely due to the support of the unions that Mr Michael Moohan, who is not as senior as some of his colleagues still in the House, was elected vice-president of the party in place of Mr James Roberts, a stalwart who has held Labour leadership, or near leadership, for many years and has just retired. Labour will probably produce a good many young candidates who will provide some answer to the frequent criticism that the Labour old guard dies but never surrenders.

The government or National party has still to hold its annual conference, but it has a very well organised machine which is being quietly warmed up for the campaign. Government spokesmen continue to rely upon frequent reiteration of New Zealand's obvious prosperity and enquiries about how Labour could improve it. The real issue is likely to be the cost of living which has affected the distribution of prosperity rather seriously in certain sections of the community. Though the government has a margin of 20 seats in a House of 80, even its most optimistic supporters do not expect it to hold this. Current discontents, of which there are rather more than might be expected, may do some surprising things in marginal seats and the government party is being warned not to give way to its disposition towards self complacency.

* * *

Defence of South East Asia

DESPITE the amount of space devoted to Indo-China and Geneva by the New Zealand daily press, there is little to suggest that public opinion has been greatly aroused ; domestic issues still overshadow everything else. A certain section of New Zealand opinion favours the argument that the country must look chiefly to the United States rather than to Britain for protection in the Pacific. This section supports the Anzus Pact, whether Britain is included in it or not, on the grounds that New Zealand cannot dictate conditions and must make the best terms it can. This does not mean that there is any anti-British feeling in New Zealand but rather a school of thought that is not optimistic about Britain's future as a Pacific power. On the other hand there is an overwhelming feeling in favour of any agreement that preserves Anglo-American harmony and will enable New Zealand to avoid making a choice between Britain and the United States.

It was for this reason that New Zealand's participation in the five power staff talks in Washington on South East Asia was approved. New Zealanders seem to feel that something must be done to check the Communist infiltration of South East Asia, and that their country should participate in the discussion and the necessary measures without prejudice. How far public opinion would back any move to send troops or military supplies to Indo-China or anywhere else is uncertain. New Zealand has accepted the burden of maintaining a small expeditionary force in Korea with equanimity ; it has also accepted the unlikelihood of withdrawing this force in the near future. If it comes to the point, it is unlikely to hesitate about playing what small part it can in the containment of Communism in South East Asia.

One of New Zealand's chief reasons for participating in the five power military talks was that they presented a means by which the United Kingdom, excluded from Anzus, could be brought into a general military discussion of the position in South East Asia. So far as New Zealand has an official policy in the matter, it is plainly directed to promoting any discussions that may serve to reconcile Anglo-American differences and evolve a joint course of action.

* * *

Repercussions of Petrov

THE New Zealand government sent its Assistant Commissioner of Police, Mr P. J. Nalder, who is also head of its security service, to attend the opening sessions of the Royal Commission on Espionage in Australia. The main purpose of Mr Nalder's visit was to confer with Australian security officials and find out whether any of the ramifications of the Petrov disclosures affected his country, New Zealand has a natural interest in the matter because its small coterie of declared Communists has always been closely influenced by Australian Communist moves. There was more than a strong suspicion that during the 1951 waterfront strike in New Zealand, the Communist "grapevine" across the Tasman was used to convey Australian money to assist the strikers. It is not even a matter of suspicion that certain of the strikers' leaders were smuggled out of New Zealand to Australia and back again, but the New Zealand police were never able to prove how it was done.

The Soviet Embassy in Wellington had, since last year, been under the direction of the same Mr Generalov who has been withdrawn from Australia and there is a regular courier traffic between the Russian diplomatic establishments in Canberra and Wellington. Mr Generalov had been only once to New Zealand—to present his credentials—but it has been noted that the present *Chargé d'Affaires*, who has been in New Zealand three years, and a diplomatic third secretary, who was withdrawn last year, had travelled quite extensively in New Zealand and mixed fairly freely with New Zealanders. On the general thesis that Soviet diplomats who enjoy such liberty of action outside their embassies are the "key" men of the NVD, there is some natural curiosity about their activities.

The size of the Russian diplomatic establishment in this country—there are some 13 Russian nationals in the Wellington Embassy together with their wives and children—has frequently been remarked upon, particularly since New Zealand closed its own Legation in Moscow in 1950 and trade and diplomatic links between the two countries are tenuous.

New Zealand's security police operate as a section of the ordinary police force and not as a separate entity as they do in Australia and Britain. Their organisation has been criticised and the need for their existence has been questioned. If the Australian inquiry shows that Russian espionage has been carried on in New Zealand, some of the critics may be silenced, but others will want to know why New Zealand had to discover its espionage threat in Australia.

Suspicions of Communist influences in prolonging the 1951 waterfront strike played quite a large part in the overwhelming vote received by Mr Holland when he went to the country after the strike was broken. Any proof of Communist espionage activities in New Zealand as a result of the Australian inquiry could well have much the same effect next November.

* * *

Surpluses and Borrowing

MR HOLLAND, who is both Prime Minister and Minister of Finance, dealt with some big figures when he reviewed the public accounts for the past financial year. He showed what he called an "overall" surplus of £1.6 million for the year's working, and announced the flotation of a £30 million development loan, as well as a government loan of £12 million from the trading banks for housing development.

Mr Holland arrived at his overall surplus by producing surpluses of £1.8 million and £1.5 million in the Consolidated Fund and the Social Security Fund respectively and setting them off against an excess expenditure of £1.7 million in the Public Works Fund. The net surplus of £1.6 million does not appear so impressive when set against the actual expenditure of £177.5 million in the Consolidated Fund, £62.1 million in the Social Security Fund and £33.8 million in the Public Works Account. Nevertheless, Mr Holland was entitled to derive some satisfaction—and he obviously did—from the fact that he had a modest surplus and had been able to make tax reductions totalling between £8 and £10 million during the year.

The Prime Minister described the government's £12 million loan from the trading banks for housing as "a piece of good business." The transaction, however, is still being strongly criticised as basically inflationary in character. It is being equally stoutly defended on the grounds that the banks are able to lend the money without embarrassment, that they are obtaining a good return for their customers and that the money will be used to create New Zealand's most pressing necessity—houses.

The announcement of a new £30 million development loan has caused no surprise as the government had hinted that it was to be expected. Its policy is now to finance as much works' development as possible from periodic loans. There is, nevertheless, a strong opinion that tax money is still being turned into capital investment and that the greatest fillip New Zealand could receive would be a substantial reduction in the general burden of taxation. How this can be reconciled with the public reluctance to surrender social security benefits it is difficult to see.

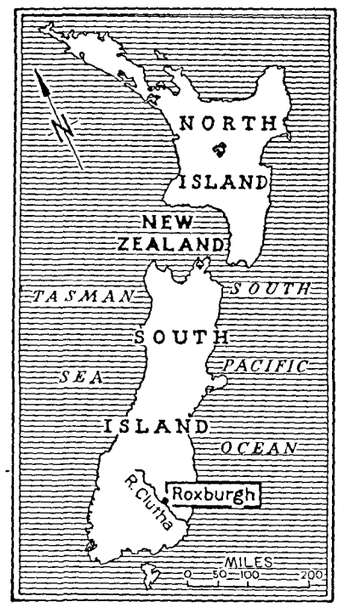
Mr Holland's review of the national finances, delivered in the form of a national broadcast, was buoyant and sanguine. It had only one notable and vital omission. It did not discuss the diminishing value of the New Zealand pound and the effects of inflation upon the small wage and salary earner. There is abundant evidence of prosperity in New Zealand, particularly in the farming community, but a considerable section of the public, wrestling with difficult family budgets, is inclined to be critical of Mr Holland's deft handling of millions.

* * *

Delay at Roxburgh

GROWING concern about slow progress on New Zealand's major hydro-electric power project, at Roxburgh in Central Otago, has come to a head with the revision of the existing contract between the New Zealand Ministry of Works and a British and a Swiss firm which had contracted to carry out the diversion of the Clutha river and the installation of the dam and generating machinery for £8,600,000.

Various charges and counter-charges have been made about the reasons for the delay. Some British workmen have claimed that labour has not been efficiently used and that the New Zealand Ministry of Works officials, jealous because the project had been taken out of their hands, have not been co-operating fully with the contractors. But the Minister of Works, Mr Goosman, has stoutly defended his officers.



It has, however, been announced that the contractors will pay £200,000 to the New Zealand government in compensation for past delays in the progress of the scheme and that in future, they will associate themselves with the New Zealand contracting firm of Arnold Downer, Limited. Mr Arnold Downer, who is a former engineer of the New Zealand Ministry of Works, has announced that he will introduce "more New Zealand custom" on the job. This was interpreted by Mr Goosman to mean, more New Zealand engineers.

It is now estimated that the job will be completed in March, 1958, and it is expected that the first generator will be installed and supplying power by the end of 1956, a year later than was originally planned. A new estimate has also been made of the cost of the completed contract. It is £1 million more than the original estimate made by the Ministry of Works (£10,200,000) which was £1,600,000 above the tender by the British and Swiss contractors. It seems apparent that the real cause of the trouble, apart from some inevitable labour friction, has been the fact that the

original tender was too low and that the contractors found themselves in difficulties as a result.

Journal of Geneva—VIII

JUNE 10th.—At a plenary session on Indo-China, Mr Eden summed up the position reached by the conference as follows: (1) *The cessation of hostilities.* It was agreed that this should take place simultaneously in all three Associated States and that the problem should be examined first in Vietnam. The conference was awaiting a report from the military representatives discussing a Vietnam cease-fire. (2) *The supervision of an armistice* which Mr Eden believed was a "crucial" issue. All agreed that some form of international supervision was essential but they did not agree on how to make it effective and impartial. The British Government believed that the five Colombo powers (India, Pakistan, Ceylon, Burma and Indonesia) would make a truly impartial commission. A commission composed of two Communist and two non-Communist countries simply would not work. Mr Eden also believed that the proposed commission must take decisions by majority vote, that there should be no use of the veto, and that the international commission must have authority to reconcile differences in the mixed armistice commissions of the two high commands. (3) *The future of Laos and Cambodia.* Mr Eden pointed out that the peoples of Laos and Cambodia were divided by race, religion, language and culture from those of Vietnam, and that there was not the slightest justification for forcing Laos and Cambodia into a union under the Vietminh against their wishes. He said that references to "resistance armies" in Laos and Cambodia and to "two belligerent sides" did not agree with the information of British representatives on the spot. Mr Eden said that unless the deep divergences on the armistice supervision and on the future of Laos and Cambodia could be narrowed without further delay, the conference would have to admit its failure. Both Mr Molotov and Mr Dong (Vietminh), who spoke after Mr Eden, maintained their former positions.

June 11th.—At a plenary session on Korea, Mr Eden and delegates from Canada and New Zealand all made speeches strongly supporting the authority of the United Nations and insisting on genuinely free elections. They all refused to accept a general agreement on vague principles such as Mr Molotov suggested on June 5th. Mr Eden pointed out that this left all the vital differences on one side; for instance, the Communist proposal that would in effect give a veto to the North Korea minority on the mixed commission to supervise the elections was unacceptable. He added that unless some solution of the deep differences between the two sides could be found they would have to admit their failure.

Mr Chou En-lai urged the conference to adopt Mr Molotov's five proposals of June 5th.

(In a speech at Los Angeles Mr Dulles made it clear that while the United States would be prepared to intervene unilaterally to meet overt Chinese aggression in Indo-China or elsewhere, it would only intervene in the present situation in Indo-China if the following five conditions were fulfilled:—(1) an invitation to intervene from the present lawful authorities; (2) clear assurance of complete independence for Laos, Cambodia and Vietnam; (3) evidence of concern by the United Nations; (4) the co-operation in the collective effort of some of the other nations in the area; (5) an assurance that France itself would not withdraw from the battle until it was won.)

June 12th. Mr Eden and Mr Molotov had an "inconclusive" private meeting.

June 13th. No meetings.

June 14th. Mr Eden and Mr Molotov had another private meeting, at which they are believed to have again discussed the possibility of direct military talks between the two sides now fighting in Laos and Cambodia.

At a restricted session on Indo-China Mr Molotov made proposals on the composition and functions of an international armistice commission, which were coolly received by the western delegates. Mr Molotov said that the international commission need take only major decisions by a unanimous vote; but his definition of what would constitute a major decision was so widely and vaguely drawn as to make this apparent concession valueless. He also said that if the votes of the four-nation commission proposed by the Communists were evenly divided, the chairman should have the casting vote, and that India should be the permanent chairman.

Mr Eden proposed that the talks on Indo-China should be suspended until the secret military talks on an armistice in Vietnam had been concluded.

June 15th. At a plenary session on Korea, General Nam Il (North Korea) proposed:—

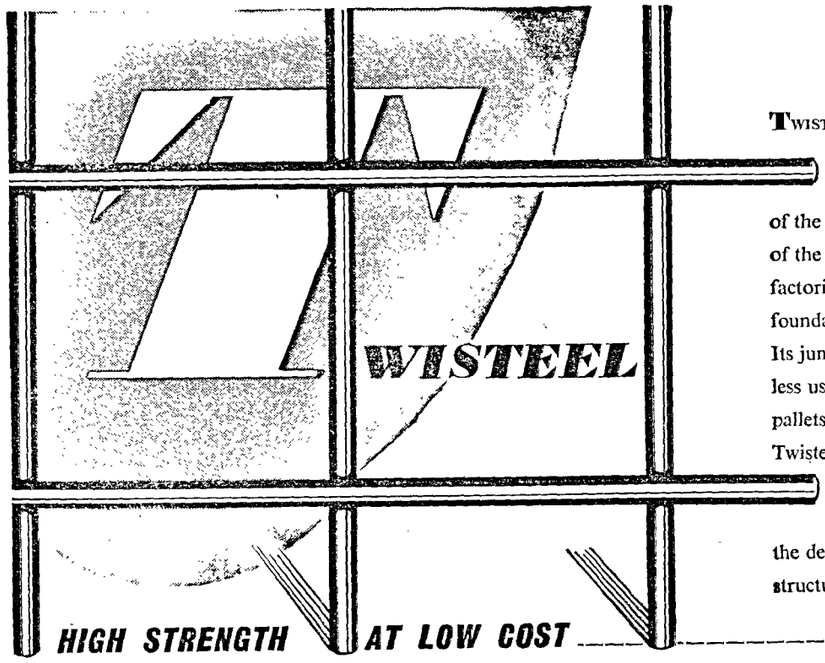
(1) The proportional withdrawal of all foreign troops from Korea as soon as possible. (2) The reduction of the North and South Korean forces within one year to not more than 100,000 men on each side. (3) The formation of an all-Korean commission to consider "gradual liquidation of the state of war" and "transition of the troops of both sides to a peace-time position." (4) The recognition that treaties between either Korean government and other states are "incompatible with the interests of the peaceful unification of Korea" in so far as they involve military obligations. (5) The formation of an all-Korean committee to work out and implement agreed measures for the development of economic and cultural relations between South and North Korea. (6) The recognition that the peaceful development of Korea should be ensured by the states taking part in the Geneva conference.

Mr Chou En-lai and Mr Molotov both supported these proposals and suggested that the five great powers plus the two Korean governments should discuss in restricted session measures to consolidate peace in Korea.

After the session the 16 non-Communist countries taking part in the Korean talks issued a statement saying that they disagreed with the Communists on two basic matters of principle:—(*a*) the authority and competence of the United Nations in Korea; and (*b*) genuinely free elections in Korea. The Communists repudiate the authority of the United Nations and insist on procedures that would make free elections impossible. The 16 nations reluctantly concluded that so long as the Communists reject these two principles it is useless to continue the talks on Korea.

June 16th. Mr Eden and Mr Chou En-lai had a private meeting and later, at a restricted session on Indo-China, the latter is understood to have indicated that he was in favour of the withdrawal of foreign troops from Laos and Cambodia, including, it is believed, Vietminh as well as French troops. He also proposed a meeting between the two high commands in Laos and Cambodia.

Mr Molotov suggested that Indonesia might be included with India, Pakistan, Czechoslovakia and Poland on the armistice commission, and that if this were not approved there might be a three-member commission composed of Poland, India and Indonesia.



TWISTEEL is a name you should know. TWISTEEL make Wireweld steel fabric which forms the heart of the concrete roads you ride upon, of the barrel vaults that roof your new factories, of the concrete floors and the foundations for your machines. Its junior partner Gridweld has countless uses from machine guards and pallets to simple fencing. Twisteel's advisory service is at your disposal: its staff includes engineers who are experts in the design of reinforced concrete structures.

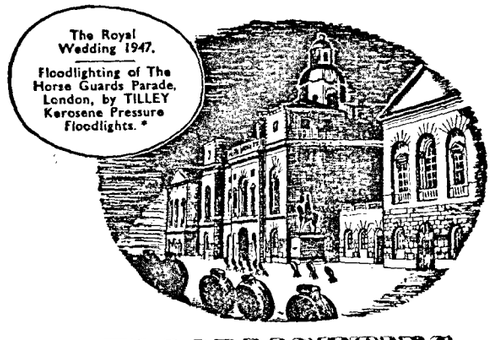
Light Problems....



....FLOODLIGHTING

There are times as at the Royal Wedding in 1947, when normal static floodlighting is impracticable. At such times The TILLEY Lamp Company is consulted.
TILLEY kerosene pressure Lamps and Floodlights serve industry and commerce in an infinite variety of ways. Whether you require 5,000-candlepower Floodlights for emergency lighting, Storm Lanterns or Irons for safari, suspension lamps for a marshalling yard or railway lamps for track repair, why not consult us? There is a TILLEY Lamp for every job and a TILLEY Lamp does every job better!

* *The Tilley Floodlight, Model F.L.6. burns 40 hours on only 6 pints of kerosene.*

Atlas-Copco puts compressed air to work for the world

Irrigation schemes in India are bringing new fertility to millions of acres that were once parched and useless. Helping to deliver this life-giving water are Atlas-Copco compressors operating air-lift pumps, capable of raising 20,000 gallons per minute. In France, the rapidly developing aircraft industry devoted many months to testing new compressed air tools. After assessment on standards of handiness, air consumption and vibration, Atlas-Copco were chosen to supply the industry with many hundreds of these tools, including filing, drilling and riveting machines. As in India and France, so in almost every part of the world, wherever compressed air is working hardest Atlas-Copco is on the job. Atlas-Copco equipment covers every conceivable application of compressed air. Add to this, the servicing and delivery facilities of allied companies* in 37 countries, and you realise why Atlas-Copco are among the world's leading compressed air specialists.

Atlas-Copco embraces companies trading under the names Atlas, Atlas Diesel, Atlas Polar, Atlas-Copco, Copco, Delfos and Sampa. Enquiries in the U.K. should be addressed to THE ATLAS DIESEL COMPANY LTD., *Beresford Avenue, Wembley, Middlesex.*

THE BUSINESS WORLD

Taxation and Expenses

TAX evasion is the subject of a comedy now playing in the West End and the dramatic critics have recommended it for businessmen, with the rider that the tickets ought to be a chargeable business expense. The businessman's lunch and the car on an expense account are stock jokes in the suburban music halls. A joke is a serious matter, though there is no need, as a few inspectors of taxes and a few taxpayers seem to think, to regard it as a tragedy. Any discussion on expenses and taxation always seems to provoke tempers. The last rumpus in Parliament—there is one every year—concerned a questionnaire which demanded an itemised account of expenses claimed against the tax assessment of a businessman. The Institute of Directors objected to the questionnaire; Mr Boyd-Carpenter apologised for its wording and it was withdrawn. The Inland Revenue staff can be forgiven if they feel that they have been criticised for doing what the Government told them to do a year ago. This week the Institute of Directors has given evidence before the Royal Commission on Taxation on the whole subject of directors' expenses.

This is no storm in an inkwell. The Inland Revenue authorities are tightening the screw on expense allowances. It is evidently their administration of the law as much as the law itself, that is the cause of complaint. The law is clear, and its wording is rigorous. The 1948 Finance Act made a distinction between expense allowances claimed by a company and those claimed by a director or by a highly paid employee. A company, a sole trader and a partnership can set against profits for tax purposes any expenses (including those incurred by employees earning less than £2,000 a year) which have been "wholly and exclusively" laid out for the purposes of trade. A director (no matter what he earns) or an employee earning £2,000 a year or more (inclusive of any sums received as expenses either as a round sum or specific allowances) can claim tax relief only on those expenses which have been incurred "wholly, exclusively and necessarily" in performing the duties of his office. The single word "necessarily" marks the difference in treatment of expenses under Schedules D and E; it produces such different effects upon the taxpayer that it has been said that these are not two different schedules but rather two different taxes. In granting relief under Schedule E the Inspector of Taxes is bound by an "expense rule," dating from 1853, and by a mass of judicial decisions and administrative annotations which have been appended to it:

> If the holder of an office or employment of profit is necessarily obliged to incur and defray out of the emoluments thereof the expenses of travelling in the performance of the duties of the office or employment, or of keeping and maintaining a horse to enable him to perform the same, or otherwise to expend money wholly, exclusively and necessarily in the performance of the said duties, there may be deducted from the emoluments to be assessed the expenses so necessarily incurred and defrayed.

The days when the commercial traveller went his rounds in a gig are long past, but an inspector of taxes has still to follow the wording of a rule which, in Mr Justice Vaisey's words, is as "stringent and exacting" as ever.

The law presumably singles out directors for particular attention under Schedule E on the argument that although every claim for expenses, no matter who makes it, is a cost to the company directors and managers will keep a tighter rein on the expenses of employees than on their own. There have certainly been cases of unjustifiable extravagance and of wilful evasion. Most tax inspectors would agree that some taxable income leaks through their net as expense

allowances; most of them would agree that if these sums are kept within reasonable bounds, they are not usually worth the trouble of detailed vouching. It is the duty of an accountant to limit his client's liability for tax by all legitimate means and, without necessarily holding a watching brief for the Inland Revenue, to prevent his client from making a fool or a criminal of himself. Between the inspector and the accountant, an informal system of administrative tolerances has been established which effectively checks abuse, but avoids for the majority of taxpayers the worries and waste of a detailed inquisition. There is, admittedly, considerable incentive for a director or employee earning a high salary to push as many as expenses as he can on to the company or to secure them free of tax. If tax rates were low and earned income relief did not run into a brick wall at just over £2,000, there would be far fewer squabbles about expenses.

If squabbles are to be avoided, the law, so exacting in its wording, needs to be administered with reasonable tact. There are heavy-handed inspectors, who work inflexibly to rule and who demand the last detail of evidence; but there are many more who are prepared to deal with the conscientious taxpayer in a spirit of give and take. It is an advantage to the hard worked inspector as well as to the taxpayer that a reasonable claim for tax relief goes through with the minimum of fuss and argument. If the law were administered in its full rigour, all sums received as expenses would be grouped with the individual's salary and tax would be deducted at the appropriate rate, leaving the taxpayer to claim relief (and the reimbursement of tax) on those expenses "wholly, exclusively and necessarily" incurred. To prove his claim, he would have to provide the inspector of taxes with an analysis of the sums spent on his expense account. In its memorandum to the Royal Commission on Taxation, the Institute of Directors declared that an unnecessary amount of detail is required to satisfy the Inland Revenue authorities. The Institute added that the claimant has to submit to a "searching inquisition" and that the inspectors make "the procedure as difficult and unpleasant for the claimant as possible." In answering this charge the Inland Revenue authorities could argue that all they require is a "reasonable" analysis; that they do not insist that every bill should be produced; that, in any case, this procedure is not often followed; and that inspectors of taxes have quite a free hand to grant dispensations.

To secure a formal dispensation, the taxpayer's employer has to submit to the Inland Revenue office a claim asking that certain specified sums should be regarded as expenses and should therefore be exempted from tax. Once the inspector has satisfied himself—and he is bound to do so by law—that no additional tax would fall to be paid even if a dispensation were refused, he can formally exempt from tax the sums claimed as expenses. These dispensations can be withdrawn at any time and it is the inspector's duty to review them periodically; but while they are in force, he says in effect to the successful claimant: "others abide our question; thou art free." Hence, these formal dispensations are not very popular with tax inspectors, for they then have few means of telling whether the sums so exempted from tax have been spent on those expenses that are allowed by law.

To safeguard the revenue and at the same time to avoid excessive penalties and restrictions on the taxpayer, the Inland Revenue (working cooperatively with accountants) has devised a reasonable compromise between the rigidity of the first and the slackness of the second procedures. This is the system of "half" or "informal" dispensations. Under this scheme sums paid to individuals as expenses are not added to their salaries and taxed; instead such sums are shown separately as tax-free items, usually on the back of the PAYE card. Each year the company has to make a return, showing for each individual concerned what sums have been paid out in expenses and for what purposes, and what benefits have been made in kind. Usually, the inspector of taxes does not require an excessively itemised return and if the sums claimed appear to him to be reasonable, after taking into account past claims, the status of the individual in the company, and the trade in which the company is concerned, he will exempt these sums from tax without much question. But obviously he must retain his right to dispute the claim, and his right to reopen the dispensation.

Given this broad administrative framework, everything turns on the attitude of the individual inspector of taxes, for the smooth settlement of claims for expenses, as for all other claims for relief, depends finally on the outcome of discussion across the table. Zeal can outrun discretion and then the taxpayer may feel that he has grounds for grumbling—though he certainly has no legal complaint. One of the dangers is that so much depends on specific details and particular individuals that the authorities in Somerset House can issue directives only of a general nature. And these directives can, as the recent questionnaire suggests, be too literally interpreted.

The reason for the tightening up of the administration of expense claims can perhaps be found in last year's Finance Bill debate, when the Opposition pressed for a more exacting administration of the law. With a shortage of staff in the tax offices, the review of dispensations may have got behind the clock. Now, it seems that the authorities are passing them through a finer sieve than they did in the past. In its memorandum the Institute of Directors claims that "dispensations already given are being withdrawn" and that "even where the claimant succeeds in satisfying the inspector that his expenses for any given year are properly allowable no dispensation, at any rate as regards entertaining expenses and foreign travel, is now given for ensuing years: the procedure is an annual one." Entertainment and travelling allowances are the biggest loopholes and hence they always cause the most trouble. There have been innumerable complaints, for instance, about the deduction of "home savings" from such claims. In settling these claims, the authorities accept only that portion of the sums spent which represents extra expense, after deducting what the claimant would have spent if he had remained at home. In this respect the authorities follow a ruling in the Courts in 1930, in *re Nolder v. Walters*; with such a precedent it is difficult to see what else they could do.

On this and on other more important points, there have been several suggestions that the law and practice should be revised. From one side, Sir Frank Soskice has proposed that sums claimed as expenses should be sworn on oath by the claimant. This is wholly excessive. A signature on the income tax return is already given under penalty; the inspector of taxes already has sufficient powers to query or reject the claims made in that return. On the other side, it has been suggested that the Inland Revenue should accept a statement from the taxpayer's accountant that the sums claimed as expenses have been spent with strict regard to the wording of the law. That suggestion would put an unreasonable burden on accountants and deprive inspectors of taxes of powers that they could not spare. More recently, the Institute of Directors argued that the word "necessarily" should be deleted from the expense rule. Amendments such as that would need most careful scrutiny, for the law must remain as precise as possible if evasion on an appreciable scale is to be prevented. The real question is whether the law as it now stands is administered fairly and reasonably. To that question, the fair answer seems to be a qualified Yes.

King of Diamonds

IN the diamond trade the De Beers group "doth bestride the narrow world like a Colossus." It controls over half the world's output of diamonds by value, and the odds are nineteen to one that any diamond bought has passed through the hands of its sales organisation. Yet De Beers Consolidated Mines, on which the market puts a value of some £85 million, is only one of three empires over which Sir Ernest Oppenheimer presides. Anglo American Corporation of South Africa is the mainspring of this group of gold, diamond and base metal undertakings. From this company, which is primarily a gold mining finance house, two offshoots extend: Rhodesian Anglo American superintend's the group's investment in Rhodesia, largely in copper and coal; and Anglo American Investment Trust holds the diamond investments—a 20 per cent interest in De Beers Consolidated Mines, with minority holdings in the marketing and investment companies of the De Beers group.

DIAMOND SALES BY CENTRAL ORGANISATION

(£ million)

	Gem	Industrial	Total
1948	26·8	11·3	38·1
1949	19·9	8·5	28·4
1950	38·3	12·6	50·9
1951	46·8	18·3	65·1
1952	45·8	23·9	69·7
1953	43·3	17·8	61·2
1st 5 months 1954	20·0	6·6	26·6
1st 5 months 1953	21·0	6·7	27·7

Since the war the diamond branch of the Oppenheimer empire has enjoyed unprecedented prosperity. There was a brief setback in 1949, but it was soon followed by the Korean war; dealers and cutters bought heavily, fearing a shortage and rising prices, and people scrambled into diamonds as a "safe" hedge. At the same time large quantities of industrial stones were absorbed by defence production and by the American strategic stock. De Beers reopened the New Jagersfontein mine at the end of 1949 at a cost of £2 million, and laid out over £4 million in reopening the vast Premier mine the following February. In 1952, the total sales of the diamond selling organisation reached a peak of £70 million. They have fallen since, but the demand for gem stones—though not for industrial diamonds—is still buoyant, and stocks are low.

For several years De Beers have spread their net beyond mining and selling diamonds into widening fields, through two subsidiaries. De Beers Industrial Corporation is interested mainly in a half share of African Explosives and Chemical Industries, ICI being the other partner. The second, De Beers Investment Trust, has recently pumped large sums into the expanding economy of South Africa and Rhodesia mainly by way of short-term loans often carrying conversion options into ordinary shares. In all De Beers Investment Trust has provided £50 million of new finance. Of this, £20 million in short loans constitutes the reserve fund which the Diamond Corporation could use to sustain the diamond market should bad times return. Most of the balance—also derived from the huge profit which the Diamond Corporation made from the sale of its old stocks after the war — has been reinvested in mining and industry. Sir Ernest Oppenheimer gave the breakdown of the De Beers group's investment to Anglo American shareholders this week:

	£
To National Finance Corporation	20,849,000
Loans by De Beers Investment Trust—	
West Rand Gold	5,057,875
Orange Free State Mines	16,291,364
Finance Companies	1,742,628
Rhodesian Copper	245,000
Rhodesian Coal	490,365
Chemical Industry	5,060,977
	£49,737,209

The decision to apply diamond profits to develop

De Beers Directory

De Beers Consolidated Mines: capital £6,082,184 in 800,000 40 per cent pref. of 50s. and 16,328,739 5s. ord.

Anglo American Investment Trust: owns 20 per cent of De Beers' equity.

Premier (Transvaal) Diamond Mining Company: De Beers holds 92 per cent of the pref. and 98.2 per cent of the defd.

Consolidated Diamond Mines of South West Africa: De Beers holds 96.4 per cent of the equity.

Griqualand West Diamond Mining Company, Dutoitspan Mines: De Beers holds 54.48 per cent.

New Jagersfontein Mining and Exploration Company: De Beers holds 53.95 per cent, but rents the mine.

Consolidated Company Bultfontein: De Beers holds 41.29 per cent.

De Beers Industrial Corporation: De Beers holds 71¼ per cent of the equity.

African Explosives and Chemical Industries: Equity is owned jointly by De Beers Industrial and ICI.

Diamond Corporation: De Beers holds 60 per cent, Cons. Diamonds 23.1 per cent, and Anglo American Investment Trust 16.9 per cent.

De Beers Investment Trust: owned 84.1 per cent by Diamond Corporation, 10.9 per cent by De Beers, 2.7 per cent by Cons. Diamonds, and 2.3 per cent by Anglo American Investment Trust.

Consolidated African Selection Trust: Diamond Corp. holds 16.63 per cent.

Société Minière du Beceka: Diamond Corp. holds 16.62 per cent.

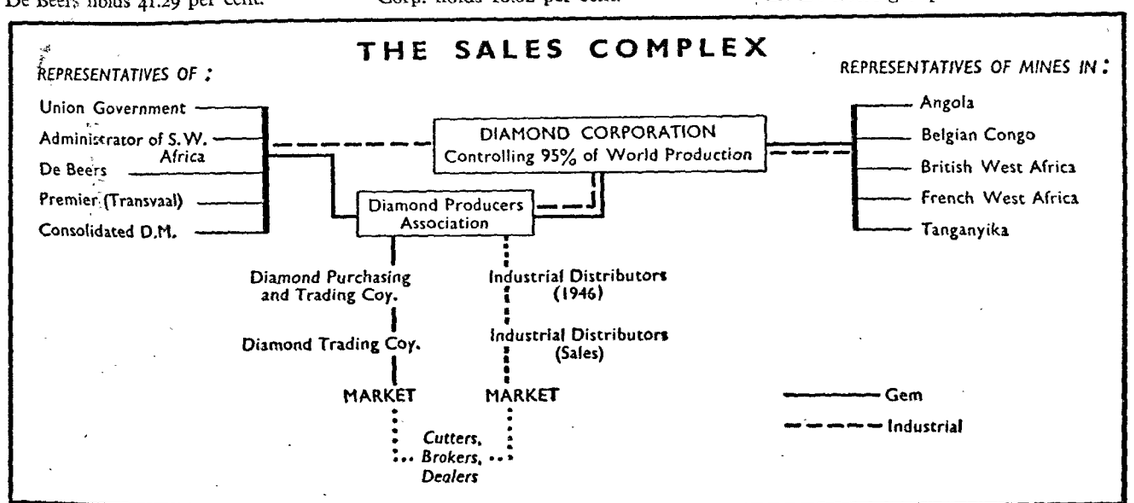
Companhia de Diamantes de Angola: Diamond Corp. holds 0.82 per cent.

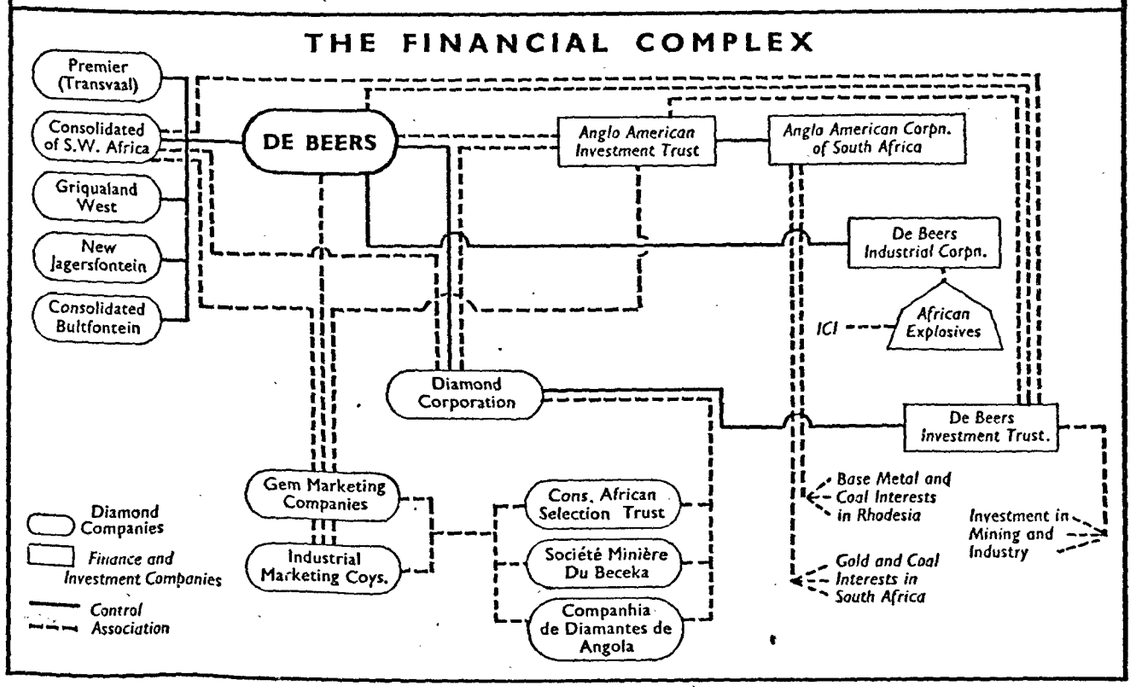
Diamond Purchasing and Trading Company: De Beers holds 32 per cent, Cons. Diamonds 8 per cent, Anglo American Investment 16.6 per cent.

Diamond Trading Company: De Beers owns 32 per cent, Cons. Diamonds 8 per cent, Anglo American Investment Trust 22.2 per cent.

Industrial Distributors (1946): De Beers owns 24 per cent, Cons. Diamonds 6 per cent and Anglo American Investment Trust 10 per cent.

The remaining capital of the marketing companies is held by producers outside the De Beers group.





the gold, coal and other resources of South Africa and Rhodesia attracted much comment in Britain. It was argued that shareholders might have been allowed to decide for themselves whether to invest their money in the speculative ventures of the Orange Free State, but Sir Ernest would have none of it. He saw that to bring the OFS mines into production and to nourish South Africa's growing economy would be no light task. He was the mining financier with large cash resources at his disposal and he claimed that he was "reviving the tradition of Cecil John Rhodes," the De Beers chairman of 54 years ago. So shareholders of this group have followed Sir Ernest pioneering with the mantle of Rhodes around his shoulders whether they liked it or not. So far they have come to no harm and he has chosen mainly prior charges for the investments; income from investments other than trade investments rose last year in De Beers' consolidated accounts from £2.1 million to £2.8 million—a bagatelle compared with the diamond account, though that fell a little from £28.6 million to £26.2 million.

The investor's first feeling about the accompanying charts, which explain the financial and marketing arrangements of De Beers, may be that they provide a text-book example of an international monopoly. It would be a true diagnosis, but a harsh one. The velvet glove of association has been used far more freely than the mailed fist of control. Even De Beers itself is linked with the Anglo American group by a mere 20 per cent shareholding—far less than a controlling interest, though effective enough for a workaday alliance. Full control covers the diamond mines of South and South-West Africa; it stretches down into the marketing organisation through the complete control of the Diamond Corporation. Then the velvet glove reappears. The Diamond Corporation is a potential fairy godmother to outside producers because it holds the £20 million fund reserved to take up the minimum quotas of diamonds if the need should arise. The Diamond Corporation also has useful but minority investments in producing companies in the Gold Coast, the Belgian Congo and Portuguese Africa. The picture is further complicated by Anglo American Investment Trust, for in addition to its investment in De Beers this company has minority holdings in the trading and investment companies right through the group.

*

Not unnaturally, De Beers have long favoured centralised selling, and when the old diamond syndicate collapsed in the slump of the 'thirties, it formed the Diamond Corporation to carry on those functions. The latest recruit to the cartel is Dr Williamson, owner of a fabulous mine in Tanganyika, who after an earlier disagreement with De Beers on prices, returned to the fold in 1952. The hub of the organisation, which now handles 95 per cent of the world's output of diamonds, is the Diamond Producers' Association, which establishes a minimum quota of guaranteed sales for each of its members. They are: De Beers; Premier (Transvaal); Diamond Corporation; Consolidated Diamond Mines of South-West Africa, and the Union government and the Administrator of South-West Africa representing the state diggings in their territories). The outside producers are indirectly represented on the Association by the Diamond Corporation, which has long-term contracts to purchase their outputs, subject to a guaranteed minimum.

*

Gem stones are passed to the market via the Diamond Purchasing and Trading Company, which carries out the highly skilled task of sorting and pricing, and the Diamond Trading Company, which effects the actual sale. Industrial stones are similarly handled by Industrial Distributors (1946) and Industrial Distributors (Sales). The bulk of the output is sold through London. Cutters, brokers and dealers on the organisation's list attend the monthly "sights" held in an unpretentious building opposite Hatton Garden. The buyer is shown into a small room with a northern light to examine the parcel that he has been allotted. If he approves the parcel it is his, for prompt payment. Objections to the quality of the parcel are met if they are considered to be valid. Some members of the trade would complain that the selling organisation tends to be autocratic, but most would agree that in the long run its policy of attempting to stabilise prices is in their own interests. Three-quarters of the total supplies of gem and industrial stones find their way to the United States; a small quantity is imported direct, the remainder after cutting and polishing in Europe and Israel.

The diamond trade has lost a little glitter, but its prospects are still bright. The mines are working to the limit of existing capacity, which appears to be below current demand for gem stones. As stocks are now very low, sales of gem stones will show some decline this year if present prices are maintained. The demand for industrial stones, however, has fallen off considerably in the last two years, owing partly to the cessation of purchases for the American stockpile; the fact the sales in the first five months of this year were almost as high as in the same period of 1953 is explained by unexpected purchases for the stockpile. There seems little likelihood in the near future of any marked decline in De Beers' profits. The more distant prospect is inevitably uncertain. Demand for both gem and industrial stones is greatly influenced by world political developments, good or bad. Though the central selling organisation controls both supply and price, it is not omnipotent. The Diamond Corporation's resources are greater than they have ever been, but they could only mitigate, not abolish, the lean years to which the diamond trade is prone. Investors in De Beers now have their risks spread over a wider field, but the yield of nearly 11 per cent on the equity emphasises that despite its size and strength it is still in the risk class.

Business Notes

Resilient Markets

No rise in the share markets proceeds without a pause. One such occurred in the early days of this week when both industrials and gilt-edged suffered a minor shake out. But the abiding impression must be one of strength. The rallies continue to come swiftly and decisively, and often they exceed the extent of the previous decline. By the middle of this week a rally was in progress. Dated gilt edged stocks, leading industrials, and to a smaller extent gold and copper shares, were involved. The accompanying table showing the peaks and troughs since the budget gives an impression mainly of firmness and stability.

	Industrial Index (Financial Times)	US Industrial Index (Dow Jones)	Savings 1965/75	3½% War Loan
April 6.....	142·6	304·26	89 11/16	87⅝
„ 23.....	147·1	313·37	90 1/16	87 3/16 xd
„ 28.....	144·2	313·75	89⅝	86¼ xd
May 14.....	149·9	322·50	91 11/16	88 3/16 xd
„ 27.....	151·7	326·37	91 1/16	86⅞ xd
June 4.....	152·6	327·63	91 11/16	86⅝
„ 14.....	147·1	322·65	91⅛	86¼
„ 16.....	149·6	327·28	91 11/16	86 5/16

The market thus runs into a period of many calls for new finance in good fettle. There is already evidence of the willingness of investors to absorb suitable stocks. The great success of the Government's conversion operation was an example of it. The heavy oversubscription of the £4 million Rolls Royce Debenture issue was another, and there were indications that yesterday's offer of £500,000 4¼ per cent debenture stock, 1964-79, of British Rollmakers, at £99 was also attracting a good response.

The quick absorption of the £20 million of Treasury 3½ per cent stock issued in part compensation for the nationalised coal mines was of a different nature. The amount was larger than expected even though it compares with a previous half yearly instalment of £33 million in December. But even though the half yearly Coal Compensation is now tailing off the Government still has to take back much of its stock. Now that most of the colliery companies are winding up, liquidators tend to sell at once and the Government broker stands behind the market ready to take back stock at a jobber's turn below the issue price. The issue was made on the basis of £96¼ being equal to £100 of compensation, compared with a price of £92 11/16 on the December issue—showing appreciation of medium-dated stocks in 6 months.

Skilled Conversion

THE Government's latest cash-and-conversion offer has certainly been a striking success—a genuine and not merely a nominal one. After the lists for the conversion side of the operation closed last Tuesday it was announced that holders of £292 million of 3 per cent National Defence Loan, 1954-58, had accepted the invitation to exchange into the new 2 per cent Conversion Stock, 1958-59. Only £29 million of the £321 million of 3 per cent stock will therefore remain for redemption in cash on the Treasury's chosen date of September 2nd next. In all operations of this character participation by the departmental funds is a normal procedure; but when the acceptances announced amount to so high a proportion as over 90 per cent of the theoretical maximum it can usually be presumed, even in the absence of other indications, that there has been a substantial "genuine" response. And in this case it was well known that at the moment of the offer a considerable proportion of the called stock was in the hands of the banks and the money market.

*

At the outset some of these institutions took the view that the terms had been cut too fine to make an appeal, while to the discount market the maximum life of four years and seven months looked on the long side. But, as so often happens, initial resistance gradually gave place to acquiescence, if not to eagerness. It was perceived that this unexpected break in the recent practice of the authorities of offering stocks with steadily lengthened dates—in the sixties, and with the last February's issue dated 1969—was a tactical move and not a change in policy. A clear hint had in effect been given that it would be wise not to count upon the offer of another "short" when the autumn maturity of £535 million of 1¾ per cent Serial Funding stock is refinanced. Willy-nilly, the banks found that they had been left with hardly any alternative but to convert at least the greater part of their holdings; and on the same argument banks and other institutions have switched out of the maturing Serial Funding stock (via sales to the Government broker) into the cash issue of the new stock.

Thanks partly to these and analogous processes, the cash subscriptions from non-official applicants are believed to have amounted to £150 million or more; and, to judge from the premium established since—the quotation at the close on Thursday was 99¼, compared with the issue price of 99½—the eventual result of the operation will be more impressive still. Meanwhile, the threat to stocks with spread dates has provoked a frantic search for short-medium and medium stocks with single or narrow dates, thereby lifting precisely that sector of the market at which the next official shaft is likely to be directed. The authorities are noted for their skill at the game, but this latest round is one of the shrewdest yet seen.

Prospects for Stewarts and Lloyds

IT is still early to be sure, but the portents are moving favourably for success when the public offer of 10 million £1 ordinary shares at 35s. in Stewarts and Lloyds is made next week. After a dip in the ordinary share market that must have dismayed the consortium for a few days, prices are rallying each day. The conclusion of the resale of English Steel shares to Vickers and Cammell Laird provides a gesture of confidence from industry as welcome as it was long awaited. The Stewarts and Lloyds prospectus will be published on Monday. Application lists will open on Thursday and close on Friday—the Bank of England taking yesterday's price of 3½ per cent Treasury stock 1979/81 as that at which that stock may be tendered.

The yield is generous—though for that Mr George Strauss deserves the discredit. On the basis of a 12½ per cent dividend Stewarts and Lloyds at 35s. yield 7 1/7 per cent compared with about 7½ per cent now obtainable from United Steel and Lancashire Steel. United Steel's increased interim dividend of 4 per cent against 2½ per cent has prompted a reassessment of the total dividend for the current year and assisted the atmosphere for the Stewarts and Lloyds issue. In former days the differential between Stewarts and Lloyds—the cream of steel equities—and the general run of steel shares was nearer 1 per cent.

The offer will be fully covered under the arrangements by which institutional and other underwriters support their commitments with firm applications. There are indications, indeed, that some of them would be ready to buy excess shares in the market after allotment, and at a premium. The unknown factor, as in earlier steel issues, is the attitude of the private investor. If he will not apply for Stewarts and Lloyds on these terms, he will never be attracted to any other steel shares. The application money of 5s. per share is low and might encourage some stagging on "pink forms." The technical success of the issue is not in doubt; but real success depends on the maintenance of a steady market and a small premium—in other words on the reverse of what happened after the United Steel and Lancashire Steel offers.

English Steel

AFTER many months of hard-fought negotiations Vickers and Cammell Laird have agreed to buy back the equity of English Steel Corporation of which nationalisation deprived them in 1951. The price is £10 million, and it covers 6 million £1 "A" ordinary shares sold to Vickers and 2 million "B" ordinary shares sold to Cammell Laird at 25s. a share. The two classes are governed by a complicated trust deed, but their voting and dividend powers are *pari passu*. Therefore English Steel's equity goes back 75 per cent to Vickers and 25 per cent to Cammell Laird. The company was nationalised with a different capital structure, so that precise comparison is not possible, but 70-30 was the approximate pre-nationalisation ratio.

The deal was well timed in view of the Stewarts & Lloyds offer next week. How far Sir John Morison, the chairman of the Iron and Steel Holding and Realisation Agency, has made a good bargain is difficult to judge. When English Steel was taken over for £22.1 million it consisted of 2,234,899 preferred ordinary shares of £1, 1,131,120 deferred ordinary shares of £1, and £821,167 of 6 per cent debenture stock. It comes out again with 8 million of ordinary shares, 5 million 5½ per cent preference shares of £1, and £5 million of 4½ per cent debenture stock. The 6 per cent debenture stock has now been paid off, and the equity sold for £10 million, leaving the preference shares and the new 4½ per cent debenture stock in the hands of the Agency against a book value of £11,273,311.

Thus if the Agency can eventually sell £5 million of 5½ per cent preference capital and £5 million of 4½ per cent debenture stock at par—which should not be impossible—no loss will have been suffered, at least superficially. But there is another factor. The old 6 per cent debenture was repaid out of profits accumulated during the period of nationalisation. The Agency has in fact reduced its book value to the tune of £821,167 with its own money. Fortunately the making of a profit on resale, however calculated, is not the Agency's exclusive task. The figure which is likely to govern the prices at which steel companies can be sold is the "net maintainable revenue"—effectively the probable profit after last year's premium on exported steel has been excluded. The English Steel transaction was private, and it has not been necessary to make any estimate of net maintainable revenue, but the Agency is probably not dissatisfied with the price obtained.

Trade and Convertibility

OFFICIALS of countries in the Organisation for European Economic Co-operation have met in Paris this week to discuss the problem of reconciling a move towards formal convertibility with the cause of the continued liberalisation and expansion of international trade. The possibilities of a direct clash between the two objectives has for some time been a matter of serious concern to the Chancellor of the Exchequer and his advisers; and it is to discuss the ways of avoiding such a clash that the special meeting of OEEC finance ministers will be held in London under the chairmanship of Mr Butler towards the end of next month. This week's discussions in Paris were intended to prepare the way for that ministerial and potentially important meeting. Meanwhile, the Chancellor has this week re-affirmed in Parliament the Government's continued aim of convertibility, on the three familiar conditions—continued improvement in the gold reserves; good creditor policies by other countries; and adequate financial support from the International Monetary Fund.

The first and main item on the agenda at the Paris talks was the preservation and extension of the OEEC's code of liberalisation. This has provided for the dismantling in a non-discriminatory way, and on a defined minimum scale, of quantitative restrictions on imports from other OEEC

countries. The scheme has worked in conjunction with the arrangements of the European Payments Union and would be threatened if EPU were to fall a victim to the convertibility of one or more of its international currencies. Can this code of liberalisation, with its precise targets and its mechanism for permanent co-operation, be dovetailed into the wider but looser system of the General Agreement on Tariffs and Trade? Or will a new organisation, doing the work of the OEEC on a world-wide basis, have to be evolved?

A parallel problem is that of the credit facilities now automatically available under EPU, and threatened by the move to convertibility. Can these credit facilities be effectively provided by a wider organisation such as the International Monetary Fund? And, if not, can the IMF be loosened and adjusted to take the strain of the new responsibilities that will fall upon it in the event of a collective advance to convertibility? This is a problem that will undoubtedly come before the annual meeting of the International Monetary Fund due in Washington in September. But it is reassuring to note the thoroughness with which these questions that go to the very roots of the convertibility problem are being considered before the event, instead of being allowed to cause trouble afterwards.

Waiting in Wheat

BUSINESS in wheat here and on the Continent is stagnant while the trade awaits the outcome of the International Wheat Council's meeting in London. The meeting began last Wednesday and is expected to continue until the 23rd. The United States, which has the most pressing disposal problem, will probably suggest that the importing members should take up wheat to the limit of their quotas next season, on the basis of the minimum IWA price of US $1.55 a bushel for no. 1 Manitoba wheat, ex-Fort William, compared with the equivalent present Canadian price of $1.75½. Nothing could be done about the unfilled balances of this season's quotas, which amount to 5.6 million metric tons out of a total of 11.4 million, and lapse on July 31st. Although total consumption of wheat should increase at lower prices, the main purpose of the suggestion would be to increase sales by the United States, Canada and Australia, at the expense of exporters outside the agreement, principally Argentina, and smaller exporters such as Turkey. Canada and Australia would have mixed feelings about this proposal, but they could not avoid following the market. And it seems that Canada is aware of America's intentions, for the Canadian Minister of Trade has said that his government would not make a fetish of maintaining present prices if they interfered with exports. Some of the smaller importing nations might cavil at fulfilling their obligations under the agreement, and it is likely that the United States would not press the matter at this stage, preferring to await the response to an informal approach.

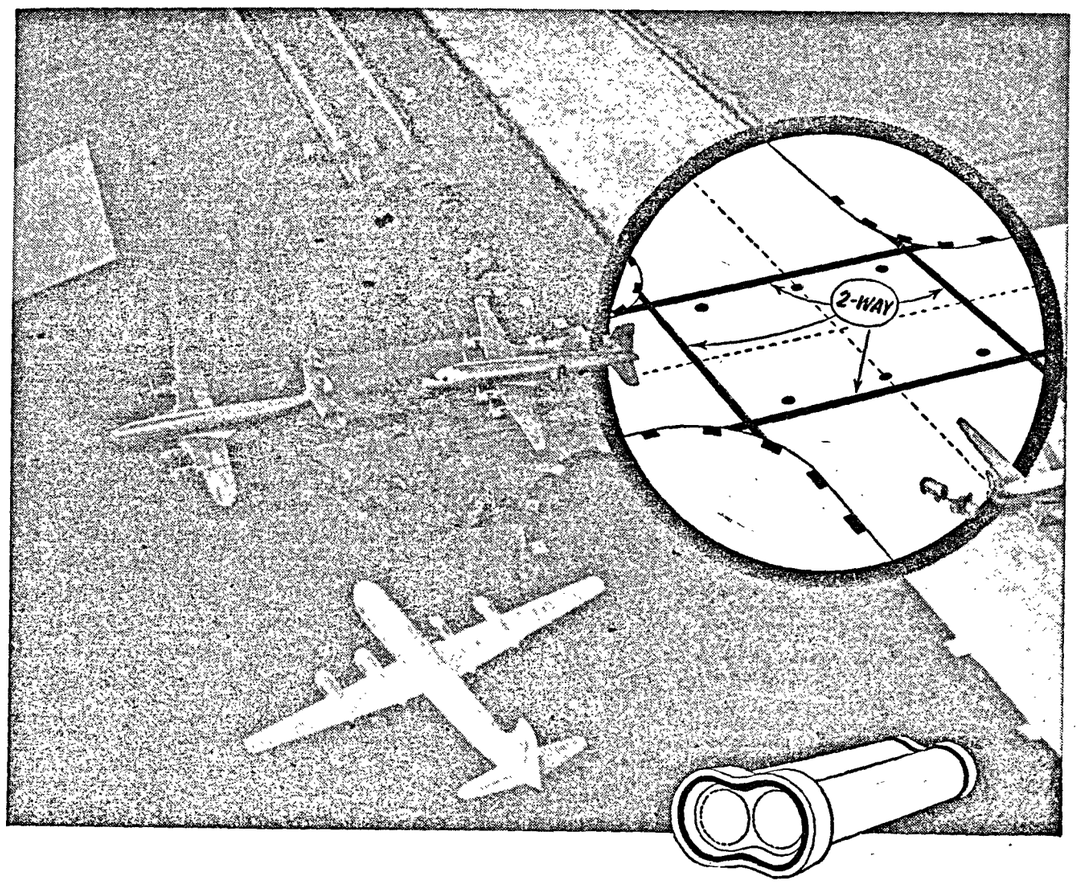
Meanwhile the earlier reduction in prices is stimulating sales of American red garlicky wheat, chiefly for feed, but also for milling. The price of this soft wheat dropped from £22 10s. a ton cif UK to £20 and has since strengthened slightly to £20 10s. At this price it is over £3 a ton cheaper than any other wheat available. Its quality is said to be good for its type, but for milling it has the disadvantage that the seed of wild garlic sticks to the rollers and taints the flour. The garlic seed can, however, be removed beforehand, and the resulting loss of weight is more than outweighed by the large saving in price. The quantity of this American wheat is relatively small, but the response to lower prices does emphasise that millers can adjust their practices within limits to use the cheapest wheat.

In Defence of Banks

RECENT criticisms of the banks—notably those made in addresses by Professor R. S. Sayers and Professor A. K. Cairncross and in an article contributed to *The Economist* some months ago—are provoking some reasoned replies from the bankers. The critics have affirmed that the banks are turning too fast and too much into savings banks, that their function of discriminating lending based on nice judgment of business risks has been dwindling in importance, that it is not in any case a function that is readily combined with the huge routine task of providing and running the nation's mechanism of payments, and that in performing this mechanical function the banks have not seized all possible opportunities for streamlining their organisations in the interests of maximum efficiency. A spirited commentary upon these and other recent criticisms appropriately formed the principal theme in the presidential address delivered this week by Mr J. J. Campbell, general manager of the Clydesdale and North of Scotland Bank, to the annual general meeting of the Institute of Bankers in Scotland. Mr Campbell's retort was the stronger for not being a mere apologia. He finds complacency dull and informed criticism welcome: "There is much more need today for us to strive to adapt our practices to the new situation than to hark back to days that are past, and to find reasons in the difficulties which undoubtedly exist for delaying rather than speeding the process of transition."

Although he thus emphasised the importance of a constant search for improvements, Mr Campbell pointed out that many of the banking trends upon which the critics have seized have resulted from influences beyond the banks' control. The big rise in the part played by investments in their balance sheets and the fall in the proportion of advances are primarily a legacy of the war—and, Mr Campbell might have added, also of Daltonian finance after the war. But, aside from this, the ratio of advances would undoubtedly have recovered more rapidly in recent years had it not been for the necessary official restraints, in the form of Treasury "directives," upon bank lending. In reply to Professor Cairncross's specific point that "it is high time the banks stopped insisting on full collateral," Mr Campbell affirms that the proportion of bank lending that is unsecured or only partly secured is higher now than at any previous time in this century. A banker's judgment of his customer as a man and of his business record is more important than any formal security; and the effective competition that exists between the banks tends to ensure that all creditworthy customers get the finance they merit—if their projects fall within the scope of the directives.

At a number of the points of administration and mechanics raised by the critics, Mr Campbell admits, there



Under an Airport Runway

If you never want to have to dig them up again put down

This is a typical runway intersection—it is a key point. Under it is a network of conduits, carrying the cables for the runway lights. If anything happens to those conduits, if they have to come up again—*two* runways will be out of action.

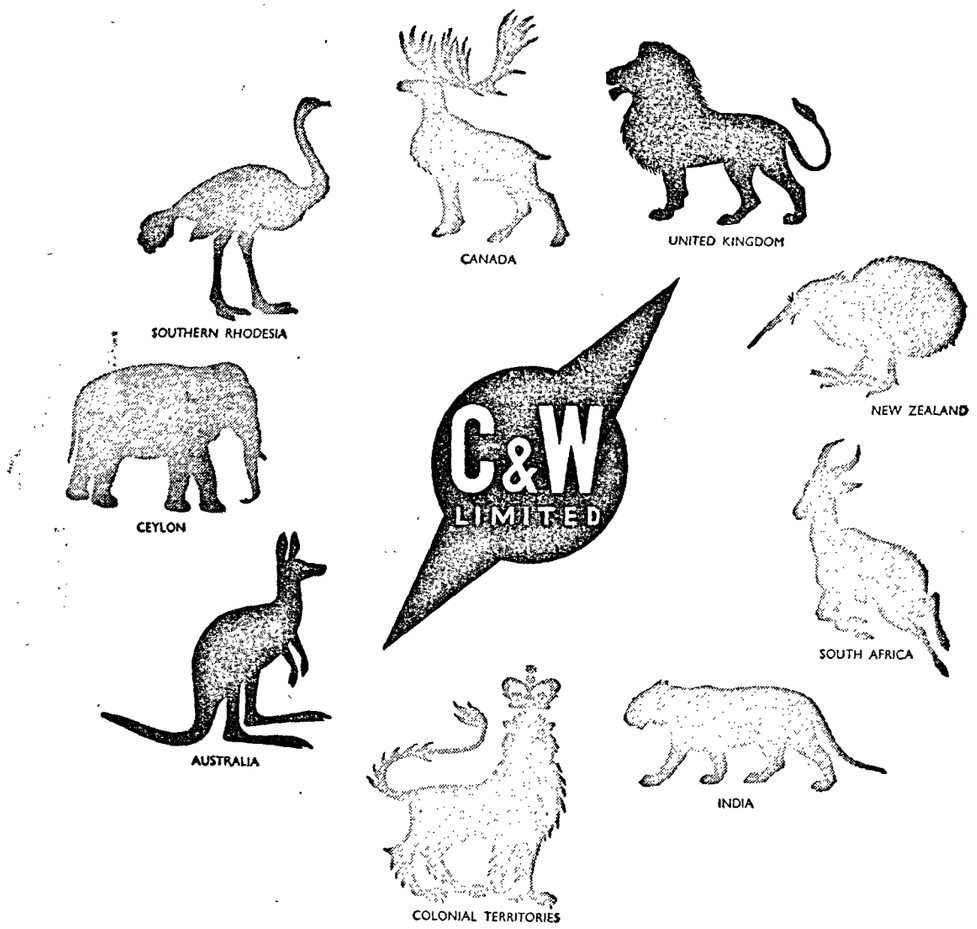
Think what that means to a big airport. Last year *in August alone* London Airport handled nearly 8,000 aircraft and 160,000 passengers. A lot depends on those conduits; they must be able to stay down there, doing their job—for good!

That's why they put down conduits of salt glazed vitrified clay.

Salt glazed conduits are glassy smooth and hard as nails. They are acid-resisting; sulphates in the soil cannot corrode them. The same applies to the hundreds of salt glazed *drain-pipes* that are out there too. Safe and efficient, salt glazed conduits and pipes can —and do—stay down for centuries.

Salt Glazed VITRIFIED CLAY *pipes and conduits*

NATIONAL SALT GLAZED PIPE MANUFACTURERS' ASSOCIATION



The Lion has a message

The Lion has many messages that must travel speedily and securely. To the lands of the Caribou and of the Springbok; to the lands of the Kiwi and the Kangaroo. To the sovereign nations and all the other countries of the Commonwealth.

These territories in their turn have information and opinions to send to one another. Who carries the messages?

Consider how the eight senior countries of the Commonwealth exchange messages. Each within its own boundaries collects messages and sends them overseas. Each receives and delivers incoming messages. For example, in the United Kingdom the G.P.O. does these things. In Australia they are done by the Overseas Telecommunication Commission (Australia) and the Post Office. The messages may travel by cable under the sea or by wireless through the ether. Cable & Wireless Ltd. owns the 150,000 mile Commonwealth cable network and maintains it with its fleet of 8 cable ships. The Company also owns, maintains and operates the wireless relay stations on the trunk routes. The Company's staff, at their stations in 74 countries, stand at the centre of Commonwealth communications.

Cable & Wireless Ltd. operates the overseas telegraph service of most of the Colonial territories and the cable services of foreign countries in which concessions are held.

How these services are carried out is explained in a 40-page illustrated booklet "World Wide Communication", which gives many interesting details about the Company's equipment, operations and administration. A copy will be sent to you without charge if you will write, mentioning this paper, to:— The Public Relations Officer, Cable & Wireless Ltd., Electra House, Victoria Embankment, London, W.C.2.

CABLE & WIRELESS LIMITED

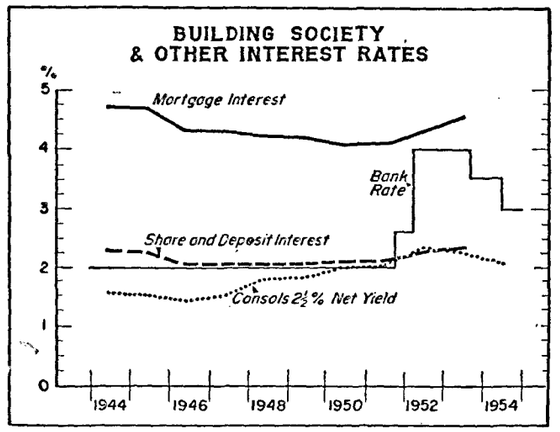
Electra House, Victoria Embankment, London, W.C.2

CVS-237

are possibilities of improvement; but the general tenor of his argument was that most of these possibilities involve changes of a kind that can take place only gradually. In Scotland, for example, there is scope for change in the law to widen the types of acceptable banking security; and in Scotland, too, he concedes that there may be too many small branches, but they are being reduced as a result of the recent amalgamations between Scottish banks. More generally, there may be further possibilities for mechanical aids to banking efficiency, but "mechanisation cannot be equated with efficiency in every case."

Building Society Rates

THE Building Societies' Association has issued a further statement on the relation between mortgage charges and Bank Rate; it differs from previous statements only in being more amply argued. The claim is repeated that there is no necessary or immediate connection between Bank Rate and the rates paid and charged by the societies. As a statement of fact, that cannot be denied. Indeed the accompanying graph (compiled by *The Economist*, not by the Association) underlines the point. The rates per cent paid to shareholders and depositors and charged to borrowers have shown remarkably little fluctuation over the past 10 years once the calculation is based on all the societies and on all the money outstanding. The graph is thus even flatter than it would be if the calculation were based on the rates currently charged and offered for new money. By comparison the net yield on 2½ per cent Consols and Bank Rate itself have moved in sharp jerks.



But on this occasion the Building Societies' Association goes further than it has before. It claims that the increase in the rates charged for mortgages from 4 per cent to 4½ per cent that occurred shortly after the Bank Rate had been raised from 2½ per cent to 4 per cent in March, 1952, was not caused by that event, and would have taken place even if Bank Rate had not been raised, because of the general increase in the level of interest rates that had already taken place. It is unfruitful to argue about "might have beens" but it is at least permissible to suggest that the decision to bring Bank Rate back into use—which came in November, 1951, not in March, 1952—cannot be divorced from the general rise in interest rates nor even from building society charges, for it happened to be a vital long term policy decision.

Nevertheless there is good sense behind the Association's view. The interest policy of the societies must be governed by the question of whether they want borrowers or subscribers most. At the moment they stand behind a big house building programme with an ample demand for mortgage loans in sight. Their advertising and presumably their money policy are geared to attract the investors who will provide finance for relending on new mortgages. The Association's statement seems to accept the idea that the next change in rates, whenever it comes, will be downwards. The societies, it says, "may be relied upon to reduce the mortgage rate if and when they can reduce the rates paid to investors without the risk of withdrawal of the funds on which the lending activities of the societies depend."

Co-operation on Rockets

LAST week's talks in Washington between the Minister of Supply and the American Secretary for Defence turned on ways of improving Anglo-American co-operation in the development of guided weapons. Existing arrangements for exchanging information on such weapons between the military staffs have not prevented unnecessary duplication of effort in their design and development.

The joint statement issued after the talks suggests, for all its vagueness, that the two countries are contemplating a complete interchange of information and collaboration in the development of guided weapons. There is little doubt that such collaboration would be valuable to both sides. The development and production of guided weapons make demands on the manpower of the electronics industry that appal even the Americans; scientists of the highest calibre are still rare in this field; and it would be folly to waste first-class American and British brains in duplicating each other's work. There are two main problems. One is to develop the systems for guiding and homing the missile with the necessary motors, fuelling, and explosives. And after these "missile systems" have been developed, they must be perfected in application by solving the second problem—the elimination of mechanical inefficiency from the components used in construction.

Closer co-operation between the two countries could imply that the design of certain classes of weapons might be left to the country that is best equipped to develop them. There should therefore be a fair prospect of some measure of standardisation on guided weapons in the Nato forces. There remains, however, the problem of differing military requirements. Guided weapons for air defence have developed along different lines in the two countries, and this would have happened quite apart from any interchange of basic information. Guided weapons were not seriously studied in this country until three years after the American programme had started, consequently the first generation of British guided weapons are not likely to be in service as soon as the American, but when they do begin to appear,

in roughly two years' time, they should in some cases embody more advanced techniques. A great deal of unnecessary secrecy surrounds the amount of work on guided weapons that has been done in this country, at a cost of several millions of pounds for each design ; the fact that the two countries appear to be on the verge of an agreement to share in development work is an indication of the strain that it imposes on military budgets and on the scientific manpower of both countries.

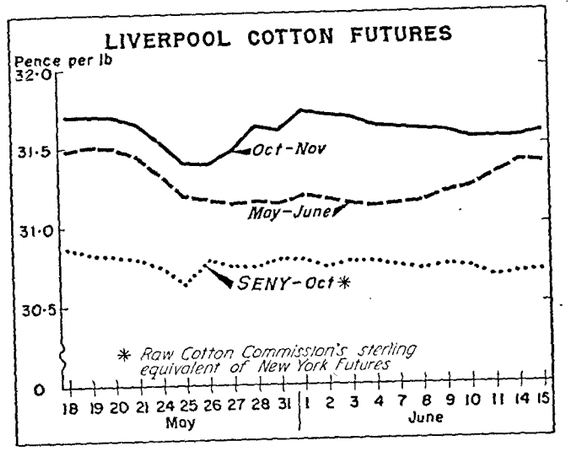
A Cable Maker's Reply

PART of the cable manufacturers' objection to the pressure that is being put on them by the Government to implement most of the recommendations of the Monopolies Commission about their industry is based on the argument that they are being ordered to abandon trading practices that many other industries employ without question. Sir Alexander Roger, the retiring chairman of British Insulated Callender's Cables, complaining of this "discrimination" last week, commented that "many of the customs which have not found approval are recognised and adopted throughout much of British industry." This is probably true ; and it will remain true at least until the panel of the Monopolies Commission entrusted with the inquiry into exclusive dealing practices hands down its conclusions. This general inquiry, however, will hardly produce as thorough a survey of the circumstances of any particular industry as the commission has conducted into cable-making, matches, dental goods and the others ; and its conclusions about these practices in general will not invalidate its earlier finding that in the cable industry they operated against the public interest.

Sir Alexander objected to the Government's request—which is backed with the threat of an Order in Council—that the prices of certain cables which the industry's trade associations would retain the power to fix should be no higher than would give the lowest cost producer a reasonable profit, and should be subject to Government inquiries into costs. "The lowest cost producer in certain sizes of common cables," he argued, "can be one who spends no money on technical research and development and sales marketing, particularly overseas." It would not be difficult to find some academic economists who agree broadly that price-fixing may be a necessary condition of technical research and development in an industry ; this argument (discussed in the special section on "Research in Industry" in this issue) is ingenious if not convincing. But there seems something slightly odd in the argument that a company may be unfair to keep its prices low by not spending enough on sales promotion—the mere possibility, indeed, might strike the Incorporated Sales Managers' Association and the Advertising Association as a distinctly subversive suggestion. Does cheapness never bring its own reward ?

Cotton Futures Quiet

TRADING in cotton futures in Liverpool is quiet, as was to be expected at this stage, but the market is functioning satisfactorily. Most business can be done within one point (one-hundredth of a penny) a lb of the last price quoted, and transactions for 1,000 bales or more have moved the price by less than three points. Selling is almost entirely by spinners transferring their hedges from the public cover scheme of the Raw Cotton Commission, and most of the buying represents straddle operations between Liverpool and the New York market, mainly by American interests. Since trading began on May 18th, prices have been cheap compared with New York, i.e. the difference between the two markets has been appreciably smaller than is justified by the cost of shipping cotton from New York to Liverpool. Hence traders have found it profitable to buy futures in the cheap market and sell in the dear. Late last month a spurt of buying in Liverpool, mainly by exporters who had made forward sales of actual cotton, led to a recovery in prices of cotton for delivery in October/November. Prices subsequently eased, but prices of the distant delivery months rose on straddle buying, thus narrowing the difference between the near and distant positions. Last Monday the whole market advanced on the announcement that the United States would not subsidise exports of cotton from the 1954 crop, but slipped back later as spinners took the opportunity to transfer hedges from the Commission.



The announcement should allay one of the market's anxieties, but another remains—the belief in some quarters that sterling may appreciate against the dollar. This is helping to keep the market below parity, and some of the big spinners who are also participants in the market control scheme are transferring hedges from the Commission to New York, and covering the risk of revaluation in the foreign exchange market. Seinners generally would prefer to remain hedged with the Commission until the Liverpool market is nearer parity with New York, and hope in the meantime to reduce their hedged position by sales of yarn. There is still ample time for this, because public cover will continue until August 31st. But no spinner wishes to leave the transfer of hedges to the market until the last moment, and many are wisely taking opportunities to do this gradually. The use of New York by some of the larger spinners will relieve the potential weight of hedge selling in Liverpool, and as this becomes more widely realised it should help to bring the market into closer parity with New York.

Ryders Discount Introduction

AN interesting event in the discount market this week has been the introduction to the Stock Exchange of the shares of Ryders Discount Company Ltd., a bill market house dating from 1903 ; dealings began on Thursday in the company's £1 ordinary shares (£1 million in issue), which opened at 31s. 7½d., and in its 5 per cent cumulative preference shares (£885,000), which opened at 20s. 9d. In 1946-47, when the discount market substantially expanded its capital resources to meet the postwar need for flexibility in the short bond market, most of the discount houses that were still private companies were converted into public companies and secured stock exchange quotations for their shares. But Ryders, although ranking fifth or sixth in size among the twelve houses, was one of the three that retained private status ; its capital expansion then was provided for by an increase in the financial participation that had been taken in it in 1943 by the United Dominions Trust. This week's introduction, and the recent reorganisation of its capital, partly by a scrip bonus distribution on conversion of the business into a public company, are part of the process of sale by the United Dominions Trust of the greater part of its shareholdings in the company—885,000 of preference shares and 450,000 ordinary shares have been sold to (and through) Morgan Grenfell & Company Ltd., leaving the UDT with a residual holding of 200,000 ordinary shares.

Thanks to the information published for the purposes of the introduction, detailed figures of discount market portfolios and profits are now available for ten of the twelve discount houses. At May 31st last, Ryders is shown to have had a bond portfolio of just over £22 million and a bill portfolio of nearly £52 million. This combined holding of £74 million is equivalent to about 7 per cent of the aggregate portfolio shown by the latest accounts (at varying dates) of the ten houses. Ryders this year has been fortunate in the incidence of its accounting date, as the accounts were made up roughly a fortnight after the recent reduction in Bank rate and also benefited, of course, from last September's reduction. This partly explains the exceptional steepness of the rise in its profits. To meet the requirements of the Stock Exchange, these are shown before deduction of tax, and therefore cannot be compared with the published figures of other market houses ; in the twelve months to end-May they totalled £445,000, compared with £163,000 in the previous year and only £87,000 in 1949-50 (a period that embraced both increases in Bank rate).

Second-Hand Car Prices

The table below shows the average discount—or premium—that could have been obtained on a two-year-old car during the past 2½ years, based on its original cost, including purchase tax. The final column shows the list prices of current models.

* Model change. † One-year-old car.

There has been a distinct hardening in second-hand prices this summer, especially those of the smaller popular cars. Eighteen months after the lifting of steel restrictions for the car industry, several cars command, after two years' service, 80 per cent of their cost when new. The gap between the second-hand price of such a car and the current list price for the equivalent model is even narrower. The owner of a 1952 Austin A40 would have paid £736 for it new. The average market price for that car today is a little over £600, while the current list price of the same model is only £665. The drop in prices of new cars is largely due to the cut in purchase tax rates, from 66⅔ to 50 per cent, made in the 1953 budget. The growing importance attached to the second-hand market is shown by the fact that both Vauxhall and British Motor Corporation are introducing schemes under which they will guarantee (for short periods of 3 to 4 months after purchase) used cars that have been reconditioned by approved dealers.

Exports Hold Steady

BRITISH overseas trade showed little change in May. Exports rose by £4 million to £228.9 million f.o.b. and imports fell by £3.9 million to £280.4 million cif. As May had 26 working days, two more than April, the rise in exports might seem disappointing, but comparison between the two months cannot be pressed too far owing to the effect of holidays. Taking exports in April and May together, the monthly average of £226.9 million was one per cent higher than in the first quarter of this year, and eight per cent above that of the second quarter of last year. The average monthly value of imports in the first five months of the year was £277.0 million, two per cent less than that of the first half of 1953. With a rise of £1 million to £9 million in re-exports in May, the gross visible trade deficit fell by £8.7 million to £42.6 million, which was also the monthly average deficit in the first five months —one-third less than that of the first half of 1953.

Why it pays to send your vehicles to MEASHAM

Every new vehicle delivered means a used one to dispose of . . . travellers' cars . . . delivery vans . . . lorries . . . Measham deals with the situation twice a week! That's why the big concerns buy and sell at Measham: Government Departments, Local and Police Authorities, firms with vast fleets of private cars and commercial vehicles. Big organisations have to think big; and they have found over the years that Measham's immediate market offers the most buyers, the widest selection of vehicles, and the best and fairest terms. One or a fleet —it's Measham every time!

In Every Ship of the Royal Navy

Exports to North America in May rose by £400,000 to £25.5 million; shipments to Canada were unchanged at £12.9 million, but shipments to the United States rose by £300,000 to £12.5 million. For the two months April and May the average of exports to North America was 14 per cent below that of the peak second quarter of last year; shipments to the United States were 11 per cent less and to Canada 18 per cent less.

Dunlop and Synthetics

THE Dunlop Rubber Company is in a delicate position. It is beginning to launch out into the synthetic rubber field; it is also deeply committed in the natural rubber growing business, and in any event, must look to the natural rubber producers for the bulk of its raw material. This calls for diplomacy a quality with which the chairman, Lord Baillieu, is richly endowed. It is a pity that in his speech to the shareholders on Monday he felt inhibited from making a closer examination of the pros and cons in the argument on natural versus synthetic. He meets half way the supporters of both. Dunlop, he reports, is spending large sums of money in replanting its Malayan estates and has recently acquired Brynmawr Rubber. The new synthetic factory at Fort Dunlop has not been designed for large commercial production but to produce a wide range of new rubbers for development. At the same time he considers it important for Britain to have full access to adequate supplies of synthetics for both commercial and strategic reasons. Therefore Dunlop must be able to take part in synthetic production and develop the technical skills.

What are these commercial reasons? They may provide the key to the whole synthetic versus natural rubber question. Is it that as a manufacturer Dunlop would find it useful to be able to rely in part on a raw material the price of which fluctuated seldom because it was fixed by a few manufacturers instead of by a volatile market? To put such a point bluntly and at the same time to support the principle of free markets is not easy; but it is possible to like both free markets and price stability. If Dunlop were manufacturing wholly against firm orders for its finished products it should be possible to use the mechanism of the London Rubber Market as a full hedge. But the group must hold a stock of unsold goods and it may feel that there would be an element of speculation in hedging by forward sales the rubber content of its unsold wares. Now prosperous and thinking of embarking on a policy of interim dividends, the board is naturally influenced by the disagreeable experience of writing down inventories as prices fell during the last two years.

Helicopters Over London

THE Ministry of Transport has now decided to follow the example of the Belgian and French civil authorities and permit experimental helicopter landings in the centre of London. Provided that they give one day's notice, and that they follow a prescribed route up the Thames, helicopters will be allowed to land freely on the South Bank site. On Thursday, coveys of helicopters converged on Waterloo, but it may be a long time before helicopter passenger services are put on a normal commercial footing. All previous British European Airways helicopter services have been operated at a loss, and so have those of Sabena in Europe. Mr Profumo told the House of Commons on Wednesday that the government pays 88 per cent of the annual cost of BEA's helicopter unit.

The link between London Airport and the South Bank terminal that BEA plans to operate (with Sikorsky S55 helicopters carrying about six passengers with luggage at a time) is not expected to pay its way either, but it will give BEA and the Ministry experience of operating helicopters in and out of a city. A handful of air passengers will also benefit through being able to cut the tedium of the hour's journey to the airport by nearly 40 minutes; they may find the helicopter draughtier, but otherwise no more uncomfortable than coaches. American operating experience of military helicopters suggests, however, that it would be optimistic to suppose that services will automatically become economic when the big load carrying helicopters now under development are ready for service. American army spokesmen have recently had hard things to say about excessively high and complicated maintenance needed to keep a helicopter flying. But the imminence or otherwise of economic passenger services at this stage is much less important than the fact that the Ministry and the LCC have at last taken a step towards making such services possible. Permission to land in the centre of cities is the determining factor in the success of helicopter services, and hitherto the British authorities have been conspicuously slow to acknowledge the fact.

The Revival of Private Savings

AN interesting analysis of the National Income statistics so as to show the striking revival of private savings that has occurred in recent years provides the appropriate theme for the first of forty-eight articles in a special review of British industry published this week by the *Financial Times*. This analysis is contributed by Professor F. W. Paish, who points out that since 1951 the growth of private savings has more than made good the progressive decline in savings of the public sector of the economy in consequence

of the steep rise in defence outlays and the continued expansion of social expenditures. Hence, in spite of the decline in the investible resources provided through the public sector from £730 million in 1951 to about £460 million in 1953, the total investible resources available in the United Kingdom rose over these two years from £2,130 million to about £2,700 million.

In addition to this striking change in the relationship between the public and private sectors, there has been an even more significant change in the composition of private savings. In the early postwar years, new personal savings by some individuals were almost certainly less than the drafts made by other individuals on past savings, so that personal saving as a whole was negative. Official estimates —which at this point are particularly liable to error—show that even by 1951 the total investible resources accumulating in the hands of persons still contributed less than 7 per cent of total private savings. But in these past two years the growth in the total private supply of investible funds has been very largely due to the personal sector. According to Professor Paish's estimates, net saving companies and public corporations (including provision for depreciation) did indeed rise from £776 million to nearly £1,400 million, but the greater part of this improvement reflected a decline in reserves for taxation and for dividends and in capital transfers, so that the net growth was only £130 million. By contrast, net personal saving (also including depreciation) is estimated to have risen from £158 million to over £900 million; after allowing for changes in tax reserves, capital transfers and for taxes on capital, the investible funds becoming available through persons are estimated to have risen from £88 million to £750 million. All these estimates, it should be noted, are on the basis of current market prices.

Shell Pointers

SIR FREDERICK GODBER had three main pointers to set before the shareholders of "Shell" Transport and Trading at the annual general meeting last Wednesday. He disclosed, first, that the publication of interim figures for the Royal Dutch-Shell group, which had been in mind for some time, would be started this year with "a figure of income on a half-yearly basis." Secondly, he added a note of cautious optimism to the growing hope of success in the Iranian oil discussions, to which the spokesmen for the eight-company consortium would shortly be returning after their consultations in London. And thirdly, he was unsparing in his criticism of the Onassis-Saudi Arabia agreement—"a virtual, and possibly a complete, monopoly for the transportation by sea of the crude oil produced in that country . . . a flagrant instance of flag discrimination and a most serious breach of accepted international maritime practice." These are strong words, but by no means unduly severe.

Company Notes

BRITISH CELANESE. The preliminary figures of British Celanese were issued hard on the heels of those of Courtaulds. They were equally cheering. But there was one difference. The Courtaulds statement raised the price of the £1 ordinary shares by 1s. 1½d. to 31s., offering a yield of 5.1 per cent. The dividend from British Celanese, although it had been raised effectively from 16 to 18 per cent over a full year, was followed by a fall of 9d. in the 10s. ordinary shares to 30s. 3d., offering a yield of 5.9 per cent. The fall mirrored the general decline in equities rather than any particular disappointment with the results; on the same day Courtaulds shares also fell 9d.

There was no reason for any disappointment. Celanese profits before tax in the 53 weeks to April 3rd were £4,069,209, compared with £1,841,346 earned in the 9 months to March 28, 1953. The major producer of acetate in this country has clearly enjoyed a recovery in trade comparable with that of the major producer of viscose rayon, Courtaulds. An ordinary dividend for the full year of 18 per cent has been declared, compared with 12 per cent paid for the previous nine months. Moreover, the directors have recommended a 100 per cent free scrip issue. Shareholders could hardly ask for more, particularly as the latest year has seen the virtual end of the company's funding certificates—an extinction which benefits the equity.

BRITISH NYLON SPINNERS. Owned half by Courtaulds, and half by ICI the results of British Nylon Spinners are of interest chiefly as a guide to the progress of a vigorous young competitor in the field of textile raw materials. The 20 per cent dividend which the parent companies again take out on the £8 million of capital is not going to make or break either of them. British Nylon Spinners enjoyed an excellent year in 1953. Trading profits rose from £5.9 million to £6.6 million. The tax charge also rose from £4.4 million to £4.7 million. The parents could nevertheless have withdrawn a higher dividend had they insisted for the net profit is up from £1.6 million to £2.1 million and the general reserve receives £1 million, compared with £600,000. To have done so would clearly have been unwise when Nylon Spinners is on the edge of a big increase in production at Pontypool and in the throes of a heavy capital programme at Doncaster.

The future seems to be bound up in the solution of a triangle of forces. First from 1954 onwards the group will be free from EPL, which last year cost no less than £1.1 million. Secondly, the company must this year feel the effect of the sharp price reduction (ranging from 12 per cent to 15 per cent), which was granted this spring. The cost will depend upon the denier of yarn sold, but between £1½ million to £2 million a year is a reasonable guess. Thirdly, at these lower prices production is about to be rapidly increased from the present 10 million lb a year to a rate of 25 million lb by the end of the year. The profit margin on this new production will naturally feel the effect of the price reduction, as compared with last year's output, but it seems a reasonable hope that the earnings for 1954 should at least not show a decline.

★

BOOTS PURE DRUG. In the year to March 31st last the shops owned by Boots Pure Drug Company served over 324 million customers and gross receipts brought in over £55 million. These are record figures. The average rate of profit on sales is about 6 per cent and in 1953-54 the group's profits, before tax but after depreciation, advanced from £2,940,492 to £3,294,567—another record figure. The only fly in the ointment was that in common with other manu-

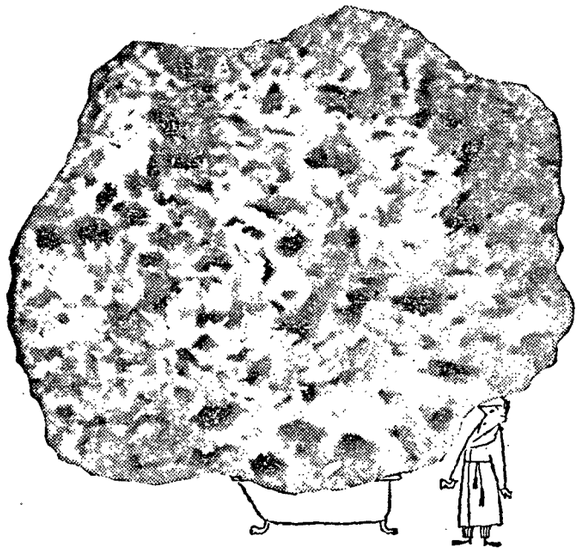
We suggest that you throw out the sponge



We suggest that the linings of many furnaces are, in effect, sponges — heat sponges: they soak up heat that should go into the charge. On batch-type furnaces this is not only a waste of fuel but a waste of time and quite unnecessary. It can pay very handsomely to get rid of this heat sponge. And it can be done very simply — by using M.I. bricks for the lining instead of ordinary refractories: they require only a fraction of the heat (and fuel) to bring them up to the same working temperature.

M.I. refractories are low heat-storage hot-face insulators which can be used as direct furnace lining up to 1540°C (2800°F). They may be used in either new or existing furnaces. Either way they permit faster throughputs and lower fuel consumption, whilst with new furnaces the whole structure is lightened, with savings in steel, foundations and floor space.

The Lady of the House

AND THE BALANCE OF POWER

BRITAIN today has more electricity than she has ever had before. In the past six years, 40 new power stations have been brought into operation and power supply has increased by 50 per cent. At the same time, the demand for electricity is greater than it has ever been.

When the Lady of the House goes about her tasks, using labour-saving devices to lighten her day, she is using electricity. Is she thereby depriving Industry of electricity, and upsetting the national economy? She is not!

If electricity were more widely used by homes, factories, farms, shops, offices and for street lighting—this would keep the generating plant more fully loaded. The demands on the power stations coming from these different classes of consumers would be diversified. That is to say the loads would not occur simultaneously but, in the main, at different times of the day—and continuous full output from the generating plant would reduce the cost of electricity.

BRITISH ELECTRICITY

ELECTRICITY *PROSPERITY*

facturing chemists Boots experienced a decline in sales abroad. At home 34.6 million prescriptions were dispensed, compared with 35.2 million in the previous year, but though the number of prescriptions declined the proportion of all prescriptions issued that came to Boots continued to increase.

The new chairman, Mr J. P. Savage, comments that the group is now reaping the benefit of the capital development programme that was started just after the end of the war. Excessive caution in the matter of equity dividends should therefore be a thing of the past. Since 1947 the ordinary dividend remained effectively unchanged until this year, when it was raised from 20 to 22½ per cent. The 5s. ordinary shares of Boots are not one of the "wonder drug" equities; they are solid—perhaps a little stolid—"blue chips." On a long-term view, the shares may not be over-valued at the current price of 25s. and a yield of 4½ per cent.

★

ASSOCIATED PORTLAND CEMENT. The Blue Circle group of companies is responsible for about two-thirds of cement production in this country. Last year's paradox of demand outrunning capacity but profits falling, was discussed in these columns on May 8th. Associated Portland had to meet demand by importing cement and the foreign cement was sold at a loss at home trade prices. In his statement with the full accounts Sir George Earle reveals that these sales failed to meet their costs by over £800,000—a loss that more than accounts for the fall of about £600,000 in trading profits. As the floods temporarily closed four of the group's largest works, only 95,000 tons more clinker were produced last year than in 1952, and the group's "total income from sales of its own products and investments" declined slightly, from £42,147,000 to £41,686,000.

The directors seem confident that the setback is only short-lived. They showed no hesitation in increasing the ordinary dividend effectively from 15 to 17½ per cent and in keeping the development programme running in top gear. The group spent about £5 million on capital account last year; capital works under construction are valued in the accounts at £3,101,640

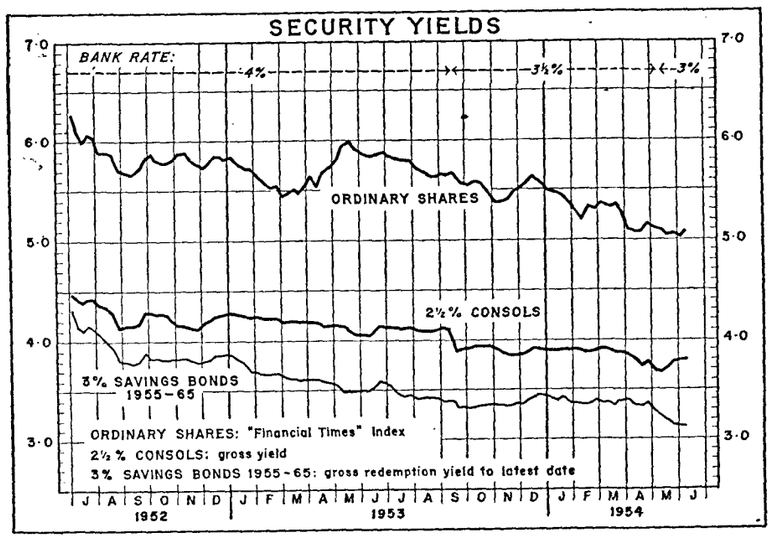
and outstanding commitments are estimated at £1,930,723. This programme has so far been carried out without an appeal to the capital market and without making any serious inroad into liquid resources. The cost of building new works is largely provided by heavy reserve appropriations, particularly to replacement reserves which the directors treat as a charge against profits rather than an appropriation from them. The capital extensions have already begun to earn their keep, for production so far this year is 215,000 tons higher than in the same period in 1953. While he warns shareholders that "boom conditions cannot last for ever," Sir George predicts that: "there seems but little doubt that we shall have to produce all the cement we can this year."



LONDON STOCK EXCHANGE

Next Account begins: June 23rd.
Next Contango Day: June 23rd.
Next Settlement Day: June 29th.

EQUITIES were on a see-saw in the markets this week. Following the collapse in prices on Monday, when the market was unsettled by the news from Geneva, prices began to swing up again in response to more favourable reports from Geneva and to an improvement on Wall Street. Gilt-edged stocks throughout this period remained reasonably firm, but price changes were small and most of the gains were reported in the medium dated issues. Not until Thursday did any appreciable demand for the irredeemable stocks appear. In the foreign market both Japanese and German loans recovered from their setback on Monday; Greek issues continued to go ahead and in early dealings on Thursday there was some activity in Chinese stocks.

Almost without exception, all sectors of the industrial market were dull on Monday, with textile shares suffering some of the worst losses. Then the upswing in prices took most equities with it; buying, however, was concentrated on the higher grade issues and such stocks as Unilever and Woolworth made very handsome recoveries. Motor shares, with Rolls-Royce in the van, and building material and paper shares, made a particularly good showing. United Steel gained 6d. to 24s. 6d. in response to the increased interim dividend, and Lancashire Steel strengthened in sympathy. The equity market remained firm in early dealings on Thursday and Fisons put on 4s. 9d. to 51s. following the higher interim dividend. Movements in the leading oil shares mirrored the rest of the market, Anglo-Iranian making a sturdy advance. By the close on Wednesday they were quoted at 12$\frac{13}{16}$. Rubber and tea shares were no more than steady. Kaffirs, having made some slight losses on Monday, began to improve later in the week; the biggest gains were reported in the OFS and uranium issues. Copper shares were beginning to rally before the Nchanga dividend was announced and after that event shot ahead, Nchanga rising to 8⅝ and Rhokana to 23.

[1] Relates only to prices in capital cities for Austria, France, Greece and Turkey. Cost of living in Paris based on 1949=100, and in Western Germany on July–December, 1948=100. [2] Index numbers of unit value which compare the current average value of trade with its value in 1948; they are influenced by changes in the composition of trade as well as price movements. Index numbers for Germany based on 1950. [3] Notes only for France and Austria. [4] Holdings of the government and central bank at end of period; figures for Greece are gold reserves only. [5] Average for fourth quarter.

Financial Statistics

EXCHEQUER RETURNS

For the week ended June 12th, there was an "above-line" deficit (after allowing for Sinking Funds) of £35,162,000 compared with a deficit of £32,642,000 in the previous week and a deficit of £33,123,000 in the corresponding period of last year. This raised the cumulative deficit to £105,766,000 (£117,975,000 in 1953-54). There was a net receipt "below-line" of £2,038,000, bringing the total cumulative deficit to £147,895,000 (£179,965,000 in 1953-54).

THE MONEY MARKET

The Treasury bill rate fell by a further ⅛ per cent at last Friday's tender, when the market raised its bid by 2d. to £99 11s. 11d. per cent. Rates on bank bills were later reduced correspondingly. As had been anticipated by the market, the offer at the tender of £260 million was again under-allotted, by £10 million. Applications rose by £4 million to £418.3 million, and the market's allotment declined slightly, from 58 to 57 per cent. The average rate of discount fell by a further 8d. to £1 12s 3.51d. per cent—making a fall in the rate of nearly 2s. per cent in two weeks. The offer at yesterday's tender was at £260 million.

The short loan market had a quieter week than of late. Credit has been distinctly usable, but on the whole market supplies have been adequate for demands. In the week covered by the Bank return official help was necessary only on Thursday and Tuesday, and then only on a limited scale. The banks' buying rates for August maturities ranged from 1⅛ per cent (before the Treasury bill tender) to 1⅛ per cent, with considerable business taking place at 1⅛ per cent.

The gold market has again been active. Strong demand raised the price at the fixing on Thursday of last week to 249s. a fine ounce; thereafter it eased only fractionally.

The Bank return shows an outflow of notes of £3.5 million, but Government securities rose and public accounts fell, so that bankers' deposits were up by nearly £8 million to £287.2 million.

INCREASING POPULARITY OF ST. MICHAEL TRADE MARK

REHABILITATION AND MODERNISATION OF STORES CONTINUED

The twenty-eighth annual general meeting of Marks and Spencer, Limited, was held on June 10th at 82 Baker Street, London, W.

Sir Simon Marks, DSc (chairman and joint managing director), who presided, said, Ladies and Gentlemen: May I take it that in accordance with our usual practice the directors' report and accounts may be taken as read ? (Agreed.)

CHANGES IN THE BOARD

We regret to report the retirement of Mr A. E. Lees on account of ill-health. Mr Lees joined the company in 1931 and was appointed to the board in 1940. You will desire me on your behalf and on behalf of my colleagues and myself to express our gratitude to him for his many years of devoted and valuable service to our company, and our hope that release from the labours and anxieties of office will enable him to enjoy his well-earned leisure for many years to come.

We have elected to the board three new members, Dr Eric Kann, PhD, FRIC, Dr Alec Lerner, MD (Man), MCPS, and Mr Marcus Sieff, OBE, BA, and appointed as alternate directors Mr J. A. Lewando and Mr Michael Sacher, MA. All these gentlemen are, and have been for years, active in the business in responsible posts. I am sure you will agree that the normal method of recruitment to the board should be from within the organisation of men bred in its traditions, tested by its problems, and educated in its philosophy.

PROFIT AND LOSS ACCOUNT

Our profit, after tax, amounts to £3,017,000—an increase of £551,000 on last year. Taxation has required £4,850,000 (last year £4,275,000), and includes the provision of £550,000 for the excess profits levy. With the amount of £4,051,000 brought forward, the sum of £7,068,000 is available for distribution.

Your board recommends a final dividend on the ordinary and "A" ordinary shares of 45 per cent which, together with the interim dividend of 20 per cent makes a total of 65 per cent for the year (last year 50 per cent).

After the transfer of £2,705,000 to the general reserve and payment of the dividends and appropriations set out in the directors' report, the balance to be carried forward is £2,561,000.

SCRIP ISSUE

We propose to capitalise the sum of £4,523,491 10s., being a part of our reserves of £11,424,000 to enable a scrip issue to be made on the basis of 1 "A" ordinary share, for each ordinary or "A" ordinary share held on May 15, 1954, the date on which our registers were closed. As a result, our capital structure will be brought more into line with the capital employed in the business. Our ordinary capital will amount to £9,047,000 and our reserves to £6,901,000.

Since the incorporation of the company in 1926 we have ploughed back the sum of £14 million, which has provided the major part of the finance required for our general expansion. The fruits of this policy can be seen in the profits we show today.

PROPERTIES

Our freehold properties appear in our balance sheet at £6,558,000—an increase of £935,000. We have enfranchised a number of our leasehold stores and acquired additional sites for development.

Our leasehold properties stand at £3,351,000. They consist for the most part of sites leased on terms of 99 years or longer on which we have erected our own buildings. Over three-quarters of these sites have still 75 years or more to run.

Our properties were acquired almost wholly before the war. Their value today is much in excess of the amount which appears in our balance sheet.

Stock.—Large stocks are necessary to cope with our trade. They amounted to £7,793,000, compared with £5,831,000 last year.

SUBSIDIARY COMPANIES

Our subsidiary companies have earned £32,000, after tax. This sum is not included in the profits of the parent company, but is added to their reserves, which now stand at £145,000.

They supply our garment manufacturers with materials and their stocks of cloth—in the grey and finished—amount to £1,648,000 (last year £1,148,000).

GENERAL TRADING CONDITIONS

I am pleased to be able to report a further substantial increase in our volume of sales during the year. The turnover, nearly £94 million, is more than 10 per cent higher than last year and 26 per cent higher than in 1952, when our sales amounted to £73 million.

The general conditions in which the business operates have changed markedly in the last two years. The most notable factors have been the removal of government controls and the increasing availability of raw materials. With more abundant supplies at our disposal, and the lifting of restrictions which for so many years hampered our freedom of action, we have been able to take steps systematically to improve our values over a wide range of our goods. The expansion of our sales is evidence that the public responds to our efforts.

RISING PURCHASING POWER OF THE COMMUNITY

A most encouraging feature of these two years has been the rising purchasing power of the community, a sign of the growing strength of the British economy. There has been a remarkable industrial recovery in this country, matched by a no less striking revival of agriculture. The causes go back a number of years. They can be traced above all to the powerful impetus which the war gave to scientific research. The leaders of industry learned much from that experience. They realised that in order to deal effectively with Britain's peacetime problems they must continue that partnership of minds with the scientists which had proved so fruitful during the war. As a result, both industry and agriculture have made great strides forward. New industries have been founded and are being rapidly developed. Older traditional industries have benefited and have expanded considerably.

In textiles, science has opened up new avenues for development by providing the trade with interesting materials. Man-made fibres have been growing steadily in importance and now represent about a fifth of the world output of textiles. The developments in rayon and the introduction of nylon and Terylene, with their unique properties, will have far-reaching effects. Nylon, which is now in supply, has already exerted a considerable beneficial effect on the hosiery and allied trades.

MULTIPLYING DEMANDS FOR BETTER GOODS

The demand for British goods throughout the world has ensured the continuance of full employment, with rising wages. With greater earnings have come multiplying demands and requirements. Goods and services for the consumer are more freely available and there is no doubt that the standard of life of the people has been steadily improving. They are insisting upon better housing, better furniture, more amenities such as television, better and more attractive clothing. And they have the means to satisfy their wants at the right price.

When some thirty years ago we entered the field of textiles, quality and beauty of garments were reserved for those of ample means. For the mass of the people the clothing available was drab and of poor quality. The rise of the multiple shops distributing boots and shoes, and all kinds of clothing, produced by mass-production methods, brought about great social changes. Men, women and children changed over to more practical and attractive garments, cheaper in price and better in quality. It is not without satisfaction that we can say that

Marks and Spencer took a prominent part in those social changes.

MERCHANDISE DEVELOPMENT WORK EXPANDED

One of the main elements in our success before the war was our policy of offering to the public a wide range of well-made garments of good value. In order to further this policy we set up in 1936 a merchandise development department which carried out most interesting and valuable work halted only by the outbreak of war. The exigencies of war compelled the Government to introduce the Utility scheme, designed to eke out supplies which were becoming increasingly short, and to save labour. It was not surprising, therefore, that the scheme, in which standards and specifications were laid down, narrowed the variety and lowered the quality of materials and goods.

It was not until 1952, some eleven years later, that the rigid Utility scheme was superseded by the more flexible D scheme. The period of austerity in Britain's economy was at last coming to an end, and with its passing came new opportunities for initiative. We increased our technical staffs and expanded our merchandise development work to cover our most important departments. Whilst they do not undertake any basic research in textiles, our technicians keep abreast of progress in new techniques and new fibres. They follow with great care and attention advances in machinery, processes, finishes, dye-stuffs and so on.

We are successfully pioneering new cloths and collaborate closely with our spinners, weavers and knitters in working out new standards of quality, always bearing in mind the end product and its selling price to the public. Our knowledge of consumer demand gives us a vital and creative part to play in this work.

EXCLUSIVE GOODS AT INEXPENSIVE PRICES

We are therefore concerned with the production of our garments throughout all the stages, beginning with the raw material. We provide our garment manufacturers with the finished fabrics and the models of garments we desire them to produce in bulk. The designs of the prints are selected mainly from leading Paris studios, and the garment models are styled by our own specialists. This considerable but rewarding work enables our suppliers to produce original garments which can be termed exclusive in every sense of the word. Under the brand name of St. Michael they can only be bought in our stores. There is no doubt that our goods are making a considerable appeal to the widening section of the community we now count as customers.

This business lives and flourishes by the principle of giving the public the best possible values in the fields it has chosen. Our trade mark, St. Michael, guarantees the quality and value of our goods, which our customers buy with confidence. By following our tradition of service to the public we shall continue to earn their goodwill, an asset which we prize most highly.

We aim in our food division to develop a selected range of high quality foodstuffs at reasonable prices. Today, with raw materials in free supply, we can specify the best ingredients for each product. I am pleased to say that during the year under review it has been possible, while up-grading quality, to reduce the price of a number of our more important items.

High standards of cleanliness and hygiene are a social responsibility for all concerned in the food business. We strive to set an example in our own stores. I am glad to say that our suppliers are equally aware of the importance of hygiene in the manufacture of foodstuffs. We have pioneered and developed the clean and simple packaging of foodstuffs in transparent film. This is much appreciated by our customers who can see what they are buying while being sure that the goods are not exposed to indiscriminate handling.

TRIBUTE TO MANUFACTURERS

It gives me considerable satisfaction to be able to say that 99 per cent of the goods we sell are British made.

The production of the great quantities of goods we require, and their phasing to conform to the seasonal pattern of our trade, is a task which demands the closest collaboration between our manufacturers and ourselves. Continuity of production is as necessary to them as a constant flow of supplies is essential to us. In pursuing our aim of up-grading the quality of our goods we have built up a relationship with our suppliers which is unique. They value this relationship just as much as we do. It has encouraged them to invest considerable sums of money in new machinery and equipment, and in many cases, in new buildings. They have introduced modern production techniques which have gone far to improve their efficiency. I am happy to record the fact that they appreciate the importance of maintaining high standards of workmanship and finish, to which our customers attach so much importance.

We thank our friends for their co-operation in the past years, and look forward to strengthening our ties with them during the coming period.

REHABILITATION AND MODERNISATION OF STORES

We have been concerned since the end of the war with the vital tasks of rehabilitating our properties, modernising our stores, and rebuilding those that were bombed. Apart from the 16 which were destroyed completely and the many others which were damaged by enemy action, all our properties suffered enforced neglect during the war. The conditions of our buildings, and of their fixtures and equipment, deteriorated sadly.

I am glad to report that 12 of our destroyed stores have been rebuilt and are now operating. Phoenix-like they have risen from the ashes to play their part in our expansion. It is with particular pleasure that I can report that Coventry—which was the first to be destroyed—has now been rebuilt.

We have continued our policy of modernisation. While this is a process which we can never regard as being complete, we have already carried out major schemes of improvement at a considerable number of our stores. As I told you in my last address, modernising a store means a radical conversion in order to give it a new look and a new character in keeping with the specialised goods we are now selling.

Much of the work carried out since the war has been subject to licence, and we have therefore not been able to proceed as far or as fast as we should have liked. Nevertheless, £13,500,000 has been spent during these eight years. A considerable proportion of this sum has been invested in re-equipment which we regard as an essential part of the process of modernisation. As you will see from the balance sheet, fixtures, fittings and equipment now stand at £3,464,000 (after depreciation).

Now that building licences, after 15 years, are more freely available, we can contemplate a new and more systematic programme of development. With the widening of our range of goods, space has become a most important factor in the stores. It is essential to provide more room for our goods so that they can be adequately and attractively displayed, and above all more room for our customers to shop in comfort. We plan to extend and develop many of our present stores which, as you know, are situated in the best positions in the major towns throughout the country. This is a long-term programme, which will require a further large investment of funds and take some years to carry out.

TRIBUTE TO STAFF

Once again it is my pleasure to thank all members of our staff, both at head office and in the stores, for their devoted efforts during the past year. There are now 28,000 men and women in our employ. Whatever their sphere of activity, they make their contribution to the success of the business.

All have the interests of the company at heart. Their zeal, enthusiasm and loyalty are worthy of the highest praise, and we take pride in the knowledge that the amenities and services we offer provide conditions under which so many find pleasure and interest, as well as reward, in their work.

We congratulate the welfare department on reaching this year the 21st anniversary of its formation. Members of the department can look back with satisfaction on the part it has played in the prosperity of the business. It has pioneered a tradition of welfare which has brought added prestige to the company.

The report and accounts were unanimously adopted; the formal business was duly transacted; the proposed capitalisation of reserves and increase of capital were approved and the proceedings terminated with a vote of thanks to the chairman, directors and staff.

THRELFALL'S BREWERY

IMPROVED TRADING FIGURES

The sixty-seventh annual general meeting of Threlfall's Brewery Company, Limited, was held on June 10th, in London.

Mr F. Cornwall (chairman and managing director), in the course of his speech, said: Your board are in the happy position today of submitting trading figures showing an improvement over last year. The gross profit on trading is higher, also the net profit, so that your directors are able to recommend an increased dividend. You will no doubt agree that the result for the year is very satisfactory.

A substantial portion of this increase is accounted for by the reduced price of malt used, but, in the main, our higher profits are due to the steady level of our trade coupled with improved business in certain instances. The demand for bottled beer still continues to increase. For some time also we have had a period of full employment in most areas wherein we trade.

Dealing with the directors' capital proposals, he said: Briefly these comprise the increasing of the authorised capital to £2,750,000; the capitalisation of certain reserves and part of the sum standing to the credit of the profit and loss account amounting to a total of £687,500 and the distribution of that sum amongst the holders of ordinary stock in the proportion of one fully paid ordinary share for every £2 of ordinary stock held by them on May 5th last.

The profit from trading is £816,902, an increase on last year of £81,881, the net profit is £281,582 and the directors recommend a dividend of 25 per cent on the ordinary stock for the year.

The report was adopted and the capitalisation of reserves was approved.

SPILLERS LIMITED

IMPROVED RESULTS

INCREASED PROFIT AND DIVIDEND

CAPITALISATION OF RESERVES APPROVED

The sixty-seventh annual general meeting of Spillers Limited was held on June 11th at the Abercorn Rooms, Great Eastern Hotel, Liverpool Street, London, E.C., Mr Wilfred D. Vernon, chairman of the company, presiding.

The secretary (Mr Cyril Harvey, FCIS) read the report of the auditors.

The following is the chairman's statement which had been circulated with the report and accounts for the year ended January 31, 1954, and was taken as read:

In accordance with usual practice, the more detailed comments on the accounts are contained in the directors' report.

My colleagues and I are gratified that this year we are able to report results more commensurate with the amount of capital employed in the business and the scale of our operations. The profit after providing for depreciation and obsolescence is £3,096,000 as compared with £2,256,000 for the previous year. Taxation at £2,180,000 (including £391,000 for excess profit levy) absorbs some 70 per cent of the profit, leaving available for appropriation a net amount of £916,000 as against the previous year's £736,000.

Last year I pointed out that the steady development of the business had been carried out by the ploughing back of profits over a long period, and that we recognised that the level of distribution to the equity stockholders did not adequately reflect such expansion. I am glad, therefore, that the improvement in this year's results and our ability to assess more accurately the conditions following decontrol enable the directors to recommend that the final dividend on the ordinary stock be increased to 10 per cent, making 12½ per cent for the year as against the former 10 per cent.

CAPITALISATION OF RESERVES

The directors are also recommending that in order to bring the issued capital of the company more nearly into line with that employed in the business a further £2,916,872 of the reserves be capitalised by the issue of one fully paid ordinary share to the holders of every £2 of ordinary stock. The new shares will thereupon be converted into stock. If this is approved by the Capital Issues Committee and the stockholders, the issued capital will then amount to £10,130,825, and the reserves (including that for future taxation) will be £4,153,000 in the parent company's balance sheet and £7,589,000 in the consolidated balance sheet.

So far as the interim dividend on the ordinary stock for the year ending January 31, 1955, is concerned, it will be our intention, provided the circumstances warrant it at the date of declaration, to maintain this at the rate of 2½ per cent. I give this information now because I wish to emphasise that such a step should not be taken as implying that the total rate of dividend for the year on the increased capital will be greater than that required to effect the same distribution in money as for the year ended January 31, 1954.

FINANCIAL POSITION

I now refer to the general financial position of the company. Stocks, debtors and creditors as shown in the consolidated balance sheet represent, so far as we can judge, average amounts in relation to the current scale of operations and price levels. The liquid balances together with the normal proportion of earnings which would be retained in the business during the current year are regarded as adequate to meet any known capital and other commitments during the year and to provide a sufficient working balance. Our existing resources, therefore, are sufficient for our present requirements, and unless there is some wholly exceptional change in circumstances, such as a major expansion, I can see no need for the raising of additional capital from external sources. It is, I think, interesting in this connection to recall that since January 31, 1939, we have expended some £13 million on buildings, plant and equipment, the acquisition of other businesses and increased working capital, and that this has been financed wholly from our own resources without recourse either to the capital market or bank borrowing. As I have said, it is satisfactory that the stockholders are now receiving some return from all this development financed from earnings.

DECONTROL OF THE INDUSTRY

The most noteworthy feature of the past year was the decontrol of cereals and feeding stuffs which, following the White Paper announcing the Government's policy and the satisfactory conclusion of negotiations with the trading interests concerned, became effective on August 29, 1953. In my statement last year I gave an outline of the decontrol proposals, and it will therefore suffice to say that the milling industry is now being conducted on a normal commercial and competitive basis subject only to the regulations governing the nutritional standards to be observed in the manufacture of flour.

These regulations permit the sale of both long extraction (national) and short extraction (white) flour. The basis is that certain elements are presumed to be present in certain quantities in the national flour, but have to be made up to a prescribed level in white flour by admixture. The bread subsidy, however, is only given to bakers in respect of bread manufactured wholly from national flour. Since the subsidy at the present time is approximately twopence on a 1½ lb. national loaf selling at sevenpence halfpenny, it is not surprising that the demand for white flour has been very low. It seems to me that it would be helpful to the public and the trading interests concerned if there were a clear statement of the evidence upon which this policy is based.

There can be no doubt that decontrol has been beneficial both to the country and the industry. Efficiency and enterprise have been stimulated by the restoration of commercial freedom and incentives. The price of national flour has been reduced by stages from £44 2s. a ton on August 29, 1953, to £39 4s. at the present time. This reduction has not been reflected in the price of bread to the public because of the bread subsidy arrangements. It has, however, operated to reduce the burden of that subsidy on the Exchequer. The main factor in this reduction in price has been the fall in the cost of wheat which in turn has been influenced by the return to commercial buying and the Government's decision that this country should not be a party to the renewal of the International Wheat Agreement.

I cannot leave the subject of decontrol without a reference to the outstanding services rendered to the industry by Sir Archibald Forbes who has played the leading part at every stage of the decontrol negotiations, and it is only appropriate that I should here place upon record an acknowledgment of the immeasurable debt which every member of the industry owes to him.

WHEAT MARKETS

Before commenting upon the world wheat position, it is important that I should remind stockholders of my reference last year to the wide disparity existing between world prices in 1939 and those of the present day. As an illustration, the price of No. 2 Manitoba wheat in 1939 was approximately £6 5s. a ton, which compares with £29 a ton for the same wheat today.

The harvest in 1953 resulted in bumper crops in most wheat-growing countries, notably the USA, Canada, and Australia. In North America, in particular, this has greatly added to the accumulated surplus from former years. Under free market conditions this pressure of supply would normally lead to a greater fall in prices than has already occurred. That this has not happened is due to the arrangements in the principal wheat exporting countries whereby there is a single selling agency—usually a government or government sponsored body. The handling of wheat by a single seller and the support price arrangements in certain countries make it even more difficult than formerly to predict the course of prices. I can only suggest that the extent of the surplus is such as to indicate that some readjustment of policy is inevitable to avoid serious embarrassment regarding storage and eventual disposal.

MAINTENANCE OF SUPPLIES

This lends point to what I said last year about the risk involved in carrying stocks under these conditions. In prewar days we were able to minimise this risk either by forward sales of flour or by hedging operations on the futures market. Under existing conditions there are virtually no forward sales of flour, and although the wheat futures market in Liverpool has been reopened—and I warmly welcome the Government's decision to make this possible—it is as yet operating on too narrow a base to give effective cover for more than small quantities. Stockholders will appreciate, therefore, that at today's price levels, some risk is inseparable from the maintenance of sufficient supplies of wheat to keep the company's mills in operation. The decontrol arrangements have, however, afforded us some limited measure of protection for a short period and this has so far enabled us quite quickly to pass on to customers the benefit of the fall in wheat prices.

There have been and are special problems regarding home-grown wheat. The milling industry accepts firstly that a certain quantity of wheat should be grown in this country, secondly that this should find a ready market, and thirdly that the grower should receive a price sufficient to provide him with an adequate return. And the milling industry is very willing to use its best endeavours to assist the Government and the growers to these ends.

PROVISIONS OF WHEAT ACT

From 1932 until 1939 the problem was met by the provisions of the Wheat Act. Broadly

speaking, they were to the effect that each grower sold his wheat in the open market in the ordinary way and received the amount (if any) by which the average realised price fell short of a standard price, the latter being determined by the Government at the average level necessary to recoup the costs of production and show a reasonable margin. In this way a premium was set on the quality of the individual grower's wheat and his marketing ability. The conditions arising on the outbreak of war brought this arrangement to an end, and from that date until now each individual grower has received the same guaranteed price for his wheat irrespective of quality provided it came within the category of "millable."

Up till the date of decontrol of cereals in the summer of last year, marketing presented no difficulty because under control conditions each miller had to use a prescribed proportion of homegrown wheat in his grist. The return to competitive conditions following decontrol rendered this impracticable and special arrangements were made to deal with the 1953 homegrown crop pending the institution of more permanent measures. Under these arrangements the milling industry undertook to use its best endeavours to clear 1¼ million tons being the then estimated proportion of the crop which would be available for milling. This estimate, however, proved too low by reason of a record yield resulting from the 1953 harvest, and the milling industry consequently increased its undertaking to 1½ million tons. The arrangements made have worked well and there is every prospect that this exceptional quantity will be cleared. So far as the 1954 crop is concerned, the Government's proposal is that this shall be dealt with not on the basis of a uniform guaranteed price to the grower, but by a system of deficiency payments akin to those payable under the former Wheat Act with the variation that the standard price will be graded seasonally.

We, as millers, welcome this proposal which we are sure is in the best interests alike of the country, consumers and growers. The milling industry is again prepared to give an assurance that it will continue to use its best endeavours to dispose of the whole of the 1954 crop available for milling on the understanding that the wheat will be sold in a completely free market, for it must be remembered that we must always be in a position to compete with imported flour on the basis of the world price of wheat. We hope that when considering permanent arrangements for the 1955 and subsequent crops the Government will revert to the well-tried principles of the Wheat Act, modified as may be necessary in the light of circumstances then prevailing.

FLOUR MILLING OPERATIONS

On the flour milling side of the business the year under review has naturally been a transitional one because of the change from control conditions to those of commercial freedom and competition. On the whole the arrangements for decontrol have worked smoothly, but it was inevitable that such a major change after a period of 14 years of rigid control should give rise to certain difficulties and readjustments. There has been, as indicated in the directors' report, a significant drop in our flour sales as compared with the previous year. This has derived from two main factors. First there has been a falling off in the overall consumption of flour in the country. This was to be expected with the greater availability of alternative foodstuffs. In the second place the resumption of the direct sale of imported flour to customers has had its effect. Despite these adverse factors, the financial results of the flour milling side of the business showed an improvement over the previous year. Having regard to the up-to-date condition of our mills and their location, and granted the ability to purchase wheat in a free market, I have no doubt that we shall be able, under fair trading conditions, to secure our due proportion of available trade in the face of any competition, whether from home or abroad.

I might add in this connection that Mr C. P. Rishworth, one of the directors, and Dr Green, the company's chief chemist, recently paid a visit to Canada and the USA in order at first hand to study the latest technical developments in all aspects of business in which the group is engaged.

EXPORT TRADE

Following the removal of the virtual prohibition on exports of flour which has subsisted over the past 14 years we have made a close study of the markets in which we formerly had an established trade. I regret to say, however, that the length of time during which we have been excluded from these markets and the various developments there during that period have led us to the conclusion that for the time being the revival of our export trade to any substantial degree is unlikely.

NON FLOUR MILLING ACTIVITIES

Turning to the non-milling side of the business which now represents an important part of our activities, I have to report improved results in virtually all departments and particularly in animal foods. There we are reaping the benefit of many years of pioneering work in the study of consumers' requirements and the manufacture of high quality products to meet them. The volume of sales shows a satisfactory increase with a corresponding effect on the financial results. I might say that we have decided to supplement our research work in animal foods by carrying out practical experiments on a farm of our own. With this object we have recently acquired a farm at Middle Aston, Oxfordshire, and the animal foods side of our research laboratories will be transferred there.

NATIONAL ASSOCIATION OF BRITISH AND IRISH MILLERS

I referred last year to the nomination by the Council of the National Association of British and Irish Millers of Mr Humphrey B. Vernon, one of the joint managing directors, as next president of the association. Mr Vernon completes his year of office this month and in warmly congratulating him upon the outstanding success he has achieved during such an exacting year, you may be assured that I am speaking with the wholehearted support, not only of my colleagues, but of all those engaged in the flour milling industry to whom he has rendered such invaluable service.

STAFF AND WORKPEOPLE

In conclusion I would like to express to the managements, staff and employees generally throughout all the companies in the group the appreciation of myself and my colleagues for all the hard work which they have done in the past year which has contributed to the satisfactory results which we are able to lay before the stockholders today.

The report and accounts were adopted, and the dividend as recommended was approved.

The retiring directors, Mr Wilfred D. Vernon and Mr Laurence Hosegood, were re-elected, and the directors were authorised to fix the remuneration of the joint auditors, Messrs Impey, Cudworth and Company and Messrs Deloitte, Plender, Griffiths and Company.

Resolutions were also passed approving the capitalisation of reserves.

The proceedings terminated with a vote of thanks to the chairman, directors and staff.

UNION INSURANCE SOCIETY OF CANTON

ASSETS EXCEED £16,900,000

The annual meeting of the Union Insurance Society of Canton Limited was held on May 27th in Hong Kong, the Hon C. Blaker, MC, the chairman, presiding.

The following are extracts from the report and accounts and his circulated statement:

Marine.—The net premiums for the year amounted to £3,492,101. After releasing £160,000 to profit and loss account and increasing the underwriting balance by £20,000 transferred from the profit and loss account of a subsidiary company, the marine fund stands at £5,187,978.

Fire.—The net premiums for the year amounted to £3,524,102. £271,454 has been transferred to profit and loss account. The additional reserve has been increased by £25,000 by a transfer from the profit and loss account of a subsidiary company. The fire fund stands at £1,948,394.

Accident and General.—The net premiums for the year amounted to £2,628,468. £151,927 has been transferred to profit and loss account. The additional reserve has been increased by £25,000 by the transfer of £15,000 from the Society's profit and loss appropriation account and £10,000 from the profit and loss account of a subsidiary company. The accident and general fund now stands at £1,201,387.

Profit and Loss Account.—Interest and dividends amounted to £406,829 and transfers from underwriting accounts to £583,381. After charging outgoings not brought into account elsewhere, making provision for taxation, and allowing for the minority interests of the outside shareholders of the subsidiary companies, the profit for the year appertaining to the Society is £643,429.

Consolidated Balance Sheet.—Total assets amount to £16,967,243.

CHAIRMAN'S STATEMENT

In the marine field our premiums decreased from £3,802,075 to £3,492,101.

Worldwide competitive pressure for lower cargo rates and wider terms of cover, resulting largely from the impact of an expanded marine market on the reduced volume of business available under present trade conditions, must inevitably have its effect on both premium income and claims ratio.

All signs point to a lean period ahead for marine business, but our marine fund now amounts to over 148 per cent of the year's premium which, having regard to the heavier reserve required because of the increased proportion of hull business included in the account, is considered to be at a level adequate to cover all liabilities.

The fire department with increased production in many fields continues to expand most satisfactorily, and has experienced another excellent year.

The fire fund has been strengthened and should adequately meet the requirements of all companies' portfolios in the group.

Our accident and general business has again made substantial progress, showing an increase in income of £491,862, or 23 per cent, over 1952. This increase, I would record, is general throughout the Society's worldwide organisation, with particularly good progress being made in Canada, Australasia and the United Kingdom. Claims are somewhat heavier, largely due to the adverse motor experience in certain territories and higher losses under burglary and all risks policies.

The report and accounts were adopted.

DUNLOP RUBBER COMPANY, LIMITED

YEAR OF SOLID ACHIEVEMENT

LORD BAILLIEU'S REVIEW

The fifty-fifth annual general meeting of the Dunlop Rubber Company, Limited, was held on June 14th, in London.

The Rt Hon Lord Baillieu, KBE, CMG, the chairman, in the course of his speech said: Our results for the year 1952 reflected two adverse factors, the first being the change that had taken place to a buyers' market in this country and abroad, and the second the inventory adjustments that had been necessary by reason of a very steep fall during the year in the prices of our principal raw materials, and in particular rubber. In the year 1953 trading generally was on a steadier basis with demand at a much more normal level. In consequence the volume of goods sold by the group was higher than in the previous year, but selling price reductions had the effect of reducing slightly the turnover value of goods sold from £250 million to £243 million.

During 1953 our raw material prices again fell, the price of rubber falling from 27d. per lb at the end of 1952 to a low price of 16d. per lb, finishing at the end of the year at 17d. per lb. Thus over the 12 months there was a net reduction of 10d. per lb. This was a good deal less than the fall in the previous year, but it nevertheless again created problems with inventory adjustments.

MODEST PROFIT PERCENTAGE

I would emphasise that, throughout the group, selling prices are constantly under review so that adjustments are made wherever costs and production volume permit. You will have noticed the reference in the directors' report to our modest profit percentages in relation to turnover, the percentage, after tax, for the year 1953, representing only 5½d. in every £1 of sales.

You will note in comparing our profit rate in 1953 with that in 1951 that although the rate before tax is lower, the profit rate after tax at 2.3 per cent is slightly higher than the 1951 rate of 2.2 per cent. During the two years tax reductions have occurred and these are directly reflected in the comparative rates before and after tax for the two years. This illustrates very clearly what I have said on previous occasions in relation to the very heavy burden of taxation which industry is continually asked to bear. A sound progressive business must provide, from its trading balances of the year, full depreciation in order to maintain, renew and expand its plant and equipment, and full taxation requirements to meet the exigent needs of the Treasury. Then and only then can directors consider what they can and should do to provide for reserves and dividends.

OVERSEAS ACTIVITIES

Our overseas activities have again contributed over 50 per cent of the total group profit. In 1952 markets became over-stocked as a result of heavy shipments in the early part of the year and there was a considerable drop in the export rate of the industry as a whole. We have a different tale to tell this year. Although in the early months of 1953 exports were not very favourable, the position began to improve towards the middle of the year. The heavy stocks acquired in 1952 were gradually absorbed and replacement began. This resulted in a much more normal and healthy level of demand. Consequently, our exports in the second half of 1953 showed a welcome improvement despite increased foreign competition.

The finances of the group have considerably strengthened during the past year. The reduction of working capital invested in inventories has correspondingly reduced the amount of our borrowing by bills and bank overdrafts. Even after this reduction the total temporary borrowing was still over £9 million.

For the second year in succession over £7 million has been added to fixed assets, against which our total depreciation provision was about £5 million. Our programme of capital expenditure, involving the replacement of existing plant and the provision for new developments, will inevitably continue in the highly competitive industry in which we are engaged.

The reserve position is particularly strong. Although the effect of the capital changes which took place in 1954 is not shown in our 1953 balance sheet, you will have noted that taking these changes into account our total group reserves amount to £28¼ million, against the issued ordinary capital of the parent company of £19¼ million. You will, I am sure, agree that this is a very healthy state of affairs.

RESEARCH

As one of the world's largest producers of natural rubber, we are continuing intensive research on natural rubber at our research centre on the Dunlop estates in Malaya. Extensive research is being conducted on synthetic rubber in both Europe and North America.

I have mentioned on previous occasions the intensive research and development work which we are continually undertaking. Some examples of the progress made in 1953 are our tubeless car tyres, "Extron" conveyor belting, "Fortiflex" industrial containers (first marketed early in 1954), "Rubbaseal" protective coating for motor-cars and "Polimul" emulsion for use in the textile, paper, paint and cement industries.

The demand for tyres considerably improved in 1953, compared with the previous year. The high quality of the Gold Seal car tyre, introduced in 1952, has fully justified our hopes.

LEGAL PROCEEDINGS IN USA

There is a matter which has been raised in a letter to me from a shareholder and to which you may have seen reference in the press during the past two weeks. I refer to the announcement made by the Department of Justice in Washington concerning the Consent Judgment to which we have recently agreed in the proceedings brought in the United States against the Dunlop Rubber Company and other companies. The Department of Justice stated that the charges made against these companies included price fixing and cross-licensing agreements, the pooling of foreign patents and licensing on restrictive terms. One of the transactions on which the allegations were based was the formation of joint companies by the United States Rubber Company and Dunlop for the development of elastic yarn, particularly that sold under the trade mark "Lastex."

Your company has never admitted that any of these charges were well founded and in fact this is acknowledged in the Consent Judgment itself. When it had been explained to the Department of Justice that many of the agreements objected to had for various reasons been inoperative for very many years before the proceedings were commenced the matter was settled by the Consent Judgment, the terms of which, in the opinion of the board, do not materially affect your company's interests.

Far from having in any way set out to restrict the supply of latex or the development of its uses, our research and efforts both on our plantations in Malaya and in the factories at home, have always had as their aim to extend its uses and promote the sale of articles made from latex. One outstanding example of this is our invention over twenty-five years ago of latex foam which has led to the building up of an industry in this product which has been of world-wide benefit. The annual consumption of latex throughout the world has increased from 8,000 tons in 1932 to 180,000 tons in 1953.

We are naturally concerned and astonished that a statement issued by the Department of Justice in Washington should have been accompanied by a comment of the senior official in charge of the Anti-Trust Division which implies that these agreements impeded the free flow of raw materials and the manifold products in the manufacture of which rubber is essential; this is not justified by the facts nor by your group's record as outlined above.

Incidentally, it has just come to my notice that the United States Rubber Company have made a short statement in New York concerning the Consent Judgment and, as you may not yet have seen this in the Press, I would like to read it to you:

"In New York, US Rubber Company stated it still does not consider it has violated the anti-trust laws in this case. However, the company said it has joined in the consent decree, since it would be less costly to revise its methods of conducting its foreign elastic thread business in a manner to satisfy the Government than to contest the case in a court trial."

This statement seems to put, very fairly, the view which we ourselves have taken in regard to this matter.

CURRENT YEAR'S OUTLOOK

The year 1953 has been one of very solid achievement. We have increased the physical volume of business, we have completed the adjustment of inventories necessary during the last two years of falling prices, we have strengthened our finances and we have made considerable progress in the development of new products and new methods of manufacture. So far this year trading has continued on a satisfactory basis.

We live, however, in a world of tension and challenge, and I am not prepared to make any prophecy for the future. Let us trust that those who bear the responsibility for guiding the fate of nations may succeed in resolving present conflicts and avoiding the supreme catastrophe of another world war. The Geneva Conference may well be a turning point in human history. For the first time since the war, East and West have met to discuss the issues which divide them. We must await the event to know if this process will exacerbate or relieve the conflicts which have afflicted the world in recent years.

The report and accounts were adopted.

BRITISH CELANESE LIMITED

The Report and Accounts for the year ended 3rd April, 1954, contain the Directors' recommendation for the payment on 31st July, 1954, of the following dividends to Stockholders registered at the close of business on 16th June, 1954:—

A final Participation dividend of 0.7309% actual (less Income Tax) on 7½% Participating Second Cumulative Preference Stock in respect of the year ended 30th April, 1954, making with the interim Participation dividend of 1.7691% and fixed dividends already paid a total of 10% on this Stock for the year (*10% for the year ended 30th April, 1953*), and

A final dividend of 12% actual (less Income Tax) on Ordinary Stock in respect of the year ended 3rd April, 1954, making with the interim dividend of 6% already paid a total of 18% on this Stock for the year (*12% for the 9 months ended 28th March, 1953*).

The following details are extracted from the Report of the Directors and audited Accounts for the year ended 3rd April, 1954, which will be posted to Stockholders on or about 22nd June, 1954.

INCREASE OF CAPITAL AND CAPITALISATION OF RESERVES

The Directors recommend the capitalisation of certain Reserves to the amount of £3,759,267 by the issue to the Ordinary Stockholders on the Register at the close of business on the 8th July, 1954, of 10/- of further Ordinary capital credited as fully paid up in respect of each 10/- Ordinary stock unit already held. The stock will then be transferable in units of £1. The issue will not increase the number of votes exercisable by the Ordinary Stockholders. The object of this proposal is more closely to relate the Share Capital to the Capital now employed in the undertaking.

It is also proposed to increase the Authorised Ordinary Capital of the Company by £6,000,000 to provide for the above mentioned issue and to leave a substantial amount of unissued Ordinary Capital for future requirements.

The necessary Resolutions are contained in the formal Notice convening the Annual General Meeting.

LONDON, W.1. *11th June, 1954.*

MILK MARKETING BOARD

THE NEW ARRANGEMENTS

MR THOMAS PEACOCK'S SPEECH

The annual general meeting of the Milk Marketing Board was held on June 11th in London.

Mr Thomas Peacock, CBE, JP, the chairman, in the course of his speech, said:

I am particularly conscious of the importance of today's occasion, the first time for fifteen years that the Board have been able to report to milk producers as a marketing board in fact as well as in name. It is an occasion to which my predecessors, Sir Thomas Baxter and Mr Ben Hinds, constantly looked forward and for which they worked so diligently. More than three years have gone by since the Board first made an approach to the Government for their reinstatement as the marketing authority for milk. In the event, reinstatement has come upon us suddenly, for it was not until last November that the Government finally announced their policy in regard to the marketing of agricultural produce.

PRICE GUARANTEES

The most important feature of this policy is the Government's endorsement of the principles of the Agricultural Marketing Acts along with the acceptance of their obligation under the Agriculture Act of 1947 to continue to provide guaranteed prices and assured markets for the main products. This is particularly satisfactory to the Board, for we have constantly maintained that the policy of the Agriculture Act and the growth and development of producer marketing boards are complementary.

The work of the Board should be made easier by the maintenance of price guarantees, while the Government's responsibilities are greatly facilitated by the pursuit of efficient marketing by a producers' organisation. The Board have never had any doubt that they can bring real benefits to industry and consumers alike in the exercise of their marketing powers; I can assure you that we undertake our new tasks with a full sense of responsibility, not merely to the producers we represent and to the dairy industry, but to the consumer and the nation as a whole.

THE 1949 ACT

We must not imagine, however, that the clock has been put back to 1939. The milk market of 1954 may bear a certain resemblance to the conditions of 1939, but in many respects there are important differences that we must not forget; in fact, they must be constantly in our mind. The Agricultural Marketing Act of 1949, for example, gives the Government important new powers which can greatly limit the authority of the Board. Your Board have always taken the view that the provisions of this Act were amply sufficient to provide consumers with safeguards against any possible act of marketing boards that might be contrary to the public interest.

Nevertheless, under the new marketing arrangements for milk decided this year, even when there is no longer any element of consumer subsidy, the Board will be required to give the Minister of Agriculture an opportunity of considering the prices of liquid milk they propose to prescribe before they come into operation. This is an extension to the provisions of the 1949 Act, which limits even further the Board's powers of price fixing.

During the negotiations of recent months the buyers of milk made strong representations for formal recognition of their interests in the marketing of milk. The Board believe that the understanding which has now been reached with the buyers will prove to be satisfactory to all parties. They have given the buyers an undertaking that they will set up a committee consisting of members of the Board and of representatives of the Central Milk Distributive Committee. This joint committee will be consulted by the Board on the policy and methods of marketing milk as they affect the distributors and manufacturers.

GUARANTEED PRICE

The Agriculture Act of 1947, which provides for a guaranteed price and an assured market for the main farm products, has brought about a fundamental change in the method of arriving at producers' prices. The prewar pooling arrangement, whereby milk producers received an average of market realisations without Government support, has gone. Now it is the Government, as a result of the February price review, that are mainly responsible for the level of producers' prices. The Government have, however, taken the opportunity of modifying the form of the guarantee. The new price arrangements are necessarily more complicated than the system with which we have been familiar during the past several years. I would advise producers, however, not to be unduly concerned with the mechanism; it is the principles of the new arrangements which must concern us and with which I wish to deal briefly today.

The price of milk will continue to be negotiated on the producers' behalf by the national farmers' unions at the annual review of farm prices. The guarantee will, however, in future relate to a certain quantity of milk, which will reflect the Government's views in regard to the amount of milk which is required from our farms. The guarantee will also relate indirectly to market realisations, because milk which is in excess of the standard quantity fixed by the Government will earn, not the price fixed at the annual review, but only the price realised in the market for milk used for manufacturing purposes.

PUBLICITY FUND

The Board have already taken steps to tackle the problem of improving liquid consumption by their decision to allocate ¼d. per gallon of milk sold in the months May and December to a publicity fund which will be handled by the National Milk Publicity Council. The distributors are contributing an equivalent amount. Here again is another joint body representing both producers and distributors who, of course, have an identical interest in maintaining a high level of consumption of milk. The Board are certain that a publicity campaign is not merely important but essential if liquid consumption is to be sustained.

We want, however, to utter a warning that it is not sufficient in our opinion for either producers or distributors merely to contribute towards the publicity fund without making some conscious effort on their own part. For producers it is of the utmost importance that the milk supply shall be constantly of the highest quality and that it shall be produced as cheaply and efficiently as possible. For the distributors, it would be a tragedy if the immense value of the personal link between distributor and customer that arises from our system of household delivery were not to be fully used in this campaign to raise consumption.

SEASONAL PRICE VARIATION

I mentioned in my report last year that the Board viewed with some misgiving the Government's policy of reintroducing a seasonal variation of the retail price of milk. Experience has shown that the effect on milk consumption of such variations in monthly retail prices last year was very small. They certainly did not achieve what the Government had hoped, which was to bring the demand for milk in line with the seasonal trend of output. Nevertheless, the Government have once more decided to vary prices seasonally and they have recently announced monthly prices until March, 1955.

The Board have viewed the new scale of prices with much apprehension and concern. Last year the amount of any change between one month and another did not exceed ½d. per pint. This year, on August 1st, the retail price of milk will be raised by 1d. per pint and the Board cannot think that so large an increase in price can fail to have repercussions on the demand for milk. This is scarcely encouraging at a time when every effort is being made to increase consumption. Let me make the same plea to the Government again, not to repeat this on another occasion; it does no one any good.

OUTPUT AT RECORD LEVEL

I have referred to the importance also of improving the realisation of milk used for manufacture. The Board took over at a most unfavourable time for selling milk to manufacturers. The expansion of milk output, which is now at a record level, has meant that increasing quantities of milk are becoming available for manufacture at a time when stocks have been accumulating and world prices are falling. The changeover has taken place so quickly that it has not been possible to make all the preparations we would like for handling heavy quantities of milk in the manufacturing market.

We have thought it advisable, therefore, to contract with manufacturers initially for a period of six months only. In September we shall negotiate another contract, this time for the full year.

We hope to improve the cheese market. Milk producers may remember that before the war this market was one of the most difficult of the Board's problems. We believe, however, that it is possible to increase very considerably consumers' appreciation of home-produced cheese. We can produce in this country cheeses which are as palatable and as attractive as any of the so-called fancy cheeses now being imported into this country. We can also compete with these cheeses in price as long as the cheese is manufactured in months when costs are low.

We have continued during the year to operate with success the services which we perform for producers. These services extend from the farm right through to the point of sale and they have a common purpose. They are designed to help the producer to concentrate on the task of producing milk and to help him to produce it efficiently and cheaply.

The report was adopted.

GENERAL MINING AND FINANCE CORPORATION

(Incorporated in the Union of South Africa)

A YEAR OF MARKED PROGRESS

SIR GEORGE ALBU'S SPEECH

The fifty-fourth annual general meeting of the General Mining and Finance Corporation Limited was held on June 8th in Johannesburg.

The chairman, Sir George W. Albu, Bart, in the course of his speech said that the year 1953 had been one of marked progress and had included the absorption of the undertakings of Consolidated Rand Investment and Trust Company, Limited, and Transvaal Mining and Finance Company, Limited. These transactions, which involved both the allotment of shares and a net cash consideration, together with the redemption at par of 1,836 6 per cent cumulative convertible redeemable "A" preference shares, explained the allotment during the year of 250,000 6 per cent cumulative "B" preference shares and 274,848 ordinary shares, all of £1 each, resulting in the creation of a share premium account of £960,803.

The Corporation had also expended considerable sums during the year on the purchase of additional shareholdings in other companies, mainly with interests in the Orange Free State. In consequence over the year the surplus of cash assets over liabilities and provisions had been reduced by £500,175.

PROFIT AND DIVIDEND

The main source of revenue, being income from dividends, which showed a satisfactory increase for the year, was derived mainly from the investments acquired under the absorption scheme and from increased distributions by West Rand Consolidated Mines Limited. The net profit for the year had increased from £582,217 in 1952 to £837,657 in 1953, after taking into account profits on share transactions amounting to £170,504. After having made the usual provisions for depreciation of land, buildings and investments, and for the service of the preference shares, £75,000 had been set aside to revenue reserves, whilst the distribution on the increased ordinary share capital had been maintained at 5s. per share.

At the end of the year revenue reserves had totalled £3,332,487, and the preference share redemption reserve, established to provide for the redemption of any 6 per cent cumulative convertible redeemable "A" preference shares not converted, stood at £55,556.

The Stock Exchange value of quoted investments at £9,577,027 was considerably higher than their book value, and the directors considered that the value of investments not quoted substantially exceeded the figure reflected in the balance sheet.

Investments from which no dividend income had been received during 1953 amounted to about 45 per cent of the total investments, and comprised mainly companies interested in mining in the Orange Free State.

The Corporation continued to hold a substantial interest in General Exploration Orange Free State Limited, on whose properties in the Van den Heeversrust area very encouraging indications had been obtained in zones lying above the Basal Reef horizon. Developments on neighbouring properties were being followed with close interest.

THE GOLD MINING INDUSTRY

The gold mining industry as a whole had experienced a sharp rise in profits after devaluation of the South African pound in 1949, accompanied, unfortunately, by an inflationary tendency which had greatly increased working costs over the period 1950 to 1953. The supply of native labour had declined steadily over the same period, but had been offset to some extent by more efficient use of the labour available, through extended use of mechanisation. An improvement in the numbers of non-Europeans coming forward for employment had been noticed towards the end of 1953 and had continued into 1954. The mines of the Orange Free State were, however, absorbing a growing allocation of the available labour.

In spite of a decline in the tonnage milled during 1953, there had been an increase in the number of ounces of gold produced, due to an improvement in the average recovery under the increasing influence of the mines of the Far West Rand, the Klerksdorp area, and the Orange Free State.

The commencement in 1952 of uranium production had been of great significance, and its importance to the profit-earning capacity of the industry would materially increase as further plants came into operation.

WEST RAND CONSOLIDATED MINES

In 1953 for the first time in its long history West Rand Consolidated Mines Limited paid dividends in excess of one million pounds. A reduction in tonnage mined from the Kimberley reef and also increased mining of the lower gold content Bird Reef series for uranium had resulted in a decline in the profit from gold, which, however, was more than offset by the profits derived from uranium production. Capital expenditure was also at a much lower level than in the two previous years.

The corporation had for some time been in charge of the administration of South Roodepoort Main Reef Areas Limited, and in 1953 had acquired a shareholding in that company. Uranium was present in the Contact Reef mined by the company, but was in quite unpayable quantities. Over recent years South Roodepoort had maintained a uniform rate of tonnage milled and gold recovery, and the future outlook was satisfactory.

Steps were being taken to improve the benefits under the staff pension funds to bring these into line with modern practice.

The report and accounts were adopted.

Owing to the necessary quorum not being present, the meeting was unable to consider the item appearing under the heading of "Special business" and was accordingly adjourned to Tuesday, June 15, 1954, at the same time and place for consideration of this part of the business.

A full copy of the report of proceedings may be obtained on application to the London office on and after June 25, 1954.

UNITED DRAPERY STORES

YEAR OF SUBSTANTIAL EXPANSION

The twenty-seventh annual general meeting of United Drapery Stores, Limited, was held on June 10 in London, **Sir Brian E. S. Mountain, Bart.** (the chairman), presiding.

The following is an extract from his circulated statement:

Heelas Limited. Members were advised in May last year that we had accepted an offer of £825,000 for the shares which we held in Heelas Limited and which resulted in a substantial capital profit of £450,000 from the sale of an investment made only three-and-a-half years previously. This profit has been added to Capital Reserve.

Prices Trust Company Limited. In July of last year an offer was made for the Ordinary Share Capital of Prices Trust Company Limited and was accepted by over 90 per cent. of the members. At January 30 we had acquired 97.9 per cent. of these shares at a cost of £4,686,851. Subsequently, we have acquired the whole of the remaining Ordinary Shares. No profits of Prices Trust are included in the Consolidated Profit and Loss Account.

Trade Investment. This was an investment which we made in a manufacturing business in 1947 and it has served a most useful and profitable purpose to our Group by ensuring supplies of commodities which would not otherwise have been obtainable. With the freeing of controls and the easing of the supply position, we sold our interest in this Company at a Capital Profit which also has been added to Capital Reserve.

The Year's Results

With the foregoing transactions in mind, you will see that the Group Trading Profit, excluding any return from our investment in Prices Trust Company, and excluding also any profit from the business of Heelas Limited (which was a subsidiary last year), amounted to £2,781,541, an increase of £422,491 on the corresponding figure of last year.

If the seven months' trading figures of Prices Trust covering the period from the date of its acquisition up to the date of our consolidated account are brought in, the Group Trading Profit is increased to £3,113,006, an increase of £753,956 on the corresponding figure of last year.

I think you will agree with me that these results are very satisfactory, and show the development which has taken place during the year in the U.D.S. Group.

The Group Profit, excluding Prices, before taxation is £2,601,584, and from this we have to provide for taxation amounting to no less than £1,674,270. The total represents over 64 per cent. of our Group Profit. This is indeed a heavy burden, but it includes £309,000 for Excess Profits Levy. The net profit attributable to the Holding Company is £850,039. We recommend the payment of a final dividend on the Ordinary Share Capital of 32½ per cent., less tax, making 50 per cent. for the year, compared with 40 per cent. paid last year.

We are retaining in the Group, in the form of reserves and increases in undistributed balances of profits, a total sum of £440,419 out of the profit of the year, as compared with £409,620 distributed by way of Dividend on the two classes of capital. This is in general line with our distribution policy of the past five years.

Share Bonus

Capital Reserves have now increased by over £1,500,000 and Revenue Reserves and Surplus have increased by more than £500,000. Our total Reserves have, therefore, increased by over £2,000,000 to the total figure of £5,079,107.

Your Board consider that a portion of these Reserves should be capitalised, and the Issued Ordinary Share Capital of the Company thereby brought into some more reasonable relation with the actual capital employed in the business. The Capital Issues Committee has given permission to capitalise £1,473,027 from these Reserves, and to apply this in paying up an equivalent amount of Ordinary Stock to be distributed amongst the Ordinary Stockholders.

With regard to the future, turnover since the beginning of February again shows an increase over the corresponding period last year. Provided economic conditions do not change materially for the worse, your Board have no reason to believe that the progress of your Company will not be continued.

The report was adopted and the capitalisation and bonus issue proposals sanctioned.

IMPERIAL CHEMICAL INDUSTRIES

HIGHEST SALES IN COMPANY'S HISTORY

DR ALEXANDER FLECK ON PROPOSED PROFIT SHARING SCHEME

The twenty-seventh annual general meeting of Imperial Chemical Industries Limited was held on June 17th in London.

Dr Alexander Fleck, the chairman, presided and, in the course of his speech, said:

The sales in 1953 were the highest in our history, and with new plants coming into operation we can confidently look forward to further increases in the years to come.

The net income of the company for 1953 before appropriations for dividends and reserves was more than £17½ million. The true profits for 1953 available for appropriation are really better than those of either 1951 or 1952.

The board's intentions, announced two years ago, of bringing the ordinary share capital more into line with the true capital employed in the business by the capitalisation of reserves can now be carried out.

PHARMACEUTICAL INDUSTRY

In the annual report reference is made to the attitude of the Ministry of Health towards the cost of pharmaceuticals required by the National Health Service. Any effort by a Government department to cut down waste and extravagance is commendable. In this instance, however, there is the serious danger that a rather unintelligent application of quite inappropriate costing methods may damage or even destroy the most vital parts of the pharmaceuticals industry in this country. The danger is that pharmaceutical research may be rendered so unattractive in this country and so unprofitable that this important field of research may be abandoned by one company after another, and this country may be forced to rely upon the scientific achievements of other countries. Research for new drugs is, and must remain, highly speculative; only a small part of the research effort can ever be directly fruitful, but when success is achieved the cost of all the work which has proved fruitless for its original purpose must be taken into account. The profit on the successful discovery must cover the cost of the unsuccessful research if any concern is to be encouraged to carry on this speculative but valuable work. Even the successful product may hold the field for a short time only and be replaced by some other product discovered either in this country or overseas. Costing principles permitting a very limited percentage of profit on the manufacturing cost of a commodity may no doubt be appropriate and proper in some cases, but I suggest that in the case of drugs which it is decided to produce and which the National Health Service wants, the rigid and unimaginative application of such principles will lead to results that are unfair to the industry.

NATIONALISATION

The board remain as firmly as ever opposed to every form of nationalisation of the company. They keep this subject of the danger of nationalisation under constant consideration and will continue to do so even though the danger may from time to time appear to recede.

PROFIT SHARING SCHEME

The references in the report and in the Press to the proposed profit sharing scheme for employees will not have escaped your notice. This matter has been under consideration for a long time, and the scheme which the board now propose to introduce is the result of prolonged and earnest thought on the subject.

Any scheme which gave employees a cash sum regularly each year would suffer from the disadvantage that the receipt of the sum would become a normal expectation and would lose the character of profit-sharing. If for any reason the amount had to be reduced or withheld altogether, there would be widespread comments among employees probably suggesting hardship. At the same time, any scheme which distributed each year very large numbers of exceedingly small holdings in the company would be unsatisfactory and difficult to administer. The board believe that the scheme proposed, which puts the net bonus to the credit of the employee in the accounts of trustees appointed for the purpose, and provides for the issue of a stock certificate to the employee himself only when the account reaches a reasonable figure, is more likely to induce employees to retain their holdings of stock than one in which the shares were issued each year direct to the employees.

The board do not believe that the existence of the scheme will have a direct effect upon the amount of work done or the productivity of individual workers; that is not its purpose. There are other means of encouraging hard work and good work, including the scientific application of work study (including method study), a field in which this company plays a leading part. We believe that the scheme which we propose to introduce will play a useful part in bringing management, factory payroll and stockholders together and in spreading a better understanding of our mutual interests.

The scheme provides for an increase in the bonus if dividends are increased. Stockholders and employees will thus both share in any increased prosperity which it may be our good fortune to enjoy in future years. They will also have some share in any adversity which we may suffer.

Bonuses under the scheme are in no way part of the terms and conditions of employment and are not intended to be a substitute for fair wages and conditions.

THE OUTLOOK

So far this year the company has enjoyed, in common with other industries in this country, a period of expansion, and the prospects are, in general, good. In overseas markets competition is strong, but we believe that we can hold our own and in some directions gain further ground. Neither at home nor overseas can there be any easing-up, but with competent, loyal and energetic personnel throughout the whole organisation, we have every reason to believe that difficulties will be overcome and further progress made both this year and in years to come, when much of the present capital expenditure will be completed and will give us additional productive capacity.

The report and accounts were adopted.

The proposals for capitalisation of reserves and scrip issues were duly approved at the extraordinary and class meetings subsequently held.

"SHELL" TRANSPORT AND TRADING COMPANY, LIMITED

INVESTMENT ALLOWANCE WELCOMED

The annual general meeting of The "Shell" Transport and Trading Company, Limited, was held on June 16th in London.

Sir Frederick Godber, the chairman, said:

Since my statement went to press, an "investment allowance" has been proposed in the United Kingdom 1954 Finance Bill. This is a welcome innovation. It may not at once provide any great additional incentive to capital investment, in that its effect will be spread over a rather long period; it will, however, be of some assistance to concerns which are committed to a substantial and continuing programme of expansion. In the course of time it should make a valuable contribution to the competitive strength of British industry in world trade. It is to be hoped that the new tax allowance will be adopted and allowed to remain as a permanent feature of the United Kingdom tax system. Frequent changes, such as have occurred, for example, in the system of "initial allowances" can only tend to lessen the beneficial effects which it is the purpose of such allowances to promote.

A suggestion was put forward at our meeting last year that a diagram of expenditures on wages, dividends, etc., should be included with my statement and I would like to say that although we have not included such a presentation this year, we are bearing it well in mind. It is a fact, however, that the complexity of our group's world-wide business with the many and varied phases of its operations does not readily lend itself to simplification in diagrammatic form.

IRANIAN OIL DISCUSSIONS

You will, perhaps, be expecting me to tell you something about the progress of the negotiations now proceeding with the object of enabling the flow of Iranian oil into world markets to be resumed. The oil companies' representatives have already had exploratory talks in Tehran and have recently met their principals in London for consultation. They will be returning to Iran very shortly. I cannot at this stage of the proceedings give you any particulars of the discussions, nor would it be proper that I do so. There are many problems on each side which are not readily reconcilable, but if these are examined patiently in a spirit of mutual understanding I am not without hope that a solution may be found.

I have referred in my statement to the general situation prevailing in the tanker market. I would now like to mention one particular agreement which is reported to have been closed recently between an individual tanker owner and a Middle East Government. The agreement has not been made public, but, in spite of denials, it appears that a virtual, and possibly a complete, monopoly has been created for the transportation by sea of the crude oil produced in this Middle East country. Details have not yet been officially released, but there seems no doubt that we are faced with a flagrant instance of "flag" discrimination and a most serious breach of accepted international maritime practice. An arrangement of this nature, if it becomes effective, is bound to create serious problems in connection with sea transport. Not unnaturally the affair has evoked a storm of indignant protest which we most vigorously endorse.

The report was adopted and the capitalisation proposals were approved.

J. LYONS AND COMPANY

SIXTY YEARS OF PROGRESS

DEVELOPMENT OF NEW PRODUCTS

MR M. GLUCKSTEIN ON ELECTRONIC DEVELOPMENT

The annual general meeting of J. Lyons and Company, Limited, will be held on July 5, 1954, at the Trocadero Restaurant, Piccadilly Circus, W.1.

The following is the statement by the chairman, Mr M. Gluckstein, which has been circulated with the report and accounts for the year ended March 31, 1954: The company has just completed its sixtieth year, and we were gratified that, in March last, HRH the Duchess of Kent honoured us with a visit to our Greenford factories. We were proud of the privilege of showing her some of our activities there, particularly our tea department which shortly will complete its fiftieth year.

THE YEAR'S RESULTS

From the report and statement of accounts for the year ended March 31, 1954, which accompanies this statement, you will see that the net profit for the year is £686,914, as compared with £689,451 for the previous year. We feel that this result is not unsatisfactory taking all the circumstances into account. We propose the payment of final dividends at the same rates as last year on the ordinary and proportional profit capital and on the "A" ordinary capital already issued at the beginning of the year. On the new "A" ordinary capital we propose a dividend of 1s. 6d. per £1 unit. The balance of net profit, £76,652, is carried forward in the profit and loss account.

The balance sheet shows that the authorised capital now stands at £12,925,000, having been increased by two million pounds by the resolution passed at the extraordinary general meeting held last October. 629,069 "A" ordinary shares were issued immediately afterwards, and they have now been converted into stock, the units of which rank, in accordance with the terms of the issue, for the dividend mentioned above.

We feel we had reason to be well satisfied with the success of the issue which was made at £4 2s. 6d. per share. Excess applications totalled 1,634,495 shares, and for these, after dealing with acceptances of rights and special allotments to members of the company's staff, only 22,740 shares were available. Applications for one share up to nine shares received allotments in full; the balance was disposed of by ballot, each allotment being for ten shares.

NEW DEVELOPMENTS

The business continues to progress. We have now been able to resume full activity in the whole of the bakeries which were operating at Cadby Hall before the war. Extensions have been made to several of our factories and others are projected. Whilst, for manufacture, there are, generally speaking, economic advantages in concentration, we find some break-up of distribution into local centres, an advantage, both to relieve pressure in Cadby Hall and to give an improved service locally. We are now completing one of these local centres in Chessington, Surrey, where we have also built a bread bakery. We continue to develop new products for our wholesale distribution and new ideas and types of service in our catering establishments. Now that oranges and sugar are free from control, O. R. Groves, Limited, one of our subsidiary companies, has been developing the sale of two new orange drinks, "Sunkap" and "Sunfresh." They are made from fresh oranges by a special process; "Sunkap" is sold ready to drink and is delivered to the home by the dairyman; "Sunfresh" is an orange concentrate. I am glad also to be able to report further progress in our export sales, including those which earn all-important dollars.

ELECTRONIC PROJECT

Developments of a different kind have been proceeding in the Lyons electronic office or, as we have named it, "LEO." Large-scale electronic computors have been built on both sides of the Atlantic, but they are designed for calculations of a purely mathematical and scientific character. We felt that it should be possible to design one primarily for commercial needs and utilise the very high speed at which these instruments work to avoid the arithmetical drudgery of much clerical work. Thus LEO has been built. It has already reached the stage where it has taken over some sections of our clerical work. It is also capable of all types of mathematical and scientific calculation and is doing, and will continue to be available for, much work of a varied character for other organisations.

The more liberal policy now being adopted in the issue of licences for building and for acquiring the necessary materials has made it possible for our programme of improvements at a number of our teashops to be speeded up, and further work of this character will be carried out in the coming year.

STIMULUS OF TRADING FREEDOM

We welcome the end of food rationing and the easing of controls generally. It is a stimulus to everyone and affords the opportunity for new effort; we can now devote to constructive work the time which previously had to be spent in completing forms and questionnaires and in persuading the various authorities that we ought to be allowed to build this or buy that.

The abolition of development charges cleared a major blunder of postwar legislation; and there seemed hope that this was a foretaste of greater freedom in this respect and a recognition that the whole machinery of planning control was too complex and too costly. There is now before Parliament, however, still another Town and Country Planning Bill and two more major Bills affecting property. Had these Bills and their postwar predecessors been enacted 30 years earlier there would have been no Coventry Street Corner House and no Cumberland Hotel.

NEED FOR MORE LIBERAL TAXATION ALLOWANCES

For some years past, chairmen of companies have been drawing attention, with increasing emphasis, to the need, if industry is to be maintained, for more liberal taxation allowances on capital expended in the purchase of plant and equipment either for replacement or for extension. This year the Chancellor is taking the first step to meet a situation which has been a growing threat

to the future of industry, and we are all thankful for this. The prosperity of all classes in the country is dependent on increased output, and whatever may be the contributions of labour and management to that increase, it cannot be secured if the equipment is not maintained at a high pitch of efficiency. We can only hope that further relief will be given in subsequent budgets; there is great need of it.

TRIBUTE TO STAFF ENTERPRISE AND LOYALTY

At the close of the company's sixtieth year it is natural to look back a little as well as forward. The business began in 1887 and became a public company in 1894. In October of the latter year, the first teashop was opened at 213 Piccadilly; it is there today—modernised but still preserving the familiar white and gold shop front which has become so distinctive a feature all over London and in many provincial towns. Down the years, the company has shown steady growth and progress to its present position, and it has been greatly indebted to the skill, loyalty and enterprise of its staff, without which success would have been impossible. We feel that we have countered the risk that in so large a staff the individual may be a mere cog in the machine. Our employees have always had the right of direct access to "those at the top," and I believe this has done much to strengthen the good relations that have existed for so long. There are now some 3,000 employees with over 25 years' service, and they have set a very high standard of loyalty and efficiency which those who, comparatively, are newcomers can and do emulate. I am sure you will wish to join me in expressing to all of them appreciation of their efforts, their loyalty and their enterprise.

HALL TELEPHONE ACCESSORIES

EXPANDING ORDER BOOK

The twenty-sixth annual general meeting of Hall Telephone Accessories Limited was held on June 11th in London, Major the Hon Oscar M. Guest, chairman and managing director, presiding.

The following is an extract from his circulated statement for the year 1953:

The accounts show a net profit of £51,353, which compares with £63,261 for the previous year. Your directors recommend the payment of a dividend for 1953 of the same amount as we have paid for many years past, namely, 10 per cent (less tax).

During the first half of the year we experienced a considerable slackening of trade, and a number of our customers were forced to reduce their demands upon us, which has accounted for some reduction in profit. During the second half of the year orders from customers increased, and our order book continues to show expansion.

For the British post office we continue to manufacture telephone coin collectors and postage stamp machines. These are also supplied to overseas administrations.

We have recently completed a considerable order for platform ticket machines for British Railways, who are adopting our type of machine. We have recently developed two new types of coin-operated commodity-vending machines, which we have reason to hope will be successful. The first is for the sale of packets of chocolate and other commodities. The second is for the sale of refrigerated soft drinks in bottles.

The report was adopted.

ALLEN WEST AND COMPANY

CREDITABLE RESULTS

MR M. W. H. LANCASTER ON HEAVY TAXATION

The forty-fifth annual general meeting of Allen West and Company, Limited, was held on June 15th at Brighton, Mr M. W. H. Lancaster, MC, FCA (the chairman), presiding.

The following is his circulated address: Ladies and gentlemen, I now have pleasure in putting before you the accounts for the year ended January 31, 1954.

The trading profit is less than last year by £66,000, but as I then said, last year was a record in every way and we cannot expect to break records each year. The reason for this fall in profits is a slight reduction in sales, the probability of which I forecast last year. I am pleased to be able to say that this reduction does not appear to be progressive.

Dividends on investments are down by £6,000, this is largely due to our associated French company reducing its dividend. Taxation is up by £19,000, due entirely to the method of assessment. The net profit, after providing for taxation and all charges, is down by £90,000, to a figure of £338,000.

The South African and Canadian companies have never had their capital structure altered since their formation, and we decided that this should be carried out in order to make their respective balance sheets look more reasonable. This reconstruction involved the South African company making a bonus issue of £80,000. To suit local conditions, the South African company have transferred this year from their general reserve to their appropriation account £40,000 to provide the necessary funds. The bonus issue will then be met through the appropriation account, and not by a straight transfer from the general reserve to the issued capital account. The parent company owns all the capital of the South African company.

BENEFIT OF "PLOUGH BACK" POLICY

We propose to deal with the profits of £338,000 by transferring £200,000 to general reserve, paying a dividend of 15 per cent, less income tax, which will cost £96,000 as well as a bonus of 2½ per cent, less income tax, which will cost £16,000.

The policy of "plough back" followed by your directors, together with the present liquid position, enables us to pay this bonus, even though the profit has fallen. At the same time it must be remembered that whereas employees have been awarded several wage increases, stockholders have had no increase for some time.

The unappropriated surplus that we carry forward this year is £218,000, which is £66,000 greater than last year, but it includes the transfer from the South African general reserve of £40,000 already mentioned.

PLANT IN EXCELLENT CONDITION

We have expended during the year £71,000 on new plant and have written off by way of depreciation £74,000. Our plant is in excellent condition and is really modern. The freehold land and buildings have been increased by £125,000, of which £100,000 has been expended on our new factory in South Africa, which is now complete and will make trading conditions for the South African Company better in every possible way. The £25,000 was required to complete the Moulsecoomb No. 3 factory, which I mentioned last year.

I am pleased to say that we have managed to get the stock reduced because this item had increased very considerably over the recent years. It may, however, be that we cannot keep it down to this figure of £1,260,000.

TAXATION

You will see that our liability to future taxation is the gigantic figure of £439,000, and whilst I am talking of taxation I think I ought to tell you that we paid hard cash to the Inland Revenue during the year amounting to £436,000 and we collected, free of charge to the Revenue, but at considerable expense to us, £96,000 from our employees.

During the year approximately 27,000 incidents and cases of illness were treated by the doctors and nurses of our welfare department, without charge, nearly half of these not being attributable to their occupation.

During the year we co-opted to the board Mr John Hall, who has been with us about thirty years, and has travelled abroad extensively on the company's business. This follows our policy of arranging for continuity of directors as well as departmental heads, by promotion from existing personnel where suitable.

Our relations with our employees remain excellent, and to conclude I would like to thank all those of our staff and workpeople who have assisted in producing the very creditable results shown by the accounts now before you.

The report and accounts were unanimously adopted.

F. FRANCIS AND SONS

The fifty-third annual ordinary general meeting of F. Francis and Sons Limited was held on June 14th in London, Mr John Ismay (the chairman) presiding.

The following is an extract from his circulated statement:

The balance of profit for the year, including dividends from subsidiary companies, amounts to £185,305. Taxation provision requires £61,500, leaving an available sum of £123,805. Your directors have again transferred £50,000 to general reserve and now recommend a final dividend of 17½ per cent on the ordinary share capital, making a total of 22½ per cent, an increase of 2½ per cent on the previous year.

The net profit of the group, after providing for taxation, amounts to £136,231, and this includes, for the first time, trading results of the subsidiaries acquired in November, 1952 (covering a period of approximately 13 months).

Your board has decided to increase the issued capital of the company by a further £300,000, by the creation of 1,200,000 5s. ordinary shares, and at the same time it is our intention to apply to the Capital Issues Committee for permission to make a one-for-two scrip issue which will require a total of 750,000 new ordinary shares. As we have only available at the moment 500,000 unissued ordinary shares the balance will have to come out of the new shares to be created.

It is not proposed to issue any of the balance at the present time.

Addressing the meeting, the chairman announced that the CIC consent had now been received and notices convening an extraordinary general meeting would be dispatched before the end of the month.

The report was adopted.

WILMOT-BREEDEN (HOLDINGS)

RECORD OUTPUT AND SALES TURNOVER

The fifth annual general meeting of Wilmot-Breeden (Holdings) Limited was held on June 14th in Birmingham, Mr D. L. Breeden (chairman and joint managing director) presiding.

The following is an extract from his circulated review:

Production for 1953 was a record, both in terms of physical output and of sales turnover. The demands for the company's products increased very rapidly during the year. As a result our manufacturing resources were extended to the full, in spite of capital expenditure on new plant which was greater than in any previous year.

At the same time, production of components for the aircraft industry continued to expand, and it is anticipated that during 1954 this group of products will again increase its contribution to the sales turnover of the company.

The efforts of our main customers in the motor industry to establish permanent markets overseas have been so succesful that they are clearly anticipating an even greater demand for British cars and laying plans to meet it. In order to keep in step with these developments, it will be necessary to maintain our present high rate of capital expenditure in new plant, particularly for the extension of automatic processes.

We are continuing to increase our facilities for development and research, directed partly to improving our existing products and the methods of manufacturing them, and partly to the development of new products and manufacturing techniques for the future.

The outlook for 1954 is favourable, and there is no sign of any slackening-off in the demand for the company's products. Mention should be made, however, of the continuing need for reductions in costs referred to in my last review. At the same time there are signs that with the recent increases in wages, corresponding rises in the price of raw materials are on the way.

FINANCIAL REVIEW

The consolidated profit and loss account shows a net income from all sources of £730,397 (against £575,378 for the previous year), after setting aside £164,951 (against £151,861 for the previous year) for depreciation and obsolescence, and £50,000 (against the same amount for the previous year) towards the increased cost of replacing fixed assets.

Taxation of £517,591 is made up of income tax £393,268, profits tax £65,000, and excess profits levy £80,000—less an overprovision in previous years of £20,677. After taxation, the amount available for distribution is £212,806.

The directors recommend a final dividend of 10.54 per cent (less income tax at 9s. in the £) on the ordinary shares as increased by the bonus issue made on March 19, 1954. This will absorb £48,695 and make a total distribution for the year to the ordinary shareholders of 16½ per cent on the increased capital. After payment of these dividends, the balance unappropriated in the consolidated profit and loss account is £695,822.

Current assets of £3,051,475 exceed current liabilities by £1,692,553, which is an improvement of £93,517 during the year.

The report was adopted.

NATIONAL BANK OF GREECE AND ATHENS

THE GENERAL MEETING OF SHAREHOLDERS

MR COSTI ELIASCO'S STATEMENT

The first ordinary general meeting of the National Bank of Greece and Athens was held on May 15, 1954. The Governor of the Bank, Mr Costi Eliasco, read the report on the activities of the bank during the period of ten months ending December 31, 1953, that it has been operating since its establishment on February 28, 1953, following the amalgamation of the National Bank of Greece and the Bank of Athens.

This period, said Mr Eliasco, was characterised by the effort to rehabilitate, revive and balance Greek economy through the policy prepared and, ever since, strictly followed by the Government of Marshal Papagos. "The successful currency reform of April 9," said the Governor, "which did away with the various difficulties and obstacles that confronted the economy of the country, the substantial curtailment of unnecessary expenses, as well as an exceptionally favourable agricultural production, have been the most important events, and may be considered as a turning point in the economic life of Greece. These developments have resulted in favourable conditions which have contributed to the establishment of economic equilibrium and stability, as well as to the more normal and smooth functioning of the whole machinery of the Greek economy."

The result of the policy applied by the Government, and the gradual return of confidence in the currency, as outlined in greater detail in Mr Eliasco's report, have greatly contributed towards a more regular functioning of the money market, which, in its turn, has helped much to promote a rational development of the country. The main contributory factor, however, was the increase in loans and advances made by banks, and especially the change in the source of the loan funds, which has resulted in a definite improvement of their quality. Mr Eliasco continued, "while loans and advances to trade and industry out of the bank's own funds increased by 330,500 million drachmae, those derived from the Bank of Greece amounted to 87,400 million. It is characteristic in this connection that while advances of the National Bank of Greece and Athens, and its predecessors, made from their own funds increased in 1953 by 264,700 million drachmae, those granted from funds of the Bank of Greece were reduced by 59,400 million drachmae. These changes were due to the fact that a much larger portion than formerly of private, or rather commercial savings, found their way to the banks in the form of deposits, which increased from 1,157 milliard drachmae on December 31, 1952, to 1,898 milliard on December 31, 1953, i.e., by 64 per cent."

Under these general economic and credit conditions, the efforts of the Administration of the National Bank of Greece and Athens turned, on the one hand, to the rehabilitation and reorganisation of the Institution; and, on the other, to the expansion of its participation in the economic development of the country. A careful investigation of the nature of the Bank's advances led to the conclusion that it was necessary to entrust to separate departments the granting and supervision of credits to commercial enterprises and to industries. The services and activities of the Bank in their new form, referred to by Mr Eliasco, find their clearest expression in the balance sheet of December 31, 1953, which shows that from a total of 3,364 milliard drachmae advanced to Greek economy, not including the accounts of the branches abroad (as against 2,780 milliard drachmae on February 27, 1953, representing total advances of the two predecessor banks before their amalgamation), an amount of 1,309 milliard drachmae was allocated to trade and 2,054 milliard drachmae to industry. These figures point to the importance and the extent of the financial assistance granted to these two branches of the economy, and particularly to industry, which makes the National Bank of Greece and Athens the real industrial bank in the country.

Gross earnings for 1953 amounted to 323,881 million drachmae, and net profits to 14,263 million drachmae, allowing the distribution of a dividend of 400,000 drachmae per share, or 12,146,400,000 drachmae in all.

After paying tribute to the loyal and efficient service rendered by the staff, Mr Eliasco, in conclusion, said: "Should the favourable prospects for the sectors mentioned above continue to prevail, all those who are concerned with the banking and economic programme will eventually realise that the decision of the Government under Marshal Papagos to establish the new Bank has contributed in a positive manner towards the progress and prosperity of Greece."

THE BAH LIAS RUBBER ESTATES, LIMITED

SIR ERIC MILLER'S SPEECH

The forty-third annual general meeting The Bah Lias Rubber Estates, Limited, was held on June 16th in London.

Sir Eric Miller, the chairman, in the course of his speech, said: The 1952-53 crop of our three estates in Sumatra was approximately 7½ per cent more than that for 1951-52 and the highest since the war.

The report of the last meeting of the Rubber Study Group, held in Colombo, stressed the need for replanting as a means of strengthening the competitive position of natural rubber vis-à-vis synthetics. In our own case, more than half the planted areas carry trees over 30 years old, but we cannot contemplate any large-scale replanting unless and until we are assured of adequate security and duration of tenure and are satisfied that conditions generally in Indonesia afford the prospect of obtaining in due course a fair return on the substantial outlay that would be involved.

The "balance from trading account," before taxation, is £92,873 (previous year £167,618), out of which we have to provide £14,748 for depreciation on buildings, machinery and plant. Then there is the swingeing new Indonesian Government levy of 66⅔ per cent on profit and similar remittances. Like a number of other postwar impositions in Indonesia, this is of retroactive effect, for it applies to all remittances made since March 2, 1954, including those in respect of financial periods ended before that date. It is indeed paradoxical that the Indonesian Government whilst seeking to attract new investment from oversea, should discriminate so unfair against existing foreign enterprises, especially as these are responsible for such a large proportion of Indonesia's foreign exchange earnings. We still await permission to effect remittance in respect of 1952-53 and can now only hope to receive about £24,000 after paying the equivalent of approximately £16,000 by way of levy and £37,500 of Indonesian company tax, in addition to export duties equivalent to £41,000 charged to trading account.

In these circumstances members will see the wisdom of our having taken an interest some 21 years ago in the growing of rubber in the Federation of Malaya. We have received a 30 per cent dividend from Kulai Rubber Estate Limited, the gross amount payable on our 76 per cent holding being £27,930, from which Malayan income tax of £8,379 had to be deducted.

The recommended dividend of 10 per cent, less income tax, is the same as for the two preceding years, and £25,000 has been transferred to general reserve.

RECOVERY IN PRICE

There has been a welcome recovery in the price of rubber from the low point of 16d. to which it had fallen in March. The statistical position is in better balance; USA manufacturers have to book their requirements of GRS ninety days ahead with the RFC, but there has been no large-scale forward business in natural rubber, with the result that there is a fairly steady day-to-day inquiry for near shipment. The GSA have revised their rotation policy and if this is strictly adhered to there should be less room for complaint. The recession in USA business activity has had some effect on their sales of automobiles, but the tyre-replacement business has taken a seasonal upturn resulting in a reduction of inventories. The use of latex foam upholstery is growing apace, on its merits, and the offtake of rubber in this form is a welcome addition to the traditional outlets for the commodity.

I hope you have all read Lord Baillieu's speech to the members of the Dunlop Rubber Company which appeared in yesterday's papers, for it contains much of interest and encouragement to the producing side of the industry.

The long-term trend clearly indicates an expanding use for rubber, and it would be a great relief to the board of this company if the Indonesian Government would adapt their policies to the obvious needs of the section of the industry operating in their territories.

The report and accounts were adopted.

THE UNIVERSITY OF SHEFFIELD

Applications are invited for a post of ASSISTANT LECTURER in ECONOMIC STATISTICS, to begin duties on October 1, 1954. Applications from persons about to graduate will be considered. Salary scale £450 x £25 — £500, with F.S.S.U. provision and family allowance. Initial salary according to qualifications. Further particulars should be obtained from the Registrar, to whom applications (3 copies) should be sent by July 31, 1954.

A WELL-ESTABLISHED INDUSTRIAL COMPANY requires a Chartered Accountant, with costing experience, age 30 to 35 years. The post calls for strong personality and drive. A salary of up to £1,500 per annum is offered, but the successful applicant is expected to reach £3,000 within five or six years.—Full particulars of qualifications and experience should be sent in confidence to Box 682.

THE EDINBURGH AND EAST OF SCOTLAND COLLEGE OF AGRICULTURE invite applications for post of Research Assistant in Department of Economics, in either Farm Management or Marketing and Co-operation. Candidates should hold degree in Agriculture or Economics or Agricultural Economics, preferably with some post-graduate experience.

The post is tenable for period of three years from September 1, 1954, and carries a fixed salary of £400 per annum, plus pay addition, £40. It is a condition of appointment that subject to University approval the candidate works towards a higher degree.

Further information and forms of application from Secretary, 13, George Square, Edinburgh, with whom applications should be lodged within two weeks of appearance of advertisement.

so many projects depend on

Plessey

The Plessey Company Limited
Ilford • Essex
electronics • radio and television • mechanics
hydraulics • aircraft equipment

So diverse are the interests of Plessey in the Aircraft, Radio, Television, Electrical and Mechanical Engineering industries, that it is difficult to instance any large project in these fields which does not at some vital stage depend upon the Company. The service offered to top managements in industry or Government service is unique. Expressed briefly, it is the development of an idea through to prototype stage and on to production—cheaply, efficiently and in time to meet a market.

If you have a new product in rough outline that is ripe for specialist development you cannot do better than talk it over with Plessey.

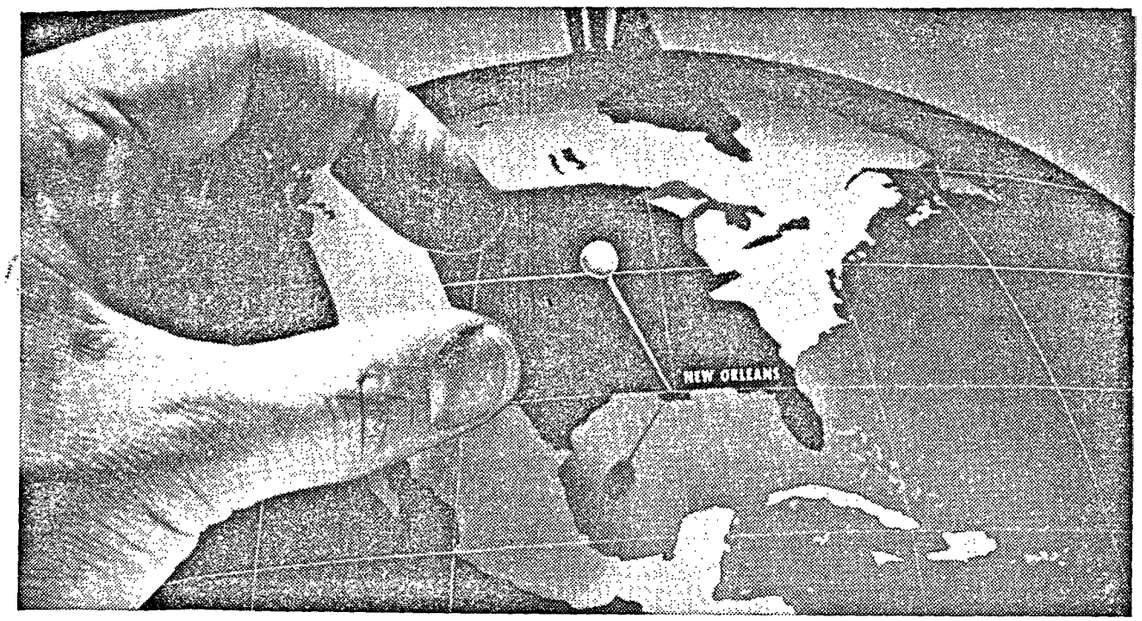
Here's where you pin down shipping savings



To or from any point in the Mid-Continent U. S., shipping costs can be cut by specifying *via New Orleans.* Inland freight rates are from 66¢ to $5 a ton *lower*—and just look at the many other savings:

1 Direct Savings in Money—

- Lower rail, truck, and barge rates to or from entire Mid-Continent U. S.
- The Port's Foreign Trade Zone No. 2 provides all the savings of a "free port."

2 Money Savings in Time—

- Shorter inland transit time, with network of rail, air, truck and barge lines. Faster handling between inland carrier and ship.
- Ample marginal wharfage and belt railroad mean no delaying "traffic jams."
- No delays due to weather—a year-round port.

3 Money Savings in Convenience—

- Complete handling equipment for all types of cargo.
- Banking facilities in New Orleans and throughout Mid-Continent—"Bank where you buy."
- International House and International Trade Mart give unique aid to importers and exporters, domestic and foreign.
- World-wide service by almost one hundred steamship lines.

Which savings are most important to you? Write for detailed information to:

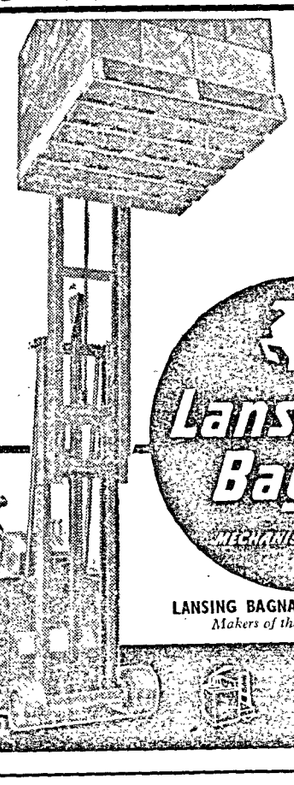
'Air housing' solves warehousing problems



Air space is free ! Make the fullest use of it—economically, with a Lansing Bagnall Fork Truck which manoeuvres easily in narrow aisles and stacks to a height of 10′ 10″. But that is only one of the many advantages. Wasteful man-handling can account for anything up to 50% of your costs. Let us show you the complete and really efficient solution which increases throughput and reduces non-productive man hours.

Whatever your product, however specialised you consider your activities, our range of materials handling vehicles will take the quickest way to economical lifting, shifting, stacking, storing.

FIXED MAST FORK TRUCK

Only the carriage tilts. Constant stability of load at all times. Overload indicator. Battery operated. Built-in charger. Models with load capacity ½ to 1 ton.

Time Limit for France

BETWEEN them M. Mendès-France and Chou En-lai have made the prospects of the Geneva conference brighter than they were last week. It is most unusual for a conference between the free world and the Communists even to look like producing profitable negotiation. The Chinese Foreign Minister appears to have lowered his price for peace by admitting that Laos and Cambodia are entitled to treatment different from that planned for Communist-infiltrated Vietnam, and the new French Prime Minister has raised his bid for peace by saying that he will get a settlement in Indo-China by July 20th or resign. This is something gained, at any rate for the moment, even if a full truce and a political settlement are still beyond the horizon ; but the price to be paid will shock many when they realise what it may be.

It is foolish and cowardly to evade two facts that hopefulness may want to hide in the weeks ahead. The first is that Communist terms for a political settlement with France in Indo-China—as distinct from the military terms for a truce—are not yet known. They may, as Mr Eden knows, be no less stiff for the amenable Mendès-France than for the buoyant Bidault. Public opinion, in France and outside, must be prepared for the possible loss of Vietnam right down to the Gulf of Siam—not perhaps immediately but in a matter of months. The second fact to be faced is that the Chinese concessions over Laos and Cambodia, incomplete though they were, came only when Mr Eden was on the point of ordering his aircraft. The Prime Minister, it is true, has denied that the Chinese acted under pressure of the announcement that he and Mr Eden were going to Washington ; but the moral remains unadulterated. Negotiation with Communists will be futile unless there is readiness to be tough and take risks. They interpret as weakness attempts to "improve the atmosphere."

The fact that the British Prime Minister and Foreign Secretary will be talking this weekend with President Eisenhower and Mr Dulles should, therefore, have a salutary effect in Geneva. For it is unlikely —though, alas, not impossible—that the meeting will leave Anglo-American relations as it finds them, or worse. What must be hoped is that it will prove to the world the inexhaustible powers of recovery of the alliance and show once again that it is never stronger than after a period of fever and relapse. Mr Dulles has had his lonely fling—at times it has been a sword dance—and Mr Eden has had his quadrille with the Communists and Mr Nehru. Each statesman should now find it easier to pick up the other's step.

Their reconciliation and agreement cannot, of course, stop at Asian matters, pressing though they are. The whole Atlantic alliance is in a sorry state as a result of its failure to prevent France from being squeezed into appeasement by Chinese pressure in Asia and by Soviet pressure in Europe. It is especially at Europe that they must look, at the base on which all policy—political, economic and military—must hinge. And there they will see the danger, more imminent than is

be honoured? India, for instance, has increased taxation upon its payments to ex-Indian civil servants. Will the oversea servants be left to carry all the risk?

Again, some territories cannot even now afford in strict terms the salaries and pension rights of their colonial servants. This is particularly the case of the poorer West Indian communities. If self-governing territories regretfully conclude that sound administrators are a luxury they cannot afford, has the last word been said on the subject? Sound administration is the first need and not the last luxury of any community, and Britain has a special interest in maintaining the stability and efficiency of what is a vital trading area. It would be wiser to reconsider the financial burden of the new Oversea Service and to ask whether a measure of subsidy to the service or even direct employment by Britain of the civil servants concerned might not better meet the case. The White Paper makes it clear that Her Majesty's Government has kept an open mind on this point. It should certainly be explored further.

★

Another doubt left by the proposed reorganisation is whether the sensitive feelings of the new governments will be entirely soothed by the service's change of name. Their need for effective administrators may be as great as ever, but they have to swallow a pill of pride before they admit the lack of local talent to do the job. Is an Oversea Civil Service the best way to meet this difficulty? In its present form, it envisages the recruitment presumably of men and women from Britain. They will, it is true, become the servants of the overseas government provided the financial terms can be negotiated, and, moreover, they will no longer be appointed by the Secretary of State but will be invited to serve by the local government—a difference of procedure that covers an important point of prestige. The fact remains that they will be officials drawn from the metropolitan power, the ex-master, the former colonial overlord. It is to overcome this possible barrier of prejudice that some people have suggested that the new service should be recruited from the Commonwealth as a whole, from the new as well as the old dominions, and that it should represent not a transformation of an old service but an expression of the new family of nations working together for their mutual social and economic advance.

Admittedly both the extension of the service in this sense—and indeed any financial underpinning of it by Britain—go beyond the responsibility of the Secretary of State for the Colonies, and it is at least satisfactory to learn from the White Paper that the establishment of the Oversea Service does not exclude the evolution of this wider scheme should it be thought desirable and practicable. But time for protracted deliberations is the one thing that the British Government will not be allowed to have. If its stipulations are honestly and conscientiously carried out, the White Paper should effectively defend the interests of the members of the new service. It is much less certain whether this is enough. The Commonwealth will soon have to meet its hardest test: will the African states, having achieved complete independence willingly remain within the Commonwealth and be willingly and unconditionally accepted? No one act or gesture can bring this about. But a Commonwealth Service, imaginatively conceived, might well create a unifying force, perhaps less powerful but at least more tangible than the common symbol of the Crown.

War Through the Looking Glass

LAST week Guatemala held a small but well polished mirror up before the face of a surprised world, which saw in it a reflection faithful enough except for the fact that, quite naturally, all the words were the wrong way round. The Security Council, at the first Sunday emergency meeting it had held since the invasion of South Korea almost exactly four years ago, heard a Soviet demand for immediate United Nations action to halt "naked aggression" in Guatemala—a demand made by the same Soviet delegate who just forty-eight hours earlier, had vetoed the sending of UN "peace observers" to Siam. Mr Cabot Lodge's rejoinder, a suggestion that the Russians should keep out of the western hemisphere, recalled to many listeners the fact that for the past six months Mr Molotov and Mr Chou En-lai have been persistently trying to exclude the United States from the affairs of Europe and Asia. Some organs of the Communist press found themselves, in one column, citing Munich and demanding that Guatemala be protected not by the "American-dominated" Organisation of American States but by Uno, while, in another, they were denouncing all idea of "intervention" in South-East Asia as warmongering and branding Uno as too "American-dominated" to be entrusted with the reunification of Korea. Here was paradox in plenty, and irony by the ton.

But that is not to say that the Guatemalan conflict can be dismissed as a local eccentricity, a bizarre exception to prove all the normal rules of international politics. True, its scale is not impressive. Despite the ringing communiqués issued by both sides and the black headlines in the world's press, the first days of the campaign have proved an affair of mule trails and small, slow-moving columns, with a handful of aircraft providing little more than diversionary tactics. Of the three million Guatemalans, the greater number must be remote from and scarcely touched by the present conflict; of a country which on the map appears nearly as large as England, the greater part is forest and mountain, thinly peopled or quite empty, and half a dozen key points suffice to control the whole area. Nevertheless, this is not a war in a teacup. It is a war in a test-tube. Not only great interests, but also great principles, are involved; and if the Guatemalan situation is mishandled, the harmful consequences will extend far outside Central America.

But what exactly is this situation? The only glib answers come from people less concerned with the truth than with fitting Guatemala into their preconceived patterns. On the one hand, those who see the contemporary world solely in terms of a Communist camp of darkness and an anti-Communist camp of light have naturally welcomed Colonel Castillo, the leader of the Guatemalan rebels, as a new ally, and accepted at face value his statement that he seeks only to liberate his own oppressed people. On the other hand, not only the Communists, but also many other people whose guiding light is suspicion of the United States have already cast the Guatemalan government of President Arbenz in the role of an innocent victim of foreign aggression inspired by Wall Street. A third school is inclined to see the whole affair as merely a variant of the familiar game of ins and outs that plagues so many Latin American republics.

Yet, while information about the latest events in and around Guatemala is far from complete, quite enough is known to show that none of these three oversimplified theories will cover the case. Colonel Castillo may well have genuinely believed that the Guatemalan people would rise against the Arbenz government as soon as he raised his standard; but their failure to do so has discredited his claim to be fighting against a hated tyranny. In turn, President Arbenz's charges that the invaders are foreign mercenaries acting for the United States will not hold water. His regime has forced into hostility and exile enough Guatemalans, including trained airmen and senior army officers, to make up a sizeable rebel force. And it is incredible to suppose that the United States government, having with infinite labour coaxed the majority of Latin American republics to agree that the threat of Communism in the hemisphere must be curbed, should order a proxy war in Guatemala just a fortnight before the opening of talks in Montevideo on the translation of that agreement into joint action.

It is, however, equally impossible to treat the conflict as merely a military *putsch* of the traditional kind. It differs from that in two ways. First, both the United States and the Communist bloc are openly committed as regards Guatemala. The extent to which the Arbenz government is guided by Communist back-seat drivers may be disputed; there is a clear discrepancy between the modest scale of its internal reforms and the doctrinaire extremism of its propaganda. But it is a matter of record that Mr Dulles and other responsible figures in Washington have condemned that government, root and branch, as a menace to the hemisphere; and it is equally noteworthy that the Arbenz regime is never criticised, but invariably supported by the Moscow propagandists—an honour accorded to no other government outside the Communist bloc.

The United States alarm at the appearance of a potential Soviet base in Central America is understandable enough, even if there is sometimes a tendency to exaggerate the strategic importance of Guatemala. But it is now painfully clear in Washington that many Latin Americans, Asians and even Europeans regard the State Department as Colonel Castillo's sponsors, and that, whether he wins or loses, mistrust of the United States is likely to increase among smaller nations. The position could hardly be more embarrassing for the Administration, which has repeatedly assured the twenty Latin republics that it will respect their sovereignty, and has begged them to grasp the Guatemalan nettle themselves. Lack of any reliable evidence of bonds between the rebels and the United States will not prevent Latin Americans, and others, from linking violent acts in Guatemala to violent words previously uttered in Washington. Meanwhile the Soviet government can, for once, adopt an attitude of outraged innocence and sound the tocsin of collective security, relying on the shortness of human memories to spare it uncomfortable reminders of its own attitude to earlier conflicts in Greece, Persia and Korea.

★

However, if the Guatemalan revolt were a purely internal affair there would be no more reason for outsiders to concern themselves with it than there was, for example, in the case of the Bolivian revolution two

Notes of the Week

Shadow over Summer

THE Foreign Secretary's interim report on the Geneva conference, delivered to the House of Commons before he left with the Prime Minister for Washington, contained elements of caution and warning; but these were almost swept away by the plaudits of an enthusiastic House. Mr Eden spoke of Britain's friends and responsibilities in South-East Asia, and of the visible risks of a wider conflagration; he pointed out that the fate of the present military talks must depend on a real desire for agreement, and that the kind of Asian Locarno that he envisaged was only a possibility, not a probability; and he concluded with a reminder to the Communists that if they stepped up the fighting in Indo-China they would endanger what he called "a chance—I do not put it higher than that" that the Geneva negotiations would produce an acceptable result. But this, it seemed, was not what the House, in its sunny mood, wanted to hear. Members on both sides reserved their applause for Mr Eden's more optimistic remarks; he was warmly supported when he proceeded to hand out bouquets, somewhat indiscriminately, to Mr Molotov, General Bedell Smith and M. Mendès-France; and his references to the value of British contacts with the Chinese were also well received. In glaring contrast, hardly a voice was raised to echo his warnings.

The debate thus reflected a most dangerous atmosphere of complacency. Without accepting the charge that current British policy can be likened to that pursued by Neville Chamberlain at Munich, or belittling the importance and the skill of Mr Eden's single-handed efforts at Geneva, it is reasonable, indeed essential, to reserve judgment on the question whether the conference will yet succeed in salvaging anything of lasting value from the wreck of French hopes in Indo-China. The Foreign Secretary himself has made it clear that he still harbours grave doubts; but with both the nation and its parliamentary representatives in a midsummer mood of mingled optimism and indifference, there is a harsh and urgent need for further recalls to reality—preferably from the highest level.

Still Waters at Geneva

THE captains and kings have now departed from Geneva, for the time being at all events. What do their lieutenants and viceroys remain to face? Three parallel sets of military discussions are now in train, for Vietnam, Laos and Cambodia. The first goal set for the Vietnam talks is the separation of the opposing forces into clearly defined zones; for the talks on Laos and Cambodia, it is the withdrawal of all foreign forces from these two states. The framework of the talks is thus a reasonable one; but as Mr Eden reminded the optimists in the House of Commons on Wednesday, what has been achieved so far is not an agreement but only an opportunity for the military commands to talk to each other and to seek an agreement. In these circumstances, the Foreign Secretary was fully justified in giving his warning that any intensification of the fighting while these delicate talks are going on would jeopardise all hope of a settlement. But will this warning be heeded by the Viet Minh, who have not in past weeks found any difficulty in reconciling talk of peace at Geneva with offensives in Tonking?

Meanwhile the negotiations on Korea, which were the original purpose of the meeting at Geneva, have reached their end with scarcely a whimper, let alone a bang. Nobody is surprised and very few can be disappointed. The Communist delegations had successively introduced a number of well worded formulae for a Korean settlement, but had never come near to acceptance either of the United Nations' authority in the matter or of adequate arrangements for free elections. Mr Eden has explained with admirable clarity that the allied offer to continue negotiations remains open on the understanding that there can be no compromise on these two principles. It is much to be regretted that Mr Attlee's main contribution to the debate on the subject was to declare that the real obstacle to a Korean settlement was the exclusion of China from the United Nations—a remarkable over-simplification, after his own admission that Korea had shown the world's resolve to stop aggression. Does Mr Attlee really believe that Mao Tse-tung's government, once seated in Uno, would open up North Korea to international supervision?

Sir Thomas Dugdale's Hair Shirt

THE Crichel Down report has stirred the Tory party to its primeval depths. Its pages crystallise years of Tory propaganda against bureaucracy, and the party finds it a bitter irony that so crushing an indictment of officialdom should be hung round the neck of one of its own ministers. But for this, Crichel Down would be assured of a high place in Tory mythology, perhaps even ranking with Ground Nuts. Constitutionally, however, the blame for the petty follies of Crichel Down can be laid only on the Minister Sir Thomas Dugdale, and it is to his credit that he has accepted the position with almost masochistic fervour, not only publicly in the House of Commons, but even when

brought to bay privately by the Tory Food and Agriculture Committee, to whom the hunting of Sir Thomas is becoming almost a quarterly rite.

The application of the rule of ministerial responsibility, though harsh, usually contains an element of justice. In the Crichel Down case the Tory backbenchers feel that Sir Thomas should have made his policy clearer to his officials and should have held a tighter rein on his department generally. But their basic charge against him is political rather than administrative; they feel that while no minister can be familiar with more than a small part of the detailed work of his department, a shrewder politician—a Morrison, say, or a Macmillan—would have smelt political trouble as soon as the first complaints dropped into his tray and the first questions were asked in the Commons.

The Tory MPs do not necessarily want Sir Thomas to resign, but they are remarkably united in demanding somebody's head; and Sir Thomas, to their embarrassment, insists that it must be his. By earlier political standards Sir Thomas would have been expected to resign already, but this practice is now right out of fashion and the Tories are not sure that they want to revive it. The farmers have been grumbling about Sir Thomas for some time, but the party as a whole seems to feel that his resignation at this moment might do more harm than good. The demand for civil service scalps will still be pressed; the party is only partly appeased by the setting up of an independent inquiry into the administration of the Ministry of Agriculture. Here again Sir Thomas has not been very astute politically. His decision to set up an inquiry was rather bold, and meant treading on some civil service corns. A cleverer politician would have played it up for all it was worth and would probably have thereby satisfied the Tory backbenchers of his anti-bureaucratic ardour. The guileless Sir Thomas seems, if anything, to have underplayed its value, so he can hardly complain if his party does the same.

Mr Attlee's Dark Horse

MR ATTLEE'S courage over German rearmament is being ill-rewarded by events. The Labour party's National Executive recently decided to launch a campaign to win support for the official party line of rearming the Germans through the European Defence Community; an explanatory pamphlet was to be issued and Mr Attlee and other prominent advocates of the policy were to address special regional meetings. The first move—the publication last weekend of the pamphlet—coincided with a fading of hopes of the ratification of EDC in France. The pamphlet, "In Defence of Europe," is ably and persuasively written, but from the day of publication much of it seems doomed to be academic.

It contains, however, at least one sentence of significance for the future—"If the (EDC) Treaty is not ratified, an alternative method of providing a West German defence contribution will have to be sought." Recent Labour declarations had laid so much emphasis on EDC that Mr Attlee had been suspected of trying to get out of his party difficulties in unscrupulous fashion. With so much opposition to German rearmament in his party, he was suspected of seeking to avoid backing a loser by putting his shirt on a non-starter. But nothing could be more explicit than the sentence in the pamphlet; he is committed to finding some horse to back, although with the reservation that if a German jockey is put up the horse must carry plenty of weight.

In so far as it explains the general need for rearming the Germans, "In Defence of Europe" has still a vital part to play in the argument within the Labour party. Unless in the meantime M. Mendès-France finds a palatable alternative to EDC, Mr Attlee now faces the prospect of having to ask the annual Labour party conference in October to give him a blank cheque to support German rearmament as a general principle. The party is likely to be even more reluctant to accept this than the specific plan for EDC. Seeing events moving slightly in its direction, the party Left wing has been the more annoyed about the BBC's programme on German rearmament. Mr Bevan claims that this was an intervention in Labour's private controversy, but the next few months may prove his attitude too parochial. If EDC becomes a dead letter the controversy over German rearmament is likely to spread far beyond, as well as across, party boundaries.

TV Bill Through the Commons

SPURRED by the guillotine, the Government's Television Bill received its third reading in the Commons on Tuesday by a majority of 26 and is now on its way to the Lords. Ministers must be very relieved to see it go, especially Mr Gammans and Sir David Maxwell Fyfe, who were in charge of it, for its passage has been arduous and difficult. The Bill is a product more of politics than of logic; it is the sort of measure, of which every government has a few, that is very easy to attack and much more difficult to defend. Ministers have been under very heavy fire, with relatively little support from behind. Moreover, they could not stick to their prepared positions; the Bill has been considerably altered in its passage through the House, and though some of the alterations were concessions to the critics, others involved a forward movement in the teeth of their hottest fire. Ministers are obviously getting frightened lest, with such an elaboration of safeguards against the wickedness of the advertiser, he should in the end refuse to provide enough revenue to keep the alternative programme going. Accordingly, some limit has to be set on the arbitrary powers of the Independent Television Authority.

Some of these last-minute amendments led the Opposition to accuse the Government of bringing sponsoring in by the back door; Sir David Maxwell Fyfe indignantly denied that the evil creature was being allowed even to put a paw over the lintel. This is a fair sample of the artificial sloganised atmosphere in which the subject has been debated. If the advertiser is going to provide the major part of the revenue, his wishes will inevitably have some influence on the programmes, even if it be an indirect one. The only way to avoid that would be to give the ITA a revenue from licence fees larger than its revenue from advertising. But why try to exclude all tincture of commercialism? As one member pointed out, it keeps creeping into the BBC itself. The essential thing is that it should

not be dominant, and that is quite compatible with a certain amount of advertising revenue. Imposed total abstinence is as ridiculous a policy in this field as in others.

It will be interesting to see what happens to the Bill now. Their Lordships will certainly bark, and some of them will want to bite. Some of them will be attracted by the argument that it will be a good thing for the Lords to show they can oppose a Conservative government as well as Labour—especially since the Government will have the last say when the Bill returns to the Commons. But most of them will have a vision of the struggle that poor Sir David Maxwell Fyfe would then have to put up against two fronts—and two fronts of outraged morality at that. They will want to spare him such a dreadful embarrassment.

Four Thursdays to Go

FRANCE'S best political commentators have hailed the parliamentary success of M. Mendès-France as something of a "miracle." It is not easy either to explain why a miracle happened or to speculate on how long it is likely to last. It had been generally expected that M. Mendès-France would be unable to muster a sufficient number of non-Communist votes to form a government, thus proving that without the Communists there is no alternative in the present assembly to a centre-right coalition. But the incalculable French deputies managed this time to baffle the students of form. The clouds that had gathered in Geneva and threatened doom to the Laniel cabinet suddenly lifted. By a stroke of parliamentary genius M. Mendès-France asked for just a month to take advantage of this brighter weather. With the country sick of the Indo-Chinese war, could the assembly refuse "four Thursdays" to a man promising to achieve a solution or resign?

Yet this is only half the explanation. More than this was needed to win 320 non-Communist votes for M. Mendès-France. On paper his objectives in Indo-China do not differ from those of M. Bidault: to do everything to negotiate a settlement, while building up military forces for every eventuality. Indeed, the new minister of defence, General Koenig, had been busy in recent weeks with various schemes to reinforce the French expeditionary force. By giving M. Mendès-France the votes it had refused to MM. Laniel and Bidault, the Assembly thus implicitly confirmed the charge that M. Bidault's efforts for a compromise had been half-hearted. But this gesture of non-confidence applied to the past even more than the present: to the eight years of almost uninterrupted MRP rule at the Quai d'Orsay. There is a strong feeling in the country that French policy during that period had missed its chances, lost its independence, and become an ineffective echo of Washington. This anti-American wave, paradoxically strengthened by French reverses in Indo-China, has now reached the Palais Bourbon, where the new prime minister has the reputation of being very pro-British but less attentive to Washington than his predecessors. Above all, he appears as a new and bold man who had the courage to stand outside the tragic governmental "merry-go-round" of recent years. The Assembly expects from him a fresh start, a clean slate; in a mood of hope mixed with despair it has decided to back an outsider.

Leftist on the Right

How long can such a mood prevail over party interests and parliamentary calculations? Indo-China will obviously be the new leader's first task; but he has also promised to face in the near future the problem of the European Defence Community and to clarify his economic policy. On the first matter he announced his intention of seeking no more than a compromise acceptable to a large majority; even this clever move may cost him a few precious votes of whole-hearted partisans of EDC. Yet it is in the economic field that M. Mendès-France is most likely to meet the fate of his predecessors.

His victory did not prove that a centre-left grouping is possible in the present assembly; it has merely shown that in time of crisis the parties are capable of patching up yet another strange coalition. The man who was symbol of a leftist revival now heads a team based on the right and centre. He has spurned Communist votes and has no Socialists in his cabinet, though he is greatly dependent on their backing in the chamber. Should his economic policy attack vested interests, it will lose him right-wing votes; should it be austerity with no compensations for the workers, it will drive the Socialists into opposition; and discounting the Communist vote M. Mendès-France has scarcely more room for manœuvre than M. Laniel had. Years of preaching in the desert have enhanced his stature, but he may well soon lose his path in the shifting sands of governmental politics. It is difficult to prophesy how far he will be carried by the present mood of despairing enthusiasm, but on balance it would seem that the rule of M. Mendès-France will be judged as an interval—an important and significant interval—rather than a turning point in the history of the Fourth Republic.

"At the Highest Level"

MR ATTLEE remains inquisitive and the Prime Minister remains rather elusive about the idea that there should be a great power meeting at the highest level. No one knows, except Sir Winston himself, whether President Eisenhower will be asked once again to consider it, even at the risk of his refusing. But there is one aspect of the matter that is seldom considered. Assuming that the American President and the British Prime Minister could be brought together in Moscow, or with someone from Moscow, who would the Soviet representative be?

Malenkov is Prime Minister of the Soviet Union and should, therefore, be the man. On the other hand, the Kremlin has been at some pains to avoid giving the impression that Malenkov now wears the mantle of Stalin. In the first months of the new regime, it is true, he was presented as *primus inter pares* (in accordance with the principle of "collective leadership"); but since the fall of Beria the star of Khrushchev, the new first secretary of the Party, has been rising. His sixtieth birthday was celebrated with exceptional pomp and he received more medals than even Malenkov received for his fiftieth birthday. He has been conspicuous not only as leader of the vital campaign for bigger and better agriculture but also as special emissary to Communist parties in Eastern Europe, where he attended first the Polish and then the Czech congresses. He is, however, a party boss, not a minister, and his supporters could hardly assert his right to meet the American head of state.

There is clearly rivalry and doubt in the Kremlin about the succession to Stalin, about whether there is to be one boss or, so to speak, a boss-ship. If Sir Winston proposed a meeting with the Soviet head of state he might, therefore, cause quite a lot of embarrassment. The Soviet leaders would doubtless be able to decide who should represent them in such talks if they believed them worth while. But Moscow must be highly satisfied with the recent turn of events, and the handling of policy by Mr Molotov. From its point of view his tactics, particularly at Geneva have been wholly successful in straining, and almost breaking, western unity. Could they expect even better results from talks at the highest level? Surely not unless Sir Winston went to Moscow alone—which is, presumably, out of the question.

Steamhammers and Nuts

WHEN the Labour government used to rush its legislation through Parliament, with the aid of guillotine and kangaroo, accusations charging tyrannical behaviour flowed freely from the Conservative benches. During the last three years the position has been neatly reversed. A Conservative government normally has less use for rapid legislation; but, in the difficult circumstances surrounding the denationalisation measures, it has not hesitated to stoop to the same devices. The allegations of tyranny have been met with counter-allegations of obstructionism, and seasoned parliamentarians have joined in spirited debate on the relative blackness of pot and kettle.

Up to a point this has been good parliamentary fun, and most people can see the need for arming governments with these powers. But they can be used too often, and an example was provided last week in the relative obscurity of the Scottish Standing Committee. The debate on the Town and Country Planning Bill had to be completed within a time limit that clearly prohibited discussion of the 66 clauses and 92 amendments outstanding. The latter included 26 new amendments, together with one new clause, which the Secretary of State had himself just introduced. The only way of debating the Bill properly was for the Opposition to sacrifice time already earmarked for discussion of the Estimates. Sooner than do this the Labour members walked out of the committee in disgust, leaving the Bill a free passage.

No doubt the pride of Scottish members is easily punctured by any suspicion of cavalier treatment. Doubtless too it would be amazing for the Government to have either to forgo its own last-minute amendments or else to put the Bill back into cold storage until next session. But the Bill was no major measure to be forced through against obstructionist tactics; it was a relatively minor and uncontroversial measure which the Government itself wished to change. As the dangers from delegated legislation grow, the greater is the need for adequate and fair debates on the original statutes. The Conservatives should be the first to recognise this principle; certainly they have the most to lose from its neglect.

Moves Over Boundaries

IF the Boundary Commissions' recommendations for reshaping the present electoral jig-saw ever reach the statute book, it will not be the Labour party's fault. The publication of the English commission's final proposals—for London and Lancashire—has released a flood of grievances, both general and particular, directed against the sweeping interpretation that the commissioners seem to have put upon their instructions. On balance, these latest proposals will eliminate three seats, one each in London, Manchester and Blackburn; as a result, the number of extra seats in England that will result from the proposals as a whole will be reduced from eight to five. Proposals from the other commissions—notably from Wales—have still to come in, and some more local inquiries have still to be held. It seems probable that the Opposition will then try to get the Home Secretary to refer the recommendations back to the commissions before they reach the form of draft orders in council.

The Labour party does not assert in public that the proposals may hurt them electorally and initial fears on this score may prove to have been exaggerated. But it maintains that the commissioners have laid too much emphasis on the requirement that each constituency should contain as nearly as may be the same number of people, and too little on the equally explicit instruction that local boundaries should be respected as far as possible. The commissioners have certainly been less scrupulous than formerly in avoiding violations of local government units, and some ridiculous anomalies have been created, such as, for example, the moving of Wandsworth Town Hall right out of any of the five Wandsworth constituencies into Battersea South.

Even so, it seems that the commissioners have not been very successful at producing greater electoral equality. Although drastic changes have been made with this presumed object, no fewer than five new constituencies have been created with well under 50,000 electors, when the electoral quota stands at over 57,000. This gives the impression that the commissioners are merely making changes for changes' sake. But the Conservatives can hardly be expected to drop the proposals just because the Labour party does not like the way they are working out in practice.

Communists in the ILO

THE presence of the Soviet Union for the first time at a conference of the International Labour Organisation has provoked some heated and bitter debates at Geneva. The credentials of both employers' and workers' delegates from Communist states were challenged with the argument that they were not truly representative of either employers or workers but were, in fact, additional government delegates. The matter was referred to the credentials committee,

which last weekend eventually endorsed, by a majority decision, all the disputed credentials ; its decision was later upheld at a plenary session of the conference, but the voting showed that the delegates were deeply divided.

The challenge to Communist workers' delegates would seem to be on much firmer ground than the challenge to Communist employers' representatives ; for it is generally agreed, although it may be difficult to prove, that Communist trade unions are not free and democratic associations, whereas nationalised industries are not purely Communist phenomena and the complicated problems of representation that they pose cannot be solved by simply refusing to accept delegates from those who manage them. But speeches at the conference made it abundantly clear that the crux of the matter was not the correct interpretation of the ILO constitution (after all, some Communist countries have belonged to the organisation for years) but the fear that Russia has only joined the ILO in order to throw a great many spanners into its works.

Admittedly the chances are that the Russians, who in the past have heaped a great deal of abuse on the ILO, have at last entered the fold for no good purpose. Admittedly, too, all the Communist delegates will in effect act as their government's agents. But it is surely rather hysterical to suggest that these delegates, who are outnumbered by at least seven to one, can seriously disrupt and sabotage the work of the ILO. To turn any of them out at this stage would be to hand the Russians a splendid propaganda weapon ; it would also deprive them—even if they are unlikely to profit by it—of an opportunity of seeing how labour relations are handled in the free world. But if Soviet Russia and the other Communist countries consistently fail to carry out their duties and fulfil their obligations as members of the ILO, then is the time to think about expelling them. In this case, as Sir Walter Monckton said, "the proof of the pudding is in the eating."

Turkey's Debts

IT is time that something was done about Turkey's commercial debts. For many months imports into Turkey from a number of its partners in the Organisation for European Economic Co-operation (OEEC) have been cluttering up the bond-stores at the ports, not because the importers have not paid—mostly the bills have been scrupulously met in Turkish liras—but because the National Bank has been unable to find the foreign currency to effect transfer to the creditors. Britain and West Germany are the principal creditors ; roughly £10 million is owed to British firms and about £20-£30 million to the Germans.

Recently the Turks, after entertaining Dr Adenauer, sent on his invitation a team of financial experts to Bonn to talk about debts and the future of German-Turkish trade. By the end of May the discussions were over and, although no official details were released, some kind of agreement was fixed up. According to the German press, arrangements were made to clear the arrears by the end of August—a formidable task—by expanding German imports of Turkish grain, chrome, cotton and copper. Earlier attempts to work off the arrears in this way had failed, the obstacle being Turkey's inability to produce the required amounts of grain, at reasonable prices and in satisfactory qualities. The figure of 400,000 tons of grain mentioned in the reports seems over ambitious, and it must be doubted also whether the Turks have storage and port facilities, not to speak of the shipping, to meet this heavy commitment.

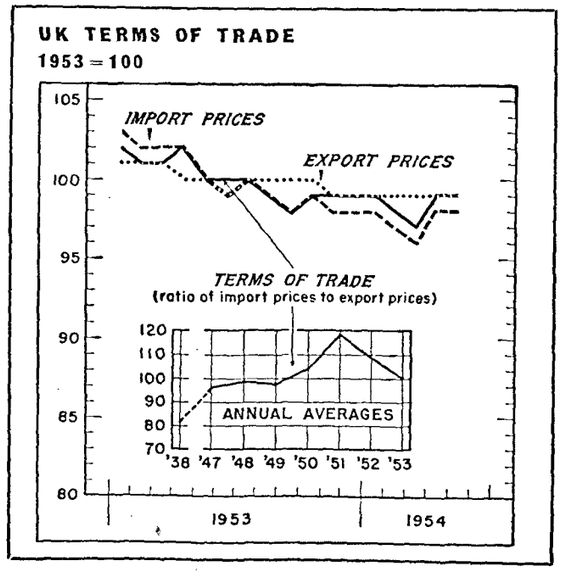
British creditors will find little to please them in the outcome of the Bonn negotiations, for it is unlikely that a similar plan to increase Turkish exports into Britain would succeed. Indeed, in the present glutted world wheat markets it is hard to see how the German market will absorb the Turkish wheat, unless the government is prepared to accept a loss on it. But what irks the British creditors most is the apparent desire of the Turkish government to play fast and loose with its various creditors. It has a clear obligation to treat them, as far as possible, alike. The principle should be oldest debts first, no matter what the nationality of the creditor. And the proper place for negotiating a settlement is in the OEEC.

Vicious Circle in Prague

DELEGATES to the tenth congress of the Czechoslovak Communist party may have felt flattered and impressed by the presence amongst them of no less a person than Comrade Khrushchev from Moscow ; but it can hardly have been an inspiring occasion. Economic matters dominated the proceedings ; and the speeches of the party leaders were largely résumés—and not even brief and concise ones—of all the directives, complaints and cajoleries that have been showering on Czech workers and farmers for months past.

A great deal was said about increasing the output of the farms, especially of meat. Czechoslovak farmers, who are now, according to the Premier, Mr Siroky, producing roughly the same as before the war, are to have their own special two to three-year plan ; by 1957 they are to increase the average yield of wheat by at least 12 per cent and fodder beet by 30 per cent, and they are to increase meat production by 26 per cent. Lack of manpower is clearly felt to be a major obstacle. Country people have duly gone to swell the industrial labour force, but their loss on the farms has not been made good, as it should have been, by increased mechanisation. By 1957, 320,000 people are to be drawn back into agriculture. Farming is to be made into a desirable career and what Mr Siroky calls "suitable social conditions and the preconditions of a rich cultural life" are to be created in the countryside. But it is doubtful if the Communists will succeed in selling the attractions of a country life so long as they nail their colours so firmly to the mast of ultimate collectivisation. There is, it is true, to be no compulsion ; but the emphasis on a new deal for the private farmer that marked the "new course" policy introduced last autumn is now largely swamped by solicitude for the collective farms.

For the industrial worker, however, the "new course" still seems to promise some benefits. The Communist leaders are worried about inadequate supplies of coal, electric power, and other essential raw supplies for industry ; about severe shortcomings in the transport system ; about the "recurring failure and bad quality" of the engineering industry's output. But even more they seem to be worried about the inadequate supplies and poor quality of consumer goods. Last April there was another series of price cuts, but they clearly realise that it is worse than useless to cut the prices of goods that are not there to be bought. Czech industry is falling down heavily on its export orders, especially to the Soviet Union, and the Communists seem to feel that frequent doses of something nice are needed to overcome the absenteeism, apathy and general passive resistance of the Czech workers. Unfortunately, however, the provision of the remedy itself requires the active collaboration of these same workers ; the Czech Communists are caught in a vicious circle.



Too Many Parks?

THE National Parks Commission is an energetic body. It has created six national parks to date, and recently public inquiries have been held into its designation of two other areas (the Yorkshire dales and Exmoor). At the Exmoor inquiry this week, Somerset and Devon County Councils opposed the proposal on the ground that no case had been made out to justify the administrative cost. There was no shortage of tourist facilities in the area, and there was no immediate threat to its natural beauties. Then why bother to create a joint board and to appoint special staff ?

The commission took the view that its sole job was to decide whether a tract of country was "of national park quality." There was no need to demonstrate specific need or benefit. This view of its rôle is grossly inconsequential. Half the area of Britain has enough in the way of natural beauty to justify its being turned into national parks on this basis. In any case it is not enough to choose areas of outstanding scenery which warrant careful protection. Fully adequate powers are available under the Planning Acts to protect all such areas—if there is sufficient desire by the local authorities and forebearance by central departments to do so. But if these conditions are lacking the elevation to parkhood will not (as the vicissitudes of Dartmoor demonstrate) prevent an area from being spoiled.

Something more is needed to justify the expense of creating the special machinery of a national park. The Peak district is an example of a well chosen park. Not only has it great beauty, but it is also much visited from the surrounding towns. It is the scene of strong conflicts over land use between the claims of recreation, agriculture, mineral development and so on. Several counties are involved whose energies are mainly absorbed in dealing with the urban and industrial parks of their areas. None of these circumstances applies to Exmoor. The Yorkshire dales are a slightly better case, since the proposed park is close to urban areas and is controlled by one of the largest and busiest county councils. Before yielding to the commission's desire to show an impressive list, Mr Macmillan should consider whether there may not be almost enough parks already. If so, the few to be added need careful choosing.

The Customs of the Customs

SOME holiday makers on a day excursion from Folkestone to Boulogne had an unpleasant shock last week when they returned to England. They had heard an announcement on board that they were allowed to take half a bottle of brandy or other spirits and 200 cigarettes into the country duty free, and most of them acted accordingly. When they got to Folkestone they were told they must pay the duty, and that the concession did not apply to people on day trips.

The workings of the British customs at least appear less capricious than they used to. In law everything purchased abroad is dutiable—except one or two items like books—and everything must be declared. In practice concessions are made, and about three years ago HM Customs and Excise made public the items that the traveller can be sure of bringing in duty free. These are: up to half a pound of tobacco or its equivalent in cigars and cigarettes ; half a bottle of spirits ; a bottle of wine ; and half a pint of scent and toilet water, of which not more than half can be scent. The idea behind this concession is that duty should not be charged on things that the traveller might normally be expected to carry about ; it is not intended to enable him to "stock up." The concession is not likely to be extended to day trippers because there is already some concern at the amount of revenue "lost" since a million returning travellers a year have known just what they could get away with.

Not that the gambling element of going through the customs is ended. Officials are usually generous about small purchases ; but it is a matter for their discretion, and experience shows that young customs officials are more zealous than older ones and that it is imprudent for the traveller to have a swarthy and sophisticated appearance. There is a case for eliminating inequities by the introduction of a system like that of the United States, where the returning traveller is allowed to bring in goods worth up to $500 in any one year. The amount need not be large, but it would be humane to give official recognition to every tourist's desire to bring back small presents and souvenirs.

German Money Worries

THE controversies over German rearmament are finding curiously little echo in Federal Germany itself. There the main topic among business and industrial circles is the capital market, and whether it will soon be possible to borrow at rates that will compare less unfavourably than at present with their British and other competitors. Germany's new taxation laws are still not in force, owing to disputes between Dr Schäffer, the Federal finance minister, and the *Länder*. Until they operate, the capital market will not permit German concerns to achieve their aim of making long-term bond issues at five per cent. At present, the difficulties met by industrial borrowers are not due to the public's shortage of money. They are caused by the government, which some years ago unwisely removed or reduced taxes on state bond issues, and on mortgage bonds for "social housing" and shipbuilding. The result was that funds flowed into these investments, and the public authorities raised more money than they needed; and to compete with these privileged borrowers, industrial companies have to offer a yield of eight or nine per cent for short-term bond issues. Furthermore, until Dr Schäffer's tax cuts are in force, dividends, though they are steadily rising, cannot reach the level that would attract buyers of new shares. The action of the *Bank deutscher Länder* in cutting bank rate to 3 per cent has simply made the yawning gap between short-term and long-term money wider than ever without helping the market.

Herr Abs, head of the Suddeutsche Bank, has recently given an example of the absurd kind of transactions that are now being carried out owing to this distorted situation. A bank, he declared, bought bonds carrying reduced income tax. The institution whose bonds were bought left the proceeds of the sale with the bank that bought them. With these funds the bank then gave an "investment credit" to an industrial concern, which used the credit to invest, not in plant, but in tax-free state bonds, which were deposited with the bank as security for the credit. This mad hatter's method of financing and investment will go on until Dr Schäffer's taxation bill is in operation, and that cannot be until next year. If, in the meantime, German industrialists and the public realise that it may be threatened by the need to meet increased defence costs, their readiness to rearm will be severely damped.

Pakistan Looks Both Ways

THE arrival in Turkey earlier this month of Mr Mohammed Ali, the prime minister of Pakistan, is a big occasion for both countries. For the Turks it is living proof that the policy of giving a new form of leadership to the Middle East is beginning to bear fruit. They have, it is true, prided themselves on being a European power; but the Turkish-Pakistani alliance is being developed as a hard-headed piece of realism. It will serve the twin ends of making Turkey the link between Nato and any future defence system to be created in the Middle East, and a valuable, if not an essential, basis for that system.

For Pakistan the alliance has three significant aspects. Like the Turks, the Pakistani leaders in Karachi have long been worried about the vacuum in the Middle East, but there has been a clear division of opinion about the way to fill it. Until lately the main trend of Pakistan's thinking has been towards an Islamic bloc, in which it might play a leading, perhaps the leading, role; yet the Turks are now said to insist that the new pact, whatever else it does, must have no formal Islamic character.

The other aspect of the treaty is often overlooked. This is the fact that it can have little appeal to East Pakistan, which lives in the political atmosphere not of the Middle East but of South East Asia. Apart from the new military aid agreement with the United States, this treaty with Turkey is as decisive a step as Pakistan has ever taken in international affairs. That it should attempt to turn the country westwards, when the East Bengali is already at loggerheads with Karachi, may yet make it a factor in helping to split Pakistan. Karachi's effective influence in the Middle East cannot be rated very high until the existing divisions between East and West Pakistan have been bridged.

England's Competitors

What is true of other countries is true of our own. As there is scarcely an article provided by one of them, but some of it, or some substitute for it, can be provided by some other, so there is hardly any article supplied by England but may now be supplied, though not in equal quantities nor at as low prices, by some other countries. Machinery, as well as cloth, is now made in the United States, in Belgium, and in France. It is our duty to look ahead, and look at all possible contingencies; it is especially the duty of statesmen to look at these facts, and remove all obstacles to our success in the universal competition, from which no art can now save individuals or communities; and as we can, in emergencies, draw supplies from other countries—dispensing certainly for a time, perhaps for ever, with the products of Russia for example—we may suppose it possible, at least, that other countries may dispense with our products if we make them difficult of acquisition. Our trade has rapidly and continuously extended, because we have been able to supply the commodities we have sold at continually falling prices. Our increasing skill and knowledge has made us more and more serviceable to other nations. We must take care not to lose by an erroneous policy or negligence this important advantage. To secure it, we must not only know what is going on abroad, what other people are doing, what they are learning, and what they are making,—we must also adapt ourselves to their wants and our markets to their means, that we may successfully extend the trade which is the chief part of our greatness. Some persons in the United States expect to profit at our expense, in consequence of the war—not very wisely, for whatever injures us will injure them. They can, we believe, derive no benefit from it though we, in prosecuting it, may hamper our own industry and exclude ourselves from making advantageous exchanges. Happily the doctrines of free trade are now so firmly established, that even to prosecute war they will not be departed from; and experience has demonstrated that it is only by extending the application of them that the means of great national expenditure can be obtained without causing national injury.

asbestos cat

Only an inhabitant of the lower regions could possibly have any use for an Asbestos Cat. But if our export department received an order for one, they would scarcely turn a hair. Seriously, the uses of Asbestos in industry are growing at a fantastic rate.

Apart from its first great natural property, the fibrous structure of asbestos renders it easily adaptable to many uses, often in combination with other materials. It can be spun, woven and moulded. We, ourselves, turn it into many products. Amongst these are Caposite and Caposil, both Preformed and Plastic heat insulations, also Capasco Moulded Brake Linings and Asbestolux Incombustible Building Board. It is available as yarn or cloth, as mattresses for locomotive boilers and also has its uses in those transports of delight, the jet liners.

Asbestos may solve some problem that's proving a bit of a headache in your branch of industry. If you think so, consult the people who know best about Asbestos . . .

It shall not burn

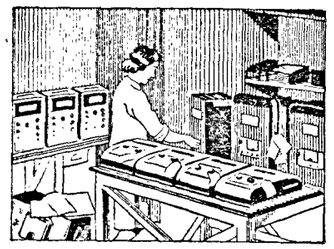
At last, nuclear knowledge brings to every building, office and industrial enterprise, a sure and certain means of fire prevention which is now available to all.

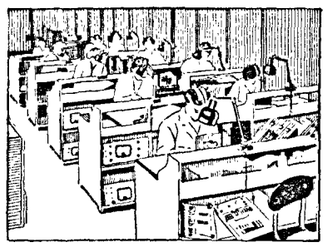
WHAT DOES IT DO?
Minerva instantly detects the first trace of smoke from any smouldering material.

HOW DOES IT WORK?
The activating source of the detector is a particle of radio-active material with a theoretical life of more than a thousand years. No current is consumed while the detector is on guard. The entry of smoke triggers the detector.

HOW IS IT INSTALLED?
Each detector is no larger than an electric light bulb and can be fitted as simply.
Only one is required in a room or for every 1,000 sq. ft. of floor area.

WHAT DOES IT COST?
Only the cost of the simple wiring—the detectors and signal equipment are hired to the user by the makers at a low annual fee which includes servicing and free replacements.





Approved and adopted by the Admiralty and Air Ministry, and already installed by many hundreds of industrial and Government organisations throughout Europe, including leading shipping and airline companies.

Letters to the Editor

Iran Must Decide . . .

SIR—It is sad to see that a journal of *The Economist's* calibre has produced a modern Hajji Baba's aphorisms as evidence on "Iranian national predilection for doing nothing and letting matters take their course."

Curiously enough, in recent years very little of substance and insight has been written in England on the Iranian spirit and character. Politics, finance, transport, mineral resources and even flora and fauna have all received their full and profound share of English research, but, alas, not the eighteen million people who inhabit the Iranian plateau ! Since Professor Edward Browne's monumental "Literary History of Persia" and "A Year Amongst the Persians," published before the First World War, little of distinction can be traced in English letters which provides a key to the predilection and trend of thought of the people of Iran.

At this critical stage in oil negotiations when the people and Government of Iran have come a long way towards a practical solution of the oil problem and consolidating their friendship with the British people and Government, it ill becomes responsible sections of the British press to treat Iran in a casual and cavalier manner. There is a striking opportunity for Britain to show the Iranian people that she has no intention of thwarting her social awakening and is, in fact, prepared to help the national and social aspirations of the mass of the people as she did in 1906 when Iranians fought for and gained their Constitution.

To suggest that "the Iranians want to leave all decisions including technical ones to the whims of an Iranian governmental body," and that the solution of the oil problem is now "up to Teheran," is posing an entirely false dilemma. Any arrangement on an equitable and just basis consonant with the full sovereign rights and *amour-propre* of Iran would be welcome to the Iranian people and Government. The Oil Consortium would contribute effectively to solution of the oil problem if they set their sights on a long-term policy of public approbation and support in Iran, rather than solely on short-term commercial requirements. To achieve economic stability, it is essential that production of Iranian oil should be commensurate with Iran's position in the Middle East, as well as her pre-eminent production potential. It would be well to remember that a solution of the Iranian oil problem would not only settle the issue of the day, but of tomorrow, too, and would consolidate the political equilibrium of Iran and the Middle East.—Yours faithfully,

A. H. HAMZAVI,
Iranian Embassy Press Counsellor

What is the Public Interest?

SIR—Your editorial registers surprise at the surprise of the public at the Crichel Down report. We have certainly been warned—not least by you, Sir—long enough. Many for more than a generation have said this kind of thing not only could, but would have to, happen here; that it could not help happening. Yet press and public seem indignantly surprised, as though there were no moral writ plain for all to read, from Cicero on "offices" to Mr James Burnham or the newest Fabian pamphlets, from the old serfdoms to the new, from Gogol's *Dead Souls* to the present Russian praesidium's admissions of bureaucratic anti-social arrogance and *esprit de corps*.

But if (as you say) "the new despotism" is a reality, who made it one, and why? Is it fair to blame functionaries for effects which too great and too detailed power over citizens on the part of the state must always cause? Is it fair to blame a Minister? These effects necessarily stem from policies and methods deliberately pursued by our political parties, their leaders and (be it remembered) their followers. The overwhelming majority of our people wanted it this way, and they have got it. If, now they have it, they dislike what the worst tyranny of all—that of the majority—brings, they can think again or lump it.

Happily there is evidence that, on left and right, they are thinking again. Realisation has spread that our familiar rules of ministerial responsibility, functionaries' immunities and executive anonymity arose when the citizen's freedoms were at their widest and were protected by an overriding "rule of law." That rule no longer protects, no longer overrides, and the citizen's freedoms are fewer and thinner. Fabians, other Socialists, Tories and Liberals now publish their misgivings about this "new despotism"—whether it be manifested in such bodies as the Coal Board or BBC, a trade union, a trade association, or an agency of the state itself. People begin to realise that even the biggest oligopoly or quasi-monopoly in private enterprise must face *some* competition or risk starting it up; that such powers in private hands are far less abusable and abused, far less threatening to employees or customers, than are these newer monopolies in public affairs. Monopoly makes despotisms; *despotism* depends on bureaucracy; so bureaucracy becomes despotic.

A whiff of competition anywhere along the line works wonders. The Crichel Down case would not have occurred—or, if it had started, it would have earlier come to light and been scotched—had there been any independent and offsetting power, public or private, to which the citizen could go. In the case of too many of our omnipresent monopolies, the employee, customer, or citizen can go nowhere—either for satisfaction or alternative employment. In the past generation you, Sir, have regularly and cogently put the case for such "built-in competition" in both public and private enterprise. Now people seem readier to learn.—Yours faithfully,

London, W.1 GRAHAM HUTTON

First Editor

SIR—The recent advertisement of a new edition of your centennial volume "*The Economist*: 1843-1943" prompts me to write of an item in regard to James Wilson that I think has never appeared in print. In September, 1953, when I was a member of the American Lend-Lease Mission to India, I visited the grave of James Wilson in the Lower Circular Road Cemetery in Calcutta. That he is buried there is known to those who have read his sketch in the Dictionary of National Biography, but I have never seen any reference to the barely legible epitaph on the gravestone. This is such a concise statement of the life and public services of James Wilson that I think its text would interest you and your readers.

SACRED TO THE MEMORY OF THE
RIGHT HONOURABLE JAMES WILSON:
Who was expressly sent from England
to restore order in the finances of
India at a period of disastrous
confusion.
He proposed several important measures
for that purpose,
But died from the combined effects of
climate, anxiety and labour
Within eight months after his arrival
in India.
Mr Wilson was one of the soundest
political economists,
Safest financier and best administrator
in his generation.
He contributed to the adoption of a
Free Trade Policy in England by a
long series of elaborate meetings,
As well as by protracted exertions in
Parliament and in office.
He was Secretary of the Treasury
during two administrations,
Besides spending many laborious years
in other departments of State,
And his aid was often sought by his
political contemporaries
When economical difficulties required
investigation,
Or grave financial work required to be
done.
Mr Wilson was born at Hawick in the
County of Roxburghshire NB on the
3rd day of June, 1805,
And died at Calcutta on the 11th day
of August, 1960, aged 55.

—Yours faithfully,

FRANK W. FETTER

Evanston, Illinois

Books & Publications

The Art of Diplomacy

THE EVOLUTION OF DIPLOMATIC METHOD.
By Harold Nicolson.
Constable. 93 pages. 10s. 6d.

THE historian, the *causeur* and the professional diplomat all show to brilliant advantage in Sir Harold Nicolson's Chichele Lectures. As he sketches the ups and downs in the growth of diplomatic method—it has been by no means a sustained progress towards perfection—the shafts of wit and irony fly in all directions. These guided missiles of criticism may shatter some illusions in Washington, in Delhi, perhaps even in London. Sometimes it is a quotation, sometimes a faintly sketched analogy between old and modern times, sometimes a downright judgment based on personal experience. It must have been a treat to hear these lectures, with the raised eyebrow or the inflexion of the voice stimulating the audience into perception of deeper meanings.

It is good to know, for example, that Odysseus used on the platform one or two of the favourite tricks of the late Ernest Bevin; that diplomatic immunity is observed among the Australian aborigines; that ambassadors arriving in Constantinople in Byzantine days would witness a parade in which the same troops would appear again and again wearing different kinds of armour; that professional diplomatists have always distrusted diplomacy by conference. It is also a revelation to learn how much permanent wisdom is to be found in the treatise on diplomacy written in 1716 by De Callières. Perhaps a copy of his *De La Manière de négocier avec les Souverains* might be sent to Mr Dulles, with footnotes by Mr Dean Acheson.

The Greeks, says Sir Harold, were bad diplomats because they were too clever to create confidence. So they never discovered how to make the diplomatic method of a democracy as efficient as that of an autocracy. The Romans failed by being too masterful; they also made the mistake of employing professional politicians as diplomats.

Then the art of professional negotiation came into Europe from the Byzantine Empire, via Venice and Italy. There it found a period of disunity, ferocious competition between unstable states relying on mercenaries for security and threatened eternally by fifth columns. So the art became a wolf-like practice, which had its influence on the great national states springing up at the time of the Renaissance. Deception and opportunism became fashionable; justice was subordinated to expediency. It was Machiavelli's day and later Queen Elizabeth's.

Then came the great French contribution, most of it begun by Richelieu and developed later by Louis XIV and his officials. It was decided that negotiation must be permanent, not a hurried, sporadic endeavour. Diplomacy becomes a continuous process, with ambassadors and ministers in every capital of importance. The element of stability and certainty is prized above everything; and the great Cardinal preaches that national interest must come above "sentimental, ideological or doctrinal prejudices and affections." The negotiator must have—it is a memorable phrase—the patience of a watchmaker. Good diplomatic method is akin to sound banking; both depend on the establishment of credit.

By now, at the end of the third lecture, the reader has been prepared for a rousing final exposition of modern errors—and he gets it. President Wilson's principles and their effects are taken to pieces with all the precision of a watch maker—and made to look very foolish. The methods of that "great good giant"—*the United States*—are criticised for their opportunism and for unreliability. Open diplomacy is snubbed with a quotation from Jules Cambon: "The day secrecy is abolished negotiation of any kind will become impossible." Sir Harold recognises that the conditions on which the old diplomacy was based have gone; but he thinks something could still be done to shatter the illusion that the conduct of external affairs can follow the same methods as the conduct of internal affairs in a liberal democracy. He has made a readable and convincing start. The book costs over a penny a page, but it is worth it.

Marxism and Chinese History

INTRODUCTION TO THE ECONOMIC HISTORY OF CHINA.
By E. Stuart Kirby.
Allen and Unwin. 202 pages. 18s.

MR KIRBY holds the Chair of Economics and Political Science in the University of Hong Kong, a position in which it is hardly possible not to be very much *engagé* in Chinese politics. In this book he appears not to have quite made up his mind whether he is writing on his own an outline of Chinese economic history from the earliest times or whether he is making a critical survey of current Chinese and Japanese thinking on the subject. The former aim cannot be said to have been achieved with any degree of success, though this is not altogether his fault, for, as he frequently points out, the detailed preparatory work required for generalisation has not been done to anything like the extent needed, even where the evidence is ultimately available.

Thus, Mr Kirby provides only an extremely vague and superficial account of Chinese economic development because he simply has not enough straw to make the bricks. On the other hand, his description and analysis of contemporary theories constitute a valuable piece of work, particularly as showing the extraordinary results of the attempt to apply the categories of Marxist doctrine to the history of the Far East. As Mr Kirby points out, this leads to the Chinese Communist historian having to classify the greater part of Chinese history, from Confucius down to the time of Chiang Kai-shek, as "feudal." In Europe the influence of Marxist methodology always had to contend with an older tradition of exact historical scholarship highly resistant to *a priori* construction, but in China, and to a lesser degree in Japan, Marxism arrived almost simultaneously with the introduction of modern scientific historical method, commending itself as a guide with a short cut to truth through the vast complexity of past history.

Even before the final triumph of the Communist revolution Marxism became the prevailing mode of thought in Chinese academic circles, and since the establishment of the party dictatorship it has been the only permitted one; Mr Kirby declares that in the historical field it "ignores or rejects the whole subsequent progress of thought in Europe in the last seventy years to an extent that is not generally realised." Japan, on the other hand, has been much more receptive to the influence of recent Western non-Marxist thought, and Marxism itself has been "always less orthodox than in China, less exclusively associated with the Communist party and its discipline." Since 1945 Japan has been open to currents of thought from all quarters, while in China historical studies have been restricted by a narrow dogmatic orthodoxy similar to that which has long been imposed on them in the Soviet Union.

Through the Curtain

ESCAPE FROM PARADISE. *By seven who escaped and one who did not.*
Edited by C. A. Smith.
Hollis and Carter. 255 pages. 16s.

THE title of this book refers to the contrast between the Garden of Eden and the new world of free and happy life that Communism claims to have created in the lands where it has seized power. As the editor points out, the Biblical account declares that God placed cherubim and a flaming sword on the east of the terrestrial paradise to prevent former inhabitants from returning there, but the rulers of the Soviet *bloc* maintain large forces of special police on the western borders of their paradise to prevent present inhabitants from getting out. Since 1934 attempted "flight abroad" has been legally punishable by death in the Soviet Union, while members of the offender's family who knew of his intention are liable to a prison sentence of up to ten years and those who did not know to deportation to "far regions of Siberia" for five years.

The satellite states have adopted similar measures to dissuade their ungrateful citizens from exiling themselves from their native lands, and in Korea the refusal of the western governments to repatriate by force Chinese prisoners of war unwilling to return to their own country was for months the sole issue on which the conclusion of an armistice was held up—an issue which Communist China has even sought to reopen at the Geneva conference. This extraordinary preoccupation of the self-appointed saviours of mankind with the thwarting of "escape from paradise" serves two distinct purposes: the first, to close channels of information to the outside world; and the second, to strengthen the hold of the totalitarian system by demonstration that escape from it is impossible this side of the grave.

Several books have already been published with accounts of Communist prisons, interrogations and forced labour camps by individuals who have been fortunate enough in the end to reach a free country, but "Escape from Paradise" is the first to provide a kind of symposium of the experiences of persons of the most diverse origin and background, who have had nothing in common except subjection to the same tyranny. The eight authors include a Spaniard, a Rumanian, a Czech, two Poles, a Bulgarian, an Estonian and a Lett; they differ widely also in profession, religious belief and political sympathies. It is perhaps a pity that there is no Russian in the company to give balance to a picture that is mainly one of the Russian conquest of Eastern Europe. But it is in any case that conquest which has brought the Soviet reality nearest to this country, and, especially in following the narrative of the former Czech officer Jan Sad, deported without legal charge or trial to forced labour in Russia by the "liberators" of Czechoslovakia, the reader can hardly fail to appreciate the relevance of the editor's comment that "what befell them is what, but for the accidents of birth and geographical position, would have befallen us."

The Inimitable

DON'T TRUST TO LUCK.
By Lord Beaverbrook.
London Express Newspapers. 108 pages. 3s. 6d.

WHEN Lord Beaverbrook sets out to teach the young and ambitious, he commands the respect due to his own success. Young men whom he has trained are now prominent on both sides of Fleet Street. The Editor of the *Daily Herald* once worked for Lord Beaverbrook; so did his predecessor; so did two-thirds of the editorial board of *Tribune*. But the high positions won by Lord Beaverbrook's young men have not been confined to journalism. One of them was Minister of State in the Labour Government; another ran the groundnut scheme; another became a leading member of the Oxford Group.

"Don't Trust to Luck" is a rewritten version of "Success," published in 1921. Lord Beaverbrook said in "Success" that "The money brain is, in the modern world, the supreme brain. Why? Because that which the greatest number of men strive for will produce the fiercest competition of intellect." Now he repudiates this view, and only calls the money brain "the shrewdest brain"; thus is Einstein re-instated. But it is still obvious enough that Lord Beaverbrook would agree with Dr Johnson that "there are few ways in which a man can be more innocently employed than in getting money." Holding this view, with everything that is to be said for it, he might be expected to write a useful book teaching young clerks how to become managing directors, how to float a company, how to raise an overdraft. Unfortunately, however, "Don't Trust to Luck" includes very little practical business instruction, concentrating instead on well-meaning moral exhortation. The reader is treated to such sentiments,

Is it Recordworthy?

Every day our expert chroniclers who study, check and compare the *leading* newspapers of the world, pouring into our offices *from every* corner of the globe, have to single out each detail in present-day Politics, Economics, Social Questions, consider its significance, and decide whether it is worthy of being placed *on record* for permanent reference in KEESING'S 'living' documentation of Current Affairs.

Having had over 20 years' specialised experience in extracting, translating, condensing, indexing and—above all—tabulating (*but never interpreting*) the important news items from the Press of the World and other selected sources, we take pride in being able to offer you in KEESING'S a scholarly compilation of Facts which is internationally recognised (and much cherished by many *Economist* readers) as the authentic Reference Tool of our Day: truly impartial, fully comprehensive, intelligently indexed and always up-to-date.

Special Trial Offer

For only £2.19.0 you can now obtain KEESING'S weekly Service for six months including a temporary folder.

KEESING'S — KEYNSHAM — BRISTOL

Where do people get their ideas?

GRAHAM HUTTON *says of this important book:*

"I am fascinated and impressed by the array of results from this skilful, accurate and most valuable research. It makes one wonder why it was never done before, and how one will ever stop quoting it in future."

THIS study breaks new ground: it deals with the very springs of public and private opinion—a subject of direct concern to anyone who needs, whether for business or political reasons, to "make friends and influence people."

The authors examine in detail the channels by which thoughts and attitudes are communicated, and the extent to which the individual is exposed to them: pubs and clubs, schools, churches and cinemas, sport and politics, reading, radio, television, and much else. The book carefully presents, with information from other sources, the findings from a detailed and extensive Field Survey among the people of Derby.

THE COMMUNICATION OF IDEAS
by T. Cauter and J. S. Downham
with a foreword by SIR ARTHUR BOWLEY, Emeritus Professor of Statistics in the University of London

PUBLISHED FOR THE READER'S DIGEST ASSOCIATION LTD. BY CHATTO & WINDUS—PRICE 25/-

inspiring but a little vague, as "Money is nothing but the fruit of resolution and intellect applied to the affairs of the world. To an unshakeable resolution fortune will oppose no bar."

It would be unkind to say that the only young man so far to show signs of profiting from reading "Don't Trust to Luck" was the one who, when the *Daily Express* asked to buy back copies of the book from the public, thought of offering to sell them his own for 7s. But it is obvious that Lord Beaverbrook's gifts as a teacher depend on personal magnetism rather than on anything he can put into words. The main interest in the book lies in its references to the author, his achievements, and to some of his past adversaries. There is a quotation in denigration of the first Lord Baldwin, brought in as a footnote with little apparent relevance. There is a one-sided attack on Ernest Bevin. All this, together with some candid confessions, helps to throw some light on the strength of Lord Beaverbrook's own personality. And probably the real reason why the book is a failure is that Lord Beaverbrook at his greatest is inimitable, and that attempts to copy his methods can be disastrous. Only Lloyd George, Beaverbrook himself, and perhaps Churchill have ever run a Government Department in the Beaverbrook way without creating chaos—and even this statement may call for qualification. Lord Beaverbrook evidently has the best of intentions; he sincerely thinks young men should want to follow his example, and he wants to teach them to mould themselves in his image. But the attempt was impossible from the start: Lord Beaverbrook has been, is and—some people would say fortunately—always will be unique.

Ancient Monument?

ELEMENTS OF PURE ECONOMICS. By Léon Walras, translated by William Jaffé.
Allen and Unwin. 620 pages. 42s.

LEON WALRAS was even in his own day—he died, one is always surprised to remember, only in 1910, and was effectively a contemporary of Alfred Marshall—very much an economist's economist. Half a century after the publication of the fourth and definitive edition of his "*Eléments d'Economie Politique Pure*," now translated for the first time into English, his work is likely to appeal only to that scholarly minority of economists who feel an absorbing interest in the historical development of their subject—and indeed, among that minority, only to those armed both with considerable mathematical competence and with more than the average amount of patience. To that minority the volume under review may be commended as a model of how such things should be done. Mr Jaffé shows himself not only an adroit, responsible and sensitive translator (though it is possible to quarrel with his pious retention of *rareté* for "marginal utility" in the interests of "Walrasian flavour") but also an admirable editor. On its smaller scale, indeed, his work of collation, cross-indexing, annotation and unobtrusive elucidation stands comparison with Professor Staffa's magnificent edition of Ricardo. This is a job which will never need doing again.

Was it worth doing at all? For the dignity of scholarship, undoubtedly; but for the further advancement of knowledge? Is there really any but a historical interest in a theoretical argument, however majestic in its logical unity and completeness and however seminal in its own day, which has been much better stated since and whose premises make it totally inadequate as a description of the way things really happen? To a generation brought up on the study of imperfect competition and of the interdependence of macro-economic magnitudes the answer must at first sight be "No." One can never be sure, however, that the major work of a first-rate mind has entirely exhausted its capacity to touch off valuable trains of thought. The concept, for instance, of the "service of availability" (*service d'approvisionnement*) rendered by stocks is recognisably akin to that of liquidity, but Walras does not restrict it to monetary theory; it might have been recalled with advantage during the "empty economy" period which immediately followed World War II, and if extended from stocks to fixed assets themselves it becomes relevant in the highly practical field of public utility policy. One may hope that at all events a few qualified persons will read Walras's book in a spirit of curiosity other than purely antiquarian.

What Makes a Happy Ship?

THE SOCIAL PSYCHOLOGY OF INDUSTRY.
By J. A. C. Brown.
Penguin. 310 pages. 2s. 6d.

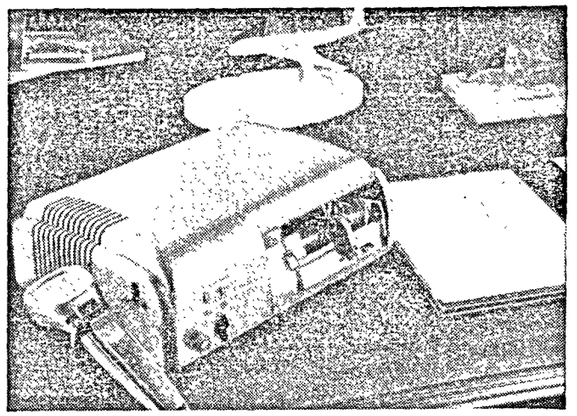
MAN is a social animal; work is a social, not an isolated, activity; the quality, tempo and spirit of work depend, therefore, not merely on forces affecting the individual as such (physical environment, rewards and sanctions) but also, and indeed overwhelmingly, on those shaping his human relationships with workmates, superiors and subordinates; the economists are most perniciously on the wrong track, so are the efficiency experts, so, to a hardly lesser degree, are the Socialists—though they at least have a proper distaste for the carrot-and-stick mechanism. If the motivation of economic life is to be understood, if the waste and frustration of industrial strife and of grudgingly-done work are to be abolished, the approach to these problems must be by way of social psychology—the study of group human nature.

Thus the social psychologists, who are unfortunately prone to antagonise their audience, partly by the use of a gobbledygook surpassing in pretentiousness even that of their economically minded adversaries, and partly by a degree of arrogance that paradoxically recalls that of the less eminent nineteenth-century champions of *laisser faire*. Dr Brown writes like a human being—it is not his fault if the simple, straightforward word "group" has acquired a power to raise the hackles of almost anybody but a professional sociologist—and he is much less of a know-all than most, though he really should not confuse Adam Smith with Mr Gradgrind. It is an excellent thing that this compact, meaty, authoritative and frequently entertaining book should be available to a public which would never dream of buying Elton Mayo's "Social Problems of an Industrial Society."

The central subject, which gives Dr Brown his title, is firmly and skilfully keyed in on the one hand to the history of industrial development and on the other to the psychologists' and anthropologists' data on personality; expertise is blended and balanced with common sense. Here, and here—so expert research into the springs of motivation has shown — are the roots of the behaviour which, as a matter of common experience, can be expected in these, or these, conditions. This and that sort of trouble can be traced to this common source—failure of communication, misapprehension of the nature of leadership, self-perpetuating mutual antagonism. Here are the reasons why this move succeeded and that move failed. Practical handbook of management, primer for social scientists—it is all admirably done.

One may retain a conviction that even when every factory and office is as happy a ship as HMS *Mantelpiece* some measure of carrot and stick—such as Nature inexorably provides for the farmer, the fisherman, and others to whom the relationship between extra effort and extra return presents itself unblurred by transition through a wage-packet—may still be necessary and effective. One may find the typical worker as presented by Dr Brown a discouraging mixture of prima donna and problem-child. The fact remains that a proper regard for human nature, including such of its manifestations as go with the sub-adult status of the weekly wage-earner, does pay off both in production and in happiness on the job. What is more disquieting is the social psychologist's implied ideal: the harmonious Huxleian Brave New World in which the group—blest word—is everything, "everyone belongs to everyone else," and the aberrant lone wolf is scientifically cured of deviationism at an Adult Reconditioning Centre. "The Social Psychology of Industry" is very highly recommended; but it might be a good idea to read Mr Hemingway's "The Old Man and the Sea" as a chaser.

If you called on Sir Miles Thomas of B.O.A.C.



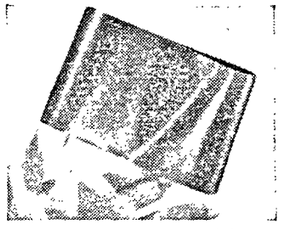
Should you call on Sir Miles Thomas, Chairman of British Overseas Airways, there are two things you would particularly notice on his desk: his beautiful and unusual jet-aircraft ashtray, and the slim grey elegance of his Dictaphone Time-Master.

ON THE DESKS of men of the calibre of Sir Miles Thomas — men whose business lives are full and successful—you will usually notice this trim little machine, the Dictaphone Time-Master.

Their time is precious. The Time-Master saves them time. Their ideas are more valuable still. The Time-Master records them instantly. And by dictating the Time-Master way they leave their secretaries time to be real *assistants*.

The Time-Master is as simple to use as your telephone. Yet, as thousands of business men have found, it can double your capacity to get things done. Indeed, old-fashioned methods of dictation may well be robbing you of many thousands of productive hours.

Why not try the Time-Master on your own desk? Without obligation, of course. Telephone or post the coupon to-day for a free trial.



Revolutionary plastic Dictabelts are "inside secret" of Time-Master. Each takes 15 minutes dictation, folds flat, can be mailed, filed.

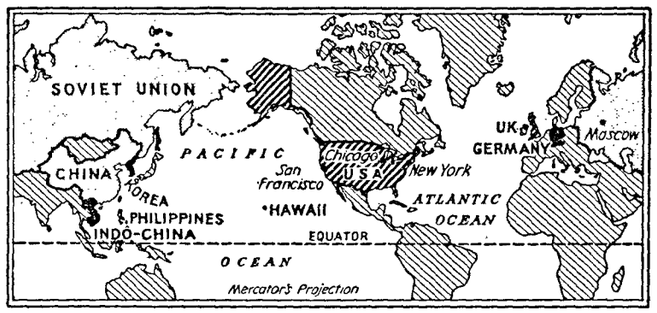
AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Doubts About Defence

Washington, D.C.

OF all the arguments, unusually numerous and noisy even for Washington, that have been occupying the city during the last few weeks, the noisiest has been over whether "to intervene or not to intervene" in Indo-China. For this argument involved not only disagreements between the press and the public over the Administration's handling of the issue, but also disagreement within the Administration itself. For the moment the question is decided: there will be no American intervention in Indo-China unless a list of conditions which has grown longer with each of Mr Dulles's public statements is fulfilled—and most of these conditions depend on France and cannot be fulfilled now that M. Mendès-France has decided to seek peace. In fact the Washington tide was never as firmly set in the direction of saving Indo-China from Communism at all costs, even that of using American armed forces if necessary, as it appeared to be from official remarks during March and April. Now the tide has definitely turned the other way, leaving Admiral Radford, the chairman of the Joint Chiefs of Staff, in full view upon the beach, as the only senior figure in the Administration who has consistently advocated the necessity of American intervention at this time.



The Radford thesis is a straightforward one; the strategic balance of power is in danger of shifting in favour of the Soviet Union as it did between 1945 and 1950; there is reason to believe that new Russian long-range guided missiles may be lessening the advantage that the United States possesses through its numerical superiority in atomic weapons. The new Soviet intercontinental bombers pose a threat to the industrial heartland of the United States which the latter cannot hold over the dispersed industrial areas of Russia and China. It is imperative both for political and for military reasons that no Communist expansion be permitted in South-East Asia and that Indo-China be saved while there are still French and Vietnamese forces in being. It was at this point that the Admiral's views diverged from those of his fellow members of the Joint Chiefs of Staff, particularly those of General Ridgway, the Chief of Staff of the Army. Admiral Radford is said to have believed firstly, that, even if American intervention in Indo-China did bring in Communist China, Soviet Russia would not intervene and secondly, that American air and naval forces, probably using tactical atomic weapons, would be sufficient to check the Communist forces.

This view his colleagues disputed. From the naval point of view the Gulf of Tonking is a nightmare of shallows and offers none of the opportunities for manœuvre and surprise that the deep waters on both sides of the Korean peninsula afforded. From the Air Force point of view intervention in Indo-China would place the same limitations on the use of strategic airpower that the Korean war did without providing a chance of deploying tactical airpower to the same advantage. But it is believed that it was General Ridgway who put up the strongest resistance both within the Defence Department and with the President, pointing out that naval and air intervention would lead inevitably to the use of American ground forces, that at least eight divisions (which the United States does not possess) would be needed and that they would be separated by a thousand miles of ocean from their nearest supply base in the Philippine Islands.

General Ridgway has discreetly but firmly opposed many of the assumptions on which the "new look" in American strategic and defence policy is based, and in so doing has added to his standing in Washington. For it is his service that has taken almost the full brunt of the cuts in this year's defence expenditure; they involve a reduction in the strength of the Army from twenty to seventeen divisions by the middle of 1955. This has caused considerable disquiet among Americans who follow the problems of their national defence closely, for it has become clear that the corollaries to this reduction, envisaged by the present Chiefs of Staff when they completed their review of strategic policy last autumn, are not being carried out.

Their thinking was done in the brief period of quiet between the final conclusion of the Korean armistice and the failure of the Navarre plan in Indo-China, and at a time when the Bureau of the Budget and the Treasury dominated policy making, as indeed they still do. The Chiefs of Staff intended that the Navy would remain at roughly its present

size, with 400 ships in commission, that the Air Force would expand from its present strength of 120 wings to 137 by mid-1957 and that the Army would shrink to 17 divisions and an establishment of 1,180,000 men in the next year. But the basis which made this reduction seem safe was that an effective mobile reserve would be created. The United States Army with five divisions in Germany and seven in Korea has a problem of supply and maintenance which is faced by no other army except the British. It was the hope of the strategic planners that a Korean armistice would enable the Army to build up a "fire brigade," a highly mobile force of say three or more divisions located either in Hawaii or on the Pacific Coast which could be used as a deterrent threat against any possible outbreak of trouble in the Far East.

In fact, however, the mobile reserve shows few signs of coming into being; the divisions from Korea come home for demobilisation, not to go into reserve; there is still only one fully operational division in the United States, the 82nd Airborne (though another armoured division is being prepared for action), and the Air Force's strength in troop-carrying wings has been reduced. The United States is in no position to intervene with ground forces, even if the Administration decided upon intervention, without demanding something approaching full mobilisation.

Last week the doubts of the experts about the relevance of the new strategic policy to the facts as presented in Indo-China were transferred to the political field as the Senate debated the defence appropriations. The Administration had asked for $29,887 million for the coming fiscal year, some $5,500 million less than was provided for the present year. The House had reduced this to $28,684 million. When the Bill came to the Senate thirty-eight Senators supported a resolution submitted by the Democratic Senator John Kennedy of Massachusetts calling for the restoration of $350 million in order that the United States Army might be restored to nineteen divisions. It was defeated by fifty votes.

The vote itself is interesting, for it is remarkable that thirty-eight Senators should in an election year support the cause of the least glamorous of the three services, especially since, if their amendment had gone through, it would have meant that more of their constituents would have been conscripted. But the debate was even more interesting, for it revealed, with a clarity hitherto seldom shown, the underlying assumption of many Americans, particularly many elderly Republicans, that actual fighting on the ground should henceforth be done by soldiers of other nations, not by Americans.

As Senator Ferguson asked:

> Why should not we furnish the aviators and the scientists and the machinists? I believe the time has come when the other countries in the mutual security compact must realise that, although America has more men under arms than they have, yet America's real place is in science and industry.

If perhaps this weekend Sir Winston Churchill shows some reluctance to settle the Suez dispute solely because that would release three divisions of British troops, or the South Asian and Anzus countries show an anxiety to discover the extent of the American commitment to any South-East Asian security pact before making up their minds about it, it will perhaps be because they have been reading reports of this Senate debate.

Economic Concerns

THE Federal Reserve Board's move to expand credit by lowering bank reserve requirements may not reflect concern about the economic outlook but it certainly reflects concern, now become a habit with the central bank, that the FRB shall not be blamed for any deterioration in that outlook. By the beginning of August the reduction, to be applied by stages, in the amounts that banks have to hold in reserve to back up their deposits will have made an additional $9 billion of funds available for lending; fuller details will be found on page 1072. The FRB's relaxation, like its similar move last year, is seasonal, coming at the time when the demand for loans will rise; in the last six months of the year the government is expected to need some $10 billion of new money, farmers will be borrowing against the security of their crops and businessmen will be wanting credit to build up stocks for the autumn trade. Bankers, however, are by no means unanimously content with the additional freedom the FRB has given them. For at the moment they still have more than enough money available for loans, yet are reluctant to lower interest rates since they argue that not enough new borrowers would be brought in to offset the loss in income.

Whether or not the FRB's move brings the fall in interest rates that bankers fear, it guarantees that rates will go up little, if at all, during the next few months. This promise will perhaps shake businessmen out of their present caution and some such encouragement certainly seems to be needed if the autumn economic upturn is to be more satisfactory than the spring one has been. The readjustment may be over, but the recent seasonal improvement did not go far enough to suggest that a steady rise in activity can be counted on after the coming seasonal summer decline.

It was probably for psychological reasons that Dr Arthur Burns, the President's chief economic adviser, abandoned recent precedent and held his first press conference two weeks ago, but his optimism seemed to go farther than the reasons he gave for it: that spending on industrial plant and equipment, contrary to some reports, was being well maintained, that construction contracts were breaking all records, and that sales have been rising and inventories falling. Furthermore, Dr Burns admitted that the unemployment figures were still disquieting. The real reason for his uncharacteristic lack of concern about the future can probably be discerned under his carefully noncommittal answers about government outlays for defence purposes; one of the reasons for this year's economic difficulties has been that military expenditures have been lower than had been expected. As a result they can hardly fail to be higher than had been expected during the rest of the year.

Farmers under Control

SPURRED on by the recent forecast that at the end of this year's harvest the United States is likely to have a two-years' supply of wheat on hand, Mr Benson, the Secretary of Agriculture, has announced the tightest controls in history over the acreage and crops that a farmer can plant and sell. Such a move seems imperative if the pressure of the agricultural price support programme on the taxpayer and on crop storage facilities is not to become intolerable; it may also show an election-minded Congress that the alternatives to the President's flexible price support proposals may be even more unpalatable to farmers.

Acreage and marketing controls made their first important postwar appearance a year ago, when wheat acreages were cut back by 20 per cent and cotton and maize plantings were also limited. But the ingenuity and industry of farmers, who took only their marginal lands out of cultivation, heaped fertilisers on to their allotted acres, and switched output to other uncontrolled crops, largely defeated the attempt to bring agricultural production into line with demand. This year, Mr Benson hopes to prevent this by imposing rigorous controls over the use made of "diverted" acres and over eligibility for price supports on all crops. The "legal" wheat acreage is to be reduced from the 63 million acres which will be harvested this year to 55 million acres, and Congress will be asked not to raise this figure, as it did last year. Marketing quotas—which limit a farmer's sales to the amount he can grow on his "acreage allotment"—have by law to be submitted on July 23rd to a farmers' referendum for approval; if they are rejected the right to full price support on sales is forfeited.

To the Administration these quantitative controls are not a substitute for more flexible price supports. Mr Benson thinks both are necessary, but puts more emphasis on the second. Mr Eisenhower's threat to veto any Bill continuing high and rigid price supports has led the House Agriculture Committee to wrap up its agreed decision that they should be extended for one year in a "single package" Bill which includes other provisions desired by the President. When this gets to the floor, a compromise will probably be worked out, but it remains to be seen whether this will be a genuine middle way between the economic and political aspects of this problem, or will merely save the face of the President, who has taken a firmer stand on agricultural policy than on the rest of his legislative programme.

More Effective Diplomats

WHEN early in March the Secretary of State appointed a committee of distinguished private citizens with experience in administration and diplomacy, led by Dr Henry Wriston, to advise on how to improve the effectiveness of the Foreign Service, many in Washington felt that only three words of advice were needed: "Remove Scott McLeod." Mr McLeod is the *protégé* of Senator McCarthy who last year was put in charge of security, and for a time of personnel, matters in the State Department; his activities there, particularly his investigations of the loyalty of officials, are widely held to have demoralised the Foreign Service. However, the Wriston committee, whose report was released last week, did not find that the morale of the service had collapsed, although it agreed that repairs were needed.

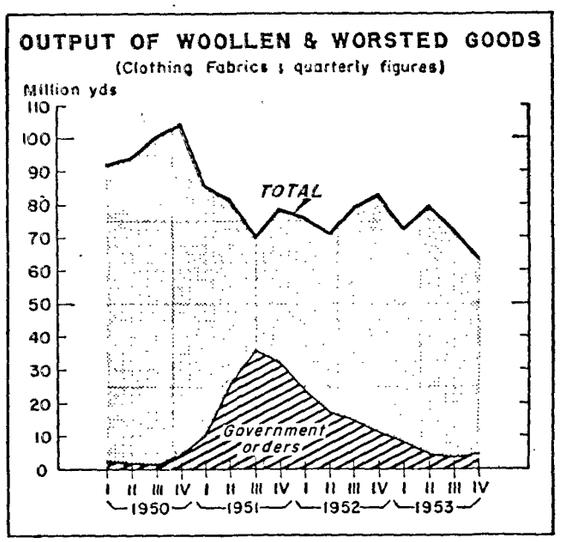
The committee's constructive remedy for the absence of suitable recruits for the Foreign Service—no new member has joined the junior grade for almost two years and the staff is "below rock bottom"—is the provision of university scholarships; recipients would be assured of immediate entry to the Foreign Service on leaving college, while at present the process of examination, security clearance, posting and so on can keep applicants in uncertainty for as much as three years. These scholarships must be authorised by Congress, but the committee has almost guaranteed a favourable reception by proposing that two-thirds of them should be allotted by congressional patronage as are vacancies at the military and naval colleges. This proposal should also do something in the long run to improve Congress's relations with the State Department by giving members a vested interest in, and personal knowledge of, the Foreign Service.

The other recommendations contain little that is new, although much that is important. There is criticism of the waste of specialised knowledge that results from the practice of shifting officers, especially in the lower grades, at short intervals over long distances. And the amalgamation of the Foreign Service and the home departmental service is once more advocated, only this time the name is "integration"; thus, it is hoped, the proposal will smell sweeter both to diplomats jealous of their prestige and home officials fearful of life abroad. Of more practical importance, Mr Dulles himself is wholeheartedly behind the reorganisation and Mr Charles Saltzman, an energetic member of the committee, has been nominated as Under Secretary of State for Administration, with the responsibility of implementing the recommendations before the end of the year.

Cuts in Textile Wages

New York

ARBITRATION in the labour dispute at Botany Mills, a New Jersey woollen and worsted firm, brought a wage cut for employees of 9½ cents an hour, accompanied by modified welfare benefits which, the trade union estimates, will save the company another 4 cents an hour. The Botany decision, which seems to have set the pattern for this year's agreements between the Textile Workers Union of America and this branch of the textile industry, was quickly followed by a settlement of the six-week-old strike at the American Woollen Company's mills in New England, and by similar agreements with two other leading firms. These wage cuts,



although less severe than the employers were seeking, cancel the increases won by the unions in 1951 and manufacturers who did not grant increases then will not benefit from the cuts now. In the cotton and rayon branch of the industry, the wage reductions sought by two important New England companies were refused on the ground that the gains of 1951 had already been cancelled and no further cuts were therefore justified.

Textile workers, including those in the hosiery mills, are alone among American trade unions in accepting general wage reductions—only in a few of the more profitable mills is there any likelihood that workers will strike against lower pay packets. The steady downward drift in employment figures has more or less forced the union to accept this unpalatable move; in the woollen and worsted mills, the sickest part of a sick industry, the number of workers has fallen from 148,000 in December, 1949, to 85,000 at the end of 1953 and to an estimated 70,000 today. By agreeing to wage reductions the union hopes both to keep in production a number of marginal mills and to put the northern mills, which are still responsible for some 80 per cent of woollen and worsted output, in a better position to compete with the non-unionised southern mills. Since the "half-million forgotten workers" in the southern textile industry did not get increases in 1951 and are not now faced with wage cuts, the differential between northern and southern wage rates, which was estimated at 31 cents an hour early in 1952, will be narrowed. In the cotton mills, the much smaller north-south wage differential almost disappeared when the northern workers took pay reductions last year.

Although wage cuts may be a palliative, it is clear that they are no cure, and even a general upturn in business activity will not fully restore prosperity to the American textile industry. The union has joined the industry in demands for increased protection from imports, and for further government assistance in the form of more defence contracts to firms in distressed areas, and more stockpiling of military clothing. But the only lasting solution is to be found in a vigorous re-equipment programme and in concentrating production in the more efficient mills.

Minority Hysterias

FROM A SPECIAL CORRESPONDENT

IT is difficult to consider the struggle between civil liberties and hysterical fears in the United States without falling victim to the optical illusion that permits the single, satanic figure of Senator McCarthy to crowd everything and everybody else out of the picture. Yet the price of yielding to this illusion is at once to exaggerate and to underestimate the magnitude of the problem. To exaggerate, because the evidence is that fully as many Americans condemn the Senator as approve of him, and that the ratio is now probably shifting somewhat against him; and to underestimate, because much "McCarthyism" exists without McCarthy since, to a certain extent, the fear and obscurantism have native roots, far from Washington, in the states and the local communities themselves.

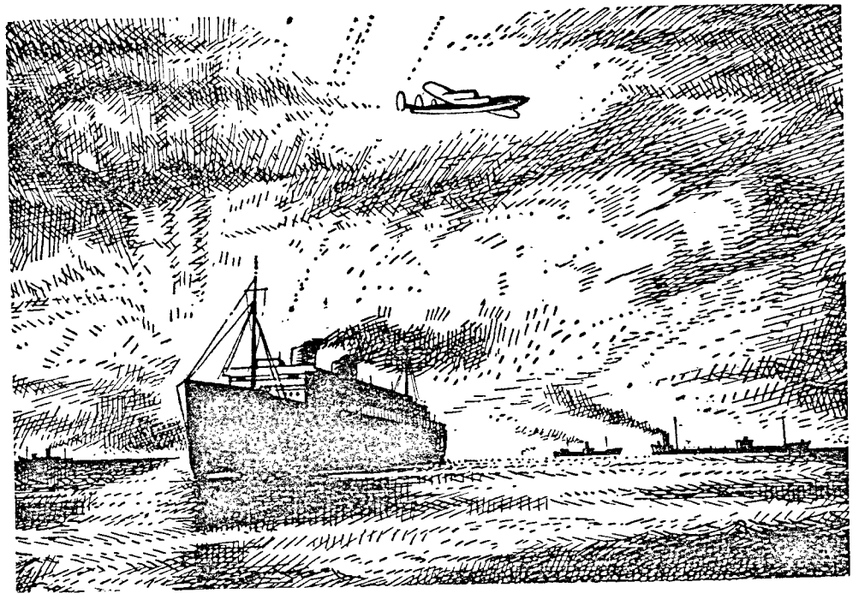
It would require a sharp eye and a bloodhound's nose to discover a section of American life in which the concern over "subversives" has not manifested itself. The American Bar Association lies awake at night pondering ways of safeguarding any American from falling into the clutches of Communist counsel. The University of Illinois got rid of its president last year in part because he had been a leading supporter of the United Nations Educational, Scientific and Cultural Organisation, and because of his alleged toleration of Communists on his staff—this despite the fact that the University was already requiring a loyalty oath from its faculty members and maintaining a security officer on its payroll, and that the president's accusers could not name any Communists that he had tolerated. The American business community has cleaned its house of Communists—though the premises can never have been very dirty; the trade unions, with a more real problem to face, have been all but completely successful in doing likewise. In that most sensitive of areas, Houston, Texas, matrons have been warned that the insidious Reds will gladly infiltrate even garden clubs, given the opportunity.

★

The campaign against subversion (a conveniently broad term, often indicating nothing more than a sympathy for international good will or a weakness for fair play) goes on at many levels. Many state legislatures have passed acts aimed at eliminating disloyalty—by outlawing the Communist party, by requiring security investigations of state employees, by attempting to police the teaching in the state schools and universities, or even, in some cases, the reading done there. In Alabama, a ridiculously unworkable law required that every book to be used by a student in state-supported institutions must bear a label with a statement from the author or the publisher concerning the author's record in respect of Communism, Communist front groups, or even "Marxist socialism." (There were to be more labels for all books recommended in the original work for additional reading—a requirement which bade fair to make the number of labels in some tomes exceed the number of pages.)

Municipal politics have been affected, too. In Cincinnati, the city elections last year were completely dominated by the issue of whether or not certain public officials had been sufficiently alert to the risks of employing as City Planning Director a young man who had seven years earlier terminated a flirtation with Communist movements. More typically, the school systems have been the focal points of such local excitements. And, in contrast to the Cincinnati affair, in which the furor was generated largely by professional politicians, the campaigns against education officials have often originated with private citizens' groups. In the wealthy suburban community of Scarsdale, New York, where a Communist might be expected to feel as little at home as an alligator in the Arctic Sea, a Committee of Ten has, since 1949, been trying to get the local school libraries cleansed of all books by Communists or pro-Communists.

Sometimes, these movements conceal behind a general *brouhaha* over "subversives" or "Reds" a very specific, if unrelated, object. Thus the Cincinnati campaign was designed to discredit the local municipal reform movement and campaigns against subversive influences in the schools are often in reality the vehicles for attacks on progressive methods of education. To an almost mysterious extent, the United Nations, and particularly Unesco, have been the surface objects of these attacks. Unesco publications which describe social practices in foreign lands, polygamy, for example, are taken as advocating such practices for the United States. Sympathy with foreigners is made to appear



On the trail of trade

THE National City Bank of New York was the first American national bank to open a foreign branch. Since that day it has always been a leader on the trail of trade.

Wherever trade has been active, The National City Bank has opened a branch. Today the bank commands a world-wide network of 57 overseas branches, staffed by men with a first-hand knowledge of local business practices and regulations. In addition, The National City Bank has correspondents in every commercially important city in the world.

The London branches offer the facilities of this world-wide organization and are, as well, uniquely equipped to advise on trade with the dollar countries.

THE NATIONAL CITY BANK OF NEW YORK

(ESTABLISHED 1812)

Incorporated with limited liability under the National Bank Act of the U.S.A.

Head Office: 55 WALL STREET, NEW YORK. *London Offices—City:* 117 OLD BROAD STREET, E.C.2. *West End:* 11 WATERLOO PLACE, S.W.1

In Singapore or around the world... here's what we can do for you!

• • • SERVING COMMERCE AROUND THE WORLD • • •

Want to know the price of rubber in Singapore? Or the latest quotations on wool in Sydney? How many dollars to Iraqi dinars in Beirut? Chances are we can tell you. Our International Banking Department is constantly receiving and evaluating daily reports from its men in all parts of the world ...in every important center of world trade. And if there's something you don't know—and we can't answer—we'll find out. closely related to support for foreign ideologies, and, in the present state of American opinion, it is probably not unfair to say that "foreign ideology" and "Communism" are, to many people, very nearly synonymous terms.

In other cases, the promotion of hysteria has behind it mere personal ambition. The organisation, originally in California, of Students for America—a self-constituted loyal underground, devoted to infiltrating "leftist" student groups and to exposing subversive teaching—appears to have stemmed from the frustrations of a young man who had failed to get ahead in college politics by more normal means. But perhaps the purest form of the disease is represented by the "hysteria-monger" who is himself genuinely hysterical. Such was apparently the case in the branch of the Veterans of Foreign Wars at Norwalk, Connecticut, which instituted a system of organised reporting to the Federal Bureau of Investigation, through a secret committee of its members, of persons in the community whom the committee suspected of subversion.

A more serious case is that of the Houston chapter of the Minute Women of America, Inc., a national organisation founded in 1949 by Mrs Suzanne Silvercruys Stevenson. Allegedly to avoid infiltration by Reds, the Minute Women of Houston have no constitution, no elections of officers, and allow no motions from the floor at meetings. Refraining from all public action as a group, the Women have used with great success the technique of deluging city officials with seemingly unorganised individual protests; an official who might shrug off a single protest from an organisation of only 500 citizens is impressed by even a few score informal, personal protests from individuals. As a result of these efforts, the Deputy Superintendent of Schools in Houston was dismissed as "too controversial," the annual school essay contest on the theme of the United Nations was abandoned, the American Friends Service Committee was refused the use of a hall because Alger Hiss had attended Quaker meetings, and two candidates for the school board were defeated as supporters of Unesco.

★

But the striking feature of all these developments, dangerous and damaging as they may be, is that they are the product of minorities, usually small minorities, that they thrive not so much on demoralisation as on apathy, and that they can be defeated by a determined counter-attack. The Cincinnati campaign failed and the alleged dupes of Communism were returned to office, because it aroused an effective opposition, the Committee of 150 for Political Morality. The Alabama textbook law has been declared unconstitutional in the state courts. The Students for America, after three years in being, and with ample funds, can only claim 2,500 members (not all in universities) in a nation of 2,500,000 university students. The Norwalk VFW was pelted with stern lectures, many of them from conservative and respectable sources. The Minute Women were, at length, thoroughly exposed by the *Houston Post* and, although Texas will undoubtedly continue to spawn such strange children, it may be doubted whether Houston bureaucrats will ever tremble so again at the sound of irate female voices over the telephone.

Creeping Anti-Socialism?

IT is just a year since President Eisenhower pointed to the Tennessee Valley Authority as an example of "creeping socialism." Even though he later modified his condemnation of this great regional development scheme, he has never cleared himself of the suspicion that he would be glad to see it undermined. This suspicion was fostered by his refusal to ask Congress for funds which would enable the authority to build steam generating plants to supplement its hydro-electric capacity and keep up with the growing demands for power in the area it serves. The President's lack of sympathy for the TVA idea was confirmed when he refused to reappoint Mr Gordon Clapp, the popular and experienced head of the authority, apparently because he did not share the President's "philosophical approach" to power problems—that hydro-electric development should be a partnership between public and private interests.

The argument has now crystallised round a directive which the President—setting a Socialist to catch a Socialist—has sent to the Atomic Energy Commission, the biggest of all government operations, ordering it to negotiate a 25-year contract with a private undertaking, for the supply of electricity to its new installations in Kentucky, rather than with the TVA. The proposal is that a generator should be built in Arkansas, just outside the TVA area, to feed electricity into the authority's facilities, thus enabling it to supply the AEC without either building a new plant or curtailing supplies to other customers.

The legality of such an indirect contract being made by the AEC, particularly without public consideration of other bids, is being contested in Congress. But the practical objection to the President's order is that electricity obtained by this means would cost the commission about $3.5 million a year more than would electricity provided by the TVA. A large part of this difference would, however, be offset by receipts from the private company of taxes which the TVA does not have to pay; nor would taxpayers be responsible for the construction costs of the private plant. Underlying the whole dispute is, of course, the belief that the President, well aware by now that a direct attack on the TVA would have dangerous political repercussions both locally and nationally, intends to creep up on it without publicity by encouraging private companies to take over its services.

Hard Competition for Soft Drinks

New York

AMERICANS spent last year over a billion dollars on 28 billion bottles of carbonated soft drinks. The cola type drink accounted for nearly two-thirds of these sales, and in the southern states, the heart of the cola country, it held nearly 90 per cent of the entire soft drink market. But Coca-Cola, once described as "the sublimated essence of the American way of life," and which traditionally provides some 50 per cent of all soft drink sales, is not without some very lively competitors. Within the cola field, Coca-Cola's chief rival, Pepsi-Cola, has, by wider distribution and aggressive promotional campaigns, boosted its sales at a rate more than twice as fast as that of the industry as a whole—although Americans still drink four "Cokes" to every "Pepsi." The second major threat is one which must now be met by almost any seller of a product containing sugar to weight-conscious customers—the threat of the calorie which, once a useful selling point, has now to be hidden from the suspicious amateur dietician.

The latest innovation in the industry is the tin can, which is easier and cheaper to transport and avoids the inconvenience of "returning the empties." The tinned soft drink is still largely on an experimental basis, but the new medium is being rapidly adopted; even the Coca-Cola and Pepsi-Cola companies, whose loyalty to the bottle is so far unsullied, are conducting intensive research into this method of marketing. The tin can has brought a host of entirely new competitors into the soft drinks industry—the brewers (who have long marketed beer in cans), the fruit juice canners and even the can manufacturers themselves. To all these groups the easy-to-make soft drink is the remedy for excess canning capacity. There are still many technical problems to be solved, before both the "fizz" and the flavour of the tinned soft drink can be said to match those of the bottled variety, but with tinned beer—which accounts for over 30 per cent of packaged beer sales—as an ebullient example, the tinned "pop" manufacturers seem justified in their optimism.

Faced with so many insurgents, the established brands have to fight hard to retain their position, and the high cost of sugar inhibits price cutting. But, although profit margins have been squeezed, the industry takes comfort from a market which shows no sign of becoming saturated. Soft drink sales have doubled in each of the last two decades; and when the products of the high wartime birthrate enter the soft drink consuming group—the "pre-martini" set in high school and college—sales may well double again. Consumption a head has also risen, from 100 bottles a year in 1940 to 178 last year, and is expected to increase in future at least as fast as incomes. And since Southerners often drink three or four hundred bottles each in one year, the rest of the United States clearly has a long way to go.

SHORTER NOTES

The confusion which arose when the General Services Administration—the government agency which buys for the stockpile—turned down offers of lead at the market price while at the same time accepting those of zinc, has now been explained. It appears that GSA had been authorised to purchase these metals up to a ceiling price of 14 cents a pound for lead and 13 cents a pound for zinc, and that in the case of lead the market price had already risen above this ceiling. This method of government purchasing is now realised to have a disruptive effect on the market, and future GSA purchases will be at the market price.

★

The last of the independent automobile producers—the Studebaker Corporation and the Packard Motor Car Company—have agreed on a merger of the two companies, subject to the approval of their stockholders. The serious decline in car production by the independent companies has already resulted in mergers of the other four independents—the Frazer Corporation with the Willys Company and the Nash Corporation with the Hudson Company—in the last two years.

The World Overseas

No Panic About Canadian Wheat

FROM OUR OTTAWA CORRESPONDENT

CANADIAN authorities are keeping their heads and putting a bold face on the wheat situation. In the House of Commons, the minister responsible for wheat marketing is Mr C. D. Howe, Minister of Trade and Commerce, who approaches these problems with the straightforward attitude of a businessman. He is not naturally patient with critical arguments, and he is less interested —and much less adept—in answering criticism than in selling wheat. Opposition members, especially those from the west, have thought it a good thing to paint the situation in gloomy colours. Canadians have certainly been told how disastrous a situation they may be facing as a country which still, in spite of all the industrialisation of recent years, depends on producing and selling a lot of wheat.

But, apart from politicians who may have peculiar interests in such matters and the sprinkling of gloomy individuals which is usual and proper, it is remarkable how calmly most Canadians are taking the situation. This includes the major farm organisation, the Canadian Federation of Agriculture, to which the "wheat pools" of the three prairie provinces are affiliated. Long ago most people accepted the fact that income from the sale of wheat would be very much lower this year than it was last. The indirect effects of this on general business in the west were probably discounted by most serious men in their earliest planning for 1954. Farm income this year will be substantially down.

It was also decided by most of the people concerned that the effects of one difficult year would not be too serious, simply because the western farmers were starting on the ordeal from a very strong position. They have had a succession of years much better than normal. Their debt position was good. They were well stocked with machinery and, by and large, well provided for domestically. Last winter one bad year seemed—and it still seems now—to be a passing misfortune which the farmers in particular and Canada in general can ride out. The real anxiety covers a longer period, of which the outcome is in the hands of Providence. A few good crop failures—in other countries of course—would quickly straighten out the world wheat situation.

In the meantime the authorities here are not blaming the United Kingdom (for staying out of the International Wheat Agreement) or Argentina (for having a big crop) or the method of marketing through a Government Wheat Board or any other extraneous factor for the fact that wheat is more difficult to sell this year than last. They are saying that Canada has had three exceptionally good crops in a row; that the latest of them happened to coincide with good crops in other countries; and that the world has too large stocks of wheat. Of course it is more difficult to sell. Of course the price is bound to go down.

In such a situation the best that anybody can do is to make sure that Canadian wheat-growers provide at least their fair share of a relatively limited world demand for wheat. So far the Wheat Board and the minister to whom it reports, Mr C. D. Howe, can claim that their percentage of the world wheat market is almost as large as it was last year. Argentina's return as a major seller, in fact, has taken it out of other exporting countries and not out of Canada. This, of course, is because of the quality of hard Canadian wheats which millers want to mix—in what is usually reckoned to be a virtually irreducible proportion—with the softer wheats which are produced in the southern hemisphere, and in parts of the United States.

It is understood here that it was mainly the American desire to try to maintain its share of the market for soft wheats that led to the 10 cent price reduction in early June. Certainly Canada, which was consulted in advance, neither precipitated nor advised the American price reduction: it merely followed suit, as it will follow any other reduction made by its competitors. The American price support system works in such a way that the increase in subsidy, which amounts to a decrease in export price, applies across the board to all kinds of wheat. Canada, therefore, will be involved in any competitive price reductions which may be made by the other three big exporters—the United States, Argentina and Australia—even though they arise from the effort to sell soft wheat in which Canada is not concerned.

Politically, as it now appears, price reductions may be easier for the United States, which pays for them out of the Treasury, than for Canada, where the government marketing operation merely gives farmers the sale price without subsidy. But the United States Administration impresses Ottawa as being thoroughly responsible in its marketing policy. It is not giving away the American taxpayers' money unnecessarily by arbitrarily slashing export prices. Moreover, Canada had no serious rebuttal to offer to the American argument early in June that the existing price ($1.80 US) a bushel was unrealistic in terms of the available market. And Canada could only agree that if the reduction had to come it was better that it should come before the meeting of the International Wheat Council at which importers' objections to existing prices were certain to be raised.

For the present crop year, which ends on July 31st, it is certainly too late to think of resorting to the IWA enforcement clauses to require the importing countries which are signatories to take up their full quota. It would be too late, even if Canada and the United States were prepared to accept the minimum price of $1.55 per bushel, which they are not yet. If the IWA minimum is to be enforced the time to invoke it would be early in the new crop year.

According to present indications, next year's marketing prospects will not be markedly different from this one. Stocks plus current crops still look like exceeding market demand. By the autumn a case could perhaps be made for reducing export prices to the IWA minimum, making sure of that market, and trying to keep the price outside the agreement at least up to the same level. But it does not now look as though Canada will resort to the $1.55 floor even then. If it does not, the decision will be based, amongst other things, on the calculation of how far other exporting countries are likely to reduce their prices.

The open market system has always had its advocates in Canada, on the prairies, and particularly in Winnipeg. But it would be difficult to choose a time at which it would be more hopeless to advocate a return to such a system. If the grain exchange were still selling wheat, and individual farmers were rushing in to anticipate a drop in price, then —it is argued—there would be real reason to fear that an oversupply, which must be temporary in the long run, would lead to a "price war" and a real price slump. Government marketing will not indefinitely keep prices up, particularly when the governments concerned are competing for sales. But it will surely exercise a moderating influence and tend towards a maintenance of prices. Canada still sees the world wheat problem as one of demand rather than of price. It does not believe that much more wheat would be consumed if the price were 20 cents lower. Surprising as it seems the world demand has proved relatively inelastic. Certainly it is much less elastic than the world supply, which can change from shortage to over-abundance according to the vagaries of the weather. The period of abundance therefore appears here to be a phase which has to be got through with as little reduction in price as possible, until the day when wheat is again a more precious commodity.

Premier for a month?

FROM A SPECIAL CORRESPONDENT

THE *Assemblée Nationale* has seen some strange permutations but nothing—oddly—more dramatic than last week's investiture of M. Mendès-France. This Radical, who is scarcely a member of his own party and preached Crippsian austerity after the war, was voted to power for four weeks by 419 deputies against 47 with 143 abstentions. His self-limited mandate is simply to seek an honourable peace in Indo-China. "My policy? To make peace. If I succeed then we can have a broad African policy and undertake the political and social revival of the country." Of his 419 supporters M. Mendès-France rejected the 99 Communists in advance. "What," he asked their spokesman M. Billoux, "would be the feelings of our soldiers in Indo-China if they learned that the country they were fighting for was governed by a man designated even partially by a party which had disowned them for years?"

When M. Mendès-France failed, narrowly, a year ago with a similar programme before the same Assembly, the Communists were against him but more than half of the Catholic MRP gave their support. The new Prime Minister owes his constitutional majority from the non-Communist parties to added support from ex-Gaullists and Conservatives. These changes speak volumes about the decline in French fortunes.

Until this year's defeats in Tonking and troubles in North Africa the foreign policy of M. Bidault was roughly accepted by the French Right as a tolerable balance between European and French Union themes. Recent events have shaken the French Union to its very foundations: so much so that the partition of Indo-China is seen by nearly all deputies as a prerequisite of any other policy. The MRP, which has held the Quai d'Orsay since 1946, save for a brief interlude when M. Léon Blum combined it with the premiership, is not unnaturally furious at being ousted from its fief in the middle of the Geneva conference. But at last the surgery of M. Mendès-France commends itself more than the equivocal panaceas of M. Bidault, who has never publicly established clear priorities between Asia, Africa and Europe.

Breaking EDC Deadlock

The new Prime Minister's priorities are clear enough: disengage from the Indo-China war; transfer French Union forces to Africa; actively prepare the French economy for European integration. For M. Mendès-France the EDC deadlock must somehow be broken. The long outstanding debate on the European Defence Community cannot, he recognises, simply be postponed. He has, therefore, asked that the Assembly should clearly pronounce before July is out, if not on the EDC, at least on German rearmament.

Le Monde welcomes M. Mendès-France as "the man who has singularly distinguished himself by refusing to be a minister in governments of whose policy he essentially disapproved." This political detachment combined with a reputation for brilliance—in his day he has been France's youngest deputy and youngest minister—is standing M. Mendès-France in good stead.

Should M. Mendès-France prove able to cut French Asian losses with honour—and he has expressly renounced any other kind of Asian solution—he will certainly receive national support for what he does in Africa. The Prime Minister has spoken in almost a Commonwealth vein about Morocco: "We must not regard every Moroccan and Tunisian nationalist as our enemy . . . need I recall what Lyautey used to say: 'Morocco has not only the right but also the duty to be nationalist'?" These sentiments will not please the diehard *colons*; but they represent the thwarted policies of many Socialists, MRP and also Gaullists who have never subscribed to the otiose philosophy of repression. M. Lacoste, the new resident-general at Rabat, is a distinguished administrator who might well change the climate on the spot if the climate were first to change in Paris. All that is needed is a steady, firm and generous policy which is not dictated by local interests.

M. Mendès-France, by limiting his mandate, has secured a government of national union for four crucial weeks. He has improved upon M. Laniel's government, which could find in the hexagonal chamber no certain majority for any policy whatever. Now that disaster has imposed action in the Far East, *immobilisme* has become synonymous with

treason. Provided that France's Asian Communist adversaries are themselves out for a settlement and not merely a delaying manœuvre, a surgical cutting of Indo-Chinese losses should be feasible. It is here that the French require and deserve the full weight of allied support. For it is the allies' chance—and perhaps the last one—of reviving French will-power and placing it behind their own effort. So long as a French government is a many-headed monster incapable of sustaining a coherent policy, France's allies can at the most regard the party leaders as passengers in the Atlantic ship. Now for the first time since General de Gaulle's resignation in 1946 there seems to be a chance of a French Prime Minister speaking for the bulk of the nation.

One question puzzled Parisian commentators: where did M. Mendès-France get the unexpected votes which enabled him to reach and even exceed the necessary 314 non-Communist ballots? These votes may be attributed to:

(1) The ten MRP who today raise him to power, just as yesterday they had approved him in opposition.

(2) The 15 overseas Independents who are confident that he will restore a policy of *détente* and economic progress in *Afrique Noire* as well as in North Africa.

(3) The 25 Conservatives hostile to EDC who hope that M. Mendès-France will deliver them from it by offering another solution.

(4) A dozen Gaullists who did not want to back him because he was getting Communist votes but who were swayed by his anti-Communist outburst.

General Templer's Achievement

FROM A CORRESPONDENT IN MALAYA

WHEN the appointment to Malaya of Sir Gerald Templer was announced in January, 1952, there were many who said "Who is he?" Now after a stay of less than two and a half years the question is "What has he done?"

That he has done something is evident from the easing of tension throughout Malaya and from the terms of the new Constitution that is to carry Malaya into the first stage of self government. Now that he has just left it is possible to assess the Templer Plan in retrospect. Its object was to take the sting out of terrorism and render it innocuous, to demonstrate to the common people of Malaya that democratic freedom is possible, and better than Communism, and finally to supersede communalism by uniting the different races in Malaya into a common Malayan nationality to which self-government could flow without strife.

He was throughout a man of mystery—a general who was not a general, an autocrat who liked little children—and he cannot easily be placed in any known category. "He was a man like ourselves"; you will hear the comment in a Malay kampong. Perhaps that is the answer. As a man he is not a genius but he has an infinite capacity for taking pains. In his fifties he is young in outlook and has boundless energy. He has not allowed experience or success to mould him; he did not use the past as a ready reckoner for solving the problems of the present. He takes nothing for granted and thus nothing is to him impossible.

Such a character enabled him to bring to Malaya's affairs a really open mind and such men are rare in Malaya or anywhere. In keeping with this he knew what he wanted and had abundant self confidence; he was willing to back himself. Although he was not a dictator his will prevailed, in Malaya and at Whitehall, and it was a personal will. In this however there may lie some danger and perhaps it is for the best that he leaves Malaya when the clear cut decisions essential in an emergency are becoming blurred in the haze of political issues.

In itself, his appointment was a guarantee to the waverers in Malaya that Britain meant business. This in turn set the pace for active operations against the terrorists. General Templer took risks and the responsibility for them. He issued rifles to planters and to the local Home Guards despite fears that such arms would melt away into the jungle. He went to the length of organising a force of surrendered terrorists. He made full use of propaganda and kept his word to those who gave up.

He convinced Malaya that Communism is not inevitable but the emergency is not yet over—it has been curbed not cured. Only one-eighth of Malaya is as yet "white." How much of the credit goes to General Templer and how much to those who came before him? When he took over the reins much had been planned. He inherited schemes and made them work. His secret lay in personal contacts; few men have seen so much of Malaya in so short a time. He not only made himself known to thousands in all walks of life but he also made them aware of his personality. At Tanjong Malim stern measures were necessary and yet he somehow carried them through with the air, not of a dictator, but of an angry uncle. He said hard things to those who stood in his way, regardless of race or position; he was blunt and at times rude, but was always human.

Accent on Community Welfare

Resettlement has been necessary as a safeguard against intimidation and forced collaboration. At root this was a defensive measure but General Templer brought out its positive side by his accent on community interests. There have been hospitals, schools, welfare centres and women's institutes. People have been encouraged to manage their own local affairs and to defend themselves against those who would take these benefits from them. By identifying himself with the common man General Templer went to the root of the matter.

It is in the success of his ultimate aim that he will wish to be judged but it has yet to be seen whether self government will come to a united Malayan nation or be snatched by communal hands. It is inevitable in a country seeking self government that some measure of hatred should be fomented against the protecting power. General Templer realised this and believed it to be "fostered only by a small minority in which may be found the representatives of most communities, including some British." The new Constitution which sets the pattern for the future is reasonable and moderate. It is perhaps too moderate for some but it is certain that however far the Electoral Committee went there would have been further demands from those wishing to win the credit for having won independence.

The issue however remains an open one and the results of General Templer's work will not be seen for some time to come. The stage has been taken by the UMNO-MCA Alliance which fortified by its reception by British Members of Parliament, is talking of boycott and non-cooperation. Perhaps moderate counsels will prevail. General Templer has probably interpreted the will of the common people and rulers but not that of the politicians who come between them. It is true that the UMNO-MCA Alliance is a fusion of Malays and Chinese but they remain communities and possibly temporary allies for a purpose. The new and untried Party Negara is more on the Templer model and may in the event have greater support than is thought. Although on the face of it the small elected majority looks like token independence it should be remembered that the nominated members are not stooges to ensure British control. Most of them are genuine representatives of sectional interests and if the party that comes to power governs wisely it will win their support.

What people in Britain should realise, and what General Templer saw, is that Malaya is not an oppressed colony dominated by European interests. It is a pleasant and prosperous land, built up by British leadership, which has attracted people from neighbouring countries so that it is occupied by three major and several minor Asian communities. Why else should citizens from free India seek what is sometimes described as colonial tyranny? Why should Chinese shun all that Communism has to offer?

Jugoslavia in Transition

FROM A SPECIAL CORRESPONDENT

AT the end of March the Central Committee of the League of Communists of Jugoslavia held a plenary session in Belgrade. Though this "Fourth Plenum" did not devote much time to the case of Milovan Djilas, the leading Communist whose doctrines on the withering away of the Party had been formally condemned last January, its essential task was to reaffirm the Party's role in the State and to restore the confidence of the members after the doubts and confusion of the winter.

All Communist parties in power face the difficult task, prescribed by party doctrine, of providing general leadership and inspiration for policy, without taking on themselves the details of administration. They must, in the classic Soviet phrase, "direct but not replace" government departments. For more than thirty years the leaders of the Soviet party have alternately exhorted its members to give firmer leadership or more responsibility to government officials. In Jugoslavia for some years there has been much greater emphasis on individual responsibility and decentralisation than there has ever been in the history of the Soviet Union. In his articles of last winter, Djilas stopped only just short of the logical conclusion of his arguments—that the League of Communists should give up its monopoly of political life. The fourth plenum strongly reasserted the necessity of Communist leadership. President Tito put the matter as follows:

> Today we shall not command this or that competent institution, we shall not tell them that they must do this and that, but we must suggest it to them in various ways. And everyone—professor, teacher, official and anyone else—must know that that is the attitude of the Communists, and the Communists mean something in this country, their importance has not ceased. And if anyone afterwards goes against that, it will mean that he is against the correct development of socialism in our country.

The plenum also stressed the need for stronger Communist leadership in intellectual life. A rather ominous passage in the speech of Rodoljub Čolaković, Jugoslavia's education boss, complained of the tendency of intellectuals to raise the bogey of *Zhdanovshchina* when they were criticised. It would, however, be premature to suppose that Čolaković, or his seniors, admire the methods of the late A. A. Zhdanov, let alone that they wish to reintroduce them in Jugoslavia.

The fourth plenum showed no inclination to reverse the policy of decentralisation in the political and economic fields. The new economic organisation, in force since January, 1954, gives greater powers to the "communes"—the county and city councils. It is these bodies which now dispose of that portion of the profits of industrial enterprises which is left after the central and republican governments have levied their taxes and an interest rate on the assessed value of fixed capital has been paid to the National Bank. Under the previous system this portion of profits was at the disposal of the workers' councils elected in the factories themselves. The change is perhaps intended to counteract what is officially known as "particularism"—the tendency of workers' councils to spend their factories' revenues on their own welfare rather than on such objects as the authorities consider to be of more general value. Communes now also appoint directors of enterprises, who are responsible only to them. It would, however, be surprising if a commune were to select, as director of an important concern, a person who was not an outstanding member of the League of Communists, personally known and approved by the supreme leaders of the League.

It is possible that the increased importance of the commune may mean a relative decline in the importance not only of the lowest level of the hierarchy—the workers' council—but also of the level intermediate between the commune and the central government—the national republic. On the surface, relations between the central and republican governments are excellent. It would, however, be rash to assert that the old "national problems" of Jugoslavia have been "solved." Admittedly they do not exist in their old form. There is absolutely no question of deliberate discrimination for or against any of the consistent nationalities. That this is so, must be reckoned greatly to the credit of the regime. But two types of conflict cannot be ignored.

One is between the republics and the central government. To the Croat, "Belgrade" still means the central authority which issues decrees, and which he can blame for most things that he does not like. The more enlightened Croat

DEVELOPMENTS OVERSEAS

Fifty quarterly reports on conditions in other countries are now regularly prepared by The Economist Intelligence Unit. These reports cover 70 countries and their range is being steadily extended. For example, subscribers to the reports on Belgium will find that information about the Belgian Congo is also included.

Why not write for a full descriptive leaflet—and a free specimen report—to

The Economist Intelligence Unit
22 Ryder Street, London, S.W.1
Whitehall 1511

will readily admit that " Belgrade " no longer means, as it did in the times of King Alexander, Greater Serb supremacy over Croats. But the feeling remains that the fate of Croatia is decided outside Croatia, and the grumbling which the hardships of life cannot fail to provoke, can easily take on a nationalist flavour. And this is not confined to Croatia.

The other type of conflict is concerned with the uneven pace of economic progress in different republics. The most advanced of the republics is Slovenia, while both Croatia and Serbia contain both advanced and backward regions, the former on the whole predominating. Bosnia, Montenegro and Macedonia are much poorer, and are both economically and culturally backward. It has been a deliberate policy of the government, ever since the war, to give a high priority to the development of the three backward republics. Most of all has been done in Bosnia, which not only needed help but possessed great mineral resources and occupied a vital strategic position.

But the progress of Macedonia is also striking. Before 1941 the Belgrade politicians denied the existence of Macedonians—they were " South Serbians," speaking a dialect of the Serbian language. Today their separate nationhood—separate not only from Serbian but also from Bulgarian—is not only recognised but emphasised. Today the number of pupils in primary schools has substantially increased, and in secondary schools still further, and instruction is in the native tongue (Macedonian, Albanian or Turkish). Skoplje, the republican capital, which before the war had a philosophical faculty, subject to Belgrade University, with 160 students, now has its own university with more than 4,000 students. Quality lags behind quantity, but remarkable progress is being made. Industrialisation has not gone so far in Macedonia as in Bosnia, but even so the industrial labour force in 1953 was almost three times that of 1939.

Danger of Centrifugal Forces

The cost of these improvements in the backward republics has been borne by the people of the wealthier regions—Slovenia, Croatia-Slavonia and Central Serbia. To a foreign visitor who has memories of the old Jugoslavia, the government's policy in this respect appears true statesmanship. But the Slovenes, Croats and Serbs feel that they have good reason to grumble.

It is the national, regional and cultural diversity of Jugoslavia that is the main justification for ruthless centralised government. If the present dictatorial state machine were suddenly largely dismantled—which was the logical conclusion of Djilas' argument—centrifugal forces might prove extremely dangerous. The present regime is probably more ruthless than that of twenty years ago, but it is also more impartial. In the present writer's view it is not totalitarian. The citizen's private life is his own, and intellectual and cultural life, where they do not touch politics—in the traditional sense of the word—are surprisingly free. The disgrace of Djilas does not appear to have changed this. It is perfectly possible for persons who are not Communists to hold the jobs for which they are qualified, and to perform tasks of responsibility. Such people feel that this is better service to their country than sterile opposition.

Western observers may dislike the dictatorial methods of the Jugoslav regime, and may feel that its leaders are prevented by Marxist-Leninist dogma from seeing several simple truths about the art of government. But such feelings, justified or not, are of small practical importance. It is merely academic to compare Jugoslav realities today with an ideal state of western democracy, which has never had very vigorous roots on Jugoslav soil, and which is explicitly rejected by Jugoslavia's present rulers, who will certainly not be removed from power except by some catastrophe whose effects could not be confined to Jugoslavia. It is more realistic to set present realities against such improvements as men bowed down under the burden of Marxist-Leninist ideology are mentally capable of achieving, and also against the many pitfalls into which the same burden may cause them to stumble. Set in this perspective, the Jugoslav scene permits of hope.

Leadership in New China—II

Soldiers Around Mao

RELATIONS between the ruling party and the armed forces are crucial for the stability of a totalitarian state. The army under a dictatorship is not only charged with the defence—or expansion—of the country against an external enemy, but is also in the last resort the indispensable instrument for quelling internal revolt ; at the same time, if it becomes disaffected, it can overthrow the regime itself, or at least change its leaders, by a *coup d'état*. How to keep the army under control is the problem which confronts any totalitarian party which has attained power.

There are two alternative methods of doing it ; one is to build up an internal security police force with armed units of its own as a check on the regular army ; the other is to fuse the political and military elements in the direction of the armed forces in such a way that the formation of a separate police army is rendered unnecessary. The former method has been that characteristic of Soviet Communism, under which the Cheka in its various transformations and rebirths has always had its own organisation and armed strength separate from the Commissariat or Ministry of War. Hitler followed the same path in building up the Waffen SS as a rival to the German regular army. The Chinese People's Republic, on the other hand, has adopted a system whereby political police forces are not separated from the army, but the army is controlled by a body in which the political leadership of the government directly participates.

The contrast between Soviet and Chinese practice in this matter may be attributed partly to the long duration of Communist armed struggle in China, and partly to the special relation which has existed for many years between Mao Tse-tung and the commander-in-chief of the Communist armies, Chu Teh. From the Nanchang insurrection of August, 1927, which followed the original break between the Communists and the Kuomintang, to the completion of the conquest of mainland China in the autumn of 1949, the Chinese Communists as a party under arms were waging war continuously against either the Kuomintang or the Japanese or both for a period of over twenty-two years. The period of fighting after the Bolshevik Revolution—less than three years—was brief by comparison.

The difference in Chinese experience has produced a difference in the character of Communist leadership. Many of the " civilian " leaders in China were so immersed in strategy and the direct conduct of military operations that they could be regarded as soldiers. This was true particularly of Mao himself, who personally led guerilla forces in Hunan in the early days and had definite ideas of his own about how to wage a war. In conjunction with Chu Teh, the professional soldier, he worked out in theory and put to the test of practice his strategic conception summed up in his well-known formula:

> When the enemy advances, we retreat ;
> When the enemy halts, we harass him ;
> When the enemy avoids battle, we attack ;
> When the enemy retreats, we pursue.

Chu Teh, born in Szechwan province in 1886, a member of the landlord class, graduated as an officer from the Yunnan Military Academy ; in the early 'twenties he went to Europe and studied military subjects in Germany, France and Russia. Having become a convert to Communism, he took part in the Nanchang insurrection in 1927 and subsequently joined Mao in the mountains on the Hunan-Kiangsi border. He developed an intense personal loyalty to Mao, and their partnership was so close that the Communist leadership came to be known popularly as the Chu-Mao, a sort of composite personality in which neither element was imagined as subordinate to the other.

Underground in Shanghai

Chu's support was probably the most decisive factor in enabling Mao to achieve the position of supreme leadership in the party. Until 1932 the Central Committee and Secretariat of the party remained in Shanghai, working underground in China's largest city, while Chu and Mao were operating in the mountains hundreds of miles away. At last, however, Kuomintang police activity forced them out of Shanghai and they transferred themselves to the guerilla territory, where effective power belonged to the Chu-Mao. Mao still further strengthened his position during the " Long March," when everything depended on day-to-day military decisions and contact with Moscow was lost for several months.

During the war against Japan, when the Communist " Eighth Route Army " was officially recognised by the National Government, Chu Teh was its commander (and concurrently deputy commander under a Nationalist general of the Second War Zone), and P'eng Teh-huai was its deputy-commander, with Lin Piao, Ho Lung and Liu Po-ch'eng as divisional commanders. P'eng Teh-huai, a Hunanese fourteen years junior to Chu Teh, is today his rival in popular fame, having followed up his career of fighting against Kuomintang and Japanese with the command of the Chinese " People's Volunteers " in Korea.

P'eng, like Chu, belongs to both the Politburo of the Communist party and the Revolutionary Military Council ; he is not, while Chu is, a member of the Central Committee Secretariat, but he is, while Chu is not, a member of the State Planning Committee. Chu remains commander-in-chief. In the organisation of the super-provincial administrative regions under the Central People's Government, P'eng was appointed chairman of the north-west administrative council, but his duties in Korea seem to have made him permanently non-resident.

Of the three former Eighth Route Army divisional commanders mentioned above, Ho Lung is no longer important ; an illiterate Hunanese peasant and old-fashioned partisan fighter, he lacks the capacity to adjust himself to the transition from local skirmishing to large-scale military organisation. He has been rewarded for past services with the Ministry of Physical Education, for which his talents appear to be well suited. Lin Piao and Liu Po-ch'eng are in a different category. Lin Piao, aged 46, a graduate of the Whampoa Academy, of which Chiang Kai-shek was director, took part in the Nanchang revolt and in the Long March and was largely responsible for the decisive victories over the Kuomintang in 1948-49. He is chairman of the central-south administrative council and a member of the Revolutionary Military Council and the State Planning Committee, but does not, as do Chu Teh and P'eng Teh-huai, belong to the Politburo of the Communist party. He was recently reported to be out of favour with the higher authorities.

The Importance of Chu Teh

Liu Po-ch'eng, who is chairman of the south-west administrative council (with the Laos, Burma and Indian borders in his charge), is a graduate of the Soviet Military Academy and has translated a number of Russian military textbooks into Chinese. He was chief of staff to Chu Teh during the Long March and captured Nanking during the civil war in 1948. Like Chu Teh, he is a Szechwanese, and at the age of 62 he is one of the oldest among the notable Communist generals. He is a member of the Revolutionary Military Council, but not of the party Politburo or of the State Planning Committee.

Other military figures who have achieved prominence are Chen Yi, a Szechwanese who studied in France, working for a time in the Michelin factory, organised guerilla bands in South China after the shift of the main Communist forces to the north in 1934, and was made mayor of Shanghai after the Communist conquest ; Yeh Chien-ying, from Kwangtung, graduate of Moscow and Whampoa, who has been made mayor of Canton ; and Hsiao Ching-kuang, from Hunan, graduate of Moscow and Whampoa, who was second in command in Manchuria during the civil war. There are also Hsu Hsiang-ch'ien, from Shansi, the Chief of the General Staff, who seems to have been recently somewhat in the shadow—he was once an opponent of Mao Tse-tung, and has perhaps never gained the latter's confidence—and his deputy, Nieh Jung-cheng, a Szechwanese who studied chemistry in France and Belgium, graduated from the Soviet Military Academy and from Whampoa, and has for some time apparently been acting in the place of his nominal superior.

The Revolutionary Military Council, with its mixed professional military and civilian elements under the chairmanship of Mao Tse-tung, closely supervises all military formations, including the regular army, the militia, and the political security troops. There is no separate department of the Government Administration Council in charge of the armed forces. The system of control appears to have worked well so far, but much depends on the immense personal prestige of Chu Teh and his enduring loyalty to Mao Tse-tung. If either of them were to disappear from the scene, the People's Army might be more difficult to manage than it is now.

(To be continued)

Zhdanov's Ghost Rides Again?

THE struggle for power in the Kremlin is played behind closed doors but its echoes are to be heard in all walks of Soviet life. Sometimes from these side-issues, reflections and echoes it is possible to gauge the fortunes of the tough and the soft, the diehards and the reformers in this vital struggle. Literature provides probably the best mirror in which to watch the balance of power in the Kremlin from outside its walls. The treatment of literature is no minor problem in the Soviet Union and the general line for *belles lettres* must be approved by the highest quarters. Changes in that line, therefore, are a reflection of general changes in policy-making; the loosening or tightening of the literary strait-jacket is not merely of interest to aesthetes—it is a symptom of great political significance.

Early this year attention was drawn in *The Economist* of January 16th and January 30th to a systematic attack on the Stalinist totems and taboos in Soviet literature. In spite of Beria's fall, important writers—such as Ilya Ehrenburg or Konstantin Simonov—and critics continued to attack openly the system of writing to official measure. With official blessing, and even encouragement, they cried out for psychology instead of technology, for more truth, for greater sincerity in writing. A constant fire was directed against "Zhdanovism," the Stalinist system of literary controls named after the late Andrei Zhdanov who after the post-war relaxation led the drive for regimenting Soviet art.

For months the partisans of greater literary freedom held the stage and their opponents kept silent. Now, however, the "Zhdanovites" have launched a counter-attack taking advantage of preparations for the writers' congress to be held this autumn. Their position was most clearly expressed by A. Surkov in a lengthy article in a recent issue of *Pravda*, One of the chief arguments against writing to measure was that it can only produce mediocre work and so Surkov—on the principle that quantity changes into quality—starts with a long list of "eminent" Soviet writers. Then, under the flag of "social realism," he attacks the tendencies towards "naturalism" and other bourgeois deviations in recent Soviet writing. The meaning of this is simple: "naturalism" stands for the right of an author to paint the seamy side of Soviet life as he sees it; "social realism"—for his duty to keep the prescribed proportions of positive and negative and provide a "moral" ending. As if to drive this point home, Surkov then proceeds to condemn those people who last winter made a daring plea for greater freedom; to recall approvingly Zhdanov's decrees of 1946; and to revive the old arguments about cold war, foreign encirclement and the "constructive" duties of writers. It is with such slogans that literature had been transformed under Stalin into a crude utilitarian weapon.

Nor is this an isolated case. The counter-offensive is waged on all fronts and spreads even to satellite countries. Moscow's three literary monthlies, which were the platform for the partisans of a new deal for the writers, have come under heavy fire. The editor of one of them, the novelist F. Panferov has been sacked. (One of the reasons of his disgrace was probably his presentation in his latest novel of a high party official as a drunkard.) Other novelists and playwrights have been taken to task for showing too many "negative" characters and depicting these criminals fitting into Soviet society as easily as "fish in the water." Many writers must now repent that they had taken seriously the signs of relaxation of a few months ago.

This development is a setback for Mr Malenkov. It was he who, on the eve of Stalin's death, called on Soviet artists to take their pink glasses off when describing Soviet society and it was generally assumed that he was also responsible for the more liberal attitude towards literature after Stalin's death. Other counsels must now prevail in the Kremlin, but their victory is not yet complete. Ilya Ehrenburg is still allowed to describe shortages in Russia and vent his indignation against the frame-up of the doctors (though he, too, has just been rebuked); the poetess Aliger can still snub the above-mentioned Surkov by reminding him that articles are no substitute for novels or poems. Above all the party has not yet as in 1946 issued any stifling directives for art. Zhdanov's ghost haunts again, but other voices can still be heard.

There is a more important reason why the struggle cannot end so rapidly. The relaxation of literary controls, like other reforms introduced by the post-Stalinist regime corresponded to the needs of Soviet society: it was part of a general attempt to purge Stalinism of its outworn features. The millions of literate Soviet citizens brought up on the classics of Russian and world literature could not, and cannot any longer swallow the crude pills of Zhdanovist propaganda. The new rulers may or may not have wanted a clean break with the Stalinist past ("We want Gogols who give us no trouble" mocked a bold satirist in *Krokodil*), but at first they clearly wanted a change. The Stalinist diehards may have concluded that such changes, however, were dangerous and would inevitably spell the doom of the society which they had inherited from their Leader. But for how long can they artificially stop the course of events? The literary barometer shows that the diehards have now the upper hand, but it would be foolish to assume that this weather forecast will hold good for long.

Journal of Geneva—IX

JUNE 17th. A day of private discussions on Mr Chou En-lai's proposals of the previous day. M. Bidault returned to Paris.

June 18th. A restricted session discussed the problem of getting military talks started for Laos and Cambodia.

June 19th. After a restricted session a communiqué was issued stating that

> with a view to facilitating the simultaneous and rapid cessation of hostilities in Indo-China, it is proposed that (a) the representatives of the commands of the two sides shall meet immediately in Geneva or on the spot; (b) they shall study the questions relating to the cessation of hostilities, on the territories of Cambodia and Laos, beginning with the question concerning the withdrawal of all foreign armed forces and of foreign military personnel . . .; (c) they shall report as soon as possible to the conference. . . .

June 20th. Mr Molotov and Mr Eden left Geneva.

June 21st. Mr Chou En-lai invited the delegates from Laos, Cambodia and Vietminh to their first private social meeting.

June 22nd. A meeting to discuss armistice supervision in Indo-China was described as inconclusive.

June 23rd. A day of private talks at Geneva. Mr Chou En-lai and Mr Mendès-France had a meeting in Berne.

SIMON ENGINEERING GROUP

Sulphuric acid

No. 3 IN A SERIES ON RESEARCH & DEVELOPMENT

The uncertainty and dollar cost of sulphur supplies have given prominence to pyrites, anhydrite and spent oxide as raw materials for sulphuric acid. Simon-Carves are developing highly efficient pyrites-roasting techniques in conjunction with Swedish and German specialists; plants using these techniques are already in use in Britain and under construction in Australia and South Africa. They are building two huge anhydrite plants in Britain with chemical engineering know-how provided by ICI and licensed to Simon-Carves throughout the world. They are also building the first two plants in Britain to use the Kachkaroff tower process of making sulphuric acid from spent oxide, which is produced in large amounts at gasworks but has not so far been found usable alone in orthodox "contact" plants.

Is it a job for Plastics?

Some production jobs are just right for plastics, some can be made right by simple alterations to the drawings, some are better made in other materials. The point is, who can say? We, in the B.I.P. Group, believe that we can.

We have been in plastics from the early days. We make moulding powders, we design and make tools and presses and we are considerable moulders of our own and other materials.

In addition we maintain a Product and Mould Design Service staffed by highly-skilled, practical men who know the plastics industry from A to Z. This Service is freely at your disposal.

B·I·P GROUP

The most comprehensive service in plastics

BEETLE UREA & MELAMINE MOULDING POWDERS · BEETLE POLYESTER RESINS · BEETLE RESINS FOR THE PAPER, PAINT, TEXTILE, WOODWORKING & FOUNDRY INDUSTRIES · MOULDING TOOLS & PRESSES

THE BUSINESS WORLD

On Doing It Yourself

MISS Do It Yourself, a young lady in gaily coloured overalls recently cut her way graciously with an electric handsaw through a plank nailed across the entrance of a New York "Do It Yourself" exhibition. The lady has no counterpart in this country. Nor has the high pressure salesmanship that christened her and organised the show of home decorating materials and equipment specifically for the home handymen who are today responsible for the vast majority of all the painting and papering and varnishing that is done in American homes. In Britain, the spread of amateur decoration has been rather slower; and the reaction of the decorating materials manufacturers to what may become a major shift in their business has been slower still. Nobody knows quite how far it has gone here, though a few market surveys have been attempted. But it has already gone far enough to cause considerable alarm among professional decorators; and many of these, who until recently stood out against co-operating with the amateur who wanted to do the easy work himself, are now bowing to the inevitable and accepting commissions for the difficult items, such as plastering and "ceilings only."

Between the handyman's loss of wages (less tax) that his leisure work costs and the price he would have to pay (out of his net income after tax) for professional work there is a widening economic divide. When saving can be combined with fun, "do it yourself" ought to be the easiest proposition in the world to sell. Yet, so far, British manufacturers have only tiptoed into it. They have provided construction toys for several generations of schoolboys (think of "Meccano," Hobbies, and "Trix") and they offer vest-pocket diesel motors that will drive the budding aircraft designer's model nearly as fast as the real thing. But they seem a good deal more shy of catering for the man (to whom the child is father)—perhaps because what father does as an amateur bricklayer, carpenter or decorator is thought, in these hypersensitive days of full employment, unfairly to take the bread out of the mouths of the trade.

There are fewer inhibitions in the United States on this point. Americans have a marked readiness in mechanical construction, and industry has gone a long way to develop it into a market. Electric power tools, home decorating materials and appliances, cut timber for small buildings and furniture, complicated bits and pieces for radio and gramophone kits—these are among the common products that are demonstrated at "do it yourself" exhibitions, featured in the home magazines, and promoted in effective co-operation with local dealers. One mail order store sells packets of "do it yourself" instructions for different jobs, containing drawings and advice on materials. The turnover in electric power tools alone has been estimated at $150 to $200 million a year, which is big for spare time money.

The point that differentiates "do it yourself" in the United States and this country is that here the selling appeal to the amateur is still incidental, something on the fringe of an established market with the "trade" rather than a new market in its own right. That new market in the United States has recently been brought to the attention of manufacturers here by the Board of Trade. The scope for a similar expansion in Britain from hobby to industry is perhaps less evident. But already it has gone some distance; while Edward covers the kitchen table with a panel of the latest type of plastic material (using the latest type of bonding resin), Angelina busies herself with a "home perm." Since the war the difficulty of finding a decorator not engaged for months ahead, and the rising cost of his work when he found time to do it, have forced many families to try their hand with paint and paper.

Of the 13½ million houses (and flats) in Britain, 3¾ million are owner-occupied; the rest are rented from private landlords and local authorities. In the United States, over half the houses are owner-occupied, so that "do it yourself" here starts with a handicap that may be made good if tenants themselves acquire the habit of doing an increasing amount of decoration for themselves. In the north and in Wales it has long been the general custom for tenants of private landlords to be responsible for interior decoration; through the pressure of rising costs upon controlled rents, this is becoming more true of the south also. The same change seems to be occurring in public housing. More and more local authorities in the south are now encouraging their householders to undertake interior decorating and even minor repair work. The cost of maintenance—which can be as much as 4s. 6d. a week for each tenant—has led some councils to present their tenants with the choice of paying more rent, taking over the responsibility for minor upkeep, or doing the work in return for a gift of the materials.

*

Such surveys as have been attempted suggest that three-quarters of all households do at least some of their own decorating. The trade is slowly resigning itself to this fact. Against the postwar rise in costs, in which labour represents as much as 40 per cent of the total bill, the decorator has had little defence. There is little room for technical innovation in decorating; the difference between a professional job and that of the careful amateur is a matter simply of craft skill. The amateur can find out how to go about the job, and he probably works harder, and with care almost as effectively. It seems likely that the one or two man firm, which in the past has been the characteristic unit of the decorating trade, will continue to lead a bleak existence in the future. The larger firm, which often combines building with decorating and repair work, will still find its bread and butter work with local authorities, shops, offices and factories. Since 1949 (when it was certainly too high) the number of operatives and firms known to the Ministry of Works in the decorating business has been falling steadily. The main hope of the trade at the moment—that the do-it-yourself habit is only a passing fad—seems rather forlorn.

*

Paint and wallpaper manufacturers in Britain, so far, remain wary of upsetting their professional customers and have refrained from deliberately encouraging the home decorator. They may not have realised that he spends more money more frequently on decorating materials than if he employed professionals to do his work or had to pay his landlord for it. Moreover, he now has the help of several new techniques. The use of quick-drying paints and emulsion paints, which are easy to apply, washable, and proof against steamy atmospheres, is growing, and is providing severe competition for the wallpaper industry, which is reacting by trying to make paper hanging an easier job. But pre-pasted wallpaper, which is marketed in the United States, has not yet been seen in this country. Probably the most important development for the home decorator is the paint-roller, which has become very popular amongst those who were never very good at wielding a brush. Rollers and spray-guns also offer professional firms perhaps the best chance of cutting their costs, though the ways of the trade die hard. "Colorizers," which are mixed with grey or white basic paints to produce a complete range of colours have recently appeared in this country from across the Atlantic. These help the householder with a most varied colour scheme and help the dealer to economise on storage space and working capital.

With the return of a buyer's market in paints the industry has been forced to start overhauling its sales and distribution organisation. The shop around the corner is the place where amateur decorators will buy and from which they seek preliminary guidance. But perhaps there is already room for more specialisation. One shop has recently been opened in London solely to advise and lend equipment to the home decorator, and there are now others elsewhere. Institutions that provide evening classes for the home decorator report a growing attendance. But if the manufacturers are to make a full-blooded attack upon the "do it yourself" market, they must set about providing him with the materials, the advice, and the equipment that he needs at a reasonable cost in the nearest convenient shop.

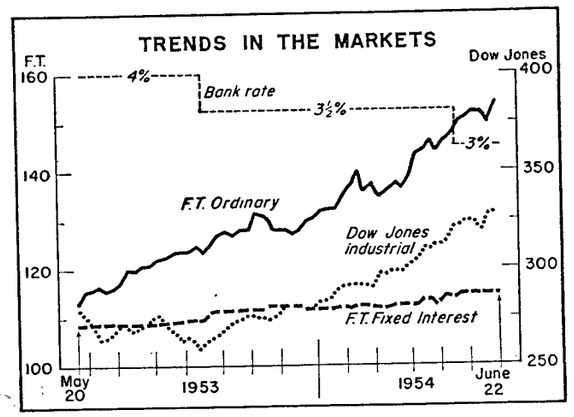
The crucial question facing manufacturers is whether the self-service phase will last and how widely it will spread. Britain's climate may make expert decoration necessary for rather more of the house than in the United States—where houses are largely built of wood, and the tradition of painting the outside every year has always been a family affair. But factors suggest that doing it yourself will spread, and last. It must always, at the time if not over the years, be cheaper for the householders than employing someone else; and the level of skill required is not out of the reach of the average person. Moreover, such new techniques as are emerging favour the amateur as much as the professional, and devalue his craft skill. Floor-finishes, for instance, are still largely laid by the expert, but only the completely incompetent fails with the paint-roller. In recent years, the self-service trend has emerged over a wide new field, from furniture making to laundrettes—wherever, in fact, professional services have become expensive and new techniques have enabled the relatively untrained amateur to attain a certain competence. A minor revolution in living habits is taking place today, of which doing it yourself, because hand labour is too costly, forms a significant part; and the wise manufacturer will do what he can to adjust himself to the changing market.

Business Notes

The Bull Rampant

At the very least the "bull market" on the Stock Exchange is thirteen months old. Whether it started from the low point of mid-May last year shown in the accompanying graph, or from an earlier period, is immaterial. It is still behaving like a vigorous and playful young steer at its liveliest early this week when the *Financial Times* index of industrial equities continued to break new records until it reached 154.8 on Tuesday and paused for breath, declining by small fractions on Wednesday and Thursday. Stock Exchange bargains marked have been running at the high level of over 12,000 a day, more than 2,000 ahead of most corresponding days last week. Every type of buyer has been in the market: the institutions, the country investor, the small man, and the speculator.

But it has been the risk taker, whether speculator or investor, who has made the running. Buying by speculators—big speculators—has been seen in the gilt-edged market. It brought about sharp advances of half a point a day in undated gilt edged, throwing aside the recent disfavour in which undated stocks have been held. This new wave of



confidence based itself on the argument that the dateless stocks would have to advance into line with the recent progress of the dated stocks; and so far it has not been proved wrong. In the industrial market, too, the semi-speculative investor was in the mood to take moderate risk. The old favourites of the stores group—Great Universal, Debenhams, Marks and Spencer, and United Drapery—were well to the fore, and there were no signs of boiling over until mid-week.

There are no signs that ragged speculation has taken control of the share markets. At no time during the past year have Kaffirs and rubber shares been sold across the West End as they were in the past when speculation got out of hand. Indeed these groups have not participated in the movement at all. But there are signs that investment has been becoming less the prerogative of the institutions and the pension funds and that private investors have been returning to the market with a feeling that they are justified in some moderate risk taking. The frame of mind that prefers a dateless gilt-edged stock where the possible gains and losses are greatest is much the same as that which carried ICI ordinary up to a new peak of 70s. 3d. on Tuesday. The chart shows that industrial equities have been rising much more steeply than fixed interest securities, which in turn suggests that confidence, rightly or wrongly, is still waxing.

Stewarts and Lloyds

The ordinary share markets provided an auspicious background for the offer of 10 million £1 ordinary shares in Stewarts and Lloyds at 35s. on Thursday and Friday. *The Economist* goes to press with the extent of the subscriptions unknown. But the technical fact of oversubscription was a foregone conclusion since firm applications were required from underwriters. What happens in the first few weeks of market dealings will determine the true measure of success of the Realisation Agency's policy. The Agency has not spared any effort to make the issue a success. It is spending £530,000 (or 1s. 0¾d. per share) on expenses, including underwriting commissions, though this figure represents no more than 3 per cent of the £17½ million involved. The consortium is paying commissions of 7¾d. per share out of the 9¼d. per share which its members themselves receive; hence the underwriting institutions and others will have a reasonable margin in hand for buying additional shares up to a modest premium if their allotments are not up to their expectations.

The market's progress seems to have left even the Bank of England a little behind. The price at which it will accept 3½ per cent Treasury Stock 1979-81 instead of cash was fixed, on last week's closing level plus an allowance for full payment on application, at £97 9s. 1d. per cent. But the market price of that stock has refused to stay pegged and is up to £97 12s. 6d.; hence it is cheaper to apply with cash. It is unlikely that Stewarts and Lloyds will be resold to the public at a loss, though with £10 million of 5½ per cent preference capital and £10 million of 4½ per cent debenture stock still in the hands of the Agency the final result is unknown.

But the success or failure of the Agency's transactions cannot be judged by crude measurements of profits or losses compared with the nationalisation values taken at a series

of arbitrary dates. Mr George Strauss and Mr Hugh Gaitskell fell into that error when they attacked this week the sale of the ordinary shares of English Steel to Vickers and Cammell Laird. They forgot first that so long as the prior charges remain unsold no profit or loss can be struck. They forgot secondly that the prices of sale of steel companies are the result of months of tough negotiation and that the Agency is no whit less keen than they to get the best price; indeed its members know that down at the bottom of their list are some steel units that certainly are not saleable without loss. Critics forgot, above all, that what is being resold in 1954 is not the same thing that was nationalised in 1951. If there are losses on steel, a lot of the blame will attach to Mr Strauss and his colleagues who threaten renationalisation.

Cheaper Money in America

THE dilatoriness with which American business is picking up from the setback that began about twelve months ago has induced the Federal Reserve Authorities to make another pump priming move. It is a general relaxation of member banks' reserve requirements which will add some $1,500 million to excess member bank reserves and may, if other things remain unchanged ultimately allow a $9,000 million expansion in the total bank credit of the member banks. This method is unusual, for the change will not come into full operation immediately but will be spread gradually over the next six weeks. When the reductions have been completed by August 1st, the reserve requirements will have been affected as follows. On net demand deposits for Central Reserve City Banks, i.e. New York and Chicago, the requirement will be lowered from 22 per cent to 20 per cent (the legal minimum being 13 per cent). For reserve cities the requirements will be lowered from 19 per cent and 18 per cent (the legal minimum being 10 per cent). For country banks the requirements will be cut from 13 per cent to 12 per cent with the legal minimum at 7 per cent. On time deposits all member banks, wherever situated, will have their reserve requirements cut from 6 per cent to 5 per cent. Thus the substantial cuts just announced will still leave reserve requirements well above their legal minima and a plentiful supply of fuel will remain for further pump priming.

These reductions are also significant as an illustration of the differentiation in changes in reserve requirements which was made possible by wartime legislation. The pressure has recently been greatest on member bank reserves in New York and Chicago and there the requirements in respect of demand deposits is cut by two points; the reduction everywhere else is only one point. The Federal Reserve Board has pointed out that it was acting in anticipation of estimated demands on bank reserves during the summer and autumn months. Account has also been taken of the Treasury's financial needs. It should be noted that member bank reserves have also been modestly reduced recently by a net gold outflow from the United States. Even with all these explanations and reservations the move is having a further depressing effect on short term money rates in New York where the three months Treasury Bond rate is now down to 0.64 per cent as against 1.58 in London. It is not, therefore, altogether surprising that this latest move in the American credit policy should have stirred up some hopes of a further sagging in money rates and perhaps even in Bank rate in London.

Bill Rates Down Again

THE discount market caused some surprise last Friday week by raising still further its tender price for the weekly offering of Treasury bills. This was the third successive rise; at the tender immediately following the launching of the Treasury's 2 per cent Conversion issue, as *The Economist* noted on June 12th, the discount houses raised their price by 4d. per £100, equivalent to a reduction of ⅛ per cent (per annum) in the rate of discount on the bills; and at each of the two following tenders they raised it by 2d. This carried the market's tender rate down to a shade under 1$\frac{13}{32}$ per cent; and the average rate for the whole allotment was 31s. 7.57d. per cent, compared with 32s. 3.56 per cent in the previous week and 40s. 10.84d. per cent on the eve of the reduction of Bank rate to 3 per cent last month.

This keen bidding for bills springs from the market's anxiety to check the declining trend in its bill portfolios that has been proceeding for some time past. But on these recent occasions, unlike those before the reduction of Bank rate, the pressure upon portfolios has apparently not come mainly from an increase in "outside" competition for bills. Total applications at the tenders are still high, but they have lately been well below the peaks reached in April and May; last week they fell by £18 million to £400 million. The supply of bills has, however, been falling; at each of the three tenders the authorities "cut off the top" of the offering by under-allotments totalling £40 million, with the result that by the end of this week the total tender issue will be down to £3,290 million (and will fall by at least £10 million next week), compared with £3,340 million at June 5th. This decline, at a time when the Exchequer has been seasonably in deficit, is, of course, a consequence of the recent bond issue.

The success of that operation has also affected the market's bill portfolios in another, and perhaps even more significant, way. By putting pressure on yields generally, it has intensified the clearing banks' appetite for bills. For some time past the banks have been preferring to buy bills from the market rather than to lend call money to it, in order to reap the better return obtainable from bills. Shortly after the reduction of Bank rate the margin between bill rates and the clearing banks' charges for call money secured by Treasury bills was unusually wide; but now, after this third fall in bill rates, it is down to a shade under $\frac{11}{32}$ per cent. It has been pointed out that, even now, the Treasury bill rate has fallen since early May by $\frac{3}{32}$ per cent less than the $\frac{1}{2}$ per cent reduction then made in Bank rate. But, if one can judge from market conditions during the greater part of the phase of the "new" monetary policy, the movement should be nearing its limit. Although the margin between money and bills is now fractionally wider than on the eve of the Bank rate reduction (when that move was being anticipated), it is narrower than it has generally been during these past two years or so.

As Basle Sees Us

GREAT Britain emerges from the Annual Bank for International Settlements prizegiving bearing an almost embarrassing load of commendations. It may not be top of the class, but it unquestionably gets the award for the most promising performance. That promise, needless to say, is measured in terms of progress towards convertibility, a cause to which the BIS has given such persistent and devoted support since the end of the war. There is a barely suppressed note of triumph in the comments on this particular subject, "The momentum of the movement towards convertibility has not been lost; only dire political emergencies would now be capable of arresting its advance. For this movement is impelled not only by the interests of the individual countries anxious to consolidate their postwar recovery, but also by the transcending and no less real interest of all countries in establishing between themselves the elastic but strongly knit bond provided by the system of convertible currencies."

Of Britain's achievements, the one that receives most praise is the reopening of the commodity markets. The success that attended that policy is mentioned to illustrate one of the lessons learned in the postwar years, namely that "the system of direct controls, which was used in an endeavour to check inflation has, by introducing rigidities into the cost and price structure, had the effect of hindering steady economic growth." The BIS report also pays special tribute to the steps taken by Great Britain to expand the use of sterling in international trade by reopening a foreign exchange market in London, allowing arbitrage both in spot and forward exchange, and in simplifying exchange control by broadening the transferable account area. Looking back on the past year the BIS finds it the most reassuring of the postwar era. The author of the report derives special delight from the success of the application of flexible monetary policies. He draws attention to the success with which the non-dollar world, and Europe in particular, has withstood the decline in industrial output in the United States. He also takes special pleasure in the fact that a strengthening of monetary reserves and an improvement in the value of individual currencies has been found compatible with a policy of full employment.

Coal Imports "As Usual"

IT is some years since the experts decided that Britain was becoming an "importing-exporting" nation for coal, but regularly each year the demonstration of that fact causes a deep and understandable chagrin among the public. The balancing imports of large coals that the Minister of Fuel and Power has now approved for 1954-55 were inevitable, given British domestic heating habits. The amount, some 700,000 tons, is tiny even beside the National Coal Board's exports of some 16 million tons a year; coal is not a homogeneous material, and there is nothing more humiliating in importing less than half of one per cent of the country's coal output while exporting about 7 per cent than in importing 2-3 per cent of the country's steel production while exporting about 15 per cent of it. Comforting and factual excuses for this week's foregone decision to import coal, therefore, are not lacking, and imports on this scale are probably here to stay. None of which denies the public's instinctive feeling, each time, that something must be radically wrong with the British coal industry. Incidentally, the amount of imports authorised this week may well be too small for safety this winter.

Arab and Greek

A LETTER addressed to the Minister of Finance and Economics of Saudi Arabia identifies the writer, for the avoidance of any doubt in interpreting an agreement of January 20, 1954, as "Mr Aristotle Socrates Onassis of Greek birth and Argentine nationality, residing in Montevideo and with his office at Paris." This letter, and a second one also dated April 7th fill out the story of the Onassis-Saudi Arabia agreement and greatly increase the objections already taken to it on the ground that it involves flag discrimination of the gravest kind.

For example, Article IV of the original agreement has been amended as follows (italics have been inserted):

> The (Onassis) company will have priority for the shipment and transport of oil and products exported from Saudi Arabia by sea to foreign countries from Saudi ports *or from the terminal of the pipeline outside Saudi Arabia.* This right is subject to two conditions: (*a*) Priority in the first place will be given to tankers *owned* by the companies holding a concession, or companies forming them, or purchasing companies, provided that the ownership of these tankers is *registered in the names of those companies* and that they were *carrying out regular shipments of Saudi Arabian oil and its products prior to December* 31, 1953. . . .

These are highly restrictive arrangements. They purport to give Mr Onassis rights beyond the confines of Saudi Arabia itself; they cover crude petroleum and refined products. They suggest that none of the tanker tonnage on charter to Arabian-American Oil Company would qualify for the priority reserved to the concessionaire companies, and this tonnage is likely to be far larger than that directly owned by Aramco and its associates. They do not mention, indeed, whether directly owned tonnage could be renewed when it became too old for service.

For this virtual monopoly of oil transport, Mr Onassis will be paid not less than the average rate under the London Tanker Brokers' award from April, 1952, to March, 1954. He undertakes to train and employ Saudi Arabians; to carry without charge 50,000 tons of oil or products from Saudi Arabian ports to ports on the Red Sea—apparently a once-for-all transaction. He will pay a tax to the Saudi Arabian Government of 1s. 6d. per ton on all oil carried by his tankers anywhere beyond Saudi Arabia. And he undertakes to register a minimum of 500,000 dw tons of tankers to the Saudi flag, under which they will carry Arabic names. There are still some tricky hurdles to jump, for Saudi Arabia has yet to introduce its own maritime law "similar to the maritime laws of friendly governments" and the registration of tankers by the Saudi Arabian Maritime Company, Limited, will certainly be closely watched by the lawyers on both sides

In case it should any longer be thought that the agreement is a piece of extravagance intended to secure other aims, the following extracts from the second letter written by Mr Onassis on April 7th should be pondered:

> Within one month of the date of delivery to me of a copy of the royal decree, the Government of Saudi Arabia will address letters to concessionaire companies giving them notice to make the arrangements necessary to fulfil the royal decree. After one month from the issue of the letters . . . the Government will discuss with me the situation resulting from the replies of the concessionaire companies. If necessary the Government will arrange for a trilateral meeting at which each concessionaire company is represented . . . (to) ensure execution of the agreement. (If it is) impossible to hold this meeting or reach agreement . . . the Government will discuss with me the possibility of taking legal proceedings against the company or companies which are preventing fulfilment of the agreement (of January 20th). If it is decided to take legal proceedings against the concessionaire company or companies . . . the Government will come to an agreement with me on the manner in which these proceedings shall be conducted so that the interests of both parties may be safeguarded.

Nothing could show more clearly where Mr Onassis stands. He gives sinister new meanings to freedom of shipping and to 50/50 agreements in oil.

Chemical Export Prospects

THE chairman of Imperial Chemical Industries had good reason for building his address to shareholders on a foundation of sober confidence. ICI achieved record sales in 1953; it is in the throes of big developments which in due course will yield additional productive capacity. Dr Alexander Fleck can claim that so far this year the group has enjoyed continued expansion and the prospects are good. He expects ICI to hold its own against strong competition in overseas markets and in some directions to gain further ground.

His remarks on the nature of these possible gains deserve the widest attention, for the ICI board is boldly making plans for a change in the pattern of the company's exports. The group has suffered from import restrictions in many markets, and last year its total export trade declined from £62 million to £58 million, largely owing to these restrictions. Now the chairman has decided that "it is not good policy to strain our efforts to sell to countries which cannot pay us or cannot pay us in a currency which we can use." He intends a greater concentration upon countries that want British goods and have adopted internal policies that make it possible to pay for them. Two examples of good markets are provided—North America, where ICI nearly doubled its exports last year, and Australia.

So far the 1954 export figures are giving support to Dr Fleck's forecast. Of British chemical exports for the first five months of 1954 Australia has continued to take an increasing share and has this year been the largest single market; Canada has also taken a little more, the United States a little less. But there seems much scope for further adjustment. The three markets mentioned absorbed only £12 million out of total British chemical exports of over £80 million in the five months.

Jet Transport for the Army

AFTER long discussions with the Treasury, a production order has been placed by the Air Ministry for Vickers-Armstrong's big jet transport the V.1000, which is to replace the Hastings as the standard troop carrier for the services. Work was begun on the prototype last year, which will be the first aircraft designed to fly with Rolls-Royce Conway engines. The Secretary of State for Air has told the House of Lords that the V.1000 would be capable of carrying 120 troops, with personal arms and equipment, distances of 2,500 miles, and has calculated that five aircraft could lift a battalion of infantry as far as Kenya in 18 hours.

This should provide the big increase in mobility that the army has been demanding, and it may be the only way to remedy the shortage of servicemen compared with the country's military obligations. The probable cost of an aircraft of this size is in the region of £750,000 to £1 million, and the order is said by Lord de L'Isle and Dudley to be big enough to justify tooling up on an economic scale. The order will help forward Vickers' plans to market a civil version of the V.1000 for trans-Atlantic operation. No decision has been made on the financial support that the Ministry of Supply may give to the development of the machine as a civil air liner, but a substantial government order for a largely similar military transport should avoid many of the hazards of civil development. The order is a victory for those who have pressed for the increasing use of air transport in the services; a further big order has also been placed for the less glamorous but equally essential Blackburn Beverly freighter.

British Celanese Looks Ahead

THE return of prosperity to the synthetic textile industry has been impressive in its speed and scope. In the 53 weeks to April 3rd, British Celanese earned over £4 million, compared with the equivalent rate of £2½ million a year in the previous period. The directors raised the ordinary dividend from the equivalent of 16 per cent to

CONSOLIDATED BALANCE SHEET

	March 28, 1953	April 3, 1954
	£	£
Fixed assets, *less* depreciation	10,534,811	11,641,168

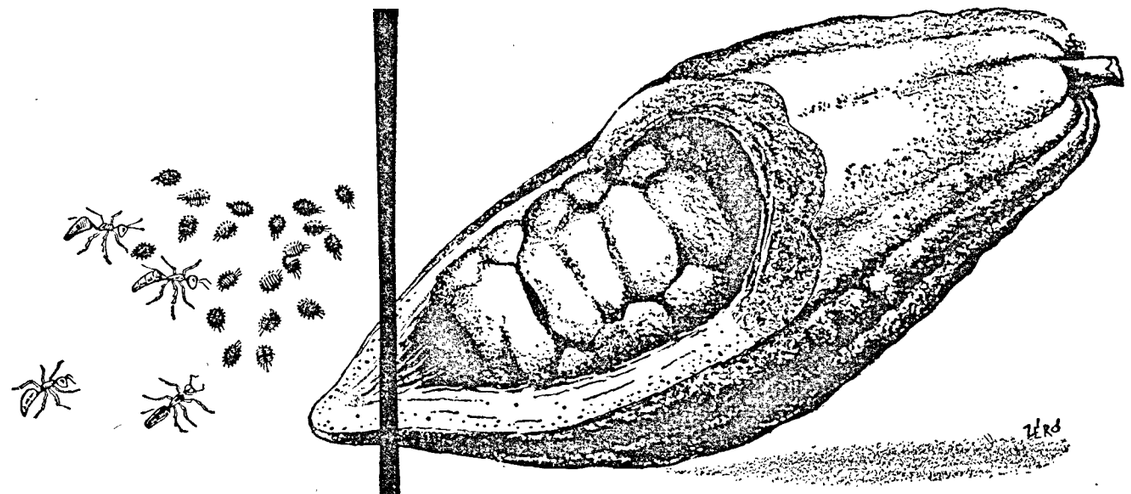
18 per cent while reinforcing the group's liquid resources. This recovery justifies a note of reasoned optimism in the chairman's statement.

Mr G. H. Whigham's comments imply that the advance in profits was entirely due to increased sales. Profit margins were actually lower. Three factors appear to have been at



In West Africa, the cocoa tree is the basis of the national economy. Like man, trees are afflicted with many diseases and the cocoa tree has, in recent years, been stricken with the virulent swollen shoot disease.

the cocoa tree's challenge to science

Scientists in the Gold Coast have studied the problem for years and one remarkable result of their research work was the discovery that the mealy bug transmits the disease from tree to tree. This discovery might well be compared with that of Sir Roland Ross when he established the mosquito as the carrier of malaria.

Scientists of Pest Control Limited, working on this information, discovered a chemical which—when fed to the tree—kills the mealy bug. Hopes ran high that the defeat of the swollen shoot disease was in reach, but new facts and practical difficulties constantly appeared. Pest Control Limited, now supported by all the resources of the Fisons Organisation, will continue, with renewed vigour, the attack on the swollen shoot disease, which presents one of the most important and difficult problems science has yet been called upon to solve.

the kind of life you want

It is an established fact that resistance wires of similar basic composition can have different lives under equivalent conditions of working temperature.

The production of a wire giving long life within its admitted range of working temperature can be achieved only by a specialised melting technique and by strict control in the subsequent processing.

These two essential manufacturing characteristics are fundamental, in conception and in practice, to our production of resistance wires for high temperatures. They are factors which can only come from long experience of this exacting work and constant development of technique.

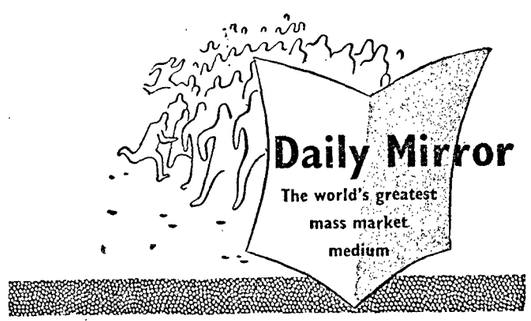
Here comes your future

Yes, your future. For she is one of the vital younger generation whose decisions can affect your business for years ahead. Keen and vigorous . . . . receptive to new ideas, she is forming buying habits today which may last for the rest of her life.

With its realistic approach to the problems of our time the Daily Mirror has gained the biggest daily sale on earth (it exceeds 4,600,000) and offers you the most powerful mass market coverage in the history of daily newspapers at the lowest square inch per thousand rate of all national dailies.

But what is so vital to you as an advertiser is that the majority of its readers are young readers. *By advertising in the Daily Mirror you can make them your customers today . . . . next month . . . . next year.*



work here. First, the price of acetate staple was reduced last July. Secondly, the company has been adding to its sales organisation, bringing an increase in overheads costs perhaps not immediately matched by bigger sales. Thirdly, "the re-emergence of the normal prewar pattern of trade," has added to manufacturing costs. The change in the pattern of trade involves smaller stocks in the hands of customers, and smaller and more frequent orders to the manufacturer, who thus has to hold larger stocks. Though this change means that forward order books are reduced, Mr Whigham welcomes the return to more normal, if more competitive, conditions. Though prospects abroad are not reassuring he feels that "at home there seems to be every evidence of the continuance of a good domestic market for textiles, although it will be highly competitive."

Even if the recovery continues apace, it may not bring a spectacular increase in dividends. Reinforcing the warning by the directors that the free scrip issue does not necessarily affect the total amount to be distributed, Mr Whigham points out that in the next two or three years British Celanese will have to spend about £5 million on capital account. Its liquid resources are ample, but provision for new developments, for replacement of existing assets and for working capital may rank before generous dividends.

Contrasting Trends in Advances

THE expansion of the private sector of the economy now seems to be making smaller demands for new bank finance than it was doing at this time last year. That is the principal broad deduction to be drawn from the latest quarterly classification of bank advances, which relates to advances made in Great Britain by members of the British Bankers' Association. Total advances rose between February and May by £47.8 million—whereas last year they fell by £3.7 million in the same period. But of this year's increase no less than £31.4 million was accounted for by the growing requirements of the public utilities group, which in the similar period last year made a net repayment of £41.3 million to the banks.

The borrowings of all other groups thus increased by only £16.4 million from February to May this year, against £37.6 million in 1953. Many of these groups are, of course, non-industrial. But when semi-public borrowers, such as the local authorities, churches and charities, and the important personal and professional group, are excluded, it remains true that the borrowings of private trade and industry in this latest period increased by less than in the corresponding period of 1953. This reverses the relationship that has been consistently shown, on the annual comparison, since November, 1952. The explanation of last year's sharp fall in the borrowings of the utilities group was, of course, the launching of the Electricity Authority's last market issue last April. The latest rise in the utilities' borrowings from the banks emphasises the need for new approaches to the market. The outstanding overdrafts of the utilities group have now risen to £118.3 million. This is the highest total since the record level of £140 million was reached in February, 1953, just before last year's BEA loan.

Whilst the swollen size of the utilities' advances is attributable to their recent absence from the new issue market, the limited increase in those of other groups might, correspondingly, be put down to the recent activity of a number of industrial borrowers in that market. But this explanation cannot be the whole one. Probably the higher level of business profits, the slowing down in the growth in industrial production, and possibly some check also to private stock-building have all played their part in lessening industry's dependence on bank accommodation. The engineering group reduced its borrowings by £10 million, and shipbuilding and iron and steel also made small repayments. Nineteen of the twenty-five groups registered increases, but the only significant ones among the industrial groups were those of the food, drink and tobacco and retail trade groups. A notable movement was the increase of £5.6 million in personal and professional borrowings, which until the last quarter had fallen continuously since August, 1951.

Foolhardiness in Factories

THE report of the Chief Inspector of Factories* for 1952 records a drop in the number of accidents compared with earlier years but there was no improvement in the standard of care of the average factory worker. It records 177,510 accidents of all kinds during the year, 792 of them fatal. This is nearly 6,000 fewer than the total for 1951, and the lowest figure since the 1937 Factories Act came into operation. The chart shows the principal causes of accidents that happened in factories, but not the background of carelessness and indifference that caused them. Falls, for example, rank as a major cause of accidents, and nearly 10 per cent of them were falls from ladders. A high proportion were caused by faulty or slipping ladders, two types of accident, the inspectors feel, that should never happen.

One of the unsatisfactory features is the negligible reduction in the number of accidents to young people; 11,763 of them were injured during the year, and the inspectors suggest that managements are failing to protect them adequately from hazards that they are too immature to recognise. Not that the adults themselves set a good example—the inspectors' most scathing comments are reserved for 28,045 victims of foot injuries, two-thirds of which could have been avoided had they worn safety shoes.

This is, unfortunately, typical of the attitude of many British workers to normal safety precautions; observance of safety rules in British factories makes a poor showing beside the strict discipline enforced in the United States. The Inspector's report contains a hint that managements may not have done all that they might to get the co-operation that is so noticeable in America; there are references to Accident Prevention Committee meetings in factories that "tend to be purely formal gatherings for the exchange of platitudes." The most hazardous industries, the atomic factories among them, have the best safety records in the country; the lesson for the others ought to be obvious.

* Annual Report of the Chief Inspector of Factories for the year 1952. HMSO. 6s. 6d.

The Supply of Airline Pilots

THE future supply of civil pilots has caused the airline operators concern. They have hitherto depended on *ad hoc* recruitment of ex-RAF men. The air transport industry had already grown too big to rely solely on this source of recruits, and the matter approached a crisis after the Air Ministry's recent decision not to train National Servicemen to fly unless they were to stay on in the service. Operators are pressing for pilot training to be put on a different basis, independent of the RAF, and a working party representing the British airlines, nationalised and independent, and the pilots' organisations put its proposals before the Minister of Transport this week.

It is estimated that an annual intake of between 70 and 100 pilots is needed for civil flying, and the memorandum suggests that training scholarships should be offered each year to roughly 400 boys (to allow for wastage during training), aged between 16 and 18. Selected candidates would be taught to fly at a civil flying club and then trained for two years for their commercial pilots' licences, for which the minimum age is 18. They would then be ready for recruitment by the airlines, which would be responsible for all further training. This, the memorandum suggests, would put the preliminary training of civil pilots on the same footing as training for the professions; the course would last approximately three years.

In one respect, however, it would seem to be different for the memorandum does not suggest that the boys or their families would be asked to meet any of the training costs. Training, it says, should be financed by the Treasury, at an estimated cost of £250,000 a year, since "the cost borne by airline operators in giving advanced training to pilots after their initial engagement is already very high and it is not thought that the operators can be expected to pay more than they already do." In a working party composed entirely of airline operators and their pilots, this attitude can be understood, but it is not quite self-evident.

Dorman Long Looks Forward

THE universal beam and structural steel mill for Dorman Long's new works at Lackenby has been a topic of discussion in the British steel industry—and of heart-burnings among British steel plant manufacturers—ever since the inception of the industry's first development plan after the war. Today, the company is clearing the site alongside the new steel melting shops at Lackenby, prior to laying foundations and firm orders are in hand for the mill equipment, which has acquired some refinements since it was first decided upon. Some of the plant is being built by the United Engineering Company of Pittsburgh, though much less than originally appeared necessary; for some $6 million Dorman Long is buying this specialised equipment, plus the consulting experience of the plant builders, and a good deal of "know-how" from the operators of these beam mills in the United States. Only five such mills exist there, and there is no universal mill, properly so called, in this country; since it is well over twenty years since the last one was put down, Dorman Long's has set even the American consultants some problems. Using their advice, Dorman Long's own engineering staff have actually designed the mill, and it incorporates some ideas that the company is patenting in Britain and America; it will be largely constructed by Dorman Long's own constructional departments and subsidiaries, as have been the company's other great developments since the war.

This mill, plus a medium section mill and a rod and bar mill at Cleveland, will balance the finishing end of the whole reconstructed iron and steel works. At Cleveland, too, foundations are laid and the steelwork is rising for two new blastfurnaces of 27 ft. 6 in. hearth diameter; these, fed by an enlarged ore handling plant and a vast new coke oven battery, will take over the work of the seven old hand-charged blast furnaces on the site, two of which have already been closed down. Three other modern furnaces are already in operation; the five will eventually produce much more iron than the ten. These will feed Lackenby; the melting shops at Cleveland have for the present been closed down. The Lackenby melting shop, which incorporates five 360-ton tilting open-hearth furnaces and two mixers, is designed to produce 625,000 ingot tons of steel a year, and could be extended to a capacity of 900,000 tons. Melts of some 450 tons have already been achieved in the 360-ton furnaces. The whole process of reconstruction and replacement, when completed, will raise Dorman Long's steel output from about 1¾ million ingot tons to some 2¼ million tons, all from modern capacity. The company will have achieved this largely by employing its own engineering resources, and from its own financial resources—a significant item when the denationalisation queue makes a further move.

Role of Engineering Exports

THE recovery of British exports continues to stem mainly from larger sales of engineering products to the sterling area. In the first quarter of 1954 the rise in such exports over the average rate in 1953 occurred principally in machinery, farm tractors and aircraft engines. Since March, however, road vehicles can claim most of the credit. Exports of road vehicles have forged ahead from a monthly average of £21 million in January and February to £26 million in May. This reflects partly the seasonal rise in exports of cars to Western Europe, which in May were nearly double the average value in January and February, and to Canada,

Arteries of Steel

IN THE one hundred thousand miles of rails in Great Britain's railway network each yard of every rail is nearly a hundredweight of high quality steel.

In the latter part of the nineteenth century there was a great changeover from iron to steel rails. Up to this time almost all rails were wrought iron; within ten years the position was completely reversed. This remarkable change was made possible by Bessemer's invention of a method of producing good steel in great quantities by blowing cold air through molten iron.

Before the turn of the century nearly every steelworks in Great Britain made rails. Today, as a result of new and larger plant, only a few works are needed to produce the country's total requirement of steel rails.

STEEL is at your service

THE BRITISH IRON AND STEEL FEDERATION S.65

although shipments to that market in the first five months of this year, at £3.7 million, were £2 million less than in the same period of 1953. It reflects, too, the further easing of import restrictions in Australia, to which exports of cars in May, at £1.7 million, were also twice as high as the January-February average.

In exports of metals, a rise of £1 million to a monthly average of £29 million in April and May was also partly due to larger sales to Australia. Exports of textiles dropped slightly, but in "other manufactures" there was a notable increase in exports of chemicals, which rose from a monthly average of £15.7 million in the first quarter to over £17 million in April and May. In the first five months exports of chemicals were 14 per cent higher than in the same period of last year. Most of that increase has been in shipments to Australia—which rose by nearly £3 million to £6.3 million—India, and South Africa, but shipments to non-sterling countries, such as West Germany, Sweden, Argentina and Egypt were also significantly higher. The expansion has been shared by almost all classes of chemicals, and shipments of plastic materials, one of the "newer" exports, rose by 30 per cent to a record level of nearly £2 million a month in the first five months.

Parking in Cities

THE announcement by the Minister of Transport on Wednesday that a detailed study is to be made by consultant engineers of the cost of building car garages under three London squares is a preliminary step towards solving the problem of traffic congestion in London streets. Eighteen months ago a working party on car parking in the inner area of London examined the idea; the new study must take some months to complete; and consultations between government departments and local authorities will then take up further time. It seems unlikely that London can expect any early and material relief to its traffic congestion; and general or a selective restriction of city traffic by prohibition is neither desirable nor practical.

Underground garages were one of three complementary proposals made by the working party. More garages, above and below the ground, would reduce the shortage of off-street parking space; a survey of parked cars in 1951 showed that nearly 16,000 vehicles were parked for more than two hours in London streets in areas where there were fewer than 4,000 off-street garage spaces still unoccupied. At the same time it was proposed to introduce metered short-term parking at authorised street parking places and, on other nearby major traffic routes, "waiting" regulations would be extended. Motorists could choose between paying a charge to cover the cost of the more convenient space their vehicles occupied or leaving them free of charge some distance further away.

Legislation is necessary to make charges for parking in public places. The Minister intends to do this shortly in a general road traffic bill. The power will cover other parts of the country where traffic congestion is becoming serious. In Bristol last week the local planning committee approved a scheme to build a seven-storey ramp type garage for nearly 800 cars in the city's new shopping centre. As more bombed site car parks are redeveloped in British cities and more factories, shops, and offices arise in their place, traffic seizure becomes daily more imminent.

A Wider Wheat Agreement?

THE International Wheat Agreement may have been strengthened by the recent meeting of its thirty-nine member countries in London. The communiqué that followed it was both unanimous and realistic. It frankly recognises the danger of a collapse in the world market and equally frankly that the agreement—the best instrument for preventing such a collapse—would be more effective if it included other important importing and exporting countries. The Council will meet again in London in October, when an effort will be made to increase the number of participants in the agreement, which now covers just under half the world trade, by inviting Britain and Argentina in particular to join.

Importing members would gain, for there would be more competition among exporters, and they would have a wider choice of supply from non-dollar sources without compromising their obligation to take up their quotas in full at the minimum price of $1.55 a bushel for No. 1 Manitoba wheat. The communiqué makes it clear that they would honour that obligation though the United States did not reveal whether it would lower its price to the minimum next season. The advantages to the exporting members are that a wider agreement would strengthen their ability to hold the "free" price at the IWA minimum and would assure them of a larger market. It would, however, be a less effective means of increasing total sales if importers were called on to take up their quotas in full.

Will Britain, the largest importing country, and Argentina, the major "outside" exporter, come in? Their decisions will depend mainly on how real the danger of a collapse of the market appears to them. Accession by Argentina alone would help little unless the total outlets under the agreement were significantly enlarged by the accession of Britain and its obligation to buy at the minimum price. It is doubtful if Britain will join. It might argue, with some justice, that the prime responsibility for averting a collapse lies with the two exporters in North America, where the surplus of wheat is concentrated.

Flammable Fabrics

THE introduction on July 1st of the United States Flammable Fabrics Act, which proscribes the sale of apparel so highly flammable as to be dangerous when worn, should not give too much trouble to British exporters to that market, and it has the merit of bringing order into what might have become a chaotic situation. In their concern to minimise the risk of fire in wearing apparel, several states had passed or prepared their own legislation, and the American textile industries therefore supported the introduction of a Federal law that would have universal application. To avoid unnecessary testing

for inflammability, the law provides that a wide range of fabrics can be "class tested." Thereafter any manufacturer, domestic or foreign, of a fabric in a class that has passed that test may refer to the published result as the basis of his guaranty that his cloth meets the requirements of the Act. It is expected that about 90 per cent of British exports to America will be able to take advantage of this procedure.

The remaining border-line or suspect fabrics will have to be tested in Britain, and the Manchester Chamber of Commerce has imported from America the prescribed testing equipment which will be available to British exporters for a small charge. Few failures are expected, and most of these may be remedied by a slight alternation in the construction of the cloth and additional care in processing. Such improvements should also benefit consumers of British fabrics in other countries and at home, for it is unlikely that manufacturers would produce slightly different versions of the same cloth. The Chamber has stated that extensive research is being carried out in the United States and Britain on finishing processes that retard inflammability, and it is hoped that they will soon become commercially practicable. The difficulty is to discover a process that retards inflammability without impairing the intrinsic properties of the cloth or appreciably adding to its cost.

SHORTER NOTES

With the signature of Indonesia this week, the proposed International Tin Agreement now commands a majority of producers' votes. Acceptance by four more consuming countries with 72 votes is required. Closing date for signature is June 30th.

★

Pye, the radio and television manufacturers, is to make a "rights" issue of £700,000 of 5s. "A" deferred ordinary shares. The price of the issue will be fixed later. The new money will be used to pay off the £500,000 issue of 4¼ per cent of unsecured notes; about £100,000 will be spent on new buildings and the remaining money will finance working capital commitments.

★

The Raw Cotton Commission (Dissolution) Order has been laid before Parliament. A liquidator will be appointed to wind up the Commission after August 31st and assume responsibility for its outstanding functions, including the contracts for the purchase of raw cotton from Nigeria, Aden and Nyasaland.

Company Notes

W. & T. AVERY. The £1 ordinary stock units of W. & T. Avery are not "market leaders" for they command only a small market. But they are "blue chips" on the strength of the company's earnings record and the occasional increase in dividends. This week they were given a fillip by the announcement of a bigger dividend and a free scrip issue. The full year's ordinary dividend is raised from 15 to 20 per cent and £1,025,014 of reserves is to be applied in issuing as free scrip three £1 ordinary shares for every £5 of ordinary stock held. Profits after all charges rose in the year to March 31st from £688,539 to £837,780.

Throughout the boom in the stock markets investors have obstinately refused to see free scrip issues as what they are—merely paper adjustments that add nothing to the company's earnings, to the shareholder's share of the equity, or to the amount which ought to be paid to him as dividends. The trouble is that these illogical shareholders have often been right. The rises in share values following scrip issues have often been justified, because boards of directors do not make scrip issues unless they know that the company has a margin in hand and expect the dividend trend to be upwards. W. & T. Avery's announcement immediately brought in an investment demand for a few thousand shares and sellers withdrew. The market was not caught short, but the price had to rise 7s. 6d. to 106s. 10½d. before sellers reappeared.

What dividend assumption should investors make now? They do not expect a high yield on shares of the W. & T. Avery class. But if the amount distributed were left unchanged the yield at the current price would be only about 3¾ per cent. If the distribution were moderately increased—say to 15 per cent on the new capital, which would be in the company's tradition—then the yield on the basis of the current price would be about 4½ per cent.

★

BRITISH PLASTER BOARD. The preliminary report of British Plaster Board also shows what can happen after a free scrip issue has been made. A year ago British Plaster Board issued as free scrip one new share for every share held. But unlike W. & T. Avery it did not have a massive cover for the rate of dividend paid. British Plaster Board has now effectively raised its ordinary dividend from 10 to 11¼ per cent, following an advance in gross profits from £1,767,454 to £2,508,592 in the year to March 31st and in net profits from £454,677 to £663,988. This announcement added only 1¾d. to the price of the 10s. ordinary stock units, which at the current price of 19s. 6d. xd offer a yield of 5¾ per cent.

The question that investors must ask themselves is whether the difference of 25s. between what is merely a conjectural yield on the W. & T. Avery equity and the actual yield offered by the British Plaster Board units discounts rather too heavily the risks to which British Plaster Board is subject. If they look beyond the statistics of the past year's results, they may note that the immediate trading prospects for British Plaster Board, with its interests in the building trades, are hardly less good than those facing W. & T. Avery, with its interests in the admittedly less volatile trade of manufacturing weighing machines. Then, perhaps, the scales will seem to have been tipped a little too much against British Plaster Board ordinary.

★

ULTRAMAR. The gradual repayment of the loan stocks of Ultramar, the joint parent with The Texas Company of a group of developing oil companies in Eastern Venezuela, has been carried forward another stage. In 1952 the loan from the Finance Corporation for Industry was repaid; in 1953 the remaining loan stocks were reduced. During that year Mercedes repaid $2 million to each of its parents, The Texas Company and Caracas Petroleum (the wholly owned subsidiary of Ultramar). Caracas Petroleum passed on the $2 million it received to Ultramar, putting into the hands of its debenture trustees £684,996. A further sum of $1 million was remitted to Ultramar through Caracas Petroleum last April, when Mercedes repaid another $1 million to each of its parents. Another £354,534 was thus passed on to the debenture stock trustees.

The trustees used these sums to redeem the whole of the outstanding amounts of the 1960 convertible debenture stock, and part of the 1962 loan stock. They were then left with a balance of cash in hand of £57,054. Originally, £750,000 of the 1962 debenture was issued; by the end of 1953 the outstanding balance of stock had been reduced to £235,023, for holders had exercised their options to convert into ordinary stock at par to the extent of £514,977. The outstanding remainder was redeemed at the beginning of this year at a premium of £3 per cent. Transferable option certificates valid during 1954

to subscribe in cash at par for an equal nominal amount of 10s. ordinary shares were issued to those stockholders who had waited for redemption.

The 1962 loan stock was issued while Ultramar's difficulties were greatest and the terms were stiffer. The original issue was £3,500,000; by the end of 1953 it had been reduced to £3,232,819, as some holders had exercised their option rights to convert 12½ per cent of their holdings into 10s. ordinary shares at par. But the outstanding amount also included £1,362,509 of the loan stock on which these option rights had not been exercised; these rights expire at the end of this year.

Since the end of 1953, Ultramar has redeemed in two successive stages part of the loan stock at a premium of £15 per cent reducing the outstanding balance in issue to £2,589,007. Those stockholders who have accepted redemption but who have not as yet exercised their option rights have been given transferable option certificates entitling them to subscribe in cash at par for a nominal amount of ordinary stock equal to 12½ per cent of the nominal amount of their holdings of the loan stocks which has been redeemed.

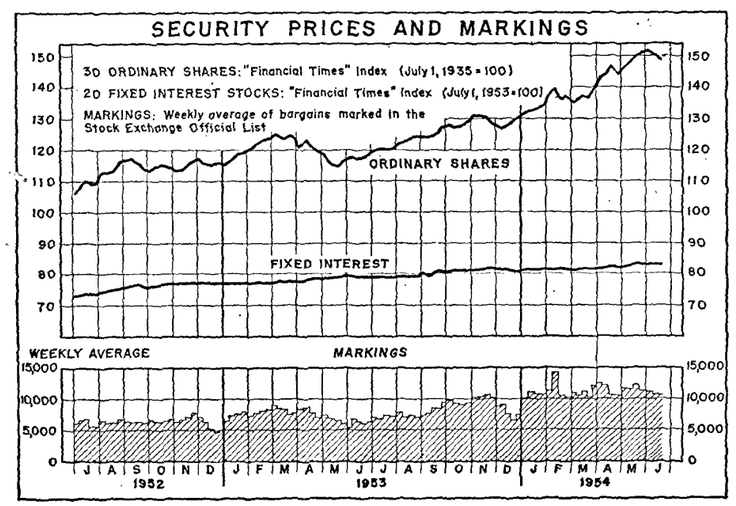
Whether the biggest gains were made by holders who waited for redemption and secured these subscription rights or by those who exercised their conversion rights before redemption depends, of course, on the price of the 10s. ordinary stock (which now stands at 32s.) when the decision had to be taken. To wait until redemption has the obvious advantage that the redemption itself automatically enhances the value of the equity, for it means that Ultramar is rapidly freeing itself of debt.

★

E. K. COLE : FERRANTI. The full accounts of E. K. Cole and Ferranti, both drawn up on March 31st, were issued this week. Superficially, they seem to have much in common, as both companies have substantial interests in radio, television and electronic equipment. Both companies are prospering. In the year to March 31st last, E. K. Cole's trading profits advanced from £652,781 to £719,010, and in the nine months to March 31st Ferranti earned a profit of £1,673,467, compared with the previous full year's profit of £1,575,319. The order books of both companies are quite full; in particular Ferranti's unexecuted orders amount to £15 million. But there the similarity ends.

Ferranti, whose interests range far beyond radio and television to embrace electric transformers and domestic heaters, is far bigger than E. K. Cole, which is still predominantly interested in radio and television receivers. Ferranti's ordinary shares are still held privately, while those of E. K. Cole are quoted on the Stock Exchange. The decision by the directors of E. K. Cole to raise the ordinary dividend effectively from 23.6 per cent to 27½ per cent is therefore of far more immediate significance than the decision by the directors of Ferranti to pay a dividend of 6 per cent, as they did in the last full year, for the nine months to March 31st.

Nor are the capital problems facing the two companies of the same order. It is true that Ferranti recently made a £500,000 issue of preference shares and that E. K. Cole is to make a rather smaller issue of ordinary shares. But these issues seem to be for rather different purposes. Although the book value of its stocks has risen from £1,782,929 to £2,541,841 E. K. Cole has no difficulty in financing its working capital commitments. It may therefore be conjectured that the new money will be spent largely on fixed assets. Ferranti, on the other hand, has had to rely on large bank overdrafts. Following the new issue of preference shares, these overdrafts were reduced from £3,386,097 to £2,057,756. But Ferranti's stock commitments are still high, amounting to nearly £4,100,000, and the company has only a handful of cash in hand.



LONDON STOCK EXCHANGE

Next Account begins: July 7th.
Next Contango Day: July 7th.
Next Settlement Day June 29th.

A VIGOROUS rise has affected most sections of the London Stock Exchange carrying the indices up to new high points. Both gilt-edged and industrials were included in the movement. The *Financial Times* industrial index reached a new high point of 154.8 on Tuesday. The fixed interest index reached a high point for this year of 115.07 on Wednesday. Steady investment demand in the gilt-edged market and among industrial favourites was coupled with some semi-speculative buying. A feature of the gilt-edged market through the week has been the demand for undated stocks. In the week ended on Wednesday 2½ per cent Consols have advanced 1⅛ points to 66⅛ and 3½ per cent War Loan has risen 1⅜ to 87⅛.

The recent favourites in the stores group have reached new high points. "Gussies" have gained 5s. on the week at 81s. 9d., Grattan Warehouses 2s. 3d. to 47s. 3d., Marks and Spencer "A" 5s. to 98s. 6d., Woolworths 2s. to 76s. 6d.

Strong features were to be found right through the engineering and aircraft group. Hawker Siddeley have risen 7s. 9d. to 70s. 6d. The unchanged interim dividend of 6 per cent has been accompanied by the announcement of a one for one free scrip issue. The Rolls-Royce £4 million debenture issue was oversubscribed 6 times; the public basis of allotment was 10 per cent of the amount applied for with a minimum allotment of £50 stock. The new stock opened at ⅝ premium, subsequently easing to ⅜ premium. AEI were strongly supported on Thursday with a rise of 9d. to 52s. 3d.

Good features were to be found in the foreign bond market. German Potash 7 per cent bonds have risen on the week by 3 points to 188. Saar 4½ per cent bonds have advanced during the week 11½ points to 96½ following the announcement of the back coupon payments.

Gold shares and commodity shares in the main stayed outside the burst of market activity.

Financial Statistics

EXCHEQUER RETURNS

For the week ended June 19th, there was an "above-line" deficit (after allowing for Sinking Funds) of £21,472,000 compared with a deficit of £35,162,000 in the previous week and a deficit of £26,716,000 in the corresponding period of last year. This raised the cumulative deficit to £127,239,000 (£144,691,000 in 1953-54). Net expenditure "below-line" absorbed £22,070,000, bringing the total cumulative deficit to £191,438,000 (£247,961,000 in 1953-54).

THE MONEY MARKET

THE Treasury bill rate fell for the third successive week at last Friday's tender. The offer of £260 million was again under-allotted by £10 million, and the market raised its bid by another 2d., to £99 12s. 1d. per cent. This reduction of $\frac{1}{32}$ per cent in the rate of discount was followed by an equivalent reduction in rates on bank bills. Total applications fell by £18 million to £400·4 million, but the market's allotment dropped from 57 to 56 per cent. The average rate of discount on all bills fell by a further 8d. to £1 1s. 7·57d. Yesterday the offer was again £260 million.

Conditions in Lombard Street have again been free from marked stringency. In the week covered by the Bank return official help was necessary on any scale only on Monday, when it was freely given through the banks. In the rest of the week normal credit supplies were generally adequate, and after the Treasury bill tender business was done in bills at $1\frac{11}{32}$ per cent. A few houses were, however, forced at times to sell bills to the banks at $1\frac{5}{16}$ per cent.

The gold market was active on Thursday and Friday of last week, but in the rest of the week covered by the Bank return demand gradually fell away. The price at the fixing accordingly fell steadily from 248s. 11d. on Thursday to 248s. 9½d. per fine ounce on Wednesday of this week.

The Bank return shows a fractional outflow of notes into circulation. Bankers' deposits fell by £3.7 million to £283.5 million.

£2,450,000	Ordinary Stock	£2,450,000
£1,550,000	Ordinary Shares of £1 each	£255,000
£100,000	"A" Ordinary Stock	£100,000
£5,100,000		£3,805,000

LOAN CAPITAL

Authorised.		*Issued and Outstanding.*
£400,000	5½ per cent. First Debenture Stock	£186,549
£500,000	5 per cent. First Debenture Stock, 1947-1967	£166,929
£1,000,000	5 per cent. First Debenture Stock, 1962-1967	£973,588
£1,900,000		£1,327,066

Apart from the above the Company has no Mortgages, Debentures or other loan capital outstanding, but on 11th June, 1954, had unsecured loans totalling £834,000 from its associated company, Telephone and General Trust Limited, which will be repaid out of the proceeds of the present issue.

The Subscription Lists will open and close on Tuesday, 29th June, for an

ISSUE OF

1,000,000 6 per cent. Cumulative Preference Shares of £1 each at par.

The full Prospectus states (inter alia):

1. The Company was incorporated in England in 1887 and under a contract granted in 1928 for a period of 40 years operates the telephone systems in the Cities of Lisbon and Oporto and surrounding areas. During the past five years the number of telephones connected to the Company's systems has increased by over 50 per cent.; despite this, applications for service continue to be received at the rate of over 1,400 each month. To meet the demand for service new exchanges are continually being constructed and brought into operation whilst at the same time existing exchanges are being extended.
   An 8 per cent. dividend has been paid on the Company's Ordinary Stock for the past 27 years.
2. Proceeds of the present issue will be applied :—
   (*a*) To repay temporary borrowing which has been largely used to expand the Company's systems by the purchase, in Great Britain, of plant and equipment.
   (*b*) To provide for further expansion of the Company's telephone systems.
3. The profits for the year ended 31st December, 1953, as shown by the Auditors' Report, amount to £465,966, and after deduction of £21,141, being the Debenture Stock Sinking Fund instalments for that year, cover the gross dividend (£72,000 inclusive of Profits Tax) on the Cumulative Preference Shares now being issued, six times. The Directors consider that prospects for 1954 are encouraging and anticipate that profits for that year will be not less than those for 1953.
4. Net available assets at 31st December, 1953, together with the net proceeds of the present issue and of the issue of 255,000 Ordinary Shares of £1 each at par to Ordinary and "A" Ordinary Stockholders, amount to £4,254,682 and cover 4½ times the nominal amount of the Cumulative Preference Shares now being issued.

Copies of the full Prospectus, on the terms of which alone applications will be considered, and Forms of Application are obtainable from:

Bankers :

MIDLAND BANK LIMITED, New Issue Department, Poultry, London, E.C.2, and Branches.

Brokers :

ABRIDGED PARTICULARS OF OFFER FOR SALE

BY

THE IRON AND STEEL HOLDING AND REALISATION AGENCY

OF

10,000,000 ORDINARY SHARES of £1 each in STEWARTS AND LLOYDS, LIMITED at 35s. per Share payable in cash or by tender of 3½ per cent. Treasury Stock, 1979-1981 (formerly British Iron & Steel 3½ per cent. Guaranteed Stock, 1979-1981) as follows :

IN CASH	On Application	5s. per Share
	On 26th July, 1954	15s. per Share
	On 30th August, 1954	15s. per Share
		35s.

Payment in full may be made, after the issue of Letters of Acceptance, under discount at the rate of 1½ per cent. per annum.

BY TENDER OF 3½ PER CENT. TREASURY STOCK, 1979-1981 — Applicants may also or alternatively tender on the tender forms provided for that purpose an amount of 3½ per cent. Treasury Stock, 1979-1981, the value of which, calculated at the price shown in the Notice issued by the Bank of England and dated 18th June, 1954, is not less than the full amount payable, at the price stated above, for the Shares applied for by tender. Stock on registers other than the register of the Bank of England must be transferred to the Bank of England register before tender.

A Consortium (hereinafter referred to as "the Consortium") consisting of Baring Brothers & Co., Limited, Robert Benson, Lonsdale & Co. Limited, Hambros Bank Limited, Helbert, Wagg & Co., Limited, Lazard Brothers & Co., Limited, Morgan Grenfell & Co. Limited, N. M. Rothschild & Sons and J. Henry Schroder & Co., have agreed to put in or procure to be put in irrevocable applications on the terms of this Offer for the whole of the Shares now being offered. In making acceptances on this Offer such applications will be treated on the same basis as applications from the public.

Applications made on the special forms provided for use by former holders of stock of any class in the share capital of Stewarts and Lloyds, Limited, whose names were on the register of members of that Company on 14th February, 1951, will receive preferential consideration.

Each application on forms provided for use by former holders of Stock of any class in the Share Capital of the Company must be for 10 Shares or a multiple thereof : other applications must each be for 50 Shares or a multiple thereof.

The Offer for Sale shows (*inter alia*) that :—

1. The principal business of the Company and its subsidiaries is the manufacture of tubes and pipes. These products enjoy a high reputation and are known throughout the world. The Company and its subsidiaries in the United Kingdom, own materials for the manufacture of tubes and pipes, which render them largely independent of outside supplies, apart from coal and coke. With the plant now in operation the U.K. Group holds a pre-eminent position in the steel tube and iron pipe industries. Throughout its history the Company has been in the forefront of technical development and of schemes to improve quality and reduce costs.
2. At the 30th April, 1954, some £33,500,000 had been spent since the war on general modernisation, development and extension of the works in the United Kingdom, with a resultant substantial increase in the output of the main products. At that date the Directors had approved further expenditure over the next five to seven years amounting to £12,700,000 and it is anticipated that the whole of this amount should in the course of the next five to seven years be financed from depreciation provisions and profits retained in the business, although at the peak period of expenditure temporary facilities up to a maximum amount of £10,000,000 might be necessary. The Directors are satisfied that such temporary finance will be obtainable when required and in the light of this they are of the opinion that working capital is sufficient for the Group's present needs.
3. Profits have risen considerably since 1947, and for the 53 weeks ended 3rd October 1953, the combined profits of the Company and its subsidiaries, after depreciation but before United Kingdom taxation, amounted to £12,225,502. During the years from 1947 to 1953 the Company and its subsidiaries in the United Kingdom enjoyed the benefit of higher prices for exports than were obtainable at home. Since the summer of 1953 export prices have become less favourable and it may well be that once again conditions similar to those before 1939, when export prices were lower than home prices, will be encountered. Further, the major units of the U.K. Group which in recent years have been operating at or over their rated capacity have since the summer of 1953 shown a tendency to revert to more normal conditions of working. The Directors consider on the basis of the results for the current year to date that the Group profit for the 52 weeks ending 2nd October, 1954, will be in the neighbourhood of £10 million and that over the next few years Group profits may reasonably be expected to average approximately £7 million per annum before U.K. taxation.

From this figure of £7 million there would, on the basis of present rates of taxation, fall to be deducted :—

1. Interest on £10,000,000 4½ per cent. Unsecured Loan Stock—£450,000.
2. Income tax at 9s. in the £ and profits tax at 2½ per cent.—£3,111,250.
3. Net Preference dividend, including profits tax at 20 per cent.—£412,500.

leaving a balance of £3,026,250, out of which to provide Ordinary Dividends (together with profits tax thereon) and Reserves. On the basis of these figures it would be the intention of the Directors to recommend to the shareholders a dividend at the rate of 12½ per cent. on the Ordinary Capital which would require, including profits tax, a net amount of £937,500 per annum. A full year's dividend for the year ending 2nd October, 1954, will be payable in January, 1955. It is the intention of the Directors, provided profits permit, to pay in respect of the year ending 1st October, 1955, and subsequent years, interim and final dividends.

Copies of the Offer for Sale, on the terms of which alone applications will be considered, and Forms of Application together with copies of the Notice issued by the Bank of England and dated 18th June, 1954, can be obtained from the Bank of England, Loans Office, 2, Bank Buildings, London, E.C.2, and any of the branches of the Bank of England, the Members of the Consortium, the Head Offices and branches of the London Clearing Banks and of the Scottish Banks, Banks in Northern Ireland, the Brokers and the Company.

COMPANY MEETINGS

BRITISH CELANESE LIMITED

MR G. H. WHIGHAM'S STATEMENT

The thirty-fifth annual general meeting will be held at The Great Hall, Winchester House, 100 Old Broad Street, London, E.C.2, on Thursday, July 15, 1954, at 12 noon.

The following statement to stockholders by the chairman, Mr G. H. Whigham, has been circulated with the full report and accounts for the year ended April 3, 1954:

The accounts under review cover operations for a period of twelve months, whereas the previous accounts covered a period of only nine months.

The group net profit, before taxation, of £4,069,209 compares with £1,841,346 for the previous period of nine months only (which was equivalent to just under £2,500,000 for twelve months).

The net profit after taxation amounts to £1,777,236, from which £600,000 has been transferred to general reserve and £400,000 to reserve towards increased cost of replacement of property and plant. The aggregate of these reserves is now £6 million.

After providing dividends and interest on funding certificates and after transfers to reserves, the carry forward of the group is increased by £44,354 to £811,146.

£66,454 of debenture stocks were purchased and cancelled during the period.

DIVIDENDS

The final dividend now recommended on the ordinary stock brings the total for the year to 18 per cent, as compared with 12 per cent for the previous nine months (which was equivalent to 16 per cent for twelve months).

The recommendation of 0.7309 per cent participation dividend on the second preference stock brings the total dividend to the maximum of 10 per cent for the year to April 30, 1954.

Whilst the rate of dividend for the year on the ordinary stock may appear conservative, it is considered by your board necessary for a substantial part of the profits which remain after tax to be retained in the business for providing towards the increased cost of the replacement and modernisation of fixed assets, for new projects and the higher cost generally of providing the working resources of the business. In this connection, I would emphasise that there are payments to be made over the next two or three years amounting to approximately £5 million for capital expenditure already sanctioned by your board. In addition, it is anticipated that considerable further amounts will be required each year to provide for the continued development of the business, so it is important to maintain a strong financial position.

We welcome the introduction of the new investment allowance which will replace the initial allowance in respect of certain capital expenditure incurred from April 6, 1954. This allowance will be of material assistance to the company in view of its heavy capital programme.

The total dividend of 18 per cent on the ordinary stock is equivalent to 4.8 per cent on the issued ordinary capital plus reserves at the end of the year.

TRADING

The year under review was one of recovery from the recession which affected our results in 1952 and 1953. Turnover increased substantially though profit margins were not maintained at their previous levels. There is every evidence of the re-emergence of the normal prewar pattern of trade, which first became apparent in 1950, only to be interrupted by the abnormal buying due to the Korean war and subsequent stock-piling.

This means that throughout the trade there is no forward order position of any magnitude. Consequently, there are no large stocks in the hands of our customers, and the general position is healthy and liquid.

The absence of large stocks in the hands of our customers and the fact that orders are placed upon manufacturers for smaller quantities at more frequent intervals and for quicker delivery than was practised in the immediate postwar years entails the manufacturer himself holding stocks in greater amount and also involves higher handling and selling costs.

The prices of our main raw materials are now reasonably stable and we have no difficulty in obtaining adequate supplies. Wages and the price of fuel and power were higher than in the previous year.

Our increased rate of turnover is due not only to the recovery in long established lines, but also to intensified effort in cultivating new markets and in exploiting new developments. Our sales organisation has been adjusted accordingly and, at least until the full benefits accrue, the profit margins on many products are necessarily lower. Nevertheless, it is by building up turnover, albeit at a slightly reduced rate of profit, that the continuance of a satisfactory business is best assured.

The company's export turnover during the whole period under review showed an improvement over the previous twelve months, but the export markets remain difficult and a great deal of effort has to be applied to finding new markets to replace those from which we have been excluded for one reason or another. We have a substantial market for our products in Australia, and recently Mr G. H. Spilman, managing director, together with some of our senior executives visited that country and made an up-to-date and extensive survey of the market.

As you will no doubt have seen in the Press, we prepared a case and gave evidence before the Australian Commonwealth Tariff Board in opposition to proposals which could result in the imposition of substantial import duties on acetate yarn and flake. The result of the Tariff Board inquiry has yet to be published and no doubt will to some extent influence our future plans for that country.

In general, many countries which hitherto imported textile products are seeking to manufacture these themselves. Certain countries seem to be aiming at complete self-sufficiency. No doubt this is due to a great extent to the incidence of two wars during which international trade suffered and there arose in these countries acute shortages of various commodities and articles, some of them urgently required for war uses.

As a result, industries were initiated in these countries which can only be maintained behind high tariff walls. If such countries decide to produce and manufacture everything they need for their own consumption, how can they expect to dispose of their surplus commodities to countries which, in the past, have taken such commodities in exchange for goods produced by them?

FUTURE OUTLOOK

As far as the future outlook is concerned, at home there seems to be every evidence of the continuance of a good domestic market for textiles, although it will be highly competitive. Abroad the position is not so clear. At the moment we have on hand a reasonable amount of export business, but the long-term position is not very reassuring; competition is bound to be severe and will affect not only our own direct exports but indirect exports through our customers.

I have referred in previous years to the effect of the new types of man-made fibre upon your company's acetate products. I said I thought that these new fibres would gradually find their own niches for special purposes and would also be useful in the making of mixture fabrics. To some extent this prognostication has proved to be correct and there has been a considerable interest and experimentation in mixture fabrics with these new fibres, in many cases with a blend of acetate, and there is no doubt that this development is of advantage to us.

Expansion, even survival of fibres, depends on their fitness for purpose, the availability of the raw materials from which they are made and the price at which they can be sold. Fashion will from time to time play a part in increasing the popularity of one or another textile material. This popularity tends, moreover, to be a cyclic phenomenon. The recent popularity of cotton for fabrics in goods of the higher price categories illustrates this point. On the other hand, the increasing use of man-made yarns for tyre cords and in industrial fabrics has replaced cotton in one of its formerly established fields of use. So we shall see the field in which a particular fibre was apparently well established invaded by another fibre. Now that many of these new fibres are more freely available, the textile industry is entering into a period of sorting out or reassessment of the contribution that modern chemistry can offer in the way of textile polymers; and in our view, based on our considerable experience since the launching of acetate as a new fibre, there would appear to be reason for caution during this period of re-appraisement of values.

Our Wrexham buildings are nearing completion and the plant is now being installed. There have been some minor delays, but spinning is planned to commence early in 1955.

RESEARCH AND DEVELOPMENT

The results this year again show that we have every reason to be satisfied with the current position of acetate, our raw material for textile fibres and plastics. Our substantial research, particularly in the primary stages of manufacture, has paid handsome dividends in keeping down the cost of our resultant products and has enabled us to absorb a substantial increase in the cost of

labour and power as well as to meet price reductions in some of our products. It is our policy to maintain acetate on a strictly competitive basis.

Acetate continues to show itself capable of modifications which widen the technical possibilities as well as provide scope for manufacturing economies. Difficulties encountered in making such modifications in earlier days have, as a result of continued research, been overcome and these modified acetates have been brought within the sphere of practical application. As you know, our company were leaders in the development of what has become known as the dry spinning process for fibre forming. There already existed the wet or precipitation process. Later, with the development of the wholly synthetic polymer fibres, the method known as melt spinning is being practised on a large scale. All these methods have to be kept under continual study by us, both as a short term and long term policy, together with a study of materials of fibre- and plastics-forming characteristics, especially keeping an eye on their value from the point of view of our own manufacturing economy. It has become known, if only from our patents, that for some time we have been closely interested in the development of polymer yarns and to this end we have recently installed a small melt spinning plant.

In view of our diverse interests, we have thought it right to expand our research activities. For many years, our research and development as well as our production was centred at our Spondon factory. More recently, we have adopted a policy of a measure of decentralisation with regard to production, and this has entailed the movement of certain development sections to some of the new production sites. We now think it important to decentralise research as well, and to this end we have purchased a suitable building and site for new laboratories and for pilot plant work at Putteridge Bury, Herts, 35 miles from London, where we shall be able to extend our research and to undertake more work of a fundamental character, and where the research workers themselves will be freed from the day-to-day problems inevitably associated with production.

This new research centre, being easily accessible to our central direction, is also conveniently situated in relation to the specialised technical libraries in London and other resources necessary to the research worker.

INDUSTRIAL EFFLUENT

A further suspension of the injunction against the company was granted by the Court until December 31, 1955, the Court being satisfied that this was justified by the steps being taken and the progress already made. It having now been established beyond doubt that the most satisfactory way of treating our industrial waste is to treat it in combination with domestic sewage, Derby Corporation have agreed to accept it into their works. They will accordingly extend their Sewage Disposal Works to deal not only with the increasing amount of domestic sewage arising from their district, but additionally with our waste. The work on the extension, which will be considerable, is expected to start in April, 1955, and should be well advanced by the time the present extended suspension comes to an end. The cooling units, which we built to deal with the complaint of overheating the river, came into operation last November.

PERSONNEL

The provident fund, which the company set up in 1952 for the purpose of paying pensions to long-service works employees and making other payments of a benevolent nature, has been highly appreciated. To show our appreciation of those who give the company long service, it has been decided to increase the annual contributions made by the company to the fund in order to enlarge the scope of the benefits.

In our large and expanding business, which covers textiles, chemicals and plastics, there is plenty of opportunity, both technical and commercial, for talented and ambitious young men who wish to make their career with us.

I am sure the shareholders would like me to express thanks to all the company's employees for their loyal and able co-operation during the year, which has helped so much in the achievement of the results obtained.

INCREASE OF CAPITAL AND CAPITALISATION OF RESERVES

Substantial appropriations have been made to reserves out of profits since 1945, in addition to which the share premium account stands at £2,951,899, resulting in the capital employed in the business being greatly in excess of the issued capital.

In order therefore more closely to relate the share capital to the capital actually employed, you are asked to approve the capitalisation of certain reserves and at the same time to approve an increase in the authorised capital of the company. Full details of the directors' proposals appear in the accompanying report and the formal resolutions are contained in the notice convening the annual general meeting. It will be noted that approximately 80 per cent of the reserves to be capitalised is derived from the share premium account.

TELEPHONE RENTALS LIMITED

DIFFICULT CONDITIONS SUCCESSFULLY SURMOUNTED

BROADENING BASIS OF OPERATIONS

PROVISION OF FURTHER FINANCE FOR EXPANSION

MR FRED T. JACKSON ON NEW ISSUE PROPOSALS

The twenty-fifth annual general meeting of Telephone Rentals Limited was held on June 21st at The Caxton Hall, Westminster, London, S.W.1, Mr Fred T. Jackson, OBE, CompIEE (chairman and joint managing director) presiding.

The secretary (Mr W. J. H. Ainley) read the notice convening the meeting and the report of the auditors.

The following is the statement by the chairman which had been circulated with the report and accounts for the year ended December 31, 1953:

Once more I am pleased to be able to report that we have had a successful year, as you will see from the accounts before you, which show a further increase in profits. I feel this is a very satisfactory result, especially as the year under review has been very difficult and one which has called for a great deal of anxious thought and hard work by all concerned.

You will remember that in the period 1951-52 we were in considerable difficulties over finance owing to the then prevailing restrictions on capital issues and credit. In due course these difficulties were overcome, but those of you who are industrialists will realise that when the planned progress of a company of our size with an extensive organisation is interrupted in this way, through no fault of its own, it is a very difficult matter after the organisation has been broken down to a certain extent, to reconstitute and build up anew. I might liken this to the fly-wheel of a large engine which is able to put out a great deal of power before it is run down and stopped.

I would like to take this opportunity of paying tribute to the whole of our staff and employees who are members of our profits participation scheme, who on this occasion put their shoulders to the wheel and worked all hours. This is something that is rarely found in any industrial concern in like circumstances, and to my mind is a wonderful tribute to what I might call a partnership between the workers and the shareholders, and is something which cannot be recognised in terms of money.

WIDENING SCOPE OF OPERATIONS

Your board of directors always have in mind the broadening of the basis of your business which makes for stability as a profit-earning organisation. In this connection your directors have not been unobservant of the trend of industry to transfer some of their manufacturing activities to the Dominions, either as assembly or actual manufacture. That being the case, there is bound to be a demand for the services which we supply in this country. As an example of this growth we could quote South Africa, Canada and Australia. As you know, a few years ago we opened up business in Johannesburg and in Cape Town. I am very glad to be able to tell you that this business is now very successful and is in a position to pay us for its requirements in equipment and also is earning satisfactory profits and will be able to pay a dividend for the past year.

Based on our experience in South Africa, during the past year we have opened an office in Toronto. We intend to limit our activities there around Toronto itself, and later on, open up in other parts of Canada, as the distances in that country are so enormous it would not pay us to spread our activities over the whole country.

We have also acquired a half-interest in a business in Australia which has a quite substantial rental revenue. I might say that this was a business started by us before the last war, but at the outbreak of war we sold our interest to Australian industrialists. The acquisition of 50 per cent of this business has been financed from our own resources.

THE DIRECTORATE

During the year we have lost the services of one of our directors by death, Mr W. A. Jackson, who will be greatly missed at our regular board meetings. In his place we are fortunate enough to obtain the services of Sir Leonard Browett, KCB, CBE, who I am quite sure will be of very great value to us because of his unique experience of taxation problems and finance generally.

Your directors also have decided to exercise the powers they have under the Articles to appoint executive directors. We think that we should appoint two or three of our most promising managers, having in mind that possibly this will be a very good training ground for one or more of them to become directors.

During the past year my colleague, Mr Philcox, has visited Australia, Canada and, quite recently, South Africa. The work involved in dealing with our overseas interests is already considerable, and will become more so as each business develops. It is our intention to appoint one of our executives as manager of our overseas companies department, and thus relieve administration at head office.

PROPOSED NEW ISSUE

At the moment your company is quite well off for liquid funds, but it will be necessary to raise further capital to finance our overseas commitments and to provide us with a reasonable working capital at home. We accordingly submitted an application to the Capital Issues Committee, and it gives me great pleasure to be able to report that we have received their consent. We therefore propose to issue 640,000 ordinary shares in the ratio of one to ten at present held, at 7s. 6d. per share, which will realise £240,000 gross. The issue will be made direct to the shareholders for the proportionate number to which they are entitled and an application form will be provided to enable shareholders to apply for extra shares, should there be any not taken up.

HEAVY TAXATION BURDEN

You will have noticed from the group accounts before you that our liability for excess profits levy amounts to £85,750. This is a very heavy sum, and when it is added to income tax and profits tax, you are bound to realise what a brake provision for such large sums for taxation is on the development of the business, and it seems to me, that the heavy burden all industries in this country have to meet on account of taxation is such that in the long run it is bound to defeat its own ends, inasmuch as it prevents the earning of profits, which on a more reasonable basis of taxation would contribute very liberally to the revenue of the country.

ACCOUNTS

I will now refer to the accounts, which reflect one or two major changes as compared with the previous year.

Profit and Loss Account—The gross profit at £655,569 is another record and shows an increase of £38,683 over the previous year, but after deducting profits tax, excess profits levy and income tax totalling £458,779 the net profit is £196,790, which is £14,814 less than the net profit for 1952. This result will help you to appreciate the force of my remarks on the penal effect of the present level of taxation.

During the year we managed to secure repayment of the remainder of our war damage claims, as a result of which we received interest amounting to £8,643 which has been credited in the profit and loss account.

After providing for the transfer to general reserve of £100,000 and the dividends on both the ordinary and preference shares amounting to £97,900, we are left with an unappropriated balance of £121,575 to be carried forward to the current year.

BALANCE SHEET

The issued capital has increased to £2 million by virtue of the £280,000 bonus issue made in May of last year, and the share premium account has been reduced by £284,463 for the same reason. The only other movement in the capital reserves has been to increase the surplus on realisation of capital assets by the sum of £447, representing the profit on sales of company-owned houses.

The revenue reserves now stand at £800,000 after the transfer of £100,000 from the profit and loss account.

The shareholders' interests, consisting of capital, reserves, and the unappropriated profit balance, amount to £2,969,380 as compared with £2,874,506 at the end of the previous year, and this sum is fully employed, as you can well see, in earning what I think may justly be termed a most satisfactory profit.

Current liabilities reflect the substantial increase of £364,079 over the previous year, which is mainly accounted for by the increase in our liability for taxation.

Turning now to the assets side of the balance sheet, the net value of the revenue-bearing installations is £2,529,885, which is equivalent to just over 1.5 years' rent.

The cost of freehold and leasehold proper-

ties at £102,936 shows an increase of £9,470 due to the purchase of premises for our Newcastle branch, and additional house property we have been obliged to buy in order to enable us to transfer our managerial staff where they are most needed to further the profitability and efficiency of our business.

The amounts invested in our subsidiary companies, either by way of capital or advances, has increased by £76,450 to £501,316. This increase is mainly due to our Canadian venture which accounts for £52,531. The balance represents increases in advances to our two British subsidiaries to cater for their expansion, less a repayment of £25,000 received from South Africa.

Stock and work in progress shows the substantial reduction of £101,860, which enviable result has been achieved by our manufacturers reducing their delivery periods, thus enabling us to carry smaller minimum stocks.

We have increased our holding in tax reserve certificates by £350,000 in an attempt to provide for our comparatively huge tax liabilities, and we have since been obliged to surrender £200,000 to meet our income tax liability on January 1st last.

Cash in Australia has increased from £5,810 to £102,962 as a result of our remitting £100,000 at the end of 1953, as a first instalment towards the cost of purchasing our 50 per cent interest in an Australian company, which I have already mentioned. We have remitted a further £90,000 in February of this year, and these two sums, together with the proceeds from the sale of our quoted investments in Australian issues will be sufficient to purchase our share of the initial capital.

CONSOLIDATED BALANCE SHEET AND PROFIT AND LOSS ACCOUNT

The consolidated accounts having been prepared on an identical basis to that of the parent company, the material changes have already been dealt with in the foregoing remarks.

The net profit of the group before taxation is £702,430 compared with £667,068 for 1953. After providing for taxation, the transfers to reserves, and dividends, the balance of unappropriated profits carried forward and attributable to the holding company's shareholders amounts to £177,078.

SUBSIDIARY COMPANIES

All the subsidiaries of your company traded at a profit in 1953, with the exception of the two Canadian companies, which showed a combined loss of $24,926 (£8,934). This loss is incorporated in the figures shown in the consolidated accounts. The Canadian companies were only formed in September, 1953, and it is anticipated that we shall suffer further losses for the next year of two, until we are able to build up a reasonable rent roll, as this is an entirely new venture, and unlike our other Dominion subsidiaries where we were able to take over going concerns with existing rental contracts.

CONCLUSION

In concluding my remarks, I would venture the opinion that although business has hardened considerably in this country and competition has increased, we anticipate being able to obtain our fair share of orders in this current year. For the first four months of this year we have obtained the target figure which we set ourselves.

As far as our two latest ventures in Canada and Australia are concerned, it is too early to prophesy, as there is still a tremendous amount of spade work to be done, and training to be accomplished. To produce the necessary momentum to ensure the smooth running of a machine takes time, but we have little doubt that in due course we shall make these two latest recruits to the group as successful as the others.

The report and accounts were adopted and the final dividend of 6 per cent, making 10 per cent for the year, was approved.

The retiring directors, Mr C. H. Jackson and Sir Leonard Browett, KCB, CBE, were re-elected, and the remuneration of the auditors, Messrs Chas W. Rooke Lane and Company, having been fixed, the proceedings terminated.

THE CAPE ASBESTOS COMPANY

A HIGHLY SATISFACTORY ACHIEVEMENT

MR ROBERT WALKER ON TRADING CONDITIONS

The sixty-first annual general meeting of The Cape Asbestos Company, Limited, was held on June 21st in London, Mr Robert Walker, MBE (the chairman), presiding.

The following is an extract from his circulated statement:

While the activities of the parent company again yielded an improved profit, the group as a whole was less successful during 1953. The total volume of sales was actually higher than in any previous year, but the margin of profit suffered a sharp contraction. This was due almost entirely to difficulties encountered during the year in the milling of our crude asbestos in South Africa, difficulties which have to a considerable extent now been overcome. Competition in all markets both for crude asbestos and manufactured goods has intensified during the year and is especially keen in the export field, but I am glad to be able to say that the volume of exports secured by your company, particularly in the dollar area, is extremely gratifying.

FINANCE

The group trading profit amounts to £1,038,963, compared with £1,407,058 in 1952, and the net profit attributable to your company amounts to £668,611. Adding the amount of undistributed profits brought forward, £1,240,801, and an amount of £13,509 for taxation over-provided in earlier years, there remains £1,922,921 for disposal. This figure is a striking index to the internal strength which has been built up in your company.

From this sum the amount required for taxation is £414,234, compared with £586,380. It is proposed that £244,475 shall be placed to reserves and that £142,743 shall be distributed as dividend, leaving £1,121,469 to be carried forward.

Turning to the parent company alone, trading profit has risen to £551,960, compared with £506,645, which represents a highly satisfactory achievement in the face of the keen competition, which shows no sign of abating.

Adding the amount brought forward from 1952, £148,326, and an amount of £13,509 for taxation over-provided in earlier years, there is available the sum of £713,795. From this, £281,000 must be set aside for taxation. Your directors recommend that £150,000 be placed to general reserve and that a final dividend of 20 per cent be declared on the ordinary shares, making, as last year, a total distribution of 25 per cent.

CAPITAL EXPENDITURE

In the consolidated balance sheet the fixed assets have increased from £2,691,656 to £3,348,787 after allowing for depreciation of £371,597 written off during the year. The principal additions have been the erection and equipment of the new factory at Stirling, the erection of the new mill at Westerberg, Cape Province, and the completion of the equipment of the Marinite factory at Glasgow. These additional ventures, together with other improvements, have been financed out of cash resources which have been reduced during the year by £715,515. The planning of further expansion must involve consideration of the desirability of creating additional capital, and this is a matter which your board will keep under the closest review.

Current assets are lower at £3,257,396 compared with £3,778,721 last year, but still exceed current liabilities by £1,876,293. Reserves and surplus have again increased at £3,559,533 compared with £3,462,031.

FACTORIES

I am gratified to be able to report a year of successful endeavour in the home field. At Barking there has been a year of steady progress, with notable improvement in manufacturing efficiency. At Uxbridge the board section has provided a greater contribution to revenue, and at Kentmere increased efficiency has been reflected in a higher profit. Your company's new Rocksil factory at Stirling, erected and in production in less than nine months, represents the result of teamwork and drive of a high order. While there are yet difficulties to be overcome, we hope that this will become an interesting source of revenue in the near future.

SUBSIDIARIES

When I last addressed you, I indicated that while there had been a successful year's operations in South Africa during 1952, the situation left no room for complacency.

The great pressure for production during recent years had placed a serious strain on the milling plants, which, despite constant attention, could not be maintained in operation at the required efficiency. In order to achieve the more exacting standards of quality demanded by manufacturers, it became necessary to slow down the rate of through-put in the treatment plants, and this has had the result of reducing the profit from these operations very substantially. As a result of measures taken earlier, the first production line of a new mill at Westerberg, the largest so far erected by the company, began to run towards the end of 1953, and a second line is now also in operation. While this will provide greater milling capacity than we have hitherto enjoyed, some increase in the cost of treatment cannot be avoided.

On the whole, it can be said that the demand for the special types of crude asbestos which are derived from your company's mines, still shows a tendency to increase. I am hopeful that we can look for a marked improvement in the contribution to be made by the mines to the general trading profit of the group.

The statement concludes with a review of the progress of the other subsidiary companies, at home and overseas.

The report was adopted.

OTTOMAN BANK

TURKEY'S NOTABLE ECONOMIC PROGRESS

LORD LATYMER'S REVIEW OF WIDESPREAD ACTIVITIES

The eighty-seventh annual general meeting of Ottoman Bank was held on June 23rd at Winchester House, Old Broad Street, London, E.C.

The Rt Hon Lord Latymer (the chairman) presided, and in the course of his speech said: The figures for 1953 of Turkey's economic activity show notable progress. Important increases in production are shown especially in agriculture where there have been record harvests. The fall in the price of cereals, however, following excellent world harvests, unfortunately had a serious effect in Turkey. Considerable delays in remittance of cover for imports resulted in spite of the Government's vigorous counter-measures. Nevertheless, this situation has not had too discouraging an effect abroad; foreign countries continue to show confidence in Turkey, and to feel that the Government will be able to confine its foreign expenditure to those items which are necessary to the development of the country and to an improved standard of living. It is hoped that the measures taken to surmount these difficulties will soon prove effective.

A new law for the encouragement of foreign investment came into force in January, 1954. Of wider scope than the law of August, 1951, the new law invites foreign interests into all spheres of activity "which further the economic development of the country" and which do not involve special monopolies. Profits may be repatriated without hindrance, or may be reinvested in the same undertaking or in another concern which complies with the regulations. Proceeds of the sale of a part or of the whole of the business may be repatriated at any time.

Public finance continues sound: as in 1952, revenue actually exceeded budget estimates and this winter the Grand National Assembly was able to pass for the first time in twenty years, a balanced budget. This is a remarkable achievement for a country which is not only making a supreme effort to equip itself but has also to meet a very heavy defence programme.

EGYPT

During the year 1953 it was more to the political events in Egypt that attention abroad was attracted than to the general improvements in the economic position, which resulted from the country's real and successful efforts to stimulate the export of cotton, upon which her prosperity so largely depends.

I am confident that the standard of service we have set in Egypt is being well maintained.

SUDAN

1953 was a notable year in the history of the Sudan. An Anglo-Egyptian Agreement on the Sudan was signed in February and a few weeks later the Sudan Self-Government Statute came into force, providing a legal basis for the machinery of self-government in the country. In November, under the supervision of an International Commission, the elections were held for the first Parliament. The National Unionist Party obtained a substantial overall majority in both the House of Representatives and the Senate; early in 1954 they took over the government of the country.

For all our branches in the Sudan it was a busy time. The Ottoman Bank Kosti completed its first year. An excellent site has been obtained for new premises at Port Sudan and plans for construction are now in preparation.

JORDAN

In spite of the country's two pressing and permanent problems—frontier tension and refugee resettlement—there are signs of progress on many sides. The United Nations Relief and Work Association, the United States Operations Mission (formerly Point Four), the Jordan Development Board and the Jordan Development Bank have all contributed much goodwill and much practical help to the development of the country's resources, and the rehabilitation of the refugees who number over half of the population.

IRAQ

For Iraq, 1953 was a year of general stability and of progress. The new Civil code, drawn up in 1951, came into force. There was, throughout the year, a steady improvement in the cost of living index, which fell from 539 in January to about 470 in December.

Convincing evidence of the country's achievements may be found in the progress of many schemes adopted by the Iraq Development Board—itself reorganised in July—since the adoption of the Six-Year Plan in 1951.

Each of these schemes depends upon the steady flow of oil royalties. The oil output of Iraq for 1953 exceeded 27,900,000 tons, an advance of about 50 per cent on the 1952 figure. Royalties, said to be over ID.35 million, are mounting rapidly and are confidently expected to reach ID.60 million in the near future. Iraq, therefore, is well justified in pressing forward with her public works.

For your branches in Iraq it was an active year.

CYPRUS

In spite of keen competition and notwithstanding the conservative policy of your bank, our business in Cyprus shows encouraging development.

Our associated bank, the Agricultural Bank of Cyprus, maintained its policy of long-term accommodation to Cyprus farmers. It is interesting to learn that following excellent harvests, more than 99 per cent of all instalments due by farmers to the Agricultural Bank of Cyprus during the year were punctually paid.

MOROCCO

Our Casablanca branch had a satisfactory and active year although Morocco did not escape the general recession due to falling prices.

LEBANON

In the Lebanon in 1953 the citrus fruit crop was maintained and the apple crop increased. The disposal of the fruit, however, both on the home and foreign market, is already presenting something of a problem. The textile industry, the most important in the country, continued to work below maximum capacity; the cement industry, on the other hand, as there is much building activity, found an easy market.

SYRIA

The Banque de Syrie et du Liban continues to play an important part in Syria's financial economy. The activity of the branches equalled that of the previous year and satisfactory results are reported.

JUGOSLAVIA

The general meeting of shareholders of the Banque Franco-Serbe, which was held on April 27th, passed the accounts for the year 1953 and agreed the same dividend of Frs. 50 per share as for the previous year.

LONDON AND PARIS

The London and Paris offices have continued to make every effort to stimulate and foster trade between and with the countries of the Middle East, where our branches are established. For the branches in Marseilles and in Manchester also, it was a busy and encouraging year.

BALANCE SHEET ITEMS

The balance sheet totals show an increase over last year of more than £24 million, of which some £13 million is due to including this year for the first time contra accounts in respect of endorsements and guarantees, as well as acceptances which latter item alone has appeared in the past. The current, deposit and other accounts show an expansion of more than £11 million, which may be considered satisfactory, especially if the cessation of all our current banking activities in Israel is borne in mind.

We continue to maintain a liquid position with cash and money at call together showing a ratio to deposits of 27 per cent, bills receivable of 17½ per cent and investments of 16½ per cent. Advances show an increase of £8 million, most of which took place towards the end of the year.

It will be noticed that the figure of £238,122 included in the profit and loss account under the heading "Result for the year ended December 31, 1953" shows a substantial increase over the same figure for 1952, while the figure of £160,474 included under the heading "Remittances in respect of profits for previous years" shows a decrease.

It is our practice to include under the head "Result for the year" only those profits of the year under review which have been remitted into sterling before the accounts are made up. I have mentioned at former general meetings that it is often impossible to ensure that the necessary exchange for remittance of our profits from the various countries in which we operate is available in sufficient time to enable them to be included in the figures for the year in which they are earned. No particular significance must, therefore, be attributed to the variation which may occur from year to year in the relative size of these two items.

The total amount of profit available, including the balance of £30,459 brought forward from 1952, is £429,056, compared with £480,460 last year. The appropriation to "Reserve for contingencies" is reduced this year from £250,000 to £200,000, leaving a balance of £229,056.

The Committee propose that a dividend of 8s. per share be paid again this year, absorbing £200,000 and leaving £29,056 to be carried forward to 1954. The report was adopted.

LAMBERT BROTHERS LIMITED

EFFECT OF SERIOUS FALL IN FREIGHT RATES

The fifty-first annual general meeting was held on June 24th in London, Mr R. Rattcliff Steel (the chairman) presiding.

The following is an extract from his circulated statement: The consolidated profit and loss account shows a gross profit of £422,147. Taxation on these profits absorbs £215,347, leaving £206,800 as the net profit for the year after taxation.

The dividends on the preference stock and interim dividend on the ordinary stock already paid, plus the final dividend and bonus on the ordinary stock now recommended, absorb £83,016, leaving £173,784. The balance brought forward from 1952 is £791,016, making £964,800. A further sum of £200,000 has been put to fleet replacement reserve which will now stand at £1,200,000, so that £764,800 is left to the credit of the profit and loss account and it is proposed to carry this sum forward.

We also propose to repeat the payment of 2½ per cent on the ordinary stock out of realised capital accretions, which does not attract any form of tax in the hands of the stockholders.

The considerable reduction in profits is entirely due to the serious fall in freight rates, to which, as I have explained in the past years, most of our business is linked. Unfortunately there is no sign of early improvement and I should be wrong if I encouraged you to hope for any better results during the year we are now half way through.

I am glad to say that there has been no lessening of the activities of any of the departments or subsidiaries, apart from the falling off in the demand for bunker coal, which must continue.

Our oil department, which is progressively taking over the large bunkering business formerly handled by the coal department, has fully maintained its trade in all respects, notwithstanding the general recession. It also brings many reciprocal benefits to our other departments.

Our shipowning company—the Temple Steamship Company Limited—has naturally been affected by the fall in freight rates from the very high levels of 1951. Rates are now at levels which still show only a small margin over running costs, and then only for the more efficient vessels.

FLEET CHANGES

The first of the two new motor vessels, *Temple Hall*, was delivered in February, 1954, about 4½ months later than expected owing to the cumulative effect of steel shortages in the last two years. Her sister ship, *Temple Lane*, is expected to be delivered about the end of September, 1954, some 3½ months late for the same reason. In addition to our own Temple ships, our ship management department has operated vessels for clients during the year.

After reviewing in detail the departmental results, the statement continued:

From my recent statements, our stockholders will have appreciated that the altered methods of transport have necessitated the re-arrangement of many of our activities; nevertheless, for the most part our business remains closely related to ships. Although we are expecting another difficult year, we are fortunately well situated and feel confident of being able to secure our fair share of any business that may be obtainable to replace those activities which are lessening due to world changes. The report was adopted.

TIMOTHY WHITES AND TAYLORS, LIMITED

VOLUME OF SALES AGAIN INCREASED

The twenty-fifth ordinary general meeting of this company was held on June 24th in London. Mr G. I. Rushton, MPS (vice-chairman and managing director), in the unavoidable absence of Mr Louis Nicholas, JP, FCA (chairman), presided.

The following is an extract from the chairman's circulated statement: The accounts of the company for the 53 weeks ended January 2, 1954, show a continued improvement in the profits of the company and its subsidiaries. The total sales of the company and its retail subsidiaries for the period were higher than the high level of sales for the year 1952 but, in common with other businesses of a similar nature, expenses, particularly wages, salaries, rents and rates have continued to rise.

The trading profit and sundry income of the group for the period ended January 2 last was £1,373,558 (equated to 52 weeks £1,347,642) as against £1,247,365 last year.

The provision for taxation, including taxation due January, 1955, amounts to £654,994 equivalent to over 60 per cent of the profits. Your directors recommend a total dividend of 30 per cent, less tax.

The total reserves of the group, capital and revenue now total £2,800,975 as against a paid-up capital of £2,809,517.

With regard to the future, present sales are in excess of those for the corresponding period of 1953. I have every hope, subject to nothing unforeseen occurring, that the trading results for the current year will be satisfactory.

The report was adopted.

THE ARGUS PRESS HOLDINGS

EARNINGS WELL MAINTAINED

The twenty-fifth ordinary general meeting of The Argus Press Holdings Limited was held on June 23rd in London.

Mr F. R. Lewis, who presided, said: In his speech to the shareholders last year the chairman indicated the possibility of a fall in net profit. You will have seen that, in fact, the figures were almost identical with those of the previous year. The trading balance is £191,974, against £189,102 for the previous year. After deducting expenses, directors' fees and taxation, we have available £54,123. If you pass the recommendation of your directors that a final dividend of 10 per cent, making 17½ per cent for the year, be paid we shall carry forward a sum of £230,921, against £211,426 brought in.

A year ago shareholders were informed that we had made an offer for the entire share capital of Messrs Kelly & Kelly Limited, general printers, of Singer Street, Finsbury, E.C. That offer was accepted and Kelly & Kelly Limited is now a wholly owned subsidiary of The Argus Press. The profits of Kelly & Kelly subsequent to the date of acquisition have been included in the accounts.

Turning to the future, increases in production costs have not yet ceased but the demand for print is generally very satisfactory. In the field of magazines and newspapers, competition is strong. This year the figures so far are very encouraging and we are looking for further opportunities of expansion.

It may be necessary in the future to arrange for further finance for the provision of new plant. The report was adopted.

AMALGAMATED BANKET AREAS, LIMITED

MAJ-GEN W. W. RICHARDS'S SPEECH

The eighteenth annual general meeting of this company was held on June 22nd in London.

Major-General W. W. Richards, CB, CBE, MC, chairman, in the course of his speech, said: When I addressed you last year, I drew attention to the near completion of the last of our Ropeways and I suggested that the attainment of that goal should, after a reasonable interval, result in progressively smoother and more profitable operations. To our regret it is taking far longer to secure maximum tonnages from the Fanti Mine.

Notwithstanding the absence of any premium in the free market price of gold, which amounted during the year under review to no less than 14s. 6d. per ounce, the net mine profit last month amounted to the gratifying figure of £26,669; and this was achieved after charging development expenditure amounting to £7,561. These good figures were not, as may have been assumed, due to a better return from the Fanti Mine, but were largely attributable to our older and tried sections, Abbontiakoon, Mantraim and Pepe. The total tonnage mined and milled from all sections reached the record figure of 70,958 tons.

We must now enlarge development operations to ensure the future maintenance of the ore reserves. The present rate of 700 feet of development per month will accordingly be increased to 900 feet per month for the remainder of this year, after which the rate will be progressively increased to reach 1,200 feet per month by September, 1955. The report was adopted.

VAB PRODUCTS LIMITED

A FAVOURABLE RESULT

The seventeenth annual general meeting of Vab Products Limited was held on June 17th in London.

Mr Ivor Lloyd, AMIAE, FCS, MInstBE (the chairman), in the course of his speech, said: The profit of the group amounted to £54,103 for the twelve months ended December 31, 1953, which compares very favourably with the profit figure of £37,349 for the previous year. Taxation absorbs £35,854—almost two-thirds of the profit earned by the group. The sum of £8,500 has been retained in the accounts of the subsidiary companies, and the group profit and loss account balance carried forward is increased from £13,740 to £22,017.

Towards the end of the year we acquired Tupholmes (Sheffield) Limited, a well-known firm of hardware merchants. Your directors are of the opinion that during the current year this company will make a useful contribution to the group.

IMPROVED SALES SERVICE

During the year, part of the premises in Sheffield occupied by Royse Brothers Limited were brought into use as a Northern depot for the distribution of the products of Vab Rails Limited and Vab Plastics Limited, which has had the effect of improving the sales of these companies and their service to our customers in that area. The parent company has now acquired this leasehold property in order to ensure the continuity of this service.

Your board has continued its policy of increasing the efficiency of various subsidiaries by the installation of new plant wherever possible. Whilst conditions are still difficult, your board are optimistic with regard to the current year. Legislation has been introduced making the carrying of reflex reflectors compulsory on all vehicles, and I am confident that your subsidiary, Fairylites Limited, one of the oldest companies specialising in this type of accessory, will derive much benefit during the current year.

The report was adopted and the total dividend of 12½ per cent was approved.

SOUTHERN AREAS ELECTRIC CORPORATION LIMITED

YEAR OF FURTHER PROGRESS

The twenty-first annual general meeting of Southern Areas Electric Corporation was held at Caxton Hall, Westminster, on June 18th.

During the course of his speech to the shareholders, the chairman, Sir Arnold B. Gridley, KBE, MIEE, MP, said:

You will recall that a year ago I informed you that we had but recently agreed to purchase the whole of the share capital of Tyer and Company Limited, manufacturers of railway signalling and automatic train control apparatus. In the accounts before you is incorporated a satisfactory return on that investment and I would add that we have some interesting developments pending.

ANNUAL ACCOUNTS

Our capital reserve balance as at December 31, 1952, was £51,646. Of this sum £13,000 has been converted into bonus shares of two subsidiary companies and allotted to the holding company and we have added £6,568 which was the profit realised on the sale of some of our outside investments. Our capital reserve is now £45,214 as shown.

Referring now to our revenue reserves, the contingency reserve of £40,000 is unchanged, but the general reserve is increased by £37,750 (from £45,000 to £82,750) transferred from profit and loss account.

The third item of £215,348 is an increase of £87,422 on last year's figure of £127,926. Of this increase of £87,422, the major contribution is £68,533 from EPT postwar refund to which I have already made reference.

The net effect of all these changes is that our combined capital and revenue reserves now aggregate £383,312 as compared with £333,105 a year ago, an increase of £50,207.

We have to make provision for income tax liability in respect of the trading results for the year 1953 of no less a sum than £145,182, which is nearly four and a half times the dividend distribution of £32,319 which we are proposing today.

You will observe next that our bank overdraft has been reduced by no less than £107,309, viz. from £361,442 at December 31, 1952, to £254,133 at December 31, 1953. At our meeting a year ago a shareholder enquired how we intended to finance our various capital commitments and other needs. We have spent on extensions and additions to land, buildings and tool equipment of subsidiary companies no less than £160,000. We also completed during the year the purchase of the Tyer Railway Signalling business, and provided additional working capital for subsidiary company needs. We have achieved all this by turning into cash £109,000 of our last year's stocks and work in progress, by selling some of our outside investments for £44,568 cash at a satisfactory profit, and by ploughing back undistributed profits of subsidiary companies. I trust shareholders will agree that our financial policy has been sound and prudent.

CONSOLIDATED PROFIT AND LOSS ACCOUNT

In the consolidated profit and loss account we start off with profits, including dividends on our outside investments, of £284,781, compared with £265,600 in the previous year, an improvement of over £19,000. Depreciation requires nearly £10,000 more, due to the additional expenditure on fixed assets. We have also deemed it prudent to write £16,699 off our patent rights, etc., as compared with £109 last year. We next have to provide £131,252 to meet our tax liabilities, which include £27,700 for Excess Profits Levy, which is a non-recurring item. For this relief in our subsequent accounts let us be thankful.

I turn now to the profit attributable to the Holding Company's interest, which this year is £92,157 compared with £82,460 last year, which gives you the true net profit comparison. We show a sum available, adding in last year's carry forward of £127,926, of £288,616. After providing for the proposed dividend and bonus, transferring £37,750 to general reserve, and writing off formation expenses already referred to, we have a carry forward to our next year's profit and loss account of £215,348, as compared with £127,926 brought in, an increase of £87,422.

STOCKS WRITTEN DOWN

Before computing the profits of the subsidiary companies incorporated in the group consolidated accounts, those companies in the aggregate wrote down the value of their stocks, tools and other smaller items by approximately £83,000.

To summarise briefly the net effect of the group figures I have commented upon, it is this: Stocks, etc.; have been written down by £83,000 and patent rights by £16,000, fixed assets have been added of the value of £150,000, balances carried forward are up by £87,000, and capital and revenue reserves are increased by £50,000. Yet we had reduced our bank borrowings by £107,000. I think I may let these figures speak for themselves.

I should mention that as Colonel Hardie is no longer resident in London and wishes to be relieved of a portion of his responsibilities as joint managing director with me, the board have asked him to continue to serve as technical director. He will also retain his directorship of some of the more important subsidiaries while resigning from others.

I hope that the results for the year 1954 will, in the uncertain world conditions which unhappily still prevail, be at least as good as those which we now present to you.

The report and accounts were adopted.

THE UNIVERSITY OF HULL

DEPARTMENT OF ECONOMICS AND COMMERCE

Two graduate Research Assistants required: one appointment is for research on regional industrial problems and will be within the salary range of £400 to £650 per annum; the other, for work on bulk import of foodstuffs, will be for a period of two years with salary £550, £600 per annum. Superannuation benefits under the F.S.S.U. and children's allowances.—Further particulars from the Registrar, to whom applications (four copies) should be sent not later than July 19th.

GROUP of expanding companies seeks executive capable of co-ordinating the activities of the various companies with a view to streamlining and economy in the various basic operations. Knowledge of accountancy, buying, sales, advertising, administration, systems and methods, production. The position calls for someone capable of examining the various departments of the group, interviewing and engaging staff and representatives and bringing in new ideas. Applicants must have a strong personality and must have held top executive positions recently. All replies will be treated in strict confidence.—Write, stating full details, age, experience and salary required, to Chairman, Box 594.

THE British Transport Commission invite applications for a position of Statistician-Economist, Statistics Division, B.T.C.HQ., the salary range for which is £1,200-£1,700 p.a. Good University degree required preferably in economics. Sound knowledge, theoretical and practical, of statistical method, of current economic statistics and of principles and practice of economic surveys. Candidates should be between 26 and 40 years of age and will be eligible for membership of a Superannuation scheme subject to the requirements of the fund. Applications, giving full particulars of education, experience and age, should be sent within 14 days to the Chief of Establishment & Staff, B.T.C., 222 Marylebone Road, London, N.W.1.

GENERAL SALES MANAGER required by well-known engineering group near London to take charge of division handling mechanical components and equipment for the aircraft and automotive industries. Applicants must possess recent and first-hand knowledge of the requirements of these industries and be competent to conduct top level negotiations at home and abroad. Salary up to £3,000 p.a. and excellent prospects to the right man.—Please send full details to Box 601.

FOR Sale, complete sets *The Economist*, 1947 to 1953.—Offers to Box 590.

WYE COLLEGE

(UNIVERSITY OF LONDON)

The Governing Body of Wye College invites applications for the post of Agricultural Economist in the Agricultural Economics Department. Applicants must be graduates, preferably with qualifications in Economics and Horticulture or Agriculture. The appointment will be made in the A.E. scale (£676-£949, consolidated) with superannuation under the F.S.S.U.

Further particulars may be obtained from the Registrar, Wye College, Nr. Ashford, Kent, to whom applications should be forwarded by July 17, 1954.

AN INVITATION TO INDUSTRIALISTS

Small French town (Normandy), entirely reconstructed since 1947, invites inquiries from British/American firms seeking factory-space in France. Efficient modern services, reliable non-Communist labour, generous municipal facilities.—Please write Mairie, Aunay-sur-Odon, Calvados.

CONTINENTAL Department of internationally known company requires a Manager. A versatile and capable man who has a first-rate knowledge of French and/or German and is an able negotiator should find this a congenial and progressive position.—Applications should give details of age and experience.—Box 603.

AN EXCEPTIONAL OPPORTUNITY occurs for woman graduate with good honours degree. London office controlling European network of world-wide advertising organisation offers a position of unusual interest with every chance of rapid advancement. Essential qualifications are: good spoken and written French and German, a clear concise prose style, pleasing personality, energy, initiative, organising ability and an analytic mind. Experience in any of the following fields will prove useful: economics, statistics, social studies, library work (indexing, extracting, precis, etc.), journalism, public relations, market research, advertising.—Write Box 588.

BIOGRAPHER required to write history of a business, including life and background of its founder. Should appeal to young English, History or Economics graduate aspiring to be an author. Will those interested please write, giving brief details of their qualifications and other relevant information.—Box 593.

THE Economists' Bookshop, 11-12 Clement's Inn Passage, London, W.C.2, invites you to submit lists of books on Economics, History and Social Services, you may wish to sell (*periodicals excluded*).

VICTORIA UNIVERSITY COLLEGE
WELLINGTON, NEW ZEALAND

The Council of Victoria University College proposes shortly to appoint a SENIOR LECTURER IN THE DEPARTMENT OF ECONOMICS, and invites applications from suitably qualified persons for this post.

The salary will be £1,092 8s. per annum, rising by annual increments of £50 to £1,292 8s. per annum. The initial salary will be determined according to the qualifications and experience of the appointee.

Approved fares to Wellington will be allowed for the appointee, his wife and his children.

Duties to be assumed on September 1, 1954, or as soon thereafter as may be agreed upon.

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5, Gordon Square, London, W.C.1.

The closing date for the receipt of applications, in New Zealand and London, is *July* 31 1954.

MARKET RESEARCH

A company of high national repute, engaged in the large scale manufacture of consumer goods, invites applications for a most interesting appointment. The successful applicant will be responsible to the Chief Market Research Executive for the continuous study of consumer wants in relation to the company's products, the regular scrutiny of specifications and quality through sample surveys, and the interpretation of statistical data to provide a basis for the company's product development and marketing policies. Candidates should be under 35, have a university standard of education and a wide experience in the field of market research. A knowledge of distribution problems embracing the wider issues of marketing and product presentation is especially important. Initial salary will be commensurate with the candidate's breadth of experience in this field and a figure not less than £1,500 is in mind. In addition, the company offers a non-contributory pension scheme, life assurance and other substantial benefits.—Apply in confidence, giving full details of age, education and career to date, to Box 609.

SENIOR SCIENTIFIC OFFICERS; SCIENTIFIC OFFICERS; PATENT EXAMINER AND PATENT OFFICER CLASSES. The Civil Service Commissioners invite applications for pensionable appointments. Applications may be accepted up to December 31, 1954, but early application is advised as an earlier closing date may eventually be announced. Interview Boards will sit at frequent intervals. The Scientific posts cover a wide range of scientific research and development in most of the major fields of fundamental and applied science. In biological subjects the number of vacancies is small; individual vacancies exist at present for candidates who have specialised in palaeobotany, foraminifera, malacology and lichenology. The Patent posts are in the Patent Office (Board of Trade), and Ministry of Supply.

Candidates must have obtained a university degree with first- or second-class honours in an appropriate scientific subject (including engineering) or in mathematics, or an equivalent qualification; or for Scientific posts, possess high professional attainments. Candidates for Senior Scientific Officer posts must in addition have had at least three years' post-graduate or other approved experience. Candidates for Scientific Officer and Patent posts taking their degrees in 1954 may apply before the result of their degree examination is known.

Age Limits: Senior Scientific Officers, between 26 and 31, but specially suitable candidates under 26 may be admitted. For Scientific Officers and Patent Classes, between 21 and 28 during 1954 (up to 31 for permanent members of the Experimental Officer class). Salary (London) Senior Scientific Officers: (men) £975-£1,150; (women) £845-£1,025. Scientific Officers: (men) £470-£855; (women) £470-£750. Patent Examiner and Patent Officer Classes: (men) £440-£760 (rates under review). Women's rates somewhat lower. Somewhat lower rates in the provinces.

Further particulars from the Civil Service Commission, Scientific Branch, Trinidad House, Old Burlington Street, London, W.1, quoting No. S.53/54 for Senior Scientific Officers and S.52/54—S.128/54 for the other posts.

OLD-ESTABLISHED firm of Engineers and Machinery Merchants, with ample technical and financial resources, are interested in acquiring complete Works, Industrial Installations and large ranges of Machinery of virtually every type—either in GREAT BRITAIN OR OVERSEAS. Notable purchases in recent years include plants for the manufacture of Chemicals, Heavy and Light Engineering Products, Iron, Steel and N-F. Metals, Artificial Fibres, Machine Tools, Hydraulic, Plastics and Rubber Machinery, Cement, Radio and Gramophones, etc.; also redundant Railways, Mines, Electric Generating Stations, Breweries, Distilleries, Boilers. The advertisers have highly qualified technical staffs and every facility for the expeditious dismantling and removal of large industrial equipment. All replies will be treated in the strictest confidence.—Box 606.

SALES MANAGER with a sound grasp of technical aspects of electronic materials, including ceramics, required by Midlands branch of large industrial group. Applicants, preferably metallurgists or chemical engineers, having ability to anticipate and develop the uses of the materials and competent to negotiate, with customers respecting commercial applications to products are invited to apply for this position. Good salary and prospects.—Please send full details and indication of salary desired to Box 598.

MARKET RESEARCH ASSISTANT required by large industrial company near London. Pensionable post. Applications are invited from graduates, preferably in Economics, who have a minimum of three years' experience in market research work.—Apply, stating age, qualifications and experience, to Box 592.

SALES MANAGER required by large organisation to take charge of a group of miscellaneous products supplied to the electrical and radio industries. Specialised experience in this field is of less importance than the ability to appreciate the potentialities and exploit the commercial and other applications of the products. Ability to conduct negotiations at top level is absolutely essential. A substantial salary is offered and prospects are excellent.—Please send full details of age, experience and salary desired to Box 595.

LARGE Industrial Group, leading in its own field, with Headquarters near London, invites applications for position of Chief Accountant, who must be chartered accountant with industrial experience and able to assume responsibility for subsidiary and consolidated accounts, taxation, costing, finance and organisation of accounting methods. Age 37 to 45 years. Considerable prospects for applicant with right experience and personality. Commencing salary at least £2,000. Only applicants of outstanding ability can be considered. Full details of education, career, qualifications, age, etc., should be sent to Box No. T.3966/3, Foster Turner & Everetts Ltd., 11, Old Jewry, London, E.C.2.

UNIVERSITY OF BIRMINGHAM

Applications are invited for a Grade I lectureship in the Faculty of Commerce and Social Science (salary £1,100 to £1,600, depending upon qualifications). The principal duties of the post will be to pursue research into and lecture on Employer-Employee relations. It will be an advantage if candidates, besides holding a good degree in commerce or economics, have had some experience in industry. The lectureship is tenable under a deed of gift and is established for a period of seven years.

Applications, with the names of three referees, should reach the Registrar, The University, Birmingham, 15, before July 12, 1954. Further particulars may be obtained from the undersigned.

C. G. BURTON, Secretary.

The University, Birmingham, 15. June, 1954.

THE DURHAM COLLEGES
in the University of Durham
BOARD FOR EXTRA-MURAL STUDIES

Applications are invited for the post of Temporary Staff Tutor for Extra-Mural Studies. The appointment will date from September 1, 1954, or such other date as may be arranged. The salary attaching to the appointment will be £500 per annum, together with the benefits of the F.S.S.U. Scheme and Family Allowances.

The Staff Tutor will be required to teach one or more of the following subjects :—

Economics.
Industrial Relations.
Sociology.

Applications (three copies), stating subjects offered and giving the names of three persons to whom reference may be made, should be sent not later than July 10th to the Secretary, 38, North Bailey, Durham, from whom further particulars may be obtained.

GENERAL MANAGER

Required by West African trading company. Experienced in wholesale and retail trading in building materials, hardware, cycles and accessories, provisions, etc. Company operates its own stores in the principal British territories. Applicants must possess leadership and must be industrious, fit and between the ages of 35 and 45 and able to produce impeccable references. Permanent position offering considerable scope for a man with sound merchandise knowledge, sales and administrative ability, and capable of taking full control of European and African staff. Knowledge of budgeting, stock and financial control essential. Free furnished accommodation provided, first-class passages, 12-18 months' tours with good leave periods. Pension, generous salary and bonus terms; Colonial rates income tax. All applications will be treated in confidence.—Apply, own handwriting, giving full details of past experience, educational and other qualifications, to Box 610.

THE MARKET RESEARCH DEPARTMENT of a Midland company requires a Male University Graduate aged 20-24, trained in economics and statistics (the latter preferably to more than elementary level). This is a new post, demanding an alert man, capable of setting down the results of his work adequately, yet concisely. Salary in accordance with age and qualifications.—Apply, giving details, to Box 586.

PRODUCE OFFICER required for NIGERIA in the MARKETING and EXPORTS DEPARTMENT for 18 to 24 months in first instance. Salary, etc., according to experience in scale £807 rising to £1,631 a year. Gratuity of £100/£150 a year. Outfit allowance £60. Free passages for Officer and wife. Assistance towards the cost of children's passages or grant up to £150 annually for maintenance in United Kingdom. Liberal leave on full salary. Candidates, under 40, must have a University degree in Commerce, Economics or Agriculture, and should possess administrative ability. Experience of inspection and grading of agricultural products an advantage.—Write to the Crown Agents, 4, Millbank, London, S.W.1. State age, name in block letters, full qualifications and experience, and quote M1/33943/EN.

SALES DEVELOPMENT, U.K.-U.S.A. Highly qualified Executive seeks appointment. Sales Manager and Sales Promotion Manager with important National and International Companies, experienced in planning and organising major sales development campaigns. Has had general business experience including administration and accounts. Has lived and travelled extensively Canada and America.—Box 591.

SALES MANAGER with experience of transformers and coil winding or other specialised field of electrical components, required for important department of large organisation. Must be fully accustomed to controlling a sales organisation, able to conduct negotiations at highest levels and technically conversant with current developments in electronics. Substantial salary and excellent prospects.—Please send full details and indication of salary desired to Box 596.

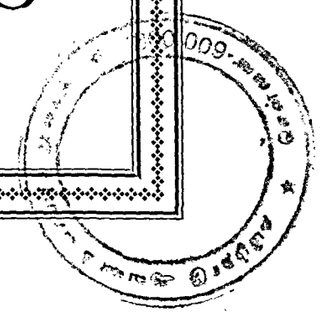
GENERAL SALES MANAGER required by important engineering group in South West to develop and expand existing large sales of mechanical components and general engineering work. Applications are invited from persons holding similar appointments in the machine tool or mechanical engineering fields, possessing a wide circle of trade contacts and able to negotiate at highest levels. Salary up to £3,000 p.a.—Please send full details to Box 599.

TECHNICAL SALES MANAGER required for important company near London to expand existing large turnover with particular emphasis on the technical development of mechanical components for the electrical and allied industries. A wide experience coupled with ability to conduct negotiations at Director level and direct the technical development into the most profitable fields are essential qualifications. Substantial salary and excellent prospects.—Please send full details and indication of salary desired to Box 597.

GENERAL SALES MANAGER required by well-known company to develop and expand existing large turnover in electrical components and equipment for Aircraft. Applicants must possess up-to-date experience of requirements and be connected at high level in this field and be able to conduct surveys and negotiations at home and abroad. This is a senior appointment, which will be well paid, and demands wide experience and administrative ability.—Please send full details and indication of salary desired to Box 600.

FOREIGN SALES MANAGER required by old-established company; age preferably 30-40. First-class references essential. Position would necessitate foreign travel for approximately six months annually. Fluent French essential, German and/or Spanish advantageous. Minimum commencing salary £1,500 p.a.—Box 589.

SPRING BOOKS 1954



Captain and Cassandra

SIR WINSTON CHURCHILL'S fifth volume ended on the eve of D-Day: the sixth* and last therefore covers a period of uninterrupted military victory for the Allies. That is the Triumph in the title he has chosen. The Tragedy, of course, lies in the politics of the Allies, or at least of the Western Allies. For in the year between June 6, 1944, when the British and Americans landed in Normandy, and July 26, 1945, when Mr Churchill, defeated in the General Election (a defeat which he still ascribes to mere technical unreadiness), resigned his office, the fruits of victory in Europe—and in Asia, though he deals much more sketchily with that—were being cast away. That they were cast away we now know only too well. Mr Churchill's defence is that they were not cast away by him. He was the realist of the West, he was betrayed (though he never uses such a discourteous term) by the illusions of Washington. This view is now generally admitted, and Sir Winston does not need to press it. He allows it to emerge from the documents which he prints. Indeed, in some instances, his personal friendship for Roosevelt seems to make him over-indulgent: he ascribes the Russomania of the period before and after Yalta partly to the fact that Roosevelt was first ill, then dead, and that he had not properly briefed his successor to resist the pressure of the State Department. This is difficult to square with some of the evidence recently published in America, which clearly shows that Roosevelt's personal friendship merely papered over the wide gulf between his own positive policy of indulging Russian ambitions and Sir Winston's far sounder and more historically minded realism.

The Anglo-American differences in this crucial period were almost all concerned, even if only indirectly, with this political problem: the central problem that Sir Winston consistently, if somewhat pessimistically, saw and the American statesmen spasmodically glimpsed and optimistically disregarded. Even when their divergence seemed strategic, its significance was political. Thus the landing in the south of France was opposed by Sir Winston not only because, by the time it was carried out, it could no longer fulfil the function for which it had been designed, but also because, by weakening General Alexander's armies in Italy, it ruled out that dash through the Ljubljana gap to Vienna that might have forestalled the Russians; and in March, 1945, Sir Winston protested against General Eisenhower's undertaking, in direct and unauthorised correspondence with Stalin (as Generalissimo), to leave Berlin to the Russians because "I do not consider that Berlin has yet lost its military and certainly not its political significance." Similarly he urged Eisenhower to advance to Prague—*in* vain, for Eisenhower, in deference to the Russians, halted and left Prague to be cleared by them.

But the crucial diplomatic struggle was, in Europe, over Poland: Poland, in whose defence Britain had declared war in 1939, to which Britain was bound by honour, and which had provided Britain, even though defeated, with so many fighting men, but which also lay militarily helpless before the Russian armies. The principal charge against Britain and America at Moscow and Yalta will always be the surrender of Poland; and it is on this subject that Sir Winston, in this volume, most constantly dwells. On other countries he was able to conceive a *modus vivendi*. In spite of American suspicions, he allowed—and demanded—"spheres of influence." He granted Bulgaria and Rumania to Russia and asserted British authority fortunately and decisively (against the virtuous protests of *The Times*, the *Manchester Guardian* and the Americans) in Greece; and Stalin, in return for a free hand in Bulgaria and Rumania, and because he, too, had to temper political ambition with the military necessities of the alliance, did not interfere while British troops destroyed the Communist forces in Greece.

But over Poland there could be no such agreement. Sir Winston could not say of it, as he can of Rumania and Bulgaria, that "I had never felt that our relations with them in the past called for any special sacrifices from us." On the other hand he could not, as he could in Greece, send in British troops and force the exiled King, by an ultimatum, to accept the Regency which, in the end, saved his throne. All he could do was to bargain at the council table. For this he required bargaining-counters. Fortunately, such bargaining-counters, once the Anglo-American armies were sweeping across Europe, might easily be acquired elsewhere than in Poland. Unfortunately the American statesmen, distrusting "imperialist" Britain and eager to appease the Russian government about which they entertained such

confident illusions, positively refused to pick up such bargaining-counters. They halted armies that might have gone on and withdrew from areas that they might have continued to hold until the Russians had fulfilled some of the promises which they had already made and have never fulfilled even to-day

Such is the argument of Sir Winston's narrative, which is documented throughout with inescapable evidence. The result was the tragedy we know: that communisation not only of the Balkans, which he foresaw in 1944, but also of Poland, East Germany, and China which might perhaps have been prevented had he received American support. Could he perhaps have prevented it even without that support? The Grand Alliance was committed to military co-operation even without further concessions to Russia and America. Supposing Sir Winston had felt less bound to acquiesce in American decisions, to grant Russian demands? This is a hypothesis that he does not consider. Perhaps he is right when he says "it is difficult to see what more we could have done."

It is now nine years since the war ended in this triumph and this tragedy. In those nine years Sir Winston's stature, as the architect of the Triumph and the Cassandra of the Tragedy, has, if possible, been enhanced. The other great international figures of those years are all gone, some severely, some indulgently judged by history. He remains, nearly eighty, Prime Minister of Britain once again, vindicated once again by his prescience in the wilderness, and, on top of all that, he has completed, in the intervals of this enormous septuagenarian activity, the six stout volumes of his Memoirs. It is an astonishing feat, and the result is in itself astonishing. In an age when every politician writes his memoirs, these stand out not only for their substance—for what other statesman could have covered, from so central a position, the whole crisis of the age of Hitler?—but also for their style. The rhetoric has subsided a little in the course of them, the narrative has taken on a faster pace; perhaps, and not surprisingly, the personal part of the author is less apparent; but the orderliness, the lucidity, the unmistakable if sometimes ponderous personal touch is still there; the six volumes are a single work.

They are also a majestic and important work. It would be reasonable if Sir Winston were now to take leave of them with something of a flourish, as Gibbon took leave of his "History." In fact he does not. The great work ends without a peroration. But then Gibbon's "History" was a life's work, Sir Winston's Memoirs are a parergon.

A Man Who Got Away

THE AGE OF SUSPICION.
By James A. Wechsler.
André Deutsch. 348 pages. 16s.

MR JAMES WECHSLER has the distinction of having escaped from two American nets—that of the Communist Party and that of Senator McCarthy. What is even more unusual he made his escapes without being swept over the weir of reaction; he is still swimming hard and effectively with the liberal stream. As editor of the *New York Post* and as a leading member of Americans for Democratic Action, he is doing his best to fill the "vacuum of the left" with an acceptable alternative to Communism.

It was the existence of that vacuum in American political life, he believes, that explained the appeal of Communism for young Americans in the prewar years and its revival in the immediate postwar years. An interesting sidelight is his account of the Communist capture of Mr Henry Wallace's campaign for the presidency in 1948, and of how at that time middle-aged men went through the same process of sympathy with Communism, turning to disillusionment, that Mr Wechsler and many of his young friends had gone through earlier.

Mr Wechsler had the advantage that when disillusionment came he was young enough and able enough to build himself new ideals and a new life. The story of how he and his wife consolidated their escape into liberalism is the most instructive part of this well-written book, although it is not this middle section, but the beginning and the end, that have aroused comment.

The beginning and the end tell a story that applies to most of the intellectuals of the nineteen-thirties who became victims of McCarthyism in the nineteen-fifties. Mr Wechsler tells of a boy who thought he had discovered in Communism the answer to economic depression and approaching war, who realised his mistake sooner than did many others and who found himself called to account, fifteen years later, by a Senator who obstinately refused to admit that Mr Wechsler had ever ceased to be a Communist, in spite of all the evidence to the contrary. It was, however, that evidence which made Mr Wechsler's case different from those of most of Mr McCarthy's victims. For the evidence was Mr Wechsler's record as an outstanding liberal journalist, who had attacked threats to freedom whether they came from the left or from the right, from the Communists or from Senator McCarthy. And it became clear in the course of the Senate Committee's examination of Mr Wechsler that Mr McCarthy's design was to intimidate one of his most outspoken critics.

To make sure that this attack on the freedom of the press would be exposed, Mr Wechsler struck a bargain with the Senator and revealed the names of those whom he had known in the Communist Party. This is something that other victims of Mr McCarthy have refused to do, even though such refusals have pulled a cloud of suspicion over the witnesses themselves. Whether or not these others did right or wrong, there can be little doubt that Mr Wechsler did right. For a refusal would have obscured the issue which, in his case, was not the liberty of a single individual, but that of the whole American press.

Mr Morrison on the Constitution

GOVERNMENT AND PARLIAMENT.
A Survey from the Inside.
By Herbert Morrison.
Oxford University Press. 363 pages. 21s.

MR HERBERT MORRISON has not hitherto enjoyed the reputation he deserves for moderation of mind and judiciousness of temperament. The teasing manner he affects in the House of Commons and the perky partisanship he so often shows in small matters have obscured the fact that of the leaders of both parties, he comes closest to having a cross-bench mind. This book will serve to enhance his reputation in this respect at least. For it is fair almost to a fault. He does not conceal the fact that he is a man of the Labour party. The reader will be left in no doubt that, in Mr Morrison's view, it is better for the country for Labour to be in office than in opposition. But he will gather it by inference, not by statement. In this book Mr Morrison is not arguing, he is describing how the system works. And in this he shows himself to be a true conservative. He loves the parliamentary system. There is very little in it—if indeed there is anything—that he would change. And if he mentions other systems of government it is only to point out their infinite inferiority. (Indeed, the iteration becomes almost tactless. If an ex-Foreign Secretary cannot find anything to commend in other people's forms of government perhaps he should not mention them at all. There is also a small error in one of these references: confirmation of the President's nominations in the United States requires only a simple, not a two-thirds majority of the Senate.)

There are not many active front-bench politicians who could command the detachment and tolerance to write a useful book about the workings of the constitution. Indeed, after reading Mr Morrison's book, one wonders whether there is any active politician at all who can really do full justice to the subject. For it is precisely the issues that are still controversial that are likely to be the most interesting, and it is on these that a man who has recently been Leader of the House of Commons, and may be again, must watch his step most carefully. For example, is party discipline overdone; is the tyranny of the Whips excessive? Mr Morrison contents himself with saying that nobody would want the indiscipline of the French Assembly—which is hardly the point. But could he safely discuss the real issue, without running the risk of having what he writes quoted against him in some future argument?

For this reason, those who search this book for striking expressions of opinion will be disappointed. Mr Morrison is very discreet. The nearest he comes to an opinion on a current controversy, curiously enough, is on the House of Lords, where he comes down quite strongly in favour of its retention, always provided that it makes no more trouble for Labour governments than it did between 1945 and 1951. In some of his other opinions—in what he calls his "Parliamentary Secretaries' Charter," for example—he is disappointingly imprecise. And in others, such as the relative roles of ministers and civil servants in making policy, some people will beg leave to doubt whether Mr Morrison has not unduly generalised from his own rather unique instance.

There are also some strange gaps even in the purely descriptive parts, where one might have hoped that Mr Morrison's experience would have illumined dark places. The section on the monarchy, for example, contains no reference to the Private Secretary. It is clear from a number of recent books, notably from Sir Harold Nicolson's life of King George V, that the Private Secretary plays an important part in the constitution. But we still know little or nothing about how he does it. What is the nature and extent of his contacts with ministers? Does he ever meet other politicians? Mr Morrison could have answered these questions. Again, in a book on "Government and Parliament," it is strange that nothing should be said about the way in which candidates are selected—another subject on which Mr Morrison must know as much as any man alive.

Perhaps the strangest omission of all is that there is nothing about politics. Legislation and administration are here—but not the endless adventure itself, the ceaseless struggle for power. Mr Morrison knows about this, too. But in the academic atmosphere of Nuffield College, he—like other political scientists—evidently thinks it improper to describe the fighting that goes on in the arena. He sets the stage, but there is no Prince—either of Denmark or of Darkness. Lord Campion is in the index; but not Mr Aneurin Bevan.

But for all this, the verdict on the book is thumbs up, not thumbs down. It was a brave venture and it has been well carried out. In the words that Mr Morrison himself uses of the ideal Cabinet paper, it is "understandable, honest, persuasive and clear." When Mr Morrison is reminiscing, when he is drawing on his long parliamentary and administrative experience, even those who think they know the workings of the constitution will find a great deal to learn. And when he comes to describe the way in which the Labour Cabinet operated, and particularly the way in which it prepared its very heavy legislative programme, he breaks into entirely new ground. There is, it is true, a great deal of "what I did." But that is justified; Mr Morrison was the hinge on which that very busy government turned, both in its administration and in its approach to Parliament. If the book has defects, the fault is, in a sense, the sponsor's rather than the author's. For it was the unaccustomed academic atmosphere of Nuffield College presumably which made him think that he had to produce something systematic and scholarly. Others can do that. Mr Morrison has done it well, but in the effort to do it at all, he has somewhat cramped the parts that only he can do. Let us hope that he has found authorship so attractive that he will go on to write his annotated parliamentary memoirs.

SUDAN DAYS AND WAYS.
By H. C. Jackson.
Macmillan. 262 pages. 18s.

JUST now, when Cairo Radio is spitting forth allegations of what Britain did to poison the life of the Sudan, and when even Sudanese have caught the habit of belittling everything done under administration by Britons, a book about the Sudan at the turn of the century is opportune. When Mr Jackson arrived there in 1907, less than ten years had passed since the end of the oppressive Dervish Empire, and only twenty-two since Gordon's death and the end of the cruel and inefficient Turco-Egyptian administration. Men still showed the dreadful scars of Turkish punishment; whole tribes almost annihilated by Egyptian slave-dealers numbered as few as forty or fifty survivors; and villagers in the south, seeing no difference between people with light skins, thought that young men fresh from Balliol, Lords and Henley had come to requisition them as slaves. As the Nuer put it to Mr Jackson: "We don't want a government of any kind. We don't want what you Turks call progress. All we want is to be left alone."

Year by year and province by province these young men restored confidence in government. They checked crop returns, passed judgments fit to be Solomon's, controlled cattle plague, and twitted tax-evaders in their good Arabic. Their secret weapon was the habit of authority, selflessly wielded, and on their second visit to some new district, trust in them was already such that they were expected to kill a lion with a .256 rifle. ("Sir, are you not an Englishman; of course you can do it with whatever gun you have.") Within a few years, the security that they organised was taken so much for granted that it is wholly undervalued today.

This book gives a good idea of what their life was like. The climate was bad; quarters were poor; government revenue was so low that convenient office equipment could not be afforded. As the book's title suggests, it is written in a conventional vocabulary; a crocodile is "the brute" and the Upper Nile province a "glorious place for the big game hunter." Yet it is agreeable to read because of its humanity, good humour and sense of a useful life well led.

> First impressions of a new country are the most lasting. I call to mind the sweltering heat in the desert, the light at sunrise and sunset, the barbaric cruelty of some of the people matched by the goodness and sympathy of others, the hostility of the natives in the south and the gratitude of the Berberines in the north for any little thing we could do for them. But more vivid than anything else will always be the remembrance of the extreme poverty of the people in those days, and the kindliness, friendliness and generosity of most of those we had come so far to help.

At present the Sudanese does not reciprocate this tolerant attitude. But he is broadminded by African standards, and some day he will do so.

A Deep Gust of the Worl

ECHOES.
By Compton Mackenzie.
Chatto & Windus. 188 pages. 10s. 6d.

IS it true that "they don't make the like that any more"? Eve generation, looking appreciatively at i veterans, has shaken its collective hea over the degeneracy of the times. Loo at the unquenchable gusto of A, th exquisite urbanity of B, the seren detachment of C, the furious energy D; who, among their effete juniors, wi be found worthy to rank with thes magnificent octogenarians? The bree is dying out. . . . And then, odd enough, the effete juniors of fifty yea ago have achieved magnificence in the turn; a new vintage has matured, as full flavoured, nutty and subtle as its pre decessors; and a new set of *laudatore temporis acti* mutters sadly that "the don't make them like that any more."

Sir Compton Mackenzie's "Echoes —a collection of twenty-eight broadcas talks, mostly in reminiscent vein— prompts these reflections all the more powerfully because its author, whose vintage quality is unmistakable, has barely entered his eighth decade and may be thankfully expected to go on maturing for a good time yet. The kind that they don't make any more can be discerned, as it were, in the making. "In seventy years"—Sir Compton quotes Sir Thomas Browne on his last page—"a man may have a deep gust of the world; know what it is, what it can afford, and what 'tis to have been a man."

Typically, this splendid affirmation is cited *à propos* that little-realised privilege of advancing years, freedom from seasickness—typically, because a "deep gust" and an affectionately astringent appreciation of the ridiculous are repeatedly blended in these wonderfully durable little ephemera. The account of Henry James—unmistakably a revered and reverend figure—ordering six jars of marmalade from the Army and Navy Stores is at once drily and outrageously funny. "The China Cockatoo in Piccadilly," perhaps the best of the lovingly savoured London reminiscences, is both a sunlit evocation of the past and an occasion for quite unsentimental anecdote. "People," "Things," "Old Snapshots," "In Praise of Cricket," are no more than anecdotal soufflés, but their lightness of texture and excellence of flavour derive from the same "gust" that gives the tributes to Cunningham Graham and Ellen Terry their moving warmth and vividness.

Enjoyment of retrospect does not mean discontent with the present. In "The Festive Spirit," in "A Passage to India," in "The Nineties," above all in "Living," Sir Compton makes it plain that despite some robust dislikes he prefers the world of today to that of yesterday, finding it kindlier, juster, and less humbug-ridden. A long memory can provide, in fact, not only entertainment but a salutary corrective to discontent.

Armchair Fairway

GOLF.
By Bernard Darwin.
Burke. 222 pages. 21s.

THIS is a notable addition to the "Pleasures of Life" series. It puts golf at par with the pleasures of food, drink, gardens and cricket. Of these there could never be question; apart from over-indulgence, no one could possibly fail to take pleasure in them. But how does infuriating and demeaning golf come to qualify as a pleasure of life? And for whom—the championship player, all nerves and ulcers, or the amateur ridiculously struggling against his years to keep his low handicap or, even more pitifully, to get one? If these are pleasures, golf must be a funny game —against which there is the sour authority of the Scottish caddie "Aweel, it's no meant to be funny."

Mr Darwin resolves the point with penetrating charm at the outset of his apologia. "We want" he says, "to return thanks for much more than the playing of golf; for the good companionship it gives in beautiful places, for the friendliness of club houses and conviviality of golfing dinners, for the traditions of old courses, for the exploration of fresh ones." To this list, all golfers would add the writings of Mr Darwin himself, for he has the magic to restore the mutilated ego, to encourage the ordinary golfer to forget his folly and go out yet again with self-respect instead of misery.

In his anthology *cum* commentary, Mr Darwin has gathered together much good writing, culled from days when golf was the game of the few and also from more recent times. His own urbane introduction and asides are as engaging as the extracts he has chosen. He is old enough to enhance for the reader the savours of past times, and young enough to share with him the excitements of the present. He is historian, technician, reporter, psychologist and good companion. He can recall the venom of "blood matches" of the last century, the subtlety to be employed fifty years ago in cajoling a clubmaker to produce the putter of one's heart, and the brusque independence of caddies of the old Scottish persuasion. The two chapters on temperament and cures are worth the price of the book to all golfers who strive to integrate their puny personalities and their clumsy physique in perfect swing, precise timing and machine-like accuracy. Few of them, alas, will succeed; but they will have enjoyed reading of the struggles of others greater than themselves.

For those who care to mix their golf with economics, there is the terrible demonstration of the ever falling value of money in a letter written by Old Tom Morris, about sixty years ago, in which he put the cost of laying out a golf course at about £200; that was indeed on austerity lines, before golf courses had become "architectooralooral" (after golf, Mr Darwin's second love is surely Dickens) but would anyone like to take on the same job today for ten times the money? At the other end of the scale is the story of Mr Charles Blair Macdonald who pumped in sand and created alps on 115 acres of marsh on Long Beach to make a golf course costing $800,000. Something of the same order of comparison, perhaps, exists between golf club subscriptions in this country and in the United States. Perhaps the golf standard would do better for the pound than the gold standard. Yet on second thoughts there would be the familiar trouble, for American productivity excels on the golf course as elsewhere. It may, after all, be better to fumble round the course in the usual British way—at least so long as Mr Darwin is ready with entertainment and tonic after another round of disaster.

Thought for Food

FOOD IN ENGLAND.
By Dorothy Hartley.
Macdonald. 676 pages. 30s.

"TAKE the umbilical cord of the calf" . . . few people will relish muggety pie if they have to do this, and Miss Hartley admits that she has not made it herself. But it was apparently a traditional dish in some parts of the country, and it is only one of the hundreds of local recipes that Miss Hartley has gathered in this enterprising and entertaining book.

It is indeed far more than a recipe book. Drawing on her historian's knowledge, Miss Hartley has interspersed her recipes with notes on fuels and fireplaces, on the economy of the country household, on feasts and famines—on almost everything pertaining to food before and after it reaches the table. The reader will learn not only all about the different joints of the cow, pig and sheep—very useful knowledge for those brought up on rationed meat—but also the origin of odd customs, such as why bread is broken at table and not bitten. The whole of this vast feast is flavoured liberally with quotations—though one looks in vain for Trollope's description of the archdeacon's stupendous breakfast in "The Warden"—and garnished with hundreds of the author's own drawings: of fish, flesh and fowl; of cooking utensils, old and new; of cheese presses and butter churns; of kitchens and bakehouses. The whole is pounded out with zest and served up most appetisingly.

Amid so much good fare, one hesitates to ask for more. But the author has dealt rather cursorily with the English tea—whether high or afternoon. This is such a peculiarly English meal that Miss Hartley might have given us more recipes for jams, cakes and scones; for instance she does not mention the north country rum butter spread on bread at teatime instead of jam. Nor, and even more surprisingly in a Yorkshire woman, does she mention the Wensleydale in her chapter on cheeses. Like everybody interested in good food, she laments the sacrifice of local farmhouse cheeses imposed by milk marketing policy. The French, one feels, would not have allowed such a national asset to disappear. Does the different attitude over here explain, or does it merely exemplify, the present decline in English cooking?

AN HISTORICAL INTRODUCTION

John Bowle

Conceived as a complement to *Western Political Thought*, the theme of the present book is the development of liberal-social-democratic political thought from the Romantic Age to the early twentieth century, the attacks made upon it by doctrines of Class War, Nationalism and Nihilism, and its later reinforcement by the beginnings of modern sociology. *May 10* 25s.

JOHN MURRAY

Mr Noel Coward's War

FUTURE INDEFINITE.
By Noel Coward.
Heinemann. 344 pages. 21s.

ANY novelist would delight in a situation so rich in possibilities, comic and other, as that treated in Mr Coward's account of his wartime activities. Take a successful, versatile, personally charming, brilliantly cosmopolitan social and theatrical celebrity; give him a full share of patriotic enthusiasm and a few promising but fragile personal wires to pull; see to it that he is above military age, but not so far as to make him quite safe from spiteful imputations; turn him loose on the eve of Armageddon; and let the story take its course. It should be a honey.

It is. Its entertainment value can be taken for granted; Mr Coward could not be dull if he tried. The episode of the Russian hotel manager and the tadpole; the telegram from Miss Rebecca West about the Nazi "black list"; dozens of thumbnail portraits sketched in five continents; even the horrid effects on Mr Coward's digestion of a motor smash in India; all are conducive to anything from appreciative chuckles to uninhibited rib-aching laughter. It is as a self-portrait, however, that "Future Indefinite" scores highest; as a character-study, executed in all honesty and with no more egotism than is—one must surmise—a necessary ingredient in the entertainer's make-up. The portraiture is not always deliberate. Mr Coward reconciling himself to the fact that he is an incurable sentimentalist about his country, confessing to emotion—grief, irritation, frank enjoyment, anger—is explicit enough. But there also constructs itself, touch by touch, a picture less consciously painted; of an individual who, gifted with an extraordinary ability to reflect and personify the values and characteristics of a particular period, finds that the *persona* built up in the public eye has become inappropriate, distasteful, not himself—but not entirely alien.

The chameleon whom some unkind experimenter put down on a piece of tartan is reported by legend to have promptly exploded. Mr Coward, who embodied so delightfully and wholeheartedly—as far as his public could see—the sparkling flippancy of the twenties and the sophisticated *gemütlichkeit* of the thirties, manages not to explode against the lurid background of the forties. But he is painfully expatriated. He works like a black—propagandist, unofficial envoy, one-man Ensa, lightening war weariness and heightening morale from Auckland to Imphal and from Cape Town to Scotland. He makes *In which We Serve.* Success faithfully attends him, the eminent appreciate him, Royalty thanks him, audiences applaud him. He remains, somehow, uneasily not "in," not orientated, uncertain of his proper rôle; a figure at once more complex and more sympathetic than one would conjecture him to realise. Perhaps, after all, in this groping for a satisfactory *persona,* for continuity between the disintegrated past and the enigmatic "future indefinite," Mr Coward embodies a prevailing mood as accurately as ever he has done in the past.

The Riddle of Swift

JONATHAN SWIFT.
By John Middleton Murry.
Cape. 508 pages. 30s.

IN his preface Mr Murry defends himself for having attempted "at once a life of Swift and a critical study of his works." But, while the book does give both these abundantly, its main concern is with neither. Mr Murry, like many before him, has been fascinated by the riddle of Swift's personality; and it is in considering this against a thoroughly mastered and vigorously delineated biographical, political and literary background that the excellence of his study consists.

How widely Mr Murry has ranged, and how profitably he has pondered, is thrown into odd relief by the index. This is simply to "the writings of Swift discussed or mentioned in the text," and affords no ready guide either to the liberally provided formal biography or to the development of Mr Murry's reading of the man. It is a reading, certainly, much more widely and securely based upon Swift's own works than has been apparent in many recent interpretations; and we are continually made aware that the highly perceptive literary critic who once predominated in Mr Murry is still vigilantly at work in the service of the present student of human nature. This is at once apparent in the attention given to Swift's early poems. These, commonly passed over as inept exercises in a moribund form, are shown to be intensely personal and very revealing. "To the Athenian Society" is the work of one who declares himself to be the enemy of censure and the modern cynical wit, more apt to praise than to blame. A year later, in the poem "Occasioned by Sir William Temple's Illness and Recovery," there is sudden and complete revolution. His affection for his patron has been slighted (or so he feels) and the Swift we are to reckon with has appeared. The change has as its first major issue, "A Tale of a Tub," which Mr Murry calls "a prolonged whoop of laughter over a dead self"; and it is continued and deepened by the failure of his courtship of Miss Jane Waring.

Here indeed was the definitive point in his life. "The proud man had humbled himself in love to a woman, and his gift of himself had been refused. He withdrew into the citadel of his pride and remained there for ever." From this everything followed—even down to that phase of "Excremental Vision" of which Mr Murry does not spare us very much. It is a coherent interpretation of a terrifying spectacle. But one feels that Swift must have been largely born what he became, and that Miss Waring would have had much to face had she married him.

Travellers' Joys

FROM AN ANTIQUE LAND. *Ancient and Modern in the Middle East.*
By Julian Huxley.
Max Parrish. 310 pages. 25s.
THE ONE REMAINS. *A report from Jerusalem.*
By Stewart Perowne.
Hodder and Stoughton. 192 pages. 20s.

FOR an odd reason, these two very different books make a good pair. Dr Huxley, in the course of two journeys in the Middle East in 1948, covers, either personally or by hearsay, nearly all its most beautiful and famous antiquities. But, strangely, he leaves out Jerusalem. His reason, no doubt, was that in 1948 it was a seat of war; even so, the omission would have been worth a word of regret. Mr Perowne fills this huge gap.

"From an Antique Land" is proof of what even lightning travel can do for an enquiring mind already furnished with scholarship and world wide experience. Dr Huxley freely admits that he saw "improbably much" in "an impossibly short time." He was Director-General of Unesco and, everywhere, archaeologists sprang out of the ground to point his way, and governments to proffer permits and transport. But he made the utmost of these advantages; and he will be the envy of many a more footsore writer for his happy gift of catching in a phrase the essence of what he saw. Baalbek gives an impression of "disciplined luxuriance"; Lebanese terracing, seen from an aeroplane, looks "like part of an enormously enlarged finger print"; the first pink view of a temple seen through the dark crack of the gorge into Petra reveals "instead of shadow, sunlight, instead of nature, art." Anyone who has seen these places must admire his way with words. This is amplified by superb colour photographs.

Another asset is the Huxley family capacity for packing in stores of unusual information. Coming from a Fellow of the Royal Society, much of this will please amateurs, from birdwatcher to anthropologist. Pelicans are spotted in the wilderness. The rift valley and Dead Sea are geologically and scientifically explained; Tyrian purple is described chemically, and historically until it is abandoned and cardinals take to cochineal; words like bible and parchment are followed to their roots.

There is not room in a book of 300 pages for comprehensive modern as well as comprehensive ancient lore, and the former suffers badly from subjection to speed and hearsay. Some comments are out of date, such as that it is impossible to stay at Petra; others were never exact, such as that Iran in 1948 had "no money" for development. But these flaws are trifles in so rich a treat.

Mr Perowne is the antithesis of Dr Huxley in that he is a resident and not a traveller. He knows the stones and speaks the language. He has not quite so great a gift with words, nor can he, while serving the Arab refugees, enter Jewish Jerusalem. A truly moving and comprehensive picture of Divided Jerusalem in all its tragedy has therefore yet to be painted. Here and there, he strikes a discordant note: who wants to be reminded of the foxhounds of mandatory days in the middle of a moving description of the crowded and pitiful frontier villages? But he makes up for this by his love for the Old City, and by his ranging knowledge of the Bible, and of writers about Palestine from Isaiah to St. Jerome and Edward Lear.

He writes at his best when he describes the work on which he is now engaged—the building of new villages for refugees with the money subscribed to the Anglican Bishop in Jerusalem. His analysis of why the refugees would not settle, of how to defeat the politician who from a limousine adjures them not to let down the Arab Cause by leaving lice-ridden caves, and of how to initiate settlement without offence to the existing inhabitants, ought to be studied by every United Nations delegate who casts a half-informed vote on their fate. For this piece of wisdom alone the book is worth a far wider circulation than that simply of a traveller's companion.

Worm's Eye View

THE ADVENTURES OF JOHN WETHERELL.
Edited by C. S. Forester.
Michael Joseph. 18s. 275 pages.

DR JOHNSON used to say that a ship was worse than a gaol because there was the added danger of drowning. The author of these memoirs certainly found it to be true, because the happiest ten years of his life were spent as a prisoner of war in Napoleonic France. Prison life, learning arithmetic, ship modelling, the violin, was a relief after the treatment he received on board one of H.M. frigates. From the day when he was pressed from the merchant service to that a year later, when HMS *Hussar* ran on the rocks, his life was one of unrelieved brutality and hardship.

It would be quite unfair to judge life at sea from his evidence alone, for such records are mere vehicles of personal rancour; but they do give a picture of conditions prevailing on board a man-o'-war very different from the politer reminiscences of officers of the Nelsonian epoch. Mr C. S. Forester, the obvious choice to introduce such a manuscript, has made some attempt to punctuate his author's rugged sentences, but he has taken his editorial duties somewhat lightly. A similar journal published last year under the title of "Landsman Hay" gives a juster and more reliable picture of life at sea.

On the other hand, the part of the book describing prison life is unique and altogether delightful. When Napoleon's regime began to collapse, the prisoners were sent out of reach of the invading armies, to wander about central France with their band playing "Begone Dull Care" to the delight of villagers bored with eternal warfare. Wherever they halted for the night "we play'd several favourite airs, and young girls and boys were hopping around the square like poppets." At last they encountered Wellington's troops marching up from the south and hailed them with a spirited rendering of "Britons Strike Home!"

European Thought in the 18th Century

This book is the companion and sequel to *The European Mind, 1680-1715.* The two works together are the best modern account of the intellectual history of Europe in the decisive century which culminated in the French Revolution, and ushered in the modern world with all the "isms" among which we live. 35s. net.

HOLLIS & CARTER

Octogenarian Essays

CATHERINE THE GREAT AND OTHER STUDIES.
By G. P. Gooch.
Longmans. 303 pages. 21s.

IT would be difficult to name anyone who has, during a long and mainly academic life, contributed more to English political and historical thought than Dr Gooch. Older than Sir Ernest Barker by one year and than Dr Trevelyan (to name only comparable Cambridge worthies) by three, he has celebrated his eightieth year by collecting and republishing two volumes of essays, mainly dealing with the European history of the eighteenth century. The central figure in each was a woman and a German—first, Maria Theresa, now Catherine the Great. Ever since his classical work on "History and Historians of the Nineteenth Century" Dr Gooch has been specially interested in the reactions of Germany to the ideas of the French Revolution—he has indeed written a book directly on the subject; and the last pages of the study that gives the title to his new volume deal with the inevitable clash between Enlightened Despotism and Enlightened Democracy. Catherine would have treated Danton and Robespierre as she treated Pugatcheff, and she went into mourning for Louis XVI; but she took the opportunity, while inciting Austria and Prussia to intervene on the Rhine, to employ her own troops in Poland.

From 1792 Dr Gooch looks back to pre-revolutionary France, and forward to post-revolutionary Prussia. The essay called "Four French Salons," reprinted from the *Contemporary Review,* deals with Mme. Geoffrin, Mme. du Deffand, Mlle. de Lespinasse, and Mme. Necker—ladies well enough known from the gossip of Walpole, Gibbon and other English travellers, but always worth restudying for the influence of their circles on the literary men and politicians who did not make, but directed, the Revolution. This is even truer, of course, of Voltaire, the subject of the next essay. "Voltaire the Historian" never ceased to be Voltaire the philosopher and satirist, the author of the *Dictionnaire philosophique* and the *Essai sur les moeurs,* and his influence had as much to do with the "ideas of '89" as Rousseau's had to do with the "facts of '92-4"; both influences to be blended in the rational-romantic mind and policy of Bonaparte.

The short concluding essay, "Bismarck's Legacy," was evidently written soon after the publication of the evidence about the negotiations with Madrid preceding the Hohenzollern candidature in 1870, and the truth about the "Ems telegram." Without defending Bismarck's sharp practice, Dr Gooch evidently thinks French policy was principally to blame for what happened.

All through these essays there is apparent the same solid learning, good judgment, and (what does not always go with them) ability to put a point clearly. It is a book of reprints; but there is evidence in the bibliographies at the end of each that Dr Gooch has kept his reading up to date. He is a model to some younger and more hasty historians:

For the Young

ENGLISH CHILDREN'S BOOKS, 1600-1900.
By Percy Muir.
Batsford. 256 pages. 42s.

THE number of children's books grows year by year; in 1953 1,590 new titles were published. Mr Muir shows us the source of this vast flow, in the puritan tracts and the chapbooks sold at fairs, and traces its course until it had become a well-established stream by the turn of the century.

By taking his survey up to 1900 Mr Muir is just able to include in it Beatrix Potter, whose early books were written—though not published—before that date, and E. Nesbit, whose families of children continue to ring true fifty years after they first appeared. In sharp contrast to the Bastables, the Fairchild family must, one feels, have been little horrors in any period. Yet the "History" of these priggish and sanctimonious children, first published in 1818, went, Mr Muir tells us, into innumerable editions throughout the century. He explains its success and that of others like it by the general scarcity of children's books. But there may be more to it than that. Death was a fairly common event in the average Victorian family, and religious beliefs were much more strictly inculcated than they are today. The ghastly piety of the Fairchilds was probably not so alien to Victorian children as it would appear to our own. Moreover, they had their defences. In one mid-Victorian family, the boys used to beg their parents to read aloud "The History of the Fairchild Family" because they secretly delighted in its effect on their susceptible elder sister, who could always be relied upon to cry before the end of the first chapter.

Perhaps the real test of a good book for children is whether their parents enjoy reading it aloud to them. By this standard most of the present huge output fails lamentably. One wonders indeed whether the banal stories which children's minds are so often fed on today are not more harmful than the pious moralisings of early Victorian authors. Being plentiful and easy to read they obscure the few excellent new books and make it less worth while for publishers to reprint the classics. A glance at Mr Muir's lists of books at the end of each chapter shows how much there is that would merit reprinting, and even the authors whose tales are best forgotten had a feeling for words that is usually lacking in the most popular authors for children today.

Mr Muir's survey is admittedly only a bird's-eye view; nor does it claim to be an original piece of research. But he has an interesting chapter on the illustration of children's books, which came into its own in the last century, and this has given the publishers a chance which they have seized to the full. Examples of the work of Tenniel, Randolph Caldecott and Kate Greenaway—to name only three of the many who excelled in this sphere—will be found among the profuse and beautiful illustrations that enliven the rather pedestrian text.

A Monument to English Craftsmanship

THE DICTIONARY OF ENGLISH FURNITURE.
Revised and enlarged by Ralph Edwards.
Country Life. Three volumes. 30 guineas.

HERE is one of those noble undertakings on the part of publishers, editors, and authoritative contributors, which result in national monuments. Exactly thirty years have elapsed since the first volume of the first edition (1924-27) appeared. Its re-appearance, much revised, should be warmly welcomed by all who appreciate English craftsmanship.

Furniture stands foremost among the domestic crafts because it is more closely allied to architecture, the design of a building wherein to house them. Percy Macquoid, who died in 1925, was largely a pioneer in the historical study of English furniture and became joint editor, with Mr Ralph Edwards, of the first edition. Only two of the ten original contributors are now living. They were associated pioneers, and to their researches among inventories, accounts and other documents and their scrutiny of constructional techniques, makers' catalogues, and books of designs, we owe the wealth of further knowledge embodied in this new edition. One of them, the late Miss Margaret Jourdain, devoted many years of a long life to research among records of a craft in which English achievement ranks high. The uninitiated need look no further than the present display of English furniture at the Victoria and Albert Museum in order to understand why this splendid facet of English culture deserves such a dictionary.

Chippendale, Hepplewhite and Sheraton tend perhaps to float vaguely in the minds of people able to associate these names with furniture, but how many know, for example, that Thomas Sheraton's fame rests solely on his published designs? There is no evidence that he ever "possessed a workshop of his own or executed the designs illustrated in his books." An economic historian might be tempted to assume that the eighteenth-century cabinet-maker's trade approximated to that of a cottage industry. In point of fact, the Industrial Revolution, even more a process of organisation than of technical invention, embraced this craft. The London firm of George Seddon employed four hundred journeymen in 1786,

> including in their ranks joiners, carvers, gilders, mirror-makers, upholsterers, workers in ormolu and locksmiths. No other cabinet-maker is known to have owned a business on so great a scale. Some idea of the size of Seddon's establishment may be gathered from the annual stocktaking in December, 1789, when carpets alone were entered at £9,069, the contents of the upholsterer's warehouse and wood in hand at £3,293 and £21,702 respectively; while the total amounts to no less than £118,926.

The illustrations to these handsomely produced volumes are lavish and sumptuous. Recent improvements in half-tone reproduction have done much for the rendering of surface textures. The coloured plates serve as reminders of the extent to which the beauties of mahogany and satinwood depend on an element lost in monochrome illustrations.

Philosophy of Couture

JUST SO FAR.
By Hardy Amies.
Collins. 256 pages. 15s.

MR HARDY AMIES, the London couturier has written a pleasant little autobiography. He is evidently modest, serious, good-hearted and unpretentious. He has great professional pride, not least in his roots in the court dress-making establishment for which his mother worked before the first world war. But he is no snob. The characters in this book are the tailors, cutters, fitters and stockroom keepers who worked with him and for him as he progressed from the house of Lachasse to his own establishment in Savile Row. It is a pity that much of this story makes such banal reading.

The most interesting chapters are those dealing with the economics of this business that is more than a trade and yet less than an art. Couturiers are chronically short of capital. To start a business of any size you need at least £30,000. You are always owed about a third of your year's turnover; a dress which may contain as much as £50 worth of material can be a month or six weeks in the making; and during January, July and August the house must run at a heavy loss while the collections are being made. You do not, says Mr Amies, become extremely rich, even if, like himself, you avoid the extravagancies that make news but not sales.

Let Paris startle the world; let New York dress for one season only. Mr Amies wants to make clothes—particularly suits—that his English ladies, and his customers abroad, will find wearable and durable. But not too durable. He is designing for an ideal woman who is constantly changing—"she has put at least three inches on her hips in the last fifteen years." She is changing, Mr Amies believes, not because the couturier decrees it but because women will it. It seems that to attract men (Mr Amies will not allow that they dress for other women) they have unconscious mass urges to have, say, flat bosoms, padded hips or rounded shoulders; and the designer's job is to find out what shape they want to be at any particular time and "interpret it artistically." It is true that the changing line of fashion over a period reflects deeper trends—even the fashions of the nineteen-twenties made sense in terms of the *Zeitgeist.* But this modest view of the couturier's role will surprise women who, as they threw away the perfectly good dress that suddenly seemed all wrong, had always thought themselves more designed against than designing.

Single-minded Woman

PORTRAIT OF JOSEPHINE BUTLER.
By A. S. G. Butler.
Faber. 222 pages. 21s.

THIS is the biography of a sensitive woman with a passion for justice, a fine brain and a pleasant aptitude for writing. It is presented through the medium of letters, reported conversation, the reminiscence of friends and the loving—sometimes too loving and therefore insufficiently ironic—memory of an admiring grandson.

The most remarkable attributes of Mrs Butler were courage and singleness of mind, and the most astonishing circumstance of her career was the forbearance of her husband. Here was a carefully nurtured lady of delicate health, born early in the last century, married to a scholarly English gentleman who was "almost the archtype of what the public schools aim at." She became the indefatigable and impassioned campaigner against the horrors of prostitution, and he became a Canon of Winchester. He supported her in what was generally considered her outrageous procedure even to the length of sacrificing his career, but the couple remained ideally united. Indeed, they must have been the most untypical of typical Victorians.

Mrs Butler ascribed prostitution to the exclusion of women from many suitable kinds of employment. But her most relentless attack was against the Contagious Diseases Act. Disregarding the censure of friends and insinuations of enemies she rampaged through Britain and Europe, lecturing, addressing conferences, witnessing before Royal Commissions, writing letters of appeal, interviewing hostile officials, buttonholing influential ministers, until gradually the opposition quailed and many of her stoutest critics became convinced supporters. She even abashed Mr Cavendish Bentinck.

Nevertheless, her goal was not achieved until many years after her death, for her ideas were in advance of her time. She advocated the raising of the age of consent above twelve years, the responsibility of both parents for bastard children, and equal laws for both sexes against soliciting. She urged the moral reclamation of fallen women, instead of punishment and moral ostracism, and she took the outcasts from brothels into her own home to end their broken lives in peace.

There can be no doubt that she was a remarkable woman, but her admirable enthusiasm did sometimes wax to fanaticism. Her fight against the compulsory examination of suspected harlots attacked a great and pitiful evil, but scarcely "the typical crime of the universe"; nor could her contemporaries accept her declamation that not only England but also Europe was in imminent danger of self-destruction by debauchery. Even the author eventually escapes from his familiar bondage and admits with an overdue concession to the comic that there must have been times "when Mr Gladstone wished she was less intense" or that "George Butler must sometimes have sighed."

Great Revivalists

A TALE OF TWO BROTHERS.
By Mabel Richmond Brailsford.
Rupert Hart-Davis. 301 pages. 16s.

MISS BRAILSFORD has chosen ground already well cultivated, but she has undersown it with another crop. She has not attempted any consecutive or complete history of the Methodist revival, but rather a study of the two Wesleys in their relationship with each other, particularly in regard to Charles's intervention which ended in separating John from Grace Murray. Hitherto John Wesley's several love affairs had blossomed and then been blighted. Miss Brailsford speaks of his having a mother fixation, which is easily said of any man who had, as Wesley had, a remarkably able mother. It may be that it was Wesley's work that was his "fixation," and that he feared that marriage would conflict with it. He had seen the unhappiness of his own home and the burden of the appallingly large families of his day—he was one of nineteen children, his mother one of twenty-five. He knew that his constant travelling forbade home life in the usual sense. On the other hand, many of his friends, including Whitfield, urged him to marry, if only to escape the attentions thrust upon him by embarrassingly enthusiastic women disciples.

Finally came the tragic affair of Grace Murray, a widow of thirty-three who had devotedly nursed Wesley through illness, and with whom Wesley was undoubtedly in love. But his vacillation and the bitter opposition of his brother succeeded in throwing Grace into the arms of John Bennet, one of Wesley's helpers, and he, on the rebound, made a disastrous marriage with the widow Mrs. Vazeille. Miss Brailsford gives a sympathetic and well-balanced judgment of the whole tangle.

There are a few slips. Methodist ministers still "migrate," but not necessarily triennially now. The hymn which is said to celebrate the conversion of the brothers was "Where shall my wondering soul begin?" not that given by Miss Brailsford. One may think that the reference to the early Methodist chapels as "repellent Houses of God set up in the shadow of the ancient Norman churches" is somewhat less than fair. It suggests a rivalry which Wesley, stout Churchman to his dying day, would never have tolerated. Moreover the ugliness was not part of the "curse" left by Puritanism, but the fact that the poorest gave of their poverty, and the meanest building meant a sacrifice.

The eighteenth century has been called a bankrupt century. One must thank Miss Brailsford for this renewed reminder that a century that produced the personality and preaching of John Wesley, the hymns of Charles Wesley and the revival, which more than anything else saved England from revolution, paid a dividend. As Augustine Birrell said of John Wesley

> You cannot cut him out of our national life. No single figure influenced so many minds, no single voice touched so many hearts. No other man did such a life work for England.

The France of Louis XIV

AN INTRODUCTION TO SEVENTEENTH CENTURY FRANCE.
By John Lough.
Longmans. 314 pages. 21s.

THE need for an informed account in English of the society and institutions of France in a period that witnessed the rounding off of the frontiers, the creation of Versailles and the flowering of the French classical genius has long been felt. Professor Lough insists that his book is only an introduction, intended for those who "approach seventeenth century France through the great works of its literature." But it fulfils more than this modest ambition and should attract a wider audience. Two-thirds of the book is devoted to the political and social structure of France. The final section, the fruit of Mr Lough's own research, is a lively discussion of the effects of the social climate upon the literature of the period, together with some interesting evidence on the social status and earnings of writers.

The historical chapters are not merely a summary of existing knowledge. The treatment of political history and foreign policy is perhaps conventional, but the social analysis is shrewd and distinguished by telling quotations. In particular, Mr Lough has a far more thorough knowledge of the literary sources than have most historians, and he uses this most effectively. He treats of Versailles not by giving a conventional description of court life but by using contemporary letters to show how an extravagant nobility, unable to squeeze more from the peasantry, was forced to jostle and beg for the patronage of the state. The financial and social weaknesses of the French state lay in an inequitable system of taxation. The reports of the intendants, cited extensively by Mr Lough, show clearly why the century was punctuated by peasant revolts. Resort to the sale of offices resulted in an inflated bureaucracy and a haemorrhage of capital from trade. French society was caste-ridden, but the wealth of the tax-farmers and office-holders overcame aristocratic scruples. The marriages of indebted nobles to bourgeois heiresses give Mr Lough the opportunity for telling some charming stories.

Mr Cyril Connolly in *Horizon* once enquired of a selection of writers what they considered a reasonable income. Mr Lough's researches explode the myth that the France of Louis XIV provided either security or ease for its writers. Since there was no copyright, publishers paid very little; illiteracy severely restricted the market; state patronage was undiscriminating and private patrons uncertain. Richelieu was a genuine patron of the arts, but Louis XIV paid for little but eulogies, and the pension lists shrank rapidly before the demands of war. Although the writers were mostly of middle-class origin, they were highly orthodox in their acceptance of the social prejudices of the Court. Indeed the rigid social hierarchy was mirrored even in their vocabulary, for whole classes of words were eliminated from the accepted literary language because of their middle and lower class associations. Mr Lough is to be congratulated upon a stimulating book, its value enhanced by the admirable illustrations and marred only by the surprising lack of an index.

Spain Revisited

THE SPANISH TEMPER.
By V. S. Pritchett.
Chatto and Windus. 219 pages. 15s.

MR PRITCHETT lived in Spain in the twenties, knew it in the thirties and has revisited it in the fifties. His aptly titled, exquisitely written book begins as if it was going to be a traveller's tale of his postwar visits, but by the second page this pedestrian idea is abandoned; either defeated or inspired, certainly intoxicated, by his new encounter, he is at grips with the polemical spirit and generalising as freely as any native of the country of "all or nothing"—*todo o nada.* Mr Pritchett knows as well as anyone that he is exposing himself to attack; Spain is the finest of battlefields on which to deploy that classic gamesmanship gambit for travellers' talk: "Yes, but not in the south." But his readers will bless him for his boldness. Its result is a book as sparkling as the best of that Andalusian conversation which it praises.

In the Talgo train to Madrid, Mr Pritchett's real fellow travellers are not dry Gallegos and ridiculous Brazilians, but Sancho Panza, Loyola and Ortega y Gasset. His thought plays backward and forward in time between Moorish Granada and General Franco's hopes of American aid. He is repetitive to an extent that would be irritating if the eye were not always charmed by the restless liveliness of his words. Politics, architecture, religion, and rural economics serve him in turn as new approaches to the theme he cannot and will not break away from—the Spanish character and, more precisely, the character of Castile. Against the bleak background of this "bare, military country, frugal and hard" he builds up the familiar but never more vivid picture of an anarchic, insulated, austere and uneconomic people, which to him is not so much non-European as anti-European.

> . . . Spain is the old and necessary enemy of the West. . . . All the hungers of life are blankly stated there.

In the Escorial, "its appearance as of an infantry regiment drawn up in stone in the mountains," Mr Pritchett sees the symbol of all the attempts ever made to grip Spain's natural anarchism in a hand of iron authority. And, recalling how Philip II forbade Spaniards to study abroad because contact with foreigners was inherently dangerous, he adds the shrewd comment that to Spaniards this restriction seemed "positive, progressive and the very expression of Spanish enlightenment," an assertion of the superiority of the Spanish way of life. King Philip's point of view is still upheld today—and at both ends of Europe.

EYRE & SPOTTISWOODE

Self-Effacing Revolutionary

CARNOT, 1753-1823.
By S. J. Watson.
The Bodley Head. 223 pages. 18s.

LAZARE CARNOT figures in most histories of the French Revolution and Napoleon as a member of the Legislative Assembly in 1791, as the man who recommended arming the defenders of Paris with pikes, as the military expert on the Committee of Public Safety who reorganised the republican armies and was the "architect" of their victories in 1793-94, as Bonaparte's supporter in the Directory, as the almost solitary opponent of his assumption of Life Consulship and Empire in 1802-04, and as his Minister of the Interior in 1815. Yet he is little known to French historians, except by his *Correspondance* (and that only covers the years 1792-95), the two partial *Mémoires* of his son Hippolyte, and the recent life by Reinhard; he has never yet found an English biographer. Here, then, was Mr Watson's opportunity. How has he used it?

He has conscientiously covered the ground, especially the military history, piecing together the printed material, and making use of Jomini, Phipps, and some other expert studies; and he leaves the reader with the conviction that Carnot was not only a skilful engineer and organiser, but also a strong-minded patriot, who broke both with the Revolution and Napoleon when national interests seemed to be threatened by the ambitions of dictatorship; risking his career, and perhaps his life, for a principle to which most of his contemporaries paid lip service. Unfortunately Mr Watson has too little understanding of the complicated history of the Revolution to be always a safe guide. Apart from a few mis-spellings and his classing together of Santerre, Simon, and Hébert as "the Ne'er-do-wells," he misunderstands the September massacres, the *armée révolutionnaire*, the Hébertists, Robespierre, and Sieyès' part in Brumaire; nor is he quite at home with the Constitution of 1799 or the politics of the Directory. This makes it doubtful whether the last word has been said either on Carnot's responsibility for the terrorist policy of the Committee of Public Safety (though full weight may be given to his evidence at the trial of Billaud and Collot) or on his relations with Bonaparte in 1796-97 (Mr Watson seems to underrate both his original opposition to Bonaparte's plans and his subsequent championship of them). On the other hand we are given frequent and important extracts from the *Correspondance* and *Mémoires* illustrating Carnot's opinions about nationalism, dictatorship and education; analyses of his writings (though the system of fortification expounded in the *Traité de la défense des places fortes* may still puzzle a layman); and neatly translated examples of his occasional verse. Thus the personality of Carnot emerges pretty clearly from the complicated and sometimes rather confused background, and we follow him with increasing respect into exile and retirement.

It is too easily forgotten that Carnot was an older man (already 36 when the Revolution began) than most of those he worked with, and made his way without any advantages of birth, favour or showmanship. He was a silent self-effacing worker, but also a convinced revolutionary and republican, who did not scruple to vote for the death of Louis XVI any more than he shrank from inscribing his solitary *Non* against Bonaparte's Life Consulship; both decisions sprang from the same conviction that "it is less difficult to establish a republic without anarchy than a monarchy without despotism." History has in the long run confirmed this judgment, and with it the greatness of the man who backed it with the devotion of a lifetime.

Raking Over the Ashes

THE ASHES CROWN THE YEAR.
By J. H. Fingleton.
Collins. 320 pages. 16s.

THE 1953 Test Match series against Australia was one of the happiest, one of the most exciting, and one of the least skilful on record. On the various grounds and on television it was watched by more people than ever before, and if the flow of runs often slowed to a trickle, the torrent of written and broadcast comment never ceased to gush forth in unprecedented volume, alternately uplifting and tormenting the hearts of the cricketing faithful.

To this torrent Mr Fingleton contributed, as an Australian journalist covering the tour. Now, after returning home to think about it all for a while, he has delivered himself of a book—and a very good book it is, from a cricketer's point of view. A critic's job, says Mr Fingleton, is to "describe, analyse and, where necessary, criticise." The author is unusually well qualified to do all these things, having himself played a great deal of Test cricket for Australia before the war. This, combined with his journalistic training and his very real understanding and love of the game, gives him a considerable edge over most of his journalistic colleagues. His descriptions of the Tests, and of the tour generally, are fair and accurate; his analyses are sound and often highly illuminating; his criticism, when it comes, is free from shrillness or partisanship and one feels that he makes it only when it is in the interests of the game to do so.

If Mr Fingleton's command of English were as outstanding as his command of cricket, he would indeed be a paragon among cricket writers. His book consists partly of a diary written during the tour, and partly of reflections written considerably later; but, as no attempt is made to separate the two, the reader is apt to find himself wondering whether the author's undoubted cricket wisdom is being displayed before, during or after the event. The style, too, is often clumsy and is by no means free from such blemishes as mixed metaphors, misquotations and grammatical mistakes.

Apart, however, from those who have been brought up exclusively on the works of the "masters-of-English-prose" school of cricket writers, there will be few enthusiasts who will regard these reservations as important or even relevant. And, as the book is likely to be read exclusively by cricket enthusiasts, it would perhaps be wiser to recommend it wholeheartedly and without any reservations at all.

The English Village

THE SECRET PEOPLE.
By E. W. Martin.
Phoenix House. 319 pages. 21s.

THIS is "an account of English village people, their lives, work and development" since 1750. The book is simply constructed with successive chapters on squire, parson, farmer, labourer, gamekeeper and poacher, rural industries, education, and so on. Nevertheless it is not a book for beginners. Plainly the author has a deep knowledge of the literature of the countryside, and he quotes extensively and interestingly from a wide range of sources. Unfortunately he does not elucidate his subject matter, and each chapter is an unresolved discussion with no clear continuity or conclusion. Part of the difficulty lies in the style, which is sometimes wordy and involved although there are many felicitous passages. But the basic obscurity arises from the fact that the author himself has not yet found a thread to guide him through the labyrinth of his subject.

Although discursive in method, Mr Martin's real strength lies in his intuition. He is keenly and intuitively aware of the cultural decline of the countryside, due to the break-up of rural society under the impact of agrarian and industrial revolution. In particular he deplores the disappearance of the peasant-craftsman, less for his economic than for his spiritual worth. In this he follows H. J. Massingham, but without fanaticism and with more sense and persuasiveness. He sees hope in village colleges, in better parsons, in small industries, but above all in a state-assisted peasantry.

Mr Martin is at his best in writing about people. Some of his portraits are excellent, especially those of the parsons: Charles Kingsley and F. W. Tuckwell, the reformers; R. S. Hawker of Morwenstow with his tame pig; Sydney Smith, the wit—all virile and true friends of the countryman, in an age when friendship was often inexpedient. He writes well, too, of William Cobbett, Arthur Young and Joseph Arch. It is here that he shows real sympathy and understanding. The book is handsomely produced, with good print and illustrations, although the jacket is prettily misleading. The photographs of Victorian farm-life are excellent, likewise the line drawings and tail-pieces. There is a bibliography, and J. W. Robertson Scott, venerable founder of *The Countryman*, has written a foreword.

EDWARD ARNOLD

Eccentric Traveller

THE TORRINGTON DIARIES. Edited and introduced by C. Bruyn Andrews and abridged by Fanny Andrews.
Eyre and Spottiswoode. 535 pages. 30s.

THE Honourable John Byng was born in 1743, the second son of the fourth Viscount Torrington. He succeeded to the title on the death of his brother in 1812, but died a few weeks later. His wife bore him at least thirteen children, but she seems to have shared none of his tastes. The truth is that Byng did not really care for female company; and when Mrs Byng, an irritating frivol, set out with him in her carriage, he deposited her at one of the fashionable "spaws" as soon as he decently could, and rode off alone, or with one or two gentlemen who liked him well enough to fall in with his eccentricities. But his friends seldom stayed the whole course. This is scarcely surprising, for it required a thick skin as well as a tough physique to ride in the Colonel's "Cavalry"; after jogging along breakfastless, you might find yourself facing an irritated peer upon whom your intrepid leader had called uninvited. For Byng was a sort of a "National Trustee" born before his time; he was driven by an insatiable curiosity to inspect other men's possessions—a curiosity only equalled by the lack of restraint with which he criticised them.

His dislikes were catholic. He disliked what he called "Venetian" architecture—a distaste possibly due to his childhood visits to palladian Mereworth; he scorned the attempts to improve nature's scenery made by the Duke of Devonshire, Lord Lyttelton, the poet Shenstone, and the noted landscape gardeners they employed. He felt happier in the presence of ruins, new or old—though he grumbled at a cell or grotto which did not provide the tourist with comfortable seats; and he dismissed the great Norman pillars of Gloucester Cathedral as "gouty."

But he was no modernist. Unlike Miss Fiennes, who had toured England a hundred years earlier, and who appreciated the industrial revolution of the sixteen-nineties, Byng mistrusted both the agricultural and industrial revolutions of the seventeen-nineties. He is no "fellow-traveller" with Arthur Young—indeed it is typical of his contradictory nature that he accuses English land-owners of the absenteeism that Young deplores in France; while he bitterly complains of the up-to-date agricultural methods that many of them initiated and personally supervised.

To his grouses about turnpikes, the growth of towns, tree-felling and, in fact, changes of any kind, Byng's riding companions no doubt became inured; and they probably agreed with his frequent criticisms of contemporary parsons and church services. Mr Bryant's introduction rightly praises him as a "character"; and despite Byng's crusty prejudices, his diaries vividly describe places and people as he saw them. But what would Lord Acton have thought of a diarist who barely noticed the American and French Revolutions?

This collection of the many journals written by John Byng, amassed with such pertinacity by the late Mr Bruyn Andrews and his daughter, deserves to be popular enough to go into another edition; in that case, the publishers, who are to be congratulated on their enterprise in producing a single volume edition of the journals, might consider using a type and paper that make for more comfortable reading.

Mexican Journey

TEMPLES OF THE SUN AND MOON
A Mexican Journey.
By Michael Swan.
Jonathan Cape. 288 pages. 21s.

MR SWAN has an excellent tale to tell. He is young enough to travel rough and old enough not to boast about it. Indeed, one of the minor charms of this book is the wry humour with which he decorates his uncomfortable encounters with bad food and lodging, rickety buses and truculent mules. While giving himself to Mexico with infectious enthusiasm, he remains implacably honest about such unappetising things as *tortillas*. He is equally honest about his own objectives. A tour originally intended to end in the north-west of Mexico, in Southern California, was brusquely reshaped as soon as he had been warned that the north-west was overrun by tourists and the Californian peninsula an arid waste. Turning back from Mexico City, Mr Swan plunged happily eastwards into the forest country of which he had already seen the fringes, and his journey resolved itself into a pilgrimage to such Maya and Maya-Toltec sites as Palenque and Chichen Itza. Of these fantastic places he writes vividly and without pedantic pretensions (most readers will be grateful for the potted accounts of Mexican history and art, with special reference to Yucatan, which he includes as appendices).

But the best of the book is its series of glimpses of more or less obscure places in southern Mexico. Unashamedly using his hesitant Spanish, making the most of every chance of a little contact with the people of these towns and jungle villages, willing to change his plans whenever an intriguing diversion presented itself, Mr Swan has collected a rich haul of anecdote and characterisation. He saw at close quarters the cruel streak that survives in Mexican life, and scenes of degradation, fanaticism, and ugly erotic fierceness. But it is the smiling moments that linger in the memory, the kindness of the poor, the rural *fiestas*, and the touches of quiet humour.

To a lively narrative Mr Swan adds two bonuses: thirty pages on his characteristically unplanned detour into British Honduras, which shed some interesting light on a subject more topical now than at the time of his visit; and some thirty-five photographs, which complete an exceptionally well produced book.

Capitalist Realism

EXECUTIVE SUITE.
By Cameron Hawley.
Hammond and Hammond. 304 pages. 12s. 6d.

THIS novel has a certain curiosity value because it is about businessmen by one. It is some years since Mr Luce's magazine *Fortune* first drew attention to the tradition that decrees that in American fiction the businessman is generally depicted as a bloodsucker, a bully or a bore; but it cannot be recorded that since then American professional novelists have noticeably mended their manners towards the boss. Their unkindest attentions, perhaps, have since been directed towards advertising executives, Hollywood producers, radio sponsors and even, be it said, towards the publishers of news magazines; but most of them keep a spare snook to cock at any stray captain of industry. In Britain Mr Balchin continues to explore the emotional inadequacies of Managerial Man, and Mr Scott follows the new careerists up the technocratic ladder, but the attention is still clinical, if a little more sympathetic.

It seems, therefore, that professional novelists cannot or will not think themselves into the boardroom. Mr Hawley has, however, set out to rehabilitate the businessman as hero, and this book is the crude but interesting result.

Mr Hawley has taken what might, but for the prejudices of novelists, be a stock situation of the contemporary novel—the problem of succession in a business. His novel opens with the collapse and death of a dominating industrialist, and describes the manoeuvres of his associates to obtain the presidency of the company. This is an adequate frame for a novel, and as contrasting types, if hardly as human beings in the round, the characters are credible; moreover, the incidentals of this tale of what makes the boss work, the appurtenances of a way of living rather unlike any outside America, are themselves of interest to a European. It is true that the book resembles nothing so much as those painstaking essays in Socialist Realism with which Soviet novelists fulfil the directive to glorify a cement-mixer; and that it seldom exceeds the level of, say, the *Saturday Evening Post* and translation into celluloid—but that presumably was its aim.

In demonstrating to the professionals that business is a whole new environment awaiting the understanding pen, Mr Hawley may partly have proved his point. But the businessman in action, the man taking risks and making decisions, still awaits a novelist. At this level, few modern novelists have ever essayed the character—except, on occasion, Dreiser, and oddly enough, in one glancing sketch, Scott Fitzgerald. "The Last Tycoon" was a novel of Hollywood, where business is half art and a quarter exaggeration; but the film producer Stahr caught something of the essential quality of the American businessman, the part that deserves writing about, that hardly any other novelist has ever set down on paper.

Within the Ring

SCHOOLMASTER'S HARVEST.
By J. H. Simpson.
Faber. 224 pages. 18s.

THAT Mr Simpson has a nice sense of humour is shown by the first chapter of his book—a most entertaining account of his own preparatory school days in the nineties. It is the more the pity that he has not allowed this humour to overflow into the subsequent chapters, which, full though they are of humanity and good sense, could do with a little sparkle.

The impression left by Mr Simpson's fifty years' experience is reassuring. Most of it was spent within the public school system, at Rugby, Gresham's, back to Rugby, followed by Rendcomb, and finally as the head of a teachers' training college. He had only the briefest excursion into the state school system, in the days when its prestige was very low. Nevertheless, even within the public school ring, Mr Simpson shows not only how far the good orthodox public school has travelled since the beginning of the century, but how much unorthodoxy could march under the same umbrella. Gresham's in 1908 and Rendcomb in the nineteen-twenties were astonishingly different in atmosphere from the conventional public school, but sufficiently in touch to make the blood-relationship admissible. English education has been extraordinarily fortunate in the influence of its experimenters. Perhaps the greatest debt that the English owe to their public schools is this vigorous tradition of independence that has permitted the newcomers to graft fresh ideas on to the existing system. In the fifty years covered by Mr Simpson's experience the change has been remarkable. No doubt some of the less satisfactory public schools still ape the traditions of forty years ago—the cult of athleticism, the authoritarian aloofness of masters and prefects, the narrowing influence of rigid taboos—but broadly speaking the change of atmosphere has been remarkable.

Not all of this transformation can be attributed to the more experimental schools, important though their influence was. The political climate has also forced a change of attitude. The lesson of Mr Simpson's book is how well orthodoxy can adapt itself, and how high are the standards of education presented by the home of privilege.

Potted Palmerston

LORD PALMERSTON.
By W. Baring Pemberton.
Batchworth Press. 375 pages. 25s.

PALMERSTON was a member of every government from 1807 to 1865, except those of Peel and Derby; he was foreign secretary for more than fifteen years, prime minister for nearly ten; and died, in office, two days before his eighty-first birthday. Un-Victorian in his habits, save in his passion for hard work, he dominated the first third of the Queen's reign. His gay manners are as well known as his lack of punctuality; but behind the celebrated jauntiness lay the gravity of a statesman and his judg-

ment on foreign affairs was—for a time—as sound as any man's in Europe. By slaving at his papers, he mastered the details of his problems; and for principles of action he relied on a buoyant confidence in his country and himself.

Mr Pemberton has succumbed to the fascination of Palmerston, and has written an agreeable short life which holds closely to the main printed sources. The compression has been skilfully done; room has been found for many insertions based on wide reading in the treasure-house of early Victorian biographies; and the characters in the story are brought alive by good writing and a score of excellent illustrations.

There is much in Palmerston's career that retains a permanent interest, for the principles on which foreign policy ought to be conducted vary much less than do the circumstances of relations between the powers. Moreover, some of the comments recorded in this book are by no means devoid of topical interest (not least when another patriot of Palmerstonian eminence is approaching his eighty-first year). This remark of Palmerston's in 1839 may serve as an example:

> Russia does not, I believe, wish to go to war with us, but is always trying to push on just to the extreme point of encroachment and aggression to which she may be allowed to go without war. She then halts to take breath and waits till people are looking another way to make another step or two forward.

Indecisive History

THE DECISIVE BATTLES OF THE WESTERN WORLD. Volume I.
By Major-General J. F. C. Fuller.
Eyre and Spottiswoode. 616 pages. 30s.

MAJOR-GENERAL FULLER has planned a trilogy. It has a grandiose title: "The Decisive Battles of the Western World and their Influence on History." His theme is imperialism, his first hero Alexander. The first volume is dominated by the rise and fall of the Roman and Byzantine empires. The second, apparently, will be linked to the "emergence" of the British Empire. The third will lead up to "the supreme political event" that "has still to appear." The battleground shifts from the Mediterranean basin to the shores of the Atlantic. After Waterloo the world is the field. The romantic is left wondering what comes next. Perhaps a new imperialism in space?

The first volume, the only one yet published, begins in 1479 BC with the battle of Megiddo, the battle that Allenby and his staff studied in 1918, and ends in AD 1571 with the battle of Lepanto, when as all Chestertonians know Don John of Austria rode to war. Not content with selecting and describing many of the innumerable battles and campaigns fought in these three thousand years, Major-General Fuller has tried to weigh their influence on political, social and economic history. Gibbon is added to Fortescue, with Western Europe as the theme.

Paring the complex tissues of history to the bone, Major-General Fuller tags on his generalisations to his battle pieces. But his skeleton is not articulated. At the worst the reader can expect such sentences as these:

> Had the north-eastern frontier rested on the Elbe, instead of on the Rhine, the next chapter in this book could not have been written, and because of it every other chapter would have been different. . . .
>
> Had Italy never been invaded; had the battle of Taganae never been fought; and had the Ostrogoths continued to rule in Italy, medieval history would have been different. . . .

The standard is often higher than this. And if Major-General Fuller had left well alone and forgotten all about influences on history he would have written a popular account of important, but dimly remembered, military campaigns. That story by itself is worth telling; if the reader acts as his own censor Major-General Fuller has told it.

Ocean Racing

PASSAGE EAST.
By Carleton Mitchell.
John Murray. 248 pages. 21s.

TAKING part in a sailing race across the Atlantic, according to Mr Mitchell, is really neither a technical feat nor an adventure in the classic sense; but any armchair reader would find it difficult to choose apter words to summarise such a 3,000-mile voyage in a vessel no longer than Threadneedle Street is wide. Nine men, two professional sailors and seven "amateurs"—if that is the right word for such yachtsmen, one of whom was crossing the Atlantic by sail for the third time in twelve months—made up the crew.

The trip from New England to old took a month, including a few days between races at Bermuda. Mr Mitchell's *Caribbee* finished the course first of the five competitors in twenty-one days; but the smallest yacht, just over half the *Caribbee's* size, reaching Plymouth four and a half days later, won on handicap this eleventh trans-Atlantic race since 1866, the fastest crossing having been made nearly half a century ago. Altogether, perhaps as *many* people have crossed the Atlantic for pleasure by sail during this century of steam as Europeans have crossed Arabia by motor car in the age of the camel.

Although Atlantic crossings under sail are by no means unusual, books are still surprisingly often written about them. This one has the usual accounts of complaints about calms, difficulties with chafing gear, friction on food problems and bright remarks about other members of the crew; but there is little about storms simply because there was not one during the race. For the fanatical yachtsman there is little of specialised detail of sails and stores; for the general reader the paraphrase of the ship's log is broken up by slices of knowledge about sea and wind, the abyss and currents. Now and then Mr Mitchell throws a fine sentence worthy of either Rachel Carson or Henry de Monfreid. But like most other yachting writers, he forgets in an idealistic haze about past navigators that their crews came more often by press gang than for romance. Ocean sailing, whether racing or not, is, as Mr Mitchell says, an almost infallible escape from boredom; the escape would be less certain without canned food, radio direction finding, the auxiliary engine and that extraordinary combination of aerodynamic knowledge and practical seamanship that makes the modern ocean racing yachts capable of surviving most gales and keeping going in almost flat calms. Those were the very real turbulations in the historic era of the sailing ship.

Italy Without the Mandoline

MANZONI. (*Studies in Modern European Literature and Thought.*)
By Bernard Wall.
Bowes and Bowes. 64 pages. 6s.

THIS little volume works out at about a penny a page; yet it is well worth buying by anyone who wants to know whether or not to read Italy's one great nineteenth century novel "The Betrothed," to use the English title given by Mr Archibald Colquhoun in his recent translation. The author, Mr Bernard Wall, belongs to that small band of studious Englishmen, unbyronic, unshelleyan in their affection and study of things Italian. In their company people travel farther and better in Italy than ever before.

This wisp of a book is an introduction to Manzoni's work. It describes his poetry and his only novel. Mr Wall finds the characters and the setting of this novel richer and more interesting than anything he has read in Walter Scott, with whom Manzoni was once fleetingly compared—by Edgar Allan Poe. He finds Manzoni a realist such as would please the present impatient age; also he finds the great book (which took its author nearly twenty years to write and re-write) inspired by a "Virgilian sense of faith and reverence and *pietas*, by nature linked up with the seasonal round of labour."

This sentence shows how concentrated Mr Wall's writing is; it also reveals what he especially likes about "I Promessi Sposi." "Manzoni's novel is only understandable," he writes,

> if we can view Italians as ordinary people, whose problems are very similar to those of ordinary people in other countries; if we can imagine Italy without the mandoline.

And again;

> We are only just recovering today from the romantic vision of Italy, thanks partly to the very unromantic experience that hundreds of thousands of common soldiers had of that country during the war, and partly to the new Italian novel and cinema.

At the end of Mr Colquhoun's edition of "The Betrothed" there is a brief essay that gives a more detached and speculative picture of Manzoni's mental activities. Mr Colquhoun's essay raised several questions. This one achieves something else, which is to send the reader out in search of a copy of this long neglected novel.

TURKEY

The Westward Course

CELAL BAYAR is again to be President of Turkey and the Democrat Party which he helped to found eight years ago is launched upon a second four-year term of office. In 1950 the Democrats were an unknown quantity; they were swept into power not because of anything they had said or done, but because the Turkish elector was determined to enjoy the novel sensation of turning out the men in power. This month the elections were equally free. But the voters decided not to indulge again in the pleasure of putting down the mighty from their seats; they evidently thought they were on to a good thing and they intended to hang on to it. The People's Republican Party (PRP) can fairly claim that owing to the workings of the electoral law its 30 seats do not properly reflect its voting strength; nevertheless, it is also true that its share of the popular vote suffered a substantial decline.

In the election campaign no basic issues of principle divided the contending parties. Both the Democrat Party and its principal opponent, the PRP, are determined to preserve Atatürk's reforms and to develop their country along western lines (although they may differ as to whether constitutional changes are necessary to achieve this purpose). Both have firmly set their faces against any revival of religious reaction. Both are firmly committed to a foreign policy based on active membership of the United Nations, of Nato and of the Balkan Pact. The issue of state versus private enterprise which bulked so large in the 1950 elections is now more apparent than real; in effect, both parties accept a judicious mixture of both.

It is perhaps this lack of anything really solid for the politicians to get their teeth into that makes Turkish politics sometimes so bitter and so personal. Yet as far as the ordinary voter is concerned it is unlikely that any issue of principle would have seriously distracted his attention from what touched him most nearly—the outstanding increase in the country's material prosperity since 1948, and especially over the last four years.

ELECTION RESULTS

	May, 1950		May, 1954	
	Seats	Percentage of Votes	Seats	Percentage of Votes
Democratic Party.....	408	53·6	504	63.0
People's Rep. Party....	69	40·0	30	35·0
Nation Party.....	1	3·0	...	...
Rep. Nation Party	...	...	5	1·5
Independents.....	9	3·3	2	0·5
National Uplift Party ..	...	0·1	...	...
Total.....	487	100	541	100

Turkish statistics are still in their infancy, but according to a reliable estimate the national income rose from TL8,998 million (at current prices) in 1948 to 8,771 million in 1950 and to nearly 12,000 million in 1953. This is equivalent to a *per caput* increase between 1950 and 1953 of 21 per cent measured in constant prices. The concrete and visible results of this expansion are to be seen most clearly in the countryside. By a variety of means (described in an article on page 4) an outstanding increase in agricultural production, particularly of wheat and cotton, has been achieved, and the farmer finds himself with more money in his pocket than he has ever had before. More and better roads and more radio sets are breaking down the centuries-old isolation of his village; while electrification and better water supplies are adding to its amenities.

These results would certainly not have been achieved—at any rate not nearly so quickly—without generous foreign aid. In particular, by the end of last year, in addition to military aid, Turkey had received from the United States $277.5 million in economic aid and about $6 million in technical aid; and loans from the World Bank amounted to over $60 million. Yet it is fair to add that the Turks are determined, as far as they can, to pull themselves up by their own bootstraps. And fundamentally the Democrats have gone about this in the right way: above all they have realised the importance of more investment in agriculture, and in industry of encouraging private enterprise.

Where the Turks have gone wrong is in failing to plan and co-ordinate their investments and in trying to do too much too fast, thereby encouraging inflationary forces and piling up a formidable trade deficit. It is true that most economic planning

in Turkey will tend to be rather a hit-and-miss affair until the present grave dearth of trained and experienced administrators can be made good. But at least there is no need, especially for a government with such a huge majority, to let politics intrude into economic planning as the Democrats have sometimes appeared to do.

The Opposition has no doubt exaggerated the extent to which political opportunism has influenced economic planning. They have also made the most of the rising cost of living. But the election results seem to show that inflation has not yet become a burning issue ; if it is causing serious trouble to the townspeople, it does not yet seem to have made much impact on the villagers, who form 80 per cent of the electorate. All the same, inflation is clearly becoming a serious problem for Turkey ; and although the government has to some extent been the victim of circumstances beyond its control—such as the post-Korean rise in world prices and the need to devote sums equal to half of the budget to defence—yet its over-ambitious policies must bear their fair share of the blame. The central budget has been running at a loss. The method of financing the wheat subsidy and the considerable stockpiling of cereals have both increased the inflationary pressures. There has been a tremendous expansion of credit, especially for agriculture ; in 1951 bank credit increased by 32 per cent, and in 1952 by a further 46 per cent. This has been part of a large increase in the currency supply ; according to an index compiled by the International Monetary Fund, by the end of 1952 this was 62 per cent above the 1949 level.

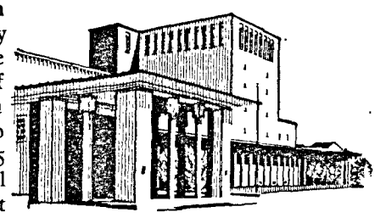
In the current financial year the government is planning for a balanced budget. But otherwise it has not made much effort to deal with an inflationary tendency that can hardly fail to grow worse if present policies are continued, especially as the growing trade deficit has made drastic import restrictions imperative. However, now that the elections are safely over the Democrats may steel themselves to deal with the situation—to scale down their over-liberal distribution of agricultural credits, especially the proposed new ones for farm-buildings ; to raise the bank rate (which has remained at 3 per cent since February, 1951) as a prelude to a tighter credit policy ; and to put into temporary cold storage some of their more ambitious projects, such as some of their irrigation schemes. They may even find the courage to reduce the agricultural subsidies a little and to tax at least the richer farmers who at present get off practically scot-free as far as taxation is concerned.

Credits for tractors and the price of wheat are the kind of topic that is most anxiously discussed in the village coffeehouses. This is inevitable ; but the question of constitutional reform is also important. During the election campaign the Opposition parties did their best to keep this in the public eye—obviously not without ulterior motives. They proposed a second Chamber, a constitutional court and a new electoral law providing for single-member constituencies. Under the present constitution (which was drawn up during a period of revolutionary change when a strong hand was essential) a great deal of power is placed in the hands of the ruling party. With no second Chamber and

no constitutional court, with a President elected from the ranks of the majority party and with a judiciary nominally independent, but in fact vulnerable to government pressure, the only effective check on the government is a strong opposition in the Grand National Assembly. And this is just what the present electoral law tends to prevent ; it allows a party with only a small lead to romp away with the representation of an entire province.

By western standards the arguments for constitutional reform are strong, and by any standards it is a pity that the voice of the Opposition in parliament should be as weak as it now is. But there is a good deal to be said for the Democrats' argument that Turkey is not yet ready for constitutional change, that it cannot afford the luxury of a parliament on the French or Italian model, and that it is better to have some ill-judged and hasty legislation rather than frequent deadlocks and delays. Their argument assumes that the Turkish citizens' rights and liberties can be safely entrusted to the care of the Democrat Party. Opposition politicians, of course, would hotly deny this ; but on the whole it is probably fair to say that the assumption is justified. It is true that the government has sometimes been guilty of distinctly high-handed behaviour ; in particular, its confiscation of the PRP's assets only a few months before the elections is hard to justify—as many of its own supporters felt. But the administration of the new Press Law, which the Opposition maintained was designed to stifle free speech, has on the whole been fair and restrained. And most impartial observers agree that the government was amply justified in suppressing the reactionary right-wing Nation Party last year.

Indeed, the possible danger to Atatürk's Republic from this right-wing reaction forms the chief argument against constitutional change. It is probably true that the major division in Turkey today is never ventilated in parliament, or on the hustings or in the press ; it is the division between those who want the country to continue its present liberal westward course and those who have never become reconciled to the Atatürk reforms. But it is becoming abundantly clear that the latter are fighting a losing battle. The government responsible for suppressing the reactionary Nation Party has just been given an overwhelming vote of confidence. And the Republican Nation Party (RNP) which rose out of the ashes of the Nation Party a few months ago only received 1.5 per cent of all votes ; although it stood on a liberal platform, most people were firmly convinced that it was in fact reactionary in its aims.



Now that a tide of material prosperity is slowly flooding the countryside those who want to turn the clock back in Turkey could hope for some success only if religious intolerance were to create serious discontent and frustration. But the present government has clearly demonstrated that it has no quarrel with religion as such ; on the contrary, new mosques, built at the expense of the state, are a common sight in many towns. A regime which provides both new tractors and new mosques is unlikely to be seriously threatened in Turkey.

Allies and Soldiers

FOR Turkey foreign policy is a matter of clear choices, simple methods and resolute mien. Russia is still the main enemy. Russia's friends are Turkey's enemies and those who stand up to Russia are Turkey's friends. Where the issue is in doubt, as in neighbouring Persia, Turkey is calm and cautious. Friends must be powerful, efficient and reliable—and preferably able to give credit. At the moment the roll of favour is the United States, Britain, Western Germany, France, Greece, Jugoslavia. The Arab states come low because they seem to offer as allies neither military power, nor administrative efficiency, nor that self-confidence that is so strong in the Turks themselves.

That Turkey should think of itself as a European and not as a Middle Eastern power is part of the western reorientation that has been going on for thirty years. It recognises that it has a political and strategical function to perform in the Middle East, which is to provide a buffer between Russia and a divided, backward region of the world where Europe and America have great interests. But it will do that job as a European power acting first and foremost through its alliance with the Atlantic powers. Turkey struggled hard to join Nato for just this reason ; it felt itself to be the hinge not only between two worlds and two civilisations, but also between a hemisphere tightly organised for defence and a region where conflicting interests made an effective defence organisation impossible. It is a sign of realism in the men of Ankara that they preferred the role of a small power in Nato to that of a big power in the Middle East. So Nato comes first ; and it is difficult to imagine a change in Russian policy so radical that it could tempt Turkey back to neutrality. Turkey's economic future, too, depends on aid and co-operation from the West.

Next to Nato comes the Balkan pact, the grouping with the neighbours Greece and Jugoslavia. The pattern is complicated by the fact that Greece—like Turkey—is a member of Nato whereas Jugoslavia is not, and is not likely to be. But there is a common strategic interest to make up for this. If these three nations act together, their power of defence is immensely greater. Jugoslavia guards one approach to Greece ; and Greece guards the European flank of Turkey. With the three standing together there is just a chance of holding Thrace against a Soviet-Bulgarian attack and of maintaining for the Nato powers an area between the enemy and the sea deep enough to make possible the reinforcement of these allies. It is doubtful whether the Turks—whatever the others may think—have more than military hopes of the Balkan pact, for they have only one foot in the Balkans.

The latest addition to Turkey's allies is Pakistan, with whom a pact was signed seven weeks ago. This does not mean that Turkey favours or would hope to lead a grouping of Moslem powers. The heirs of Mustapha Kemal's revolution are the last men to base foreign alliances on religious sympathies. But it does mean that they are interested in Mr Dulles's idea of a northern tier of Middle East states that would do something together to resist the expansion of Russian influence towards India. Behind the pact lies the hope that in time Iraq, Syria and Persia may seek membership ; but it is not thought of as an alternative to a proper Middle East defence organisation under American and British leadership or sponsorship.

Interested in neither neutrality nor Third Force ideas, Turkey none the less takes seriously the duties arising out of its membership of international organisations. It is proud of the record of its contingent in Korea, where its soldiers had their first taste of modern warfare for thirty years. It is perhaps less proud of its association with such bodies as the OEEC and the EPU, whose techniques and principles call for greater experience and skill in economic matters than the Turkish statesman and civil servant can normally command.

One quarter of the total divisions claimed by Nato is provided by Turkey. These 22 infantry divisions, 3 cavalry divisions, 3 armoured brigades, and the nascent air and naval forces that support them, make an annual claim equal to about half the national budget. This burden is in no way resented or deplored. Indeed, any suggestion that the Turkish army should be reduced—as the Greek army is about to be—would be greeted with scepticism, if not incredulity. The gravity of the economic burden is recognised ; but it is argued that security comes first, that Turkey's strongest claim to respect lies in its military strength, and that national service in the ranks gives young men a technical and general education.

There are three weaknesses in the Turkish forces that modernisation is trying to remedy. The first is lack of experience of modern warfare. Some observers maintain that their infantry tactics and their use of supporting arms are out-of-date, and that their undoubted capacity for defensive action is not matched by an ability to take the offensive against modern forces. Others—notably American advisers—will maintain that Turkish military methods are under regular Nato inspection and are being brought up to the best western standards. The fact remains that conservatism is strong in the officer corps.

The second weakness is the lack of cadres for training. Too often the conscript in his second year is teaching the conscript in his first year. Turkey needs a small regular army around which to group its hundreds of thousands of peasant footsoldiers ; but political resistance to any revival of the power of the janissaries is too strong to allow the idea even to be discussed.

The third weakness is the dependence of Turkish forces on weapons from abroad. Until Turkish industry can do more for its forces, costly foreign equipment—and costly maintenance of it—will have to be begged or borrowed or bought. The effectiveness of Turkey's forces must depend in wartime on the Mediterranean supply routes.

Of the reputation of these forces there is no doubt. Some good judges consider the Turkish infantrymen the most dogged and most reliable soldiers in free Europe. They are also by the standards of Nato the easiest and cheapest to maintain in the field. Unfortunately, the more they are modernised and mechanised, the more they will cost. Further progress along present lines can be maintained only if American aid is indefinitely continued and if Turkey can tolerate a growing claim on its real resources.

The Boom in the Countryside

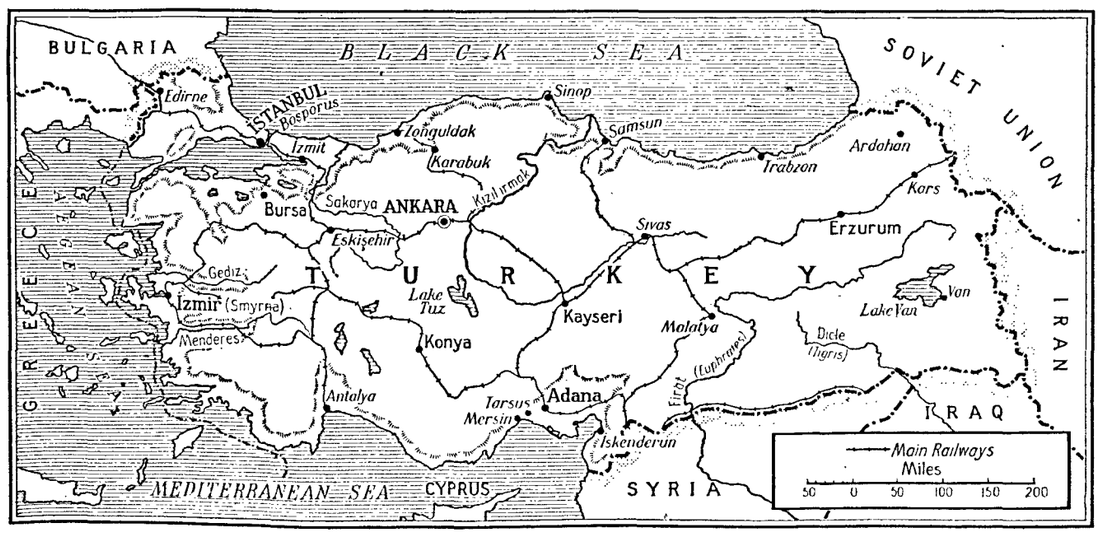
IN the streets of Ankara there are always plenty of country people mingling with the more prosaically dressed office workers and civil servants ; and in most government offices the man at the door is a sturdy countryman who has clearly not long left his Anatolian farm. This encroachment of the country on the capital is natural ; for 80 per cent of the people of Turkey are peasant farmers. It is in their hands above all that the economic future of the country rests ; and the most formidable task confronting the men behind the desks in Ankara's smart new government offices is to provide the country people with the equipment, the knowledge and the incentives needed to turn them from subsistence farmers, employing the most primitive techniques, into modern farmers anxious to get the most out of their land because they have markets for their produce and a growing appetite for the amenities of life.

There is no doubt that an impressive start has been made with this task. Since 1948 the area under cultivation has increased by at least 40 per cent and an outstanding increase in agricultural production has been achieved, especially over the last three years. Last year total cereal production alone amounted to over 14,000 tons, more than double the prewar average ; and Turkey, which used to import cereals, has become the fourth largest wheat exporting country in the world. It has achieved this by a mixture of good luck and good management. The good luck has come in the exceptionally good weather over the last three years ; according to one crude estimate this has been responsible for one-third of the agricultural expansion. The good management has been shown in a variety of government measures, many of which have been greatly helped by American aid—guaranteed high prices, easier credits, imports of farm machinery, irrigation works, more and better roads, the dissemination of seeds, fertilisers and technical knowledge. It would be misleading to single out any of these measures as much more important than any of the others. Turkey's agricultural stagnation has been blown away not by a single whirlwind but by steady breezes from several different quarters.

If a choice between measures must be made, perhaps the policy of subsidising cereal prices, originally introduced in 1938, has given the largest single fillip to production. Between 1948 and 1952 the prices paid by the official purchasing organisation, the Toprak Office, rose steadily ; in particular between 1951 and 1952 the basic price paid for wheat was stepped up quite sharply—from 28.8 kurus per kilo to 30.3. This wheat subsidy has played a vitally important part in supporting the market, especially in the last two years when export prices have been falling ; it has made the farmer feel that it is well worth his while to produce more, and it has given him confidence that he will go on getting high prices for his produce. This is the overriding justification of a policy which on other grounds can be criticised for its inflationary effect. But however open to criticism the agricultural subsidies may be, it is fairly clear that to remove them, or even to reduce them steeply, might bring the country's agricultural expansion grinding to a halt. In any case it is unlikely that any political party would consider it politically possible to do anything drastic about them.

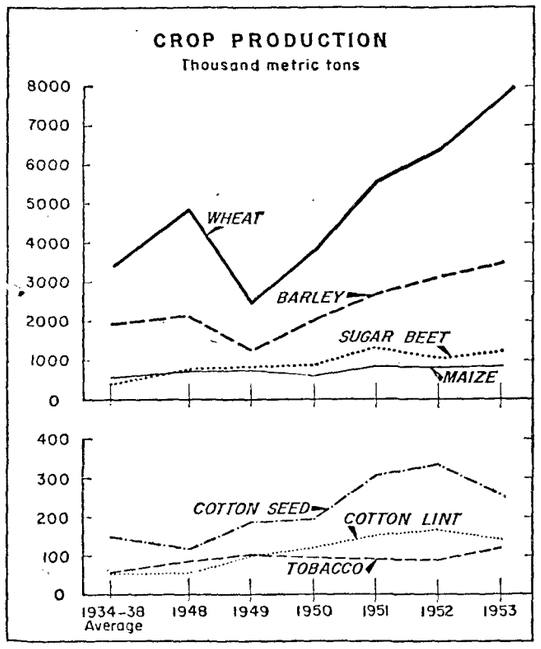
The huge increase in the credits extended by the Agricultural Bank has also played an important part in the agricultural revival. At the end of 1948 the credits outstanding to the bank amounted to TL242 million ; at the end of 1950 to 412 million ; at the end of 1952 to 1,068 million.* This liberal extension of credit has also not been without its inflationary effects, but without it the Turkish farmer could never have obtained the implements, the improved seed and all the other things that he had to have if he was to make progress. Some of these credits have, it is true, gone astray ; they have been spent on badly needed stoves, suits and suchlike things. Of course, a suit improves a man's morale and a stove his comfort and the Turkish farmer would have been more than human if he had not sometimes succumbed to this temptation.

* The Turkish lira (100 kurus) is officially valued at 7.8 to the pound sterling.

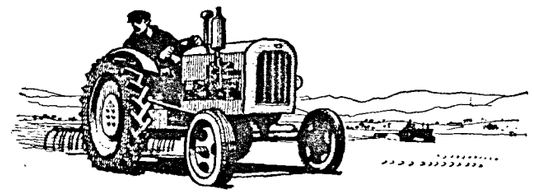


The bank, which has over 400 agencies and branches throughout Turkey, as well as over 800 credit co-operatives, does what it can to keep a check on the use of its credits. In some cases this is feasible ; the long-term (6-8 year) improvement credits are given by instalments, and the man who is being helped in this way, say, to irrigate his orchard, must, in theory at least, show some practical progress before he receives each successive instalment. But it is not easy to supervise the use made of the short-term production credits which, together with other short-term credits, make up by far the greater part of the bank's credit activities. This excessive concentration on short-term credits, which the farmer often has difficulty in repaying and which do not really go far to build up his permanent productive capacity, has perhaps been the major weakness in the bank's activity. But it is a weakness that has been recognised and is now being gradually overcome ; whereas in 1948 96.4 per cent of the bank's credits were short-term, in 1953 the proportion had dropped to 76.7 per cent. There has also been an encouraging increase in the proportion of credits paid when they fall due ; this rose from 40-45 per cent in 1947-8 to 84 per cent in 1952.

The most spectacular increase in agricultural credits has been in medium-term (4-6 year) credits for the purchase of tractors and other agricultural machinery. This increase in mechanisation has played an important part in increasing both the area under cultivation and the productivity of the land. But perhaps mechanisation could have achieved even more if the glamour of the tractor had not tended to distract attention from the farmer's more basic needs. In 1948 Turkey had less than 2,000 tractors ; today it has over 35,000, of which about 7,500 have been brought in under Marshall Aid. This great influx of tractors has become the symbol of the country's agricultural renaissance. But it is a somewhat misleading symbol. Tractors are a boon to those blessed with many acres, provided of course they know how to mend them when they break down. But in Turkey those



with large farms, except in certain regions like the Adana plain, are few and far between ; only one-tenth of the farmers have more than ten hectares ; over two-thirds have less than five hectares. Many of the tractors imported into Turkey, therefore, in spite of all the efforts of the Agricultural Bank, have not been adequately utilised, either because the farm to which they belong is too small, or because the farmer has failed to buy the necessary equipment such as ploughs and seeders to go with the tractor. It is not uncommon to find a tractor, perhaps with a trailer hitched on behind, being used purely as a means of transport. In theory the formation of machinery co-operatives should provide an answer to this problem. In practice, however, this does not work, because the independent Turkish farmer, like his British counterpart, prefers to go his own way and



is either unable or unwilling to fall in with co-operative arrangements.

But the arrival of the tractor in the Turkish countryside has not done away with the small farmer's more basic mechanical needs. There is, for instance, a long way to go before the primitive wooden plough is replaced by even a simple iron plough ; there are nearly 2 million of the former still in use, and 900,000 of the latter. Again, a great advance could be achieved by substituting simple animal-drawn drills for the old method of ploughing in broadcast seed. These drills both reduce the amount of seed required and make it much easier for the farmer to get his sowing done on time ; but only about 6 per cent of the 1953 small grain crop was seeded by grain drills.

No amount of mechanical equipment, however, will help the Turkish farmer if he remains ignorant of modern farming techniques. It is not enough to provide him with an iron plough ; he must be taught the use of fertilisers and persuaded that it would be to his advantage to introduce a fodder crop into his traditional crop rotation of one year wheat and one year fallow. It is not enough to provide him with a grain-drill ; he must have good seed and if he lives in, say, the drier parts of the Anatolian plain he must have a variety that can stand up to prolonged drought. It is not enough to give him the benefits of a regular water supply ; he must be taught the different techniques that are needed with irrigated land or else he will be caught dry-farming right beside his new stream.

A good beginning has been made with this immense task of adapting modern agricultural techniques to the widely dissimilar regions of Turkey (which range from the arid Anatolian plateau to the lush Mediterranean coastal plain and the hill valleys of the eastern provinces) and of transmitting this knowledge to the men on the land. In over half of the country's 64 provinces there are extension offices which keep in close touch with the farmers and provide them with free fertilisers and improved seeds which they can try out for themselves. There are a number of agricultural research stations which try to devise the best type of seed and the best methods of cultivation for each particular region. In 1952, for instance, the research station near

Ankara was responsible for 800 experimental fields scattered throughout Central Anatolia in which improved seeds and methods of cultivation were demonstrated, so that the conservative Anatolian farmer could see their advantages with his own eyes; last year the number of these fields was increased to 2,000.

It is easy enough—and true enough—to say that in spite of generous American aid and their own energetic efforts, the Turks have not got very far with the task of modernising their agriculture and educating their farmers. In particular, they have scarcely even begun to modernise their livestock farming, which, as they themselves recognise and as an article on page 10 shows, could become an even more valuable and steady source of foreign exchange than their surplus cereals. But it must be remembered that the task is a vast one and that in agriculture as in every other field Turkey is gravely handicapped by its lack of trained technicians. Thanks to American technical aid a stream of young Turks are going to the United States to receive every conceivable form of agricultural training. Unlike most of the peoples farther to the east they come back with a real urge to build up a great country. But it will take time for the fruits of their training to be visible in the Turkish countryside, just as it will take more than a few years to begin to satisfy the need for modern equipment, fertilisers and all the rest. What is really surprising is not the magnitude of the task ahead, but the amount that has been achieved, with so comparatively little, in so short a time.

Roads for the Villages

ANYONE who has flown over the high plateaux of western Asia has had an impression of busy roadlessness. Beginning in Bulgaria and lasting until Pakistan there is a tract of country in which land is to all appearances tilled by unseen hands. Villages are too small and mud-coloured to be visible from 10,000 feet, and there is no discernible way in which man or plough travelled from stable to furrow. This is still the impression given by most of Anatolia, but there are more roads there today than six years ago.

The Turks approach their road-building with the zeal of crusaders. They have, moreover, received substantial American aid in the form of both mechanical equipment and technical advice. In 1948, when the present programme was begun, there were rather less than 44,000 kilometres of Turkish roads including barely passable tracks. When the programme is eventually completed—no one quite knows when—there will be a total of about 200,000 kilometres of roads in Turkey—about 24,000 of "national highways," 26,000 of provincial roads and 150,000 of village roads.

The greatest effort so far has naturally been concentrated on the network of national highways. Expenditure on these (exclusive of American aid) has steadily risen—from TL28,861,000 in 1948 to 61,879,000 in 1950 and to an estimated 150,000,000 in 1953. By far the greater part of the national network actually exists today in a more or less serviceable form. But by the end of last year only about one-sixth had reached the official standards set for surface, width and gradient; while a further 5,500 kilometres had been improved to "tolerable" standards.

The Turks are building their roads for use and not for show. They are not interested in constructing a few spectacular *autobahnen*, but in linking as many places as possible, as quickly as possible, by safe and serviceable roads; and if this means that the motorist's life is made miserable by occasional potholes and ubiquitous clouds of stifling dust, then he must just put up with it. In general a Turkish road must prove its worth by the volume of traffic it carries before it can graduate to the luxury of a macadamised surface. But whatever their surface, the greater part of the Turkish national highways are now being adequately maintained; three-quarters of them are getting mechanised maintenance.

Last year the improvement of provincial roads made a big step forward; but a great deal remains to be done and even more so in the case of the village roads. The value of the progress so far achieved, however, can be judged by the impressive increase in freight and passenger traffic carried on Turkish roads. Freight transport, which in 1949 amounted to 620 million ton-kilometres, rose to 1,166 million in 1951 and to an estimated 1,500 million in 1953; while the number of passenger-kilometres travelled increased from 1,229 million in 1949 to 4,670 million in 1951 and 6,370 million in 1952. The greatest handicap to further rapid progress is not so much lack of mechanical equipment as lack of trained personnel of all kinds, and particularly of trained engineers.

New Chapter for Industry

BY western standards the greater part of Turkish industry is still in its infancy, and still having its fair share of teething troubles. But it is beginning to grow up and in the long run its future prospects look bright. On the whole, these lie not in foreign markets—the Turks cherish few, if any, illusions about that—but in meeting the growing and insatiable demands of the domestic market for consumer goods of all kinds, from radio sets to electric light bulbs, from textiles to pots and pans.

The present agricultural boom, in fact, is providing Turkish industry with the most powerful stimulus and the greatest opportunity it has ever had. And it has not failed to respond; the share of industry, including mining and construction work, in the increase in the national income rose from 13 per cent in 1952 to 28 per cent in 1953. There is, it is true, a gloomy side to this picture: there is the large trade deficit, to which the imports of capital goods for industrial development have made a formidable contribution. Above all there is the shortage of workers, especially—in spite of the enterprising development of technical education—of trained workers. According to the 1950 census, only 6.3 per cent of the population were then engaged in manufacturing, mining and utilities; since 1950 the number has gone up by roughly 7.5 per cent. It is not that the Turks cannot turn themselves into good industrial workers; it is just that on the whole they do not want to. The girls in traditional peasant dress who tend the most up-to-date textile machinery do their work well enough; but many of them will not stay on the job. Sooner or later they will take up their savings and their traps and walk back

OTTOMAN BANK

(Incorporated in Turkey with Limited Liability.)

FOUNDED 1863

PAID-UP CAPITAL - £5,000,000

The Bank offers its services and the benefit of the experience of nearly a century to those having, or contemplating, business with TURKEY, where it maintains the following branches :—

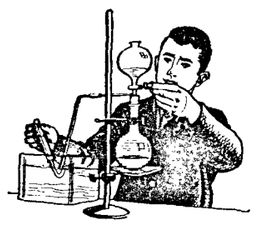
to their villages. It is true that in some of Turkey's most important industries, such as tobacco and dried fruit, seasonal labour does not come amiss ; but obviously in many factories a high labour turnover causes low productivity and greatly complicates the task of the management.

One answer to the problem is to disperse industries, especially light industries, as widely as possible throughout the countryside. Another is to make life in the factory so attractive that the countryman will want to stick to it. This has always been the policy of the Sümer Bank, which is responsible for most of the state industries ; indeed, in the past it has sometimes gone too far and provided housing, hot meals and other welfare amenities with reckless disregard for cost. But most private manufacturers have not the capital to put into such non-productive investments. Moreover, a great many workers are simply not interested in good houses and hot meals ; they are interested only in amassing as much hard cash as they can before returning to their village. Fundamentally, of course, what is needed is a change of attitude by the Turkish peasant ; and although over-population in the villages and shortage of land are gradually pushing him into making this change, the process can be only a slow one. Meanwhile, the Turks can at least congratulate themselves that they have not to grapple with the social and political problems posed by the sudden growth of a large urban proletariat. Ankara is not cursed with the city mobs of Cairo or Teheran.



The development of Turkish industry during the last few years has been a combined effort by both state and private industry. When the Democrats first came to power in 1950 a major item in their programme was the abandonment of the *étatiste* economic policies pursued by their predecessors and a new deal for private enterprise. (*Etatisme* had not eliminated the private investor but was Atatürk's far-sighted answer to Turkey's lack of capital for investment in industry. The trouble was that the private investor had come off badly in competition with the privileged state industries.) The Democrats were even rash enough to promise to transfer existing state industries to private hands ; it is now widely recognised, however, that in spite of the undoubted weaknesses of many state industries, this would have been an unwise step even had it been practicable. But the Democrats' first four-year term in office has at any rate seen the private Turkish industrialist beginning to play a much more important role.

It has been estimated that last year, when private investments made during 1951 and 1952 were beginning to bear fruit, the increase in output was greater in the private than in the state sector. Although the increase was modest, it is encouraging. There is no industrial tradition in Turkey ; there is a grave shortage of both entrepreneurial skill and private capital. There is no equity capital market, and a study group which, at the suggestion of the Industrial Development Bank, recently investigated the possibility of establishing one in order to assist in the financing of private industry, has held out no hope of any rapid development in this direction. To a people whose forebears suffered the confiscations of the Ottoman Empire and who may themselves have been hard hit by the notorious Capital Levy of 1942 it still seems foolhardy to advertise and expose one's wealth by investing it in bonds and shares. The notion is alien to many far more sophisticated rural communities. In 1950, moreover, many people assumed that few of those with money to invest would put it into industry when commerce and building promised much quicker and higher returns and allowed the money to remain under the investor's control. This assumption has not proved entirely incorrect ; all the same, the private investor in Turkey has gone far to confound those gloomy prophets who in 1950 maintained that the government, in putting its money on him, was making a bad bet.

It is, however, hard to estimate exactly how large a part the private sector has played in the industrial expansion of recent years. No comprehensive indices of industrial production exist ; those published include only a limited number of private firms. But the activities of the Industrial Development Bank give some idea of the directions in which private industry is developing. This bank was set up in 1950, with capital provided from private sources, from the World Bank and from Marshall Aid funds, with the object of making it easier to set up private industries primarily to meet the growing domestic demand for consumer goods of all kinds. Each loan approved by the bank covers about half the investment cost of the project concerned ; and the total value of the loans approved up to the end of last year was over TL100,500,000. The largest volume (over TL42 million) went into textiles, the second largest (21,650,000) into stone, earthenware, cement, glass and ceramics and the third largest (17,870,000) into food and food products.

Private enterprise has not had enough capital to risk in heavy industry. The Karabük iron and steel works, which, like almost all the state-owned manufacturing industries, is controlled by the Sümer Bank, is responsible for by far the greater part of Turkey's iron and steel products. Nor has the state yet had to face much serious competition from private enterprise in the mining industry. The state-owned Eti Bank is responsible for the whole of Turkey's production of coal, copper and sulphur, for 90 to 95 per cent of the iron ore production and 70 to 75 per cent of the lignite.

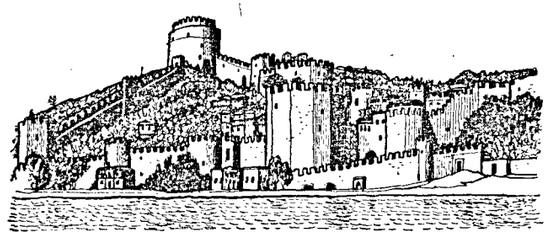
(*Source :* Eti Bank.)

Only in the mining of chromium, Turkey's most valuable mineral export, does the bank play second fiddle to private enterprise, which is responsible for at least 70 per cent of production. But after a period of steady expansion in most of its enterprises, which has been financed partly from its own resources and partly from substantial American aid, the Eti Bank is preparing to rest on its laurels and lend a hand to its potential rivals in private industry.

What opportunities does this development of industry and mining offer to foreign capital? The state mineral research institute (MTA) hopes to complete the first broad geological survey of the whole of Turkey by the end of next year. The results of its researches, which used to be treated as strictly confidential, are now open to all, and requests by private individuals for permission to develop mineral resources are now treated on the same footing as those of the Eti Bank. The recently enacted Petroleum Law, which gives foreign firms the right to prospect for and exploit oil in Turkey, has been drawn up on sound and progressive lines, in the realistic belief that the state possesses neither the financial nor the technical resources to extend its own activity in this field much beyond the small oilfields that it already operates in south-eastern Turkey.

It is still too early to say whether either the Petroleum Law or the Law for the Encouragement of Foreign Investment passed last January will succeed in attracting to Turkey the foreign capital that it needs. There is a great deal of leeway to be made up because of foreigners' memories of the ruthless expropriations of Atatürk. The Foreign Investment Law is a tremendous improvement on a previous law passed in 1951 which allowed only 10 per cent of profits to be exported and offered the foreign investor hopelessly inadequate inducements. The new law recognises that the latter must be wooed if he is to be persuaded to put his money into foreign countries; it puts no limit on the net profits that can be exported, gives foreign investors the right to export profits and capital if their concern should be liquidated and allows them to employ foreign specialists and technicians on satisfactory terms.

It is probably safe to say that investment in Turkish industry seems to be a good proposition for any foreign firm that is prepared to wait for a return on its money and to put up with the inconveniences and irritations inevitably caused by the inexperience of Turkish administrators. In the long run the foreign firm which is prepared to import capital and build a factory for, say, the manufacture of chemical fertilisers inside Turkey will probably do better than the firm that sticks to the less imaginative course of importing fertilisers manufactured in its home country. Few people in Turkey today, however, are suffering from the illusion that foreign firms are queueing up eagerly to break into the home market. It is realised that, seen from the outside, various snags, such as Turkey's shortage of industrial manpower and its large trade deficit, with all the dislocations that they cause, loom a good deal larger than the country's huge potentialities for economic expansion. And understanding is the first step towards a remedy.



Turkey's Trade Troubles

UNFORTUNATELY—but understandably—to many outside observers the trade deficit bulks so large that it obscures almost everything else in the rapidly developing Turkish economy. In fact in ordinary circumstances trade is less vital to Turkey than it is to many other countries, such as Britain; even last year foreign trade was only 23 per cent of the national income. If the Turks had been content to jog along in their old ways they could have kept their economy pretty well self-balancing. But they want to develop their potentially very rich country and improve their standards of living as quickly as they can. It is this that has caused them to run up so many bills; for they have not been able to build up exports of the quality and quantity that are necessary if they are to develop their country quickly without getting into debt.

In 1951, Turkey's trade deficit rose to about TL247 million; and in 1952 it soared still further to about 540 million. In September, 1952, the government was forced to abandon its trade liberalisation programme, and this, combined with an increase in exports, brought last year's deficit down to the still formidable figure of about 382 million. Turkey's trade troubles are largely concentrated in the European Payments Union; with the rest of the world it has a surplus. Its original quota of 50 million EPU units of account was used up long ago, in August, 1951; and at the end of last February its net cumulative deficit, taking into account the special resources granted by the United States, was 172.8 million EPU units of account; current debts are settled 100 per cent in gold.

Capital equipment and materials have played the major part in piling up this deficit. Imports of non-essential consumer goods have also helped, but their importance is often exaggerated. Between 1951 and 1952, when the deficit made its most spectacular leap upwards, imports of machinery rose almost twice as steeply as imports of manufactured goods. In 1952 investment goods and raw materials accounted for 68.25 per cent of imports and consumer goods for 20.18 per cent; in 1953 the comparable figures were 67.15 per cent and 19.68 per cent.

In the past the important Turkish exports have been limited to certain minerals, particularly chrome, and certain agricultural products, particularly dried fruits and tobacco. But the boom in the countryside during recent years gave rise to the hope that other surpluses, especially of wheat and cotton, would play a large part in solving Turkey's foreign trade problem. These hopes have been only partially realised. Sales of wheat and cotton have, indeed, risen

sharply; wheat exports, which in 1948 (a good year) were nil, rose to nearly 450,000 tons in 1952 and to about 587,000 tons in 1953; while cotton exports rose from about 72,000 tons in 1952 to about 100,000 tons in 1953. But in spite of these increases, the usual bugbears of the Turkish export trade—high prices, poor quality and lack of standardisation—have tended to blight the hopes held out by increased production.

In particular, the story of the 1953 wheat surplus has not been an altogether happy one. The amount has turned out to be about a million tons smaller than was at first estimated. Its value as an earner of foreign exchange (and this is true of most agricultural exports) has suffered considerably from the fall in world prices. Turkish wheat has not, in any case, found a ready market abroad because of its poor quality and high price. And the Turkish authorities have not always been very clever about marketing it, which is not surprising since the Toprak Office, the agency responsible, has only slight experience of the ways of the international wheat market. As a result of all these handicaps, Turkish wheat has either been sold at a price considerably below that paid to the farmer (the loss to the Toprak Office has been about 10 kurus a kilo) or else it has been disposed of in unsatisfactory barter deals with Spain, Jugoslavia and other countries outside the EPU area.

The Turks tend to excuse their trade deficit by maintaining stoutly that they must either import or stagnate. This is true enough, but it is an argument that can be carried too far, and in Turkey this has been done. The country is earning a bad name among its trading partners. Bad blood is being created on both sides and both sides are feeling increasingly frustrated. The Turks are genuinely, if rather ingenuously, outraged at the unwillingness of foreign countries to buy their wheat; there is a feeling that Turkey's friends and allies ought to be willing to help it through a bad patch even if this does mean buying wheat that is not as clean as it might be. British, German and other exporters, on the other hand, are becoming more and more indignant at their inability to get payment for their goods, for even though Turkey is a partner in the EPU, debts are contracted in good faith by Turkish importers only to find that the Central Bank simply has not got the foreign currency to meet them. It is small comfort to the foreign exporters to be told that the Turkish importer has paid on the nail for their goods, and that only the unfortunate fact that the Central Bank lacks foreign exchange prevents them from getting payment in their own currency. And they are not amused when they complain to an official in Ankara that their payment is up to 12 months overdue, and receive the uncompromising answer that they will just have to wait—for anything from four to seven years.

Manufacturing firms inside Turkey that are anxious to modernise and expand their plant to meet the growing domestic demand are now in a fix because they cannot obtain the necessary equipment from abroad. For the government, alarmed at the way things are going, is becoming ever more tight fisted with its import licences; while foreign firms, especially British ones, are sometimes reluctant

to take up even those that are issued. This earns them a bad mark from the Turks, but they can hardly be blamed if they do not want to burn fingers already singed in the Turkish market. (The larger German firms, however, are determined to go on exporting to Turkey, whatever the unpaid bills, in order to keep a foot in the market.)

In this situation the Turkish economy is bound to suffer. Yet in the long run, provided it can get over its present difficulties, its prospects are good. In spite of all the development of the last five or six years, Turkey has only scratched the surface of its wealth and has only begun to make the best use of what it produces. When, for instance, the extensive programme for the provision of grain storage, handling and cleaning facilities and equipment has been completed, Turkish wheat will appear to much greater advantage in the world wheat market. Cotton production tripled between 1948 and 1952; with a wider use of improved techniques, with more fertilisers and more irrigation, the further expansion of production could be even more impressive.

The livestock industry is at present the Cinderella of Turkish agriculture; its possibilities as a source of foreign exchange have barely been explored. At present some livestock is exported on the hoof, but the meat-processing plants now planned and under construction in various parts of the country will at first only be able to produce for domestic consumption because of the poor quality and weight of the animals. But if the production of barley and fodder crops could be stepped up (and plans to do this are being laid) and the quality of the livestock improved, Turkey could in time build up a flourishing export industry in canned meat products to neighbouring Mediterranean and Arab countries which are now poorly supplied with meat products.

In short, given reasonable luck with the weather, the time and the wherewithal to develop its resources and experience in marketing them (and the government seems ready to

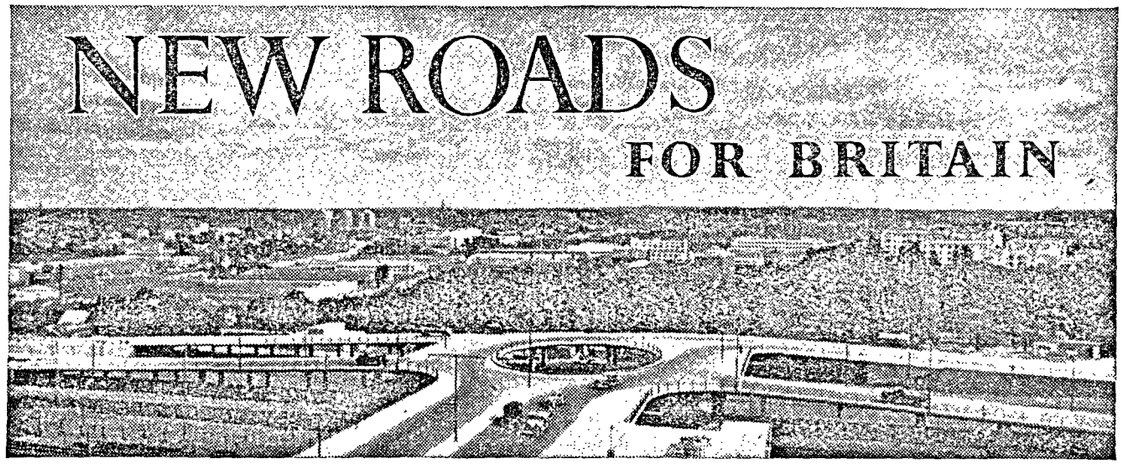
learn from its past mistakes), Turkey should be able to boost its exports considerably above their present level; and although its import requirements are more likely to increase than diminish for some time to come, few doubt that it will succeed in closing its trade gap in from four to—at the most pessimistic estimate—ten years.

But bright future prospects do not remove present difficulties, although they make it possible to face them more optimistically; and the immediate and essential problem for Turkey and its trade partners is to overcome the present trade crisis. Some Turkish traders feel that a devaluation of the lira is the only course. On the whole, however, the general opinion seems to be that this step will not be taken, although the currency is undoubtedly overvalued. Of course devaluation would allow the Turks to sell abroad at more competitive prices, but unless they have large stocks to get rid of—and on the whole they have not—offloading exports would hardly outweigh the disadvantages of raising the prices of badly needed imports, and of outraging Turkey's foreign debtors who would find the value of what they are owed sharply diminished.

It is essential that the Turks should face their debts problem more squarely than they have in the past. But it is hard to see how they are to get over their present difficulties unless the governments of the countries with which Turkey has the largest deficits are prepared to lend a hand. In the case of Germany, Dr Adenauer has already recognised this, although it remains to be seen how effective his intervention will prove. The British Government, for its part, has only recently tacitly acknowledged its belief that Turkey is in the long run a good bet, by guaranteeing long-term credits extended to Turkey by British firms for the construction of grain handling facilities and the development of electric power. Would it be possible for it to go further and extend a credit to the Turkish government for the specific and clearly defined purpose of enabling it to pay off some at least of Turkey's commercial debts to Britain? Such an unorthodox step would no doubt be uncongenial. But it could go far to help both the Turks, whose present troubles, if unchecked, could seriously hamper their long-term development, and those British traders whose dealings with Turkey have, through no fault of their own, landed them in serious difficulties.



Argument for Advance

AN economist, asked to make an estimate of the cost of road accidents to the community, began by constructing a graph of the net value of a human being throughout life. From the helplessness of babyhood to the close of education, he reasoned, the young person was simply a net cost. Throughout employment, reaching a peak in the prime of life, he made a net contribution to the economy. But in the sixties, after retirement, he went below the line again, into the red. At this an older colleague declared that he had sometimes thought of throwing himself under a bus at one of London's traffic black spots, in a desperate attempt to get some action out of the highway authorities, but had never realised that he would confer a net benefit upon the community by doing so; should he take his grandchildren, too?

Not all attempts to apply economic costing to road policy are as unpromising as that. But the economics of transport as a whole, and of the road system in particular, cannot be said to offer the clearest of briefs for an administrator. Roads constitute a national asset on which it would be extremely difficult to set a value or a working life, and hence to provide realistic depreciation. They are an investment the return from which is reaped by others than those who have the spending of the capital. They are, moreover, an inheritance physically and to some extent geographically unsuited to the economy that depends on them and to the motor vehicles that rescued them from the disuse of the railway age. These—plus the neglect of politicians—are among the reasons why Britain's road system is today becoming a dangerous brake upon the development of national productivity. An economy with so many inherent advantages of close industrial concentration is in danger of losing them through the inadequacy of its internal transport.

More than 5 million motor vehicles are licenced to use the roads of Britain today, against just over 3 million just before the war. The use they make of the roads—the total traffic—seems to have increased much less fast, though it is far harder to measure. Official sample inquiries suggest that road traffic last summer may have been about 25 per cent higher than in August, 1938, though goods traffic, the heaviest load, was nearly 90 per cent higher; there are, indeed, over twice as many goods vehicles registered as there were before the war, the great bulk of them "C" licence vans and lorries carrying their owners' own goods. But half as many private cars again, compared with 1938, recorded less than 5 per cent more traffic; the tax-inflated cost of motoring is having its effect.

The "vehicle population" has grown fairly steadily since the war, by about 7 per cent a year. Such a rate of increase—at present some 400,000 extra vehicles each year—would mean double the prewar figure in four years, and imply a population of more than 7 million vehicles by 1960. More generous projections have been made; some guesses in these columns last October suggested that on very favourable assumptions cars alone might number 5 million in five years. A more refined form of crystal-gazing, based on an observed relation between income per head and vehicle registrations that has been remarkably consistent over the years, would not suggest 7 million vehicle registrations in Britain until 1965. But it may be worth adding that these formulae and assumptions would imply that by 1980 the country would have some 10 million motor vehicles, and that by the end of the century the vehicle population might reach 17 million.

★

It is tempting to guess at the volumes of traffic that such a growth in vehicle registrations might imply. Will traffic continue to increase more slowly than registrations? Hopes of reduction in fuel and other motor taxation seem vain at present, though purchase tax may eventually fall less heavily on the capital costs of motoring. Extension of car ownership down the income ladder may mean that the extra cars do less mileage. Again, it has recently been argued that the shifting balance of cost, which brought about a surge of freight traffic to the roads after the war, may now swing, for a time, towards the rail. Nevertheless, it seems doubtful

whether such factors could prevent the long-term growth of road traffic to double the prewar volume and more. The only limiting factor that may be set, in the long run, upon the growth of traffic and eventually upon the vehicle population, is that British roads will burst at the seams unless something is done about them.

The "capacity" of a country's road system is almost impossible to estimate; the concept is hard enough to define even for a single stretch of road. But the effects of a fast-growing vehicle population and the rise in traffic volume that must follow are not difficult to foresee. Greater congestion on the roads implies even slower average speeds—Britain already stands accused of the slowest road speeds in Europe—new bottlenecks on main routes, and in all probability another upward turn in the graph of road accidents, at present still mercifully lower than in the late thirties. It would impose further costs of delay upon an economy that is making growing demands upon internal transport, and particularly upon road transport, through the increasing interdependence of industries dispersed over many new locations, and through the country's increasing need for direct exports of more and more complex products.

★

Expenditure on movement by all road users today has been estimated at more than 10 per cent of the national income—perhaps four times the total expenditure on rail transport. About half of this expenditure is concerned with the goods transport. Of all road haulage some 55 per cent is done by industry's own "C" licensed vehicles, with the British Transport Commission's nationalised lorries sharing the ton-mileage recorded on "public haulage" about equally with all other hauliers. Industry, drawing upon ever-wider areas for its labour, also has a direct interest

in the passenger-miles of traffic by coaches and buses; and by far the largest part of motoring by car is done on business.

It might be argued that if an obsolete road system for a growing motor fleet is rapidly pushing road transport towards the stage of diminishing returns, while greater traffic might bring the railways increased efficiency, much of the growth of traffic might conveniently be shifted to rail. This idea might be ingenuously extended into a theory of "transport integration"; but it would be an odd kind of integration that happened only when movement by road in the economy began virtually to seize up. Even modern politicians, always comfortably aware that roads do not vote, would hardly allow that extremity to approach. Some shifting balance may in future be achieved between road and rail in the public haulage of passengers and freight, though last year's Transport Act does little to define it; but it seems most unlikely that the modern industrialist will be disposed to relinquish control of the transport of his own goods to the home consumer or to the port.

What is more likely—it is indeed foreshadowed by the disappointing "new road programme" which the Government produced last winter—is a slightly more adequate standard of maintenance for existing roads, some opening of bottlenecks and improvement of black spots on the major routes, and a nibble at the fringe of the major projects that have been waiting the longest of all. But there are no signs that any serious approach will be made for several years, under the present plans to spend up to £14-£15 million a year, upon the modern motorways that almost every other industrialised country, poor or rich, now possesses.

Postwar neglect of investment in roads, during years in which public investment in other basic industrial resources of Britain—coal, energy and steel—has been pressed forward, has arisen partly from the diversion of the building and contracting industry and its materials to housing and schools, with power stations second and other factories a bad third. Since the war, transport has never been a very effective claimant on investment resources, except through private investment in motor vehicles; only recently have the railways at length been permitted some sizeable rolling stock construction programmes. The defence programme, moreover, made considerable claims on construction for airfields, atomic energy and the like. But today it is doubtful whether any physical limitations of contracting resources need hamper a much more resolute start upon arrears of road modernisation than the Government contemplates. Arguments for an independent authority to supervise road expenditure are not necessarily convincing; but when one compares expenditure on the roads—some £8½ million a year—with £490 million on housing or the £160 million invested in electricity, it is understandable that the British Road Federation should sigh for a Macmillan or a Citrine.

It has recently been questioned in these columns whether the Federation's latest advocacy of a road loan is the best method of approach; but the object of the federation's ceaseless exercise, and the detailed programme that it has now produced as an alternative to the present timid plans, deserve complete support. Mr C. T. Brunner recently outlined a ten-year programme:

- To bring existing roads into adequate condition by raising the present level of expenditure (some 70 per cent of prewar spending, in real terms) to about £100 million a year, against the present £80 million.
- To spend £25 million a year—instead of £4½ million which is only 2 per cent of the prewar effort—on clearing not only accident black spots, but the bottlenecks that impede traffic flow, particularly on the roads approaching cities or by-passing smaller towns.
- To begin on the new arterial routes linking the country's main industrial areas with its ports, starting with the Birmingham-Bristol-South Wales motorway. To build 100 miles of motorway a year would cost some £22 million.

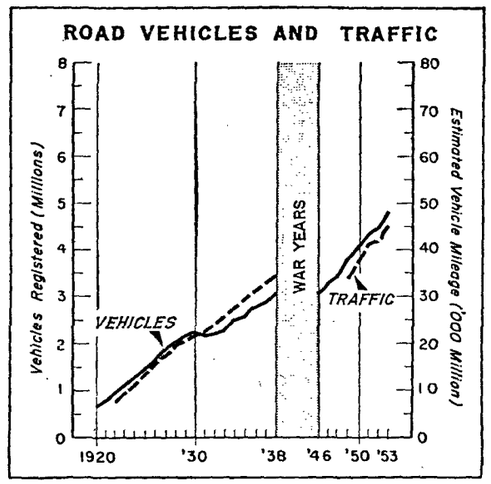
Such a revised programme would cost about £150 million a year, against £88½ million at present; it would broadly restore expenditure on roads, in real terms, to the level of the late thirties.

★

The return from investment in roads is shared by too many people to be counted. Nor are estimates based upon the costing of traffic delays—until research now in hand is completed—really meaningful. In the same way, though it is reasonable to contrast the growth of motoring taxation with the pitiful record of road expenditure, few would now assert that there should necessarily be any direct relation between the two; the Road Fund, in its original form as a store of money to spend on the roads, died long ago, and has only confused the form of the accounts for road building and repair. Investment in new motorways may or may not yield "higher returns" than investment in coal, steel or power; the point is that without it the country's other industrial investment as a whole cannot yield its full benefit, and some shift of the balance towards spending on the roads cannot be delayed.

This is a task for the Government; but there is one aspect of it that might well be undertaken by industry. It is understandable that the industrialist, faced with the suggestion that roads should be financed directly by the user, should reply that he pays enough in vehicle and fuel duty already (the yield of motor taxation, it may be noted, has long put out of date the old road-rail controversy about bearing the cost of the track). But if direct savings from new roads approach the magnitudes that are claimed by advocates of better roads for industry—there is no reason to doubt the reality of these savings, hard though they may be to measure—the simple commercial proposition follows that they ought to be worth buying. The toll road presents the primary argument for a separate road authority, free to cut red tape.

To leave the toll road out of proposals to construct the motorways that Britain needs does not weaken the absolute case for those motorways, even if it may make official stonewalling easy. The record of the American expressways and turnpikes suggests that industry might find that special payment for speed in moving its manufactures was triumphantly worthwhile. And in urging the provision of better roads for British industry upon the public authorities that have allowed Britain's roads to decay, it is hard to escape the feeling that some limited injection of business responsibility and commercial incentive would make for more effective care and development of these industrial and national assets.



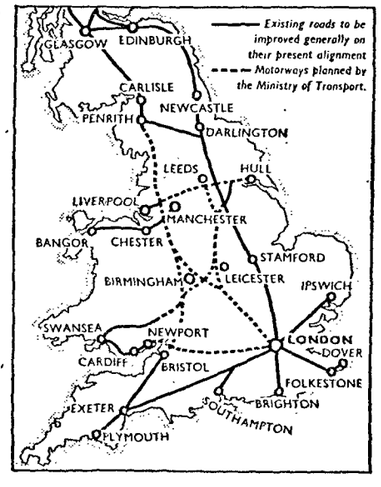
Plan on the Shelf

IN 1946 the Government approved a comprehensive 10-year programme for modernising the road system, after catching up with arrears of maintenance accumulated during the war. Bridges were to be strengthened and congestion in London and other big cities was to be relieved. There was to be a thoroughgoing reconstruction of the principal national routes, including the building of some 1,000 miles of modern motorways.

None of this has been done. After the 1947 economic crisis, roads were placed at the bottom of the list of investment priorities. It was not until last December that the present Government decided that expenditure on road improvements should be increased, but not nearly to the extent of the 1946 plan.

Schemes to be authorised during the current financial year will eventually cost the Exechequer an extra £19 million, and projects to be authorised in 1955-56 and 1956-57 will cost it a further £31 million, making £50 million altogether. Central government spending on major improvements and new construction is now about £5 million a year; by 1957-58 it will have reached £14-£15 million a year; and it is expected to remain at about that level for "a period of years."

This will not be the total expenditure on major improvements and construction under the new programme. Local authorities will be making a contribution, as yet unspecified. In recent years about two-thirds of the total expenditure on the roads—maintenance as well as improvement—has come out of the rates.



WHO IS RESPONSIBLE FOR WHAT?

Public Roads (miles)	Classification	Exchequer Grant (%)	Responsibility
8,200	Trunk	100	Ministry of Transport

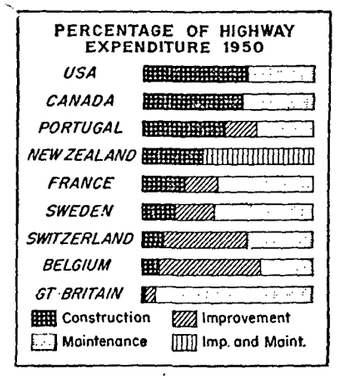
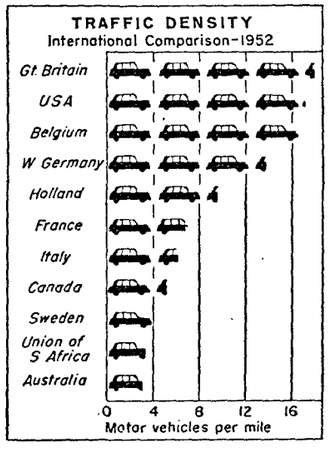
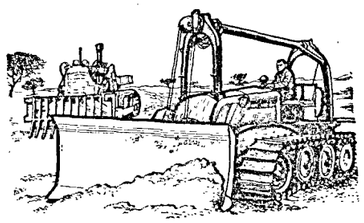
Total length of public roads in Britain = 185,000 miles.





Modern Macadam

BY A CORRESPONDENT



ARE the techniques and methods of road construction keeping pace with the potential track demands of the vast flood of traffic on British roads today? Because track development has not kept in step with traffic growth, experience of modern road construction on any appreciable scale in this country is almost negligible: since 1939 housing estate roads and a few miles of new main road construction are all that Britain has to show. Given small resources, a greatly restricted and reorganised road labour force, and using machinery wherever possible, the highway engineers of the country have made a remarkably determined attempt to improve the tracks so as to keep the wheels running. Partly because airfield construction, which has much in common with highway construction, has provided engineers with much valuable experience, there is hardly an aspect or technique of road construction which has not improved in some material way in the past decade. An expansion in the road-building programme would probably show that the leading British engineers and contractors are fully competent to take their place with the best and most experienced road-builders in the world.

Many things must be taken into account in planning and building a road: the engineer must consider the composition, speed and weight of the traffic to be carried, the degree of traffic segregation, the accident potential of the road, the aids to traffic movement such as signposting and marking, the topography of the country, the obstacles to be crossed, the gradients to be used, the cost of the land, the soil conditions, the availability and cost of materials, the structural design of the carriageway, the surfacing, and the effect of snow and ice. The whole procedure constitutes a complex engineering problem, and the best solution calls for a carefully made economic balance involving initial costs, maintenance costs and the cost of traffic operation. To some extent every road is a problem in itself.

The soil beneath the road crust must not be overloaded, but nor can it be covered with a wastefully thick road crust. The soil may be provided by an embankment or a cutting, and its properties will depend not only upon its mineral constitution but also upon its moisture content. In the last two decades, knowledge of soils—how to sample them, how to classify them, how to compact them and how to treat them—has grown into the science of soil mechanics. Careful investigation, by the Road Research Laboratory and other bodies, has provided the means of avoiding many of the mistakes, failures and difficulties experienced with the new roads built between the wars.

Soil can now be regarded as an engineering material. By no means all the problems are solved, for with more knowledge and experience from experimental lengths of roads, particularly on clay soils, large economies might still be possible. When suitably treated the soil itself can often also be used to form a substantial road base, a process which is being increasingly employed with great economy in housing-estate roads. The development of soil-moving equipment, including bulldozers and scrapers and special soil compactors of great variety—ranging from massive pneumatic-tyred and sheepsfoot rollers down to small vibrators and tampers—has played an essential part in the transformation that has taken place. One of the most recent developments is the "single-pass" soil stabilising train, which in one process will pulverize and mix the soil, add the stabilising agent—usually cement—and the required water and compact the mixture to form a hard uniform base. In appropriate circumstances this method will show a saving on traditional methods of 50 per cent or more.

But not all soils are suitable for processing, and other methods find their place in modern construction. The Telford base of hand-pitched stone is outmoded, for skilled men are scarce and it does not lend itself to mechanisation. The crushed stone base using the most suitable local material is gaining in popularity. This approximates to the system of employing uniform crushed stone evolved by Macadam about 150 years ago, the main difference being in the mechanisation of the process of laying and compacting which, by the use of rollers and vibrators, can give a high degree of density and stability. The postwar improvement most noticeable to the road user is the evenness of the road surface which has followed the introduction of the spreading and finishing machine. One such machine is capable of resurfacing with an inch of bituminous material one-third of a mile of 20-ft. carriageway a day. To accomplish such a task in the same time with hand-spreading would require five labour gangs instead of the one required with the machine, and the result would be inferior. For surface dressing of roads with tar and stones, the improvement in tar sprayers has resulted in much faster working and in greater durability. British tank-spraying machines are in fact the best in the world.

In large-scale concrete road construction small hand-fed mixers have been supplanted by travelling pavers and large concrete-batching plants with outputs

AVERAGE COSTS PER MILE OF BUILDING BRITISH ROADS

Class of Road	Nature of Carriage-way	Width of Carriage-way (*a*)	Cost per Mile
		ft.	£'000
Motorway (*b*)	dual (two-lane)	2 × 22	200–250
Trunk roads and class I roads	single (three-lane)	30	60–100
Class 2	single (two-lane)	22	30–50
Class 3 and housing-estate roads	single (two-lane)	18	20–30

(*a*) These widths are typical; other widths are frequently employed.

Pearl diving in the South Pacific

Road making in Britain

Atlas-Copco puts compressed air to work for the world

A man who has devoted almost all his life to the dangerous trade of pearl diving in the South Pacific knows what risks a man runs by descending to the sea-bed day after day. That is why he uses a number of small petrol-driven Atlas-Copco compressors to supply precious air to his divers. Vital though it is to the diver, this unusual job is only a small facet of Atlas-Copco's tremendous range of compressed air equipment. Atlas-Copco reliability is also specified for such formidable jobs as road making and maintenance in Britain.

In almost every part of the world, wherever compressed air is working hardest, Atlas-Copco compressed air equipment is on the job. Atlas-Copco equipment covers every conceivable application of compressed air. Add to this, the servicing and delivery facilities of allied companies* in 37 countries, and you realise why Atlas-Copco are among the world's leading compressed air specialists.

**Atlas-Copco embraces companies trading under the names Atlas, Atlas Diesel, Atlas Polar, Atlas-Copco, Copco, Delfos and Sampa. Enquiries in the U.K. should be addressed to* THE ATLAS DIESEL COMPANY LTD., *Beresford Avenue, Wembley, Middlesex.*

CAN WE AFFORD NEW TRUNK ROADS?

The economic consequences of the latest developments in "Caterpillar" earthmoving equipment

IN A LITTLE over two decades road projects have almost completely reversed the role they play in the economies of nations. As recently as the early thirties, many countries of the world (notably the U.S. and Germany) were turning to public works and road building programmes as a cure for chronic deflation and under-employment. Today not only do problems of under-employment hardly exist, but present day labour wages and costs would make road building by hand labour out of the question. Yet no-one will dispute that the *real* and urgent need for new and better trunk roads is greater than ever. Are then, new roads an economic possibility or not?

An important answer is given by the revolutionary reduction in earthmoving costs during the last 20 years—due to the tremendous technical developments in earthmoving machinery. For the building of trunk roads entails the removal and re-siting of literally millions of tons of earth, a job for machines alone.

The earthmoving problem and the continual striving to move *more* earth at less cost is one which has pre-occupied the Caterpillar Tractor Company for 50 years. The big yellow "Cats"—Diesel tractors, bulldozers, scrapers, shovels and particularly the recently imported high speed rubber tyred equipment have now brought road construction earthmoving costs well below those which prevailed during even the lowest wage levels of the thirties.

Since the war, many great new highways have been built in the U.S., the Commonwealth and in Europe. More Caterpillar machines have been used on their construction than all other makes of earthmoving equipment —two facts surely, which amply demonstrate how these great machines can make new roads an economic proposition for Britain.

On road building projects throughout the world a vast amount of experience has been collected in the economics of earthmoving. Much of it has been included in a paper read to the Georgia Highway Conference in Atlanta, Georgia, by Mr. L. E. Schumacher of the Caterpillar Tractor Co., last February. If you would like a copy of Mr. Schumacher's paper or any of the many illustrated brochures published by the Caterpillar Tractor Co., relevant to road construction, please get in touch with any of the Caterpillar dealers listed below.

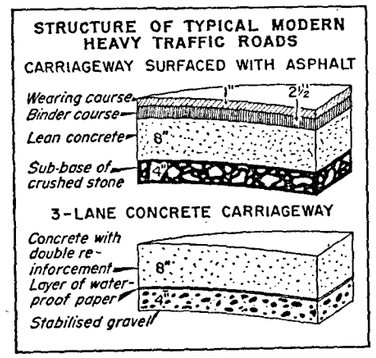
whenever you think of new roads think of the big yellow machines that help to build them

of hundreds of cubic yards of high-grade concrete per day, working in conjunction with special compacting and finishing machines. The hand barrows and hand screeding and tamping of prewar years are obsolete. By the new methods, outputs can be vastly increased and the quality of the finished road immeasurably improved. Concrete road construction, even when up-to-date mechanical plant is used, calls for skilled men. Severe restrictions imposed on new road work by the scarcity of cement and the lack of sizeable projects have handicapped the development of the skills to match the new methods; despite the long life and low maintenance cost of the concrete road, it is less used in this country than formerly. Rolled concrete of low cement content covered with a bituminous surfacing has been used as an alternative. If new construction began on an extensive scale, and if more cement were available, concrete would again take up the running.



The thickness of a carriageway to be constructed on top of the soil depends on the type and condition of the soil and on the volume and weight of traffic. With light traffic and a good soil, such as gravel, a thickness of 6 inches would be adequate; with the same traffic and poor clay soil up to 15 inches might be necessary; with heavy commercial traffic a good soil would call for 10 inches and a poor one would need rather more than two feet. When concrete is used the figures could be somewhat lower.

Although much has been accomplished in the field of road-making machinery, there is still room for improvement in the design of much of the equipment used by the road engineer and for the development of new plant, such as compacting machines for backfilling trenches, stationary mixers for soil-stabilisation, concrete mixers with improved cleanliness of discharge, improved compacting and spreading machines for concrete and self-propelled and towed spreader boxes for spreading broken stone bottoming. At present, unfortunately, manufacturers of civil engineering plant often have difficulty in diverting effort to the development of new machines whilst fulfilling orders for existing machines. Nor will manufacturers usually embark on the expense of the development and production of a new item of plant without clear indications that there will be a market for the equipment. The absence of a programme of new road construction has set up a vicious circle in the supply of new equipment and progress has been restricted. It may be possible to encourage the production of new machines by development contracts financed wholly or partly from public funds.

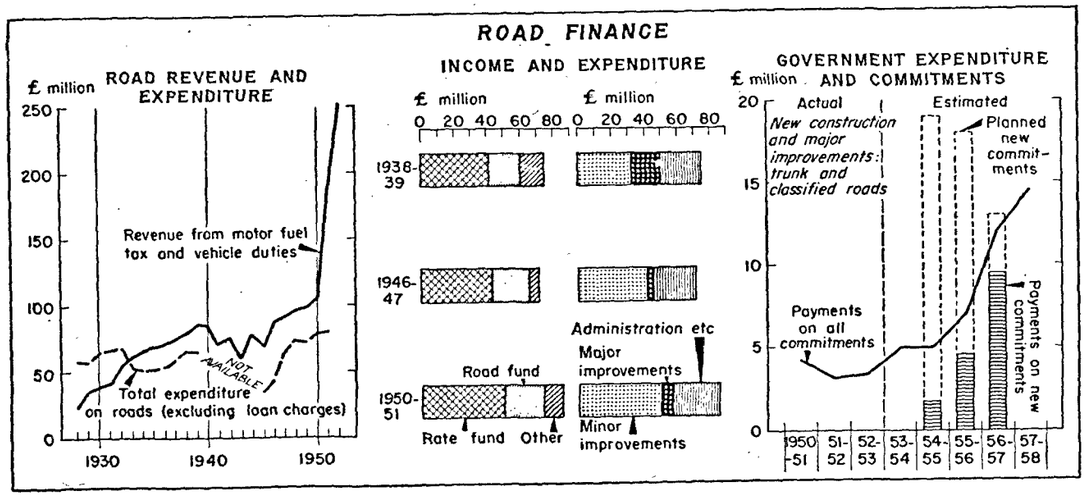
The cost of constructing roads depends upon many factors. For roads on housing estates, earthworks are small and few bridges are involved; the main cost is in the carriageway pavement, kerbs, drainage facilities and footpaths. At the other end of the scale are motorways which may involve earthworks of considerable magnitude, because of the need to avoid steep grades and for the provision of complicated flyovers and bridges. Thus in motorways such as the American turnpikes the cost of the carriageway may be no more than a fifth of the total cost. An estimate of the average present-day costs per mile of roads of the various classes in this country is shown in the table on page 4. The figures include cost of land, earthworks, drainage, carriageway pavement, footpaths and bridges.

In 1950 the Ministry of Transport recommended the following standards for rural roads:

Vehicles per hour

Up to 300	—	Two-lane carriageways
300 to 600	—	Three-lane carriageways
600 to 1,000	—	Dual two-lane carriageways
over 1,500	—	Dual three-lane carriageways

The standard lane width recommended is 11 ft., and 10 ft. for three-lane roads. Many roads in this country carry traffic running far above these figures. For example on trunk road A.40 east of Oxford in the peak hour a two-lane carriageway carries 700 vehicles; on A.40 at Denham a three-lane carriageway carries 1,300 vehicles and on A.406 a dual two-lane carriageway carries 2,300.

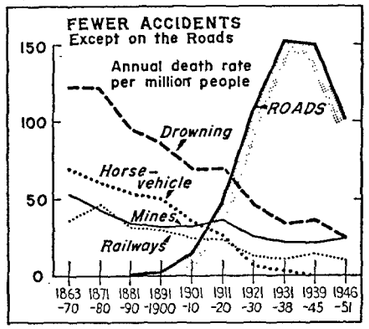


Road Safety and Research

SINCE Mrs Bridget Driscoll, a 44-year-old Irishwoman, was knocked down and killed by a private car travelling "at the speed of a horse" at the Crystal Palace on August 17, 1896, over 200,000 people have been killed in road accidents in this country—which is not far short of the total number of lives lost on active service during the last war—and several million more have been injured.

It may be said that some fringe of road casualties has to be accepted by any industrial community as an unavoidable cost of effective transport. In the design of roads there must often be some compromise between safety and flow. Segregation of traffic by type and by speed, which can usually resolve the problem, cannot be achieved everywhere. But a good number of the 170,000 or so road accidents that take place each year certainly need never happen if the condition of the road or vehicle were better or the particular road user involved were to pay more attention to the surrounding traffic.

Since 1946 the detailed problems of road safety and the particular causes of road accidents have come under the

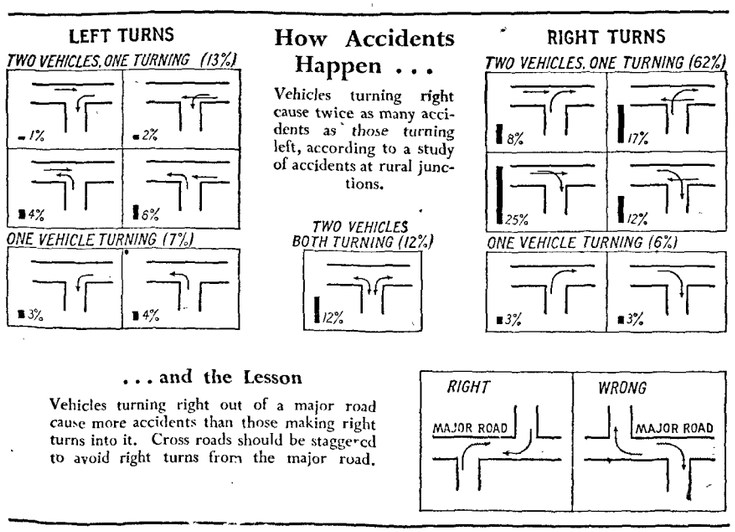


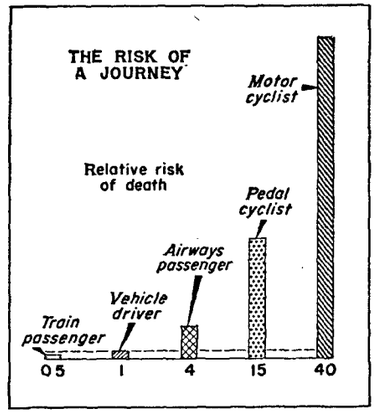
close scrutiny of the Road Research Laboratory, a branch of the Department of Scientific and Industrial Research. This is leading to a growing fund of knowledge about how accidents happen and how to prevent their recurrence. Already the effects are noticeable. Zebra crossings were first thought of at Harmondsworth, the headquarters of the laboratory, and the recent proposal to tighten up lighting regulations arose from investigations carried out by the laboratory's research workers.

The Road

THREE-QUARTERS of all road accidents occur in built-up areas, and almost half of these happen at junctions and cross-roads, where two or more streams of traffic try to join one another or disentangle themselves. An investigation into the design of road junctions begun some years ago by the County Surveyor of Buckinghamshire and since taken up by the Road Research Laboratory has thrown interesting light upon these accidents at junctions. According to the findings of this study, which are set out below, a vehicle making a right turn at a junction is more than three times as likely to cause an accident as one turning left; and a right turn made by a vehicle trying to leave a major stream of traffic for a minor one is more dangerous than a right turn made by a vehicle trying to enter that major stream.

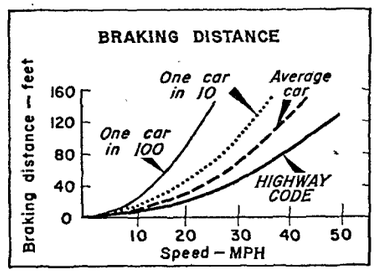
Certain road junctions have been redesigned with these conclusions in mind, and the investigation has also had an effect upon the design of cross-roads.





The Vehicle

Over a quarter of a million vehicles are involved in accidents each year, but no one can really say how many of these accidents are due to some defect in the vehicle. Police records put the blame on the driver or on a pedestrian for thirty accidents for every one that they say was caused by a defective vehicle, but these classifications are doubtful. When vehicles are examined for one reason or another, however, many are found to be defective or in poor condition.



Good brakes can stop a car in 45 feet from 30 mph. But, as the preceding diagram shows the brakes of very few cars actually reach that standard. About half of the cars may need 70 feet, one in ten over 100 feet, and one in a hundred over 200 feet to pull up. These are braking distances, and do not include the distance travelled in the time taken by drivers to apply their brakes. Cars travelling at 30 mph can cover over 40 feet in the second that most drivers take to apply their brakes in an emergency.

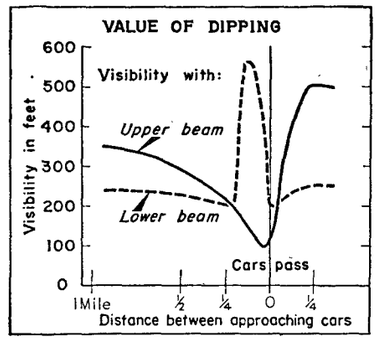
Even if all brakes were up to Highway Code standard, a good driver moving at

30 mph would be doing well if he stopped within the length of a cricket pitch; most would take twice as long. As would be expected, the heavier the vehicle the greater the distance it needs to stop. Heavy lorries pulling loaded trailers at 20 mph can be expected to cover nearly 70 feet even when their brakes are in good condition. On the other hand, technical changes may increase braking hazards on very light vehicles; not all the cyclists who now have light engines to assist them have brakes adequate for what has become a much faster road vehicle.

The Lights

Though most accidents occur in daylight, street and vehicle lighting make important contributions to road safety. Dazzle caused by headlamps is a frequent cause of complaint, but it does not seem to cause as many accidents as people imagine. "Dipping" one's headlights, in certain conditions, will enable a driver to see farther, as the chart at the top of the page shows. When approaching cars are 1,200 feet to a few hundred feet away from each other, objects may be silhouetted against the road by the approaching set of lights. At that range one can see silhouettes in the dipped beam better than a full view of the road with undipped headlights, particularly if objects in the road are dark coloured and merge easily into the night.

The theory of dipped headlamps is



sound enough. The trouble is that few headlamps are correctly aimed. A recent sample of the headlamps of nearly a thousand vehicles on the road revealed that only about one in ten were even approximately correctly aimed, whilst half were three degrees out of true—which is more than the angle of dip in an ordinary dipping headlamp. Half of these vehicles, therefore, had "dipped" headlights that were less than useless. The intensity of vehicle headlights also deteriorates with age. As many as one headlamp in eight in use now has only a tenth of the brightness it once had. Half of the cars using the "dip and switch" method had lamps with less than half their original intensity: even if correctly aimed such lighting would simply be inadequate for safety.

Poor or even non-existent rearlights are also blamed for accidents. Only a very small proportion of cars, lorries and bicycles, according to a recent survey, are fitted with rearlights sufficiently intense to make them plainly visible in or near the dipped headlamps of an overtaking car. Since these tests were taken steps have been taken under the Road Transport Lighting Act, 1953, to tighten up the standard of rearlamps and reflectors.

The unsatisfactory state of some vehicles using the road—and today nearly half the cars licensed are still pre-war models—raises the question whether vehicles should be subject to a compulsory test. As long ago as 1947 the Road Safety Committee of the Ministry of Transport proposed that vehicle testing stations should be set up. These tests would cost money but as American experience has shown, states with vehicle inspections have lowered their accident rates whereas those without have not; the resulting saving in accident losses might well pay for the cost of inspection many times over.

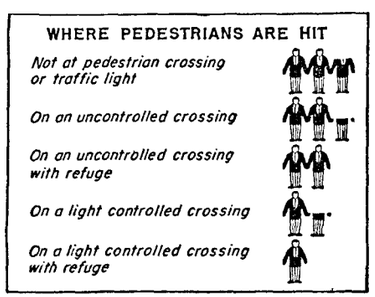
BRIGHTNESS OF REARLIGHTS ON THE ROAD

Intensity	Cars m/cs and buses %	Vans and Lorries %	Pedal Cycles %
Less than standard.	75	78	98
Less than a tenth of standard	33	59	84
Less than a fortieth of standard.....	13	26	50

Pedestrians and the Zebra

ABOUT two-fifths of the dead and a quarter of the injured in road accidents in recent years have been pedestrians. All but a tenth of these casualties occurred in built-up areas and nearly a half when the pedestrian was reported to be trying to cross the road.

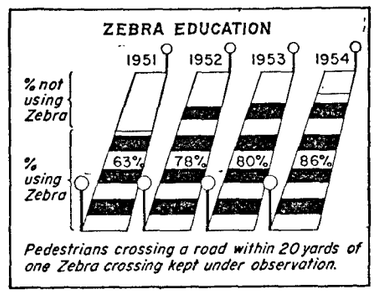
During rush hours in most large cities there is not room for everyone on the pavement, and the overflow of pedestrians into the roadway is a frequent cause of accidents as well as a serious hindrance to traffic. Unless they are compelled to, pedestrians will not use the crossing provided for them if it takes too long to use. Even when alternative routes are made as easy—or as difficult—as the direct route, by erecting barriers, by installing subway escalators, or by lowering the pathway before it reaches the subway entrance, the jaywalker will still prefer to "chance it" a hundred yards up the road.



Only in recent years have attempts been made to plan and to measure the effect of new road safety measures. The "Zebra" crossing is perhaps the best-known example, and certainly the most successful. Pedestrian crossings were first introduced in 1934, but in October, 1951, the majority of crossings were removed—they now number little more than 12,000. All uncontrolled crossings were striped, and parking at the approaches to many of the crossings was prohibited.

The introduction of "Zebras" has been associated with the biggest drop in pedestrian deaths since driving tests and the speed limit were introduced in the thirties.

One particular crossing, situated in Hornsey, London, and striped experimentally several years before "Zebras" were officially adopted, has been kept under observation more or less ever since. It has been found that the proportion of pedestrians who used it has been steadily growing year by year. Twice as many drivers are now giving way than in 1951, although drivers' manners have never quite re-attained the standard of 1952.

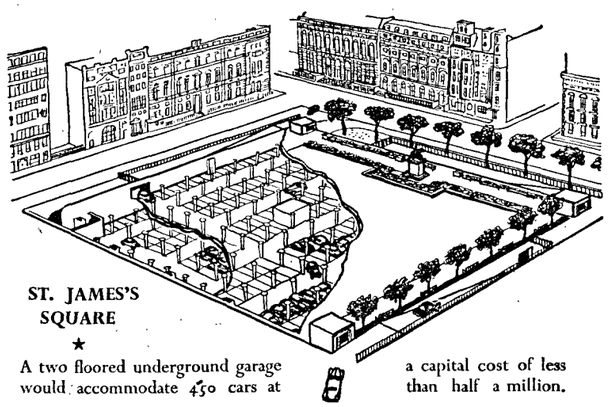


Pedestrians crossing a road within 20 yards of one Zebra crossing kept under observation.

Freeing the Streets

THE one major improvement that the New York motorist really needs from Detroit is a moderate-sized automobile—say 200 horsepower—that he can drive up to the sidewalk, step out of, fold up to briefcase size and deposit with his hat in the cloakroom. In London, as yet, congestion is not yet quite so bad; the cars are smaller. But so are the roads. On a normal weekday, in working hours, between 20,000 and 25,000 vehicles are parked in the 250 miles of streets of inner London. In some West End streets, three-quarters of the kerb is lined with stationary cars, vans and lorries; and this congestion is 50 per cent worse today than it was two years ago. London is a special case; yet it epitomises problems common to many British cities already—and to more in the future.

Street patterns first laid down in the days of the carriage are no match for the traffic that the motor vehicle has introduced, and any substantial re-planning of the central streets of most cities is not a practical possibility—except where a certain amount of preliminary site-clearing was done during the last war by the enemy free of charge. Traffic flow can be quickened in minor ways, by cutting a new thoroughfare or two, by making a few streets a bit wider and re-timing traffic signals in the light of operational research rather than of pre-conceived ideas. But none of these measures can do much to ease traffic congestion while parked cars continue to choke city streets.



ST. JAMES'S SQUARE

★

A two floored underground garage would accommodate 450 cars at a capital cost of less than half a million.

How can these cars be moved off the street? In the past parking space has never been regarded as an essential part of any new office block or other building, and few cities now contain enough garages for the thousands of vehicles attracted by the work and trade carried on in their central areas. Powers given to local planning authorities by the Town and Country Planning Act of 1947 will, if used, ensure that in all new and reconstructed buildings garage space is provided at least for the normal use of the eventual occupiers, but this will only slowly ease the existing congestion. There may be one or two sites in most cities that could with little difficulty be adapted to provide parking space for a number of vehicles, but the shortage of off-street parking will never be solved by tinkering. Existing buildings do not lend themselves easily to adaption as roof-top or basement garages; the costs of underpinning and tunnelling are usually too high. The best site for a new car park or garage is often some distance away from the districts where one is most needed. What is becoming essential is a large programme of new garage building in the central areas of the larger cities. Such programmes will be expensive; present-day garages, whether built under the ground or above it, cost from £800 to £1,200 for each car they take. But little good will come of the costly motorways and improved arterial highways that need to be built between the larger cities if they attract more vehicles into city centres than the streets and garages there are able to accommodate.

★

In Inner London alone another 15,000 off-street parking places are needed in addition to the 8,000 or so that are available now—excluding the 3,500 places available in bombed site car parks that will be redeveloped within the next three or four years. A working party appointed by the Ministry of Transport recommended in 1953* that new garages should be built to take nearly 11,000 cars at a cost (on 1951 prices) of £11,700,000. It proposed that nine of these garages should be built under some of the famous London squares; the remainder were to be multi-storey structures erected in the areas of greatest parking need. These garages were for the long-period parker who in London, where people go shopping by bus and Tube, creates his own problem. Up to 80 per cent of the vehicles parked at any one time in inner London stay for more than two hours. If the streets could be cleared of these vehicles there would be ample room for the short-term parker, of whom at least 9,000 arrive during the most crowded hours. But no motorist can be expected to use a garage or car park if it is easier and cheaper for him to leave his car parked by the side of the road. If the new garages are to be used and the streets substantially cleared of stationary vehicles, waiting restrictions would have to be rigidly enforced and extended to the most congested areas and vehicle owners would have to be charged, by means of parking meters, for authorised central street parking places.

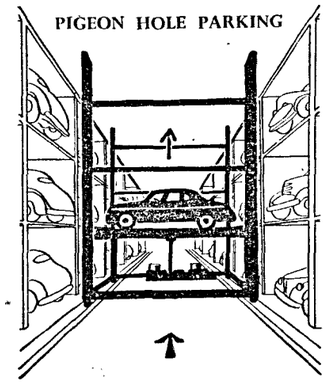
Motoring organisations so far have strenuously opposed the imposition of charges for the use of the highway, holding that motorists and hauliers are already heavily taxed. But parking space costs money, whether at the kerb-side or in a garage off the highway. The demand for parking is at present limited by congestion—by the amount of delay, annoyance, and inconvenience that drivers are willing to accept on journeys into and out of town. "Rationing by congestion" operates mainly on a first come, first served basis; hence a high proportion of the available kerb-side parking space in central London is taken up by all-day parkers arriving fairly early in the morning. The price

* "Report of the Working Party on Car Parking in the Inner Area of London." HMSO. 1953.

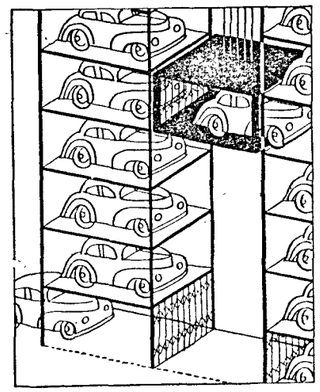
mechanism, properly applied, might be the simplest and most effective way of putting some order into the use of streets. Parkers should be encouraged to choose between parking their vehicles at nearby garages or street car parks, paying a small charge for the convenience, and leaving them free of charge in a street a few hundred yards further away, where they would be less of a hindrance to traffic.

Britain has had little experience of mechanical parking systems, and that has not been very encouraging. Delays and an occasional breakdown have given mechanical systems a bad name but to a large extent these were teething troubles, and it is perhaps unfortunate that the working party should have come down on the side of ramp garages. The greatest drawback to mechanical parking systems is perhaps the time taken to park and deliver one vehicle, especially during peak hours when speedy operation and quick movement are essential to prevent congestion. But in the United States, where several years' experience has now been acquired, timings are gradually being cut and if sufficient reservoir or overspill space is available, perhaps at an adjacent conventional garage, the peak-hour congestion problem becomes more manageable. In areas of considerable parking need, mechanical systems are able to offer several advantages. They cost more to build, but less to operate, use their space more efficiently than in garages where cars are parked by hand, employ less labour, and cause less damage to cars. More floors can normally be operated under a mechanical system than by ramp—which makes them particularly suitable where land values are high.

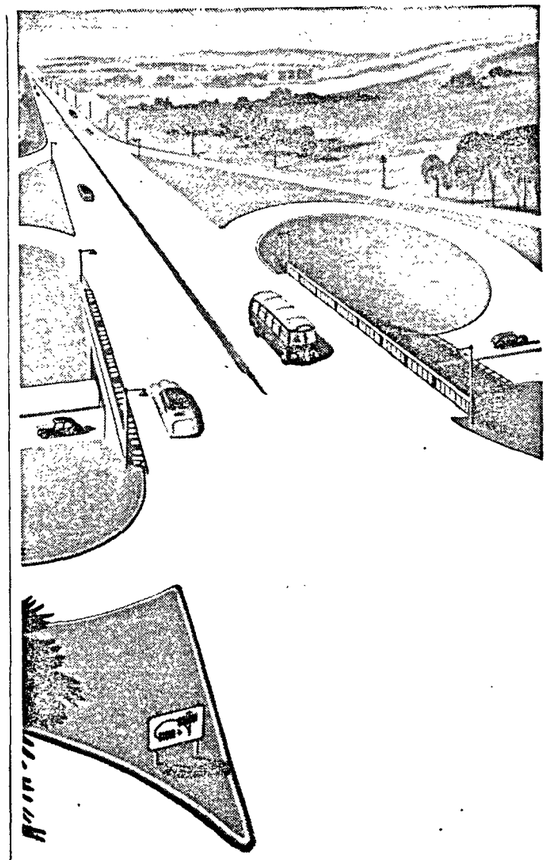
PIGEON HOLE PARKING



PARK-O-MAT



Three of the mechanical parking systems currently used or being planned for use in the United States are illustrated in this article. The three systems are Pigeon Hole Parking, the Park-o-Mat, and the Rotogarage, of which only the last two can be considered fully automatic in the push-button sense. Pigeon Hole Parking consists of two tiers of two car stalls facing each other across a corridor, in which an elevator moves horizontally along rails at the same time as it moves vertically, thus bringing the car in one movement to the selected stall. This system is classed as semi-automatic, as is an operator required to man each



Whether it be an airport, a dock or a gigantic road intersection, concrete gives confidence to the traveller. It is the very foundation of man's swift and sure encirclement of the earth. Concrete, owing its character to the cement from which it is made, has become a

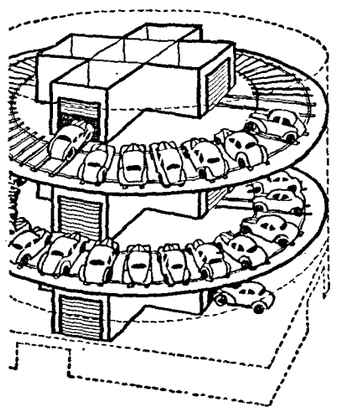
elevator. In the Park-o-Mat system one, or two, elevators feed the entire building. The car is driven on to the runway on the ground floor, an attendant selects the floor and stall to be used, presses a button on the control panel, and the elevator carries the car up to the correct stall and pushes it in. The Rotogarage is the most original of the three here illustrated, and it is still in the planning stages. The elevators are fixed ; it is the floors that revolve and so provide the horizontal movement. With four elevators to one tower each floor moves ordinarily through 90 degrees, but in an emergency the full turn of 360 degrees can be made and all 28 cars on each floor unloaded by the one elevator.

ROTOGARAGE



Although central London garages are at present so few they are hard put to it to fill even the limited room they have available because motorists are able to block the streets free of charge. Whilst this continues private capital will remain unwilling to venture further into the garage business ; local authorities, too, are reluctant to use ratepayers' funds to build garages for fear of the loss they may incur. Last year's working party therefore suggested that the Government should build the new underground garages and then lease them to other bodies. But the case for subsidising these garages, which was also advocated, is far from made out. There are no grounds for believing that they would not be used if street waiting regulations were extended and enforced, and there is no real reason why motorists and hauliers should not be prepared to pay for the space their vehicles occupy. Artificially cheap garage facilities would encourage an increase in demand for parking space, and private developers would feel with some justice that they, too, deserved a subsidy to help cover the cost of incorporating garage space in new buildings. Existing garages, too, might not be able to stay in business without subsidy, as the tariffs suggested still for the new garages were some way below those of the privately-owned garages.

A policy of restricting traffic would probably solve the problem of congestion, but it is neither desirable nor practical. Although heavy lorries might with advantage be banned from the most congested streets at peak traffic hours, a widespread prohibition of vehicles or a severe rationing, by means of a new licensing system, of the vehicles entitled to use the busiest districts would raise its own problems. As the traffic in London at Coronation time showed, the margin between congestion and complete blockage in the largest cities is tiny. Unless steps are taken soon to accommodate more vehicles in the garages and streets of British cities, growing congestion may lead here, as it has done in the United States, to the decay of city centres and the movement of business outwards to the suburbs.

Roads in Africa

Among the road works in Africa undertaken by British engineers is the new all-weather bitumenised highway to link the capitals of Northern and Southern Rhodesia. The 94-mile stretch between Lusaka and Chirundu runs through steep mountains and wooded valleys, then drops 3,000 feet to the Zambesi lowlands. Maintenance camps have been set up along the route to service heavy equipment working under abnormal strain, and four stone quarries with crushing plant supply materials. Here and on other road contracts in Africa, difficulties are overcome by organisation combined with team spirit among British and Africans alike.

Roads in Britain

The same organisation is now available for construction of Britain's new roads. It is backed by experience in earth-moving, high quality paving and many civil engineering works on the largest scale in Britain and overseas; equipment selected after exhaustive investigation from the finest available in the world ; a unique system of progress and cost control ; and materials testing and research laboratories working in collaboration with national organisations.

BRITISH BANKING 1954

This series of six articles surveys outstanding financial and banking trends in Britain and the British Commonwealth. A complementary survey of Foreign and International Banking will be published in the autumn. In these two half-yearly features THE ECONOMIST *continues the tradition of its* ANNUAL BANKING SUPPLEMENT, *which has been published for many years.*

The Rebirth of London

BY far the most striking development in the world of banking and finance in recent months has been the great stride made by the City of London to recapture its former supremacy as an international centre. Necessarily, the tendencies and changes that have most clearly speeded this advance have arisen in the international sectors of Britain's trade and finance ; and this first chapter of the annual banking supplement, unlike the chapter published each autumn, is traditionally devoted to British rather than international banking. Yet this rebound of London unquestionably demands pride of place now—partly for its intrinsic importance, partly because the influences of international finance are now playing strongly again upon the domestic markets, and partly because the spring-board had to rest on the broad foundation laid by economic and monetary policy at home.

London's pretentions to supremacy have been questioned twice within the span of a generation—both by cynics at home and aspirants abroad. After each world war the damage done to sterling, to Britain's status in world commerce and to the technical apparatus of the London market has seemed for a time to be so nearly irreparable as to justify these doubts. But now it can safely be said that each time the predictions of decay or decline have been falsified. And it is interesting to draw the parallel between the patterns of revival after the two wars.

Between 1914 and 1919 London suffered the paralysis that must grip any international mechanism during a period in which commerce and finance become quite subordinate to the primary aim of waging total war. And after the war Britain's position had been gravely weakened ; a large slice of its foreign investments had been sold, sterling had depreciated in both its internal and external value, and the relative growth in the strength of the United States was evident. All these developments had crystallised into a widespread conclusion that London's supremacy was gone and that at best it would have to be shared with other centres, notably with New York.

London's answer was the laborious return of sterling to the gold standard at the 1914 parity. It was an unconscious answer, certainly made without counting or understanding the costs in terms of industrial recession and unemployment. The effort "to look the dollar in the eye" was costly and doomed to failure. But it did unquestionably help to restore London's prestige as a great financial centre, and it did so despite the nemesis of 1931—for the dollar came tumbling down soon afterwards.

The restoration of London also owed much to some purely negative factors, especially the weakness of the competition from the overseas centres. Attempts were made to create a discount market in New York and to foster the art of the acceptance credit among American banks ; but

only a few of these efforts met with any notable success. Paris also strove to emulate both the discount and the acceptance houses of the City; but these institutions; built on the volatile basis of the French franc, were never in the running as competitors in the business for international commercial credits. Amsterdam did, indeed, make great strides in this particular direction, but even in the brief phase when the guilder could claim to be a more stable currency than off-gold sterling Amsterdam handled no more than a small fraction of the business done by London. In the world of encroaching economic nationalism on the eve of the second world war, London could well substantiate its claim to be by far the most important international financial centre.

Its re-emergence after 1945 was somewhat slower than it had been a quarter of a century before. The disparity of financial strength between the United States and the United Kingdom had widened alarmingly—had become, indeed, the yawning dollar gap. The inconvertibility of sterling for non-residents as well as residents, and the whole paraphernalia of exchange control, with its blockings and its segregation of capital from current transactions, all these were new phenomena the like of which had not been experienced either during or after the first world war. Moreover, the postwar aftermath of physical economic controls, the continuance of State trading and the submergence of free commodity markets lasted much longer than after 1918. Above all, the damage done to Britain's creditor position—reflected in the wartime sales of foreign securities, the loss of reserves and the growth of both short and long-term overseas liabilities—was incomparably greater than that sustained during the Kaiser's war.

★

How, then, has London not merely survived as an international financial centre but regained its strength and influence to the point at which it is beginning to claim again to be the greatest centre of all? First and foremost is the fact that the mechanism and the tradition of international banking inherited from the past are still intact. London's close integration of financial institutions of every kind—banks with branches or agencies throughout the world, the acceptance houses, the discount market, the bullion and foreign exchange dealers, insurance brokers, the shipping and commodity markets and the rest—is one unmatched by any other mercantile or financial capital in the world.

It is true, of course, and highly important to remember, that if this inheritance from the past is to live and endure it must always be backed by a capacity to lend overseas that can derive only from an adequate surplus in the United Kingdom's balance of payments. Equally, if the progress is to continue, London must be assured of a stable currency and there must be no hampering restrictions on its use. Underlying changes in the relative economic strength of Britain may to-day set limits to the extent to which these conditions can be fulfilled. But, even after making the fullest reservations on this score, the fact remains that London is given a tremendous momentum by reason of its established mechanism. It would take many decades to build up a system of comparable efficiency elsewhere.

The second reason for the resilience of London is also to some extent an inheritance from the past. An indispensable ingredient in London's strength has been the continued allegiance owed to sterling as the basis of currency

by a large area of the world. This loyalty springs partly from tradition and habit; but it is also a testimony to the adaptability and flexibility of the sterling system. The use of sterling as basic currency and the regard for London as the banking capital of the sterling area have not been impaired, or even diminished, by the fact that the banker is now a net debtor on capital account and that his overseas liabilities payable at sight and short notice greatly exceed his immediately available assets.

Indeed, the change of role and the fact that the sterling area's holdings in London have grown so much may actually provide part of the explanation of this continued hegemony of the sterling area. "When you owe your banker one thousand pounds," Maynard Keynes once said in this very context, "you are at his mercy; but when you owe him a million he is at yours." Sterling has not been a freely convertible currency for the past fourteen years; but it has been more freely converted into the goods and services of international commerce than any other. The oft-repeated assertion that half the foreign trade of the world is transacted in sterling may be difficult to substantiate and appears, at first sight, somewhat exaggerated; but no other currency could even approach to such a claim.

★

Admittedly, this status might not have survived much longer in the face of a persistence of the bi-annual sterling crises that punctuated the history of the United Kingdom and of the sterling area from 1945 through the odd years to 1951. But that sorry sequence was broken in 1953; and it is from that year that the true re-emergence of London as a great financial centre—a centre reputed for current performance instead of mainly resting upon past achievement—can be said to date. This progress can be detected at many points; but each advance forms part of the broad movement towards greater economic freedom that can best be described as the approach to convertibility.

During this last phase, the major commodity markets have been freed, including those for cereals and cotton in which dollar trade is important and in which, therefore, the task of marrying exchange control to freedom of dealing has been beset with special difficulties. Moreover, many of these freed commodities, including copper and coffee, are not even subject to restrictions on re-export. A genuine foreign exchange market has been reopened in London in which the operators are again dealers for their own account and not mere agents for the Bank of England, and accordingly can exercise their technical skill. The fruits of this freedom and of the arbitrage facilities more recently granted with it have begun to be harvested in the past few months, when London has regained to the full the share in foreign exchange business that it enjoyed before 1939. Further, the use of sterling in transactions between non-sterling countries has been greatly extended and the many varieties of sterling held by non-residents have been reduced to only a few. Last, but certainly not least, a free gold market once again functions in London.

In part as cause and in part effect of these practical steps to convertibility—their technical details are discussed in a subsequent article—world confidence in sterling has steadily grown. As the international use of sterling has extended, so have foreign bankers and merchants found their need for working balances in London rising; and a new and important impetus to this building up of working

THE OX WAGON: It is only fitting that the ox wagon should be displayed on the South African coat of arms. For without this apparently primitive but wonderfully effective method of crossing difficult country the development of the Union might well have been immeasurably handicapped. Serving both as beef cattle and draught animals, oxen were the mainstay of the early South African economy—and even in the Union of to-day they play a large part in transport and agriculture. The original trek wagons were surprisingly small when compared with those in use to-day, measuring only some twelve feet in length, about the same size as an English farm wagon which they greatly resemble.

Our branches in the Union of South Africa are particularly well placed to answer questions on trading conditions and local markets.

Please address your initial enquiries to our Intelligence Department, 54 Lombard Street, London, E.C.3.

capital in sterling was felt after the reopening of the gold market. But in addition to these demands for sterling for such specific purposes, and partly in consequence of them, demands have been arising simply because sterling has been shown to be once more a desirable currency to hold—instead of being, as so often in the early postwar years, a currency to get out of at the first opportunity. Arbitrage movements of short-term funds, which had been of little significance in the international markets generally during the difficult years for the non-dollar world, have been revived by the new facilities and new confidence in London, and are gravitating towards it. And with them have come some speculative funds—as was plainly shown during the recent phase of rumours that sterling was about to be allowed to break from its moorings and rise above its present upper "gold point" of $2.82.

★

The confidence built up since 1952 has now demonstrably surged far beyond the point of merely making good the psychological damage done by the recurrent crises. Until only a few months ago, there were widespread (and not unreasonable) apprehensions that new stresses would soon appear. But instead of the confirmation of these fears, the world has witnessed one of the most remarkable exhibitions of resilience and strength that sterling has ever provided. The Chancellor of the Exchequer pin-pointed the measure of this achievement succinctly in a recent speech. "Between July, 1953, and April, 1954," he said, "United States industrial production fell by 10 per cent. Between those dates, the sterling area gold and dollar reserves rose 19 per cent. If anyone in the middle of last year had forecast this combination of percentages, he would have been written off as an optimist or an ignoramus—possibly both. Yet here it is."

It is of course true that some of this increase in the gold and dollar reserve is spurious to the extent that the recent rumours caused some anticipatory commercial demand for sterling and other more speculative transfers. Yet this contrast between the strength of sterling and the significant slackening of American business activity remains the most impressive token of the success that has attended the rebuilding of confidence in sterling and the concurrent "collective approach" to convertibility. The anticipatory purchases of sterling are, indeed, in themselves a tribute of the same kind.

But most of the fortification of the reserves that has come from this resurgence of London and of sterling is more dependable. The new functioning of the city's traditional apparatus, and of the international mechanisms of British commerce generally, have brought in overseas capital resources that will be needed here, in greater or less degree, so long as the whole system continues to do its newly-resumed job. Moreover, it is also already providing a bigger flow of foreign exchange from its own current "invisible" exports—quite apart from the even less visible flow of funds that is attracted to a virile international market so long as its currency looks healthy.

This last condition is paramount—both as a promise and as a warning. The technical facilities of the London market cannot by themselves make good any weakness in sterling that may spring from underlying deficiencies in Britain's economy or in that of the overseas sterling area. But the City can give valuable support to those economies, as it is now again being permitted to do, by providing the best possible framework within which sterling may play its fullest role as an international currency.

Flexible Money in the Freer Economy

THE contribution made by domestic monetary policy to the great resurgence of sterling and of the London market may seem, at first glance, to have been of little significance beside the impetus given by the monetary authorities through their activities in the sphere of international finance. In this sphere, as a later article demonstrates, almost every month has witnessed some new and well-publicised initiative. By contrast, the monetary scene at home has seemed to most people—or at least to those beyond the inner circle of the City—to have been relatively quiescent, and policy almost passive. But these appearances are highly deceptive. The unobtrusiveness of domestic policy does not mean that it has played a subordinate role; nor, indeed, is it really possible to separate the two strands of policy. But, if any distinction can be drawn, it is fair to say that domestic monetary policy, so far from being of less importance, has in fact provided the very foundation upon which sterling's international progress has been built.

Of all the influences that combined to break the sequence of Britain's recurrent crises, by far the most important of those deliberately contrived was that started by the change of monetary policy in 1951. This provided the basis not only for Britain's recovery from the acute strains of the crisis but also for the subsequent drive towards economic freedom—in the domestic economy as well as in its international dealings. Sterling's full resurgence is the product of both these processes acting together; the mere avoidance of danger, without the drive for freedom, could never have achieved so spectacular a result. And, whatever argument there may be about the part played by the "new" monetary policy in the first process, there can be no question that in the process of freeing it has played an indispensable role.

The key both to the recovery and to the derationings and decontrolling was the disinflation that spread through the economy in 1952. By prewar standards, it was a very mild disinflation, but the forces of inflation met their first effective check since the war, and that was sufficient to relieve the pressures of excessive demand, to restore buyers' markets in most sectors of the economy and to enable the physical cuts in imports to take place without causing a dangerous depletion of domestic stocks.

The tightening of supplies of credit and the raising of short money rates, though they had violent effects in the financial markets and in certain vulnerable branches of industry, were not pushed to extreme lengths, so that their influence upon the sectors not directly affected was often

not apparent—and has probably been generally under-rated. To many people, the non-monetary sources of disinflation—the loss of business through the cuts in overseas demand and the exhaustion of home consumers after their post-Korean spree—seemed to be much the most important. But it can be argued that even the first of these pressures owed much to Britain's monetary measures—for the dramatic swing to a positive policy after the long years of an atrophied Bank rate went far to convince the overseas sterling area that retrenchment had become desperately urgent. And, on the domestic plane, the change in monetary policy was virtually the only way in which the new Government's immediate measures for meeting the crisis differed from those used by its predecessors. When there is added to

these considerations the fact that the change in monetary policy unquestionably exerted a widely pervasive "psychological" restraint, it becomes reasonable to rate it high among the causes of the recovery.

It was certainly so rated by the authorities. Before the event, the effectiveness of the long-disused monetary weapon could not be surely foreseen; and its actual achievement surpassed most expectations. Once the immediate dangers had been surely passed, this demonstration of the worth and power of the orthodox monetary techniques furnished much of the inspiration for the second process—the drive for greater economic freedom. Flexible money policy is the classical and natural regulator of the free price-system, and the monetary measures of 1951-52 were the first major move in this direction. Its success became symbolic, as an augury and an encouragement.

It also provided much more tangible support than this. Just as the disinflation had created the economic elbow-room within which it became feasible to ease the physical controls, so the knowledge that an effective monetary control was being restored provided the reassurance against the risks that greater economic freedom would bring. Many of the freeings of these past two years, and especially those in import licensing, in commodity markets and in exchange controls, could not reasonably have been risked unless there was confidence that the money and capital markets could effectively perform their full regulatory functions and would be increasingly responsive to the touch of the central bank.

The important contribution of monetary policy in this second phase has not been displayed in dramatic acts such as those that marked its reawakening in 1951-52. Its task has been twofold—to ensure that monetary tendencies did not in themselves give rise to a new disequilibrium, and to improve the technical apparatus so that its flexibility and effectiveness at least kept pace with the needs created by the freeings in the price mechanism as a whole.

It was to discharge this first responsibility that Bank rate was maintained at its crisis level of 4 per cent so much longer than many people deemed necessary. The monetary authorities were obviously determined not to take any chances; their aim was to consolidate the gains that had been won and to ensure that there remained a safety-margin for the drive for freedom. But although the tautness of domestic monetary policy—in the sense, for example, of the directives to the banks about lending policy—was eased hardly at all, the authorities could not be accused of pressing unduly upon business. The successful disinflation of 1952 had given place to reflation; but this occurred partly spontaneously and partly through the deliberate stimulus of the 1953 budget, and did not need an added stimulus from any overt softening of monetary policy.

This explains the seeming paradox, plainly displayed in the accompanying tables, that the phase of continued tautness of monetary policy was marked by a vigorous expansion of the volume of money. The source of this expansion was at first the borrowings by the Government itself, as its budgetary surplus ran down and Britain's deficit-borrowing abroad gave place to a current external surplus. In this period bank deposits rose despite the sharp contraction of the credit needs of the private sector of the economy. But in the past eighteen months or so, although the Government has still been increasing its borrowing from the banking system, its rate of new borrowings has been much reduced, while the private sector, instead of reducing its indebtedness to the banks, has been absorbing credit rather more rapidly than the Government. Part of this intake of credit by the private sector of course results from the return to it of financing functions that had been performed by the Government; but, apart from this, it is mostly the natural result of the recovery in domestic activity. So long as the credit expansion was not out of line with this revival, and so long as other evidence suggested that the general level of the economy was still below the inflationary danger-point, there was no reason for the monetary authorities to feel that the credit trend was inconsistent with the cautiousness of their

for many bank loans and overdrafts. But the authorities contended then, and would still contend, that the softening was really only incidental to an attack upon the second part of their task. That Bank rate "adjustment" was the first of a series of moves designed to give more genuine flexibility to the revived monetary apparatus once the difficult transition from inertia had been accomplished and the lines for further advance tested. The shock of the transition had been cushioned by special devices that were quite out of keeping with the principles of a freely functioning money market—and whose adoption had, indeed, led many people to question at first whether the authorities were not rather half-hearted in their protestations about the virtues of flexibility. But their moves last autumn showed that these devices had been designed for temporary use only.

The reduction of Bank rate then, without any reduction in the rate for seven-day loans to the discount market (formerly the "special" rate, introduced in 1951, for loans against the security of Treasury bills only), struck away the advantage that had been given to the Treasury bill. Simultaneously, the Bank withdrew its objection to a lowering of the market's uniform rate for commercial bills, and by these two measures enabled the Treasury rate and commercial rates generally to come into more reasonable alignment. And, a few weeks later, its conversion operation to deal with the November maturity of Serial Funding Stock—one of the stocks by which the banks' holdings of Treasury bills had been funded as a means of curtailing the liquidity ratio—revealed that the objectionable technique of compulsory funding had been entirely dropped.

These measures not only produced a more natural relationship of rates in the market but enabled the authorities themselves to operate more flexibly upon it. The technique of using variations in the day-to-day supply of funds as the means of deliberately influencing market discount rates has been developed much more noticeably in recent months, and on several occasions has been valuably employed to give a clear lead at moments when other influences—notably those emanating from New York—threatened to cause a change of trend.

The new flexibility has, of course, been seen most strikingly in action on the occasion of the reduction of Bank rate, to 3 per cent, last month—the first entirely normal change in the rate for many years. This is indeed the point at which the intimate connection between the availability of efficient monetary weapons and the drive for freedom can be most easily seen. The new freedom, and the confidence it has inspired, has been the immediate cause of the massive flow of overseas funds towards London in recent months. But an undue intake of highly volatile money might raise the risks of freedom embarrassingly; the classical instrument has therefore been used to discourage that particular type of influx. Sterling's strength has in the traditional manner provided the signal for an easing of rates at home. And the traditional weapon will surely be used again when the opposite pressures recur.

Steps in Convertibility

UNDER British exchange regulations at present, the only foreign holders of current sterling that can automatically convert their balances into dollars are residents of the dollar area, and holders of certain other special types of sterling accounts. But in the past year the drive towards effective convertibility for all foreign holders of sterling has gone so far that it is only a slight exaggeration to say that a granting of full sterling convertibility to non-residents would represent little more than an official recognition of a practical *fait accompli*. The progress made in widening the scope for using sterling has in this important phase followed the dual lines of the so-called "collective approach" to convertibility—its aim has been freer trade as well as freer payments.

Along the first line a major achievement has been the liberalisation of imports into the United Kingdom from other West European countries. In spite of the fact that Britain has remained in substantial debt to the European Payments Union, the percentage of private-trade imports that are permitted without restrictive licence (expressed as a proportion of total imports in 1948) has been raised during the past year from 58 to 80 per cent. The extent of relaxation has, moreover, been greater than these figures suggest, because the proportion of total imports into Britain handled by private traders has substantially increased—so that the percentages apply to a larger segment of total imports.

The removal of quantitative restrictions on imports has not, however, been restricted to goods originating in countries of the Organisation for European Economic Co-operation. There has also been a substantial, though less publicised, easing of restrictions on imports from the dollar world. For certain goods, such as newsprint, larger allocations of dollars have been made available; but by far the most important easing of restrictions on dollar imports has come from the freeing of commodity markets and the associated granting of "open general" (that is quite unrestrictive) licences for many of those commodities—provided that any resultant dollar imports are made only for consumption in the United Kingdom. About 50 per cent of the imports now coming into Britain from dollar sources are wholly free of import restrictions.

The list of commodities freed from Government import and restored to private trading during the past twelve months is long and impressive. In foodstuffs it includes wheat, other cereals and feeding stuffs (May, 1953), rice (July), dried fruits (December), and oil and oilseeds (January and February, 1954). Among other commodities freed in the past year are copper (August, 1953), and hemp, sulphur, magnesium and tungsten in the first four months of 1954.

The associated reopening of many commodity markets of international importance has embraced, moreover, markets of special significance from the standpoint of convertibility, namely, those for copper, cereals and cotton. Copper is one of the few dollar commodities that may now be freely re-exported to any destination—and hence provides a medium through which foreigners can in effect freely convert their sterling into dollars. In the case of cereals, exchange control arrangements have been made that allow imports irrespective of the country of origin

and of the currency in which payment has to be made, but only on condition that they are intended for home consumption. Cotton is at present importable freely only from non-dollar sources, but in September dollar cotton also will be freely negotiable on the Liverpool futures market. Where these commodities are intended for re-export to a sterling area country, the necessary permission of the exchange control in the country in question must be secured if dollars have been paid by the United Kingdom importer. If re-export is made to a non-sterling country the general rule to be followed is "dollar for dollar."

Considerable restrictions do thus remain on convertibility of sterling into commodities having an international market, though it is interesting to note that those restrictions are less rigorous for residents than they are for non-residents. The freedom with which dollar goods can be imported into Britain for domestic consumption may, however, be ranked as one of the major aspects of the advance towards convertibility made over the past year; whilst the more limited freeing of commodity markets to international traders has made a far-reaching step towards convertibility for the foreigner.

*

It is, however, along the line of freer payments that the most direct evidence of progress towards convertibility will be found. One of the first actions of the Conservative Government after it took office in October, 1951, was to resurrect the London foreign exchange market. Official quotations for forward exchange were discontinued and authorised banks were permitted to deal forward at rates dictated by supply and demand in the market. More important was the freedom given to authorised banks to transact foreign exchange operations as principals and no longer merely as agents for the authorities. These moves were, however, merely the curtain raiser. The genuine performance began in May 1953, when the resumption of arbitrage transactions between the principal European exchange markets in the more important EPU currencies was permitted. At first, the arbitrage operations were limited to spot dealings, but in October they were extended to forward transactions for periods of up to three months.

This restoration of arbitrage facilities marked a considerable step forward in the freeing of foreign exchange dealings. The new scope for multilateral arbitrage operations in a free foreign exchange market quickly ensured that the cross-rates of exchange came into line with bilateral rates. Experience showed that the dealing skill of London bankers and specialist houses had not been wholly lost; before long, London was again attracting a very substantial part of Europe's foreign exchange business. It was then found that arbitrage dealings through sterling, in the main transacted in London, took up most of the clearing function previously borne by the monthly settlements through EPU.

Two further considerable moves towards convertibility were made last March, when the London gold market was reopened and steps were taken to unify, with a few temporary exceptions, all non-resident sterling other than that on American, Canadian and blocked accounts. The transferable account area was extended to include all non-dollar countries outside the sterling area—except, for the time being, Persia, Turkey and Hungary. The effect was to allow balances in transferable accounts to be transferred freely and without formality for any purpose, capital or current, over virtually the whole non-dollar world. A major simplification has thus been secured in the variegated structure of non-resident sterling. Apart from blocked or capital sterling, non-resident sterling now therefore conforms to two main groups: American account sterling, which is automatically convertible into dollars, and transferable account sterling. In a technical sense, it will need merely the touch of a switch, allowing equally free transfers of sterling between these two groups of accounts, to achieve effective convertibility of all non-resident sterling.

The reopening of the London gold market was necessarily subject to restrictions on its freedom. Complete freeing of the gold market for non-residents would clearly have conferred convertibility of sterling into gold and dollars. Under the present arrangements, therefore, dealings in the gold market are conducted in sterling, and anyone may sell gold in the market, but purchases are allowed only against payment in American or Canadian account sterling or against sterling acquired previously against sales of dollars or gold, and called "registered sterling."

Almost from the moment of its reopening, the London gold market re-acquired its previous position as the premier centre of the world for dealing in this metal. It is a genuine two-way market in which the bulk of the Commonwealth production of gold is now sold and where a large part of the world's demand for free gold is attracted by the exceptionally close rates that dealers quote. Some fears were expressed at the outset that sterling might be damaged by permitting quotations for gold that might depart from the official sterling parity. But the price quoted for gold in London has steadfastly remained below the mint parity of 250s. per fine ounce, so that in fact no such damage has been done. Indeed, by greatly extending the scope of London's facilities as an international financial centre the gold market has made an important contribution to the strength of sterling and so, indirectly, to the goal of convertibility.

*

Yet another straw to show how the wind blows towards convertibility is the more liberal policy that has been pursued by the Treasury and the Bank of England in providing dollars for new investments in Canada. There is accordingly a considerable measure of convertibility of resident sterling into Canadian dollars even for capital investment.

Other significant milestones on the road to convertibility have been passed during the year as the rising confidence carried the various rates for sterling up towards the official parity. The official rate itself has for several months been bumping up against the ceiling of the upper gold point of $2.82, and it would unquestioningly have risen beyond that figure had it not been for official intervention. The rate for transferable sterling has strengthened to nearly $2.79 and that for security sterling is only a fraction below it. These unofficial rates, it should be noted, are within the present official range of permissible fluctuation of the London sterling rate.

This remarkable strength in the unofficial rates for sterling has been achieved without apparent intervention by the authorities. It is for this reason that it can be argued that for most practical purposes convertibility is an accomplished fact, since non-resident holders of sterling can now secure convertibility of their balances at virtually the official rate. This puts a reassuring gloss on the estimates of the strain that may have to be taken by sterling if and when that accomplished fact is formally acknowledged.

East of Suez

East of Suez! A phrase that quickens the imaginative pulse, evoking images of a strange, exciting world—the mysterious Orient, the exotic East of Stevenson, Kipling's India. Life would be dull, indeed, without fiction, and Kipling and Stevenson will always find a welcome from the armchair traveller; but for those concerned with the sterner stuff of eastern commerce, information of a more realistic nature is required. This explains why so many businessmen and traders consult the National Bank of India for accurate and dependable information on conditions in the East. Through their long-standing associations the National Bank of India have established an unrivalled knowledge of the many problems peculiar to eastern trading, and can supply up-to-date information on the prevailing conditions and trends in your particular market.

A comprehensive service is available at the Bank's branches in INDIA, PAKISTAN, CEYLON, BURMA, KENYA, ZANZIBAR, UGANDA, TANGANYIKA, SOMALILAND PROTECTORATE AND AT CAMP AND STEAMER POINT, ADEN.

Canada Plans a Money Market

THIS current year, the year of the decennial revision of the Canadian Bank Act, under which the eleven chartered banks operate, is proving to be an unusually eventful one. Some of the significant changes in banking practice now taking shape stem from actual changes in the law—including amendment of the Bank of Canada Act, under which the central bank operates—but one of the most interesting will come from the voluntary action of the banks themselves. The chartered banks are now actively discussing an arrangement that would give Canada its first beginnings of a short-term money market. The Bank of Canada, which has long favoured such a development, has acted as an unofficial godfather behind the scenes, and it is expected that the first definite steps will be taken within a week or two.

Under the present system the absence of a genuine call loan market has led the Bank of Canada into a role that cannot be regarded as suitable for the regular operations of a central bank. The cash position of each chartered bank has to be regulated by strictly bilateral transactions with that institution. If one bank finds itself temporarily short of cash it goes immediately to the Bank of Canada to sell bonds, while a bank that is "over" in cash will in due course correct its position by buying bonds from the Bank of Canada. It has long been felt in official quarters that it would make for a healthier and more flexible banking system if these corrections could be made by inter-bank dealings. Inevitably, banks that are short of cash are in more of a hurry to replenish their reserves from the Bank of Canada than the banks that are long on cash are to get rid of it, so that the volume of central bank credit constantly tends to be larger than is strictly necessary, thus weakening the central bank's power of control.

*

Last year, moreover, the Bank of Canada found itself obliged to inaugurate a scheme of its own for financing the inventories of bond jobbers. Having, early in 1953, rearranged the issue of Treasury bills so as to provide regularly weekly issues and maturities, the bank wished to encourage dealing in these and other short-term maturities by encouraging jobbers to "run a book" in them. To provide adequate finance at sufficiently low rates, the Bank offered a purchase-and-resale agreement. Reporting on this in the Bank's annual report for 1953, the Governor, Mr Graham Towers, said:

> "These arrangements offer jobbers an alternative method of financing inventories of such securities so that they are at all times able to meet the requirements of their customers, including other bond dealers who only occasionally have transactions in short-term securities. A further effect of this arrangement is the relieving of the market from excessive pressure in the event of a temporary shortage of cash on the part of the chartered banks. Development of a broader market in Treasury bills and short bonds is of value to chartered banks wishing to adjust their cash positions either by increasing or reducing their portfolios."

When the new scheme begins to operate, cheaper call loans from the chartered banks may displace the purchase-and-resale agreements as the main source of finance for bond jobbers, but it is probable that the Bank of Canada will maintain its facilities as a sort of backstop.

If the new call loan market develops as expected, it will fit in with the new statutory requirement governing the banks' cash ratios. The Bank of Canada is now given power to regulate the minimum monthly cash ratio of each bank at limits set between 8 and 12 per cent. The cash ratio will not be a fixed daily minimum, but will be calculated on the average reserve held over a period of a month, in order to provide a reasonable flexiblity. A fixed daily minimum, it is argued, would prevent the reserve from ever being used. When the new procedure takes effect, the required minimum ratio will be 8 per cent, and the Bank of Canada will be able to raise it at any time provided it gives a month's notice; but no increase may exceed 1 per cent in any one month. The new power is regarded in Canada as furnishing a potent weapon to the central bank against the return of inflationary pressure; but it is not expected to be used in more normal conditions.

*

Another major change, which had a mixed reception from the commercial banks, was legislation authorising them to invest and deal in insured mortgages on residential property. The major source of mortgage money for a very considerable housing programme in recent years has been the insurance companies, but last year they showed signs of approaching their saturation point for mortgage investment. The federal government's housing authorities were therefore confronted with the alternatives of increasing the government's participation by direct loans, which they were reluctant to do, or of finding other private sources of funds. A scheme was therefore devised whereby a Crown Corporation, called Central Mortgage and Housing, would insure approved mortgages on new house building, subject to inspections by its own staff. The banks have been authorised to invest in these insured mortgages, and they are being encouraged to deal in them, though it is provided that if a bank sells mortgages to a private investor, it must continue to manage them for a small fee.

As some time-lag was expected before the banks could meet the whole demand for mortgage money, the Central Mortgage and Housing Corporation was provided with funds and authority to provide direct government loans for house-building if this appeared necessary. After two months' experience, it now seems much less likely than it did that the Government will have to lend on any substantial scale. In spite of the rather grudging reaction of some banks, the way has been opened by others. The Bank of Montreal jumped in immediately after the law came into effect, and made the first loans, both to commercial builders and to private owners, at both ends of Canada. Immediately afterwards the Royal Bank followed with newspaper advertisements inviting people to discuss their mortgage needs with their bank managers. The scheme appears to be off to a good start.

During the House of Commons' discussion of the amendments to the Bank Act, the question of personal loans was

raised by one of the banks. Mr N. J. McKinnon, general manager of the Canadian Bank of Commerce, suggested to the Commons Banking and Currency Committee that the permitted interest rate on small personal loans should be 1 per cent per month, and that the banks should be allowed to take chattel mortgages as security. Under the old act no loan payable in Canada may carry interest or a rate of discount higher than 6 per cent, and chattels may not be accepted as security for ordinary personal loans. The Bank of Commerce has already devised a scheme whereby it makes personal loans at a 6 per cent discount and payable in instalments, giving it an effective interest rate of nearly 10½ per cent, and Mr McKinnon explained that he thought the bank could provide a greater service to borrowers if it could get a slightly higher return. Mr T. H. Atkinson, general manager of the Royal Bank and this year's president of the Bankers' Association, opposed this proposal, and the Commons Committee was obviously not sympathetic to it; but the Government did say, rather unenthusiastically, that it would not oppose an amendment to make chattel mortgages available as bank security for personal loans. The Committee is reporting to the full House accordingly; and chattel mortgages will presumably be permitted in the amended Bank Act.

Another recent development of practice as distinct from law, the launching of a new type of personal savings plan, has aroused some interest and argument. The Bank of Nova Scotia has started a "Personal Security Plan" that combines an insurance feature with a regular monthly savings deposit. The small saver, between ages 6 and 46, undertakes to reach a stated "savings goal," between $100 and $1,000, in 50 monthly instalments. So long as his deposits continue regularly, he is insured from the time of his first deposit for the full amount of his savings goal. The success or failure of the plan will be followed with some interest, because many bankers believe the bookkeeping will be too great for the results achieved.

Other changes in the Bank of Canada Act are worth noticing. The most important of these, on the longer view, may be a removal of the restrictions that formerly forbade the central bank to hold securities of over two years' maturity to the extent of more than 50 per cent of its liabilities. This relaxation does not foreshadow any early change in the Bank of Canada's holdings, but it does clear the way for Central Bank operations in the long-term market if such intervention should ever seem desirable in the future. It would ensure that the Government would not again have to resort to the use of its own securities investment account if it wished to influence the long-term market, as it did for a while in the years immediately after the war. A more immediate advantage for the Bank of Canada is the increased scope afforded to it for smoothing the launching of new issues—such, for example, as the $300 million of 3¼ per cent 1976 stock and the $550 million of 2¼ per cent 1956 stock issues that were sucessfully issued in May.

New requirements have also been laid down for the holding of foreign currencies by the Bank of Canada. Its new powers are restricted to holding any amount of obligations of the United States Government in any form and obligations of the United Kingdom Government in maturities of up to six months. Formerly, the Bank was authorised to hold maturities up to six months of any British Dominion or of France. Now the restriction to the short-term securities of the United Kingdom alone—and, in effect, virtually to UK Treasury bills—will merely leave scope for employment of the limited amount of sterling that the Bank holds as working balances.

Australia's Economic Recovery

BY A SPECIAL CORRESPONDENT

"AUSTRALIA'S finances have never been more solid, her prosperity never more noticeable, and her Treasury never more solvent." This broadside marked the opening of Mr R. G. Menzies's successful campaign in last month's general election. Its hyperbole did not, however, go beyond the bounds of electoral licence; for Australia has indeed made a striking recovery from the near-crisis of 1952.

The drastic cuts in imports, aided by the maintenance of high prices for exports, converted the external payments deficit of £A580 million incurred in the twelve months to mid-1952, into a surplus of £A171 million in 1952-53. In the eight months to end-February last there was a visible surplus of roughly £A136 million. Net payments for invisibles absorb nearly £A200 million a year, but when receipts from non-monetary gold and net capital movements are taken into account, it would appear that, even after the almost complete lifting of the import ban, Australia should this year show a comfortable surplus on its balance of payments as a whole.

This external recovery has been buttressed by a check to the dangerous wage-price spiral. On September 12, 1953, the Arbitration Court suspended the automatic quarterly adjustment of basic wages to movements in the cost of living index, and in the ensuing six months this index (for the six capital cities) was virtually stabilised. This process has, of course, been assisted by the tendency of the average cost of imported goods to fall, but there has also been a decline in the average cost of goods of internal origin. The shortages, notably of fuel and power, that were a constant danger to the economy until two or three years ago have almost completely disappeared.

An interesting aspect of this recovery is the comparatively painless manner in which it has been achieved; it might have been expected that the extremely drastic cut in imports would have caused major dislocation. The maintenance of reasonably high and stable export prices obviously eased the transition, especially by sustaining confidence—even though it maintained domestic demand at a time when the supply of consumption goods was falling. But there can be no doubt that the comparative smoothness of the adjustment owed much to the banking system, and especially to the Commonwealth Bank—which inspired a flexible banking policy, and ensured that the deflationary shock (particularly to the import trades) did not go beyond bounds. But although the pressure was not allowed to lead

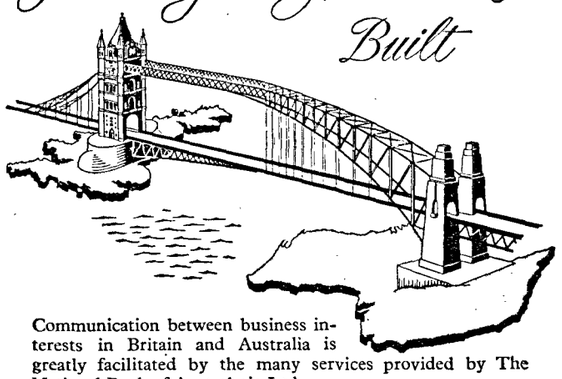
EVERY TYPE OF BANKING BUSINESS UNDERTAKEN

The Bridge the "National" Built



Communication between business interests in Britain and Australia is greatly facilitated by the many services provided by The National Bank of Australasia Ltd.
In addition to providing a full range of financial facilities the Bank undertakes industrial surveys, supplies economic information and helps with business introductions. If you deal, or are thinking of dealing with Australia, the Information Department of its London Office can smooth your way.

THE **NATIONAL** BANK
OF AUSTRALASIA LIMITED
(Incorporated in Victoria)

Your best introduction to Australia

to great hardship or many dramatic failures, it was sufficiently acute to carry a sharp lesson both to management and to labour. The resulting shake-out was salutary; labour conditions have certainly improved since then, and, so far as can be judged, there has also been a real drive for increased efficiency from the side of the employers. In the last six months, moreover, the process of rehabilitation has led on to a marked upswing in business in practically all fields; economic activity has reached a new high level.

★

These are the high-lights in Australia's economic picture. There are, however, some dark shadows. Despite its shake-out, the economy still has a dangerously high cost structure and is beset by rigidities that make the costs problem particularly intractable. The curve of wage rates, which was relatively gentle during the war and early post-war years, steepened violently after Korea, and its flattening in the past twelve months may soon give place to a new advance.

The basic wage (Sydney) rose between 1939 and November, 1946, only from 81s. to 101s.; four years later it was 146s. But in December 1950 a special review conceded an increase of 19s., and in the following two-and-a-half years the quarterly reviews carried it, by May 1953, to 243s., at which level it has since remained. Statistics for New South Wales show that basic average real wages rose by 14 per cent between 1939 and 1952, while the average hours worked declined from 44 to 40 a week.

There is much evidence to show that these trends have established Australia as a high-cost economy. A striking illustration comes from ICI; they may be presumed to be reasonably efficient in keeping down such costs as are within their control, yet the caustic soda produced at their plant at Osborn in South Australia costs approximately twice as much as the ex-duty landed cost of soda from the United Kingdom. Admittedly, production in the United Kingdom has advantages over that in recently erected plants in Australia; but this discrepancy is too great to be healthy.

Every chairman's speech refers to the need for cutting costs, but there is no real prospect of any substantial progress in the immediate future. The strength of the unions in industry and of the Labour party in politics on the one hand, and the political influence of secondary industry on the other; the easy habit of recourse to tariff protection, and the unwillingness of either political party to face the temporary unemployment that would accompany readjustments resulting from even a moderately free play of economic forces—all these factors rule out any radical approach, except under the pressure of imminent disaster.

Moreover, it seems likely that the wage-price spiral will start turning again towards the end of this year. There is a pending demand from the Metal Trades Union for a 28s. a week increase in margins for skill. The Arbitration Court decided last February to defer consideration of this claim until later in the year in view of its likely adverse effect upon the economy as a whole. But the steady rise in the basic wage has indefensibly narrowed the margins for skill. Pressure to expand the concertina at the higher end will eventually become irresistible; the unions will not get everything they ask for, but they will get something.

Similarly, the virtual ban on imports at the beginning of 1952 provided a shield behind which a substantial expansion of secondary industries occurred, some of it uneconomic. The lowering of the ban has consequently led to a flood of applications to the Tariff Board for increased protection. That board, like the Arbitration Court, is acutely aware of the damage that can be done to the economy by any action that tends to increase costs, and it will undoubtedly approach these applications with a critical eye. But, here too, whilst the applicants will not get all they ask for, they will get something—and to that extent the increase in costs implicit in the expansion of industry behind protective barriers will begin to show itself. Courtaulds, for example, has announced that it operated at a loss in Australia during the six months to end-1953, and has consequently applied for increased tariff protection. Similarly, British Celanese (Overseas) has stated that its decision to go ahead with the setting up of a rayon factory on its Geelong site will now depend upon the outcome of the Tariff Board's enquiry into the degree of protection that should be given. A few weeks ago new duties were announced on various types of electronic equipment, titanium oxide, and titanium white; and a host of applications are now before the board.

It should be noted, too, that another inflationary force has come from the budget of 1953-54, which gave "incentive" cuts in taxation totalling £A118 million. The Government, when framing this budget, recognised that much would depend upon the extent to which the released purchasing power went into investment or into consumption; but the financial authorities are now convinced that substantially too great a proportion has been going into consumption.

These inflationary threats naturally do not mean that the current high level of domestic activity will soon subside. Many specific cost comparisons do indeed show the Australian pound to be grossly over-valued; but so long as the present high level of export income is maintained, the economy is effectively insulated against the normal consequences of inflation. If there were a sharp contraction of export income, however, the consequences to the Australian economy would be very rapid and very painful. The fall in internal incomes would, if left to itself, bring about an immediate slump. And if measures were taken to cushion the deflationary impact—the political pressure for such measures would certainly be very strong—a further devaluation of the Australian pound would be hard to avoid.

★

The prospect therefore depends absolutely upon the level of export income, and for the next few years at least this still mainly means the income from wool. Perhaps more clearly than ever before, Australia is riding today on the sheep's back. Of a total export income of some £A800-850 million a year, wool now contributes roughly £A430-450 million. In 1946-47, when wool prices were just beginning to rise, the Australian wool cheque was £A126 million; in 1948-49, not a bad year seasonally, it was £A231 million, little more than half the present level.

There is, however, no reason to take a gloomy view; the statistical position of wool is reasonably sound, and the situation that threatens in the Far East could easily work as a stimulus to commodity prices. It is true that Australia has had virtually eight good seasons in succession, and as the record for such a run is eleven years it would be prudent to expect some drought years in the immediate future; but unless the drought was prolonged and on the disastrous

scale of 1945, it would not be likely to cause major trouble for the economy as a whole.

On a somewhat longer view, an intriguing prospect opens up. Australia's natural resources, it seems, are likely to prove to be of considerably greater importance than was formerly supposed. When every allowance has been made for the exaggerations that greeted the discovery of oil at Exmouth Gulf, it does appear that a substantial field will be brought in, and that favourable conditions exist for the discovery of oil in other areas—with particular promise in Papua and New Guinea. Meanwhile, the outlook for uranium production steadily improves. In addition to the well-publicised operations at Rum Jungle, there have been promising finds at Radium Hill, Myponga, Lake Dundas, Mount Isa, and Adelaide River near Darwin.

Aside from the possibilities of other mineral development, recent research has established beyond doubt that the productivity of land in Australia can be very greatly increased, and some major projects are now afoot to bring into production areas that have hitherto been quite useless. Other land, particularly in pastoral areas, can, by the appropriate measures, have its sheep-carry more than doubled. Experiments in the seeding of clouds that are still in progress suggest that a degree of rain control may be possible that would be of incalculable benefit.

During the next five years, too, Australia will begin to reap the benefits of her major programmes of investment. Power and irrigation projects—notably the vast Snowy River scheme, involving eventual expenditure totalling £A422 million—should be beginning to show a dividend. Programmes of expansion in some of the major industries, particularly steel, chemicals and cement, will be completed, and the extensive re-equipment of certain secondary industries should show its results. The remarkably rapid increase in population, which has hitherto been mainly a source of difficulties, should by then be bringing in its advantages.

Altogether, the long-term prospects for Australia are favourable; though they may not compare with those of Canada, they may come a good deal nearer to the Canadian expansion than has hitherto been expected. Whether these possibilities can be realised comparatively easily and comfortably by a steady expansion will largely depend on the course of the traditional sources of export income in the important development phase that lies immediately ahead.

Extending Bank Mechanisation

IN a number of recent controversies, notably that surrounding the tricky question of bank charges, the banks have faced criticism for not seizing eagerly every available mechanical or technical device that might offer a reduction in the costs of their routine operations. They have indeed been slow to contemplate the revolutionary possibilities of "robot" banking conjured up in some minds by recent developments in electronics that are now being employed to meet other needs in other types of business. But the banks have some excuse for hesitancy on this particular issue, for the problems of organisation that would be involved in any radical change—and only such a change could economically capitalise the real potentialities of electronic equipment—would be immense. And it would be a grotesque mistake to suppose that the banks' attitude towards electronic projects of this major kind is indicative of their attitude towards mechanical aids in general. The banks were among the pioneers in the mechanisation of commerce.

Nearly all branch banks are now mechanised in greater or less degree. Within the past few weeks, indeed, the Midland Bank has become able to claim that all its branches are equipped with some form of accounting machine. Although not all banks have reached this stage, in all of them the process of mechanised account posting that began in the 'thirties has since been creeping outwards to cover almost the whole of the banking network of the country. The pattern of organisation laid down by these machines will not change again until some radically new system of book-keeping is developed. Short of the introduction of revolutionary new systems, there is little that the banks can do in the way of basic innovations. In consequence, their research departments have concentrated during the past three or four years on extending mechanisation to some of the smaller drudgeries of banking.

Within the banks, the man who has gained most from the innovations is the cashier. Two specialised pieces of equipment have come into routine use, a note-counting machine and note-weighing scales. These have relieved the cashier, wholly or partially, of the hypnotic tedium of counting notes by hand. The counting machine can handle notes at the rate of 20,000 an hour, excluding stoppages for torn currency; this compares with roughly 5,000 notes an hour that a trained clerk can count by hand. The scales are designed to weigh notes, normally in bundles of £100; and they are accurate enough to register the weight of a postage stamp.

Opinions differ among the banks about the relative merits and reliability of these two machines. But on one point there is universal agreement: mechanisation of note-counting is economic only when a branch handles quite an appreciable volume of notes a day. A daily intake of about £40,000 in notes is probably the economic minimum—and this is a comparatively high average. When a branch transacts this amount of business, the choice between the two machines is determined largely by the nature of its business. The scales, which are worked on the counter by the cashier, are useful in districts where—but only where—large numbers of £100 bundles are likely to be paid in. For there is less chance of congestion building up round the counter if the cashier can weigh the bundles as they are handed in instead of thumbing through them while the customer waits. The weighing is done, moreover, in the presence of the customer, so that any discrepancy can be immediately queried. This is quite clearly a faster method of working than by using a counting machine, which must handle each note separately; but the scales save work only if the bank normally receives large quantities of notes in convenient £100 packages. The scales are indeed considerably cheaper than the note counter—at less than £50 compared with £750—but the risks of using them may be greater. Opinions differ, however, about the significance of these risks in practice.

The traditional practice of the banks requires that

each bundle of notes received over the counter should be counted once each by two different cashiers. But some of the Big Five do now rely on the reading of either the scales or the counting machine—provided that the customers are known, and that an occasional hand check shows nothing amiss. The banks that adopt this attitude do so because they question the ability of any cashier to detect a forgery once the mesmeric influence of note counting by hand has taken effect; and they believe that the technical difficulties of preparing paper to the exact weight of a £1 note are sufficient to prevent cheating on the scales. Other members of the Big Five are prepared only to halve the hand counting, and not to dispense with it entirely; they use their machines merely as a substitute for the second of the two cashiers who normally count by hand. Needless to say, none of the banks publicises its method of working.

There is no doubt that the introduction of one or other of these two machines has saved the bank counters from becoming swamped under the flood of extra currency that has been flowing across them since the war. The number of bank accounts has risen by 30 per cent since 1939, and the note circulation more than threefold. Without some mechanical devices of this kind it is difficult to see how the extra work could have been handled; it would certainly not have been possible to get enough cashiers behind the existing counters. Silver sorting machines that swirl the coins into slots have had less dramatic effects, but solely because there is only a limited demand for sorted silver.

★

At head offices, mechanisation has taken more advanced forms. In particular, the banks are making increasing use of photography. Cheques are no longer listed separately in the central clearings but are fed automatically into recording machines and photographed on to 16 mm film. The immense number of cheques handled daily in the clearing department of a head office of any of the big banks—it ranges from 250,000 to 750,000—must be visualised in order to appreciate the amount of handling and machine work that has been saved. The banks are also increasingly using photography for the recording or storage of documents other than cheques.

The growing use of photographic film and the consequent acceptance of a photographed copy as the equivalent of the original for most business purposes is indeed providing a new basis for the projects for centralised grouping of branches—even though the actual experiments in centralisation that have taken place have been written off one after the other as impractical. The latest such experiment, technically more advanced than any previously attempted, linked the branches by teleprinter with a central bookkeeping office. From a purely mechanical standpoint, the experiment succeeded, but it was discontinued because the bookkeeping centre could not meet the time-table that the branch managers considered necessary for efficient banking—a time-table that was influenced by the leisurely practice of the Post Office.

Centralisation of bookkeeping is, however, certain to remain a live issue, for in busy and expanding districts the branch banks are often intolerably cramped in premises bought before the war and incapable of extension. If enough cashiers are to be brought in to ensure good service, something must go to give them room, and the obvious candidates for displacement are the accounting sectors and their machines. Already one or two banks have had to move their records away from their main offices. Glyn Mills' experimental television link is well known, but another branch bank, separated from its head office by a shorter distance, is linked by tele-photography with the office where its records are kept. It is hoped that in the next few weeks the apparatus should be able to reproduce material the size of a customer's statement within two minutes. It operates along an ordinary telephone line, and, unlike television, gives a copy of the document than can be torn off.

A third main element in the banks' use of machines is the setting of ordinary office equipment to new uses. Addressing machines are being adapted to do the routine of standing orders for regular payments for customers. Punch cards are coming into more general use in the departments handling foreign business, and also for the banks' own general administration. Less conventional devices, such as tele-tape that will send a hand-written message from one end of a long room to another, are also being used experimentally.

★

Each bank's research for new methods involves the introduction, trial and abandonment of a surprising number of machines. Only a handful of the original products of research ever turn out to be winners. The banks' most conspicuous failure has been to find a way to mechanise the sorting of cheques at the head office clearing. This is the more disappointing as every cheque already carries in the form of its branch code the kind of markings that could be read and interpreted by most of the photo-electric reading devices used in industry. The technical difficulty seems to have lain in the varied size, the crumpled condition and the generally flimsy nature of the cheque itself; it was not easy to visualise a machine that could adapt itself to all these features. But note-counting machines have pointed the way, and now a number of prototype cheque-sorting machines are at last being developed.

Faster progress might have been made not only in this but in many other of the banks' mechanisation problems had they been prepared to put up funds for prototype development. Individually, the banks spend considerable sums on research every year; but their research programmes consist of buying in new machines and testing them out experimentally, and as the majority prove failures it seems reasonable to conclude that the money spent on them might have yielded better dividends had it been employed in contributing to the cost of developing apparatus to do a specific job stipulated by the banks rather than in the purchase of a machine designed for a wider market. An important matter of banking policy that may soon be decided is whether the banks are to sponsor a joint banking research institution with its own small laboratory, or whether they separately place development contracts with individual manufacturers.

The joint committees that have considered mechanisation—and from time to time electronics—have not indeed been fruitful, for the banks appear to remain convinced that the way to maintain their individual identity is to go their separate ways. Provided, however, that the banks accept the need to permit their research departments to take a financially active rather than a passive part in initiating development, there is no need for this commendable desire for individuality to stand in the way of new developments.

Research for Industry

Who are the Innovators?

EVERY theory of the course of events in nature, it has been said, is to some extent a fairy tale; and certainly the conventional tale of technical innovation in that perfectly free and competitive society that economists' dreams are still made on has something of the unwinding other-worldly logic of The House That Jack Built. "This is the inventor who has the idea and takes out the patent and finds the backer who founds the enterprise that markets the invention that earns the profit that pays the dividend that enables the shareholder to back the next invention that the patent system gives an inventor the incentive to devise. . . ." The virtuously spiralling generalisation was never, perhaps, universally true. Today it is by no means universally false. But how far, as a theory of technical innovation in the modern industrial economy, has the classical bargain of the free inventor and the competitive entrepreneur faded into fairy tale?

Some economists would answer that it no longer fits the facts at all. Research has institutionalised invention; today's entrepreneur, or the salaried managerial revolutionary who has filched his chair, has his own forcing-house of new techniques, the laboratory; and it is only big companies that can afford effective research. The new ideas, such economists assert, now grow in the deep furrows where big companies have been ploughing back into research profits withheld from their shareholders. "Most of the cheap and simple inventions have, to put it bluntly, been made." Has the lone inventor of today the equipment to develop new techniques, or the solitary risk-taker the information or resources to back complex research and development? Most innovations can be easily and quickly imitated today, this argument adds, and a freely competitive market might well pass on their rewards to the public before the innovator could get his money back. In industries dominated by a few large firms, however, price leadership may ensure that the costs of development can be recouped before the benefit of innovation is passed on. Is it only in these industries that the high cost of continuous innovation through research can be met?

A glance at the financing of research in recent years, in Britain or the United States, might suggest a reality even further removed from the tradition of the aspiring inventor and the businessman who backs his hunch. Whoever operates the laboratories where technical innovations are nurtured nowadays, it can be argued that the Government often takes most of the risk. In global terms, this is true; the biggest single contribution to expenditure on research and development, in both countries, at present comes from the government—money ploughed into rather specialised technical innovation ordered from Whitehall or Washington. This state support for research and development is largely for defence, and is hence concentrated into a smallish though growing group of industries. Its present level—some 55 per cent of all research spending in America, and possibly an even higher percentage here—may be abnormal. But it was at a high level even before rearmament began.

The significance of these developments may be debated. But both are real changes, and represent major shifts of responsibility for innovation from the individual's imagination and judgment to an administrative plane. The decisions are taken out of the hands of the private capitalist; his contribution to technical progress may be mulcted, before it ever reaches him, by the board or the Chancellor.

★

Some of the direct responsibility for new technical ideas has certainly passed, during this century, from the individual inventor to the team of research workers. Most of the inventions upon which the nineteenth-century industrial economy was built up were the work of ingenious engineers who had experience in the workshop and a consuming interest in scientific knowledge, but seldom academic training in science. Nations and industries, admittedly, differed. In the United States the inventor had perhaps even less contact with scientists than his British counterpart, while in Germany the links between industry and the universities were closer. The chemical industry, again, is one in which such links—and the employment of qualified scientists in management—developed earlier than in most others. But in general the inventors utilised and combined the principles that the scientists made available to them; they were seldom the same people. The lag between scientific discovery and its application in industrial practice was long; the intellectual and social gap between scientist and inventor, too, was often wide.

It was the development of the chemical industry and of electrical engineering that narrowed the gap towards the end of the last century. The first major laboratories set up to serve industry with a regular flow of new ideas to develop came in these fields, though at the outset the laboratories were often still dominated by outstanding individual inventors such as Edison. Investment in research has since become more general—though it still appears to be concentrated into certain industries and into the larger companies—as an insurance premium against obsolescence and an assurance of continued growth. Industry as a whole has become more complex, and requires heavier capital investment, which has indicated new requirements and fruitful areas for research.

Theory and Application

Applied research in the industrial laboratories, moreover, is moving closer to the frontiers of scientific theory. It is perhaps only in the atomic energy industry that application has seemed to advance hand in hand with theory—less through miraculous new methods of applying scientific knowledge quickly than through the removal of normal restraint upon the expenditure the nuclear physicists could command. But in certain other fields applied research is hard on the heels of theory ; and throughout industry liaison with fundamental research is close and the possibilities of application are systematically explored. This, too, loads the dice against the individual inventor, reducing the area of unexplored scientific knowledge from which he may draw undiscovered applications to industry.

Over the years, the proportion of patents held in the name of corporate bodies, not individual inventors, has grown considerably ; though, in general, reliance upon the patent system may be declining. In modern research organisations, the man who makes a discovery seldom benefits directly from the time-limited monopoly that a patent confers, whether it is filed in his name or not. In government laboratories, various tribunals may award the individual a grant or certain rights in the value of the idea. In the research association or many industrial companies' laboratories, even the grant system is dying out. In cases where individual responsibility for valuable new ideas can be established, the scientist concerned often receives his reward as a rise in salary or promotion.

Use of the patent system, too, has been affected by the fact that rival companies' research teams can quickly imitate most innovations. A patent, after all, has been called "only a licence to litigate" ; and to file the application immediately a discovery is made may hand valuable information over to equally research-minded competitors. Innovations in one's own manufacturing processes, in particular, are often nowadays patented only after a period. A competitor who learns enough of a new process from the patent specification as deposited to use it in his own plant, directly or indirectly, but who never intends to sell the process itself, might gain more from the patent than the original discoverers. One real meaning of that word "know-how," which has recently become so common as to irritate purists in English, is the technical knowledge that a company considers it unwise to patent but may after a time be prepared to sell. Its substantial value is demonstrated by the fact that while a patent may be licensed for perhaps 2 per cent of turnover, patent plus know-how may cost as much as 8 per cent.

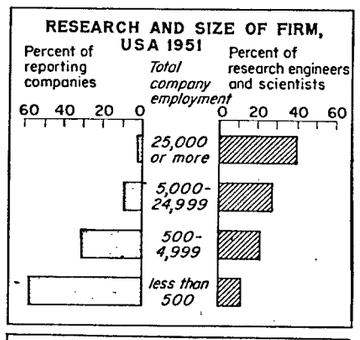
The individual inventor, it should be said, is by no means a figure of the past, limited though his field of operation may have become. There is a continuous flow of new ideas and gadgets from the inquiring amateur, particularly in ingenious applications of such standardised devices as the low-powered electric motor—the mechanisation of the home is an obvious field. More importantly, the extent to which innovation flows from research varies between industries. In engineering, for example, much of the improvement in capital equipment still comes from the ideas of the production engineer, the design department, a new demand from the customer, or from the ingenious operative. Though the company's suggestions box may exist primarily to improve labour relations, it brings in a residue of technical ideas as well as better operating methods ; and, particularly in light engineering, some very profitable new ideas since the war have come from men with little training but a flair for doing things differently, who have found backers with some money and more imagination in much the same way that James Watt went into partnership with Matthew Boulton at Soho in 1775.

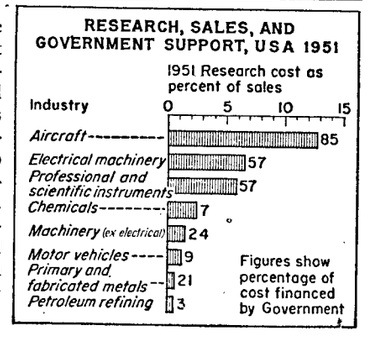
Technological change, moreover, is not confined to actual innovation ; its main effect upon an economy, perhaps, occurs through the imitation by industry in general of the new ideas of the most advanced companies. Some industrialists, indeed, would argue that there is always an advantage in being second or third in a field, rather than first ; and the large mass of smaller companies will change their methods—though more slowly—to follow the leaders. Fashion, indeed, seems to have some influence ; and in this way the research carried out by the leading companies must eventually pass some of its rewards to the rest of the industry.

Research and Bigness

IT may cost £15,000-£20,000 a year to run anything effective in the way of an industrial research department. That is why, as Sir Ben Lockspeiser once said, the firms in this country that can afford to do any substantial amount of research themselves are numbered in hundreds, while those that need research are numbered in their thousands. The chart showing research and development expenditure by size of industrial companies is for the United States ; but the pattern is probably similar here.

Concentration of research into the larger companies is perhaps a permanent feature of modern industry. Its concentration into industries heavily engaged on research and development contracts may be temporary. The British Government does not disclose the industries into which its military research and development expenditure channels public funds. But some of those that receive most support in the United States—aircraft and electronics — are certainly the main recipients here, too, and among the largest industrial spenders on research.





New Agents of Change

During this century, then, the development of large-scale research along with other large-scale economic organisation has partly transformed the traditional picture of technical innovation in the free economy. Dependence on the free inventor and the free investor, who were together the agents of change during the most profound technological revolution in history, has diminished. Many scientists and some economists would argue that what Calvin B. Hoover this winter christened "the organisational economy" of today has found a surer and faster method of technical progress.

That the applied research team is generally superseding the old agents of technical change, nobody doubts. It is to be hoped that it is surer and faster—but perhaps rather early to be sure. It has not yet, perhaps, had time to pile up as impressive a record of practical innovation. Many of the technical triumphs of recent years, certainly, have come from these big battalions of applied science—the new synthetic fabrics, for example, and most of the new plastics. But the jet engine, which combined individual brilliance, development by big companies, and government money, is a reminder that the parentage of technical change is still often mixed. It has been asserted that companies operating large research organisations themselves commonly rely on outside sources for two-thirds of their new ideas, though it is not easy to know how this could be measured. Such external inspiration does not necessarily come from the outside inventor on his own ; it is often the incidental product of research in other large companies. The brains corralled in a big laboratory often range beyond the periphery of their own employer's direct interests ; this may provide the organisation with profitable ideas to dispose of elsewhere—as Calico Printers passed on "Terylene" to ICI. Alternatively, it may encourage the company to enter into new fields to exploit these branching ideas.

The amount of government money in research, too, raises some questions. Its present extent—and the width of its range—may be temporary. In the United States between 1951 and 1953, it has been said, almost any company that had a new technical idea even remotely "affecting the national interest" could get some agency or other in Washington to pay for development. In Britain, too, the Ministries most concerned with research and development have nearly doubled their expenditure since rearmament began, though this is more confined to defence industries. Even so, with the main research effort in new industries such as atomic energy likely to remain entirely under state control, the Government seems likely to continue to provide a large slice of total research expenditure ; which is not an unmixedly good thing. Its support may assist certain valuable technical innovations towards commercial practicability ; but it would seem likely, over any long period, somewhat to twist the direction of research effort away from the lines that ordinary economic demand would indicate.

In counting the high cost of defence to the modern economy, people commonly talk of the perhaps 10 per cent of national income that may go into it. They might better count the long-term cost of pre-empting as much as half 60 per cent of the nation's research resources—in which first-class men are much scarcer than money—for defence. Military research brings much valuable civil development in its train ; but inevitably other technical progress has to be forgone.

Today there is every need to devote the maximum share of industrial resources—in Britain in particular—to research, if the twentieth-century industrial economy is to be made as effective in promoting technical advances as the nineteenth-century economy out of which it has been crystallising. The change, call it what one will, of course affects more than technical innovation. One may hope that self-financing and institutional investment can be relied on to promote as many risks as saving by the individual investor. But they may not ; and individual originality will still have a contribution to make to the scientific industries of the future. Mr Murray of Salford, tethered ten feet above the ground in his home-made helicopter by order of a government that ploughs millions into the development of new types of aircraft by established companies, may well reflect upon the Duke of Edinburgh's dictum "The day of the private adventurer in science is over." It is still perhaps not too old-fashioned to hope that he will not quite believe it.

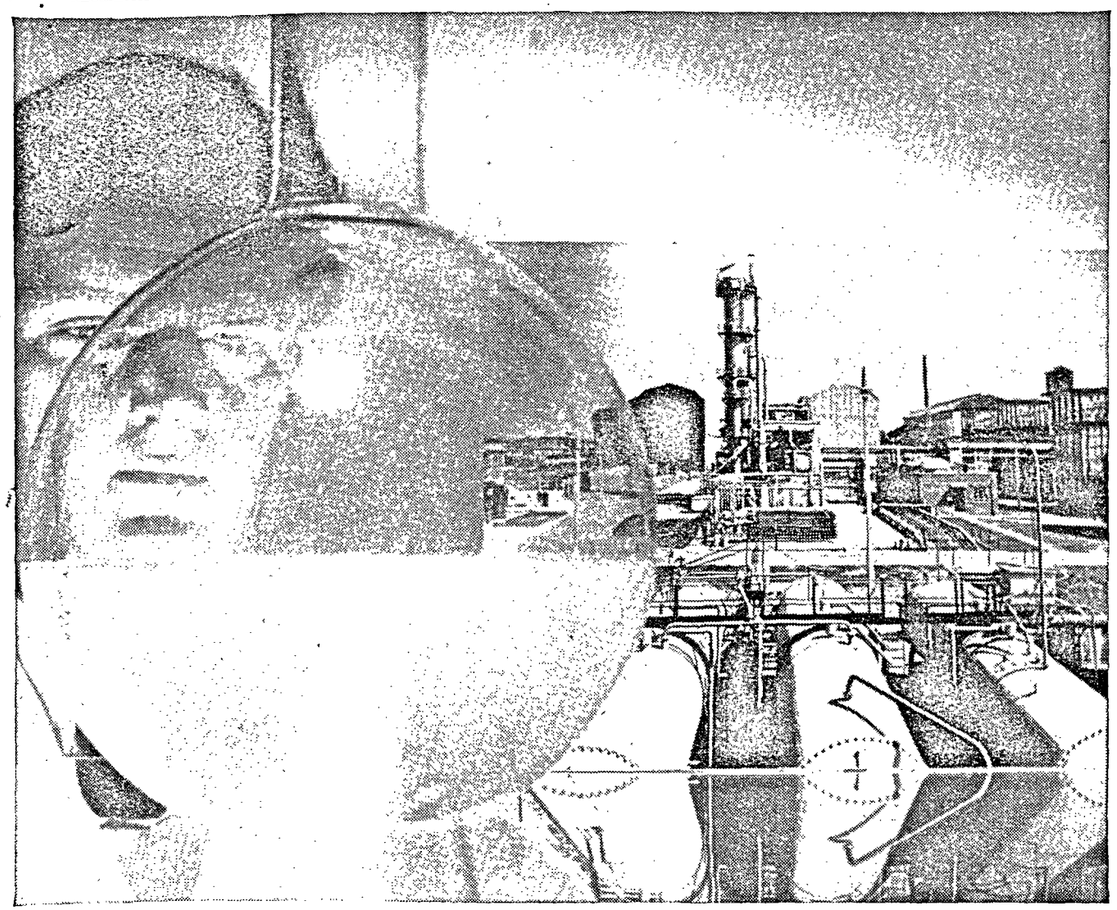
Assisting the Inventor

ALTHOUGH industry's own laboratories have taken over much of the responsibility for technical change in the modern economy, a continuing flow of new ideas still comes from the individual inventor. Do these ideas receive sufficient welcome ?

Prewar economic folklore had it that large numbers of potentially valuable inventions were either frozen out by the indifference of established industries or bought up and suppressed. There was not much truth in that. There was more truth in the complaints that some useful British ideas went begging until they were developed in America or sold back and licensed to this country—though the reverse was occasionally true, too.

Postwar economic folklore has it that the National Research Development Corporation was set up in 1949 simply to develop valuable British inventions that failed to find commercial support. In fact, the corporation's first duty is to develop and patent possibly commercial innovations that arise in Government research work, though it has also the power to put public money into the development of inventions from other sources when this would appear to it to be "in the public interest."

In its first four years, the corporation considered only five inventions submitted to it from private sources worth developing with public money. This might indicate that the majority of new ideas from the individual inventor, if worth while, can find sufficient commercial backing from industry itself. But the element that is to some extent lacking today is the individual capitalist prepared to take a gamble on an inventor's brain-child. The proper prudence obviously required in the investment managers of trusts, insurance companies and the like is not the ideal attitude required for putting money on long shots in engineering. And the almost emotional link between the backer and the inventor, plus the amount of time and worry that small capitalists often invest along with their few thousand pounds, is something for which institutional money may offer no substitute.



INVENTION AND ACHIEVEMENT

EVERY TWELVEMONTH sees a score of entirely new products added to I.C.I.'s selling range. The list may include new plastics, new fibres, new paints, new drugs, and more besides—materials which, because they offer new properties and qualities, have an invigorating effect upon countless branches of activity. These are the fruits of a research and development programme which operates over a very wide front, and is currently costing I.C.I. no less than £7,500,000 a year.

Yet research—and discovery—are only the beginning. There remains the problem—always complex and sometimes supremely difficult—of translating laboratory techniques into bulk production processes, so that the new knowledge won may be swiftly made available to the nation's industries. It is significant that, in the nine years 1945-53, I.C.I. spent over £146,000,000 on new capital construction, of which nearly £50,000,000 was for the erection of plant to make entirely new products. A further £60,000,000 has still to be spent to complete new projects now in progress.

I.C.I.'s policy is to anticipate the changing trends and likely demands of industry and agriculture, and to be ready with the new products and production capacity to meet them.

Problems in a Mirror

IT has become a truism, of late, to complain that Britain fails to apply new scientific knowledge within industry as fast as the United States. It is less well known here that the problem has what might be called its mirror-image in the United States. The worry of scientific administrators on the other side of the Atlantic is that their great industrial republic, with the superb technique it has developed for turning fundamental ideas into prodigious ironmongery, is itself doing insufficient fundamental research to generate those new ideas.

Comparison of the effort devoted to research within the two economies is hampered by a familiar difference. The United States produces so many statistics of research that it is difficult to know which to choose or quite what they mean, while Britain produces hardly any useful figures at all. In the last three years, in particular, American agencies such as the National Science Foundation, the Bureau of Labor Statistics and the Department of Defence, with the assistance of industrial associations and specialised academic bodies such as the Division of Research of the Harvard Business School, have carried out an exhaustive statistical survey of almost all research and development activity in the United States. Providing that certain discrepancies are accepted—for example the estimate of total research and development expenditure in 1952 is nearly $3 billion by one count, and about $3¾ billion by another—and that the definitions of research and development are not taken too strictly, these figures offer an informed basis for comparison—and for policy. The educated guesses possible for Britain, on the other hand, are inadequate by any statistical criterion.

Certain of the estimates are illustrated on page 12. Broadly, it appears that American spending on research totals some $3 billion, or about 1 per cent of the gross national product; that more than half of this research and development is currently being paid for by the government, while roughly two-thirds of it is actually done inside industry; and that the money spent inside industry for research and development amounts to some 8 per cent of total investment in new plant and machinery. British figures for 1951—the latest date for which estimates for industry, based on a very small sample, are available—suggests a total expenditure on research and development, in the widest definition, of perhaps £200 million; on a more conservative basis of guessing the total would not exceed £100-£125 million, which is also of the order of 1 per cent of GNP. Lack of information about industrial spending on research—particularly in small and medium-sized companies—is one source of uncertainty here. Another is the ragbag of activities that the Government includes under "Research and Development Expenditure" in its annual estimates. For 1951-52, these totalled some £141 million; for 1954-55, the estimates total nearly £200 million, plus some unspecified part of the £53 million to be spent on the atomic energy programme and the research expenditure included in the £28 million that goes to the universities.

In the United States, the Bureau of Labor Statistics has estimated, some 96,000 research engineers and scientists were employed by 2,000 companies that did about 85 per cent of American research and development. The cost of research effort amounted to some $22,000 per qualified man. In Britain the comparable cost may be no more than about £2,500.

It is not too easy to separate fundamental research from applied research; but in 1952, the National Science Foundation has estimated, only about 6 per cent of the $2.2 billion spent by the American Government went into fundamental, or "basic" research. The comparable proportion for Government spending here might be somewhat higher, and almost certainly the proportion of total effort devoted to fundamental research in this country is considerably higher than in the United States. One American economist who came to study research in this country, indeed, put it as high as a quarter of all research work, shortly after the war. A similar emphasis upon fundamental research may well exist elsewhere in Western Europe.

The result of this contract, so far, has been that the United States has relied to a considerable extent upon the flow of fundamental scientific knowledge from Europe; and that Britain, at least, has complained that its new ideas are too often developed in America faster than at home. The United States is no longer content to rely upon so many imported ideas, partly for reasons of prestige and partly because it feels the flow might dry up or be turned off. A frequent habit of American historians of science is to count the number of American giants of fundamental science, as measured on one list or another. Of late, the numbers who have won Nobel Prizes is a favourite yardstick—and one by which America's score is greatly improving.

★

Britain, at first sight, has much more to be anxious about. With few natural resources except skill, in a world where technological know-how is spreading fast, this country needs to retain its technical lead, a task that is always inherently difficult. Moreover, the supply of basic scientific data to America for development is an unprofitable division of labour, even if America possesses undeniable advantages in the job of application. One famous estimate by an American economist, indeed, has suggested that America receives considerably more economic benefit from British fundamental research than Britain does itself; and that British basic research, therefore, has reached the stage of diminishing returns. For fundamental scientific knowledge is communicated free. Development costs more money; but its results are saleable.

Need America, then, pursue this scientific autarchy? Should it not remain content with staying able to develop anybody's ideas, wherever they come from, faster than the next economy? Its administrators might well reply that the free flow of scientific knowledge is at present threatened, directly and indirectly, by political dangers. The veil of security shrouds atomic development, giving rise to the admirable but somewhat wasteful efforts by which America's allies have had to duplicate much of its development work to reach the stage of nuclear energy production; and it is drooping over other fields of scientific inquiry. Moreover, an economy based upon such a rate of technological progress as the American must ensure that the flow of basic ideas is uninterrupted. It can surely maintain its capacity to apply new knowledge fast without the present

lopsided distribution of its efforts in scientific research.

It will probably be easier to adjust the balance in the United States than here, in terms of spending. There, it is a matter of altering allocations within a huge expenditure. In Britain, whether or not fundamental research may yield diminishing returns, it would be intensely dangerous to attempt to cut the country's effort in fundamental science. What is needed is a larger expenditure upon the application of science; a larger flow of technologists than there are today facilities for training or than at present seek training; and some changes of attitude within industry itself.

Both countries may find certain shifts of emphasis necessary within their educational systems. Here, a more easy acceptance of scientific knowledge at all levels of education is needed; and there, perhaps, more exacting training of the first-class brain. In recent years, of course, the United States has relied upon a flow of scientific immigrants from Europe, as well as a flow of scientific ideas; and recruitment is still continuing. Europe need not begrudge these scientists; the interchange is generally valuable. But it does not seem likely that the United States, in the future, should have any difficulty in supplying its own share of fundamental scientists. In Britain, it can perhaps be assumed, raw material of the necessary quality is not lacking, though too little of it, still, may be receiving scientific training. Other resources for technological progress here are much scarcer; this economy offers far less room for manœuvre. It is as difficult to say how much of its resources a country should be putting into research as it is to say how much a particular company should. But considering the natural resources and the present economic circumstances of the two countries, it may be permissible to guess that Britain should be devoting a much greater effort to research, in proportion, than the United States.

How Scarce are Scientists?

IN April, 1946, the Barlow Committee reported to the Lord President of the Council—then Mr Herbert Morrison—that even if the British universities were to double their output of science graduates "at the earliest possible moment," Britain would probably still, in 1955, be a long way short of the number of qualified scientists that it needed.

The universities did in fact double their population of science students more quickly than the committee hoped—by 1947. It is not quite clear how the committee defined the "output" of science graduates, which it said was about 2,500 a year before the war and needed to be raised to 5,000 a year. But in the academic year 1952-53, allowing for those remaining to seek higher degrees, the net output of scientists will have been about 4,500.

The Barlow Committee's prescription for output, then, has roughly been filled. What of its calculations about supply and demand? At that time, the committee held, there were about 55,000 qualified scientists in the country. By 1955, there might be 64,000, against a demand of perhaps 90,000.

Since 1946, in fact, something over 30,000 qualified scientists will have left British universities. On the original assumptions, the country's "capital" of scientists at the end of 1955 might be built up to 70,000 or more, which would be considerably better than the Barlow Committee could hope, but still far short of the number that it believed the country would need. How acute has the shortage turned out to be in practice?

★

Four or five years ago the answer to that question could have been fairly optimistic—at least in arithmetical terms. There arrived a time, in 1949-50, when scientific talent, along with various other commodities, seemed to be approaching that invisible frontier that divides shortage from abundance. It was becoming difficult to find jobs for all the biologists who were leaving the universities, and certain other specialists were not in the strongest of demand; though there remained continuing shortages of chemists and chemical engineers.

Then rearmament arrived. It made heavy demands for physicists and engineers, and again for chemists. An assessment of the situation by the Advisory Council on Scientific Policy in 1951-52 found that "for years there will be a particular shortage of physicists qualified to undertake defence work in the thermionic valve field"; that chemists might remain scarce until the end of 1954, while the shortage of chemical engineers would continue even longer; and that demand for electrical engineers was rising, while the output of these engineers was remaining the same and universities were tending to retain more of these graduates for research. There were roughly enough geologists, civil engineers, and metallurgists; and while the total output of biologists was greater than demand, there were a number of specialised jobs in biology that could not be filled with men of the right quality.

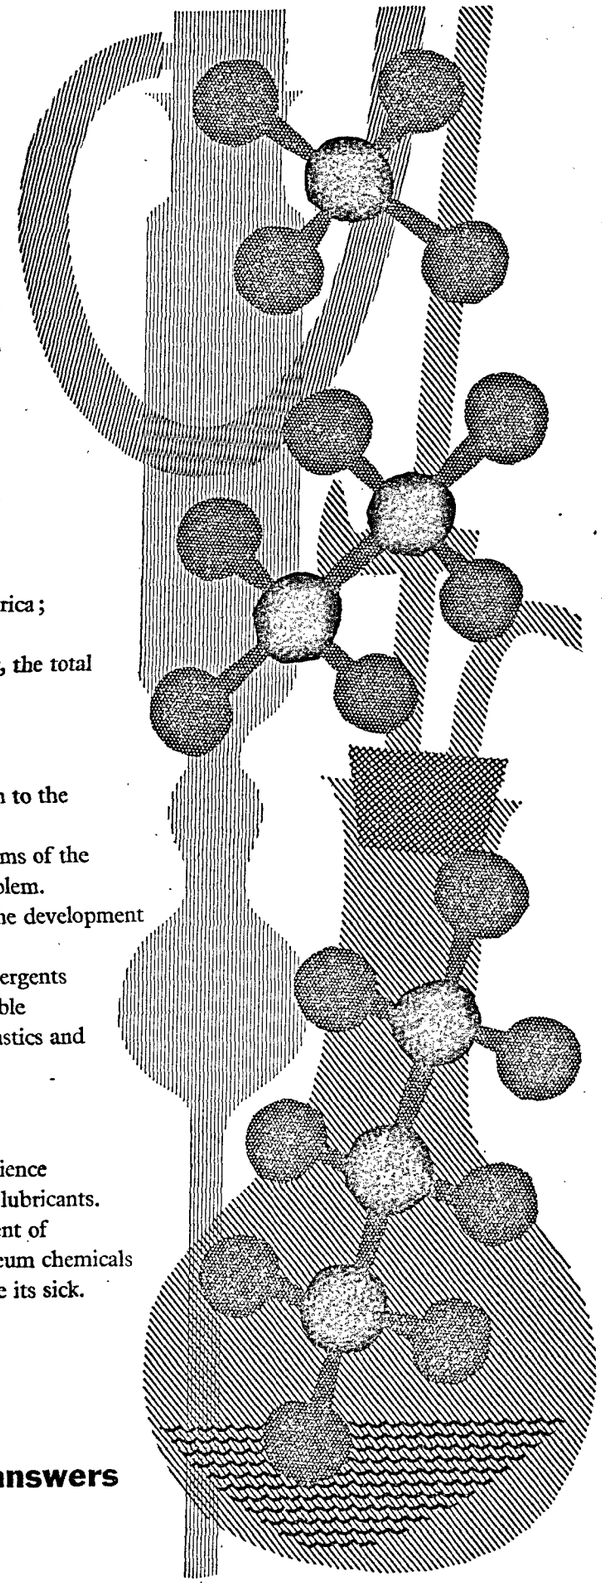
The situation has not radically altered since. A report early this year made plain perhaps the most serious shortage of science graduates, one where the prospective supply falls far short of fairly immediate needs—the lack of science teachers. Government support for defence and civil research is increasing, and the enlargement of research facilities in industry has been encouraged by extension of the 20 per cent investment allowance to the provision of capital expenditure on research projects.

Effective demand for scientists, therefore, seems likely to remain ahead of supplies, so far as specialists in many fields are concerned; if it is perhaps not as acute as the Barlow Committee guessed eight years ago, there are plenty of distinguished voices to argue that that is only because British industry is still not making sufficient use of the scientist. In technology the situation is more complicated. But there appears to be some slackening in the flow of young people who want technological training; not all the places on offer at the universities are being filled.

★

Yet it is in the technological field, rather than that of actual research, that the shortage of qualified men is often most evident. One advantage that American industry often appears to possess over British, at least to the visitor, is the number of young men on the lower rungs of the executive ladder who have at least been exposed to university life. The quality of their degrees may not be as high as British. But the background gives these young men an acquaintance with academic criteria, and an easy familiarity with the graduates from the research department whom they meet across the table, that is of tremendous value. In many British companies, there still remain constraints between the works engineer with little academic background, the manager with a public school education but no degree, and the graduate from research—roughly the NCO, the officer, and the boffin of industry—that are largely absent in America; and it is difficult not to feel that these may often have an effect upon the technical efficiency and progressiveness of a company in making full use of research results.

Oil means brainwork



SHELL RESEARCH is one of the big brains-trusts of the world. You could call it a Graduate University of Applied Science, with ten specialist colleges.

There are seven major Shell research laboratories: two in Holland, two in England, three in North America; and three Agricultural Research Stations: one in England, two in North America. At last count, the total staff of those ten establishments was nearly 5,000. The back-room boys of a great industry.

The main, perpetual task is to make fuels and lubricants provide bigger power and better protection to the modern engine in all its forms. But Shell Research has also been tackling some of the big general problems of the twentieth century. Malaria control was one such problem. The jet turbine was another. The war against rust, the development of selective weedkillers, the quantity manufacture of sulphur, the production of glycerine, alcohol and detergents from new sources, so as to leave all edible fats available for the world's food supplies, the development of plastics and synthetic textiles . . . Shell Research has been, is and will be working on all these things.

Shell's back-room boys are occupied with one of the most exciting branches of new knowledge . . . the science of hydrocarbons. Shell Research improves fuels and lubricants. But it also prompts, points and paces the development of the brave new world of petroleum chemicals. Petroleum chemicals are helping to feed and clothe the world, and to cure its sick.

Progress in Electronics

MULLARD research and development have made many notable contributions to Britain's progress in electronics. The illustrations on this page are but representative of the fields of activity covered, and give the briefest indication of the range of products finally produced and the modern manufacturing methods employed.

Active research is currently undertaken on projects as diverse as microwave valves and semi-conductors; ultrasonics and servo-mechanisms; magnetic materials and colour television.

The benefits of this research are brought quickly and economically to both industry and the community by an extensive chain of Mullard factories situated throughout the country. Employing advanced production techniques, many of these factories are among the most efficient of their type in the world.

Board and Back Room

IN a sample survey of research in industry around Manchester that it carried out between 1950 and 1953,* the Manchester Joint Research Council found that more than 16 per cent of the science graduates employed by the companies it consulted were on the board of directors. On the other hand, none had reached board level direct from a research department. Even if they had originally been in research, they had made the move over to development or works management fairly early in their careers.

This finding came from a very small survey in a particular area, but it does not appear to have been focused upon companies with any exceptional degree of interest in research. Nearly half of the companies consulted employed no science graduates at all, and more than half did no research or development. The proportion of directors with scientific training throughout British industry, therefore, may be higher than was previously imagined. This has a bearing upon two major problems of top management today —to decide how much resources it should devote to research and development, and to get the best value out of the resources—primarily human resources of a rather special kind—that it does employ there. These questions can really only be answered at the top. The Manchester inquiry, indeed, suggested that the personality of the chief executive of a company is often the deciding factor in settling its attitude towards research and innovation.

In deciding the total amount to allot to research, and assessing what this buys, the industrialist has only one dubious assurance—that he is no more likely to be wrong than the next managing director. Although many possible formulæ have been propounded, there seems to be no generally accepted guide to right action in budgeting for research. Criteria of alternative cost hardly apply. The licensing fee paid for other people's discoveries, for example, applies only to successful ideas (and du Pont has said that research is worth while if only one idea in twenty pays off). It applies also to ideas that one gets second-hand only when the other fellow chooses, without the building of a bank of knowledge that is relevant if not immediately saleable. There is after all some advantage even in finding out which alleys are blind.

The old rule of thumb that a company should spend about 2 per cent of turnover to equal the average—which in any case ignored the great variations between industries —is today out of fashion. Research, the current doctrine runs, should be related to investment, not to sales. Some research administrators favour a fairly steady relation between the research allocation and capital investment, taken as averages, and a few attempt more elaborate relations between research expenditure and the investment envisaged by the time research projects come to fruition. This attempt to find formulæ has not so far been very productive, but it is likely to continue, if only because it might provide a yardstick to measure performance as well as to decide future expenditure. In the meantime, as the director of one of Britain's greatest industrial research departments said recently, "You only find out in the long run. If you are doing too little research, you eventually notice that the company is falling behind in competition. If you notice that there are more proposals to manufacture piling up than you have resources to invest, you might—perhaps—be doing too much."

The extent to which research and development work is costed varies in British industry. Many of the smaller companies employing two or three people, often very effectively, upon technical innovation will not trouble to separate even their salaries from others in the design and engineering departments. Even if a separate research department is accounted for, it will not always be charged with overheads. Among the larger companies, where most of the country's spending on research probably takes place, the budgeting is much more detailed. But not all of them attempt the financial analysis of effectiveness carried out by companies such as du Pont and Monsanto in the United States. Between 1941 and 1950, Monsanto estimates, it began to sell 250 new products; by 1950, these amounted to 43 per cent of its gross profits, which represented a return of $2.80 on each dollar invested in research over the 10 years.

★

Contact between board and back room, therefore, is primarily concerned with the allocation of research and the settling of broad directions of investigation, a normal concern of top management with one of the departments in its business. Though the Manchester inquiry recorded a complete lack of mutual understanding between the top management of a few companies and scientists—"they might be living on different planets"—liaison between management and research in many firms is perhaps better at the top than lower down. If only because they may share a common university background, directors and scientists may often meet on an easier plane than scientists and some junior men in management. It has been argued elsewhere in this survey that Britain lags behind America in the educational and social quality and assurance of its lower levels of management, and this may be partly responsible for inadequate application of research. The friction possible there may be less likely at the level of top management; but there are two fields in which the man at the top is today being faced with rather special claims upon the part of the scientist, within his own company and from outside. These are the claims that scientists, by virtue of their calling, are needed on the board of British industry to promote technological progress; and that new scientific techniques, such as operational research, should be employed much more generally in the ordinary business of management.

The first claim is not easy to controvert. The highest posts in certain of Britain's most technically progressive companies have recently been going to eminent industrial scientists. Last year the Government's Advisory Council on Scientific Policy argued effectively:

> It is no accident that the enormous growth of American production has coincided with an increasing representation in management with a strong scientific or technical background.

One seldom meets a German industrialist who is not a Herr Doktor of one science or another. And it is true that many boards of management in British industry are unaware of the advantages they might draw from the results of

* Industry and Science. Manchester Joint Research Council. Manchester University Press. 12s. 6d.

scientific research, while many more certainly do not take these advantages to the full.

Nevertheless, some reservations remain. The best use of the best scientific brains, almost certainly, is in research; and most of these, of course, will never leave the universities or other institutions of fundamental research even for the research departments of industry. The quite ferocious intelligence that some of them can occasionally bring to bear on any problem that is mentioned might well be an asset in any group where problems have to be analysed and decisions made; but it would be best employed in their own sphere. The applied scientist who has made his career in industry, again, will probably at some time have cast his die for management or research; and while this need not be a point of no return, few directors can be more ineffectual than the *ex officio* research director who will monopolise the discussion when research or technique are in question but can hardly conceal disdain or boredom at other times.

Many scientists can bring a fresh point of view and a high intelligence to the deliberations of a directorate; not all excel in powers of decision or breadth of understanding. The argument sometimes advanced that the application of "scientific method" can work wonders in ordinary decisions usually rests upon a crude vulgarisation of that method, and the illusion that common sense and trial and error belong particularly to science. Few arguments more justly irritate the scientist than the lordly assumption by men with a classical background and a proudly abysmal ignorance of the sciences that scientific training narrows the mind. But a career in research, with its own peculiar satisfactions, hopes and jealousies, is often not the best background for taking broad decisions about profit; particularly as certain scientists retain an obstinate inkling that economic criteria are grossly unscientific, anyway.

The claims upon management of operational research—which can be grossly overplayed and sometimes partakes of the same irritating mysticism as advocacy of "the scientific method"—are of a different nature. The operational researchers, broadly, do not want to share in the management's decisions; they want to assist them by narrowing the process of decision. This war-bred technique, which often brings together scientists and engineers of quite varying backgrounds, is concerned with the study of organisations and processes in action, and with the application of advanced statistical techniques to problems of production. It had certain outstanding successes in war, and has recently achieved some impressive results within certain civilian industries. It may be able to offer the manager quantitative information about the actual and likely behaviour of systems that involve the combination of many variable factors, as most production processes do.

At one edge, this ill-defined technique of "operational research" may shade off into various methods of work study. At the other, it may enlist the esoteric mathematical techniques of "linear programming" to determine the most effective method of operating a large production shop working on a variety of products in varying demand. Its offer to narrow the spark gap of individual decision arouses an instinctive suspicion among some managers ("What am I paid for except taking full account of every significant factor?"), and it is true that it might complicate a decision that would be taken anyway and make it unnecessarily expensive. But greater certainty is often worth buying.

It is possible—though highly unfashionable—to argue that right at the top, where major decisions finally have to be made, British management is of a quality that is certainly no lower than in the United States or Germany, and may in some respects be higher. Certainly there is much to be said for the unspoken assumption of many British industrialists that management is as much an art as a science. But scientific methods that can inform the process of decision to the utmost are hardly to be disregarded. As Sir Geoffrey Heyworth said last year, "Your technique is to be able to drive in a fog." Anything that will help management see forward through that fog is worth considering. And that—in operational research and, in a wider sense, in most other applications of research—is what science in British industry is trying to do.

Research for Sale

WHEN a company that cannot afford a research department itself has a technical problem, or one that can has a problem right outside its own field, it would seem sensible to get someone else to do the job. In the United States many firms do. In Britain some research is bought outside, but not nearly as much as might be expected, considering that 85,000 firms in this country employ fewer than 100 workers.

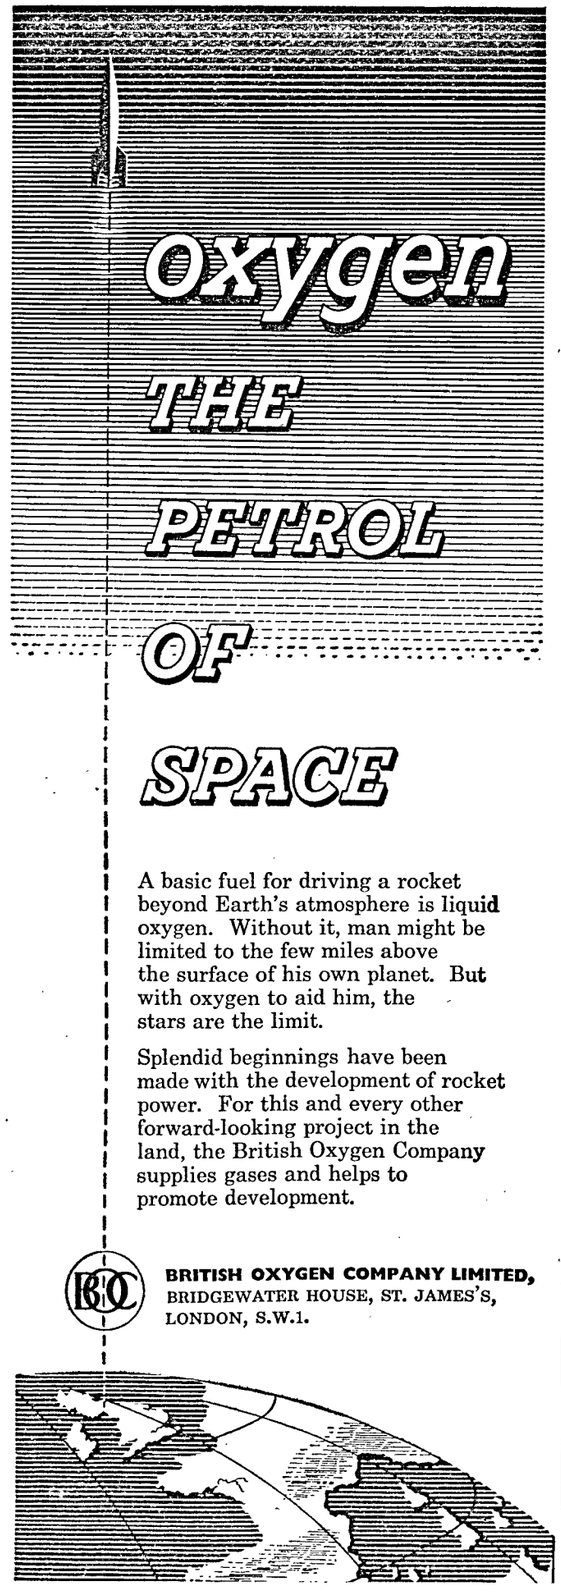
This is partly because Britain has some 42 co-operative research associations that supply all the companies in particular industries with scientific information about materials, processes and products. Nevertheless, a good deal of the work of the research associations is comparatively "fundamental"; and in any case their research is almost always available on equal terms to all the members. The technical problem that a particular company may want solved is often directed to getting ahead of a competitor, and secrecy is essential. It is only recently that a few research associations have set up separate organisations to handle members' particular problems in confidence.

Here and in America some companies have their more fundamental problems worked out for them in university laboratories on a contract basis, while technical colleges also do a little for industry on rather simpler problems. This research is generally somewhat remote from the production stage, and usually can only be done if it fits into the programme of research already going on in a university.

In the United States co-operative research is infrequent, though developing. But a large number of "sponsored research" organisations exist to do research on particular problems for particular clients, on a commercial basis. The research results they obtain become the sole property of the client, and there is no formal limit to the range or the nature of the work they can undertake.

Britain has two major "sponsored research" institutes, Fulmer and Sondes Place; there are two or three other small laboratories working in particular industries or areas. A considerable amount of work that both institutes do is on Government account; neither yet is on the scale of the larger American institutes. They do not, admittedly, promote the sales of their facilities with the typically American salesmanship of the Battelle Institute, whose activities have recently been widened to Europe.

It is sometimes argued that the slow progress of sponsored research in this country by comparison with America derives from the fact that Americans are always more prepared to hire somebody else to undertake part of their work for them, while the British have traditions of greater insularity in industry. This may be true; but many companies simply do not know what is on offer, and there seems scope for a little British salesmanship.



A basic fuel for driving a rocket beyond Earth's atmosphere is liquid oxygen. Without it, man might be limited to the few miles above the surface of his own planet. But with oxygen to aid him, the stars are the limit.

Splendid beginnings have been made with the development of rocket power. For this and every other forward-looking project in the land, the British Oxygen Company supplies gases and helps to promote development.

RESEARCH EFFORT: Britain and USA

FEW statistics are shakier than those dealing with research and development. This is partly a matter of definition. In a university, for example, it will be difficult to divide a don's time arbitrarily between imparting knowledge and advancing it; in industry, hard to set the point at which research into a new technique passes into development of the process—or that into manufacturing design. In practice, British universities and many American make no attempt to measure the amount of effort or expenditure which goes into research, except in the case of separate research institutes within a university. And though some inquirers—notably those in the recent Manchester survey—have used what seemed to them satisfactorily separate definitions of research and development, most statisticians working on this subject lump the two together. Certainly most companies do.

There is a plethora of data upon research and development in America. The figures of total research and development expenditure over the years used here are those of the National Science Foundation in Washington, between 1941 and 1952, and those of Dr. Vannevar Bush for earlier years. This may be a conservative estimate. The Department of Defense quotes consistently higher figures than the NSF from 1940 onwards. Its estimate for the 1952 total, indeed, is $3,750 million.

The British charts have no claim to accuracy, and indicate only "orders of magnitude." The historical totals are based upon the "educated guesses" of various authorities, plus some quite specific Government figures which unfortunately refer to a rather wide definition of "research and development."

The estimates of expenditure on research in industry come from the Federation of British Industries—but again are based on a very small sample of companies; the total may be some £30-45 million. Since 1951, Government expenditure on "research and development" in the military field has increased considerably. But these defence figures cover expenditure on production of prototype equipment, which may well take the largest part of the money and can perhaps only dubiously be classified even as "development."
