There are three quite clear objectives for British and Commonwealth policy in this respect. The first is that Mr Yoshida and men like him—there are not many—should earn prestige by success. Unless they do so, Japan's attempt to restore its version of free institutions and western ways will not succeed; yet it is important that the attempt should succeed, with China going in precisely the opposite direction. The second is that Japan, which is being rearmed by the Americans, should be accepted as an indispensable nucleus of collective security in the Pacific, rather as Western Germany is being accepted as a partner in the defence of Western Europe. The third is that Japan must be allowed to pay its way in the markets of the free world. If it is not, then a serious decline in economic conditions for its 87 million people is inevitable, with all the political consequences that can be imagined. To argue that the solution of its trading troubles is to be found quickly and simply on the Chinese mainland is to ignore the trends of Peking's policy that were analysed in *The Economist* of January 2nd.

Mr Yoshida's visit should mark the beginning of real understanding, even in Lancashire, that Britain can decisively influence the chances of stability and peace in the Far East by its policy towards his government.

Who Pays Teachers' Pensions?

WHEN the Teachers (Superannuation) Bill comes before Parliament next week there is likely to be stiff opposition to the clauses that seek to raise the rate of contribution from teachers as well as from employers to six instead of five per cent of their salaries. Mr W. G. Cove, a Labour member and a former president of the National Union of Teachers, has tabled a motion for the rejection of the second reading of the bill; and teachers' organisations in both England and Scotland stand behind him, with the demand that the Treasury should meet the whole of the deficiency in their pension fund.

The teachers contend that they are being accorded worse treatment than any other body of public employees. They

cite the superannuation schemes of the Airways Corporation, the BBC, the Coal Board and the Electricity Authority, where the solvency of the funds is guaranteed by the Board or Corporation and contributions can only be varied for new entrants.

The case of these public corporations is not really parallel. They are commercial undertakings whose accounts are supposed to balance in the long run, and the way in which they choose to manage their pension schemes has no more relevance to the teachers' problem than the (widely varying) ways in which private businesses choose to manage theirs. But the way in which the Government should handle the pension funds to which taxpayers and ratepayers contribute offers a legitimate field for public debate. The actuarial deficiency in the teachers' pension fund at March 31, 1954, is expected to be £220 million. Under the new Bill the Treasury will meet £144 million of this, while the teachers and their employers meet the balance. On the face of it, even those who accept the argument that teachers' salaries are too low must find it difficult to call this an ungenerous contribution—especially as the case may set a precedent. For in introducing the Bill the Minister should make plain what is the Government's general policy towards superannuation funds. What about other local authority staffs, in whose superannuation funds deficiencies have also appeared?

Marry in Haste . . .

WITH the welter of picturesque images in which the jargon of demography abounds—such as "marriage intensity among women," "women exposed to the risk of child-bearing," and "marriage cohorts"—the Registrar General's Statistical Review of England and Wales has this week set down detailed figures of marriages and divorces in the five years from 1946 to 1950. It shows that the proportion of women who find a husband is higher than before the war. This is clearly because there is no longer any surplus of women at any age under 40. The boy babies who once died more readily than girls have for a long time now been saved by better medical care and the excess of 1½ million women in England and Wales therefore begins at middle age. At the ages when marriage is most frequent, indeed, there are four unmarried men to every three unmarried women.

Not only do a higher proportion of women get married, they also marry earlier. Unfortunately all the warnings of anxious parents are justified by statistics of the fate of these marriages. Divorce is far commonest among those who marry young. To judge by the experience of 1950, one-quarter of all girls marrying at between 16 and 18 years of age will be divorced within 20 years. So, too, will one-tenth of those marrying at ages 19-22; but only one-sixteenth of those marrying at ages 23-27. While couples without children are still more likely to be divorced than those with them, the days when a gentleman always assumed the guilt in divorce cases are long since over. Wives in 1950 presented only just over half the divorce petitions, and during the war and just after it husbands' petitions were actually in a majority. Desertion is the chief ground cited in the petitions of both sexes, with adultery second.

The wreck of so many marriages—in 1950 7 per cent of all marriages celebrated 5-15 years before—would normally serve to stunt the growth in population. But about one-third of those divorced remarry, and the greater number of all marriages partly makes up for the prevalence of divorce as well as for the smallness of the modern family;

so that, although the nation is not yet reproducing itself, the number of potential mothers is no longer falling. The demographer's nightmare of a rapidly dwindling population is banished; the moralist's nightmare of disintegrating family life remains.

Paying for Paternity

A DIVISIONAL COURT has refused to direct the Birkenhead magistrates to issue a warrant for the arrest of an American soldier, who fathered an illegitimate child in this country and has refused to pay out under an affiliation order made against him by the magistrates in April last year. Since the man concerned has already returned to the United States, the warrant—even if issued—could not have been served; but effective proceedings might have been taken against him if ever he came back on even a short visit to this country as a civilian.

The decision to refuse a warrant cannot be criticised in law. Under the combined effect of the former Visiting Forces Act and the Army Act a soldier of the United States Forces serving in Britain has an equivalent status to that of a soldier in the British Army; and a serving soldier may not be arrested for failure to pay a sum he has been ordered to pay by a non-military court. But an important difference between the British and the American soldier in this respect is that the British Army authorities may deduct from the pay of a British soldier the money he should pay under an affiliation order, while the American Army authorities here no longer have that power (the power existed during the war, but it was very much restricted, by order from Washington, in 1950). The Attorney-General told the court this week, however, that when the Visiting Forces Act of 1952 is in full operation the British Government

hopes that it will be possible to make reciprocal arrangements with the Americans, whereby there will be some prospect that affiliation orders may be enforceable against American soldiers and ex-soldiers.

It seems very reasonable that they should be. There can be few traces left now of the Victorian belief, real or conventional, in the essential innocence of womanhood. But an affiliation order is not a means of punishing a guilty man. It is a means of providing for the illegitimate child, and it is hardly open to the American authorities to profess indifference to his or her fate. So far as Anglo-American relations are concerned, illegitimate children fathered by American soldiers and financially abandoned by their relatively well-paid fathers are a pile of dry tinder. The child in the case last week was stated to be one of 70,000.

Group Doctoring

THE somewhat grandiose health centres that featured in so much planning of the health services before 1948 have come to practically nothing. They were intended to bring together under one roof the local authority health services, general practitioners, dentists, chemists and opticians, with a host of ancillary workers behind them—secretaries, nurses, almoners and physiotherapists—and with laboratory and radiological facilities. It was soon realised, however, that the cost of providing numbers of health centres on this scale would be prohibitive, even if patients and practitioners wanted them and even if a limit had not been suddenly placed on health service expenditure.

As a result, the amount voted for health centres in England and Wales has gradually fallen and is now only a token figure. But during the last few years a great deal of attention has been directed towards improving the status and standards of general practice. The Danckwerts award increased the doctors' pay; but the award was made conditional upon a better method of distributing the pool from which they are paid, with the object of safeguarding the standard of medical service. It is significant that the terms of reference of the working party set up in 1952 to devise the new method of distribution included the stimulation of group practice, for it had frequently been suggested that by working together general practitioners would lose their professional isolation and would be able to give more time to their patients.

Group practice is the old health centre writ very small indeed. The capital cost of one centre would be at least £200,000 today. The working party recommended that £100,000 should be set aside from the general practitioners' pool each year to promote group practice in the country as a whole. This sum, it has now been decided, will be available in interest-free loans to doctors working in groups who wish to provide new practice premises or improve their existing ones. Few doctors will benefit to begin with, for a simple surgery built by six doctors at their own expense and described recently in the *Lancet* cost £10,000. But the annual sum will eventually be added to by repayments of the loans; and in any case it is better to start experimentally than to launch out on a large scale before the advantages of group practice are firmly established and their weaknesses—if any—overcome.

Letters to the Editor

Latin American Customers

SIR—Your article in the issue of February 6th rightly stresses the limitations of possible Governmental support. Only five countries (Argentina, Brazil, Chile, Paraguay and Uruguay) regulate their imports on a bilateral basis, and thereby invite some bargaining. In four other countries (Bolivia, Colombia, Ecuador, Nicaragua) all imports require licences, but choice of country is left to the individual importer. Ten countries (Costa Rica, Cuba, Dominican Republic, Guatemala, Haiti, Honduras, Panama, Peru, Salvador, Venezuela) exercise no control over most of their imports. In Mexico the discrimination is mainly geographical. Nothing can therefore relieve us of the necessity to compete on quality, price, delivery and credit terms. In the exports I am connected with (light engineering, hardware, semi-consumer goods) we are gradually and painfully arriving at competitive levels. It is on salesmanship that we are still woefully behind. Some British manufacturers are well established in the Americas and—in the main—they handle their own exports. The majority rely on orders coming through export merchants, without any serious effort to help.

German manufacturers produce well-presented Spanish catalogues with full specifications, price lists in dollars and sterling, etc. Normally the Hamburg exporter can answer an overseas enquiry by return airmail. The British exporter must usually make do with inadequate literature (English text, cwt., Imperial gallons, etc.), and has to collect piecemeal technical details, weights and packing specifications. By the time this is done, together with the translations and calculations, the business has probably gone elsewhere. Things are not helped by the "one price only" policy of most manufacturers and trade associations, with no provision for the exporters' pains, costs and credit risks. He is miraculously expected to sell at a higher price than the manufacturer himself (or another making the same article) is prepared to accept for direct shipment.

In Germany an overriding export discount, together with tax refunds (borne by the manufacturers) enables the Hamburg firms to keep several travellers on the road, where we may have just one. A common complaint of our exporters is that the appointed overseas agents—however reputable—after a while tend to fall asleep. The Germans counter this by posting a full-time member of their staff to the agents' offices abroad, normally with the assistance of the interested manufacturers. A very close manufacturer-exporter co-operation is characteristic of the

Swedish foreign trade. Many export firms are linked to industrial concerns on a joint venture basis, and the "all goods" exporter is rather an exception. We may eventually adopt something like the German-Swedish methods, or decide on more direct exporting by the industry, or evolve new principles. Certainly we cannot carry on with the present buyer-seller relation of exporter and producer, with the conflicting interests it breeds and with nobody really responsible for a planned and sustained sales campaign.—Yours faithfully,
London, W.1 L. SHIPMAN

German Illwill to Britain

SIR—Having followed the conflict of views arising from Herr Friedensburg's letter in your issue of January 16th, may I be permitted to add a few words? Although it seems obvious that Herr Friedensburg, in his capacity of former Bürgermeister of Berlin, should have known better, many of the facts listed in Messrs Mayhew and Robinson's letter are little known in Germany. Although in the journalistic profession myself, I was completely unaware of these facts, and hoping to get some comfort by finding others as ignorant, I asked a great number of acquaintances of mine about the matter in question. The result was appalling indeed: none of them, although generally well-informed, had ever realised the extent of British help to Germany. One wonders what the reasons are. I am certain, at least as far as the persons I talked to are concerned, that this is not just a case of stubbornness, bias or the like.

May I suggest that you are now harvesting the fruits of the failure of your Government's information service? Who, in Germany, has heard of a British information programme only half the size of the American effort? Deeds you don't advertise are generally little appreciated, let alone activities you don't even care to talk about. Nowadays, a flat statement of one's case will not do; facts must rather be presented in such a manner as to persuade and win over public opinion. In doing so, however, truth must not be distorted in its real meaning. Thus, during the past many a thoughtful German observer was surprised at the little regard your Government, acting through the UK High Commission in Germany, showed for the power of public opinion. The United States, apparently, was much more wisely advised on this score. But, may be, I am all wrong because I haven't had access to the proper information.—Yours faithfully,
Frankfurt-am-Main KLAUS BETZEN

Imperial By Default

SIR—Is your journal the latest to imply (on January 23rd) that Australia is amongst the dominions that have had recourse to "their war-accumulated sterling balances, which have now been drawn down"? The allegation has been made explicitly in other sections of the London Press. There is no substance in it. Australia's sterling balances are more than 2½ times as great as the £200 million held at the end of the war. Even during the 1952 recession, the balances remained at least 75 per cent higher than the 1945 figure.

Australia has, indeed, run down some of the sterling balances which have accrued through capital inflow rather than balance of payment surpluses since the war. The net addition to the balances is not as great as the capital inflow over the period. But if that is a ground for British complaint, the argument will require skill in the couching. Had Australia not converted some of the huge inflow of funds into physical imports, the results would have been extremely inflationary.

Australia has been charged with a second crime of having spent more dollars than it contributed to the dollar pool. It has, in fact, taken a net \$207 million from the pool in four years. Nobody is particularly proud of that, but it might be remembered that in the postwar period Australia has been concurrently a creditor to sterling, in the sense that it has accumulated £350 million of sterling balances, after deducting the equivalent of all the dollar deficits. If it had been the other way round, if Britons had piled up a creditor position with Australia amounting to 15 per cent of their national income, they might understand why it is irksome to be compelled, in spite of that credit balance, to send Treasury officials traipsing around the world on yearly quests for relatively puny loans (of the order of £10 million) in Swiss or dollar currencies. Again, however, Australia is now making more strenuous efforts not to drain the dollar pool. This year, despite the low American purchases of wool, it is hoped to break even.—Yours faithfully,
Sydney T. M. FITZGERALD

[How can it be said that Australia has been currently a creditor in sterling if its borrowing (i.e., the capital inflow) has exceeded its lending (i.e., on the sterling balances)?—EDITOR.]

INCOME Redistribution and SOCIAL POLICY

A set of studies edited by
Alan T. Peacock
*Reader in Public Finance,
University of London*

Mr. Peacock has brought together some original studies of income redistribution and social policy in a number of important countries with differing economic structures. While the main emphasis is on the techniques used in the measurement of income redistribution, some of the authors have considered in detail the economic consequences of income redistribution itself. Much of the statistical data is being published for the first time and it should be of interest to economists and statisticians, as well as to those concerned more directly with the formation and execution of social policy.

Soviet Economic Challenge

SOVIET ECONOMIC GROWTH: Conditions and Perspectives. Edited by Abram Bergson. Row, Peterson and Co. (USA). 382 pages.

THIS book is the fruit of a conference in which 31 leading American specialists pooled their knowledge in order to appraise various aspects of Soviet economic development and to explore uncharted roads of future growth. The resulting retrospect and prospect has been hailed in some quarters as the most important event in economic writing since the publication of Keynes's "General Theory." This is rather silly; obviously there is little in common between a major theoretical work by an original thinker and the collective stock-taking by researchers in an applied branch still in its infancy. Furthermore, a symposium is almost bound by its very nature to be uneven in quality. Yet, in one respect this book could and should create a stir. The exceptionally rapid growth of the national cake throughout the Soviet world implicit in most of the arguments in this book might well shock many complacent Western economists sitting on this side of the iron curtain like Chinese mandarins behind their wall.

The claims of Soviet propaganda are normally dismissed with a shrug. But this is a critical, in some cases a very critical, appraisal. Its authors cannot be suspected of any sympathy for the Soviet regime and its methods or accused of naive credulity. Some contributors have rather erred on the side of undue caution, approaching every Soviet figure with utmost suspicion. Even so, after deflating the exaggerated Soviet claims out of recognition, American experts agreed that Soviet national income is probably rising by about six and a half to seven per cent per annum and that industrial production is expanding even more rapidly. This is an incomparably faster rate than that prevailing in any Western country. It should also be remembered that Soviet growth is uninterrupted by slumps and that the years chosen to compute this average were not years of "boom" reconstruction but normal peace years.

In the economic race between East and West, the older industrialised states started miles ahead and, thanks to American supremacy, still enjoy a fair advantage. Yet, in a handicap race over a long distance the runner with a longer stride is bound to close the gap. On the other hand, the late starter often spurts for a while and then slows down. Can Russia maintain its pace? Many factors point to the contrary: the scope for bor-

rowing technological advances from elsewhere is narrowing; the rate of growth of the industrial labour force is slackening; the necessary provision for housing, transport and so on cannot be postponed indefinitely. But the law of diminishing returns is not a safe guide in a changing society. One of the contributors, after balancing the pros and cons, came to the conclusion that

Soviet industrial output in the next decades will increase at a rate not very much less than the prewar rate... and substantially greater than the United States rate...

Professor Hodgman suggested a rate of about 8 per cent per annum as a reasonable guess. At that pace Soviet output in 1970 would be four and a half times as great as in 1950.

The prospect is staggering, but since the subject-matter is dynamic accurate prophecies are not an easy task. This book was written before Stalin's death and the assumption in most arguments was that light industry would be neglected and investment concentrated on heavy industry. The pledge made by Stalin's successors to improve rapidly the consumer's lot may affect this premise, though it is unlikely to slow down the rate of growth very considerably. Thus, unless the West lengthens and steadies its stride, the Soviet Union and its third of the world will progressively narrow the gap. One may dislike the regime, its methods, even the composition and use of its final product; it would be foolish to ignore its economic achievements. Efficiency is one of history's criteria.

Professor Bergson has placed many in his debt by collecting and editing the fruits of this conference. The book is aimed primarily at the expert and should provide him with a mine of information and a basis for argument (luckily the participants themselves did not see eye to eye on every topic). But it could and should also be read with profit by all interested in foreign affairs and particularly by economists. The essays and comments may be uneven, but here at least is presented a summary of the West's knowledge of the Soviet economy in all its aspects. Here the Western economist can find, written in his own terminology, much to learn and to compare, and should he seek to find some more the copious footnotes are a guide to further reading. The veil of percentages covering the Soviet economy repels outsiders, but when it is gently lifted by an obliging hand there is no longer an excuse. The Chinese paid dearly for their mandarins' lack of curiosity.

The Gadarene Peers

MR BALFOUR'S POODLE
By Roy Jenkins.
Heinemann. 224 pages. 21s.

"THE House of Lords is not the watchdog of the constitution; it is Mr Balfour's poodle." Thus Lloyd George in 1908, and this book is a history of the famous political dog-fight which began with the overwhelming Liberal victory in the election of January, 1906, and worked up to its climax in the rejection of "the People's Budget" in 1909 and the enforced enactment of the Parliament Bill in 1911. As political stories go it is the best in our annals, even though it lacks the huge popular turmoils that accompanied the enactment of the Reform Bill of 1832. It is high political comedy undisturbed by crowd scenes. The crowds looked on. They did not even bother to vote at anything like their full strength in the 1910 elections.

Mr Jenkins tells his story extremely well and, though he is himself a Socialist MP of the younger generation, with a most commendable impartiality. He threads his way through the often tangled story, the biographies of all the leading actors at his elbow, with unflinching dexterity. A good example of his skill is furnished by his account of the interventions of Lord Knollys. Here is certainly a confusing tale and the reader will feel that the author has got to the bottom of it. Balfour and Lansdowne are of course his principal characters, and though Mr Jenkins does not much admire either of them, he treats them with fairness and understanding.

Almost everyone, even Mr Amery, would agree today that the Lords acted with Gadarene absurdity in rejecting the Budget and "die-hardening" over the Parliament Bill, and, since they were by nature just as sensible as we are, the question arises, why did they do it? Partly, they were intoxicated by the successful results of their wholesale rejection of Liberal measures in 1893-95. Partly, by the maladroitness of the 1906 Government in offering them such easily slaughtered lambs as the Education Bill of 1906 and the Licensing Bill of 1908, measures demanded by political pressure groups with no popular appeal behind them. But there is a further reason. There were "Bloods" in those days. Many will have recently read Mrs Woodham-Smith's book, "The Reason Why." Though Cardigan and Lucan had long been dead there was still plenty of what one may call Cardiganism in the British aristocracy.

Even those who think they know the story well will probably add to their knowledge by reading this book. One knew, for example, that the two elections of 1910 produced almost identical results, but did one realise that 56 seats changed their allegiance, 27 from Government to Opposition and 29 from Opposition to Government? In pre-radio days each constituency was much more swayed by local prowess. It is also a little known fact that only 24 out of the 44 Finance Bills since the enactment of the Parlia-

ment Bill have been certified by the Speaker as Money Bills and thus exempted from interference in "another place." But the other place has not interfered. The burnt child...

Mr Hoover's Rehash

THE MEMOIRS OF HERBERT HOOVER. Vol. III *The Great Depression, 1929-1941*. Hollis and Carter. 518 pages. 30s.

"MRS HOOVER and I left the White House without regrets except that the job of recovery and some needed reforms were incomplete." This sentence stands out as prominently as the Washington Monument from the surrounding prose of Mr Hoover's "Memoirs," not only as a masterpiece of historical understatement but also as the solitary admission these pages afford that Mr Hoover's tenure of the presidency was in any respect inadequate.

For 500 pages Mr Hoover looks back over his years in office and the New Deal epoch that followed them, and fails to find any errors in the first or any virtues in the second. A depression? Certainly there was a depression. But it was none of the Republicans' doing. Initially it was only a "readjustment" such as a healthy American economy must needs make from time to time. By early 1931 President Hoover's corrective programme (operating well within the limits imposed by "the American System") was already restoring America to health. But then infection from the European plague spot caught America while it was still convalescent, swept it into a high fever and exposed it to the still more deadly maladies of collectivism and regimentation. A Democratic Congress thwarted Dr Hoover's efforts to minister to America's needs and a dishonest election campaign drove him from his patient's side. Worse still, Dr Roosevelt deliberately aggravated her condition in order to win the greater credit for effecting a cure. Did he then effect a cure? Certainly not. The New Deal offered remedies more deadly than the disease, took advantage indeed of the patient's weakness to inflict on her a fate worse than death. Thus the title of this volume, "The Great Depression," reflects no careless error of taking the part of the whole; as Mr Hoover sees it, the Depression continues throughout all the years of Rooseveltian "recovery" and was only terminated by the substitution of a war for a peace economy.

This is not necessarily a discreditable thesis and Mr Hoover is a man who has every right to defend himself against the short-run verdicts of the thirties. This volume ought, therefore, to be a welcome addition to the history of the period, a first-hand restatement of the case for the losing side. Alas, it is none of these things. It is a dreary, sodden rehash of Mr Hoover's state papers and public speeches. ("I have never delivered a ghost-written public statement of importance." Oh, too, too solid flesh!) It adds nothing—and, worse, takes nothing away—from all that Mr Hoover

said at the time. It reveals something of his feelings, but nothing of his personal or official relations that was not known at the time. It is the record of a man more sinned against than sinning, but it stifles incipient sympathy beneath blankets of self-righteousness. It provides, in short, the perfect corrective to any revisionist history of the New Deal.

A Wool Monopoly

THE SHREWSBURY DRAPERS AND THE WELSH WOOL TRADE IN THE XVI AND XVII CENTURIES.

By T. C. Mendenhall. Oxford University Press. 255 pages. 21s.

THE struggle between free trade and controlled marketing has a long history and is effectively illustrated by Dr Mendenhall's study of the Welsh wool trade during the centuries immediately preceding the industrial revolution. For two hundred years the Shrewsbury Drapers' Company maintained a trading monopoly in cloth from the Welsh hills through the border markets to London, Bristol and abroad. In Wales, cloth making, employing 100,000 people, was a cottage industry, undertaken mainly to supplement farming or grazing, and there were no conveniently located towns in which to form craft guilds of clothiers. The farmers were too poor to organise the sale of their cloth direct to the London merchants, while the London merchants were reluctant to buy from the widely scattered producers of north and central Wales. This gave opportunities to the border towns; but Shrewsbury gradually displaced its rivals, and the drapers being the largest body of experienced cloth dealers on the border established for themselves the role of capitalistic middlemen which was almost unique in Britain's wool trade.

The drapers' strength was based on their long experience as a guild; the capital which enabled them to pay cash badly needed by the Welsh producers; better organisation than the shearmen who did the finishing processes in Shrewsbury; and knowledge of the London cloth market at Blackwell Hall. Especially in Tudor times they were supported by Government authorities, who believed that organised marketing ensured the greatest good to the greatest number and was preferable to the uncertainties of free competition. The drapers' monopoly was, however, frequently challenged. In Stuart times they were attacked on the ground that the multiplicity of buyers is the life of any market, and that the drapers impoverished the Welsh producers and injured the export trade by forcing up prices in the London market. But the drapers showed constant vigilance, lobbied astutely in London, and by shrewd policies succeeded in guarding their monopoly against interlopers.

Anyone interested in the results of specialised research into the economic history of Britain's main industry in Tudor and Stuart times will find much useful information in this book. The author has made good use of available

THE ECONOMIST, FEBRUARY 13, 1954

sources, and his study adds another region to those of Heaton and Ramsey for making a countrywide mosaic of the woollen industry and of trade in cloth.

Shorter Notices

AGRICULTURAL ECONOMICS.

By D. S. Chauhan. Lakshmi Narain Agarwal, Agra. 362 pages. Rs 12.

In this small volume Mr Chauhan has attempted to provide an introduction to the study of agricultural economics as a "specific aspect of the social science of economics," illustrating and applying his generalisations and principles by reference to Indian conditions and problems. The treatment of the various subjects discussed is very unequal in method and value. Some topics are illustrated mainly by reference to the past, ignoring important recent developments, whilst others include almost up-to-date material from the Five Year Plan.

But although the author's attitude is not always clearly expressed, his views are broadly based—bringing together data from various social spheres—and the policies advocated are sensible and realistic. For the European reader by far the most valuable chapters are those on "Land Utilisation," these include concise yet illuminating accounts of the River Valley and other rural development schemes which have been brought under the Five Year Plan. These accounts are well illustrated by simple maps (and tables) which help the reader to locate and visualise the nature, scope and progress of these projects in a manner not always achieved by the formidable reports from official sources.

On the other hand Mr Chauhan does not even mention the manifold agricultural problems arising from the prevailing land and tenure systems and policies, and completely ignores a number of fundamental recent trends, such as the movement towards the abolition of Zamindari and the community projects sponsored by the Five Year Plan. It is true that the latter projects had not actually been started when Mr Chauhan wrote his book, but they were projected; and it is a pity that he did not discuss their potentialities, as he seems to be well qualified by temperament and outlook to appreciate their importance.

★

SOVIET UNION IN MAPS.

Edited by George Goodall. George Philip. 33 pages. 4s. 6d.

The object of this atlas is to give a general picture of the Soviet Union's background and development. It contains historical, physical, political, climatic, economic and communications maps, each accompanied by interesting explanatory notes.

Although the maps are clear the agricultural pages are confused by the use of red names of crops and livestock overprinted upon a too heavily detailed black base map. Greater effect could have been achieved if the number of towns on the black key had been reduced and all railways omitted—these are adequately provided for on maps devoted to rail communications. A defect is the absence of maps or charts illustrating the output of the Soviet Union's major industries compared with the output of similar industries in other countries.

Apart from these criticisms this atlas provides a most interesting source of information at very low cost.

To those living in a trance

ONE may be hypnotised in more ways than one. A daily newspaper can exert a hypnotic spell which can gradually lull the mind into a trance. When this is likely to happen—it is time to turn to a newspaper such as the Manchester Guardian.

Please do not think, however, that you will be turning from the dangerous—to the dull. The Manchester Guardian is a stimulating newspaper. Its pages will enliven you. Its writings will delight you.

First and foremost the Manchester Guardian believes in telling the truth. It will not bow to the private prejudices, whims or weaknesses of the reader. It comments—but does not court the popular view. It reports—but does not pry. Can you take it? Are you willing to change from the hothouse of sensationalism and sentimentality—to the keen, fresh air of reason and good writing? If so, the Manchester Guardian is your newspaper!

If you have any difficulty in getting your Manchester Guardian regularly, please write to:
The Manchester Guardian, Manchester.

meeting place of nations

In 1947 the chief U. S. delegate to the United Nations asked of his fellow delegates:

"Where will we find a place where railroads and wonderful highways and a great river all come together to bear the burden of humanity and of goods and of communications . . . ?"

That place for the United Nations' headquarters was found in New York.

No city is more truly a meeting place for exchanging the goods of the world. Through the Port of New York flows about half of the \$25 billion or more in cargoes that make up America's foreign trade. Out go machine tools and farm implements . . . flour and fertilizer . . . bulldozers and bicycles . . . shoes and steel

and petroleum and a thousand other items.

In come olives from Greece, woolens from Britain, cameras from Germany, cheeses from Switzerland, and many other products from many other countries—making overseas trade truly a two-way street.

The Chase knows this story of two-way trade; has helped to write many a chapter. In Greater New York alone, you'll find 29 Chase offices engaged in financing overseas trade . . . one in the very shadow of the U. N. Secretariat Building. Within the United States, the Chase has the largest correspondent system of any American bank. Abroad you'll find Chase branches and

representatives' offices in Europe, Latin America, the Far East—and in market places around the globe Chase maintains close working relationships with leading banks.

If you do business in the States, why don't you talk to the people at Chase?

Security by Numbers

Washington, D.C.

IT was on October 23rd last year that a special press release from the White House quoted a report, from Mr Philip Young, the chairman of the Civil Service Commission, stating that 1,456 civil servants had been "separated" under the new security scheme by the end of September. This new scheme had only been in operation since May 27th, and the obvious haste with which the report had been compiled, two months before Mr Young was obliged by executive order to provide it, aroused suspicions that were only heightened by the reckless use to which it was soon put by speakers associated with the Administration. In January, in his message on the state of the Union, President Eisenhower advanced the figure to 2,200 and, while no one questions the President's integrity, many people suspect that political strategists are lurking behind it.

Under Mr Truman's loyalty programme a civil servant could be dismissed if there were "reasonable grounds" for thinking him "disloyal"; now no civil servant can retain his position unless this is considered "clearly consistent with the interests of national security." President Eisenhower has laid it down that no man should be publicly labelled disloyal except in a court of law, but that on the other hand to serve the government is a privilege and not a right. Obviously this broad approach has much to recommend it, but its whole essence is that suspected subversive activity is only one among many possible reasons or combinations of reasons for the removal of a civil servant. To guide the responsible heads of government departments, eleven types of conduct are defined as being inconsistent with security. They include, of course, sabotage, espionage,

unauthorised disclosure of secret information, and so on. But they also include other wide categories of behaviour, such as "any criminal, infamous, dishonest, immoral or notoriously disgraceful conduct, habitual use of intoxicants to excess, drug addiction or sexual perversion"; and "membership, affiliation or sympathetic association" with a comprehensive list of undesirable groups or individuals. A civil servant in any position, not merely a sensitive one,

is to be dismissed if any facts come to light which "furnish reason to believe that the individual may be subjected to coercion, influence or pressure."

It seems clear from case histories, such as those recently published in a series of articles in the *Washington Daily News*, a Scripps-Howard paper, that all these definitions are being strictly construed. Men and women are being discharged as "security risks" for occurrences which have no connection with subversion and would not be regarded as disqualifications in most spheres of employment. While the government is fully entitled to take this attitude if it wishes, there seems to be no excuse for the use by responsible people of total figures relating to "security" in arguments

concerned with "subversion." Indeed, the only hope of success for President Eisenhower's policy for the civil service, after all the emotion that has been spilt, would seem to lie in restraint and calm on the part of his supporters.

But if there is one motive which works upon the President's advisers more powerfully than the desire to show before the next election that the Democrats really did leave a "mess" in Washington, it is the desire to show that a Republican Administration is capable of clearing it

Herblock in the Washington Post

up without assistance from even a Republican Congress. The Administration's new brooms must be seen at work, and the hastily compiled total of security risks discharged was triumphantly compared with the number of dismissals for disloyalty under Mr Truman, rather as if a Communist production norm had been overfulfilled. Mr Bernard Shanley, who as counsel to the President ought to have known better, boasted in a speech in New Jersey that "1,456 subversives have been kicked out of government since the President took office." Both Senator McCarthy and the President have used the figure—the Senator to show how large the danger of subversion was proving to be, the President to demonstrate how rapidly it was being removed. In this atmosphere one of the main objects of the new policy was lost. The stigma of being "a security risk" is now no less than that of being considered "disloyal"; it is only more easily acquired.

★

It was hardly surprising therefore that the figure of 1,456, and the later one of 2,200, should have been scrutinised critically. Reporters used every chance of discovering how many of these "separations" were of people representing genuine security risks and how many of the security risks were genuine subversives. Mr Young admitted at the outset that only 863 of the 1,456 had actually been dismissed; the remainder had resigned when they became aware that the government had adverse information about them. This, of course, does not necessarily mean that they were admitting the charges; as some of the case histories in the *Washington Daily News* show, many may have resigned because they did not relish being suspended for months without pay, incurring heavy legal expenses, and trying to refute allegations that were anything but clear. Moreover, on January 13th the President conceded at his press conference that, when sending in their figures to be consolidated by the Civil Service Commission, some departments might have included people who had left their jobs in the normal way without being aware that there was derogatory information about them or that they were being investigated.

The Navy had already conceded as much and the Alsop brothers, in their syndicated column, have claimed that there has been the same type of inflation in the State Department. They say that, of the 306 "security risks" in that department which helped to make up the total of 1,456, only 29 were "dismissed for cause," and that Mr Scott McLeod, the department's security officer, admitted that not one was a Communist; only 11 cases involved "loyalty reasons," and the investigation of 7 of these had been begun under the Democrats. Mr McLeod also admitted, in public, that his detailed regulations for deciding these cases were published less than three months before the Civil Service Commission's report appeared, and that by the beginning of this year no final hearings had yet been held under the new system. When Mr Brownell, the Attorney General, for whom complete credit for the programme had been claimed by his patron, Mr Dewey, was closely questioned about the figures, he refused to answer for anything except the Department of Justice, where "the majority of cases did not involve disloyalty, but other types of security risks." In fact "only one" of the men dismissed from that department had been a former member of the Communist Party.

THE ECONOMIST, FEBRUARY 13, 1954

Congress, as well as the press, has taken up the trail. The Un-American Activities Committee of the House of Representatives has called for an analysis of the figures, and the senior Democrat on the committee has said that only seven of the President's total of 2,200 were Communists or members of organisations on the Attorney General's list of subversive groups. A Republican Representative has said that her information is that "ten per cent or less" of the cases involved any question of disloyalty. Even among the Administration's supporters there is growing uneasiness about what newspaper writers are calling the "numbers game" and "political fakery."

What looked like a shrewd move in psychological warfare on the home front last October appears rather less than inspired today. The President has promised to see if the figures cannot be analysed and no one is going to let him forget the promise. Meanwhile the civil servant's lot is not a happy one, for if he is so bold as to resign he cannot know what kind of reputation will be pinned on his back as he walks out of the door.

Every Man a Capitalist?

FROM A CORRESPONDENT IN NEW YORK

THE New York Stock Exchange, eager to expand the pool of investment capital which underlies its activities, has at last put into operation its much-discussed monthly investment plan for people of moderate means. The first purchase, bearing evidence of having been as carefully planned in advance as is the appearance of the first man to cut a ribbon and cross a new bridge, took place at one minute after the exchange opened on January 25th. The purchasers were a married couple in a suburban area who bought 1,1794 shares of a copper stock at \$32 a share. They plan to spend \$40 a month (including the broker's commission) regularly on such shares, over a period of at least two years. Under the new plan, the minimum which can be invested is \$40 a quarter; the maximum is \$1,000 a month. That same day 657 other shares of American companies were sold to 484 other individual participants in the new plan, and by the beginning of the second week 4,054 shares had been bought for 1,674 individual accounts.

In a market which considers business poor when fewer than a million shares change hands in a day, the first week's experience with the new plan is hardly impressive. But this campaign is long-term. Its proponents point with pride, not to the small number of shareholders who have already embarked on buying plans (and who may or may not have been new to the market), but to the great number of inquiries at investment houses which resulted from newspaper and magazine advertising during the week.

It is no new discovery that risk capital of the kind which nourishes the stock exchanges has not been expanding in proportion to the growth of the American population. The creation of great fortunes, once the mainstay of the markets, has been discouraged by taxation, and the prosperous middle-classes have failed to fill the gap. Just how marked their abstinence has been was the subject of a recent study by the Brookings Institution, which found that only about 6,500,000 Americans are shareholders, and that only one out of every eight adults financially able to buy shares actually does so. Among professional men and merchants,

GRASSLAND is one of Britain's greatest national resources, for grass is the natural food of cattle and sheep, and upon its abundance and quality depends the production of more meat and milk. To-day—in a world seriously short of these things—the improvement and development of grassland is recognised as the foundation of our agricultural expansion. It has not always been so, and it is largely due to the vision and patient researches of a few pioneers that the essential knowledge and techniques are now available to the British farmer. I.C.I. was among the first to apply scientific methods to the many problems connected with growing grass, raising its nutritional value and ensuring that the most efficient use is made of it. As long ago as 1928, an I.C.I. experimental farm was established at Jealott's Hill in Berkshire where practical research in grassland management was undertaken.

The benefits of this and other work have been far-reaching—from the development of new methods for controlling the grazing of cattle to the production of improved fertilisers. I.C.I.'s "Nitro-Chalk" for example, has shown remarkable results as a grassland fertiliser. Its use not only raises the food value of grass, but makes it grow more abundantly and for a longer period, thus extending the grazing season and helping to save imports of cattle feeding-stuffs. Another I.C.I. development is the drying of grass by machines, a method which makes it possible to preserve its full nutritive value almost indefinitely. I.C.I. is still pioneering, and the new knowledge of grassland problems that it is gaining will help the British farmer to produce still more from British acres.

BRITISH OVERSEAS AIRWAYS CORPORATION

only just over 10 per cent own shares, while fewer than half the business executives, the group with the highest proportion of share ownership, hold shares of any kind, even in their own companies.

Mr Keith Funston, the president of the New York Stock Exchange, is given official credit for the fiercely debated "pay-as-you-go" plan by which the exchange hopes to tap the savings of these potential investors. It was hailed, in the beginning, as a method of investing on the instalment, or hire-purchase, plan by which Americans customarily invest in automobiles, refrigerators and television sets, but this kind of publicity has been firmly repressed. Mr Funston's letter of November 30th to members of the exchange calls the scheme a "monthly investment plan" to satisfy "the widespread demands for a uniform method of buying listed shares by regular periodic purchases on a pay-as-you-go cash basis." He also notes that it is designed to reduce book-keeping and office work, so that member firms can handle small recurring transactions profitably on the usual commission basis. This is important to the investment business, which is beset by rising labour costs and is not yet able to apply the customary American cures of the assembly line and the mechanised process.

It is hoped by the proponents of the plan that companies wishing, or willing, to sell their shares to their own employees may be allowed to deduct the appropriate monthly payments from the pay cheque, but certain legal difficulties have not yet been cleared up. In a period of falling employment, when men are finding their pension rights imperilled by the threat of lay-offs and reductions in staff, it is only reasonable that a new scheme which assumes a steady income for at least two years should be given the closest scrutiny. This is so, even though purchasers may cry off without incurring any penalty. Responsible officials can hardly take the small town doctor in Texas, who optimistically signed up for \$999 worth of shares a month for two years, as typical.

★

So far the New York Stock Exchange, where the monthly investment plan originated, is the only one to put it into practice. The American Exchange in New York (formerly known by the more picturesque name of the Curb Exchange) has considered, but not adopted it. The reason given is that whereas the New York Exchange has among its member firms two odd-lot houses big enough to take on the complicated job of executing the orders, similar facilities do not exist among members of the American Exchange.

But outside New York City, the Midwest Exchange is actively considering adoption of the plan, and the Los Angeles Stock Exchange is arranging to offer invest-as-you-go facilities on the West Coast. Boston is being bombarded by persuasive speakers bearing an impressive packet of selling suggestions, explanatory booklets, sample advertisements addressed to the man in the street, lures aimed at the timid by mail—all of this prepared at considerable expense to make things easy for the member firm to woo new customers.

Meanwhile laymen who approach the problem from the investor's point of view make three points about it. In the first place, the plan is an example of what is called, by the knowing, straight dollar-averaging, a theory approved by that section of the investing world which thinks that putting the same number of dollars into the same shares over a period of months, however their price may rise or fall, is a sound way of getting one's money's worth. In the second place,

the fact that the plan has begun slowly, in a period of economic uncertainty, may augur well for its future. If it wins adherents now, when men think twice about investing their money, it may hold them when financial decisions come more easily.

The third observation, however, is that if any substantial change is to be made in the money-handling habits of the middle class it will be done only after a long and intensive educational campaign. Americans are more wedded to their customary ways of doing things than the casual observer might suspect. They were told, during the depression twenty years ago, that thrift was unpatriotic and that they ought to spend. But one of the lessons of that depression seemed to be that security was the greatest good, the security obtained by keeping up payments on insurance, by paying taxes for protection against old age, and by joining private pension schemes. Now Americans are to be taught (at least by implication) that security lies in taking risks, that the wise security-seeker, as well as the patriot, buys ordinary shares, and with them a stake in the country's future.

This new campaign may work. A great deal of money and time is being spent in the hope that the ownership of American industry may be significantly widened and new life brought to the stock exchanges. But first there are ghosts to be exorcised—the shades of those clerks, messengers and lift operators who learned in the nineteen twenties how to invest their weekly pay in fractional shares and whose lessons cost them very dear.

American Notes

Money for the Asking

THE chairman of the Federal Reserve Board, Mr Martin, had the same reassuring but realistic approach to the present economic situation as did the other high officials who testified last week before Congress's Joint Committee on the Economic Report. But on the following day the Federal Reserve Banks began to reduce their rediscount rate from 2 to 1½ per cent and made it look as if, when Mr Martin's "cautious optimism" was assessed, the adjective should be given more weight than the noun. The formal explanation was that the Federal Reserve System, in reducing its borrowing charges to its member banks, was merely recognising the end of the inflationary danger against which it had raised the rediscount rate a year earlier, and was bringing its charges into line with the general decline in other interest rates. Sound as are these reasons for the reduction, observers may be excused for seeing in it also an insurance by the Federal Reserve Board against being blamed should the present readjustment deepen into a recession, as it was blamed last year when the boom turned into a readjustment.

In fact, of course, the board long ago abandoned its restrictive money policy and has for months been encouraging a steady easing of credit; this has driven interest rates down until, in the last week of January, 3-month Treasury bills were cheaper than at any time since 1949. The drop in the rediscount rate is already affecting other

borrowing costs and it is thought to be only a matter of time until the downward trend is followed by the interest charged on business loans; the basic prime rate has held at 3½ per cent since last April. What the Federal Reserve Banks are in effect doing by lowering the rediscount rate is urging their members to expand the supply of credit,

and thus to make sure that shortage of funds does not prevent private enterprise from filling the gap left in the economy by the decline in government expenditure. However, it is not a shortage of credit, but a shortage of demand for it, that has kept business loans so low recently. Demand is expected to improve as the spring taxpaying season draws near but, as long as inventories are being held down, the need for credit will be reduced.

Cheap Rates at the Treasury

THE plentiful supply of money has made it possible for the Treasury to undertake the largest refunding operation in American history at cheap rates. Holders of five

types of government security, worth altogether over \$20 billion, were offered a 7½-year bond at 2½ per cent; owners of the two securities maturing in February and March could, if they preferred, exchange into a 1-year certificate at 1½ per cent while the owners of the other three, which do not mature until June, may be offered another choice later. This may come at the end of March, when there will be room under the present debt ceiling for the Treasury to borrow new money, for the first time this year—unless meanwhile the Senate has agreed to raise the ceiling, something which it is not inclined to do. It appears that holders of about \$4 billion worth of the maturing securities are either waiting for another offer, or prefer to be paid in cash.

The Treasury is expected to group all its borrowing into three or four similar large-scale operations this year, so that it will not have to go to the market so often—nine times—as it did last year. In spite of all the talk of lengthening out the maturities of the public debt in 1953, in fact at the beginning of 1954 nearly 27 per cent was due for repayment within twelve months, compared with only just over 15 per cent a year earlier. But this situation has now been much improved: over \$10 billion of the new longer-term bond has been taken up, compared with \$6.6 billion of the short-term certificate, and in addition 2½ per cent is a more satisfactory rate than could have been obtained last year.

NLRB's Fifth Man

THE appointment of Mr Albert Beeson, a businessman, to fill the fifth place on the National Labour Relations Board has precipitated another of those disputes over "conflicts of interest" with which the history of the Eisenhower Administration has been studded. The law, which was passed in 1917, stipulates that no person or association or corporation shall contribute to, or supplement in any way, the salary of any employee or official of the government. But executives going into government jobs, usually for a short time and at a financial sacrifice, are understandably reluctant to pull up all their roots, particularly if these involve pension rights.

Mr Beeson, who was appointed for a year, was unwary enough to tell a newspaperman that he proposed to return to his job as director of labour relations for a machinery firm when his time was up, and then foolish enough to deny his confirmation, that he had ever said such a thing. The appointment was approved by the Republican majority on the committee, but when the Democrats discovered that Mr Beeson was retaining rights in his firm's pension fund, two Republicans agreed that further consideration was desirable. Mr Beeson has now offered to make a clean break.

It is being noticed in Washington that although Mr Wilson, the Secretary of Defence, and his deputy, Mr Kyes, were forced to sell their industrial shares before they were allowed to take office, Mr Durkin, during his short stay as Secretary of Labour, made no pretence that he was on anything but a leave of absence from his trade union; when he resigned, he returned to the bosom of the plumbers without any delay. The National Labour Relations Board is, however, a quasi-judicial agency, which administers the

Taft-Hartley Act and deals with disputes arising under it. The Democrats insist that no direct representative of either management or the trade unions has ever been made a member.

The agitation over Mr Beeson certainly would not have been so acute if it had not been realised that he was likely to cast the deciding vote on many controversial issues. At present some twenty cases are held up because the membership of the board is divided two and two between holdover Democrats and Mr Eisenhower's appointees. The trade unions and their Democratic allies contend, and even Mr Beeson concedes, that in labour relations the decisions of the board are far more decisive than any legislation Congress may pass. There is no doubt of Mr Beeson's personal integrity, but it is felt that his background in management who helped him to get the job, mean that the scales will be weighted against the trade unions if his appointment is confirmed.

Encouraging the Golden Goose

OSTENSIBLY the twenty-five changes in the tax laws which the President recommended and which the House Ways and Means Committee hopes to have ready before the end of the month are technical. But Mr Truman has been quick to sniff out, in the business reliefs, a "rich man's tax Bill" and a promising political issue, while in Congress the Democrats have been arguing that when over-production is the order of the day, it is consumers, not producers, who need encouragement.

The Secretary of the Treasury, Mr Humphrey, and the chairman of the Federal Reserve Board have refused to be shaken, however, in their belief that business—"the goose that lays the golden eggs"—must be encouraged to expand and to modernise its equipment if payrolls are not to suffer. The chief means proposed to stimulate economic growth is the "declining balance method," can charge off two-thirds instead of a half of the value of a new building or machinery in half its useful life, they presumably will find it worthwhile to re-equip their businesses and keep the economy expanding. This is the most costly of the concessions contemplated, accounting for \$375 million of the Treasury's estimated loss of \$1.2 billion on the whole programme in its first year, but in the long run it is expected to pay for itself many times over.

A start is also to be made on eliminating the double taxation of corporation profits—that is, their taxation once in the hands of the corporation and a second time when they reach the incomes of the shareholders as dividends. This is to be done partly on the score of fairness, but chiefly to provide new sources of risk capital for businessmen who might not be able to ride out recessions if they were burdened by heavy borrowings. In the first year, \$50 of dividends would be tax free in the hands of individuals receiving them, rising to \$100 in the second year, while, in addition, 5 per cent and eventually 15 per cent of the remainder would also become deductible from income. Research at home and investment abroad are also to be encouraged by lightening the tax load.

If this is sauce for the goose, there is also something for

the gander: deductions of up to \$600 a year for widows or widowers who have small children who must be cared for while they are at work, and much larger deductions for medical expenses, up to a maximum of \$10,000 in a year for a married couple with children.

The Democrats, who have little patience with such isolated tid-bits, and even less with the "trickle down" theory of prosperity, voted instead in committee for an increase in the personal exemption from \$600 to \$700, and were defeated in a straight party vote. But not even Republicans can afford to ignore the benefits, in an election year, of cutting taxes where the voter can see the results. A revolt in the House, led by the influential Speaker, Mr Martin, suggests that the Administration may be forced to accept the loss of nearly \$1 billion in excise taxes next spring as the price of retaining corporation taxes which are due to expire and which it cannot do without if the budget is to be kept nearly in balance.

Insolvency at the CCC

THE intricate nation-wide loan operations of the Commodity Credit Corporation, which manages the farm price support programme, make its exact financial position almost impossible to assess at any given moment, but there is little doubt that at some point last week the corporation was insolvent. For toward the end of January, long before the seasonal peak in the demand for CCC loans was due, it was suddenly discovered that farmers were borrowing on an unexpectedly high proportion of their output and that the corporation had only \$16 million in hand, out of a total lending authority of \$6.75 billion. To meet this emergency, Congress was asked to do at once what it normally does only at the end of the financial year in June, and make up the capital losses the CCC was incurring in its operations during the current year. These losses are the result of subsidies paid out under the international wheat agreement, of sales of stocks at less than cost price and of declines in the values of commodities in storage.

The corporation calculated that this assistance, a book-keeping matter only, would give it additional working funds of over \$740 million. The House agreed, but the Senate, arguing that the estimates of losses were not supported by sufficient evidence, cut the sum to \$245 million, enough to keep the corporation solvent for only about two weeks. After days of discussion, during which the CCC went on making loans, as it is legally obliged to do, although it was almost sure that it had not enough money legally to do so, agreement was reached on a figure of \$680 million, which has probably been approved by now.

The objections in the Senate came from advocates of the Administration's flexible price support proposals, who would not have been sorry to point up the extravagance of the present system by forcing the CCC into insolvency and the rigid price support programme into collapse. It has been suggested that the same desire for dramatic effect also explains why the Secretary of Agriculture, although not daring to go so far as the Senators, let the CCC reach the brink of bankruptcy before asking Congress to save it. The corporation will not be on firm ground until its actual lending authority has been increased. The President asked in January that it should go up to \$8.5 billion, but recent developments make it doubtful whether this will be enough.

The World Overseas

Germans and the Conference

FROM OUR SPECIAL CORRESPONDENT IN BERLIN

GERMANY is an invisible Fifth Power at the Berlin Conference. The only reason why Dr Adenauer is not officially present is that, if he were there, the Communist foreign minister from Herr Ulbricht's headquarters would be there too. That would be precisely what Mr Molotov wants. But no West German political leader, whether of the government coalition or the Social-Democrat opposition, has been willing to recognise the Moscow puppet regime in Pankow (East Berlin). In the same way, the West German Trade Union Federation has rejected constant overtures made by the slave union leaders in the Soviet zone.

Even after this long record of failure, Mr Molotov has remained persistent. Early in the conference he presented a memorandum from the Grotewohl government demanding representation for East and West Germany and he has laid it down that the most important point about elections to an all-German government is that they shall be left to the Germans. If that were done, the Pankow government would be recognised *de facto* by Bonn; and the freely elected representatives of the 50 million West Germans would face, on a parity basis, the rulers of 18 million inhabitants of the Soviet Zone. On the one side would be a loose democratic coalition, and on the other a trained and compact body of revolutionaries working on instructions from party headquarters in Moscow. In this situation, Mr Molotov might well think that the West Germans would be easier to trick than the foreign ministers.

During the conference Dr Adenauer's representatives in Berlin have been consulted daily by the western leaders and the opposition leader, Herr Ollenhauer, has not been forgotten by them. But this is not all. The whole Western case for German unity in freedom rests on a fundamental assumption: that the Germans must consent to what is done. M. Bidault has led the way in affirming this point. He has argued brilliantly for a new deal for Germany, and against a dictated peace that would inevitably be broken by an all-German government.

Both sides have been so clear that the German public at this moment—later on it may become confused again—realises that two completely different programmes for unity have been presented by Mr Eden and Mr Molotov, and it learnt at the end of the first fortnight of the conference that the two are hopelessly irreconcilable. What is the German reaction, in the West and in the Soviet-controlled area?

Too much should not be expected of the Germans. The ordinary man in the street, particularly if he is an ex-soldier, is extremely anti-Russian, but not for that reason pro-western. There is a widespread feeling among these men that neither side wants German reunion, and that the West would sell Germany to Mr Molotov tomorrow if a big enough price were offered. One comment on Berlin from a porter who had fought against the Russians may be quoted: "It's all a swindle, and we Germans are just the pawns. Whatever comes out of it, there will be another war in a few years. The Americans will start it if the Russians don't." This is the voice of a big section of the public.

Nevertheless, thanks to Mr Molotov, the Western foreign ministers might have broken off the German part of the conference at the end of the second week without being seriously blamed except for impatience. They would have been criticised for not bargaining recognition of China against free elections, and their motives would have been suspected by the same highly mistrustful Germans, who are now spreading rumours that the West is preparing some dark deal over the Far East at Germany's expense. But Mr Molotov convinced all but the most blind that the Soviet Union has no intention of giving up its territory in Germany except at the price of capitulation to Communism.

In West Berlin the *Tagespiegel* last Sunday poured scorn on the Socialists for looking for trivial compromises from Mr Molotov to save their political prestige for a while. This paper takes a widespread view that the Russians will keep their promises, or yield, only when the West is more powerful than it is now. The writer admits that the western foreign ministers all see this, but "Dulles expresses it most plainly, Bidault most simply, and Eden most vaguely." Public opinion, according to the *Tagespiegel* still has illusions, but its criticism does not apply to the average Berliner. The realistic, resigned inhabitants of this wreck of a city never had much hope of the conference, because they have learnt profoundly to mistrust Russian smiles.

In the Federal Republic the conference was deliberately "played down" from the start by the press, except for the Socialist papers. This has proved wise, because the greater the disappointment the greater the reaction against the Bonn government. But there are a million refugees from the Soviet zone who have a personal stake in regaining their property and have been looking eagerly for signs of Russian

concessions. So have the Social Democrats. They were strenuously optimistic, not only because of their ardent wish for unity, but also in order to brand Dr Adenauer with the reputation of a "tendentious pessimist" who really does not want German reunion. The Socialists have not played a patriotic part during the conference. Herr Ollenhauer created a sensation by declaring in Berlin during the crucial second week that the West should buy free elections by giving up the EDC. This was widely regarded as a stab in the back, even by some of his supporters; and it was foolish because Mr Molotov continued to show that his price was much higher than simple abandonment of the EDC. The Social-Democrats then fell back on the idea that the Russians might sell out for a large western loan, which is even less likely. However little support they receive from Molotov, the Socialist leaders will continue to chase what M. Bidault called the *Fata Morgana* of unity. And whatever results, they will accuse Dr Adenauer of obstructing reunion.

The trade union leaders do not always follow the Social-Democrat line. They are quick to denounce any sign of western compromise. Compromise is in any case something which Germans regard as weakness. In West Berlin the trade union journal wrote a strong warning to the foreign ministers about Soviet strategy and tactics. From intimate knowledge of the East German workers, this paper declared that their only fear is that the West will be lured into slackening its armed strength and unity. The East Germans know, the writer said, that appeasement and compromise will bring neither free elections nor German unity. Only resistance everywhere and all the time will achieve freedom. One day, the writer hints in conclusion, the Russians will have to be faced with some kind of ultimatum, and this is the opinion of the many resisters in the Soviet zone. Above all, they want signs of western strength.

Reports of demonstrations for the Eden plan in Soviet zone factories have been exaggerated, and if the conference fails, there is not likely to be another June 17th. Resistance is far from dead, but terrorism has done its work in preventing overt rebellion. The effect in the Soviet zone of failure to achieve unity in freedom or of a compromise that is regarded as Western weakness will, according to the best observers, be twofold: many will give up their opposition and resign themselves, particularly if living conditions continue to improve. Many more will flee to the West. How many? No one can say for certain, but it is probable that the exodus, though it will be considerable, will not amount to a panic flight of millions.

After Sydney and Randall

FROM OUR OTTAWA CORRESPONDENT

THE long road towards freer monetary and trade exchanges between dollar and sterling seems here to have turned another corner. The Commonwealth, through Mr the Sydney meeting, and the United States, through Mr Randall and his dissenting colleagues, have both taken new positions.

Officially the Canadian Government finds both the Commonwealth meeting and the Randall report "encouraging." Rather surprisingly, behind the official position, the latter has caused more disappointment than the former. The

Canadian representatives, headed by Mr D. C. Abbott, the Finance Minister, found the Sydney meeting one of the most successful conferences of Commonwealth Finance Ministers there has yet been. The communiqué and the lamentably inept press reports suggested less than now seems to have been achieved. The reverse was true of the Randall Commission. The advance publicity and the inspired leaks had led to the hope that the Randall report would recommend considerably more than it has. The chief disappointment felt in Canada was bluntly described by the Canadian *Financial Post* on January 30th:

Perhaps it would be unkind to call this a Munich. But there is a tempting parallel. In almost every section the Randall Commission has offered compromises to voracious protectionist forces which like Hitler will see concessions only as a sign of weakness, and demand that much more because of them. Would it not have been better to stand four-square for what Mr Eisenhower, Mr Randall and most of the economists (in the United States as elsewhere) know to be necessary, and to have demanded drastic action to bring US conduct into line with the US position as the world's dominant creditor?

Nevertheless the Randall report's recommendation that a monetary backing for convertibility should be provided by mobilising the International Monetary Fund's \$3,360 million of gold and convertible currency is warmly welcomed in Ottawa. There is some doubt whether IMF resources alone can provide adequate support for a convertibility operation; but if the risks were spread over several European currencies as well as sterling it is thought that they might be. If the United Kingdom and the European countries think otherwise, it has been suggested that there could be a line of credit from the Federal Reserve System. In view of past history, Canadian authorities see some objections to such a course; but it must be recognised as another method by which the United States Administration could give its support and encouragement to the sterling plan without involving itself in Congressional wrangles. On the monetary side, American support looks like being much more satisfactory than on the trade side.

Shattered Illusions

At least, however, nobody now expects United States policy to be changed overnight in a few sweeping gestures. Looking back to a year ago, it seems that perhaps the whole "collective approach" of the Commonwealth conference involved some measure of illusion about what it was reasonable to expect from Washington. Canada was as much involved in the illusion as anybody. Now the sterling area will be planning on a more realistic basis, if it assumes—as the Sydney conference seemed ready to do—that there will be no great dramatic reversal of American policy but probably a gradual, steady and maddeningly slow change towards more liberal trade policies.

This by itself would not be much cause for encouragement if the Canadians had not also felt that the sterling countries of the Commonwealth were more certain than they were a year ago of their own direction. The conclusions of the London conference in 1952 pointed to policies of internal discipline, trade liberalisation and eventual currency convertibility. This was what Canada wanted. But it still seemed that the sterling governments had doubts and reservations about these principles. The main importance of Sydney was that these have now apparently

disappeared. At Sydney the direction was no longer in question, only the pace of advance.

Canadians are very anxious not to be regarded as the dispensers of unwanted advice about what the United Kingdom and its sterling partners should do. But it is natural that they should be impatient for further advances from the sterling side. It seems to them that Britain and other countries overseas are unduly nervous about the state of the American economy; and there is some fear lest this nervousness should cause them to lose the most favourable moment for allowing non-resident current-account sterling to be made convertible. It is agreed, as *The Economist* has pointed out, that this is a one-way street with no return. It is also seen here as the only street which can lead to that revival of trade on which the sterling area depends.

M. Faure's Gamble

LAST week the French cabinet approved the economic programme presented by its finance minister, M. Faure. In drafting his programme M. Faure had two urgent tasks: to meet the growing demand for an increased minimum wage and to spur on the halting economy. Once labour troubles are averted and production is on the up-grade the government can concentrate on deeper structural reforms. The difficulty is that the government is pledged not to include a strong inflationary dose in its initial medicine, while most of its members consider that to accept the demands of the trade unions would only be putting the inflationary spiral into action. To escape this dilemma M. Faure has decided to pacify the workers with a temporary half-measure, promising them at the same time a fair share in his expansion programme. This plan, covering the odd period of 18 months, foresees a growth of both industrial production and national income by ten per cent, and real wages are to rise in the same proportion.

The unions were pressing for an increase of the guaranteed minimum monthly wage from Frs. 20,000 to Frs. 25,166 recommended by the *commission supérieure des conventions collectives*. Instead of touching the minimum rates of 100 francs an hour the government has ordered the addition of a graduated "premium" of up to 15 francs for all those earning less than 115 francs an hour. It is estimated that the pay packets of about 1,500,000 workers will be affected to a greater or less degree, but M. Faure hopes that, unlike a rise in the minimum wage, the "premium" will not provoke a spate of wage claims by better paid workers. The government has also pledged itself to prevent these increased costs from being passed on to the consumer. All this remains to be tested in practice, and it is significant that the Christian Democratic (MRP) ministers have judged it worth while to dissociate themselves openly from this "notoriously insufficient" award. On the other hand, by granting at least some concession to those with the strongest grievance M. Faure may have forestalled direct action by the unions and gained a short respite in which to put his programme into practice.

It is difficult to call this programme a plan since no direct measures are envisaged to meet the ambitious targets. It is through the traditional fiscal weapons, through the encouragement of credit and investment, that general

expansion is to be promoted. The Bank of France has just announced a further cut in its rate from 3½ per cent to 3 per cent. The *Crédit National*, with partial backing by the Treasury, is to extend medium-term loans, particularly to manufacturing industry. Credit facilities for agricultural equipment will also be extended. Finally, tax reliefs for investments, which were introduced by decree last October, are to be broadened and parliament will be asked to vote this part of the projected fiscal reform in the near future.

M. Faure's great expectations are based on a great many hopeful assumptions. One was certainly necessary if anything was to be started, namely that this government—divided as it is over the EDC—can survive parliamentary assaults for 18 months. However, the discrepancy between the measures so far announced and the great results expected so soon has led some French critics to describe M. Faure's programme as a bet. He is gambling both on a very favourable turn in world trends and on a great change of heart among French investors. Encouraged by last year's bountiful harvest, by the build-up of treasury reserves, the reduction of France's EPU deficit and the growing confidence of investors after a period of relative price stability, M. Faure seems to consider that only a small push is needed to send France on the road to recovery. And for the long-term treatment of his patient M. Faure explicitly relies, among other things, on a cut in "unproductive charges," that is chiefly in defence and the Indo-Chinese burden.

Thus much luck will be needed for this programme to become reality. Fortune, it is said, smiles on the bold. But for the moment only the assumptions and the objectives are really bold in M. Faure's programme. When the fiscal reform comes on to the parliamentary agenda, when the programme has to be extended to cover "structural changes" and when it becomes necessary to tread on the toes of important pressure groups, then the government will require political courage, not only luck. The workers will not show much patience if the promised rewards are not forthcoming. More than the fate of the Laniel government, the political realignment in France depends greatly on the outcome of M. Faure's bet.

Benelux Moves Ahead

BY OUR SPECIAL CORRESPONDENT

At the moment there is much contentment in that cosy little economic unit called Benelux. It has not always been so. Early last year, when the Belgians and Luxemburgers were feeling the draught, Benelux was maligned; in Brussels there were public disturbances. Before that, in 1951, the Dutch partners were in difficulty, though they bore their adversity—with their customary fortitude—in silence. Now, however, events have moved so favourably that progress goes on apace towards the ultimate goal of full economic union.

The most recent development took place at a joint ministerial meeting in Brussels on February 5th, when a decision was reached on two important problems. By progressive steps, starting on March 1st and spread over two years, a common trade and payments policy for Benelux as a whole in relation to third countries, will be established. In effect

How many ergs* go to make an

Your answer to the question is probably as good as ours. But we do know this. The erg is a little thing that keeps cropping up whenever electricity is being made or used. And electricity is our concern. Many omelettes have been cooked by power that has been generated, carried and disciplined by our products. Many, many ergs for home and industry have been our responsibility. After all, we've been going for seventy-five years.

When it comes to electrical equipment...
You've got to hand it to

Whether quarrying ore or digging a garden— Nickel helps

This Rapier W1400 walking dragline, the biggest of its kind, can take a 30 ton bite out of the ground and dump it as much as 500 feet away, all in the space of a minute. It works night and day removing the "over-burden" from the ironstone beds at Corby, Northamptonshire to help Britain produce more steel. The little motor cultivator, too, works hard on the land helping the market gardener produce more food. Its engine may be of only 1 or 2 h.p.—the dragline can call on 3000 h.p.—but it is nevertheless game for a real job of work. Nickel plays a part in both of them, strengthening and toughening the steels and alloys used for highly stressed parts. Throughout industry nickel goes into the equipment that does the toughest jobs, helping it to perform better, making it last longer.

this means that treaties with other countries concerning quotas, financial arrangements, and other commercial details, will be negotiated by Benelux, instead of separately by Belgium, Luxemburg, and the Netherlands. The first practical step will be taken on March 1st when Benelux will present the Organisation for European Economic Co-operation (OEEC) with a common liberalisation list; at present the Netherlands has liberalised by 92.6 per cent and Belgium-Luxemburg by 87.2 per cent.

The second hurdle now to be jumped is the freeing of capital movements inside the Union. At present the Dutch have the more restrictive exchange controls, and the first effect of the decisions taken last weekend will be the release of some blocked Belgian balances in Dutch banks. Though the Belgian interest rates are slightly higher than those in the Netherlands it is expected that the tendency will be for capital to move towards the Netherlands, where its low-cost structure and industrial peace are an attraction to investors. Freedom will not, however, be restored at once as there are a number of technical difficulties to be solved; but, within

two years, it is hoped that all capital transactions will be freed thus permitting, among other things, the quotation of shares from all three countries on both the Amsterdam and Brussels stock exchanges.

The present rapid progress is largely the result of the improvement in the Dutch balance of payments. During last year it piled up a surplus with the European Payments Union, and enjoyed the rare experience of running a current surplus with the dollar area; 647 million guilders were added to Dutch gold

and foreign currency reserves in the first nine months of 1953. Though Belgium and Luxemburg enjoyed a less successful year their immensely strong EPU position still prevails. Thus the guilder and the Belgian franc have been able to face each other without embarrassment. Moreover, the complaints heard in the past that the liberal-minded Belgian economic philosophy did not mix with the Dutch mania for controls, can no longer be justified, since with the exception of wage and rent controls the Dutch economy has rid itself of the last vestige of *dirigisme*. Moreover, a 5 per cent increase in Dutch wage rates has been conceded from January 1, 1954; this will have helped to bring the wage structure in the three countries more into line.

At times it has seemed that Benelux's progress has been of the "one step forward two backward" variety. To begin with special arrangements had to be made to exclude agriculture from the rigorous free trade principle. Then later, in answer to the cry of despair from certain sectors

of Belgian industry, a complicated system of compensation and price uplift was evolved. But now that the sun shines once again on Benelux these temporary retreats are forgotten.

The architects of Benelux have often been criticised for the pedestrian progress during the phase of pre-Union; but in their own defence they can point to evidence of solid progress. Compared with 1938 Belgium's share of the Dutch market increased from 11½ per cent to 17 per cent in 1952; the Netherlands increased its share in Belgian markets from 8.9 to 15.2 per cent in the same period. On the other hand, despite this considerable achievement, it can be argued that, since Belgium's total exports increased by 26 per cent, and the Netherlands by 64 per cent from 1938 to 1952, integration has not, in the circumstances, gone quickly enough.

Elections for Malaya

THE recent report to Malaya's Legislative Council by its electoral committee is a contentious political document. Those who believe in self-government at almost any price have been affronted by the moderation of its tone. Those, on the other hand, who regard self-government as the proper expression rather than the immediate instrument of a people's political maturity, are glad of its caution in speaking of present day Malaya. For the members of the commission formed a fair and sincere cross-section of educated opinion in the community, and most of them came out in favour of a transitional stage during which the elected element on the Legislative Council would be less than half; in a minority report, however, 13 of the 42 members proposed an elected majority straightaway. The bulk of the work on the committee was done by a working party of 19 members who consisted of 10 Malays, 3 Chinese, 3 Indians and 3 British, under a British chairman.

Whatever its detractors may say about it, now or in the future, this report does provide a basis for beginning a new and vitally necessary period of political development in Malaya. The test in fact will lie in the use that is now made of the exploratory work which has been done with such care during the past few months. When the electoral committee began its inquiries, it had to start from scratch. It had to make recommendations on the most elementary principles of a suitable electoral system for Malaya, without any significant precedent to form a guide. It had to make proposals not only on the type and length of the proposed transitional period between now and full self-government, but to define in detail the strength of the case for retaining nominated members in the Legislative Council and a nominated Executive Council. It had to put forward recommendations about the size and nature of constituencies, about the franchise, about the desirable degree, if any, of proportional representation, and about the possible protection of special racial interests.

The majority report on the Legislative Council proposed that the nominated members should include a Speaker and 3 *ex officio* members, the 9 Chief Ministers (*Mentri Besar*) of the federal states, 2 representatives from Penang and Malacca, 20 representatives of "scheduled interests"—including commerce, rubber, mining and the Malayan trades union council—3 members from racial minorities,

and 2 government officials who would be the Secretaries for Defence and Economic Affairs. The report suggested a four-year span for this new Legislature, after which the position should be re-examined; it specifically recognised that the ultimate object was a fully elected Legislature. As to constituencies, it proposed direct elections by majority vote in territorial divisions and ignoring communal groupings. The Committee hoped—it could not do more—that elections might be held before the end of the present year. But, if they are, a great deal of preparatory work will have to be begun straightaway.

Agreement at Lagos

FROM A CORRESPONDENT IN NIGERIA

AT the opening of the constitutional conference at Lagos, Mr Lyttelton produced a cigar which was a parting gift from Sir Winston Churchill. He promised to light it only if things became difficult and intolerance was in the air. It remained unlit. Someone has suggested that the cigar should be presented to one of the Nigerian museums as a reminder of the tolerance and goodwill shown at the conference. But which museum should have it? For the time being all museums, except one, are to be under federal control. But the Oni of Ife fought strongly and successfully for the Ife museum to be regional, and if the other museums should go the same way, the custody of Mr Lyttelton's cigar might well become an occasion for regional rivalry.

This speculative symbolism is relevant only to the future. All the political leaders agree that the recent conference has been successful. One cause for concern was removed at the very beginning when Mr Awolowo announced that he did not intend to raise the Lagos question; indeed, nothing decided at last August's London conference was reopened. The main items on the agenda were Sir Louis Chick's report on the allocation of revenue between the central government and the regions; the future of the marketing boards; the Southern Cameroons; and the regionalisation of the judiciary and the civil service.

Distributing Revenue

The Chick Report is the third of similar reports on the allocation of revenue within the past few years. It recommends, among other things, that the federal and regional governments should charge each other for services rendered and thus put the relation between them on a more business-like basis. All import, excise and export duties should be collected by the federal government, and the net proceeds should then be allocated to the regional governments in various proportions. Income tax and licensing fees should be collected by the regions, whilst those from Lagos should go to the federal government. The report then recommends that discretionary grants from the federal reserves should be made to the regional governments; it suggests that, for a start, £3 million should be given to the Northern region, £2 million to the Western region and £2 million to the Eastern region. It also recommends an additional grant of £750,000 to the Eastern regional government.

At the conference the Northern delegates criticised the report because it did not carry far enough the principle of

derivation—that is, that revenues raised by a region should as far as possible be retained by that region. The government of the Eastern region felt that the principle of needs had not been sufficiently considered. The Action Group of the West with its usual thoroughness published a long and critical commentary. It opposed the amount of the East's grant from the federal government since it feels that it was the irresponsibility of the National Council of Nigeria and the Cameroons in refusing to pass the produce sales tax last year that has made the grant necessary. The East replied that the trouble lay in the peculiar circumstances of its government at that time; the party had lost confidence in its ministers who had refused to resign and had formed themselves into another party—the National Independence Party. Mr Awolowo was also opposed to the North having 50 per cent of the export duties on hides and skins while the rest goes to the centre; the conference made some concessions on this. The West also reserves the right to reopen the subject of mining royalties, which the Chick report recommended should be given to the region of origin. This means at present that the North will get most of them. The West

Nigeria's Main Parties

Action Group. Led by Mr. Awolowo and virtually confined to the Yoruba peoples of the Western region.

National Council of Nigeria and the Cameroons. Led by Dr. Azikiwe ("Zik"). Its main strength is among the Ibos of the Eastern region.

Northern People's Congress. Led by the Sardauna of Sokoto, it is the main party of the Moslem North.

feels that as the money for purchasing the United Africa Company's mining rights and rehabilitating the mines came from the Nigerian Government as a whole, some of the present royalties should go back to the centre. The conference, however, adopted the Chick report with minor recommendations.

One of the most controversial matters of recent years, the marketing boards, was amicably settled by the conference. It decided to regionalise the boards, which will be all-purpose ones, and to set up a central organisation to advise and inspect produce in order to maintain a high quality of exports. The marketing boards' reserves of £74 million were divided in the proportion of £34 million to the West, £24 million to the North and £15 million to the East, with £1 million to the southern Cameroons, whose separation from the Eastern region was endorsed by the conference.

The regionalisation of the judiciary and civil service which was also accepted by the conference aroused much public comment. The first was strongly opposed by the Nigerian Bar Association which felt that it might lead to the attraction of the best judges to the region where they would be paid most; it also feared that the judiciary might come under political influence. The Chief Justice of Nigeria himself opposed regionalisation in evidence before the conference, but to no avail. The position and rights of transfer of European civil servants have been safeguarded; this was welcomed by various political leaders who re-affirmed that it was both necessary and desirable to employ Europeans who were willing to work for the good of the country. The Nigerian public is doubtful about splitting up the civil service because of the general fear of inter-tribal domination and discrimination.

The federal principle now seems to have been accepted by all parties except the National Independence Party, the small opposition group in the East, and the Northern Elements Progressive Union in the North, which fears alleged intolerance and oppression by the emirate administrations. The NEPU would prefer the North to be broken up into smaller states, with a strong centre; this is echoed to some extent in the West by the people of ancient Benin, led by their Oba (king); it is also favoured by the leaders of the Rivers province in the eastern region. The belief of all these smaller groups is that no region or ethnic group should be too powerful. Their suggestions, however, did not influence the conference. Nor for that matter did that of the Action Group which wanted a region's power to secede from the federation to be written into the constitution.

Perón With the Brakes Off

GENERAL PERÓN announced in a speech delivered in mid-1953 that the time had arrived "to take the brake off a bit." He was referring primarily to the possibility of giving private business in Argentina a little more elbow-room and breathing space; but his words might be taken as a text in a wider sense. In the past six months, the Argentine government has given an exhibition of remarkable mobility. Indeed, General Perón has taken on some of the attributes of the star in an ice-show, swooping hither and thither, spinning like a top, leaping ebulliently clean off the ground—and never for a moment pausing. Treasured principles have been cast aside, old enemies and highly incompatible new friends wooed with equal fervour, and such diverse objectives pursued that even in the higher ranks of the Peronista movement itself there seems to be some uncertainty about which way the regime is heading.

The jumping-off point for this acrobatic bout was the highly favourable position in which the Argentine president found himself six months ago. On the home front, he had successfully diverted public attention from the economic hardships which, in April, had brought popular unrest near to boiling point. The diversion itself, a melodramatic campaign against supposed plotters, with mass arrests of opposition elements, served its own purposes; it struck a new blow at both the landowning aristocracy and the non-Peronista parties, some of whose leaders finally accepted the need to come to terms with the regime, and thus further split their already depleted ranks. Nature, meanwhile, by providing a bountiful harvest, not only eased the domestic situation but also gave Argentina a powerful diplomatic weapon in the form of grain surpluses. And the arrival in Buenos Aires of Dr Milton Eisenhower, the American President's brother and personal envoy, gave General Perón an opportunity of changing his attitude towards the United States without appearing to retreat.

The general had already dropped a number of hints that he was prepared to forgive the new American Administration for its predecessor's offences, and in July, when Dr Eisenhower had been feted, the Buenos Aires press burst into a chorus of adulation in the general direction of Washington. By the time that a Congressional mission arrived in November, one Argentine newspaper had got to the length of conferring an honorary degree in *Justicialismo*—

Perón's philosophy—on President Eisenhower; and when Senator Capehart told the Buenos Aires stock exchange that, given adequate guarantees, billions of dollars were only waiting to enter Argentina, enthusiasm knew no bounds. (The mention of guarantees was, however, omitted from press reports of the speech.)

Taking the Bull by the Horns

The attraction of American capital to Argentina, and particularly to its struggling oil industry, was indeed the obvious motive for this dramatic reversal of the old policy of hostility towards the United States. But "economic independence," usually interpreted to mean the expropriation of foreign interests, still remains one of the three Peronista slogans; and while General Perón was making reassuring speeches to visiting American oil men, he had at the same time to explain his *volte-face* to his followers. In a broadcast to the nation in December, he took this bull quietly but firmly by the horns and declared that he would "leave the door open for every well-meant contribution" to petroleum development by private interests. In fact, a draught has been blowing through this door for months, and the president's real problem is to drag reluctant benefactors in.

This wooing of US capital is an intriguing superscription on one side of a new economic coin, the other side of which is devoted to trade with the Soviet sphere. General Perón has seen nothing in the least inconsistent about pursuing both policies in parallel. His trade offensive in eastern Europe began with the famous interview that his ambassador in Moscow, Sr Bravo, had with Stalin last February. It has developed into a whole series of somewhat loosely worded agreements with the Soviet Union and its satellites, shipments under which began in October.

How much hard reality lurks beneath the impressive global figures in these well-publicised trade pacts is difficult to estimate. But what does seem likely is that General Perón has met his match, as regards skilful haggling, in Moscow. Originally, he proclaimed to his people and the world that the Russians were to grant Argentina substantial credits; but the first shipments made under the trade agreements did not consist of Soviet machinery, but of Argentine mutton, pork and butter bound for Leningrad. Meanwhile, the utmost cordiality prevails on the surface.

Drive to the Caribbean

Playing Moscow off against Washington has not, however, occupied more than a fraction of the time of General Perón's vigorous foreign minister, Dr Remorino. His greatest activity in the past twelve months has been the extension of the new South American "co-prosperity sphere." This is based on the Argentine-Chilean "pact of economic union" signed at Santiago last February. Since then, Paraguay (in August) and Ecuador (in December) have acceded to the union; and just before Christmas Dr Remorino and the president of Ecuador visited Colombia and made an intensive effort to persuade President Rojas Pinilla to bring his country in as a fifth member.

The agreements on which the new union is based are so vague that they can amount to almost anything, or almost nothing; but Argentina's intention of gradually achieving continental hegemony is obvious enough. However, the speed of Perón's drive to the Caribbean has caused enough

disquiet to bring Brazil and Peru together in a counter-balancing association; and in Chile itself, the pivot of the whole system, President Ibanez has had to defend his pro-Argentine policy against numerous critics.

At home as well as abroad, Argentine policy in 1953 was one of sloughing off old dogmas and experimenting with new initiatives. Businessmen have been promised more freedom; the second five-year plan has again been postponed; and in November General Perón successfully clipped the wings of his own creation, the monster General Workers' Confederation, by setting up a new confederation for white-collared employees. None of this can have been especially pleasing to the workers as a whole; but, with the cost of living temporarily held in line, they have listened patiently to the president's repeated lectures on the theme that only higher production can lead to higher pay.

The pattern of orthodox Peronismo has, in fact, faded, and bizarre new designs, none of them finished, have been superimposed. It is not surprising that some confusion, and even discord, reigns in the ranks; but it was somewhat startling when, in January, the *Alianza Libertadora Nacional*, the hothead wing of the Peronista movement, accused the Minister of the Interior, Sr Borlenghi, of Communism and warned him he would soon share Beria's fate. Even more disquieting to the faithful have been the recent rumours of General Perón's ill health, which have required a public denial. The sudden decision to elect a new vice-president is associated with both these rumours; the post had been vacant since Dr Quijano died in 1952, and the decision to fill it is seen by some as intended to keep power beyond the grasp of Sr Borlenghi, who is certainly too left-wing to please the Army, in the event of the president's death. But it is difficult to picture General Perón as a dying man after a year of such strangely dynamic activity.

Berlin in Brief

(The conference is now in its third week)

FEBRUARY 4th. The most notable event was Mr Molotov's rejection of the Eden plan for the reunification of Germany through free elections. He complained that it paid too much attention to parliamentary institutions and neglected the important question of the sort of results that all-German elections might produce. He proposed instead the immediate formation of an all-German provisional government to hold all-German elections. This government, which would represent Germany during the preparation of a peace treaty could, if it proved to be practicable, replace the existing German governments. It would draw up an election law to guarantee the "democratic" nature of the elections. Before the elections all occupation troops, except for a few limited contingents, would be withdrawn. M. Bidault accepted an amendment to the Eden plan proposed by Mr Dulles on February 3rd that a united Germany should be specifically free to reject as well as to accept, the international commitments of both German governments.

February 5th. The three western ministers tried to show Mr Molotov why his proposals for German unification were completely unacceptable, and to elicit from him detailed objections to the Eden plan. Mr Eden pointed out that, if the occupation forces were withdrawn, West Germany

would be at the mercy of the armed "people's police" in the Soviet zone. He summed up the West's objections to Mr Molotov's proposals as follows:

- (1) They implied that the occupying powers should abandon their responsibility to ensure that the Germans were free to choose their own future.
- (2) It would not, in fact, be possible to form a provisional all-German government through the joint action of the present fundamentally incompatible German governments; even if it were possible, such a government would not represent the free and responsible choice of the German people.
- (3) Mr Molotov would restrict the all-German government's freedom to choose its alliances for itself.

February 6th. Further fruitless efforts by the western ministers to find some basis of agreement with Mr Molotov on ways of unifying Germany. M. Bidault tried to meet Mr Molotov's objections to the West's proposals for supervisory commissions by suggesting that these commissions might consist of one representative each from east and west Germany and one neutral arbitrator. Mr Eden accepted this suggestion; neither Mr Dulles nor Mr Molotov made any comment on it. Mr Eden said that Britain would be prepared to extend the 20-year Anglo-Soviet Treaty of 1942; and that he would be glad to consider any other methods of reassuring the Soviet Union about its security. Mr Molotov ignored these proposals and brought forward the economic proposals contained in the Soviet Note of August 15, 1953, concerning Germany's reparations, post-war debts and occupation costs.

First Restricted Session

February 8th. The Ministers held their first "restricted session." They discussed questions under item 1 of their agenda (measures to reduce international tension and the convening of a five-power conference) and decided that the discussion of item 3 (Austria) should begin not later than Friday, February 12th.

February 9th. Another day of sterile debate on Germany. Mr Molotov asked if the western powers had anything to say about guaranteeing the security of Europe; but he made no reference to Mr Eden's offer to prolong the Anglo-Soviet treaty. Mr Eden suggested that it was time to recognise the fact that they could make no progress on the question of German unification.

February 10th. Mr Molotov proposed a 50-year European collective security pact with a neutralised and divided Germany. It is discussed in a Note on page 447 and also in *The Economist* of December 5th and 12th, 1953. Mr Molotov's proposals were strongly criticised by all three Western Ministers and specifically rejected by Mr Eden and Mr Dulles.

* * *

Correction

An article on page 402 of last week's issue of *The Economist* stated that a university at Lovanium, near Kisantu in the Belgian Congo, would open this month. The university is in fact to be at Kimuenza, about 20 miles from Leopoldville. Up to now Kisantu has been the home of the *Centre Universitaire Lovanium*.

HAVE YOU

NOTICED IT TOO?

How one grows out of office furnishings? How, suddenly they simply aren't your style any more? You detest tubular steel (or walnut panelling or neo-classical-contemporary-what-have-you) and Great Scott! come to think of it, you have detested them a long time. At this stage, some men must only grin and bear it. But if you are a V.I.P. in your firm, get on to Mr. Peter Catesbys and his staff at Catesbys. They have a knack of surrounding eminent men with eminently suitable furnishings — adapted to suit them.

THE BUSINESS WORLD

The Maze of Markets

IF everyone was so surprised at this week's boom on the Stock Exchange, who was feeding it? The behaviour of the markets since the beginning of the year has surprised even those who had expected firm prices and steady buying as good profits were announced and dividends increased. But this week ordinary share prices have nearly touched their highest point since the war—falling by that tiny and, as some would hold, significant fraction to break through the "highs." Without any of the stoking that Dr Dalton's shovelfuls of cheap money gave to the market in 1947, the *Financial Times* index of industrial ordinary shares is within a point of the peak of 140.6 set up in January of that year; there were 17,143 markings, also a peak since that time, on the Stock Exchange lists last Monday.

Perhaps the present Chancellor, whose account of the Commonwealth Conference last week radiated as much genial warmth as taut reasoning, is not disturbed by the market's behaviour. It has taken many of its clues from him. It shares his view of the American recession—a minor readjustment already on its way out. That is the biggest question mark removed—if, indeed, it is removed. It has noted the comfortable success of the authorities in their latest conversion operation—£340 million of National War Bonds, 1952-54, out of a total of £412 million converted into 3½ per cent Conversion Stock with fifteen years to run. "Success" in such operations is always a relative term, for who knows what the departments were already holding? But the important point is that the operation was pitched on terms that have levered the medium life stocks to a new datum. That may not have been the primary purpose of the authorities; but they have accepted with majestic calm the ensuing rise in long-dated and even undated gilt-edged stocks.

This, then, is a market with steam in it, and not merely wind. But there was perhaps more wind than sense in the expectation, duly disappointed on Thursday, that Bank rate would be further reduced from 3½ per cent to 3 per cent. What happened last September had almost the force of an atomic reaction; would it be politic to risk another explosion to add to the pressures that are already driving the security markets into the sky? The reduction in the Federal Reserve rediscount rate from 2 per cent to 1½ per cent proves that banking policy in the United States is being consistently directed towards the ending of the recession—whatever may be said about budget policy. There, for the moment at any rate, its relevance to British market conditions ceases. If by a slight, and legitimate, display of forcing tactics the British authorities have been so easily able to lift the level of gilt-edged prices, there is no need, given present market conditions and the present general level of business activity, to start using the power jack of Bank rate itself. And many market observers did not evince too much alarm at Mr Butler's comments last Tuesday on the purchase tax ("this is not the time when large concessions, or indeed concessions of any type are likely") or on the heavy supplementary estimates tabled a day later. They adhere staunchly to the view that if Mr Butler was disposed to budget as he did last year, he will not be less ready to give any further incentives that he thinks may be required when April comes.

So the average investor has firmly attached himself to the idea that the British economy is "steamed up" and will stay so for some time. The American boggy turns out to be less fearful than the portents were suggesting three months ago. A high level of activity—not least in the consumption trades—seems likely in this country for some months. Government policy will

be "easier" rather than "harder." The rigours of convertibility will not have to be faced—yet—because American policy is not ready to assist it on acceptable terms. This, then, is the background of investment calculations. And in the foreground is the continued flow of attractive profits and dividends, the continued demand of the pension funds for good equities which then permanently disappear from currency, and the continued challenge of balance sheets carrying assets far below their current values.

But the fact remains that the equity index has risen

INDUSTRIAL SHARE TRENDS

twenty points in twelve months, and the daily score of bargains marked has trebled. Do the favourable factors justify a further rise? Is there nothing to put into the other scale? The market is making some very bold assumptions. It is assuming, for instance, that a rise in British costs in a "7s. wages year" would have no effect on exports and the balance of payments. It assumes that the American readjustment has stopped rolling, and at this moment that may represent a very dangerous and uncritical swing towards undue

Enterprise in the Air

IN the past ten days, the Minister of Transport and Civil Aviation, Mr Lennox Boyd, has twice been involved in exchanges in the House of Commons over the Government's policy for air transport. Superficially they were little different from the usual run of parliamentary questions, for they dealt with such apparently uncontroversial subjects as air freighting and air charter operations. But, in fact, these are the two most inflammable subjects in British air transport affairs, and on Wednesday the temper of the Minister's questioners came near to spontaneous combustion. The impression is gaining ground, not least in the two

optimism. It assumes that the next move in the declared policy of a flexible Bank rate must be down; it could, to buttress a balance of payments crisis or an attempt at convertibility, with much better reason go up. It omits any consideration of the growth of competition in many branches of industry; the balance sheets that are now appearing cover a past period of unquestioned profitability, but a few cautionary statements from company chairmen about the level of current earnings might strike a very different note. And the appearance of a few big industrial issues (even with steel issues held in suspense for some months), together with a formidable list of dominion and colonial borrowers, could easily challenge present market levels.

The stock markets may indeed show further rises, in some sections at least, for some time. But the moment of boiling over is always a sensible time for the prudent investor to pause and reconsider his policy. All the latent factors—no devastating American recession (probably), continued "softness" in economic policy (until the balance of payments shows up the horrid realities) and the steady disappearance of the best ordinary shares into the lockers of the institutions and pension funds—point to a basic firmness in the market. But while there is no argument for the reckless throwing out of first-class equities, there is certainly a good case for systematic pruning of the lists. There may not be many more opportunities to get out of second-class equities on such favourable terms as the last fortnight has offered. Shares that are priced on the basis of grossly undervalued assets and on a dividend policy that has not been fully adjusted to contemporary facts may still be objects of esteem—and there are still examples to be found, in oil and shipping as well as in other groups. In the gilt-edged market, where the authorities have recently veered the rate structure towards longer dates, it would be only prudent to accept this as a lead—at least for a time. But on the longer view, the attractions of a date—and conceivably a shorter date than would now be appropriate—are still undimmed.

nationalised corporations, that the Government now has in mind not the "competition" between the nationalised air corporations and the independent operators that was implicit in its original statement of policy published in July, 1952, but something much nearer the permanent exclusion of the corporations from certain fields of operation so that they can become the exclusive preserve of the first independent operator who is able to gain a licence to develop them. In other words, the policy appears to be leading not towards genuine competition but towards the creation of a number of new private monopolies. The Minister's questioners,

who included two Labour parliamentary secretaries to the former Ministry of Civil Aviation, wanted to make the Government show its hand; and indeed, Mr Lennox Boyd admitted that a substantial degree of protection would be given to any company operating a new service, and that the Government was anxious to see the charter operations of the nationalised corporations bound within narrow limits. But to appreciate why these twin subjects of air freight and air charter are regarded by the industry as test cases involves some knowledge of the background of the Minister's replies.

The Government's civil aviation policy can be roughly summarised: to preserve intact the structure of the two nationalised corporations' passenger services, but to allow independent airlines to compete around their periphery. The independent operators are nominally free to develop any new passenger routes not operated by the corporations, to fly third class "colonial coach" services on the corporation's existing passenger routes, and to develop all-freight services. All passenger aircraft carry a good deal of freight to make up their pay load, but an all-freight service involves the use of aircraft with special freight-loading arrangements, so that the size of the consignment is limited only by the dimensions of the fuselage.

★

If the independent operators are to seize these new opportunities, they need to expand their organisations and increase their fleets. Heavy capital expenditure would be needed and the success of the Government's scheme to introduce competition into air transport—in addition to that already provided by foreign airlines—depends first on this investment being made. To make the prospect look more attractive to the independents, as well as to give them a breathing space in which to consider their plans when the new policy was announced, the Government asked for, and obtained, an assurance from the chairmen of the two nationalised corporations that neither would apply for any new all-freight services for twelve months, that is, from July, 1952, to July, 1953.

Shortly after this undertaking was given, the new terms of reference for the Air Transport Advisory Council was published. This is the body through which all applications for new services have to pass; its American counterpart, which enters the story later on, is the Civil Aeronautics Board. The ATAC was given instructions on the conditions that had to be satisfied before a second British carrier was allowed to fly on a route already served by a British airline. If the application was for a new passenger service, it had only to be shown that the proposal was "not likely materially to divert traffic" from existing services—not an unreasonable requirement. But the conditions on which a licence for a competitive freight service would be granted were more stringent. They require that "the position of any previously authorised operator is not likely to be undermined." The ATAC's interpretation of this clause

has not yet been tested, but the airlines themselves regarded it as granting an effective monopoly to the company first in the field in all but the most exceptional circumstances.

This put BOAC in an unenviable position. The corporation had intended to apply for a permission to operate an all-freight service across the North Atlantic, and was negotiating to buy special freighters to put on this and other routes, but the undertaking given to the Minister meant that the application could not now be put in until July, 1953, at the earliest. The ATAC's terms of reference seemed plainly to suggest that should one of the independents apply to run a freight service on the same route before BOAC's undertaking expired, the corporation's chances of getting a licence were slim. This view was supported by what actually happened. Two substantial independent companies, Airwork Ltd. and Hunting Air Transport (now Hunting-Clan) both applied for a licence to run all-freight services to America. Airwork succeeded and Hunting was turned down.

The next step for Airwork has been to apply to the Civil Aeronautics Board for permission to operate an all-freight service into the United States. Under normal conditions, this would have been little more than a formality, for it was backed by an operating licence approved by the British Government. But the CAB was having its own difficulties. One of the major American freight operators, Seaboard and Western, had been trying for seven years to get permission to fly a scheduled—as distinct from charter—freight service on the North Atlantic route, and opposition from the American scheduled operators has persistently blocked its claim. Many Americans look on Airwork as a "non-sked" too, although the company has enjoyed scheduled respectability for some time. The CAB has now recommended Airwork's application for approval, but has added a rider that it may be difficult to justify granting to a British carrier a licence that has been persistently withheld from an American one. The decision now rests with the American government and on its outcome depends the putting into operation of Airwork's freighting plans.

★

BOAC's last annual report, for 1952-53, stated that "the corporation intends to apply to the Air Transport Advisory Council for permission to operate all-freight services on certain routes as and when necessary." Mr Lennox Boyd, however, told his questioners this week that no such application had been received. The reasons why BOAC have not applied (since last July) for permission to compete with Airwork are obscure. It may have revised its estimates of the potential freight traffic available and concluded that the prospects are not good enough to support a second British service. But appearances suggest that Airwork would have little difficulty in successfully opposing any application by the corporation to the ATAC, and the corporation may have

January Trade Unchanged

BRITISH overseas trade in January showed little change from the previous month, but it compared unfavourably with the average for the fourth quarter of 1953. Exports last month, which had 26 working days, one more than December, are provisionally valued at £225.8 million f.o.b., £1.2 million higher than in the previous month but £4.8 million below the fourth quarter average. Re-exports rose by £500,000 to £8.1 million, and were £600,000 below the fourth quarter average. On a working day basis, total exports were disappointingly low at £9.0 million, compared with just over £9.2 million a day in December, when shipments were affected by the extended Christmas

holidays. Imports rose by £900,000 to £282.5 million c.i.f., but were £6.4 million above the fourth quarter average. The gross visible trade deficit in January was just £800,000 lower at £48.6 million, but it was £11.8 million larger than the average for the fourth quarter. The decline in exports to North America continued in January, when they totalled £22.5 million, £1.7 million less than in December. Shipments to the United States dropped by £1.5 million to £12.0 million. Shipments to Canada fell by £200,000 to the low level of £10.5 million, partly for seasonal reasons.

CDFC Steps In

THE first investment by the Commonwealth Development Finance Corporation is a blend of all the right ingredients. The recipe was written out in the communiqué of the 1952 Commonwealth Economic Conference which

set up CDFC, under strong city auspices, to finance approved schemes of development in the Commonwealth. Now twelve months later it has been put into practice. The investment, amounting to about £1 million in rupees, is to be made in the equity of the Sui Gas Transmission Company, Limited, now being incorporated in Pakistan. This company will transmit natural gas through a pipeline from a large field in south-east Baluchistan to Karachi, some 350 miles away. The natural gas will be available for use over a wide area of western Pakistan for industrial and agricultural development. In this way, and by reducing Pakistan's dependence on other countries for fuel supplies, this project lives up to the criterion established by the economic conference that CDFC should invest in those schemes that increased the resources or strengthened the balance of payments of the sterling area.

CDFC was also enjoined to listen most sympathetically to those applicants who had tried to raise as much money as they could locally or through the market for international loan capital. This condition, too, has been fulfilled. The scheme has been sponsored by the Pakistan Industrial Development Corporation in co-operation with Burmah Oil and with the approval of the Pakistan government. The International Bank for Reconstruction and Development has been asked by the Sui Gas Company for a loan of about £5 million and the rest of its equity capital, amounting to about £3 million, will be provided by Burmah Oil, the Pakistan Industrial Development Corporation and by private investors in Pakistan. The third enjoiner on CDFC that the projects should offer a reasonable chance of being commercially remunerative and should be expertly managed has been followed, in so far as it can at this early stage of development, by a long term agreement with Burmah Oil that one of its wholly-owned subsidiaries will be responsible for the management of the gas company. The mixture in this instance and in those to follow is clearly of local and international finance and of local and international expertise.

The Corporation has further investments in the offing. They will probably show that the present equity investment is not an invariable prototype. At this stage CDFC will probably favour loan stocks. When it accepts a project it will certainly require the developing company itself to put up a share of the finance and will hope to attract capital from a still wider field. The cachet of CDFC's approval by attracting new money into the Commonwealth from outside sources could be at least as important as its own investment.

Persian Oil Complications

THE "green light" that the American oil companies have been given to join in the exercise of making Iranian oil flow again is of a pale shade. The Attorney-General last week showed in his statement that the clearance did not constitute an immunity from anti-trust proceedings. A state Department spokesman declared that the five American companies can participate in the "production and movement" of Iranian oil, but that the clearance did not cover "marketing" and did not allow the companies to collaborate in any consequential adjustments of production in areas outside Iran.

Steel Figures from the Board

STEEL output in January—the weekly rate was 360,300 ingot tons, a record for the month—was announced this week by the Iron and Steel Board, not the British Iron and Steel Federation, though it is the federation's statistical department that continues to collect the figures. The change may seem trifling; but it may also symbolise the way in which the board is superimposing itself upon the existing superstructure of the British steel industry.

Recent annual reports from the steel companies—for example, Colvilles' this week—have referred to development projects upon which the decision of the Steel Board is awaited; its organisation for this particular function of supervision is now complete and operating. It has set up a development committee and co-opted a technical committee from the industry, to which projects are submitted direct from the companies, without preliminary technical vetting by the federation. It has itself taken over the collection of statistics for ironfoundries (these are quarterly, and it has not published any). In the fields of raw materials and of forward production budgeting for the industry as a whole, it is now represented upon the committees of the federation and of the central buying agencies; and it has established a right to be consulted before any changes are made in the industry levy operated by the federation. It is already, of course, the authority for setting maximum prices (which it has published) for iron and steel (though not for scrap); the collection of costs for the industry's pricing arrangements will now be operated on behalf of the board; and perhaps the main preoccupation of its members is an elaborate and detailed review of the industry's whole price structure.

As the Minister of Supply mentioned last week, the board is at present re-examining the question of steel plate supplies. The adequacy of the present and projected capacity to meet demand after the present "hump" has been argued by the British Iron and Steel Federation and examined departmentally within the last year. But shipbuilders and other consumers of British steel plate still complain of shortage, though they show little anxiety to import plates at the world price, as they are free to do.

Profits from Steel

FIVE companies of the "Big Seven" of the steel industry are still waiting to offer their shares to the public. In advance of this test, two of these companies, Colvilles and John Summers, have published reports on their trading years to October 3rd. These reports illustrate two aspects of the steel industry's development programme. The various items of development carried out by Colvilles have already cost the group about £10½ million and will cost it at least another £2½ million more, but none of the developments have been big enough to disturb the activities and profits of the group as a whole. John Summers, on the other hand, has carried through a major programme of development and integration at Shotton and the teething troubles it has experienced have been sufficiently irksome to affect profits.

Houses by Easy Payments

OVER one form of hire purchase the Treasury does not exercise a strict anti-inflationary control, the purchase of houses on mortgage with the help of the building societies, and the local authorities. This week and last something has come to light about the plans now being discussed between the Government, the local authorities and the building societies for making the terms of house purchase still easier. These plans were mentioned by the chairman of the Temperance Permanent Society, Mr Cyril Black, at last week's celebrations. It is proposed to reduce the percentage of the purchase price of an owner-occupied house which the purchaser has to find himself initially. The present level is normally about 20 per cent. It will be reduced to 10 per cent by co-operation between the Government, the local authorities and the building societies. The idea is to extend the machinery of the Housing Act of 1933, under which when a building society is prepared to lend part of the value the local authority may bring the advance up to 90 per cent.

Terms have not yet been settled and the building societies still have a good deal to say. First they will point out that if the purchaser likes to buttress his mortgage security with an insurance policy he can already borrow 90 per cent of the valuation (which is incidentally not always the same thing as the purchase price). Secondly they will have something to say about the proportions in which any loss resulting from the procedure is to be borne. Under the 1933 Act when a building society guarantees part of the advance it suffers one third of the loss, the Treasury and the local authority also shouldering one third each. In the new discussions the building societies seem entitled to say to their partners: "We were prepared to advance 80 per cent as a normal trade risk, it is entirely to oblige you that we have become involved in a more generous advance than we should normally have made. Our proportion of any loss ought to take account of that." But the loss ratio sustained by building societies is normally low.

Agreement is however to be expected. For the Government and the local authorities the advantage is clear. A house sold is a house unsubsidised. But a house let by the local authority, involves the Government and the local authority in a subsidy burden lasting for more than a generation.

Profits earned by the John Summers group have fallen from £3,572,782 to £2,767,727. The directors explain that this decline is "due to the expenditure involved in bringing into production new plant at the Hawarden Bridge steelworks." New equipment means much heavier depreciation charges. The increase in the group's depreciation provision from £644,542 to £1,293,732, though it is accompanied by a fall in the tax provision, has been so large as to bring the group's net profits tumbling down from £1,409,399 to £485,937. Even without the extra costs of running-in, John Summers might well have had to report

Years ended	Colvilles		John Summers

smaller profits. Earnings in 1951-52 were inflated by windfall gains on stocks while profits in 1952-53 may have been affected by the fall in the demand for sheet steel last spring and by the decline in the premium on its export price.

With the demand for heavy steels from the shipbuilders and other industries running at a high level it is not surprising that Colvilles has reported full capacity working and a rise in trading profits. Alloy steels, however, were not in such great demand, and, while the group has sold high tensile steels for welded construction to shipbuilding yards overseas, these steels have not been so popular at home. With full capacity working and a full order book the directors have no need to be anxious about the rise in stocks (from £7 million to £9½ million) which followed on the improvement in the supply of iron ore, pig iron and scrap.

Woolworth's Sales and Stocks

WITH a greater variety of goods to sell, Woolworth's chain stores cashed in handsomely on last year's rise in personal spending. Trading profits jumped by about 15½ per cent to £19½ million. The sudden spurt in spending on confectionery and on hardware must account for a good part of this increase. The Woolworth stores operate on small profit margins and the advance in profits is a direct correlation of yet another increase in sales. In commenting on the policy of "small profits, quick returns" the chairman, Mr S. V. Swash, tells shareholders that if the price of all the goods sold had been reduced by a halfpenny all profits would have been wiped out and the company would have been left "nursing a loss." About 65 per cent of

these profits has been absorbed by taxes and about a sixth of this provision represents EPL. It is the demise of this tax that helps to explain why the 5s. ordinary stock units yield only £4 7s. at the current price of 69s. on the current dividend of 60 per cent, which is 5 per cent higher than that paid in 1952.

Woolworth's success depends largely on a strict control of stocks. Last year its stocks rose by less than £125,000 to

ASSETS AND LIABILITIES

Years to December 31	1952	1953
Fixed assets, less depreciation	12,367,819	14,144,662
Investments	4,050,243	4,125,688
Net current assets	23,232,676	24,129,631
Stocks	11,087,015	11,210,250
Tax reserve certificates	11,130,000	12,200,000
Cash	18,407,760	20,988,818
Revenue reserves	9,807,157	11,573,471
Future tax reserves	7,600,000	8,430,000
Ordinary capital	15,000,000	15,000,000

£11.2 million. Mr Swash explains that the company likes to keep stocks "rather on the light side" at the end of the year provided that there is no indication that prices will go up. After the Christmas rush stocks have to be built up again and "if there were not a little slack in the stock figure inventoried, the investment after this re-stocking would be too high," with the risk of losses before they are liquidated. Evidently Woolworth's directors do not expect prices to rise much this year, so that another increase in profits must depend on a further expansion in sales.

Reshaping EPU

THE European Payments Union is becoming a lively topic of discussion in both unofficial and official circles. The latest changes in its mechanism relate to the position of Belgium and Austria. The Council of OEEC has recently considered, as a matter of urgency, the persistent creditor position of these two countries, and has decided on a temporary addition to the quotas for each of them. The Belgian additional quota is increased from \$75 million to \$125 million, which is superimposed on a basic quota of \$331 million. Austria's basic quota of \$70 million was supplemented last year by \$25 million and is now to be increased by a further \$6 million. It has been decided that in each of these cases additional surpluses accumulated with EPU will be settled as to one half in credits and one half in gold.

Wider issues concerning the future shape of EPU have also been raised officially—in the preliminary negotiations for the extension of EPU beyond June 30th next. These discussions, which have already begun, are partly concerned with the problem of merging EPU into a wider multilateral payments system in the event of one or more of its major currencies becoming convertible. In preparation for such a shift to a wider system, some of the EPU member countries are urging that the Union should be "hardened," partly by requiring that surpluses with the Union in excess of 150 per cent of quotas should be settled, not, as now, in equal proportion of gold and credit, but as to 70 per cent in gold and 30 per cent in credit. The

Nature's brute force is a blind and wasteful thing.

But Man can tame and direct it. Man harnesses the strength of animals, yokes the winds of heaven, places the soil itself in careful bondage.

The life-giving sun winters in other skies, but we do not go hungry.

Man the thinker has become Man the farmer.

why are we by all creatures waited on...

We do not know in what century, or even millennium,

man first tilled the soil: nor do we know how soon afterwards

he learnt to make his soil more fertile by feeding it.

These things happened before History was first written.

But the science and application of fertilizers

is not much more than one hundred years old.

This has been Fisons business from the start. And, today,

with roots also in the field of chemicals for medicine and industry,

Fisons contribute to the harvests, health and wealth of Britain.

other demand is that overdrafts with EPU, if of more than eighteen months' duration, shall be redeemed within three years. These demands, as might be guessed, are being pressed by representatives of Western Germany, Belgium and the Netherlands. They are being resisted by the British spokesmen; their attitude in this respect is traditional, but it may also be conditioned by the Chancellor of the Exchequer's recent prophecy in the House of Commons that Britain is likely to increase its debt with EPU in 1954, and may possibly move into a higher gold *tranche*.

The Britannia Fire

THE engine fire that brought the Britannia airliner down in the mud last week was not an accident in the sense that it was wholly unavoidable. By landing in the mud, the pilot was able to avoid damaging the aircraft to an extent that might have destroyed some of the evidence on which the engineers are now working. The outbreak was caused by the failure of certain components under unexpected loads; the precise cause of the fire has not yet been determined, but from an engineering point of view this is not likely to require any drastic re-designing of the engines themselves. This means that the Bristol Aeroplane Company can feel reasonably confident that the airliner will be ready to go into service only a few months behind the original schedule.

The financial consequences, however, are more serious. The two prototype Britannias belong to the Ministry of Supply, and the Ministry pays for all their development and flying costs. The flying hours necessary to qualify the design for a Certificate of Airworthiness were being built up on the second of these aircraft, which must now be considered as a total loss. The next Britannia due to fly is the first of the 26 production aircraft being built for British Overseas Airways Corporation, and it is on this machine—operated presumably at BOAC expense—that the C of A trials will now have to be carried out. At several hundreds of pounds an hour, this is an expense that BOAC may attempt to pass on to the Ministry. The corporation has repeatedly complained at the burden incurred by route development with new aircraft, and it faces a heavy bill for the modifications that are being made to its Comet fleet in the absence of any conclusive evidence about the cause of the Elba accident last month.

Fisons Offer for Pest Control

THE proposed acquisition of Pest Control by Fisons is one sign of the difficulties facing the farm chemical industry. There is an expanding market for the newer insecticides and weedkillers, in which Pest Control specialises, so much so that the Ministry of Agriculture's working party* has just published a report on the effect of their residues on food. Higher farm labour costs encourage the use of these scientific short cuts to good husbandry, and the sale of the newer insecticides can no doubt be advanced.

* Toxic Chemicals in Agriculture. HMSO. 1s. 6d.

tageously linked to the sale of fertilisers. But these organic farm chemicals call for large capital resources; development costs are considerable in the laboratory and also in pilot trials spread over several seasons. Another side of Pest Control's business—contract spraying—also involves heavy investment and gives slow returns. From Fison's point of view, the acquisition opens the back door to a field at present dominated by the Imperial Chemical Industries—Cooper McDougall, Robertson subsidiary, Plant Protection.

Both companies may be reasonably satisfied with the terms of the merger. Ordinary shareholders of Pest Control receive one £1 ordinary share of Fisons, plus 2s. 6d. cash—say 47s. or a shade over 7s. 10d. per Pest Control share. As Pest Control 5s. Ordinary shares were standing at 7s. 7½d. at the announcement (compared with a low point of 3s. 4d. last year), holders should be well satisfied. This is a company of bright and enterprising ideas which had run ahead of its commercial range and its cash resources. The last Ordinary dividend was 10 per cent for the 1949-50 period and the chairman has already warned ordinary shareholders not to expect a dividend for the year ended September last. Shareholders will therefore be exchanging from a security which pays no dividend into one which does pay.

Fertilisers on the Farm

THE fertiliser manufacturers are launching a concerted campaign to persuade farmers to buy their fertilisers some time before they are needed, but it is doubtful whether the campaign will meet with much success. The bulk of fertilisers go on the land in early spring, and about 3 million out of the 4 million tons used each year are ordered between mid-February and mid-April. With the rise in consumption, these seasonal peaks are becoming more than the factories can handle.

When the industry was working below capacity, idle plant could be brought into commission during peak demand. Today, with every piece of plant fully employed, this safety margin no longer exists. But not even quite substantial financial inducements seem sufficient to overcome the farmers' prejudice against early ordering. This winter, the industry has been offering an early delivery rebate of 25s. a ton in November, 20s. in December and 10s. in January, but manufacturers do not believe the response has been anything like big enough to flatten the top of the March peak.

Prejudices apart, the two reasons why farmers have not co-operated to a greater extent are a lack of storage capacity, and a fear that the fertiliser will deteriorate and become too rocky for the drills—which it may if it is not properly stored. The manufacturers, therefore, will probably still have to budget for this peak in demand. The least expensive way to do so may be to retain some of their oldest equipment on a "care and maintenance" basis during the rest of the year. Few are ready to invest substantial sums in new plant while the fertiliser subsidy to farmers continues to maintain demand at what seems to them an artificially high level. When the subsidy was removed in 1951, average monthly consumption of compound fertilisers dropped sharply (from 171,500 tons in 1950 to 103,900 in 1952). The subsidy was replaced in the middle of 1952 (after

Consommé Super Jet

Basic chemical ingredients are as vital to the world's refineries as stock and seasoning are to the cook in the preparation of consommé. One of these basic chemicals is liquid sulphur dioxide, essential for the refining of modern jet fuels. The large independent company of Brotherton, established in 1878, is now one of the world's chief manufacturers of this basic chemical.

A BIG NAME IN THE CHEMICAL WORLD

Brotherton

One of the world's largest manufacturers of hydrosulphites, liquid sulphur dioxide and hexamine. Makers of an extensive range of Metachrome dyes for dyeing wool in all its forms.

Brotherton & Co. Ltd., City Chambers, Leeds, 1.

Works: Birmingham, Wakefield and Birkenhead.

the buying season) and consumption rocketed up again to an average of 148,300 tons in 1953. Many companies in the industry would have preferred to let demand settle at its true, unsubsidised level, rather than to see it artificially stimulated into recovery by the return of subsidies.

Coke off the Ration

ON the second day of the recent cold spell, roughly half the domestic fuel consumers in the country ordered coal or coke from their local merchants. This week's decision by the Minister of Fuel and Power to end the rationing of coke, therefore, has followed complaints from some householders of coke shortages in various parts of the country—which seem to have arisen because the merchants naturally had not enough lorries and drivers to meet this rush of orders on instant demand. Freedom to buy cannot alleviate a sudden and absolute overloading of the distribution system such as this, but it gives the customer a chance to find a supplier who will deliver in time and the merchant an incentive to get extra business. How far customers may be tempted to use coke to eke out coal, which is still rationed, remains to be seen; they can already use gas and electricity freely. Domestic consumption of coke seems to have grown somewhat last year; the figures of consumption for 1949, 1950, and 1951 are considerably larger than for 1952 and 1953, but are not directly comparable.

Stocks of coke at the gasworks were ample at the beginning of the cold spell, at about 1½ million tons. It is this gas coke that is mainly affected by the Minister's decision, which concerns domestic consumers alone. The "pro-

gramming" of coke supplies for industry appears formally to be continuing, though for some time this has hardly been acting as a restriction upon the amounts of coke that industrialists want to buy. The largest industrial consumers are the blast furnace operators, who last year took nearly 12 million tons, all but a fraction of it metallurgical "hard coke" from the coke ovens; the remainder of the iron and steel processes, plus engineering, take roughly another 2½ million tons annually. Almost all the growth in total coke production in recent years has come from the coke ovens; much new capacity has been brought in to feed the demand for extra pig iron from the blast furnaces.

Guessing Soviet Gold Output

THE recent heavy shipments of Russian gold to London have given new zest to the intriguing pastime of guessing the volume of the Soviet gold output. Estimates of this output have always varied so widely that they do indeed seem little better than guesses. Before the war some official Soviet figures were published showing how the gold industry had conformed with the plans set for it; but these figures were invariably shown in the tantalising form of percentage variations from a base year for which no absolute data were available—and there were also indications that the base year was changed from time to time. The official figures had therefore to be discarded in favour of unofficial ones. The Union Corporation, which makes annual estimates of world gold production, has for some years past put Russian production at two million ounces, whereas the Bank for International Settlements not long ago put forward an estimate of twice that amount. In Washington, however, the International Monetary Fund has played for safety; it has all along refused to commit itself to any estimate of Russian gold production and, in its gold statistics, it goes out of its way to exclude the USSR, China, Bulgaria, Czechoslovakia, Hungary and Rumania.

But now comes the United States Bureau of Mines, which suffers from no such inhibitions. In its recent estimates of gold production it has put the Russian output at 7 million ounces in each of the years 1948 and 1949, 8 million ounces in 1950 and no less than 9,500,000 ounces in each of the years 1951 and 1952. On the basis of these figures the USSR would rank as the second largest gold producer in the world; the sharp increase in output that they postulate is presumably regarded as attributable to the working of alluvial deposits in Eastern Siberia. The publication of these impressive figures is perhaps a happy chance for the Soviet authorities who recently have been so busily converting their gold into foreign currencies—and thus into imports of capital and consumer goods. They may feel that these gold figures lend slightly greater verisimilitude to the massive volume of orders that have been dangled before the eyes of the British business men now visiting Moscow.

Rayon Resurgent

OF all textiles, rayon—or rather synthetic fibres as a whole—made the most spectacular recovery from the 1952 slump. Output last year reached 419.3 million pounds, which is very nearly 50 per cent greater than the 283.0 million pounds produced in 1952. What is more, production soared above its 1951 level, exceeding it by a margin of 9 per cent. It may not be wholly accurate to attribute all this improvement to a net rise in rayon production above 1951 levels, which represented something approaching capacity rates of output. The figures include all synthetic fibre production, nylon, "terylene" and "ardil," and while some of this is still on a pilot scale, it does nevertheless contribute to swell the total figures.

THE CASE OF THE Sunday Dispatch

Every Sunday, nearly 3,000,000 copies of this famous newspaper are sold. The day following, accounts and order forms to hundreds of agents must go out...

Day of reckoning: Monday!

A BEHIND-THE-SCENES STORY on the workings of a great national newspaper comes from Associated Newspapers Limited. Their problem was to streamline the office system by which they control the sales operation for the ever-popular "Sunday Dispatch." Statements to all the agents were being handwritten. It threw a heavy load on office staff.

Associated Newspapers Ltd. wanted a system that could guarantee that all figuring on sales accounts was finalized, and weekly accounts sent out, on the Monday following the paper's publication date.

After consultation with Burroughs, they installed Sensimatic Accounting Machines to handle the postings. These are used in conjunction with an ingenious method of invoicing, by which the agent receives, on one single form, a statement, a receipt for his payment, and an order slip for next week's copies.

Result: So fast do these Burroughs machines serve the office that it is now normal practice to get "Sunday Dispatch" weekly statements prepared

and dispatched on Mondays. Cash collection is swift and efficient and next week's orders come back in time for action by the circulation department.

One more result has been that Associated Newspapers Ltd. are now using Burroughs Sensimatics on sales

210 postings in 45 minutes—that's a normal rate of work achieved by Mrs. J. Dickens, seen preparing statements for newagents in the offices of Associated Newspapers Ltd. Watching her use one of the Burroughs Sensimatic Accounting Machines is Mr. Paul Stark, the Burroughs man who helped solve "The Case of the Sunday Dispatch."

accounts for their latest paper, the "Daily Sketch."

What about you? If your business could benefit from faster, accurate figuring, call in Burroughs. They can offer advice on all the latest systems, for Burroughs market the world's broadest line of modern record-keeping machines: Adding, Calculating, Accounting, Billing and Statistical Machines, and Microfilming Equipment. Remember, once you have any Burroughs machine, Burroughs Service guarantees its efficiency in operation.

Call Burroughs today. Burroughs Adding Machine Limited, Avon House, 356-366 Oxford St., London, W.1. Sales and Service Offices in principal cities round the world.

The experience of the wholesale trade in textiles during the same period suggests that there are limits to the volume of textiles that the home market will absorb. Total sales of wholesale textiles were nearly 6 per cent higher in value during 1953 than they were the year before. But towards the end of the year, two disturbing features began to emerge: sales turned downward, and the value of stocks rose. Only in December did the level of sales fall below those recorded for the same months of 1952, but what the trade describes as the "stagnation" of business in the late autumn and early winter made an unwelcome contrast to the buoyancy of sales during the summer and early autumn. Taking the year as a whole, wholesalers had 10 per cent less capital tied up in stocks than in 1952, but from August onwards the value of their stocks in any one month began to exceed their equivalent 1952 values. This does not promise well for the New Year's trade.

Unconvincing Narrative

Two facts only emerge from the circular which the Savoy Hotel directors issued to the shareholders on Tuesday—that the directors are thinking in terms of a bonus for 1953 in addition to the ordinary dividend and that plans for the future of the company, probably including something to the benefit of ordinary and preference stockholders, will be submitted at the annual meeting in April. Neither the amount of the bonus nor the nature of the advantageous plans is specified. Something more than this will be needed to bring the shares back to 62s. 6d. which the still unknown friends and associates of the directors paid to wrest control from Mr Samuel last December. The circular hoisted the stock only 2s. 6d. to 51s.

But it seems hardly necessary that Mr Wontner and his fellow directors should have taken the shareholders for another 700 word tour of historical retrospect. The circular sums up the battle for the Savoy thus: "Neither the directors, nor the staff, nor, it seemed, a great number of the company's patrons, were in favour of a change in control." The patrons? Has the Savoy become a consumers' co-operative? Is it no longer necessary to mention even the existence of shareholders?

If the Savoy board are devising something which may be of benefit to the shareholders, they must have turned over in their minds Mr Samuel's idea of turning the valuable Berkeley Hotel site to better financial advantage. It would be horrid to have to say: "Perhaps Mr Samuel was right after all." But it might be said after an interval. It certainly would not be said unless and until the Savoy had acquired an alternative site for a new Berkeley Hotel.

Edible Oils Ease

AFTER rising steadily for six months, prices of edible oils have eased by several pounds a ton. The threat that has always overhung the market—that the Commodity Credit Corporation might become an aggressive seller—has

become a reality. The Corporation has about 400,000 tons of cottonseed oil accumulated under the American price support programme. Restrictions on sales to foreign countries have been removed, and the CCC is offering this oil at the attractive price of £106 a ton, c.i.f. Continent. Prices of copra and coconut oil are also under pressure because of the recovery of production in the Philippines, and also from the larger quantities of palm kernels now being offered to the Continent by the marketing boards in British West Africa. Coconut oil for nearby shipment is about £5 cheaper at £130 a ton, c.i.f. Continent, and copra is about £6 cheaper at £88 a ton. Groundnut oil, which is in short supply, has nevertheless fallen by £5 and is rather nominally quoted at about £160 a ton; palm kernels are about £8 lower at £65 a ton, c.i.f.

Whether the market will suffer any radical decline is an open question. On the one hand consumption in Europe, particularly in Germany, is increasing, owing partly, perhaps, to a change in public demand from high-priced butter to the better qualities of margarine, and partly to the easing of the dollar shortage. The producing countries of the Far East are also consuming more oils; India, until recently a large exporter of groundnut oil, has allowed very little to be shipped in the past year, and Indonesian exports of copra have been reduced by the growth in domestic consumption. Russia has been buying more oils and fats, but its purchases tend to be fitful. On the other hand, the British and Dutch governments have been building up large stocks of oils and fats in preparation for decontrol, and though this has contributed to the market's strength in recent months, these stocks will have to be disposed of. The Commodity Credit Corporation may push its sales more vigorously, and the removal of restrictions on the export of its huge stocks of butter may also threaten prices of edible oils.

Troubles in Lead and Zinc

PRICES of zinc and lead, on the London market, have lost the recovery from their sharp falls last month. On Thursday both metals closed easy: for zinc, the price of the current month fell back to £71 15s. a ton and three month's to £70 7s. 6d.; for lead the current month slipped to £82 a ton and three months to £81 5s. Both metals are under

DO YOU KNOW YOUR EXPORT PROSPECTS?

If you do not, the reports will give you authoritative, clear and concise information.

Reports on 70 countries are published every three months.

The Economist Intelligence Unit

22 Ryder Street, London, S.W.1
WHITEHALL 1511 Extension 129

pressure following the recent decline in consumption in the United States. American producers are naturally clamouring for increased protection against imports. They are having to cut back production—particularly of zinc, stocks of which are very high—and this should eventually stabilise prices. The posted price of spot lead in New York has been reduced by half a cent to 13 cents a lb (£104 a ton); but on the Commodity Exchange the price of the current month is 11.75 cents a lb (£94 a ton). In California, the weight of Australian imports has compelled one smelting company to bring its price of lead in that state to parity with the current St. Louis quotation of 12.80 cents a lb. The St. Louis price of zinc has also been cut by half a cent to 9.50 cents a lb (£76 a ton). To ease the surpluses, American producers have been exporting heavily to Europe. In Britain, where there is still a shortage of zinc, the American metal has been well absorbed, but their offerings of lead saturated the market.

Meanwhile, the Committee of the London Metal Exchange is introducing a new contract for lead on June 1st. The contract should be more to the liking of buyers than the existing one, and may encourage more business to pass through the exchange. The principal change is that the settlement period has been divided into two half-monthly periods. The buyer will therefore obtain delivery within half a month, instead of within just over one month as at present, and the prompt delivery clause has

accordingly been dropped from the new contract. A clause which excused the seller for delays in delivery due to *force majeure* has also been dropped and a new clause has been inserted; this makes the seller responsible for replacing any lead lost on voyage or delayed at sea and for making delivery within thirty days of the last day of delivery allowed under the contract.

SHORTER NOTES

"There has been no addition to the list of countries in default on their external debts." That is the most encouraging point from the 1953 report of the Council of Foreign Bondholders. On the contrary the number of defaulters was further reduced by debt settlements with Austria, Ecuador and Peru. The list of defaulting countries remains long. It includes, Costa Rica, the province of Buenos Aires, China, Bulgaria, Greece, Hungary, Poland and Rumania as well as the debts of Czarist Russia.

The International Bank has made a loan of \$81 million for highway construction in Ecuador. It is made to the Comité Ejecutivo de Vialidad de la Provincia de Guayas and guaranteed by the Ecuadorian Government. The loan is for 10 years at 4½ per cent.

the company's accounts are published nearly a year after the end of the financial year. Unless this gap is closed shareholders will not receive accounts that are free of the EPL incubus until 1956.

LIEBIG'S EXTRACT OF MEAT. Mr Kenneth Carlisle, the chairman of Liebig's, has two stories to tell in his statement accompanying the full accounts for the year to August 31st. There is the dismal story from Argentina and the encouraging account of the group's activities elsewhere. The group's profits rose from £1,944,607 to £2,432,397. The previous year's fall in the profits of Oxo Limited was more than made good, while the results of the French and Belgian subsidiaries also improved. The group benefited substantially from the decision to raise prices in the autumn of 1952. In line with the increase in profits the directors decided to raise the tax free ordinary dividend from 9 to 10 per cent. They wished to pass on to shareholders the benefit of the reduction in the standard rate of income tax. They hope that it will be possible to maintain the dividend at this rate, but the chairman adds the customary warning that the "assessment of prospects for the current and future years is a hazardous business." A drag on equity dividends is already in being through the large commitments of the group, and more particularly of Oxo Limited, for capital expenditure over the next few years. Much of the money retained by subsidiaries is to meet these commitments.

Some of these retentions, however, are involuntary, for the subsidiaries in Argentina have been unable to remit profits or

dividends to the parent company for the last three years. In Argentina matters have gone from bad to worse. The delay in signing the protocol to the Anglo-Argentine trade agreement and the reduction in the quantities of corned beef purchased by the Ministry of Food forced the

† Tax free.

group to look for a market outside the United Kingdom for the sale of a whole season of production. The group was prevented from tapping the only other important market, the United States, by the fixing of the value of export permits by the Argentine authorities at a level too high to attract buyers in the United States. Hence the group's stocks of corned beef have piled up in the Argentine and an "undue strain" has been put on its liquid resources.

LINEN THREAD.—A week ago textile shares were in the van of the boom

in equities and Linen Thread's £1 ordinary stock units were very prominent in this advance. Between the time when Tootal announced a share bonus and a much bigger dividend and the date of Linen Thread's preliminary announcement, these £1 ordinary stock units put on 7s. to 6s. Investors were hoping that Linen Thread would imitate Tootal's example. They were wrong.

Linen Thread's ordinary dividend has been left unchanged at 15 per cent. And the directors made this pill even more uncomfortable to swallow by adding that, having considered the question of a bonus issue to equity shareholders, they have decided that "the earnings outlook, particularly in the United States, is too uncertain to justify action at the present time." After this announcement the equity stocks were marked down 2s. to 58s. to offer a yield of under 5½ per cent. The bulls have found what consolation they can in the implied promise in this announcement that a bonus issue (and, hence, possibly a bigger dividend) will be made once the future of the group's earnings in the United States is clearer.

On the evidence of the group's latest results (for the year to September 30th) it would, however, be difficult to construct a hope that even if the American prospect improves the company can afford to be as generous as Tootal. It is true that the group's profits after charges for repairs and depreciation have risen from £685,574 to £834,823 but, thanks to a much heavier bill for foreign taxes, the balance attributable to the parent company has risen by only £69,068 to £255,366. Out of this sum about £66,000 has to be provided in preference dividends, so that the maintained ordinary dividend, absorbing about £136,000, is covered by earnings of only about £190,000.

LONDON STOCK EXCHANGE

Next Account begins: March 3rd.
Next Contango Day: March 3rd.
Next Settlement Day: February 16th.

By the last day of the old account the boom in the stock market had carried the *Financial Times* ordinary share index to 140.2, or only 0.4 of a point below the all-time peak reached in January, 1947. The biggest gains were recorded on the Friday before the week-end and on Monday, when 17,143 bargains, again the highest level since January, 1947, were marked. This latest phase of the advance was based on the lowering of the American and French re-discount rates, the success of the Government conversion operation and hopes that interest rates in Britain would be lowered as well. The boom in equity prices was, therefore, reflected in the general marking-up of gilt-edged stocks. Gilt-edged prices advanced on each day by about ½ of a point until Wednesday when the market closed little more than steady. In the foreign market speculative interest was concentrated upon "iron curtain" stocks and on Greek issues, which continued to go ahead in sympathy with rises on Wall Street.

The rise in the equity market continued until the first day of the new account. Most of the sections of the market took part in this advance, with the exception of textile shares. Investors began to take profits on Tuesday, so that on that day the *Financial Times* ordinary share index gained only 0.1 of a point. Further profits were taken on the first day of the new account, when store shares were particularly affected by the reaction of prices in late dealings. On that day the ordinary share index fell back to 139.9, and further losses among industrial shares were recorded on Thursday. Oil shares remained firm, and by the close on Wednesday Anglo-Iranian had risen to 9½, but the actual changes in prices were far less spectacular than those in industrial equities. Rubber shares remained steady, but tea shares tended to drift lower. At the end of the old account the gold "producers" in the Kaffir market lost some ground, but the uranium issues remained in favour. At the beginning of the new account, however, the uranium issues received more support.

Company Notes

DECCA RECORD. The stock market could not quite make up its mind about Decca Record's preliminary statement for the year to March 31, 1953. The increase in equity payments was smaller than had been expected but the market also had to work out the implications of a share split and a "rights" issue of ordinary shares. Immediately after the announcement the 5s. ordinary shares were marked up 6d. to 39s., but later they were marked down to the old price.

A bigger dividend paid out of higher profits had been confidently anticipated. In fact neither the rise in profits nor in equity dividends was spectacular. Trading profits advanced from £1,200,000 to £1,310,000. The equity dividend was raised from 1s. 6d. on each 1s. share (equivalent to 30 per cent on the revised capital after the 400 per cent share bonus) to 1s. 9d. on each 5s. share (that is 35 per cent). The directors added the encouraging rider that turnover in the current year has risen above that reported in the year to March 31st last. The group has become firmly established in the market for long playing records, and radar equipment for aircraft and airfields may prove as important as the development of the Decca navigator for ships.

Against this background the implications of the share split look encouraging. Each 5s. ordinary share is to be split into a fully paid 4s. ordinary share and a fully paid 1s. preference share. These preference shares (which will rank after the existing preference issues) are to be

to a "rights" issue of 200,000 4s. ordinary shares at 5s. each in the ratio of one new share for every thirteen held. If the directors expect to maintain a payment of 1s. 9d. on each of these new ordinary shares, then the preference issue may turn out to be a true bonus. And this may very well be the directors' intention, for the first interim dividend (payable on the revised capital) has been maintained at 3d. a share. The chances that the directors will decide to make at least this payment are strengthened by the fact that the company was an outstanding sufferer under EPL. In the latest year it has accounted for £122,000 (against £33,000). The one black spot is that

(1) Petroleum production in Canada in 1938 and 1951 includes natural gasoline. Annual figures of electricity production in Australia are for 12 months ended June 30th of year stated and for New Zealand 12 months beginning April 1st; monthly figures for New Zealand represent about 87 per cent of total generation. (2) Copper production is smelter; tin is primary metal. (3) General trade (including re-exports) except for Canada, which is special trade only. Imports are c.i.f. except for Australia, Canada and S. Africa which are f.o.b.; exports are f.o.b. Trade for India and Pakistan includes that going by land; annual figures for India are for 12 months beginning April 1st of year stated and for Australia and Pakistan 12 months ended June 30th. (4) Gold and foreign exchange holdings are those of the government and central bank; only figures for Australia include holdings of commercial banks. Cost of living for Pakistan is based on 12 months ended March, 1949, as 100; for S. Africa relates to Europeans only. (5) Average of third quarter.

EXCHEQUER RETURNS

For the week ended February 6th, there was an "above-line" surplus (after allowing for Sinking Funds) of £149,287,000 compared with a surplus of £123,130,000 in the previous week and a surplus of £139,763,000 in the corresponding period of last year, raising the cumulative surplus to £151,904,000 (£119,534,000 in 1952-53). Net expenditure "below-line" absorbed £12,683,000 which brought the total cumulative deficit to £184,123,000 (£365,168,000 in 1952-53).

* In consequence of official purchases of tender bills in connection with cash subscriptions to the Exchequer Stock issued in October, it was impossible to calculate the division between tap and tender bills until all the bills purchased had passed their original maturity date.

Financial Statistics

THE MONEY MARKET

The discount market raised its bid by 2d. to £99 9s. 8d. per cent for the £220 million of bills on offer at last week's Treasury bill tender; its action was influenced less by the reduction of the bank rates in New York and Paris during the week than by the unduly low allotment received at the previous tender—and the likelihood of high applications at the current one. The average rate of discount fell by nearly 7½d. to £2 1s. 3.68d. per cent, its lowest for nearly two years.

In the event, Lombard Street appears to have chosen an unfortunate time to raise its bid, for credit conditions in the following week were exceptionally difficult. On the preceding Thursday supplies had been not quite so short as on previous Thursdays in the new year and only small special purchases had been necessary, whilst on Friday the market was just able to balance its books without official help. But on the following days the shortage of money became acute; on both Monday and Tuesday moderate special purchases (made indirectly through the banks) did not save a few houses from recourse to the Bank at the penal rate, whilst on Wednesday a recurrence of Bank borrowing was prevented only by considerable official purchases of bills from the banks. The market was forced to concede rates of 2½ per cent on late April bills in sales to the banks during these days of stringency, and on Wednesday it paid up to 2½ per cent for outside money.

The week's heavy special purchases are reflected in the Bank return, which shows an increase of £15.8 million in Government securities held in the banking department (though "securities" are down by £9.3 million).

COMPANY MEETINGS

COLVILLES LIMITED

AN EVENTFUL YEAR

GRATIFYING IMPROVEMENT IN RAW MATERIAL SUPPLIES

A FULL ORDER BOOK

SIR JOHN CRAIG'S STATEMENT

The twenty-third annual general meeting of Colvilles Limited was held on February 5th at the registered office of the company, 195 West George Street, Glasgow, Sir John Craig, CBE, DL, LLD (chairman and joint managing director), presiding.

The following is the chairman's statement which was circulated with the report and accounts for the 53 weeks ended October 3, 1953:

The twelve months under review have been eventful both nationally and internationally. At home, the Iron and Steel Act, 1953, came into force on July 13, 1953, and the Iron and Steel Corporation of Great Britain was dissolved. The new Iron and Steel Board was set up to supervise the operations of the industry, and the Iron and Steel Holding and Realisation Agency took over the ownership of the various steelmaking companies with the object of selling them to the general investing public.

CONDITIONS AT HOME AND ABROAD

Abroad, there has been the armistice in Korea with its effects on the demand for defence materials and the reactions on world markets. Nearer home, we have the European Coal and Steel Community, better known as the Schuman Plan, with its High Authority beginning to function actively in the affairs of the Continental steel makers. It is now facing problems within its own organisation, and the shape of the future development of this great scheme will depend on how these present problems are solved. The question of the relationship between the British Steel Industry and the Schuman Plan countries is one of national policy and is therefore a matter for the Government. You will not expect me to comment on it. In the past, we had cordial relations with the Continental steel makers, and we were satisfied that these were of benefit not only to the steel industry, but also to the consumers of steel in this country.

Another outstanding development internationally during the past year has been the discovery of great resources of iron ore in various parts of the world. The subject is naturally one of great importance to us, for we draw substantially upon foreign ore for our production of pig iron. Very large resources have been discovered in Africa, and, through the British Iron and Steel Federation, we are associated with other makers in developing iron ore mines in that country. It is evident that there is an abundance of iron ore available, and the question of transport has been duly considered. In this field, too, British makers have co-operated by completing agreements with shipowners for the building of ships specifically for the carrying of iron ore.

It is gratifying that the improvement in our own supplies of raw materials, mentioned in last year's statement, continued and has enabled us to add to our stocks.

ACCOUNTS

I will not trouble you with many comments on the details of the accounts, as I think the

directors' report gives full particulars. With the transfer of £900,000 to the general revenue reserve, you will have noted that the balance of £3,900,000 is in line with the total ordinary capital; in fact, when all the reserves are taken into account, they are substantially in excess of the issued capital.

The increase in stocks, which I mentioned earlier, is, of course, reflected in the balance sheets, and it is satisfactory to have been able to add over £2,500,000 to stocks, and to have spent over £2,100,000 on new plant and yet to have maintained our high proportion of liquid resources. In calculating our surplus current assets, the loan to the Agency must be taken into account as it is on call at short notice. In the consolidated balance sheet the current assets total £23,050,500 and the liabilities, including the tax due on January 1, 1955, total £15,603,237, showing a surplus of over £7 million.

This year's expenditure of £2,100,000 on plant brings the total spent on fixed assets since the war to at least £10,500,000. Taking into account the commitments of over £2,500,000, the total capital expenditure since the war will have exceeded £13 million in the near future. In addition to the expenditure on capital additions, a substantial sum has been spent in maintaining the works in good repair.

MAGNITUDE OF TAXATION CHARGE

The profit and loss account shows the magnitude of the charge for taxation which amounts approximately to 61 per cent of the gross earnings, which is about five times the amount paid as dividends.

Some relief was introduced at the last Budget when the rate of income tax was reduced, but further reductions must take place if plant is to be maintained in an efficient state, especially when the continued reduction in the purchasing power of the £ is taken into account.

It is interesting to note the position regarding investments in coal subsidiaries. While progress was made during the year, and certain payments were received, the compensation due to Russell's has not yet been finally adjusted. It is disappointing that the provisional valuation is less than our claim, but the matter is still open and we have appealed. It is clear, however, that the total compensation to be received will exceed the cost of our original investment in coal.

PLANT AND WORKS

Recently the light section mill came into operation at Dalzell and is proving a successful addition to the plant, embodying as it does the most modern features in operating technique and reducing costs substantially. The alteration to No. 4 Melting Shop at Dalzell has just been completed but not in time to affect results of the past year. The electrification of the drive of the wide plate mill has been ordered and during next year should come into operation, together with additional heating plant. These alterations

will increase the output of plates at these works.

The engineering works at Mossend have been steadily developed. Much new plant has been installed and more is on order. We are satisfied from our experience that these works are of real value in carrying through major improvements in existing plant, as well as in the production of new plant for the extensions which are necessary from time to time.

At the works of the Lanarkshire Steel Company, the electrification of the heavy section mills has been completed and has proved a success, so much so that at these works the use of steam as a motive power has almost been eliminated, with great economy in the cost of fuel. The steam produced from the waste heat is now used to generate electricity sufficient not only to provide all the needs of the Lanarkshire Steel Company, but also to supply a substantial quantity of electrical current to Dalzell Steel Works.

SUBSIDIARY COMPANIES

Smith and McLean have had another successful year and the demand for their products is undiminished. They continue to meet a widespread demand for the exceptional sizes and qualities of sheets which they produce. Their galvanising works also have been fully employed on work for both the home and the export markets. A great amount of work of a special kind has been done and the demand continues.

The Clyde Alloy Steel Company have been fairly well employed throughout the year but the readjusting of consumers' stocks brought about some recession in the demand for alloy steel during the summer. Generally, however, the demand for their products has been maintained and steel of special qualities has been exported to America, as well as to Continental countries. A contract for the reconstruction of one of the mills has been placed and is anticipated to be completed by the summer of 1954.

The Colville Constructional Company have had a successful year. One of the important contracts recently completed was the new buildings occupied by Rolls-Royce at East Kilbride, requiring the supply of several thousand tons of steel. The work was completed in less than the contract time. Several important constructional contracts for power houses have also been completed during the year.

At Fullwood Foundry, Mossend, we are now laying down extensive plant for the treatment of sand, as well as a hydro blast for the dressing of moulds. At Hamilton Foundry, a new sand preparation and handling plant has proved advantageous, both as regards tonnage produced and finish of castings. At these works, over two years ago, we decided to install baths for the workmen. Only now have we received the necessary licence to proceed and we hope that the baths will come into use during this year.

We have limestone quarries in Northern Ireland, and during the past year, we have reached the final stages of a scheme of modernisation. The improved plant, in addition to supplying material for our own works, is now producing a wide range of limestone products for several markets.

DEVELOPMENT

Reference was made in last year's report to the decision of the directors to prepare a scheme for further expansion in pig iron production. Plans embodying the erection of new coke ovens, blast furnace and a melting shop at Motherwell are in the hands of the Iron and Steel Board and we now await their decision.

The plant designed for the manufacture of a high quality facing brick from blast furnace slag is now being erected, and will soon go into production. Provision has been made to extend the capacity if market conditions warrant it. We are confident that there will be a good demand for these bricks as they have passed the most rigorous tests of the Building Research Station.

FUTURE PROSPECTS

The future is difficult to forecast with any certainty. We have quite a full order book, and, generally speaking, we anticipate a continuance of the present demand. It must, however, be recognised that steel is now being produced in many countries which previously depended upon imports from other countries for their requirements. At the same time, with the great expansion in the production of oil, the demand for steel remains at a high level, not only for tankers to carry the oil by sea, but for overland pipe lines and for storage tanks. The general trend of building wagons of steel instead of wood has likewise increased the demand for steel.

We manufacture many products and we are well equipped to meet the demands of a variety of industries. The demand for our stainless clad steel Colclad is steadily growing. We confess to some disappointment at the lack of interest in this country in Coltuf—the high tensile steel specially developed for welded construction and which is free from the brittleness at ordinary temperatures that has been in recent years a matter of such concern to engineers and shipbuilders. We have exported thousands of tons of Coltuf to foreign shipbuilding yards, who have used it to great advantage, and so far we find our greatest market for this improved quality in other countries.

EMPLOYEES AND STAFF

It is satisfactory to record the excellent work being done by the welfare committees at the works. The directors are pleased to co-operate with them in contributing to the cost of the various welfare schemes.

During the year, agreements for extended holidays and a reduced working week in certain departments have come into force. These have required the employment of additional men, and the necessary period of training has not been without its difficulties. However, I am glad to say our relationship with labour has continued satisfactory, and we realise the value of their co-operation.

To the managers and the staff, for whom we know the year has not been an easy one, we record our appreciation and cordial thanks.

The report and accounts were adopted and the proposed final dividend of 9 per cent on the ordinary stock, making a total of 13 per cent for the year, was approved.

The retiring directors, Lord Bilsland, MC, DL, LLD, and Mr T. R. Craig, OBE, TD, were re-elected.

BARCLAYS BANK LIMITED

ANNUAL MEETING OF STOCKHOLDERS

The annual general meeting for the year 1954 of the stockholders of Barclays Bank Limited was held on February 10th at the Head Office of the Bank, 54 Lombard Street, London, E.C.3.

Mr A. W. Tuke (the chairman) presided.

Mr H. G. Tickle (the secretary) read the formal notice convening the meeting and the report of the auditors.

With the concurrence of the stockholders present, the report and accounts were taken as read.

On the motion of the chairman, seconded by Sir F. Cecil Ellerton (deputy chairman), the report of the directors of the company, together with the accounts annexed as at December 31, 1953, duly audited, were received, approved and adopted.

Mr Theodore David Barclay; Mr David Martyn Evans Bevan; Sir Matthew Watt Drysdale; Mr Thomas Calderwood Dundas, MBE; Lieut-Colonel The Lord Dudley Gladstone Gordon, DSO; Mr Quintin Edward Gurney; Mr Adam Denzil Marris, CMG; Mr Roger Henry Parker, MC; and Mr Anthony William Tuke, retiring directors, were re-elected directors of the company, and other ordinary business was transacted.

A vote of thanks to the staff, and a vote of thanks to the chairman, for presiding at the meeting, were unanimously accorded, and the proceedings terminated.

NATIONAL MORTGAGE & AGENCY COMPANY OF NEW ZEALAND

SATISFACTORY TRADING

The seventy-eighth annual general meeting of this company was held on February 9th in London, the Rt Hon Lord Glenconner, chairman, presiding.

The following is an extract from his circulated review of the year to September 30, 1953:

For the first time in a number of years the wool market remained at a comparatively steady level throughout the 1952-53 season and at approximately 15 per cent above the previous year's average.

Killings of meat for export over the past year are approximately 5 per cent below the previous year's figure. Exports for the past five years have been fairly stable, around 350,000 tons, with the exception of 1950-51. Production of dairy produce has been buoyant.

The general trading side of our company's business has again had a satisfactory year and turnover has been well maintained.

There is a substantial rise in the cash and bank deposits from £507,089 at September 30, 1952, to the present figure of £1,341,792. Loans on mortgage and secured accounts show a reduction owing to the good season our farmer clients enjoyed last year.

Our trading profit shows an increase of £13,211, which is considered satisfactory. After payment of tax the net profit comes out at £107,682. A final dividend of 5½ per cent, making 9 per cent free of tax for the year, is recommended. The report was adopted.

THE LAW DEBENTURE CORPORATION

RECORD INVESTMENT INCOME

The sixty-fourth annual general meeting of The Law Debenture Corporation, Limited, will be held on March 5th in London.

The following is an extract from the circulated statement of the chairman, Mr Robert R. J. Turner, OBE.

For the first time in the history of the Corporation, our income from investments has exceeded £100,000, and shows an increase of over £11,000 gross as compared with 1952. Part of this increase is accounted for by the investment of the cash received from the issue at the beginning of 1953 of £50,000 Second Debentures, but in the main it is due to a satisfactory improvement in the dividends and interest received from the rest of our investments.

Our income from the two items of "Commissions and Fees," and "Fees as Trustees and Registrars," shows an increase of nearly £1,500, while the net profit on realisation of securities shows an increase of approximately £15,700. The latter is largely due to our holding in Central Wagon (Holding) Company having been exchanged for cash and shares in Central Wagon Company, Limited, which produced a substantial profit over book value.

STAFF PENSION SCHEME

We have taken the opportunity to use a considerable part of this profit for the purpose of putting our house in order with regard to pensions. Hitherto, these have been paid out of the Corporation's annual profits, but our staff are now members of a non-contributory pension scheme which has been arranged with one of the leading life offices. The annual cost of this scheme, as shown in the profit and loss account, is at present approximately £2,300. We have also bought annuities for two former members of our staff, who were previously in receipt of pensions, at a cost of £8,419. The whole of this non-recurring sum has also been charged to profit and loss account for the year. The net result of the year's working has enabled us to place a further £10,000 to general reserve and to recommend a final dividend for the year of 9 per cent, making, with the interim dividend of 6 per cent, a total of 15 per cent for the year, against 14 per cent for the previous year. The carry-forward is raised by £3,904 to £19,796.

The balance sheet reflects the placing of £50,000 5 per cent Second Debentures repayable between 1968-78 which has been mentioned above. A policy of keeping funds more fully invested was followed by the Board during the latter part of the year, which has absorbed a large proportion of our liquid funds.

BOARD'S INVESTMENT POLICY

Investments show an appreciation of 19 per cent over book value as at December 31, 1953, which represents an improvement of 10 per cent compared with the previous year. As stated in the directors' report investments are divided as to Bonds and Debentures 20 per cent, Preference stocks and shares 27 per cent, Ordinary stocks and shares 53 per cent, reflecting the continuation of the policy of the past three years to increase our holdings of equities. This appreciation may be regarded as satisfactory bearing in mind that we still have 47 per cent of our funds in fixed-interest securities. As a result of a conservative estimate of interest and dividends for the current year, we hope to maintain the 1953 total.

F. W. WOOLWORTH AND COMPANY, LIMITED

INCREASED PROFIT AND DIVIDEND

MR S. V. SWASH ON TAXATION

The forty-fifth annual general meeting of F. W. Woolworth and Company, Limited, will be held on March 5th in London.

The following are extracts from the statement of the chairman, Mr S. V. Swash, which has been circulated with the report and accounts:

I have pleasure in presenting the report of the directors and the accounts for 1953, a year of good trading in which your company made substantial progress. The profit after taxation at £6,787,123 is £1,017,051 higher than last year. There was an over-provision for taxation in the previous year of £494,191, due mainly to the reduction of the income tax rate from 9s. 6d. to 9s. in the pound, so with the balance brought forward from the last account of £2,557,157, there was a total of £9,838,471 for disposal.

It is considered desirable to strengthen the reserves and the transfer to general reserve of £1,250,000 brings that reserve to £5 million. The final dividend of 2s. makes a total of 3s. per unit for the year compared with that of 2s. 9d. for the previous year. This final dividend absorbs £3,300,000 and there is a balance carried forward of £3,073,471, an increase of £516,314.

STOCK ON HAND

The balance sheet as at December 31, 1953, follows the pattern of recent years and most of the items are strengthened as a result of the company's favourable experience during the past year. The stock on hand at £11,210,250 is but little variation from the figure a year ago, and your board is satisfied that it is well assorted and represents good clean stock that should in due course be turned into money over the counters of the stores.

We always like stock on hand at the end of December to be rather on the light side provided there is no indication of the price of goods rising; because after the big Christmas trade and the stocktaking period the assortment is always depleted and it is necessary to spend big sums to complete the range of merchandise in the stores. If there were not a little "slack" in the stock figure inventoried, the investment after this restocking would be too high, and the new year would be handicapped with overstocks and consequent risk of undue loss before they were liquidated.

Merchandising the stores in the endeavour to maintain the best possible variety on sale without over-heavy investment is one of the duties calling for great alertness on the part of the individual branch managers and constant training in the proper ordering of goods is a vital part of the experience of young men learning the business.

Your board is constantly watching the recruitment and training of these young men and I am glad to say that we have in adequate number, as far as can be foreseen, good men in training for store management who can take up opportunities as they arise.

TAXATION

Item 15 on the profit and loss account shows: (a) income tax £8,618,831, (b) profits tax £1,391,000, (c) excess profits levy, £2,180,000, a total of £12,189,831.

This is a very big figure and makes the Treasury much the greatest beneficiary from the enterprise and very hard work put into the business. About 65 per cent of the profits goes to the Exchequer this year, and the

present level of taxation is undoubtedly penal. One can but hope that now excess profits levy is ended, Government spending can be cut so that the levy is not merely replaced by another tax. Your company has certainly been a massive contributor to the proceeds of EPL during its short but devouring lifetime.

The present level of taxation on the individual, too, is a very real threat to the development of enterprise and initiative and one cannot contemplate without intense worry the effect of long years of its continuance on the future of a nation that must live by trade.

TRADING PROFIT

The trading profit showed a very fine expansion in the past year and more and more millions of transactions were carried through by our customers in all the stores. It is the aim of your board to make the stores ever more popular by offering an interesting and varied selection of merchandise at a highly competitive price.

The gradual easing of controls and the return of free trading in various commodities has widened the choice before the customers and sharpened competition. Many hundreds of items were cheaper owing to the Purchase Tax changes and prices of goods not affected by Purchase Tax were on the whole very steady. I estimate that the reduction by about one halfpenny of the selling price of every piece of merchandise we sold would about have wiped out the whole of the trading profit and left us nursing a loss. It has always been known that your business wins out on the immense number of transactions carried out at a small monetary margin of profit and the old saying of "small profits—quick returns" is illumined by the illustration I have given.

I should like once again to call attention to the good service we have had from our manufacturers and suppliers. Their co-operation has been a feature of the year just completed and they work constantly with our buyers in the attempt to interpret the public taste and produce merchandise in tune with and ahead of the demands of the customers.

In order to produce the quantities needed to fill the wants of our customers, work often has to start, particularly on seasonal lines, almost a year ahead of the time when the goods are going to be on sale in the stores.

STAFF

This statement on last year's work would indeed be incomplete without an expression of appreciation of the work of the staff in the offices and stores. In any undertaking, loyal and experienced staff are the key workers who provide continuity of operation, who tide over sudden emergencies and who instinctively put out the effort needed to cope with the tests and trials of everyday work.

It is not wise to prophesy far ahead in our modern times and your company results will of course depend on conditions in the country and the spending power of the public. Meanwhile, the organisation is in good fettle, alterations and improvements in the stores are carried out as far as building licences allow, and the buyers have put on the counters a range of merchandise in which they are entitled to take real pride. Your board feels that at the present time the stores have the confidence of the shopping public, and will put forward every effort to justify, sustain and strengthen that confidence.

LIEBIG'S EXTRACT OF MEAT COMPANY

SALES OF OXO PRODUCTS MAINTAINED

The eighty-ninth annual general meeting of Liebig's Extract of Meat Company, Limited, will be held on March 4th at Thames House, Queen Street Place, London, E.C.

The following is an extract from the statement by Mr Kenneth M. Carlisle, chairman and managing director, which has been circulated with the report and accounts:

Profits, less losses on trading, rents, etc., are up by £488,000. Last year's fall in the profits of Oxo Limited was more than made good in the year under review and a marked improvement was shown in the results of our French and Belgian subsidiaries and of Tanganyika Packers, Limited.

Profits earned by Liebig's (Rhodesia), Limited, in the year ended December 31, 1952, showed a decline as compared with the excellent results obtained in the previous year.

The profit brought into the accounts of the parent company amounts to £288,003, as compared with £265,162 for the previous year. In recommending an increase in the ordinary dividend of 1s. per £5 unit, tax free, making 10s. for the year, your directors have been influenced by the favourable results shown and, at the same time, have wished to pass on to stockholders the benefit of the reduction, from 9s. 6d. to 9s. in the rate of United Kingdom income tax. Although it is hoped that it will be possible to maintain the annual rate of dividend at 10s. assessment of the prospects for the current and future years is a hazardous business.

The reported ending of the Ministry of Food's rationing activities will be a step which we shall warmly welcome, but the change may not be without losses and difficulties in the early stages. The abandonment, after 14 years, of the Ministry's policies and practices, together with renewed competition to sell the wider selection of meats and meat products available, cannot fail to have their effect on market prices and some considerable time may elapse before normal market conditions are reached. Also to be borne constantly in mind are the considerable requirements of the group for capital commitments, towards meeting which substantial sums have been put to reserve in the period since the end of the war and for which further allocations will be required.

OXO LIMITED

Sales of our major products have been fairly well maintained during the past year, which in present circumstances must be regarded as satisfactory in view of the general restriction of trade due to the desire of all traders to keep stocks down to a minimum.

During the year the Ministry of Food released to the trade a considerable quantity from their stock of corned beef, and, despite the relatively high price fixed by the Ministry, it found a ready sale. The Ministry of Food continue to be the sole importers of corned beef, but it is hoped that the bulk purchases to be made by them during the next few months will be their last, and that thereafter the corned beef business will be handed back to private traders.

After a detailed review of the group's world-wide activities, the chairman, referring to the European interests, concluded: "Competition in the food industry is becoming more severe, but our companies are well equipped with modern plant and active managements to face the future."

WEYBURN ENGINEERING COMPANY, LIMITED

RECORD RESULTS

The eighteenth annual general meeting of this company was held on February 6th at Elstead, Surrey, Mr Hamilton Gordon, chairman and managing director, presiding.

The following are extracts from his circulated statement:

The year ended October 31, 1953, has been the best the company has yet had, and

these results have not been obtained by any increase in the margin of profits but by improved methods and the efforts of all coupled with increased output.

The profit for the year, before taxation, is £181,495, an increase of £28,112. Taxation again takes an enormous toll, reducing this record profit to only £56,094 for building up the business and for distribution to the shareholders.

The directors recommend a final dividend of 25 per cent, plus a special Coronation bonus of 5 per cent (which will absorb £2,887), both less income tax. A Coronation bonus has been distributed to the staff and workpeople costing £2,549.

Our record profits are somewhat illusory when we consider the proportion paid out to the Inland Revenue. I hope that in any negotiations concerning wages in our industry both sides will approach the problem with a sense of moderation. The only safe way to earn more is to produce more.

The present flow of work is satisfactory, but there are indications that a slacker period might develop towards the end of 1954. Foreign competition is stronger, and the sellers' market at home is disappearing. I hope, however, to place satisfactory results before you next year.

The report was adopted.

UNIVERSITY OF NEW ENGLAND, ARMIDALE, NEW SOUTH WALES, AUSTRALIA

Applications are invited from suitably qualified persons for appointment to Professorships in:

1. MATHEMATICS.
2. PHYSICS.
3. CHEMISTRY.
4. BOTANY or ZOOLOGY.
5. GEOGRAPHY or GEOLOGY.
6. ENGLISH.
7. PHILOSOPHY or CLASSICS.
8. FRENCH or GERMAN.
9. and two out of—
10. HISTORY, ECONOMICS, PSYCHOLOGY.

Where alternatives are indicated, selection will be made strictly in accordance with the merits of the applicants.

The University reserves the right to fill any appointment by invitation.

Salary will be at the rate of £2,000 per annum, plus cost-of-living adjustment, which is at present £A252 per annum.

Further particulars and information as to the method of application should be obtained from the Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1.

The closing date for the receipt of applications, in Australia and London, is April 12, 1954.

MARKET RESEARCH

A vacancy occurs in London for a qualified and experienced Market and Media Research Executive. The position offers an excellent opportunity to one who may already be engaged in similar work and is seeking wider opportunities for his abilities. The applicant should not be over 35 and have experience in planning, controlling National Surveys and in the preparation of subsequent reports and recommendations.—Write, giving age, experience, and other particulars, together with salary required, to Box 450.

ASSISTANT Cost Accountant required for Electronic Engineering Division of expanding Toronto Factory. Accounting qualification essential. Age 25-35. Preferably, but not necessarily, single. Experience in Costing in Electrical or Mechanical Engineering. Practical knowledge of Budgetary Control an advantage. Applicant should be those who intend to emigrate and who are willing to pay part cost of travelling. Interview will be in the London area, and a probationary/training period will be served for 1-3 months in an associated factory in Great Britain. Commencing salary approximately \$4,000 with possibility of rising to \$6,000 in a relatively short period. Commencing salary for engagement in Great Britain £900 per annum. Write giving age and full details of education, qualifications and previous experience to Box 451.

LONG established Midlands firm pioneering light engineering products of the highest precision is strengthening its commercial side and seeks a first-class man. An engineering background is desirable and applicant who should be in the thirties, must have had practical postwar commercial experience. The post calls for resource and imagination in organising for selling a group of high quality precision industrial instruments and machine tools on a world wide basis. The post, which might include directorship, carries a commencing salary of not less than £1,500 a year.—Apply Box 455.

CIVIL SERVICE STAFF ASSOCIATION has a vacancy for a research officer to be responsible for the collection and analysis of information required in negotiations on a wide range of conditions of service. Candidates must possess drafting ability and a knowledge of economics and statistics. An interest in the trade union movement is essential and experience in the Civil Service would be an advantage. The successful applicant will also act as Press Officer.

Subject to the satisfactory completion of one year's probation the appointment will be permanent and pensionable (non-contributory). Starting pay according to experience and qualifications within a scale of £610 x £30—£730 x £35—£870 x £30—£900.

Applications to the General Secretary, Society of Civil Servants, Palace Chambers, Bridge Street, S.W.1.

A LEADING MERCHANT HOUSE in Malaya offers an attractive appointment to experienced executive, aged 35-40, with successful commercial engineering background, to take charge of all their engineering activities involving the sale, installation and servicing of a wide range of engineering plant and equipment and the representation of many important U.K. manufacturers. This senior post involves control of technical staff and direct responsibility to the Board for the success of a major department. Total remuneration would be not less than £4,000 per annum.—Write, giving full details, to Box W.179, Haddons, Salisbury Square, London, E.C.4.

REQUIRED for responsible work which may involve travelling, theory and experience of time-series analysis. Salary according to qualifications.—Reply, stating training, experience and giving references, to Box 426.

EDITORIAL ASSISTANT (man or woman) required by professional Institution. Qualifications in Chemistry, or Engineering, or previous editorial experience essential.—Box 454.

GOVERNMENT OF SOUTHERN RHODESIA FOUR AND A HALF PER CENT INSCRIBED STOCK, 1953-58

CITY OF JOHANNESBURG THREE AND A HALF PER CENT REDEEMABLE STOCK, 1959-60.

Notice is hereby given that in order to prepare the Warrants for Interest due April 1, 1954, the Balances of the several Accounts in the above-mentioned Stocks will be struck on the night of March 1st, and that on and after March 2nd the Stocks will be transferable ex dividend.

For **BARCLAYS BANK (DOMINION, COLONIAL AND OVERSEAS)** (London Registrars for the above Stocks)
Circus Place, London W.1, E.C.2. G. A. D. HARRISON, Manager.
February 8, 1954.

UNIVERSITY OF MELBOURNE, AUSTRALIA

Applications are invited for the position of Sidney Myer Professor of Commerce.

The salary will be £A2,500 per annum, with superannuation similar to F.S.S.U.

Applicants should have a specialised knowledge of some branch of Applied Economics, preferably International Trade, Agricultural Economics or the Development of Natural Resources.

Further particulars and information as to the method of application should be obtained from the Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1.

The closing date for the receipt of applications, in Australia and London, is May 14, 1954.

MONSANTO Chemicals Limited invite applications for the appointment of a Rubber Technologist, in the sales division, as a Representative. The applicant must be prepared to travel in the U.K. and abroad and should hold scientific qualifications of university degree or comparable standard. He should possess extensive experience in the manufacture of rubber and thermoplastic compounds or in the technology of compounding ingredients for the rubber industry. The applicant should have full appreciation of the relative value of the commercial and technical aspects of the position. Although scientific qualifications are important, the qualities of initiative, self-confidence and ability to accept responsibility implicit in any salesman will be equally taken into account when making the appointment. Applications giving full particulars of age, training and experience, should be sent in writing to the Chief Personnel Officer, Monsanto Chemicals, Limited, 8 Waterloo Place, London, S.W.1.

SALES DIRECTOR. A prominent group of companies manufacturing electrical equipment wishes to appoint a Sales Director. This position calls for considerable experience in sales promotion and administration in relation to both Home and Overseas territories. In addition to the direction and supervision of the activities of the independent sales organisations of the companies in the group, he will be required to explore and develop new markets, particularly overseas. Applicants, who must be qualified electrical engineers, must have held a similar senior appointment in the electrical industry. The commencing salary will be not less than £2,500 per annum.—Applications which will be treated in strict confidence, and which should state present salary, should be forwarded to Box 2J C.4832 A.K. Adv., 212a Shaftesbury Avenue, London, W.C.2.

CHARTERED ACCOUNTANTS, wishing to widen their experience in Management Accountancy, are invited to apply for an appointment with a well-known industrial company. Applicants, aged 28 to 33 years, holding a University Degree, will be given preference, and industrial experience would be an important additional qualification. The prospects are outstanding, and a commencing salary up to £1,500 is offered.—Please send replies, giving full details of qualifications, etc., in confidence, to Box 462.

SWISS EXECUTIVE seeks post as European representative for British firm. Wide business and commercial experience. Speaks and writes English, French, German and Italian. Would be prepared to travel any country in Europe, Near and Far East.—Apply to Box 461.

EXECUTIVE: Management and Sales experience, Home and Overseas Marketing, Sales research, in Automotive, Aircraft and Engineering Trades with considerable administrative and sales ability, genuine drive and real initiative, young (37), successful experience reorganising indifferent or unprofitable businesses, requires appointment.—Write Box 456.

LEADING MANUFACTURING COMPANY requires men trained in Works Study and/or Time Study and/or O.M. Investigations. Age preferably 22-35 years. Position offers work of a varied and interesting nature, and opportunities for advancement. Permanent employment with contributory pension scheme.—Write, giving full details of education, training and experience, to Box 458.

LEADING STOCKBROKERS require Senior Statistician with Investment Department experience.—Write, stating age, experience, salary required, etc., to Box "C.R." c/o J. W. Vickers and Co., Ltd., 7-8 Great Winchester Street, London, E.C.2.

REQUIRED TO PURCHASE, or acquire controlling interest in, small Electric Motor or similar manufacturing business, range up to 10 h.p., or a company having suitable facilities for same.—Box 457.

ECONOMIST Back Numbers. Complete years 1946 and 1948-1953. Also 1947 less two copies. Offers to buy to Box 452.

From bunsen & bench —to big business

British achievements in scientific research are second to none

But in research development—the efficient and economical transition from laboratory or bench-scale to factory scale, a part that can be properly played only by the pilot plant—Britain lags behind

At Sondes Place, however, there is a Pilot Plant House, with 2,000 sq. ft. of floor space, part of it permanently equipped for wet and dry separation, crushing and grinding, filtration, extraction, distillation and drying, and the rest available for the erection of pilot plant to special requirements. ... One of the many research and development services the Institute offers to industry

for the unusual
man

By no means everybody recognizes the supple feel of good leather . . . appreciates the skill behind a line of strong, straight, stitches . . . can even see the small points of finish which betoken masterly skill in leathersmith.

Which is just as well, perhaps, because there's a limit to the number of Unicorn briefcases that even the deft hands of the Bury craftsmen can make—at workbench prices—for the people of unusual perception who really appreciate them.

The model illustrated has two interior fooscap compartments and zip-sealed section for overnight things. Capacious exterior zip pocket for newspapers, books, etc. English lever lock and fittings of solid brass. All leather handle. Press studs in the base for slimming. Size 17" x 11½". In golden tan or Autumn tan pigskin at 12 guineas; smooth polished hide (golden tan, brown or black), or natural coach hide at 9 guineas.

Matching zip folio cases size 16" x 10½", available separately at £4.10.0 and £2.15.0 respectively. Post free and tax free in U.K. (In U.S.A. \$36.25, \$27.25, \$13.50, \$8.25 respectively, carriage and insurance free, 20% Customs duty payable in U.S.A.)

Zip Folio Case.

Complete satisfaction guaranteed or purchase price refunded immediately. Obtainable at the Unicorn Showrooms, 39, Burlington Arcade, London, W.1. Telephone Hyde Park 8939, or by post from our works:

Unicorn Leather Co. Ltd.

READY MARCH 2nd — The Annual Issue of the

MANCHESTER GUARDIAN

SURVEY OF INDUSTRY

TRADE & FINANCE, 1954

The Challenge of Change The annual Manchester Guardian report on industrial trends, problems and views; with sections on production, order-books, costs and prices, capital expenditure, labour, etc., etc.

Report on the North-West How the birthplace of the Industrial Revolution is adapting itself to today's conditions. Sections on: The land and the people · The industrial structure · Cotton · Engineering · Oil-refining · Transport Selected Lancashire towns and cities.

Fifty Million Customers An inquiry into the changing British consumer market. The social revolution of the last two or three decades; its commercial implications; and the ways in which manufacturers and retailers are responding to the exciting opportunities it offers.

The City of London Today A commentary by R. H. Fry, Financial Editor of the Manchester Guardian.

Aids to Business Progress A group of articles on up-to-date business practice, including forecasting, budgeting, electronics in the office, etc., etc.

Also articles on the future of the British aircraft, shipbuilding, and textile industries, etc., etc.

Factory walls should be made of daylight. All the evidence goes to show that natural light—and the more the better—has a beneficial effect on workers, and their work. Big windows sensibly placed to transmit the maximum amount of daylight; translucent panels of "INSULIGHT" Hollow Glass Blocks to give light, privacy, and thermal insulation; "INSULIGHT" Double-Glazing Units to let in the light without letting out the warmth—with the help of these you can make daylight pay a dividend. For advice on the best way to use glass in your factory, consult our Technical Sales and Service Department. Supplies are available through the usual trade channels.

Because each member of the Ward Group of Companies can call upon any of the others to supplement its experience, the knowledge and competence of the entire group is immeasurably increased. Here is partnership with

GEARED FOR INDUSTRIAL DEVELOPMENT

a practical meaning... a group of companies each offering a specialised service to industry, yet able, by reason of group associations, to call to such service all the advantages of closely integrated group resources.

This is the modern interpretation of the principles with which Thos. W. Ward started his business 75 years ago. For three-quarters of a century the founder and his successors have been guided by a single aim—to provide a comprehensive range of products and services which would assist in the development of industry and commerce throughout the world. How far that aim has been achieved can be measured by the position which the Ward Organisation occupies in world industry today.

The TWW Service Includes :-

IRON AND STEEL • NON FERROUS METALS • PLANT & MACHINERY • TRACTORS & EARTH MOVING PLANT • FOUNDRY PLANT & SUPPLIES • CONTRACTORS' PLANT & EQUIPMENT • EXCAVATORS & CRANES • INDUSTRIAL PLANT • STRUCTURAL STEELWORK • CEMENT • GRANITE & FREESTONE • ROADSTONE & ROADMAKING • INDUSTRIAL DISMANTLING • RAILS & SIDINGS • SHIPBREAKING • WIRE & WIRE PRODUCTS • NUTS & BOLTS • PACKINGS & JOINTINGS • INSULATING MATERIALS • FOOD PREPARING MACHINERY

* THROUGH THE PHILIPS WORLD WINDOW

An oscillograph in SYDNEY

THE name of Philips has long been associated with measuring instruments of all types. And a Philips Oscillograph can be supplied on the spot to a Sydney industrialist as quickly as can a radio set, an electric lamp or any other of the numerous electrical products for which the name of Philips is famous.

Indeed, you will see the well-known Philips emblem in every corner of the globe. Behind this emblem stands a great reputation, built up during more than half a century of research and experience in all aspects of electrical development.

PHILIPS

SERVE THE ENTIRE WORLD

ELECTRONIC TUBES • INCANDESCENT, FLUORESCENT, MERCURY AND SODIUM LAMPS • RADIO AND TELEVISION RECEIVERS • MEASURING APPARATUS • ELECTRIC DRY SHAVERS • HOUSEHOLD APPLIANCES • MEDICAL APPARATUS • H.F. GENERATORS • WELDING ELECTRODES AND WELDING PLANTS • CINEMA EQUIPMENT • RADIO AND TELEVISION TRANSMITTERS • TELECOMMUNICATION EQUIPMENT • AUTOMATIC AND LINE TELEPHONY INSTALLATIONS • RADAR INSTALLATIONS • DIAMOND TOOLS • INDUSTRIAL RECTIFIERS • PUBLIC ADDRESS INSTALLATIONS • IMAGE AMPLIFIERS • TAPE RECORDERS.

Wherever you may be in the world
a Philips local organisation will
always supply you on the spot.

Success of a Failure

IF Mr Molotov were foreign minister of a normal country, he would be spending an anxious weekend. Having addressed the cabinet on his return from the Berlin Conference, he would be recalling the way they raised their eyebrows when he explained how he had failed either to agree with his western opposite numbers or to set them at loggerheads. There might cross his mind the thought of retirement, and of the book he would write, arguing that his instructions had made negotiation impossible. He would show that he had started well by out-manceuvring the British and the rest: the conference was held at the place and on the date of his choice, and the agenda was his. He had warned everyone beforehand in Notes of what he was going to say, but everyone had persisted in thinking that he had something new or something extra to say. Then everything went wrong. He was expected to produce a rabbit from his hat; indeed, the British had hoped to tempt it out with the fresh titbit of a security plan. But Mr Molotov had been given no rabbit and so was not interested.

The Soviet Union, unfortunately, is not a normal country. Mr Molotov is probably spending a quite comfortable week-end. From the army and air marshals there will be congratulations on holding fast to the forward bases in Austria and Germany; from the propaganda chiefs humble thanks for re-varnishing their picture of a doomed capitalist world preparing aggression against the home of Socialism; and from Professor Varga, wearing his new Order of Lenin, the assurance that the Foreign Minister is right to go on waiting for the slump that will bring the West to its knees. Mr Molotov will claim in public that he has reduced world tension and in private that Stalin himself could not have given less away.

The curious thing is that the western foreign ministers will expect, and probably receive, similar congratulations. They have kept their solidarity unbroken; they have defended the Germans' right to choose the Government of a united country by free elections; and they have forced Mr Molotov to show his hand. It will be explained that the meeting did not break down, but ended last Thursday by agreement; that relations never really became tense; and that only those who had unreasonable hopes can reasonably say they are disappointed. Like Mr Molotov, they will claim success.

In one very important sense they are right. The air has been cleared of fog. The issues between the Communist and the Atlantic groups stand out more clearly than before for ordinary people to see. The month in Berlin was a revealing and salutary exercise in what the Kremlin means by "relaxation of tension." Extravagant charges were made against the Americans and their allies; preposterous plans were tabled for spreading a Russian umbrella over Europe; the half-a-dozen important concessions offered by Mr Eden and his colleagues were treated with contempt. Yet there was no sabre-rattling, no exchange of threats, and no serious loss of temper. They made in private only slightly more progress than they made in public. What

was divided between them when they met—Europe, Korea, Germany and Austria—remains divided now they have parted.

In another sense, too, the conference must be seen as having produced success out of failure. Imagine that Mr Molotov had been more reasonable, more flexible on two matters: China's claims to join the Big Four and Mr Eden's plan for German unity. Imagine M. Bidault being led by Mr Molotov to believe that if France would give up the European Defence Community and support China's claims, then Chinese aid to the Viet-minh in Indo-China would stop. Imagine Mr Eden being led to believe that the Russians would accept the plan for free elections throughout Germany if changes were made in it here and there. (Any change of substance would in fact have wrecked the plan.) The western ministers would now be looking forward to indefinite haggling in committees; there would be no assurance that at the end of it all there would be a truce in Indo-China or a representative government for a united Germany. The chances of creating the European Defence Community, uniting Western Europe and adjusting the balance of power on the Continent would be fast slipping away. Mr Dulles would be feeling the first pangs of reappraisal; Mr Eden would be hearing in the House of Commons the first voices in favour of a neutralised Germany; and M. Bidault would be facing crisis and disarray in Paris.

To achieve this Mr Molotov needed to change only his tactics, not his objectives. And it is a mystery why he did not do this. He may, of course, do it yet. The Berlin conference may yet be seen as the prelude to other conferences or negotiation behind the scenes; and Mr Molotov must be expected to play with patience and skill such cards as offers to trade, proposals for banning atomic weapons, and minor concessions to all kinds of foreign organisations and persons. Having failed to divide the western ministers in public, he will go on trying to divide them in secret.

★

The lesson for the West could be salutary if it is clearly stated and firmly held in mind. It is that the Russians have no real need to offer concessions in Europe so long as the plans for harnessing Western Germany with its neighbours and Nato hang fire. They never make the western mistake of stating the price they will pay before bargaining begins. They will accept from the great powers no guarantees of their security which imply the retention of American forces and bases on and around the Continent. They refuse to give up their own forward bases in Eastern Germany and Austria. They insist on a way of unifying Germany which would provide elections only after a provisional government had been appointed, after a peace treaty had been imposed, and after an

electoral law had been passed weighting elections in favour of the Communists.

These facts, if clearly and persistently explained, should have a profound effect in France; many Frenchmen hoped for Soviet concessions on Germany that would spare them a decision—a really agonising decision—about the EDC. They have been bitterly disappointed; and M. Bidault can return to his own country as a prophet with honour. Even more disappointing for them, if that is possible, was the lack of any hint of a new way to peace in Indo-China. Likewise, for many Germans the result of the conference is a shock, if not a surprise. For every German who supported Dr Adenauer's policy of western integration first and German unity afterwards, there was another German who hoped that somehow the order of events might be reversed. Mr Molotov has rendered the great service of making untenable the arguments of those Social Democrats who claimed that Dr Adenauer's devotion to EDC was the one obstacle to German unity. For the Russians have refused not only the EDC but free elections as well. Here, too, Soviet intransigence has produced benefits for the West.

★

There remains, however, among the items on the debit side, one poignant and dangerous fact. The results of the Berlin meeting offer not a gleam of hope to those behind the iron curtain, 18 million of them Germans. Whatever it may do to consolidate Western Europe, it has done nothing for the liberation of Eastern Germany. The *fait accompli* of a Communist-controlled military and economic bloc in Eastern Europe remains as it has been for the last five years. And Mr Molotov made it clear in Berlin that even withdrawal of American and British forces from Western Germany—and Austria—to their home bases would not be matched by withdrawal of Russian forces behind the frontiers of the Soviet Union. That is, perhaps, the only ultimate peaceful means by which German unity, Austrian independence and a measure of freedom for Eastern Europe can all be attained. But it can be made possible only by years of steady effort to make Western Europe strong enough, within the Atlantic community, to live in independence and safety.

To persist in thinking, as Sir Winston Churchill suggested last May, that there is a short cut to agreement, is to look at Soviet policy in blinkers. The United States, Britain and France have to convince the Kremlin that they can and will organise security in Central Europe, and that they have a plan to which they will stick. Nothing less than a long-term plan, with a full declaration of their intentions, will carry that conviction. But it means that France must come to terms with the Federal Republic, that Mr Dulles must put off his reappraisal, and that America and Britain must fully underwrite the risks of rearming Germany. Then, perhaps, Mr Molotov will one day find something new to say.

Defence on the Defensive

IN the financial year 1954-55 Britain expects to spend almost exactly the same amount on defence as it originally expected to spend in the financial year now drawing to a close. Before allowing for the usual and unnecessary juggle with counterpart funds, the total defence estimate for 1954-55 is just under £1,640 million, compared with an original estimate of just under £1,637 million for 1953-54. There are a few complications to mar the simplicity of this comparison. The chief one is that expenditure on defence in the current financial year is clearly not coming up to estimate; in particular the new fighter aircraft do not seem to have been brought along as swiftly as had been hoped. If expenditure in 1954-55 does come up to estimate, it will therefore be rather bigger than actual expenditure in 1953-54.

But it is not clear that this is a factor that will need to weigh very heavily in Mr Butler's budget calculations. The broad budgetary conclusion to be drawn from the defence estimates, indeed, is that the major part of any further increase in production in 1954-55 can be used for an increase in domestic consumption or investment, and for fortification of the balance of payments; comparatively little of any such potential increase will have to be siphoned off to dismay the Queen's enemies and the country's taxpayers. This does not mean that the budget can be a kindly one. There seem to be at least five barriers in Mr Butler's way. First, the scope for another increase in production is probably small, now that the country's resources are again fully employed. Secondly, since wages have recently risen faster than prices, the Chancellor may feel that consumption is likely to increase under its own steam in 1954, even if there are no tax concessions. Thirdly, the Government is committed to lift the spending power of farmers far above the value of their real contribution to national production. Fourthly, the measures taken (and rightly taken) to increase investment last year are only just beginning to wreak their full effect. Fifthly, the balance of payments may need fortifying if—as is quite likely—the terms of trade turn more sour. For these five reasons, if Mr Butler were drawing up his budget now, it could hardly be a sunny one.

It is obvious, given this rather unpropitious budget outlook, that the close correspondence between next year's defence estimates and this year's is no accident. The defence departments have clearly been told that they can have about as much money as they asked for a year ago, and must make the best of it. In Britain, as in America and the rest of the free world, the defence programme has therefore become an expensive pensioner, and is likely to remain one for some time to come. It is no longer, as in the years of mounting danger, a mounting element in budgetary costs; nor yet, as in the years that the ostriches have

eaten, a residuary legatee. But in this very fact there lies a need for even closer public scrutiny of the form of the defence estimates than ever before. For the planning of Britain's defence programme has now become a most complicated business; and it is important that the public should understand the nature of these complications, and the temptations for error in official policy that arise from them.

The complications are the consequence of fundamental changes in defence strategy. In the first place, the authorities now have a clearer idea of the sort of war that Britain might be called upon to fight. They believe it would be a war with a blinding first act of atomic fury on both sides; but that, in the words of the White Paper, "If no decisive result were achieved in this opening phase, hostilities would decline in intensity, though perhaps less so at sea than elsewhere, and a period of broken-back warfare would follow, during which both sides would seek to recover their strength, carrying on the struggle in the meantime as best they could." Secondly, however, nobody has any idea when this peculiarly frightful sort of war might break out. As Lord Alexander told the Constitutional Club three weeks ago—and as everybody except Labour politicians who are not members of the Constitutional Club knew long before—the object of defence strategy is no longer to lay down a particular date by which Britain "must be ready for hostilities down to the last button." Instead the object is to make a steady, calculated build-up of military strength, so that if war should break out at any time in the next twenty years, Britain will be able to spring swiftly to the arms that would be needed to fight that war—and not merely be in possession of weapons to fight the war that did not break out five years earlier, or in the process of shuffling slowly towards the newer weapons that would have been needed to fight the war that some bad guesser had expected to break out five years later. The new White Paper on defence is shot through and through with recognition of this dilemma.

But recognition of the dilemma does not imply recognition of the answer to it. The danger is frankly that, while the back-room planners are busy working out the strategy of the new look, the authorities that really matter may succumb to the temptation, in this period of uncertainty, merely to pass round the money among the different claimants in very much the same proportions as they have been allowed to enjoy in the past; and then to leave each claimant to decide how he will spend that money in the new circumstances now emerging. There are two reasons for fearing—the layman can, of course, never be sure—that this may have happened in the estimates for 1954-55. In the first place, not only is the total defence estimate remarkably similar to the estimate for 1953-54; the different components

are suspiciously similar, too. Among the different departments, the Ministry of Supply is to be voted £27 million more than its estimate for 1953-54, but this is almost wholly because of increased demands for common Nato infrastructure (that is, the construction of airfields and other military works in Western Europe) to which Britain was already committed; to make up for this, the War Office is to get £20 million less than this year and the Air Ministry £11 million less. Among the different items of expenditure (apart from a cut in works) most of the major items are within 2 or 3 per cent of the current year's estimate.

★

The second reason for uneasiness is that, in its survey of the probable future programmes, the White Paper contains more than a hint that proposals to amend the pet plans of any of the services have not been able to survive the clash of their rivalries. First, although it is recognised that the atomic bomb and the United States's strategic air power to use it is the "primary deterrent" to war, the White Paper explains rather huffily that on past experience and current knowledge, Britain has a significant contribution to make in this field; and the RAF is therefore to press forward with its plans for building up a strategic bombing force as soon as possible. This may well be the right decision, but the impression remains that, even if inter-service research had shown it to be the wrong decision, the air force's sensitivity on this matter would have been taken as an excuse for leaving bad alone.

Having ascribed this primary role in Western Europe to the RAF, however, the White Paper then hastily explains that the "navy has its worldwide commitments"; the programme of building modern aircraft carriers is to continue, and it is therefore considered unlikely that expenditure on the navy can be reduced below its present level. The army is, indeed, expected

to fall gradually below its present strength in the next few years, but this may be little more than a forced recognition of its major manpower problem. Regulars can usually opt out into civil life every three years and it is known that those technicians with qualifications especially suited to a fully employed industrial economy are doing so in large numbers; but the only remedial measure mentioned in the White Paper are that inducements to persuade them to prolong their service will be continued in 1954. It seems clear that these inducements should be strengthened, instead of merely continued; but, with a stable defence vote, this would involve diverting money from other sections of service activities, and the vested interests in charge of each of those activities can always plead that at this period of uncertainty they are the last people whose votes should be cut down.

When these estimates are debated, the Government will have to show clearly that it takes the new look in defence strategy seriously. For public opinion in both America and Britain has taken that new look dreamily; it has jumped well ahead of the atomic gun. There is already a widespread belief that the length of national service can soon be cut, on the theory that a dozen men with an atomic gun will soon be able to stand where a thousand men with bayonets stood before. Despite its reference to a slow decline in the strength of the army, the White Paper makes it plain that this view is flagrant nonsense. It is inconceivable that there will soon be enough fissile material to throw about the battle lines at small enemy formations; in the foreseeable future the ground on which West Europeans live will still have to be mainly defended by men, not by split atoms. But if the dreary long haul at the defence programme is to become dramatically alive, the public will have to be convinced that sober planning lies behind it; at the moment a disheartening smell of *amour propre* still pervades the arsenals and admiralties of freedom.

New Broom at the Town Hall?

THE efficiency survey undertaken at Coventry by an Organisation and Methods team from the Treasury is having widespread repercussions throughout the whole field of local government. The Treasury experts put forward proposals which they believed would enable Coventry City Council to save at least £50,000 a year (equal to 10 per cent of the City's present administrative overheads) and to dispense with about 120 of their staff. And there will be a reasonable suspicion that the scope for economy in most local authorities is greater, perhaps much greater, than at Coventry—which voluntarily invited the Treasury to expose the skeletons in its cupboard (and paid for them to do so) because of its interest in improving efficiency.

Unfortunately, however, the Treasury's major proposals seem to be a mistake. They are a mistake because they tend to ignore the fact that the cheapest form of public administration is not necessarily the best; and because they point the way—perhaps unconsciously—to a reversal of traditional conceptions of local democracy.

These conceptions centre around the committee system and the independence accorded to various departments. The first principle of local government, as it has developed in England, is that councillors should exercise a close control over the details of day-to-day administration. They do so through their standing committees; generally there is one standing committee

for each of the principal local services. No matter is too obscure to be placed on a committee's agenda, although in practice a good chief officer can lead his committee by the nose on most matters. The second principle is that the head of each department is, in general and subject to the control of his committee, the master in his own house. The Clerk has come to be recognised as the council's chief officer, but he does not normally concern himself with the policies or with the internal efficiency of the individual departments. Their independence is in turn further reinforced by the strong protective loyalty which a committee usually displays towards the department for which it is responsible.

Apart from one weakness, these conventions work very well. The weakness is that they tend towards a dispersal of responsibility and a lack of co-ordination between the council's various activities. While individual departments may be well run, the total efficiency of the local authority may suffer. The three most important proposals in the Treasury experts' report are all designed to remedy this lack of co-ordination.

★

In the first place, the experts call for the establishment of a powerful new committee, which would exercise a general control over the organisation and staffing of all departments. At present the main instrument of internal control is the finance committee, but its authority is often weakened by allowing the chairmen of the principal committees to sit on it *ex officio*. The Treasury experts are flatly opposed to this system; and they believe that by taking over all responsibility for establishment work their new committee would also be able to avoid the suggestion that this function of control "is a negative one tied closely to the cutting of costs." The Treasury, of course, is used to control over establishments in its own domain of central government; but a little reflection suggests that the recipe proposed—a clear separation of administrative and financial functions, with seniority accorded to the committee responsible for the former—is a strange export to come out of Whitehall.

Secondly, the experts want all the standing committees to delegate responsibility more freely to their chief officers. Without doubt, time and money could be saved if it were not necessary to get committee approval for every decision taken and every pound expended. Most committees certainly concern themselves too much with the minutiae of administration and too little with the larger questions of policy; but this is due less to any inherent defects in the system than to the level of interest and understanding of what Jeremy Bentham once called the "lay gents" who sit on them. There can be no cure for this but the education of councillors in the problems of modern administration, a task which most chief officers cheerfully essay; indeed they essay it so cheerfully that they probably do not

want more power devolved upon themselves. The real point of local government would surely be lost if committee men were prevented from expressing a lay point of view (however foolish) on any matter (however small).

The experts' third proposal is the most sweeping of all: it is a proposal that would in effect radically alter the status of the Town Clerk and the work of his department. Instead of acting primarily as secretary and legal adviser to the council, the team proposes that the Clerk should become an efficiency expert responsible for "the effectiveness and economy of all administrative arrangements throughout the Corporation." Instead of achieving a limited amount of co-ordination on particular matters by means of persuasion, the Clerk would be asked "to ensure that administrative activities . . . are effectively co-ordinated." Instead of intervening as little as possible and always by indirect means in the affairs of other departments, he would "bring to the notice of Departments (and, if necessary, Committees) the need for any change." Under these proposals the Clerk (who would take on the additional title of Chief Administrative Officer) would exercise a large measure of control over the staffing and the organisation of the other departments. It is usual at present to give the chief officers considerable latitude in appointing and selecting their own staff, so long as they keep within the fairly flexible upper limits that are periodically settled by the Council. The Treasury officials are opposed to this latitude. They believe that the Clerk's department should exercise a continuous oversight over staffing, that it should recruit centrally all the staff to non-professional grades which are common to more than one department, and that it should investigate and determine all requests for additional staff.

★

The eventual object behind these proposals is the creation of a new post in local government which would have little in common with the traditional role of the Town Clerk. The new functions are ascribed to the Clerk as a matter of expediency and economy, but it is emphasised that his post would in future have a "purely administrative nature" and that it would be thrown open to future generations "on the basis of their administrative abilities and not primarily of their professional or technical qualifications." In other words, the Clerk would not need to be a lawyer. To make their intentions on this point quite clear, the Treasury experts argue that the Clerk ought no longer to act as the Council's legal adviser, since this would weaken the office "by the association of unrelated activities." His legal functions would be handed over to a small separate department.

These proposals go almost half-way towards embracing the American idea of the City manager, who takes orders (on matters of policy only) from the Council, but

who has complete authority over the heads of departments. By applying business methods to local government, the manager can usually effect economies. The system achieves especially good results in the management of public utilities, but in the administration of the more personal services it would be likely to hamper the initiative and independence of the chief officers and of their committees—without very much reward. This danger is recognised in local government statutes in this country which confer specific duties on certain of the chief officers, with whose execution nobody (the Clerk included) has a right to interfere. They are statutes that should be retained. Once the case for circumscribing the Clerk's authority over other departments is thus granted, however, the case for divesting him of legal responsibilities and qualifications becomes much less strong. Most clerks are in fact appointed—even under the present system—primarily on their reputation as administrators. But since the activities of local authorities are closely governed by law and convention, it is a convenience that the chief officer should have legal knowledge; and if the Clerk is to get his way (both with his own councillors and with Government departments) mainly by the exercise of tact and diplomacy and of skill in negotiation, a legal training is as

good a training as any other in how to quibble with a smile.

It does not follow that all the proposals in the Treasury report should be dismissed out of hand. Some centralisation of the recruitment and training of local government staff may well be desirable, and the possibilities of establishing an Organisation and Methods service within local government warrant close examination. It is also desirable to have a strong and independent committee watching over the general efficiency of the local authority's work (although, if economy is the aim, a strengthening of the status of the finance committee would seem to be the best way), and to give the Clerk stronger powers to effect such co-ordination as is needed. Some of the larger authorities might also experiment in the appointment of clerks who are not lawyers. Coventry City Council has accepted, in principle, the proposals in the report that can be effected without a drastic change in traditional conventions. But it is understandable that Coventry should be cautious (and other local authorities will be more so) about the wisdom of embarking upon broader experiments. In deed, perhaps one of the happiest consequences of this research experiment is that it should have taught some people at the Treasury what local government is about

As the Romans Did

THIS weekend the Royal Numismatic Society is celebrating the half centenary of its Royal Charter. Numismatists have in recent years steadily integrated the study of old coins with the study of ancient economic history; and in their researches into ancient Rome, in particular, they have dug up some facts that seem to have an odd relevance to the twentieth century. It appears that so long as the Romans were Republicans they believed in sound money; and it was not until they were fooled in this belief that they enjoyed their Augustan age.

The Romans' first coins were all full-blooded value-money—that is to say, their face value was equal to the value of the metals incorporated in them. The silver (with very few lapses), and the gold when it was introduced shortly before the Christian era, remained value-money for centuries. But already during the Republic the weight of the bronze coins diminished far more than any possible changes in the market values of their metals (copper, lead and tin) could have justified. The final reduction, early in the first century B.C., was a bankruptcy measure in a desperate war with Italian "allies"; it was regarded as such an immoral measure that confidence immediately faltered, and the issue of bronze coinage had to be suspended. But tin was now too scarce for large mintages to be made at the full weight again. There seemed only one way out of this dilemma: from that time no bronze coins at all were

issued at Rome, for sixty years. The result of this puritanism, as of financial puritanism in some more modern ages, must have been an unnecessary shortage of a convenient medium of exchange.

This was one of the many problems left to Augustus. Thousands of surviving coins show how ingenious his solution was. Their weight is light; they were undoubtedly token currency; yet the public accepted them. Modern analyses show why. The basic coinages were not made of bronze at all; and, in their early days, they did not look like bronze. The unitary denomination—the basic coin was the "as"—was of almost pure copper. This was a complete novelty for the Roman coinage and it challenged no invidious comparisons. Its deep red colour, much more impressive than the old brown bronze coinage (which was often dingy from an excess of lead), evidently inspired public confidence, for it flourished and multiplied for several centuries. Sixteen centuries before bankers began to create notes and deposits (to the great annoyance of orthodox economists) and twenty centuries before economists began to explain and justify this creation (to the great annoyance of orthodox bankers), the Romans had made one of the major financial discoveries of all time: namely that money need never be honest, although it must always appear to be.

Augustus and his successors seem to have made large profits out of this discovery. Their overheads in pro-

ducing the new coinage were relatively small. In the Aegean area, where Augustus operated large branch mints, the greatest supply-centre of copper—in Cyprus—belonged to himself. And its working cost him nothing, for he leased it to Herod the Great, while demanding that half the proceeds should be handed back to him. Another great mint was in France, where the copper mines conveniently belonged partly to Augustus's wife and partly to an intimate collaborator (so intimate that he was entrusted with the murder of the emperor's grandson). Moreover, imperial troops conveniently stamped out a troublesome *maquis* in this Alpine region shortly before the great western copper coinages started; critics might call this currency imperialism, but then critics always would.

Encouraged by the success of his copper coinage, Augustus turned to brass—or rather to a golden-yellow zinc alloy (made apparently by heating zinc ore with copper). These coins were admirably known as "gold copper," and Cicero even seems to hint at the impressive effect that they might have on simple minds. Augustus boldly issued this brass coinage very light. He did so with impunity. Once again, the best zinc ore came from his own mines in Cyprus; and the copper which most easily took this alloy belonged to his wife. So his brass coinage, like his copper, could be produced inexpensively but issued at a wholly fictitious face-value; the public, dazzled by its aureate colour, did not object.

In this case, however, Augustus was merely following an example set earlier, outside Rome, by another acute business man, Julius Caesar. For Caesar, too, had issued a brass coinage; and he may have issued it not far from zinc-ore quarries in the Bergamo district, where his influence was greater than anywhere else. This and other early brass coinages bear the signatures of families known to have been engaged, during these Civil Wars, in vast and often shady financial operations. Presumably these signatories shared with their overlords, such as Caesar, the profits from this happy choice of new alloy. These were the men who coined money, in both senses of the word, during the period of upheaval. Caesar himself once observed: "Even if, in defence of my position, I had used the services of crooks and thugs, I should have to reward them just the same"—though it is only fair to add that the reputations of the Republican bankers were not all as black as this.

Later on, the emperors continued to farm out the lucrative privilege of token coinage—to reliable provincials, and to municipalities. But the rulers themselves issued the bulk of it, over a great area, though not always continuously, for excessive issues might have undermined its credit. All would have been well if so many emperors, including the saintly Marcus Aurelius, had not tampered with the gold and silver coinages as well. For it was still an article of faith that these should

remain value-money; even modern statesmen who pay only lip service to the principle of honest money hesitate to change the currency price of gold. Yet it was very tempting for emperors slightly to adulterate the silver alloy, to make a series of almost imperceptible deteriorations. And finally, when crisis after crisis made the government desperate for fresh sources of income, caution was abandoned, and the metal-content and even weights (of gold and silver alike) deteriorated sharply and noticeably.

The consequence, in the third century A.D., was a disastrous failure of confidence in the currency. At the cost of untold misery, the whole system lurched to collapse. Emperors ruthlessly insisted that taxes should be paid in bullion or coin of full weight and quality. Yet the coinage which they themselves now issued was worthless. In the course of this catastrophe the use of copper and brass, as alternatives to bronze, was abandoned; and brass has not often been used for coinage since. For nearly 300 years the rulers of Rome enjoyed a good run with their token money. They had never had to worry about the balance of payments with foreign countries or about gold cover. They made money the servant of their government instead of its master; and it is perhaps as well for the world that they did.

The American Tariff

In the late Message of the President of the United States, the removal of the import duties from all raw materials was promised. In the list of these materials, subsequently received, we observe that "linens, bleached or unbleached," and "lastings for making shoes, slippers, boots, etc.," are admitted duty free. . . . It is extraordinary that "linens and lastings for shoes" which are worn only by females, and those chiefly of the middle and upper classes, should be allowed to be imported duty free, whilst "leather," used by the whole mass of the population, from the President to the peasant, is doomed by this new legislation to pay an import duty of 25 per cent—5 per cent more than its present duty. The palpable inconsistency of placing "linens and lastings," which have passed through various processes, and are in truth manufactures, with duty-free raw goods, and placing "leather," which is merely the raw hide after the simple process of tanning, amongst silks and satins, can only be accounted for by the supposition that some class influence has been used to obtain this protection on leather. . . . If the United States were, after the example of England, to remove this duty, the result would be an increased exchange of the goods of both nations. The well-finished and better managed oak bark tannages of England would find their way to Boston and New York, whilst the equally useful, but more unsightly, hemlock-made leather of Baltimore, would obtain more buyers in England. The quality of American leather would soon be improved by the rivalry of our manufacturers, and the relative prices of leather of both countries be more equalised. The character of American boots and shoes would be raised (at present they are very inferior to English), and an important and advantageous branch of commerce would be greatly extended.

Notes of the Week

Austrian Hopes Dashed

AUSTRIA has been waiting nine years for the occupying powers to fulfil their promise to restore its full independence; it now looks as if it will have to go on waiting indefinitely. The western foreign ministers have the negative satisfaction of knowing that their good faith has been made abundantly clear; but this is no consolation to the Austrian people.

In Berlin, indeed, Mr Eden and his western colleagues, together with Dr Figl, almost fell over backwards in their efforts to leave Mr Molotov no shred of an excuse for not signing the draft Austrian State Treaty. Since the end of 1949 all but five of its 59 articles have been agreed. The remaining five are not of major importance; they deal with such matters as the Austrian government's debt liabilities, its relations with refugees, and the employment of foreign technicians. But for four years the Russians have stalled on them. In Berlin the western ministers thought to corner Mr Molotov by accepting without further ado the Soviet version of all five disputed articles. They went even further. With Dr Figl's consent, they agreed to drop the Austrian request that the extremely onerous economic clauses of the treaty should be revised. Under these clauses Austria is obliged among other things to allow Soviet Russia extensive rights of exploitation in the Austrian oil fields and to pay it the equivalent of \$150 million for former German assets; after years of Soviet exploitation this sum is now far in excess of the real value of these assets.

It is difficult to see what more could have been done. But Mr Molotov is a man who refuses to recognise when he has been cornered. With his proposals for the neutralisation of Austria and the retention of occupation troops (which are summarised on page 548) he erected a new and quite unsurmountable obstacle. It has been plain for some time that an independent Austria would agree to play a neutral role; but no Austrian government could agree to foreign troops staying indefinitely on its soil. Mr Molotov argued that they must stay to prevent an Austro-German *Anschluss*, which the Russians appear genuinely to fear;

but since Article 4 of the draft treaty categorically prohibits any form of Austro-German union, his excuse is hollow. The truth probably is that the Russians are determined not to move their 40,000-45,000 troops out of the Austrian salient in Central Europe so long as Western Germany remains in the western camp.

The Ambitions of China

COMMENTS from Peking and Moscow show extreme disappointment at Mr Molotov's failure in Berlin to bring China into a five-power conference that would discuss the affairs of the whole world. He probably launched this proposal as the first item on the agenda in Berlin for the simple reason that it was, in fact, his prime objective. It was a way round the failure to bring a representative of Mao into the permanent seat on the security council of Uno that is allotted to China. As Mr Molotov said, Communist China's exclusion from Uno "makes it all the more necessary that the five powers should meet." If they did so, to talk about Germany or any other question, as well as Asian conflicts, Mao would have received recognition through the good offices of his ally.

A report on the Berlin proceedings in *Pravda* this week states that Mr Molotov has "stressed that a five-power conference should play the part of an arbitration body in all questions which concern the participants in the Berlin conference and in which arbitration would be useful." If this means that Chou En-lai should appear in a five-power conference on, say, Germany, Mr Molotov and Mao are aiming too high. Mr Dulles at the outset of the Berlin meeting refused to talk with the Chinese on any matters except Korea and Indo-China. And M. Bidault went further by stipulating that, before he would talk about Indo-China, the Chinese must give proof of their peaceful intentions and stop aid to the Vietminh forces.

There will, therefore, have to be a further concession from the Soviet-Chinese side if any five-power meeting is to take place. One point has been conceded by them already: that representatives of other Asian states should take part in the conference on the matters that directly concern them. This was in response to the demand made by Mr Dulles and M. Bidault on behalf of the governments of South Korea and the Associates States of Indo-China. It was not a big concession if it leads the Russians and Chinese to secure their main aim, which is to establish Mao's right to join in settling every problem under the sun. The West should think many times before admitting that Communist China should be accepted as the only representative of an Asia that includes India and Japan.

Mao Uses the Side-Door

COMMUNIST China has entered a section of the United Nations by the tradesmen's entrance. Because the World Federation of Trade Unions is still affiliated to Uno, representatives of this Soviet-controlled organisation have been able to attend the conference in Ceylon of the Economic Committee for Asia and the Far East (ECAFE), which is part of the United Nations. A delegation led by the Chinese secretary of the All-China Federation of Trade Unions went to Kandy where the opportunity was taken of making political speeches against the non-Communist governments of the Far East.

The Soviet representative also made the most of his chances. He invited delegations from twelve Asian countries, including India and Pakistan, to visit the Soviet Union next autumn, expenses paid. At the same time, he repeated the promise made at previous ECAFE conferences that his government was ready to supply Asia with industrial equipment on a long-term credit basis. So far, it is only China and North Korea that have benefited from Soviet credits and these countries must be absorbing most of the Soviet surplus machinery. But if political effects can be achieved by these loans, more may be heard of the Soviet offer in future. It may at least prove more realistic than the Chinese declaration at Kandy that the participation of Mao's government in ECAFE will greatly help economic development in Asia and the Far East. The Far Eastern World Federation of Trade Unions is hardly designed for such a purpose; it is the Asian branch of the Cominform, and is engaged in organising revolutions in non-Communist Asian countries.

Pay and Politics

THE Select Committee on MPs' pay had alarmingly narrow terms of reference. In 1946 MPs considered themselves entitled to £1,000 a year; to maintain a similar standard today requires £1,446. Round the figure off (allowing, perhaps, for MPs having to spend longer at the House than anyone expected) and the case for a rise to £1,500 was considered to be established. The question of whether an MP is worth £1,000 a year at 1946 prices, or whether he is worth more, did not arise within the committee's terms of reference, which were carefully restricted to purely statistical considerations.

But, on a broader view, the question is made much more complicated by two important points of principle. The first principle is that the pay of a politician should never be high enough to make the prospect of a cosy job a prime motive for standing for—or for retaining a seat in—Parliament. To be fair, the new proposals about pay (as distinct from pensions) seem to avoid this danger, although only just. The Select Committee reports that in 1953 the Inland Revenue allowed members an average amount of £750 a year each as expenses "wholly, exclusively and necessarily" incurred in carrying out parliamentary duties, and that most MPs incurred (but did not get allowances for) other expenses that were scarcely less necessary. Accountants' abilities to justify expenses vary greatly, but

it is probably a fair conclusion that, even after any increase of £500 a year, the average MP will be left with less to live upon than he could make outside the House, at any rate if he was starting his career from scratch. The proposed increases in senior Ministers' salaries, from £4,000 to £5,000, and for junior Ministers from £2,000 to £3,000, pass this test with greater ease; Ministers, of course, have to give up all outside jobs upon appointment.

But the committee's second main proposal, for a non-contributory pensions scheme, seems a grave mistake. The proposal is that retired members, of 65 or over, should get a pension of £350 a year if they have completed between 10 and 15 years' service in the House, and £500 a year if they have completed more than 15 years' service; pensions for their widows are also proposed. It is easy to conceive of circumstances where this scheme could cause a member to tone down unpopular opinions, or retreat further into the party fold, for understandable (if inexcusable) personal reasons. Admittedly, as Mr Attlee pointed out in a letter to *The Times* this week, the prospect of a pension may make a member who has qualified for it more willing to retire. But why this tidy-minded insistence on length of service instead of a more generous adaptation of the present flexible system, of pensions based on need? A rigid stipulation tying benefits to periods of service raises precisely the dangers that a parliamentary pensions scheme should avoid at all costs.

The Piper's Tune

TO the Government the Select Committee's report must appear as a piece of sheer political devilment. This is not primarily because of its worry over the lofty principles involved; but because of its recognition that, whether it rejects the recommendations or seeks to implement them, it will run into a trap of its own devising. If Ministers reject the proposals, pleading that they would have an adverse effect on wage demands, what becomes of the Bill to raise the pay of judges from a starting point five times higher than that of MPs? Alternatively, if Ministers accept the recommendations, including the non-contributory pensions scheme, what happens to their case for raising the teachers' share of a contributory scheme? How, also, will they be able to resist their back benchers' campaign on

THE ECONOMIST
will include a Special Section
on
DEFENCE

officers' pensions? Any resort to logic will be brushed aside in a wave of emotionalism. Nor will the argument be happier at a more elemental level. MPs know that their constituents retain a firm conviction that it is distinctly shady for anyone to be able to vote himself more money and that anyway £1,000 is high enough pay for "just talking."

Labour MPs generally favour the change; most Conservatives either oppose it altogether or feel it is at least inopportune. The Government will move circumspectly, and even if it agrees to support the proposals it may well insist that no higher salaries should be paid until after the next election.

Tories Still Ascendant

THE Conservatives held on to their seats at the by-elections in Harwich and the Haltemprice division of Hull with the greatest of ease. At Harwich, where 59 per cent of the electorate voted, there was a fractional (0.2 per cent) swing towards the Conservatives compared with the general election of 1951; at Haltemprice, where only 46 per cent of the electorate voted, there was a swing towards them of 3.7 per cent. In neither case was the swing as large as at Ilford the week before (where Labour dropped 5.7 per cent of the poll), but the Conservatives' performance was still far better than would normally be expected at a by-election at this stage of a Government's career.

RECENT BY-ELECTIONS

	Percentage of Poll			Total Poll as per cent of Electorate
	Conservatives	Labour	Liberal	
Ilford North				
By-election.....	59.8	32.3	7.9	45
General election....	55.5	38.0	6.5	85
Harwich				
By-election.....	59.1	40.9	...	59
General election....	58.9	41.1	...	79
Hull-Haltemprice				
By-election.....	61.8	38.2	...	46
General election....	58.1	41.9	...	83

There are five by-elections outstanding. At one of them—the ultra-safe Conservative seat of Bournemouth West—polling is proceeding as *The Economist* goes to press; the Labour candidate there has clearly been pressed for funds and he does not seem to have made a very serious effort. Two of the others—due to the resignation of the ailing Conservative MPs for Harrogate and Arundel, announced this week—are seats with even more massive Government majorities than Bournemouth. The other two, Edinburgh East and Motherwell, are Labour seats. To capture them the Conservatives would need a swing of over 4 per cent at Edinburgh East and over 7 per cent at Motherwell; since Labour will presumably make greater efforts to get its supporters to the polls than it did at either Ilford or Haltemprice, such captures seem very unlikely. But at the last general election Labour won 14 of its seats on a split

vote with the Liberals, and another 82 with less than 55 per cent of the total votes cast; there must be at least twenty or thirty of these ninety-six seats on which the Conservatives would be casting very hungry eyes indeed if anything happened to their present incumbents, or if there was an early general election.

Moscow's Shopping List

THAT the Russians should show such keen interest in the products of British heavy industry is a matter for real satisfaction, especially in the places where their orders might be placed. Indeed, the visit of British businessmen to Moscow has been, from the purely commercial point of view, a success. But Mr Kabanov's claim that between 1955-57 there may be orders for Britain worth £400 million must, for several reasons be taken with a pinch of salt. The 4,500 million roubles of which he spoke cannot simply be converted at the overvalued official rate; and it is estimated by the Board of Trade that more than half the items on the order list are subject to strategic controls.

There has been so far no suggestion that the British Government and its partners in the exercise of these controls are proposing to disregard them. Yet the Russians have said that these deals will be completed only if there is a "normalisation of Anglo-Soviet trade" and if British imports from the Soviet Union increase greatly. The first condition implies the scrapping of controls, which would be difficult even if it were desirable; the second will also be difficult unless the Russians and their allies can offer at reasonable prices goods that Britain needs. As was pointed out in the last issue of *The Economist*, their exports to the West have been falling fast in the last two years. Can they suddenly recover, and if so in what classes of goods?

★

For the Soviet Government the business trip has been a great political success. The offer to spend £400 million was timed to impress the Berlin conference and, what is more important, it has caused a sensation in Germany. In the absence of any clear warning from the Board of Trade, German businessmen assumed that the Soviet-British deals have gone through, with government approval, while they themselves remain bound by the existing allied controls. Full of indignation, they are preparing to make their own pilgrimage to Moscow, where they expect to have more success than in the secret Soviet-German trade talks that were held in Copenhagen in August, just before the West German elections.

This rush to trade at any political cost, which is artfully encouraged by Mr Mikoyan's representatives all over Europe, threatens to break up completely the embargo system that has been operated by common agreement since the passing of the Battle Act. Mr Mikoyan can say "Heads I win, tails you lose." For either the controls are maintained, in which case western businessmen and workmen grumble at their governments; or they are abandoned, in which case the Soviet Government can expect immense assistance from abroad in its triple task of maintaining military strength, diverting industrial resources to consumer goods, and industrialising China.

France's Fateful Choice

FRANCE cannot postpone much longer a final decision about the European Defence Community. To outsiders who are impatient with the delaying tactics of the National Assembly, Frenchmen reply that they face one of the most fateful decisions in the history of their country about an issue on which France is divided. Some insist on the need to maintain an independent French army, for reasons examined by a correspondent on page 545; others look forward to an integrated European army as the only hope of avoiding a national disaster. Some have their eyes fixed on the Rhine, others on the Elbe. In both camps are to be found men with glorious names, famous as well as bankrupt politicians. The division cuts across party allegiances, and the mass of the people stands perplexed and undecided.

The desire that such an important decision should not be imposed by one-half of the nation on the other half would be enough to determine some people to seek a compromise solution. But there are more practical reasons for attempts to water down the treaty. A small majority could probably be mustered now for the EDC treaty in the National Assembly, but it would have to rely on Socialist support. The Socialists, however, are in opposition, while the Gaullists who are in the government oppose the treaty, at least in its present form. At a recent cabinet meeting a Gaullist minister recalled threateningly that his seat was previously held by M. Mitterand—a minister who resigned over the Moroccan question.

To avoid a collapse of the present rightist coalition, political match-makers are busy seeking alterations in the treaty to make it more palatable to the Gaullists. In the maze of wild projects two tendencies emerge clearly: first, an attempt to postpone political integration and the creation of a "supranational" authority; secondly an effort to extend as far as possible the "transitional" period. It remains to be seen whether the Christian Democrats (MRP)—the great champions of integration—will accept a watered-down version offered by the right wing. It is even more doubtful whether the five other signatories to the Treaty would or could accept any revision of established clauses. A straight choice between the treaty as it is and no treaty at all can probably no longer be escaped; for it should be clear that changes that would leave France more freedom of action would harness any future government of Germany less effectively.

Notional Insurance

LAST week's debate in the House of Lords on Lord Beveridge's motion "to call attention to the problems facing the people and the Government of this country in the coming years in relation to national insurance" suffered from the confusion that has beset the whole national insurance scheme from its beginnings: the confusion between actuarial principle and the reality of economic administration. "National insurance" is not, and never has been, insurance in any real sense. It is a system of

earmarked flat-rate taxation, conceived and applied in open defiance of the canons of both equity and economy; and the only justification for keeping it separate from the general body of public finance is that the heritage of goodwill from the voluntary approved societies made the necessary contributions more acceptable than an equivalent amount of straight taxation would have been.

Actuarial calculations, if strictly followed, would have meant a long postponement of a full subsistence rate for pensions (or crushingly heavy premiums for the older worker); a strict segregation of funds built up under different parts of the plan; and a discrimination between good and bad risks, industry by industry and even firm by firm, which would have laid the costs of uncertainty or of danger at the doors of those incurring them. As things are, the monumental labours of the Government Actuary—whose first quinquennial review of the financial condition of the national insurance fund and the adequacy of contributions to maintain benefits is due this year—are in the nature of an academic exercise. The benefits which can be paid, like the sums expended on education or housing, will be determined by the whole economic situation and by the Government's assessment of priorities, not by the nominal distribution of Government securities between the fund and other holders.

Lord Beveridge, while assigning unconditional priority to old age pensions, explicitly recognised this fact. He pointed out that, regardless of any change in contribution rates, the Exchequer would have to carry the extra £100 million or £150 million that would be needed to bring benefits into conformity with the subsistence principle laid down in 1946. But to spend any money that can be afforded in this way would push up the standard of living of those pensioners who do not have to seek supplements from national assistance (because they have extra resources) while leaving the (generally poorer) supplement-seeking pensioners where they are now. This would be in accordance with the principles of equal pension rights for all which the Beveridge Plan embodied; but it would not be in accordance with the principle of making life a little easier for the hardest pressed pensioners, which is what most people think proposals for pension adjustments mean.

Smoking and Cancer

WHEN the *British Medical Journal* published a paper on smoking and cancer of the lung in December, 1952, it provoked little public stir. Even last week's statement by the Minister of Health, giving a second opinion on the relationship between the two, received less publicity in part of the national press than would have been given to a statement of comparable importance on poliomyelitis—which in its worst year so far has caused 750 deaths, compared with the 14,000 attributed to lung cancer. Some cynics may observe that the press does not want to lose its advertising revenue from the cigarette manufacturers; others, probably more justifiably, will remark on the widespread public dislike of facing the facts about cancer—especially when those facts concern so darling a sin as smoking.

The main findings of Dr Doll and Professor Bradford Hill (the authors of the original paper in the *British Medical Journal*) are detailed elsewhere on this page. In 1953, as a result of their paper and of similar evidence from research workers in the United States, a panel under the chairmanship of the Government Actuary was set up to report to the Minister of Health's standing advisory committee on cancer. That committee's opinion may be briefly summarised as follows: (1) a relationship between smoking and cancer of the lung has been established; (2) although there is a strong presumption that the relationship is causal, there is evidence that the relationship is not a simple one; but (3) no dramatic fall in death rates could be expected if smoking ceased, since the development of lung cancer may be a long-term process (although young people should be warned of the apparent risks of excessive smoking).

The main complicating factors are the difference in the

incidence of the disease between town and country, which suggests that atmospheric pollution may be responsible for part of its increase in recent years; and the failure, so far, to identify in tobacco smoke a substance producing cancer of the lung. (Certain tars derived from tobacco smoke have produced skin cancer in mice, but this is not considered conclusive evidence that it could be responsible for cancer of the lung.)

The tobacco companies have offered the Medical Research Council £250,000 for research, and until there is firmer evidence incriminating tobacco the Minister of Health may feel justified in not sounding too alarmist a note. But if that evidence is forthcoming there may be a strange clash between the Ministry's duty to further preventive medicine, the public's attachment to its favourite vice, and the Chancellor's attachment to his £600 million of revenue from tobacco duties.

Facts About Smoking and Cancer

THE British investigation into the effect of smoking on cancer was reported in a paper by Dr R. Doll and Professor Bradford Hill in the *British Medical Journal* of December 13, 1952. The main method of inquiry was to interview 1,465 patients (1,357 men and 108 women) with lung cancer and the same number of "matched control" patients (of the same age and sex) with other diseases. The interviews were made in 1948 to 1952 in hospitals in London, Bristol, Cambridge, Leeds and Newcastle-upon-Tyne. The main results were as follows:

(1) Only 4.5 per cent of the male patients with lung cancer were non-smokers or very light smokers (less than five cigarettes a day) compared with 14 per cent of the male control patients with other diseases; 24.4 per cent of the male patients with lung cancer smoked more than 25 cigarettes a day compared with 12.2 per cent of the control patients. Similarly 13 per cent of the women with lung cancer smoked more than 25 cigarettes a day, although none of the women control patients did. The

first table below shows details of this progression.

(2) The association between smoking habits and the prevalence of lung cancer in men was found in each of the five areas of inquiry. For women it was found in London only but the sample elsewhere was tiny; only 28 women patients were interviewed in the provinces.

(3) Pipe smokers seem to run less risk than cigarette smokers. Among male lung cancer patients who smoked, 3.9 per cent smoked only pipes, and 74.4 per cent smoked only cigarettes; the corresponding proportions in the non-cancer patients were 6.9 per cent and 69.4 per cent. Although the numbers of pipe smokers are so small, the difference is significant.

(4) The proportion of cigarette smokers who had ever used a cigarette holder was significantly smaller among the cancer patients (5 per cent) than among the control patients (12 per cent). Similarly, only 3 out of 504 patients with lung cancer had smoked filter tipped cigarettes compared

with 15 out of 467 control patients. The observations are too few for any definite conclusion to be drawn but they suggest that filter tips may be a deterrent and that cigarette holders probably are.

(5) There is no evidence that the use of petrol lighters has any effect.

(6) There is no evidence that any one brand of cigarette is more closely associated with lung cancer than another.

(7) The relative risks associated with different levels of smoking were estimated for the Greater London area only. On the assumption that the smoking habits of the lung cancer patients were typical of those who died of the disease and those of the control patients were representative of the inhabitants of Greater London generally, it was found that hardly any men died from lung cancer between the ages of 45-64 if they were non-smokers, but that for heavy smokers in this age group the death rate reached 3 to 5 deaths a year for every 1,000 people living.

LUNG CANCER AND THE EXTENT OF SMOKING

Average number of cigarettes (or equivalent in pipe tobacco) smoked daily over 10 years before illness	Percentages in Each Group			
	Men Patients		Women Patients	
	Lung Cancer	Control	Lung Cancer	Control
Non-smokers*	0.5	4.5	37.0	54.6
Less than 5	4.0	9.5	14.8	23.1

Under Starter's Orders

MR MULLEY'S perseverance has earned first the silence of doubting colleagues and the guarded support of the Government; and there is a good chance that his Pools Betting Bill will reach the Statute Book in the summer. This Bill, which was discussed in *The Economist* two weeks ago, seeks to compel all pool promoters to register with local authorities, to be subject to the scrutiny of a local authority auditor and to publish a breakdown of the finances of each competition. It is the first proposal of the three-year-old report of the Royal Commission on gambling over which any action has been taken at all.

Mr Mulley's success may encourage those interested in some of the other proposals of the Royal Commission to move up under starter's orders. The Commission's main proposal was the legalisation of off-the-course betting—in other words, the substitution of registered betting shops for the illegal street corner tout. This would not only make the law less of an ass but would offer a chance of easing the economic difficulties now facing horse racing. Many of the claims of the bloodstock industry are undoubtedly exaggerated. But it can justly argue that it has a useful dollar export trade, which depends on flourishing racing; that owners nowadays are estimated to get back in prize money less than half of what they spend in training bills, transport and entry fees; and that other countries (Ireland is the most popular parallel) have derived real benefits from legalising off-the-course betting and exacting a levy from which a substantial contribution to racing can be made.

In a limited way this was what the Tote was supposed to do over here; but the results have been disappointing, chiefly because its profits have been taxed. The racing world claims this is contrary to Parliament's original intentions, and the matter has been taken up with the Chancellor. Moreover, there are signs that, now Mr Mulley's Bill has broken the ice, the broader issues may move nearer to serious consideration. Has not the Jockey Club two distinguished members strategically placed at 10, Downing Street and the Ministry of Agriculture?

Franco Draws the Sword of Islam

GENERAL FRANCO is busily spoiling a good case in Morocco. He was justifiably nettled by the high-handed way in which the French brought about a change of Sultan in August, without consulting either of the other two zones—Spanish Morocco and Tangier—over which the Sultan of Morocco is sovereign. The French had the imperative need for haste as an excuse for their initial discourtesy; but they made a grave blunder when they omitted to have a formal exchange of views with Spain immediately their deed of deposition had been done. The Spaniards, after a silence of some months during which, presumably, they have taken the temperature in their own zone, have started to vent their chagrin.

Last week, General Franco received a delegation of

pashas and caids from Spanish Morocco who came to offer him a decoration. In a speech that advertised the degree of his annoyance with Paris, he declared at one point that Spain was the champion of Moroccan unity, but at another that the Khalifa—or Sultan's representative—of Spanish Morocco was for the moment regarded by Spain as sovereign in the Spanish zone. What does he mean by two such conflicting statements? And has he any policy for the day after tomorrow? The confusion about his intentions created by this ambiguity becomes worse confounded by a claim in the Madrid newspaper *ABC* to the inclusion of Tangier in the Spanish zone. (*ABC* is censored, and could not have printed such a claim without approval.)

Only fifteen months ago the Spaniards triumphantly agreed to adjustments in the international regime for Tangier that restored them to a position they had lost in 1945 owing to their behaviour during World War II. Does the Caudillo now wish to undo what was then settled? And is he hoping, by posing as champion of the deposed sultan, to steal a march on Europe by currying favour with Arab nationalists? Spanish Moroccans, in interviews given to Cairo newspapers which General Franco may not have read, clearly think of him as the catspaw through whom they will gain autonomy, and the first step towards liberating the whole of Morocco from Europe. An inevitable result of upsetting the appellation in other people's zones is to expose the Europeans in all three zones to insecurity. The General's liberalism should begin at home.

The Ever-receding Plebiscite

THE plebiscite by which the people of Kashmir are supposed to have an opportunity to decide their future allegiance under the supervision of the United Nations seems to be ever fitting away from the present as the months and years go by. Since the Indians have agreed in principle to holding it, they cannot simply refuse to allow it; but the endless haggling over conditions for holding it has had the effect of postponement without limiting date. There appeared to be a step forward last August when India and Pakistan agreed at least to appoint a plebiscite administrator by April of this year. But during the past fortnight the situation has again taken a turn for the worse.

The Kashmir Constituent Assembly (which cannot be regarded as more than partially representative of the Kashmir people) has passed resolutions that are equivalent to a ratification of accession to India, and this has been declared by the Kashmir Prime Minister, Bakshi Ghulam Mohammed (with echoes in the Indian press) to be final and irrevocable. At the same time it is reported from Delhi that the Indian Government is saying that further negotiations over the plebiscite will not take place unless Pakistan gives satisfaction to India over the projected American military aid. It is natural that India should be dismayed at the prospect of such a strengthening of its unloved neighbour, but that does not seem a sufficient reason for laying down totally irrelevant conditions for the implementation of a promise which has been given to an international body. It seems to be time for the United Nations itself to take up the matter again and try to get the plebiscite

actually held. If India and Pakistan cannot agree on terms for the policing or defence of Kashmir during the plebiscite, the United Nations might offer to provide a neutral force similar to the one which India itself provided for supervision of the prisoner-of-war provisions of the armistice in Korea.

The Greek Children

THE Communist government in Hungary recently announced that it is willing to send back over 1,100 Greek hostages removed from their homes in Epirus by Communist guerrillas during the Greek civil war. If all goes well, they should begin the journey home this weekend. The safe restoration to Greece of these unfortunate people will be doubly welcome; first for its own sake, and then as another sign that the Cominform countries want to take practical steps to reduce tension with their neighbours.

But Greece will not be impressed by the overtures of its northern neighbours so long as they do nothing about between 25,000 and 28,000 Greek children who were dragged behind the iron curtain during the civil war. Of this fantastic total scarcely more than 500 have been sent home again—and all these from Yugoslavia. Last autumn the Hungarian and Czech governments announced that they were willing to negotiate about the return of some hundreds of Greek children, but in neither case has anything happened since, Greek-Bulgarian negotiations for the resumption of diplomatic relations have been going on in Paris since December; but so far, the Greek delegates' inquiries about—among other things—the Greek children carried off to Bulgaria have met with no satisfactory response. Nor did the large delegation of parents and guardians of abducted children who called on Mr Sergeyev, the Soviet Ambassador to Greece, when he visited Salonika last month.

The truth probably is that the Communists are unwilling to let most of these children go because they have gone to a great deal of trouble to turn them into good young party members. It has been reported that some of them are even trained as guerrilla fighters—presumably to make mischief once they are back in their native country. How far the process of indoctrination has gone it is impossible to say; but some of the children must now be well on in their teens. It is obvious, however, that the children's parents will not give up hope; and that Mr Sergeyev's tours through Greece in the interest of better Greco-Soviet relations will fall flat so long as Soviet Russia does nothing to hasten the return of the abducted children. Their story, as the Salonika delegation told the Ambassador with bitter irony, "is in no way flattering to the much-advertised moral qualities of the people's democracies." It is, indeed, among the cruellest of the many cruel things done in their country since the war.

The Discomfort of Freedom

MEAT and bacon are to be set free before the middle of July, and after more than fourteen years every family in Britain will be able to consign its ration books to the dustbin. The announcement had been expected for

so long that it has caused little stir; although it has set reminiscences in train about why rationing worked more smoothly in Britain than in most other countries. The principal reason probably did not lie in praiseworthy national characteristics, so much as in the fact that Britain did not have countless small farms that could profitably feed domestic produce into the black markets.

Politicians, however, are looking forward instead of backward; and there is eager speculation over whether the dramatised lifting of the last straw from the camel's back will add to the Conservatives' popularity. There is a cynical reason for supposing that it may not have the effect that the Conservatives are expecting. For although de-rationing has not, in sober fact, been accompanied by any exorbitant increase in prices, many housewives plainly believe that it has. And herein lies an odd social experience of the past two years, of which many males are unaware and which many housewives will deny: namely, the roughness of readjustment, in millions of homes and along thousands of shop counters, to the responsibilities of freedom.

In the last two years, as rationing has eased, a very large proportion of housewives—in fact, virtually all those now under thirty-five or so years of age—have been meeting for the first time the opportunities and the risks of economic independence. Instead of pushing three or four ration books over the counter, in the secure knowledge that the quantities of bacon, eggs, cheese, fats and so forth obtainable would, however inadequate, at least be well within what she was prepared to spend—and subsequently turning with a clear financial conscience to the fancy biscuits and processed quasi-cheeses—the housewife now has to think seriously about staples; to take the consequences of any of those errors of judgment which, under the benevolent paternalism of the ration book, she was not allowed to make; to discover, by trial and possibly painful error, the pattern of weekly spendings best suited to her family budget and needs. And all the time, as the shelves and shopwindows fill up, temptation besets her to spend not merely as much as ever but more than ever on the fancy trimmings, for the purchase of which the enforced restriction of her food budget once left her free. It is not surprising that the total effect is of a wasting hæmorrhage of the purse—an effect easily translatable into an honest belief that everything is getting dearer every day. Those who variously attribute the achievement of de-rationing to careful policy or kindly terms of trade can be left to argue among themselves whether all this should be called a proof of feminine inconsistency or a mysterious form of justice.

Colonel Wigg and Private Bills

PARLIAMENTARY strategists might have smiled if an amendment to the Ashridge Trust Bill, moved in the House of Commons on Tuesday by Colonel Wigg, had been taken to a division; but the students at Ashridge College would have been saddled with some odd homework. In order to air his views on the need for an enquiry into the whole procedure of Private Bills, Colonel Wigg recommended—as a parliamentary expedient to remain "in

SECRETS OF THE WOOLWORTH MILLIONS

Seventy-five years ago, Frank Winfield Woolworth opened what he rather flamboyantly called "The Great Five Cent Store" on Bleeker Street, Utica, New York State. Inside four months it had closed down—a complete failure.

Recently F. W. Woolworth, & Co., Ltd., which runs 782 of the familiar red and gold stores in Great Britain announced record profits of £18,986,954 (before tax) in 1953 and a dividend of sixty per cent.

This is only half the financial tally, for the F. W. Woolworth Company of New York, which owns fifty-two per cent of the British Company, 1,193 stores in the United States, Canada and Cuba, and controls another 44 in Germany, makes about the same nett profit.

The story of Woolworths between that first flop in Utica and the latest record profit announcement is one of the marvels of the financial world. Start reading this amazing story in "Everybody's" on sale next Monday, February 22nd.

What Shape is a Window?

In the case of a Vybak flexible window the answer is—any shape at all. In a car hood, for instance, it folds with the canvas and spends much of its life bent double. Yet—when the hood goes up it is as straight and clear as ever, with no sign of a crack.

This means greater safety and convenience. In a 'convertible' a Vybak rear window for the first time allows the interior driving mirror to be used even when the hood is up. It is only one of many advances springing from Bakelite Limited's development and research. The history of plastics is already a long one, but new pages are being written every day—by the organisation whose pioneering efforts were mainly responsible for the general adoption of these versatile materials.

...burning
bright

SOME eight thousand miles from London lie the jungles of Malaya.

We, the British, are the people who brought to this ancient land of tiger and jungle a common law and order, who constructed railways and roads, pushed back the jungle, built towns and cities, developed the tin mines and introduced the rubber tree. We have made it one of the most important countries in the world.

The rubber plantations of Malaya, which now supply industry with an enormous volume of cultivated rubber, were begun from the Brazilian seeds shipped to Britain towards the end of the 19th Century and propagated in Kew Gardens.

Today Dunlop Malayan Estates Ltd. cultivates 80,000

acres, the largest rubber plantation property in the world under single control. It employs many thousands of Tamils, Chinese and Malays. They work for good wages and live in good houses. They have schools, hospitals, crèches, laundries, bus services, entertainments and temples.

This is an age of greatly differing ways of living. We have no reason to be too modest. The British way of life has brought to millions a new conception of living, a greater prosperity, a wider freedom. Whether we work alone or as colleagues in one of our great industries, such as Dunlop, we still have to finish the job we started—the creation of a common prosperity and a common wealth of work and happiness for all peoples of the world.

DUNLOP makes things better for everyone

DUNLOP RUBBER COMPANY LIMITED ST. JAMES'S HOUSE - ST. JAMES'S STREET - LONDON, S.W.1

order"—that the compulsory study of this subject should be written into the college's statute. He delayed the passage of this particular Private Bill in the hope that this might eventually help other Private Bills to pass more expeditiously.

Private Bills are introduced to legalise specific changes in such matters as the terms of a trust or the powers of a local corporation; they do not make general laws. The dissatisfaction that has lately been voiced at the cumbersome procedures involved in their passage has two main roots. First, some local authorities wishing to introduce such bills have been thwarted by what they regard as small and unrepresentative cliques at the town polls or town meetings that the present law demands; Birmingham's experience in this matter was discussed in *The Economist* on January 16th. If the proposed "reform" of the law merely meant the destruction of political safeguards against administrative encroachments upon personal liberty, it would be a sorry reform indeed.

Once a Private Bill has reached Parliament, however, its opponents take over from its proponents in feeling that they have grounds for complaint. The objector can then only state his case by making a petition which is heard (through counsel) by a Select Committee of the House, and which is liable to be a very expensive business. Some Members of Parliament have turned themselves into what is in effect a self-appointed watch-committee to guard against any abuses of individual liberty threatened by Private Bills; but their contribution is necessarily one-sided. It is now twenty-five years since the procedure for Private Bills was last thoroughly sifted by an investigating committee of the House; and even if there is little room for change, much can be said in favour of Colonel Wigg's argument that a new look should be taken at the old problem.

Unwillingly from School

ELTHAM HILL GIRLS' SCHOOL—an ordinary but well-run grammar school, with reasonably up-to-date buildings on the outskirts of South-East London—has been elevated by the London County Council into a test case. Within the next few weeks, at the latest, the Minister of Education will have to decide whether she will accept the LCC's decision that it should be closed in order to allow the new Kidbrooke comprehensive school an undisputed field; or whether both schools should continue side by side.

The buildings at Kidbrooke will be complete in three months, and in this area there is no need for Eltham and 500 more grammar school places in the comprehensive school. The broad outline of the LCC's School Plan, which was approved by Miss Horsbrugh's Labour predecessor, included the transfer of the Eltham School to another comprehensive school (the existing buildings would still be used as a school). But, as late as 1952, pupils were still coming to Eltham on the assumption that they would complete the whole of their grammar school education there. The LCC's decision that the school should close raised a storm of protest from parents; the argument put forward by some Socialists for comprehensive schools—that the intellectuals who gain grammar school places should be educated in the same buildings as the unintellectuals

tuals who do not, so that the latter might occasionally punch the former's heads—does not go down very well in Eltham.

In a speech last October Miss Horsbrugh emphasised that she had no power to interfere with the LCC's general plan for comprehensive schools, because her predecessor had authorised the necessary buildings. She had only the power to decide whether existing schools should be closed against the wishes of local parents and residents. The hub of the problem is that if the two schools continue side by side, they will be competing for the limited local amount of grammar school talent; and one or the other—it would almost certainly be Kidbrooke—would attract less than its share of bright girls. But when a school that is considered unattractive by parents has to have its more attractive neighbour closed down, somebody somewhere is driving a steam-roller over the efficiency of state education.

Roads to Disaster

THE only comforting feature about the Ministry of Transport's analysis of "Road Accidents 1952," published this week, is that although the population has increased by 6 per cent since 1938 and the number of vehicles on the roads by 50 per cent, accidents are rather less common than they were before the war. The provisional figure for 1953, although 9 per cent higher than that for 1952, was 5 per cent below the total for 1938. But the toll is still appalling. As Mr Philip Noel-Baker pointed out in the House of Commons on Monday,

if last year's rate of casualties continues, 4,500,000 people, nearly one in ten of the population—will be killed or injured on the roads in the next twenty years.

Both last year and this year the Government has diverted only £2,250,000 of its expenditure (£3 million, including expenditure from the rates) to deal with the "black spots" where accidents most frequently occur. As there are some 50,000 black spots in the

country the present rate of progress is very slow. The Ministry's analysis shows that three-quarters of the accidents in 1952 occurred in built-up areas, and of these about half were at junctions or cross roads. The most common cause of accidents (in 21,000 of them in 1952) was that pedestrians crossed the road carelessly. Next came turning to the right, by both drivers and cyclists, without due care (11,000), and carelessness in getting into or out of a vehicle (7,000).

Letters to the Editor

Weapons to End War?

SIR—In your leader of February 6, 1954, you raise the question, "Is it now the intention to do exactly the opposite of what was done in 1950 in Korea—that is to say, to extend a local conflict by striking at the source of aggression?" And you answer that question by stating that "It is, perhaps, better that aggressive governments should be left in doubt on this point; it is certainly not a matter for a public pledge." Are you suggesting that the allied governments should repeat Sir Edward Grey's mistake of July, 1914, and leave a potential aggressor in doubt about their reaction to local aggression? The new policy will be workable as a deterrent to local aggression only if the potential aggressor is reasonably certain that local aggression will be met with atomic retaliation. If the allied governments leave any serious doubt in his mind on this count they will invite exactly that kind of miscalculation that has so often in the past led to the outbreak of a general war which nobody wanted and which would not have broken out had the potential aggressor known in advance how the other side was likely to react.

The new policy will make new Koreans impossible, for no government in its senses will start a local aggression in the knowledge that its industrial and population centres will be reduced to rubble in retaliation. Yet by making new Koreans impossible, the new policy will raise a new problem which apparently neither its supporters nor its critics have yet faced. For either a potential aggressor will abstain from local aggression altogether, or, if he is committed to aggression even at the risk of a third world war, he is bound to anticipate atomic retaliation by atomic prevention. That is to say, a new Korea will not start with the attack of North Korean ground troops attacking South Koreans, but by Russian bombers dropping atomic bombs on the military and industrial establishments of the nations committed to atomic retaliation. The very announcement that local aggression will be met by a war of atomic retaliation will make such a war impossible. Instead it will call into being a war of atomic prevention from the other side.

Atomic retaliation, whatever its merits, is, however, only an answer to open military aggression. The new policy must assume that the threat to the status quo, conjuring up the spectre of a third world war, is likely to take that form. Yet the real threat to the status quo arises from the revolutionary ferment which holds much of Asia, Africa, Latin America, and Western Europe in its grips. Obviously, it would be no answer to the threat of

a Communist revolution in Italy to drop atomic bombs on Moscow, nor could the inroads of Communism in Indonesia be stopped by reducing Peiping to rubble. That crucial problem Mr Dulles's speech of January 12th refuses to face by anything more than the expression of confidence that freedom is more attractive than slavery and cannot help winning out in the end. Yet while that problem is not faced squarely, the "new look" of American foreign policy is nothing more than an obsolescent look, the look of ultimate catastrophe and defeat.—Yours faithfully,

HANS J. MORGENTHAU
University of Chicago

Mr Butskell's Dilemma

SIR—This dilemma is double. Mr Butskell's behaviour before the dilemma was rightly described by you. But that is only half the story. Behind that dilemma, undoing as much as ever Mr Butskell did, has been Mr Gaitler. Butskell may have been bad, but Gaitler has been worse. What both have achieved, simultaneously and in opposite directions, has been disastrous: double Jekyll and double Hyde: double schizophrenia: "double, double..."! —Yours, equally confused,

GRAHAM HUTTON
Abingdon, Berks

Squaring Strasbourg with Gatt

SIR—As an observer at the second Westminster conference of the European Movement of economic and social problems, may I welcome your notice of that body and its deliberations last week? It is gratifying to see a fuller acknowledgment in the press of the views which have been put forward so long and so consistently in the European Movement, the Council of Europe and the European League for Economic Co-operation, to the effect that some strengthening and closer association of the EPU area is a necessary prelude to any further advance towards real free trade.

I should be grateful for an opportunity to dispel any impression that the Westminster conference was riven by disputes between protectionists and free traders. Fairly close acquaintance with many of the persons present and study of the reports lead me to believe that there were few, if any, *a priori* autarkists present. The conference merely reaffirmed the view, widely held in this country and in the Commonwealth, that the doctrinaire and purist insistence on the Most Favoured Nation clause is inhibiting the policies of which the world stands urgently in need.

The relatively small number of

Commonwealth delegates present was due to internal administrative arrangements, and in no way invalidates the strong Commonwealth support which was voiced in favour of similar or stronger views at the Commonwealth Conference of the European League for Economic Co-operation in Brussels two years ago.

Finally, let us not delude ourselves with debating points. The remarkable recovery of sterling since 1951 is surely attributable in the foremost degree to the rigorous "discrimination" which was effected two years ago. As for the alleged "howling down" of the protection of infant industries by German and French delegates, the official policy of these nations is clear enough. France is certainly not one of the most free trade nations in the world, and I have just perused an article by Dr Theodor Sonnemann, State Secretary in the Federal Ministry of Food, Agriculture and Forestry, entitled "German Agriculture Must Be Protected On The World's Markets."

Events are in any case slowly forcing us to follow the right line. Despite all opposition the Strasbourg Plan is now receiving extremely close official consideration both in this country and in the rest of the EPU area.—Yours faithfully,

PETER BAKER
House of Commons

Enterprise in the Air

SIR—In your article of February 13th you mention that "the impression is gaining ground, not least in the two nationalised corporations, that the Government's 'policy' appears to be leading not towards genuine competition but towards the creation of a number of new private monopolies."

Certainly if this opinion is held in corporation and Opposition circles, often so strikingly coincident in view, it may be assumed that the Minister's statements have been heeded. He is, as he has said, not trying to make the functions of the public and private sectors of the industry senselessly competitive but rather complementary. Indeed it is this, not the opposite, that has always been implied in the Minister's policy statements in the House of Commons as it was in reply to a Question of mine last week. Your article was thus based on a false premise.

To fly to the other extreme, however, and impute private monopoly, as the BOAC-Labour Party axis seems to assume, is again taking leave of the facts. Only delusions of grandeur could underlie the belief that a corporation could undertake the whole of British air transport, unless the believer be a rigid socialist. There is plenty of competition already on any single route or service, and the foreigner supplies it. Let this competition be fought by each sector where it is met, but surely let us see our corporations make a business success of the vast network of routes they already properly claim before unlimited new commitments are undertaken. There is room for both, I hope, in the future of

our aviation. It would be poor policy for a Government to promote dog-eat-dog competition between British interests in the earliest days of their operating new services; but nothing in our present policy will justify the assumption of monopolies anywhere except, in fact, in favour of the corporations.—Yours faithfully,

REGINALD BENNETT
House of Commons

Who Pays Teachers' Pensions?

SIR—It is difficult to think that the above question, in your issue of February 13th, was posed with any seriousness. Presumably the uninformed reader was to infer that the scheme is heavily subsidised by the Government. Nothing could be further from the truth. The Exchequer carries some liability in respect of the years 1918-22, the only period during which teachers enjoyed the non-contributory scheme promised them in the 1918 Act. For the rest it is doubtful whether as much as a single penny has been expended from national sources. Indeed, the monies contributed by the teachers and the local authorities in accordance with the scheme, have been used by successive governments for their own purposes to the extent of £220 million. That is the credit balance of the scheme today. The annual income is in the region of £23 million a year and expenditure has never yet reached as much as £6 million in any year. Little wonder that no one has dared risk a prediction as to when the scheme will be "in the red." There is little chance that the paper contribution of £144 million will ever be translated into hard cash.

If the teachers' scheme has been selected as a precedent for a wholesale revision of pension schemes then a singularly inept example has been chosen. Or is it that teachers have been singled out for attack merely because they are the most pacific, and long-suffering element in the community?—Yours faithfully,

R. W. DARGAVEL
Newcastle-upon-Tyne

Controlling Private Schools

SIR—Your note in the issue of February 6th on the operation of Part III of the Education Act, 1944, is interesting. May I make the point that the introduction of this part of the Act, by closing the less desirable schools, will work immensely to the advantage of private and other independent schools? It would give these schools a powerful argument for continuance against upsurging socialist demands to end independent education, since, once on a Part III register, the schools can hardly be accused of inefficiency. It is therefore ironical that demands for applying Part III generally come from Labour benches; but from the Labour back benches—the front bench remains informed and silent.—Yours faithfully,

JAMES NOWELL
Bearssted, Kent

Books & Publications

Economics in an Attic

A BALANCED ECONOMY.

By L. S. Amery.
Hutchinson, 12s. 6d. 263 pages.

THE dust-cover proclaims that this "is at once a challenge and a confident and conclusive answer" to nearly all the major economic problems before Britain today. Unfortunately, the tone of the books shows that Mr Amery believes this. As a result the first two impressions to leap out of the text are of astonishing industry and astonishing arrogance. This is a pity: first, because the distinguished elder statesman who is its author has made a proud mark on one golden moment—and several silver moments—of English history; and, secondly, because both impressions are probably wrong.

Mr Amery's main thesis is that pursuit of Adam Smith's doctrine of maximisation of income through division of labour can degenerate into a very tiring and bewildering chase; and since tiredness and bewilderment are both nasty things to suffer from, he wants to put something else in liberalism's place. That something else he defines as pursuit of an economy in balance; and although his early remarks do not explain satisfactorily what an economy in balance is, the reader is left to suppose that he will find out later.

From this, Mr Amery plunges enthusiastically into an exhaustive and exhausting survey of the primary resources of Britain and the Commonwealth, with sweeping recommendations attached to each. Food production in this country should be raised to at least twice its pre-war figure; Britain should start digging vast quantities of low-grade lead, zinc, tin, wolfram and other metals out of its own soil; all the other countries in the Commonwealth should start doing the same; and the Commonwealth should erect the sternest possible trade barriers to prevent foreigners sending in their cheaper products from outside. Nearly all these proposals suffer from the disadvantage that vast capital investment would need to be undertaken in order to start up production; and that, once production had been started, it would be much more expensive than existing production elsewhere. In short, these are all schemes for diverting resources from the production of current wealth in order to lay the expensive framework for schemes in which those resources could eventually be employed in producing less current wealth than they are producing now; but the reader has already been told, in Chapter I, that finicky and complicated objections of this sort are a sign of short-sighted timidity.

Ordinary cost analysis has been consigned to the rubbish dump with Adam Smith, and the reader is still waiting—as he draws nearer and nearer to the end of the book—to discover what the balanced economy will put in its place.

Then, in the middle of a passage complaining that Canada is very short-sighted because it does not come into the sterling area (for the obviously inadequate reason that such entry would not be in its economic interest), the book comes to a sudden stop. And, as it does so, realisation dawns. The balancing factor that a balanced economy would set against the uneconomic nature of these various schemes is that Mr Amery thinks that all of them would be nice things to do. With this realisation earlier impressions must be softened. The two emotions that really underlie this book are the normal energy and opulence that we all feel when we are turning over belongings in our attic; this is a harmless occupation, provided that it is realised that those belongings have no relevance at all to the parts of the house in which anybody with any pretensions to a decent standard of living can ever expect to live.

Brave New World?

THE DOORS OF PERCEPTION.

By Aldous Huxley.
Chatto and Windus, 63 pages. 6s.

IN this essay Mr Huxley describes his experiences after taking a single dose of mescaline. Peyotl, of which mescaline is the active principle, has been used for centuries in the religious rites of many Indian tribes in northern Mexico and in the south-western part of the United States. Psychiatrists have been interested in it for the last twenty years because of the striking similarity between the experiences and behaviour it temporarily produces and the signs and symptoms of schizophrenia. Indeed, this book originated in the testing of the theory that the production of a mescaline-like toxin in the body might account for the phenomena of schizophrenia. Phenomena peculiar to both conditions include strange alterations in sense-perception; hallucinations of sight, smell and hearing; an immobility and a withdrawal from all contact with reality into a dreamy ecstasy; thinking in images rather than in concepts; a feeling of heightened significance of objects; and strange feelings of unnatural influence.

Mr Huxley was fortunate in not experiencing the unpleasant—indeed terrifying—effects sometimes produced

by the drug. He concentrates upon the visual changes it produced in his immediate world: on the intense brightness of things and on richness and saturation of colour; on the enhanced significance of form, contrast and texture which he experienced. He made, he says, a fresh discovery of a world of visionary beauty in which spatial relationships and time became unimportant. This has all been described before, but never so well; and never by an artist trained to communicate his experience in words. He tells how under the influence of the drug he saw for the first time a chair as Van Gogh painted it, and draperies as Botticelli and El Greco had reproduced them.

What the rest of us can see only under the influence of mescaline, the artist is congenitally equipped to see all the time.

These aspects of Mr Huxley's essay are so exciting that many will wish that he had repeated the experiment so that his description could have been fuller.

Some of Mr Huxley's readers may well have had to part company with him in 1937, in the last chapters of "Ends and Means," because they could not follow him in his excursion into the realms of mysticism. They may also find many passages in the present book incomprehensible—passages where the detachment and contemplation induced by mescaline lead to allusions to "Suchness," "the Dharma-Body," and "is-ness."

Friends and Society

THE QUAKER APPROACH TO CONTEMPORARY PROBLEMS.

Edited by John Kavanaugh.
Allen and Unwin. 254 pages. 15s.

IN the popular mind Quakers are known primarily for opposition to war and the taking of oaths, for marked business ability and for zeal in philanthropy. More than one writer in this interesting but uneven symposium gives as one reason for business success the fact that since Friends were till 1870 debarred from taking university degrees, and consequently from entering most of the learned professions, they turned their abilities, always diligently applied, to manufacture and commerce; the association of Quaker names with banking (Lloyd, Barclay, Tukey) to some extent brewing (Hanbury, Buxton, Crowley), chocolate manufacture (Fry, Cadbury, Rowntree) and biscuit manufacture (Huntley and Palmer, Gray Dunn) is familiar.

On the whole it is more likely that success in business was due primarily to the strict integrity practised in commercial transactions. Friends were certainly not debarred from the law (witness Sir Edward Fry) or from medicine—Lister qualified well before 1870, and Fothergill and Lettsom were among well-known Quaker physicians. Moreover, in one of the best contributions to this volume Professor Kathleen Lonsdale observes that the Society of Friends has abounded in botanists, geologists and astronomers, and that an acute contemporary problem, the legitimacy

for Quakers of the pursuit of atomic research, gains significance from the fact that a Quaker scientist (John Dalton, 1766-1844) "may fairly be regarded as the father of modern theories of atomic structure and chemical combination."

The fifteen contributors to this discussion are all of them Friends and most of them Americans. The symposium is not entirely successful. Most of the chapters are too short to cover the ground adequately, and some, notably on economic life, are disappointingly discursive and inconclusive. That on business and industry, by Robert Yarnall, though still briefer, is more to the point, although in the end it gets little further than urging the necessity for close human co-operation between employer and worker, and for the conscientious examination by every individual of the possibility of remaining in the world without conforming to prevalent standards which may be very different from those of Quakerism. An English writer on this subject might have said more of the record of twentieth century Quaker employers in this respect, and of the careful thought given by most of them to the right disposition of their wealth.

William Penn, the best-known Quaker after the founder of the Society of Friends, George Fox, is quoted by Robert Yarnall as writing: "True godliness does not turn men out of the world, but enables them to live better in it." That is generally accepted by the writers who here discuss Quaker principles in relation to the problems of today—education, race relations, crime and punishment and the rest. They have a good deal to say worth considering by readers who are not Quakers and never will be.

What is Income?

THE MEANING OF INCOME IN THE LAW OF INCOME TAX.

By F. E. LaBrie.
University of Toronto Press. (London: Geoffrey Cumberlege.) 380 pages. 97s. 6d.

"INCOME TAX, if I may be pardoned for saying so, is a tax on income. It is not meant to be anything else." So said a learned judge half a century ago. But what is "income"? The British Income Tax Acts nowhere define it. Sources of income are enunciated and the methods of computing "profits and gains" from them are prescribed. But the Acts are silent about the nature of income, whether the receipt pertains to "revenue" or "capital." Taxation statutes of Commonwealth countries similarly have not delimited the expression "income"; both here and abroad its legal import has to be deduced from the decisions of the courts.

Under the British Income Tax code, unless an "incoming" can be assigned to one of the sources set out in the five famous Schedules it is not "income" for taxation purposes. This explains why the profit from the sale of a capital asset is not income unless it arises in the course of trading or dealing in property.

The American concept of income differs strikingly from this, for the Supreme Court in one of its earliest decisions held that "income" embraced the profit made on a capital transaction even if it were an isolated one.

In Canada, "income" is statutorily, and most unhelpfully, defined as "income derived from all sources" including income from business, property and employments. The Canadian courts have made no independent attempt to develop a concept of income, but have generally followed British decisions. In this book, Professor LaBrie draws on the tax cases of the two countries to deduce two cardinal principles. First, "income includes only amounts arising or resulting from the pursuit of gain"; this principle, he says, determines whether the "incoming" is of the nature of income and accounts for the exclusion of "capital gains" from the meaning of income. Secondly, "income means net income, or 'incomings' less certain 'outgoings' to be determined according to ordinary commercial principles"—subject, naturally, to any statutory exceptions.

Dr LaBrie is very critical of the British judge-made rule that an expense cannot be deducted in computing business profits unless "it was made for the purpose of earning the profits"; the Tucker Committee on the Taxation of Trading Profits recommended the abrogation of this test. In Canada the courts are even stricter, for there an expense cannot be deducted unless it was incurred "in the income-earning process from which the income was derived."

From the economic point of view, the income of a company and of the shareholders arises from the same source. Dr LaBrie observes that, in English law, double taxation of company income, in this economic sense, is avoided through the system of taxation at source; both in Canada and in the United States, multiple taxation of income derived from companies is the rule rather than the exception. On this contrast—and on many other aspects of comparative taxation, Dr LaBrie has stimulating and provocative views to offer.

Shorter Notices

A FIELD GUIDE TO THE BIRDS OF BRITAIN AND EUROPE.

By Roger Peterson, Guy Mountfort and P. A. D. Hollom.
Collins 318 pages. 25s.

This small book, which would fit into a large pocket, aims to give a precise field identification of every species of bird occurring in Europe. It combines extraordinary comprehensiveness with simplicity and it is truly international. The illustrations are clear and bright. The birds are arranged according to the latest method of scientific classification of species, which may be more correct, but makes identification for the not-so-expert more difficult than in "The Pocket Guide to British Birds," by R. Fitter, in the same series. This places similar-looking birds on the same page, together with a silhouette of a sparrow, to show size. Nevertheless, with a pair of field glasses and a ticket to the continent, the new guide is well worth its twenty-five shillings.

A joy to own— a dream to drive

With its long, low lines and elegant new styling, the Riley 1½ litre Saloon proclaims its good breeding and your own good taste wherever it goes. Its special appeal is to the discriminating motorist who expects 'all round' excellence in a car. The Riley has one of the most successful engines ever designed, matched by incomparable steering, superb road-holding, suspension and braking. See and test the Riley 1½ litre for yourself. For the sheer pleasure of driving there's nothing quite like a Riley—it's a car of rare character.

Yes indeed! Riley for Magnificent Motoring

Ask your Riley dealer for full information about the brilliant new Riley 'Pathfinder'.

Riley models are fitted with safety glass all round.

ZEITSCHRIFT für das gesamte KREDITWESEN

(THE JOURNAL OF FINANCE AND CREDITS)

Editors: Erich Achterberg and Volkmar Muthesius

Board of Associate Editors:

Walter Hofmann, Frankfurt Bank, Chairman, Frankfurt on Main
Fritz Burschka, President of the Association of Saving Banks and Central
Giro Institutions, Düsseldorf
Eduard Christ, Westdeutsche Bodenkreditanstalt, Cologne
Kurt Forberg, Partner in C. G. Trinkaus, Düsseldorf

Johann Lang, Manager of the Association of German Cooperatives, Bonn
Clemens Plasmann, Rheinisch-Westfälische Bank, Düsseldorf
Günther Schmolders, Professor of Economics at the University of Cologne
Kurt Tornier, Bayerische Hypotheken- und Wechsel-Bank, Munich
Erich Trost, Manager of the Association of Berlin Banks and Bankers, Berlin

The "Zeitschrift für das gesamte Kreditwesen" is the leading financial and economic journal in Western Germany having international significance and circulation.

It reaches all important banks, associations, public authorities, importers, exporters and business enterprises in all countries of the world, keeping them informed of trends and current facts in regard to money, banking and stock exchanges in Western Germany.

Published twice monthly in German.

Annual subscription DM 52.60, plus postage.

VERLAG FRITZ KNAPP (Publishers) FRANKFURT on MAIN GERMANY

THIS ANNOUNCEMENT SHOULD NEVER HAVE TO BE PUBLISHED!

If the dilemma of British farming had been considered seriously, such a plea as we are about to make would have been unnecessary!

Here we all are, in an overcrowded island of some fifty million people. After two world wars, we depend increasingly on home production for our food supplies. The era of cheap imported food has gone forever.

During the vital war years, our farmers got the support they so rightly deserved and they responded in full measure to the call for extra food. Now, when the need is just as great, we ignore their reasoned arguments for easier credit facilities. Is this a sensible attitude?

We must have more food from more acres. Farm wages have risen, so farmers must offset these rising costs with more mechanisation and the replacement of antiquated machinery. More money must be found—yet loans to farmers are still subject to the high rate of 5% interest! Taxation adds yet another burden, preventing the accumulation of capital to plough back into the farms.

This absurd situation must be altered. Loan interest rates must be lowered. Some form of tax relief must be granted. Capital must be readily available for agricultural expansion—not to line the farmer's pocket, but to produce the nation's basic essential—food!

The land is our finest investment. Let us not forget it!

GROW MORE FOOD IN BRITAIN

Issued in the interests of British agriculture by
Massey-Harris-Ferguson, Coventry.

Ferguson tractors are manufactured for Massey-Harris-Ferguson (Sales) Ltd., Coventry, by The Standard Motor Company Ltd.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Rallying Republicans

Washington, D.C.

WITH only nine more months to go before the next congressional election the Republican National Committee can be pardoned for seeing in last week's annual celebration of Lincoln's birthday an opportunity for demonstrating that President Eisenhower and the Republican leaders in Congress belong to the same political party. Unfortunately the net effect of the committee's efforts has been to revive acute party warfare at a moment most embarrassing for the President, and to provoke Mr Eisenhower into a thinly veiled rebuke of his leading supporters.

What adds peculiar point to the election in November is that, although there is a Republican President in office for the first time in over twenty years, the Republican party must avoid the slightest decline in its local voting strength if it is to retain a majority in the House of Representatives, and win one in the Senate. There the Republican position as majority party is purely fictional—the Democrats have one more vote—while in the House the Republicans at present hold only 219 seats, as against 215 held by the Democrats and one by an independent who inclines towards the Democratic camp. If they are to be in a stronger position in the next Congress, the Republicans will have to defy all the historical precedents which, except for that of 1934, are against the party in power gaining in a mid-term election (in which the presidency is not being contested).

The Republicans' main asset is the personality of the President and the remarkable fact that, after a year of not very impressive achievement, he seems to have retained most, if not all, of his original popularity. The tantalising problem that faces Mr Leonard Hall, the chairman of the Republican National Committee, and Mr Murphy, the chairman of the Citizens for Eisenhower movement, which sets out to rally fellow travellers for the Republican party, is how to translate Mr Eisenhower's prestige into votes for local Republican candidates.

It is at least obvious that, if President Eisenhower's supporters are to be asked to rally round the Republican party, then some effort must be made to show that the Republican party is rallying round President Eisenhower. This explains the warming affirmations of loyalty at the box supper given on Washington's largest ice rink by the National Committee in honour of President Lincoln and his heirs. "Let me make one thing clear," Senator Bricker shouted on this occasion, "there is not now, nor will there be, any split in the Republican party," and the President responded in his best impromptu manner with the Lincolnian appeal: "Let us lift our chins and our

heads, square our shoulders and walk right square into it."

This love feast was certainly not superfluous, for the political headlines since Congress returned to Capitol Hill last month have been filled with the obscure manoeuvrings over Senator Bricker's constitutional amendment, which is unacceptable to the President, and flat statements by Republican leaders that the President's farm programme and the recommendations of his Commission on Foreign Economic Policy, to both of which he attaches great importance, were dead before they were born. Mr Eisenhower may still be a hero to his country, but in an evenly-divided Congress he has the unqualified support of only a minority group in one party. The President, with the nation behind him, has still to convert the Republican party to his own brand of conservative liberalism; in spite of all the talk of a crusade, this can only be done by speaking the language of expediency to many who are pure conservatives out of deepest conviction.

★

President Eisenhower believes that it is his programme which will win votes for the Republican party from outsiders in November; in putting it through Congress he and his advisers in the White House have already shown a considerable access of political skill in this session. The regularly wrecked project for American participation in the construction of the St Lawrence Seaway has passed the Senate, while the Bricker amendment is on the rocks. As the campaigning season approaches the President's schemes for better health and housing and the extension of the benefits and coverage of social insurance will look more and more like things that it is unwise to vote against. Even the programme for lower and more flexible farm price supports does not seem in quite such a sorry pass as once it was.

Mr Eisenhower has freely conceded that, if he is to achieve anything positive, he must be supported by Democratic votes in Congress. But during Lincoln's week the Republican party, in the course of applying to its own ranks Lincoln's injunction to speak and act "with malice toward none, with charity for all," went a fair way towards making that support impossible. There is no more cheering demonstration of party unity than a blow aimed at the enemy, and the Democrats, who have hitherto been somewhat left outside the political struggle, have now been brought violently back into the centre. Two major accusations have been hurled at them—that they are trying for party advantage to talk the country into an economic recession and that they are all guilty of treason by association.

It is undeniable that two of the most responsible Democratic leaders in the Senate, Mr Douglas and Mr Fulbright, have been using the hearings of the Joint Congressional Committee on the Economic Report to advance the thesis that if a serious recession is to be avoided something more must be done to increase the purchasing power of consumers. Mr Douglas has also challenged, with some success, the validity of the official figures for unemployment. These and similar arguments have provoked Mr Sherman Adams, the President's chief assistant, into a denunciation of the "political sadists" who were trying to launch a "Fear Deal."

Although Mr Adams's speech has been so deeply resented by the Democratic leadership in Congress that Mr Eisenhower has had to promise to restrain the language of his official family, the greatest offence has been caused by the campaign that is epitomised in the title of the series of lectures Senator McCarthy is at present giving throughout the country—"Twenty years of Treason." The President's remark at his press conference that the times were too serious to indulge in extreme partisanship throws a strange light on the specific endorsement of Mr McCarthy's tour by Mr Leonard Hall of the National Committee.

Mr Hall's basic difficulty is to make up his mind whether the Democrats and independents who voted for Mr Eisenhower in 1952 did so mainly because they wanted as President a war hero who would be above party, or because they wanted to protest against administrative slackness and alleged corruption within the Democratic Administration. If the first, the more the President is kept above party the better; if the second, the more attention that can be called to the "mess" the Republicans found when they came in the better. As is the way with political managers Mr Hall is evidently hoping to benefit by following both policies at the same time.

It might be just possible to do this balancing trick successfully if Republican orators could be restrained from slipping from accusations of administrative laxity into implications of treason; after all, many Democrats had a low opinion of their party's administrative capacity. But if Mr Eisenhower is not to see his programme wrecked by obstruction from the Democrats in Congress, Mr Hall will soon have to ask himself whether spokesmen such as Mr McCarthy, with his statement that "the label Democrat is stitched with the idiocy of a Truman, rotted by the deceit of an Acheson, corrupted by the Red slime of a White," do not constitute security risks whose careless talk might be easily confused with disloyalty to the man who is not only President of the United States but the titular head of the Republican party.

Chemical Protection

New York.

THE American chemical industry describes itself as "dynamic and competitive" and statistics support the description. Sales of organic chemicals were multiplied by ten between 1939 and 1952, while the real value of the gross national product merely doubled, and the industry's rates of profit are high. Imports have increased but there is no sign that they are causing unemployment and the United States has an important export trade in chemicals, particularly in medicinals. Although less than seven per

cent of the output of the chemical industry as a whole exported, some individual products are heavily dependent on foreign markets. The United States exports, for example, nearly one half of its production of DDT and over one fifth of its penicillin. Such an industry might be expected to be in the forefront of the movement for freer trade, but in fact it is leading the fight for more effective tariff protection.

This apparent paradox can be resolved only by examining

ing the chemical industry's structure and history. Chemicals are normally divided into two groups—organic and inorganic. The organic chemicals are compounds which, like plant and animal matter, contain the prevalent carbon atom. Almost all are derived from coal or petroleum, or from fermentation of agricultural products. Compounds that do not contain carbon, and are largely obtained from minerals and atmospheric gases, constitute the inorganic chemicals. The most important of these, such as sulphuric acid, soda ash, chlorine, and caustic soda, are also classed as heavy chemicals; they are produced in large quantities, and sold in bulk relatively cheaply.

Because of their low value in relation to their weight and cost of transport these inorganics have little difficulty in meeting import competition. The organics, on the other hand, include the whole range of fine chemicals—the more intricate compounds, made to grade and specification, in small volume at high unit prices. Dyes, resins, organic acids, solvents, plasticisers and medicinal chemicals—all are particularly vulnerable to competition from abroad, and it is therefore in this part of the industry that the most powerful protectionists are to be found.

The opposition to freer trade stems also from the circumstances in which the industry began. At the outbreak of the

first world war the United States discovered that it was almost completely dependent on Germany for its essential requirements of coal-tar intermediates, dyes, medicinals and other synthetic chemicals. Moreover, while dyestuffs are not direct war chemicals, the same plant, equipment, organisation and trained personnel is needed if TNT and other explosives are to be produced. The demands for self-sufficiency that resulted from this experience led to the rapid establishment, behind a high protective tariff, of a domestic synthetic organic chemical industry which freed the United States from its dependence on imports. Despite the increase in size and efficiency during the inter-war years, the protective tariffs were retained, partly in order to counteract the attempts of the German chemical trust to dump marginal production on the American market. The American industry is now concerned that the protection it has so long enjoyed should not be removed by reciprocal tariff concessions.

★

The industry maintains that the effects of the substantial cuts in the American chemical tariff negotiated at the Torquay conference in 1951 have yet to be tested in a buyers' market; that, although the volume of imports in relation to exports may be small, imports have recently been rising sharply; and that, because of the interdependent nature of the industry's operations, even a small volume of imports of key synthetic organic chemicals may result in a critical weakness in time of war. Moreover the American chemical industry does not think that reciprocal tariff reductions would do much to assist its export trade. There is, with few exceptions, no reciprocal market in Britain and Germany for American chemicals, which cannot be sold in Europe at competitive prices. Furthermore, the expansion of American chemical exports to underdeveloped countries, which form a major market for American medicinals and agricultural chemicals in particular, is limited not by protective tariffs but by increasing price competition from lower cost European chemicals.

Finally, the American chemical industry, disturbed by evidence of dumping by European producers in the American market, and by reports of attempts to reorganise "good" cartels in Germany to stimulate exports, is now prevented by the anti-trust laws from taking part in any international market-sharing agreements to protect its domestic sales. As long as European chemical exporters employ multiple pricing practices to earn dollars, the American industry can hardly be blamed for demanding, as it does, not only the stricter enforcement of anti-dumping duties, but also the assurance of higher tariffs whenever existing duties fail to give adequate protection.

The industry rests its case for protection, as does any national chemical industry, on its essential contribution to national security; on its applications to medicine; on its dynamic role, as one of the major sources of innovation, in maintaining the growth and flexibility of the economy; and on the services it renders by providing a pool of trained scientists, vital in wartime, and by encouraging scientific training and research in universities and throughout industry generally. All of these valuable contributions would be eliminated, in the view of the industry, were it not granted immunity from import competition. This follows from the premise that, if the existing protec-

tion were removed or even reduced, the industry would not be able to compete, by using more efficient production methods, with lower cost imported products.

The production of synthetic organic chemicals is essentially a batch process, in which the productivity of the American industry is admitted to be no higher than that of the European manufacturers who were the original inventors of the method. This, especially in the production of dyestuffs, may involve as many as a hundred separate, consecutive steps, and it may take months before the entire batch has been processed. The cost, once the initial research has been completed, depends mainly on the cost of labour; since the United States has, in this case, no advantage over Europe in physical productivity, lower wage rates in Europe also mean lower wage costs. The disparity, it is argued, is so great that no conceivable increase in the efficiency of American manufacturers could enable them to compete with imports. But in this context the industry glosses over the contention, of which it makes so much when seeking domestic tax concessions, that its most substantial cost is the expensive, lengthy and often unremunerative research that must be undertaken before a new product or a new process becomes a commercial proposition.

It may be doubted whether, if the tariff were in fact reduced, the major chemical companies would go meekly to the wall without the most strenuous attempts to convert their batch processes to the continuous processes which have so much lower labour costs. The growth of petrochemical production, which utilises to the full the advantages of continuous process equipment, is an indication of the progress already made. But, while petrochemicals can provide mass-produced intermediates to replace coal-tar intermediates, batch processes are still required to convert these intermediates into finished products. Another, and probably more general, reaction to the removal of tariff protection would be for American companies to set up subsidiaries in Europe, to take advantage of low labour costs there, and export their output to the United States.

American Notes

Exploiting the Atom

PRESIDENT EISENHOWER'S recommended amendments to the security provisions of the Atomic Energy Act of 1946 are linked not with his proposal for an international pool of atomic energy, which the Secretary of State has been discussing in Berlin, but with the fact that it is five years since the United States lost its monopoly of the atomic bomb. The legislation designed to protect that monopoly has no longer any point and it is preventing the United States from exploiting to the full the nuclear advantages which it still has—a great variety of atomic weapons and a near prospect of producing industrial power economically from atomic energy.

The President therefore wishes that the Act be extensively modified in order that more information on atomic matters may be given to the allies of the United States and

to private businessmen in the United States. He does not propose that this exchange of information should cover the actual manufacture of nuclear weapons, but only the tactical use of such weapons by other members of the North Atlantic Treaty Organisation. He himself was hampered when in charge of Nato's defence planning in Paris by his inability to give such information to military commanders from other countries. There is little doubt that, with the weight of his authoritative experience behind the request, Congress will be prepared to relax the restrictions in this respect. The President suggests that information about atomic weapons should be classified, from a security point of view, in the same way as information about other types of weapons.

With the weight of industry's desire to develop atomic reactors for peaceful and profitable purposes behind the request for permission for private firms to own fissionable materials, there is little doubt that Congress will allow this also. Such industrial participation in atomic development would not only save the taxpayers' money but would also hold out hope of reducing government activity in this business, which would be a welcome relief to Republican believers in free enterprise. But it is not so certain that Congress will be ready to permit friendly nations to have fissionable materials for industrial and research purposes, even though the President insists that the strictest security measures will be insisted upon. This presumably means that not all America's allies will be treated equally generously in this respect, or equally freely when information on atomic energy is made more widely available.

Reassurance for Senators

THE Senate spent the first part of this week seeking reassurance on two questions of foreign policy—one of permanent and one of immediate concern. On the long-term question, that of the treaty-making authority of the President and the constitutional separation of powers, reassurance has been found in approving amendments, acceptable to the President, to Senator Bricker's original amendment. So far the constitutional changes voted by the Senate are superfluous but innocuous; the most controversial amendments, dealing with executive agreements, have not, however, been finally debated at the time of writing. It seems probable that in the end not only the Bricker amendment but also the amendments to it will be smothered by compromise and that the Constitution will continue as before.

One of the ways in which the President's constitutional responsibility for foreign policy is in practice restricted by Congress was illustrated by the Senate's concern over the immediate situation in Indo-China. For in order to reassure Senators who feared that the presence of an extra 200 US Air Force technicians there might involve the United States directly in that war, the Administration was obliged to state categorically that it has no intention of sending American ground forces to Indo-China or of getting deeply committed there. Such a definite statement can only have the result of weakening the anti-Communist front, for it cancels out the psychological effect of the dispatch of the technicians, which might have been even more encouraging to the French and even more deterring to the Communists than the practical help that they will give.

Guinea-pig in the Dairy

THIS week Mr Benson, the Secretary of Agriculture, shocked dairy farmers, and delighted Democrats who need farm votes next November, by proving that his bite is as bad as his bark. He announced that, when the new marketing year begins on April 1st, the levels at which the prices of butter, cheese and dried milk are supported will be reduced by the full amount permitted by law, from 90 per cent to 75 per cent of the parity prices which are supposed to ensure the farmer a fair return for his labour. Such a high-principled man as Mr Benson could hardly have done anything else; for dairy products, especially butter, are providing a laboratory demonstration of the unworkableness of the present system of high and rigid farm price supports, against which Mr Benson has been inveighing to Congress, and these perishable commodities are among the few to which, under the present law, can be applied the lower and more flexible price supports which Mr Benson advocates for general use.

Furthermore, when a year ago he continued their price supports at 90 per cent of parity, Mr Benson warned dairy farmers that this would be for twelve months only, while they worked out a scheme by which supplies of dairy products could be satisfactorily related to demand without government interference. A stabilisation scheme, of which

more may be heard, was produced at the end of November, but it included doubtful proposals for government protection against domestic and foreign competition. During the year of grace the excess supply of dairy products grew to proportions that dwarfed last year's supposedly unmanageable surplus. Some \$370 million worth is now in government hands, representing 8 per cent of the year's output of milk; milk production has been increasing and butter has been coming into store at the rate of 1 million pounds a day.

Schoolchildren refuse to eat as much butter as the department would like to give them free and housewives, of course, long since turned to the margarine which sells at about 30 cents a pound retail compared with nearly 80 cents a pound that is asked for butter. It remains to be seen whether the fall of perhaps 10 cents a pound which should follow the reduction in support prices will encourage domestic retail sales and discourage farm output enough to justify the President in maintaining, as he did in his agricultural message to Congress, that the present law is satisfactory as regards dairy products.

But even then there will still be the problem of disposing of the 270 million pounds of rapidly deteriorating butter which the government owns. Mr Benson hopes to make an announcement about these and other dairy surpluses before long, but admits that it will be difficult to get rid of them. One idea is that the storage butter should be given to retail traders for little or nothing, mixed with butter bought directly from farmers and sold at an averaged price. There are various other suggestions for making cheap butter available at home, which might then mean that there would be less objection to selling it abroad at cut prices.

The proposal that butter belonging to the government might be pushed behind the Iron Curtain has been rejected, but it is still possible that export licences may be granted for farm products bought on the open market. Another scheme, for which butter may also be made a guinea-pig, is that work on American bases overseas, in Spain for example, might be paid for in surplus commodities. A longer-term plan for disposing of these commodities abroad, mainly in under-developed countries, without disturbing normal marketing patterns, is also being discussed by the Administration.

Unemployment Unconcealed

NO sooner had the Federal Reserve Board confessed that the decline in industrial production had been sharper than had been realised than the Department of Commerce announced that unemployment in early January had been worse than had appeared from the Bureau of the Census's official estimate of 2,358,000. The revised figure of just over 3 million is the result of a new method of computation which puts those out of work but not actually seeking jobs among the unemployed for the first time. The Census Bureau has always included people who are only temporarily laid off in the total of employed. This is one of the reasons why its figure for non-agricultural employment is higher and steadier than that of the Bureau of Labour Statistics, which bases its estimates on pay-rolls only; the Census Bureau also counts the self-employed, domestic workers and so on. The

BLS had already announced that, by its reckoning, the fall in non-agricultural employment between mid-December and mid-January had been unusually large and the deepest, for the season, since 1949. It estimated the drop at 2 million, while the Bureau of the Census had earlier put it at just under 900,000. Both bureaus, however, agreed that the average hours worked in factories fell markedly between December and January, which confirmed the existence of what trade unionists regard as part-time unemployment.

All these statistical revisions and second thoughts will reinforce the contention of Democrats and labour leaders that unemployment has been concealed and is more serious than has been officially admitted. But there is no doubt that the Administration is seriously concerned: at his press conference this week the President promised to take action if the usual seasonal improvement does not develop in March.

Comfort is, however, being taken from the recent falling-off in the numbers seeking unemployment pay for the first time. The close watch that the Administration is keeping on the situation, and its readiness to give help as soon as it is needed, have already been demonstrated by its speed in certifying as areas of substantial unemployment both Detroit, Michigan, and Toledo, Ohio, places especially close to the heart of Mr Reuther, the head of the Congress of Industrial Organisations, who is also head of the automobile workers' union.

This brings to 22 the number of areas where over 6 per cent of the labour force is unemployed and which are therefore entitled to preference, for what it is worth, in the granting of government contracts. The difficulties of Detroit and Toledo come from a simultaneous decline in both defence contracts and automobile sales. It may be that the labour force in the motor industry has been over-expanded and that alternative jobs will have to be found for some of these workers. This is a problem which has long faced the New England textile towns, where most of the other areas of officially recognised labour surplus are to be found.

Lorry-loads of Trouble

MOST state governments undoubtedly sympathise with Ohio's desire to make heavy motor carriers pay their fair share of keeping up the roads their loads do so much to destroy. But when Ohio imposed a new axle-mile tax on all lorries last month, and refused to exempt lorries from states with which it had reciprocal agreements, the back-fire was tremendous. Reciprocity is the basis of all interstate passenger and commercial road traffic; without such pacts, a car or lorry would have to be licensed anew every time it crossed into another state.

Ohio, however, lies across the stream of transcontinental traffic, and if it exempted out-of-state vehicles, which make up over half of those which use its roads, the revenue from the new tax would be nothing like the \$19.6 million a year which it is hoped to devote to Ohio's road system. Four states have authorised retaliatory taxes and these are already being collected in two. Kentucky, for example, now requires a \$300 licence fee for each lorry registered in neighbouring Ohio which crosses its boundaries. Fourteen other states are preparing to break off their reciprocal arrangements with Ohio. If they do so, Ohio's carriers will have a choice of moving out or going bankrupt.

Ohio's troubles are not all out-of-state. There is the threat of a strike by owner-drivers in the state who lease their lorries to large firms and are determined not to pay the tax themselves, as the law requires. It does not seem possible that Governor Lausche can hold out against the risks of isolation and the breakdown of the smooth flowing road transport which carries so many products of America's farms and factories. Motor carriers fear, however, that Ohio's experiment will merely encourage the hard-pressed state governments to collaborate on means of exacting more tolls from those who use their roads.

SHORTER NOTES

The contradictions in the Interior Department's awards of contracts for power generating equipment to foreign firms has been illustrated again. After turning down the bid of an Austrian firm for the contract for a transformer at the Bonneville dam in favour of a much higher bid from an American firm, the department then awarded the Austrian company the contract for transformers of another type for a hydro-electric project in the Missouri basin. It is understood that the State Department was concerned at the effect the rejection of these foreign bids would have on opinion abroad.

The Supreme Court has decided that after all it must rule on whether the prices at which natural gas is sold by producers to the pipeline distributors is subject to federal regulation. The Federal Power Commission is relieved at the decision, for the ruling of a lower court, requiring it to regulate these prices, gave it a responsibility that it was reluctant to assume, and set many complicated legal problems for the natural gas industry itself.

The main qualification of Mr Robert E. Lee for the membership of the Federal Communications Commission, in which he has now been confirmed, rather unenthusiastically, by the Senate, seems to be his friendship with Senator McCarthy. An accountant by profession, his only experience of wireless, for which the FCC is responsible, has been as moderator of "Facts Forum," an extremely right-wing programme that is financed by a Texas oil millionaire who is also a friend of Mr McCarthy.

Congress has passed a Bill creating thirty additional federal judgeships. The new appointments are much needed in themselves, but they will also offer Republicans much-needed opportunities of rewarding their friends.

A special census, for which the federal government had to be paid, has given Los Angeles the satisfaction of being able to claim that it is the third largest city in the United States, with a population of 2,104,663. Philadelphians may now ask for a special count too, for in 1950 their city, with 2,071,605 residents, had pride of place after New York and Chicago; it is arguable that natural population increases since then have kept Philadelphia ahead of Los Angeles.

The Office of Defence Mobilisation has set a goal of 37,500 tons a year for expansion of titanium smelting capacity, to be reached by 1956 with the help of special amortisation allowances for tax purposes. Present titanium smelting capacity is 7,680 tons a year, and the goal for titanium sponge, to be processed in these smelters, is at present 25,000 tons a year.

Spacious...Powerful...Economical

How brilliantly these two Vauxhalls meet the needs of motorists today. Velox and Wyvern alike are roomy, powerful, easily manoeuvrable cars, a pleasure to drive and completely comfortable for five or even six passengers to ride in.

They are handsome and beautifully finished, yet at the same time surprisingly economical both in first cost and in petrol consumption. Higher compression "square" engines boost power, run longer without overhaul, and reduce

petrol consumption. Expert and inexpensive maintenance is assured by Vauxhall Square Deal Service, operated by dealers in every part of the country with factory trained mechanics, low-cost, genuine parts and standard repair times.

For the owner who wants every penny of motoring value, these roomy, powerful, economical Vauxhalls are unequalled on the road today. Your Vauxhall dealer will be happy to arrange a demonstration run for you.

That's Vauxhall Value!

THE 6-CYLINDER VELOX

Maximum speed of 80 m.p.h. 28.68 m.p.g. at an average speed of 40-89 m.p.h.* Spacious 5/6 seater. Length 14 ft. 4 ins., turning circle only 38 ft. Price £535 plus £224. Os. 10d. P.T.

THE 4-CYLINDER WYVERN

Same size body and the same modern styling as the Velox. Maximum speed of 70 m.p.h. 33.46 m.p.g. at an average speed of 30-51 m.p.h.* Price £495 plus £207. 7s. 6d. P.T.

The World Overseas

Cocoa Coast

FROM OUR SPECIAL CORRESPONDENT

THE Budget Session of the Gold Coast Assembly, which has opened recently in Accra, is one of more than ordinary interest. It is the last to be addressed by a British Minister of Finance. After June, the new constitutional developments call for an African Minister to take his place. At the same time it is the last session of Dr Nkrumah's three years of apprenticeship. On the showing of the last three years, the prospects of future African control must be judged. It is true that the African Ministers have enjoyed the guidance of the Governor and the constant assistance of three British Ministers and of senior British officials. Yet the decisions have been in the main African decisions. No policy could have been forced on the African Ministers if they had been unwilling to pursue it. The record of the last three years is therefore the best available index of what lies ahead.

The economy which the African cabinet will direct is in most ways typical of the world's under-developed tropical belt. On the one hand, it is still a highly inelastic economy. Increasing purchasing power does not lead readily to increased production in either agriculture or industry. In fact, in agriculture increased earnings can even decrease production. On the other hand, it is in the main a single crop economy. The value of exports between January and November last year was £79.7 million. Of this, cocoa provided nearly £50 million. Manganese exports at some £8 million and gold at £8.5 million are important commodities. Timber is rising—to over £5 million—and although returns from diamonds have fallen, they still bring in over £3 million. But cocoa is the decisive crop. Its influence can also be measured in the revenue figures. In the 1954-55 estimates, cocoa duties account for over £15 million in a total tax revenue of £35.5 million. All import duties put together only amount to just under £12 million, income tax (in the main company taxation) to £5.4 million.

The most startling index of cocoa's supremacy, however, lies in the Gold Coast's capital reserves. The total sterling balances of the Gold Coast on September 30, 1953, amounted to £158.5 million. Of these, the currency reserve is held at £33.29 million and government investment and short term funds cover £41 million. But the Cocoa Marketing Board has accumulated, in investments and short term funds, the sum of £70.6 million.

The combination of an inelastic economy and dependence upon a single crop has brought difficulties and disasters to many economies in recent years. The price of cocoa has

been, like other primary commodities, far above prewar levels. The following table shows how far.

FLUCTUATIONS IN COCOA PRICES PER TON
(Calendar years)

	£		£
1930-9	24	1949	129
1940-5	25	1950*	204
1946	50	1951	263
1947	136	1952	248
1948	197	1953	229

*Post-Korean price.

The immature Gold Coast economy has therefore been faced with all the risks run by similar one crop countries. If it permits the whole, or a large part, of the enhanced purchasing power to flood into a community whose local supplies of food and materials cannot be rapidly expanded, the only result is drastic price inflation. In his speech opening the Budget Session, the Minister of Finance quoted examples from Ceylon, Cuba, and Malaya of the inflation that has followed increased prices of their main exports. Nor is it a hazard to which only backward economies are exposed. It recently occurred in Australia.

It can be argued that inflation may be checked provided massive supplies of consumer goods are imported to mop up local demand. This policy, however, has the effect of establishing standards of living and consumption far above the country's capacity to maintain in any but abnormal years, and, moreover, encourages a tendency which is already the greatest obstacle to long-term economic advance in backward areas—their propensity to consume on a western scale before they have learnt western habits of work and production.

Above all, neither a policy of letting the purchasing power flood in nor of using imports to boost local standards of consumption is any guarantee against extreme and continuing instability in the economy as a whole. The community follows the trend of world prices up and down and, in the words of the President of Cuba, quoted in the Finance Minister's opening speech, the economy "goes from abundance to sadness, from joy to misery" with the changing pattern of world demand.

The correct policy for under-developed areas in times of prosperity has been outlined in report after report issued by every authority interested in world development. The government must appropriate as large a share as possible of the purchase price for its main commodity and set it to

reserve for capital development and for contingencies such as subsequent falls in price. The local price should be no more than is needed to stimulate efficient production. The "unearned increment" above that figure, which represents not the farmer's efficiency or productivity, but the hazards of world demand, should be earmarked for the community. The golden years of high prices should be harvested not for current consumption but for the future.

There is equally no secret about the reason for the failure of virtually all governments to follow this precept. High consumption and high local purchasing power are politically very attractive. The voter would rather spend his money freely at once even if the consequence is that this money will lose half its value a year hence. Inflation, high consumption, low reserves—this is the almost universal pattern of recent years. The significant feature in the Gold Coast is that a new, untried and largely African government has had the foresight and the courage to follow the opposite path, and to base its entire cocoa policy upon the stability of local prices and local consumption and the building up of capital reserves for development. While the local price of cocoa has been held between £140 and £160 a ton, the balance over and above this figure has been retained by the government either in the shape of the cocoa duties or else in additions to the reserves held by the Cocoa Marketing Board.

Testing Time Ahead

The Gold Coast is a community of only 4½ million inhabitants. To be able to spend, in four years, about £70 million on development, all drawn from the country's own earnings, is an unparalleled achievement and one which would have been impossible if the Prime Minister and his colleagues had not continued to resist steady local pressure for higher cocoa prices for the farmer and greater spending power and import programmes for the public at large. The decision to maintain the same restraints on the internal price of cocoa and to place the same large sums to reserve for development will require quite especial courage in 1954. The forward price of cocoa has risen to an astronomical figure—over £400 a ton—and a general election is to take place in June. The temptation to bribe the voters with a short-term advantage and let the ultimate risk of price inflation run its course is only too obvious.

The achievements of the government in the past three years do not, however, give any grounds for complacency. Challenges as testing to the Gold Coast leaders' good sense and initiative lie ahead. Cocoa so far has not followed other commodities in a downward trend. Some of the Gold Coast's prosperity this year is due to a ten per cent fall in its import prices and the maintenance of high demands for cocoa. Yet a glance at the table of cocoa prices shows clearly that future fluctuations cannot be ruled out. Moreover, in spite of genuine courage in enforcing the cutting out of cocoa trees infected with swollen shoot, the government has not yet found means of increasing the standards and the productivity of the cocoa farmer. If quality is not improved and production maintained, other world producers of cocoa may ultimately take the Gold Coast's place.

This issue of raising local productivity is crucial over the whole field of the economy. At present in a budget expenditure estimated at £40 million, fixed charges for administration and for ambitious schemes for health, education and other social services, absorb about £25 million. This is recurrent expenditure which will tend to rise as the

economy develops. The annual expenditure on basic development runs at just under £15 million, and is virtually equivalent to the revenue earned from cocoa duties. In other words, all sources of revenue, save cocoa, which is a fluctuating factor, are absorbed by fixed charges. There is a risk of dangerous rigidity in this relationship, and it is the chief reason why, in the new development plan which is due to begin in 1956, and is already under consideration, the chief emphasis must be put on forms of development which directly increase revenue.

Diversity Through Industry

One of the main reasons for local interest in the Volta River project is the belief that to develop a strong aluminium industry for export will diversify the economy and greatly increase the range of its wealth-producing activities. Yet it is in these fields—in expanding export industries and local industrialisation, in domestic food production, and in the expansion of transport, electricity and ancillary services—that some of the main weaknesses of an immature economy are likely to be encountered. Public utilities and services are, perhaps, not too great a problem provided the local cost of labour can be held steady, and outside contractors show reasonable standards of efficiency; but in agriculture, the government is at the mercy of the local farmer and of his efficiency and willingness to learn. In industrial expansion, the government's programmes are handicapped by the dearth of local managerial experience, and by a still widespread and surviving doctrinaire suspicion of foreign business investment and enterprise.

Today it can be said that by its courage and foresight the Gold Coast government has created the pre-condition of expansion. It has saved capital and reserved it for investment. Now the challenge is to find the actual working instruments of development. These lie in creating a new pattern of work and efficiency in the domestic community. They lie in high and honest standards of administration and the retention of British officials during the transitional period. They lie in working out terms of reasonable partnership with foreign enterprise.

OEEC Takes Stock

PROGRESS reports of the Organisation for European Economic Co-operation are not written by prophets or by economic dictators who can impose their own policies. They are the work of economists or civil servants from various countries who by reason of their "international" standing are able to take a somewhat detached, global view of things. As such their annual diagnoses and recommendations, made on the basis of member countries' detailed reports, are always interesting.

In the fifth OEEC report* now published, the whole argument of the introductory chapter springs from the conclusion that the West European economy has clearly emerged from the inflationary phase. Since the beginning of 1952 prices have tended to move down rather than up. Western Europe's balance of payments has improved considerably and the gold and dollar reserves of member countries rose to \$10 billion by last September. Against

*Progress and Problems of the European Economy. Fifth Annual Report of the OEEC. (Including reports on individual member countries.)

this must be set the continued stagnation of industrial production. If by mid-1953 combined industrial production was slightly higher than in the corresponding period of 1931 this was almost exclusively the result of West German expansion. Hence the chief immediate objective emphasised in the report is to spur the economies of other countries to higher rates of production.

Previous headaches have not been forgotten. Expansion, it is stressed, should not endanger internal financial stability and the dollar problem, which is a structural one, is far from being solved. No lasting progress, however, can be made towards balancing Europe's accounts unless its industrial capacity is stepped up and modernised. True, in 1952 and in the first half of last year Western Europe's balance of payments showed a slight surplus not only with the whole world, but with the United States as well, and in the first six months of 1953 it had no deficit with the dollar area as a whole. But the improvement, camouflaging the structural dollar gap, is largely due to temporary seasonal factors. The terms of trade moved in Europe's favour. A bumper crop has made it possible to cut food imports. Industrial stagnation itself has proved of some "help"; for with industry expanding at a slower rate than in the

United States, there has been a fall in imports from, and a rise in exports to, America. To cap it all there was the growing American military expenditure in Europe.

It is estimated that without a conscious policy to change the present pattern of development the current trends should continue in the near future. The American net military expenditure abroad is expected to rise from about \$2.5 billion in 1953 to \$2.1 billion in the first six months alone of the current year. Since no great changes are foreseen in either internal or external demand Western Europe would probably continue to build up its reserves while industrial production would go on stagnating. Yet it is clearly impossible to build a healthy economic structure on the prop of permanent American military aid. Some of the extraordinary American expenditure is scheduled to be cut in two or three years' time and Western Europe may wake up one day faced with a dangerous new crisis.

The disequilibrium is deep rooted and the real dollar gap cannot be closed overnight, but the only way to do so is through the development of European productivity and efficiency, through preparation for competitive conditions and the building up of alternative sources of supply. For this purpose it is necessary to expand European production,

to stimulate investment and direct it into productive channels. This is likely to result in a temporary worsening of the balance of payments and a fall in reserves, but the risk is small and it is worth taking. Concerted action by the member countries should in fact limit the risk. Few would advocate a "Malthusian" solution and quarrel with the report's advice that the primary need now is to encourage and direct investment, though more could have been said about the difficulties of that task.

There is some duality in the report's treatment of outside threats to European development, or rather a change of emphasis: at first a warning is issued about the dangers of American instability and then in the following pages this is played down. The report stresses the "multiplier" effects on European trade of a fall in American production, recalls the experience of 1949 and 1938 and concludes that "grave repercussions could result from even a minor fluctuation in the United States." But even among those who are confident about Washington's ability to cope with a dangerous situation, few would dismiss the risk of small fluctuations. It would therefore have been worth while to devote more space to an analysis of measures to be taken in such an event. True, concerted encouragement of home demand and expansion would then become even more imperative. But even if the idea of a storm is dismissed more thought could have been given to ways of calming dangerous waves.

Fears for the French Army

FROM A CORRESPONDENT IN PARIS

THE Berlin conference has provided fresh arguments both for opponents and supporters of the European Army. Opponents find a new weapon in M. Bidault's speeches setting out the Western view that a reunified Germany should be free to leave the EDC. Supporters reply that Mr Molotov's renewed intransigence makes Four-Power agreement over Germany's unification as unlikely and remote as ever. Still, the danger of seeing the rearmament of Western Germany withdrawing from the European Army and becoming the nucleus of a new independent *Wehrmacht* adds fresh point to one of the big objections against the Paris treaty in France; that it would destroy the French national army without really preventing the rebirth of a German one.

Even when it is not specifically put forward, this objection is inspiring most right-wing hostility towards the Paris treaty. The Army is so closely linked with France's glorious past, and so many hopes were focused on it after the national collapse, that it seems a crime to throw it into such a hotch-potch as the European Army appears to those with only a superficial knowledge of the treaty's complex articles. Frenchmen may well jest about their Colonel Blimps as much as, or more than, any other nation, but they cannot remove the stamp imprinted on each of them by military service either in peace or in war. There is a much longer tradition of compulsory military service in France than in Britain or the United States. Most inveterate French tax-evaders would be ashamed to evade military service, at least in time of war. Would this feeling remain as strong if the French national army disappeared?

For many the army is not only one of the pillars of the French State; it is the French nation itself, the "Nation in Arms"—a symbol of French unity. True, its prestige was at stake in the great controversy during the Dreyfuss case, but the first World War showed that this had not destroyed France's devotion to its army. The question now is whether France's present reconstruction can be fully achieved and France's self-confidence restored without a national army, complete with its own traditions, flag, uniforms, military schools, or without its men and officers speaking their own national language and undergoing the same specific training methods.

First of all, what will change in the status of the individual French soldier or officer when he is incorporated into the European army? A recruit will see no difference at the beginning, when he rejoins his regiment in Metz, Nancy, Strasbourg or any other garrison-town. He will be a French soldier among other Frenchmen in a French regiment. All national traditions can easily be preserved, as not only each regiment but each division (or *groupe ment national*) will escape integration, which will begin only at the army corps level. Thus, in manoeuvres or in time of war, he will fight side by side with his compatriots. There should be no language difficulty so long as he is only in touch with his own division's men or officers. Even his division's staff officers will receive their orders in French, since the language used in orders will be that of the recipient. His general's reports will be given in French too; if necessary they will be translated by the army corps' integrated staff. *Espirit de corps* will be maintained within the division as well as within the regiment.

The question of uniforms is important from a sentimental point of view. A French *chasseur à pied* or *chasseur alpin* is as proud of his dark-blue uniform as a Highlander of his kilt. But much has already been changed since the last war. The battle-dress will be the same in all the units of the European army, though parade uniforms may differ at first as no precise time-limits have been fixed for standardising them. And even when this stage has been reached, nothing will prevent national divisions from wearing a national badge on their European uniform. It should also be possible to introduce special badges for the *chasseurs* and *tirailleurs*, and even regimental badges.

The Real Cause of Fear

Training methods and regulations will not be changed in regiments or divisions any more than they were for those included in Nato forces. NCOs' and officers' schools, such as *Saint Cyr* and *Saint Maixent*, will remain national. Only two things will gradually change. First, there will be a tendency to harmonise their curriculums. Secondly, at the end of each yearly period, French cadets will meet some of their Italian, German, Belgian and Dutch colleagues in European training camps, where mutual understanding can be developed. The specialised schools for artillery, cavalry or engineering officers will also gradually be made inter-European. The staff officers' schools will be internationalised from the beginning.

It thus appears that the French or other units of the European Army will not actually be denationalised as some of the opponents of EDC pretend. There is, of course, a special problem for France. Because of its special responsibilities overseas, it will keep not only a national navy, but also national land forces to be used in other parts of

the French Union. No fundamental difference of spirit between these national forces and the French units in the European Army is to be expected. Moreover, nothing will prevent France from transferring within reason soldiers as well as officers from its overseas forces to its European units and *vice versa*.

The unity of the French officers' corps will be preserved. Appointments and promotions within the European army are to be made by the national governments according to proposals submitted by the supranational Board of Commissioners, which in turn will need unanimous approval from the Council of Ministers for the appointment of any high-ranking officer. Thus, each member state will be able to look after its proper representation in the integrated staffs of army corps and armies as well as in the combined general staff.

France, it is true, as well as the other members of EDC, will lose part of its budgetary control over the armed forces. Within the framework of the budget approved by the Community's Assembly, it will be the prerogative of the Board of Commissioners to distribute expenditure between the Community's forces. The French Parliament will only be able to vote *en bloc* the yearly lump sum which France is to contribute to the European Army. This is a very important restriction of parliament's rights. But it is not likely to alter the nature and traditions of the Army.

The argument, therefore, that the integrity of the French Army is threatened looks less important on analysis than the fear of German predominance in the EDC over a France weakened by the Indo-China war. British and American guarantees are not as binding as the French parliament would wish and therefore fail to counter the overwhelming distrust of Germany. This is why any British or American insistence on EDC immediately raises acid reactions in French political quarters. It would be so much easier for a French soldier or officer to serve under a British than under a German general.

The Soviet Economy

STALIN'S death has clearly brought about changes in Soviet economic thinking. Not so long ago it would have been a deadly sin to put the main emphasis on the production of consumer goods. Now this is the official slogan of the government and party and the new line is illustrated in the latest annual report of the central planning board. It is claimed that in the second half of 1953 the output of light industry was 14 per cent higher than in the corresponding period of the previous year and for the first time its growth outpaced that of the heavy branches. Previously there has been a strong bias in favour of basic production and though the gap was narrowed when the current Five Year Plan (1951-55) was proclaimed in 1952, heavy industry was still scheduled to lead the way. Soviet indices of industrial production must be taken with a grain of salt, but the shift remains none the less significant.

Has the plan drawn up in Stalin's lifetime been radically altered? Have the emergency measures to step up the output of light and food industries and to expand rapidly the supply of consumer goods slowed down the development in other sectors? It is still too early to judge the full impact of the new policy and the extent of the shift in

engineering cannot be gathered from published statistics, but there has clearly been no major revision in the plans for basic expansion. True, last year the rate of growth in pig iron and rolled steel somewhat slackened and coal extraction again lagged behind. If the present rate is maintained, however, only coal and oil will fail to reach their 1955 objectives.

National income last year rose by 8 per cent against an increase of 11 per cent in 1952. It is claimed that a larger share of the cake went to the consumers and the government's slice was somewhat reduced. The volume of state capital investment increased by only four per cent compared with a rise of six per cent in the previous year. This may appear strange at a time when there is apparently a great flow of capital into light industry. The only significant outlet for investment to have disappeared from the report are the so-called "Great Projects" of electrification and irrigation. In Stalin's time publicity about work on the dams and canals on the Volga or in Central Asia served as a smoke-screen distorting the real picture. Now, the canals are still needed, but a smoke-screen is not so indispensable. It is also possible that the amnesty has deprived the managers of some of their slave labour and that as part of the new line Stalin's pet projects have been put further down on the priority list. On the whole, however, Stalin's successors seem to be in an optimistic mood as if they were capable of carrying out the dead master's plans and the drive to produce more consumer goods as well.

SOVIET LIVESTOCK

Oct. 1954 plan ..	65.9	29.2	34.5	144.4	...

Housing is one domain in which the Soviet citizen sees little hope on the horizon. There is no sign as yet of a special campaign to eliminate urban and rural overcrowding. Last year 28 million square metres of floor space were laid down in the towns: this is only one million more than in 1952. The average Soviet town-dweller still probably does not possess more than four square metres of floor space. On the other hand, there has apparently already been a great improvement in the supply of consumer goods. Indeed, there is a disconcerting discrepancy between the rise in production and retail sales, particularly of foodstuffs. Thus, for example, output of butter and meat rose by 3 and 12 per cent, respectively, and their retail sales by 36 per cent. The government must have been running down its stocks, hence its new interest in foreign consumer goods and foodstuffs.

Agriculture has been the main headache of the new regime. While discipline, relaxed after Stalin's death, was quickly reimposed in the towns, the task proved apparently more difficult in the countryside and Beria was made, among other things, the scapegoat for peasant restlessness. This restlessness may have contributed, together with bad weather, to a generally poor harvest. The grain crop was smaller than in 1952—when it amounted to 130 million tons in the inflated "biological" computation—and the

target of 180 million tons by 1955 now appears completely unrealistic. The total area under cultivation increased by 1.4 million hectares and the wheat area by 2 million hectares, and thus there must have been a drop in yield. The potato crop was also poor, but the harvest of cotton, sugar beet and vegetables was apparently better than in 1952.

The policy of incentives for the collective farms and the peasants themselves was only launched in the second half of 1953, and its effects will really be felt only this year and next. It is therefore astonishing that great successes have already been claimed for livestock breeding, particularly for pigs.

The campaign to foster agricultural development goes on unabated. Congresses of delegates from the State farms and machine tractor stations were recently held in Moscow and the publicity surrounding them overshadowed the Berlin conference. The fulfilment of Malenkov's pledge to the consumer will largely depend on the success of his agricultural policy. Last August he was careful to ask for "two or three years" to meet his pledge, but at the end of this year it should be possible to gauge his chances of success.

Crisis in Kazakhstan

THE wave of purges that has swept the Soviet Republics since Beria's fall has now reached Central Asia. It is confirmed that both the first secretary, Shayakhmetov, and the second secretary of the Communist party, and the premier of the huge though sparsely populated Kazakh Republic have "been relieved of their functions." The crisis must be acute, for two important personalities were sent from Moscow to take over the party jobs: P. K.

Ponomarenko, Soviet minister of culture and former member of the Presidium, and L. I. Brezhnev, once a member of the All-Soviet secretariat and recently political head of the Soviet navy. Such national leaders are not given local jobs in a republic unless matters are serious.

The chief reason for the change is said officially to be the failure of the former rulers to cope with the agricultural situation, but political considerations must be tied up with economic ones. Kazakhstan, with an area about 11 times

as large as the British Isles, is in size the second of the Soviet Republics. Though its population is under seven million, it has rich resources and great possibilities. There is plenty of coal in Karaganda, oil around Emba, and the biggest Soviet reserves of copper, iron ore, non-ferrous and precious metals are in the republic. There is also great scope for agricultural expansion. Vast plans were drawn up for raising the cotton crop and increasing the already important sheep flocks on irrigated land. It is the leaders' inability to carry out these plans that is put forward as the cause of their downfall. A failure of Kazakh supplies would certainly be a great blow to Nikita Krushchev's crucial plans for Soviet agricultural expansion.

Yet this cannot be the complete explanation. Before Stalin's death similar accusations of "nepotism" and insufficient attention to communal stock were already being made; but first secretary Shayakhmetov managed to weather the storm, even though "nationalist deviations" were then included in the indictment. They may well be the reason for the present purge. Russians and Ukrainians now account for about one-third of the population, the Kazakhs—Moslems of nomadic origin—still form the majority, and they have often been accused of pan-Turkish, pan-Iranic tendencies. Their "deviations" may have been encouraged during the first months after Stalin's death, and tough customers have now been sent from Moscow to suppress them once again. There are many obvious links between the new appointments and Beria's fall; and the wave of purges has clearly not yet run its full course.

Berlin in Brief

(The conference entered its fourth week)

FEBRUARY 11th. A restricted session at which the four ministers discussed item 1 on their agenda dealing with the calling of a five-power conference.

February 12th. After a further restricted session in the morning, the ministers turned to the third item on their agenda—Austria. The Austrian Foreign Minister, Dr Figl, appealed for a speedy conclusion of the Austrian State Treaty, and asked that the economic clauses of the draft treaty should be reconsidered and made less onerous. Mr Molotov then made the following proposals:—

(1) The four deputy ministers should be instructed to complete the draft treaty within three months.

(2) A clause should be added to the treaty obliging Austria (a) not to enter any coalition or military alliance directed against any power that fought against Germany; (b) not to allow any foreign military bases on its territory and to exclude all foreign military instructors and specialists. The four powers would undertake to observe this article.

(3) The occupation troops would remain in Austria (but not in Vienna) until the German peace treaty is concluded "in order to prevent any attempts at an *Anschluss*" between Austria and Germany. They would not perform occupation duties and their status would be regulated by a special arrangement.

(4) Austria could pay the \$150 million to be paid to the Soviet Union in place of the former German assets in Austria in goods instead of in convertible currency.

(5) The deputies should also consider Trieste in the light of the Soviet proposal that it should not be used as a military base.

Mr Eden proposed that the Ministers should try at once to complete the draft treaty.

February 13th. M. Bidault and Mr Eden both said that they would accept the Soviet version of the five outstanding articles of the draft treaty. Mr Eden added that this offer was valid only during the present conference, and was made on condition that agreed articles were not reopened; but he accepted a new Soviet version of an agreed article on denazification.

February 14th. Mr Dulles formally proposed that the Soviet version of all unagreed clauses in the Austrian draft treaty should be accepted and that the treaty should be signed on the last day of the conference, February 18th. He was supported by Mr Eden and M. Bidault. The Western Ministers also offered not to ask for the revision of the economic clauses of the treaty if Mr Molotov would not reopen any of the agreed clauses. Mr Molotov offered to drop his proposal that the draft treaty should go back to the deputies; he also suggested that Trieste should go to the Security Council instead of to the deputies. He then offered to sign the draft treaty, but with the addition of a clause incorporating his proposals of February 12th. Dr Figl said he could accept the draft treaty, but he had no authorisation to accept Mr Molotov's amendments.

February 15th. In the morning, in restricted session, the Ministers discussed a conference on Far Eastern questions. In the afternoon the Ministers again discussed Germany and European security without making any progress. Mr Molotov offered some minor amendments to his security plan, but these did not remove the basic western objections to it.

February 16th. The meeting was devoted to Austria. Dr Figl, the Austrian Foreign Minister, on behalf of his government, refused to sign a treaty if it meant the retention of foreign troops on Austrian soil. The Western Ministers tried in vain to get Mr Molotov to sign the draft treaty as it stood. Mr Molotov suggested that if foreign troops were retained in Austria after the signature of the State treaty, the four powers should agree to reconsider the question "not later than in 1955"; this modification was unacceptable both to Dr Figl and to the Western Ministers.

February 17th. In the morning the Ministers met again in restricted session to discuss item 1 on their agenda. At the afternoon session Germany and European security were again discussed. Mr Molotov said that his security proposals were an alternative to EDC, but suggested non-commitally that Nato might not be incompatible with them. He also proposed:—

(1) that the four powers should reach agreement on the relative strength and armour of the police forces in West and East Germany;

(2) that they should recommend to the German authorities in East and West Germany that they should set up two all-German committees, the first to agree and co-ordinate in the fields of commerce, settlement of accounts, transport frontier and other economic matters, and the second to deal with cultural, scientific and sports relations.

The Western Ministers reserved their reply.

February 18th. As *The Economist* went to press the Ministers, in restricted session, were discussing a five-power conference and later, in open session, Germany and Austria.

If you were
advertising to
lady balloonists,
what journal
would you use?

Obviously your first reaction would be to try and find a publication specialising in this art.

And you might find it very difficult.

On the other hand, if you are selling to women with a specific and concentrated interest in their homes and families, your problem is quite simple. GOOD HOUSEKEEPING is your obvious choice—the only magazine supported by the GOOD HOUSEKEEPING INSTITUTE—that most famous authority on homes and homecraft. It is in fact as much a specialist magazine for the home as a balloonist journal would be to a balloonist, or gardening paper to the enthusiastic gardener. Always remember this when planning advertising campaigns.

The quest for know-how

NO. 1 IN A SERIES ON RESEARCH & DEVELOPMENT

The Simon companies serve many key industries in Britain and abroad, and contribute substantially to Britain's engineering

exports. Selling their experience and skill in competition with every industrial nation in the world, their success depends largely on first-class know-how in many diverse technical fields. In the unceasing quest for knowledge—for better processes and better designs—the Simon Engineering Group has immensely expanded not only its own resources for applied research but also its intimate contacts with new and developing technology in other countries. The only know-how worth selling is the best there is.

Pensions and Taxation

The Committee on the Taxation Treatment of Provisions for Retirement (the Millard Tucker No. 2 Committee), which reported this week*, was set up by Sir Stafford Cripps in August, 1950. At first sight, three and a half years may seem a long time to spend on a single aspect of fiscal policy: retirement benefits and their associated tax problems take up only 16 out of the 532 sections in the Income Tax Act of 1952. Even allowing for the burden of work that has fallen on Mr J. Millard Tucker, QC, and his colleagues, there seemed to be grounds for the eagerness with which the report has been awaited. Now the scale of the committee's work can be appreciated. It is as though it has had to unravel a dozen inferior tapestries, disentangle the skeins of wool and attempt to remake them into a single homogeneous design. The unravelling and disentangling has clearly been the hardest part of the job. And throughout the report (as in all efforts at taxation reform) runs the lament: "If only one could start from scratch, with no regard to vested interests!"

Questions and Principles

The "Tucker Two" committee was given a four-fold task:

- Are alterations desirable in the tax treatment of pension arrangements by employers for the benefit of their employees?
- Are alterations desirable in the tax treatment of private life assurances?
- How should annuities purchased out of capital be taxed?
- What tax treatment is appropriate to pension schemes for those who are unable to benefit from an arrangement sponsored by an employer?

In these questions, matters of principle and detail are so closely joined together that no conveniently broad generalisations are possible. The report gains in authority for this very reason; it has been drafted as a working document, with a minimum of matters left for departmental consideration in the hope that action can be taken in this year's Finance Bill.

Three main principles govern the committee's conclusions:

- A man who works in a business for substantially the whole of his working life should be rewarded over a longer period than his actual service.

- The build-up of bona-fide and reasonable schemes by means of contributions from employers and employees and by income earned on the accumulated funds should be exempt from tax; benefits should be taxable as and when they emerge (subject, on grounds of expediency rather than principle, to the exemption of lump sum payments in commutation of benefit rights within certain limits).

- The existing distinction between employed persons who can provide for retirement out of untaxed income and those who cannot should be abolished and a broad uniformity should be introduced into future arrangements.

Hitherto the working population has been divided: employees (including whole-time service directors) of concerns enjoying approved schemes form the "haves"; those employees for whom no schemes are available, the self-employed and controlling and part-time directors, make up the "have nots." The committee estimates that of the 23 million employed in 1953, 6 million were already covered by some form of pension other than the national scheme. It puts the number of self-employed at just over 2 million, of whom 400,000 would not be interested in

* Cmd 9063. HMSO. 5s.

any arrangement because they are not liable for tax. In the past the self-employed and controlling directors have been excluded, mainly because pensions had their origin as an element in basic wages and salaries, but also because such persons had the power to make arrangements for themselves by which they could obtain tax advantages beyond what would be reasonable. Now the committee proposes a realignment. All employed persons should have the right, following the general principles, to translate some of their current earning power into provision for old age and to obtain broadly similar tax benefits by doing so. A line is to be drawn, however, between those who could arrange their schemes to suit their own best advantage and those who perforce have to take what their employers provide for them.

Aid for the Self-Employed

It is to this first group of the self-employed, controlling directors, part-time directors and employees who are not at present covered by any scheme arranged by their employer that the report holds out the hope of tax benefits, subject to prescribed limits. It is estimated that 1,600,000 self-employed and 9,500,000 non-provided-for employees and controlling directors are involved. The committee recognises that these classes are fiscally under-privileged in that they cannot now provide out of current earnings, after personal taxes have been paid on them, for retirement benefits of the kind and on the scale afforded to ordinary employees who belong to approved schemes. The committee is at pains to show that it is concerned with principle rather than with expediency in this matter. Some form of special relief for savings has been provided ever since 1799, when Pitt introduced Life Assurance Relief; again the Royal Commission of 1920 must have proceeded on the principle that remuneration earned from work should be spread forward to cover retirement. The committee's analysis brings it to the conclusion that what applies to an ordinary employee should apply equally to a person who is self-employed; it is most unfortunate that two members of the committee have felt unable to accept this view and have entered a reservation to this part of the report.

Having thus justified equality of treatment for the self-employed on wider grounds than that of need alone, and with the salutary reminder that "the law of Income Tax is not one of the laws of nature," the committee considers the special circumstances of the four cases. Since there is no employer to exercise a restraining influence, the first need is to ensure that the spreading forward of income does not become unreasonable: this is to be done, not by controlling the amount of benefit (which would be impossible), but by controlling the proportion of each year's earnings which may be put into a scheme and fixing the date at which the benefits can be drawn upon. The scheme itself must be put beyond the control of the contributor. No doubt group

schemes to cover particular professions will be set up; in other cases the Life Offices have indicated their willingness to issue special policies to individuals giving effect to what the committee proposes, and it is hoped that standard forms will be agreed between the Revenue and the assurance companies to facilitate the approval of individual schemes. Stated in its simplest terms the committee's proposal is that each year's contribution by an individual out of his earned income shall in effect be a single premium securing a specified amount of annuity at the specified future retirement age. There would be options to provide for widows' and dependants' pensions.

The fixing of a retirement age is difficult, not only because some self-employed people have to retire early, but also because people who are their own masters usually enjoy twilight years which are neither work nor play. The committee recommends (and it is a typically useful proposal designed to iron out anomalies and uncertainties) that whatever in fact actually happens the schemes should be arranged on the footing of retirement at between 65 and 70 for men and between 60 and 65 for women. Contributions may be paid and will be allowed for taxation up to whatever limits are chosen; thereafter benefits will be paid whether or not the self-employed person goes on working.

★

The committee then considers what maximum permissible contribution may be made in each year. If the figure is fixed too high, the sum of the annuities bought with each year's contribution will eventually produce a pension which is disproportionate to the remuneration enjoyed before retirement. It therefore contemplates two types of annuity—one, Type A, with alternatives in the event of death before retirement age, and with provisions for dependants; and the second, Type B, for a deferred annuity only, with no other benefit or any return in the event of death or disability before retirement age. The individual may choose which he prefers, or have some of one and some of the other. In ordinary circumstances, the committee concludes, it would be reasonable if 12 per cent of a year's earned income were put into a Type A policy, or 10 per cent into a Type B policy.

These general percentages are to be varied to allow for two special factors. First, in some cases income may be derived from capital assets rather than from personal exertion; it is this point which most worries the two signatories to the reservation. Clearly, income from capital assets ought not to add to the amount which can be set aside to build up retirement benefit: but, equally clearly, any detailed computations to exclude them would be an accounting monstrosity. In the end, the committee recommends that the difficulty should be met by a rough and ready adjustment of the annual percentage contribution itself. It proceeds on the assumption that income from capital assets will fall

in the highest part of total earnings and that only in the case of earnings of over £5,000 will the amount be of significance. A lower percentage is therefore suggested for earnings over £5,000: the figures proposed for the Type A policy are 12 per cent of the first £5,000, 9 per cent on the second £5,000 and 6 per cent on the balance whilst in Type B the corresponding percentages are 10, 7½ and 5.

Thus under a Type A policy an individual earning £5,000 could invest £600 free of tax in the purchase of a deferred annuity, but another earning £15,000 could invest not £1,800 but only £1,350. This in itself would be in injustice to professional men who work hard but employ little capital and the committee recommends that the Inland Revenue should have a discretion in such cases. It is noteworthy that the minority report exempts the earnings of self-employed professional men from its criticism of the proposals.

Secondly, some provision has to be made for "back-service" where an individual is already of mature age. The proposals to this end are simple, equitable and ingenious. The committee recognises that to put the four under-privileged classes on an equal footing with employees who benefit from approved schemes logically implies that the self-employed should be entitled to set aside the appropriate percentage of earnings of all past years. But this is hardly practicable; in any case few of the self-employed could afford it. The committee concludes that justice will be done if back-service relief is extended to 1939 but no further; if the scheme were to come into force for 1954-55 this would make fifteen years of leeway. It is proposed that the basic 12 per cent should be increased by 4/10ths of one per cent for each year between April, 1939, and April, 1954, during which a person was in any of the four classes (war service counting as part of the qualifying period). Thus the maximum rate for all future annual contributions would be increased from 12 per cent to 18 per cent, i.e., by 6 per cent representing 15 years at 4/10ths per cent per annum. The rates in the 10 per cent class would be correspondingly increased.

This would be a material help to those self-employed persons who still have a reasonable number of years of working life before them. A man who began professional life twenty years ago, for example, with twenty years ahead and an average earned income in the neighbourhood of £4,000 a year would be able to set aside twenty contributions of £720. At present rates of tax (12s. 6d. in the £ between £3,000 and £4,000) the net annual cost to the individual would be £270 a year. The gross sum of £720 a year accumulated at 3½ per cent interest (the interest would be tax free) for twenty years would amount to £20,000, of which a quarter could be commuted in a tax-free lump sum; if the remainder were translated at 65 into a life annuity it would provide a pension of about £1,500 a year. The position of persons closer to retirement age would not be so favourable.

Schemes for Employees

In a careful survey of existing arrangements for providing retirement benefits for employees the committee brings out the many inconsistencies which now exist. Employees' contributions are sometimes allowed in full as deductions from taxable income as if they were expenses; in other cases, only life assurance relief can be claimed; sometimes the whole of the benefit is taxable; sometimes part or whole is tax free; the income of some funds is exempt from tax, whilst in others it is liable. All the evidence received from important representative bodies pleaded for greater uniformity, but as the report wryly records, they were by no means agreed on how uniformity could be secured.

The committee proposes that all future schemes for the provision of benefits for employees should be based on a general plan allowing for the exemption from tax of the build-up of the fund and for the taxation of the benefits. To qualify for the tax reliefs, future schemes must first secure the approval of the Revenue (from whose decision there is to be no appeal) and certain broad rules (subject to a wide discretion of the Revenue) are laid down. Employees must not be able to withdraw benefits at will—otherwise the scheme would be a mere device for spreading remuneration and no more than a temporary savings bank. The contributions of both employer and employee must be effectively alienated so that they cannot be dealt with except in accordance with the scheme. The arrangement should be known to the employee, the employer should participate, and the nature of the benefits should be the same for all who are included. The retirement benefit should not be excessive in relation to the remuneration earned in the closing years of service: the Revenue is to give automatic approval if the benefit is limited to a pension of one-sixtieth, for each year of service, of the average salary for the last three years. After 40 years this will give a two-thirds pension which is common today. If the employment extends longer than 40 years and beyond the age of 60 the maximum benefit may be increased to three-quarters. The existing £2,000 limit for contributory pensions should go. Finally, the scheme must provide that benefits should not escape proper taxation; pensions cannot be assigned or (except for certain permissible lump-sum payments) commuted.

A scheme which satisfies these conditions should be exempted from taxation on its build-up. Payments by employers would be allowed as business expenses, whilst special payments to cover back service will also be allowed if spread over a period. The employee's annual contributions would likewise qualify for full relief up to 15 per cent (a generous margin) of his remuneration for the year. Where the scheme is funded the investment income of the fund should be exempt from tax; and where it is operated by the purchase of a deferred annuity through an insurance company, the investment income of that company's annuity fund

should be exempted to the extent that it covers pensions policies.

On the taxation of the benefits as they emerge at retirement or at earlier death, the committee is clear that all amounts received by way of annual pension ought to be taxed as if they were earned income. But it finds itself in difficulty when it considers the lump sum benefits which are now a common element in many pension schemes. The principle that it lays down would require the taxation of all lump sums or alternatively their prohibition. But this could not be done without interfering with existing contractual arrangements providing for lump sum payments. It would seriously upset uniformity if future schemes were to leave out lump sum payments or make them taxable. The Civil Service have received some part of their benefits in the form of a lump sum since 1909 and even the 1947 Finance Act, by implication, approved such tax-free payments. With reluctance, therefore, the report records:

If we were dealing with the matter without any reference to existing practice we should have found it very difficult to recommend that any part of the benefit should be in tax-free form; but since the practice is now so firmly established and seems to have been tacitly provided in the 1947 legislation and in the 1950 legislation relating to judges we find it impossible to say that in future it should not apply.

The committee proposes therefore that the existing arrangements which enable an employee to take up to one-quarter of his retirement benefit as a tax-free lump sum should be continued, but subject to limitations. The greatest lump sum payable to any civil servant is a little under £8,000. The committee is aware, however, that arrangements made since the 1947 Act, commonly known as "top-hat" schemes, are resulting in very large lump sum payments and cases of up to £40,000 were quoted. This it regards as excessive, and it recommends that there should be an absolute upper limit on lump sum payments of £10,000 in future schemes. At the other end of the scale the committee feels that, largely for convenience, small retirement benefits should not be subject to the requirement that three-quarters should be in pension form. If the aggregate value of the benefits is £1,000 or less the whole amount might be taken as a lump sum.

Transitions from one basis to another are always difficult. The committee would, of course, have liked to wipe the slate clean and start afresh. Many contributors, however, have already made their future plans in the expectation that the present arrangements would stand, and any compulsory alteration to their detriment would be unjust. But it would be equally unjust to bind a contributor to an unfavourable arrangement when new entrants could get better terms. So the committee proposes that all existing schemes should be divided into two parts, one under the old and the other under the new rules. The old part would be closed to new entrants, who would form the new part and in addition old members would be given the option

to transfer if they wished. It is the type of taxpayers' option which is naturally not welcomed by the Revenue, but it is difficult to see an alternative.

Taxing Annuities

The purchase of an annuity, if the scales were not so heavily weighted against it, would be a part of the normal provisions made for retirement by a person outside any existing scheme, or who wished to make additional provision. The taxation treatment of such annuities has long been a fiscal enormity and Mr Gaitskell, when Chancellor, added the subject to the committee's agenda. On any common sense view an annuity is made up partly of a return of the capital expended on its purchase and partly of interest earned thereon: on this basis the first part ought to be tax free, and the second taxable. But British tax law has not developed on these lines and a closely reasoned view of the law as it now exists, backed by the findings of Royal Commissions of earlier years, is that a capital sum has been sunk in the purchase of a source of income, and that everything flowing from that source is taxable.

In such circumstances the purchase of an ordinary life annuity has become highly imprudent to any one liable to a normal rate of tax unless he rates his expectation of life very highly, and an artificial hybrid, the annuity certain, has been invented to take care of some, but by no means all of the mischief. The committee, remembering its earlier dictum that the Income Tax Acts are made by and for man, recommends that the law should be changed and that the estimated capital content of annuities should be exempt from tax. This relates, of course, only to annuities purchased out of individual savings or capital and is quite separate from and independent of the provision of retirement benefits for self-employed and similar persons as part of a scheme; such annuities would be fully taxable as earned income.

Cost and Prospects

The committee has obtained from the Revenue tentative estimates of the costs of its proposals. Changes to existing schemes come to £5 million; provision for the self-employed and controlling directors would cost £35 million, for the "non-provided-for employees" (assuming one half take advantage) £30 million; for "partially-provided-for employees" £5 million; and the cost of relieving existing annuities would be £2 million. The total of £77 million is impressive, and will not be welcome to Mr Butler. But it is important to recognise that it does not represent a net cost to the community as a whole. The creation of pension rights in the future will create additional taxable income, albeit taxable at lower rates than those at which the initial contributions were realised, just as surely as interest on the national debt creates taxable income. Moreover if the full advantages are to be realised, relief from taxation given in the short run will have to be matched by an upsurge of real saving by the self-

employed and others; indeed, one of their big headaches of the future will be how to provide the permissible contributions. And when eventually the benefits are received much dis-saving, in the form of living on capital, will be avoided.

It is difficult to judge from the short, two-page reservations of Sir John Cater and Mr Woodcock how fundamental are their objections to the proposals relating to the self-employed. At first sight it would seem that their dissent is based largely on the assumption that the self-employed usually possess sufficient capital assets to provide for their retirement—an assumption scarcely supported by the fact that 88 per cent of the self-employed enjoy incomes under

Towards Bigger Wagons

MEASURED in work and money, the biggest single job that British Railways has to do is to move 189 million tons of coal a year round the country. During each weekday of the year, the railways have to clear about 60,000 wagons, loaded with 700,000 tons of coal, from the sidings of 900 collieries, and deliver another 60,000 empties to take the next day's output. The average round trip for a wagon from the siding and back is about ten days, and the average one-way journey actually carrying coal between 24 and 72 hours; at any time, therefore, about a million and a half tons of coal may be in the railways' "coal pipeline"—say 3,000 mineral train loads. Over the year, "coal and coke" loadings chalk up about 10,500 million ton miles, paying the railways about £109 million—of the same order of value as total passenger traffic or total merchandise, and far greater in ton-miles worked.

This steady movement from colliery towards customer is as essential to coal production as to its distribution: if the wagons are not at the pithead to take coal away, mining must soon stop—as in the transport freeze-up of 1947. The National Coal Board therefore has one of the largest internal transport organisations in the country, working closely with British Railways to keep the coal on the move. Yet the Coal Board is not, for the most part, a direct customer of the railways. It puts the coal into the wagons (544,000 of which it sold to the Transport Commission in 1948); but the freight charges on coal are paid chiefly by the merchants and large customers, who buy at pithead prices.

One of the largest of these customers, the British steel industry, is itself responsible for a volume of freight traffic second only to coal. It brings by rail to its plants some 20 million tons of coal a year, 5 million tons of coke, 11 million tons of British ironstone, and 6 million tons of imported iron ores; it despatches about 20

£1,000 a year. It must be hoped that these reservations will not be misused to inflame political controversy on a matter that ought to be non-political.

Mr Millard Tucker and his colleagues have done a difficult job well. If their proposals are implemented some better order will be brought to pension arrangements, which have long been chaotic; in particular a dangerous social schism between the pensionable and the non-pensionable will have been closed. If individual saving out of net income will never again be possible, because high rates of taxation are here to stay, it is the more necessary that sponsored saving through retirement funds should be open on equal terms to all taxpayers.

million tons of its own products between processes or as finished steel (on which it pays for freight, since it charges zone-delivered prices). The steel industry's direct financial interest in the efficiency of mineral traffic by rail, therefore, is considerable. This week it has announced* a step forward in that efficiency: it has agreed with the Transport Commission that railway wagons carrying iron ore shall be completely replaced by bigger wagons with a carrying capacity of 27 tons (wagons without doors, to be unloaded by tipplers) or 25½ tons (hopper wagons for bottom discharge). There are already more than 6,000 of these two types of wagon in service for iron ore; all new wagons built for iron ore movement will be to this standard (except a few of yet larger capacity), and the existing 16-ton and 22-ton wagons will eventually be cleared out.

Inevitably, the steel industry's announcement this week raises the question of freight efficiency in handling the largest traffic of all. If 25½-27 tons is to become the standard wagon capacity for iron ore, what about coal? Iron ore, of course, is much more dense than coal, and the cubic capacity of a wagon that will carry 27 tons of ore would accommodate only 14-16 tons of coal. Today, the average load of coal is about 11½ tons in a 13½-ton wagon. Since 1951, it has been "settled policy" with British Railways that a new coal wagon of 24½ tons capacity "should be introduced as soon as possible." This wagon would have a capacity of some 1,029 cubic feet, against 648 cubic feet for the 16-ton coal wagon (or the 27-ton ore wagon). Only about 600 of these now exist. British Railways recently announced its decision to build some 53,000 wagons this year, and has in fact placed a number of five-year contracts with certain independent wagon builders. Yet no more than 5 per

* British Iron and Steel Federation Statistical Bulletin, January, 1954.

cent of the mineral wagons included in this building programme will have a capacity of more than 16 tons.

Once built, a railway wagon is depreciated over thirty years and may well be worked for forty. Today, about two-thirds of the 600,000 mineral wagons on British Railways are of less than 14 tons capacity, and about a fifth are 16-tonners, the standard adopted for building during the war. So the decision to build perhaps 35,000 mineral wagons a year for five years ahead, almost entirely 16-tonners, will certainly improve the efficiency of the fleet. But it will also build up a block of some 250-300,000 relatively new wagons of only two-thirds the carrying capacity that British Railways now considers ideal, and thus defer for many years any approach towards standardisation on the larger wagon. So this investment decision—involving perhaps £15-20 million a year—invited, and has drawn, some criticism from major consumers.

Criticism of Britain's railways for carrying coal in too small packets is not new. Over the years the standard has gradually been inched up; no new 10-ton wagons were built after 1923, and in 1929 a standing committee recommended some modernisation of terminals, to be followed, in 1932, by a standard capacity, for new coal wagons, of 20 tons. During the war the 16-ton standard was adopted as a wagon that could be used universally; and soon afterwards a committee on industry standardisation, led by so eminent a rolling stock engineer as Sir Ernest Lemon, suggested an eventual standard of 40 tons capacity or more. Mineral wagons of this or greater capacity are common on American railroads, and a few run on special routes in Britain—for example, thirty 56-ton ore wagons operate between Tyne Dock and Consett steel plant (though these would carry only about 25 tons of coal). The steel industry, indeed, would like to work towards a standard of about 35 tons capacity for handling imported ore.

Wagons of 40-ton capacity or more, however, would require bogies at each end; a gross weight of 35 tons—which allows a maximum carrying capacity of 25½-27 tons for iron ore and 24½ tons for coal—was recommended by an official committee of British Railways engineers after the war as the most that could be loaded on two single axles. Such a 24½-ton coal wagon offers a high pay load in relation to wagon tare weight, reducing the gross weight of handling a given tonnage of coal and cutting down the weight of hauling back empties; it makes possible a quicker turn round of wagons for a given tonnage, in smaller sidings; and it is more economical in operating costs and carries much lower capital charges, per ton of capacity, than smaller wagons or the larger wagons that need to run on bogies.

★

What stands in the way of this ideal coal wagon? Simply, and literally, the equipment for putting the coal in and taking it out. The 24½-ton wagon is 10-10½ feet high, against 8½ feet for the 16-tonner, and has a wheelbase three feet longer; only about a sixth of

the collieries in the country can get it under their screens or through their sidings, and none of the coal ports can handle it. At the delivery end, the steel industry could probably take 50 per cent of its tonnage today in 24½-ton wagons, 60 per cent in 1956-57, and 80 per cent by 1960; the power stations, coal's largest customer, could take perhaps 20 per cent today and about 65 per cent by 1960. All new and reconstructed collieries will have surface equipment to take the larger wagons, and it might be possible to refit a proportion of the existing collieries to take them at a capital cost of up to £5,000 per colliery.

★

But there are a large number of collieries in the country where complete rebuilding of screens or washeries would be needed to take the larger wagons, which would cost up to £100,000 at each pit; and a residue of pits of limited life where the National Coal Board would be understandably reluctant to spend anything on rebuilding surface equipment. The Coal Board is not prepared to make promises of the percentages of its tonnage that it will be ready to deliver in 24½-ton wagons at various future dates, because, it argues, the flow of coal throughout the country is subject to continuous and considerable change, which would make guarantees of percentages meaningless. It has taken about 600 of the big wagons into service and used them for testing its clearances at collieries; and it is beginning to use them on a few selected regular routes. It is not always easy to find a customer equipped to accept big wagons, even where the collieries can load them; for example, one group of pits supplying steel plants in South Wales can load the 24½-tonners, but the Steel Company of Wales is having to modify its coal equipment at Margam to unload them. The Coal Board is prepared to introduce the large wagons as and when it can on selected routes; but it is far more interested in the supply of further 16-tonners to supersede the existing "tail" of smaller wagons, many of which embody antiquated grease lubrication that causes immeasurable difficulty in coal sidings in cold weather.

In freight efficiency as elsewhere, therefore, the better is the enemy of the best; and the railways' major efforts to improve and modernise their wagon fleet shift farther off the standard of the ideal wagon. Obviously, the larger wagons could only be introduced gradually; it is an open question whether their introduction needs to be quite as gradual as is planned today. Essentially, this is a question of return on capital, invested by various people at various points. Ultimately, the return from these investments in coal handling efficiency should accrue to all three parties—the large consumers, British Railways, and the Coal Board—but the net benefit to the railways and the coal industry may be a long time coming. Whether or not some sharing of financial benefits might be worth considering, greater co-ordination of investment by the basic industries concerned to accelerate progress towards this higher standard of freight efficiency may still be possible.

Business Notes

Fat Boy in the Markets

THE rate at which the pension funds can tuck away the securities they fancy is a matter for never ending wonder. Everyone foresaw that they would like the Dunlop Rubber 7 million £1 5½ per cent preference shares at 21s. But no one guessed that 24 million shares would be applied for, and in an issue which was made to stockholders only. That result forced the company to scale down heavily all applications for more than 400 shares. The very method of allotting the smallest applicants in full and progressively scaling down the bigger ones tended to limit the opening premium for if there were "stags" they would be found among the smaller applicants. The opening premium was 6d. per share.

Now institutional investors have been given another meal before they have digested the last, for the steady programme of gilt-edged borrowing cannot be allowed to lag. This week's offer of £80 million British Transport 4 per cent stock 1972-77 at £101 was even a little more than the stalwart gilt-edged market had expected. It would have taken a Dominion or Colonial issue of up to £20 million more easily in its stride. As it was, the authorities repeated the tactics they had used so successfully with the Conversion 3½ per cent issue only three weeks earlier, and pitched the price right up to the highest level which they judged the market would stand. The new stock is a further line of an existing issue. The Transport 4 per cent stock 1972-77 of which there is already £120 million, was first issued in November, 1952, at £95½; the difference between that price and the present £101 marks the extent of the market's rise in 15 months. Still the terms have been finely drawn; the old stock with about 12s. 10d. of accrued interest stood at £101 13/16 with a yield to redemption in 1977 of £3 18s. 6d. when the new issue with the promise of 17s. 6d. interest in June was announced. The new stock offered a redemption yield of £3 18s. 8d.

If the authorities hoped that the finely drawn terms of the new issue would give the gilt-edged market a further slight tilt upwards, they were not immediately successful. The gilt-edged market declined a small fraction so that the old Transport 4 per cent stock offered a slightly higher yield than the new issue. That did not spell failure for the issue. As a trustee stock guaranteed as to principle and interest by the Treasury it is obviously designed for the institutions. The Government guarantee is also backed by a forecast that the British Transport Commission's surplus for 1953 will be approximately the same as in 1952 when a net surplus of nearly £4½ million after interest charges and capital redemption was earned. But it is the kind of issue in which the public departments can be expected to play their traditional helping hand towards full subscription. Their part is not an unduly large one. The lists closed at 10.30 on

Thursday, and the larger applicants for over £250,000 received 77 per cent of their applications, which is long-hand for a satisfactory response.

The Atomic Energy Authority

THE text of the Government's bill to set up an Atomic Energy Authority follows fairly closely the outlines in the White Paper of four months ago. The Authority will assume responsibility for producing fissile materials, atomic energy and radio-active substances, and all the day-to-day operations connected with these functions—including research and any necessary building work. The Lord President of the Council has broad powers to direct the policy of the Authority, subject to the reasonable safeguard that he "shall not regard it as his duty to intervene in detail in the conduct by the Authority of their affairs unless in his opinion overriding national interests so require." The AEA will publish annual accounts.

The bill gives the Authority power to arrange for universities and "other institutions" to carry out research on its behalf into "matters connected with atomic energy or radio-active substances" and to "make grants or loans to persons engaged in the production and use of atomic energy or radio-active substances." But while the government thus concedes that "institutions or persons" outside the Authority might be permitted to own and operate nuclear power plants, there is no expressed intention of calling on industry to help with the design or running of the key plants of the atom industry, those that produce the fissile materials themselves. The Authority will be a manufacturing organisation, not a body co-ordinating the activities of its agents, as in the United States. Will it in fact be possible to draw a dividing line between power production and other activities? Certain atomic power plants also involve the production of fissile materials such as plutonium and anyone "engaged in the production or use of atomic energy" by these methods will certainly need to know a great deal about the techniques for separating fissile materials.

In the White Paper, responsibility for providing atomic weapons was to remain with the Ministry of Supply. But while the bill calls on the Ministry to arrange with the Authority for the development and production of atomic weapons, it does not limit the power of the Authority to conduct "experimental work which may lead to improved types of explosive nuclear assemblies for atomic weapons." Hence the Authority is free to experiment along its own lines, whether or not these conform with the views of the Ministry of Supply.

By the bill, the scientists will win a considerable measure of control over the destinies of the new atomic industry. All important aspects of nuclear physics come within the purview of the Authority, and it will have considerable discretion in seeking co-operation from outside. Subject to the general guidance of the Lord President, whose powers are defined with welcome clarity, a great deal depends now on the attitude of the chairman and the six to ten directors of the Authority, only four of whose names—all of them scientists—are yet known. The AEA will have a great measure of independence—and some critics will complain that it has too much. That remains to be tested. In principle, the experiment is entirely worth while, and its success may depend in large part on the quality of the lay directors who have yet to be appointed.

Potash Loan Settlement

THREE weeks ago Messrs J. Henry Schroeder, as principal paying agent for the German potash bonds, and the Royal Exchange Assurance as trustee had to announce that they would tell the British court that the German debtors had not improved their unacceptable offer of last August. But last week-end brought the welcome news that the minority members of the Potash Syndicate of Germany had come into line and that a basis of an agreement had been reached, putting the potash bonds on substantially the same footing as the German loans covered in the Anglo-German debt agreement of last year. The steady buying in the last two weeks, thought to be on German and Swiss account, suggests that the new development was foreseen on the continent ahead of last week's announcement. The history of these negotiations, extending over many years, shows errors on both sides. But the final outcome seems the only possible one. It is recommended not only by the paying agent and the trustee but also by the bondholders' committee and the committee of long term and medium term creditors of Germany. No doubt the general body of bondholders will also accept it in the spirit of Sheridan's description as a settlement "of which every man ought to be glad but of which no man ought to be proud."

Substantial improvement on the unacceptable German offer of last August is shown by these items:—

(i) The 1951 distribution on capital account made from assets outside Germany is to have the benefit of the dollar clause so that the £35 10s. distributed ranks as only £20 9s. of nominal capital.

(ii) The life of the bonds (which are already due for repayment) is extended by 20 years beyond January 1, 1953, instead of 25 years.

(iii) The whole service of the debt on the new basis is guaranteed whereas in the previous offer 3.8 per cent domiciled in the Soviet zone was not to be serviced.

On the new basis, service from January 1, 1953 is likely to begin in June, and the bonds will then be full of three half-yearly payments. The rate, on the lines of the German debt agreement, will be 5½ per cent per annum on the 7 per cent issues (amounting to £5½ million nominal) and 4½ per cent on the 6½ per cent tranche (of £1,800,000). The arrears including dollar clause benefit are aggregated as capital, so that the 7 per cent bonds rank for between £232.3 and

£235.5 and the 6½ per cent bonds for between £225.5 and £228.4 according to the date when this £35.5 distribution is deemed to have been made. Both issues rank for a further *ex gratia* payment from the custodian of ex-enemy property which makes impossible an exact calculation of yields at the present prices of £169½ for the 7 per cent bonds and £153 for the 6½ per cent issue. But the indicated yield of over 9 per cent is well up to the return on other German issues. One of the most important features is the promise to restore the "receiving bank system" under which the proceeds of potash sales outside Germany are to be received by Schroeders on trust and the service of the bonds is set aside out of that total. This provision gives the special quality to the security of the potash bonds.

Postscript from the Bankers

CONTROVERSY about bank dividends has restored to the annual general meetings of the big banks some of the wide public interest that was lost when, during the war, the bank chairmen started the sensible practice of circulating their "statements" beforehand, with the annual accounts. At this year's meetings the banks have been replying to two opposite kinds of criticism. Some that have raised their dividends have proved sensitive to the taunts, unfair though these have generally been, from Labour spokesmen; whilst the two big banks that have maintained their traditional dividend rates have had to try to console disappointed shareholders. In this second category the principal defence has come from Lord Harlech, of the Midland Bank, who emphasised—as, indeed, *The Economist* did some weeks ago—that in framing its dividend policy a bank had to be "entirely uninfluenced" by the decisions of other banks. Lord Harlech put some weight, however, on the fact that the Midland's dividend had for twenty years represented a higher rate on total capital than that of any other leading bank except the Westminster, which has likewise kept its payment unchanged this year. The Westminster's chairman, Lord Aldenham, did, indeed, make the same point more tartly—complaining at the bouquets handed to the other banks for making "rather tardy and hesitating steps" towards the Westminster's dividend rate. He gave no hint of any advance in future. On this point Lord Harlech was specifically discouraging; he thought that, given the greater flexibility that is being restored to the national economy and to money rates, there could be no assurance that gross earnings would be maintained, whilst costs continue to rise. There would be "little purpose" in raising the dividend unless the possibility of subsequent reduction "could be regarded as remote."

Among the dividend-raising banks, the most weighty statement came from Lord Balfour of Burleigh, of Lloyds Bank, in a protest against the tendency of "some quarters" to try to use the increase in bank dividends as an additional argument in appeals for wage increases. The real purchasing power of the net amount of Lloyds' dividend, he pointed out, was still only two-fifths of what it was in 1938. As for the increase in dividends in general, its contribution to inflationary pressure had been "quite negligible" by comparison with the effect of increases in wages and salaries; the aggregate additional amount paid in wages and salaries

in 1952 by comparison with 1938 was thirty-five times the additional amount paid, in the aggregate, in dividends on ordinary shares. To this telling point there should be added one from Mr A. W. Tuke, of Barclays Bank; he put his bank's increased dividend into perspective by remarking that it was equivalent, on the average stockholding of £250, to an additional 2s. a week of gross income.

Belgian Uranium Contracts

CONSIDERABLE secrecy surrounds the terms on which uranium ore is bought and sold, and the Belgian foreign minister, when he told the Belgian Chamber last week that fresh contracts for Congo ore were being negotiated, gave no information about the points being discussed. Belgium has a ten-year agreement, signed in 1944, to sell what amounts to the entire uranium output of the Belgian Congo to a joint Anglo-American purchasing agency. Deliveries were based on estimated production, and these assessments have coincided fairly closely with actual output. This agreement is due to expire this year, and the terms on which the agency will buy future supplies from Belgium are likely to show certain important changes. In particular, it is unlikely that the agency will continue to take the whole output of Belgian ore.

Until recently, Belgium was the only supplier of uranium outside the Iron Curtain, but new sources in Canada, Australia and South Africa are coming into production, and this ore tends to be free of constituents that have made the Congo ore, rich though it is, difficult to handle. For these and other reasons, British plants are likely to switch gradually from Belgian to Commonwealth ores. Such a change would leave more uranium available for Belgium's own domestic use than has been the case hitherto. But it may also follow that certain advantages that Belgium could expect under the old contracts will no longer hold.

The uranium supplying countries have generally maintained that if they sold their ore to Britain and the United States, leaving little or none for their own laboratories, it was only fair to expect that some of the non-military "know-how" obtained in the course of using that uranium should be made available to the supplying country. While atomic research and production was wholly pre-occupied with military work, as it has been during most of the course of the Belgian contract, the matter did not arise. Now that both Britain and America are actively starting to study the generation of atomic power, countries like Belgium, with limited domestic resources of conventional fuels, but with available supplies of uranium, have an interest in learning

Next week's issue of
THE ECONOMIST
will include a Special Section
on
DEFENCE

as much about these developments as possible. It seems, however, more than likely that Belgium will find it difficult to get the British Government to buy Congo uranium for anything but military purposes; and that Commonwealth supplies will be used in applications where questions of an exchange of know-how is likely to arise, until the experts feel that there is no longer any military advantage to be gained from keeping secret the engineering details of such plants.

Protection for Dundee

LORD WOOLTON'S announcement this week publicly admitted the protective character of the Jute Control and assured the jute manufacturing industry in Dundee that it will not be exposed to the full blast of competition from cheap Indian jute goods. His statement did not, however, bring a solution into view. Government trading in raw jute, which has been an incidental feature of protection for Dundee, will cease "at an early date," following talks with the industry. In practice, private imports may be resumed when the new Pakistan crop becomes available in the summer. But the Control will continue to be the sole importer of jute goods "until appropriate measures to safeguard the home industry under conditions conducive to efficiency can be worked out and introduced." The Government, said Lord Woolton, was giving full consideration to this problem, but could not promise any early solution. It has still not decided which of several methods, all objectionable in varying degree, it will adopt. These are:

(1) Restriction of Indian imports either by volume or by certain weights and types of goods. This would penalise those consumers who could not obtain a share of imported goods, which now meet about 40 per cent of Britain's requirements. Selective restriction would probably lose its protective effect, because consumers would try to adjust their demands to the types of Indian goods that could be imported.

(2) Centralised purchase of imports by a trade body instead of by the Ministry of Materials. Any such monopolistic system is usually better left in the hands of a government agency. Both (1) and (2) would also offend the cardinal principle of Gatt, that quantitative import restrictions should only be used to protect the balance of payments.

(3) A direct subsidy to Dundee.

(4) A tariff on Indian jute goods.

This last has some technical limitations, but it seems in fact to be the only proper form of protection. So far the Government has shied away from imposing a tariff on a line of Commonwealth manufacture that has long enjoyed the right of duty-free entry to Britain under the Ottawa Agreements. In view of the negotiations and legislation that would be required, however, the Ministry would be unlikely to get jute goods off its hands this year.

Retailers Reprieved

THE Chancellor's purchase tax statement last week got a much warmer welcome among retailers than it did from other traders. The shops are far less concerned about a

reduction in tax rates—although naturally enough they would welcome one—than they are with the effect of pre-budget uncertainties on their total volume of trade. They are hit in two ways, through the ever-present possibility of losses on tax-paid stocks should the tax rates be reduced, but also through the loss of trade during the pre-budget period that cannot, because of its seasonal nature, be recouped during the early summer. The manufacturer, on the other hand, if he makes goods attracting a high rate of tax, can be reasonably confident that sales are postponed, rather than permanently lost, during the weeks before the budget, and while this may mean dislocation of production, it does not follow, as it does among retailers, that there will be a net drop in turnover over the year as a whole.

The level of retail sales during the two months before Christmas shows that trade generally was not too seriously affected by the mild weather. Sales in November of non-food merchandise were 6 per cent higher than in November, 1952, and in December, 5 per cent higher than twelve months before. The general level of December trade was, in fact, better than the figures indicate, because the 1953 figures include a week of slack post-Christmas trading, while the 1952 figures cover the four weeks up to and including Christmas, with none of the aftermath. The rising level of stocks, however, does suggest that, good though it was, trade was not as high as retailers had anticipated it might be. In November, stocks were 9 per cent higher than the year before, and at the end of December they were 10 per cent up. The probable explanation for this upward swing is that Christmas trade started a week or so later than usual, and while it was exceptionally good once it got under way, the number of transactions that any one shop could handle was too limited to make up for the late start.

Germany and EPU

THE January settlement of the European Payments Union reveals Germany again well in the lead of creditors—on the past month's transactions as well as on accumulated credits. The German surplus for January amounted to \$43.1 million and was settled in equal parts of gold and credit. In its EPU operations to date Germany has secured gold to the amount of \$382.1 million and in addition has built up a credit balance of \$482.1 million with the Union. The build up may be accelerated, moreover, by Germany's decision, announced this week, to concede a generous liberalisation of German imports from the dollar countries. The relevant regulations provide that dollar goods imported into Germany as a result of this relaxation of import licensing may not be re-exported to hard currency countries unless they are further processed in Germany. With or without this last reservation, however, it seems highly probable that Germany will soon be acting as a funnel for the import of dollar goods into the whole EPU area—a process that on balance will cost Germany some gold but which at the same time will further increase its cumulative accounting surplus with EPU.

While Germany has far outpaced the other creditors with EPU (the second in the order of holders of credit balances is Belgium-Luxemburg with a credit of \$234.6 million), the United Kingdom heads the list of members that are over-

drawn. The British debit balance at the end of January was \$552.8 million. The fate of this and other overdrafts of long standing has been a topic of highly controversial discussion in Paris, where, as was noted in *The Economist* last week, the Management Board of EPU has been considering the terms on which the Union will be extended after June 30 next. The plan for "hardening" EPU that certain continental countries are propounding as part of the convertibility exercise is being strongly resisted by the British representative—not because Britain has any aversion to repaying its debts, but because the introduction of this element of rigidity in the EPU mechanism would be likely to provoke defensive measures, including further cuts in imports from EPU countries that would seem to run counter to the expansionist definition of the plan for convertibility.

Helping the Small Spinner

NO changes of substance have been made in the Cotton Bill, which had its third reading in the Commons this week. The Government rightly refused to prolong the trading and cover activities of the Raw Cotton Commission for a further year, but it will probably go most of the way towards meeting the Opposition's concern about supplies of cotton to contracting-in spinners after August 31st. These spinners, who are almost by definition the smaller firms in Lancashire, are in a difficult position. They contracted to buy from the Commission up to the end of August. The Commission's statutory obligation to spinners ends when the Bill becomes law this spring, though it will supply them until August 31st. By that time many of this season's crops, particularly the Sudanese, Pakistan and East African, may have been sold. To ask contractors-in now to waive their right to obtain cotton from the Commission, and to import privately their own requirements from the 1954 crops, would be expecting too much. The smaller spinners would argue that they could not afford to finance such purchases, and that the banks would not lend them as much money as they would wish against Egyptian-type and "outside growths," which will not be fully hedgable on the Liverpool market when it opens in May.

The Government has already stated that the Commission will buy sufficient Peruvian and Sudanese cotton to tide contractors-in over until the 1955 crops become available, and there is no doubt that this undertaking extends to the other cottons that are marketed in the next few months. How will this cotton be hedged? The Commission could sell it forward at a fixed price, leaving the buyer to hedge the risk of a fall in price on the Liverpool market; this would not appeal to the small spinner. Or the Commission could itself hedge the risk, and sell "on call"—the difference in price between the grade of cotton sold and the basic growth being fixed, and the spinner paying the market price when he calls for delivery. Either of these methods would increase the strain on the Liverpool market, which will then be taking up the hedges transferred by contracting-out spinners from the Commission's cover scheme. The industry and the market would no doubt prefer the Commission to sell on call without hedging its cotton, as has been its normal practice. The objection to this is that

Could YOU make a hit with her?

She's vigorous, vital and breathlessly young and she's going to have a big say in your future.

Why?

Because hers is the generation that's looking ahead . . . forming brand habits . . . deciding on the things to buy now and in the years to come. If your advertisements make a hit with her you're sowing the seeds of tomorrow's prosperity.

With its realistic approach to the problems of our time, its brilliant presentation of the news, the Daily Mirror has gained the biggest daily net sale on earth (4,500,000 plus) and offers you the most powerful mass market coverage in the history of daily newspapers at the lowest square inch per thousand rate of all national dailies. Moreover most Daily Mirror readers belong to the vital, keen-to-get-on younger generation. Your customers today—next month—next year.

BUSY EXECUTIVE SAVES TIME AND MONEY WITH OWN RECTOPHOT!

'... and 12 Rectophot copies of these by 11.30, please!'

It's as simple as that—excellent photographic copies of the Minutes of the Annual General Meeting will be ready in good time—and of course no mistakes!

No matter what he wants copied, the Rectophot is always right there in the office ready to do the job; in no time—with no upheaval—no great expense.

Perhaps you should know more about this? (our representatives are at your service). There are four models (we can send you a catalogue). Operation costs are next to nothing (so why not today, that letter to put us in touch with you?).

public funds would still be exposed to the risk of a fall in price after the Commission ceases public trading. But as the Commission has lost nearly £50 million in the last two years, the Government might consider this remaining risk a small price to pay for smoothing the industry's return to a free market.

Yet Larger Tankers

THE eighth of the ten tankers that Vickers-Armstrongs has been building for Mr Stavros Niarchos's World Tankers Corporation was launched at High Walker, Newcastle, this week, and at the launching Mr Niarchos and Lieutenant-General Sir Ronald Weeks indicated that the two companies were negotiating about further orders. The *World Harmony*, of 33,000 deadweight tons, is the largest tanker yet launched from a British yard, though Mr Niarchos's *World Glory*, launched a week before from a yard of the Bethlehem Steel Company in Massachusetts, is of 45,100 tons dw. The two remaining tankers of the programme, which are being built at Barrow, are planned to be even larger; they will vie with a hull now being built at Kure in Japan, for an American owner, for the title of "the world's largest tanker."

The independent tanker operators such as Mr Niarchos and Mr Onassis—both of whom have fleets of about a million tons dw—have been pioneers since the war in the development of larger and larger tankers; their latest giants are still somewhat ahead of the oil companies' own vessels. The major oil companies generally plan to carry about 40 per cent of their total oil tonnage in their own tankers, and probably an equal percentage is carried in tankers on time charter or consecutive voyage charter, a trade in which the big independent tanker operators specialise; the spot market accounts for little more than 10 per cent of the transport of oil by sea. Vessels such as the *World Harmony*, which will operate between the Persian Gulf and Britain, are mainly booked on time charters, which tend nowadays to run from two to five years. This question of forward bookings for ships that have to be

built has made the question of delivery dates a vital one in the placing of orders during recent years; while there is probably not much to choose in price between British and German construction, German yards have been less heavily booked and have indeed managed to offer shorter delivery periods after keel-laying. It has been the availability of berths in Japan, too, that perhaps brought its yards most of their recent orders, though its prices are now somewhat below European figures. And though with their high wage rates American shipyards can hardly compete in price, the speed of delivery they can offer can be a significant factor in obtaining tanker orders.

Talk About Take-overs

LAST week's Commons debate on take-over bids was, from the political angle, tame. The gap between the views of the Opposition and those of the Government proved narrow. The two philosophies are clear: the Labour view was put by Mr Roy Jenkins: "the whole technique of take-over bids drives a coach and four through the policy of dividend restraint"; not only boards actually afflicted with bids but many others who fear them, try appeasement on the shareholders. For the Government the attitude is summarised in the Chancellor's phrase: "if we were to keep industry and commercial activity absolutely static we should get nowhere." But Mr Jenkins was leaning hard to the right to admit that many of today's great undertakings could not have been built up without amalgamations and bids, while the Chancellor almost bent himself double in a leftward direction in expressing his condemnation of the "spiv" who gets something for nothing, and the type of bid where the objective is pure capital gain. He still urges a modified policy of dividend restraint.

Where there is so much common ground there is a risk that some of the most important points will be slurred over, and they were. Why should the Chancellor regard a pure capital profit as improper while he has no inhibitions about a profit on revenue account? Clearly one escapes the tax net and the other pays up. The remedy is in the hands of the Chancellor and he was entitled to plead an approaching budget as an excuse for silence. Still it cannot be denied that a distorted tax system which leaves capital profits free and taxes distributed revenue profits to the hilt does far more to encourage take-over bids than any original sin in the hearts of the bidders. Why also did no member pick up Mr Gaitskell's condemnation of Great Universal Stores' purchase of Rylands and other textile units and the alleged closing of a spinning mill? Is it suggested that more efficient redeployment of capital is a bad thing? Or that a business man as shrewd as Mr Wolfson would create unemployment by selling machinery which could be run efficiently?

Two useful things did emerge from the debate. Mr Butler has effectively demolished the claim that a coach and horses has been driven through the dividend restraint policy. In 1953 there certainly was an increase in the percentage rates of dividend paid, though most of this percentage—say, 6 out of 10 per cent—was attributable to the reduction in the standard rate of income tax. Measured against the shareholders' funds employed there

was only a trifling increase last year. Mr Gaitskell called this "a most dangerous argument to use." Dangerous it is—to him. The Opposition admitted that the ploughed back profits which have increased capital employed are the property of shareholders. Surely they cannot suggest that shareholders should go on ploughing back for ever and never desire any return. There will be general approval of the Chancellor's announcement that the President of the Board of Trade is still considering whether to appoint an inspector to investigate the transaction whereby the Savoy Hotel board sought last December to remove the Berkeley Hotel from the bidders' grasp by transferring it to a new company over which the Savoy hotel shareholders would have had no control. This damaging affair still needs to be cleared up.

P & O Becomes Airborne

THE purchase of a controlling interest in Britavia Ltd. by the P and O associate, The General Steam Navigation Company Ltd., is the third purchase of shares in an air transport company by a shipping group in the past five months. Now that the independent airlines are to be given a substantial degree of protection on any of the routes they are licensed to operate, the prospects of investing in established air companies have evidently presented distinct attractions for shipping.

This happens to be the first of such deals involving a controlling interest in an independent airline. Britavia Ltd. owns Silver City Airways, which operates a scheduled car ferry service to five points on the continent and does a good deal of non-scheduled charter work. Last summer, Britavia acquired Aquila Airways, which operates flying boats between this country and the Mediterranean. Britavia's financial backers included Cable and Wireless Ltd., and also a group of insurance companies; the latter have sold their interests, or part of them, to P and O. The fact that the short and medium range freight and passenger operations of these two airlines are in the same general category as the short-haul shipping business handled by the General Steam Navigation Company, seems to be no more than a coincidence. Silver City is building an airfield, and expanding its fleet; both commitments will call for capital of the kind that P and O can provide, but they had already been undertaken before negotiations for the share purchase were opened less than two months ago.

Last October, Clan Line acquired a 50 per cent non-controlling interest in two companies belonging to the Hunting Group, which began as a family shipping company in 1874 but which is now predominantly interested in the air. Then, early this month, Furness Withy acquired a "substantial" interest in Airwork Ltd. This again is not a controlling interest, Airwork's backing comes primarily from Guinness Mahon and Whitehall Investment, and it is expected that new shares will be created for Furness Withy. These developments have narrowed considerably the field remaining for investment. The only big independent operators still unlinked to shipping are the Lancashire Aircraft Corporation, which acquired Skyways Ltd. in March, 1952, and Air Charter Ltd. Apart from the medium-sized Scottish Airlines, the remaining independents operate on a very modest scale.

Export-Import Bank at Murupara

NEW ZEALAND has secured a credit of \$16 million from the Export-Import Bank to finance dollar equipment for the well-known pulp and paper project at Murupara—for which the New Zealand Government came to the London market for a £10 million loan last December to finance supplies from Britain. Although the Export-Import Bank, which is an agency of the American Government, is easily the largest source of dollar capital, it has made relatively few loans inside the sterling area. The primary deterrent is undoubtedly the provision made on all its loans that the proceeds shall be spent on purchases from the United States alone. This condition was of little moment for the Murupara scheme, however, as a considerable part of the equipment has in any case to be obtained in the United States.

The funds for the Export-Import Bank loan are actually to be provided by private banks and insurance companies in the United States; the Export-Import Bank's role is to guarantee payments of interest and repayment of the principal. The loan therefore makes no charge on the United States Budget but simply imposes a contingent liability upon it. The technique of guaranteeing loans from private companies has been successfully used by the International Bank, but it has hitherto had little part in the Export-Import Bank's lendings—and has never been used before for long-term loans. The scope for the investment of American capital should be appreciably widened by the Bank's new flexibility; but that will be of little benefit to the balances of payments of third countries so long as the dollars that are lent have necessarily to flow back to the United States.

Support for Scottish Aviation

THE Ministry of Supply has undertaken to "provide some technical assistance and a measure of financial support" for a light civil aircraft known as the Twin Pioneer. The Pioneer series has been designed by Scottish

ENGAGEMENT BETWEEN ANSON'S "CENTURION" AND THE TREASURE SHIP "CAVADONGA", 20TH JUNE, 1743, by Samuel Scott

BEFORE THE THUNDER and smoke of battle, the tensest moment: the ships sliding towards each other over the hissing sea, the guns run out, the crews still...and waiting. When someone murmurs the blasphemous grace "For what we are about to receive..."

Yet the men that died from round shot, from steel, were few compared to those who died from scurvy, the real scourge of the sea in those far-off days. And it was not only at sea that men died through lack of proper food, or from diseases caused by dirty food.

Today we know far better what to eat. And how to treat our food. How to keep it fresh and free from contamination. Much of our food today is protectively wrapped...from the baker, from the factory, from the shops. Wrapped, it may be, in packaging made by Bowaters. For Bowaters make wrappers and containers of many kinds—for food protection and a thousand other purposes in commerce and industry, all of them contributing, in their several ways, to the health, pleasure and efficiency of modern living.

More steel... less fuel

A steel furnace built in 1946 needed 66 therms to produce one ton of steel. The latest type of furnace in 1953 needed only 37 therms. The new open hearth furnaces are three times as big and cut fuel consumption per ton of steel by almost half, as compared with the 1946 unit.

This change is the impressive result of continuous research aimed at reducing the fuel bill by cutting down heat wastage.

The steel industry is not only producing more steel for our needs at home and the raw steel for 40% of our exports; less fuel per ton is being used in the process.

STEEL is at your service

Aviation Ltd. with the specially difficult operating conditions of the Western Islands in mind. These demand an aircraft that is rugged, able to land on grass or sand airstrips, and able to take off and land on very small areas. The twin-engined version of the Pioneer, capable of carrying about 16 passengers and taking off in 342 yards, has been developed as a private venture and the first prototype is due to fly this summer. The reason for the Ministry's decision to provide some financial support at this stage is more likely to be due to the possible military applications of the aircraft rather than its civil uses.

Experience suggests that the volume of air traffic in the remoter parts of Scotland is not big enough to encourage investment in new aircraft; but the prospects of atomic war, and indeed experience of operations in some of the less attractive jungle and desert conditions under which British troops are serving, has underlined the necessity for the Army of taking to the air. This rugged, light aircraft, with "exceptional take off and landing performance," is a direct and formidable competitor of the helicopter for these operations. No doubt political arguments in favour of supporting aircraft production in Scotland have also played a part in inducing the Treasury to consent to the Ministry's intervention.

Sables and Ermine...

THE winter fur auctions, the biggest of the year, went with a swing this month. In a large hall off Garlick Street, E.C.4, the rather dingy centre of the world's fur trade, the auctioneer sits on a dais overlooking the impassive faces of the buyers in the benches below. On either side of him are assistants, each closely scanning a section of the hall to spot the discreet signs of the bids. As this is a sale of Russian furs, the Russian representative sits on the auctioneer's left, and two other Russians are seated below. "One sixteen, one sixteen... all done at one sixteen." The auctioneer drops his gavel, and a Belgian buyer becomes the owner of one lot of 68 skins of ranched Russian mink, at 116s. a skin. In the warehouses nearby are millions of furs—some baled, some laid out for inspection—that have journeyed up the Thames from Russia, Canada, the United States, Scandinavia, South West Africa and elsewhere. Wild furs and ranched furs; sable and ermine, mink and Persian lamb; silver and blue fox, baum marten and squirrel, marmot and musquash, Brazilian otter, Australasian opossum and Baghdad lamb. The buyers, too, have come from a score of countries. Their stocks have been sold, they have money in the bank, and they are restocking for the autumn. Bidding has been extremely keen and spread over a wide variety of furs. Last year prices declined steadily, except for the ever-desirable mink. The United States, inevitably the largest consuming country, banned the import of seven varieties of Russian furs, which resulted in heavier offerings in Europe. This year, although the United States is buying much less than usual, prices have been firm because demand from the Continent, particularly Germany, and other countries has risen sharply. Prices of Persian lamb from South West Africa were very firm compared with the December sale, male ranched mink was about 10 per cent, and the female about 15 per cent higher than in January,

and ermine was about 10 per cent higher. Although the winter auctions are usually good, because they attract large numbers of small buyers as well as the large firms, the trade feels that prices should hold their present levels. At the latest auctions some 10 million skins were on sale, and for some varieties the quantities offered were a record. London has not only regained its prewar lead, but appears to be increasing it. The closing of the Russian selling organisation in New York has diverted more trade to London and increased the competition here. Sellers are therefore tending to send more furs to Garlick Street.

SHORTER NOTES

Associated British Engineering has announced that it has sold its holding of 2 million 5s. Ordinary stock units in Brush Electrical Engineering to Thomas Tilling. The deal has been done at the current market price which on Wednesday was 5s. 7½d. per unit. The deal involves only one-sixth of the Brush ordinary capital and a sum of approximately £550,000. It however breaks the close connection between Brush and Associated British Engineering built up under the chairmanship of the late Mr A. P. Good. Thomas Tilling, the former transport owners, is now an industrial holding company and has substantial cash assets.

★

A meeting to discuss the future of the North Atlantic weather ships is being held this week in Paris by the International Civil Aviation Organisation. Last autumn the United States Government announced that all 14 American ships, out of a total of 25 ships used to operate the service, would be withdrawn from service by July, 1954, when the present agreement expires. This would leave the whole of the Western Atlantic without means of high-altitude weather forecasting, which would be a distinct handicap to transatlantic air traffic. There have since been signs that the American Government was prepared to reconsider its attitude, and the presence of an American delegation in Paris tends to confirm this view.

Company Notes

IMPERIAL TOBACCO.—Tobacco equities flickered up in the stock markets immediately after the preliminary announcement from Imperial Tobacco Company that its dividend was to be left unchanged at 20 per cent while its profits had risen slightly. "Imps" themselves were marked up by 1s. to 56s., to offer a yield of 7 3s. per cent. The report for the year to October 31st showed that the profits of the Imperial Tobacco group had risen from £20,250,742 to £21,024,368 and that the profits of the parent company, that is of the tobacco company proper, had fallen slightly, from £18,896,593 to £18,823,674.

This direct comparison understates the improvement in Imperial Tobacco's fortunes last year, for the profits both of the parent company and of the group in 1951-52 included a surplus of £612,000 arising from the conversion of dollar leaf tobacco (purchased before devaluation) at

the post-devaluation rate of exchange. If this surplus is excluded, the other way of looking at Imperial Tobacco's profits shows that the parent company's profits have risen by about £540,000 and the group's profits by about £1,385,000. Thus, the modest increase in the earnings of the parent company suggests that Imperial Tobacco benefitted slightly from the marginal increase in the consumption of tobacco in 1952-53 but that further rises in costs, particularly in wages, kept the improvement in profits on a tight rein.

The rather more impressive increase in the earnings of the group as a whole probably springs from the important influence that paper and packaging have upon the group's prosperity. Packaging is both a cost to the group and a source of revenue; some of the subsidiaries do "quite a substantial amount of trade" in packaging materials outside the group. These subsidiaries bore the cost of the steep fall in raw material prices in their 1951-52 accounts; probably in the latest year profits from this trade have shown improvement. For the group as a whole the cost of these materials will have been lower, and, as the accounts of Tate and Lyle have already shown, this sort of change in costs can have an impressive effect on a company depending upon small margins and a huge turnover.

The slight alteration in profits, arising from a special cause, cannot dislodge the general impression that earnings in the tobacco industry are not likely now to advance much further. Tobacco equities

seem rather more vulnerable than other industrial "blue-chips." This vulnerability has been accentuated by the serious concern about the statistical correlation between lung cancer and smoking.

BOWATER PAPER CORPORATION. An increase in the profits of the Bowater group and, rather more problematically, an increase in its equity dividend have been in the back of investors' minds for some time. Both the prediction and the hope have been justified. The group's trading profits in the year to September 30th advanced from £6,708,295 to £8,184,070 and the equity dividend has been edged up from 15 to 16 per cent.

A bigger increase than this 1 per cent seems to have been precluded, in the directors' view, by the fact that in the spring the corporation's ordinary capital will be increased by another £1,800,000 when the £1 shares now under option are issued at par. The dividend decision cannot have been an easy one for the board to reach. The expansion of the group over years has been impressive and the directors must have felt that the latest increase in profits was far more genuine than that in 1950-51, when profits were inflated by inventory gains and when the

dividend was appropriately left unchanged at 15 per cent. Last year the increase in profits was also achieved without the aid of the new paper and pulp mills in Tennessee, which should come into operation in the spring, though the new capital required to build this plant was already being serviced. And it was achieved while the installation of new power plant and newsprint machine was still in progress at the corporation's mills in Kent. A further consideration, apparently, was the fact that the group's financial resources have been strengthened; its net current assets at the end of September totalled about £16,750,000, an increase of £2,680,000 over the 1951-52 figure.

The consideration which, however, must have been given the greatest weight was the revival in the group's trade last year. The trade recession, which gave

the group's earnings a very sharp knock in 1952, was followed in 1953 by "a marked and sustained improvement in trading conditions in this country." This improvement is reflected in the advance in the group's trading profits. The group makes a large part of the newsprint which British newspapers use. So year after year the directors have been at pains to explain that the high profits come from the overseas interests and that home newsprint profits are quite small. This year they say the same thing, but *sotto voce*. The bulk of the earnings still come from the overseas interests, but a larger proportion than usual was contributed by British subsidiaries. The accompanying table shows that while the Newfoundland company's profits declined, earnings of at least two British subsidiaries increased.

Bowater's preliminary report has come at a time when the plea for bigger newspapers has taken on a fresh lease of life. Bigger newspapers may or may not mean fatter profits for the newspapers themselves, but they should certainly mean bigger profits for the owners of the largest integrated woodpulp and newsprint mills in Europe. This is a factor that must have its place in any consideration of the yield of 6 17s. per cent offered by the £1 ordinary stock units at the current price of 46s. 9d.

ENGLISH ELECTRIC. The warning by the directors of English Electric that last November's 50 per cent share bonus did not necessarily imply an increase in equity dividends went more or less unheeded in the market, where the £1 units continued to be quoted on a comparatively low yield basis. It now turns out that the directors meant what they said, for by paying a final dividend of 6 1/2 per cent on the equity capital of £10,616,193 (as increased first by the £1,769,365 rights issue and secondly by the £3,538,731 bonus issue) on top of the interim dividend of 5 per cent on the

Ordinary dividends.....	418,013	535,253
£1 ordinary stock at 41s. 6d. yields 4 1/2 per cent.		

original capital they have effectively left the dividend rate unchanged. In 1952 they declared a full year's dividend of 15 per cent; the equivalent rate for a full year on the new capital is 10 per cent. This is the rate on which yield calculations should now be based, and it should be remembered that this dividend is servicing capital increased by an influx of new and presumably remunerative money, as well as the bonus shares issued last November.

The dividend disappointed the bulls, but the preliminary profits statement for 1953 suggests that the directors had little choice but to maintain for the present the effective rate of dividend. The group's net profits have risen by only £163,938 to £1,546,995. This increase

follows an advance in gross profits from £5,481,002 to £6,042,380. The rise is proportionately much smaller than those recently announced by companies in the consumer goods trades. Naturally it is so, for the capital goods industries, of which English Electric is a good example, never suffered the sharp 1951-52 recession which a large section of the consumer goods industries experienced. Therefore they now offer far less scope for quick advance, strong though their order books may still be. In the very long run, the merits of English Electric's equity and of other capital goods equities are undimmed, but in the short run their yields occasionally look narrow.

LEYLAND MOTORS. One of the stock market's hunches that has gone wrong is that Leyland Motors would raise its dividend. Three weeks ago investors began buying in anticipation of a better dividend, and the £1 ordinary stock units were gradually forced up to 92s. 6d. The buyers, lured perhaps by the increased profits of Associated Commercial Vehicles, seem to have forgotten that Leyland had cut its prices a year ago and that in the summer its factories were on short time, because import restrictions had reduced the sale of commercial vehicles. Instead, they based their hopes on the improvement in trade that took place towards the end of the financial year—but which came too late to prevent trading profits for the year to September 30th, from showing a decline. As an investment, the record of Leyland Motors is far from even.

The group's trading profits did indeed fall, from £3,359,290 to £2,997,498, and so, too, did its net profits, from £928,612 to £771,297. And the directors left the equity dividend unchanged at 25 per cent. After this announcement, the company's £1 ordinary stock units were marked down 5s. 6d. to 87s. They lost all the gains that were made in the last three weeks; at 87s. the equity units yield just about 5 1/2 per cent.

BORAX CONSOLIDATED. The full report of Borax, for the year to September 30th, is reasonably encouraging. The group's trading profits have risen slightly from £1,337,297 to £1,385,539 and the chairman tells shareholders that "demand was at a very healthy level but wages and some costs increased again." Investment income fell slightly, from £325,912 to £314,786. A reduction in taxation was followed by an advance in net profits (from £510,521 to £617,192) and the directors decided to raise the ordinary dividend from 10 to 11 per cent. In the current year the directors will recommend a bigger interim dividend than the 2 per cent paid in the last seven years, but this step is towards an equalisation of the two dividend payments and it in no way foreshadows an increase in the full year's distribution.

The directors may have been encouraged to be a little more generous by the fact that the group's liquid resources were strengthened after stocks had fallen from £1,928,740 to £1,798,497. Planning a long way ahead the group has secured an agreement with its bankers in the United States to have a credit of £1 million on tap over the next ten years. There are no immediate plans for expansion or diversification in the United States but the directors feel that there may be a need for substantial funds over there sometime in the future. This credit will be secured on the group's investment in the United States Potash Company. Commenting on that investment, the chairman points out that recently the Potash Company has had to reduce its dividend, to an extent which will reduce the Borax group's income by about £30,000 this year. The United States Potash's profits were adversely affected by the fall in sales of fertilisers during the severe drought of 1953 and to a lesser extent by imports of the lower-priced German potash. Immediately after the publication of the full accounts the £1 deferred ordinary stock units were marked up by 4 1/2d. to 44s. 7 1/2d., to offer a yield of 4 1/2 per cent.

LONDON STOCK EXCHANGE

Next Account begins: March 3rd.
Next Contango Day: March 3rd.
Next Settlement Day: March 9th.

In the middle of the week the stock market staged a slight recovery from the losses recorded in equities just before and after the week-end. Gilt-edged prices drifted lower in a very quiet market after the details of the Transport issue were published but after the lists had been closed prices had begun to edge upwards again. Dominion and Colonial issues remained reasonably active, with much of the interest concentrated upon the longer dated 4 and 4 1/2 per cent issues. In the foreign market German Potash bonds were marked up, taking the Young and Dawes loans with them, on the details of the new offer, but they soon reacted from these new levels. Later in the week the German government issues made some fresh gains but on Thursday morning the Potash issues were again marked down. Elsewhere in the market "iron curtain" issues were dull but Greek and Japanese issues improved slightly.

Immediately before and after the week-end industrial equities made quite heavy losses in the face of a bout of selling. Once the selling orders had been carried through, however, prices again began to improve. Tobacco shares were particularly badly hit by the statement in Parliament on lung cancer and smoking; elsewhere in the market the biggest losses were reported in engineering, building material, electrical equipment and textile shares. Later on a better demand for leading equities brought about new gains in tobacco, engineering, store, electrical equipment, steel, and paper shares. Oil shares were dull at first but began to show signs of picking up again in late dealings on Wednesday and in early dealings on Thursday. Rubber and tea shares began the week on a reasonably steady note but later in a narrow market moved somewhat irregularly. No definite trend was noticeable among Kafirs; a rally in prices was staged on Tuesday and in early dealings on Wednesday but prices reacted sharply when profits were taken later on in the week. Base metal issues were inclined to sag.

(1) Relates only to prices in capital cities for Austria, France, Greece and Turkey. Cost of living in Paris based on 1949=100, and in Western Germany on July-December, 1948=100. (2) Index numbers of unit value which compare the current value of trade with its value in 1948; they are influenced by changes in the composition of trade as well as price movements. Index numbers for Germany based on 1950. (3) Notes only for France and Austria. (4) Holdings of the government and central bank at end of period; figures for Greece are gold reserves only.

Financial Statistics

EXCHEQUER RETURNS

For the week ended February 13th, there was an "above-line" surplus (after allowing for Sinking Funds) of £58,597,000 compared with a surplus of £149,287,000 in the previous week and a surplus of £53,923,000 in the corresponding period of last year, raising the cumulative surplus to £210,860,000 (£173,457,000 in 1952-53). Net expenditure "below-line" absorbed £14,974,000 which brought the total cumulative deficit to £140,141,000 (£325,619,000 in 1952-53).

In consequence of official purchases of tender bills in connection with cash subscriptions to the Exchequer Stock issued in October, it was impossible to calculate the division between tap and tender bills until all the bills purchased had passed their original maturity date.

THE MONEY MARKET

CREDIT was still generally short in Lombard Street in the week covered by the Bank return, but there was no acute stringency comparable to that experienced in the previous week. Before the weekend market funds were not quite adequate for demands and the authorities stepped in each day to buy very small quantities of bills through the banks. Their purchases on Monday were somewhat larger, but on Tuesday none at all was needed, even though some houses had to repay loans from the Bank. Conditions tightened again on Wednesday and, despite some further indirect aid, a number of houses were forced to part with early May securities at 2½ per cent—that is, ½ per cent above the prevailing rate.

The market maintained its bid at £99 9s. 8d. per cent at last week's Treasury bill tender, at which the amount of bills on offer was raised by £10 million to £230 million. Applications, however, were down by over £16 million, to £369.9 million, and the market's allotment accordingly rose from 49 to 58 per cent. At yesterday's tender, the offer was raised further, to £240 million; if this is fully allotted there will be an excess of new bills over maturities of £10 million next week.

The Bank return shows an outflow of notes of £2.2 million in the week to Wednesday last. Government securities in the banking department rose by £2.1 million, but discounts and advances were down by £8 million—reflecting in part the repayment of the previous week's loans at Bank rate. As public deposits fell by £2.7 million and other accounts were also down, the fall in bankers' deposits was limited to £5.8 million.

LLOYDS BANK LIMITED

FACTS ABOUT DIVIDENDS AND WAGES

LORD BALFOUR OF BURLEIGH'S STATEMENT

INCREASES BETWEEN 1938 AND 1952

The annual general meeting of Lloyds Bank Limited was held on February 12, 1954, at the head office, 71 Lombard Street, London, E.C.

The Right Hon Lord Balfour of Burleigh, DCL, DL, the chairman, presided.

With the concurrence of the members present the report and accounts and the statement by the chairman, all of which had been previously circulated, were taken as read.

In moving the adoption of the report and accounts the chairman said:

As I notice a tendency in some quarters to make the small increase in dividends recommended by some bank boards, including our own, an excuse for still further pressing wage claims, I want as an addendum to my statement already in your hands to try to bring into proper perspective the relative importance of wages and dividends in relation to inflationary pressure.

The additional dividends declared for 1953 by the clearing and other banks were considerably less than £1 million gross: to be precise, £853,000. In the calendar year 1953 wage increases amounted to £125 million. And remember that the present series of increases in bank dividends are the first changes since the drastic reductions of more than twenty years ago, whereas the £125 million of wage increases are simply the continuance of a process that has been going on since 1939.

Our present dividend of 14 per cent nominal actually represents a smaller money payment to a holder liable to tax at the standard rate than the 12 per cent dividend paid in 1938. In 1938 a holder of 100 "A" shares received £12, less tax, at 5s. 6d., i.e., £8 14s. Today he receives £14, less tax, at 9s., i.e., £7 14s. So he is down £1, even in money terms, and the real purchasing power of his present dividend is only two-fifths that of the 1938 dividend. The yield on an investment in our shares, with the 14 per cent dividend, at a price of 60s., is 4½ per cent, or, in actual cash, after deduction of tax, at 9s., just over 2½ per cent.

WAGE INFLATION

May I now put the relationship of wages and dividends in a wider setting? What we are concerned with is the weight of money as spending power in causing inflation, and the facts can surely leave no doubt that any contribution of higher dividends is quite negligible compared with that of wages and salaries.

The amount of money received as wages in 1952 was £5,460 million, and in wages and salaries taken together £8,215 million,

compared with £472 million in ordinary dividends. This means that in 1952 dividends on all ordinary shares were something less than 50 per cent higher than in 1938; on the other hand, salary incomes were about two and a half times as great as in 1938, and wages had more than trebled. In actual money, the increase since 1938 in wages alone was nearly twenty-five times as great as the increase in ordinary dividends. The increase in wages and salaries taken together was thirty-five times as great. (See Diagram above.)

It is also a fact that industrial production in 1952 was no higher than in 1950, yet during those two years wage incomes in the relevant industries increased by £542 million, and salaries by £153 million. To adapt a familiar advertisement: That's inflation, that is.

And while I am unlikely to be asked in this company what service the ordinary shareholder performs in return for his dividend, it is perhaps worth reminding ourselves that he is the source of the life-blood of industry, the risk capital without which labour could not have been set to work in the first instance. And without a constant supply of fresh risk capital, industry cannot work properly or continue to provide full employment. Moreover, of the millions of equity shareholders a large proportion are people of quite small incomes. The average individual holding of the 60,000 shareholders in our bank is in the "A" shares 248 and in the "B" stock £56.

What seems to me so regrettable is that attempts are being made in certain quarters to engender class bitterness by statements about wages and dividends which represent the dividend receiver as a profiteer, whereas in sober fact it is the wage earner who has been the real beneficiary of the inflationary process.

The *Daily Herald* has in fact taken pride in pointing out in its advertising that the real purchasing power of wage earners in 1952 was about one-third higher than before the war. And that is true even after payment of taxes and before making allowance for social security benefits. I think it is undeniable that this change has been brought about largely at the expense of other, and not only the wealthier, sections of the population.

We British are a magnanimous lot and no one, I believe, grudges the redistribution brought about by progressive taxation and designed expressly to help the poorest. But superimposed upon this process there is continuing a further redistribution due purely to inflation and benefiting all wage earners as such, regardless of the scale of their earnings.

The wage earner is at heart as magnanimous as anyone else, and I believe that if

these facts could be brought home to him he would hesitate before pressing a claim to a still larger share of the national income. For that is what is involved by any increase in wages without a corresponding increase in productivity; for example, if wages are raised to meet every rise in the cost of living—itsself often engendered by increased wages—other sections of the population have to meet the bill.

UNEMPLOYMENT DANGER

It is, I think, beyond doubt that if the wage earners exert their full power they can under present conditions, and in the short run, secure for themselves a still greater share of the national cake. In the light of the facts and figures I have just given you that would not seem to be a generous course, but in suggesting to the wage earner that it would be unwise, I am thinking less of magnanimity than of his own self-interest. For it is the stark truth that in our present economic position higher costs will, in a period quite short in terms of years, price us out of our export markets to an extent which, in my opinion at least, will create grave unemployment in this country—unemployment which no attempt to whip up internal purchasing power by cheap money or other expedients of the kind could conjure away.

What a wonderful thing it would be if we could wake up one morning to find each pound buying more; cost of living falling; real wages rising automatically. Yet this miracle could be brought about quite simply by higher productivity without higher costs. No one has more to contribute to, or more to gain by, that process than the earner of weekly wages. Moreover, he can nowadays rely with certainty on his bargaining power to secure for himself his full share of any increase in the national cake. My point is that—as things are now—he cannot safely take more until there is firmly and solidly a larger cake to divide, and a stable pound in which to draw his weekly wage.

It is a simple recipe; could we not try it?

The report and accounts were adopted and the other ordinary business transacted.

Votes of thanks were passed to the chairman and directors and to the staff.

MARTINS BANK LIMITED

ANNUAL GENERAL MEETING

The one hundred and twenty-third annual general meeting of Martins Bank Limited was held on Tuesday, February 16th, at the head office, Liverpool. Mr A. Harold Bibby, DSO, DL, the chairman, presided.

The notice convening the meeting and auditors' report were read.

The report and accounts for 1953 and statement by the chairman, all of which had been previously circulated, were adopted. The chairman said he thought the most gratifying aspect of the present position was that the bank's shares had once more emerged from what was fast becoming a fixed interest stock, back into a genuine equity and assured the shareholders that it would be the ambition of the board to maintain that position.

Resolutions were passed re-electing the retiring directors and fixing the auditors' remuneration.

A vote of thanks was unanimously accorded to Mr Bibby for presiding.

The chief general manager, Mr C. J. Verity, JP, acknowledged the tribute to the staff.

CLYDESDALE & NORTH OF SCOTLAND BANK LIMITED

CHANGING ECONOMIC CONDITIONS

SIR HAROLD E. YARROW ON PRIME IMPORTANCE OF HIGHER PRODUCTION

The one hundred and sixteenth annual general meeting of the Clydesdale & North of Scotland Bank Limited was held on February 10th in the head office, St. Vincent Place, Glasgow. Sir Harold E. Yarrow, Baronet, CBE, LLD, chairman of the bank, presided, and in the course of his speech said:

I am sure you will share with me a feeling of satisfaction in the position disclosed by the annual report and balance sheet.

RECORD ASSETS

The total assets show an increase of over £9 million compared with 1952 and, with the £200 million mark now passed, another landmark in Scottish banking has been established. In 1952 our deposits increased by over £7 million, and I am pleased to say that they have now gone ahead by a further £6½ million to a record total of £166,408,638. It may be of interest to mention that the increase of £13½ million in the past two years is greater than the total deposits of the Clydesdale Bank in 1911. While the continued growth of business activity and the growing inflation over the years is largely responsible for the increase, we can also claim that the wide service which we are now able to offer the public is a factor of no small importance.

The profit for the year shows a moderate increase of £39,327, but, at £429,495, is still £14,319 less than that recorded for the two constituent banks in 1938. Salaries and general charges continue to rise, but the reduction of 6d. per £ in income tax and the income from the larger resources at our disposal have resulted in an improved profit margin. The rate of dividend and the allocations of £32,500 and £100,000 to staff widows' fund and staff superannuation fund respectively are all unchanged, but the increased profit has enabled us to allocate £80,000 against £55,000 to reserve for future contingencies. The resulting carry-forward to 1954 of £199,257 is up by £2,187.

NO GROUNDS FOR EASY OPTIMISM

The past year has, on the whole, been one of fairly steady recovery from the reduced level of activity in 1952. But there are, I fear, no grounds for easy optimism; in fact, there are grave dangers ahead if we as a nation fail to realise the changes now in progress in the economic sphere throughout the world.

One fundamental fact which should be stressed is the extent to which we in Britain depend for our wellbeing on trade with overseas countries. Without export trade on a large scale we must not only decline in status as a world power but also suffer a serious decline in our standard of life.

Already there are definite indications that in some respects Britain is no longer holding her ground. The future is thus potentially grave. It seems to me, therefore, to indicate a serious misconception of the realities of our economic position that at this time a general movement should be afoot to raise further our industrial costs. I can only ascribe this policy to the fact that wage increases have been more or less regularly secured year by year, and that manu-

facturers' order books are still on the whole comfortably filled. Full order books, like full employment, carry their own dangers for the future if they result in constantly rising costs. If our prices are not competitive, a time will certainly come when replacement orders cannot be secured. That time, I suggest, is ominously near and in some cases has actually arrived. It is, then, surely unwise, to say the least, to speed its approach by our own deliberate action. The level of wages should by this time have regard to the need to secure orders in the future rather than being based on existing orders which are, in fact, being steadily worked off.

PROFITS THE BASIS OF NATIONAL WELFARE

Of prime importance is the need to increase production without an increase in costs. Indeed, higher production would actually bring about a relative reduction in costs—a very necessary result—and there can be little doubt that without any suggestion of hardship the additional effort needed to secure it could easily be made. As a nation we have not of late been guilty of overworking.

Increased output would, moreover, provide the only sound means of satisfying the desire for increased earnings. It might also, but with no certainty, lead to higher profits, but this, it should be emphasised, would be wholly to the national good. Apart from the fact that national prosperity—which, like peace, is indivisible—indicates a healthier economy and thus a greater assurance of comfort for all, profits are the basis of our national welfare. They not only, through the taxation, help to sustain our social security system, but they also provide the source of the capital which is constantly needed to maintain our productive machine at the highest pitch. They should, therefore, be encouraged rather than criticised. It is from profits that large sums have been expended in modernising industrial plant to increase both production and efficiency, and it cannot be too strongly emphasised that the present burden of taxation is diverting large sums which ought properly to be applied to this purpose.

To achieve the necessary expansion in economic activity, efficiency in organisation and intensified effort on the part of everyone engaged in industry—employers and employed—are absolutely essential if we are to sustain the volume of trade which we conduct with overseas markets and thus make our future secure. In any case, the alternative cannot be contemplated lightly, and there are already serious indications of a new upward movement in the costs structure with all that that implies.

I should like to emphasise afresh, however, that the remedy is in our own hands. Given an appreciation of the dangers ahead, and a general determination to advance the national rather than any sectional cause, we need not despair. Recent years have demonstrated afresh the inventive genius of the British people, and if this is supported by conscientious individual effort throughout the country the prospect need not be gloomy.

The report and accounts were adopted.

THE NATIONAL BANK LIMITED

ANNUAL GENERAL MEETING

The one hundred and nineteenth annual general meeting of the proprietors of The National Bank Limited was held on February 11, 1954, at 13 Old Broad Street, London, E.C.2. Mr Michael J. Cooke, the chairman, presided.

The secretary, Mr H. J. Woollard, read the formal notice convening the meeting and the report of the auditors.

The directors' report for the year, which had been previously circulated, was taken as read, and the chairman reviewed the principal movements in the balance sheet figures as compared with those of a year ago. Reference was made to the transfer from profit and loss account of £30,000 to the reserve fund, contributions of £126,677 to the staff pensions and provident funds and the provision for a final dividend of 6 per cent, making a total of 11 per cent for the year, which left the sum of £50,644 to be carried forward.

The Chairman moved: "That the profit and loss account for the year ended December 31, 1953, the balance sheet as at that date, and the directors' report be adopted by the meeting and entered on the minutes."

Sir Cornelius J. Gregg, KCB, KBE, LLD, seconded the motion, which was carried unanimously.

The retiring directors, Michael J. Cooke, Esq., Sir Evan M. Jenkins, GCIE, KCSI, and Sir George F. Murphy, Bt, were re-elected, and the remuneration of the auditors, Messrs Peat, Marwick, Mitchell and Company and Messrs Stokes Bros. and Pim, was fixed.

BRITISH TABULATING MACHINE COMPANY

The forty-seventh annual general meeting of The British Tabulating Machine Company, Limited, was held on February 12th in London, Sir Cecil M. Weir, KCMG, KBE, MC (the chairman), presiding.

The following is an extract from his circulated statement:

Trade conditions during the year have presented a challenge to our sales force. People need more convincing to spend money when trade is difficult than when it is easy and we have, therefore, had to fight hard for the substantial increase in rentals and sales revenue we have achieved.

Satisfactory as the growth of our turnover has been in recent years, the nature of our rental business still makes it necessary for us to use financial resources beyond those provided by our earnings or our issued capital. It remains our intention to replace, at least to some extent, our short term borrowing by more permanent capital as soon as a suitable opportunity offers.

The company continues steadily to consolidate its financial and operational position. The company now manufactures any type of equipment previously obtained from the United States and, additionally, it has already placed on the market new machines both of the electro-mechanical and electronic types.

The group profit, before taxation, amounts to £630,619 as compared with £587,446 last year. We propose a final ordinary dividend of 5 per cent (making a total of 8 per cent for the year). Our various subsidiary companies in the United Kingdom are making a more and more useful contribution to the requirements of the parent company.

The report was adopted.

JONAS WOODHEAD AND SONS

(Manufacturers of Road and Rail Vehicle Suspensions)

RECORD OUTPUT

CAPTAIN ALLAN KYLE'S SPEECH

The thirty-fourth annual general meeting of Jonas Woodhead and Sons, Limited, was held on February 15th at Kirkstall Road, Leeds.

Captain Allan Kyle, the chairman, in the course of his speech, said: I have pleasure in presenting to you the balance sheet of your company at September 30, 1953, and from a group angle, a consolidated balance sheet and the consolidated profit and loss account. Alongside, you have the relevant figures for the previous year. As these accounts have been before you for some time, with your concurrence I will take them as read.

ACCOUNTS

You will see that once again we have done remarkably well. That is, we have again succeeded in creating a new record in output, again widened our markets in the export field and again reached a higher level of trading profit. But this delightful story ends abruptly in a blizzard of taxation liabilities. One does not mind a patch of bad weather, in fact it is expected, but when one has to face a howling blizzard for nearly nine continuous months, then it is cruel, disheartening and dreary. Out of a taxable revenue of £198,675, the fantastic sum of £144,154 has to be provided for the Exchequer leaving a miserable £54,521 for the company. We have to hand over to the Revenue, for the year under review, a sum of money in cash which is more than three times as great as the sum which the company is proposing to pay to its shareholders as dividend. By all means let us make a worthy contribution to the financial needs of the nation, but not to an extent where incentives gain no reward and the vitality of enterprise is stunted. Although the Excess Profits Levy has now ended, I should remind you that we have this liability with us for the first three months of our current financial period.

I do not think it is necessary to occupy your time in analysing the accounts in detail as they should be self-explanatory. Perhaps I should point out that the net consolidated trading profit recorded a further advance by £35,768 to the new high level of £303,767. Capital expenditure amounted to £201,700 which is reflected in an increase in the depreciation charge from £39,924 to £49,947. Current assets total £1,251,984, exceeding current liabilities by the substantial margin of £819,791. Most of this excess however is accounted for by stocks and debtors, cash being at a very low ebb.

NEW CAPITAL

Dealing now with the proposed new issue of 300,000 5½ per cent redeemable cumulative preference shares of £1 each, my letter of January 21, 1954, enclosing the notice of an extraordinary general meeting to be held immediately after the close of this meeting, gave a brief explanation of the proposed method of raising further capital and of the necessity for doing so. If the balance sheets of the past few years are examined in detail, then the reasons become obvious. In broad terms, our working capital has been absorbed in the acquisition of new and modern plant, the installation of which has been greatly accelerated over the last year or two, in the building up of reasonable stocks of steel, and in the general expansion

and broadening of the Group's activities both at home and abroad. For a time we were able to meet these calls with the aid of bank finance and of accruing profits, until such time as the latter had to be dissipated in paying resultant taxation. After a careful survey of current and foreseeable requirements of the business, your board came to the conclusion that the company needs £300,000 additional long term finance to carry on the business progressively and smoothly. On examination of the various alternatives available it seemed that, despite the unhappy incidence of profits tax, the interests both of the shareholders and of the company would best be served by an issue of preference shares on the terms indicated, particularly as every shareholder has the opportunity of subscribing for the new shares.

As you have already been informed, we have obtained the consent of the Treasury for the capitalisation of £131,250 out of reserves, in order to bring the issued ordinary capital more into line with your company's trading importance and to make its shares more marketable. This sum will be issued in the form of renounceable allotment letters to existing shareholders on the basis of 28 new fully paid shares for every 100 held.

SOUTH AFRICA

As you know, for some years past we have had a substantial but not a controlling interest in our two associated South African companies. An opportunity occurred during the past year to acquire further shares, with the result that these companies now become subsidiaries in which we hold approximately a 75 per cent interest. The addition of £38,221 to the balance on profit and loss account represents the proportion of undistributed profits referable to our original shareholding, while the balance referable to the additional shares recently acquired has been adjusted in capital reserves in the consolidated balance sheet. At this point, I might add that we are now the largest manufacturers of road and rail spring suspensions in South Africa. In taking a long-term view, we feel our investment and enterprise will not only prove highly satisfactory, but will indirectly more than offset the loss of our exports to the country through the effect of their import controls.

We have further developments under negotiation in other parts of the world, but I regret to say that I am not yet in a position to give you any reliable information in this regard.

THE RIGHT TO STRIKE

In view of the recent serious disturbances in many industries, I am wondering whether the time has not come when management will have to demand some form of protection for their own workpeople in regard to strike action.

It is an essential part of the rights of the British wage-earner that he should have the right to strike, and that his voice should be heard through his works committee or, at a higher level, through his union. All this is to the good and, as I have recorded publicly several times, the union officials with whom we are in direct contact are respected by us as responsible and earnest people.

maintain the British standards of fair play to both sides. But protection is needed by us all when this strike weapon gets into the hands of irresponsible people, actuated by dubious motives and operated by dubious methods, thus creating a state of affairs not only injurious to the nation, but to the workpeople themselves. When distant strikes take place in whatever phase of the country's activities, we here sooner or later feel the effect by the postponement or cancellation of orders or shortage of supplies and our fine and decent crowd of workpeople have to suffer, your assets become less productive and a well-planned industry is thrown out of gear.

The Companies Act has seen to it that the interests of the shareholders are widely and amply protected. They have the right to act and the power to investigate while their leaders, the directors, can be subjected to serious penalties if they fail in their duties. When shareholders make a decision by a majority vote, the world at large knows it is the expressed opinion of the majority because it has been reached within the framework of the law. When, however, we come to the affairs of the workpeople, and a strike is declared by a majority vote, are we all content and certain in our own minds that it is really the expressed opinion of the majority?

If there is this doubt then, in my opinion, it is the duty of employers' federations, trade associations and other similar bodies to press for the introduction of immediate legislation to remedy this weakness and to make it illegal for any body of persons to declare an official strike until it has received a majority vote of all the workers concerned, by secret ballot in a proper and regularised manner. Any other type of strike should become illegal. From discussions I have had, I would go so far as to say that all sensible thinking wage-earners would welcome such legislation and that any political party having the courage to introduce it would gain, and not lose, votes.

THE COST OF THE SPIRAL

It is no idle comment to say that we, along with the greater part of industry, have run into competition of some intensity not only in the home market but internationally. To those who have been ever on the watch to attain greater efficiency, both in equipment and methods of production, to achieve a greater throughput of products and to maintain a high level of return for the workers, there should be no real anxiety. In all modesty, I would like to include your group of companies in this category. These distant strikes to which I have referred did disrupt us a little while ago, but we are now once again in steady production, and I know very well that it is the earnest endeavour of every man in the organisation, whatever part he performs, to overcome this lag and to produce successful results by the end of the year, in the typical Woodhead spirit. To these people I would like to say thank you.

While I am on this subject of competition I would like to bring up the question of the seriousness and alarm caused by the ever-rising prices of our basic raw materials. Consider, for instance, the recent history of coal

larity, immediately followed with equal regularity by uplifts in the price of coke, gas, electricity, then steel, then transport charges, followed somewhat later on by price increases in everything else we have to buy. And so it goes on, an enormous spiral of price increases stemming from a nationalised industry, which individual industries can only slow down, but are powerless to stop. If only the Government had the courage and the initiative to step in and tackle the spiral at its base, and so stop the ever passing on of the snowball which becomes an avalanche, then perhaps their exhortations to private enterprise to produce more goods at lower cost and to increase exports might be more realistic both in sound and in effect.

The report and accounts were unanimously adopted and the proceedings closed with a vote of thanks to the directors, staff and workpeople.

At the extraordinary general meeting held immediately afterwards, resolutions were passed unanimously increasing the authorised capital of the company, adopting new Articles of Association and authorising the capitalisation of part of the company's reserves by the issue of additional ordinary shares.

THE METROPOLITAN RAILWAY COUNTRY ESTATES LIMITED

SUBSTANTIAL IMPROVEMENT IN PROFIT

SIR BERNARD DOCKER'S STATEMENT

The thirty-fourth annual general meeting of The Metropolitan Railway Country Estates Limited will be held on February 24th at Kensal House, 553-579 Harrow Road, London, W.10.

The following is an extract from the statement by the chairman, Sir Bernard Docker, KBE, circulated with the report and accounts for the year ended October 31, 1953.

Net consolidated profit for the year to October 31st last after providing for tax and profits tax is £36,190, including £15,565 arising from the book amount of the development rights, less tax, returned to the company by reason of the amendments to the Town and Country Planning Act, 1947. This shows a substantial improvement as compared with the previous year, for which the corresponding figure of net profits was £12,288.

We recommend a dividend of 10 per cent, less tax. The balance on consolidated profit and loss account to be carried forward will be £126,139, which compares with £109,199.

ESTATE DEVELOPMENT

In my statement last year I referred to the fact that we were at that time just beginning to resume building on our estates. We are now engaged in the development of further sections of those estates, making available a considerable number of building sites for houses. We are experiencing a very keen demand for these sites in spite of the high prices relative to prewar levels we are compelled to ask, having regard to current costs of road-making.

For some years past I have felt it necessary to deplore the adoption of and adherence to unrealistic policies in respect of housing and town planning. I am all the more happy, therefore, to join now in the congratulations

generally being offered to the Government and to Mr Macmillan in particular, for the success achieved in new housing this year and perhaps even more for the more realistic approach made to these problems.

At first sight the proposals in respect of housing repairs and rents and the programme outlined in the Government White Paper "Houses the Next Step" must appear timid and trivial in relation to the problems they are designed to solve. These are the problems created by many years of refusal by all parties to face up to the fact of steady deterioration in the condition of one of the country's major assets next to the people themselves, I refer of course, to the houses in which they live. At the same time my colleagues and I feel it our duty to commend the fact that a start has been made.

SUBSIDIARY COMPANIES AND ACTIVITIES

I am very glad to say that our farming venture in which we have a very substantial investment through our subsidiary, MRCE Farms Limited, has justified itself this year.

Our other subsidiaries have continued to trade on a small but successful basis. During the year our purchases of agricultural estates have been limited; we have directed our energies to a greater extent to the improvement of the existing estates and the negotiation of improved rentals.

Conclusion: I conclude by saying that our funds are fully and beneficially employed and that we face the future with quiet confidence that we shall continue to do a useful and constructive job in the several fields in which we are now committed and that in the absence of any sudden change in general conditions, these activities should enable us to continue to earn what we believe are satisfactory if moderate profits.

BUKIT KAJANG RUBBER ESTATES

MR JACK ADDINSELL'S STATEMENT

The annual general meeting of Bukit Kajang Rubber Estates Limited was held on February 11th in London, Mr Jack Addinsell, the chairman, presiding.

The following is an extract from his circulated statement:

The profit for the year before taxation amounted to £21,014 compared with £41,571 for the previous financial year. Although, as compared with 1951-52, the profit for the year was practically halved, the position was relieved to some extent by the lower provision for taxation.

The average price realised for our crop during the year was 9½d. per lb less than for the previous twelve months, and since the end of the financial year there has been a further fall in the price of between 2d. and 3d. per lb. All possible economies are being effected; unless there is an improvement it is unlikely that the directors will be able to recommend a distribution in respect of the current financial year.

The company has entered into a contract with H. and C. Latex Limited to dispose of the output of Bukit Kajang Estate in the form of field latex, which will assist in reducing estate costs. Rengo Malay Estate continues for the time being to manufacture smoked sheet.

Owing to a surplus of natural rubber the industry has entered a period of severe competition with the synthetic product and the question of production costs is now one of considerable concern.

The report was adopted.

THE NEWCASTLE BREWERIES LIMITED

OUTPUT CONSTITUTES A RECORD

The sixty-fifth annual general meeting of The Newcastle Breweries Limited was held on February 18 at the registered offices, Haymarket, Newcastle-upon-Tyne.

Mr Alex. McConnell (the chairman) presided and, in the course of his speech, said:

Various changes have taken place during the year in the general structure of the company. For many years it has been the policy of the board to place to reserves a proportion of the annual profits, much of which was invested in properties, and it was felt that the time had arrived when a part of these reserves might be capitalised. It was therefore decided to raise the ordinary capital from £400,000 to £1 million by issuing bonus stock at the rate of £3 for every £2 held. It was also decided to purchase the ordinary shares of The Northern Corporation Limited, which made that concern a subsidiary company, and along with Forsters Bishop Middleham Brewery Limited, another subsidiary, it has been placed in voluntary liquidation.

After the end of the financial year and after prolonged negotiations an offer was made for the ordinary shares of Robert Deuchar Limited, which was eventually accepted, thus making that concern a subsidiary of this company. This purchase, along with that of the ordinary shares of The Northern Corporation Limited, constitute a long term policy and may take some time to bear fruit.

Once again it is my pleasure to inform you that the output at the brewery in both draught and bottled beers constitutes a record. The higher gravity beers have accounted for most of the increases in deliveries, i.e., the Exhibition Pale Ale on draught and the Brown Ale in bottle. The standard beer sold in the houses at 1s. 2d. per pint has just about held its own. It is greatly to be wished that the Chancellor when opening his budget in the spring may see his way to reduce the duty to a figure that would allow this ale to be sold at 1s. per pint whilst retaining its gravity. Drinks of all kinds, and tobacco, are too heavily taxed, no doubt one of the causes of unrest throughout the country.

The trading profit for the year was higher by £52,000 at £700,418. This profit has had to bear a charge of £344,401 for taxation—an alarming figure which I think goes far to prove my contention last year that industry is being asked to provide far too much for taxation, leaving it too little to meet essential commitments for rehabilitation and reconstruction.

Cash resources since the end of the financial year have been completely altered owing to the purchase of the ordinary shares of Robert Deuchar Ltd. At present temporary accommodation has been provided by our bankers until a permanent scheme for additional capital has been arranged and which will be placed before you in the near future.

The amounts placed to general reserve and properties reserve will go some way to finance future capital expenditure, but I must warn stockholders that large sums will be needed in the near future for heavy expenditure at the brewery and bottling factory to provide for additional output and the purchase of contiguous properties required for further accommodation. On top of this licences in certain cases are now obtainable for the erection of public houses and hotels and very shortly we may be asked by the authorities to proceed with the building of those properties for which removal permission has been granted, or for which new licences have been obtained.

The report was adopted and the ordinary dividend of 6½ per cent was approved.

MILLS & ROCKLEYS POSTER ADVERTISING

GROWING DEMAND FOR SERVICES

The twenty-fifth annual general meeting of Mills & Rockleys, Limited, will be held on March 12th at Nottingham.

The following is an extract from the statement by the chairman and managing director, Mr George T. Mills, which has been circulated with the report and accounts:

It gives me satisfaction to report that in a year of rising costs in almost every department we have been able to maintain our profit figures without having recourse to increased charges. This year your board recommend an increase in the dividend on the ordinary shares to 1s. 2d. per share (compared with 1s. 1½d. last year) less income tax.

THE "HELLBERG" POSTER PANEL

Substantial progress has been made in the replacement of the older type of advertising structure by our Hellberg poster panels and public information panels which we introduced. The task of replacement is considerable and involves substantial capital and revenue expenditure over a number of years, but your board are fully satisfied that they are taking the right action to ensure that both the plant and service meet the more exacting requirements of advertisers and at the same time be acceptable to the public. We, therefore, decided to take the opportunity of the easier supply of materials to accelerate our programme of reconstruction to some extent.

It is a pleasure to record that the advertisement regulations are, broadly, now being operated by planning authorities with more reason and discretion. More of them are realising that outdoor advertising is an important economic necessity in the business life of the country. There continues to be a steady and, indeed, a growing demand for the services your company provides and I look forward with confidence to the future, provided that costs can be kept down. In this respect the growing burden of local rates is a question that gives your board concern.

QUARTER CENTURY OF PROGRESS

I draw attention with some pride to the fact that this company was formed just over 25 years ago and the progress it has made in a quarter of a century is, if I may say so, an achievement. When formed the business operated in towns with a collective population of some two million. Today it functions over an area comprising about 250 towns with some six million inhabitants. Its profits have grown (before tax) from £54,000 to some £150,000. The reserves and undistributed profits now amount to well over £300,000 and more than equal the amount standing in the accounts as goodwill. Goodwill, it should be remembered, is the difference between the price paid for the shares in companies acquired and the value of the tangible assets. It really is in the case of your company the price paid for the benefit of thousands of licences and agreements for advertising space held by the respective businesses and on which the earning power of your company is based. Except for the war and subsequent period your company has paid dividends of never less than 10 per cent on its ordinary shares and its issued capital has expanded from £348,000 to £622,000. The business has been built soundly on a conservative basis and enjoys an enviable reputation in the advertising world and among its many customers.

TEACHER (DISTILLERS) LIMITED

STEADY EXPORT SALES EXPANSION

The fifth annual general meeting of Teacher (Distillers) Limited was held on February 16th in Glasgow.

Mr R. M. Teacher (the chairman) presided, and in the course of his speech said:

The group profit for the year amounts to £573,788, as against £580,703. This slight reduction in the profit is almost entirely accounted for in the lower profit from our retail establishments, which reflects the lower spending power generally, and the considerable running and maintenance costs which we now have to face. The high figure for taxation, at £295,504, as against £332,230, is a reduction largely accounted for by a smaller requirement for profits tax, which gives a higher net profit for the group of £248,463, compared with £221,150 last year.

The general reserve has been increased by £150,000 to £500,000. During the middle of last year we commenced a programme of replacement and expansion of our plant and properties which had been held up owing to the difficulty of obtaining the requisite licences and materials. At Ardmore Distillery the original wash still had to be replaced, and it is our intention to bring the maltings more up to date. Warehousing of the larger stocks of whisky is becoming a problem and, while we are able to meet our needs for the moment, we will be faced with the expansion of our warehousing accommodation. Also, in order to meet the ever-increasing demand for our product, and to give greater speed and economical working, considerable replacements are required in our bottling plant to maintain it at the highest state of efficiency. It is for the above reasons that your directors anticipate that the additional resources will be required, and have thought fit to retain more by increasing the reserves against these commitments.

SALES

Turning to sales, export markets continue to show a steady increase, consistent with our policy of maintaining the high quality of our brand and with the availability of stocks. When it was announced that the quota system agreed with the Government for releases of Scotch Whisky for home consumption would terminate, it was taken in some quarters that there would be free supply on the Home market, or that such supplies would be at the expense of exports. It is neither true to say that there will be free supply on the Home Market, nor that exports will be reduced. Exports still remain an understanding with the Government, that they will be increased, or, at least maintained, while the Home trade will benefit only to the extent of the availability of stocks.

The dollar markets continue as the markets of first importance, and your company is still one of the largest earners in this field.

Home trade sales show the increased quantities which were distributed for the Coronation.

Production at Ardmore Distillery has been maintained at full capacity, and the results for the year were very satisfactory.

As to the future, we realise that the Scotch Whisky trade is approaching new problems—competitive and social, but I am confident that we are well prepared to meet them.

The report and accounts were adopted and a final dividend of 7½ per cent, making 12½ per cent for the year, was approved.

WILLIAM TIMPSON LIMITED

MANUFACTURERS AND RETAILERS OF FOOTWEAR

The twenty-fifth annual general meeting was held in Manchester on February 19, 1954. Mr W. H. F. Timpson (chairman) presiding. The following are extracts from the chairman's circulated statement:

SATISFACTORY YEAR

The directors consider the profit of £559,699 is satisfactory in a year in which the footwear trade has experienced many difficulties, not the least being the unseasonable weather—cold and wet in summer, followed by a dry, mild autumn.

As income tax is 9s. instead of 9s. 6d. in the £ the tax provision at £309,500 is £16,500 less and, in addition, £15,000 over-provided in previous years has been taken to credit. A balance arose on sale of assets and settlement of war damage claims, and these exceptional items brought the profit for the year, after taxation, to £265,199, against £205,615 in 1952. The general reserve is increased by £100,000 to £800,000, and stock reserve by £25,000, and this now stands at £275,000.

During the latter part of 1952, the fall in leather prices was arrested. 1953 showed a firmer market, and as the year progressed there was evidence of advances in values, against which your company was well covered by forward purchases.

BUSINESS EXPANSION

New shops have been opened in Newport (Mon), Scarborough, Workson, Redcar, Bebbington and Newall Green (Manchester), all trading satisfactorily.

Our North Park factory has been employed to capacity producing shoes of finest character to maintain the well-known Timpson tradition of quality.

The company's export trade has continued successfully and directors have been in personal touch with our American agents.

Following the call for Branded Footwear on which the public may rely as to value and durability, I make special mention that we manufacture ladies' shoes under the name of "Flexite," children's are branded "Walk-right," and our men's "Empire" shoe is one of the most reliable and best-known products in the footwear trade.

INCREASED DIVIDEND

It has been your directors' policy to keep the shareholders' interests in mind, and benefits from our trading have been passed on in the form of dividends and bonus shares, and by progressively increased distribution. Shareholders will be glad to know that this year we have again been able to recommend an increase in dividend of 5 per cent, making a total of 20 per cent for the year.

PENSION FUND

The company's contribution on account of pensions was over £50,000, and the fund now holds invested capital of over half a million pounds.

BONUS TO EMPLOYEES

The welfare of our 3,500 employees is a matter the directors always have in mind, and all with over one year's service receive a share in the profits, £46,000 having been set aside for this purpose.

so fast...so elegant...so comfortable

A car not built for speed alone, but princely comfort as well. The dynamic 4½ litre 'Blue Riband' engine seldom leaves top gear; the breath-taking beauty and whispering silence will be admired wherever it goes.

No car will ever be the fastest, the most luxurious, and the most economical; but no car so nearly is as the Humber Super Snipe. £985 plus P.T. £411 10. 10. White-wall tyres, optional extra.

To questions of
"how many
of what
at how much"

Just one right
answer is enough...

Invoicing, inventory, payroll, or stock record computations—all routine figure work, all done on calculating machines. Done better and faster on Burroughs machines. Whatever model you choose it will help you operator get to the final result—without any unnecessary intermediate steps—in the shortest possible time...

...but two save you
even more money!

The Burroughs all-electric Duplex Calculator—the first of its kind to be made, and still the best—has two answer dials. One for the result of individual calculations, one for grand totals or net results. On invoicing for example, multiplication begins as soon as the keys are depressed. Amounts don't need to be pre-set and there are no control keys to operate.

One more key depression, and the amount shown in the front dial is cleared and automatically accumulated in the rear dial. This means that an operator never rehandles the same set of figures—and can save up to 40% in operating-time.

Whenever a total is wanted—it's shown, without a "re-cap."

Like to see this demonstrated in relation to your figuring problems? Then call Burroughs today.

Burroughs Adding Machine Limited, Avon House,

CALCULATOR

PROGRESS IN ELECTRONICS

THE rapid growth of air traffic throughout the world and the introduction of high speed aircraft flying at great heights have multiplied the problems of the meteorologist. The methods of forecasting weather conditions which were adequate ten years ago cannot provide the detailed and accurate data which are required to-day.

A new technique for weather forecasting has, however, now been developed. By employing an equipment known as Radar Sonde, the complex conditions in the upper atmosphere can be accurately measured and recorded.

A small balloon carries a miniature radio and

meteorological station up to a height of 100,000 ft. and is borne by the wind to distances exceeding 100 miles. Throughout its flight the balloon is continuously interrogated by a powerful radar transmitter, and the answers are transmitted back by return.

As the information is received at the ground station it is decoded, computed and recorded to give a detailed picture of wind speed and direction, and of temperature, pressure and humidity.

The Radar Sonde has been designed and built by the Mullard Research Laboratories in co-operation with the Ministry of Supply and the Meteorological Office.

She saw it in *Woman*

Every week over one third of Britain's women read and study WOMAN—the greatest weekly magazine for women in Britain.

WOMAN is a magazine that deals with their personal tastes and affairs. They have confidence in its editorial pages and their minds are conditioned for the advertisers' announcements.

The certificate for WOMAN just published by the Audit Bureau of Circulations guarantees an average weekly net sale for the period July—December, 1953, of 2,837,044 copies.

This gives WOMAN a total readership of over 6,000,000 women every week—by far the greatest direct approach to women available to advertisers in British journalism.

The surest way to maintain big sales of an established product or to create big sales of a new line is to advertise regularly in WOMAN.

for Industry—

★ *At a fire-fighting demonstration in Glasgow*

★★★★★★★★★★★★

Pye Industrial television was recently used as a method of control in a full scale fire-fighting exercise of the Glasgow Fire Brigade. TV Cameras at the scene of the fire relayed pictures to the Central Headquarters, giving immediate and accurate visual information of the size, condition and progress of the fire.

Observers were enthusiastic regarding the value of television as a new aid to fire fighting. It is not envisaged that local operations would be directly controlled from headquarters, but television removes the difficulties of assessing from verbal reports the size and menace of a particular fire.

This application of television as an aid to Fire-Fighting is only one of the many uses for industrial television. For further information will you please write to Pye Limited, Industrial Television Division, Cambridge.

In basic form the equipment comprises a lightweight television camera and a viewing monitor; these are linked together by a single co-axial cable which may be any convenient length from a few feet to a thousand feet, depending upon the user's requirements. The camera, weighing only 31 lbs. and measuring 16 x 6 x 14 inches approximately, carries three lenses giving a wide choice of viewing angles and features a newly developed low-cost camera "pick-up" tube possessing adequate sensitivity to normal industrial lighting. In practical terms, a clearly defined picture will be obtained with a scene brightness as low as 50 foot-lamberts—corresponding to the light reflected from an "average" subject placed 4 feet from a 200 watt lamp in a suitable reflector.

The viewing monitor displays a well-defined picture on a 14 inch diagonal rectangular cathode-ray tube with a built-in "black screen" to permit clear viewing with normal room lighting. A normal domestic television receiver may, without modification, be employed as an additional monitor if required.

Alternative versions of the camera and monitor provide scanning standards of either 405 lines or 525/625 lines and the equipment will operate on any normal AC supply voltage, with a total power consumption of only 350 Watts.

Berlin to Geneva

IT is a strange turn of the wheel that is to bring the representatives of Mao Tse-tung, Bao Dai, Syngman Rhee and Kim ie Sang across the seas to confer with the four foreign ministers—in Geneva of all places. They will not come until late in April; but the fact that they are going to meet is already casting a subtle influence over Europe, which has been so deeply affected by the far-away wars in Korea and Indo-China. People are noticing that this rendezvous in Geneva six weeks hence is the result of concessions made during the Berlin conference by both Mr Dulles and Mr Molotov, which led to an almost unprecedented compromise between them. And it has always been in compromises between these two stubborn men that lay the main hope of useful and realistic Great Power agreement. Hopes are bound to rise, whatever is felt about the deadlock that was Berlin, for some advance towards a settlement in Korea and some easing of the French burden in Indo-China. How far are they to be encouraged? What real interest have the men of Moscow and Peking in making and trading concessions?

The question is not easily answered for the bargaining counters are less familiar than in the negotiations over Germany and Austria, and there have been new developments. First, Mr Molotov retreated from his demand for an exclusively Five-Power conference (including China) on all international issues to a position where he accepted a conference to include other states, and dealing only with an agenda covering Korea and Indo-China. Previously Mr Dulles had taken American policy some way to meet him by agreeing to consider in restricted session the idea of a conference about Asia, and later by consenting to sit at a table with the representatives of Peking, in order to discuss Korea and Indo-China. Thereby he modified American insistence on observing the letter of the Korean armistice agreement and turned his back on the wreck of Panmunjom. Anyone who thinks this was an easy thing to do should read the sharp criticism that assails the Secretary of State in his own country, where the diehards accuse him of accotding "a degree of recognition to Communist China that has heretofore been denied by this government."

The critics do not, perhaps, realise the extent to which Mr Molotov, too, has changed his ground. They may not have noticed *Pravda's* recent statement:

The most important demand in world politics today is the demand to reestablish the lawful rights of the Chinese People's Republic in the United Nations.

In spite of this, the Soviet Foreign Minister dropped his demand for a conference which would recognise Communist China as a Great Power—the first item on his Berlin agenda—and agreed to its attendance in Geneva at what would not be a Great Power conference. The concession was at China's expense and not the Soviet Union's; but Peking's silence about it is a sure sign of disappointment and reluctant agreement. To be recognised as one of the Big Five, as their only Asian

member, as superior to free India and Japan, dealing as an equal to the United States and to the Soviet Union, with the world's affairs—all this is clearly the first objective of Chinese policy. Such dignity was first accorded to Chiang Kai-shek's government when the United Nations was founded, and China was made one of the five permanent members of the Security Council. But the seat is still occupied by the representative of the exiled Chiang, and to oust him is as important for Mao Tse-tung as it was in the past for a Hanoverian King of England to frustrate the Jacobite pretenders. Lately, moreover, the Chinese have made it clear that they, like Mr Molotov, would like to arrange between the Foreign Ministers a five-power peace pact outside the United Nations that would deal with all international issues—a sort of concert of continents.

★

How great is the setback for China and how important the concession made by Mr Molotov may be judged from the agreement reached in Berlin. It says that the four Foreign Ministers

propose that a conference of the United States, France, the United Kingdom, the Union of Socialist Soviet Republics, the Chinese People's Republic, the Republic of Korea [South Korea], the People's Democratic Republic of Korea [North Korea], and other countries the armed forces of which participated in the hostilities in Korea, and which desire to attend, shall meet in Geneva on April 26th for the purpose of reaching a peaceful settlement of the Korean question.

The Americans gain thereby three important points: (i) Asian neutrals are excluded against Chinese wishes; (ii) nothing in the Asian complex—for example, the future of Formosa—will be discussed except Korea and Indo-China; (iii) American recognition of Peking is brought formally no nearer, for the text of the agreement includes a statement that the conference will not involve diplomatic recognition where this has not already been given. Not only has patient negotiation from strength paid the West; it has made possible a shift in the positions of both sides. This is not appeasement but diplomacy as it should be conducted.

Why was Mr Molotov, otherwise so uncompromising in Berlin, ready to agree to a Far Eastern conference on terms so disappointing to his ally? He was, of course, giving away no vital interest of his own country in order to secure this measure of *détente* in his relations with the West. But it seems probable that he had more positive reasons. The Korean situation remains unsatisfactory from the Soviet point of view so long as strong American forces remain on the mainland of Asia in South Korea. There they—or some of them—will obviously remain so long as there is only an armistice and not a peace settlement. To get them out is a common interest of Moscow and Peking, for they are dangerously near to Vladivostok as well as to Mukden; and this may be China's main reason for accepting the

Geneva meeting. Mr Molotov cannot get American forces out of Europe save at a price that he is unwilling to pay; but he has some chance of getting them off the Asian mainland without great cost in power or prestige. Some kind of settlement may, therefore, be intended, short of a "united and independent Korea."

Even more important for Mr Molotov must have been the wish to involve France in negotiations over a settlement in Indo-China and thus indirectly, but most effectively, to influence French policy in Europe. The United States Government has always been anxious that any Asian conference should cover Indo-China, because it feared that a settlement in Korea alone would leave China free to turn its energies southward.

The French, too, wanted a conference on Indo-China; having failed to gain a military victory against a Vietnamese Communist army supplied from China, they see no way to end fighting save by negotiation with the major Communist powers, which can at will increase or reduce support for Ho Chi-minh. This is the possibility that interests the Russians, who have otherwise no stake in Indo-China. By playing on French hopes and fears there it may be possible to keep M. Laniel's government stalling on the rearmament of Germany and the creation of the EDC. By giving way a little on China Mr Molotov may be able to undo the effect in France of his giving away nothing on Germany and Austria.

★

It is a shrewd calculation and one that had been foreseen. It is almost as embarrassing to the Americans—for reasons described in an article on page 610 by our Washington Correspondent—as it is to the French. M. Bidault, it is true, has declared that he will not allow vague hopes of what might happen in Geneva to hold up progress with France's European policy. But the French Assembly may think differently; it may argue that France cannot hold its own with Germany in the European Defence Community unless the drain on its strength is checked in Indo-China. If so the Americans and the British may find themselves asked to give yet a little more in guarantees and assurances to France, in order to prevent success at Geneva becoming the condition of success with the EDC.

The western ministers will need to prepare very carefully for this April meeting. It may lead to yet another meeting, and then another, until Europe and Asia are involved in a chain of interlinked conferences, slowly producing piecemeal and minute improvements in the international situation. There is a lot to be said for piecemeal negotiation and improvement; it is the method that Mr Eden has consistently advocated against Mr Molotov's broad sweeps of talk. But it must not be allowed to interfere with the organisation of Western Europe and the reconciliation of France and Germany. These are things good in themselves, not to be bargained about.

How to Conserve Conservatism

IT is never wise to insist too shrilly that the Conservatives must have a coherent policy. They have been the largest single party in the House of Commons for more than forty of the first fifty-three years of this century, and have got along very nicely without one. They are getting along very nicely still. But it is not altogether fanciful to find some parallel between the Conservatives' present popularity and the popularity of the Liberals just before the first world war, when success at the polls was masking the fact that the old order in which Liberalism had flourished was changing—and bringing with it the seeds of doubt and unrest among the faithful, which so quickly became the seeds of decay. Of course, it will never be possible in a democracy for one out of two parties to fade right away, as one out of three can and has. But the Conservatives should ponder deeply two long-term problems which the Liberals forgot: namely the reasoned case that they propose to put up to the electorate if they are to do as well in the next half century as they have done in the last, and the difficulty of quelling unrest among their own bewildered backbenchers.

Their electoral problem may not seem a pressing one, because the Government has done very well at recent by-elections. In these circumstances the Tories may see little incentive to make their propaganda rise above the groundnut and red meat level. Their strenuously prepared party political programme on television next month (like that of the Labour Party) is likely to conform to what might be called Woolton's Law: that the amount of thought given to a policy is in inverse ratio to the amount of time and money spent on disseminating it.

The Conservatives should realise, however, that the ultimate dangers of the rule of Woolton's law are greater for them than for the Opposition. However Labour's internal argument may end, indeed even if it does not end, Labour will offer some sort of programme in each general election in the foreseeable future, with much new legislation proposed and many traditional left wing war cries. The Conservatives cannot always rely on poking fun at those war cries, and asking for another doctor's mandate—even though, at the next general election, provided nothing goes wrong in the meantime, they will be able to claim that during the present mandate they have cured the patient of the 'flu if not of his general debility. But the time will come when the electors will ask, "What next?" and the danger is that Conservatives will then be deeply offended.

The electors' question can be answered in two ways. First, the Conservatives might try to scramble together a ragbag of proposals with which to match the Labour programme in time for each new contest; if they do this, however, they may be forced eventually to promise

legislation to make such things as co-partnership, joint consultation and contracts of service compulsory, in bland disregard of the fact that it is the essence of Conservatism that such practices should be adopted voluntarily. Their back-benchers will not like that. Alternatively, they must state frankly that their theory of government does not call for any great programme of state action. This is almost certainly their right course, provided they can adopt it without looking weedy. For too long the Conservatives have allowed Labour to make the running and to indoctrinate the electors to expect all parties to offer lavish plans for Government action. If the Conservatives now want to teach that legislation is only a means to an end, and not always the best means, then they have no time to waste.

★

It so happens that the next few months should provide a golden opportunity for such a restatement of the Conservative party's basic principles. For most of last year, because of the illnesses of Sir Winston Churchill and Mr Eden and because of Mr Butler's immersion in the problems of day to day leadership, the three men with the stature to lift the party's eyes further than the length of a three line whip were wholly prevented from doing so. Now the prospects are better. Mr Eden, the heir-apparent to the leadership, who can do this sort of thing rather well, has a breather between conferences; and the fact of those conferences may convince Sir Winston that the world situation will get on all right for a week or two without his undivided attention. But if Conservatives are to adopt this unusual habit of philosophising, a habit they have hitherto left to the Labour Party, they will have to decide on what their philosophy should be based.

The answer ought to be obvious. The Conservatives' broad philosophy must be based on the precedents set during the leisured days of Opposition, after the thumping defeat of 1945 had forced the party to think. At that time Mr Butler with his charters, and later the "One Nation" group with their detailed survey of the social services, showed that Tories could handle the mystique of economic planning and the welfare state just as well as the Wykehamists. Admittedly, the Industrial Charter may look a little fusty today; but after a little dilution from the ideas of Mr Eden, with his "property-owning democracy," and of Sir Winston Churchill, with his ladder up which all can climb and his net to catch those who fall off, it can be made to look like something that can be called a recognisably Conservative economic pattern. To this there can be brought in aid the useful and general beliefs that the Conservatives are better at reacting against economic crises than Labour (for it is difficult for Labour politicians to proclaim that they are abler reactionaries than

their opponents); and that they are more willing to set the people free from unpopular controls if circumstances permit.

This is the policy that the Conservative leaders should try to sell to the country, if Conservatism is to be conserved in the long run. But the problem remains: can they also sell it to the amorphous collection of no-longer-hard-faced but still-rather-soft-thinking men on the benches behind them? There are two main dangers. The first is that some Tory back benchers are now so fearful that they might be launched on a vague Gadarene slide to something akin to Socialism that they are fighting every real or imagined break with traditional Tory practice, however out-dated. The much criticised, and now probably defunct, Industrial Organisation and Development Bill is a case in point. In calmer moments many back benchers would probably agree that this measure contained the germ of a useful idea. But when they were presented without warning with a Bill to allow compulsory levies all over industry they shied violently. A much more important example, of course, has been the revolt over Suez; and this is the sort of revolt that is very likely to recur. In the field of foreign policy it is still regarded as respectable for Conservatives to be

Our Duty to Interfere

It is anything but pleasant to be for ever travelling over old ground, answering old objections, and exposing old misrepresentations; but when speakers persist in reiterating exploded fallacies, writers are perforce compelled to reiterate previous refutations. . . . Both Lord Grey and Mr Cobden are of opinion that we have been quite wrong in interfering in the Turkish quarrel at all. Both speakers admit that the conduct of Russia has been unjust, aggressive and indefensible; yet both agree that we should not have interfered to thwart that conduct. Russia has been very wicked, they say; but nevertheless we ought to have allowed Russia to have her way. A great violation of the law of nations has been ventured on; but what concern was that of ours? A great wrong has been done; but our duty was to stand by and see it done. . . . But has Mr Cobden read history or travels to so little purpose as not to know that a claim to "protection" is one of the regular steps in the progress of Russian ambition towards the absorption of the States whose territories she desires to append to her already colossal Empire? And has he in his heart the smallest doubt that the demands of Prince Menschikoff, out of which the quarrel has arisen, were, however they may have been worded, but one stride further towards the possession of Constantinople? Did not the seizure of the Principalities show them to be so? . . . Finally, have not Russian avowed despatches, Russian intercepted despatches, Russian acts, made all this as clear as daylight? We say, therefore, without fear of confutation, that the real question now at issue is . . . whether Russia shall be allowed to appropriate European Turkey and establish her throne at Constantinople—whether she shall be allowed to thwart and repress the internal improvements and for ever to disturb the internal tranquillity of those countries whose greatest misfortune is their contiguity to her—whether she shall be allowed to obstruct and destroy the navigation of the Danube, and to make a *mare clausum* of the Black Sea?

The Economist

February 25, 1854

reactionary, since foreigners who are reacted against do not have votes.

The second danger lies in the broad field of policy where Conservative back benchers have no coherent emotions to lead them, but where Conservative Ministers are equally unsure about where they want to go. The Government has hitherto settled these problems by resort to a Ministerial mediator. When the demand for a dash to convertibility welled up out of Conservative attachment to the ideal of setting the people free, and promptly clashed with Conservative traditions of both desirable caution and undesirable protectionism, the task of working out a compromise "collective approach" to convertibility was delegated to Mr Eden. When the desire for a free market in agricultural produce clashed with the traditional Conservative policy of cossetting the farmer, the task of finding a compromise was delegated to Mr Butler. When the demand for competitive television clashed with a strange but very Conservative belief that the standard of reasoning power among those who usually watch television programmes might be grievously impaired thereby, the task of finding a compromise became such a popular one that several Ministers joined in it.

★

It is not surprising that the proposals emerging from all these mediations have been unworkable; Conservative politics in such matters have degenerated into the art of devising the impossible. Inevitably, this has added to the distrust and disillusion among the back benchers; and it is only a temporary comfort to the party to reflect that almost all the issues that are referred to compromise solutions in this way are necessarily such complicated issues that the general public does not understand what is happening.

In essence, therefore, Conservatism, despite its successes of the last two and a half years, is in a state of unstable equilibrium. It is this state that is so reminiscent of the Liberal Party just before its decay. Apart from the all-important point that a flabby second party can never be in such danger as a flabby third, there are three factors that should prevent, or at least slow down, a similar decay of the Conservative Party, even if no positive lead is given from the front bench. The first is that the Tories' present party organisation is stronger than the Liberal organisation ever was. The second factor is that people attracted into the Conservative Party are, almost by definition, the sort that do not regard rebellion as respectable (even if grumbling is). The third is that the party can be bound together by the common desire to oppose the Opposition, which happens at the moment to be the natural thing for most sensible men to do. But this comes perilously close to saying that since Socialism is losing the force of its former appeal to the heart, Conservatism can get by through making an appeal to the liver. This is a very dangerous principle for any major party to adopt.

Arab Wealth from Oil

THREE years ago, a Middle Eastern oil company first set the fashion for sharing its profits equally with the local government, on a model copied from Venezuela. The Middle Eastern prototype was the "fifty-fifty" arrangement reached by the Arabian American Oil Company (Aramco) with Saudi Arabia at the turn of the year 1950-51. It is also three years since Dr Mossadegh deprived the south Iranian oil industry of access to a like arrangement. In the years between, the other oil companies and governments of the region—in Iraq, Kuwait, Bahrain and Qatar—have one by one followed the fifty-fifty example; they have also filled the gap created by the collapse of the Iranian industry.

At no cost, effort or risk to themselves, therefore, the governments of these fortunate territories have suddenly found themselves richer by more cash per ton and more tons per day; the table shows how they have benefited. Three years is a short time in which to judge the results of such a stroke of fortune; but there are some interesting differences in local notions of how to spend the money, and the shape of things to come is beginning to be discernible.

This rain of wealth has fallen upon a dilapidated landscape. For several centuries Arabia and Mesopotamia, once centres of inspiration and the site of civilisations, have been allowed to slide into decay. Ruined cities and crumbling cisterns, forests stunted by goats and fields swept by flood, have been accepted as the will of Allah; these were lands poor in the natural resources that count in the modern world and incapable of producing any margin for improvement from their primitive agriculture. And then, overwhelmingly, the world's most desirable raw material cropped forth, providing wealth almost beyond belief. Already, it is changing the landscape. Will it also change the outlook of peoples so long accustomed to a life of hazard and poverty, and so sunk in habits of accepting sudden twists of fortune, good or bad, and of snatching quickly at advantages before these disappear?

Whether revenues from oil will remain steady is of

less concern to Middle East minds than it would be in the West. Some are content simply to spend while the money lasts. Most of them find it easier to think in terms of capital costs than of running costs; the problem whether a particular plant could continue to be productive if the revenue from oil were to dwindle occurs to only a few. Why should it be of concern to people who have never been able to be regularly productive? The policies preached by economists with experience of one-crop countries ring hollow in deserts; when there is little or nothing to replace oil as a source of wealth, who wants to listen to sermons about the dangers of letting consumption rise far above local capacity to produce, and about tucking aside funds for capital development to meet lean years?

One of these fortunate lands—Iraq—is differently placed from all the others in this respect; it alone among the "fifty-fifty" countries is endowed with immense alternative resources; Iran would be similarly well off if its oil production climbed back to the 1950 scale. Iraq is blessed with five harnessable rivers, lands capable of heavy cropping if treated well instead of carelessly, and rich prospects of producing industrial as well as food crops. It can afford to develop an attitude to its wealth more prosaic but much

more practical than that of less promising lands. The Bahrain Islands, which are also blessed with water, are certainly the next best placed for sedate spending; a steady tradition of security under British auspices has won them a comfortable role as an entrepôt and an airport. Kuwait (which has no water), Saudi Arabia and—above all—the desolate peninsula of Qatar have less choice of alternative resources.

Iraq differs in one other important respect from its fellow-beneficiaries; unlike theirs, its pattern of government is democratic, and it must pass all revenue and expenditure through an exchequer that is subject to the authority of parliament. The others belong to absolute rulers who regard their fiefs much as a feudal landowner thought of his family and tenantry. Their revenue, or the bulk of it, goes to the paterfamilias

* Under the supplemental agreement then offered Iran was entitled to receive nearly twice this figure.

who alone is answerable for the amounts he spends on the family and on the tenants and estate; for instance, it is still thought perfectly natural, as it was in medieval England, that a member of the family should appropriate some hitherto unwanted tract of desert in order to sell it to the state for development.

The question posed at the start of this article was whether and how soon ingrained habits might change to match a changing landscape. Firm conclusions are difficult to draw from so patchy a picture. Two of the most disquieting features are the expensive tastes that are being inculcated without cost to the inhabitants in either risk or effort, and, in the feudal territories, the social upheaval that is inevitable when children now being educated along twentieth-century lines—taught by Egyptians or Palestinians or at the American Univer-

sity of Beirut—begin to question the customs of elders who are by tradition their betters. Plainly, Iraq is the place best endowed for solving these problems of tomorrow, and it is probably, therefore, chiefly to Iraq that optimists must look for first signs of a departure from the habits of centuries. Today, technical improvements are more often sought because they will put money into some private pocket than because they will bring about a deeper change, such as generation of a creative spirit or the dawn of a spiritual or cultural renaissance. These former attributes of Islam have, as the Agha Khan recently declared, been dormant for so long that they threaten to disappear. One cause of their collapse was lack of money. Now that this missing ingredient has reappeared, who is going to show that they are capable of revival?

Nothing short of a place-by-place survey can convey the variety of five separate Arab responses to the phenomenon of wealth. This is given below, with the comment that, if the measuring stick is capacity to spend upon increasing productivity, Iraq, with its promise of developments that do not depend on oil, must take first place.

Iraq. Oil revenue represents about one-third of the national income. At first, it was wholly earmarked for capital development, and paid to a Development Board which has been well managed financially. The Board's proportion has since been reduced to 70 per cent, the balance going to current ministerial budgets in order that these may shoulder their share in improving the country. Ministerial expenditure on defence and social affairs has notably risen as a result.

The Development Board, which handles all major capital works, has budgeted to spend just over £150 million in the five years 1951-56; more than one-third is earmarked for flood-control and irrigation, the next biggest items being new industries and roads. The Board got off to a slow start because flood control is the prerequisite of nearly all development in southern Iraq. The Euphrates flood was under control in the winter of 1952-53; that of the Tigris will be controlled by 1955; contracts for three of the eight major dams that it will now pay to instal have been awarded; so are contracts for one or two of the first major industries, including a national oil refinery. The Board's great failing is poor publicity; its major achievements, though praiseworthy, are remote and unseen, and the keynote of Iraqi sentiment towards it is impatience.

Kuwait. No one can chide the Kuwaitis for moving too slowly. They are a thrusting people who, a century and a half ago, moved away from unwanted neighbours—built a town on a waterless bay and thereafter made a scanty living by seafaring and boat building. This hard life endowed them with gusto; from the start, therefore, they determined to spend their oil revenue (which now constitutes over four-fifths of their national income) on building a welfare state.

Naturally, a comfortable income goes to the ruling family, but in 1953, out of a round £60 million "earned" from oil, about two-thirds was spent on new state

developments and their maintenance, and most of the balance was entrusted to an investment board and tucked away abroad. Within three years Kuwait has produced the most up-to-date hospital in the area, free to all (including non-Kuwaitis), and free schools equipped with apparatus that would be the envy of most British towns of equal size.

The direction of spending has mostly been good, but its volume is wide open to criticism, for the pace has cost millions of pounds that may later be regretted. Departments, vying with one another in energy and grandeur, have run up costs out of all relation to estimates; undue haste has resulted in several million pounds' worth of white elephants that dot the landscape, and expensive imported equipment has been damaged beyond repair because proper port facilities were lacking. If the whole of the £90 million development programme is completed, it will burden the privy purse and Treasury with running costs which, at a conservative guess, will be £25 million per annum.

The only investment contemplated that will be permanently productive independently of oil is that for a sweet water canal from the Shatt el Arab which could turn a place without a blade of green into an agricultural community.

Bahrain. The Bahrain Islands differ from Kuwait and Qatar in that they have enjoyed an income from oil since 1933 and their increase of wealth has been, by comparison, both small and slow. Bahrain, for generations a centre of Persian Gulf trade and of its pearl market, had a window on the outside world; for instance, it started schools on modern, as opposed to Koranic, lines as early as 1919. A British adviser, the friend and contemporary of a prudent sheikh, has worked shoulder to shoulder with him for nearly thirty years, and no violent scenic revolution has taken place; Bahrain's latest annual report remarks that "as usual, the increase (of expendi-

ture) is mainly in the education and public health budgets," and the first two words tell their own story.

Oil revenue now amounts to three-fourths of the national income. One-third of it goes to the Sheikhly family and two-thirds to the state.

Qatar. The ambition of this unpromising peninsula is to blossom into a likeness of Kuwait. Its preoccupations, for lack of productive enterprises on which to spend, include the question whether or not to spend £3 million upon dredging a channel through the shallows opposite its capital to suit its *amour propre* and reduce its dependence upon the entrepôt of Bahrain. Its ruling family retains an income rather greater than the revenue that it has so far been able to spend upon developments; further plans are to spend £31 million on development between mid-1953 and the end of 1956.

Saudi Arabia. Assessment is difficult when so large a country publishes no figures for actual revenue and expenditure and issues budget figures only intermittently. Despite a rise in revenue from about \$7 million in 1938 to about \$197 million in the fiscal year ending March 16, 1953, the Saudi government is overdrawn. It is slightly in debt to the Export Import Bank, also to the Netherlands Trading Society that till lately acted as its banker, and it owes Aramco for advances made to build a railway that cost over \$50 million—a debt that it will probably not finally pay off until 1960.

By comparison with Kuwait or Iraq its expenditure on public benefits such as health and education and social services is sadly low (5 per cent only of the total budget was earmarked for these in 1952-53). Saudi Arabia must needs spend on defence and on the internal security which it maintains by means of subsidies to its tribes. But if millions remain unaccounted for, there are 325 Saudi princes of the realm who expect handsome allowances; money poured down the drain at least needs no upkeep.

The Consumer in Freedom

IT is a strange reflection on the state of economic knowledge that so much depends on the demands of the consumer and yet so little has been recorded about them. The official figures of personal spending, which appear in the annual national income blue books, date back only to 1938. They reflect, therefore, demands that have been shackled by rationing and controls and distorted by subsidies. But now, with rationing practically over, and even food prices again mostly reflecting world costs instead of reflecting what the gentlemen in Whitehall think fair prices should be, the free consumer is emerging from his retirement. Will he be a completely new kind of consumer or will he behave much as his predecessor of prewar days? With this question in mind, it is timely that there should have been published this week the first findings from an extensive research into consumer spending between the wars.*

This research, which is part of a project to build up a consistent series of national income estimates, has been sponsored jointly by the National Institute of Economic and Social Research and the Cambridge University Department of Applied Economics. In this, the first of three volumes on consumer expenditure (a later volume will take the figures back to 1900), Mr Richard Stone and his collaborators analyse the British public's spending on food, drink and tobacco, fuel and light and housing. Those who know the waywardness of such statistics today, let alone thirty years ago, will appreciate the patient and exacting way in which these pieces of the jig-saw puzzle have been joined together. And, formidable and sometimes rough-hewn though the underlying calculations must have been, the results are portrayed in a style which would do justice to any book on fine art.

The outline picture of total spending, which can now be drawn up for the last thirty years, holds several surprises. Table I shows that in 1920 personal expenditure averaged £115 for every man, woman and child in the country; in 1938 the figure was down to £94. But since prices had dropped by as much as one-third during these years, the actual quantity of goods and services obtained from the lower outlay had risen by more than one-fifth. Indeed, whereas consumption per head today (even after allowing for the most recent increases) is only some 4 or 5 per cent higher than it was in 1938, in the preceding fifteen years it rose by as much as 22 per cent—an average increase of 1.3 per cent each year. And this upward climb in consumption was almost unbroken, the general strike and the slump causing barely perceptible retardations in its growth. It took a war to bring any real check.

These findings seem to make nonsense of the

* The Measurement of Consumers' Expenditure and Behaviour in the United Kingdom, 1920-1938. Volume I. By Richard Stone. Assisted by D. A. Rowe and W. J. Corlett, Renée Hurstfield, Muriel Potter. Cambridge University Press. £5 5s.

widespread belief that only in recent years have living standards been improving so fast. It is easy to forget the benefits that came from the fall in the prices of British imports between the wars. This comparison between the rapid increase in consumption in the troubled twenties and hungry thirties and the small increase in the forties and early fifties does, however, ignore two important factors. First, an average figure of consumption tells nothing of the way in which it is distributed. Today there are far fewer people living at either the high or low ends of the scale than there were between the wars. Secondly, the welfare state makes a much larger contribution to the standard of living today; Government spending on health and education, for instance, does not enter into these personal estimates.

I—TOTAL EXPENDITURE AND AVERAGE PRICES

	Total expenditure at current prices	Expenditure per head		Average price index
		At current prices	At 1938 prices	
	£ million	£	£	1938 = 100
1920	5,051	115.5	77.1	150
1925	3,938	87.4	79.1	110
1929	4,052	88.7	83.9	106
1932	3,736	80.6	84.3	96
1935	3,989	85.1	90.1	94
1938	4,444	93.6	93.6	100
1943	5,318	121.8	82.7	147
1946	6,907	147.5	92.4	160
1952	10,407	208.8	95.2	219

Expenditure on food (which does include the full values of welfare foods) can now be traced back for thirty years, both in money terms and after allowing for changes in prices. Food consumption has kept more or less in line with consumption as a whole but it has increased rather more rapidly in the years following each of the wars. Over the whole span since 1920, food consumption per head has risen by about a third. But because food prices fell more than most between the wars, food absorbed only 30 per cent of the average family budget in 1938, compared with 35 per cent in 1920. Today it takes 32 per cent again.

The details of food bought between the wars tell the story of a nation getting more variety into its diet yet at the same time growing more lazy in its cooking. Table II shows that the consumption of bread changed very little; but its fancy rivals—biscuits and cakes—went ahead. Much less margarine but more butter went into the larder in the 1930s than in the 1920s. The consumer in 1938 ate much more cream than he did in 1920, and much more sugar and confectionery; he used more pickles and sauces and discovered that he liked soft drinks much more and hard drinks much less. And

he made life easier with the tin-opener—there was a striking increase in the consumption of canned vegetables and fruit.

While most other prices fell the average value of rents went up between the wars by about one-quarter; in part, however, this must have been a reflection of the fact that the standards of accommodation were improving rapidly. In consequence, while rent absorbed rather less than 6 per cent of total spending in 1920 it absorbed

II—CONSUMPTION AND PRICES OF FOOD
(1935-38 compared with 1920-23: percentage changes)

	Con- sump- tion per head	Price		Con- sump- tion per head	Price
Bread	+ 3	- 22	Cheese	+ 10	- 50
Cakes & biscuits ..	+ 76	- 43	Vegetables	+ 14	- 27
Meat	+ 9	- 33	Fruit	+ 34	- 39
Eggs	+ 122	- 52	Sugar, chocolate & confectionery ..	+ 46	- 62
Fish	- 2	- 24	Tea	+ 7	- 18
Milk	+ 8	- 16	Coffee	+ 4	- 16
Butter	+ 109	- 47			
Margarine	- 49	- 36	All Food	+ 21	- 35

11 per cent of it in 1938. Since then, rent restriction and subsidies have brought the share down to 7 per cent, while expenditure on keeping the house heated and lit makes about the same proportionate claim on the purse as it did thirty years ago.

A striking exception to the general rise in consumption between the wars was drink. Beer consumption declined sharply in the early 1920s and again during the depression years, but recovered somewhat in the late 1930s. Spirits declined in popularity almost continuously; less than half the amount was drunk in 1938 as in 1920. These declines may have been partly aided by the fact that drink prices fell much less than most other prices. But smoking, which also became relatively more costly, makes quite another story. While the pipe became less popular, cigarette-smoking went up by leaps and bounds. After allowing for the influences of changes in incomes and prices, Mr Stone calculates that the demand for tobacco increased between the wars at the

average rate of about 3 per cent each year. There was some rise in consumption per smoker, but the increase was mainly due to the spreading of the habit among women; Mr Stone estimates that the numbers of women smoking increased from 2.7 million to 6.5 million between 1928 and 1938.

It is such changes in habits and tastes, associated perhaps with social and educational movements, that are the stumbling block in the prediction of demand. But in the long run, the real usefulness of these consumer statistics must lie in the realm of prediction, in the hope that it will be possible to make a sensible forecast of how consumers will react to changes in economic conditions. Some encouraging steps have been taken by Mr Stone when he analyses, as a skilled econometrician, the effects of changes in income and prices on demand. Briefly, he believes that—in the short run at least—consumers tend to buy a fairly stable amount of food whatever the changes in prices and incomes, although relative price changes may cause them to change from

III—CONSUMPTION AND PRICES OF DRINK AND TOBACCO
(1935-38 compared with 1920-23: percentage changes)

	Consumption per head	Price
Beer	- 21	- 11
Spirits	- 45	+ 1
Wine	+ 24	- 18
Cigarettes	+ 78	- 3
Pipe tobacco	- 34	+ 4

one sort of food to another. Demand for goods other than foodstuffs is likely to be much more variable; it can change rapidly as prices change and according to the amount of money that people have left over after meeting their food budget. He has no doubt that in many ways the free consumer of today will behave as the consumer of yesterday. But there are still important influences that have not yet yielded to the mathematicians' skill. The mysteries are likely, however, to be considerably lessened by the time this investigation is complete.

Notes of the Week

Labour's Brave Decision

THE issue of German rearmament has divided Labour so evenly that the party can scarcely claim a collective attitude; but the leadership has shown courage and good sense by deciding to go ahead with a split one. At Margate last year a resolution was passed that "there should be no German rearmament before further efforts have been made to secure the peaceful reunification of Germany." Both the Parliamentary party and the National Executive have now voted that these efforts have been made and have failed, and declared in favour of a German contribution to Western defence. In the Parliamentary party the official motion was passed only by 113 to 104, after a delaying motion by Mr Harold Wilson had been rejected by an even narrower margin of 111 to 109. It is possible that Mr Wilson might have won the day if Mr Attlee had not taken a tip from Lord Salisbury and rallied his backwoods peers. The voting was less close on the National Executive, where the official view was approved by 16 to 9; but here again the minority was more than just Left Wing.

The fear of German rearmament has brought together an oddly assorted collection of Labour groups—the lunatic left, the ordinary Bevanites, the bloc of Jewish MPs, ex-servicemen of both wars, some MPs who are unexpectably emotional on this subject without being emotional on anything else, and many of the party's old women of the male sex. Some of these strange bedfellows will soon part company, but in the meantime Labour seems curiously cheered at finding an argument which cuts clear of the all too familiar Bevanite wrangle. Mr Morrison struck the right party note in the debate in the House on Wednesday, when he prefaced his exposition of the official decision by an equally lengthy explanation of the doubts and fears of the minority.

Apart from the fact that the Shadow Cabinet counselled the right course—although even there a strong minority emerged—it is hearteningly significant that the party leaders forced their rank and file to make a decision at this time. Whether the initiative came from Mr Attlee himself, or more from Mr Morrison and Mr Gaitskell, remains obscure; but when procrastination could have avoided a split (the famous Attlee conditions underlying the Margate resolution have always been very elastic) the Right Wing leaders insisted on a show-down. In domestic matters the Labour leaders, and particularly Mr Attlee, can be infuriatingly timid, but on the big issues affecting foreign policy—conscription, Korea, Nato and Britain's own rearmament—they have invariably acted decisively and in defiance of the vocal minority on the left. Some hard things have been said in *The Economist* about Mr Morrison's

conduct of foreign affairs when in office; it would be wrong to miss this opportunity of acclaiming him with a loud "well done."

"Dangerous and Unrealistic"

OPINION abroad should not let itself be misled by the over-dramatised split in Labour ranks. Far more important is the fact that there is virtual bipartisanship on this cardinal issue of foreign policy, and that Mr Morrison saw and stated clearly the strategic as well as the political objections to any neutralisation of Germany. Indeed, it has never been clear how those who maintain that German rearmament cannot be kept within reasonable and agreed limits by the joint authority of the European Defence Community and Nato can also argue that its strength could be limited when all occupation forces had been withdrawn and all alliances forbidden. That argument postulates complete confidence and loyalty between Moscow on the one side and Washington, London and Paris on the other, with Germany just playing dummy. It is, as Mr Eden pointed out, a "dangerous and unrealistic" idea, not a policy but a projection of emotion.

The feelings of distrust and resentment aroused by the idea of rearming Germany can be understood, but they are dangerous for two reasons. First, because they poison the atmosphere of goodwill and trust that Dr Adenauer has built up with the help of European and British statesmen; secondly, because they offer the younger generation of Germans no political idea that can be opposed to the harkings back of the nationalist elements in the older generation.

German Socialists' Line

MR MORRISON and the majority of the Parliamentary Labour Party accepted the fact that the Berlin conference had met the party's demand that German reunification should be attempted before Germans were rearmed. Mr Molotov has himself to thank for this result. The stand he took in Berlin made it impossible for Socialists in Britain or Germany to claim convincingly that the alternative to German rearmament in the European Defence Community is reunion in freedom.

It is evident that both in Britain and Germany the crux of the matter is whether the opposition believes, with Mr Molotov, that talks on Germany should go on in order to hold up the EDC. In Federal Germany the Socialists are taking the same line as that of Mr Harold Wilson and his

followers, whose amendment (defeated by only 2 votes) stated that the rearmament of Western Germany could not be countenanced so long as the possibilities of relaxing tension by east-west negotiation were not exhausted. The German Socialists are still saying that the Western Foreign Ministers might have secured a promise of free elections from Mr Molotov if they had specifically abandoned the EDC. They are not satisfied with the fact that united Germany would not be bound to the EDC in advance; nor do they frankly admit that Mr Molotov would evidently not risk free elections in any circumstances. Their leader, Herr Ollenhauer, has again rejected a fresh attempt by Dr Adenauer to adopt a bi-partisan foreign policy. If the German Social Democrat leaders were not blind, they would be impressed by Mr Morrison's statesmanlike rapprochement with Mr Eden. It is still possible that the majority view of British Labour may affect the Germans at the meeting of European Socialists in Brussels this weekend. But, unfortunately, it seems likely that the Bevanites will encourage the Germans to maintain the illusion that further talks with the Russians will in some way bring about a miracle.

The Social Democrats are not alone in criticising the Western Ministers for not doing enough in Berlin. German nationalists of all shades are taking up a cynical, carping attitude as if both sides were to blame and somehow "Germany's true interests lie between East and West." It is depressing to note how Dr Adenauer's broadcast on the conference contrasted with most of the comment in the German press. His wholehearted approval of the Western bid for German freedom in Berlin and his unequivocal belief in the European Community are hard to match in any other German quarter.

Kenya's Bad Report

THE report of the parliamentary delegation which visited Kenya in January heavily underlines many of the more pessimistic things that have lately been said about the colony. It makes no attempt to gloss over unpleasant truths. Most notable of all, the three Conservative and three Labour MPs who made up the delegation are unanimous both in their assessment of the situation and their recommendations for ameliorating it. This unanimity should be a great help to Mr Lyttelton on his forthcoming visit to the colony, when he can hardly avoid important decisions.

The gist of the delegation's findings is that the situation in Kenya is worse now than when the emergency began nearly eighteen months ago. The Government has failed to rally the mass of the Kikuyu to the side of law and order; even—indeed, particularly—in the centre of Nairobi itself Mau Mau terrorism is getting an ever firmer grip on the fears of the population. For the first time there are grave

New Look in Defence

page 657

risks of the disease infecting tribes other than the Kikuyu. The report bluntly accuses the police of brutality, corruption and lack of discipline; even when all allowance is made for the fact that the police have had to operate in terribly difficult circumstances with raw, untrained levies against an enemy of unspeakable brutality, this section makes ugly reading. The new Commissioner of Police, Colonel A. E. Young, will have to wield a ferocious new broom in and around his own office if his service is to command willing co-operation from the loyalists among the Africans. The six MPs also roundly condemn the demands for "summary justice" and the disrespect shown by some sections of the European population for the due processes of law.

The main policy conclusion of the report is one that both the British Government and the Kenya Government have hitherto resisted—that long-term political objectives cannot be dissociated from the day-to-day conduct of the emergency. The delegation felt that it would be a mistake to delay African, and Asian, political advancement any longer, if these communities are to play their full part in putting down Mau Mau. The more moderate settler leaders agree, even though they have a tendency to avoid making speeches that would annoy the diehards. It would be foolish to pretend that the closer association of African politicians in the ranks of Government would necessarily lead to a more efficient conduct of the emergency; in particular there is a tragic lack of African leaders capable or trustworthy enough to take executive responsibility—partly because so many of the best African leaders have been murdered. It may be that Mr Lyttelton will have to decide to devolve more power upon the military while moving circumspectly but steadily towards a broadening of the structure of civilian government. Whatever Mr Lyttelton's decision, he must recognise that one of the basic assumptions behind the British Government's attitude to date—that pleas for political reform serve only to obscure the fact that the first essential is a speedy end to the emergency—now stands discredited; those who have ignored the reformers' fiddling have not prevented the flames from spreading.

To the Guillotine!

NOT even the oratory of Mr Macmillan and Mr Bevan could prevent Monday's debate on the "guillotining" of the Rents Bill from being anything but perfunctory. Timetable motions are nowadays becoming necessary for most controversial Bills of any complexity, and the real question at issue is at what stage they should be introduced. Oddly, the answer seems to be that it is more democratic to introduce them early rather than late.

After Labour's frequent use of the "guillotine" when in office, Mr Macmillan was fully justified on Monday in accusing Mr Bevan of putting up a sham fight; but Mr Macmillan's own party, when in opposition, was always righteously fervent in opposing all curbs on discussion. The Government could fairly claim that the use of the "guillotine" has rarely been so clearly justified as in the present case. The Repairs and Rents Bill consists of 44 clauses and 5 schedules. The Standing Committee had taken 10 sittings (25 hours) to reach the middle of Clause 7.

when the Government's patience gave out. As the controversial rent clauses had not yet been reached, the Government had good grounds for fearing that at the rate of progress being set the Bill might not even reach the Statute Book this session.

But whether the Government's timetable now allows sufficient time for the rest of the Bill to be scrutinised is more debatable. Assuming that the committee does not change its sitting habits, there cannot be more than 30 hours at most for the rest of the committee stage; Mr Bevan had some grounds for his argument that this does not allow sufficient time for considering the complicated issues raised in the later clauses of the Bill. But the moral seems to be that the Government's best course would have been to introduce a timetable right from the start, as the Labour Government did over its Steel Bill. It is usually possible to tell in advance which Bills are likely to need a "guillotine." Delay in applying one merely means, as in the present case, that the first few clauses are discussed at inordinate length and the remainder tend to be skimmed.

M. Bidault's Next Move

M. BIDAULT has returned from Berlin with a greatly heightened prestige. His performance has been applauded not only by the French champions of EDC. Some of the Frenchmen sitting on the fence may well have come to the conclusion that a firm stand in the Western alliance pays dividends not only in praise and compliments but in actual tangible rewards. It is generally held in Paris that the calling of the limited Geneva conference (discussed in an article on page 587) marks a personal victory for M. Bidault and a concession not only from Mr Molotov but from Mr Dulles as well—an American concession to keep France on the European path.

Encouraged by these developments the government is apparently determined to pursue its European policy and finally bring about the debate on the ratification of EDC. Despite the internal quarrels about the shape to give to the treaty and the various suggested amendments, a small majority could probably be found to ratify it. Mr Molotov did little in Berlin to strengthen the ranks of the "anti-Europeans." On the other hand, France's reward has its seamy side. Many of those who applauded M. Bidault would like to postpone further decisions to see whether Geneva will prove more propitious than Berlin, and to add the solution of the Indo-Chinese problem to the other French pre-conditions for EDC.

The conviction that France must somehow get rid of the Indo-Chinese burden is certainly gaining support in the country and in the Assembly. Furthermore, it may still prove impossible to stage the EDC debate before the Geneva conference; the committee stage, Franco-German negotiations about the Saar and the Easter recess are likely to prevent it. Well aware of this, the government is, however, trying to keep the two issues separate. M. Bidault would not deny the direct link between the Indo-Chinese commitments and France's fear of a rearmament Germany, but he may well point to the lesson of his Berlin experience that firmness is the best method to obtain tangible results. He could also add that by explicitly linking the fate of EDC

with the success of the Geneva conference France would only encourage the Communist negotiators to delay or to offer impossible terms.

Eclipse of Neguib

As *The Economist* goes to press, news reaches London of the high words that passed only a few hours earlier inside the Council of Revolution in Egypt, and of the resultant resignation by President Neguib of all his posts. Colonel Gamal Abdul Nasser, chairman of the junta has taken over full executive powers. The fact that it was necessary to cancel the President's trips to the Sudan next week and Pakistan next month shows how sudden was the crisis. Colonel Nasser, a more authoritative figure than any other member of the officers' committee, has long been acknowledged by most members to have been the brain behind the movement since its earliest days of secret meeting in the desert. All are now busy reminding the world that Neguib joined them only at a later stage.

Coming so soon after the dissolution of the Moslem Brotherhood, this no less great upheaval is bound to split Cairo into even more factions than it already contains. The prospect is one of difficulty for any government. The likelihood is that whoever rules will have to increase the volume of anti-British and anti-western propaganda and policy if he is to keep a hold on public favour. The day not only of settlement with Britain, but of securing big foreign investments, would appear to be postponed.

Tories anxious to count blessings are bound to reason that, from Britain's point of view, an unsettled Egypt cannot be worse and might be better than a settled one bent on deadlock. They can add that unsettled conditions might prompt the Sudan, and even certain members of the Arab League, to lean away from the Egyptians and towards the West. But upsets inside Egypt are not so obviously advantageous if their price is the security of British soldiers and of a very large foreign community in Cairo and Alexandria. The backbenchers would be unwise to gloat.

UK WAGES AND PRICES
INDEX NUMBERS JUNE 1947=100

Passed to Mr Macmillan

ANOTHER step in the wearisome and seemingly endless chain of negotiations about the reconstruction of local government has been taken. Representatives of the county, urban district, rural district and parish councils have laid a united set of proposals before the Minister. It is something that these four local authority associations should have agreed among themselves on a policy for reform; but since that policy is for the most part both vague and inadequate the matter is not much forward.

The most definite point in the proposals is that the 19 county boroughs which have less than 75,000 population should lose their present status. This arrangement would reduce the number of major local authorities and strengthen the fabric of county government; but it has merit only if combined with an overhaul of the status and functions of the larger county districts. It is absurd that while some medium-sized towns (which happen to be county boroughs) should run all their own services, other towns and districts of equal size and strength should have negligible powers and be obliged to leave the management of all their main services to the counties. These frustrating anomalies—under which Harrow with 219,000 people has the same powers as Ambleside with 3,000—are undermining the interest and participation in local government of ordinary citizens. They will not be removed by the associations' proposal to strengthen the schemes for delegating powers from county to county districts. All such schemes fall foul of the fact that financial responsibility—and hence real control—remains with the county.

The fifth local authority association, the Association of Municipal Corporations, has so far held its hand. It certainly will not agree to the proposed abolition of the smaller county boroughs. Thus Mr Macmillan, who has said he will take no action unless the local authorities agree among themselves (which they never will), will be faced with another deadlock. The supine attitude of the present Government to this problem is only slightly less stultifying than the frivolous attitude of its predecessor. The Labour Government dismissed the Local Government Boundary Commission for the political crime of producing a coherent—and therefore contentious—plan of reform. Mr Macmillan's duty is to the public at large and not to the vested interests of particular local associations. Both the structure and finances of local government need a thorough overhaul—and by this Government, not the next one or the one after that.

Pledges for Uganda

UGANDA is no longer a political issue. On his recent visit to London, Sir Andrew Cohen, Governor of Uganda, may not have succeeded in convincing all Labour members of the rightness of the decision not to allow the Kabaka to return; but official Labour policy is evidently going to concentrate on the long-term plans for the progress of the whole protectorate and to ignore the Kabaka—at least for the time being.

Those plans were outlined by the Governor in his speech to the new legislative council at the beginning of this month, and underlined in the statement made by Mr Lyttelton on Tuesday. They are all based on the development of Uganda as a primarily African state, which means—in Mr Lyttelton's words—that "when self-government is achieved the government of the country will be mainly in the hands of Africans." That is the principal pledge given to allay Baganda fears that through federation or immigration Africans will find themselves in a subordinate place. Economic development will need foreign capital and foreign skill. But immigration is already strictly controlled, as is the alienation of land. There is no reason to fear that industry and mining, which are bound to be on a small scale compared with agriculture, will upset the Africans' land rights or lead to much immigration. Nor will industrial development be accompanied by an industrial colour bar. The clearest possible pledge on this point was given by Sir Andrew and reaffirmed by Mr Lyttelton this week. They went farther and declared that both government and industry will train Africans for skilled work and responsible posts.

On constitutional issues Mr Lyttelton made no definite statement, although the Baganda's proposal that Uganda should be a federation was implicitly turned down by his declaration that only as a united country would the protectorate be strong and prosperous. But the Government is taking one new step to help solve Buganda's constitutional problems: in particular the relations between the Kabakship, the Ministers and the Lukiko, and between the Lukiko and the Legislative Council. An independent "expert," as yet unnamed, has been asked to go out to Uganda to hold discussions with the interested parties, and to help them to put forward agreed recommendations. He will also discuss the implications of industrialisation. This is a novel and interesting alternative to the usual investigation of colonial troubles by a formal commission. It has the advantage that whatever recommendations are put forward will come from the people concerned rather than from an outside body.

Sparring on Disarmament

THE Soviet Union as a champion of disarmament in a wicked and warmongering world plays an important role in Soviet propaganda. It was hardly surprising, therefore, that Mr Molotov could not be entirely prevented from harping on the theme at Berlin. His proposal that a world disarmament conference should be convened this year was met by a counter-proposal from M. Bidault that the matter should, in effect, be returned to where the western ministers thought it belonged—the United Nations. What happened after Mr Molotov had been persuaded to confine his remarks on disarmament to the restricted sessions is not known. (Nor is it known what the Soviet and American foreign ministers said to each other at their private talks on the policy of atomic energy.) But at the end of the conference the four ministers announced that they had agreed to hold an exchange of views on disarmament "as provided for" in the United Nations resolution of November 28, 1953.

This agreement represents something of a concession by

the Russians to the western point of view. At the General Assembly last November great efforts were made to draw up a disarmament resolution for which both East and West could vote, in the hope that this would serve to heave the UN Disarmament Commission out of the rut into which it had fallen. This resolution suggested that the commission should consider establishing a sub-committee of "the powers principally involved which should seek in private an acceptable solution" of the problems of disarmament and of atomic weapons. But the Russians would do no more than abstain; and their abstention was held to mean that they would not collaborate in the private talks proposed by the resolution. Now, however, they seem to have changed their minds.

After the Berlin conference Mr Molotov said that the agreement on disarmament talks imposed "definite obligations" on the four powers. What exactly—if anything—he meant by this remains to be seen. Last November the Russians were still trying, without success, to stuff down the throat of the General Assembly their omnibus peace plan, which calls among other things for the unconditional prohibition of atomic and hydrogen weapons and a one-third reduction in the armed forces of the Big Five. Unless they can produce some more realistic ideas, the proposed private talks have little chance of success.

Mr Rhee's Pacific Pact

MR SYNGMAN RHEE is trying to drum up support for a Far Eastern anti-Communist alliance. Last November he went to consult Chiang Kai-shek on Formosa and both men afterwards issued a joint appeal to the nations of South East Asia to join an anti-Communist Pacific pact. Now Mr Rhee has dispatched a goodwill mission to take further soundings in Saigon and Bangkok, as well as in Formosa. His objects are clearly to build up his own prestige and obtain still more support and military aid from the Americans.

The South Korean President has no doubt found grounds for hope in the statement made last June by the American Secretary of State when discussing the problems of Middle East defence. Mr Dulles said that the United States, while waiting for a formal security association to grow up in this area out of the present vague desire for a collective security system, could "usefully help to strengthen the interrelated defences of these countries," so that they can resist the "common threat to all free peoples." There is no theoretical reason why the same principle should not apply to other parts of the world, including the Far East.

In practice, however, there are at least two important respects in which the Far Eastern situation differs markedly from the Middle Eastern. In the first place, the countries now being canvassed by Mr Rhee's emissaries are already receiving American military aid on a substantial scale. The Americans have recently increased their efforts to reinforce the Thai army, navy and air force, partly in response to the general threat of the war in neighbouring Indo-China, partly with an eye on the autonomous Thai area within China; it is thought that China might some day use these Thais as "volunteer" forces in Burma, Laos and Siam itself. In the second place, the Americans have always been highly

sceptical about the possibility of a really effective anti-Communist alliance in the Far East. At this stage it might be of some use psychologically, but they maintain that such an alliance, if it is to carry any weight, must include Japan; and there is not the ghost of a chance that either Rhee or Chiang would welcome Japan as a member of their club.

Pink Peers and Red Scouts

A YOUNG man called Paul Garland is a member of the Young Communist League, a fatuous organisation which has about 1,500 members and so little grip upon the faithful that in any one year about 80 per cent of its members leave—to be replaced by others. Garland has been refused enrolment as a Rover Scout, and his case has been indignantly cited as an example of the evils of McCarthyism. One evil of McCarthyism has indeed been demonstrated in the affair; the fact that it has induced woolly libertarians to suppose that it is respectable to start hunting for witch-hunters, as a sign that one does not believe in hunting for witches. This attitude is based on a total confusion between discrimination and intolerance, which are very different things.

The Scout movement, after all, "fears God and Honours the Queen," and demands of its members a pledge in those words. It may be held that the scouts ought to cut the "Scout Promise" out of their constitution. So long as it stands, however, it is hardly reasonable to protest at a scoutmaster's refusal either to waive it for the special benefit of Communists or, by accepting it from Communists, to allow it to be cheapened to the point of tongue-in-cheek meaninglessness. One would not deny to the Ancient Order of Rechabites the right to refuse admission to a newly-enrolled and active supporter of a drinking club; nor could the refusal be reasonably regarded as persecution; intolerance, and the infliction on its victim of a pariah's status. Or would it? Perhaps if Senator McCarthy had devoted his attention to drinkers and their friends and associates, if every Civil Servant who had once laughed at a Guinness advertisement or expressed an admiration for G. K. Chesterton were lying awake at night wondering whether to resign or wait to be fired, the answer to the question might be different. But, for the moment, the Labour peers and politicians who have been criticising the Scout movement's decision are in an invidious position. Among the forty organisations quite rightly proscribed by the Trades Union Congress and the Labour party for their membership stands the Communist party. McCarthyism at Transport House?

Civil Service Centenary

A HUNDRED years ago this month the Northcote-Trevelyan Report on the Organisation of the Permanent Civil Service was presented to Parliament. The centenary has been marked by two elegant little publications—one a

historical account by Mr Wyn Griffith and the other a lecture delivered in the University of London by Professor K. C. Wheare.*

The report of 1854 made four main recommendations, which became the corner stones of the service as it is today. These were, first, that appointments to the civil service should be made by competitive examination and not by patronage; second, that promotion should be by merit and not by seniority; third, that there should be a distinction between copying and intellectual work; and fourth, that there should be single integrated service. At the time these recommendations, especially the first, were horrifying to many people. Queen Victoria feared that to abolish patronage would fill the public offices with "low people without the breeding or feelings of a gentleman." Trollope, in "The Three Clerks," caricatured the authors and suggested that they would in time subject the whole population, even females, to examinations. Sir James Stephens declared that

No man of real mental power, to whom the truth is known beforehand, [will] subject himself to an arduous examination in order to win a post so ill-paid, so obscure and so subordinate.

How wrong he was. That the service has been able to attract able young men is largely due to the separation of routine from intellectual work suggested by Northcote and Trevelyan—the creation, in fact, of the Administrative grade. Professor Wheare suggests another reason: the social prestige that once derived from aristocratic patronage survived the introduction of the competitive examination, and still contributes to the honour in which the service is held.

But if the civil service has had more than its share of the nation's talent in the past, there are now fears that the standard of entrants will fall. It was disputes over pay in the lower grades of the civil service that prompted the appointment of the Royal Commission that is now inquiring into pay and conditions; as a result, the centenary has also been marked—through historical coincidence—by the publication of a factual memorandum submitted by the Treasury to the Commission on the share-out of the £400 million odd paid in salaries to the 745,000 non-industrial civil servants (excluding the foreign service) last year. The report suggests that there are obvious anomalies in the "Tomlin formula" under which civil service salaries are now determined. But it is to be hoped that the Commission will not merely concentrate on ironing out these anomalies in the lower grades; the vital problem before the civil service in this centenary year is whether rewards of public service are high enough at the top to attract those who can become "statesmen in disguise."

Hands across Iran

WHEN Sir Zafrullah Khan, Pakistan's Foreign Minister, was asked last week whether his new pact with Turkey could be called a first step towards a regional defence organisation, he replied cautiously that "it might and it might not." Two days later came his formal request to Washington for military aid under the Mutual Security

* The British Civil Service 1854-1954. Wyn Griffith, HMSO. 1s. The Civil Service in the Constitution. K. C. Wheare. Athlone Press. 2s. 6d.

programme. The pact is therefore a first breach in the "neutrality" front that India and Egypt would like to make of the so-called Arab-Asian bloc. As the map shows only too clearly, sheer distance impairs its military significance. Its importance is psychological, for it marks a shift in the pattern of Asian thinking.

Only a month ago, this seemed uniform. Moslems on a round of visits from Karachi to Damascus and Cairo assured one another that each had no thought of military links either with the west or Turkey, and that all were inimical to Israel. Since Pakistan's attitude has changed so fast, there is speculation whether its example will not be infectious to other Moslems; wishful thinkers forget that,

owing to Pakistan's links with the Commonwealth, it constitutes a special case. What it has done is to present the Arabs with proof that it is possible to do deals with the West without ceasing to bear it a grudge over Palestine.

On a map, Iraq and Iran stand out as the two exposed areas that might feel inclined to seek such an alliance, but Iran has two good reasons against doing so. It is temperamentally inclined to the balancing feat as between Russia and the West that it has practised so elegantly for more than a century; moreover, until it has created social conditions in which poor men have something to lose by change, its public will not put much heart into commitments against Russia. Iraq, with its promise of prosperity from oil, has more to defend than Iran, and is a little less loth to commit itself. Its premier has this week pointed out that the West is its only possible source of armaments; but to interpret this remark as promise of joining a military alliance is highly premature. The new pact, which is "open to all peace-loving states," is thoroughly distasteful only to Egypt and India, who, as would-be neutrals, ought to be peace lovers *par excellence*.

Arming India's Neighbour

MR MOHAMMED ALI, Prime Minister of Pakistan, has now officially stated that his government has requested military aid from the United States; at the same time he emphasised that there were no conditions attached to the assistance and that the question of lending bases to foreign forces did not arise. The help, he said, would be used simply for Pakistan's own "legitimate defence" and to enable it to take part in the United Nations system

asbestos cat

Only an inhabitant of the lower regions could possibly have any use for an Asbestos Cat. But if our export department received an order for one, they would scarcely turn a hair. Seriously, the uses of Asbestos in industry are growing at a fantastic rate.

Apart from its first great natural property, the fibrous structure of asbestos renders it easily adaptable to many uses, often in combination with other materials. It can be spun, woven and moulded. We, ourselves, turn it into many products. Amongst these are Caposil and Caposil, both Preformed and Plastic heat insulations, also Capasec Moulded Brake Linings and Asbestolux Incombustible Building Board. It is available as yarn or cloth, as mattresses for locomotive boilers and also has its uses in those transports of delight, the jet liners.

Asbestos may solve some problem that's proving a bit of a headache in your branch of industry. If you think so, consult the people who know best about Asbestos...

There is a local office to administer your estate

THERE are often very real advantages to be obtained when an estate is administered by those who have first-hand knowledge of local conditions and who are easily accessible to the dependants.

The Executor and Trustee Department of Lloyds Bank has 28 offices in England and Wales. When Lloyds

Bank administers an estate the affairs are handled not by a remote organisation but by personal contact through the appropriate local office of the Department.

For information about the Executor and Trustee services of Lloyds Bank in your district, please enquire at any of our branches.

LLOYDS BANK

Executor and Trustee Department

THIS ANNOUNCEMENT SHOULD NEVER HAVE TO BE PUBLISHED!

If the dilemma of British farming had been considered seriously, such a plea as we are about to make would have been unnecessary!

Here we all are, in an overcrowded island of some fifty million people. After two world wars, we depend increasingly on home production for our food supplies. The era of cheap imported food has gone forever.

During the vital war years, our farmers got the support they so rightly deserved and they responded in full measure to the call for extra food. Now, when the need is just as great, we ignore their reasoned arguments for easier credit facilities. Is this a sensible attitude?

We must have more food from more acres. Farm wages have risen, so farmers must offset these rising costs with more mechanisation and the replacement of antiquated machinery. More money must be found—yet loans to farmers are still subject to the high rate of 5% interest! Taxation adds yet another burden, preventing the accumulation of capital to plough back into the farms.

This absurd situation must be altered. Loan interest rates must be lowered. Some form of tax relief must be granted. Capital must be readily available for agricultural expansion—not to line the farmer's pocket, but to produce the nation's basic essential—food!

The land is our finest investment. Let us not forget it!

GROW MORE FOOD IN BRITAIN

Issued in the interests of British agriculture by
Massey-Harris-Ferguson, Coventry.

of collective security. As thus stated, there is nothing to give India valid ground for objection, yet its hostility to the pact is nevertheless intense.

The main cause is undoubtedly the fear that Pakistan, with increased strength, may threaten or even make war on India over Kashmir and other disputed issues, and that India will be put at a disadvantage in relations with Pakistan by the American action. But Mr Nehru has preferred to put his case publicly on quite different grounds; he talks about Pakistan bringing the cold war to India's doorstep and seems to claim some kind of right to determine his neighbour's foreign policy. This attitude inevitably forfeits sympathy abroad, for it is clear that if India has a right to be neutral in the current division of the world, Pakistan has an equal right not to be. It is certainly not the intention of the United States to strengthen Pakistan against India; it is rather that both nations should be strong enough to prevent seizure of the sub-continent and its resources by the Communist powers in the event of a general war.

It would probably now be politically impossible for Mr Nehru to accept aid from the United States even if the latter were willing to extend it. India might increase its own arms production, but only at the cost of disrupting the present Five-Year Plan, with serious consequences both for the economy and for the popularity of the Congress party. A movement for a pro-Soviet policy which would bring arms supplies from the Soviet Union might easily become a formidable factor in Indian politics. There remains the possibility that Commonwealth countries might provide India with some help in the field of defence, particularly as regards up-to-date weapons in which it is notably deficient. Indeed, it is a mystery why they did not supply Pakistan adequately.

Free Pacts Next Year?

THE Minister of State at the Board of Trade was able last Monday to be more informative on the subject of newsprint than he had been the week before. He said that representatives of the newspapers had now told the Government that the supplies of newsprint available to them this year will not be large enough to permit the removal of rationing. Last week Mr Heathcoat Amory had puzzled the House by saying that "supplies sufficient to maintain a safe stock level and provide for any increase in present consumption are unlikely to be available this year"—a statement that seemed hard to reconcile with the known offer by Canadian mills to supply an extra 100,000 tons in the year starting next July (including about 50,000 tons by the end of 1954).

The newspapers' representatives believe that an extra 100,000 tons a year of imported newsprint might be enough to allow the end of control next year. (It would not be enough if increased imports represented the only possible addition to supplies, but the newspapers are counting on being able to attract much of the home-produced newsprint that is now exported.) Even if the Government were to make sufficient dollars available, the newspapers would certainly hesitate to seek all their additional import requirements from Canada; but it is plain that if they are to get rid in 1955 of the galling restrictions on their size, more

dollars will have to be spent than the (recently increased) amount now authorised. The Government must decide quickly what it is prepared to allow, because newsprint cannot be bought over the counter at the moment it is needed. Its decision should give due weight to the fact newsprint is one of the few raw materials still subject to quantitative restrictions, and that Britain's is the only free press in the world that still endures rationing, it should perhaps be hastily explained that weekly newspapers do not generally use newsprint; conscientious readers need not fear that increased imports of it would cause *The Economist* to grow any bigger.

Uncertain Irish Trade

THE provisional returns of the Irish Republic's trade in 1953 (writes our correspondent in Dublin) show that exports, at £114 million, were the highest ever recorded. Imports were valued at £183 million, and thus the visible adverse balance was £69 million, compared with £71 million in 1952 and £123 million in 1951. In both 1951 and 1952 net invisible earnings were around £60 million; this suggests that the total deficit on the balance of payments last year was very small—although, probably, still a deficit.

These results have been received with rather more satisfaction than they warrant. Neither side of the account looks very reliable. Imports are beginning to increase again after a sharp fall from the stockpiling year of 1951. No doubt this reflects greater industrial activity; but industrial output does not make any significant contribution to the export trade, which depends principally on the ability of Irish farmers to sell at competitive prices. It is here that misgivings are greatest. The fall in the price of some products and the freeing of the British market can hardly fail to affect a trade which has enjoyed good prices for many of its products and which was provided with unrestricted markets throughout 1952 and much of 1953. British restrictions on imports from the Continent. If exports will be more difficult to sell in 1954 than in any year since the war. This means that the Irish economy may be faced with some uncomfortable readjustments in the coming months; and it is only too easy to imagine circumstances in which the balance of payments for 1954 might go badly wrong.

Letters to the Editor

Apartheid in the Universities

SIR—In the issue of January 9th, commenting on the address delivered by Dr D. F. Malan as Chancellor of the University of Stellenbosch, you state: "Race relations are bound to suffer by this new isolation of contacts between the races." May I ask why? After all, as any schoolboy knows, contact is the one essential element for conflict. The European and the Bantu had no conflicts with one another at all at the time that van Riebeeck landed at Cape Town in 1652. It was only when contact was established in the vicinity of the Kei river, between the Bantus proceeding southwards from the north and the Europeans proceeding northwards from the south, that wars ensued.

When the various planes of contact (and therefore also of friction) in South Africa are taken into account, it is quite surprising how well South African Governments from time to time have succeeded in avoiding serious trouble. We have here not only Protestants and Catholics, not only English-speaking and Afrikaans-speaking South Africans; but also a very large number of German people in South West Africa (where German is an official language); one of the largest percentages of Jews in the world; a Bantu population of some 8 million which is divided into any number of nations or tribes; and those that fought one another bitterly until the Europeans established some measure of peace and order between them; a large number of Indians; a number of so-called "Cape Coloureds" born from an intermingling of races; and a number of Cape Malays, who are descendants of the Malays who came to the Cape under the Dutch rule.

Taking into account that practically all the groups speak different languages, have different customs and different political aspirations, it is quite clear that indiscriminate contact and intermingling must result in friction and bloodshed. Everybody realises that contact in some form or other is inevitable, but in South Africa there is such a lot of contact daily that is completely unavoidable that the Government must ease the tension by limiting contact and ensuring separation in all spheres and places where it is possible.

To compare the racial policy of South Africa in your mind's eye with that of India, or Great Britain, or the Gold Coast, would be fallacious. In those countries the minority populations are such a small percentage of the total population that, no matter what policy is followed, the consequences could not be too serious; but when the percentage

comes to 20 per cent and more, in different minority groups, racial policy that limits the planes of friction when and whenever possible is imperative. This entails a lot of work, a lot of expense, and a lot of criticism from unenlightened outsiders who have nothing to lose; but the alternative is the lynchings of the southern states of the USA where the Federal Government, ideologically blinded by the theory of equality, has been enforcing contact on the people. In contrast we prefer apartheid.—Yours faithfully,

D. W. R. HERTZOG
Stellenbosch, South Africa

Blaming the Index

SIR—The interesting chart in your issue of February 13 gave the following index figures for prices, wages and profits in 1953 on the base 1938 = 100:

Weekly earnings	300 (estimated)
Consumer prices	228-229
Wage rates	228-229
Gross dividends	140-150 (estimated)

The following are the maximum salaries of Assistant Secretaries and Principals in the Administrative Class of the Civil Service in 1953 on the same basis:

Assistant Secretaries	145
Principals	143

It has been estimated that salaries of other professional men have, in general, about doubled over the period.

These figures show what a depressed class these senior Civil Servants have become. It is also borne in mind that the "interest" rate has been 2 per cent since pre-war days, and that the maximum annual leave allowance has actually been reduced by 25 per cent. It is therefore hardly surprising that, as recently announced, the Administrative Civil Service is now attracting a smaller proportion of the best graduates than heretofore. If this continues it must inevitably lead to a decline in standards at a time when the ever-increasing complexity of government administration demands a Civil Service at maximum efficiency.—Yours faithfully,

CIVIL SERVANT

Cheap Food or Dear Farming

SIR—Your article of February 6th leaves the major question unanswered. Does the country want increased food production or not? The Government is aiming at 60 per cent above 1938 production by 1956. As things are going at present this will not be achieved. If the country made up its mind that an expanding agriculture (which is a very large customer of many home industries) was in

the national interest, then an 80 per cent or even 100 per cent increase over 1938 would be by no means impossible. But to achieve this a very different outlook would be necessary. In the first place the neglect of home agriculture of the past 100 years would need to be repaired.

It is easy to say that Danish bacon for example is cheaper and better than British bacon. This is quite correct, but it need not be so. The supremacy of the Danish bacon industry was not achieved in a year, or a decade, or even a generation. It is the result of planning and effort on the part of the Danish Government and Danish farmers for more than half a century, while you say in your article that an assurance to British farmers for four years ahead is unnecessarily long. It has been truly said that it takes longer to produce a bullock than a battleship. The builder of the battleship gets an assured end price for his product, but you would not allow similar treatment for the producer of the bullock. There is no inherent impossibility in the British farmer being able, in time, to produce as cheaply and as efficiently as the Danish or Dutch farmer, and to supply all our needs of milk, butter, cheese, cream, bacon, pork, eggs, poultry, etc., so that no imports at all of these products would be necessary.

What would be the reaction of our exporting industries to a reduction in our food imports from abroad, with a probable reduction in the purchase of our manufactured goods by food exporting countries? In other words does the country really want increased agricultural production? Farmers are coming more and more to the view that it does not, and that agriculture is going once again to become the Cinderella of our industries, to be kept at mere subsistence level in time of peace, but to be conveniently handy to save us from starvation in time of war. Your article would seem to support this view, and the farming community is naturally chary of investing too heavily in such an insecure industry. Without very considerable new investment, technical and productive progress is impossible. Farmers would be exceedingly foolish to undertake a difficult and expensive expansion programme without some assurance that this would not merely depress the price of all their production to an unprofitable level, as has so recently happened in the case of eggs.—Yours faithfully,

ROGER CHAPMAN
Newport, Monmouthshire

Uneconomic Nationalism

SIR—In your comment in your issue of February 6th, you refer sorrowfully to "the Treasury's vast—and unnecessary—labour in producing Cmd. 9051, which sets out details of revenue and expenditure in 1952-53 for England and Wales on the one hand and Scotland on the other." Why unnecessary? And why should not the same be done for Wales separately? Judging by the extravagance of your language in describing the views of Scottish and Welsh Nationalists, one suspects that on

this occasion you may have been under the influence of metropolitan provincialism.

You, Sir, appear to be quite satisfied with the light shed by aggregates; but is it unreasonable for Scotsmen and Welshmen to want to see these aggregates broken up so as to throw light on what is happening in their own countries? We now know that in the year 1952-53 Scotland contributed 9.69 per cent of British revenue and received 12.34 per cent of British expenditure which can be specifically allocated. Your comment on this is that "the English welfare state is not being paid for out of Scottish taxes," and you hint that separate returns for Wales would be even "less complimentary than those for Scotland." Your way of interpreting these figures is rather one-sided: the Catto Report was careful to point out that "... lower revenue might be symptomatic of unfavourable industrial or trade conditions that might in turn give rise to the need for increased expenditure." (Cmd. 8609, p. 53.)

Now that we have these financial returns for Scotland, it is inconceivable that the Welsh figures should continue to be merged with those of England. The whale may be quite indifferent to the presence of Jonah in his belly and he may sincerely believe that it is in Jonah's best interests to stay there, but if Jonah registers his own point of view by kicking a little, one would hardly suggest that he is the misguided victim of a "silly abstraction."—Yours faithfully,

BRINLEY THOMAS
University College, Cardiff

Housing and the Bill

SIR—A simple and equitable method of reducing the burden of housing subsidies, and one which Mr Butler could usefully adopt in his next budget, would be to add the total amount of the subsidy on any particular house to the income of the tenant for taxation purposes. This is only fair and reasonable, since these subsidies represent as much a form of income as family allowances—which are taxed. Tenants with a low income or many dependants pay very little income tax anyway, and will not be greatly affected. Tenants with a fairly substantial income and few liabilities, paying the higher rates of tax, will find the benefit of the subsidies reduced.

The subsidy on individual houses should be known to, or could be calculated by local authorities (who should, in any case, notify tenants of the amount of the subsidy on their particular property), and the actual subsidy should be used, not the minimum standard subsidy. The former averages about double the latter on recently-built property. If, however, calculations of individual subsidies were considered too involved, a fixed allowance could be substituted based on the size of the house and date of construction (which governs construction costs and interest rates).—Yours faithfully,

L. A. COOK

Revolutionary Colossus

THE PROPHET ARMED. Trotsky, 1879-1921.

By I. Deutscher.

Oxford University Press. 340 pages. 30s.

THERE are plenty of dwarf Trotskys in the world, and this detailed portrait of the giant himself may make it easier to understand and deal with them. For Mr Deutscher, in this first volume of his biography of Leon Bronstein, performs two services: he sets forth much new material that Soviet historiographers would dearly like to suppress but which is essential to the understanding of the triumphs and failures of the Bolshevik Revolution; and he reflects the puzzlement of the western intellectual, muddled by Marxism, as he confronts the passionate arrogance and lucid ruthlessness of the modern revolutionary. Now that Mr Deutscher has displayed so much imaginative brilliance and intellectual vigour in recreating this unscrupulous personality, some humble bourgeois can examine Trotsky in the light of more human considerations and more permanent values. Was he a wicked man of a deluded mind? Are the see-saws in his thinking to be remembered to his credit or to his discredit? Is his predicament in 1920 to be compared with that of a "protagonist in a Greek drama," as Mr Deutscher would compare it, or with that of a villain in a Shakespearean play? Perhaps we have more to say on these aspects of the matter, though it is only fair to add that Mr Deutscher is a merciless seeker-out of inconsistencies.

That something should be said is important, for British views of the Soviet achievement are likely to be dominated for some time to come by the recent work of Mr Deutscher and Mr E. H. Carr. The latter is almost inhumanly objective in his analysis of the Bolshevik revolution, and Mr Deutscher is almost purringly tolerant in his criticisms. Both writers, it is true, have rendered great service by restoring a sense of proportion to the discussion of events that arouse such passionate controversy and still influence the fates of nations; but a little well-balanced and hard-hitting liberal history writing will be called for soon.

Another criticism may be made of Mr Deutscher's treatment. It is that the personality of Trotsky is allowed too much to dominate its historical framework. There is no adequate picture of the "canaille" Europe that helped to form him, or of the Russia that he

helped to transform; one has the feeling that Trotsky, apart from his early cruel experiences in prison, was up against a not very efficient enemy in the Czarist system, and that something more is needed to explain the Bolsheviks' success than their gift for conspiracy and efficient organisation. In many places Mr Deutscher seems to be adapting successfully the technique of Macaulay; he should widen his canvas in the manner of that master. Otherwise there can be nothing but praise for the order, clarity and very compelling manner of the narrative.

Mr Deutscher turns some happy phrases, and his descriptive style has an engaging sleekness. Trotsky, he says, thought aloud and in public, but it needed "Stalin's bat-like character" to carry the ideas into execution. One remembers the picture of young Bronstein sitting in Siberia "bashing the cockroaches off the pages" of Karl Marx. There is a vivid brief description of the suppression of the Kronstadt mutiny; and he hits off admirably the helpless arrogance of this colossal intellectual when he writes: "Trotsky hoped to persuade people that they needed no government by persuasion" and "in his career he gave the people ample notice of the dangers threatening them." From his own plans. Mr Deutscher has obviously been stimulated by the brilliance of his subject's own style, especially by his "intuitive" gift as an historian and as a prophet of the revolution's future betrayal of its ideals. Indeed, the contradictions of capitalism look relatively simple and soluble compared with the predicaments of Trotsky and Lenin as they switched from war Communism to the New Economic Policy.

An interesting question of historical judgment arises more than once in Mr Deutscher's analysis. He sees and presents the political difficulties that confronted the Bolshevik leaders in terms of dilemmas and antitheses rather more clear-cut than the pressure of political activity normally allows. Admittedly, many of them were men with years of practice in intimate argument among themselves, in planning without responsibility for consequences, and in thinking in schematic ways. But were their decisions really made, say in 1920-21, in this way? For example, at what Mr Deutscher calls the crossroads of the revolution—the point at which the party decided to be deliberately undemocratic—he says that free voting and speaking would have destroyed the dictatorship;

but if the dictatorship destroyed proletarian democracy, it would lose its moral legitimacy, even in the dictators' eyes. That sounds like the tragic dilemma of honest and merciful men; but is enough allowance made for the vanity of Trotsky, the impatient administrator, or for the personal motives of Lenin, the astute politician, then "struggling for breathing spaces?"

One wonders whether other motives—for example, the sub-conscious contempt of the intellectual for the worker—did not play their part. Mr Deutscher remarks acutely that these leaders discovered (as the British Labour Party has been discovering) that no one in the vast literature of Marxism and Socialism had ever thought what should be done if the workers should lose confidence in socialism when they saw what its methods were. Or, as Trotsky himself said of the Jacobins of the French Revolution in his pamphlet of 1904 attacking Lenin: "The counterpart of their absolute faith in a metaphysical idea was their absolute distrust of living people." Perhaps Mr Deutscher's second volume will show Trotsky, in his opposition to Stalin, becoming more humble and more human. In any case it will be eagerly awaited, for this is a fascinating and stimulating book about historical events that are still in train.

Social Insect

WAYS OF THE ANT

By John Crompton.
Collins. 254 pages. 15s.

ALTHOUGH nearly all ants look much alike, they adopt astonishingly varied ways of life. Some live by sowing seeds, others by planting grain, cultivating mushrooms, milking aphids, scavenging, and even by capturing "slave" ants of other species to work for them. Their social systems show a number of variations on the patriarchal theme, as well as an effective co-ordination of the behaviour of the individuals *pro bono publico*. Mr Crompton describes these animals in a vivid pictorial style which makes for easy and exciting reading: this and the inherent interest of his subject will ensure him many readers.

Unfortunately, however, he has not been satisfied with the wealth of material available to him, but has unashamedly endowed his ants "with attributes that we possess ourselves but that they probably do not." He considers this necessary to make ants comprehensible to the reader. Certainly a book for human readers must contain human concepts, and a popular book like this is no place for pedantic qualifications. But Mr Crompton has so far exceeded his licence that he has strayed into the world of fiction. The real ants are obscured when he describes their behaviour in terms of "fortitude," "courage," "restraint" and so on, and talks of ants "learning" patterns of behaviour which in fact have taken countless generations to evolve.

As one might expect, Mr Crompton concentrates on the spectacular species with the more bizarre life histories at the expense of the equally interesting and

more revealing commonplace ones; he quotes at length the fascinating descriptions made by the nineteenth-century naturalists but ignores the work of the more recent and physiologically minded entomologists. This is a great pity, for ants are really much more marvellous if one remembers that they are not miniature men, and show their complex behaviour in spite of their simple organisation and tiny brains.

Sceptic in West Africa

FOUR GUINEAS: a Journey through West Africa.

By Elspeth Huxley.

Chatto and Windus. 314 pages. 21s.

MRS ELSPETH HUXLEY'S talent for interviewing is well known in Africa. Within fifteen minutes she can turn out the contents of her victim's mind, pick out the patchwork pieces she requires, discard the unwanted and return the whole to the ragbag. Back home she synthesises the colourful and variegated material she has collected, and produces beautifully written books like "Four Guineas," a travel book on the four countries which make up British West Africa, the Gambia, Sierra Leone, the Gold Coast, and Nigeria.

Coupled with her genius for amassing and imparting information Mrs Huxley has a highly developed visual sense—most of the photographs in the books are her own—and nobody has ever written better pen pictures of the African scene. This gives a unity to what otherwise might have been four essays in one volume. She captures exactly the grace and proud precence of African women, gorgeously dressed, walking, along in single file, like figures in a Grecian frieze, and also the endless, aimless movement of Africans against the static backdrop of their country. The composite picture Mrs Huxley gives is in equal parts fascinating, exhilarating, and disturbing. It is a memorable book, even a brilliant one, but alas! not the great one it might have been.

The reason is that Mrs Huxley does not really like twentieth-century Africans. She strives very hard, too hard, for detachment. Yet she is afraid that Africans will not succeed in their modern struggle for progress, and instead of Utopia will produce some terrible and unimaginable Gehenna. Strangely expecting the African to be Rousseau's noble savage, she finds Africa not primitive but decadent, and regards it as the *oubliette* down which are drained all the better elements of European civilisation that reach the continent. Moreover, Mrs Huxley is not fundamentally interested in politics, and nationalism seems to her childish, so that sympathetic understanding of African nationalist politics is beyond her range. She feels nationalism as a force carrying the African peoples through "caverns measureless to man, down to a sunless sea," certainly not as a stage, perhaps sometimes unattractive, in the growth of any people towards political maturity. The contrast between the savage old

Africa and the mechanics of modern political democracy, such as the ballot box, jars her continually. "I think," she writes early in the book, "Africa is a haunt of the ludicrous, the incongruous, the illogical, a playground of events that own no pedigree and will breed the unforeseen." Feeling too sharply the distinction between black and white, she forgets that elements of *opéra bouffe* have been present throughout human history.

French View of Germany

L'ALLEMAGNE CONTEMPORAINE—SOCIALE, POLITIQUE ET CULTURELLE, 1890-1950. 2 Vols.

By Edmond Vermeil.

Editions Montaigne, Paris. 827 pages. 38s. 6d.

PROFESSOR VERMEIL of the Sorbonne has written a number of books on German problems and in France is considered an authority on Germany. In his latest work he surveys the whole political, social and literary history of Germany from Wilhelm II to Hitler to support his thesis that the National Socialist régime was the necessary and inevitable outcome of what had gone before. This interpretation of German history is not strange in a Frenchman conscious of all his country's sufferings at the hands of the Germans. But, however much sympathy the British reader may have for the sufferings of the French, he will want to have a close look at the evidence adduced to support a theory of this kind.

Unfortunately, the political chapters of M. Vermeil's book are not so accurate as one would expect from an author of his rank. There are, indeed, some inaccuracies even in the first volume, which deals with the reign of the Kaiser; there are many more in that part of the second volume which is concerned with the history of the Weimar Republic. The author seems to get lost in the labyrinth of the party politics, coalitions and governments of this period. Professor Vermeil asserts, for instance, that the London ultimatum has "brusquement rejeté la Social-démocratie dans l'opposition." In fact, the ultimatum of May, 1921, caused the retirement of the Fehrenbach government, in which the Social Democrats had not taken part, and the formation of Wirth's first cabinet, in which they obtained three seats. When Gessler is referred to as the successor to von Seeckt, one cannot help wondering whether the author knows the difference between Reichswehrminister (Minister of Defence) and Chef der Heeresleitung (Commander of the Reichswehr). Indeed, Seeckt was for five years Gessler's subordinate and was dismissed by him in 1926.

It is perhaps more serious still that while Professor Vermeil correctly describes the devastating effect inflation had on the German middle classes, he hardly says a word about the policy of Poincaré which aggravated the inflation by the occupation of the Ruhr and

Forced Landing*

THE scene was an airfield in New Jersey. Two men, a test-pilot and a friend, took off in a small cabin monoplane. As they circled the field (with 100ft. on the altimeter) the passenger put his arm through the cabin-window and waved down to his family who were watching from the ground.

To his dismay he saw in the air below the aircraft a bright disc of metal, twinkling as it fell. The leather strap of his watch had snapped, and his Rolex Oyster, his inseparable companion, was flashing down to the ground.

It was a chastened joy-rider, who, when the flight was over, began, rather hopelessly, to search the airfield for the pieces: the gold of the watch, might, he thought, be salvaged.

Suddenly, in a muddy puddle, beside the taxi-strip, he saw his watch. Picking it out of the dirty water, he was amazed to find that his Rolex was showing the right time. It had not, in fact, lost a second through its forced landing—and it has maintained its accuracy to this day.

One result of this was that the pilot, who was even more astonished than the citizen of New Jersey, announced his immediate intention of buying a Rolex Oyster—"a watch that can take a beating like that."

But Rolex Oyster watches, of course, can take it. They have ticked happily beneath the sea, and on the heights of the Himalayas. They have travelled across the Sahara, and into the Arctic wastes. That a wrist-watch so meticulously accurate can stand up to such rigorous conditions is your witness that no more perfect protection exists for a perfect Swiss movement, than the famous Rolex Oyster waterproof case.

Though you may never expose your Rolex to such hazards, this unique feature will for ever guard your watch's accuracy from its everyday enemies—damp and dust and dirt.

★ This is a true story, based on a letter from Mr. R. Nicholas Farr, of Hummel, New Jersey, U.S.A., who was the passenger in the aircraft. His original letter can be inspected at the Office of The Rolex Watch Company, at 18 rue du Marché, Geneva, Switzerland.

THE ROLEX OYSTER PERPETUAL—truly a monarch among watches. The astonishingly accurate movement, perfectly protected by the Oyster case, is given added precision by the self-winding mechanism. The tension on the mainspring is much more even, overwinding is impossible.

THE ROLEX OYSTER PERPETUAL DATEJUST, finest of a long line of masterpieces. This watch is waterproofed by the famous Oyster case, self-wound by the unique Rolex Perpetual self-winding "rotor," and it shows the date, clearly and automatically, in a neat window cut in the dial.

... the watch was showing the right time."

The Rolex Red Seal signifies that the watch to which it is attached has been awarded an Official Timing Certificate by a Swiss Government Testing Station, with the proud title of chronometer.

As from now, all Rolex Oyster Perpetuals are graced by the new, slimmer Oyster case. This unique invention infallibly protects the movement against water, dust and damp.

The smooth-running, silent, self-winding "rotor" keeps the Rolex Oyster Perpetual fully wound automatically, provided the watch is worn for at least six hours a day. This constantly even tension on the mainspring makes for still greater accuracy.

ROLEX

A landmark in the history of Time measurement

What are you doing tomorrow?

TOMORROW (says procrastinating Man)
I will cease from procrastination.
Tomorrow I will cut down my smoking.
Tomorrow I will work harder. Tomorrow I
will resist the trite, the flippant, the foolish
thing. Tomorrow I will scorn the wiles of
popular journalism. Tomorrow I will start
reading the Manchester Guardian.

Excellent resolve. To change to the
Manchester Guardian is a seeming duty
which so soon becomes a positive pleasure.
The Manchester Guardian has much to offer
you — excellent writing, virile reporting, a
refreshing integrity and idealism. It is a
newspaper which wins, without wooing, your
loyal affection. Yes, perhaps you will change
to the Manchester Guardian tomorrow. Yet
why *tomorrow*—that dangerous never-never
day! Why not make the change on the one
day when things really happen—*today*!

*If you have any difficulty in getting your
Manchester Guardian regularly, please write to:
The Manchester Guardian, Manchester.*

RONALD MORRISON & CO. LTD., EDINBURGH

embittered wide sections of the German people.

Professor Vermeil is exceptionally well acquainted with German cultural and social literature. But whether his interpretation of the effect of a particular book on the public is always the right one must remain a matter of opinion. He finds seeds of National Socialist tendencies everywhere, even in Gerhart Hauptmann's novel "The Heretic of Soana."

Water-Jumps

THE BRIDGES OF BRITAIN.

By Eric de Maré.
Batsford. 226 pages. 42s.

THE claim that this book, published in 1954, is "the first comprehensive survey" of the bridges of this island calls for more than a mere exclamation of surprise. Mr de Maré must be congratulated on seeing and seizing his opportunity, and his publishers on backing him so handsomely. The format of the volume, its paper, type and reproduced photographs could, at a marketable price, not be bettered. On the whole, the author, too, has fulfilled his task with a commendable blend of diligence and enthusiasm, and the few criticisms which decline to be silenced should in justice be made at once and not be left as a last impression. The omission of a bibliography, however brief, is curious. Again, Mr de Maré might profitably have spent a little more time on identifying his reader; the book seems, turn and turn about, too technical for laymen, too popular for professional architects and engineers. Lastly, there are the moments when, opening the wrong bottle, he fills his pen with violet ink. The purplest of his passages—a mounting paragraph of some twenty lines of ever-thickening plush, of ever-deepening mauve—occurs, fortunately, quite early in the book; their original impetus should still be strong enough to carry most readers—even if a little troubled by thoughts of Holborn Viaduct—through it.

As in all history, here is an enormous superstructure dwindling down to scant foundations. The earliest bridges surviving, the "clapper" bridges of huge stepping-stones, are elementary in conception, but in execution still subjects of controversy; compared with the Forth Bridge, they are an enigma. We know much more about the methods of the Romans, and all bridge-builders of Britain followed them. As the Middle Ages advance into modern centuries, Mr de Maré's story grows in fullness and interest, with details of finance and labour, as well as of construction and design—and of vested interests, too. Where London Bridge stands, the Romans probably spanned the river with a wooden structure, and a stone bridge was certainly begun in 1176. But so jealous of it, so powerful, was the City that, until Westminster Bridge was opened in 1750, it would tolerate no rival nearer than Kingston.

The admired bridges of the eighteenth century and the improved communica-

tions of which they formed a part, these have their chroniclers already, who are perhaps Mr de Maré's excuse for pressing on, a trifle hurriedly, to the engineering feats of the last hundred years. For many readers this, the largest section of the book, will be also the most absorbing; and, since they will deny the premises, it is idle to invite them to wonder why canal bridges are always, river bridges almost always, and railway bridges hardly ever objects of beauty.

North East Asia

THE PEOPLES OF THE SOVIET FAR EAST.

By Walter Kolarz.
George Philip. 197 pages. 15s. 6d.

THIS book, based—sometimes with a rather precarious objectivity—on material published in the Soviet Union, makes a careful and judicious study of Russian colonial methods in the Far East. The races and tribes whose destinies are controlled, mostly via Habarovsk, from the Kremlin range from the dwindling remnants of obscure aboriginal nationalities, like the Nivkhi and the Udege, to much larger and more self-reliant ethnic groups, like the Mongols and the Yakuts; Yakutia, the biggest of the sixteen autonomous republics, has an area roughly equal to the Republic of India. There are also—or there were—fairly large colonies of Chinese and Koreans, descended from the immigrants of Tsarist days; these for the most part were summarily uprooted from their settlements near the Manchurian frontier (on the grounds that they were a bad security risk and liable to spy for the Japanese), and many of the Koreans are now growing rice in Central Asia. The territories in which these diverse peoples live are vast, ill-served by communications and remote—Vladivostok is as far from Moscow as Calcutta is from London; and the problems confronting their rulers are complicated by the multiplicity—and often by the fervour—of their religious beliefs, which include various brands of Shamanism as well as Buddhism, Mohammedanism and Christianity.

Caprice is perhaps, after ruthlessness, the most conspicuous feature of Russian colonial policy. To the staunch European Communists who rule the roost in the Soviet Far East changes in the party line, and the purges which accompany or precede them, are part of an accepted order; they cannot, however, be expected to make sense to the simple nomad or fisherman, whose language is unlikely to contain any words in which the meaning of "party" or "state" can be expressed, and whose mind is inaccessible to the mumbo jumbo of Marxist dialectic. To a Russian official the overnight transformation of a beloved hero into a detested villain (Mr Kolarz gives an interesting account of Marshal Blyukher's sudden fall from grace) seems a natural and indeed a salutary event; it is much harder for the mind of a Buryat Mongol to adjust itself, as it had to in 1937, to the execution as Japanese spies of 54 leading members of his race, one of

whom had just been given the Order of Lenin.

Though some of the aboriginal tribes, too small or too dim to matter very much, have been clumsily "patronised" by the regime, it is on the whole a gloomy as well as a muddled picture that Mr Kolarz paints. In Siberia, he concludes, after pointing the contrast with Africa.

the peoples can have no hope of an end of European rule. They are too small in numbers to withstand the Communist offensive which combines the implementation of economic development schemes with social experiments and attacks on tribal institutions and customs.

His book is a serious and useful, though not a first-hand, study of a fascinating subject.

National Atlas

ATLAS OF AUSTRALIAN RESOURCES.

Edited by Conrad Frenzel.
Angus and Robertson. Maps, 10s. 6d.
Commentaries, 10s. 6d.

DURING the last thirty years, to the familiar world atlas of schoolroom and library has been added the national atlas, consisting of maps of one country only. Many of these are heavily subsidised "prestige" productions, of which the largest and glossiest is the apparently uncompleted "Great Soviet Atlas." Some of the more useful of these atlases consist of a series of maps of various national resources produced to assist schemes of town and country planning. The excellent British series of National Maps on a scale of 10 miles to the inch is one example, the new "Atlas of Australian Resources" is another. This will eventually consist of about fifty maps on a scale of about 95 miles to the inch, to be issued at a rate of some fifteen a year.

The subjects of the atlas include general geographical conditions and physical resources (16 maps), economic activities (8), transport (5), population and housing (11), and "potential development" (10). Cartographically the new maps are very pleasing. All are overprinted on a common base map, which facilitates comparison of the various distributions shown. Lettering is simple and uniform; symbols and colours are clear and intelligently related to the subjects that they represent. Tasmania, which in so many maps of Australia appears somewhere in the Great Australian Bight, is shown in its correct position. Already in the first five maps to be issued, the difficulties of Australian development are neatly displayed. On the one hand, in maps of mineral and water supplies, there is evidence of rich resources, while on the other the maps of temperature, rainfall and soils present some of the real, but not insuperable, geographical barriers to development. Irrespective of its immediate importance in development planning, this new atlas cannot fail to aid the understanding of Australia's problems, while a number of its sheets will be of the greatest value in school and university teaching.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Anxiety Over Indo-China

Washington, D.C.

WHETHER the current Vietminh offensive in Indo-China succeeded in producing "a sense of crisis" at the Foreign Ministers' meeting in Berlin, as General Bedell Smith, the Under Secretary of State, believes it was meant to do, is difficult to tell from Washington. But there is no question that it has produced a three weeks' crisis in Washington for reasons only indirectly connected with the tide of battle.

Three factors have contributed to the sense of anxiety over Indo-China. The first is the mounting irritation of the Department of Defence with the French conduct of the campaign and the use to which American military aid has been put. The second is an outbreak of Congress's perennial fear, occasioned by the dispatch of some 12 light bombers and 200 Air Force mechanics to Indo-China, that a major decision of foreign policy is being made without its knowledge. The third is a more widespread questioning about whether the Administration's new strategy of deterring aggression by the threat of "massive retaliation" would make sense in the first practical test to which it might be submitted.

It has been obvious for some months that friction has been growing between the Defence Department and the French military leaders in Paris and Saigon. There has been constant criticism by American officers in Indo-China about the way in which American equipment has been used and maintained. Although an influential Republican Senator, Mr Smith of New Jersey, has suggested that American military and budgetary aid to Indo-China for the year beginning next July should be increased to \$1 billion as against the \$785 million granted for the current fiscal year, many senior American officers feel that successful resistance to Vietminh is no longer a question of *matériel*, but of the training of the Vietnamese forces, and of France's relations with the Associated States. A hint of the disappointment that is felt with the progress of the Navarre plan was given by President Eisenhower himself in his press conference of February 3rd, in which he made a mildly disparaging remark about the morale of the Vietnamese (which had to be softened in the first explanatory statement of its kind to be issued by the White House since he took office).

The United States Army is very proud of its success in creating a South Korean army of 600,000 men within three years, and has pointedly suggested by numerous means that the French High Command in Indo-China could usefully copy its methods. In the face of obvious French reluctance,

the offer of American services has been pressed to the point where it is now assumed that General John O'Daniel will go to Indo-China, not merely as the senior American liaison officer, but as the head of an executive mission, to help train the Vietnamese forces.

Difficult as it is for France to refuse the offer, it is a bitter one to accept, for it implies an admission by the descendants of Ney and Foch, not only that American strength, but also that American military skill, is superior. Nor is the friction eased by the difficulty that the Defence Department has in dissembling its view that, if Indo-China is a vital strategic interest of the United States, the campaign should be under direct American surveillance.

★

The State Department, which has consistently taken a more sanguine view of the situation in Indo-China and of General Navarre's prospects of success than the Defence Department, has fought off—thus far successfully—some of the more harebrained schemes for building up French-Vietnamese strength. It has its own reasons for not wishing to undermine France's position in Indo-China at what looks like the moment of final decision on the European Defence Community. But such considerations apart, the chain of reasoning which has led the Joint Chiefs of Staff to press for a more active American role in Indo-China, has raised in Congress the fear of American "involvement" in a new Far Eastern war. The decision to dispatch the 200 United States Air Force technicians to Indo-China was based on the sound military reason that increased Vietminh anti-aircraft fire made it necessary to give more attention to the maintenance of the American aircraft in the theatre than French resources could supply, but it brought Congress and the public to the sudden recollection that the conclusion of the Korean armistice nine months ago had not solved every problem in the Far East.

It was not entirely fortuitous that the most vocal expression of alarm came from Democratic Senators, including a number of Southerners and others who are normally well disposed toward the Eisenhower Administration's foreign policy. The traditional American dislike of colonialism is more strongly expressed in the Democratic than in the Republican party, even though the policy of aid to Indo-China was started under President Truman.

But there is also a more compelling political reason. Within the space of five years the Democrats suffered under

the Republican lash, first, for failing to expend American lives by intervening in the Chinese civil war, and then for expending them by intervention in Korea. It is difficult for the Democrats to be charitable at a moment when Senators McCarthy and Jenner, with the discreet encouragement of the Republican National Committee, are stumping the country accusing them of "twenty years of treason." Indo-China presents a stick with which to beat the Administration—whether it does too little or too much—which it is beyond the fortitude of Democratic flesh and blood to resist, particularly since, apart from the economic situation, there are few political weapons for the Democrats at the moment.

As a result, the Administration has protested too much. The President told his press conference that he was bitterly opposed to involving the United States in a hot war in Indo-China; the Secretary of Defence told him that "from our view and that of the French, the war is going along as well as expected at this stage." Senator Knowland gave a "categorical assurance" to his fellow Senators that the Administration had no plan of sending fighting troops there; and General Bedell Smith suggested that reports of the Vietminh successes had been exaggerated. Senator Saltonstall, the chairman of the Senate Armed Services Committee, said that he had been assured that the Air Force technicians would be withdrawn by mid-June.

In consequence the physical support to the French afforded by the technicians has been offset by the fact that Moscow and Peking have now received the firmest assurances that the United States will not make Indo-China a test case as it made Korea. As Mr James Reston put it in the *New York Times*:

The United States started out to reassure the French and the Vietnamese that it was increasing its help and ended with a demonstration in Washington that the United States was determined to avoid intervention in the war at almost any cost.

★

But a deeper sense of anxiety about American policy in Indo-China than the somewhat disingenuous alarm of Democratic Senators is discernible. It was less than a month after Mr Dulles precisely stated that henceforward American strategy would be developed on its own terms, not in hurried reaction to Communist attacks, that the Air Force technicians were rushed off to Indo-China. If "massive retaliation by means of our own choosing" is the order of the day, does this mean that the United States atomises Peking, Chungking and Shanghai when the first Mig shows its nose over Indo-China? By what standards can a policy so cataclysmic be judged effective?

The implications, though not as yet the realities, of Indo-China have exposed the shaky assumptions of the Administration's new strategy of deterring aggression. Mr Dulles's speech of January 12th to the Council of Foreign Relations, which is considered to be the definitive statement of that policy, is actually as full of reservations as a lawyer's defence of a doubtful criminal case, and it contains enough "escape clauses" to enable the United States not to take action in any case where it does not choose to move. But the interaction of the political and strategic implications of its application provide at least one clue to the reason why Mr Dulles acceded at Berlin, to the surprise of American opinion, to French pressure for a negotiated settlement in Indo-China.

American Notes

The Army Surrenders

THE Army's defiance of Senator McCarthy has proved shortlived. A week ago Mr Stevens, the Secretary of the Army, seemed ready to stand fast when he refused to allow any more of his officers to testify before the Senate investigating committee and perhaps undergo the same humiliations suffered by General Zwicker. General Zwicker, acting under orders, refused to tell the Senator who had been responsible for the promotion and honourable discharge of Dr Peress, a conscripted Army dentist who would not answer questions about his possible Communist affiliations. For this the General was told that he was a "disgrace to his uniform" and the Army was accused of "coddling Communists."

Mr Eisenhower and Mr Wilson, the Secretary of Defence, have kept ostentatiously clear of the dispute, but it is

"Oh, No — Not That Number Again"

Herblock in the *Washington Post*

widely believed that Mr Nixon, the Vice-President, intervened to prevent the scheduled appearance of Mr Stevens before the committee. The terms on which a complete break with Mr McCarthy have been avoided are spoken of as a compromise, but it is the Army which has done the lion's share of the compromising. Senator McCarthy with-

draws, though only by implication, his insinuation that the Army is anxious to protect Communists. But in return the Army has had to agree that once its own investigation of the Peress case is complete, the committee will be able to question any officer it pleases, including General Zwicker, Dr Peress's commanding officer.

Senator McCarthy lost no time in following up the Peress case with that of Mrs Annie Moss, an Army communications clerk who, he says, has been a Communist. The Administration's reluctance to let the Army be dragged through the mud is natural. But it seems to have learned nothing from the history of other compromises with Senator McCarthy, from, for example, the investigations at Fort Monmouth and the surrender of the State Department to the control of Mr Scott McLeod, a friend of the Senator. Mr McCarthy seems well on the way to using the anti-Communist issue to seize a control over all the executive departments which is specifically withheld from Congress by the Constitution.

The issue of Communism is proving a two-edged sword to the Administration, and one which only the completely unscrupulous can wield without cutting themselves. The Administration's own efforts to show how successfully it has cleared the disloyal out of the government have turned into a humiliating nightmare. The figure of 2,200 security risks discharged—which Republican speakers have been only too eager to assume represented the discharge of 2,200 subversives—is now being broken down. Of the first thousand, only 41 seem to have been involved in any sort of disloyalty charge; it was the discretion or the morals, not the patriotism, of the vast majority which were questioned.

Trial by Chairman

THE wild charges against Chief Justice Warren, made public by Senator Langer, chairman of the Senate Judiciary Committee, suggest at first sight a terrifying extension of McCarthyism. But Mr Langer is no McCarthy; his attempts to hold up the confirmation of the Chief Justice, one of the most respected figures in the Republican party, were so absurd that they would have collapsed of themselves without the roars of indignation from Mr Langer's committeemen, from Senator Knowland, from the Vice-President, and from Mr Eisenhower himself.

It is deplorable, certainly, that a chairman of committee should be able to give privileged publicity to the charges of an eccentric who was wanted by the Californian police, and that for the first time a member of the Supreme Court should be investigated by an extremely reluctant Federal Bureau of Investigation. But the Senate, which is used to Mr Langer, and the workings of the seniority system which have brought him a chairmanship, has learned not to take him too seriously. He has not been able to do more than delay Mr Warren's confirmation, which has now been approved by the Judiciary Committee.

If it really was Senator Langer's intention merely to draw attention to the neglect of his native North Dakota in the matter of patronage, as is widely believed in Washington, he has chosen a characteristically odd way to increase his

popularity. The Administration not unnaturally regards with some suspicion a Republican who has not concealed his affection for Mr Truman. In any case, many more orthodox Republicans than Mr Langer feel left out in the cold. The pickings have been slim, partly because the Administration has refused to wreck the civil service system, partly because the number of federal jobs has been declining. More skilful politicians than Senator Langer have been driven to hint, particularly to heads of departments who must weather congressional storms, that their passage will be easier if they throw overboard more Democrats and replace them with Republicans. Mr Benson, the Secretary of Agriculture, is one who cannot afford to turn a deaf ear. It is probably no coincidence that his high-principled but unpopular farm policies are to be administered increasingly by Republicans and that he has discovered an urgent need to secure the "maximum efficiency and loyalty" by making changes in his staff.

Dividends from Income Taxes?

AS a recession appeared at the door of the President's press conference room last week, his balanced budget prepared to fly out of the window; readjustment, the officially approved euphemism for the present economic situation, was already hanging from the sill and seems unlikely to be saved from oblivion. The President's admission that additional tax concessions to consumers would certainly be considered if the economy did not turn upward in March gave official approval to what was already becoming a respectable remedy instead of a Democratic nostrum.

The next day Dr Nourse, who thought Mr Truman went too far and resigned from his Council of Economic Advisers in 1949, criticised the Administration's programme of tax concessions to stimulate industrial activity and employment; he considered that in the present situation measures to maintain consumers' buying power would pay better economic dividends, especially if concentrated on the lower income brackets. Senator George, the Democrats' conservative financial expert, who constantly tried to force a balanced budget on Mr Truman, followed Dr Nourse by proposing that the amount of personal income exempt from tax should be raised from \$600 to \$800 for each individual, increasing to \$1,000 next year.

The Senator's proposal shows how quickly the economic climate is changing. He bid \$100 more than even his liberal colleagues in the House had thought advisable a little while before. Their amendment, for an increase to \$700, has already been turned down in the House Ways and Means Committee, but they intend to bring it up on the floor. There it is likely to be approved unless, and perhaps even if, the Administration puts its foot down. For many Republicans feel that if the House does not act the Senate will, and they see no reason why Senators—or Democrats—should collect all the political dividends which such a tax concession would pay next November.

It is the coming election that explains the sudden popularity of higher individual income tax exemptions as an economic medicine, even though each \$100 increase would cost the government \$2.3 billion a year. For this type of

Nothing succeeds like The New Yorker

To get national distribution in the States, British firms must advertise from coast to coast. The best—and by far the most economical way—is to use The New Yorker. Consider these indisputable facts:

CIRCULATION. 81% of The New Yorker's U.S. circulation is in the 47 key trade areas which contain 50% of the total population and account for 56% of all U.S. retail sales. This means that your advertising has maximum efficiency in The New Yorker.

READERS. The sort of people who read The New Yorker are the cream of the U.S. buying public. They have the taste—and the money—for British quality goods. The special New Yorker survey, "The Primary Markets for Quality Merchandise" is available in very limited quantities. For this and any other information about your New Yorker advertising write to The NEW YORKER Magazine.

tax relief would make more voters, especially in the lower income groups where Democrats are usually found, feel that they are better off under the Republicans than would changes in either excise taxes or general income tax rates, which are the other favoured methods of encouraging personal spending by tax reductions.

Rail Road Young

IN a country where railways are often rail roads and battles for their control have survived into the second half of the twentieth century, Mr Robert R. Young's initials suit a financier who specialises in wars on rails. His latest fight is for control of the New York Central Railroad, after the Pennsylvania Rail Road the most important in the country, with well over 10,000 miles of track and yearly revenues of \$800 million. Early this month Mr Young pointed his purchase of a substantial amount of stock at the heads of the Central's directors and demanded not only a seat on the board for one of his colleagues but also the chairmanship for himself. Defied by the directors, Mr Young is now enlisting an army of

small stockholders who, he hopes, will give him enough proxy votes to turn out the present board altogether at the annual meeting at the end of May.

His outspoken recruiting campaign, in which he can be relied on to make imaginative use of all the facilities of modern advertising, is so far following two lines. Both are calculated to appeal to the pensioners, schoolteachers and other "Aunt Janes" who make up the bulk of the 44,000 holders of the railway's 6.5 million outstanding shares, but both come rather oddly from a man whose practical experience of railroading is financial, not operational. Firstly, Mr Young alleges that the New York Central is being run in a selfish way to further the interests of the Wall Street bankers on the board rather than of the shareholders. This is a continuation of his long-standing feud with eastern banking houses, particularly with the Morgan interests, which began when they hampered his first railway undertaking in 1938, and which has also been manifested in another of his battles, to secure competitive bidding for the underwriting of new issues of corporate shares.

Secondly, Mr Young maintains that the railway could be more profitable if it were run more efficiently and that in

particular better service, maintenance and equipment would improve its passenger revenues, at present showing a deficit. This claim is substantiated by the well-publicised improvements he has made in the service offered by the Chesapeake and Ohio Railway (of which he obtained control through the Allegheny holding company in 1937), even though his financial record there is not very satisfactory. Mr Young believes that steady profits and good railway services depend upon consolidation into regional systems, but the Interstate Commerce Commission, the government agency which supervises the railways, insists that competition must be maintained. For this reason, when Mr Young made his first attempt to hold up the New York Central in 1947, with 800,000 shares belonging to the Chesapeake and Ohio Railway, the ICC disarmed him by putting the shares into the trusteeship of the Chase National Bank.

Now, however, Mr Young, withdrawing in order, it is suspected, to leap further, has disposed of his holding in the Chesapeake and Ohio, and handed over the chairmanship to an old associate. He may therefore argue that in May it should be allowed to exercise its New York Central voting rights itself—and presumably in his favour. In the end the outcome of this argument may be more vital than the rival wooing of the Aunt Janes.

Teamsters' Hold-up

THE American Federation of Labour and the Congress of Industrial Organisations were rolling steadily along the road to a united labour organisation until last week the teamsters' union put a spoke in the wheels of their agreement which threatens to upset it altogether. The chassis on which the agreement is built is a no-raiding pact, under which unions belonging to one organisation undertake not to steal members from unions covering similar jobs and belonging to the other organisation. Nearly all the CIO's industrial unions have already signed the pact, but only about 40 of the AFL's 111 craft unions have come in so far. And now the AFL's powerful Brotherhood of Teamsters, the biggest and richest union in the country, with 1,300,000 members and assets worth over \$30 million, has set a bad example by refusing to accept either the no-raiding pact or a plan for settling jurisdictional disputes within the AFL itself. These arise, particularly in the building trades, when two unions claim the right to do a particular kind of work; both plumbers and painters think they should instal bathroom mirrors, and carpenters and machinists argue over who should put bottling machines into breweries.

Mr Dave Beck, the head of the teamsters, says that he would be ready to approve these pacts provided that first he was given back some 50,000 drivers and warehousemen who in his opinion should belong to the teamsters and who have been stolen by other unions. A no-raiding pact, he argues, would "freeze" these workers in the wrong union. He himself, he insists, never conducts raids and is willing, as he has already shown, to negotiate peace agreements with individual unions whenever they wish. Mr Beck, of course, does not admit it, but there is little doubt that his real objection to the no-raiding pact is that it would hold up his empire building, and keep him from colonising the east coast as completely as he has the west.

Since Mr Beck became president of the teamsters' union eighteen months ago he has moved its headquarters to Washington, D.C., from Indianapolis, but there is less scope for him in the long-established and well-organised trade union structure of the east than there was in the rapidly growing and little unionised Pacific Northwest when he began to work there thirty years ago. He will need as many as he can get of the egg breakers, chewing gum workers, car salesmen, vending machine operators and so on whom he collects into the Miscellaneous Division of his union. This unorthodox expansion, and the fishing expeditions which Mr Beck makes into such troubled labour waters as the New York docks, could hardly continue without raids on other unions and jurisdictional disputes.

Dealers' Dilemma

New York

ON February 10th there were 640,000 unsold new cars crowding into automobile dealers' showrooms; the figure, based on factory estimates, is perhaps inflated, but stocks seem to be at record levels. Nevertheless, with the spring buying season approaching, and with all 1953 models disposed of in the majority of cases, most dealers, despite the prospect of lower sales this year, feel happier than they have for some months. Last year the dealers complained that the manufacturers were forcing them to accept more cars than they could sell at a profit. If the present curtailment of production in many automobile plants is evidence that the manufacturers have been taking a new look at the market, another "inventory squeeze" of dealers' profit margins may be avoided.

All automobile dealers in the United States operate under a direct franchise from one or other of the seven automobile manufacturers. In practice, if not in theory, this is an exclusive right—a right to be the only dealer in that make of car within a specified area—but it has not been found possible to keep out dealers from other districts. What does cause resentment, however, are "bootleg" sales when dealers sell new cars at cut prices to second-hand dealers in another territory.

The form of the dealer's agreement varies from company to company, but all contracts can be terminated at short notice by either party. To obtain a franchise, the dealer has to convince the company of his integrity, financial strength, sales ability and repair facilities. He may lose the franchise at any time, if for example he persistently fails to sell his quota of cars and the company thinks it could do better by replacing him. Such action, however, is normally taken only as a last resort.

Although the dealer's agreement with the company does not specifically preclude him from selling competitors' models, in practice, with few exceptions, he can obtain a franchise from one manufacturer only. The exceptions are franchises to sell imported European cars. There are also still a few large dealers holding franchises from more than one company, but selling each make in a different territory. Of 43,000 enfranchised dealers in the United States, less than 7,000 handle two or more makes of car, and these are virtually all "within the family." Thus in the Chrysler family, a Plymouth dealer may also handle Dodges, DeSotos and Chryslers. The system of effectively exclusive dealerships undoubtedly handicaps the smaller manufacturers,

who cannot always guarantee their dealers a turnover sufficient to cover, unaided, their overhead expenses.

The manufacturers do not set the prices of their new models, but "suggest" list prices to the dealer, and pay him a commission varying from 20 to 30 per cent of the list price on each car sold. The dealer has, however, complete freedom to vary, with each transaction, the actual selling price to the customer, either by granting him a discount from the list price or by the more usual practice of adjusting the allowance granted on the old car the customer trades in. The dealer's profit can, therefore, only be computed by considering the two transactions together.

SHORTER NOTES

Dr Clarence Manion, the head of a government commission to redraw the proper frontiers between state and federal functions, has been spending so much time making speeches in favour of the Bricker Amendment, which the President wholeheartedly opposes, that he has had little left for his proper functions. He had to ask for a postponement of the date on which his commission was due to report, and the President replied, not unexpectedly, by asking him to resign.

★

The Senate confirmed Mr Albert Beeson as a member of the National Labour Relations Board, but by the smallest majority—only three votes—that has been given to any of the President's appointees. Doubts had arisen about whether he had completely severed his connections with his former employees and about whether he was sufficiently impartial to sit on a semi-judicial board.

★

The new figure of three million unemployed in January with which the Census Bureau ruffled the economic waters last week, is the result of a new sampling method that is still only being tested. The new count, like the old, which had found only 2,400,000 unemployed in the test week, covers 25,000 households, but they are much more widely distributed.

The World Overseas

Internal Order in Burma

FROM A CORRESPONDENT

THE internal situation in Burma today is better than many observers would have thought possible three years ago. It remains, nevertheless, full of difficulty, and in certain respects there is even the threat of a fresh deterioration. The government in Rangoon, in its efforts to impose a unified and orderly administration on the whole of Burma, is confronted by no fewer than four distinct forces of domestic armed rebels, with the refugee anti-Communist guerrillas from China as a fifth hostile element. The internal forces of disorder are the Karen separatists, Communists of two different factions, and ex-mutineers of the former People's Volunteer Organisation (PVO). This diversity of opposition is up to a point an advantage for the government, as there is no unity of rebel purpose or command; on the other hand, the total of disaffection is dangerously large for a new state striving for political and economic stability.

The government's greatest success so far has been achieved against the Karens, whose forces have now dwindled to a small hard core of extremists operating in the Salween jungles. The government army struck a crippling blow at their supply position by the recapture in November of the Mawchi wolfram mines, the products of which, traded by Kuomintang Chinese through Siam, had kept them in funds. Last month the second in importance of the Karen leaders, Saw Kyaw Lay, surrendered with a number of his followers, and Saw Po Htoon is now left as the only notable leader who is in a position to carry on the armed struggle.

This is clearly the moment for the government to rally the moderate Karen nationalists by the concessions, such as special schools, which they claim. But military success seems to have caused the Burmese to harden their hearts; it is officially declared in Rangoon that "the time for negotiation is past," and the Karen moderate leader, Mrs Ba Maung Chain, who was taken into the government as Minister for Karen Affairs, has resigned in protest. The official attitude has its dangers for the future, for even if the rebellion now collapses, Karen discontent may again

become a serious factor if Burma is faced with a new challenge to its integrity. Recently, moreover, there has been a tendency for the Mons, a relatively small ethnic minority living mainly in the Moulmein area, to make common cause with the Karens and the government has outlawed the Mon National Defence Organisation, along with the corresponding Karen body—the KNDO.

The Karen rebels have made temporary pacts for co-operation against the government forces both with the Burmese Communists and with the anti-Communist KMT (Kuomintang) Chinese guerrillas. Since they were driven out of central Burma, their contacts have been closer with the latter than with the former. Unlike the other armed bands at large in Burma, the KMT forces have become an international problem, since the Burmese have been unable to intern them, and their presence in Burma affords a standing provocation and pretext for the Chinese Communists to follow them on to Burmese territory. After long negotiations the Nationalist Government in Formosa agreed to evacuate them to Formosa via Siam, but only 2,000 have actually gone, and some 10,000 remain, stubbornly refusing to move from the territory they occupy. Although the Burmese believe that the Chinese Nationalist government is deliberately encouraging them to stay, it would probably be difficult in any case to remove them except by force, as they are Yunnanese provincials with no interest in the wider issues of the Chinese civil war; they have no desire to be transported to

Formosa, where they would be among "foreigners." In the Shan states, where the Yunnanese have always carried on trade, they feel quite at home, and those who have not prospered there have been going south to Tenasserim where they trade surplus arms to the Mons in exchange for rice. The KMT guerrillas get aid from their supporters among the Chinese in Siam, and they have an airstrip at Monghsat for communicating with the outer world.

Both the Karens and the KMT have their strongholds in the eastern borderlands of Burma near the Siamese

frontier. The Burmese Communists and PVO bands, on the other hand, are active mainly in central Burma, where they collect the taxes in certain rural areas, and do their best to interfere with communications; thus, in November they blew up the Mandalay-Maymyo train, killing or wounding over fifty passengers. The Communists also have units in the Irrawaddy delta region, but the government has been successful in preventing their close approach to Rangoon, and recently captured their headquarters in Bassein with an arms dump and printing press. The Communists have never yet been able to muster a military force strong enough for a pitched battle with the government army; on the other hand, they are widespread, mobile and elusive. In the endeavour to suppress them the government is hampered by the lack of a reliable police force for rural use; it has been much more successful in training an army (with British assistance) than in restoring the prewar police organisation. Another adverse factor is the political pressure of the Burma Workers' and Peasants' Party, which denies that it is Communist and forms a legal opposition, but is certainly infiltrated by the Communists, so that the latter can operate violently and peacefully at the same time.

So far no Chinese Communist troops have entered Burma, nor is there any evidence of arms being sent to the Burmese Communists. On the other hand, it is reported that a number of Burmese Communists have been sent to China for military training and indoctrination, and Ba Thein Tin, the Communist leader in the Bhamo area, recently went there, ostensibly for medical treatment. Aid to the Burmese Communists, however, is not the only way in which China can take advantage of disorder in Burma. An Autonomous Thai State has been set up in Yunnan with its centre at Cheli, and an Autonomous Kachin State is said to be in preparation. These may be used to stir up trouble among the Shans (who are Thais, Siam being only a variant of the name Shan) and Kachins in Burma. There has not so far been any trouble among the Shans, but the Kachins, who have always been very difficult to handle, have been restive of late. They have a leader, New Sang, who is reported to be intriguing with the Chinese. The Kachins live on both sides of the frontier in high mountain country, and the frontier itself is undemarcated. There is plenty of opportunity for mischief here if Peking's thoughts should ever turn in this direction.

Japan and Its British Markets

FROM OUR TOKYO CORRESPONDENT

IT is both significant and regrettable that there has been little open or public reaction in Japan to the strong British criticism of the Anglo-Japanese trade agreement. Just as Sherlock Holmes's attention was aroused by the "curious incident of the dog in the night-time" ("The dog did nothing," said Inspector Gregory. "That was the curious incident," remarked Sherlock Holmes) so also the observer in Tokyo must be impressed by the curious lack of Japanese interest in the vigorous, if sectional, denunciation of a vital trade agreement, designed to restore and increase the nation's dwindling sterling reserves and to boost its languishing and over-priced export trade.

The *Asahi*, Japan's leading newspaper, described the British objections as "unexpectedly strong," but pointed

out that they had been raised "by the cotton and china-ware industries, and not by the British people." The paper conceded that there was evidence of British "distrust of Japan" and "fear of unfair Japanese business practices," but argued, without specific detail, that Japan had counter grievances against Britain and should also draw attention to Britain's "defects and insincerities" in the interest of friendlier understanding. There were no political or government references to the Labour Party's challenge to the agreement in the Commons, and the industrialists, preoccupied with union demands for higher wages, the difficulties of cost-cutting and the prospects of a dollar-backed rearmament boom, also officially ignored the criticism.

This studied, apathetic or fatalistic indifference emphasises the mood of stubborn unrealism pervading 1954 Japan, bedevilled and distracted but numbed and bemused by the fundamental weaknesses of the national economy. The sterling agreement itself was definitely more newsworthy in Lancashire than in Japan. Few Japanese manufacturers and exporters can yet properly estimate the potential benefits of the agreement. The harassed government planners of the Ministry of International Trade and Industry, and the textile and pottery industries, which alone can hope to compete immediately with British-priced products, were the only interests to be palpably interested.

Useful Instincts Misaid

The aims—ideal and practicable—of Prime Minister Yoshida's new "super-balanced" budget have yet to be appraised. The budget's belated austerity measures are hopefully designed to cut prices by from five to ten per cent. But leaders of the influential Federation of Economic Organisations (*Keidanren*) believe privately that prices must be slashed by at least 25 per cent before trade can be balanced. And even the modest Yoshida policy must run into violent labour opposition. Key industrialists and conservative politicians are reconciled to a tough showdown with the unions as an essential approach to "a purification of the national economy."

The Japanese people are clearly not prepared for this "purification." The national will to recovery has been sapped by the unnatural effects of dollar aid and Korean war profits. Since defeat, the Japanese have been helped so much that they have forgotten or mislaid the instincts of self-help and enterprise which were once the nation's strongest characteristics. An old Japanese proverb warns: "If you carry a man too long, he loses the power to walk." This is now Japan's greatest disability. Nor is it yet evident how bold, drastic and decisive the government will be in stripping away the clutter of subsidies, props and excessive loans, which both confuse and weaken the existing costing structure of Japanese industry and conceal the vital need for modernising equipment and streamlining techniques.

All this preliminary and fundamental groundwork must be completed, regardless of the resurgence of the armaments and heavy industries and of the politico-commercial coquetting of Communist China, before the Anglo-Japanese sterling agreement, or any other trade pact, can be more than a temporary palliative or a muffled opportunity. Until then, the Japanese people, still largely unaware of any real crisis, will not feel the urge to throw their hats in the air over a conditional trade agreement, nor will the Japanese leaders search their souls in the face of foreign criticism of any such agreement.

However, when that groundwork has at last been accomplished, Lancashire will certainly have real cause to line the walls and stiffen the defences. Meanwhile, the government experts in the Ministry of International Trade and Industry, who have nothing to say now, but who properly appreciate the opportunities and responsibilities of the sterling agreement, are at present unquestionably resolved to resist any covert attempts by irresponsible exporters to revert to the old practices which besmirched Japan's prewar trading name. If they meet with a reasonable understanding of Japan's desperate difficulties and needs, their resolution will not necessarily falter in the future.

Splits Around Strauss

Ex Unitate Vires

IT is an ironic twist that a motto which extols the virtue of unity should belong to one of the most divided countries in the world, South Africa. Scarcely less odd is the fact that a party calling itself the United Party is in reality split from top to bottom by internal disputes. Seven of its former disciples now sit as a splinter group on the same opposition benches as their former colleagues, but separated from them by an invisible *apartheid* wall. They call themselves the "Independent United Party group." Furthermore, reports received from Capetown this week suggest that a fundamental split has occurred between the so-called liberal and conservative wings of the party.

A distinction is drawn in South Africa between a "liberal," meaning a person who opposes Malan to the last, and a "liberalist," who is by contrast a dangerous fellow who wants to advance the economic and political status of the Africans. There are both "liberals" and "liberalists" in the United Party, but there are also a substantial number of "non-liberals." These, though opponents of Malan, are not prepared to go to war with him on questions of colour (for fear of being called "liberalists"). The break in the United Party is between the "liberals" and the "non-liberals"; the "liberalists" are too few to matter.

A lot of fuss is being made in United Party circles about a speech on native policy made by the party leader, Mr Strauss, on February 18th. While it is true that he was much bolder than before in admitting the integration of the races as an irreversible fact, what he proposed was a small thing. The party will set up committees to study various aspects of the colour problem and report back to a national congress. Ultimately, a new policy will be worked out. But Mr Strauss spoilt his forward-looking policy by indicating that the party is not happy about the 1936 Act, by which Africans acquired limited, indirect, representation in parliament. This is not the only disturbing feature of recent United Party actions. One of their leading figures, Mr Harry Oppenheimer, made a speech a few weeks ago which to Nationalist ears was definitely temporising in tone. Moreover, the United Africa Trust Fund, which played a significant role in financing the United Party at the last election, has announced that it will no longer extend its financial support. The party has a long way to go yet before it hits on a united policy; by that time its numbers may have shrunk.

China's Agriculture—1

Slow Boat to Collectivisation

ONE thousand nine hundred and fifty-three was the first year of long-term planning in China. Intoxicated by the age-long dream of industrialisation, Chinese propaganda dwelled chiefly on future steel mills, modern factories and power stations. Agriculture seldom came into the official picture, though it was admitted that because of natural calamities production showed no progress compared with the previous year. But a regime which rose to power on peasants' backs and rules a country, where well over 400 million people live in the countryside, cannot manage for long without an agricultural policy. Thus last month the Chinese Communist Party finally issued a decree mapping the Chinese peasants' path for the future.

The road, as might be expected, should lead to collectivisation, but this does not mean that China is now on the eve of a bloody upheaval on the Soviet model. Parallels between the two revolutions are fruitful as long as they do not overlook radical differences in the respective backgrounds. The established and officially accepted Communist pattern for the countryside leads through land reform to collectivisation and ultimately to the "bridging of the gap between town and country." The crucial question, however, is at what pace should one travel along this path. In the Soviet Union there was a long pause after the initial land reform, but once planned industrialisation had begun in earnest it was accompanied by a ruthless collectivisation drive and at the end of the first five-year plan peasant opposition to collective farming was broken.

In China some sort of loose co-operation has been fostered from the very beginning, but by 1957—that is, at the close of the first five-year plan—only one-fifth of the Chinese peasantry is to be incorporated in the so-called "producer co-operatives." And these co-operatives, in which members are paid a rent for their land, cannot be likened to the closely integrated Soviet *kolkhozy*.

Mutual Aid First

To judge by actual performance and the new programme, collectivisation will be a long-drawn out process in China. Mao Tse-tung, the peasant leader carrying out an industrial revolution, knows well what risks would be involved in a forcible collectivisation. Ten years ago he advocated a gradual introduction of socialism into the countryside with the progressive spreading of loose forms of mutual aid as the vital first step in the right direction. Official policy-makers are apparently to follow the same road, at a slightly faster pace, for some time to come.

Out of roughly 110 million rural households nearly 48 million are already involved in some sort of mutual aid. On the other hand, state and collective farms are still so few that they play no role in the economy, even as an example. The loose "mutual aid" associations are still the almost exclusive form of co-operation in the countryside. The temporary mutual aid teams are most widespread throughout the country. Peasants from a dozen farms work together during the sowing and harvesting seasons pooling their scarce equipment and cattle. In the northern regions, which have been under Communist rule for a longer period, many of these associations have been linked together on a

It's no tall story...

**higher
mileage**

is a REALITY!

It's quite certain—tyres cost less per mile when you fit Avon H.M.'s. Years of Avon research, and road tests over more than 1½ million miles, make their higher mileage an assured fact—whatever your car. The tread is deeper and thicker: its pattern is scientifically calculated to reduce wear and increase performance and safety. There is no finer, more economical tyre—thousands of motorists have already proved it to their great satisfaction.

AN ALL BRITISH ACHIEVEMENT

YOUR OWN OXYGEN CONSTANTLY "ON TAP"

—from storage banks and cylinders

Cheaper oxygen... and a dependable supply—these are the benefits derived from a Butterley Oxygenator. A storage bank is kept charged to feed the works pipelines and meet fluctuations in demand, while cylinders for use at points not served by the pipeline can be quickly recharged. Butterley Oxygenators are complete, require no additional equipment, and are available in sizes that meet every oxygen/nitrogen need. They are easy to install, operate and maintain. We will be glad to send you a copy of *Butterley High Purity Oxygenators*, a book which fully describes and illustrates this aid to easier, cheaper production.

BUTTERLEY
OXYGENERATORS

Makers since 1790 of railway and other bridges; constructional steel work, unit bridging; overhead cranes, railway wagons and mine cars; iron castings; iron paving; mining and sheet metal machinery; wrought iron bars; sewage ejectors; pumps and air compressors; wool washing machinery

permanent basis. In such cases there is more division of labour; the produce is sold together; while some tools and stock are bought and owned collectively.

Producer co-operatives form the next stage of development. They are somewhat larger and the land, though privately owned, is managed and exploited in common. All resources are pooled together, but members are paid according to their share of both labour and land. Thus in the co-operative of Chu An di, including 18 households and 76 people, out of the total revenue 52 per cent was paid out as wages, 40 per cent as rent, and the rest was used for "the productive and cultural needs of the community." Producer co-operatives are also more common in the northern territories, particularly in Manchuria. But at the end of last year there were only about 14,000 such co-operatives averaging less than twenty households each.

The way ahead is quite simple. In the next few years the mutual aid is to be spread to almost all the farms in the land and the proportion of all-year round associations is to be raised. Producer co-operatives are to be fostered and the share of rent in their accounts gradually reduced and thus paving the way for collective farms. But, at least on paper, everything is to be carried out without haste. By the autumn harvest this year there should be less than 40,000 producer co-operatives and the target for 1957 is only 800,000, leaving four-fifths of the peasant population outside their orbit. There has been some coercion in the past and, though the "culprits" were officially reprimanded last year, there is likely to be some more in the future. Unless the government suddenly decides to speed up the tempo, however, the present programme could be carried out without any major peasant revolt.

Why should Mao be spared the calamities which followed Stalin's attack on the country? Stalin's inhuman determination and Mao's peasant caution cannot account for the difference altogether. Both countries needed more industrial labour and agricultural surpluses to feed it. China, however, can rely partly on Soviet assistance in its industrialisation drive. Its industry is not yet ready to train and absorb all the excess labour available in the country. Above all, China is a country where land is very scarce and must therefore be cultivated very intensively. Hence, large-scale collective farming by itself provides no solution even in the eyes of a Communist planner.

(To be concluded)

If Signor Scelba Falls

FROM OUR ROME CORRESPONDENT

IN presenting his Cabinet to Parliament, the new Italian Prime Minister, Signor Scelba, claimed to be speaking not only for the three parties in his government, but for the nation. By this he probably implied that he also represented sections of the Monarchists and the Nenni fellow-travelling Socialists. Democrats everywhere would like to share his belief. But the parliamentary debate has shown that his coalition cannot rely on outside support and is not itself very strongly cemented. No one takes the small centre parties seriously; and they themselves know that their post-war decline would be completed at the next elections. The other constituent of the coalition, the

Christian Democrat party, is becoming more and more enveloped in a cloud of scandal and accusations of corruption. Thus the present efforts to revive the centre coalition are being compared to the reanimation of a corpse. Signor Pella, on the other hand, has attained a great measure of popularity. His decision to resign in January on an issue of principle startled Italians by its novelty.

Signor De Gasperi, who is the power behind the throne in the new government, has declared that if, as is thought to be inevitable sooner or later, Signor Scelba falls, there is no alternative to new elections. This view is not generally accepted, even by all the Christian Democrats. The right wing of the party wants Signor Pella back. And it is possible that his chances of a come back have been improved by reaching an understanding with the leader of the left-wing, Signor Gronchi. This union of the two extremes is not so far fetched as it might seem at first blush. At the elections of the Christian Democrat parliamentary group in January, there was a head-on collision between Gronchi and Fanfani, De Gasperi's ally of the centre. Signor Gronchi then led his group to the polls in a common front with the Pella supporters and almost unseated the centre candidates.

The present Prime Minister, moreover, is associated with a tough policy towards the Communists; and police action, especially in a Sicilian village where three women and a boy were trampled to death when a crowd panicked, has given the Communists an excellent opportunity to play the martyrs. Signor Pella believed in being firm without violence, while Signor Gronchi, though a Christian Democrat, has the sympathy of the extreme Left. The two men might therefore find common ground in a policy which would avoid new elections but at the same time keep the Left out of the government.

This is not just a matter of an internal party squabble. For, if Signor Scelba falls and new elections are held, Italy is almost certain to be reduced to impotence. Only a Pella government has some chance of forming a stable administration and avoiding this pitfall. Indeed, looking back over the sorry story of Italian politics since the June elections, observers tend to agree more and more that Signor Pella's resignation in January was a disaster, and that it, in its turn, was due to the western powers' decision first, to offer, then to withhold, Zone A of Trieste. Had the issue of the Free Territory been settled, there would have been no question of Signor De Gasperi unleashing, involuntarily but inevitably, the government crisis.

Malaya Welcomes the Report

FROM OUR CORRESPONDENT IN MALAYA

REACTION in Malaya to the recently published Report of the Committee appointed to examine the question of elections has been surprisingly small. It might have been supposed that when the first summary leaked out the heavens would fall. Instead there has not been anything at all in the nature of a popular outburst, even in the local press, against the proposed delay in bringing about full self-government.

The fact is that if the real attitude of all the people living in the Federation of Malaya could be obtained—and always supposing that they could be given to understand the full

implications of the Report—there would be an overwhelming vote in favour of the moderation of its tone. In practice it would be virtually impossible to obtain such an expression of opinion, since most of the population neither understands what self-government would mean nor is particularly interested to find out. But individual comment, such as there is, has by no means been all one way, and some leading personalities have noticeably abstained from making any observations at all.

Protests have naturally come, on the other hand, from the more vocal political parties. In particular Umno (the United Malays National Organisation) and the MCA (the Malayan Chinese Association) have threatened to withdraw from the Legislative Council unless elections are held this year. They have also gone on record with the view that an elected majority is essential; it would have been strange, however, if they had not. There is, too, a report that the Pan Malayan Labour Party and the Malayan Indian Congress may combine to oppose the Report. Nevertheless, none of these protests has received much space in the press.

In the eyes of moderates of all races in Malaya, the Report has come as a refreshing breeze out of the clouds of hot air that have been enveloping the country for the past few months. It is felt that it presents a solution which has every chance of proving workable. Thus, if the majority view expressed in the Report is carried out, it will be nearly two years before any substantial change is made in the existing government structure of Malaya, and six years before further steps are undertaken.

As to the probable date of elections, it would be impossible to cover the ground as it should be covered, in time to hold the elections for the Federal Legislative Council this year. The delineation of constituencies is a major problem in itself. Although the proposed scheme is based on the British model, conditions in Malaya are not only naturally quite different, but will have to be assessed in great detail from scratch. Undue haste might ruin the prospects for the whole plan, and most responsible Asians know it.

It may be that the discontented elements are keeping their powder dry for later efforts, but at present the Report appears to stand a very good chance of being accepted by all the authorities which matter, without much amendment. One effect of this will be to steady opinion in and about Malaya. Anything that aggravates the natural hesitation to invest in the country could have dangerous effects in the future. As things stand, one of the Report's most immediate achievements should be to help to restore confidence and to encourage the flow of capital into new enterprise.

Trade With Yugoslavia

BY A CORRESPONDENT

ANGLO-JUGOSLAV trade talks began in London this week with the object of settling the annual goods list under the five-year trade agreement signed in 1949. They are taking place at an auspicious moment, for the prospects of trade between the two countries are now more promising than at any time since the war. In the first place the British are anxious to see Yugoslavia achieve viability as soon as possible so that they will no longer have to provide economic aid; for the current financial year (June, 1953,

THE ECONOMIST, FEBRUARY 27, 1954

to June, 1954) this stands at £3 million—£1½ million less than in the previous year.

In the second place, the Yugoslavs have at last seen the writing on the wall and realised that external aid cannot go on for ever. Finally, in the past three years, they have developed their economy so successfully that they now have a much wider range of good quality exports in addition to the valuable raw materials—timber, non-ferrous metals, etc.—which were their former standby. Although now exporting to many more countries than ever before they are still anxious to build up their market in Britain; they need the traditional British exports and are likely to do so for a long time to come.

In 1953 trade between Britain and Yugoslavia amounted to over £8 million each way; the British export figure includes shipments under the aid programme. More than three quarters of the British exports were manufactured goods—particularly heavy machinery. Nearly three-quarters of the Yugoslav exports were raw materials of which timber, which accounted for over 50 per cent of the total, was the largest item. More than one hundred different kinds of goods were imported into Britain from Yugoslavia last year and the variety is expected to be even greater in 1954.

Maize Shipments Resumed

The Yugoslavs would like most of all to increase their exports of food products. Before the war their most valuable food export to Britain was grain—both maize and wheat. Since the war Yugoslavia no longer exports wheat (it now imports an average of 100,000 tons per annum) and it only exports maize in a good harvest year. After the drought of 1952 it could not export maize in 1953 until after the harvest; but as the 1953 harvest was one of the best since 1945, maize shipments to Britain were resumed in December and 9,000 tons have already been shipped. Since however Yugoslavia cannot count on maintaining its grain exports it is anxious to diversify its agricultural production for the export market as much as possible, particularly canned meats and meat products, dairy produce and fruit of all kinds.

One of the most successful experiments of 1953 was the export of fresh fruit to Britain. The fruit seasons in many parts of Yugoslavia are much earlier than in this country, crops are usually abundant, production costs fairly low and fresh fruit can be transported to Britain by refrigeration, rail-van in five days. The possibility of using one-day air transport is also being considered. Apricots, peaches, nectarines, cherries, grapes, plums and melons were amongst the fruits exported last year. The Yugoslavs would also like to develop their trade in poultry.

Exporters from both countries still have a few grouses. The Yugoslavs complain of British slowness in producing the goods and failure to keep delivery dates. The British complain that they cannot get firm and quick decisions out of Yugoslav government departments. They also grumble at the uneven quality of some Yugoslav products and occasionally at their primitive packaging and even at their unsuitability for the British market—for example, prunes that taste of smoke because they are smoke, not sun-dried, and bacon that is extremely fat because the Yugoslavs prefer it that way. Yugoslav exporters are now taking steps to adapt their products to the British market and in any case, if trade between the two countries continues to develop, a tradition of trading will be slowly built up which will itself help to eliminate difficulties and misunderstanding.

THE ECONOMIST, FEBRUARY 27, 1954

NOTES FROM CANADA

These Notes are contributed by our correspondent in Ottawa.

Shake-out Suspected

UNEMPLOYMENT has been causing alarm to the labour unions and uneasiness to politicians. While the figures are a matter of dispute, the people interested in presenting a serious picture (union leaders and opposition politicians) point to more than half a million unplaced applicants for jobs at the labour exchanges. The Government, and most economists, point to the Labour Force Survey figures, based on the sampling technique, which gives a total of only 280,000 seeking work and without jobs. But even the Labour Force Survey shows fewer people working full-time out of a larger labour force. And the labour force itself has grown less than the population in the last year.

There are unquestionably a good many people suffering from a slackness in certain manufacturing industries—with textiles and farm implements as the worst cases. This has added to the inevitable seasonal increase in unemployment resulting from Canada's hard winters. And it has attracted more attention, perhaps, than it deserves, because of all the talk about a possible recession in the United States.

The probability is that it is a strictly temporary phenomenon, a shake-out after years of almost uninterrupted expansion, which by the spring will have passed like a bad dream. This is the view the Government is taking. The Finance Minister, Mr Abbott, says flatly that he expects 1954 to be another good year for the Canadian economy. While the export picture is mixed, there have been some cheerful signs lately such as a further list of open general licences for imports into the West Indian colonies. Government spending at all levels will match last year's, and private business expects to spend even more than last year's high rate of capital investment. Private incomes are high, supported by a good backlog of savings. If the present drop in employment represents a recession, then it is a mild one.

Russians Dangle Trade Offers

AN unexpected, and possibly accidental, accompaniment of the recent parliamentary debate on unemployment came from the Soviet Embassy. On the opening day of the debate the new Soviet Ambassador, Mr Dmitri Chuchavin, summoned a rather haphazard collection of newspaper correspondents to his Embassy for the first press conference to be held by the Russians since Mr Gouzenko's defection eight years ago. His object was to announce the Soviet desire to expand trade with Canada. He said a Soviet Commercial Counsellor would arrive very soon, that the Embassy already had a number of letters from Canadian firms asking about trade prospects, and that Russians would gladly buy a number of surplus Canadian goods.

Mr Chuchavin's first suggestion for the purchasing list did not precisely follow the pattern of Canadian unemployment. They included meat, butter, machinery (such as turbo-generators), and ships. The main items he had to offer were manganese, chrome and petroleum products. But in response to questions he showed great alacrity in admit-

ting as possible purchases wheat, textiles and almost anything else that Canada might want to sell. The fact that Canadian ships cost as much as 40 per cent more than current European prices did not seem to worry him. Nor did he insist on transactions by barter. "We," he said, "are not short of dollars."

There never has been any significant volume of Canadian-Soviet trade, and it seems unlikely that there will be much now. But some individual transactions may be arranged. As a factor in providing employment and thereby bolstering sympathy for the Soviet Union they are unlikely to be significant.

★ ★ ★

Exploiting Water Resources

THE shortage of waterpower in the United States, and particularly in the Pacific Northwest States, is arousing Canadians to a new awareness of the resources they are sitting on. The first to arouse controversy between competing Canadian and American interests is the potential of some 5 million horsepower which could be tapped by turning back the headwaters of the Yukon River into the Pacific Ocean.

One project, which is being pressed by the Aluminium Company of America, is to divert them through the coastal mountains—under the famous Klondike Trail of 1898—to Skagway, the little port in the Alaskan Panhandle. The other, sponsored by the Canadian

Frobisher Mining group with powerful American firms in association, is to develop the power in Canada for a huge smelting operation. Frobisher controls large reserves of ores in the East Indies which are among those which it wants to ship in for smelting by its own new electrical processes. It has found one place, Taku Inlet, where its plant could be built on Canadian soil and deepsea ships could get access through the Panhandle to within about 12 miles of the Alaska-Canada boundary. This Alaskan Panhandle, given to the United States in 1903 by Lord Alverstone, then Chief Justice of England, has never before presented such a tiresome obstacle to Canadian development.

★ ★ ★

Immigration Prospects

CANADA'S future level of immigration will probably depend on how employment keeps up this year. Before Christmas the Cabinet approved a figure for 1954 to match 1953's intake of 168,000 people. This was before the present unemployment had become so obvious, but when there were already storm signals; and the 1953 rate was set by the Cabinet as a minimum. This decision was no doubt based on the very full employment—some people would say over-full—which has marked all the recent summers. But if any general labour surplus were to develop this summer

it would be more difficult to hold to the relatively liberal immigration policy of recent years.

Immigration is already selective both by race and occupation. The theory is to maintain as far as possible Canada's racial balance, in which people of British origin account for just under half the population. It has not been possible to maintain this proportion of British immigrants, but last year came nearer than some others, with 47,000 people out of a total of 168,000, arriving from Britain and Ireland. Occupations are varied from time to time according to the employment situation, and the approved list is strictly enforced on would-be immigrants from Europe. There is no formal restriction on British people, but the advice given them by the Canadian authorities follows the variations of the occupation list. French people are also free from restriction, but the newcomers from France are a tiny trickle. The French-speaking sections of Canada keep up their one-third proportion of the total population through the unanswerable dynamics of the cradle.

* * *

British Investments Creep Up

IT is a pity that no up-to-date statistics are available on the flow of British investment money to Canada. Conflicting reports of the scale of the inflow in 1953 cannot be checked. The most that it seems entirely safe to say is that apparently more British investment was made here last year than in any previous postwar year, but that it is still a relatively small item compared with the inflow from the United States. The freer British hold on dollar investments has shown up in security transactions, but more particularly in the increased number of new branch plants and subsidiaries being established. One of the most notable features of recent years has been the switch in British interest from portfolio holdings, including government and railway bonds, into direct investment in British controlled enterprises.

has been providing about 90 per cent of this new direct investment, but in the second half of 1953 it looked as though the British share was creeping up. Neither for the United States nor for Britain, however, does the net inflow provide an adequate yardstick for the growth of their Canadian assets. Probably at least half the new investment in enterprises controlled outside Canada comes from re-invested earnings, and it takes time to compute their scale.

Queen Elizabeth Islands

THE northernmost group of Canada's Arctic islands has been named "Queen Elizabeth Islands," and Her Majesty may feel that the old custom of naming polar regions after the Sovereign has never meant quite as much as it does now. The Queen Elizabeth Islands now support four white settlements, the white men moving into territory from which the Eskimos have evacuated southwards. They are the joint Canada-United States weather stations, whose principal base is at Resolute Bay on Cornwallis Island. This summer the Canadian Department of Transport is taking over the annual sea supply of the islands which before was carried out by the US Navy.

All these moves are symptoms of the more active and enthusiastic attention given by Canada to the North. The

department responsible for administering the northern territories under the Federal Government has just been renamed the Department of Northern Affairs and National Resources, and more vigorous steps are being taken both to assert Canadian sovereignty in

regions which are of increasing interest to the US Air Force, and to develop the education of the Eskimo along lines more like those followed in Greenland. A territory where the Royal Canadian Mounted Police and the Hudson's Bay Company traders, with a few missionaries, have been the chief symbols of Canadian rule is gradually being infiltrated by more of the agencies of civilisation.

* * *

More Pay for MPs

THE Members of the Canadian House of Commons have just voted themselves a 100 per cent increase in pay. They have increased their basic indemnity from \$4,000 to \$8,000 a year, on top of which they get a tax-free expense allowance of \$2,000. Their new estimate of their own worth could not become effective without the consent of the Senate, a body appointed for life; so it was no surprise that the Prime Minister's Bill also provided for raising senators' salaries from \$6,000 to \$10,000. Some hope was expressed in the Commons that the senators themselves might think fit to take a smaller increase. But they did not. In voting themselves, as well as the MPs, \$10,000 a year, the senators were not moved entirely by covetousness. They have an anxious regard for the status of their Chamber as a full branch of the Legislature, and to take less pay might have seemed to be accepting a junior status.

The voters have had some serious doubts about MPs giving themselves so large an increase. The principal argument used in support of it is that political life should be open to people of very modest means, not merely to those who can afford it. And Canadians accept the increase less as an assessment of what present MPs are worth than in the hope that they may get more who will be worth it.

Starch

does surprising things IN SUCH SURPRISING PLACES

Example:

STARCH IN ADHESIVES

Starch is the basis of a versatile range of adhesives which can be given a wide variety of special qualities to make them suitable for particular purposes: qualities such as quick or slow setting, great or small initial tack, resistance to moisture, harmlessness to colour, and the like. The sealing of cardboard packs is one of the many very large-scale uses of starch-based adhesives. Feculose Company Limited, one of the companies in the Industrial Division of Brown & Polson, have developed special water-resistant adhesives with great success to solve

packaging problems connected with export to humid tropical countries. Brown & Polson Industrial Division produce 200,000 tons of starch products a year: more than 400 products, which are helping more than 80 different industries to reduce production costs, to make better products, or even to make products that could not otherwise be made at all. We have spent more than 100 years in building up this large and varied business. We have learned a lot about the industrial uses of starch products, and our advice is freely at your disposal.

CAN STARCH HELP YOU?

When you read in these advertisements how starch products are helping other industries you may see new possibilities of turning them to account in your own business. We shall be glad to discuss them with you.

FECULOSE COMPANY LIMITED

THE BUSINESS WORLD

Housewives' Choice

ON May 10th branded margarine will return to the shops and competition will rule in the margarine industry after a lapse of fourteen years. Manufacturers will be free to produce as much as they please and to sell where they please. Competition for the consumer's favour will be keen. It will not be competition mainly between two or three large firms, as it is in synthetic detergents. The margarine industry is dominated by Van den Berghs and Jurgens, a manufacturing subsidiary of Unilever, Ltd., which has supplied between 65 and 75 per cent of the margarine absorbed by the controlled market. An engaging rumour in the trade, strangely persisting despite the company's denial, whispers that Thomas Hedley & Company (Unilever's principal competitor in soaps and synthetic detergents) contemplate the manufacture of margarine. Thomas Hedley have long been makers of cooking fat and the manufacture of margarine, which uses similar materials, would be a logical development if the company could count on a market large enough to justify the capital expenditure that would be involved.

The two "Co-ops," English and Scottish, together supply over 10 per cent of the market; the remainder is shared by about eighteen smaller firms, who are likely to view decontrol with private qualms about the fight that lies ahead. During the long period of control, the manufacturers of margarine and the refiners of oils and fats—often the same companies—have acted simply as agents of the Ministry of Food. The Ministry has supplied the raw materials and taken delivery of the finished product. All margarine (and cooking fat) has been distributed on the Ministry's behalf by a central organisation, "Marcom," set up by the trade in 1940. Thus the margarine industry throughout this period has not had to finance the necessary stocks of raw materials nor the finished products. For Unilever alone, the cost of

carrying such stocks was estimated a year ago at about £15 million, and it is probably of the same order today. In addition, manufacturers will have to expand their sales staffs, and to begin advertising again. Extra charges of this kind can more easily be faced by the larger companies as they seek to expand their share of the market, but they will certainly strain the resources of the smaller firms.

Gone, too, will be the Ministry's system of fixed payments. The oil refiners were paid a sum based on the average production costs of a representative cross-section of the industry, plus a profit margin assessed on a prewar period. Refiners thus had an incentive to reduce their costs below that average. Manufacturers of margarine, however, had a less effective incentive. They were paid according to an audit of their costs in a period selected by the Ministry, plus a profit margin also assessed on a prewar period.

The leading manufacturers hope to expand their sales by the introduction of a first quality brand of margarine, which may sell at about 1s. 10d. to 2s. a lb, compared with the present unsubsidised price of 1s. 6d. for standard margarine. Some manufacturers may later be able to reduce the price of their ordinary brands slightly below 1s. 6d. a lb, although this—and the price of the first grade—depends largely on prices of edible oils in the world market. Both grades, especially the first quality, will be a distinct improvement on the existing standard grade. The claims of manufacturers that the new products will surpass in flavour and texture anything known before may lead consumers to wonder why they have had to wait fourteen years for a better margarine. The answer seems to lie mainly with the Ministry of Food, and partly with the manufacturers.

Freshness is almost everything in margarine. Owing to the Ministry's proper desire to economise in distribu-

tion costs, and to hold what seems to have been an unnecessarily generous level of stocks, margarine has been reaching the shops up to a month or more after the time of manufacture. In future manufacturers will minimize stocks, and they intend to reduce the distribution period to a maximum of about two weeks. The leading companies will send their sales representatives into the shops, as before the war, to ensure that retailers' stocks also are kept to a minimum, and margarine which falls below a certain standard of freshness will be sent back to the factory. Rapid disposal will enable manufacturers to improve the flavour further by dispensing with preservatives.

During the period of control, the Ministry has fixed the composition of margarine, and has checked the quality by a regular sample from each manufacturer. Some manufacturers have appreciably exceeded the official standard of quality; in fact, consumers who have spotted the makers' code letter on the wrapper could enjoy the best available in their district. Other manufacturers have been content to maintain the Ministry's standard; indeed, the absence of competition gave them no compelling reason to exceed it. Naturally the leading manufacturers have kept some of the fruits of their research up their sleeves until it can be exploited in a free market. After control ends, the companies will produce brands combining flavour, texture, colour, "spreadability" and price in the ways that they consider best suited to the market.

★

Margarine is made from a variety of edible oils, mostly vegetable. Almost any combination can be used, according to the manufacturer's skill in blending and refining. A typical recipe could be: take four parts of groundnut oil, two of coconut oil, two of palm kernel oil and two of palm oil. Add one part of skim milk to give aroma and flavour, a dash of vitamins A and D—the "sunshine" vitamins—and the mix is ready for the machines. In the "batch" method of production, the mix would then be churned, cooled, kneaded and blended in a row of machines roughly the length of two cricket pitches; the finished product is then moulded in half pound shapes, and finally wrapped in parchment paper at the rate of 92 packets a minute. But this "batch" method of production is being rapidly superseded by continuous machinery, such as the "Votator," which performs all these operations except packing in a space about 8 ft. by 20 ft. at an appreciable saving in cost. The risk of contamination is reduced to a minimum, because the materials are not exposed to the air, and the finished product is considered to be at least as good as that produced by the batch system.

That consumption of margarine in Britain will increase after decontrol is generally taken for granted. But the extent of the increase, and how much of it will be at the expense of butter, cannot be foreseen. Before the war the consumption of butter was nearly three

times that of margarine—24.7 lb per head per year against 8.7 lb. This was when New Zealand butter sold at an average price of about 1s. a lb, and top quality margarine at about 8d. a lb. The present relation of prices is much more in margarine's favour, and under rationing the pattern of consumption has largely been reversed. Consumption of butter rose to 16.9 lb per head per year in 1950; in 1952, the last year for which figures are available, it fell to 10.9 lb, not much more than half that of margarine, which was 19.3 lb. Butter is expected to sell at between its present unsubsidised price of 3s. 8d. a lb. and 4s., or roughly twice the price of top quality margarine. This week the butter ration went up by 1 oz to 4 oz a week, and it will be interesting to see whether the ration is fully taken up at the higher price. The margarine ration is now 5 oz, and consumption is running at about 90 per cent of the total ration.

★

Margarine may gain custom from people who consider that there is no perceptible difference in taste between branded margarine and butter, or from those that consider that the difference is well compensated by the margin in price. Its use may also increase in home baking and cooking, stimulated by advertising and by ample supplies of sugar and eggs. And the bakers and manufacturers of biscuits and other foodstuffs are almost certain to use more.

But the battle between these two fats will not be one-sided. Butter will also be fresher, because there will be a similar speeding up of its distribution, and it will also be produced to suit the varying taste of consumers at varying prices. Though margarine is regarded scientifically as in every way equal to butter in nutritional value, provided that it is enriched with vitamins A and D, many people consider it to be inferior. Nor, perhaps, has margarine quite lived down its earlier social stigma of being the poor man's butter. And those who are still particular about their food—an admittedly small fraction of the British public—will always maintain that for cooking butter has no substitute. It may be some time, however, before competition fully returns to the market, in the sense that the manufacturers of margarine and the blenders of butter are entirely free to choose their raw materials. Several long-term contracts between the Ministry of Food and overseas suppliers of butter and edible oils are still running; most of them expire in mid-1955, but contracts for oils and oilseeds from the Pacific Islands continue until the end of 1957. For those contracts which cannot be ended this year by mutual agreement, the Ministry will presumably allocate the quantities involved among the members of the trade. But the competitive pace will quicken soon enough, and long unfamiliar words like salt, fresh, Stork, Silver Seal and the rest will once again be part of the housewife's vocabulary. Her new freedom of choice is the least reward for living in a country which has rationed margarine longer than any other.

Middle-Age Spread in the Banks

By A CORRESPONDENT

THE season of the bank chairmen's speeches has passed; one by one they have reviewed and pronounced judgment upon fiscal policy, monetary control, the export trade and industrial problems. They have justified their particular dividend policies; but they have made only passing reference to emergent problems of banking that are unseen by the general public and are little understood even inside the banks.

It may be that the formative and expanding years of the banks have passed for ever; after the early amalgamations that produced the main structures, there was a burst of activity in the between-wars period, but now this, too, seems to have merged into an uneasy middle-age, marked by a burgeoning waistline of bulging assets. But there is also a rigid structure of high cost working set against this impressive backcloth of astronomic balance sheet figures—both the product of an inflationary age that it is too early yet to describe as under control. The mere presence of assets does not imply adequate earnings, and interest rates have been far from stable or altogether remunerative over the last few years; the result has been a general re-thinking about the scope and cost of banking services, and about the long-term questions of staffing and organisation. Whether this analysis has been adequate or effective is still open to serious doubt.

The need for extra earnings has been marked in most cases by higher charges for current accounts, by the introduction of charges for services formerly free, and by an expansion in the work of the specialist departments. In the main, a less adventurous postwar policy in branch expansion is being coupled with a drive to obtain more customers for existing offices, and encouraging each to employ more fully the range of valuable services that the banks provide.

The importance of additional revenue from general banking services has been emphasised by postwar difficulties on the lending side, both in rates and in the application of official credit policy. Loans to essential industry, which too often tend to be a substitute for long-term finance, have been given a marked advantage over the private and professional borrower, formerly good friends to the banking system—but there are expanding specialist loan organisations to which these once favoured customers may turn. The potential borrower in the bank parlour too often finds that by the time the branch manager has made a penetrating investigation of his application for an overdraft, squaring it with current credit regulations, and perhaps making reference to higher authority, his feeling of fatigue and uncertainty can sometimes be resolved by placing the business elsewhere. Although bank finance may well prove cheaper in the long run, the handling

of potential overdraft business occasionally lacks finesse and can compare unfavourably with the clear-cut charges and margins, precise forms of repayment and less cumbersome security procedure of the banks' competitors. The special place of the banks in the credit structure has made them vulnerable to competition in times of credit control, and the realisation of this danger has encouraged the more rapid development of other revenue-earning sections.

All this points a moral: the banks' business is based more firmly than ever upon the current account and the connections arising from it, and only secondarily upon overdraft business; but high costs and keen competition for customers who are not easily reconciled to increased bank charges pose a problem of efficiency in organisation and management control. And these in turn involve three powerful influences in British banking: first, the cumbersome and time-wasting design of the cheque as a negotiable instrument; secondly, the method of long-term recruitment of male staffs resulting in a working life of some 42 years; and thirdly, the difficulty of effective control and guidance in widespread concerns made up of branch units of varying size.

Considerable handling time would be saved if the traditional type of cheque were replaced so far as possible by a non-negotiable, non-transferable document for credit to the account of a named payee only. Some concession in stamp duty and bank charges for the use of the newly designed payment slip would no doubt help to popularise such a change. Cash turnover has increased immensely, but little has been done to apply mechanical aids in handling cash. After a struggle, the passbook has given way to the statement of account, but here and in the ledger record there is far too much detail. Do customers wish to pay heavily for the insertion in their statements of information that can easily be found from the counterfoils of their cheque books?

Banking business in this country offers special scope for higher productivity. Seventy-five per cent of the work is well adapted for mechanisation and bulk handling, and the remainder might be dealt with in ways more economical of time and labour. But it is, unfortunately, the repository of custom, tradition and false professional values; as a result an unthinking and almost extravagant use of high cost labour too often persists rather than a calculated search in all sections for mechanisation and better organisation.

The real problems of bank organisation and mechanisation emerge, in fact, in the consideration of the human element. Guidance on methods can be—and is—largely initiated in London, but the effective implementation of policy is largely in the hands of men who entered the banking business as long ago as the first

world war. Then it was a business characterised by expansion, amalgamation, an almost exclusively male staff, steady if not spectacular promotion, few problems of high labour cost in relation to earnings and, above all, manual operation of practically all banking processes. It was a different world with different values and a different tempo. Two major wars and a trade recession have shown that much of the traditional superstructure of early banking, with its mass of record, regulation and counter-checking can be avoided with real economy; but in too many cases older men, whether engaged in management or clerical duties, lack an understanding of the conflict between cost and income that is implicit in their own office routines, and wish merely to postpone change—until their own retirement. This outlook may seem harmless and understandable, but it is in fact catastrophic to younger members of the staff who, in the early and formative years of service, too readily assume as normal or inevitable the more extravagant and pedestrian aspects of the banking system.

Given the acceptance of mechanisation in banking, whether operated in the branches or in centralised machine rooms, the whole staffing structure comes under review. The need for a majority of long-service entrants disappears, since the bulk of machine and repetition work can be carried out by a short-service element of women, supervised by a comparatively small long-service core of both sexes.

Mechanisation would demonstrate that the present male bank staffs are, in the main, over educated for the duties they have to perform. Integrity and constancy are fundamental, but the slower rate of expansion in the internal banking business has led to frustration among those who might have expected to progress from routine duties to positions of responsibility. Another serious difficulty arises. The banking business competes with every other industry and profession for recruits, offering new scales of pay that give higher maxima at younger ages than formerly. The new intake has the opportunity of promotion at a much younger age than previous recruits; one bank chairman pointed out that young men at an initial training centre in 1950 were already passing through a junior course at a staff college proper during 1953. Earlier appointments to managerial and equivalent positions will mean, with permissive retirement at 60, that the channels of promotion will be blocked for longer periods than formerly; the implications for bank staffs recruited, for example, between 1930 and 1940, and for those to be taken in from about 1960 onwards, could be serious unless a careful scheme of dilution between the two classes is worked out.

Banking, for all its attractions, is a specialised—almost isolated—area of endeavour hard to compare with the creative fields of law, medicine, science, architecture and perhaps accountancy. In banking there is too little movement within the industry as a whole, and too little movement within the banks from branch to branch to avoid stagnation. At present, entry

must be something of an act of faith, supported by the knowledge that the branch manager and executive of the future will undoubtedly need the technical ability, enthusiasm and drive that will enable him to transmute, for the bulk of his staff, routine and repetitive work into a worthwhile occupation with a real sense of purpose. The new entrant must acquire an undistorted conception of the banking business as a great accounting machine of settlement and record for most of the internal and external trade of this country.

The absence of individual professional status in banking is harmful to the banks themselves and to their staffs, particularly in the later years of service when the limitations of routine are felt more keenly. While the present examinations and internal training systems may yet serve some purpose within the banking system itself (though some diversion of resources from new entrants to management training in organisation and the application of machine methods might well provide a better dividend) there is a real need for a generally accepted standard of higher education, linked with University status. Only the realisation of wider horizons in banking will encourage the young man of intelligence and ability to sample, to enter and to stay in banking. That also implies that his seniors, formerly young men approximating to the same description, are making at least some headway in the career of their choice, carried on in well organised and equipped offices where manual labour is an anachronism and not the norm.

IN GRANDPA'S FOOTSTEPS

"BRITISH TRADE WITH MEXICO"

Mr. Björklund, of His Majesty's Legation at Mexico, holds that if British manufacturers and merchants were to show the enterprise and adaptability displayed by the Germans and Americans, they might participate more largely in Mexican trade. At present our share in that trade is declining. American traders who, from their proximity, enjoy special advantages, are constantly sending their representatives through the country, and the German manufacturers, according to the Consular official, are more ready than our own to adopt suggestions from their agents in regard to the style or finish of their goods.

From a Business Note in The Economist, 17th January, 1953.

As it happens, in 1952 Germany took Britain's place as Mexico's second largest supplier.*

Our quarterly reports on over seventy countries keep exporters informed about economic conditions in their overseas markets.

*Our ninth quarterly report on Mexico is published this week.

Business Notes

Budget Shock

THE estimates of civil expenditures in 1954-55, released just as this issue of *The Economist* went to press, will surely chill some of the optimism lately prevalent about the coming budget. The fact that current expenditure has this year been running below 1952-53 levels, despite the presentation of very large supplementary estimates, is a sign of under-spending on other votes; and this had encouraged hopes that substantial savings might be shown in the estimates for the new year—especially as part of this year's supplementary votes had been understood to be for outlays that would prove to be non-recurring. But in fact the civil estimates for 1954-55, after deducting the portion of the Ministry of Supply vote that is included in the bill for defence, total no less than £2,327.8 million, which is some £10 million more than the total estimates for 1953-54—which include the supplementary votes of £228.7 million, but naturally take no account of the under-spending on other votes.

These total estimates for the old year, though they always figure in the papers presented to Parliament, are not, however, the relevant basis for comparison, since supplementary estimates have become a normal hazard of each year's finances; and, in any case, the total voted for 1953-54 will not in fact be spent. The proper comparison is with the original estimates for that year; and on that basis the new estimates show an increase of no less than £235.6 million—which is a highly disturbing prospect. Inevitably, a large part of this increase comes from the Ministry of Food, the bill for which is put at £146 million more than at this time last year (though at £16 million less than the revised estimate). Even more depressing, because less expected, is the absence of any perceptible savings throughout the rest of the list. Instead, there are some substantial increases—£20 million more for education, a similar addition for housing (including the Exchequer grants to local authorities), £16½ million more for the Health Service (raising it to £433 million), £15 million more for Colonial services, and many smaller increases (but sometimes proportionately larger ones) on other items. The only sizeable reduction is one of £7½ million on the dying Ministry of Materials, with possibly some saving on the Ministry of Supply's "civil" expenditure—but comparison here is obscured by transfer of the atomic programme to the new Commission.

The upshot is that the bill for supply that the Chancellor will have to face in his budget will be £3,882.4 million, including £1,554.5 million for defence. In his last budget the bill was £3,586.3 million, including £1,496.8 million for defence. The increase will therefore be nearly £300 million; and the only consoling qualification that can be made to that figure is that £54.6 million

is a purely "bookkeeping" increase. This arises from the fact that American aid—which, in these figures, is deducted from the defence estimates—is this year expected to decline from £140 million to £85 million.

The Price of Atom Power

THE Vote on Account reveals for the first time the cost of running the atomic energy project. No hint of this has been allowed to escape before; now that the totals have been published, their sheer size is impressive. The estimates for the coming year, 1954-55, put expenditure at £53.7 million; last year's total, when the organisation was under the direct control of the Ministry of Supply for nine out of the twelve months, is put at £46.5 million. And these figures do not include the cost of producing atomic weapons; this is borne separately by the Ministry of Supply, and it is unlikely that any direct indication of its size will be given.

In round figures, there are probably about 15,000 people employed by what is shortly to become the Atomic Energy Authority. The organisation is still expanding; this year two atomic piles are being built in Cumberland for the Authority's first experimental power station and work should start shortly on a breeder reactor. Several buildings have still to be completed at the gaseous diffusion plant at Capenhurst, and a certain amount of minor construction work is in hand at the other plants. The Authority's budget of £54 million will cover these building costs as well as the running expenses of the plants, the purchase of uranium ore, and all research and development. Big though it is, the sum is dwarfed by comparison with the estimates for the American Atomic Energy Commission for 1954-55, which amount to a monumental total of about £865 million.

£30 Million for ICI

IMPERIAL CHEMICAL INDUSTRIES is a giant and acts like a giant. Not content with announcing the largest cash issue ever made by a British company, it has linked the issue with a massive equity share bonus of nearly £71 million, with a higher dividend forecast and with a reconstruction of its preference capital. All these proposals have a most up-to-date look.

Since the war ICI has raised about £60 million by two "rights" issues of ordinary shares and by placing privately £20 million of 4 per cent unsecured loan stock (1958/60).

It now intends to raise another £30 million by issuing a 4½ per cent unsecured loan stock (1972-74) at par. Financing by a loan stock, the interest on which does not attract distributed profits tax, is an orthodox move these days. Also in economical vein, the board have followed the example of Dunlop's preference issue; the new stock is being offered only to stockholders on the register on February 25th—and not for public subscription. The issue deliberately courts institutional investors. As these shareholders on the register can apply for as much stock as they like, success seems assured.

ICI's decision to capitalise £70,651,162 from reserves, in order to issue as a bonus one fully paid ordinary share for every £1 stock held, throws an interesting light on the attitude of the Capital Issues Committee towards scrip issues. In April, 1951, a similar application from ICI was turned down, presumably on the grounds that just over £96 million of reserves arose from the revaluation of the group's assets in January, 1950, and not directly from ploughed back profits. Now the reserves are sufficient to enable the company to make the bonus without using the 1950 revaluation reserves. Whether that is the only reason for the change in the Committee's attitude remains uncertain.

Bonus issues of shares can cause confusion—and speculation—about the next dividend. ICI has wisely accepted the modern principle of announcing the board's intention with the details of the issue. The full year's dividend for 1953, to be paid on the unrevised capital, is to be 15 per cent, compared with 13 per cent in 1952. This dividend is in line with expectations in the market and after its announcement the £1 ordinary stock units (which since the beginning of the year have risen gradually from 53s. 6d.) rose by only 4½d. to 58s. 1½d. The equity has been established on a yield basis of 5.2 per cent, or just a fraction below the average yield on the market leaders.

Another £9,631,078 is to be capitalised from reserves (which at the end of 1952 totalled £173.7 million) in order to issue two new 5 per cent £1 preference shares for every £5 of 7 per cent preference shares now held. The coupon rate on the existing preference shares is to be reduced at the same time from 7 to 5 per cent. Preference shareholders will thus receive exactly the same amount in dividends as they did before. They will be asked to agree to make the preference stock an open-ended issue. In return for that concession they receive the light-weight compensation that each £5 of existing stock now becomes £7 in the wildly improbable event of liquidation.

£70 Million Programme

No further issue of preference or other capital by ICI is, however, likely for some years. The deputy chairman, Mr S. P. Chambers, pointed out that the new £30 million issue would keep the group out of the capital market for some time ahead. The group still intends to find much of its needs from ploughed back profits. There is still £60 million to be spent on capital projects already sanctioned by the directors and they expect to sanction another £70 million of capital expenditure in the next three years. This will be another massive stride forward in the group's capital programme, on which about £210 million, including £150

million coming from internal resources, has been spent since the war.

The new money is not required for one particular project but once again it will be used in an advance in depth all along the line. Among the many projects the directors have in mind are expansions in the production of soda ash, caustic soda and chlorine, nylon and Terylene. Not less than £12 million may be spent on the Wilton group of factories; about £3½ million will be spent on a factory to produce 1,500 tons of titanium a year; and perhaps as much as £8 million more will be spent on the nylon polymer plant, on which in 1950 the directors decided to spend at least £5 million. This increase in expenditure seems to account for more than the projected rise in British Nylon Spinners' output this year from 10 million to 30 million lb, presumably because of the acquisition of the Bemberg plant which will come into nylon production next year. These are all massive figures building up that impressive development and expansion on which ICI bases its answer to the threat of nationalisation in its booklet "The Chemical Industry and Challenge to Britain."

New Look in the Trade Accounts

THE new British Trade and Navigation accounts introduced for the month of January are a great improvement, both visually and technically, on the old. The classification adopted by the Board of Trade is based on the Standard International Trade Classification approved by the United Nations in 1950, which has been adopted by all the main trading countries in their own accounts, or in the trade figures they submit for publication by the United Nations. The principal changes are that the number of commodity headings is increased by nearly one-third; the number of divisions is increased from 46 to 52 and the divisions are grouped into four main classes, instead of three.

The new class, which is most welcome, is *Mineral fuels and lubricants*, comprising crude and refined petroleum, lubricating compounds and mineral waxes, coal, coke and manufactured fuel, pitch, and bituminous asphalts. These items have been transferred from *Raw materials and articles mainly unmanufactured* and from *Articles wholly or mainly manufactured*. Those two main classes, with some further amendments, now become *Basic materials* and *Manufactured goods*. The familiar *Food, drink and tobacco* reappears as *Food, beverages and tobacco*. The fourth and fifth classes in the old accounts, *Animals, not for food*, and *Parcel Post*, are now brought together in *Miscellaneous*. The vehicle division, which formerly covered road and rail vehicles, ships and aircraft, has been broken down into three divisions, rail, road and aircraft, and ships, while wool tops have appropriately been transferred from textiles to basic materials. Special care will now be needed in making comparisons with earlier years, particularly in the sub-classes of manufactured goods, such as engineering products, which now refer to a different range of items. The first three textile divisions, woollen and worsted, cotton, and synthetic, include only yarns and woven fabrics; other manufactures have been taken to the miscellaneous division.

Classification by country generally has been increased, and the number of such tables reduced by extending the

grouping of related commodities. This makes it possible to give countries of destination covering a higher proportion of the total value of exports, although the proportion of imports so covered has had to be slightly reduced. Textiles are an exception; analysis by type is greater than before, but analysis by country is less extensive. In some of the engineering divisions, particularly those which now form a larger proportion of total exports, analysis by country and type has been increased. Total British trade with particular countries, which used to be given one month in arrears, was brought up to date with effect from the December accounts. The appearance of the tables is much clearer, owing partly to the use of a cleaner type face. The British trade accounts are published more promptly than those of any other major trading country, and the Board of Trade is to be congratulated for having improved them without any delay in publication.

Engineering Exports Up

ALTHOUGH total British exports in January were not particularly encouraging, shipments of engineering goods maintained the recovery made in the last quarter of 1953. These goods, which form nearly one-third of total exports, amounted to £89 million f.o.b. in January, £8 million more than the monthly average in the first and second halves of 1953. These products of the engineering industry played a part in the revival: shipments of non-electrical machinery, at £36 million, were £3.5 million above the monthly average of the second half of last year; road vehicles and aircraft, at £25.5 million, were £1.2 million

UNITED KINGDOM TRADE
£ million—monthly averages or calendar month

	Exports			Imports		
	1st half 1953	2nd half 1953	Jan. 1954	1st half 1953	2nd half 1953	Jan. 1954
Food, beverages and tobacco	12	13	12	110	110	114
Basic materials	8	8	8	93	83	87
Mineral fuels and lubricants	12	13	14	26	26	26
Manufactured goods	...	...	...	51	56	53
of which:						
Metals	28	29	27	...	...	...
Engineering products	81	81	89	...	...	...
Textiles, ex. clothing	26	29	29	...	...	...
Other manufactured goods	36	40	40	...	...	...
Total†	209	221	226	282	275	282

* Estimated. † Including Miscellaneous.

higher, and shipments of electrical machinery rose by £800,000 to £15 million. Of the other main classes of manufactured goods, exports of metals in January fell £2 million below the monthly average of the second half of 1953 to £27 million, while exports of textiles and of "other manufactures" were unchanged at £29 million and £40 million respectively. Exports of mineral fuels and lubricants increased by £1 million to £14 million, owing to a further rise in shipments of refined petroleum; exports

of food, beverages and tobacco fell by £1 million to £12 million and basic materials were unchanged at £8 million.

Imports of food, beverages and tobacco, the largest item in Britain's import bill, rose to £114 million c.i.f. from a monthly average of £110 million in the first and second halves of 1953, mainly because much larger arrivals of dairy products, sugar and tea more than offset a fall in imports of fresh fruit and vegetables and cereals; imports of wheat, at £6.7 million, were £3 million below the monthly average of the first half of last year. Imports of basic materials rose to £87 million from a monthly average of £83 million in the second half of last year, but were still £6 million below that of the first half. A rise mainly in imports of raw wool and cotton more than offset a fall in imports of timber. Imports of crude and refined petroleum were slightly higher in quantity than the average of the previous six months, but were lower in value.

Schumania is Waiting

THOUGH M. Monnet may at present be preoccupied with plans to seek a loan from America, his request to the British Government to open negotiations for some closer form of association between Britain and the European Coal-Steel Community has been awaiting a reply since Christmas Eve. Some form of answer, at least, cannot long be delayed; and negotiations can hardly be refused, though few people in the British coal or steel industries seem anxious to be committed to economic concessions for a political gesture, however intrinsically desirable this may be.

Writing in the *National Provincial Bank Review* published this week, Sir Ellis Hunter, of Dorman Long, who was until this year president of the British Iron and Steel Federation, puts a view commonly heard in both British industries:

... the common market has been in existence for too short a time ... and is working in too uncertain a manner to permit of any firm judgment on the likely effects of any British association with the Community. ...

... this background of uncertainty would seem an unhappy concomitant to the proposals for an agreement with Britain. It would require a decision on insecure data.

Similar reserve is expressed in the coal industry, though the common market for coal has lasted rather longer and been more settled. There are feelings in both industries that any acceptance by Britain of the "common rules" from Luxemburg would require concessions by the British—for example, an end to dual-pricing in coal exports, which might leave some £15 million a year more to be found from the British coal consumer, and possible increases in British steelmaking costs—while the continental industries have few useful economic counters to offer in exchange. The political desirability of support for the High Authority

New Look in Defence

page 657

is not questioned, however. "Some form of closer association" does still seem likely to be achieved, with M. Monnet content for the moment to get his foot in the door and the British industries confident that, for the moment, they need not open it farther than they want to.

The Unpaid Tax Collector

WHAT is most striking about the balance sheet of Imperial Tobacco Company is what is not there—cash. For an industrial giant with assets of over £220 million there is an amazing dearth of liquid funds. Group overdrafts and acceptance credits on October 31st were £31,868,858, compared with £29,977,226. Acceptance credits (which must surely be the cheapest way of financing bonded tobacco stocks) again amount to only £5 million of the total, suggesting that the company has found a limit to what it can conveniently finance through the discount market. On the other hand cash is down from £377,363 to £257,115. Clearly the group has continued to finance its stocks largely with the aid of short term finance and with the aid of shareholders' money ploughed back. The group ploughed back last year, as the chairman points out, £4,600,000, about a quarter of the total coming from previous tax provisions. It is not only tobacco which the shareholders and the banks are thus financing. It is also the Exchequer. Stocks last year rose from £120,669,509 to £123,027,184 and debtors (that is goods delivered to the shops but not yet paid for) from £52,213,866 to £54,909,923. The stocks are mainly bonded, but it is safe to assume that there is a tax element of around £80 million in the stocks and debtors together.

CONSOLIDATED BALANCE SHEET
(£'000)

Years ended Oct. 31	1951	1952	1953
Fixed assets, less depreciation	17,517	19,294	20,610
Quoted investments, at cost*	11,170	11,170	11,170
Net current assets	111,991	114,706	117,388
Stocks	130,369	120,670	123,027
Debtors	51,066	52,214	54,910
Cash	383	377	257
Bank overdrafts	34,475	24,977	26,869
Acceptance credits	5,000	5,000	5,000
Reserves	51,029	32,114	36,700
Loan capital	40,000	40,000	40,000
Ordinary capital	37,563	60,101	60,101

* Market value: 1951, £46,150,000; 1952, £43,817,000; 1953, £52,144,000.

Both the short term debts and the shareholders' enforced savings are thus helping to finance the Exchequer in advance of collection of the tobacco duty from consumers. More such short term finance may be needed this year: the stock of £123 million is by no means excessive for a company of this kind with an annual turnover of about £600 million; the Mutual Security Act tobacco bought for sterling towards the end of last year is not included in the present accounts, and the chairman considers that stocks in a year's time may be a little higher. There is no indication that the directors of Imperial Tobacco have any intention of funding the short term debts. It is more likely that they have

decided that bank finance is the most satisfactory solution. And if there were ever a reduction in the tobacco duty the need for finance might decline. But "hope deferred maketh the heart sick."

What is most striking about the address of Sir Robert Sinclair, the chairman, is the point he omits to make. The lung cancer controversy is not enumerated among the three factors he considers important in assessing the outlook for this year. These are: (1) the availability of leaf tobacco, which he believes will be a little better than it recently has been; (2) the trend of costs, which has recently been upwards and he regards as "less encouraging" but "prices to the public will not be increased unless and until it is absolutely imperative" and (3) the demand for the company's products, which has recently been well maintained. Sir Robert's general conclusion on those factors is that the results will not be very different from last year's and that there is little hope of a big expansion in business with the tobacco duty at its present rate. Since he has left lung cancer out of his assessment he must have done so deliberately, believing that it will have little influence on the year's results. Elsewhere in his speech he claims that "nothing whatever in the way of proof in this matter has emerged."

Is Shipping Competition Fair?

AMONG other and more sensational matters, the annual report of the Chamber of Shipping this week has raised the question of the direct and indirect aid that the German and Japanese governments afford their shipping and shipbuilding industries. These nations have since the war replaced the greater part of their destroyed fleets with new and efficient vessels, and postwar replacement of the Japanese fleet, in particular, has been financed chiefly by government loans. These have been nominally at a high rate of interest, but it is suggested that the Japanese government has been steadily easing, and may even have waived for the time being the terms of interest and repayment. Published results for 1953 and the experience of British competitors indicate that many Japanese shipowners, although their vessels are running at a loss, have no financial reserves. The Chamber concludes that their competitors' current and accumulated indebtedness to commercial banks is being underwritten by the Japanese government.

The Chamber complains that the British Government, on the other hand, confines its protective attitude to air transport, which the Chamber argues has had the effect of preventing British shipowners from exploiting the possibilities of this complementary form of transport as they were prepared to do. Recently, of course, the Government has been encouraging independent operators to participate in the development of air independent transport. The report states that if shipowners are to contemplate greater participation in air services, they need first to be assured "that this is the policy of the Government and that as air operators they would be given a fair field and continuity of service." It is also added that if shipowners were to be restricted to "cargo only" air services, they would be heavily handicapped in competition with the

Building for the Future . . .

ATOMIC ELECTRIC GENERATING STATION

Built to the direction of the Ministry of Works
for the Department of Atomic Energy

FACING up to the fact that the nation's reserves of easily workable coal will, it is estimated, last for about 200 years at the most, Britain has begun to construct a thermal reactor capable of producing electrical power in industrial quantities.

Constructional work in connection with this epoch-making scheme is now in hand at Calder Hall and it is forecast that the completed station, and a breeder reactor which is also to be built, will result in the generation of 50,000 kilowatts.

The building of this, the world's first atomic electric generating station, has been entrusted to Taylor Woodrow. Here is new and unique evidence of the way in which this firm is, both in Britain and abroad, Building for the Future

throughout the free world

The BIG Yellow 'CATS'

ARE PURRING BEFORE THE HEARTH

Before new hearths and homes can arise, row upon row, Caterpillar earth-movers must get to work. On building sites up and down the country, where soon there will be houses, hospitals, offices, schools and factories, you can see the distinctive yellow of the 'Cats' (world-famous nickname for these world-famous machines) and hear the powerful, purposeful throb of their engines. These are busy times for the 'Cats', speedily doing the spadework for Britain's building developments.

Can you use Lustrex in your industry?

Versatile plastic
offers new
opportunities to light
engineering and
electrical industries.

HAVE you considered using plastics for industrial purposes? Do you know that hard-wearing, economical components for more and more industries are being made from one particular, highly-successful plastic? This is LUSTREX*, Monsanto's polystyrene—and an extremely useful and versatile material. Lustrex is light, yet strong. It is easy and inexpensive to fabricate and, for many purposes, is the most economical of all plastics. It can be moulded into intricate shapes, for any type of component. It has excellent insulation characteristics, low loss and low power factor and strong resistance to acid and water. It is supplied in a wide range of standard colours and, in addition, can be easily produced by your moulder or supplier in any shade you wish.

Where LUSTREX is already used

Lustrex is used in refrigerator and radio cabinet fittings, coil formers, brush backs, instrument panels, packaging, cutlery handles, buttons, houseware, domestic appliance parts, wall tiles, camera, battery and torch cases and other applications, where bulk quantities of standard mouldings are called for.

Lustrex is one of Monsanto's wide range of chemicals and plastics for industry. If you have an industrial problem which chemicals might help you solve—get in touch with Monsanto today!

corporations and foreign competitors (though recent developments suggest that independent "freight only" services are likely to be protected from competition by the corporations, at least). The recent entry of shipping companies into the air transport field, moreover, indicates that some of them take an optimistic view than the Chamber of Shipping in general.

Home-truths about Dividends

BETWEEN now and the budget much more will evidently be heard of the Labour attack upon rising dividends and their alleged connection with the latest phase of wage pressure. The statistical facts about the relative trends of these two streams of personal incomes—a small rivulet on the one hand and a broad river on the other—cannot, therefore, be too often reiterated. For almost every move in the left wing campaign so far has been based on grotesque misrepresentation of the figures, and daily aggravates the formidable but vital problem—in this phase of rising competition in world markets—of keeping Britain's wage costs in line with Britain's productivity. It is well, therefore, that the Chancellor himself has now felt impelled to protest at these distortions and to put the relevant figures in perspective.

In a speech at Glasgow last week he vigorously rejected the charge that the Government's policy of "enterprise and incentive" represents a "smash and grab" for one section of the population—an effort to encourage an increase in dividends whilst trying to freeze wages. He himself had never asked for a "freeze" of any kind, but only that increases in personal money incomes should not be sought unless they are supported by increases in output. There has not, in any case, been any "runaway" rise in dividends. In the four years to 1952, according to the latest available estimates from the official national income statisticians, the money incomes of wage-earners rose by 30 per cent and those of shareholders by 23½ per cent, whilst in real terms these increases were equivalent to 6½ per cent and 1 per cent respectively. Moreover, if the comparison is extended back to prewar days, the average wage-earner's money income has risen twice as much as the average shareholder's; in real terms, his income has risen by 28 per cent whilst the shareholder's has fallen by 35 per cent.

These figures admittedly do not take account of the rise in dividends in the past twelve months; but even the recent experience does not perceptibly alter the comparison. The index of wage rates was unchanged in January (at 138, compared with 100 at mid-1947), showing a rise of 3 per cent, or roughly twice as much as the rise in the retail price index, since December, 1952. Labour spokesmen have contrasted this movement with the increase of roughly 10 per cent in the money amount of dividends paid by companies whose accounts were published in 1953. But this was a net amount, reflecting the benefit of last year's reduction in income tax; the increase in gross dividend incomes was only 5½ per cent—and part of this was attributable to this year's additions to capital. In other words, the rise in the average return to equity capital during the year was

roughly the same as that in wage rates; the monthly average of these in 1953 was 4.6 per cent higher than in 1952.

Properly construed, therefore, the comparisons of wages and dividends provide no basis at all for pleas of the kind now being launched by the TUC in its pre-budget message to the Chancellor. Its budget prescription this year includes an increase in the distributed profits tax, an increase in the duty on share transfers, a reimposition of the foolish tax on bonus issues—a tax disowned and repealed by a Labour chancellor—and the introduction of statutory limitation of the amount of distributed profits. This is a prescription of class-prejudice; but, worse than that, it is a prescription for ossifying the economy. The TUC this year falls far below the standards of economic judgment it has shown in many postwar years.

Tideland Coal

COAL is mined under the seabed at about 25 pits in Britain, mainly in the north. The seams that extend out from East Fife under the Firth of Forth, probably meeting the Lothians coal measures, offer large amounts of coal within reach of coastal pits, and have been called "one of the few really rich areas available for intensive exploitation in Britain." In Northumberland and Cumberland the significance of certain undersea reserves is enhanced because the same seams inland have largely been worked out. The programme of undersea boring that Mr Humphrey Browne this week announced the Coal Board is to undertake will be concerned primarily with proving the extent, quality, thickness and depth of such reserves before existing coastal workings are extended; later it might be widened to include prospecting—for such possibilities as anthracite beneath the English Channel.

This is a fairly expensive venture. The "scafort" drilling rig may cost £250,000, and marine drilling costs may considerably exceed those on land—where a 2,500-foot borehole may cost £20,000, and drilling below that depth some £9 a foot. But proving the undersea reserves by forward "drivage" underground is also costly, and limited for practical reasons; while the risk of developing workings underseas, at huge capital cost without full information makes the marine boring a worthwhile insurance. So the "scafort" is to be built, as the most spectacular of a number of technical innovations that the Coal Board has in hand:

Use of "electric logging" processes to investigate strata from its inland boreholes;

Experiments with a "cactus grab" for faster sinking of new mine shafts;

Purchase of a Swiss "electrogyro" locomotive, in which energy is stored by a large flywheel which is "topped up" to 3,000 revolutions a minute from electricity supply points, that acts as a "battery" to drive the traction motor;

Tests of "wired radio" for mine communication systems, and—in one Kentish colliery—of underground air-conditioning.

Mr Browne also reviewed the many types of coal-getting and power-loading equipment the industry is testing—a perhaps significant absentee from his list being the once-favoured "Samson Stripper."

Profits from Welsh Steel

Two more of the giants of the steel industry, Richard Thomas and Baldwins and the Steel Company of Wales, have published full reports for the 53 weeks to October 3rd last. Neither of these companies is thought to be high on the Realisation Agency's list of companies for resale. Their last year's profit record, and indeed the ups and downs in the tinplate industry, provide one of the reasons.

The total income of Richard Thomas and Baldwins, which owns a steelworks and wide strip mill laid down before the war and a number of small tinplate works, fell by £3.7 million, or by nearly 31 per cent, to £8.5 million. The gross profits of the Steel Company of Wales, owning the Abbey steelworks and strip mill built since the war and the Trostre tinplate mill, have fallen by £700,000, or just over 9 per cent, to £7.7 million. Both companies were obviously hard hit by the recession in the tinplate industry, when a number of the small works, which had been enjoying handsome export premiums on much of their output, were closed or put on a "care and maintenance" basis. In commenting on the fall in profits the directors of both companies draw attention not only to the "temporary recession" in the tinplate industry but also to the considerable decline in export prices. Towards the end of the financial year, however, there was an improvement in demand for their main products—an improvement that has been maintained in the current year of trading. In contrast to this experience, Thomas Firth and John Brown, which concentrates on forgings and special steels, has reported that its profits in the same period rose slightly, to nearly £2 million.

With a plant erected since the war the Steel Company of Wales has to set aside a far greater part of its profits for depreciation and for servicing its loan stocks than does Richard Thomas and Baldwins. Further increases in these provisions last year explain why its net profits have fallen by £787,000—and this despite the halving of the transfer to a tax equalisation account. Net profits of Richard Thomas and Baldwins, following an abrupt fall in the tax provision, have been reduced by £583,000 to £3,132,000. These results do not suggest that the task of selling these companies back to the public will be easy—and for the Steel Company of Wales the difficulties must be greater than for Richard Thomas and Baldwins. One of the reasons for this is that while the directors of Richard Thomas and Baldwins speak of a development scheme estimated to cost £7½ million, the outstanding capital schemes sanctioned by the Steel Company of Wales are estimated at a cost of £33 million.

Money From Brazil

A most striking achievement in the recovery of blocked sterling debts in Brazil has been made by Ocean Coal and Wilsons which recently announced the repayment of 1s. 6d. per 4s. stock unit. The repayment takes £1,600,000 and it is now disclosed how the group which had only

THE ECONOMIST, FEBRUARY 27, 1954

£662,000 in sterling on December 31, 1952, has found the money. The group is a combination of Welsh colliery interests not yet fully paid for by the nationalised undertaking and an old-established merchanting business deeply involved in South America, chiefly in Brazil. Both halves of the undertaking have contributed: the colliery side, Ocean and United National Collieries, have repaid to the parent company £976,250 partly out of liquid assets which they already held and partly out of interim compensation recently received; the South American trading section, Wilson, Sons and Company, have succeeded in clawing back no less than £827,500 from blocked debts in Brazil. The colliery business has been left with £320,000 together with a further claim for compensation, and the chairman, Mr F. A. Stackpole, gave shareholders on Wednesday a rough estimate that they might expect a further capital repayment of about 9d. per unit. The merchanting business is to continue. Overdrafts in Brazil are down from £2,835,781 on December 31st to below £700,000 today. This is partly due to repayments but also partly to using the free exchange rate of 150 cruzeiros to the £ in place of the official one of 52½ cruzeiros.

This great improvement in Brazil has been achieved by trading the foreign currency invoices for which transfer had not been authorised against the Brazilian Government's long position in cotton. Merchants bought the sterling debts at a discount and used them to buy Brazilian Government cotton also at a discount. The cotton went out to every part of the world where sterling payments are accepted. It was done at an astonishingly small discount. The sterling debts were sold at discounts ranging from 8 to 14 per cent—evidently chiefly at the better figure—for the effective average rate of exchange was below 60 compared with the official 52½ and the free 150.

One question remains. Has the Board of Ocean Coal and Wilsons, in this smart stroke of business, jumped the queue of Brazil's sterling debtors? The answer must be, No. It has acted with the knowledge and approval of established authority in both countries. If there is a tinge of envy in the hearts of Brazil's numerous unpaid sterling creditors it should be focused on the two governments and their central banks—not on the Directors of Ocean Coal and Wilsons.

A Gift Horse Examined

REPRESENTATIVES of the Canadian Wheat Board met the London grain trade late this week to hear criticisms of its new pricing policy. Paradoxically the London trade is protesting against the decision to cut the price of wheat ex-store Fort William by seven cents to \$1.79 a bushel, but only because the trade considers that the board has prejudiced the existing contracts for shipments from Vancouver, which formerly were quoted at the Fort William price. The reduction has been made to bring the price for shipments out of Eastern Canada (ex-Fort William) more into line with the Vancouver price. The bulk of the British and Continental contracts have recently been placed with Vancouver, where c.i.f. prices were some 30s. a ton below those from the Atlantic port of St. John, despite the long haul through the Panama canal. The board hopes that its action will

Manufacturers of: "Thames Board" for cartons and box making; "Fiberite" Packing Cases in solid and corrugated board; "Essex" Wallboard.

Two out of three are power-starved

Two-thirds of the world's population live without electrical power. Yet electricity offers the quickest way of raising basic living standards and, therefore, the most effective answer to discontent and unrest caused by primitive conditions. This is the measure of the opportunity before THE BRUSH GROUP — the greatest makers of diesel electrical power plant in Great Britain and the world's greatest exporters of industrial diesel engines.

That opportunity is being grasped. THE BRUSH GROUP exports most of its output, the greater part of it going to the less developed regions of the

world. Compact, economical power units and generators, easily transported, installed and serviced, are answering the world's urgent need for industrial power. Barren lands can be irrigated, villages lighted, swamp areas drained. Machines, powered by electricity, can raise human productivity a hundredfold. THE BRUSH GROUP is helping to bring about a new industrial revolution, a revolution that will, in time, transform the lives of the two out of three who are, as yet, denied the benefits that follow the introduction of electrical power.

THE BRUSH GROUP

Manufacturers of diesel engines and electrical equipment for agricultural, traction, industrial and marine purposes.

encourage sales from the east and relieve the congestion of wheat in Manitoba and Saskatchewan when the St. Lawrence opens for shipping in April. The British grain trade, which bases its business on the Fort William price, argues that it will, in effect, lose nearly £1 a ton on its Vancouver contracts, and it wants the reduction to be postponed until those contracts have been cleared. Although the reduction is basically designed to meet an internal problem, the United States government promptly recognised its external implications by raising the export subsidies on American wheat shipped from Atlantic ports by six cents a bushel and from Gulf ports by four cents.

Most British and Continental buyers are holding off the market until the Canadian policy is clarified. Buying this season has been hand-to-mouth at the best of times. The latest figures published by Broomhall show that from August 1st, the start of the new season, to February 6th, world shipments of wheat and flour totalled 41 million quarters (of eight bushels), 9 million less than in the same period of 1952/53. The United States has shipped 7.6 million quarters less this season; Canada 7 million less and Australia 1 million less. Argentina has shipped over 7 million quarters, compared with almost nothing in the same period last season. The American government's policy, announced on November 19th, of subsidising exports of wheat sold outside the International Wheat Agreement down to the agreement price, has so far been of little avail. Up to February 11th only 2 million bushels had been sold, mostly as flour. In the first six months of the new agreement total exports amounted to only 142 million bushels, or 17.8 million quarters, out of a total annual quota of 421 million bushels. Some major importing members have bought negligible quantities, and a few have bought nothing. If the price fell to \$1.55 a bushel IWA members could be obliged to take up their quotas in full. The test will come in the spring, when the prospective size of the new North American crops becomes reasonably clear. In the broadest sense, a fall to much below \$1.55 would harm importing and exporting countries alike.

Building Society Plans

CHAIRMEN of two leading building societies, both of which produced record figures last year, have been telling members of their hopes for further expansion this year. They are Sir Harold Bellman, of the Abbey National, and Mr Harry L. Score, of the Co-operative Permanent. After lending the record sum of over £19 million on mortgage last year, Mr Score reports that the demand for loans was such that much larger amounts could safely have been advanced had the funds been available. He puts forward a plea for a reduction in the housing subsidies applied to houses built by the local authorities to rent. A house financed by building society money and sold to an owner occupier is unsubsidised, a house built to let by the local authority carries subsidies from the taxpayer and ratepayer of at least £35 a year for 60 years. Mr Score points out that that subsidy is applied irrespective of need and that often the poorer paid worker is helping through rates and taxes to pay the rent of some one earning £1,000, £1,500 or occasionally even £3,000 a year.

The Abbey National Building Society also enjoyed record expansion last year, mortgage advances amounting to £38.4 million compared with £30 million, and total assets rising £154 million to £181.2 million. A feature of the Abbey National's expansion is that it has been achieved not only without any sacrifice of liquidity, but with an actual increase. The ratio of liquid assets to liabilities to the shareholders and depositors improved last year from 13.4 per cent to 13.7 per cent. The temptation to lend more liberally at the expense of liquidity must have been severe; Sir Harold Bellman's address makes it clear that the society is in a position to make good use of further savings entrusted to it. He, too, is looking forward to fresh fields for expansion. One of these may come from the proposal already under discussion between the societies, the local authorities and the Government for reducing the size of the initial deposit required from owner-occupiers. This receives his blessing. Another, which he calls "no more than the germ of an idea," is the possibility of the building societies supplementing the activities of the local authorities in the provision of houses for letting. This is certainly a novel idea for the building society movement, so long connected with the claim that to buy is better than to rent. It is a pity that he did not develop it.

SHORTER NOTES

The first results from a large departmental store, those reported by Harrods for the year to January 31st, are an encouraging foretaste of the results that can be expected from other retail traders after the end of Coronation year. The untaxed profits of the Harrods group have risen from £1,419,591 to £1,786,424, and, although taxation has increased from £868,870 to £1,111,892, its net profits have advanced from £550,721 to £674,532. The directors have not been slow in seeing in this increase in profits an opportunity to increase the equity dividend.

★

In the Business Note "Ice-Cream and Cinema Profits" in *The Economist* of February 6th, Messrs H. E. Browning and A. E. Sorrell of the Board of Trade were quoted as suggesting, in a paper to the Royal Statistical Society, that the cinema exhibitors in Britain, as a group, might have been able from film revenues to cover all costs "except the payment of rent." In fact, they had calculated that revenues would have been sufficient to cover not only the cinemas' operating costs, but also an allowance for operating profits of some 10 per cent of gross takings, a percentage that had been suggested by the 1952 report on Entertainment Duty of the Cinema Exhibitors' Association.

★

Marks and Spencer caused a flutter in the markets this week when its directors announced the second 100 per cent share bonus in the last two years. The company intends to issue one fully paid 5s. "A" ordinary share for every ordinary and "A" ordinary share in issue; at the moment the company has in issue £600,000 of ordinary shares and £3,932,492 of "A" ordinary shares, which have no votes. After the announcement the "A" shares made a net gain of 2s. 3d. to 8s. 6d.

Company Notes

BRITISH-AMERICAN TOBACCO. Of all company accounts those of British-American Tobacco, trading all across the world, must be one of the most difficult to prepare. Fluctuating exchange rates and the blocking of profit remittances must stretch accounting techniques for consolidation to the limit. The same facts pose for the shareholder the most difficult questions of interpretation. It would be a bold shareholder who could set a figure on the amount of the group's profits available for distribution—and his guess would probably be wrong.

The buyer of the BAT equity is therefore doing more than taking a stake along with Imperial Tobacco in the export trade. He is expressing belief that the directors will be as generous as they can when occasion serves. He must hope that a freeing of exchange controls will ultimately allow the directors to pursue a dividend policy that will bring

Perhaps because world-wide inflation has been damped down, the directors show less concern than formerly with the real cost of replacing assets and stocks, but they still state that sufficient profits have been appropriated to replacement reserves to maintain the "real capital of each company in the group," but the actual amounts appropriated have been reduced. From net profits, which have risen in line with the reduction in British taxation, the parent company has reduced its transfer to replacement reserves from £800,000 to £550,000, and its subsidiaries have reduced their appropriations from £4,500,000 to £1,800,000. Altogether subsidiaries appear to have retained £14,564,000, compared with £13,337,012 in 1951-52. A good part of these retentions may be the involuntary retention of profits impossible to remit through the tangle of exchange controls.

A further headache for the directors is the fluctuation in exchange rates. As a result of changes in the rates applicable to the conversion to sterling (for the purposes of consolidation) of the current assets and liabilities of certain overseas subsidiaries, the holding company has had to charge a "net resulting difference on exchange of £4,326,000" against devaluation reserve, which has thus been reduced to £6,704,000. In earlier years the company charged these exchange differences against trading profits but in 1952 these differences were negligible. In valuing the BAT equity, investors should note that this and similar perils are the lot of the international trading company.

* Transferred to stock and fixed assets replacement reserves.

the market valuation of the equity closer in line with the true value of the group's assets. Last year's share bonus, and the latest increase in equity payments, show that the directors are aware of the confidence thus placed in them. For the year to September 30th last they have declared a tax-free ordinary dividend of 12½ per cent, compared with an equivalent rate on the new capital of 10 5/6 per cent, tax free. In addition they have declared a tax free interim dividend for 1953-54 of 4 1/6 per cent, compared with 3½ per cent, tax free, the year before; but this rise in interim payments is designed merely to even out dividend payments over the current year.

The increase in dividends, which was in line with market forecasts, follows a year in which at worst the group maintained its share of world markets. Its trading profits are almost unchanged at just over £42 million, which suggests, in view of the rise in the cost of leaf tobacco and other costs, that the group added to the volume of its trade. Profits are struck after transferring to replacement reserves the devaluation surplus on the group's stock of dollar leaf tobacco; this surplus has fallen from £1,047,243 to £598,000, a natural consequence of the exhaustion of stocks purchased before devaluation.

liminary report. The preliminary figures discussed in these columns last week, revealed that trading profits, before all charges, had risen from £7,346,028 to £9,192,364, and that the equity dividend was to go up from 15 to 16 per cent.

The full report details even more impressive achievements.

The net book value of the group's fixed assets have risen by over £10 million to nearly £31 million and its total assets have risen by over £11 million to £66 million. By far the greatest part of this increase comes from the expenditure on the new mills in Tennessee; in the balance sheet "expenditure on mills and timberlands in the United States" is entered at £10,950,328, compared with £1,760,895 the year before. But another, though much smaller, part of the increase in fixed assets springs from capital expenditure to increase production in the group's plants in Britain, Canada and Scandinavia. The reduction of over £2 million in the group's stocks looks like small beer when set against those figures, but it does at least indicate how much easier it is for the group to operate now that raw material prices are more stable.

Stocks can be financed by short-term loans from the banks, but, now that the emphasis is much more on fixed capital expansion than on working capital commitments, a change in the group's financing technique has become discernable. It is beginning to rely more and more on long-term loans. It is no accident that, while bank overdrafts and acceptances have fallen from £7,905,313 to £4,620,995, secured and unsecured loan capital has risen from £13 million to nearly £25 million.

The group's development programme suggests high confidence in the long-term demand for newsprint and other papers. And this confidence is echoed in the directors' comments on more immediate prospects. Their paper mills in this country returned to full capacity working at the beginning of 1953 and they still continue to operate "on that basis and with full order books." In Canada, too, the group's mills operated at full capacity, but the adverse exchange rates between the Canadian and United States dollar, the further rise in costs, and the lower price of sulphite pulp, led to a fall in earnings. Speaking more generally, the directors remark that production at the mills both at home and abroad, including the new mills in the United States, has been sold for "some long time ahead, mostly under long-term contracts." Their confidence in the future is based on these forward sales and to the greater stability in the prices both of the group's raw materials and its finished products. Thus Bowater's equity can still be reckoned among the "growth" stocks.

ENGLISH ELECTRIC. An illustrated brochure from English Electric sketches out the industrial background against which the group's trading profits last year rose from £5,948,403 to £6,489,863. The full accounts by filling in the financial details help to explain why the directors decided, as was noted in these columns a week ago, to leave the equity dividend effectively unchanged. The principal reason, of course, is that this dividend is now servicing a capital enlarged not merely by the book-keeping transaction of a bonus issue but also by

a "rights" issue of new shares so that the higher earnings come from more money actually employed.

The consolidated balance sheet provides additional reasons for the dividend decision. It shows such an expansion in fixed and working capital that it seems inevitable (though not necessarily praiseworthy) that the directors should continue to rely on the modern policy of ploughing back profits. The net book value of the group's fixed assets have increased from £10,314,812 to £13,274,364, an increase that reflects not

* This rate is equivalent to the 15 per cent paid in 1952, before the capital was increased by the £1,769,365 rights issue and the £3,538,731 bonus issue.

only the progress of the development programme in this country but also the purchase of a controlling interest in Canadian Marconi last August. The development programme is by no means at an end, for outstanding contracts for capital expenditure are estimated at £3,499,285, compared with £2,377,600 in 1952.

That a rise in turnover has gone hand in hand with these developments is made evident by the rise in profits and by the increases in debtors and in stocks and work in progress. Before payments received on account have been deducted, the book

value of stocks has risen from £46,233,332 to £51,862,380, and after the deduction of these progress payments it has risen from £28,146,589 to £29,147,193. Last year's issues of equity shares and loan stocks has led to some improvement in the group's liquid resources; its bank overdrafts, for instance, have fallen from £10,745,771 to £9,223,604. Yet such is the rate of development that the group is still short of cash.

MONSANTO CHEMICALS.

The profits of the Monsanto Chemicals—the British subsidiary of an American parent—have made a brisk recovery from the 1952 recession, but they still fall short of the 1951 figures. The equity dividend has been stepped up, from 18½ per cent to 20 per cent, in line with this recovery, but this dividend also falls short of the rate of 22½ per cent paid in 1951. Last year, the sales of the British parent company rose by 9 per cent, from £9,954,289 to £10,852,854, and the trading profits of the British group as a whole rose from £1,476,400 to £2,354,084. This profit should be compared with that of £2,889,330 earned in the boom of 1951.

The increase in profits is ascribed to bigger sales, increased efficiency (presumably reflected in smaller manufacturing costs) and to a fall in the price of some raw materials (though, again, presumably not in the price of all of them). Much of the recovery in profits must have taken place in the last six months of the year for the half yearly report (to June 30th last) showed that net income before tax was only £488,886, compared with £608,183 in the corresponding period of 1952. But at least some profit margins must be lower than they were in 1951, for some selling prices are down and wages are up. In advance of the full accounts, due in April, the directors report that new construction has been kept in line with the increase in demand; a good part of these developments are being financed by loans from Canadian life assurance companies.

LONDON STOCK EXCHANGE

Next Account begins: March 3rd.
Next Contango Day: March 3rd.
Next Settlement Day: March 9th.

AFTER the initial adjustment to the £30 million issue by ICI, the stock markets began to improve again this week. Gilt-edged stocks were marked down quite sharply after the announcement of the ICI issue, with old Consols losing ½ to 64½, but later in the week prices resumed their advance, so that by the close on Wednesday the earlier losses were almost all wiped out. On that day the new Transport stock rose to a premium (of ¼ of a point) for the first time. In the foreign market German issues made further headway at the beginning of the week and then fell back a little on Wednesday. Perhaps the most active section in this market was Greek issues, which made a strong advance at first on the news that a Greek representative had arrived in this country to discuss a debt settlement.

Equities remained in demand this week, and by the close on Wednesday the *Financial Times* ordinary share index had risen to 137.4, compared with 136.2 a week earlier. Electrical equipment and aircraft shares were prominent; breweries also gained some ground following announcements of higher dividends. ICI were marked down at first on the news of the higher dividend and the new issue, but quickly more than recovered this lost ground. Marks and Spencer more than recovered earlier losses when the share bonus was announced. Harrods and other store shares improved on the news of Harrods' bigger dividend. "Bats," on the other hand, were marked up immediately after the news of the bigger dividend, but after a heavy bout of profit taking more than lost the ground that had been gained. Other tobacco shares also weakened.

A further improvement in oil shares was reported on Monday, when Anglo-Iranian touched 9½, but this advance was soon checked when profits were taken. Tea shares advanced all along the line in response to the rise in prices at the tea auctions. Kaffirs were in demand at the beginning of the week, but prices began to drift lower on Wednesday.

Financial Statistics

EXCHEQUER RETURNS

For the week ended February 20th, there was an "above-line" deficit (after allowing for Sinking Funds) of £37,898,000 compared with a surplus of £58,597,000 in the previous week and a deficit of £13,328,000 in the corresponding period of last year bringing the cumulative surplus to £172,961,000 (£160,128,000 in 1952-53). Net expenditure "below-line" absorbed £8,893,000 which brought the total cumulative deficit to £186,933,000 (£348,234,000 in 1952-53).

* In consequence of official purchases of tender bills in connection with cash subscriptions to the Exchequer Stock issued in October, it was impossible to calculate the division between tap and tender bills until all the bills purchased had passed their original maturity date.

THE MONEY MARKET

CREDIT continued in keen demand in Lombard Street in the week covered by the Bank Return. Market supplies were adequate only on Thursday before the week-end; throughout the rest of the week the authorities made special purchases of bills, nearly all of them indirectly through the banks. On Friday the official help was given just as a number of houses were about to seek relief at the penal rate; and on Monday it reached considerable proportions. Throughout the week April and early May maturities changed hands at 2½ per cent.

At last week's Treasury bill tender the market maintained its bid at £99 9s. 8d. for the second week in succession. The offer had been raised by £10 million to £240 million, but as applications rose by £29 million to a record level of £398.9 million, the market's allotment fell from 58 to 45 per cent. At yesterday's tender the offer was again raised by £10 million, to £250 million; apparent maturities next week will rise correspondingly, so that the excess of new bills will remain at £10 million.

The Bank return shows a further outflow of notes of £2.3 million; this brings the outflow since the end-January low point to £12.7 million, against £15.8 million in the corresponding four weeks of 1953. Government securities rose by £5.6 million, but other securities held in the banking department fell fractionally on balance. Bankers' deposits rose by £3 million to £284 million.

COMPANY MEETINGS

THE IMPERIAL TOBACCO COMPANY (OF GREAT BRITAIN AND IRELAND), LIMITED

ANNUAL REPORT AND ACCOUNTS

SIR ROBERT SINCLAIR'S REVIEW

The fifty-second annual general meeting of The Imperial Tobacco Company (of Great Britain and Ireland), Limited, will be held on March 23rd in Bristol.

The following is the statement by the chairman, Sir Robert Sinclair, KCB, KBE, which has been circulated to stockholders with the report and accounts for the year ended October 31, 1953:

I will first refer to that paragraph in the report which under the heading of Directorate records two changes in our board—the resignation of Mr H. S. Burn and the appointment of Mr P. G. Cardew.

Before joining the company in 1925 Mr Burn had had a wide experience in mechanical and civil engineering, and I would like to pay a warm tribute to the great contribution which his technical knowledge, ability, and energy made to the improvement of our buildings and plant during the 23 years he served as our chief engineer. He has, moreover, been a most valuable member of our board since 1938. It is a matter of regret to us all that the time for his retirement from the board has come.

Mr Cardew has for some years past been concerned with the management of our large printing and box-making subsidiary, Mardon, Son and Hall, Limited, and two years ago became its chairman: his ability and his experience of that side of the group's operations will be of great advantage to our board.

The outstanding features of the accounts may, I think, be briefly summarised as follows. The trading profit of the parent company is virtually unchanged from last year; income from dividends and investments is slightly more; and owing mainly to the reduced provision for taxation the net profit after taxation shows an increase of £395,000. The consolidated trading profit shows an increase of £774,000, and the consolidated net profit after taxation an increase of £893,000. The parent company's stock-in-trade is up by £3,682,000; that of the group by rather less. Apart from the amount for future income tax and the small balance carried forward in profit and loss account, the addition to the reserves of the group out of this year's profits amounts to £3,260,000, which includes £2,796,000 for the parent company. With the final ordinary dividend now proposed, the distribution to stockholders before tax will be maintained at the same level as last year.

I would now like to elaborate on some of these points.

TRADING PROFIT

As I suggested a year ago might be the case, the parent company has maintained its trading profit. No one, I think, would dispute that the tobacco trade, beset as it has been by an inordinately high rate of duty, by considerable increases in costs, and by recurrent scarcity of leaf supplies, has had its fair share of trading difficulties in these postwar years—some would say more than its fair share. The year under review saw no real lessening of those difficulties; and in all the circumstances the trading results now before you may be considered satisfactory.

The volume of our cigarette and tobacco trade was well maintained throughout the year. Indeed, the demand for some of our leading brands continued to exceed the supplies that we were able to make available on the basis of our restricted stocks of tobacco. This evidence of the goodwill attaching to the company's products leads me to pay tribute to our manufacturing branches for their continuous efforts to maintain the quality of their goods at the highest possible level while at the same time pursuing every means of securing greater efficiency of production.

SUBSIDIARY COMPANIES

Our principal subsidiary companies are engaged in the production of carton and other boards, cigarette paper and fine tissues, packaging and printing. Although their primary function is to supply the requirements of the company's tobacco and cigarette manufacturing branches, they also have an extensive and growing trade outside the group. Fluctuations in raw material prices substantially affected their profits in 1951 and 1952—in 1951 favourably, in 1952 adversely. During the year now under review raw material prices in the paper and board industry were on a more stable basis: in the result the subsidiary companies' trading profits—though naturally well below the 1951 level—show in the aggregate an appreciable increase over 1952, and are, in fact, very close to those achieved in 1950.

Note 3 (b) on the accounts refers to the acquisition by a subsidiary company of a substantial interest in a printing business trading abroad. The subsidiary concerned is Mardon, Son and Hall, Limited, and the overseas business in which they have acquired an interest is that of Lawson and Jones, Limited, who have a large and progressive printing business in Canada. The consent of the Exchange Control authorities was obtained. Having regard to the great potentialities for expansion in the Canadian economy, this investment should prove a valuable asset to the Mardon Company.

The directors' report refers to the acquisition during the year of the share capital of J. and H. Wilson, Limited, of Sheffield. This is an old-established business whose brands of snuff have for many years past been held in high repute. The business will continue to operate in Sheffield.

STOCK-IN-TRADE

The value of the parent company's stock-in-trade shows an increase of £3,682,000. Our purchases of leaf tobacco during the year slightly exceeded our usings, so that our bonded leaf stocks at the end of the year stood slightly above the low level to which they had fallen a year earlier. Leaf prices in most of the world markets unfortunately showed a further increase in 1953, and this contributed to the rise in stock values. The combined effect of these factors would have been even greater but for the fact that in the more stable conditions that prevailed we reduced our inventories of packing materials and stores, and also had rather smaller factory stocks of duty paid manufactured tobacco at

October 31st last than on the corresponding date a year earlier.

I referred a year ago to the fact that we had had to curtail our purchases in America very substantially because of lack of dollars and in some of the sterling area countries because of short crops. The result was that by the middle of 1953 our stocks were very close to the minimum on which we can maintain our trade. Unfortunately, Southern Rhodesia, which is the principal sterling area source of flue-cured tobacco, once again suffered from unfavourable weather and we were not able to buy there as much as we had hoped, but our purchases in America were rather greater than the abnormally small purchase of the previous year. Moreover, late in the 1953 season—too late for this to be reflected in the accounts before you—we were able to buy for sterling, under the provisions of the USA Mutual Security Act relating to surplus agricultural commodities, some further supplies of American tobacco. This is a very welcome addition to our depleted stocks, and gives us a slight insurance against further crop failures.

We have, and have had for many years, our own leaf buying organisation and a number of redrying plants in the USA and Canada. In these days of dollar shortage, when the need to secure the best possible value in our leaf purchases is in a sense doubly important, the high degree of efficiency attained by that organisation is one of our greatest assets.

The extra purchase of USA tobacco for sterling to which I have referred will in no way affect this country's purchases of Commonwealth tobacco, and assurances to this effect have been given to the principal producing countries within the Commonwealth. A delegation of the Southern Rhodesian growers recently visited this country for discussions with the leading manufacturers on their purchasing programme. These discussions were helpful to both sides, and served to illustrate the value of regular consultation between manufacturers and the representatives of the growers in the principal producing areas. I am very glad to say that so far the prospects for this year's crops in the Rhodesias and Nyasaland encourage hopes that it may be possible to buy larger quantities of suitable tobacco than were obtainable from the 1953 crops.

By virtue of our greatly extended leaf handling factories and timber estates in Southern Rhodesia and Nyasaland we have a considerable stake in the future of Central Africa. It is therefore perhaps not out of place for me to say how glad we were to see the successful establishment of Federation, which, under the wise and able leadership of Sir Godfrey Huggins, will surely make a good start in its task of bringing economic strength and stability and steady development to the three Central African territories.

CAPITAL AND RESERVES

I have stated before that unless we could be assured of a long period of lower prices, we must aim to transfer from revenue to reserve probably at least £2-£3 million each year to assist in meeting the replacement cost liability and our considerable needs of finance. There is no sign yet of any recession in the

general level of prices, and our leaf stocks next year will require still more finance. Your directors have therefore transferred to general reserve £2,796,000 out of the parent company's profits, £733,000 no longer needed as a provision for excess profits tax and the £471,000 over-provided for income tax in last year's accounts (arising from the subsequent reduction of 6d. in the standard rate). The combined addition to the parent company's general reserve this year is accordingly £4 million. The aggregate addition to the group's reserves (apart from reserves for future income tax) is approximately £4,600,000. This is a large sum but about one quarter of it derives from amounts provided in past years for taxation, and I have no doubt of the wisdom of making this provision.

The balance sheet discloses an increase in our short-term indebtedness, the parent company's bank overdraft being nearly £2 million higher than at October 31, 1952. At the latter date, however, our borrowings were reduced because of the relatively small leaf purchases that we were able to make in 1952, and the increase at October 31, 1953, is more than accounted for by the fact that we were able during the year slightly to strengthen our stock position. From what I have said earlier about stock-in-trade you will see that there may well be a further increase in our borrowings during the current year. The financing of the operations of a company such as ours—with a turnover close to £600 million a year—is in present conditions of taxation a considerable problem; and I use the term "present conditions of taxation" to cover the tobacco duty, income tax and profits tax. I will refer later to the question of tobacco duty. As regards income tax, we in common with other industrial concerns were thankful for the limited relief that the Chancellor of the Exchequer felt able to give in his last budget. Even with this relief, however, our charge for United Kingdom income tax and profits tax amounts to £12,750,000. And it is still the case that British industry is severely handicapped in the maintenance and improvement of its assets by the great burden of national taxation. Yet it is upon those assets—the factories and shipyards and mills and all the stocks of raw and finished materials they require—that the prosperity of the country and the employment of the people largely depend. This simple truth bears constant repetition if only because of the apparently widespread belief that industry can continue indefinitely to provide these enormous sums in taxation without any ill effects on our national economy. There is perhaps a wider recognition today that if this country is to survive as a great industrial power we have both to increase our productivity and to keep our costs down. It is less well understood that the greatest single contribution that could be made to the attainment of these objectives would be through a further reduction in the present burden of taxation.

DIVIDENDS AND THEIR REAL VALUE

It is true of this company, as of many others, that it has not yet been able under existing taxation to set aside by transfers to reserve from profits enough to meet the replacement cost liability and to finance the more expensive stocks required to maintain its business. It is also true that while there has recently been some rise in dividend distribution generally, though not in this company, the real value of the total amount of dividends distributed is appreciably less than it was before the war. (There are, no doubt, exceptions to this general statement but as a general statement it is true.) By real value I simply mean the value as adjusted by the reduced purchasing power of the £. I will not here go into elaborate calculations, but content myself with saying that the official estimates of the national income show that

between 1938 and 1952 gross interest and dividends of companies and public corporations increased by about 60 per cent, while retail prices over the same period increased by about 120 per cent. This means that the real value of gross dividends and interest in 1952 was at least 25 per cent lower than in 1938. If tax is taken into account the real value of net dividends and interest in 1952 was only about half the 1938 value. The aggregate of dividends and interest in 1953 is not yet known: it was probably higher than in 1952 but certainly not to an extent that would materially affect the validity of the general comparison I have drawn.

The figures which I quote are of course national figures. There must be considerable variations between different companies and different industries; in our case, through circumstances of which you are well aware, restrictions of leaf supplies and a very high rate of duty have severely limited our possibilities for expansion since war began. Our gross dividends have been in recent years slightly less than they were before the war; after tax they have been appreciably less.

The picture that I am here endeavouring to present to you is that taxation has prevented many industrial companies from making adequate provision from their own resources for the higher cost of replacement of fixed assets and for the additional finance needed to carry more expensive stocks, and that in general the value of the dividends distributed in terms of purchasing power is very much less than it was before the war.

If such facts and figures were more widely understood—and a recent statement by the Chancellor of the Exchequer in the House of Commons and the speech of Lord Balfour of Burleigh at the annual meeting of Lloyds Bank both gave most welcome publicity to the point—we should have less complaint of so-called high profits and large dividend distributions. There are, as I see it, no grounds for the suggestion that, looked at in terms of encouragement to saving or a reasonable return on risk capital, dividends in general are too high.

GIFT TO EMPLOYEES

As will be seen from the report, the directors have again decided to recognise loyal and efficient service by making a gift to employees over and above their ordinary salary or wage. The conditions of the gift are unchanged. It is paid as a percentage on total salary or wage received during the year ended October 31, 1953. This year the rate will again be 13 per cent. The directors reserve to themselves a discretion to grant or withhold a share in the gift in any case that may appear to them to require exceptional treatment.

A gift of this character has been paid to employees for many years now. In some years the rate has been higher than in others, and of course regard must be had to movements in wages and salaries and to the company's general prosperity. I have always regarded the gift as a mark of special recognition of the part that the employees play in the whole field of the company's operations, and I believe that it has helped in no small measure to strengthen the good relations that have existed for so long among all ranks in the company's employ.

SMOKING AND HEALTH

Turning now to more general matters—I referred in my statement last year to the suggestion of a possible relationship between smoking and cancer of the lung that had been made on the basis of certain statistical enquiries. As many stockholders will have seen from the Press, the Minister of Health has recently made public a report on this subject submitted to him by his Standing Advisory Committee. We and other leading tobacco

manufacturers felt it necessary at once to issue a statement outlining the position as we see it. The main points of the manufacturers' statement were that a statistical relationship, even if established beyond all doubt, could not do more than indicate one of the lines to be further investigated; that there is no proof that smoking is a cause of this disease; and that there are a number of facts which point to a contrary conclusion and which cannot be ignored—such facts as that the disease occurs among non-smokers; that the proportion of smokers who contract it is very small indeed; and so forth. This is very much what I said a year ago. Indeed, nothing whatever in the way of proof in this matter has emerged during the past year.

This leads me to the question of research. The company will of course maintain its own chemical research into the constituents of tobacco and tobacco smoke; we shall continue to keep in the closest touch with all investigations and developments in this country and elsewhere; and, as we have always done, we shall do everything possible to maintain the purity and quality of our products. But tobacco manufacturers cannot themselves undertake medical research. The essential thing is that medical science should discover as soon as possible the true cause or causes of lung cancer. We knew of course that medical authorities have been studying various factors that might possibly contribute to the development of the disease, and towards the end of last year the leading tobacco manufacturers came to the conclusion that it was in the best interests of their companies and their stockholders as well as of the public that they should help in hastening medical research into this particular problem. We therefore jointly decided to establish a fund of £250,000 in aid of research into the cause of lung cancer, and to put that fund at the disposal of an impartial body such as the Medical Research Council to be used in whatever ways seemed to them to be best for the purpose.

I recognise the public concern that may have been caused by some of the recent statements. I also recognise our responsibility. It is with full regard to that responsibility that I feel bound firstly to emphasise that there is no proof that smoking is a cause of lung cancer, and secondly to say that in relation to the present state of scientific knowledge there has been much exaggerated comment about this matter—comment that has appeared to ignore the very important reservations contained in the official statements.

DISTRIBUTION

Before I conclude this review I should like to refer to some of the problems of distribution that have fallen to our lot in recent years. During virtually the whole of the postwar period we have been in the position—because of restricted leaf supplies—of not being able fully to meet the public demand for some of our most popular brands. This has meant that we have had to maintain a system of rationing supplies of these brands to our trade customers throughout the country. You may imagine what an immense task this has been, and how thankless it must often seem. In the conditions that I have described, and in spite of all the efforts we may make, some degree of maldistribution is unavoidable; and this accounts for the fact that supplies of our brands may at times be harder to come by in some localities than in others. Our branches have taken an infinity of pains to try to distribute their available supplies as fairly as possible in the light of population changes and other factors, but so long as the present situation holds they cannot hope to satisfy all the many appeals for additional supplies that are made to them. We do, of course, get our quota of grumbles, but I am sure that the great majority of distributors—and I hope that this is true also of the

many millions of consumers of our products—understand our difficulties and recognise that we have done our utmost to deal fairly with these problems.

THE OUTLOOK

There are three main factors to consider—the availability of leaf tobacco supplies, the trend of costs, and the demand for our products.

As regards leaf tobacco supplies, with the limited but very welcome improvement in the country's gold and dollar reserves it does not seem unreasonable to anticipate that we can purchase at least a year's requirements of dollar tobacco at the 1954 crop auctions. Similarly, we hope that the crops in Central Africa and the other sterling area sources will be such that we can make an adequate purchase this year. I have, therefore, some reasons to think that in a year's time our leaf stock position may be a little better than it has recently been.

The picture as regards costs is less encouraging. The cost of leaf tobacco, as already indicated, has risen further, and so have wages and various other charges. We shall do our best to offset these extra costs by progressive improvements in manufacturing efficiency, and we shall certainly not have recourse to any increase in price to the public unless and until this is absolutely imperative.

Demand for the company's brands, as I have said, has been well maintained. Their reputation today, I believe, stands as high as ever, and we shall continue to do everything in our power to maintain it.

Taking a broad view of all these factors, I would hope that the current year's trading will show results not very different from those now before you, although we cannot expect an increase in profits and we cannot count this year on any advantage by way of previous tax provisions no longer required. I wish that I could encourage hopes of a substantial expansion in our business, but it would not be realistic to do so while the present rate of Tobacco Duty drags so heavily on the industry. I make no apology for again stressing that if the rate of duty is maintained much longer at its present level it must inevitably bring about a contraction of consumption with consequently diminishing returns to the revenue. Consumption of tobacco and cigarettes in this country, as I emphasised in my statement last year, is by no means high compared with the level of consumption in various other countries. But if the present rate of consumption is to be maintained the duty will have to come down; and it will, in my judgment, be to the interests not only of the trade but of the national economy also if a first step in that direction is taken at the earliest practicable time.

GOLD COAST MAIN REEF, LIMITED

The twentieth annual general meeting of Gold Coast Main Reef, Limited, was held on February 24th in London.

Major General W. W. Richards, CB, CBE, MC, chairman of the company, presided, and the following is an extract from his statement circulated with the report and accounts:

The profit for the year ended June 30, 1953, was £81,622. Dividends aggregating 7½ per cent were distributed for the year and an interim payment of 5 per cent has been made in respect of the year ending June 30, 1954.

Full details of the year's operations are contained in the reports from our general manager, Mr Frank Clelland, and our consulting engineers, the West African Gold Corporation, Limited.

The ore reserves at June 30, 1953 (including ore in pillars), were computed at 398,918 tons, averaging 8.64 dwts per ton over a width of 66.4 inches. Ore added to reserve during the year was less by 6,152 tons than the total extracted.

Taxation bears very heavily on our company. Profits tax and income tax for the year absorbed no less than £45,002.

While looking forward with confidence to a continuance of profitable operations for many years to come, we are by no means complacent; and measures have been planned with a view to increasing the productivity of the mine so soon as the present underground development programme matures.

The report and accounts were adopted.

The chairman announced that the second interim dividend for the current year and a first interim dividend in respect of the next year would be declared in the autumn.

SUN LIFE ASSURANCE SOCIETY

RECORD PREMIUM INCOME

MR C. G. RANDOLPH'S STATEMENT

The annual general meeting of the Sun Life Assurance Society will be held at 63 Threadneedle Street, London, E.C.2, on Tuesday, March 23, 1954. Mr C. G. Randolph, chairman of the Society, has issued a statement to shareholders, which in outline is as follows:

FUNDS, INCOME AND OUTGO

During the year the total funds of the Society increased by £6,835,000 and now stand at £95,974,000, of which the Life Assurance Fund accounted for £83,437,000. The life premium income was £12,476,000 and exceeded by more than £750,000 the record figure achieved in 1952.

The gross interest income of the Life Assurance Fund was £3,464,000, representing a gross rate of 4 8s. 3d. per cent, which is an increase of 3s. 7d. per cent above that for the previous year and the highest gross rate obtained on this fund since 1940.

The mortality experience continues to be favourable, and notwithstanding the rapid growth of the business, the claims by death at £2,270,000 were only slightly more than in the previous year and were actually less than the total for 1951.

NEW BUSINESS

The life assurance new business secured during the year consisted of 25,983 policies and sums assured of £39,077,000, all of which was obtained from our connections in the United Kingdom. This large total once again illustrates the important part played by life assurance as a vehicle for national savings.

Our rates of premium for new assurances have been reduced several times since the war to give effect to improving mortality experience and to the higher yields obtainable on new investments. I am glad to be able to inform you that the directors have been able to announce further reductions in recent weeks in the rates for whole life and endowment assurances without participation in profits and these are a reflection of the Society's endeavour to remain highly competitive. Also, substantial reductions have been made in the rates for policies to cover building society mortgages; these policies provide that if the death of the borrower should occur during the currency of the mortgage, a sum assured

sufficient to repay the outstanding balance shall be payable.

HOUSE PURCHASE

The Society has for many years regarded house purchase loans as a highly satisfactory outlet for part of its rapidly growing funds and has by this means, we believe, contributed towards solving the housing problem. Our house purchase scheme ensures the automatic repayment of the loan in the event of the death of the borrower and attractive terms are offered.

PENSION SCHEMES

We have again been very successful in arranging pension schemes, of both the endowment assurance and the group pension types, for companies of various sizes and in many branches of industry. Our specialised staff with the experience which has been accumulated over many years is able to give clients the best possible advice and service and to ensure that the schemes are drawn up in such a manner as will enable the tax advantages allowable to be secured.

GENEROUS TERMS OF SELECTION

It is over 50 years since the Society introduced the system of life assurance without medical examination, and we are able to offer assurances under this plan at the ordinary rates of premium and on the same terms as for assurances with medical examination, so that completion of business can be effected with the least inconvenience to the public and with freedom from irritating delays.

The Society has a reputation, which we believe to be well deserved, for offering generous terms for assurances on the lives of persons who are under average from the medical standpoint. This factor has for long been of particular importance to individual proposers for life assurance; it is the more so today to employers who wish to arrange pension schemes and who are naturally concerned to ensure that so far as possible all members of their staff who join the scheme shall have the benefit of the life assurance cover.

BONUS RATES

It is hardly necessary to point out that the improvement in the rate of interest earned on the funds, the continued favourable mortality experience and the reduction in the expense ratio have a most important bearing on the profit-earning capacity of the Society. These encouraging features have made it possible to increase substantially the rates of interim bonus in respect of "with profit" policies becoming claims by death or maturity, or terminating by surrender, after December 31st last.

INVESTMENTS

I am glad to be able to state that the market value of our stock exchange investments as at December 31st last substantially exceeded their balance-sheet value, after allowing for the investment reserve fund. The principal increases in the assets set forth in the balance sheet are £2 million in mortgages, mainly due to house purchase loans less repayments, £2 million in British Government guaranteed securities, £2½ million in debentures and £1 million in ordinary shares.

TRIBUTE TO STAFF

The figures that are presented really speak for themselves, but I should like to pay tribute once again to your staff, who, from the general manager downwards, are indeed to be congratulated and thanked for their loyalty and service to your Society during the last year.

CO-OPERATIVE PERMANENT BUILDING SOCIETY

A YEAR OF GREAT PROGRESS

The seventieth annual general meeting of the Co-operative Permanent Building Society was held on February 20th at the Conway Hall, London.

The President, Mr Harry L. Score, in the course of his address, said:

IMPROVEMENT IN SAVINGS

In the course of my address 12 months ago I ventured to suggest that the people of Britain were not quite so thrifty as was sometimes made out, and that there was evidence of substantial saving, as well as evidence that the net increase in savings would grow in volume. In the intervening months events and opinions have confirmed that view. Economists and financial writers have discerned a slight overall improvement in the savings position; the National Savings Movement has fared somewhat better and sees grounds for greater confidence in the situation; and certainly building societies have received more savings and investments than in 1952, whilst at the same time withdrawals have remained remarkably stable. In our own case share subscriptions exceeded £19 million, and our share balances increased by £13 million to stand at more than £70 million at the close of the year. There was a fall in deposit balances of £1,760,000.

The increased flow of savings to the society, coupled with the regular repayment of mortgages, made it possible for us to undertake a large programme of home financing. Mortgage advances exceeded £19 million, and I am happy to assure you that from the security point of view no undue risks were taken, nor was any intending borrower encouraged to take on commitments beyond his means. Such was the demand for loans that had the funds been available the society could safely have made advances of a very much larger amount. It will be seen from the accounts that of the loans made over 14,000 were for amounts not exceeding £2,000. The overall average of all mortgage advances made was little more than £1,200, and bearing in mind present-day house property prices these figures indicate how well spread and how little is the risk.

INCREASED TURNOVER AND MEMBERSHIP

Members will observe that on December 31st investments in British Government and Municipal securities, all of which are repayable at fixed dates, possessed a market value of £239,000 in excess of the book value. The total revenue for the year was £3,596,000. The sum of £639,000 was absorbed by management expenses, £199,000 by interest on deposits and loans, and £930,000 by income tax and profits tax. The balance carried down, together with the amount brought forward and the profit on investments realised, amounts to £1,858,000. After crediting interest to shareholders at the rate of 2½ per cent per annum, there remains £340,000, of which £95,000 has been appropriated to the general reserve (Account No. 7), which brings this reserve to more than £3 million. £59,000 is appropriated to the mortgage reserve account, and the sum of £185,000 is carried forward—an increase of £50,000 over the amount brought forward from last year. As will be seen from the summarised figures in the balance sheet, the three reserve accounts, together with the

balance carried forward, now amount to £3,400,000. The total assets, at £86,674,000, show an increase of nearly £12 million on the year. It is perhaps worth noting that the total funds of the society have doubled since 1946. It is also gratifying to observe that since that date our membership has increased considerably, the number having risen from 184,000 to 294,000.

TIME FOR SUBSTANTIAL REDUCTION IN SUBSIDIES

In the first place, every penny that goes into building societies for use in financing house purchase is relieving the Government of the necessity of providing capital monies for local authorities to build houses for letting or to make loans to purchasers under the Small Dwellings Acquisition Acts. It is therefore not surprising that the chairman of the National Savings Committee, Lord Mackintosh of Halifax, should have said recently that he did not regret withdrawals of national savings which were reinvested in building societies to enable someone to put down the deposit to enable them to buy their own house.

Not only does an increase in the number of houses built for owner-occupation reduce the Government's capital commitments, but, as is by now well known, there is also a considerable economy in housing subsidies. It is not always appreciated, however, just how big those subsidies can be, especially in our large cities. The subsidy of a single dwelling house is now £35 12s. per annum for 60 years, but where flats are built on expensive sites the annual grant is considerably more. Where, as happens in the London region, flats are erected on land valued at about £10,000 per acre, the annual subsidy amounts to £96 19s. per annum for each flat and on more expensive sites the subsidies may amount to as much as £120 7s. per annum. If I can put it another way, it is that a flat in a block with lifts, on land at £10,000 an acre, draws a subsidy equal to a capital value of £2,094.

Altogether some 250,000 houses and flats were built by local authorities during 1953. In respect of each of these dwellings the taxpayer and the ratepayer were committed to at least £35 a year for each of the next 60 years. For whose benefit are these sums applied? The truth is that they are applied indiscriminately, and irrespective of financial need, to those to whom local authority dwellings are allotted. When slum clearance and overcrowding were being tackled prior to 1939 subsidies were confined to the replacement housing of people who could not afford to pay economic rents. There was general acceptance of that position. It was considered just that the man earning £1,000 a year should make some contribution through taxation and rating towards the housing of the lower-paid weekly wage earner. We have now reached the curious position (which no political party can seriously defend) where the lower-paid weekly wage earner is not infrequently helping (through rate charges and indirect taxation) to pay the rent of someone receiving £1,000, £1,500 or, in isolated cases, as much as £3,000 per annum. Strong feeling is being expressed in particular about the increasing rates burden.

In 1938 the number of houses ranking for subsidies was less than 100,000 per annum. The time has now come to face this problem

of costs far more resolutely than has been done up to now. The solution is to encourage home-ownership to a point where at least 200,000 houses per annum are being built for owner-occupiers.

NEED FOR LOW DEPOSITS

It is encouraging to learn that efforts are now being made by the government to stimulate more home-ownership, and to make it possible, by guarantees, for building societies to lend larger proportions and thus enable people with small amounts of capital to buy their houses.

It is perhaps not generally appreciated that one of the many changes which have resulted from full employment is that people are marrying much earlier than they did prior to 1939. In 1938 the number of men in England and Wales marrying between the ages of 21 and 24 was 106,000. The number of those marrying between the ages of 25 and 29 was 138,000. Today, these numbers are almost reversed, 131,000 marrying between 21 and 24 in 1951, and 102,000 between the ages of 25 and 29. The number of women marrying under 21 was 59,000 in 1938, and had risen to the very high figure of 92,000 by 1951. These figures clearly denote the change. They are significant from the point of view of encouraging home-ownership, because although regular employment (and therefore regular wages) encourages marriage at an earlier date, young couples have less time in which to save the capital necessary both to furnish a home and to put down the deposit needed. Nevertheless, there was probably never a time when young people could be encouraged with greater confidence to buy their homes than today. If this were not so, social security would be meaningless. Building societies have been pleasantly surprised in the post-war years by the number of people who have been able to put down deposits for house purchase of amounts varying between 10 per cent and 25 per cent of a present-day purchase price, and as I have already said earlier in my address there is no lack of applicants coming forward at the present time. But we must endeavour to keep the situation in perspective. In 1953, according to the Ministry figures, some 60,000 houses were built for sale. I am suggesting that roughly four times that number should be sold each year. That means that smaller deposits must be required and a scheme to enable loans of up to 95 per cent to be made will be welcomed by this and many other societies.

MR CHARLES RUNCORN'S SPEECH

In seconding the president's resolution, Mr Charles Runcorn said:

Twenty years ago the assets of the society were approximately £17 million. Today they are £87 million, an increase of £70 million. In other words, a five-fold expansion since February 13, 1934.

The reserves 20 years ago totalled £501,000. Today they amount to more than £3,400,000. Thus in spite of high taxation during the past 12 years or more, the reserves are almost seven times greater than they were.

I feel sure you will all agree that the comparative figures are both remarkable and impressive and indicate the extraordinary progress and development of the Society.

The report and accounts were adopted.

INDIA RUBBER GUTTA PERCHA AND TELEGRAPH WORKS

CURRENT TRADING IMPROVEMENT

The twentieth annual general meeting of The India Rubber Gutta Percha and Telegraph Works Company, Limited, will be held on March 18th in London.

The following is an extract from the circulated statement of the chairman, Sir Eric C. Mievile, GCIE, KCVO, CSI, CMG:

In my statement last year, I indicated that the then prevailing adverse business conditions in both the domestic and overseas markets were likely to result in a contraction of our turnover and, consequently, less favourable profits in the current year's trading. Such has proved to be the case. The contraction, which resulted from progressive reductions in the selling prices of many of our products following the fall in the cost of our basic raw materials, together with a decrease in volume demand, continued throughout most of the year. The recession in trade, which was felt in many industries, has at the moment been halted and there is now increased demand for your company's products. Wage rates in our industry have, however, recently been increased, and labour costs are a large factor in some of our more specialised lines.

The profits of the year were adversely affected not only by the lower turnover, but by very keen competition, particularly in the export field. This can be met only by producing goods of the highest quality at the lowest possible cost, and our activities are constantly directed towards achieving this objective.

The profit for the year, before taxation, was £216,572, as against £357,019 in 1951-52—a fall of 39 per cent. If we recall that the profits for the years 1950-51 and 1951-52 were, in many ways, exceptional, due to inflationary influences, and look at the average profits for the years 1945-50, about £158,000, the profit of the year under review may be regarded as reasonably satisfactory.

ALLOCATIONS AND DIVIDENDS

UK taxation, at £110,771, is not much more than half the amount required in the previous year. From taxed profits, your directors have allocated £50,000 to general reserve and £50,000 to the reserve for contingencies. The dividends proposed are the same as last year, namely, the fixed dividend of 6 per cent on the preferred ordinary shares, plus an additional 2 per cent and the fixed dividend of 6 per cent on the ordinary shares, plus an additional 3 per cent less income tax. A balance of £222,182 remains to be carried forward, against £210,241 last year. The substantial reserves which have been built up over a period of years have provided your company with strong financial resources, which will be required for the modernisation of plant and equipment now in hand.

In regard to the current year, as I have indicated, conditions already show some improvement. Our sales in the first four months are in advance of those of the same months of 1952-53, and our order book is at present more healthy. The high quality for which the wide range of Silvertown and Palmer specialised products has for so long been justly renowned, continues to be well maintained, and the progress towards increased efficiency and greater productivity, for which we are constantly striving, and the development of new and improved products now in hand, encourage us to face the future with confidence.

BRITISH TYRE & RUBBER COMPANY

ENCOURAGING TURNOVER IMPROVEMENT

The thirtieth annual general meeting of the British Tyre & Rubber Company, Limited, will be held on March 18th at Caxton Hall, London, S.W.

The following is an extract from the statement by the chairman, Sir Graham Hayman, circulated with the report and accounts:

Last year I referred to the changed circumstances and conditions then current which, it was felt, would be likely to affect our turnover and profit margins in 1953 as compared with recent years. From the figures it will be seen that those views were well founded although, as the result of improved turnover in the latter months of the financial year, the decline in earnings was less substantial than anticipated. The improvement in turnover is more encouraging than its effect on the present figures, having regard to the progressive fall in selling prices which occurred throughout the year.

Accordingly the group profit for the year before taxation is £1,485,543, compared with £1,907,235 in the previous year, a decrease of 22 per cent. Reduced taxation resulting from the lower profit and the revised rate of income tax now applicable represents 55½ per cent of the total profit against 61 per cent last year. The directors have allocated £250,000 to general reserve and £200,000 to plant replacement and stock reserve, bringing both these reserves to £1 million. Your board consider that the appropriate course is to maintain the total distribution at last year's level of 22½ per cent by a final dividend of 15 per cent, less income tax.

The closing months of last year established an improved standard of trading, which has been maintained in the current year, and consequently the present outlook may be regarded as rather more favourable than a year ago. The continued pressure of present-day competition, however, with its insistent demand for lower selling prices, not only in the home market but in overseas markets to an even greater degree, must be emphasised. While the current lower cost of our basic materials assist towards meeting these conditions, wage rates in the rubber industry have recently been raised again and the need for greater output per man-hour accordingly becomes more and more essential.

GROWING DEMAND FOR BTR QUALITY PRODUCTS

Last year your company announced a new BTR technical product known as Pluvicor and its use in the construction of BTR multi-ply fire-resistant conveyor belting which had been fully approved by the National Coal Board for use underground. The National Coal Board is now installing belting of this type at an increased rate. Pluvicor is also now being employed in the manufacture of other BTR products. The industrial products division of the group continues to make headway and during the year the technical sales and service sections of this division have been strengthened in step with the growing demands of industry for BTR quality products.

In the opinion of your board, the very diversity of the wide range of products manufactured within the group and the progressive graduation of skilled personnel, together with the substantial financial resources shown by the balance sheet, are factors which provide solid grounds for confidence in the future.

BAJOE KIDOEL RUBBER AND PRODUCE COMPANY, LIMITED

A FINE ACHIEVEMENT

The forty-second annual general meeting of the Bajoe Kidoel Rubber and Produce Company, Limited, was held on February 24th in London.

Sir Eric Miller, the chairman, in the course of his speech, said: We have just received remittances totalling £52,435, being the proportion of earned profits remittable under the present Indonesian Exchange Control Regulations.

The security situation on our East Java estates left much to be desired, yet the rubber crop of 2,433,270 lb was the highest recorded since the estates were acquired in 1911; 146 acres of rubber were planted on Anim Sand and Trebla Sala estates in areas uprooted during the Japanese occupation.

The trades union leaders who have mushroomed in Indonesia, often with definite Communist affiliations, cannot abide contentment among their members and, to justify themselves, stir up many minor disputes which occupy much of the managers' time.

The coffee crop of 318,160 kg was not up to expectations. Theft of ripe berries and drought were contributory factors to this shortfall.

CELEBES ESTATES

On our Celebes Estates the harvesting of a rubber crop of 1,680,906 lb was a particularly fine achievement. The coffee crop of 194,190 kg reflects the adverse weather conditions experienced after the blossoming. The kapok crop, estimated at over 60 tons in its raw form, turned out on manufacture to be only just over 38 tons. A modest replanting programme was continued, and 62 acres were planted with coffee on Halomhissie estate and 77 acres of old coffee on Balangriri estate were interplanted with rubber.

The consolidated trading profit of the subsidiaries at Rp.5,196,000 is not far short of the 1951-52 figure of Rp.5,554,000, despite the sharp fall in the average price of rubber.

The profit of the parent company, after taking credit for the dividends totalling £52,500 from the subsidiary companies, is £53,836 before UK taxation. Under current Exchange Control Regulations in Indonesia, remittances abroad of profits are limited to 40 per cent of the adjusted fiscal profits. The net UK tax provision is £6,276. An amount of £10,000 has been added to the dividend equalisation reserve, making that £50,000, and after charging a small exchange adjustment and allowing for the proposed dividend there remains £60,842 to be carried forward against £44,173 brought in.

The net current assets in the United Kingdom at March 31, 1953, were £200,771, approximately 16s. per £1 stock. After receipt of the remittance and allowing for expenses during the year to date and the proposed dividend the issued stock is now covered £ for £.

THE CURRENT YEAR

On the credit side we have harvested a bumper coffee crop of 951,000 kg. On the other hand, the price of rubber is much lower and our crops are below estimate owing in part to a severe drought and in part to the labour troubles, while costs of production have risen during the year as a result of the award of higher wages and rice subsidy.

The report and accounts were adopted and a dividend of 15 per cent, less tax, was declared.

MANCHESTER SHIP CANAL COMPANY

SIR LESLIE ROBERTS' REVIEW

The ninety-sixth ordinary general meeting of the Manchester Ship Canal Company was held on February 26th at Manchester.

Sir Leslie Roberts, CBE, the chairman, in the course of his speech, said:

The total net revenue was £1,106,247 compared with £1,066,448 in 1952—an increase of £39,799.

To the net revenue figure of £1,106,247 there must be added £19,850 brought forward from the previous year. £145,000 then has to be appropriated for taxation and £586,765 must be deducted for loan and debenture interest. The balance available for dividends and reserve thus amounts to £394,332.

Of this sum £35,000 (as in previous years) has been appropriated to the reserve for contingencies; and it is proposed that out of the balance of £359,332 the following dividends amounting to £331,309 should be paid:

5 per cent on the preference shares
3½ per cent on the ordinary shares
and that £28,023 should be carried forward to next year's account.

Having regard to my remarks last year on the dividend I am sure you will be gratified with this further gradual advance.

Receipts from tolls, ship dues, traffic rentals, towage and sundry receipts exceeded those of the previous year by £214,000. Expenditure, on the other hand, rose by £187,000.

HEAVY DREDGING COSTS

Dredging cost in 1953 the formidable amount of £573,000. During the latter part of the year it became necessary to commence maintenance dredging of the deep channel in the Mersey and this, together with the continued high degree of siltation, accounts for the increase of £182,000.

The balance sheet is the strongest in the history of the undertaking, the balance standing to the credit of the provision and reserve accounts can only be regarded as modest for a company with a capital of over £23 million.

The capital account shows a balance at debit which has been increased by nearly £1,400,000. This was due in the main to expenditure on the construction of the new oil dock at Eastham which is now completed.

You will have been as gratified as your directors by Her Majesty's gracious command that it should be called "Queen Elizabeth II Dock." We are, naturally, all proud of the further distinction thus conferred upon the Port of Manchester, which, as most of you know, was ceremonially opened by Queen Victoria almost exactly sixty years ago.

I told you at the last meeting of the very heavy siltation which during recent years—and it continued unabated throughout 1953—has been taking place in the Mersey and which is thought to be due to some disturbance in the bed of the Irish Sea. This vagary of the processes of nature—which we hope will sooner or later be alleviated—has greatly enlarged our dredging problem and enormously increased our dredging bill. In the years to come I have little doubt that there will be further improvements that will have to be effected, not merely to secure new traffic, but to retain the traffic we already have. All these things need money, and probably new money.

With a total traffic of over a million tons a month, we have at least regained our position as the third port in the United Kingdom. The report was adopted.

CARRERAS, LIMITED

JUBILEE YEAR: PROUD RECORD OF ACHIEVEMENT

The fiftieth annual general meeting of Carreras, Limited, was held on February 25th in London.

Sir Edward Baron (chairman and managing director) in the course of his speech said: At this meeting we formally celebrate the jubilee of the company, which was actually incorporated on June 5, 1903. Much has happened since that date, and we can be very proud of the fact that from small beginnings the company has achieved a position of eminence not only in the tobacco trade, but also in the industrial life of the country.

While the turnover of the parent company during the year showed a considerable increase in volume, costs continued to rise in all directions. In consequence, the parent company's trading profit showed only a small advance, despite the greater volume of production. The same considerations applied to our subsidiary companies and particularly to the Canadian company, which, following the lowering of the duty in the last Canadian Budget, reduced certain of their prices still further in common with the other manufacturers in that country. However, their turnover has shown a considerable advance as a result.

The very success which our introduction of Dunhill cigarettes achieved brought its own special problems, but I am glad to say that these are being surmounted and we have in recent months secured national distribution. We have every confidence that this brand will not only maintain the popularity it has already attained, but will prove in the future to be a valuable addition to our existing brands.

While our production has expanded since the close of our financial year, we have to face a further rise in costs. We still hope for a reduction in the duty on tobacco and I might say that we regard such a step as essential, not only for the sake of the tobacco industry but also for the maintenance of the revenue to which it contributes over £600 million a year, a vast sum without which our national finances would be in jeopardy. I feel that to keep the duty at its present excessive level will, in the near future, have a detrimental effect all round.

As regards our export trade, we are holding our own very well. We are confident that we can continue to meet competition successfully and secure good results in whatever markets are open to us. On the question of leaf tobacco supplies, while our stock position is at the moment somewhat better than it was a year ago, we are far from satisfied and unless more realistic allocations of dollars are made during the coming year we shall find ourselves once again with our stocks at a dangerously low level.

LUNG CANCER AND SMOKING

With regard to the subject of lung cancer and smoking, certain public statements have recently been made both from the side of the Government and from that of the tobacco manufacturers. It would be as well to recall the exhortation of the Minister of Health that uninformed and alarmist conclusions should not be drawn from the report of the Standing Advisory Committee which gave rise to these statements. That seems to me to be eminently sound advice, particularly as it still remains the fact that there is no conclusive evidence that smoking is the cause, or one of the causes, of the disease.

The report was adopted and the total dividend of 17½ per cent on the ordinary share capital was approved.

BROOM & WADE, LIMITED

RECORD PROFIT

The nineteenth annual general meeting of Broom & Wade, Limited, was held on February 23rd, at High Wycombe, Mr Harry S. Broom, MIMechE, chairman and joint managing director, presiding.

The following is an extract from his circulated address:

For the year to September 30th last we have succeeded in increasing our turnover by something like 11 per cent and show a record consolidated profit of £516,846, which exceeds our previous year's figure by £84,687. The consolidated profits are a little lower than those of the parent company only; this is due to the small loss made by the Canadian subsidiary.

The past year has been fraught with difficulties almost unparalleled in the whole of my fifty-five years' experience in business. It is the wish of your board to pay a final dividend for the year to bring the total up to 14 per cent, the same as last year.

MANUFACTURING AND SALES

Last year I said that there had been a falling off of orders during recent months. The excellent results this year have been due to the heavy backlog of orders, but the rate of incoming orders has remained below the peak which was reached in 1952. At the end of that year we had an order book which forced us to quote delivery dates, on our heavier products, of up to approximately two years. The rate of incoming orders, which has considerably improved in the last few months, together with the orders in hand, will carry us on for a further twelve months. There is a freeing-up of import restrictions in many markets, particularly Australia.

In an effort to offset the present trend of sales orders, we have been sending trained engineers to many parts of the world, and have, as you may well have noted in the press, very greatly increased our advertising and have recently arranged for a world-wide advertising campaign in co-operation with our subsidiary companies and overseas agents. We have also had excellent publicity films produced.

MODERNISATION POLICY

The increased manufacturing space which I mentioned a year ago has now been fully occupied, and we have increased our manufacturing efficiency to a surprising degree, with the result that in spite of rising material costs we have been able to maintain prices very little above those which we were able to quote two years ago. We have continued the policy of modernising and replacing plant from profits ploughed back into the business. You will see the benefit from such a policy when I tell you that since 1946 the output value has increased more than two and a half times with only a third increase in the labour force. We have to thank our stockholders for their generous support when we have asked for additional capital to enable us to effect this expansion and modernisation.

We face the future with quiet optimism. I have outlined our difficulties, and it is only my hope that they may be lightened during the present year. The fact that our prosperity is so much linked with our export trade makes it impossible to give any reliable forecast. We shall continue to forge ahead wherever we see a chance of expanding our trade.

The report and accounts were adopted.

LEEK & MOORLANDS BUILDING SOCIETY

The ninety-seventh annual general meeting was held on February 22nd at Leek, Staffordshire.

Sir Ernest Johnson, JP, the president, in the course of his speech said: The progress of this society, which takes care of accumulated savings to the extent of over £25 million, owned by more than 34,000 shareholders and depositors, and which caters for the needs of nearly 24,000 borrowers, is a matter of continuing and absorbing interest to all concerned with social progress.

Present-day Government Ministers are directly or indirectly paving the way to assist building societies in discharging their traditional role of financing home ownership. The facilities for obtaining a licence have now been made easy to private persons desirous of building a small house for their own occupation.

There is still, in my opinion, too much emphasis and freedom given to local authorities to build under subsidy compared with private building. There can be no doubt that the ever-increasing housing subsidies are proving an intolerable burden to the nation and to local authorities. They cannot continue indefinitely at the present rate.

Just as it is important to build new houses so it is imperative to maintain our existing stock of dwellings in a reasonable and habitable condition. We must maintain, we must build, and we must save. I exhort all of you to save. Acquire some nest-egg of independence.

As I exhort you to save so do I urge the Government of the day to save. There is still ample room for pruning of wasteful expenditure in Government Departments. The Chancellor has in his past two budgets seen fit to grant some measure of relief from the crippling burden of taxation imposed on individuals and businesses alike. I plead for a further easing of this burden.

CHAIRMAN'S ADDRESS

In moving the adoption of the report and accounts, Councillor Gilbert Tatton, the chairman, said: The amounts due to all classes of investors at December 31, 1953, was £24,487,551, an all-time record, and an increase of £2,440,994 in the year. This is an indisputable measure of the investing public's confidence in this society.

Having taken care of income tax, profits tax, and all interest, there is a surplus on the year's workings of £69,485. Your directors recommend that £69,000 should be placed to the general reserve fund, leaving the nominal sum of £485 to be carried forward into this year. Total reserves will then amount to £1,050,485, representing 4.78 per cent of the shareholders' capital and 4.08 per cent of the assets. The grand total of the society's assets is £25,723,978.

Another year is over, a year of excellent progress. We shall endeavour to continue the good work, and it is my earnest hope that next year I shall be in the happy position of presenting to you another excellent report.

DEPUTY CHAIRMAN'S REMARKS

Seconding the motion, the deputy chairman, Mr F. Leslie Davenport, JP, said: I share the views already expressed as to the burdensome effect of housing subsidies on national and local taxation. In home-ownership, properly encouraged, lies the opportunity of stemming this inroad into our national finances. The report and accounts were adopted.

SOUTH ESSEX WATERWORKS

INCREASED REVENUE

The annual general meeting of the South Essex Waterworks Company was held on February 19th in London, Mr G. Francis Stringer, OBE (chairman), presiding.

In the course of his statement the chairman said: The capital account indicates a net increase in expenditure of £616,142 during the year 1953, of which your company's share in respect of the Manningfield works was £547,876, and your directors have entered into commitments for expenditure of capital in sum of £1,016,730. It was for this reason that on December 17th last an issue of £500,000 4½ per cent redeemable preference stock 1973-75 was made. The issue was oversubscribed two and three quarter times. It will be necessary for a further issue of stock to be made in due course.

With regard to the revenue account, a further net increase of £26,505 is recorded. There has been a marked increase in private building, which has offset the reduction of building by local authorities. In the first six months of the year the demands of industry declined for the first time since the end of the war. This was due to some extent to the serious flooding which occurred on the night of January 31, 1953. During the second half of the year industrial demands increased again throughout the district. Pumping charges have again risen by £21,630 due to an average increase of 6s. per ton in the price of coal, further advances in the cost of materials and wages, and an increase in the total quantity of water supplied. Local rates at £129,516 comprise the next heaviest item of expense, equivalent to one-sixth of the amount paid by each consumer for water.

TWINING CROSFIELD & COMPANY

RECORD TRADING RESULTS

The thirty-seventh annual general meeting of Twining Crosfield & Company, Limited, was held on February 25th in London, Mr H. W. Backhouse (chairman) presiding.

The following are extracts from his circulated statement dated January 25th:

The Group trading profit is the highest in the company's history. It has been earned during a period when the Tea Market has been exceptionally kind to tea distributors. In November, 1952, common tea was costing 1s. 8½d. per lb. and by the end of October, 1953, it had risen to 3s. 4½d. per lb. The market has been consistently strong until now when the price is about 4s. per lb, the highest price within living memory. Under these conditions the company has enjoyed an increased turnover.

We have had to begin this current year with a very high market for tea and a possibility that lower prices for common tea may be reached during the current financial year, so that the situation is quite different and less favourable. We have been facing intense competition since control ended and we expect this to continue.

Since our last meeting the retail price of tea has advanced on three occasions. There increases were inevitable owing to higher prices for tea, and if the market for common tea remains at its present high figure a further increase in the retail prices of all teas will be inevitable.

The alarming increase in the price of coffee gives rise for some anxiety. In the

UK consumers have been sheltered to some extent against world prices by the action of HM Government in allocating coffee (for which they had made forward contracts) at a much lower cost than the rest of the world was paying. These allocations are now down to 25 per cent of what they were, and to make up the remaining 75 per cent distributors have to pay world prices. It would appear that an advance in the retail prices cannot be long delayed.

The report was adopted and the dividend distribution of 18 per cent for the year was approved.

ILLINGWORTH, MORRIS AND CO.

(Worsted Spinners)

MAINTENANCE OF HIGH QUALITY STANDARDS

The thirty-fourth ordinary general meeting of Illingworth, Morris and Company, Limited, was held on February 25 in Bradford, the Right Hon Lord Wilmot of Selmeiston, JP (the chairman), presiding.

The following is an extract from his circulated statement:

The affairs of your company have shown a satisfactory improvement during the year under review. It has now been possible to recommend that the issued capital should be increased by capitalising one million pounds of the very large accumulated reserves.

The net profit before taxation is £568,000, compared with £358,000 for the previous year. After providing £319,000 for taxation there remains a balance of net profit of £248,000, which compares with £151,000 for the previous year.

Current assets exceed current liabilities by £4,251,000.

Conditions in the worsted industry during the year under review have remained somewhat abnormal. The hold-off from buying on the part of merchants and retailers was overdone and, as was the case last year, demand did not come forward in a way which made possible an orderly spacing of work. Restocking led to a spate of orders. This abnormal pressure to some extent interfered with the welcome return to the normal practice of seasonal buying, which we are satisfied is developing again.

Our policy is still to maintain the traditional very high standards of quality for which our yarns are so well regarded throughout the world. All our branches have orders which will keep them fully employed for some months ahead.

CHAIRMAN'S ADDITIONAL REMARKS

The chairman, in reply to questions, said he was pleased to say that the trading figures available for the first four months of the current financial year were better than for the same period of the previous year, which was very satisfactory.

They had a very good order book, but it must be remembered that they had still eight months to go.

With regard to the figure in the balance sheet, stock and stores £2,900,000, the chairman stated it should be remembered that it constituted largely the work in progress and in fact at that time it was practically all sold.

The report was adopted; the total ordinary stock dividend of 14 per cent, less income tax, for the year approved, and the capitalisation proposals were sanctioned.

THE CHELTENHAM AND GLOUCESTER BUILDING SOCIETY

ANNUAL GENERAL MEETING

CHAIRMAN'S ADDRESS

The annual general meeting of Cheltenham and Gloucester Building Society was held in Cheltenham on February 17, 1954.

Mr Leslie W. Bayley, CC, FAI, the president and chairman, presided and, in the course of his speech, said:

You will remember that in 1952, owing to a change in long-term interest rates, Building Societies found it necessary to increase by a ½ per cent the rates paid to shareholders and depositors.

During 1953 these rates have remained steady, and have continued to prove attractive to the general public, particularly when the other advantages of investing in a Building Society are borne in mind. For example, the investor has no income tax to pay on his interest, this being paid for him by the Society, and we have paid this year £220,000 in income tax in order that our investors may have that advantage.

There are no costs or expenses of any kind in connection with the investment or withdrawal, and when an investor needs his money he can get it on short notice without penalties of any kind, and he always knows that he can get £1 out for every £1 he puts in, and that, in other words, there is no

risk of any loss of capital through depreciation.

Bearing all these advantages in mind, it is not surprising that Building Societies are enjoying increasing popularity with the investing public, and I should like here to acknowledge the service which our bankers render to us and to their customers in recommending the Society for investment. The result, so far as this Society is concerned, is that the record sum of £4,675,000 has been invested during the year, and after allowing for all withdrawals and interest the amount remaining invested increased by £2,193,000.

With regard to the lending side of our business, conditions have shown a marked improvement so far as the building of new houses for sale is concerned. I am sure we would all wish to congratulate the Minister of Housing and the building industry on the completion of 318,000 new houses during the year, of which over 62,000 were built for sale as against 34,000 the previous year. It is not, therefore, surprising that the Society's advances on mortgage amounted to a record figure of £4,298,000, the increase being accounted for by the larger number of mortgages on newly built houses.

Although it is the expressed intention of the Minister to endeavour to stabilise the production of new houses at around 300,000 a year, it is nevertheless apparent, having regard to the number at present in course of erection, that this figure will be exceeded during 1954, and in any event we confidently anticipate that the proportion built privately for sale to owner occupiers will progressively increase, whilst the number of those built for letting at a subsidised rental by the Local

Authorities will steadily decrease. The country cannot afford the rapid annual increase in housing subsidies, which will remain a charge on the Exchequer for the next two generations.

Restrictions on building have recently been further relaxed, and it is now possible for builders to proceed with estates of a sufficient size to enable more efficient methods to be introduced, which will, I trust, result in a reduction in prices, which are unfortunately at present too high to enable many would-be home owners to purchase.

The Society's liquid assets, representing 13.3 per cent of the total, and which, apart from cash, are all invested in trustee securities, still show a depreciation of £35,000 in market value as compared with book value, but I would like to emphasise that all these investments are in dated stocks repayable at par, and that in no case does the book value exceed par. Moreover the redemption value exceeds the book value by £45,000, and our contingency reserve of £100,000 more than covers the present temporary deficiency.

As a result of the year's working it has been possible to transfer £70,000 to general reserve, so that our total reserves and unappropriated profit now amount to £1,470,000, representing 6.7 per cent of the total assets.

At the date of the balance sheet you will see that our assets amounted to £21,824,000, having increased by £2,282,000 during the year, and I may add here that since the end of the year they have passed the £22 million mark.

The report and accounts were adopted.

UNIVERSITY OF LEEDS

DEPARTMENT OF AGRICULTURE

Applications are invited for the post of Assistant Lecturer in Agricultural Economics. Salary on the scale £500 x £25-£550 a year, according to qualifications and experience. Applications (three copies) should reach the Registrar, The University, Leeds, 2 (from whom further particulars may be obtained), not later than March 31, 1954.

HIGH LEVEL CHEMIST

TECHNICAL SERVICE MANAGER required by well-known progressive manufacturer of starch and its derivatives—such as glucose, dextrins, dextrone, adhesives—to take charge of department responsible for technical service to customers and manufacture and for development. This is an exceptional vacancy. It is an important post and an outstanding man is sought. Applications are invited from CHEMISTS 35-40 with a M.Sc. degree or equivalent, and responsible experience in industry—such as textiles, industrial experience in a relevant valuable. The salary and future paper, food or foundries—would be importance attached to this post. Replies are commensurate with the importance of the position—giving details of which will be treated in the strictest confidence—should be sent to Box 474.

FORD MOTOR COMPANY LIMITED has an immediate vacancy in a Department engaged on the examination of the financial and economic implications of its activities, both current and future.

The main requirements are intelligence and limitations of figures, foundation of knowledge of the powers and limitations of figures, administrative resourcefulness and a talent for the concise exposition of complex problems. The appointment will probably—but not necessarily—be filled by a man under forty who has a University Honours Degree in mathematics or economics, or a recognised accounting qualification, and who has had broad experience both within and without his academic or professional sphere.

A good starting salary is offered, with high future prospects depending on capacity as demonstrated in contact with the people and problems of the Company. The post is pensionable. Apply, stating salary required, to: Salaried Personnel Department, Dagenham, Essex, quoting reference C/H.

WELL-ESTABLISHED COMPANY requires experienced Management Consultant, age 35-45, preferably with University degree, good professional qualifications, and industrial and consulting experience, to help in developing their organisation in Southern Africa. Salary commencing £2,500/£3,000 per annum.—Write fully, in strict confidence, to Box 484.

ACTUARIAL STUDENT required by progressive Life Company for new Pension Scheme Department in City. Must have passed at least Part II of the examinations of the Institute of Actuaries. Faculty of Actuaries. Replies in writing giving age, qualifications, and previous experience will be treated in strict confidence.—Write to Box 481, L.P.E., 110 St. Martin's Lane, W.C.2.

ACTUARY (40) holding a responsible administrative and statistical post in government service seeks a position with wider opportunities in business. Previously twelve years with an assurance company. Some experience of private pension funds. Present salary £1,600 plus non-contributory pension.—Box 473.

ACCOMMODATION business man Central London—well furnished bed sitting room with private bathroom and private telephone line in flat—£4 15s. per week including breakfast.—Box 470.

FOR SALE.—Complete volumes of The Economist 1947-1953.—Write Arthur Press Limited, Woodchester, Glos., for details.

REQUIRED.—Complete volumes of The Economist 1928-1944 inclusive, also 1947. Please quote price.—Box 472.

LONDON SCHOOL OF ECONOMICS AND POLITICAL SCIENCE

(UNIVERSITY OF LONDON)
The Register of Graduates 1896-1949 is under revision. Graduates and diploma holders of these years who have not received, or have not replied to, the School's requests for information, are urgently required to write to the Registrar in order that the Register may be completed.

BIRMINGHAM POST (LONDON OFFICE)

Assistant to City Editor required. Pension scheme and prospect of advancement. Applications, giving full statement of qualifications, experience and age to Editor, Birmingham Post, New Street, Birmingham.

CHARTERED ACCOUNTANTS ONLY, aged 26 to 45. Starting rate at least £1,500, advancement (quite possibly rapid) to £5,000 or more. Good holidays and sick pay. Non-contributory pension (one-sixtieth of each year's pay) from sixty-five. Responsible internal audit six separate businesses, clothing, furniture, food. Present turnover £23,000,000 may grow fast and far. No executive functions beyond own department, but after first year member controlling board and chief managerial group John Lewis Partnership, co-operative society of producers begun 1914 now established by irrevocable trusts. Present capital £16,000,000, worker membership 12,000 (about one-fifth minors); yearly pay-sheet £4,000,000. Business policy strict integrity. All payments absolutely prompt. Energetic enterprise, but no great risk. Graduates (arts preferred) and similar home income preferred, but only if other considerations about equal. Letters of application must arrive by March 13th and will not be acknowledged before that date. Should answer all questions candidate would ask in making similar appointment. Enclose copies relevant documents. No calls except by invitation.—Address: "Chartered Accountants," Chairman's Office, John Lewis Partnership, Oxford Street, London, W.1.

GRAMOPHONE RECORDS.—A medium-sized Gramophone Record Company, with ample financial backing, has an opening for an experienced top executive who possesses drive and a thorough knowledge of the industry including L.P.s. In addition to managing the business, applicant must be capable of selecting repertoires and be experienced in dealing with artists. The position offers unusual scope for the right man and will be remunerated accordingly. Please give full particulars of previous experience and qualifications. All applications will be treated with the strictest confidence.—Box 469.

E. YATES LIMITED, Wellington Mills, Bramley, Leeds 13, W. woollen and worsted cloth manufacturers, require a young lady to fill vacancy through impending marriage. The work will entail analysis of published returns and information regarding trading conditions, licensing prospects, etc., together with preparation of returns of sales and sales potential. Applicants should be aged 25-30 preferably having a recognised qualification in economics, commerce or statistics, and with some previous experience of this type of work. A knowledge of shorthand and typing would be an advantage.—Letters stating age, education and giving details of qualifications and experience should be addressed to The Managing Director, ENGLISH BUSINESSMAN of 30 years' experience in Far Eastern Trade seeks position in this country. Has good working knowledge of Imports/Exports and is specialist in China Wools. Available immediately.—Box 467.

THE Economist's Bookshop, 11-12 Clement's Inn Passage, London, W.C.2, invites you to submit lists of books on Economics, History and Social Sciences, you may wish to sell (periodicals excluded).

RESPONSIBLE writer on technical topics (mainly motoring) courts commissions connected with press, publicity or public relations, requiring resource, imagination and initiative.—Box 475.

"BOMBS AWAY" — the story of an R.A.F. bomber

No. 1 in a series on the Avro Vulcan

Edwardian Aeronauts and the start of it all...

In 1907, four years after the Wright Brothers wrote a completely new page of world history by flying the first heavier than air machine, a young engineer won first prize in the Daily Mail Model Aeroplane competition. By July two years later he had designed, built and flown the first ever all British Aeroplane. His name was A. V. Roe, his plane the Roe I Triplane. Such were the beginnings of Avro—with an inspiring "first" in the aircraft world. Today the great firm of A. V. Roe & Co. Limited, has another "first", no less

inspiring, no less courageous in its pioneering audacity: the world's first 4-jet delta bomber: the mighty Avro Vulcan. The delta is the best design in existence completely to fulfil the vital new requirements for near-sonic flight at high altitudes and long range... a wing that is highly swept back, very thin, with a large surface area yet a small span. With its delta planform the Vulcan is the world's most formidable bomber. It is now in super-priority production for the Royal Air Force.

A.V. Roe & CO. LIMITED / Manchester

MEMBER OF THE HAWKER SIDDELEY GROUP / PIONEER... AND WORLD LEADER IN AVIATION

NEW LOOK IN DEFENCE

The money spent by Britain on defence has to provide the arms, ships and aircraft for three different but related tasks:

- (i) Total war, unlimited in range, against major enemies having atomic weapons for attack and scientific devices for defence—e.g., defence of Western Europe.
- (ii) War in a limited area and with non-atomic weapons against a well-equipped enemy with regular forces—e.g., the Korean War.
- (iii) Police operations in or around British possessions conducted with weapons and forces inadequate for major war—e.g., Malaya, Kenya, patrol of Formosa Strait.

The revolution in weapons of attack and defence now going on complicates the peacetime task of allocating resources between these three functions, and between the three Services performing them. No one knows precisely if—and if so when—the guided missile will displace the piloted aircraft; or if the helicopter with the convoy will displace the escort vessel; or if increased fire power will end the usefulness of the tank. The designer and the staff officer are always planning for a date that moves forward. Even the best-planned defence budget will, therefore, propose expenditure on much that is obsolescent.

★ ★ ★

In the first of the articles that follow the problem of peacetime defence planning when weapon design and international relations are so uncertain is discussed. The next three articles examine in each fighting service the basic problem that reflects all or most of its difficulties. The difficulties of the Air Force are reflected in the arguments for and against the atomic bomber; those of the Army are reflected in its manpower needs; those of the Navy are reflected in the arguments for and against the aircraft carrier.

The Cost of Uncertainty

THE three fighting services and the ministries that direct them propose to spend in the next financial year just under £1,640 million. It is a figure to make the taxpayer flinch; he may even start calculating that a fifty per cent cut in defence expenditure might save him four or five shillings on his income tax. And if he looks at the White Paper on Defence—a quite readable little treatise on the nation's present strategy—he may murmur: "Even with that they are not satisfied." For it can be read between the lines that the defence for which he is paying is a patchy thing; that the men who decide these matters find it hard to agree on what claims have priority; and that everyone who peers into the future of war is puzzled by the prospects that offer themselves. The layman had hoped that the new weapons would somehow make things simpler and

reduce the difficulty of choosing between the Services' claims. Instead he reads:

Even in a major war it does not seem likely that the possession of new weapons will make it any less necessary to keep a firm screen of troops on the ground and of aircraft to withstand the first shock of an attack, to hold the enemy until mobilisation is completed, and to exploit and consolidate the tactical situations which the new weapons will create.

That can, perhaps, be allowed to pass in the year when the RAF is receiving only its first atomic bombs, when Sir Winston Churchill and Mr Molotov have between them raised such fresh speculation about the future prospects of peace, and when everybody is agreeably surprised that the backs of the western allies have not been broken by

DEFENCE EXPENDITURE AND MANPOWER

	DEFENCE EXPENDITURE £ million			
	1947-48	1951-52	1953-54	1954-55
Navy	195.6	280.3	364.5	367.0
Army	397.4	443.3	581.0	561.0
Air Force	187.4	330.2	548.0	537.0
Ministry of Supply ..	100.3	81.5	123.8	151.0
Ministry of Defence ..	0.3	11.3	19.5	23.9
Total	881.0	1,136.6	1,636.8	1,639.9

	MANPOWER Active Strengths at April 1st: thousands			
	Actual		Estimated	
	1948	1952	1954	1955
Navy	144.4	145.2	135.0	135.0
Army	530.7	446.7	453.2	440.1
Air Force	255.9	270.8	267.3	269.2
Total	931.0	862.7	855.5	844.3

the burden of rearmament (as it was said they would be). But it will not pass in the future. For there is direct and painful conflict between Britain's need to re-equip its industries and its desire for balanced forces; and there is direct conflict between the taxpayer's feeling that war is less likely and the staff officer's feeling that it must remain one of the normal risks of a nation's life. Sooner or later the demand for economy will have to be met.

It is, however, only fair to recall—as the White Paper modestly reveals in one paragraph—that it was the British Chiefs of Staff who first warned Nato against the extravagant mood induced by the Korean War. Their plea for a cheaper and longer-term plan called the “new look” was accepted during last year by the Atlantic allies; and Nato's Military Committee is now “carrying out a reassessment of the most effective pattern of military forces for the long term, taking account, among other factors, of the effect of new weapons.” In other words, it will not be left to national governments and their advisers to settle what weapons and forces are necessary. In this fact alone there is hope; for this relief much thanks.

★

But the question remains: is the traditional conception of well-balanced national forces as the basis of independent foreign policy and strategy still tenable for Britain? It is clear that most people who think at all about these things want to maintain it. The question is whether any country, except perhaps the United States and Soviet Russia, can afford to maintain it. In the articles that follow it will be seen that the Royal Air Force wants, and has been promised, a strategic bomber force, although the United States has had one of growing strength throughout the tensions of the last five years. Is the British force, then, an extra deterrent that Nato thinks necessary, or is it regarded as something that a great power must have if it is not to become a middling power? Likewise the Royal Navy wants to maintain and improve its aircraft-carriers, although the United States has a plethora of these ships. Is that an extra precaution that everybody agrees to be necessary, or is it the Royal Navy's way of keeping in the foreground? Again, the Army is keeping abroad more men than ever before at a time when it has more allies strong in infantry than ever before—admittedly not all in the right places. Will that always be necessary or is there some way of sharing the common burden?

For the time being there is only one conceivable enemy; and so long as it looks like an enemy the alliance that it has frightened into existence should remain in being. Are the British and other allied chiefs of staff unconsciously looking forward to some time in the future, when every government will thankfully say that the cold war is over, the world is at peace, and all can again rely on their own balanced national forces—but somewhat smaller and cheaper? If so, it is a costly

obsession, and the layman is entitled to ask whether all the possibilities have been examined of achieving more economies, more sharing of burdens, more distribution of risks through the Atlantic alliance.

It is tempting to think that the airmen have the answer with their idea of preventing war by threatening the aggressor with atomic bombing: one idea, one force, one solution. The idea is examined from the strategic aspect in the article that follows; it was examined from the political aspect in *The Economist* of February 6th. It has fully convinced neither the politicians in the United States nor the soldiers and sailors in the United Kingdom. Conventional war—appalling phrase—and colonial operations lurk round the corner; and no one yet knows how the political side of the atomic deterrent works. Mr Dulles speaks as if he would decide when to use the master deterrent in retaliation for aggression. The British air marshal speaks as if he wants to make the decision. One day, perhaps, the French and the Germans will want to make their decisions. The layman cannot help wondering whether the deterrent would not be much more effective, both in warning an aggressor and in saving expenditure on the free nations' defences, if the decision were to be taken by an allied body and executed by an allied air force.

★

From the articles that follow the many difficulties of this period of transition plainly emerge. There is the uncertainty about new weapons and the mystery of Soviet intentions; there is also the puzzle of planning for the armed peace. It is not easy for men who fought and commanded in the last war to visualise what will be needed in a period where every effort will be bent to avoiding major war. Nor is it easy for one minister in a government to speak of his success in maintaining peace if another minister has to speak of the need to maintain strong defences. This is a period of political as well as scientific and strategic transition. It would therefore be wrong and unfair to put on military advisers the whole responsibility for uncertainties and extravagances that are rooted in political difficulties.

Brief observations on great issues can never be more than half true; but the doubts of the layman might be summed up by saying that the cost of being secure from enemies is being confused with the cost of being independent of friends. The criticism is as true of the Americans as it is of the British. Costly research on new weapons is being duplicated in both countries because many Congressmen do not trust an ally; costly building of new ships is being duplicated in both countries because the British want to protect Atlantic

trade routes; precious time and money are being wasted because the French do not trust their allies to pull in harness with the Germans. It is, perhaps, time that the staff officers turned on ministers, and told them to create better political conditions for cheaper yet more efficient defence. Otherwise the politicians will turn on the staff officers and tell them to save money by cutting defence down. And that policy, applied in haste, could end in disaster.

RISE AND FALL OF SERVICE ESTIMATES
(Percentages of Main Estimates* each year)

	Pre-war			Rearmament		
	1933-35 (av.)	1949-50	1950-51	1952-53	1953-54	1954-55
Admiralty	49.0	24.9	24.8	24.4	22.3	22.4
War Office	35.0	40.1	38.4	35.7	35.5	34.2
Air Ministry	16.0	27.3	28.7	31.9	33.5	32.8
Ministry of Supply †	...	7.6	8.0	6.8	7.5	9.2
Ministry of Defence ‡	...	0.1	1.2	1.2	1.2	1.4

* These percentages are based only on the Main Estimates, which reflect the emphasis of Government policy in money terms. They do not represent actual expenditure, and the effect of Mutual Defence Aid from the United States is excluded.

† By far the greater part of this Ministry's expenditure is devoted to the needs of the Army and Air Force.

‡ The chief element here is expenditure on “infrastructure” in Europe, installations mostly for the use of military and air forces.

Atomic Air Strategy

THERE is something repellent to a civilised community about the promotion of retaliatory bombing—atom bombing—to the front line of the country's air defence. The atom bomb is pre-eminently a weapon to be used against cities, and it is a horrible logic that bases any country's security on a form of strategic blackmail. Yet this year's White Paper on Defence openly accepts the need to build up in the Royal Air Force a force of modern bombers capable of using the atomic weapon to the fullest effect. A strong and efficient force of medium bombers is of the greatest importance to us both for our own security and for the defence of Western Europe.

Having said so much, it is a pity that the authors of the White Paper did not go further and explain the reason for this change of emphasis from air defence to air attack. Separated from its context, the promise of an all-powerful deterrent can be turned into a case against continued expenditure on other, less spectacular, methods of defence. No illusions must be allowed to take root that would smother this country's defence programme in atomic complacency.

The major responsibility of the Air Force is the defence of Britain. How, then, does it come about that the Air Marshals consider their most effective method of defence lies not in Fighter Command, but in attacking enemy airfields and enemy cities? Is the ghost of Harris riding down the corridors of the Air Ministry? The Secretary of State for Air, in a memorandum on the air estimates, has hinted at some of the technical difficulties of air defence against jet bombers, but there has been no official explanation of the Air Ministry's real dilemma. It turns not on the change from piston to jet power, but on the change from conventional high explosives to atomic

fission. Before the atom bomb, it was possible to calculate with fair accuracy the limit of losses to any bomber force beyond which bombing missions would be uneconomical to the attackers—when the raiders' losses, in terms of men and machines and the drain on national resources, exceeded the damage done by the raid. It was then possible to calculate the size of the fighter defences needed to achieve this critical rate of kill. During the last war, it was estimated, bombing raids could be topped if on aver-

age 20 per cent of the attackers failed to return; in practice an attrition rate of as little as 10 per cent proved sufficient.

Such calculations can still be made but they no longer give comforting results. The devastating effect of a single atom bomb is so tremendous that the fighter defence would need to be certain of destroying more than 90 per cent of the attacking bombers—and doing so before they reached their targets—to make the results of the raid no longer worth the cost of mounting it. By any standard, this is an impossible task. The fact that the raiders will in future be jet-powered does not affect the basis of the calculations; it only makes the planning of the fighter defences so much the more difficult. The attrition rate necessary is too high to offer any hope of success.

Air defence, therefore, must look for another way of making an atom attack too costly to launch. Hence, the emergence of a new strategic doctrine: if a sufficiently big stock-pile of atom bombs can be accumulated, together with bombers capable of delivering them, the fear of retaliatory bombing by such a striking force will be sufficient to stop the first atomic attack from ever being ordered. The bombers would take off for Moscow when the sire sounded over London. In an attack of this kind, the balance might be tipped a little in favour of the Western bomber. British defences will never be so perfect as to make atom attack impossible, but the area that they have defend is so small and highly concentrated that they should make such an attack a costly one even if they cannot prevent it altogether. A similar concentration of air defences could never be contemplated across the rambling vastnesses of Russia. Provided that they had the range to reach Russian targets (even if these took refuge behind the Urals), the

Western bombers would have a slightly easier mission. The pattern of this new atomic strategy is beginning to take shape. Deliveries of the Valiant, the RAF's first medium-range jet bomber, will begin this year and deliveries of atomic weapons to the British forces have already started. Such bombers can reach into the heart of Russia; the delta-winged Vulcan and the crescent-winged Victor, which do not figure in this year's estimates, can reach even further.

This is the winged deterrent on which hopes are based.

This map illustrates, in a very rough and ready fashion, the probable operating range of the aircraft at the disposal of the Western air chiefs. The limits shown for the fighter defences assume that the aircraft are based in Western Europe. The immense range of the inter-continental bomber opens a field for speculation on the possibilities of bombing missions that start from bases in Britain or the Arctic, and land on bases in another continent. But they are slower, and so more vulnerable than the medium jet bombers.

The defence of Britain against a similar air attack launched from the East is technically the most difficult task now facing the RAF. There is little room here for complacency. A modern jet bomber can be expected to approach at heights of twelve miles and at speeds of well over 600 miles an hour. Even with an early warning system strung out across Western Europe, the distance between the Russian bases and their British targets is so short, in flying time, that fighter defences must go into action at phenomenal speeds if bombers crossing the Iron Curtain are to be intercepted before they release their bombs against British targets. The fighters capable of reaching these speeds and heights, the Swifts and Hunters, will not be in service until later this year. And even these machines are hardly fast enough; they take four minutes or more to reach the heights at which bombers are likely to operate and can barely exceed the speed of sound.

★

These essentially conventional cannon-powered fighters will be far less effective than the missile-carrying machines foreshadowed in the Air Ministry memorandum. The first of these to go into service would be the all-weather Javelin, an aircraft powerful enough to carry its own search radar and the additional weight of guided missiles, although not as fast as could be wished. But the Javelin does not appear in this year's estimates, and there is no certainty that it will appear next year. When air-to-air missiles do go into service, they will do much to restore the balance in favour of the defending fighter—provided that it is a supersonic fighter of the type that the Air Ministry expects to test this summer—but not enough to eliminate the risk of atomic bombardment. The cost in terms of manpower of a fully armed Javelin-type fighter is so high that defence by sheer force of numbers would never be possible. Nor, when the first primitive ground-to-air guided weapons go into service, is there any prospect that a barrage of these robot bloodhounds could be put into the air like anti-aircraft shells. Accurate warning and accurate location become the key to atomic defence. A warning system has now been largely completed, but its effectiveness is closely bound up with the existence of advanced bases in Western Europe; thus the air defences of this country depend largely on the

An Army Extended

THERE are nearly 445,000 men on the active strength of the British army, of whom just under 225,000 are national servicemen and just over 220,000 are regulars. The effective fighting force is the broad equivalent of 11½ divisions, of which more than four-fifths are overseas. This is a larger proportionate overseas commitment than is shouldered by the army of any other country; in fact, it is probably a larger proportion than any peacetime army has ever sent overseas before. And with this necessary exile are bound up the two principal problems before the War Office today: namely, the difficulty of training the army to carry out at least two very different types of job at the same time, and the difficulty of persuading regular soldiers to re-engage once their period of service is over.

Army's ability, in the event of a major war, to maintain a line no further west than the Rhine.

The Air Ministry's admission that the production, as opposed to the development, of guided weapons is about to begin underlines the special menace of guided weapons to this country. Here the West is at a decided disadvantage. Once an enemy missile has left the ground, no one knows either how to intercept it, or to deflect it from its target, and a country is left helpless in the face of rocket bombardment. Missiles are not yet accurate enough to be entrusted with the delivery of atomic warheads over long distances, but over short and medium ranges atomic missiles may be coming into sight—over just those ranges, in fact, that separate this country from the Russian troops in Germany and Austria. If communist forces were to reach the coast of Europe, this would no longer be a threat but a fact—and the warhead might be thermonuclear. Once again, the strength of the ground forces in Europe is the decisive factor for Britain's security.

The technical problems of defence against atom bombers and atomic missiles account for the decision to build up a powerful retaliatory atomic striking force on the ground that it is the one practical deterrent to atomic attack. If the existence of such a force means that politicians on both sides refrain from using atomic weapons at all in a future hot war, the RAF's task becomes immeasurably simplified. The Air Marshals would still have a powerful striking force at their disposal, and they should be able to put up a defence effective enough to make conventional high-explosive bombing extremely costly to the enemy.

Given these two overriding preoccupations of attack and defence, has the Air Ministry devoted sufficient time or resources to its other responsibilities—to Coastal Command, to transport aircraft, to close-support aircraft, to the development of load-carrying helicopters for the Army? The other services, who are the first to feel the effects of any shortcomings in these directions, are inclined to press this question. It may be desirable to hive off some of these peripheral activities; when the Air Marshals have so fully adjusted their outlook to the atom, they can be forgiven for a less deep concern about the more mundane types of air operation. But skilled ground staff is acutely short, and this alone may rule out any such redistribution of duties in the immediate future.

At present, Britain has four divisions in Germany, and the equivalent of rather more than five other divisions spread across different non-European trouble spots or outposts of Empire all round the world. The divisions in Germany stand ready to meet the most modern and most horrible forms of great power warfare—first league warfare with an atomic vengeance. The divisions outside Europe, now that fighting in Korea has stopped, mostly stand ready for, or are actually engaged in, what might be called armed—and unpleasant—police operations. It is not easy for troops that are engaged in active operations in Malaya and Kenya (or even in guard duties in Guiana) to combine these duties with training for war in Europe.

The picture, therefore, is of an army that is uncomfortably

Admiralty use Pye Underwater TV to aid "Comet" Search

When the "Comet" jet airliner crashed into the sea near Elba in January, a Pye Underwater TV Camera of special design, more sensitive than any other TV camera in use anywhere at the present time, was used to locate the wreckage. The internationally famous Pye Group of Companies manufacture radio, television, telecommunications equipment, scientific instruments and electrical appliances with a world-wide reputation for excellence.

PYE LIMITED OF CAMBRIDGE

RADIO • TELEVISION • TELECOMMUNICATIONS EQUIPMENT • SCIENTIFIC INSTRUMENTS • ELECTRICAL APPLIANCES

fully employed and anxiously extended. The official decision that expenditure on the army must fall gradually in the next few years—to make way for increased expenditure on the air force and maintained expenditure on the navy, within the confines of a stable defence vote—has got to be made to fit in with these facts. And the understandable public clamour that the period of national service should be cut below the present two years has got to be made to fit in with them too. Apart from such trimmings on the expenditure side, as the decision not to equip the part-timers in the territorial army with the most modern weapons and a possible decision to reduce anti-aircraft command, there seem to be only two ways in which advances can be made towards the aims of smaller cost and fewer men.

The first way would be by a significant reduction in strength either in Europe or in the non-European trouble spots; this may happen anyway, but it would be a very dangerous happening unless international tension eases. It is idle to suppose that as manpower strength declines, mechanical strength can take its place. Obviously, the men on guard against Mau Mau and in Malaya cannot effectively be replaced on their present duties by machines. Even in Europe the popular conception that atomic missiles can soon replace infantry men in large numbers is mainly nonsense. Atomic bombs and missiles will grow more plentiful in the next few years, and they may make it impossible for any army to assemble as much force in a single segment as the Germans did in the Ardennes in the last war. But they are not going to make infantry men outdated.

The second way in which economies might be effected and progress made towards a reduction in the period of national service would be through a sustained growth in the regular army. Although regulars have to be paid more than national servicemen, a regular army is more efficient—and therefore more economic—than a conscript army in peacetime, if only because so many conscripts are moving out for duty and back for demobilisation across the world at any one moment of time. Because of this, and of ordinary troop movements, there are between 10,000 and 12,000 men perpetually in the pipeline today. But, in facing the problem of strengthening the regular army, a clear distinction needs to be drawn between the difficulties of recruitment and the difficulties of re-engagement.

The difficulties of recruiting regulars are not as great as is generally supposed. There were 83,600 regular recruits to the three services in 1953, and it is expected that another 80,000 will sign on this year. This is less than the 103,300 regular recruits enrolled in 1952, but as there are only about 300,000 men in each yearly age group in the United

Kingdom, the figures look surprisingly good. The army generally enlists about half of each year's batch of new regular recruits (that is, as much as the navy and air force combined), but there is a catch about its apparent success. The majority of regular recruits into the army are men who would otherwise be called up for national service. The choice before the national serviceman is two years in the conscript army, or three years in the regular army (with rather better conditions of service and prospects for promotion); alternatively a man can sign on for twenty-two years, with a right to leave after each three-year period.

The War Office's biggest headache at the moment is that so many regulars are leaving the service when their stipulated period of service is up. The problem may be going to assume alarming proportions in the near future, for the first triennium under the system of three-year engagement ends in 1954. The army seems to be less fearful than it was a short time ago that nearly all the men concerned will refuse to re-engage, but it should be noted that re-engagements under previous systems of contract have been disappointing. Although the army attracted

42,700 regular recruits in 1953, the net increase in regular strength seems to have been less than 10,000 (last week's white paper on defence estimates that the army's regular strength on April 1st next year will be just over 220,000 compared with just over 211,000 on April 1, 1953). At this moment only about 10 per cent of the army has stood the course for more than six years, a far lower proportion of senior NCO material

and experienced tradesmen than an efficient army needs. There are two main reasons.

The first reason is that technicians who have acquired excellent mechanical or other training in the army can often secure very well-paid jobs in the fully employed industrial economy of civilian Britain. A man who has just turned thirty, who knows that he can still get a good job in a factory and who remembers that if full employment falls older men are the first to suffer, can hardly be blamed for not putting off his return to civilian life until he has just turned thirty-three.

The second reason lies in the statistic quoted at the beginning of this article: that so large a proportion of the army's effective fighting force is now stationed overseas, and two-thirds of them are separated from their wives and families. The rapidly changing pattern of Britain's worldwide commitments has brought with it bewildering movements of abode but not of home; with the best will in the world about the construction of married quarters, it is impossible to send a subsidiary army of wives and families to Kenya or Guiana, chasing after the drum. The Royal

Northumberland Fusiliers have moved eight times in the last seven years (between Italy, Gibraltar, Korea, Hong Kong and Kenya) and the battalion of the Argyll and Sutherland Highlanders now in British Guiana has moved seven times; indeed, if one counts movements within individual countries as well as between them, the Argylls have moved nineteen times in the whole period since VJ day, and it is possible to cite the case of some soldiers who have spent only a few months with their families in the last eight and a half years. In these circumstances it is not surprising that so many regulars are unwilling to extend their period of service; and it should be added that even those who have drawn billets at home have some cause for unrest. The fact that so many regulars are overseas means that the 18,000 or so regulars left to train national servicemen at home are being worked very hard indeed.

★

There is therefore a clear need for increased inducements to persuade regulars to renew engagements as their periods of service fall in. The army's main hope is that it will eventually be possible to station at least half of its fighting units as a strategic reserve at home, and fly them out to trouble spots when necessary. But, until that day comes, the various inducements that can now be suggested have one thing in common: all would cost money. High up on the list should come more frequent home leave for regulars overseas; the air trooping scheme put into effect in the last year of the Japanese war had an electric effect on morale. A second step should be higher pay for technicians and for some ranks of non-commissioned officers; if these allowances have to be discriminatory as between trades—with special scales for special skills and

Waiting for a New Fleet

IN a time of changing weapons and unsettling ideas about the nature of future war, the Royal Navy spends anxious and frustrated days. It wonders what will happen to British sea power during the "gradual change . . . in the direction and balance of our defence effort" to which the White Paper on Defence cautiously refers. Minister after minister and one chief of staff committee after another has to be instructed in the historic axiom that if Britain is to fight, it needs food and fuel; and before it can get food and fuel it must trade; and both fighting and trading must be done across the sea. Once the sea routes between these islands and their friends are closed, defeat is inevitable. It is not easy to pit this humdrum common-sense against the drama of trans-continental atom-bombing, or against the urgent call for more divisions to keep Western Europe safe and free. What could be duller than the first sentence of the White Paper's statement on the Services programmes:

The Royal Navy will continue to concentrate on building up and modernising its anti-submarine and anti-mine forces, and on the completion of aircraft carriers now under construction.

It is not easy to remind the nation of its dependence on seaborne supplies when the paramount role in attack and defence is passing to aircraft. The Navy's best men feel

"dirt money"—the army must comfort itself that it is working in a competitive economy.

A third step might be an increase in the numbers and mobility of colonial forces. In 1946 the army voluntarily gave up certain tax concessions on the allowances and pay of the British officers and NCOs in charge of the 80,000 strong colonial army, and there is now a shortage of suitable leaders. Once anybody has given up anything voluntarily to the Treasury, he finds it extraordinarily difficult to get it back. It would perhaps be preferable to make direct increases in pay rather than a side-door shuffle back to the taxation allowances granted before 1946; but it should be noted that that tax decision in 1946 has had adverse effects—in particular in the re-engagement of technicians—within the British army itself.

This brief review has dealt only with the active army. Nothing has been said here about the 253,000 strong territorial army (of whom 192,000 are part-time national servicemen or national service volunteers) and the 137,000 strong army emergency reserve (of whom 126,000 are part-time national servicemen or national service volunteers); nor has anything been said about the speed with which men who saw service in the last war could be brought back into the front line if ever war returned. The reserve that could be put into the field by, say, A-bomb day plus six months, is bigger than Britain has ever boasted before. But this is comfort for a contingency that everybody hopes—and most people believe—will never arise. For the contingencies that are arising already, the blunt fact is that the British army has a quart of commitments to fit into a pint pot. If, because of demands for economy and of pressures to reduce national service, that pint pot is to be further trimmed down, those in charge of the re-engagement of regulars will have to do some very hard thinking indeed.

they lack real sense of direction so long as they cannot maintain for the service an offensive role. But how and where is it to be found? There is no enemy surface fleet in being to be challenged and mastered. Even if there were, the American, British, French and other fleets in Nato would have overwhelming superiority over it. The pursuit of the *Bismarck* might be repeated with the *Sverdlov* class cruisers, but hardly the battles of Matapan and the Coral Sea. Does the offensive role of the Navy then exist at all? If so, is the aircraft carrier the right weapon for it?

The Americans have thought it is ever since the Japanese war left them with a great carrier fleet. They have some 20 carriers active and 42 in reserve, against the Royal Navy's three active, five in reserve and four transferred to training. They are still building 60,000 ton floating air bases like the *Forrestal* to fly off medium bombers; the Royal Navy is thinking of more modest ships. The American Sixth Fleet in the Mediterranean could come swiftly to the aid of the armies of Greece, Turkey and Yugoslavia, with hundreds of fighter aircraft and a striking force of atom bombers. Or it could be switched in a matter of days from the southern flank of the Soviet bloc to its northern flank beyond Norway, or to within range of the Danish waters through which Soviet submarines would leave the Baltic

to attack the Atlantic trade routes. This offensive and defensive air force at sea, it is claimed, can play both technical and strategic roles.

The British naval officer wishes to share this offensive role, but he lacks the ships and the aircraft for it. His air colleagues—and some of his soldier colleagues—argue that all this can be done more cheaply, at longer ranges and with less risk, from land-based airfields over the whole land mass of the Nato countries. If a fleet carrier were sunk by a submarine with all its aircraft and its atom bombs, the loss would be well over £25 million. The RAF and the Army would prefer to spend that money otherwise. For the time being, the argument looks like being settled by decisions on priorities in aircraft design and production in which the Naval Staff has not the major voice. The British carrier still lacks offensive aircraft: it cannot ship the Canberra bomber, and its own Fleet Air Arm Wyvern is already outmoded. Between those two bombers lies a gap that is difficult to fill, unless fresh decisions are to be taken about the use of air power at sea. Soon, it is true, naval fighters will be as good as anything the RAF is getting; but their task is to defend ships from jet bombers not to carry bombs to land targets. Given the right kind

The Price of Arms

The defence estimates provide for the expenditure of £650 million on production during 1954-55. The probable cost of some of the items are given below:—

Fleet Carrier.....	£16 million
Medium jet bomber.....	£400,000
Light jet bomber.....	£120,000
All-weather fighter.....	£125,000
Day fighter.....	£75,000
Helicopter.....	£25,000
Centurion Tank.....	£35,000
3-ton GS truck.....	£1,200
30 automatic rifle.....	£30
Standard rifle.....	£15
303 ball cartridges, per 1,000.....	£20
2 in. mortar bomb.....	£1

of medium bomber, says the naval airman, the carrier could launch long-range attacks below enemy radar with every advantage of mobility and surprise.

If the case for the aircraft-carrier as the spearhead of the Navy is to be made successfully, it has to answer such questions as these:

- (i) Can it seek out and destroy, better than land-based aircraft, enemy surface ships and submarines operating on the trade routes?
- (ii) Can it protect against bombing, in the open sea or in narrow waters, convoys and fleets which cannot be covered by land-based fighters with limited endurance?
- (iii) Is it needed to carry out bombing and mining operations to which the RAF, with strategic and tactical tasks on land, might fail to give due attention?
- (iv) Is it needed for operations short of major war such as Korea and Malaya and to assist the Army in its police operations overseas?

Given the right aircraft and ships the Navy's answer is Yes.

Here, then, in the aircraft carrier are focused the hopes of a generation of naval officers who know that the battleship carrying the admiral's flag will never be built again,

and that there must be a pause in the building of cruisers, until the first guided-missile ship can be designed. The sailors are waiting on the scientists. Meanwhile, their old six-inch cruisers are barely adequate to keep Colonel Perón out of the Falkland Islands.

The sailors have had to fight hard to keep their present substantial share in the defence estimates. They felt that ground lost now would not be recovered in future; and in the future lies the immense task of creating a new fleet for the atomic age. By 1960 the present fleet, apart from its latest anti-submarine vessels and minesweepers, will be largely out of date. It will be important to guess right about the warships of the future; otherwise, the sailors feel, the vital importance of keeping open the sea routes of Britain and the Commonwealth will be lost sight of in the pursuit of the new strategy of atom-bombing and commitment on the Continent. But the scientists are not yet ready with their calculations of the effect on operations of new weapons.

★

It is unfortunate that the Navy, as it pleads its case, must sometimes appear as the enemy of progress, especially when it has itself initiated so many new ideas in technical research and development. But it has had to deal in the past with so many surprises that it is sceptical of other people's certainties about the future. For example:

1. Against the view, briefly set out in the White Paper, that any future war would be violent and short, it maintains that it might be what was called in 1940 phoney-and-long. If so, the need for sea-power to build up the forces of Nato would be overriding.
2. It does not accept the assumption of other services that, in case of war, the land forces of Nato would hold their position and airfields, so keeping the enemy away from the shores of the Channel, the Atlantic and the Mediterranean. It cannot dismiss the possibility of further battles to get convoys through the Mediterranean against land-based aircraft; of further evacuations of troops; of further marshalling of armadas to the continent or more distant objectives.
3. It accepts the overriding need for effective fighter defence of this country, but holds that lack of food, oil and raw materials would bring defeat more surely than enemy bombing.
4. It distrusts the idea of preventing war by the deterrent of atomic bombing, because it distracts attention from what would happen if the deterrent failed.

It is clear that the ideas expressed in the White Paper represent only a first tentative fumbling towards the new balance of forces that will be required in the future. In designing that balance, it is the duty of the Navy to call attention again and again to the maritime basis of British strategy. It may be that the scientists will devise new ways of arming ships which will restore to the Navy its traditional role of furnishing mobile striking power over great distances. The American nuclear-powered submarine is, perhaps, one portent of how it will be done. But until the ways are found the Navy will maintain the number and increase the efficiency of its aircraft carriers. It is an expensive and, perhaps, short-sighted way of maintaining effectiveness and prestige; but no one has thought of a better way.

EUCLID

22

22 TONS CAPACITY REAR-DUMP WAGONS

Will increase your profits!

EUCLID 22-ton capacity Rear-Dump Wagons—powered by Rolls Royce diesel engines—are now built in Great Britain.

The additional capacity of this larger EUCLID means not only *more* loads, but *far bigger loads in less time*—operating costs are reduced—profit is increased.

22-ton capacity EUCLID Rear-Dump Wagons are available for early delivery—place your order now—all orders completed in strict rotation.

EUCLID 22 and 15-ton capacity Rear-Dump Wagons, EUCLID Bottom-Dump Wagons and EUCLID Tractors & Scrapers are all available for Sterling.

A complete After Sales Service is maintained for all EUCLID earthmoving equipment by the distributors

International Editions

LIFE INTERNATIONAL — average net paid circulation 250,000-300,000 copies in English, circulating in 120 countries outside North America.

LIFE EN ESPAÑOL — average net paid circulation 200,000-250,000 copies in Spanish, circulating in Central and South America.

These are the INTERNATIONAL EDITIONS of LIFE MAGAZINE, with a combined circulation of over 500,000 copies every fortnight.

TIME & LIFE BUILDING, NEW BOND STREET, LONDON, W1

LIFE INTERNATIONAL Editions are a unique advertising medium for showing the world what you have to sell.

Every fortnight, the English-language edition of LIFE INTERNATIONAL goes to more than 120 countries outside the U.S. and Canada. A Spanish-language edition circulates in the Republics of Latin America.

73% of the men and women who read these editions are in the upper income groups. A large proportion of them are also in positions to influence the buying of business, industry and government.

Only in LIFE INTERNATIONAL Editions can you reach so many top-of-the-market readers in so many parts of the world. There is a place in the large, beautifully printed pages of these editions for the advertisements of your company. The Advertisement Manager will be pleased to send you further information.

Nappies aired yet, Mrs. Hollis?

When washed in water soft as rain, clothes are really clean and free from hard-water lime deposits. In laundries, Albright & Wilson's 'CALGON' (Sodium Metaphosphate) has long been used to soften hard water. 'CALGON' is not a soap, nor a detergent, but simply a water softening powder. It is now being distributed through retail shops for all home uses.

A sample of Calgon will be sent on request.

Luxembourg

THE 6th INTERNATIONAL FAIR

JULY 10th to JULY 25th, 1954

Buyers from all over the world thronged the 1953 International Fair at Luxembourg where 18 countries were represented by more than a thousand busy stands. So great was the demand for space that an additional hall was made available to the Society that organises the Fair. Yet after this hall had been fully booked a further 183 applications for space had to be refused.

You can make use of this meeting-place of the nations to introduce your products or services to new markets and to increase the volume of your export trade. But please make your application for space as early as possible in order to ensure an effective display in the large representative British section. All details from the official agents in the United Kingdom.

Animal, vegetable or mineral

The benefits to every modern industry to be gained from the use of X-ray diffraction in the study of production problems are innumerable.

The versatility of this technique includes, for instance, the identification of minerals and solid substances in very small quantities, the study of 'frozen-in' stresses in castings and plastics, the investigation of setting in cement, the examination of textile fibre structure, and the analysis of particle size in powder.

X-ray diffraction is only one of the many research techniques which Soudes Place Research Institute applies to the development projects of its clients.

Industrial research problems and techniques are discussed in 'Report'—the occasional bulletin published by the Institute. Write to us now so that we may put you on our mailing list.

International Editions

LIFE INTERNATIONAL—average net paid circulation 250,000-300,000 copies in English, circulating in 120 countries outside North America.

LIFE EN ESPAÑOL—average net paid circulation 200,000-250,000 copies in Spanish, circulating in Central and South America.

These are the INTERNATIONAL EDITIONS of LIFE MAGAZINE, with a combined circulation of over 500,000 copies every fortnight.

TIME & LIFE BUILDING, NEW BOND STREET, LONDON, W1

LIFE INTERNATIONAL Editions are a unique advertising medium for showing the world what you have to sell.

Every fortnight, the English-language edition of LIFE INTERNATIONAL goes to more than 120 countries outside the U.S. and Canada. A Spanish-language edition circulates in the Republics of Latin America.

73% of the men and women who read these editions are in the upper income groups. A large proportion of them are also in positions to influence the buying of business, industry and government.

Only in LIFE INTERNATIONAL Editions can you reach so many top-of-the-market readers in so many parts of the world. There is a place in the large, beautifully printed pages of these editions for the advertisements of your company. The Advertisement Manager will be pleased to send you further information.

Nappies aired yet, Mrs. Hollis?

When washed in water soft as rain, clothes are really clean and free from hard-water lime deposits. In laundries, Albright & Wilson's 'CALGON' (Sodium Metaphosphate) has long been used to soften hard water. 'CALGON' is not a soap, nor a detergent, but simply a water softening powder. It is now being distributed through retail shops for all home uses.

A sample of Calgon will be sent on request.

A Daniel for the Spiral?

LAST new year's day, five distinguished gentlemen—a judge, a barrister, a chartered accountant, a tobacco manufacturer and the general secretary of a trade union—were given an unenviable task. They were appointed to two courts of enquiry into the wage disputes in the engineering and shipbuilding industries, which (if broadly defined) can be said to account for between one-third and two-fifths of Britain's export trade. They were asked, in effect, whether the country should buy off a strike in these industries, even if this might involve some risk of pricing British goods out of export markets.

In their reports, published last week-end, the courts intimate, as tactfully as they can, that they think it would be wiser to avoid a strike—by a wage increase in the region of 5 per cent, or just under seven shillings a week for skilled workers. This would represent an addition of only between 1 and 1½ per cent of the total sales value of engineering products; although for some products which are fairly typical of engineering exports it might increase costs of production by between 2½ and 3 per cent. But the real point is that the 5 per cent standard the courts now set is more than twice as great as the 2 to 2½ per cent annual average increase in real national production since the war; it is idle to suppose that some degree of inflation can be avoided if one sector of the community takes twice as much out of the pot as they and everybody else have put into it.

The courts recognised this point, and they were very uneasy about it. At the end of each of their two reports, therefore, they surged suddenly and boldly beyond their immediate terms of reference. They suggested that it would be "a most valuable contribution" if "some authoritative and impartial body" were set up to examine the wider problems arising from present wage negotiations, and in particular to assess "whether even a slight upward thrust in the inflationary spiral would be disastrous" under present circumstances.

The great virtue of this proposal is that nobody knows exactly what it means. Both the Government and the Opposition, however, are likely to take it to mean that representatives of the Trades Union Congress and the employers' federations should get together at the napoleonic level, to exchange arguments about wages and costs in general. Indeed, negotiations have apparently already begun to see whether the leaders concerned would like to do so. Sir Walter Monckton also made it clear in the House on Wednesday that recent proposals from the Ministry of Labour, for widening the scope of voluntary arbitration throughout industry, are based on the same desire to encourage this vague chumminess in high places; the essential foundation, he said, must be "organisation on both sides—well-organised employers and well-organised workers."

The aim of both political parties in handling industrial relations—whether they realise it or not—is therefore to concentrate more power at the pinnacle, and less at the peripheries. And, once this had happened, it would be a much shorter step than either party recognises

towards some attempt at formulating that most dangerous of all devices—a national wages policy. By this is meant a system whereby somebody should try to work out each year by how much the national income is likely to increase, and how that hypothetical increase should be divided between labour and capital. Once the leaders of the unions and the employers' federations had been brought together in some continuing body, they could fall into this habit almost in a fit of absence mind. But, inevitably, more and more outside "experts"—experts in the arts of economics or of compromise—would then be called in to work out proposals to lay before them.

★

The temptation is therefore irresistible to speculate about what sort of report such impartial "experts" should present at this time. The answer seems to be that they should present a report with three main conclusions; and that each of these conclusions, as impartial reports should, would probably annoy all parties—unions, employers, the Government and even courts of inquiry—equally and at the same time.

The first conclusion would be that the arguments upon which nearly all current wage bargaining and mediation are based are consummate nonsense. Arguments based upon relations between wages and prices are nonsense, because it is always possible to find some base dates (usually just after some previous wage award) since which wages have risen by less than prices, and some other base dates since which they have risen by more. Arguments that wage increases need not be inflationary if they are met out of profits are nonsense, because everybody knows that more kicks at ordinary shareholders (whose net incomes now amount to only about half their prewar purchasing power) can add only a few halfpence a week to basic wage rates; while transfers from undistributed profits towards wages are transfers from savings to spending power, which is what inflation means.

Even arguments based on relations between wages and productivity (although the best available) are nonsense in some degree, because levels of wages and productivity are as inextricably linked as the proverbial chicken and its egg. The major increases in labour productivity follow upon the installation of more efficient equipment; and, because of this, increases in wages which make labour more expensive in relation to machinery are a contributory cause of higher productivity as often as they are a result of it. The proper policy for progressive unions, as American experience shows, is to squeeze wage increases out of employers until they squeak, but then to put no barriers at all in the way of their installing labour-saving machinery.

If this doctrine was accepted, the second main conclusion of the report could be one that the unions would welcome: namely that, despite its disadvantages to pensioners and others living off fixed incomes, a little recurrent inflation—a tendency for wages to increase slightly faster than productivity—would be the best

recipe for a closed economy. But to this there must be added the immediate rider that Britain is not a closed economy; it cannot afford even a little inflation unless its overseas competitors are inflating, too. And, at the moment, Germany and some other industrial countries are unfortunately not inflating, while Britain is.

The third conclusion of the report would have to be that this process obviously cannot go on for ever. But economic forecasting is not a sufficiently exact science to permit any accurate assessment of whether the 5 or 6 per cent standard now set for this year's wage increases will bring early—as distinct from eventual—disaster. For what it is worth, the best hunch seems to be that the seven shilling standard—which may increase many British export prices by between 1½ and 3 per cent at a time when overseas markets are flagging—could have very serious consequences indeed towards the end of 1954. But it would be as absurd to suggest that the Government should delegate the task of making guesses on this matter to some impartial body as it would be to suggest some delegation of the guesses that each year underlie the Chancellor's budget.

★

Indeed, it would be more absurd, because the Government knows that it cannot itself frame a national wages policy in the same way as it frames a national budgetary policy. If it tries to adjudicate on what is the economic price of labour in a fully employed economy, it will then be called upon to adjudicate upon the proper economic price for every other factor of production as well. If it tries to apportion labour's share among individual groups of workers, it will find all employed persons climbing on to a bandwagon that is now filled only by the major unions (so that the major unions' share would have to be cut down, which would lead to strikes). And if it tries to guess in advance how much to distribute, it will throw away the main advantage of the admirable untidiness of the present wage bargaining system—the advantage that the system consumes time during which wage claims can be judged in the light of changing economic conditions.

Some people might criticise such a report as rude, or even unconstructive. But such criticism would be based on a total misunderstanding of the functions of wage arbitrators. The real objectives of the courts of inquiry last week were simply to arrive at the decision which they believed would have resulted from a strike, but at the same time to save the country from the inconvenience of a strike. It is probable that their decision is an unfortunate one for the national economy, but that does not mean that the decision that would have emerged from a strike—or from any more "authoritative" system of arbitration—would have been any different or any better. These disappointing Daniels have performed the only function that Daniels can outside the land of the Medes and the Persians; they have served not as oracles, but as emollients, in labour relations.

McCarthy against the President

THE melancholy story of Senator McCarthy and the Secretary of the Army is a painful reminder that, however much President Eisenhower may have gained in authority and grasp during his first year in office, he has so far failed to take the measure of the most dangerous man in the Senate. He failed again at his press conference on Wednesday, and passed to Congress the job of curbing Senator McCarthy's excesses. The Senator's insolent rejoinder immediately showed that he has no intention of mending his ways. A year or more ago it was taken for granted that when a Republican President, and one of Mr Eisenhower's stature and popularity, was installed in the White House there would be an end to the irresponsible exploitation of Communist fears and to the growing disregard for truth and civil liberties that had done so much to discredit the United States. Surely even Senator McCarthy would hesitate to foul the Republican nest, and if he did Mr Eisenhower, armed with the powers of the Presidency, would make short work of him.

What has happened, instead, is that the Administration, believing that the Republican Party could not afford a split, has retreated again and again before the Senator: "over loyalty in the State Department, over information libraries abroad, over the question of the Greek ships. Mr Harold Stassen, when he dared to criticise Mr McCarthy, was forced to eat his bold words almost as soon as he had uttered them. Only the Central Intelligence Agency and, much later, Mr Dulles were able to secure such unequivocal support from the President that they could stand firm. Such victories, won by the unscrupulous use of half-truths and unsubstantiated allegations and through an arrogant indifference to individual rights—all weapons from the arsenal of a Hitler or a Stalin—clearly have been undermining American influence abroad. But Senator McCarthy has also shown that, if he is not checked, he is prepared to dictate foreign policy as well as control internal security on his own terms.

Americans have been inclined to think that European opinion wilfully exaggerates the importance of Senator McCarthy. But the events of the past fortnight have set the alarms ringing all over the United States. If the President reads his newspapers, he can no longer have any doubt that his own prestige and party leadership at home and the good name of the United States abroad are alike in danger. The angry and forthright comments in American newspapers which are normally non-controversial or usually support the Administration (the Senator calls these "extreme left-wing elements of the press") are a heartening proof that many Americans detest both the Senator and his methods and are not afraid to say so.

The most remarkable demonstration of the Stevens affair is that the Administration is completely lacking

in any consistent plan for dealing with Senator McCarthy, whether to combat him, to neutralise him, or appease him. Mr Stevens was allowed to issue his proper defiance of the Senator for his bullying of General Zwicker and then left in splendid isolation to extricate himself and the Administration as best he might. Yet he had already shown, in an earlier case, that for all his courage and devotion to the Army he lacked a long enough spoon to lunch with Mr McCarthy.

★

The President's admission of "serious errors" in the handling of the Peress case shows that he felt that Mr Stevens had chosen poor ground to do battle; if he had been questioned by the Senator before the television cameras, the Army would have been arraigned, not Mr McCarthy. Certainly the Army seems to have been somewhat absent-minded in this case of a dentist who was conscripted, commissioned, and promoted in a routine way before it was realised that he had invoked his constitutional privileges not to answer questions about his loyalty. But there was a principle at stake—the right of a loyal officer not to be insulted and intimidated for following orders not to discuss the Army's security procedures and there was a great deal of public indignation to build upon. The Administration will wait till doomsday if it expects Senator McCarthy to hand it a fool-proof case.

Lacking any message of support from the President, and oppressed by the fear that he might be blamed for splitting the Republican party, Mr Stevens went into the lion's den alone and came out skinned. What he gave away, when he agreed to let Senator McCarthy question everyone concerned with the Peress case, was the right of the Executive to run its own departments. Legally, Congress may have an unlimited right of interrogation; the courts have never been called upon to say. But in practice, once legislators of Senator McCarthy's stamp are free to question officials of departments, the constitutional separation of powers begins to break down; once the heads of departments refuse to protect their employees, or are not supported when they try to do so, demoralisation sets in. The Army has no desire to go the way of the State Department, which is finding it difficult to recruit new blood, and where, according to Mr James Reston of the *New York Times*, officials are beginning to reinsure their futures by currying favour with Senator McCarthy. Mr Dulles's demotion of Mr McLeod, the friend of the Senator who was made the security and personnel officer of the State Department, is an attempt to retrieve a disastrous piece of appeasement.

The President's failure to take the offensive against the Senator inevitably recalls how, during the election

campaign, he reluctantly abandoned his plan to defend General Marshall in the state of his traducer because the politicians argued it would not do to alienate Senator McCarthy. It seems all too likely that once more the President's desire to stand for principle has been sacrificed to what he has been led to believe are the interests of the Republican party. Unquestionably many Republicans regard Senator McCarthy as their chief electoral asset in a threatening year; even now, the chairman of the Republican National Committee considers that the Senator is only at fault when he turns his guns on his Commander-in-Chief. Death has wiped out the Republican majority in the Senate and by-elections have brought it near vanishing point in the House of Representatives. The mid-term elections, when the Presidency is not involved, traditionally strengthen the opposition. This year the swing may be sharpened by the recession and the discontent of the farmers.

The Administration, however, will have to consider whether a victory won under Senator McCarthy's banner would be worth having. The type of right-wing extremist who welcomes Senator McCarthy's aid is the type least likely to support the President's moderately progressive programme in Congress. The massive Republican defections over the Bricker Amendment show that little reliance can be placed on party discipline. A Republican Congress owing political

debts to Senator McCarthy might well place him above the power of any President to curb; he would be in a strong position to capture the party and imprison the President.

It is not, of course, only the President who has been unheroic in dealing with Senator McCarthy. Despite all the grumbling about him in the Senate, only one man, Mr Fulbright, had the courage to refuse to vote this year's appropriation for his investigating committee. The Democrats who walked off the committee in protest last summer and have just returned have shown no excessive zeal for the thankless task of keeping Senator McCarthy in check. The President has now indicated that he expects the other three Republican members to take a full part in the committee's work. The damage done to the Administration, to the Republican party, and to the Senate itself has been made so plain that motions are being made to draw up a code of conduct for investigating committees.

But none of these efforts to remedy long-standing abuses will come to much until the President, who alone has the necessary authority and popular support, shows by deeds as well as words that he is personally in the fight and is ready to support every effort to restore respect for the decencies of public life. There is not very much time left if the leadership of the Republican party is not to fall to the very elements in it that Mr Eisenhower was confidently expected to repress.

The In-and-Out in Cairo

THE voice of authority has quavered in Egypt and, as a result, a people with a marked taste for being told what to do is dubious and uneasy. On learning the news of last week's whirlwind changes from Neguib to Nasser and back again, factions both within and outside the regime—groups of officers, Moslem Brothers, the shirt movement that calls itself the Egyptian Socialist Party, Wafdist politicians—began to manoeuvre for positions that they had no chance of regaining so long as the Neguib-Nasser movement stood undivided.

Of two sharp impressions that emerge from a medley of reports, the first is that the mob, once a sinister master of events, was partly responsible for restoring General Neguib to the Presidency and has therefore recovered some of its deplorable power. The rest of the responsibility lies not within Egypt but outside it, in the Sudan. The young colleagues who so heedlessly toppled Neguib from office betrayed their inexperience of the world abroad when they imagined that, having built a leader up, they could change him with impunity. Not only in foreign but in Egyptian eyes, it will take more than a few sentimental photographs of reconciliations to paper over a quarrel so startling and so noisy as that of last week-end.

The trouble came to a head in the small hours of

February 25th. According to Major Salah Salem, who as Minister of National Guidance was responsible for explanations that were to turn out premature, that night's meeting of the Revolution Command Council, or military *junta*, was the culmination of a struggle that had been going on for ten months. One immediate cause of disagreement seems to have been an attack on the Turco-Pakistani pact which General Neguib had made in a speech on the previous Monday; the speech, which was contrary to policy laid down in the *junta*, had been censored outright by Colonel Nasser.

The outcome of the meeting was Neguib's "voluntary" resignation of his appointments as President of the Republic, Prime Minister and chairman of the *junta*, and the assumption of the second two posts by Colonel Nasser. The story was that Neguib, who had not "actually become a member of the Revolution Council" until August 25, 1952 (King Farouk abdicated on July 26th) had subsequently undergone "a psychological crisis"; this Major Salem described as "a craze for publicity, combined with a desire for power greater than those of a mere voting member of a council of ten to fifteen officers; 'in general he demanded absolute personal power.'" The *junta* also explained that it had been ready to return to barracks and to

bequeath Neguib the powers for which he asked, but had been prevented from doing so by pressure from "the General Assembly of Free Officers." This, in practice, is probably the committee of the officers' club in Cairo, the cradle of the 1952 revolution.

During the two days throughout which these details were being edited and broadcast, Cairo seemed gloomy and listless; no proclamation of emergency was necessary. Neguib was peaceably confined to his private house under an armed guard which even cut open the bread to see that it contained no messages. But meanwhile one army group was on his side. The Cavalry Corps, which is the armoured formation of the Egyptian army, let him know of its support through Major Khaled Mohieddin, who is a member of the *junta*, and so was able to visit him. On leaving, Mohieddin is said to have been arrested; but, meanwhile, news in another vein was reaching the *junta*. It learnt that the frontier police were for Neguib, not Nasser, that its adversaries were girding their loins for action, that demonstrations had taken place in Khartoum in favour of Neguib, and that there was imminently due in Cairo a disturbed delegation from the Sudan's National Unionist Party. This pro-Egyptian group owes its strength to General Neguib personally, and without him would have little on which to base its case for a link with Egypt.

The *junta* therefore authorised Major Mohieddin to return to General Neguib and ask him to resume the presidency. The General's agreement to do so must be seen more as an act of patriotism than of personal ambition; for he returns only as President of the Republic. The communiqué announcing his restoration is at pains to explain that he will have "no more governing power than the President of the French Republic." The public, which showed its joy by demonstrating in favour of Neguib and against a military dictatorship, drew attention to the uneasy balance of power that has been arranged. For though its idol returns to the head of the state, Colonel Nasser, who remains Prime Minister and chairman of the *junta*, holds the effective reins of power. Yet Nasser is, in a sense, Neguib's prisoner; for events have shown that not only the Colonel but also his officers' committee lack public confidence if they lose the Neguib hallmark. The General, though shorn of two major offices, has not come off the loser.

★

By Monday, the sensational weekend was being written off as of trifling importance, as "a summer cloud quickly dispersed by the sun" and an interlude that in no way impaired the spirit or substance of the army officers' "sacred movement." Major Salem explained that, because the *junta* works on a basis of one man, one vote, its policy is unaffected by any deviation on the part of an individual. But this explanation puts altogether too bright a face on what was nearly a disaster. The oriental propensity for pinning hopes on an individual rather than on a policy is precisely

what restored Neguib to power. Moreover, immediately after his restoration, he moved into a strong personal position by reviving a promise of his early days—that he would rapidly form a constituent assembly and return to normal parliamentary life within three years.

Whether it strengthens the prospect of a stable Egypt is wide open to doubt. During Monday and Tuesday the *junta* arrested several party leaders, knowing or believing that they had been taking advantage of its momentary weakness. This is not a good prelude to a return to elected assemblies. Further, the history of the last five years in Turkey and of the last five months in Syria teaches the lesson that a dictatorial regime can afford to reopen the door to party politics only if its practical achievements are sufficiently solid and widely appreciated to silence recrimination. President İnönü succeeded in Turkey only after a quarter of a century of solid work.

★

The Neguib regime has some such deeds to its credit, but they are not of the spectacular kind that attracts public acclaim. Notably, it has employed one of the ablest bankers in the Middle East as its Minister of Finance, and has therefore largely restored the nation's collapsed finances; it has pulled Egypt out of the economic slough into which the Wafd's disastrous cotton export policy had plunged it; it has begun to attract the first swallows, mostly German, heralding a return of foreign investment. It has performed the feat of getting Egypt's student generation off the streets and back to its books, the only way to prepare an educated, instead of a feckless, electorate. But such deeds mean little to adversaries who have lost access to the perquisites of office, who resent the price paid for public security in the shape of censorship and restricted liberties, and who can point to rises in the cost of staples such as bread and sugar.

Indeed, the regime's only spectacular feat was Neguib's remarkable personal success in capturing Sudanese support for a link with Egypt. It was in order to try to repair the *junta*'s thoughtless wrecking of this one unquestionable success that Neguib performed almost the most naive act of a rash weekend—his rush to Khartoum to appear there at the opening of parliament as if nothing had happened. His journey may not have been fruitless. Though it ended in anti-Egyptian riots, bloodshed and a return by dead of night to Cairo (a scene vividly described by an eyewitness in an article on page 705), his Sudanese adversaries may have overdone their demonstrations and overcalled their hand.

Although an offer to return to parliamentary practices looks so well on paper, it holds out no promise of stability. Indeed, prospects are the other way about. It is as likely to divide the *junta* as to unite it and, in a country so riddled by party faction, dictation is not to be deplored provided it is steady and selfless. For

what is the alternative? It is a return to shift after shift between parties which are too timid to explain that the way to social betterment lies through policies that do not please, and which are therefore too prone to bow to the impulses of untutored schoolboys. Even Iraq, which has today come nearer than any other Middle Eastern state to running smoothly under a parliamentary regime, is not yet wholly immune from this scourge of young democracies.

For lack of leadership, the outlook in Egypt is not bright. What is the public to make of a team that is waving ballot boxes in one hand and arresting politicians with the other? By far the most serious consequence of its disunity and diminished authority is that the progress of economic development and social welfare is now indefinitely retarded. Leaders fully occupied

in holding their own have no time for wider plans; rich Egyptians will not convert their bank deposits into new employment while in doubt as to who is going to run the country; still more hesitant will be the foreigners whose big investments are essential to all major developments, such as new Nile dams and hydro-electricity schemes. Nor has the incident strengthened, in foreign eyes, Egypt's case that it is now strong and stable enough to maintain the guardianship of a base at Suez. If leaders are to be so easily swayed by factors such as divisions within the army or the mob's impulses in Cairo or even in Khartoum, who can vouch for their reliability? Last week's events will take time to live down and whether the *junta* will be vouchsafed the time will be in doubt for weeks to come. Meanwhile, Anglo-Egyptian negotiations will have to wait.

Open Prisons—I

Convicts as Neighbours

"IT'S like the war—with this difference: the alert has sounded but there's never going to be an all clear." That was how a local farmer summed up his own and his neighbours' anxiety about the proposal to establish an open prison on their doorstep. In a dozen districts of England and Wales since the war people have had cause to feel as he did. They have suddenly been faced with the prospect of welcoming as their neighbours some two or three hundred criminals, penned at most by a low wall that any prisoner could vault, guarded by officers armed only with truncheons. Many have feared that their property would depreciate because the neighbourhood could no longer be advertised as "desirable." It is not surprising that proposals to establish open prisons have invariably met with bitter opposition beforehand from the local people.

This opposition has been heard at the local inquiries that generally precede the establishment of any open prison, and occasionally it has even succeeded in persuading the Home Office to make the Prison Commissioners change their plans. Usually, however, if the site is suitable—in the part of the country where it is needed, in a sparsely populated area which yet enjoys the main services—the authorities go ahead. They can comfort themselves that the local people almost invariably co-operate once the prison has been established; those who protest about being murdered in their beds today will tomorrow be vying for the social distinction of being asked to prison concerts.

Open prisons began as an experiment in penal reform, on Sir Alexander Paterson's thesis that "You cannot train men for freedom in a condition of captivity." They multiplied under the pressure of sheer necessity, because they can be provided so cheaply and so fast. The first experiment was the open Borstal

establishment at Lowdham Grange in 1930; and six years later the idea was extended to adult prisoners in a satellite camp at New Hall, near Wakefield prison. But though the experiment proved successful, no other open prison was opened before the war. Since the war, eleven open prisons—two of them for women—have been established in England and Wales, and one in Scotland. But the proportion of prisoners held in open prisons is still small—less than 1,500 out of a daily average prison population of nearly 20,000—and selection for them is carried out with great care, for on this the success of the system clearly depends.

The procedure of selection is least rigorous for those convicted of the least serious offences. Five open prisons (Eastchurch, Halden, Bela, Wellingore and Grendon) take "stars" (i.e., first offenders who do not seem to be of ingrained bad character) serving sentences of less than a year, as well as a few other prisoners whose sentences have less than four months to run. Many of the inmates of these five prisons are civil prisoners who have failed to pay their rates or maintain their wives and children; none has been convicted of a crime of violence. Some prisoners are sent there after the briefest stay in a closed prison—merely the time that it takes to complete the reception formalities, check their antecedents, and arrange the transfer. On a short sentence, or shortly before release, the incentives to escape are clearly much less than on a long sentence; it is not worth losing remission (in full, one third of the sentence) and being returned to a closed prison on the vain hope of for ever evading recapture.

Prisoners with longer sentences must be chosen with more care and must therefore spend longer behind bars. They are also usually sent to different camps. First offenders who have been sentenced to between one and

three years' imprisonment may be sent to an open training prison either at Falfield in Gloucestershire or at Sudbury Park, Derbyshire. With them are other prisoners, including some who have been sentenced by the courts to "corrective training," from which it follows that they must have been convicted of at least two previous indictable offences. The few corrective trainees who are allowed into open prisons are chosen carefully; they are deliberately mixed with the first offenders on the theory that this will assist their reclamation without corrupting the others—a theory based on the fact that 80 per cent of first offenders do not, in any case, get into trouble again.

★

Corrective trainees who have not passed the rigid scrutiny needed for entry to Falfield or Sudbury Park may nevertheless find themselves living under open conditions in the satellite camps attached to two of the closed training prisons, Wakefield and Maidstone. Men may be transferred to these satellites at the Governor's discretion—as a rule towards the end of their sentences. Some of them have committed serious crimes, but the security is as non-existent as at the other open prisons. At Aldington camp, for example, there is not even a wall—merely an unmarked boundary. The prisoners go out in parties of twenty or so under the supervision of a single officer, to work for local farmers; sometimes a group of two or three goes to work unescorted.

Finally, the boldest venture of all is the open prison at Leyhill in Gloucestershire, which houses prisoners with sentences ranging from three years to life; of the 268 prisoners at Leyhill, 42 are convicted murderers serving life. But murderers, most prison officers will testify, are about the best behaved section of the prison population; having removed the nagging wife or rival lover, they often return to a quiet life. From Leyhill a dozen men may be seen riding out on bicycles in the early hours of the morning to go singly and unescorted to work on farms in the district. There was one disastrous episode here, when an escaping prisoner attacked a woman living nearby; and indeed, the number of escapes from Leyhill in the first two years—22 in all—was so high as to cast doubt on the whole system. But since then techniques of selection have improved, and for the last two years there have been no escapes at all.

In comparison with closed prisons, open prisons cost a negligible amount. Askham Grange, the women's prison near York, is a Victorian mansion which was probably unsaleable for anything except an institution; Leyhill was an American army hospital, Eastchurch a disused airfield. While money is short, these open prisons seem to be the only way of quickly relieving the appalling overcrowding in local prisons.

The question therefore arises: should the system be significantly extended? The first answer must be that although open prisons have not so far been a danger to the public, it would be a grave mistake to risk trans-

ferring men whose suitability is in doubt. The right type for an open prison is the man who is co-operative and rational; who is not subject to fits of rage or rebellion in which he blindly throws away privileges, remission and freedom from locks and bars; who is reluctant to risk the privileges of his fellow-prisoners along with his own; and who is suitable, by his personal habits and character, for dormitory accommodation. Finally, he must not already be so degraded that he prefers existence within cells and high walls (as some do) to the more exacting, more responsible life of the open prison. If risks are taken with prisoners who do not fulfil these requirements the whole system could be endangered. The tradition of orderly behaviour that has been so quickly established could be shattered, and a scared public would soon demand that all prisoners be locked up. There might be greater scope for expansion if there could be more prisons where open conditions are contained within a secure perimeter. One such prison exists—the Verne, Portland—and another is shortly to be opened in the Citadel at Dover. But moats, which provide the security in both cases, are somewhat scarce.

Secondly, however, open prisons cannot be justified solely by the fact that they do not seem to do the public any harm. It must also be shown that they do the prisoner some good. There are some critics who maintain that for a not unpleasant life, amid charming country, with plenty of distractions and all found, Her Majesty's hospitality has far too much to recommend it. But that is a question for a second article.

East-West Trade

It is plain, therefore, that the probability of war has already begun to tell on business in Russia. Contracts for hemp, and flax, and linseed, and tallow, and all other articles of export, are no longer entered into for spring delivery; and money, which it is customary to advance to all the growers and dealers throughout the country, is not advanced this spring. . . . While our exports to Russia were in 1852 . . . little more than the 78th part of our total exports . . . the exports of Russia to England were in 1847-48 one-third of her total exports. . . . At this particular season we have great need undoubtedly of the corn which Russia is accustomed to sell to us; but, as long as the present high price continues, corn will bear the charge of land carriage, and we shall not be deprived of Russian corn. As to timber, the stoppage of the supply from Russia will bring greater quantities from Norway and America, where the supply is at present practically unlimited at an adequate price. So with bristles, and hemp, and flax, and tallow, all the produce of a rude agriculture, and needing only room to grow them, of which there is a great abundance out of Russia. It is highly probable, we think, that the skill of the people of America, where the crop of hemp is this year remarkably fine, including our own colonies, will be able to produce all the commodities cheaper than they are produced in Russia, and that one effect of the war will be, should the Czar be mad enough to continue it, to hasten the clearing and the civilisation of the new world.

The Economist

March 4, 1854

Notes of the Week

Laboured Defence

AFTER their brave stand on German rearmament, the Labour leaders have failed to show equal courage in standing up to the left on so delicate a matter as their own country's defence. They did manage to prevent a vote against the Defence White Paper as a whole, but only at the cost of much embarrassment and of having to move an essentially silly amendment. The amendment, which was duly defeated by 25 votes, criticised the White Paper on three counts: that it failed to make a proper allocation of national resources between defence and economic needs, that it made no proposals for a reduction in the two-year period of national service, and that too much was being spent on production and too little on research.

The reference to "a proper allocation of national resources" was merely a pompous way of stating the familiar Bevanite plea that the country cannot stand the present level of defence spending. In debate the Labour leaders tried to talk themselves out of this, by implying that they were worried not so much by this year's defence estimates as by the prospect that the present level might continue indefinitely. They were equally equivocal about national service, since they were forced to admit that the two-year term could not be cut without a reduction of Britain's commitments. The Government had great fun twisting Mr Shinwell on the spit of his own illogicality; he co-operated in his own torture by squirming round in a circle himself, as he tried to strike a responsible attitude in the Commons but to win an emotional success in the country. The third point in the amendment, urging more research and less production, was as intrinsically silly as the other two, but it could have been made to look more valid. It was characteristic of the party that it was the point pressed with least vigour.

The consequence of this performance is that the left is exultant but unappeased, thirsting to inflict more humiliations on Mr Attlee and Mr Morrison, while the right has sunk back into the apathy which is its normal condition. Any emotional success arising from the half-hearted reservations about national service will be reaped only in Labour's constituency parties, where it will all be claimed by the Bevanites. The right wing leaders—who must acknowledge in their hearts the bitter truth of Sir Winston Churchill's gibe that their party now appears to stand for rearmament in Germany but disarmament in Britain—should draw one conclusion from this week's embarrassment: in party, as in national, affairs there is no security in compromise.

Pay Packets and Big Battalions

THE unfortunate Mr Shinwell did have one happy moment in the defence debate. He described Mr Birch's opening speech for the Government as a higgledy-piggledy affair, and so it was. But Mr Birch's matter was more worthy than its presentation. He had three items of news to announce.

First, as was urged in *The Economist* last week, the Government is to spend a fairly substantial sum (£16½ million a year) in order to try to persuade regular servicemen to sign on again when their three-year contracts expire. The technically-trained NCO will rightly come off best from the pay increases, the technical warrant officer class 1 receiving an extra six shillings and sixpence per day compared with the ordinary lance-corporal's two shillings. The increases in basic rates, length of service increments, special tradesmen's rates and tax-free bounties for men who lengthen their service commitments are all discriminately designed to keep hold on the experienced NCOs and technicians that the services need most urgently. Among the officers it is the middle group—from captain to brigadier—who will benefit most; experience has shown that officers feel the pinch most at this stage, chiefly for family reasons. None of the rises will apply to national servicemen.

Secondly, and somewhat irrelevantly, Mr Birch tacked on the announcement that the Government has given in to pressure about the pensions of the 8,950 ex-officers and 3,000 civil servants whose remuneration was cut between the wars to 9½ per cent below the 1919 level. To all intents and purposes they will have those cuts restored. This announcement was accompanied by the pointed warning that the Government does not consider that there is "any sufficient case for further general improvements in pensions for public service pensioners." The case of the cut-back

pensions is clearly regarded as one that must not be allowed to set a precedent—perhaps not even for MPs' own pay.

Mr Birch's third announcement was that selected categories of part-time RAF national servicemen—who have hitherto gained from the fact that the RAF cannot always fit in the sort of territorial training that the army imposes on its ex-conscripts—will be given training in civil defence. They can thus form the nucleus of the urgently needed mobile civil defence columns. Since the RAF will not need to mobilise all its reserves on the outbreak of war, and since it is precisely in those first months of war that civil defence will be seriously short of men, this is a wise though belated decision. Even now, it seems, the training of these men may not be able to start before the summer of next year.

Green Branches in Kenya

THE announcement that Waruhiu Itote (*alias* "General China," the captured Mau Mau leader) is being used in an attempt to bring about the surrender of the terrorists in Kenya has led to a downright row between the Government and the Europeans. General China had—justly—been condemned to death. His crimes were bestial, and his surrender, when he staggered wounded into the government lines, was clearly not made in response to General Erskine's surrender offer of last year. He is now engaged in addressing appeals to his former subordinates and comrades and holding parleys with them, and his sentence has been commuted by the Governor to one of life imprisonment. The Europeans, from Mr Michael Blundell downwards, have called this move mistaken, immoral, and "a sell-out to the terrorists." The wilder ones are calling for the dismissal of the Governor and the Commander-in-Chief. Most people—at any rate in this country—would call it plain common sense.

The settlers are clearly not worried solely about General China. It is a much wider question than that. Mau Mau is as much a malignant growth as a straightforward terrorist movement; the dividing line between guilt, complicity and innocence is a hard one to draw. But if Mau Mau surrenders, an attempt will have to be made to divide the sheep from the goats. The settlers are now behaving as if they do not even want to see the attempt made—or even an attempt to bring about a surrender, in which the Government has explicitly refused to make promises of lenience. One is forced to ask how on earth the settlers think that wars are brought to an end.

It is too early to tell whether the surrender appeal will have much effect. General China appears to have said that many terrorists feel that the time has come for a move back on to the political plane—a remark which carries ominous undertones. But the writing on the wall spells something very different from the message that the settlers have been reading. It is that they must press ahead with winning co-operation for a multi-racial society, now or never. The tragedy is that a man so moderate as Mr Blundell should, only this week, have been swayed by the gusts of settler emotion into opposing a motion in the

Legislative Council which calls on Mr Lyttelton to take note of the desire of non-Europeans for greater representation in the Council.

Towards German Rearmament

NOT until the end of this month will the Allied High Commission in Germany have to consider the amendments to the Federal Constitution that were passed last week in the Bundestag. They have still to go before the upper house, and there is ample time for the French High Commissioner, who is known to disapprove, to concert a view with his American and British colleagues. The amendments, whose passage is discussed on page 707, give the Federal Republic sovereignty in defence and state that the Bonn and Paris treaties—which require and entitle Germany to rearm within a European Defence Community—are constitutional. Legislation introducing conscription and other measures needed to set up a defence apparatus have yet to come; what is new is that they could now be passed by simple majority, provided that the Allied High Commission approved.

It is clear that this approval should be withheld until it has been settled beyond doubt whether there is or is not to be a European Defence Community. Allied policy is that German rearmament should take place in a certain way and with certain precautions. That is also Dr Adenauer's policy. If French resistance to the EDC makes that way impossible, then a new policy will have to be worked out by agreement between the Chancellor and the three allied governments. It is obviously too early for an agonising reappraisal of alternatives.

The German Social Democrats bear a heavy responsibility for their opposition to the EDC, but the latest German move shows that it is already late in the day for grasping that there will one day be a German army. The only remaining question is the form it is to take. Their line of argument is far more confused and split than that of the British Labour Party. They no longer reject rearma-

UK TERMS OF TRADE
1952=100

ment outright, but still illogically reject the only safe way to carry it out. They demand that there shall be no revival of militarist domination in the German state, but object to the EDC (which would make that impossible) on the grounds that it discriminates against Germany. They speak vaguely about a wider system of security than the EDC without making clear what they mean—unless it is the United Nations. When they demand that the EDC treaty should be more explicit in giving united Germany the right to secede from the community, they find themselves in company with right-wing Liberal Democrats whose motives are not above suspicion. It is a tragedy that the Social Democrats, a valuable force against a return to power by German nationalists, have so weakened their influence by lack of clear and sensible policies on defence.

Sir Winston Wishes

THE speech on foreign policy made in the House of Commons last week by the Prime Minister combined in masterly style self-justification and an apparent humility in the face of the facts of the Berlin conference. In essentials he has not changed in mood since last May, when he set Europe agog with wishful thinking, but he was in several respects more cautious. He holds "in reserve" the idea of a meeting between the heads of states and governments and insists that

it would certainly be improvident to see that resource used lightly, and it would perhaps be disastrous to use it in vain.

He seems more sceptical than he was about changes in Soviet foreign policy since the death of Stalin; and appealed openly to the Kremlin to realise its own responsibility for creating the Atlantic alliance it wishes to see abolished, and the advantages it could gain by making a "gesture of humanity" over Austria. Sir Winston remains poised high above the telegrams.

There would be clear advantages in his maintaining this position—for no other western statesman can—if it were not that his carefully balanced periods about on the one hand "building up the defensive strength of the free world" and on the other hand creating "conditions under which Russia may dwell easily and peacefully side by side with us all" were not so widely misunderstood. As one member pointed out in an excellent debate, Mr Molotov might have wanted to negotiate in Berlin if EDC had already existed; but Sir Winston's speech last May was a factor which helped to delay the creation of the EDC. Something similar now seems likely to happen over trade.

There is no doubt that the Kremlin, having committed itself to the great, double task of giving the Soviet consumer a new deal and making China into a powerful industrialised ally, needs the products of British and European heavy industry. To make possible some of the most valuable deals it has proposed, it will be necessary to reconsider existing restrictions on goods, the export of which increase Communist industrial potential.

The question arises—and the President of the Board of Trade shows no sign of facing it squarely when harassed in the House—whether a very important concession in the cold war is to be made by this country and its allies without some Soviet concession of equal value. Is it out of the

question for Mr Eden and his western colleagues to say to Mr Molotov that trade will be gradually made more free on condition that the Russians give a formal and public undertaking to withdraw public support from subversive movements in Asia and Africa? The Foreign Office could find interesting precedents for such a policy in Lord Curzon's dealings with the colleagues of Lenin. The present prospect is that there will be a headlong dash by businessmen to Moscow and Peking regardless of the political consequences of their actions. Sir Winston speaks of this as "friendly infiltration"; does Mr Eden agree?

Socialists and the EDC

LAST Sunday in Brussels the European members of the Socialist International passed a resolution on European security, with Switzerland, Sweden and Finland abstaining and only the West German delegates voting against it. Herr Ollenhauer and his colleagues opposed the resolution because implicitly it backed the European Defence Community. Yet the vote, as is often the case with official delegations, presents a simplified and distorting picture of Socialist attitudes towards EDC. Only recently it was revealed how evenly the Labour Party is divided on German rearmament. The secretary of the French Socialist Party, M. Guy Mollet, who is for the EDC, also has to deal with a strong opposition led by MM. Moch and Danie Mayer.

Indeed, it is on the discipline of M. Mollet's ranks that the fate of EDC may depend. It is generally estimated that about two-thirds of the French Socialist deputies are in favour of it, but in a close vote the obedience of "rebels" to party whips may prove of the utmost importance. At a recent meeting of the national council of the party the opponents of ratification deliberately avoided a clash, keeping their forces intact for the special congress that will be held on the eve of the ratification debate.

Thus the French Socialists may tip the balance in the decisive battle over EDC which will be waged in the French National Assembly. But when will this finally take place? France's allies will certainly press for an early decision before the Geneva conference in late April. The French government has already warned the deputies about the dangers of trans-continental horse-trading. If the opponents of ratification succeed in postponing the debate lest it should spoil the chances of a solution for Indo-China, Mr Molotov will be able to claim that delay had paid dividends, and that he, as a stone-waller, had emerged the victor from the Berlin test.

Burying a Failure

BENEATH its welter of complex details, the Government's new Town and Country Planning Bill contains important provisions for the future control of land use. It represents the second instalment of the Government's measures—the first instalment was the abolition of develop-

ment charges in 1952—for unscrambling the financial egg dropped by the Labour Government in its Act of 1947. The new Bill retains the system of close public control over all forms of development which was then introduced, while drastically altering the financial framework within which planning of land use has to operate.

The object of the 1947 Act was to eliminate the element of development value from the market price of all land. This was to be done by paying compensation once and for all, out of a fixed fund of £300 million, and by levying a development charge in all cases where development was subsequently permitted by the planning authorities. The theoretical merit of this arrangement was that planning authorities could refuse to sanction new development without incurring any financial liability. Its practical demerits were that it did not work as intended, and that it produced many inequities. The present Bill abandons this principle and ends the attempt of the Government to restrict the prices at which land changes hands in the open market.

Under the new Bill, the global fund of £300 million is abolished, but compensation will be paid individually, as the need arises, on the basis of the claims which have already been established. This problem of compensation has two aspects which the Government has wisely separated. First, there is the need to deal equitably with owners who have sold their land at restricted values in the last few years, or have paid a development charge under the terms of the 1947 Act. The Bill's ruling principle is that compensation claims in respect of these transactions should be met at once and in full (with accumulated interest), subject to the proviso that no owner should be better off than he would have been if he had sold his land at an unrestricted value. To sort out the actual compensation liabilities will be a very complex business, but the Government has adopted the only fair principle—even though in some cases the Exchequer will have to pay compensation without the community receiving any benefit. Unfortunately the cost of these immediate payments, estimated by the Government at about £30 million, will be roughly twice the net income received from development charges before their abolition. This loss must be written off as the price of an unsatisfactory experiment in control of land use.

New Plans and Payment

THE second, and more important, part of the new Bill deals with compensation for restrictions that will be imposed in the future in the interest of good planning. A gallant attempt has been made to deal fairly with owners, while keeping the cost of compensation reasonably low. Unfortunately, there is reason to fear that the scheme still may not work satisfactorily. When development is prohibited altogether, the compensation will in future be equal to the full 1947 development value of the land (as already assessed) plus an increment of one-seventh, which is intended roughly to cover net interest at 3½ per cent for the period 1948-55. Presumably further increments will be added after 1955. Public acquisition of land will similarly take account of 1947 values, and the system will exist side by side with a private land market in which current values will be paid. Understandable though this arrangement may be, in view of the extent to which land values will be created and

affected by planning control, it seems likely to breed a new crop of anachronisms. Any claim to compensation will run with the land and will not (as under the 1947 Act) be freely disposable.

At the same time, planning control will be strengthened by ruling out the right to compensation in a number of cases. For example, stipulations about the density of buildings, their design and appearance, and the provision of parking facilities (this last, a wise innovation) are to be viewed as reasonable requirements on social grounds. Development which is not broadly in accordance with the development plan of the local authority can also be prohibited without compensation—although compensation must be paid if a second application is made more than ten years later. This should prevent frivolous attempts to claim compensation, and it will also greatly increase the importance of development plans—which too many authorities now treat as loose frameworks for their *ad hoc* decisions.

Finally, all compensation will be paid by the Exchequer instead of by the local authorities. This will ease the strain on local finance (and thus remove one of the principal barriers to proper planning in many areas), but it will bring the planning authorities under much closer central control. The Government will be in a position to revoke or modify any of the local authorities' decisions if it objects to paying compensation. Restrictions which have been imposed during the last few years will come up shortly for ministerial confirmation, so that the new system (if Parliament approves it) will receive an early test. The merit of the scheme is that it tries to preserve and extend the best features of planning control; but its bifurcation of the land market and its assumption of centralised authority are dangers that will need to be watched.

Subsidy against Advertisers

THE Bill to introduce commercial television, in competition with the BBC's own service, is expected to be introduced into Parliament shortly after this issue of *The Economist* goes to press. It is already known, however, that the Government has taken the wise decision to allow the new and competitive corporation some income from licence fees, instead of leaving it wholly dependent on advertisements.

This was revealed in Parliament on Tuesday, when the Government announced that the combined radio and television licence will be increased from £2 to £3 a year. This increase had been expected for some time. The BBC has been running at a heavy loss, and has drawn down its reserves to a very low level. Since one-fifth of the revenue from sound licences has been used to finance television, it is fair that the new burden should be laid wholly on viewers. As there is no entertainment tax on radio or television, there is still to be some contribution from licence fees to the Exchequer; but the levy will now be fixed at £2,000,000 a year instead of being 15 per cent of a revenue which is expected to rise from under £13 million in the current year to about £20 million in 1957. This will help the BBC out of its difficulties, even though it will have to pay £750,000 a year towards the running costs of the new commercial television station.

Mr Herbert Morrison protested that a citizen who does not want commercial television, and who does not have his set adapted to receive it, will nevertheless be forced to pay something for it. "Subsidising advertising," some Labour members shouted. These shouts were nonsense. The "subsidy" is, of course, a protection against advertisers, not a buttress for them. The Government has rightly listened to those who urged that a television corporation completely dependent on advertisers might have to give them all their own way in order to attract enough custom. It would be better still if the new corporation drew only the smaller part of its income from advertisements. This would be possible only if the BBC also accepted advertisements between some of its programmes; but since both corporations would then be strong enough to make their own conditions, why not?

Old Look in Syria

By a coincidence, the very morning that brought President Neguib's resignation in Egypt was that chosen by part of the Syrian army to proclaim a revolt against President Shishakly. Here, too, division within the army created the upset, but the Syrian scene was different because the dissidents sought to restore the old political parties. In Syria, division into factions is wont to be additionally complicated by disagreement between Aleppo and Damascus which are, as it were, the Manchester and the London of the country.

The revolt was first announced by an army captain speaking on Aleppo radio. Within a matter of hours other captains had revealed that it had army support all over the country except in Damascus. By nightfall the Chamber, which was elected only last October and in which Shishakly's Arab Liberation Movement held 72 out of 82 seats, had also called for his resignation. By midnight he was over the Lebanese frontier and on his way to sanctuary in Saudi Arabia. Two days later, and after some street fighting in Damascus, his adherents there agreed to compromise with his adversaries. All united to restore to the presidency Hashem el-Atassi, the aged president whom Shishakly deposed when his personal rule began in December, 1951. A civilian cabinet has since been announced, with a prime minister from the National Party, and the army, by making itself scarce during all the inaugural demonstrations, has tried to show that it has no wish for political power.

The cabinet was meant to be a nationwide coalition. But it falls short of its objective because, it is said, the army rejected the inclusion of Akram Hourani's Socialists, and because the People's Party, the backbone of which is in Aleppo, would serve only under a prime minister who was an independent. It contains some strange team mates and no generally acknowledged leader, and the optimists of last weekend now seem unsure that they did right to put such an old man at the head of affairs. Life is no longer dogged by censorship and police spying, but it is once again exposed to the political merry-go-round that made tenure of office so uncertain in the past that there was no time for constructive work on development and welfare. In this field, Shishakly's democratic successors will have to sink many old rivalries if they are to do as well as he was doing.

Turkey Prepares for Elections

NEXT week the Turkish Grand National Assembly will be dissolved and will not meet again until after the general elections on May 2nd. Although no deep controversial issues of principle divide the two main contenders for power, the Democratic party and the Republican People's party, the election campaign promises to be a lively one with no holds barred. It will reflect much of the bitterness that has dogged Turkish politics since Ataturk's People's party was turned out of power in Turkey's first genuinely free elections four years ago.

Mr Menderes, the Prime Minister, has given a pledge that this year's elections will be as impartial as were those of 1950. His opponents profess to take this with a pinch of salt. They point to the recently enacted press law, parts of which could in their view be interpreted so as to muzzle the opposition press during the election campaign. Above all, they are incensed by the government's seizure, last December, of all the properties of the People's party, on the grounds that these had been acquired by "unethical means" during the party's long tenure of power. They have naturally interpreted this step as an attempt—largely, it seems, unsuccessful—to cripple the People's party's ability to run a full-scale election campaign.

The government, on the other hand, has provided some concrete evidence, in the shape of two electoral reforms, that it honestly wants fair and impartial elections. The first stipulates that lists of electors in each province must be submitted to all parties in time for them to be able to suggest alterations and additions. The second gives the task of settling disputed elections to a High Court of Elections, independent of both the executive and the legislature, instead of to the Grand Assembly. Thus in future the party enjoying a majority in parliament will no longer be able to settle disputed elections to its own advantage. This is an important reform. It suggests that the Democrats need no reminding that Turkey would not enjoy its present high standing in the free world if it had not demonstrated its desire and ability to make government truly representative.

Full Marks for ECE

THE latest survey of Europe in 1953 issued by the United Nations European Economic Commission (ECE) is a model of objective reporting and intelligent analysis. Not unnaturally people look to this Commission in Geneva for a thorough and unbiased analysis of economic conditions on both sides of the iron curtain. This time, within the limits imposed by the limited material available, they get all they can reasonably expect. Especially in dealing with countries of the Soviet bloc, it is always necessary to treat official claims with reserve, as so often these have been proved misleading by subsequent events. Moreover, not even the ECE is able to verify the official figures by its own independent inquiry; and the methods of collecting statistics and the manner of presentation are not adequately explained by governments concerned.

Your money— and your life Assurance

When you invest in a life
assurance policy you invest in
more senses than one,
for the Life Offices are one
of this country's main sources of
development capital.

A straightforward principle guides
them in the use of your money—
the security and benefit of the policyholder.

Not surprisingly, that principle
leads the Offices to a wide range of
sound investments, including
worthwhile business enterprises
on the prosperity of which, directly
or indirectly, your own job
may quite likely depend.

Then let's leave
Life Assurance
in tried and trusted hands!

MARCH

HOTELS AND HYPERBOLE

Provident people plan their summer holidays well in advance and in this they are assisted—up to a point—by the idylls in the brochures of the travel agencies. The language in which these are composed can only be described as rhapsodic; but one formula used to occur which always had a slightly equivocal ring. *Comfort anglais* sounds on the face of it like a contradiction in terms; for the English, with their absurd licensing laws, their draughts and their defeatist cooking are widely believed to have a genius for making themselves uncomfortable. Yet by continental hoteliers the phrase was not used ironically; it signified their readiness to provide what we picturesquely call a "cooked breakfast" and also the eccentric repast known to them as *le five-o'clock*. *Comfort anglais* seldom appears among the hotelier's blandishments now. Nevertheless, the British still travel and, as the year advances reluctantly into spring, many of us immerse ourselves hopefully in the business of planning a summer excursion to the Continent. And, as we pore over the brightly-coloured pamphlets, we cannot help wondering how illusory are the amenities offered by the various caravanserais. Will the *terrace agréable* be a spacious pleasaunce commanding unrivalled views or is it merely a bit of the pavement with an awning stretched over it? We shall not find out till we get there; and often this is just as well.

In the matter of foreign travel—and even more in that of foreign trade—the Midland Bank substitutes fact for conjecture. Through a world-wide organization, it offers an unrivalled service of banking and information for traders and travellers.

MIDLAND BANK

Tried selling hot water bottles in an ice cream journal?

You'd have a lot of stock on your hands if you did! There is a right place for everything. Selling to women for example—for themselves, their families and their homes. *GOOD HOUSEKEEPING* is your obvious choice.

GOOD HOUSEKEEPING is not just another high class periodical. It is the only magazine supported by the *GOOD HOUSEKEEPING* INSTITUTE—that most famous authority on homes and home-craft. Always remember when planning an advertising campaign that *GOOD HOUSEKEEPING* is as much a specialist journal for the home as is a motoring magazine to the enthusiastic motorist.

The Resident Managers will be happy to send full particulars

In the past the Commission has been criticised, in these pages and elsewhere, for accepting with apparently too little reserve some of the official claims which ultimately turn out to be little more than propaganda. In the latest report great care has been taken to qualify all unverifiable statements. In consequence, the sections on the Soviet Union and Eastern Europe are sceptical to the right degree. The sections on Western Europe are examined on p. 706.

Dearer Telegrams

THE decision to double the charge for inland telegrams was long overdue. The average family spends only 2s. 9d. a year on telegrams, and since the Post Office has recently been making an average loss of 3s. on each telegram sent the economics of the system had become decidedly odd. Indeed, inland telegrams have not made a profit since 1872, two years after the Post Office took over responsibility for them. Lately, squeezed as they are between a more widespread telephone system and a more rapid mail, the number of telegrams sent has been falling rapidly. In 1935 the Postmaster-General tried to act as an economic man, by reducing charges to attract more traffic; but he only made the losses larger than ever. The

Post Office can also reasonably claim that strenuous efforts have been made to reduce costs—by sending telegrams by telephone, by rationalising the delivery system, by reducing staff, by automatic switching and so on—but to no avail. Even now that the charges are to be doubled, the users of other Post Office services will continue to subsidise those who send telegrams. The loss on telegrams will still be some £2 million a year, or more than twice the annual loss before the war. The main criticism that can be levelled against the scheme (although it is not a criticism that is likely to be widely propagated) is that there might have been a bigger increase on press telegrams; these are now to cost 3 shillings instead of 1s. 3d. a page, but, because they escaped the higher rates in 1943 and 1951, are still

highly privileged. On the other hand, it is sensible that, for the sake of those who are without a telephone and who live in the country, there are to be night telegrams at the existing rates, delivered with the first post. The new arrangements should hasten the decay of an uneconomic service while reducing to a minimum the hardship of those who are dependent on it.

Trouble over Teachers' Pensions

THE Minister of Education has run into a cloudburst of trouble over her new Bill to raise the superannuation contributions of teachers from 5 to 6 per cent, which would cost teachers an extra £4 10s. to £7 5s. a year on the basic scale. There is room for debate about the justice of this Bill, but unfortunately the debate is still being sullied by the deliberate injection of muddle about the facts.

The facts are that the Teachers' (Superannuation) Act of 1925 established a contributory pension scheme with—at that time—5 per cent contributions from each side. This was to be reviewed periodically to see whether the contributions were actuarially sufficient to support the benefits. They are no longer sufficient, and for an obvious reason. Since teachers' pensions are related to salaries just before retirement, teachers who paid 5 per cent of their 1925 salaries into the pool in 1925 did not in that or immediately succeeding years provide sufficient to meet pensions based on the much higher salary scales of the 1940s and 1950s. The actuarial deficiency in the fund now amounts to about £194 million.

Across this trail have now been dragged two red herrings, and two plausible arguments. The first red herring is that the fund has an accumulated credit balance of £232 million; teachers of mathematics plainly ought to explain to their colleagues that every pension fund has to have an accumulated credit balance, even when it also has an actuarial deficiency. The second red herring is that this credit balance is still increasing, and will continue to do so for about five years. This is largely because the Exchequer is shouldering directly the full cost of pensioning service before the contributory scheme was introduced in the twenties. The last gasp effects of this slowly dying liability are wholly irrelevant to the debate of 1954.

The first of the two plausible arguments against the new Bill, however, is that newcomers to teaching could provide for their own pensions by continuing to pay contributions of 5 per cent—provided salary scales do not mount substantially between now and when they retire. Since their contributions (like those of existing teachers) are being raised to 6 per cent, they will be providing a little extra to help meet some £66 million of the accumulated actuarial deficiency of £194 million; the Exchequer, not ungenerously, is to meet the other £128 million over the years. The final and most plausible argument on the teachers' side is that many other pension schemes show an actuarial deficiency—and are being allowed to gape. In many private industrial schemes employers—especially those who have not recently consulted actuaries to find out what is happening—are meeting this problem by small but recurrent *ex gratia* payments themselves, or else by mulcting the accumulated

fund. It is a question for reasoned debate, and not for pressure group pyrotechnics, whether public authorities should slide and do likewise.

The Law and the Homosexual

THE Home Secretary will clearly have to announce shortly whether he agrees to an inquiry into the laws relating to homosexuality. The case for an inquiry has been strengthened by the views expressed by a body of Anglican clergymen and doctors in an interim report produced for the Church of England Moral Welfare Society.

The report, which is not for general publication, makes some interesting distinctions. Many people will quarrel with the authors' somewhat rigid classification of types of homosexuals. But there will be general approval of their emphasis on the distinction between homosexuality as a condition and homosexual acts. The condition itself, they say, is morally neutral; it is not blameworthy because the homosexual himself is not responsible for his condition, which may be innate or have been acquired in childhood. Homosexual acts, on the other hand, are morally wrong. The homosexual cannot expect a wider moral latitude than is allowed to others—though he needs, and should be given, more sympathy and help because marriage is denied him. But the report recognises that the fact that homosexual acts are, in the eyes of the Church, a sin, does not mean that they should be treated as crimes punishable by the state. Fornication and adultery are sins; but they are not crimes, though they may well have much graver social consequences than homosexual practices. It is, therefore, anomalous and unjust that consenting homosexual men can be prosecuted and sent to prison when the criminal law ignores both heterosexual sins and homosexual practices among women.

By this distinction between sin and crime, the authors of this report come down heavily on the side of those—for whom Sir Robert Boothby has become a self-appointed advocate—who ask that the law should be altered. Like Sir Robert Boothby, the Anglican reformers recognise the duty of the state to protect the young and preserve public decency. But they also point out that the present law provides an opportunity for blackmail and may be indirectly responsible for some suicides. By giving the homosexual a grievance it also encourages him to ignore the moral implications of his acts. The Home Secretary may argue that the law should not be changed in a hurry. But he will be flying in the face of informed opinion if he even refuses an inquiry.

Russians Off to the Land

SOVIET agriculture has a crucial role to play in the new regime's policy of improving the consumer's lot. To increase the output of foodstuffs and agricultural raw

materials a new programme was sketched out last year, which combines short-term incentives and long-term modernisation schemes. But it now appears that the government is counting not only on higher yields but on a rapid extension of the area under cultivation. A campaign is now in full swing to encourage the migration of town dwellers eastwards to the virgin and less hospitable lands of Kazakhstan and Western Siberia. Last week a special ceremony was held in the Kremlin, attended by the highest dignitaries of Party and state, to celebrate the departure of young Moscow Communists to the Altay regions of Western Siberia. The Soviet press is full of reports about young drivers, mechanics and other factory workers leaving to conquer the eastern lands.

The plans are ambitious. In Kazakhstan alone 6,400,000 hectares, it is claimed, are to be brought under cultivation by the end of next year. No figures are given for Western Siberia, though "hundreds of thousands" are to be moved there. Thus the eastward shift begun during the collectivisation, and precipitated by the war is now again being speeded up. Many birds could be killed with the same stone: agricultural output could be stepped up; the new granaries could help in hastening the industrial development of these regions. Mushroom towns grew up in these areas during the war, often outstripping the local food supplies; but with the rich Kuzbas and Karaganda coal deposits and with a wealth of mineral resources, northern Kazakhstan and the Altay could easily become the two most important industrial centres of the Soviet Union. There would be obvious strategic advantages in establishing alternative concentrations of industry to those in the vulnerable west.

The idea is not new, though it has been given a new impetus by the present agricultural drive. But the great difficulty has always been to find pioneers for the distant, unexplored territories. In Canada, for example, monetary incentives are offered to attract volunteers. In the Soviet Union appeals have been made to the enthusiasm of Communist youth, but slave labour was the chief instrument in the conquest of nature and the exploration of uncharted roads. Now, apparently, camp labour is to play a diminishing role in the economy of the new regime. The climate of Altay, though mild by Siberian standards, is not particularly attractive to, say, Ukrainians or Moscovites. What sort of incentive will Malenkov and Khrushchev use to foster mass migration without the use of force or threats?

Controlling the Universities

THE financial independence of the universities is the subject of a leisurely but stubborn game of shuttlecock between the Public Accounts Committee and the Treasury. The Treasury has recently batted,* and as it is batting for liberalism it is very much to be hoped that it will win its point.

The problem at issue is the capital expenditure of the universities financed by the Treasury, which is now running

* Treasury Minute. Special Report from the Committee of Public Accounts. Session 1953-54. HMSO. 1a.

at nearly £7 million a year. The Public Accounts Committee has pressed year by year for the books relating to this expenditure to be open to inspection by the Comptroller and Auditor General. The Treasury asserts that this would necessitate increased official intervention in and control of university affairs, to which it is very properly opposed. But since the Public Accounts Committee obviously means business, some compromise has become necessary. The Treasury has therefore proposed that the University Grants Committee should appoint one or two people to visit the universities and investigate their methods of controlling capital expenditure and to report back to the University Grants Committee. Their reports, together with recommendations for improvements, would be made available to the Public Accounts Committee.

This suggestion has merits of its own. Some universities are less efficient than others; they need and would often welcome advice on methods of controlling expenditure from so fatherly a source as the University Grants Committee. But will the Public Accounts Committee accept a proposal which would leave the universities' books still closed to them? The relation between the Treasury and the universities is unique, and the Public Accounts Committee could all too easily damage it. The new proposal gives much of the substance of what has been demanded. Now that this has been conceded, Parliament would be wise to give up the shadow.

Films, Flongs and Small Fry

INQUIRY into the influence of press, radio, and films on the moral and intellectual development of children and young people the world over was an obvious task for Unesco, a body which is always eagerly searching for obvious things to do. The results of such an inquiry, carried out by M. Philippe Bouchard, are now available.*

M. Bouchard is sensibly undogmatic. He believes that films can turn a youngster towards actual delinquency "only when the child is already, to some extent, vulnerable"; but that the cumulative inculcation of false values (black-and-white crudity of character, glorification of "the easy life," the establishment of either violence or "glamour" as an expected norm, the simplification into cliché and formula of all the complexities of human relations) is a distorting and impoverishing influence on character. These conclusions apply not only to films but to "comics," other reading matter, and broadcasts. (Television is hardly touched on, being important as yet only in Britain and America.)

The report is at once highly entertaining and profoundly depressing. The portrait of the typical "superman" of the comic strips is rich and recognisable. "His narrow cranial capacity has become classical and his receding forehead contrasts with very muscular arms and legs." . . . His language gives the translator no difficulty, for it is mostly a matter of grunts—"Oof, Wham, Bam, Ugh, Bang, Beeyah." He totally lacks a sense of humour; he inhabits a joyless world, "a nightmare of summary executions, air raids and atrocities." Unfortunately he cannot be prosecuted either for indecency or for subversive and criminal activities; he is

* The Child Audience. Unesco. HMSO. 198 pages. 11s. 6d.

Good. And the less likeable he is—the same can be said of the slouch-hatted detectives, the stereotyped Western heroes, the secret agents, the space-suited morons of the future—the better he sells. "It is clear," says M. Bouchard, of the "flongs" from which American strips are printed in France for the British and other European markets, "that the most mediocre publications are exported abroad because by appealing to the least desirable tastes they can reach the greatest number of children." To discover the causes of this virtually universal taste for garbage might be more useful than to seek ways of circumventing and frustrating it; but no notion of the way to set about discovery has yet dawned on educators, child psychologists, and the public-spirited providers of better films, magazines, and comic-strips. Superman always wins.

Living Costs in Cities

THE Statistical Office of the United Nations believes that salary earners will find that £76 goes as far in London as £96 would in Paris or £100 in New York. Some of its latest estimates on living costs in different cities are reproduced below. Based on the spending habits of international civil servants, these calculations compare the level of prices in each city with that in New York, after local prices have been converted into dollars at official exchange rates.

COST OF LIVING FOR SALARY-EARNERS

Autumn 1953: New York City = 100

Paris	96	Brussels	85
Buenos Aires	91	London	76
Geneva	90	Vienna	75
Rome	90	The Hague	72
Mexico City	87	Copenhagen	66

£ MILLION

Letters to the Editor

Middle-Age Spread in the Banks

SIR—The article in your issue last week was obviously intended to be provocative, and inasmuch as it provokes constructive thought it is, of course, to be welcomed. However, it is to be regretted that the writer's argument is based so largely on unsupportable guesses and loose generalisations as to be of little help to those who are interested in the continued well-being of the British banks.

It is impossible within a small compass to reply to more than a few of your correspondent's points. He makes an interesting suggestion that the private and professional borrower has an alternative source of finance in specialist loan organisations. Yet the facilities afforded by building societies, hire purchase concerns, insurance companies, and the like (if these are what are meant) are very limited in scope, albeit less controlled by Treasury directives, and generally much more expensive than bank accommodation. They are not considered a serious competitive element to normal banking.

In commenting on mechanisation your correspondent loses sight of two obvious factors. One is that the installation of mechanical devices must be governed by principles of economic cost. The other is that public co-operation may be necessary, as for example with the mooted "electronic cheque." Business organisation is built around existing systems, and any radical departures may be resisted. Indeed the conservatism of the public was clearly demonstrated when the size of cheques was standardised in wartime. Nevertheless far greater strides have been taken in mechanisation than your correspondent credits, and experimentation with prototype machinery is continually going on.

Other points of disagreement with your contributor are not difficult to find. There is no question of "heavy" payment for detailed statements of account; reference to the monthly staff magazine of any bank shows what branch to branch movement takes place—despite housing and schooling problems; banking is not alone in having men whose careers date from the first world war (would your correspondent exclude them from responsible positions?); the banking business unadaptable to mechanisation is not necessarily handled inefficiently. And if entry into bank employment today "must be something of an act of faith," is this not equally true of other businesses, professions, trades and industries?—Yours faithfully,

J. A. HUNSWORTH, Secretary,
Banking Information Service
London, E.C.3

Apartheid in the Universities

SIR—In your issue of February 27th, Professor D. W. R. Hertzog defends the racial policy of South Africa against "a lot of criticism from unenlightened outsiders," yet completes that sentence by saying that the alternative to *apartheid* "is the lynchings of the southern states of the USA where the Federal Government, ideologically blinded by the theory of equality, has been enforcing contact on the people." Mr Hertzog thereby proves himself an "unenlightened outsider" to the USA, drawing a common caricature of the southern states not in keeping with the facts.

In its annual report on racial violence in the USA, the Tuskegee Institute, a Negro college in Alabama, recently reported that there were no lynchings last year and so few in recent years as to justify the conclusion based on the downward trend for decades that lynching had ceased to exist as a problem in racial relationships. To be sure, the report pointed out, other forms of pressure on Negroes continued on a limited and declining scale, none involving such a terrorising disregard for life or law; but for each example of such pressure that is cited the impartial observer might also find new examples of acceptance of the Negro into the American economic and social structure. One of the best examples is in the American armed forces, where integration of Negroes with whites has proved smooth and successful—not a case where contact "must result in friction and bloodshed." Through continued contact becoming more peaceful, Negro and white have learned to live together within the same economic and social structure, the Negro minority gradually assuming a place in that structure proportionate to its size.

There lies the reason Mr Hertzog cannot validly point to this country as a horrible example of what he considers the only alternative to *apartheid*. But there also lies the clue to why he will not accept the American solution of absorption into the South African structure: the South African non-whites being the actual majority, the massive impact of their seeking a place proportionate to their size would inevitably change that structure which Dr Malan, Mr Hertzog and others seek to defend through inflexible adherence to *apartheid*. It is not an easy problem for the whites of South Africa, and though the world is appalled by the implications as well as the practice of the present policy, no solution acceptable to both groups

is offered, not even by the United Party. Let Mr Hertzog and others not, however, attempt to make their solution look like the best one by representing it as the only alternative to an untrue picture of the southern United States.—Yours faithfully,
Louisiana, USA HENRY S. BRADSHER

★

SIR—In a letter in your issue of February 27th, Professor Hertzog asserts that because of the racial complexity of South Africa, "the Government must ease the tension by limiting contact and ensuring separation in all spheres and places where it is possible." I fear that confused and prejudiced thought has led him to such a definitive and categorical conclusion.

Mr Hertzog tells us that these pernicious contacts, if not limited, will lead to "lynchings of the southern states of the USA where the Federal Government ideologically blinded by the theory of equality has been enforcing contact on the people." As it is admitted that a lot of daily contact is unavoidable, the point at issue must be social and academic contacts.

Has academic contact at the University of Cape Town in fact been harmful? Is there such resentment that a predominantly European university should nominate two African members to its Student Representative Council? On the contrary, I think that the liberal attitudes of the Universities of Cape Town and the Witwatersrand have done much to improve race relations in South Africa. They have done much to lead to understanding and tolerance between the black and white races, and to answer the silly notion that Africans are inferior. Restriction of this important academic intercourse between intelligent and educated members of the community can do nothing but harm.—Yours faithfully,
EDWARD OSBORN
The Queen's College, Oxford

Enterprise in the Air

SIR—According to published timetables, BOAC are currently operating 15 flights across the North Atlantic each week and these will be increased to 23 weekly in the spring. Each of these flights is a combined passenger, mail and freight service. The contention you made in your article of February 13th that the British Government were proposing to grant a freight monopoly to Airwork Limited does not accordingly bear scrutiny.

On the other hand, passenger and mail traffic on the North Atlantic, so far as British enterprise is concerned, is the absolute monopoly of BOAC. No other British service is allowed. I imagine Airwork would welcome an opportunity to share BOAC's trans-Atlantic passenger and mail monopoly on the same terms as BOAC are already free to participate in Airwork's so-called cargo monopoly.—Yours faithfully,
London, S.W.3 L. CASTLEMAINE

Just look at these facts, Mr. Evans

Mr. Stanley Evans, M.P., who pictures British farmers as lying lazily at ease on their feather-beds, with their hands in the pockets of the British public, should consider these facts:

With an annual turnover of £1,200 millions, British agriculture has increased output by 51 per cent. since pre-war—an achievement equalled by no other country in the world.

Production per man has gone up by 40 per cent. (steel 39% and coal 4%).

Crop yields per acre have risen on average by 10 per cent.

Milk yields are up by from 10 to 15 per cent. per cow.

Average prices of the chief farming products have risen by only 14 per cent. compared with 47 per cent. in mechanical engineering.

What is Mr. Evans' first reaction to this record of achievement? He wants to "clap a flat tax of £2 per acre on every agricultural holding tomorrow morning."

Yet, farmers are already prevented from lowering their costs and raising their output still further by lack of capital due to crushing taxation and unavailability of low-interest long-term credits.

Our farmers are not fools. They know that the only sure guarantee of their own future prosperity is large-volume, low-cost output and cheap home-grown food. The way to get it for the British public is not to attack the British farmer but to assist him.

In Italy farmers get five years' credit at only 3 per cent. for the purchase of machinery. Why not here?

Grow more food in Britain

Close-up of 1951

SURVEY OF INTERNATIONAL AFFAIRS 1951.

By Peter Calvocoressi.
Documents on International Affairs 1951.
Selected and edited by Denise Folliot.
Oxford University Press. 513 pages and
723 pages. 45s. and 60s.

ANY journalist who has served abroad during the year covered by these two massive volumes must be taken aback to find how much of his own and his French, American and Swiss colleagues' work forms the scripture to which the writers refer. The surprise is never quite overcome, because only the foreign correspondent knows how much and how little he could publish; how few important documents he ever saw. Yet, what he wrote is considered worthy of reference. This is inevitable, since diplomatic documents about such recent events are not available, though there is access to official communiqués after conferences and to the speeches of statesmen and the declarations of Governments. And it is all these, collected and extremely well indexed and edited by Miss Denise Folliot, which make an essential reference book for 1951, in the same way as the previous volumes of Chatham House Documents are indispensable to students, writers of theses, would-be journalists and journalists engaged in the writing of reminiscences. The historian will scan these documents and want a good deal more.

For instance, the historian may well ask how Greece and Turkey came to join the Atlantic Pact in 1951. This was momentous. It brought the Pact right into the whole question of Middle East policy and Middle East Command. There is nothing either in the volume of Documents or in the Survey to indicate that it was the breakdown of the idea of a Mediterranean Pact (through Count Sforza's firm refusal to have anything to do with such a pact) that led Washington to consider the urgent arguments, put forward both by Count Sforza and by Signor de Gasperi in their visits to the United States in 1951, for the inclusion of Greece and Turkey in the Atlantic Pact. Mr Herbert Morrison's speech in the Commons on July 18, 1951, reveals little of the long struggle between the idea that the North Atlantic Treaty Organisation should be strictly limited to the North Atlantic countries—that is, the British, French and Scandinavian idea—and the Italian idea that Italy must join it together with all other "free" Mediterranean countries, a view which Count Sforza never tired of putting for-

ward. But no documents are yet available on the subject; only his speeches, one of which, in the early spring of 1951, advocated that if the situation should worsen then an Atlantic Union of free Europe and the United States might even become necessary. Urgency seemed always round the corner, as Mr Peter Calvocoressi points out in the preface to his survey, for 1951 was very much dominated by the aggression in Korea the year before.

In terms of the American and Allied war effort and of vast economic repercussions Korea remained important, but 1951 seems in retrospect very much a Middle and Far East year. The inclusion of Turkey and Greece in Nato held out hopes of the "containment" of Communism right across to the Persian Gulf; but the hopes were pretty soon dashed by the unilateral abrogation of the Anglo-Egyptian treaty of 1936, and hot upon the heels of crisis and "Black Saturday" in Egypt came the Persian oil struggle. How difficult the writing of such recent history can be is shown by the conflict between the explanations given by Mr Calvocoressi on page 258 and by Mr George Kirk on page 281 of the reason for the denunciation of the Anglo-Egyptian treaty. The former writes:

The principal western Powers, having resolved in June their differences about the command of the Mediterranean, addressed themselves more earnestly to the cognate problems of the Middle East. Their plans suffered a setback at the onset, for as soon as it became known that Washington, London and Paris intended to make with Ankara definite proposals for the establishment of a joint defence organisation in the Middle East, Egypt denounced, on October 8th, the Anglo-Egyptian Treaty of 1936.

Mr Kirk writes:

The maintenance of the [cotton] prices at nearly prohibitive levels when world prices had already begun to fall had caused a spectacular decline in Egyptian cotton exports... there was much popular discontent at the steadily rising cost of living. The Opposition pressed for the enactment of a law to investigate the origins of recently acquired fortunes. This was expected to strike at the Wafdist leaders and it was said that during the summer of 1951 the King himself, feeling that the Wafdist leaders had exceeded reasonable limits of self-enrichment, had compelled Nahas Pasha to disgorge some misappropriated lands. Nahas Pasha appears to have anticipated the risk of dismissal by an irresistible appeal to patriotic sentiment. A Cabinet Committee had been at work drafting the legislation necessary to abrogate the British alliance...

and on October 7th the Bills were submitted to the King.

Which interpretation is correct? Perhaps both are: it is too early to tell.

With this 1951 survey, the Royal Institute for International Affairs returns to its prewar practice of an annual survey accompanied by annual documents. The reviewer might therefore ask whether the Documents volume is not really adequate on its own, and again whether the Survey is really necessary? Both volumes (as has already been suggested) are bound to be incomplete because diplomatic documents cannot be released yet. This absence of the directives and of the initiative behind the various and immensely complex moves on the international scene is obvious in the Documents volume. It has no pretexts. It publishes what is available and leaves the rest out.

Immense pains have been taken in the Survey to preserve accuracy in the résumés of letters, speeches and notes, whether made by Professor Joliot Curie at "Peace Congresses" or by Mr Acheson at a press conference, but here a note of unreality creeps in. No serious attempt is, or perhaps can be, made to delve into the policy or intention behind these statements, but long years of attendance in continental parliaments, where the Speaker likewise meted out democratic and communist action with an equal impartiality, make this reviewer occasionally feel uncomfortable. If you think that the cold war is merely a struggle for power and watch it as a cold neutral almost scientifically, then this method is a method. But certain factors do repeat themselves, and could be highlighted without anyone being accused of engaging in propaganda.

When all this has been said, the Survey is a remarkable achievement, packed tight with information and constituting an indispensable source for those who wish to talk or write on foreign affairs. At least five thousand people in this Survey alone, counting military and political negotiators, journalists, writers of bulletins, green books, white books and documentations of all sorts are, at a guess, so concerned, and if they all read the Survey, it is just possible they might see what a strange, confused, ambitious and cunning creature is the *homo bureaucratic* in this twentieth century.

Exalted Bourgeoisie

MADAME DE POMPADOUR.

By Nancy Mitford.

Hamish Hamilton. 275 pages. 15s.

"CHAT was the pastime of the age, cheerful, gossipy, joking chat." So writes Miss Nancy Mitford of the times of Louis XV. After she has assimilated the chat from the diaries and reminiscences of statesmen and courtiers, her pen transcribes it with a lightness and charm which well matches the French gifts of expression. Her portrait of Madame de Pompadour may not be entirely convincing—it will strike many readers as over pleasing—but only a

stern moralist could fail to enjoy the comedy, wit, beauty and absurdity of these scenes of life at the most brilliant court in Europe.

Hated by the courtiers because she was a bourgeoisie, hated by the bourgeoisie because of her extravagance, it might have been thought that Madame de Pompadour led a very uncomfortable existence between two fires. Not a bit of it, according to Miss Mitford. It all sounds delightfully pleasant, with the nicest of interpretations put on the lady's actions, that they were motivated solely by her love of Louis. It is difficult, however, to make this ring quite true. There was no doubt that she was a charmer and a very capable and gifted one, too, of whom it is probably true to say that "a more accomplished woman has seldom lived." But it is difficult to believe that ambition did not play a larger part than Miss Mitford would have us believe.

However, like watching a play performed in the over-emphasised manner of the best French school of acting, which enchants but never seems quite real to English eyes, the reader will doubtless be content to be captivated by this book. In the middle sections some of the scenes overlap too much and there is a jerkiness here and there in the time sequence. But these are small irritations. The argument about Madame de Pompadour which is never settled is the extent of her influence on power politics. In this much more lovable picture of her than any text book allows, she is not given as much political weight as is often ascribed to her. The French afterwards laid the blame for the fatal Austrian alliance at her feet, but Miss Mitford asserts that the responsibility rested more with the indolent Louis. Six of one and half-a-dozen of the other, it all added up to a blatant mixture of personal motives.

Only here and there in this story of manners and elegance, traditions and privileges, can be felt the rumblings of the Revolution. Yet it was Madame de Pompadour herself who said "*après nous le déluge*."

Searchlight on Sterling

THE FUTURE OF STERLING.
By A. C. L. Day.
Oxford University Press. 227 pages.
12s. 6d.

MOST contemporary discussion of the prospects for sterling as an international currency suffers from being excessively imprecise in conception and excessively shallow in historical perspective. Mr Day has attempted to remedy the deficiency by applying to the live issues of high sterling policy his academic mind and his academic methods. His work is far from being an academic treatise, and makes no claims to be one; the analysis draws freely on past researches and is unencumbered by a welter of footnotes (which will be as pleasing to the general reader as it is annoying to the student). Essentially, and at its best, this book is

a practical essay in the application of academic method.

That is at once its strength and its weakness. Mr Day's careful, if somewhat laboured, discussion of the factors behind the strength of sterling in its pre-1914 heyday and of the implications of the progressive disintegration of those factors is certainly the best method of presenting current problems in their true perspective; but in the process Mr Day falls into the economic historian's irritating habit of weaving neat relationships between seemingly unconnected events that almost certainly were in fact unconnected. The detailed discussion of the advantages and disadvantages of the sterling area arrangement (and in particular of the common alignment of exchange rates and discrimination against dollar goods) is a welcome departure from the usual glib assumption that the benefits of these practices are too obvious to justify discussion; but here again Mr Day appears to have been carried away by his method of argument and approaches an essentially practical question in too academic a vein. The same criticism applies to his questioning of the net benefits of restoring sterling to its position as a truly international currency and London as a world financial centre. Perhaps the best part of the book is the careful analysis of the implications, for Britain and Europe, of the many forms that sterling convertibility might take.

For all its minor defects, this will certainly be a useful—and in many ways stimulating—book for readers who want a quick background to current international economic problems. But Mr Day can occasionally lapse into the jargon and incongruous examples of the lecture room. He has at least one unforgivable passage:

Even though a purchase of cheese from Italy might be just as liable to cost gold as a purchase from America, Britain might choose to buy from Italy even if Italian cheese cost rather more, to avoid the loss on the terms of trade which would arise in the latter case, because the world outside America would have to lower its export prices substantially in order to balance accounts with America after they had been put into deficit by this cheese import. Clearly such policies are based on assumptions about demand elasticities, import propensities and the like which are practically unverifiable.

This is the sort of thing that has earned contemporary economics its reputation as the muddled science.

Officers—and Gentlemen?

CROMWELL'S GENERALS.
By Maurice Ashley.

Jonathan Cape. 256 pages. 21s.

"I LOOK upon them as persons very unapt to be quiet, nor able to endure any settlement whatsoever and therefore I think the depraved appetites of such sick minds ought the less to be valued," wrote Henry Cromwell of his father's generals in 1657. Mr Ashley now adds to his knowledgeable studies of this period by telling the story of

the Commonwealth and Protectorate through the careers and personalities of Cromwell's generals.

To Henry Cromwell the generals were thorns to be plucked from the Protector's side if a constructive settlement were to be attained; to Mr Ashley they were men of principle as well as of ambition. Indeed he sees Cromwell's greatness as a leader confirmed and enhanced by a study of his relations with these generals who differed so sharply in origins, temperaments and views. He treats in turn of those who at different stages exercised a preponderant political influence upon Cromwell, of those who went into opposition and of those, like Monk and Blake, who loyally confined themselves to their military and naval duties.

Until his early death in 1651 Henry Ireton stood closest of all to Cromwell. By origin a country gentleman he was concerned to stem the radical tide in the army and then to defend property and the social order against those invoking the dangerous doctrine of natural rights. The next to influence Cromwell was the son of a butcher, Major-General Harrison, who arrayed himself in splendid scarlet uniforms and demanded the dictatorship of the godly and a radical social programme. In contrast, Major-General Lambert, untouched by the sense of religious mission, stood out unashamedly for the power of the army and the career of John Lambert. It was he who advised the unpopular policy of holding the country down by force by the rule of the Major-Generals, though it was Cromwell who sought to make that rule an instrument of moral reform and not merely of security. In the last six months of his life Cromwell relied upon the enigmatic Fleetwood, whose organising talent and bravery had contributed to past victories, whose tears helped to induce Cromwell to refuse the offer of the crown, and who ultimately conspired to bring down the Protectorate.

Mr Ashley's account is both fair and spirited. He gives an admirably clear and concise account of the campaigns, and he uses quotations skilfully to bring out the contrasts and clashes of personality. But the effect of the book is to substantiate Henry Cromwell's views and to diminish rather than increase the reputation of Cromwell, so easily influenced in turn by the mystical ravings of Harrison, the tactless views of Lambert and the tearful exhortations of Fleetwood. Mr Ashley is happier in description and narrative than in interpretation and judgment; and the judgments he ventures are sometimes uncertain. He deplores the mistaken scheme of the rule of the Major-Generals and admits the ambition of Lambert, yet credits him with a touch of enlightened statesmanship. And it requires a very elastic definition of class and a very simple view of causation to say of the Major-Generals that "they all of them belonged to the rising middle-classes which had brought about the revolution against the Stuarts."

THE ECONOMIST, MARCH 6, 1954

Historian's Old Look

THE FRENCH REVOLUTION, 1788-1792.

By Gaetano Salvemini. Translated from the Italian by I. M. Rawson.
Jonathan Cape. 843 pages. 18s.

PROFESSOR GAETANO SALVEMINI'S book was first published in 1907. Since then there have been other revolutions and counter-revolutions and two world wars, the second of which was planned by German and Italian, and exploited by Russian, revolutionaries. These catastrophic events and their political consequences have naturally influenced historians; for, as Benedetto Croce has said, "all history is contemporary history."

Thus, shocked by the Bolshevik Revolution, Nesta Welster reconstructed the French one as a conspiracy of illuminati, Free Masons and Orleanists; and a few years later Pierre Gaxotte felt compelled by the verbose incompetence and financial unreliability of French democracy to rewrite the story from a Royalist angle. This provoked a counter-attack by the Left—ten essays published by the French Communist party in 1939; and a much more useful work, "*La Lutte des Classes*," by Daniel Guérin, whose research into the economic, social and financial circumstances of the revolution deserves serious attention, even if his use of his evidence was biased. Between the champions of Bourbon and Babeuf came Georges Lefebvre, whose sincere and scholarly "*Coming of the French Revolution*" was published in 1938. Gaxotte, Guérin, Lefebvre are three historians whose studies of the great revolution have been of particular interest to English and American scholars.

From the translator's note it appears that during twenty years' exile from Italy Professor Salvemini was unable to revise his work in the light of recent historical research. But it seems improbable that he could have lived through those years without acquainting himself with its more important conclusions; and while it would be no discredit to him (or to the translator) if, after inspection of the latest fashions, he had decided not to try to give his original creation a new look, there seems no point in reproducing the old look without some indication of his reasons for considering it superior.

The narrative has been described as "exciting"; and in Italian it may be; but in that case the English language must have lowered its temperature considerably.

Occupied Country

AUSTRIA'S INTERNATIONAL POSITION, 1938-1953.

By Cary Travers Grayson.
Librairie E. Droz, Geneva. 317 pages.
15 francs.

WITH the help of a long pair of shears, a large amount of paste and a strangely erratic pencil, Mr Cary Travers Grayson Jr. has assembled a

remarkable compendium of documents on Austria since it was annexed by Hitler, fifteen years ago. Mr Grayson has deliberately confined himself almost entirely to quoting and summarising the work of other people, and about one-third of his book consists of an extremely valuable appendix containing the text of most of the official documents concerning Austria. This includes the text of the as yet unpublished "State Treaty" as it stood in 1949 when Russia, perturbed at the defection of Yugoslavia and the weakness of both Czechoslovakia and Hungary, decided not to withdraw from Austria.

Unfortunately, the undoubted skill with which Mr Grayson has plied his shears and applied his paste is seriously marred by the extraordinary carelessness with which he has wielded his pencil. Since his book was printed in French-speaking Switzerland, Mr Grayson should have been doubly careful when reading the proofs. Many of the misprints do not matter very much. But he ought not to talk about Syria when he means Styria, or about Salzburg or Studenten. At times, too, Mr Grayson's choice of phrase is strange. It is, perhaps, merely unusual to describe Austria's finances as having been "in a state of bedlam" after the war. But it is hard to believe that "Austrian minor Nazis" can ever have been "instructed that by such deeds they would expunge themselves" or that, in April, 1938, the German Catholic clergy were "already waged in a spiritual war of defence

against flagrant Nazi aggression."

Nevertheless, anyone who is prepared to ignore such blemishes in what purports to be a scientific study will find much interesting and useful information, particularly about the last eight of Austria's fifteen years under military occupation. There are, it is true, a number of minor errors and omissions. Mr Grayson is wrong, for example, in saying that the Soviet Zone includes "the full course of the Danube river through Austria." Actually, Soviet control of the river itself ends at Linz. River traffic upstream from this point to Regensburg has been under American control since the end of the war, much to Russia's annoyance, and has therefore been entirely unhampered. Mr Grayson also fails to make it clear that internal postal, telegraphic and telephonic communications in Austria were freed from four power censorship soon after the war ended, not, as he seems to suggest, in 1953. Again, the Soviet Government has undoubtedly been taking much more than 1,505,000 tons of oil from the Austrian oilfields for at least the past two years.

Such points, however, should not be allowed to hide the fact that Mr Grayson's book is indispensable for those who wish to study the background of the squabbles over Austria during the postwar years and the way in which that little country, because of its key geographical position, immediately becomes of major importance whenever there is a struggle for power in Europe.

The Truth about Advertising

By Robert Brandon

'The Truth about Advertising' is neither wholly technical nor is it non-technical. It is directed to the intelligent man who feels that the impact of advertising on the world is a subject worthy of study and understanding. The potentialities of the Press, the poster, the film, the exhibition, direct-mail letter and commercial broadcast are all understandingly reviewed; whilst psychological reactions and the influence of advertising on cost and value-for-money distribution are explored in the light of long experience.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Which Way to Prosperity?

Washington, D.C.

IT is a long time since there were so many anxious doctors at the bedside of the American economy, each with his own diagnosis and his own remedy for the ailment from which he thinks the patient is suffering. The disease is described by some as a "rolling readjustment," by others as an "inventory recession" or a "descent from the over-time economy," and by Senator Douglas, the other day, as a "situation which is now admitted to be a recession even by those who formerly shied away from that term." But whether the cure is to leave the patient to recover by himself—and even not to mention the fact that he looks a little pale—or to give him a mild course of credit relaxation or to use the shock treatment recommended by Senator George, there is one thing clear: the patient has been sinking very slowly up to now and is giving the assembled doctors plenty of time to agree on what should be done.

The anxiety is caused, indeed, less by what has already happened—the Federal Reserve Board's index of industrial production has fallen since July by about 10 per cent—than by the feeling that all the signs still point downward and by the fear that a Republican Administration is ideologically less fitted than a Democratic one to take firm measures before things get out of hand. Neither of these sentiments is probably as strong as it was a few months ago when the symptoms were less clear and the government seemed less aware of the dangers of letting things drift from bad to worse. The Economic Report showed that the Council of Economic Advisers, at least, was not prepared to sit back and watch a serious deterioration in the economy and the President's statement a couple of weeks ago that he would take the March unemployment figure—if it showed no improvement—as a danger signal is proof that he is willing to take their advice.

What worries people now is something less dramatic than the possibility of a sudden plunge into depression; it is that the Administration may be prepared to accept a succession of "second best years." Professor Alvin Hansen of Harvard explained these worries to the Joint Congressional Committee on the Economic Report. He said that, although the policy of the Administration was designed to prevent a slump, he missed "an equally reassuring statement that the federal government will employ all its powers to promote maximum employment, production and purchasing power." He saw a danger of the United States moving on to a flat plateau and eventually, after some years, finding itself in a depression engendered by stagnation.

Many observers in Washington would agree with Professor Hansen. Any political party which has been out of power for twenty years must be the prisoner, to some extent at least, of its years of opposition. The Republicans quite naturally have concentrated their attention on the inflation which undoubtedly occurred during the Roosevelt-Truman era rather than on the real economic expansion that also took place during those twenty years. And, because the inflation was almost entirely the result of war and the expansion was certainly started by the rearmament programme of 1940 and given a further boost by that of 1950, they have an emotional, and probably subconscious, tendency to equate the two.

There is, as Professor Hansen has undoubtedly noticed, a little too much complacency over the prediction that 1954 is likely to be as good a year as 1952 and, therefore, equal to the second best year in American history. There is also an unjustified assumption in some quarters that a continuation of the same state of affairs, which is no doubt tolerable in a year of adjustment from a war economy, would be satisfactory over a period of years.

Perhaps because of this attitude, and the reasons for its development, the approach of the Administration to the contraction in the economy has been as leisurely as the contraction itself. And, as the party of big business, the Republicans have presumably felt that a goodly proportion of the tax benefits arising from the reduction in government expenditure which they have achieved should go, in the first place, to industry. Mr Humphrey, the Secretary of the Treasury, can quote good economic doctrine in support of the contention that such things as more liberal depreciation allowances encourage expansion by business and thereby create employment.

But it is doubtful whether this "trickle down" method will get the money into the hands of the consumer quickly enough. The Economic Advisers concluded, after all, that the country was experiencing an inventory adjustment which was necessitated by the failure of consumption to keep up with production. Therefore, it is argued by the opposition, the important thing at the moment is to give the consumer more to spend rather than to encourage business to expand productive facilities which are already too big for the immediate market.

It was this argument that persuaded Senator George,

who has never been considered a New Deal economist, to introduce his Bill to increase the exemption for personal income tax from \$600 to \$800 next year and to \$1,000 in later years. He was probably influenced by what Dr Nourse told the Joint Committee. Dr Nourse, who was always considered the conservative member of Mr Truman's Council of Economic Advisers, maintained that only tax relief to the consumer would enlarge buying power quickly enough to counteract the real trouble which, he said, lay "somewhat deeper than the statistical surface where inventories are counted."

Dr Nourse discussed one by one what the President has called the "formidable arsenal" of weapons with which recession could be fought and dismissed all except tax relief as inadequate. The credit controls of the Federal Reserve System, he said, could do little to stop a recession and almost nothing to start a recovery; debt management and budget administration did not have enough firepower; more was always expected of public works than they could deliver; and the change to flexible agricultural price supports would, in the short run, have a deflationary effect.

Nothing that all the economists who have appeared before the Joint Committee have had to say, and none of Senator George's arguments, have affected the Secretary of the Treasury. Mr Humphrey has issued a statement in which he expresses his vigorous opposition to

blanket increases in exemptions that will throw us back into deficit financing which cannot be justified at the present time and which we have been working so hard to overcome.

The battle has, therefore, been joined and it will go on for some months unless the pace of the recession gets faster and argument loses itself in action.

This is less a battle between parties—there are Republicans and Democrats on both sides—than one between two schools of thought, between, roughly, businessmen—the National Association of Manufacturers supports Mr Humphrey—and economists and those who listen to economists. And there are two parts to the argument. The first is whether the American economy must continue to expand or whether it can afford a period of hesitation, if not of stagnation. The second is whether, as a short term measure, tax relief should be used to encourage an immediate increase in consumption or to expand production to take care of the demand which must come eventually from a population which is growing rapidly both in numbers and in ability to produce more and earn more.

Men from the FBI

Washington, D.C.

THE American public is not, by tradition, well disposed towards the police. Yet over the past twenty years one police agency, the Federal Bureau of Investigation, has become something of a national institution. This was dramatically illustrated by the extraordinary impact which the testimony of its director, Mr J. Edgar Hoover, had on public opinion during the electric days of last November, when battle was joined over the bones of Harry Dexter White. Although the Attorney General was severely criticised for bringing a non-policy-making agency into a political controversy and for using Mr Hoover's prestige as a secret weapon in such a battle, Democratic orators are still

as ready as are Republicans to lavish praise on the FBI and to take credit for having supported it. Liberals have some misgivings about this "untouchability" and Mr Hoover's undoubted flair for publicity has inspired both sarcasm and ridicule. But the FBI's popularity has a firm basis in the efficiency, courage and honesty with which it enforces the federal laws against crime.

There were few such laws until the early nineteen-thirties when Congress was forced to act by the chronic incapacity of the ill-equipped, badly co-ordinated and sometimes corrupt state police to cope with gangs of murderers and racketeers organised on a national scale. The crossing of a state boundary by the suspected criminal, the kidnapped victim, the stolen property or the absconding witness was made the signal for federal investigation. The responsibility of undertaking this fell upon the FBI largely because it was already in existence; it was a highly-trained and scientifically-equipped corps of special agents ready to go into action against racketeers as soon as it was given the authority.

The FBI had been fathered in 1908 by Napoleon's grand-nephew, Mr Bonaparte, who was Attorney General to Theodore Roosevelt, to investigate the small number of federal offences that then existed and were not otherwise provided for. Once Mr Hoover had taken over in 1924, at the age of 29, strict recruiting and training regulations were enforced—all special agents have to be university graduates in law or accountancy—so as to overcome the rooted prejudice of juries against police and expert witnesses. No agent of Mr Hoover's has ever been convicted of crime or corruption, and for many years the FBI's record of success in obtaining convictions in the cases it has prepared has been almost perfect.

But the achievement in which Mr Hoover seems to take most pride is a negative one, that he has "prevented the formation of a national police, an idea to which I have always been most vigorously opposed." Murder, assault, rape and other common law offences are still matters exclusively for state and local police unless another state becomes involved or unless the federal government has jurisdiction over the place where the deed is done—on Indian reservations or a ship on the high seas, for example. Even the older investigating branches of the federal government remain in operation: counterfeiting, smuggling and dope-peddling are handled by the Treasury, whose Secret Service guards the President, and the Post Office has its own detectives.

Although the FBI firmly refuses to handle local cases it has helped greatly to improve the efficiency of local police forces. Its scientific resources—the famous technical laboratory which can analyse every sliver of evidence and the fingerprint library with 130 million entries—are at their disposal, and their most promising officers can be sent on courses at the FBI's National Academy.

★

Misgivings arise, however, not from these admirable activities, but from the second great expansion of the FBI's field, which occurred during and since the war and which has so increased the scale of its operations that it now has a force of 5,500 agents (compared with 900 before the war) and an annual budget of \$78 million. The FBI has become the chosen instrument of the war against Communism inside America.

This development sprang from three sources. At the outbreak of the last war President Roosevelt gave the FBI

sole responsibility for internal security. This made it the principal domestic intelligence agency, with the duty of reporting to the President, the Attorney General and other heads of departments involved on any matter that it thinks should be brought to their notice—hence the reports in 1945 and 1946 on Harry Dexter White. Secondly, various Acts of Congress since the war have specifically named the FBI as the body to investigate applicants for certain positions which are "sensitive" from a security point of view. In some cases the bureau must automatically carry out a "full field investigation"; in others it only does so if "derogatory information" is found on the person's file. A full field investigation involves the questioning of people who have been neighbours and associates of an applicant at all stages of his career and the tracking down of any allegations that may be made. Finally, under President Truman's loyalty order and President Eisenhower's security order the FBI has to check every present employee of the government and all recruits to its service to see if there is anything that calls for investigation.

Mr Hoover is extremely anxious to refute charges that in the course of carrying out these tasks he has built up a "Gestapo"—a word that constantly recurs in his speeches. His answer to such charges, and to over-eager admirers who want practically everyone to be "cleared" by the FBI, is to insist on its limited function. He said for instance at the White hearings:

The Federal Bureau of Investigation . . . does not make policy; it does not evaluate; it secures facts. . . . I am merely a subordinate official of the Attorney General. . . . I am advised of the policy to be followed.

His agents are trained to report what they are told exactly in the manner of the telling, so that the witness's malice, bias or misunderstanding may be revealed and discounted when the reports are passed on by the FBI to the official who must "evaluate" them.

The idea of the FBI being a detached research organisation is, of course, not altogether realistic; for example, Mr Hoover himself evaluates the reliability of his sources whenever he wishes them to remain confidential. Nevertheless, most of the resentment that arises among those who are liable to investigation should not, in fairness, be directed at the FBI but at the "policy makers," and the prevailing climate of public opinion. It is not Mr Hoover who insists on the full treatment being given to American doctors attending conferences of the World Health Organisation or to holders of jobs that by the widest of construction could not be called sensitive. Nor is it Mr Hoover who imposes such serious penalties as suspension of employment or refusal of a passport until such time as the FBI shall have finished its lengthy search for facts behind the gossip on its file, a search which may go back over many years of a man's career and involve several different countries.

But there does seem to be a certain inflexibility about the FBI's methods, perhaps because it tries to apply the principles of criminal investigation to this very different field. The "facts" behind a concept such as "sympathetic association" with another person or group about whom other allegations are made (and so on, through a Chinese puzzle) are of a very different type from the "facts" that determine the true order of events surrounding a clearly defined crime. In spite of the care taken to teach FBI

On the trail of trade

THE National City Bank of New York was the first American national bank to open a foreign branch. Since that day it has always been a leader on the trail of trade.

Wherever trade has been active, The National City Bank has opened a branch. Today the bank commands a world-wide network of 57 overseas branches, staffed by men with a first-hand knowledge of local business practices and regulations. In addition, The National City Bank has correspondents in every commercially important city in the world.

The London branches offer the facilities of this world-wide organization and are, as well, uniquely equipped to advise on trade with the dollar countries.

THE NATIONAL CITY BANK OF NEW YORK

(ESTABLISHED 1812)

Incorporated with limited liability under the National Bank Act of the U.S.A.

Head Office: 55 WALL STREET, NEW YORK. London Offices—City: 117 OLD BROAD STREET, E.C.2. West End: 11 WATERLOO PLACE, S.W.1

That Mr Eisenhower himself was uneasy about his failure to put his foot down firmly was apparent from his bearing and from his refusal to answer questions on his statement. As a rebuke to anyone less resilient and thick-skinned than Mr McCarthy, the President's statement would have been admirably crushing, even though it was cushioned by a proper admission of error in the handling of the Peress case, the incident which gave rise to the present basic argument over principle, and a proper recognition of the separate responsibilities of the Executive and the Legislature. But propriety makes no impression on Mr McCarthy.

The President insisted that he alone could ultimately be held to account for executive action and that no government employee should be humiliated by a congressional committee—without doubt a reference to the experiences of General Zwicker (to whom General Eisenhower paid a personal tribute) before Senator McCarthy. Then the President went on to say that, while he expected all government employees to respond cheerfully and completely to requests from Congress, he also expected Congress to treat them fairly. He commended the efforts now being made by the Republican leaders in the Senate to improve the procedures of investigating committees. Finally the President regretted that the country was being diverted from the grave domestic and foreign problems that required undivided attention by "disregard of the standards of fair play recognised by the American people."

Senator McCarthy, bounding back immediately at his own press conference, agreed with the President that time was being wasted and announced that he at least was going to get on with exposing Communists. He and the President, he said, were evidently of the same mind on the necessity of getting rid of them and disagreed only on how to handle "those who protect Communists." One of those who Mr McCarthy now seems to think may be protecting Communists is the Secretary of State. Mr Dulles may thus be one of the first to find out whether the President's observations on justice and fair play have put any restraint on Mr McCarthy. For Mr Dulles has just taken away from the Senator's protégé, Mr Scott McLeod, his duties as personnel officer of the State Department and left him in charge only of security matters there. And Mr McLeod had earlier declared that the two functions were inseparable if the "chaos" in the department was to be "cleaned up."

Berlin Under Scrutiny

THE heavy strain of three international conferences in rapid succession is not all that Mr Dulles, the Secretary of State, is having to endure. In the few days between returning from Berlin and setting out for Caracas, when a little rest and preparation would have been in order, the Secretary was compelled to justify his agreement to meet the representatives of Communist China at Geneva to discuss settlements in Korea and Indo-China. Mr Dulles had noticed how reluctant Congress was to run any risk of involvement in a new Asian war; he might reasonably have concluded that negotiation would be a welcome alternative. Moreover, he considered that by standing firm he had enabled the United States to carry all its points on the composition of the conference and the limited questions it was to deal with. He had also secured an assurance,

in writing, that the meeting would not be taken to involve recognition of the Communist regime.

Mr Dulles evidently was a trifle indignant, but he cannot have been altogether surprised, at his chilly welcome from the Republican leaders in Congress. A Democratic Secretary of State, after all, would have found it more than his place was worth to suggest treating with the Communists whom the friends of General Chiang Kai-shek regard with such implacable hostility. The conductor of the critical chorus is Mr Knowland, the Senate majority leader, who warned Mr Dulles, in a speech at New York, that if the meeting at Geneva turns out to be a "Far Eastern Munich," the American people will have none of it. In Mr Knowland's view, any settlement in Indo-China is virtually certain to involve the surrender of the whole country to the Communists in a short time; he is suspicious, as well, that one of the prices of peace may be the admission of Communist China to the United Nations. Other Republicans are not convinced by diplomatic semantics that Mr Dulles can meet the representatives of China without recognising them the next time.

Mr Knowland's misgivings seem to have been shared, to some extent at least, by all the Republican leaders except Senator Wiley, the chairman of the Foreign Relations Committee. Mr Dulles has, in effect, been told to watch his step at Geneva and warned that he will be held accountable if he trips. Like Mr Dean, the American negotiator at Panmunjom, Mr Dulles cannot find diplomacy easy under present conditions. Fortunately, however, unlike Mr Dean, who has been accused of "appeasement" by Senator Welker, Mr Dulles shows no signs of resigning.

SHORTER NOTES

The 800,000 shares in the New York Central Railroad, over 12 per cent of those outstanding, which belonged to the Chesapeake and Ohio Railway, have been sold to two friends of Mr Robert R. Young, who is trying to get control of the New York Central. As long as they were held by a rival railway, there was a strong possibility that the Interstate Commerce Commission, in the interests of preserving competition, would prevent the voting rights represented by these shares from being exercised at the shareholders' meeting in May. Now it seems probable that they will be exercised in Mr Young's favour.

★

The suggestion that so far only four refugees have entered the United States under the emergency immigration programme enacted last summer may not be correct, but certainly the number has been so small that it seems unlikely that the 15,000 authorised for the first year will have arrived by next June. And if the full 209,000 are to be admitted by the end of 1956, drastic steps will have to be taken to cut through the administrative tangle, arising mainly from the complicated restrictions in the Act itself, which is holding up the programme, both in the United States and in the countries where the refugees are.

★

The three Polish consulates in the United States, in New York, Chicago and Detroit, are to be closed by order of the American government, on the grounds that they serve no useful purpose. There have been complaints that the Detroit office is a centre for Communist propaganda.

It means faster progress in the clearing of sites for new factories and housing estates, in the building of new roads, in the breaking of new ground for agriculture. It means greater economy for the contractor on every excavating and construction job.

Today, in Britain and in the many countries for which Britain is an International source of supply, contractors are taking delivery of the new

Doncaster-built International BTD-6. This is a 40.5 horsepower full-diesel crawler, incorporating the exclusive features and the traditional ruggedness of construction which have kept International in a class of their own.

With its remarkable versatility and its outstanding economy of fuel, and with matched allied equipment, the International BTD-6 certainly means business.

Spears Against Egypt

FROM A SPECIAL CORRESPONDENT IN KHARTOUM

ONLY a few hours before the Sudan was about to embark upon the political sophistication of parliamentary life, there leapt from the very earth itself an incongruous and primitive passion to remind the watching world that the good order of British administration is not deeply rooted in the tempers of the people. Sir Abdel Rahman el Mahdi, cotton king and dignified associate of premiers and princes, sent his call into Omdurman and the deserts, to tribesmen who journeyed to the outskirts of Khartoum. There, outside the airport as President Nguib arrived, they formed a fearful replica—only cleaner, healthier and better fed—of the army of that earlier Mahdi whose revolt drove Egypt from the Sudan. Nor was the purpose much changed; for if the earlier army rose to fight, this one rose to give warning that it was prepared to fight.

The imitation was too good to mean anything else. The wide plain, the bright sunshine, the mass of turbaned tribesmen with hundreds of banners waving over their heads, seemed a deliberate invocation of history. There was at that time no intention to shed blood, and no one has yet satisfactorily explained how the riot started outside the Governor-General's palace and under the very shadow of General Gordon's statue. Perhaps the most credible explanation is that memory put a sharp edge to the fears of the police, most of whom were sectarian opponents of the Ansar army. (The Ansar is the heterodox sect of Islam headed by the Mahdi: the Khatmia is its orthodox rival.) Weapons, the Mahdi: the Khatmia is its orthodox rival. Weapons, as it were, emerged by reflex action. It cannot have been that these people had been sent by El-Mahdi to attack his good friend President Nguib. On the other hand, the tribesmen came armed with spears, knives and clubs.

Whatever started the fighting, it served to reinforce the general impression by its very primitiveness. Police were stabbed with spears, knifed and clubbed with a fury so often described in stories of the Mahdiya; and then, it seemed at a word, they drew off, gathered their dead and wounded, and wandered back through the Khartoum streets to the home of El-Mahdi, where they curled up on the grass verge and in the gardens and, for the most part, dozed in the afternoon sun. El-Mahdi or his son told the police to come and get police rifles and a horse captured in the fighting, and this was done without disturbing the afternoon calm. No police, no army, came to drive away or arrest these people whose activities had caused a death roll of about 30 and about 200 wounded. Later in the day there was a clash with the police because a small group of the Ansar refused to give up their arms. After dark, one tribesman wandering

wearily back to Omdurman, still bloodstained and carrying a large sword, was stopped by a policeman who carried a baton. The swordsman quietly relinquished his weapon and went peacefully to prison. Next day, at the word of El-Mahdi, they dispersed back to their homes. The army and police would have had to fight a battle to achieve the same result.

It happened, therefore, that a pictorial design became a practical lesson to Egypt and those pro-Egyptian elements who have been so industriously working in the country since the National Unionist Party was elected. El-Mahdi, and the Umma Party of which his son is president, were not prepared to watch Egyptian penetration of the Sudan proceed unchecked during the transitional period. They had watched leading members of the National Unionist Party tolerate, if not actually help, the activities of Major Salah Salem, Egyptian Minister of State for Sudanese Affairs. They did not want President Nguib, who is personally popular in the Sudan, to leave without knowing that personal popularity was one thing and Major Salem's misreporting of the Sudanese situation another. Few Egyptians can realise what a liability Major Salem is to them in the Sudan.

The tribesmen were called out to demonstrate the strength of the independence movement, to submerge the welcome for President Nguib in cries for freedom, and to show that unity with Egypt could not be imposed without the resistance of the Ansar. As a result of the riot, it was proved that no security forces in the Sudan would willingly be mobilised against an Ansar army. Certainly Ismail el-Azhary, who is Minister of the Interior as well as Premier, was not ready to do it. President Nguib had, therefore, to spend his twenty hours in the Sudan inside the Governor-General's palace and go quietly home before dawn. Neither a pro-Egyptian government nor the Governor-General was willing to answer for security otherwise.

Most thinking people in Khartoum have come to the conclusion that the underlying cause of the trouble was the clumsiness of Egypt's policy since the elections three months ago. The enthusiastic assumption that the National Unionist victory had paved the way for Egypt in the Sudan was wrong from the outset; for the protagonists of independence in the Sudan are only prevented from displaying the fact that they are a majority by the sectarian resistance of the Khatmia to the Umma Party which derives its strength from the Ansar. Even the NUP government is not united on the question of relations with Egypt, and some were embarrassed by the activity Egypt exhibited in the Sudan. It was psycholog-

connected with this decision, and as memories of Hindenburg and Hitler are still alive, there will be great interest in the way it is finally settled. For the moment it is enough to note that nothing in any of these demands of the right-wing suggests that in their view Germany should rearm in the EDC or not at all.

A Year Without Stalin

CAN Caesar tie the hands of his successors? Can the most powerful and cunning ruler impose a political pattern that will survive long after he has left the stage? Exactly a year ago, to the strains of mournful music, Moscow radio proclaimed the death of Joseph Vissarionovich Stalin, the "leader of genius," the omnipotent, omniscient ruler of all the Russias, the "pope with battalions." The question was—could Stalinism survive Stalin? For over a quarter of a century he had reigned supreme, having first crushed and then exterminated all actual and potential opponents. His lieutenants had seemed mere puppets, carrying out their master's orders; and the master had clearly made preparations for the succession. Yet once Stalin was removed from the apex the Soviet pyramid of political power began to crumble, and the ruthlessly and painfully prepared pattern to fall apart. The currents set running a year ago have not yet run their full course, and many are still hidden from the public view. But some attempt can be made to trace their labyrinthine flow over the last twelve months and their present direction.

At first events moved at an unfamiliar speed. The "puppets" revealed voices and gestures of their own. In a matter of days the structure of party and government leadership was reorganised and the fabric bequeathed by Stalin at the last party Congress had been rent. The period of mourning was hastily brought to an end and the panegyrists made way for the iconoclasts. The cult of the individual was officially disavowed and replaced by the new rule of "collective leadership."

Undermining the Policemen

All this was more than a personal betrayal. To the refrain of "anything he could do we can do better," Stalin's successors launched their slogan of peace, plenty and freedom. They made polite overtures to the West, promised rapid improvements to the Soviet consumer and, above all, reminded the individual citizen that he had rights under the constitution. An amnesty was proclaimed, a new legal code promised and the chief instrument of Stalinist rule—the police terror—seemed to be blunted. This weapon of terror had been used in different ways at different times, but it was the real basis of Stalin's power. Indeed, on the eve of his death there had been clear signs of the building up of a new wave of terror. The vigilance campaign, a natural product of the cold war, was reaching its zenith with every citizen declared to be under suspicion as potential "spy" or "imperialist agent." The arrest of the "criminal doctors," most of them Jewish, on the charge of poisoning military and political leaders, looked like the curtain raiser to a new holocaust reminiscent of the 'thirties. But scarcely a month after Stalin's death the whole trend

was reversed. The vigilance campaign was stopped, the plot was denounced as a frame-up, the doctors were freed and the security men in charge of the case were accused of using "unconstitutional methods" to extract information.

Not only was the self-confidence of the policemen sapped, but the validity of all previous purges and trials was implicitly questioned. Nor was this an isolated instance. Similar acts of rehabilitation took place in Stalin's native Georgia and other republics, where "bourgeois nationalists" were freed and their accusers charged with Russification and extortion. A breath of fresh air seemed to be sweeping through the Soviet lands, and this purging of Stalinist survivals had to all appearances the unanimous backing of the Kremlin.

The unanimity, as later events showed, was only a façade behind which a deadly struggle was going on. After one hundred days of hope and promise, Moscow sprang another political surprise. Lavrenti Beria, head of the powerful security forces and officially second to Malenkov in the new regime, was suddenly denounced as a "bourgeois nationalist" and an "imperialist agent." In pure Stalinist fashion the record of his treason was traced back almost to his mother's womb. A coalition of policemen, frightened by Beria's "liberal" antics, of Stalinist diehards opposed to any tampering with the Leader's heritage and of military leaders, proceeded to win the second round in the struggle for the succession. What determined the waverers to take sides against the reformers? The whole story of argument and bargaining in the Kremlin remains to be told, but it can be assumed that the relaxation of internal discipline following the policy of concessions, together with the June rising in Berlin, played an important part in it. The diehards may have warned against political concessions which might cause a repetition of the Berlin troubles nearer home. Once this argument carried the day it was easiest to sacrifice Beria, since few would shed tears for the head of the dreaded NKVD.

The Beria Heresy

Yet it is now clear that Beria was himself the mainspring of the reformist group. What was the head policeman doing in such company? Under a dictatorship it is often the policeman who can best feel the mood of the country. He may have felt that it was time to relax somewhat the grip of his men if the regime was to survive. He may, too, have calculated that liberalism was likely to make him popular, and to that end took the risk of limiting the powers of his own police empire. For his audacity he paid the supreme penalty. But it was easier to get rid of the man than of the ideas for which he stood. For nearly six months after Beria's fall almost no mention was made of him. Only the glitter of army uniforms at various meetings revealed that the soldiers had received their reward, while sporadic purges of "bourgeois nationalists" in the republics disclosed that Beria's men were being weeded out.

The biggest visible change took place in the emphasis of Soviet propaganda. This was shifted from "constitutional rights" to "economic needs." The promised legal code was forgotten; but in August Malenkov made a major policy speech, in which he asserted that the standard of life of the Soviet consumer "can and must" be raised rapidly. On the other hand, he did not paint a distant vista, but promised substantial rewards within the

The Schweppshire Way of Life

1. THE DAILY BREAD

First, then, our bread*—chief pride and focal point of Schweppshire's way of living. There are still a handful who have survived from the lethal days when bread was just flour, simply baked. When the old ovens were demolished, workers specially trained in loafcraft were selected from Economics students who were rowing men and had taken a First in Botany. Their duty is to impurify the unnatural ingredients. A special centrifuge separates the husks without direct human agency; these are later put back by hand as husks. The original sand mixed with particles of old buried tins adhering to the wheat root is flung at the simmering dough. It is not generally realised that each year a typical man eats a lump of coke the size of a 5-yen piece. The essential bread residue reaches the consumer already shaped by the anatomy group, who drive to work in sterile vans, and wrap the bread in containers stored permanently at

boiling point, and covered in cellophane from the deep freeze. To add savour, many slice the bread with a rusty kitchen knife kept specially for cutting up onions. The bread is brown because white bread contains no vitamin F₁₂. It is interesting that brown bread contains none either.

Written by Stephen Potter, designed by Lewitt-Hbm.

SCHWEPPEVERESCENCE LASTS THE WHOLE DRINK THROUGH.

* Or, as we prefer to call it in Basic Schweppshish, "stuff in me put". ("Bread" belongs to our cumbersome older vocabulary, now reduced to 17 words, all tremendously short.)

Next two or three years. A month later Nikita Khrushchev, the Party secretary, whose influence seems to have risen after Beria's fall, reviewed the parlous state of Soviet agriculture. He announced a temporary retreat from his own schemes to bridge the gap between town and country, and proclaimed a new policy of incentives for the peasants to get quickly the indispensable foodstuffs and agricultural raw materials. The economic task portrayed was gigantic. The consumer is to get his benefits quickly. Nevertheless the government has apparently no intention of slowing down the rate of expansion of heavy industry and, for political reasons, cannot ignore China's demands for industry and arms.

In the meantime the political pendulum has been swinging towards and away from Stalinism as if the Kremlin were suffering from a split mind. "Russifiers" are being restored to their posts in the Republics while writers are being told to take off their pink glasses and criticise the failings of Soviet society. The outside observer gets the impression that abortive efforts are being made to put the clock back to where it stood on March 5th last year. When Beria's trial was finally staged in December it took place behind closed doors. The accused were taken from the dock to the firing squad without providing the public with the spectacle of a latter-day Vyshinsky in action. Nor was any attempt made at an open indictment of the hundred days of reform. On the contrary, every effort was made to present it as a trial of the police, and Beria's companions in the dock were all security officers. By implication the doctors' accusers and the extortioners eliminated by Beria were exonerated; but the doctors seem not to have been rearrested and their torturers have not been openly rehabilitated. Instead, they seem to be returning by the back door. Thus, Semyon Ignatiev, the Minister of State Security responsible for the frame-up, who was disgraced in April, has just now reappeared as a parliamentary candidate in Bashkiria.

The Army Comes Forward

The tug-of-war is not yet over. Attempts have been and are being made to preserve and revive Stalinism. They have not been completely successful; they are probably doomed, just as Stalinism itself was already doomed during the lifetime of its creator. The outworn political structure of its omnipotent ruler. If it was kept together only by its omnipotent ruler. If a return to pure Stalinism without Stalin is ruled out, what are the most likely developments in the Soviet Union? Either Malenkov and his associates will manage to steer a middle course, to avoid an open split within the party and provide an outlet for explosive forces through progressive reforms and concessions; or a divided and struggling party, no longer protected by the security police, will lose power to a military dictatorship. This was, perhaps, the alternative from the very beginning, and the army has already collected spoils from the Beria conflict. Its voice clearly now carries more weight in the councils of the Kremlin, and in the parliamentary "elections" now staged there are more army candidates than ever before. Should the diehards score a complete victory, crush all their opponents and revive the reign of vigilance, a Soviet Bonaparte may then forestall them and prove the real successor to the ruthless Party Secretary, the heir and executioner of the October revolution, whose long reign ended a year ago.

The Danish Economy

ONE of Denmark's special problems at present is a population bulge. The high birth rate during the war years is now about to bring on to the labour market an unusually large number of young workers. This is bound to create difficulties in a country where unemployment is a perennial, although usually mild, headache for governments. However, in 1953 an encouraging trend was visible in this respect; average unemployment fell from 12.4 per cent in 1952 to 9.2 per cent, while the average number employed in industry rose from 525,000 to 545,000. Preliminary estimates placed the gross national product in 1953 at between 3 and 4 per cent above that of 1952.

This, however, largely reflected greater internal consumption, brisk activity in house building, and a higher expenditure on defence. The picture of Denmark's foreign trade in 1953 was not so cheering. The value of exports during the first eleven months of the year admittedly rose to Kr. 5,649 million, as against Kr. 5,285 million in the same months in 1952. But, while agricultural exports in this period showed an increase of Kr. 486 million, exports of industrial products fell by Kr. 115 million (from Kr. 2,002 to Kr. 1,887 million).

Danish farms thus contributed nearly twice as much to export earnings in 1953 as did Danish industry; in 1952, the ratio had been one of three to two. The OEEC's annual review of Denmark's economy emphasises the fact that, as long as Britain and other purchasers of Danish bacon, butter, cheese and eggs find it necessary to maintain restrictions on these imports, Denmark will have to strain hard to earn more both from its merchant marine and from industrial exports. Very little help can be obtained by cutting down imports, which in the first eleven months of 1953 rose to Kr. 6,301 million (against Kr. 6,060 million in January-November, 1952); for most Danish imports consist of fuel, raw materials, and semi-manufactured products, few of which can be replaced from domestic sources, and shortage of which must bring down the general level of activity and react directly on exports.

More Exports to the Dollar Area

Earnings from shipping in 1953 remained at the lower level to which the steep fall in freight rates in 1952 had brought them; but, as considerable modernisation and expansion of the Danish merchant marine is already well under way, the outlook for improved earnings in 1954 is good. As to exports of industrial goods, the decline during 1953 should not be taken as too ominous a sign. Almost the whole of the falling off was due to smaller sugar exports, which in turn reflected a very poor beet crop in 1952. Other industrial exports generally maintained their positions; but they did not improve them, and there is clearly a case for strengthening the support already officially given to export promotion and to investments with export potentialities, and for a drive to make Danish industrial exports more competitive in foreign markets. A hopeful feature of 1953 was a notable improvement in the trading balance with the dollar area; and although part of this represented sales to American forces in Germany, exports to the dollar area proper increased by about a third with the aid of a dollar premium scheme initiated in August, 1952.

Denmark, however, must continue to look apprehensively at any portents of a general international recession. The first effect of a recession might, admittedly, be to improve Denmark's terms of trade by bringing down the cost of its imports of raw materials. But there are few illusions in Copenhagen about the speed with which this would be succeeded by a sharp fall in both exports and earnings from the merchant marine. For this reason among others, Denmark is a strong advocate of co-operative action between European governments to meet any threat of recession.

Prosperity for Cyprus

BY A CORRESPONDENT

DURING the debate in the House of Lords last week two points of importance were made about Cyprus. The first was that its Greek population is unique in the British Commonwealth in that it wants, or says it wants, not self-government but a change of master. The second was that the island is enjoying almost boom conditions. The desire of the Cypriot Greeks for union with Greece springs largely from the emotion of nationalism, which is apt to be deaf to talk of material advantages. All the same it is important to be clear about the reasons for the prosperity which Cyprus is experiencing today.

The 500,000 inhabitants of the island, which is slightly smaller than Devon and Cornwall, subsist largely on agriculture and mining. The principal export crops are of the usual Mediterranean types, citrus fruit, olives, almonds and the grape—with the addition of the carob or locust bean, an important feeding stuff for cattle. The island's mineral wealth is extensive. The mining industry employs some 6,000 people, and copper and iron pyrites, asbestos, chrome and gypsum are all profitably exploited. Since the war, the export trade has developed rapidly, and the value of exports has risen from £4.2 million in 1946 to £17.6 million in 1952. Between one-half and three-fifths of these exports consist of minerals; lower prices in 1953 reduced their value somewhat, and as a result the value of all exports was only £15 million. About £5 million worth went to Britain; Cyprus therefore exports nearly as much to Britain as, say, Greece. But, this year Cyprus raisins may find difficulty in competing for the British market now that the Ministry of Food's control of dried fruits has been removed. Imports also have increased steadily and substantially since the war; in 1953 the total value was £21.2 million compared with £8 million in 1946. They cover a wide range of manufactured goods, particularly cars and trucks, for the island now has no railway, and one of the Emmet-like engines which used to pull the train from the sea to Nicosia is enshrined in a Famagusta square. Last year some £9.5 million worth of goods were imported from Britain.

Newcomers on the Island

The persistent increase in the adverse balance of visible trade—last year some £6 million—is not causing great concern, because there has been a steady increase in invisible exports such as the growing tourist trade. Cyprus is an ideal holiday centre for Middle Eastern oil men and their

families, to say nothing of members of H.M. Forces serving in the area. Much more important, of course, is the expenditure in the island of the British service departments, and of the increasing number of foreign commercial concerns which used to base their Middle Eastern headquarters in Egypt but now find Nicosia less flighty than Cairo. There are other bodies, not only British but American as well—the American monitoring station outside Kyrenia is an example—which have decided that Cyprus is a convenient spot.

The presence of all these newcomers certainly helps the island to balance its international accounts, but they do little to keep down the cost of living (particularly of house property), and according to the government's index figure the cost of living is now some 30 per cent higher than it was in 1950 and shows little signs of falling. On the other hand the island's finances are in a healthy condition, and the 1953 revenue of about £8 million would have yielded a surplus of £1 million over expenditure if it had not been for exceptional expenditure on the earthquake at Paphos. This disaster, incidentally, will cost the government at least £1½ million. Last week's announcement that the British taxpayer is to contribute £500,000 is good news for the Cypriots.

No More Malaria

In the meantime, the shape of the island's economy is gradually being altered by two important developments. First there is the large capital expenditure of the British War Office on the cantonments at Episkopi, west of Limassol, and near Larnaca at Dhekelia, where barracks, offices, messes, roads, pipelines and all the other installations indispensable to the presence of the British Army overseas are now rapidly taking shape. Secondly, the government's decision in 1946 to spend some £15 million on a ten-year capital development programme is now beginning to bear fruit. Part of the money has come out of a grant from London under the Colonial Development and Welfare Act, but the bulk of it has been saved during the course of the last four years out of the island's current revenue, while several millions have been borrowed on the London market. Nearly £7 million has already been spent on agricultural and irrigation schemes, medical and health services, harbours, roads, and village public utilities and by the various local authorities, such as water boards; in addition, there is the expenditure on the grid scheme for electrifying the island, which alone will cost about a third of the total amount to be spent.

Socially Cyprus is already in some respects unique in the Middle East. In the last few years the authorities have totally eradicated malaria; the island has a highly developed co-operative system; its forestry service is an example to most other countries in the area, and its arrangements for social security and welfare are a good deal in advance of those of its neighbours. On top of this, Cyprus now presents the economic paradox of an area in which both trade, commerce and capital expenditure are running at what is probably the highest level in its history. It is hardly surprising that business should be good, even if much of the profits are finding their way into land and bricks and mortar instead of the banks, and that as a result interest rates should be rising. The political problems facing the new Governor are not hard. But his economic problems are likely to be less familiar, and may present him with some surprises.

"Forget the number of
our employees",

persisted the chief accountant.

'Why this improbable feat?' objected the chairman. "Because the variety of work performed by Powers-Samas accounting machines makes them an economic proposition for any size of business."

'E.g.?' "E.g. invoicing, cost accounting, payroll, sales ledgers, stores ledgers etc." 'Then let's send for the Powers-Samas people right away. Although we are streamlined rather than super-colossal, perhaps they can streamline us still further.'

There is a range of Powers-Samas punched-card equipment for every type of application.

THE BUSINESS WORLD

Pattern of the Budget

ON April 6th Mr Butler will open his third budget. After the presentation of the totals of the civil estimates for 1954-55—briefly discussed in *The Economist* last week—almost as much is known about the pattern of the Chancellor's financial problem as will be discernible before the actual budget-day. It is not a very reassuring pattern; and, indeed, if the budgetary prospect had to be judged solely by reference to the likely trend of the Government's own finances, without regard for the wider trends in the national economy as a whole, it would be definitely disturbing.

A curious feature of the current financial year is that, despite the presentation of supplementary estimates totalling no less than £228.7 million net, total ordinary expenditures have been running very close to the estimates made twelve months ago. These estimates envisaged a reduction of £91 million from the actual expenditure of 1952-53; and in the first eleven months there was in fact a reduction of £81 million. This indicates that although some departments, notably the Ministry of Food, have been spending much more than was expected (and so necessitating supplementary votes) other departments have been under-spending. This relatively favourable experience may admittedly be somewhat diluted by the big adjustments that commonly occur in the closing weeks of the year, for these adjustments are notoriously unpredictable; but there is every reason to expect the eventual total to fall substantially short of the year's estimates as revised by the inclusion of supplementaries.

It was the more disappointing, therefore, to find the estimates for the new year actually exceeding the revised estimates for 1953-54. The requirements for the civil and revenue departments, after excluding the defence portion of the Ministry of Supply estimate, are put at

£2,327.8 million, which is £238 million more than the original and £10 million more than the final estimate for the current year. This trend hardly seemed to square with the programme promised in the budget speech last year: "At home," Mr Butler then declared, "we have by no means said our last word about reducing Civil Supply expenditure. This process must go on and must play its part in maintaining the health of our economy."

It now appears that in a purely accounting sense the trend is rather less ominous than the published figures suggest. Two-thirds of the increase in prospective civil expenditure by comparison with this year's original estimates is attributable to food and agriculture, the provision for which is raised by rather more than £160 million; but an appreciable part of this addition apparently arises simply from a change in the method of accounting. Under the normal system of Exchequer "cash" accounting, receipts by trading departments from realisation of stocks are used by them in reduction of their demands for voted provision for expenditure (and, indeed, it was the prospect of such realisations that led to the big reduction shown in the original vote for the Ministry of Food for 1953-54). But now that the Government is relinquishing its trading in food and is substituting direct subsidies to producers for the so-called "cost-of-living" subsidies, the proceeds of sales of residual stocks will be credited direct to the Exchequer as "miscellaneous" revenue instead of to the former trading departments. In 1954-55 the proceeds of such sales are expected to be substantial, though the official expectation will not be disclosed until the detailed estimates for the Ministry of Food are published towards the end of this month. The actual cash requirements for agriculture and food will also depend to some extent upon

the agricultural price review now in progress, as well as upon the course of world prices during the year. The outcome of these discussions may conceivably yield some further abatement of the increase implied in the estimates just published; but in view of the experience in this past year, it would be wise not to put too much reliance upon harvesting any real savings.

There are unfortunately no such qualifications to be made about the course of the remaining items of civil expenditure, the estimates for which are some £75 million above the original estimates for 1953-54—principally on account of the rising demands for education, housing and local grants, health service, transport and expenditures in the colonies. This is not a large increase when set beside the total of civil expenditures and the pressure of rising salaries and wages; but it is evident that Mr Butler's process of pruning where he can, though doubtless continuing with as much vigour as before, cannot even keep pace with the "natural" growth of existing services. Nor is this all. Though the gross estimate for defence expenditures in 1954-55 is virtually the same as the original estimate for 1953-54 (at £1,639.9 million, against £1,636.7 million), the effective burden is likely to be a good deal

EXPENDITURE PAST AND PROSPECTIVE				
	1953-54 Original Estimates	1953-54 Final Estimates	1954-55 Original Estimates	Change on Original Estimates

* Hypothetical; official estimates not revealed until Budget day.

heavier than that for the current year—because it is in this sphere, apparently, that under-spending has been most marked. The addition to the real burden upon the domestic economy will probably be at least as big as the increase fortuitously shown in the "net" figures brought into the budget; these "net" estimates are computed after subtracting the sterling counterpart of the dollars expected to be received from the United States in defence aid—receipts estimated at only £85 million for 1954-55, compared with £140 million in the current year. As a result the "net" defence estimate rises from £1,497 million to £1,555 million.

None of these several refinements of interpretation, it should be emphasised, will affect the bill for prospective expenditure that confronts the Chancellor on

budget day. On the assumption that the increased expenditure estimated for the Post Office will be covered by additional Post Office revenues the bill for civil and revenue departments and for net defence expenditure will be £3,882 million. To that bill for Supply services there will be added the provision for Consolidated Fund Services, the estimates for which are never disclosed until budget day. These are unlikely to differ much from last year's estimates; if they were precisely the same, the grand total of prospective "above-line" expenditure would be £4,555 million, compared with an original estimate of £4,259 million for 1953-54 and a revised estimate of £4,488 million.

★

The trend of revenue is much more difficult to estimate, but it is most unlikely to match this trend in expenditure. In the current year revenue, like expenditure, has been running close to original estimate; by end-February it showed a decline of £66 million from the corresponding figure for 1952-53, compared with an expected decline of £71 million for the full year. The original estimate for 1953-54 (£4,368 million) can therefore reasonably be taken as the starting point for estimation of 1954-55 revenues. Three sets of adjustment have then to be made: to allow, first, for the effects of tax changes made in earlier budgets; secondly, for any abnormal items in the old year or expected in the new; and, thirdly, for the effects of changes in the level of business activity.

Under the first head, the tax concessions granted last year were originally expected to cost £89½ million more in 1954-55 than in the current year—£34½ million of this additional cost being attributable to the cuts in income tax and purchase tax, £50 million to the first effect of the restoration of initial allowances (at half the original rates) and £5 million to the first effect of the repeal of EPL. In addition, the recent concessions in purchase tax will cost about £2 million. On the other hand, although 1954-55 is the first year to feel the effects of the restored initial allowances and the dropping of EPL, it will also be considerably affected by the 1952 imposition of EPL and of the still earlier (and temporary) suspension of those allowances. Although the yield from EPL has been running below estimate in this past year, it is probable that the increase expected from it in 1954-55 and from the effects of the suspension of the allowances will exceed the first cost in 1954-55 of the two concessions granted last year; the full impact of those changes will not be felt until 1955-56, when the burden may rise by £150 million or so. In estimating 1954-55 revenues, therefore, the net adjustment of 1953-54 receipts to allow for earlier tax changes may be limited to the £36½ million loss from changes in purchase tax and in income tax as such.

Under the second head, it is noteworthy that miscellaneous revenues seem to have enjoyed a windfall in 1953-54; instead of falling by £22 million as budgeted, they have so far risen by £5 million. This particular gain will presumably not be repeated. On

the other hand, there will be the new credits to be expected from liquidation of food stocks in those cases in which the Government is no longer trading. There is no means of estimating these credits, but the net gain might be of the order of £25-75 million.

The third and least predictable of the necessary adjustments concerns the effect of the 1953 recovery of production upon the yield from taxes that are assessed in arrear and of the prospectively higher level of activity (and of wages and salaries) in 1954 upon the yield from taxes that are assessed or paid currently. This "buoyancy" element in the revenue should be substantial, notably because company taxation paid in 1953-54 must have related mainly to the period of decline in company profits whilst company tax payments in 1954-55 should relate mainly to the period of recovery. But if it is to lift aggregate above-line revenues to the level of aggregate estimated expenditures, this buoyancy will have to contribute £150-200 million—or, say, up to 5 per cent of present tax revenues.

★

On that basis, the prospective above-line account would be nominally in balance, whereas for the current year it is likely to show a surplus of around £100 million. The real position would, however, be less satisfactory than this, since the accounting balance would have been achieved only after taking credit (on the assumptions mentioned above) for £50-100 million of

capital receipts from sales of stocks and before providing for £85 million of effective domestic expenditure nominally written off against the "counterpart" fund. A budget founded on such a "balance" would in fact be injecting a considerable "reflationary" stimulus into the national economy. It is true, of course, that the "below-line" expenditure has in this current year fallen far below estimate, and may drop further in 1954-55. But this decline is not a disinflationary force; virtually the whole of it represents merely a transfer of financing functions from the public sector to the private, as the local authorities lean less heavily upon the Public Works Loan Board.

On the narrow criterion of the state of the Exchequer finances alone, therefore, it seems clear that only an optimistic estimate of prospective revenue would leave the Chancellor with any perceptible scope for tax relief—unless he has in mind further cuts in subsidies or changes in the structure of social expenditures that are not reflected in the estimates. On the wider criterion of the needs of the national economy as a whole, it is equally evident that there is at present no such "slack" as justified the reflationary budget of 1953. On this aspect of the Chancellor's problem, much may turn on the course of the indicators of American business in the next few weeks. If Mr Butler does in fact find room for new reliefs, it is much more likely to be because he takes a pessimistic view of world trade than because he is sanguine about the course of the Exchequer's domestic finances.

Manpower for Engineering

LABOUR mobility, as is well known, is always too low, just as labour turnover is always too high; but between the two most of the right jobs in the British economy somehow manage to get filled. Between 1939 and the end of 1943, the distribution of manpower in this country was stretched rudely out of its peaceful prewar shape; between 1945 and 1947, it moved back elastically towards its former pattern; and since that time it has been gradually shifting again, in response to new demands and pressures in the postwar economy. The most recent of these new pressures, since 1950, has been the rearmament programme, with its growing demands upon manpower, both for the services and, within industry, for the production to equip them. In a paper* delivered at the end of last year, Sir Godfrey Ince, Permanent Secretary of the Ministry of Labour, reviewed the broad changes in the deployment of Britain's working population since before the war; and the Ministry's year-end figures, published last week,

now make possible a closer scrutiny of the movement of manpower, under the pull of rearmament, over the past three years. Some of the more significant changes in the manpower pattern are recorded in charts on the following page.

The diversion of manpower to rearmament is now past its peak. From a total of about 690,000 in the armed forces in mid-1950, before the programme began, Service manpower grew to 872,000 by the end of 1952, but during last year declined to 850,000. "Rather less than half a million" workers, the Ministry has estimated, were engaged in the manufacture of equipment for defence in mid-1950; by the end of 1952 the figure had reached about 900,000; but by mid-1953 it was back to 850,000 men and women. Although there is a demand for extra labour—particularly skilled labour—on defence work in industries such as aircraft, this is being offset by the completion of contracts in others such as machine tools, so that there is not likely to be a significant increase, under the present plans. On the other hand, no considerable decline seems likely in the next few years; the forecast that during 1953

* "The Redistribution of Manpower in Great Britain following the Second Great War," by Sir Godfrey Ince. Manchester Statistical Society.

Labour on the Move

two million people might be in the defence forces or employed in their support seems to have been pitched rather too high, but the continuing level of defence seems likely to call for some 1½ million people—about 600,000 more than when rearmament began.

During the years of rearmament, Britain's working population has been going up, continuing a trend established before the war. The statistics were revised in 1948 to bring in an extra 2,500,000 people (mainly old people, domestic servants, and women working part-time); but apart from these newly-counted individuals the increase between mid-1939 and mid-1953 was still more than a million, and unemployment had declined by about a million. In 1939 the total manpower on defence work was, of course, higher, though the forces had fewer men. But the demands of defence during the past three years have been more than double the natural growth in the working population; and rearmament has therefore been a major influence in bringing about the shifts in civil employment in other sectors of the economy shown in the second chart.

Within civil industry, the diversion of labour to defence production left the number of workers manufacturing goods for the home market roughly stable between mid-1950 and mid-1953, at about 5,800,000 (though the figure has probably increased since). The number making goods for export apparently continued to rise until the end of 1951, but by the middle of

different industries. Between 1950 and 1953, the main shifts from particular industries have been net declines of 48,000 in agriculture and fisheries and of 35,000 in textiles and clothing (a residue of the recession); of 38,000 in transport and communications and of 27,000 in public administration. The distributive trades, contrarily, have regained nearly 100,000 workers and the "food, drink and tobacco" group some 35,000, and there have been small increases in coal mining, the public utilities, and professional and financial services. But the big increases in civil employment have been in the metal-using industries, which are responsible for about 80 per cent of rearmament production.

★

During the past three years, the total labour force in the engineering, shipbuilding, vehicles and metal goods industries has grown by some 200,000 (about 6 per cent). This net increase is probably smaller than the number of operatives who have been diverted to defence work within engineering, and there have been recent increases in the volume of some durable consumer goods—particularly passenger cars, radio and television sets—sold on the home market. So the manpower engaged upon metal exports and upon capital equipment for British industry will probably have decreased over the three years. During 1952 and the early part of 1953, indeed, declines in manpower in certain engineering industries making consumer and capital goods largely offset the growth of the industries working on defence; and the marked recovery in total engineering employment last autumn seems largely to have reflected the higher home demand for durable consumer goods. Changes within certain individual engineering industries are charted at the foot of the opposite page.

There remains a general shortage of labour in a few industries and areas, and a serious shortage of skilled labour. Manpower prospects for the future, as outlined by Sir Godfrey Ince last year, indicate a continued growth in the labour force until about 1962, and probably over the next 25 years—but not at a rate that will guarantee the increase in production that the country needs. For the immediate future, some growth in the armed forces may be required, while employment on defence production is not likely to decline much. Increases in exports of engineering products—whether of military or civil equipment—will demand more manpower; so will home industrial investment, which now shows some signs of growth; and there may not now be much more scope for shrinkage in the output of metal consumer goods for the home market. So the need over the next few years (recessions apart) seems to be a continued growth of total manpower—and capacity—within the engineering and metal-using industries. These will have to compete for manpower with the renewed growth of the consumer trades and of distributive services, within a freer economy where the accent recently has been upon home consumption.

Total Working Population	
mid-1939	19,750,000
Changes within Sectors of Economy, 1939-1953:	
Building & Civil Engineering	+ 65,000
Manufacturing Industries—	
Home Market	+ 570,000

People Newly Classified in 1948	+ 2,500,000

Total Working Population	
mid-1953	23,325,000

last year was down to some 2,075,000, rather below the mid-1950 level. But rearmament was not the only major influence on home output and exports; there were other factors such as import restrictions abroad and a textile recession. And "diversion to defence" is an elastic term that may range widely between the call-up of a reservist and the mere alteration of the eventual customer for the same product made by the same workman at the same bench. So the estimates of extra manpower working upon defence production cannot be equated with changes recorded in the labour force of

Business Notes

A Slice of Cake

SOME remarks by Mr Gaitskell in Wednesday's debate deserve thought, not because of what he said but because of the man who said it. The argument is familiar: company reserves have increased in the postwar years; partly because of wage restraint companies have ploughed back sums which, if the unions had used their powers to the limit, might have been paid out as wages; therefore part of company reserves should in equity belong to the workers and not to the shareholders. The new fact was that Mr Gaitskell, an ex-chancellor, a "moderate," and an exponent of the official labour view should have talked such nonsense. Apparently it must now be taken seriously. Certainly some wages might have been forced higher. Backed by a strong personality like that of Sir Stafford Cripps voluntary restraint did work to a small extent and for a short time. But who actually showed the restraint? Not labour alone. The hard fact is that compared with 1938 levels real wages are up and the real value of dividends is down. In terms of money Mr Gaitskell himself agrees that wages have risen more than dividends. No basis for a fundamental change in the ownership of company reserves is to be found by that argument.

★

What of the practicability of devising "some system whereby the workers are given a fair share of the reserves accumulated thanks to their moderation"? The ex-chancellor knows quite well that company reserves are not spare cash in the bank. They are the invested capital of the business. Owned by the shareholders or owed by the workers, they can never be handed to the workers to consume. But they are investments and some return will in due course be earned on them—both for workers who share in the increased productivity that they yield, and for shareholders to whom they belong. What Mr Gaitskell dislikes is that part of the return belongs to shareholders and that recently dividends like wages have shown a tendency to rise.

No voluntary movement like either wage restraint or dividend restraint will last for ever. It is not desirable that it should. For the sake of efficient mobilisation of savings and the cheap financing of industry it is necessary that some companies should now pay more liberal dividends. For the sake of the future financing of industry and the future maintenance of wage rates it is necessary that Mr Gaitskell should think again. He may one day be Chancellor again. If boards of directors rated his arguments high they would now be distributing as liberally as they could—and not to the workers.

Lower Dollar Earnings

THE dollar earnings of the sterling area are still contracting, a result of reduced imports of sterling goods into the United States and a reflection—happily pale so far—of the recession in American business activity. Last month the gold and dollar reserves of the United Kingdom rose by \$40 million. Of this figure \$31 million was attributable to American defence aid. A further \$7 million was received in February in settlement of the January surplus with the European Payments Union, which in turn, was more than covered by special capital receipts by the United Kingdom

* After taking account of the payment of \$181 million on December 31st for the service of United States and Canadian lines of credit, the United States lend-lease loan and the ERP loan.
† EPU settlements in any month depend on the surplus or deficit with Europe in the previous month.

from the Netherlands. The genuine commercial gold and dollar surplus for February was, thus, a mere \$2 million as against \$14 million in January and monthly averages of \$40 million, \$33 million, \$31 million and \$54 million respectively in each of the successive quarters of 1953. The trend this year continues downward, though so far the balance is still just breaking on the right side of the account. There were no special receipts of Russian gold to help the figures last month, though from the evidence of recent orders placed on Russian account in this country and of the difficulty of placing Russian exports in the sterling market, further contributions to the gold and dollar reserve may be forthcoming from this quarter before long.

The United Kingdom surplus with the European Payments Union last month amounted to £1,200,000. This will be settled in mid-March by the receipt of £600,000 in gold and the deduction of a similar amount from the British overdraft with EPU. This surplus was also due wholly to a capital transaction, namely the receipt last month of the 1954 instalment of £2,300,000 on the debt owing to the United Kingdom by the Netherlands. In the previous month the Netherlands had paid up five annuities due on this loan covering the period 1955 to 1960. But for these receipts which will not be repeated for the next six years the United Kingdom would have shown a deficit with EPU in both January and February.

The discussions in Paris concerning the extension of EPU beyond June 30th next appear to be making slower progress than had been anticipated when a meeting of the Council of the Organisation for European Economic Co-operation to consider the decisions of the EPU managing board was fixed for the end of March. It is known that all member countries are in favour of extending EPU in one form or another beyond June 30th; agreement on the precise terms of its extension is likely to be deferred until much nearer the date of the renewal.

Steel Absorbs Extra Freights

THE 10 per cent rise in railway freights is not—for the present—to be passed on to the consumer in the price of steel. That is the main significance of the Steel Board's "Price Determination, 1954, No. 1" last week, which announced changes in the price of pig iron, alloy steels, and certain finished steel products, and in stockholding extras, but no general rise in the price of steel. The steel producers are thus absorbing the rise in the price of pig iron (9s. a ton for basic and 7s. 6d. a ton for hematite pig), which does reflect the freight increase, as well as the increased freights on other steelmaking material. They can do so, presumably, because the existing prices of steel made provision for a high rate of levy on crude steel output, originally set to cover part of the high cost of imported materials as well as the cost of importing large amounts of foreign steel at high prices and selling it at the much lower British prices. Britain is today importing less foreign steel, and paying less for imported materials and their sea transport; so that the home price of steel may gradually have afforded steelmakers a cushion against increased costs and declines in export premiums.

The Board is now engaged upon a general review of "the level and structure" of steel prices, which have not been re-examined since 1949; the effect of increased freights and changes in other costs will come into its consideration, though more significance may attach to the assumptions upon which the price margins now allowed upon individual steel products are based. In theory, the export premiums earned on particular steel products were left completely out of account in setting home prices; but recent reports from individual companies have underlined the drastic changes that declines in premiums can bring about in profitability, and this has obviously had some effect upon the insistence of particular sections of the industry for revision of the price formula. Premiums, though

reduced, are still being earned except on a few steel products; a comparison of fob prices for steel products exported in January with the home trade basis prices, which gives some crude indication of "apparent premiums," suggests that over a fair range of steel products premiums of perhaps £5 to £15 a ton were still being earned. Since the beginning of the year, of course, prices of British steel exports have been cut further, in competition with the European cartel; and the trend still seems to be downward.

Extra American Aid

DURING the defence debate, the Government announced that an additional £40 million worth of orders for British military equipment will be placed by the American government. American aid for the British defence programme during the coming financial year already amounts to £85.36 million as suggested in the Defence White Paper published a few weeks ago. The pattern of American aid is becoming extremely involved. During the coming year, it looks as if £34 million will be provided in dollars in the form of "defence support aid" to be spent directly on service equipment; a further £21 million figures in the defence programme as sterling payment for American farm produce and a final £30.36 million as aircraft purchased by the American government for the use of the Royal Air Force. To this last figure must be added whatever portion of the additional £40 million mentioned by Mr Birch during Tuesday's debate is spent during that period.

The American government is thus providing more than £70 million for the purchase of aircraft for the RAF. Some of these aircraft will be the "offshore" Hunters ordered by the Americans for Nato forces; it has never been settled which Nato country will eventually operate them. But a big portion of the total must represent a direct relief for the Air Ministry's own coming budget (which allows for expenditure of roughly £225 million on aircraft armament and electronic equipment this coming year). The additional dollars will be spent on aircraft that have yet to be ordered; the sum of £40 million represents the equivalent of 100 bombers or 400 fighters. American service chiefs have been seriously disturbed at the probable consequences of the stretching-out of the British defence programme introduced last year, and this injection of £40 million of dollar orders is the result of their request that British air strength in Europe should somehow be restored to the level originally planned.

Building Society Records

WITH the publication of the results of the Halifax Building Society for the year ended January 31st nearly all the big societies and many of the smaller ones have now shown their figures for what must effectively be regarded as 1953. The Halifax, the biggest society, has also achieved new records. Total assets exceed £200 million

for the first time, rising by £19.6 million to £214.3 million. Mortgage assets are up by £18 million to £175 million. This progress comes though the rate paid to class 2 shareholders (from whom the bulk of the money comes) has so far been held a quarter per cent below the general level at 2½ per cent net. No doubt for that reason the rate of growth has been slower than in some other big societies. Halifax total assets increased during the year by a shade under 11 per cent. The next largest society, Abbey National, showed a growth of nearly 18 per cent. The liquidity ratio has been allowed to drop only from 20 per cent to 19 per cent.

It has for several weeks been obvious that 1953 was going to turn out to have been a year of great expansion in the movement as a whole—so great that it is surely time for the societies to consider how far expansion itself is a worthy object. The estimates compiled by the Building Societies Gazette, which usually turn out very close to the Chief Registrar's official figures, due in May, confirm that impression. They put the total assets of the building societies at the end of last year at £1,646 million, an increase of £168 million. For the first time over £300 million has been advanced on mortgage (£303 million compared with £266 million), and the amount outstanding on mortgage rose by £138 million to £1,401 million, while the sum due to shareholders rose by £154 million to £1,340 million. A modest rise of £6 million to £204 million in the amount due to depositors has an interest that outweighs its size. Last year was the first on which the surtax payer was required to "gross up" his building society interest for surtax purposes. It might have been expected that surtax payers would have looked for a better hole for their money once that tax concession was withdrawn. The increase in deposits suggests that there has been no substantial withdrawal of surtax payers' money. The question is becoming rather how far big deposits by companies and individuals should be welcomed by the Societies.

Planning for Atomic Power

THE debate on the second reading of the Atomic Energy Authority bill contained little discussion of the way in which the atomic power industry should be organised. This lack was the more disappointing since Sir David Eccles, in his opening speech, had provided much useful clarification of government policy on points that the White Paper and the bill left in some doubt—in particular the Authority's relation with industry. The Authority is expected to do most of the research and pilot trials in the design of atomic reactors; but when electricity supply undertakings in this country or for that matter abroad decide that such experiments appear to justify the erection of commercial atomic power plants, they will work out their own specifications, and design and erect the stations independent of the Atomic Energy Authority; the AEA's point will be to sell the fissile fuels to the owners of the power stations. A school of reactor technology is to be set up which engineers from industry and from electricity undertakings can attend to learn the necessary techniques. This suggests that industry may be allowed to play a bigger part than the terms of the bill appeared to indicate.

The first step in this policy of civil development is the

building of the atomic power station at Cumberland. This is already well in hand and on Monday Sir David announced the second step, the choice of a site in Caithness for the building of a breeder reactor. If breeder reactors can be made to produce atomic fuels from normally stable materials at a faster rate than they are consuming their original charge of fissile fuel, the biggest problem of atomic power economics, the cost and the difficulty of providing enough fissile material for a major power system, might be solved. A power race between British and American scientists has been touched off by these developments.

The problems and the risks of breeders are much greater than with the conventional thermal piles that are now working; operating temperatures are higher and fission occurs more rapidly. As a safety measure, the Caithness reactor will be enclosed in a great steel dome. The measure of the risk of atomic disintegration of one of these plants can only be guessed until one such plant has "run away"; meanwhile safety precautions are proving a major burden on atomic budgets.

According to Sir David, investment in the atomic industry amounts to about £5,000 per man employed—a high figure but one that is exceeded in the oil and chemical plants built since the war. The AEA will, it seems, be taking over capital assets of between £75 and £100 million; with the new experimental power plants completed, the total will be much higher.

Speeding Aircraft Deliveries

TWO important changes in the arrangements for placing orders for military aircraft were announced by the Minister of Supply this week. The first is the introduction of what might be described as the French system, under which a small batch of pre-production machines are ordered after the prototypes and ahead of deliveries from normal production. This corresponds to the practice in other industries of interposing pilot trials between laboratory experiments and full-scale production. The services and the aircraft industry now admit that there are no short cuts to aircraft production; experiments to save time on the drawing board and the factory floor have proved expensive failures. But if more aircraft are available for flight testing, it should be possible to reduce the time spent on development flying and the inevitable modifications that flight trials show to be necessary.

Deliveries of both the Swift and the Hunter into squadron service have been held up because of unexpected snags in the first machines off the production lines that had not been suspected on the two prototypes. But the Ministry of Supply may be unduly pessimistic in ordering as many as 20 pre-production models of the new supersonic fighter about which so much has been heard in the past few weeks; unless the design of the fighter and its engine are expected to present special problems.

The second change, which was barely touched on by the Minister, is in the long run far the more important. In the future, orders will probably be placed for a fully equipped fighting machine, complete with its electronic equipment and its armament and not simply for the aircraft alone. The newest missiles are an integral part of the air-

craft that carries them and it has been suggested that the aircraft designers could have made better progress with all-weather fighters, on which the whole structure of the country's air defence is based, had they been free from the start to draft their own specifications for the type of electronic equipment to be fitted into these machines. It is no accident that two of the most promising recent British and American designs have been private ventures, in which the designer was free to work to his own specifications.

Fall in Wool Consumption

THE first real fall for two years in the amount of raw wool entering into manufacture throughout the world came in the fourth quarter of last year. In its latest bulletin the Commonwealth Economic Committee estimate the actual consumption of virgin wool in eleven major consuming countries at 448 million lb clean weight—almost the same as the total of 451 million lb in the third quarter, when the recovery first levelled off. As there were many more working days in the fourth quarter, the rate of consumption was correspondingly below that of the third quarter, and was two per cent less than in the last quarter of 1952. In Britain, which vies with the United States as the largest consuming country, consumption per working day dropped by seven per cent; consumption in America, without correction for working day, dropped by 20 per cent. In nearly all the major consuming countries, however, activity was still at a high level. Consumption in these countries in the fourth quarter represented an annual rate of about 1,790 million lb, only 160 million lb below the 1,950 million lb consumed in the boom year 1950, and 220 million lb above the annual average of 1,570 million lb during the recession of 1951/52.

For the year 1953 as a whole, consumption rose by 16 per cent to about 1,850 million lb. The increase in Britain was well above that average, at 29 per cent; in France and Germany consumption rose by about 17 per cent and in Japan it rose by 27 per cent to a new postwar peak. The least good result comes from the United States where consumption rose by only three per cent. Production of wool tops in ten major countries rose by 30 per cent to a new postwar peak of 1,010 million lb. The British increase was again much higher than the average, at 40 per cent. Production in France and Italy rose by 27 per cent and 31 per cent, respectively, and in Germany by 66 per cent. The United States showed only a small increase of eight per cent. Output in the later stages of wool manufacture, which suffered less in the recession, increased by a smaller amount in 1953. Production of woollen and worsted yarn in twelve leading countries rose by 10 per cent to 2,406 million lb, and output of woven wool cloth in eight countries rose slightly to 1,840 million lb.

Consumption of virgin wool in the smaller countries is tentatively estimated by the committee at 750 million lb, the same as in 1952. Total world consumption is therefore put at 2,600 million lb, 11 per cent higher than in 1952 and only 80 million lb below the previous postwar peak of 2,680 million in 1950. World production of raw wool in 1953/54 is now estimated at 2,500 million lb clean, excluding normal carry-over and strategic stocks. With the addi-

tion of the 50 million lb held by the US Commodity Credit Corporation, the total world supply of 2,550 million lb thus appears to be in approximate balance with consumption, even allowing for the decline in the last quarter.

More Business in Futures

THIS approximate balance has been apparent since the new wool-selling season began last September, and has probably helped to sustain the price of raw wool. In recent weeks prices have held up well, despite the weight of the offerings now coming to auction. The estimates of the New Zealand Wool Commission (London Agency) show that the average clean prices, delivered UK, of medium and coarse crossbred wools were unchanged in February, and were hardening by the end of the month. Merino wools, however, fell further by about 5d. a lb. Competition for the spot wools available at the new series of auctions in London has been keen, particularly for crossbreds, and prices have been firm. The better tone has stimulated business in the Bradford market for tops; prices have risen slightly and delivery periods are lengthening. The London futures market in wool tops has been noticeably less bearish for several weeks. The price of March futures has risen to parity with Bradford top prices, and the discount on the distant delivery months has narrowed appreciably, aided by some arbitrage from the Antwerp market, where the discount has always been smaller than in London. July, 1955 futures are now at a discount of 15d. a lb to physical tops, compared with 21d. three weeks ago.

The volume of business on the London futures market has continued to increase. In ten months turnover has risen to an average of over 200,000 lb of 64's B merino tops a day; in January it reached a peak of about 300,000 lb a day. The hostility of some Bradford firms to the market is less now that futures are closer to actual prices of tops, thus offering a more satisfactory hedge, and part of the increased business has come through the Bradford brokers, whose clients are almost exclusively local firms. Business conducted through the London brokers has also increased, and probably reflects a greater use of the market among woollen manufacturers as well as importers of raw wool. Little interest has so far been reported from the wool-growing Dominions, where the market still tends to be viewed with apathy, if not suspicion. The market authorities will no doubt introduce a contract based on crossbred tops, which would be more attractive to users of this type of wool, when they consider that the existing merino contract has become fully established.

Falling Deposits and Rising Advances

THE latest returns of the London clearing banks show that the seasonal contraction in credit caused by the Government's repayments of short-term borrowings from the proceeds of taxation is higher than ever; but this influence is being partly offset by heavy demands for accom-

modation from the private sector of the economy. In the four weeks to February 17th, net deposits fell by £222 million; following the large fall in net deposits in the previous period, this brings the total drop in the first seven weeks of the year to £360 million—the largest yet recorded for this period.

For February by itself, however, this contraction was about the same as in 1953, but it arose in a different way. Last year's fall reflected the reduction in the banks' holdings of cash, call money and Treasury bills, following the Government's reduced call on the money machine. This year the decline in "public sector" assets considerably exceeded the fall of £270 million in net deposits. But the increased demands of the private sector of the economy were marked by a rise of nearly £46 million in advances compared with an increase of £19 million a year earlier and with an unseasonal fall of £12 million in January. Investments also fell by only £2.2 million compared with £18 million

last year while commercial bill portfolios more than made good their drop in January, rising by £2.9 million to £79.2 million. This revival in the demands of the private sector is partly the counterpart of the exceptional decline in the preceding period; the particularly large expansion in advances was spread fairly evenly among individual banks. Total advances outstanding are now only £32 million below their level a year ago.

Exceptionally large Government repayments into the banking system reflect exceptionally high net receipts from taxation and small savings in the revenue quarter. The total Exchequer surplus in the nearest four-week period was actually slightly smaller this year than that attained in the corresponding weeks of 1953, but net repayments of tax reserve certificates (and of defence bonds) were considerably lower this year than last. The upshot is that the Government's apparent needs for finance fell by only 60 per cent of the fall in its apparent borrowings in the period. The January comparisons found precisely the opposite discrepancy—a fall in apparent borrowings slightly smaller than was suggested by the fall in apparent needs—so that there is reason to believe that both discrepancies were partly due to the distortions caused by the differences between the dates of the Exchequer accounts and the clearing bank returns.

THE ECONOMIST, MARCH 6, 1954

Oil from Russia

LAST year, Russia exported nearly 2 million metric tons of oil to the West, roughly twice as much as in 1951; and the indications are that this year those exports will be doubled again. Crude oil output in the USSR has risen by about 10 per cent annually over the last four years, and this rate of growth seems likely to continue for some time. Already, supplies seem ample for its internal consumption, which is still hampered by the low standard of living and the slow development of road transport and mechanisation in agriculture; and as the *Petroleum Press Service* comments in its current bulletin, "an expansion of oil consumption at an annual rate of 10 per cent is more than an expanding yet inflexible economy could absorb year by year." Barring drastic changes in production or consumption, therefore, Russia seems likely to have "substantial and rising quantities of oil" for export from its own sources and from the satellite countries for some years ahead.

Finland is the largest buyer of Russian oil, which it accepts in payment for its exports to Russia; this year it has contracted for 800,000 metric tons, plus 425,000 metric tons of products that it hopes to re-sell to the West. Sweden is buying 600,000 tons this year, and France, Western Germany, Italy, Belgium and other countries in Western Europe have placed substantial orders. Iceland, which has had to sell its fish to Russia as a result of the dispute with Britain, is accepting all its oil requirements from there, while Argentina, Egypt and Israel are also buying.

Most of these purchases will displace oil hitherto supplied by American or sterling oil companies. These companies have built up storage and distribution facilities in the countries concerned to handle their own products; and they are reacting strongly against suggestions from the Governments that they should handle Russian oil through these sales outlets. In Finland and Iceland, where the circumstances are exceptional, they are doing so; but elsewhere they are contending that either the Governments, the small independent importers, or the Russians themselves should provide the local importing and distributing facilities. The distributing facilities in Western Europe built up by the Russians in the twenties, when their exports mounted to a peak of 6 million tons (then 28 per cent of their output) have all been sold and disbanded; this, and the opposition of the international oil companies, may set a limit to future exports.

Another CDFC Investment

IT is no more than a coincidence that the first two investments by the Commonwealth Development Finance Company are in public utility companies. Public utility projects can make an important, though indirect, contribution to the sterling area's balance of payments; but it is likely that the Company's later investments will be directly associated with industrial development in the Commonwealth. CDFC's second operation (the first, announced a fortnight ago, was the subscription of ordinary capital in the newly formed Pakistan company, Sui Gas Transmis-

service

WATCHMAN PROTECTION

Utilising equipment perfected after many years research and development, this System has unique features providing greater security and protection than can be achieved by other commonly employed methods.

PROGRAMME CONTROL UNIT

FOR

STEEL GOES UNDERGROUND

Structural steel not only reaches to the sky as the framework for buildings. It also goes underground.

A great increase has taken place in recent years in the use of steel in mines. Steel, more uniform, more fire-proof, more lasting than wood, is used in two ways.

At the coal-face, modern practice is to use hydraulic and mechanical steel props to support the roof. They can be tightened or loosened while in position between roof and floor; they give the miner greater safety. In the 'roadways', in addition, semi-circular arches of steel form the roof and sides and carry cables.

The proportion of 'roadways' supported by steel was 56% in 1946 and over 73% in 1953. The expanding output of steel, itself the result of modernisation which ever since the war has proceeded at a faster pace than in almost any other industry, thus directly serves the miner.

STEEL is at your service

This specialist service in NICKEL AND NICKEL ALLOYS

FURNACE ELEMENTS	Nickel alloys for long life at high temperatures; for certain special atmospheric conditions; for furnace constructional work.
DOMESTIC APPLIANCES	'Nichrome' V for long life at temperatures up to 1,150°C; 'Nichrome' for temperatures up to 950°C; other alloys for less exacting conditions.
THERMO-COUPLES	'T1/T2' alloys (nickel-chromium and nickel-aluminium) for temperatures up to 1,100°C, are identical with the best-known wires formerly imported. Also Special 'Advance' (nickel-copper) for use with copper or iron.
RADIO and TV FIELD	Cathode nickel, pure nickel and nickel-manganese, for sleeves, anodes, grids, filaments, supports, glass metal seals, etc.
LAMP INDUSTRY	Nickel-manganese for supports, grids, and lead wires; special alloys for a variety of efficient joints between metal and glass.
SPARK PLUGS	Alloys of the correct physical properties and temper to meet manufacturing requirements in centre and side electrodes; and such as special strip for stamping out multi-point discs for aircraft plugs.
FINE WIRES	Very fine wires from .002 in. downwards in various alloys, such as 80/20 Nickel Chrome, Pure Nickel, etc., for specialised applications.

**BUSINESS TRIPS
IN FRANCE
SPEEDED BY FRENCH RAILWAYS**

When your business involves a number of calls at scattered places it is a good idea to plan your operations from a suitable base—either Paris or one of the large provincial centres—thence making one-day or 24-hour trips by train. For instance:—

ONE-DAY TRIPS You can leave in the morning, travel from 350 to 500 Km., have several hours in which to conduct your business and return, the same evening, in comfort. *Examples:* One-day return trips from PARIS include La Rochelle, Lyon, Antwerp or Sarrebruck.

24-HOUR TRIPS You can leave in the evening, travel from 500-600 Km., stay the night at an hotel, devote most of the following day to your affairs and return to your headquarters that night. *Examples:* 24-hours Return Trips from PARIS include Bordeaux, Grenoble, St. Nazaire or Zurich.

SELF-DRIVE CARS A further saving of time can be effected if you make use of French Railways self-drive car service, available in eighty-three towns. Charge: 1,950 fr. per day for a maximum of 60 Km. per day; over 60 Km. per day—14 fr. per Km.

FRENCH RAILWAYS

Information, tickets and reservations from any good Travel Agent or French Railways Ltd., 179 Piccadilly, London, W.1.

sion) is in a £2 million loan stock of the well established South African statutory corporation, the Electricity Supply Commission ("Escom"). This loan, which will be used to step up power generation in the Rand and the Orange Free State, is for 15 years at 5 per cent; the effective issue price was 98½.

By accepting the private placing of this sound and well paying investment CDFC has behaved like any other institutional investor. But it has also fulfilled its primary function of lending for Commonwealth development when other sources of finance are not readily available. "Escom," which in the past has issued its loans in South Africa and more recently borrowed \$30 million from the International Bank for Reconstruction and Development, appears to have been anxious to secure some British participation in its latest developments as well. "Escom" will undoubtedly raise more new money in the Cape later on, for it has a massive development programme, estimated to cost about £90 million, ahead of it. But it must have been clear, or even made clear, to "Escom" that it would not find a place in the queue of Commonwealth borrowers in Throgmorton Street. The development company then stepped into the breach.

With its first two investments, CDFC has lent about one-tenth of its initially authorised borrowing powers of £30 million. This is the sudden stride forward when the starter's pistol cracks; later it may be expected to settle down to a steadier pace. The company will ultimately have to weigh the choices between calling up more of its authorised capital of £15 million, borrowing on loan in the City against the backing of its portfolio, or of passing on some of its investments to other investors. Thus it will follow in the steps of the International Bank, but its rates of lending will always be higher than those of the Bank. It cannot raise the money it needs on such fine terms as can the Bank nor does it demand, as the Bank does, that the investments it makes should be backed by government guarantees. Initially, of course, CDFC will tend to lend by way of loan stocks, though probably on those issued by companies in a much earlier stage of development than "Escom." But, as its first venture showed, it is willing when the occasion arises to take an equity interest in new projects.

Aid Cotton Goes Begging

IT is now increasingly likely that Lancashire will use more United States cotton when imports are freed on September 1st. The recent advance in world cotton prices has been sharper in certain other growths of American type than in United States cotton itself. The Raw Cotton Commission's price for US middling cotton, 1 inch staple, has risen from 32.35d. a lb on November 16th to 33.90d. this week, while Pakistan LSS-type cotton, which stood at 29.30d. a lb in mid-November, is now quoted in Karachi at the equivalent of 35.50d. Sao Paulo (Brazilian) cotton, type 5 stood at 27.70d. a lb in mid-November, whereas the Commission's index for new crop Sao Paulo is now 32.25d. a lb. In a statement on this disparity in prices of dollar and non-dollar cottons, the Commission recalls that last year Lancashire spinners enjoyed relatively cheap imports

of Brazilian cotton owing to special exchange transactions and barter deals, and it understands that such transactions will not be permitted this year. For the time being the Commission is not buying either new crop Brazilian or Pakistan cotton, owing to the unwillingness of spinners to pay the present premium for these types over the corresponding United States growths.

If outside growths continue to be dearer than US cotton—which is by no means certain—Lancashire will probably use the whole of its present entitlement of US cotton, and use still more when imports are freed. It seems all the more ironical that the \$20 million worth of cotton allocated to Britain under this year's American aid programme is not being fully taken up, because of the rigid terms on which it must be sold. Private importers have bought almost none of this cotton; the Raw Cotton Commission has bought sizeable quantities, but its requirements are limited by its withdrawal from public trading in August; hence less than half the total allotment may have been used when the current aid programme ends on June 30th. Britain will consequently have to pay dollars for cotton that it should have obtained for sterling.

From Wagons to Banking

FOR a merchant bank to make any part of its equity available to investors is a Stock Exchange rarity. For a wagon company to turn itself into a merchant bank is an even greater oddity. Both events will be in the public eye next Tuesday when Stock Exchange dealings are expected to start at around 38s. 6d. in the £1 ordinary shares of Mercury Securities. Mercury Securities was formerly Central Wagon (Holding) Company and its asset, apart from cash, is the bulk of the capital of S. G. Warburg and Company, the merchant bankers. This will give indirectly a market value for shares in the Warburg business for estate duty. The method adopted in this case shows that the direct route to a quotation is not necessarily the cheapest or the quickest.

In 1952 Central Wagon (Holding) Company found itself with government stock (which it soon exchanged into cash) in place of nationalised wagons, and some shares in subsidiaries in the wagon building and repairing business. The

ECONOMICS OF INTELLIGENCE

Whitehall 1511 Extension 129

shares in subsidiaries were distributed in kind to the shareholders and the shell—Stock Exchange quotation and cash were acquired by third parties as a repository for the equity in S. G. Warburg and Company. The name was changed to Mercury Securities, and it acquired for £940,613 some 278,520 £1 "A" ordinary shares and 514,766 £1 "B" ordinary shares of Warburgs. The income from these is estimated to be sufficient to enable Mercury to pay a dividend of not less than 8 per cent per annum, indicating a yield of a little over 4 per cent at the opening price. Warburgs have an issued capital of £1,055,000 in 250,000 5 per cent redeemable cumulative preference shares of £1, 280,000 £1 "A" ordinary shares, 520,000 "B" ordinary shares of £1, and 100,000 founder shares of 1s. each. Thus over 99 per cent of the equity of Warburgs is held by Mercury.

S. G. Warburg and Company is a merchant bank with a progressive postwar profit record. It is, moreover, more than a merchant bank, for it controls Brandeis, Goldschmidt and Company, the metal merchants of London and New York, who also have a well-established position. The Mercury shares have attractive possibilities. But no outsider will be able to buy a big voting stake in the Warburg business. Only a few Mercury shares will be available and Mercury itself, though it holds 99 per cent of the Warburg equity, has much less than voting control. The tail that wags the Warburg dog is the £5,000 nominal of founders' capital. For dividend the founders' shares rank as junior preference shares, but they wield more than three times the total votes of the two classes of ordinary capital together.

Credit Insurance for Satellites

OFFICIAL encouragement for British trade with Eastern Europe is reflected in the relaxations announced last week by the Export Credits Guarantee Department. In recent years the Department has been willing to insure the risk of selling to Poland, Hungary, Bulgaria, Rumania, Czechoslovakia and East Germany only when payment was by a confirmed irrevocable letter of credit. It is now prepared to cover exports settled by a credit of up to ninety days. But the Department's gesture is qualified by the stipulation that it may require an unconditional guarantee, by the appropriate central bank, of payment in sterling at the due date. British trade with all these countries is on a sterling basis. The terms for covering business with China remain extremely strict—an irrevocable letter of credit, confirmed before shipment of the goods by a bank in Britain for payment in cash against documents on shipment. The Department will continue to cover business with Russia, which has a high reputation for paying on the nail, on the customary terms on which British exporters normally trade with that country.

British imports from Eastern Europe and East Germany amounted to about £34 million last year, and exports to about £15 million. Trade with Poland alone is of significant size. Imports from Poland last year amounted to £23 million, and exports to £7 million; Poland seems to have spent most of its surplus on sterling wool. Exports to Eastern Europe may increase somewhat if the United States can agree to a relaxation or redefinition of the exist-

ing controls on shipments of "strategic" goods. Trade talks with Poland started in London this week and the Poles are believed to be anxious to obtain many types of capital goods. Similar talks with Hungary begin here in the middle of this month. A few barter deals have been concluded with Eastern Europe, the latest being one with Bulgaria for the exchange of wheat against British and French steel products.

Slimming a White Elephant

THE plans announced last autumn by the Minister of Supply for the reorganisation of Woolwich Arsenal, "white elephant" of the Royal Ordnance Factories, have now been discussed with the employees and the local authorities concerned, and last week the Minister confirmed that they are to be put into effect. Under these the filling factory at the Arsenal is to be dismantled and the site cleared and decontaminated; the gun and ammunition factories are to be amalgamated into a single Ordnance factory, which will specialise on experimental and development work, modifications, and the manufacture of tools and gauges, but cease to undertake regular line production. A site of some 100 acres on the south of the 1,300-acre Arsenal area is to be sold—possibly to the London County Council—as an industrial estate for new factories; the remainder of the central area will be used for the engineering workshops and stores of the Service departments, and the marshland at the eastern end of the site, still used for storage and transit of explosives, is to be raised above river level by controlled tipping.

The trade unions whose members work at the Arsenal, in discussions with the Minister, inevitably urged that the labour force should be maintained at its present level. The Arsenal reorganisation, which will take several years, will reduce the number of Ordnance workers there, but this will largely be carried out by ceasing to replace the men who leave. The Minister expressed a hope that the eventual employment on the site—when the London County Council has organised the industrial estate and attracted the commercial companies to it—may eventually exceed the 14,000 people employed there today.

Building Dividends

FLETON brick and cement manufacturers may have been barely able to keep pace with the soaring demand for building materials, but their active trading has already been heavily discounted in stock markets. That explains why the equity stocks of Rugby Portland Cement and London Brick were marked down after those companies had announced their dividends for the year to December 31st. London Brick effective rate of dividend, taking account of the 50 per cent share bonus last November, has been raised from 11½ to 14 per cent; but even so its £1 equity stock units were marked down by 1s. 3d. to 55s. 6d., yielding only a fraction over 5 per cent. Rugby Portland Cement merely maintained its dividend by declaring a rate of 1s. on each

Plastic Patisserie

Basic chemical ingredients are as vital to the world's plastic industries as flour and sugar are to pastry-cooks. One of these basic chemicals is Hexamine, a material essential for the manufacture of thermo-setting plastics for many purposes, including telephone, radio and television. The large independent company of Brotherton, established in 1878, is now one of the world's chief manufacturers of this basic chemical.

A BIG NAME IN THE CHEMICAL WORLD

Brotherton

One of the world's largest manufacturers of hydramphites, liquid sulphur dioxide and hexamine. Makers of an extensive range of Metachrome dyes for dyeing wool in all its forms.

Brotherton & Co. Ltd., City Chambers, Leeds, 1. Also at Manchester, Glasgow and London. Works at Birmingham, Wakefield & Birkenhead.

Full Employment

BRITAIN'S demand for electricity is greater than it has ever been; more factories and farms, more homes and offices are all using more—and they will require still more electricity in order to raise output and increase our standard of living.

To meet these needs, 40 new power stations have been brought into operation since British Electricity was established and the amount of power available has been increased by 50 per cent. But generating plant, which *could* work to capacity all day and night is *in fact* only required to give full output for short periods once or twice during the day.

If electricity were more widely used by factories, farms, shops, homes, offices and for street lighting—this would keep the generating plant more fully loaded. The demands on the power stations coming from these different classes of consumers would be diversified. That is to say the loads would not occur simultaneously but, in the main, at different times of the day—and continuous full output from the generating plant would reduce the cost of electricity.

Quality Furniture has BRITISH LEATHER UPHOLSTERY

For long life and comfort there's nothing like leather

Drambuie originated in the Isle of Skye where it was made in accordance with the recipe presented to a Mackinnon by Prince Charlie in 1745. The secret remains in the same family to this day.

Drambuie

THE DRAMBUIE LIQUEUR CO. LTD., EDINBURGH

5s. share, in addition to the customary tax free capital distribution of 3d. a share; the shares fell 1s. to 28s. 6d.

The Rugby Portland dividend was left unchanged in spite of a sturdy advance in trading profits, including investment income, from £675,752 to £768,772 and in equity earnings from £156,379 to £186,241. In deciding not to raise the dividend the board must have taken account of the fact that this year the dividend will have to service a further million of ordinary shares, arising from the options granted with the loan stock issue to subscribe for equity shares last December. Presumably, the directors of London Brick in deciding on an increased dividend knew that the company's profits had likewise advanced.

Unfortunately, they have stuck to the old practice of declaring a second interim dividend which takes the place of a final distribution well in advance of the year's trading results. But the directors must have had some figures before them when they reached their decision. Shareholders may feel that the practice of not supporting the dividend announcement with any statement of earnings—even subject to audit—is not the best. The practice almost universally adopted since the war of flanking the final dividend with a statement of earnings is sound and ought to be followed wherever possible.

SHORTER NOTES

Gilt edged prices took a temporary dip on Thursday afternoon when it was announced that underwriting was shortly to start for a Glasgow Corporation loan of £5 million 3½ per cent stock at £98 dated 1971-73. The terms are finely drawn to yield just the same as the existing Liverpool Corporation 4 per cent stock with a slight advantage in favour of Glasgow in that the Glasgow stock will start at £2 per cent discount. The impression is therefore that an adequate response will be forthcoming when lists open on Wednesday.

A dollar loan of \$54 million for the Commonwealth of Australia is announced by the International Bank, to be used for the import of capital goods for agriculture, forestry, transport, electric power, and for various industries. About a quarter of the total is to be devoted to agriculture. The loan is for 15 years, at 4½ per cent amortisation, starting in 1957. This is the third loan which Australia has drawn from the International Bank. The first was for \$100 million and the second, of which three-fifths has now been disbursed, was for \$50 million in July, 1952.

The announcement from Bradford Dyers that its ordinary dividend was to be raised from 10 to 15 per cent cheered up the stock markets this week; the company's £1 ordinary stock units were marked up by 3s. 4½d. to 36s. 10½d., to yield 8½ per cent. In 1953, the profits earned in Britain, where some of its plants may have been hard pressed to satisfy demands fully, advanced from £1,084,064 to £1,672,135, but profits earned by overseas subsidiaries fell from £1,032,901 to £725,385.

Private imports of tungsten ores and concentrates will be permitted on April 1st from all sources except the dollar area, but consumers will have to purchase a portion of their requirements from the Ministry of Materials until its surplus stocks have been cleared.

In *The Economist* of last week, consumption figures for margarine and butter in Britain were given for 1952. The Commonwealth Economic Committee estimates that in 1953, consumption of margarine fell from 19.3 to 18.2 lb per head per year while that of butter rose from 10.9 to 13.5 lb.

Company Notes

ASSOCIATED ELECTRICAL INDUSTRIES. Two preliminary reports, those issued by Associated Electrical and Hoover, hammered the point home this week that it is the profits and dividends of those companies that suffered most in the earlier recession that offer the greatest scope for expansion now. The companies producing capital goods, of which Associated Electrical concentrating half its output on generating plant is a prime example, have far less to offer—at the moment. This is a lesson that some investors have still to learn. In the market it had been anticipated that after the 100 per cent share bonus AEI would pay a dividend of 12½ per cent on the new capital. In fact, this dividend was increased effectively only by 1½ per cent to 11½ per cent and, as if to emphasise its transient nature, the directors described

the 1½ per cent as a bonus. After this news AEI's £1 ordinary stock units were marked down by 1s. to 44s. 9d., but they later recovered to 46s.

Are there grounds for hoping that the 12½ per cent dividend will be reached next year? AEI is still working its way through a massive order book, which at the end of 1952 was estimated at £183 million, and trading profits in 1953 advanced once more, from £12,336,000 to £13,674,000. It looks as if orders in the current year are assured, but after that the outlook may grow less certain, in view of increased overseas competition. AEI will have to keep a tight rein on costs and prices. Even though the orders are there this is no guarantee that trading profits in the current year can expand rapidly. Investors must therefore pin their hopes for a bigger dividend on the

fact that AEI's net profits in the last two years have been curtailed by EPL charges. Last year EPL took £1,340,000 from a total tax provision of £7,812,000, compared with £1,052,000 from a total bill of

	Years to Dec. 31,	
	1952	1953
Consolidated earnings:—		
Trading Profit	12,336,000	13,674,000

Ordinary dividends (per cent)	20*	11½
Retained by subsidiaries	1,185,000	1,433,000
£1 ordinary stock at 46s. 0d. yields £4 18s. per cent.		
* Equivalent to 10 per cent on the capital of £17,741,192, as increased by the 100 per cent share bonus.		

£7,202,000 in 1952. Net profits should increase this year, but if the prospect is less rosy than it has been over the last few years the directors may feel inclined to caution.

HOOVER. AEI's dividend fell short of market expectations, but Hoover's dividend far exceeded them. The ordinary payment which was reduced from 35 to 25 per cent in 1952 has been raised to 45 per cent, and the dividend on the "A" is. ordinary shares, owned largely by the company's senior executives and by trustees for the employees, has been raised from 10.9815d. a share to 3s. 8.7132d. a share. The 5s. ordinary stock units were immediately marked up by 1s. 6d. to 32s. 3d., to offer a yield of nearly 7 per cent.

The bigger dividend appears to have been prompted by the sharp increase in both gross and net profits. The group's profits before tax have almost doubled, rising from £1,602,721 to £3,095,793, and its net profits have more than doubled, from £628,089 to £1,281,650. Profits in 1953 ran at about the same level as in 1951, before they collapsed in the face of hire purchase restrictions at home, the closing of the Australian market and the strengthening of overseas competition. The group obviously made the most of the re-opening of Commonwealth markets and the rather less austere conditions at home last year. This is a happy outcome to Sir Charles Colston's valedictory year as chairman and managing director. Hoover has proved its resilience but in considering the yield offered on its stock investors should always remember that producers of durable household goods are, as Hoover's past experience illustrates, among the most vulnerable industries in a trade recession.

★

STORE PROFITS. Preliminary results recently published by some of the leading departmental stores show that they have all participated in last year's 5 per cent rise in retail sales. All the stores results so far show higher gross and net profits and two of the largest groups, Lewis's Investment Trust and Harrods, have raised their ordinary dividends. The equity dividend of Lewis's Investment

Trust has been increased from 27½ to 32½ per cent and that of Harrods from 13½ to 15 per cent; A. W. Gamage has left its dividend unchanged in spite of an increase in profits.

The figures, detailed in the accompanying table, suggest that the improvement in retail sales and profits was not confined to any particular area. The London stores, of which Harrods and Selfridges serve as good examples, benefited from

	Years to Jan. 31,	
	1953	1954
Consolidated earnings:—		
Lewis's Investment Trust:

Net Profit	550,721	674,532
Ordinary dividends (per cent)	13½	15

* Wholly owned subsidiaries of Lewis's Investment Trust.

the increase in spending at the time of the Coronation. The stores in the north and Midlands, represented in this sample by Lewis's, must also have benefited from the revival in trade in the basic industries of those areas. The advance in the profits of A. W. Gamage, which does quite a substantial mail order and hire purchase business, strengthens the impression of greater prosperity up and down the country.

In 1952-53 the profits of the departmental stores were adversely affected by the drop in textile sales, so that the moderate advances in profits reported in 1953-54 are not surprising. The departmental stores have done well, but not so well as the leading chain stores.

LONDON STOCK EXCHANGE

Next Account begins: March 17th.
Next Contango Day: March 17th.
Next Settlement Day: March 9th.

INDUSTRIAL equities continued to weaken in the last few days of the old account, but then took a turn for the better when dealings began on Thursday. Until Wednesday gilt-edged stocks moved upwards in response to steady institutional support but the announcement of the Glasgow issue sharply checked the rise. At the end of the old account much of the buying interest was concentrated upon German municipal issues and on the first day of the new account this interest broadened out to include the Dawes and Young issues. Japanese issues were marked down at the end of the account but they began to improve when the new account opened.

Industrial equities went through a bad patch at the end of the old account and on the first day of the new, so that on Wednesday the *Financial Times* ordinary share index had fallen to 135.0, compared with 137.4 a week earlier. Although a few issues resisted this trend (usually on the news of higher dividends) most sections of the market were dull; some of the heaviest losses were made among tobacco and textile shares. When the market opened on Thursday, however, prices began to improve again, stimulated in part by the higher dividend from Bradford Dyers. The leaders in this rally were to be found in the textile and stores sections of the market.

Although oil shares were a little unsettled on Monday by the news of over-production in the United States, they soon rallied and on the first day of the new account Anglo-Iranian rose above 10 for the first time since 1948; in early dealings on Thursday the shares were quoted at 10½. Tea shares drifted lower in spite of the better prices at the auctions and rubbers were idle. The end of the account in Kaffirs closed with a long list of slight falls in prices, though exceptionally Dominion Reefs and F.S. Geduld moved against this trend. In the new account, however, prices rallied under the lead of the uranium issues, with Dominion Reefs and F.S. Geduld still in the van.

(1) The index of retail prices has been linked back to 1938 with the aid of calculations made by Professor R. G. D. Allen for the London and Cambridge Economic Service. (2) Surveys made twice a year; annual figures relate to October survey. (3) Figures up to July, 1953, relate to delivery prices and subsequently to ex-warehouse prices of H.C. electrolytic copper. (4) Provisional.

* In consequence of official purchases of tender bills in connection with cash subscriptions to the Exchequer Stock issued in October, it was impossible to calculate the division between tap and tender bills until all the bills purchased had passed their original maturity date.

THE MONEY MARKET

CREDIT conditions eased markedly in Lombard Street in the week covered by Wednesday's Bank return. On the three days before the weekend credit was distinctly usable, but market supplies were just adequate for demands, and no official help was given. On Monday the repayment of the outstanding War Bonds and other Government disbursements created a superfluity of credit, and although outside loans were down to 1½ per cent there were sizable unlent balances at the close. The surplus of credit continued on the following days; on Tuesday some funds were actually being lent at 1 per cent.

Despite the prospect of idle funds in the ensuing week, the market maintained its bid at £99 9s. 8d. at last week's Treasury bill tender. The offer had been raised by £10 million to £250 million, but total applications increased by nearly £2 million to the record level of £400.8 million, so that the market's allotment rose only from 45 to 46 per cent. At yesterday's tender the offer was raised to £270 million.

The Bank return shows an efflux of notes of £8 million; the outflow since the end-January low point is now, at £20.7 million, some £5 million smaller than that experienced in the corresponding weeks of last year. Government securities in the banking department rose by £4.2 million, and "other securities rose on balance by £6.6 million. But as public accounts were up by over £11 million bankers' deposits fell by £7.4 million to £276.6 million.

BRITISH TIN INVESTMENT CORPORATION

REASONS FOR SHARP FALL IN PRICE

THE INDUSTRY IN MALAYA

MR S. H. SMITH'S STATEMENT

The ordinary general meeting of the British Tin Investment Corporation, Limited, will be held on March 24th at Winchester House, Old Broad Street, London, E.C.

The following is the statement of the chairman, Mr S. H. Smith, OBE, MC, which has been circulated with the report and accounts for the year to December 31, 1953:

In June last Mr E. V. Pearce, who desired relief from some of his responsibilities, resigned the chairmanship of this corporation and the directors appointed me to succeed him. Mr Pearce had been chairman of the corporation since 1940 when Mr Oliver Lyttelton resigned on appointment as President of the Board of Trade. Shareholders as well as the directors owe an immense debt of gratitude to Mr Pearce for his wise conduct of the affairs of the corporation throughout the difficult period of the war and the years of rehabilitation of the tin industry which followed. It must be a great satisfaction to shareholders, as it is to the directors, that Mr Pearce has agreed to continue to serve as a director so that we still have the full benefit of his unique experience, sound judgment, and abounding common-sense.

The profits (before tax) of the corporation for the year ended December 31, 1953, amounted to £541,643, a decrease of £58,520 on those of the previous year.

After making full provision for taxation amounting to £271,500 based on the profits for 1953, and crediting a sum of £90,580, being the balance of the Excess Profits Levy provision for 1952 which is no longer required, the net taxation charge in the accounts for the year is £180,920. There thus remains a balance after taxation of £360,723 which, with the balance of £93,452 brought forward from 1952, makes available £454,175.

The interim dividend of 7½ per cent and the special interim dividend of 7 per cent, paid less tax in August and October respectively, together absorb £167,881. Your directors now recommend the payment of a final dividend of 16 per cent, less tax, which will absorb £185,247, and that the balance of £101,047 should be carried forward. If these recommendations are approved by members at the annual general meeting on March 24, 1954, dividend warrants will be posted on March 26th.

EXCESS PROFITS LEVY

Shareholders will remember that under the Finance Act 1952 the corporation was, owing to its ownership of a small subsidiary finance company, not entitled to relief in respect of dividends from companies liable to excess profits levy when computing its own liability to the levy. Representations were made to the appropriate revenue authorities on behalf of the corporation pointing out that the effect of the Act of 1952 was to subject the corporation's income from such sources to double taxation.

This anomaly was rectified by the Finance Act 1953, under which proportionate relief was given retroactively from January 1, 1952, to a group such as ours, where one company is not an investment company but where substantially the whole of the functions of

the group consists in holding investments. In consequence, the corporation's liability in respect of the levy for 1952 was only £15,420, compared with the provision of £106,000 which had been made in our accounts at December 31, 1952. The balance of £90,580 mentioned above has been credited to profit and loss account in 1953, thereby reducing the net taxation charge in the year's accounts to £180,920. The provisions of the Finance Act 1953 enabled us to pay the special interim dividend of 7 per cent in October last which really came from the profits earned in 1952.

During the year the main changes in the corporation's investments have been the realisation of its shares in diamond producing companies and an increase in its investments in copper and oil companies. The usual list showing our principal investments in tin mining companies and in miscellaneous mining and oil companies is set out at the end of this statement.

PRICE OF TIN

The average price of cash standard tin during the year 1953 was £731 as compared with a price of £962 in 1952. One of the main features of the year was the very sharp fall in the price of tin in comparison with the relative steadiness of the price during 1952. During the spring and early summer the cash price fell from a high point of £985 on February 9th to £568 on July 30th. There has been a moderate rally and, for the moment at any rate, price conditions are more steady. The primary cause of the fall in price was the knowledge that at the end of 1953 or early in 1954 the fixed price contracts with certain countries for the purchase of tin for the US stockpile would cease. As is so often the case, the fall was accentuated, both in duration and extent, by a very drastic reduction in the demand for, as distinct from the consumption of, tin by the consumers, mainly those in the United States of America. Although the immediate outlook for the price of tin may be complicated by negotiations for the sale of tin in concentrates between the American Government and Indonesia, it is reasonable I think to say that the future course of the price must depend in a large degree on the ultimate results of the recent Tin Conference at Geneva.

This conference, as shareholders are aware, was held under the auspices of the United Nations and was attended by representatives of all the main producing countries and of most of the consuming countries. A draft agreement was drawn up which is now under consideration by the many governments concerned. These governments have to decide by June next whether or not they intend to ratify the draft agreement. It will, therefore, be several months before it is known whether sufficient ratifications are received to bring it into force. The agreement, which aims at enabling world production to be adjusted more nearly to world consumption and at a reasonable stability of price at a level which will give a fair return to producers and not inflict hardship on consumers, makes provision both for a reduction in output if supplies are excessive, and

for the formation of a buffer stock to take care of short-term fluctuations in demand.

POSITION IN MALAYA

The list of this corporation's principal holdings in tin-mining companies indicates that we are still deeply interested in Malaya. The political situation there continues to show improvement, but there is as yet no ground for complacency and he would be a bold man who would endeavour to name the day on which Malaya will be entirely free from political unrest. The conditions under which all those concerned with the winning of tin in Malaya are living and working are still grim and I would like to renew my predecessor's tributes to the fortitude and patience shown by them and their families during the past five years.

There are, I suggest, at least two ways by which the Government of Malaya could materially aid its tin industry at this difficult stage. First, it can evolve a clear and comprehensive land policy which will not only encourage prospecting for and development of new tin-bearing areas, but, what is equally important, will give to those who are prepared to risk the large sums required in prospecting an assurance that they will be given a mining title over any payable tin-bearing land which they prove, as was the former practice. There has been practically no prospecting for 20 years, during which time approximately one million tons of tin (metal) have been extracted, with the inevitable result that some mines are approaching exhaustion. It seems to me that prospecting for new areas ought to be actively encouraged. Political considerations, of themselves, would appear to make it essential to the future stability of Malaya that new areas should be opened up and in this connection it must be remembered that there is a very considerable time-lag between the proving of a new area and the date of its equipment for production.

TIN DUTY

Secondly, it is to be hoped that the Government of Malaya will reconsider and modify the present rate of the tin duty. This duty was fixed when there was no income tax in Malaya; it is levied whether the ore has been produced at a profit or at a loss, and, nowadays, it is in addition to and not instead of income tax. The duty seems to demand from the tin industry an undue share of the revenue required by the Malayan Government.

It is a platitude to say that Malayan tin is a strategic asset of prime importance and a magnificent earner of hard dollars, but it is a wasting asset and present policy is inducing some miners to work their best "patches" first, regardless of future outlook and sound mining practice. If new capital is to be attracted to Malaya, it will require to be given a reasonable prospect of a reasonable return upon money ventured in what must, by its nature, be an uncertain and somewhat hazardous business.

OTHER METALS

In view of the corporation's investments in non-ferrous metals other than tin, it may

be of interest to shareholders to know that the average price of lead during 1953 was £91, compared with the Ministry of Materials' selling price of £131 on the day before the London Metal Exchange Lead Market was reopened in 1952. Corresponding figures for zinc were £75 and £110. In the case of copper, the average London Metal Exchange price during the last five months of 1953, that is, from the opening of the London Metal Exchange Copper Market until the end of the year, was £231, as compared with the Ministry's price prior to the reopening of £252.

It is therefore clear that while the fall in price in the case of copper has so far been relatively small, the declines in lead and zinc have, in both cases, been substantial. I would like once again to emphasise that shares in tin-mining companies continue to constitute the predominant proportion of the corporation's total investments.

It follows from the above that it is to be anticipated that the dividends received by the corporation in 1954 cannot be expected to equal those received in the preceding year. I believe, however, that the long-term prospects are good. We have high hopes of some of our new investments. So far as tin is concerned, may I express the hope that every possible support will be given to the Tin Research Institute of the International Tin Research Council. With adequate backing the Institute may be able to make a vital contribution to the prosperity of the tin industry by discovering or devising new and better uses for tin in this metallic age.

ARISTON GOLD MINES

MAJOR GENERAL W. W. RICHARDS'S REVIEW

The twenty-fourth annual general meeting of Ariston Gold Mines (1929) Limited, was held on March 1st in London.

Major General W. W. Richards, CB, CBE, MC, chairman of the company, who presided, in the course of his speech, said: Production returns for the four months of the current financial year show a revenue of £494,615 and a working profit of £162,609. We have just received a cable from Mr Frank Clelland, the general manager, reading as follows: "February output 32,500 tons; production approximately 10,900 ounces; working costs approximately £86,000. These figures not yet final." However, from these figures the February output is a record as regards both tonnage and gold recovered.

Regarding the new winder, manufacturers' deliveries have delayed shipments of final units, which, however, will be made in the course of the next few weeks, and so enable commencement of operation about August next, as mentioned in my review.

Some little time must elapse before the full capacity of the winder, namely 40,000 tons monthly, can be utilised. In the meantime, organisation of the underground stopping position is in an advanced stage and other important elements, such as power requirements, are in course of synchronisation, and will ensure smooth take-up of the progressive increased production.

The rate of dividend of 30 per cent (9d. per unit) has been maintained for 1953. Earliest possible consideration will be given to the declaration of an interim dividend on account of the current year.

DEVELOPMENT UNDERGROUND

No. 2 OREBODY: Included in the reserves is a block (No. 6 South) between the 19th and 22nd Levels south of the central shaft of about 100,000 tons of ore of an average value of 6.0 dwt over 109 inches. Development on the 16th and 18th Levels is being carried out, and should reach the position of this block about September next. We have hopes that this work will disclose a substantial increase in the known tonnage in this section of the mine.

NORTH OREBODY: Reef exposed in this orebody on the 20th Level showed an average value of 10 dwt over 126 inches for a distance of 662 feet. On the 24th Level the reef extends over 1,500 feet of an average value of 6.8 dwt over 106 inches.

Work is proceeding to open up the orebody on the lower levels, and it is obvious that the reef so far disclosed lends every encouragement to exploration at depth.

EFFICIENCY AND LABOUR

Mr Frank Clelland, General Manager, writes as follows:

"With an assured supply of waste for stope fill now available, increasing attention has been paid these last months to improving drilling and breaking efficiency in stopes.

"Much remains to be done with regard to the setting up of properly worked out bonus incentives coupled with labour control, but steady progress is being made.

"There are now good grounds for belief that the present labour force is, at least, adequate for our purposes. The labour position is quiet."

Mr Clelland also reports that successful efforts have been made in controlling the general level of cost of living, thus contributing to the maintenance of goodwill and contentment amongst our African labour force. The report was adopted.

BOWMAKER LIMITED

CONTINUED PROGRESS

The twenty-sixth annual general meeting of Bowmaker Limited was held on March 4th at Bournemouth, Mr E. R. Bardsley (the chairman) presiding.

The following is an extract from his circulated statement:

Your company has succeeded in building up its group free reserves from their former modest proportions to the more imposing and satisfactory level of a figure exceeding £500,000. Your directors have, therefore, felt fully justified in recommending an increase of 5 per cent in the final dividend to make 15 per cent for the year and in addition a bonus of 2½ per cent.

All sections of our activities operated satisfactorily during the year.

IMPORTANT ROLE OF HIRE PURCHASE

I cannot escape from the conviction that there is a lack of appreciation in official quarters of the important part which hire purchase has come to play in our economic system. There is still a strong tendency to identify it only with the sale of domestic consumer goods and as an inflationary method of living beyond one's means. Hire purchase is, in effect, a credit system and no more inflationary in use than any other form of credit. In any economic conditions, credit has an essential part to play. We live on our exports, but economic exports depend upon a buoyant home market in which facilities such as we provide must play an increasingly important part.

I am able once again to repeat my confidence in the company's ability to maintain its strength and progress.

H. M. HOBSON

GROUP'S CONTINUED EXPANSION

The eighteenth annual general meeting of H. M. Hobson Limited was held on March 2nd in London.

Mr S. W. Hughes (chairman) presided and in the course of his speech said: I think the most important point of my speech today is that we are able to place before you a balance sheet of such exceptional financial strength added to which we have the knowledge that the time and money we have spent in research and development work over the past years is now beginning to bear fruit and we are able to look forward to the future with confident anticipation of still further expansion.

The group profit for the year amounted to £380,054. Taxation absorbs £250,200.

The consolidated net profit, after taxation, is £129,854, compared with £72,622.

To bring the capital permanently employed more into line with the issued share capital, the shareholders will be asked to approve the capitalisation of £300,000 of reserves by the application of that sum in paying up in full 1,200,000 shares of 5s. each for distribution in the proportion of one new share for each share already held.

We look forward with confidence to the future as, although the demand for our products for piston engines is affected by the adoption of the jet engine, we still retain a goodly volume of business in both new carburettors and spares for aircraft engines, and our new products in the aircraft world and in the field of guided weapons have created very great interest and substantial orders have already been placed.

The report was adopted and the dividend of 17½ per cent and bonus of 2½ per cent, less tax, were approved.

ABBEY NATIONAL BUILDING SOCIETY

SIR HAROLD BELLMAN'S SPEECH

The annual meeting of the Abbey National Building Society was held on February 26th at the Wigmore Hall, Wigmore Street, London, W.1.

Sir Harold Bellman, DL, JP, LLD, chairman of the Society, in moving the adoption of the report and accounts, said:

There has been remarkable progress in all departments and we can look back upon a year's endeavour which will doubtless give satisfaction to all our members.

The expansion in our total assets is perhaps the most striking index of our progress during 1953. These expanded from £153,974,000 to £181,183,000, an outstanding measure of growth in a single year. At the same time, our advances on mortgage to assist home ownership throughout Great Britain and Northern Ireland amounted in 1953 to the new record figure of £38,362,000, compared with £30,039,000 in 1952. The fullest regard has been paid to the security aspect in all these advances.

At December 31st, our cash and investments totalled no less than £23,478,000, as against £19,410,000 a year ago. All this should bring reassurance to our great body of investing members. They should derive further confidence from our reserves and carry forward, the total of which stands at £7,740,000.

During the year the Society's receipts upon investment share accounts amounted to no less than £35,435,000, while withdrawals in the year were below the average. The sums placed upon deposit in 1953 totalled £7,413,000. This is impressive evidence of the Society's standing and the special position it occupies in the confidence of the investing public.

The wider diffusion of the nation's wealth produces a wider range of people with a greater capacity for saving. At the same time the financial circumstances of the period predispose many other investors to continue the same type of investment.

The requirements of this large public are precisely those which the characteristic features of an Abbey National investment fulfil—i.e. security of the capital sum invested; freedom from complications, costs and charges; immunity from capital depreciation; convenient facilities for withdrawal, and an adequate return of interest, with income tax paid by the society. These are, in brief, I believe, the considerations which make a strong appeal to the investing public and account for the record result in the past year.

During the year our interest rates, including those paid on deposit and share accounts and those charged to borrowers, have remained unchanged.

GENERAL HOUSING POSITION

Turning to the general housing position, this has notably improved during the past year, chiefly because of the increasing proportion of new houses now being built for sale. This progress is cordially welcomed by the Society for the relief it brings to the large number of prospective purchasers. The number of houses being built for sale, however, is still inadequate and we must hope that the supply of labour and material will continue to improve so that output may be further increased. Costs in respect of new construction are still high. They will not, I fear, show any substantial decline, unless and until the private enterprise builder of houses is enabled to return to large-scale develop-

ment and with a measure of competition to act as a spur. The full economies of production are not attainable unless output by individual builders can reach the level where an efficient flow of production is achieved. The land problem may in some cases be a limiting factor in the scale of development, but it is to be hoped that private enterprise will not suffer from any tendency on the part of public authorities to monopolise the most suitable land.

There is no doubt that there is a large public willing to undertake ownership. With many, however, difficulty arises from the size of the normal initial deposit required. Ways and means should be found to assist such people where it is appropriate that they should be encouraged to assume the responsibilities of home ownership. Reference has already been made to this matter in the national press and it is therefore betraying no confidence to say that the possibilities of a significant development are receiving careful consideration.

In my view, it is appropriate that the State should be prepared to give a guarantee, in conjunction with local authorities, to enable building societies in suitable cases to make an advance for house purchase in excess of normal, thereby reducing the amount of the initial deposit required from the purchaser. In this way, many who now feel debarred from home ownership should find themselves more happily placed. I earnestly hope that whatever obstacles are encountered will prove not insurmountable.

The technique of granting advances in excess of normal supported by guarantees is by no means new, and with careful administration should prove of inestimable advantage to many would-be home owners. Public funds would not be exposed to serious risk and the sums likely to be involved would represent but a fraction of the saving in subsidies. I hope that it will be possible to evolve a satisfactory and workable scheme.

In a year of such growth as the Abbey National showed in 1953, there are many debts to acknowledge for devoted services. My friend, the deputy chairman, Mr Stanley Ramsey, and all our colleagues on the board desire to pay a tribute to the officers and staff. The managing director, Sir Bruce Wycherley, has, during a year which has been memorable from several standpoints, necessarily assumed added responsibilities and has been called upon to lead his team so that they give of their best under exacting conditions. The results for 1953 reflect their praiseworthy achievement. The joint general managers and secretary have responded to all the calls that have been made upon them, whilst members of the staff of all grades have given most loyal and able support.

MR STANLEY RAMSEY'S SPEECH

Mr Stanley C. Ramsey, FRIBA, deputy chairman, in seconding the adoption of the report and accounts, said:

The year 1953 has witnessed a remarkable change in the realm of housing. The Government is to be congratulated on having achieved (and indeed exceeded) its target figure of 300,000 houses, including houses for letting as well as for sale. In providing large numbers of houses for letting they were following out the policy of the late Government, although this does not in any way detract from what has been accomplished.

Probably what is more remarkable is the number of houses put up by the private

house-builder. The decision to do away with the development charge, with all the uncertainty and frustration which it entailed, is, in my opinion, one of the decisive factors in bringing about the increased number of such houses built and being built during the year we are considering.

If it were wise to do away with that part of the Town and Country Planning Act, 1947, relating to development charges, it was no less wise to retain the system of controls. We have had since the war so much in the way of control, that to many the word has become anathema. However, to use a homely adage, "the proof of the pudding is in the eating," and there is no question, in the view of a competent and unprejudiced observer, that these postwar houses compare more than favourably with those built between the two world wars.

They are better planned, of a more pleasing appearance, as well constructed and, above all, the grouping or site planning is immeasurably superior. The credit for this happy state of affairs must in the first place go to the planning authorities, either county or local, and to the tact and vigilance of their executive officers. But at the back of all this is a long history of effort by the architectural profession, the Council of Registered House Builders and the Building Societies Association. It is a story, too little known as yet, which must be told in detail some day, but meantime we can wholeheartedly welcome the higher standards of private enterprise postwar housing to which I have referred.

Building societies cannot be indifferent to housing standards as, all things being equal, the better the house the better the security.

The report and accounts were adopted.

The Society's auditors, Mr Harold Lakeman, FCA; Mr R. T. Walters, TD, MA, FCA; and Mr A. W. White, FCA, were re-elected. Mr William Cash, MA, FCA; Mr H. L. Roy Matthews, CBE, FAI; and the Right Hon Sir Geoffrey Shakespeare, Bt, MA, LLB, were duly re-elected to the board.

SIR BRUCE WYCHERLEY'S REMARKS

Sir Bruce Wycherley, MC, FCIS, managing director of the Society, said:

As managing director, in daily touch with the staff, I am perhaps in the best position to judge what a splendid effort they have made. Such progress as that shown in the report before you today is not automatic; it has to be planned and worked for at every stage.

It is only just to remark also that our progress has been achieved on the most economical basis. Our staff is substantially the same as it was a year ago, and our management expenses, on a proportionate basis, show yet again a downward trend. I doubt if there is any organisation, rendering comparable services, at once so economically and efficiently managed as a building society such as the Abbey National.

One point, however, I should like to emphasise in conclusion. As you have been reminded on previous occasions, we do not seek expansion for its own sake. Our aim is to expand our service on a sound basis in response to public requirements. If we aimed at less, we should be unenterprising; if we aimed at more, we should be imprudent. I am sure you can trust us to be both enterprising and prudent.

ILFORD LIMITED

(Manufacturers of Photographic Materials)

PROPOSED SCRIP ISSUE

NEED FOR COSTS TO REMAIN COMPETITIVE

SERIOUS EFFECT OF PURCHASE TAX ON THE INDUSTRY

HON JAMES P. PHILIPPS REVIEWS YEAR'S ACHIEVEMENTS

The annual general meeting of Ilford Limited will be held on March 24th at the Ilford Gallery, 106-107 High Holborn, London, W.C.

The following is the address by the chairman, the Hon James P. Philipps, copies of which have been circulated for the convenience of shareholders with the report and accounts for the year ended October 31, 1953:

Ladies and gentlemen, although you will have seen in the notice convening the meeting that this is the fifty-seventh annual general meeting of Ilford Limited, this year we actually celebrate the seventy-fifth anniversary of the founding of our business by Mr A. H. Harman who, under the name of Britannia Works Company, started making sensitised photographic plates at Roden Street, Ilford, on the site of our present plate factory and head office in 1879.

The company's present name of Ilford Limited was adopted in 1900, but the name Britannia Works Company Limited has been continued by another company which at the present time is actively and successfully trading as one of our subsidiaries.

RECORD TURNOVER

I am very pleased to say that we have been able to expand our business still further during the year under review and turnover increased in almost all sections. It is particularly satisfactory that we have effected this in spite of increased competition. The excellent quality of our products has helped us considerably in the competitive conditions prevailing now that practically all brands have become freely available and the customer can exercise his choice.

During the past year our costs remained fairly stable and prices showed a tendency to decline. I hope that we are not going to see during 1954 a new round of cost inflation of the type which has become familiar in postwar years. Under present competitive conditions such a cost inflation would have serious effects on the export business of the company and on the economic position of the country.

CAPITALISATION

If you turn to the consolidated balance sheet you will see that the issued Ordinary capital of the company is only £2,266,666, whilst the Ordinary shareholders' funds actually employed in the business now exceed £6 million. Your board feel that this is an appropriate time to take a further step in their policy of bringing the two more into line. They are, therefore, recommending first, that the authorised Ordinary capital should be increased to £3,500,000. Secondly, that the capital reserves, consisting of £1,613,383, standing to the credit of the share premium account together with £106,663 being the amount of the excess profits tax postwar refund so far received and expended, and the sum of £865,287 reserved for replacement of fixed assets be capitalised and utilised to pay up in full 4,533,332 new Ordinary shares of 5s. each.

Thirdly, that these new fully paid shares should then be issued free to Ordinary shareholders who are on the register at the close of business on March 25, 1954, in the proportion of one new share for each two shares held. The Capital Issues Committee have agreed to these proposals, and an Extraordinary General Meeting is being convened to consider them immediately after the conclusion of the Annual General Meeting.

TAXATION

I hope you have found that the accounts are clearly set out and easily understandable, but there are just one or two points to which I should like to draw your attention. In the first place you will doubtless have noticed in the Ilford Limited profit and loss account that an amount is included this year for excess profits levy in a total provision for taxation of £882,527, which is an increase of £204,863 over last year's figure.

Secondly, I feel sure you will agree that the company's balance sheet shows a strong financial position. Current assets amount to £5,276,003, and after making provision for the recommended Ordinary dividend there is an excess of current assets over current liabilities of £3,415,204 compared with £3,092,836 last year.

This increase in the net current assets together with the increase in fixed assets are the result of the policy of your Board of ploughing back a substantial proportion of the profit after taxation and maintaining a considerable degree of liquidity in the company's financial resources consistent with the progressive growth of its business. This satisfactory position is also apparent from the consolidated balance sheet.

FILM BASE

The Bexford film base plant has continued to operate in a satisfactory manner and during the year we used British-made base for a high proportion of our sensitised film, thus effecting useful savings of hard currency.

DEVELOPERS—PHENIDONE

I mentioned last year that we had pioneered a new developing agent under the name "Phenidone," and that I considered there was a possibility that it might displace the long-established Metol.

As the result of a further twelve months' experience we have come to believe that Phenidone can in time replace Metol entirely. Extensive trials indicate that it is more efficient, less toxic and more economical. Phenidone is at present being manufactured in England and under licence from us in the USA, and arrangements are being made for its manufacture in other countries.

Phenidone, like the older developer, Metol, is normally used in conjunction with Hydroquinone. We have in the past found difficulty in obtaining Hydroquinone in this country in the quantities we required. We have, therefore, jointly with the Geigy organisation established a company to manufacture Hydroquinone, and we are now

independent of outside suppliers for this important chemical. I think this new plant will put us in a much stronger position to develop our business in photographic chemicals.

Also with the object of increasing our trade in photographic chemicals our subsidiary, Britannia Works Company Limited, acquired during the year an old-established business engaged in the manufacture of hypo and similar sulphur-based compounds important in photography. The operation of this plant during the nine months we have owned it has proved satisfactory.

NEW PLANT

Twelve months ago I foretold that the new film coating plant which had just come into production would end the shortage of X-ray film in this country and the Commonwealth. This forecast proved correct, and during 1953 Ilford X-ray film was more or less freely available. The demand for our films of all kinds has, however, continued to increase, and it seems probable that we shall still be able to sell without difficulty the total output of our plant when, as a result of our policy of modernisation, further additional capacity becomes available in the very near future.

COLOUR FILMS

We have recently introduced a service for making colour prints from our well-known Ilford colour film transparencies. Although print production has so far only been on a modest scale, it is being steadily expanded. The prints are excellent and have been well received by customers.

These Ilford colour prints are being made available at the reasonable price of 2s. 6d. per print in postcard size, and so offer much better value than the imported product available up to now.

Ilford colour film is at present only available for the 35 millimetre type of miniature camera. In due course, we also hope to produce a roll film to yield both colour transparencies and prints.

AUSTRALIA

Three years ago we formed a subsidiary company in Australia to consolidate our interests in that country. Mr T. M. Illingworth, our deputy-chairman and joint managing director, has recently visited Australia, and reports that there are good prospects of expanding our business there.

FOREIGN COMPETITION

As a large part of our business is in export markets it is of great importance to us that our costs should remain competitive. Up to the present we have been able to meet foreign competition in price and in quality, but a comparatively small increase in our costs could weaken our position. While we can to some extent control costs in our own factories by paying attention to means of avoiding waste and increasing efficiency, we can be seriously affected by factors beyond our control, such as the increases in the cost of

fuel and transport recently announced, which will affect all industry. It still does not seem to be as widely realised as it should be that an increase in costs of production this coming year can have a crucial effect on the level of employment in the next few years.

PURCHASE TAX

The Chancellor's recent statement on purchase tax can only be described as most disappointing. Last year I told you that our industry carried a special burden in the high rate of this tax and that strong representations were then being made to the fiscal authorities for a drastic reduction of the 66½ per cent tax.

In the event, as you know, purchase tax was in general reduced by 25 per cent in the last Budget so that our own industry is still subject to a rate which is higher than applies in competitive fields of enterprise. Even though the tax is lower than it was a year ago, its effect on our industry remains serious.

Before concluding, I should like to thank, on your behalf, all our staff, both at home and overseas, for their loyal co-operation and for the great part they have played in the achievement of the past year.

THE OMNIUM INVESTMENT COMPANY

RECORD INCOME AND DIVIDEND

The sixty-seventh annual general meeting of The Omnium Investment Company, Limited, was held on February 25th in London.

Mr Patrick L. Fleming (managing director), who presided, said: In the absence of the chairman, it has fallen to me to offer a few observations on the state of the company's affairs, a task which is made easier by the fact that the accounts now before you show a record income and enable us to recommend a dividend of 10 per cent, which is as high as any in the sixty-seven years of the company's life. Whether we can improve on that depends, of course, on how long we have to wait for a real reduction in taxation, without which the dividend we receive from industry, on which the main burden of taxation rests, will begin to go down; for which reason we have, over the past few years, been increasing our proportion of fixed interest securities and investments overseas.

It has been the traditional function of investment trusts, while keeping much of their money in companies which have stood the test of time and the shares of which are easily realisable, to devote a fair proportion of their funds to new and untried enterprises which involve a knowledge, an experience, risk and a delay such as to make them unsuitable for the investing public. This business of pioneer investment is not without its disappointments, but it is largely due to the heaven of those which have proved successful that the value of an investment in our deferred stock, and the dividend paid thereon, have each doubled since the war.

The report and accounts were adopted.

THE EASTERN BANK LIMITED

THE TRANSFER BOOKS and Register of Members will be CLOSED from March 23rd to April 6, 1954, both days inclusive.

By Order of the Board,

C. L. MANNING, Secretary.
2 and 3 Crosby Square, London, E.C.3. March 3, 1954.

MARKET RESEARCH OFFICER required by important manufacturers of consumer lines to handle all market research and plan sales promotion campaigns. Must be widely experienced in the collection and interpretation of statistical and other data for sales control and development purposes. University training is desirable and direct selling experience an advantage. Salary and prospects are attractive and applicants should send details of age, education, training and experience, to Box 478.

INDUSTRIAL ENGINEER available home, abroad, consultant or executive (40), qualified, management, work study, wages negotiations, production control, methods, mechanisation, costs, sales.—Box 486.

SCOTTISH EQUITABLE LIFE ASSURANCE SOCIETY

RECORD NEW BUSINESS

The one hundred and twenty-third meeting was held on March 4th in Edinburgh, Mr R. Ian Marshall, CA, chairman of the board of directors, in the chair.

Mr Marshall, in the course of his remarks, said:

The accounts before you cover the first year of a new quinquennium and a very satisfactory year it has been. Net new sums assured for 1953 amounted to £4,504,428 showing a substantial improvement over the previous year's figure of £4,048,541 and creating a record.

If you will look at the life assurance fund revenue account you will see that there has been an advance of about £234,000 in our premium income making a total of more than one and a half million pounds.

I would like to say a few words about the increase of about £150,000 in the "Consideration for annuities"—that is in the total purchase money paid to the society in the year. In October last the society's rates for annuities were reviewed and new rates were adopted on a basis which has proved attractive to purchasers. This change quickly resulted in many more enquiries and in an increase in the volume of annuity business written during the remainder of the year.

The figure for interest income in the account represents a gross rate of £5 8s. per cent per annum, the net rate being £4 5s. per cent, both calculated on the life assurance fund.

The sums paid out during the year in respect of policies becoming claims by death amounted to £291,017.

Expenses of management are about £13,000 less than in 1952 in which year, however, there were special outlays which have not recurred; if we leave out of account these special items we find that the cost of conducting the business was much the same as in the previous year.

The increase in commission paid to agents is of course related to the increase in the new business.

The result of the year's operations is that the life assurance fund has been increased by very nearly one million pounds. The largest comparable figure for a previous year was £639,375 in 1952.

BALANCE SHEET

Turning now to the balance sheet, I should mention an increase of about £216,000 in sums held on deposit. This increase is accounted for by the deposit with the society of £220,000 by the trustees to the staff pension fund. Amongst the alterations in the assets there are, in round figures, increases of £190,000 in mortgages, £300,000 in British Government securities, £140,000 in foreign government securities and £130,000 in debentures and debenture

stocks. The increase in foreign government securities arises from a short dated investment in the United States of America. The upward swing in Stock Exchange prices has resulted in a substantial increase compared with last year in the margin between the balance sheet values and the market values of our Stock Exchange securities.

The adoption of the report and accounts was carried unanimously.

LEICESTER PERMANENT BUILDING SOCIETY

YEAR OF PROGRESS

The one hundred and first annual general meeting of the Leicester Permanent Building Society was held on March 1st in Leicester. Mr A. D. Carmichael, CBE, the chairman, presided, and in the course of his speech said:

The following are some of the outstanding results of the past year:

New monies invested with the Society, together with borrowers' repayments, amounted to £10,846,670.

Withdrawals, including capital and interest, were £3,683,912.

RECORD ADVANCES

Advances made on mortgage reached a record sum of £6,420,018.

The total assets of the Society at December 31, 1953, were £31,284,602 and showed an increase over the previous year of £2,847,300.

Reserves reached £2,537,244, representing 8.11 per cent of the total assets.

The market value of trustee securities was £112,966 in excess of the book value at December 31, 1953.

Liquid funds totalled £3,771,527.

INVESTMENT ATTRACTION

New investments flowed into the Society to the extent of £5,746,670 during the year, influenced no doubt by the attractive rates of interest paid, by the ease of investment or withdrawal without cost, and by the safety of the investment itself.

There is little doubt, too, that the slight easement in personal taxation and the stability of price levels over the last year, have made saving more worth while, and all helped to encourage people to save for the future.

The profit and loss appropriation account shows a total available of £843,921. From this sum £590,517 was paid out to the shareholders; £36,160 allocated to the staff pension fund; £100,000 to the general reserve, and £30,000 to contingency reserve, leaving a satisfactory balance of £87,244 to be carried forward.

The report and accounts were unanimously adopted.

BUSINESS PROMOTERS

Patent holders of manufacturing process, offering franchise to central organisation with empire-wide connections, wish to contact well-established promoters to handle negotiations with suitable firms in U.K.—Box 484.

ACTUARIAL DEPARTMENT—A vacancy exists in an Ordinary Life Office in London for a partially qualified man. Experience of Ordinary Life Office actuarial work is essential, and the appointment holds good prospects and the possibility of promotion.—Apply Box No. 3359/2, c/o Foster Turner and Everetts Ltd., 11 Old Jewry, London, E.C.2.

JUNIOR MARKETING EXECUTIVE required by large West End Advertising Agency. At least two years' market research experience and some knowledge of economics and statistical methods.—Box 487.

A bath with lasting effects

Before any Crittall window is allowed to be labelled 'rust-proofed' it must take a bath—in 100 tons of molten zinc at a temperature of 860° Fahrenheit. It stays in the bath until every part of its surface has been galvanized—a positive, tough amalgamation of zinc with steel. There is nothing transitory about the effect of this treatment. It ensures that much less need be spent, over the years, in keeping Crittall windows as spruce as the day they were made. It makes certain that, just with ordinary sensible care, rust and corrosion need never again mar the good looks of a building's windows.

Risks in Germany

THOSE who have chosen this particular moment to stir up bitter memories and suspicions against the policy of German rearmament in a European Defence Community presumably know what they are doing. In six weeks' time, the Great Powers confront one another in Geneva to discuss, among other things, France's problem in Indo-China. Some say that nothing should be done during these six weeks to irritate Mr Molotov, lest he should do less than he otherwise might do to assist negotiations for ending a war in which his ally China is assisting France's enemy, the Vietminh, with weapons and supplies. Others say that there can be no horse-trading of concessions in Europe and concessions in Asia, and that the western powers should go ahead with their policy for Europe and Germany as planned. In other words, some want to put off until after Geneva the great debate in the French Assembly which could lead to ratification of the EDC Treaty; others want to get on with it so that the West's hand is strengthened by holding the EDC card which Mr Molotov seemed most anxious to trump in Berlin. Those who would procrastinate are having their hands strengthened by the emotional attacks on German rearmament that are being conducted in this country and elsewhere.

In this campaign political opportunism, malice and ignorance appear as no less important elements than the genuine fear of what a future German government and army might do with the power of arms. But it is, unfortunately, only the ignorance that is vulnerable to argument. There appears to be widespread misunderstanding of two vital factors in western policy for Germany which Mr Molotov, for his own purposes, has vigorously encouraged. First, there is the failure to see that the defence community is a great political experiment in damping down and extinguishing the Franco-German feud, and in building a viable and strong Western Europe. Secondly, there is failure or refusal to admit the power and range of the restrictions that are accepted by Germany, and its fellow-members, by joining this community. Only detailed study of the indigestible and complicated treaty reveals the shape of the harness that has been designed for the European divisions; an article elsewhere in this issue presents in question and answer form what the safeguards and undertakings of the Treaty really are. To say flatly that German rearmament is in no circumstances acceptable is to ignore the three years' work done together by French, German and other European soldiers and officials to change the whole character of national defence organisations in order to meet Germany's problem.

What precisely are the risks? There are two good reasons why they should be faced and discussed frankly by those who support the EDC. One is that a powerful body of opinion in Europe is asking that the treaty be made less supra-national, less binding and less onerous for France. That would mean increasing the risks and modifying the political revolution that the EDC would bring about. Another is that failure to ratify the treaty would encourage some Americans to demand

that German rearmament should take place in an alternative form, without the restraints and safeguards that Dr Adenauer and the German parliament have accepted. Indeed, perhaps the worst offence of those who campaign in passion against German rearmament is their refusal to admit that many of those who support it, both in Germany or outside, are as eager as anyone to ensure that parliamentary democracy in the Federal Republic shall not again fall under military or extremist direction. It is no exaggeration to say that if the EDC project collapses, German moderate opinion will turn against rearmament and the whole European policy of Dr Adenauer will be discredited, perhaps beyond repair. German nationalists will be able to return to the theme of Hitler: that French obstinacy and Russian mischiefmaking leave Germany no choice but to follow its own course with all the strength it can muster.

★

The opponents of German rearmament raise a series of objections. They say, first, that Germany will dominate the defence community by its energy, industrial power and military prowess. That is obviously true—unless the French put their own potentially rich economy in order, unless the British exert the full influence that their association with the EDC will give them, and unless the United States continues to play in the Atlantic alliance the role that would enable Nato to remain military master of the EDC. These conditions are even more important than the political checks and balances embodied in the Treaty.

Then, they say, Western Germany, having been rearmed, might leave the community. It would be difficult—but not impossible—for German divisions, dependent on European supplies and equipment, simply to walk out of their corps and army groups. But any attempt to do so would be treated by France, Britain and the United States as a threat to their own security. A Tripartite Declaration to that effect exists. It is said that this is no more foolproof than the Locarno Treaty that Hitler broke by marching into the Rhineland in 1936. That is true; what was lacking in 1936 was not the right kind of treaty, but Anglo-French willpower to enforce it, and American interest in seeing it enforced.

It is argued, too, that if German unity were brought about, an all-German government would be free to leave the EDC. That is true, as the western foreign ministers pointed out to Mr Molotov in Berlin. There is good reason for hoping that a government created by free elections throughout Germany would throw in its lot with the West. Mr Molotov clearly believes it would, at any rate in the immediate future.

Then there is another group of arguments that vary the theme: "We cannot trust the Germans." Dr Adenauer, it is said, will not always be at the helm of the German state. There are still nationalists, mischief-makers, unrepentant Nazis, militarists out for jobs, and

refugees yearning for return to their old homes in the east. That is all true, and nobody knows it better than Dr Adenauer and the moderates who support his European policy. They would answer—and so would the Frenchmen who built up the EDC Treaty—that the defence community would make things much more difficult for such elements. Deception and disloyalty of the kind practised by von Seeckt and others would not be easy in an international staff, continually mixed up in the affairs of several nations, exchanging secret papers, and exposed to the supervision of a Council of Ministers and an assembly of watchful politicians. It is admitted that there might be danger in the early stages from senior officers who have known nothing but the nationalist outlook of the old Wehrmacht; but they would be confronted after three or four years with a corps of young officers, trained in European military schools and staff colleges, looking to the European Commissioners for prospects and promotion.

Finally, there is the fear that a rearmed Germany, even in EDC, would drag its associates into war to regain the eastern territories or to liberate Eastern Germany. No one denies that a revision of the Oder-Neisse line will be an object of German foreign policy; nor would everyone deny that it is an ultimate object of western foreign policy to see the Red Army retire behind the frontiers of the Soviet Union. The question is whether there is more risk of this problem leading to war when Germany is in the EDC than if Germany were out of it. And would any German government of the future risk a war that would certainly be fought on German soil? Analogies with the past break down on two new facts: the presence of a powerful Soviet system on the eastern frontier of Germany and the involvement of the United States in Europe's affairs.

★

These risks, it is true, cannot be entirely dismissed even with such arguments; what is important is that the argument about German rearmament should be conducted honestly and with full knowledge of the facts. And of those facts there is one of outstanding importance that is consistently ignored. It is that the Bonn Conventions between the Federal Republic and Britain, France and the United States—which are tied up inextricably with the EDC Treaty—are explicitly designed to assist the development of parliamentary government among the Germans. They state the right of allied forces to remain in Germany as defence forces when occupation is legally at an end. They concede their right to help a German Chancellor to protect the constitution against extremist coups or subversion from inside. They entitle the western allies to declare, in certain circumstances, a state of emergency to protect the security of their troops. In brief, it is part of the EDC-Bonn Conventions bargain that a friendly and moderate government in Bonn will have powerful friends at hand to assist it against Hitlers or Ulbrichts

of the future. That such safeguards should exist is remarkable; that a German government should have accepted them is even more remarkable. Dr Adenauer has invited confidence by showing confidence.

It is, however, one thing to advocate the quickest possible ratification by France of the EDC Treaty and the agreements with Germany, but quite another thing to insist that the defence community and its forces should be created in a tearing hurry. It is here that the pressures on Mr Dulles seem to threaten some danger. If this political and military experiment is to take root it must not be hurried. There must be time for experiment and compromise, for personalities to learn to work together, for immense administrative problems to be examined and solved. American policy could wreck the EDC, on which it sets so much store, by forcing it into premature responsibilities. The need for 45 European divisions is less urgent than it was; it is not even certain that General Gruenther and his staff want

Television Aunt

THE Television Bill has been published, and the battle about it can now go forward, free of the previous minor encumbrance that nobody has known exactly what he was battling about. Unfortunately, both sides seem to have decided that the lifting of this veil should not make any difference. For the opponents of commercial television have become so emotional that they are still furiously fighting a battle that they have already won, and the Government is so sensitive about its resort to yet another compromise that it does not like to admit the full extent of its retreat. The public is therefore being left with the impression that the new Television Bill differs only slightly from the proposals put forward in the Government's white paper last November, and that it still bears some resemblance to the proposals that were being hatched a year or eighteen months ago. Both impressions are quite wrong.

The whole principle of last November's white paper was that the new Independent Television Authority, which is to be set up in the image of the BBC, should own and operate the transmitting stations, but that it should not produce any programmes itself. The ITA was to draw the whole of its income from—and all the programmes were to be produced by—the private enterprise "programme contractors" who would hire its facilities; and these contractors would draw their own revenue wholly from advertisements. Under such a scheme the contractors would inevitably try to produce the sorts of programme that advertisers wanted, although under the watchful eye of the body that is surely destined to be known as the Independent Television Aunt.

The new Bill drops two bombs on this structure. The first is that the ITA is to have greater supervisory

so many. There is nothing sacrosanct about the figures of 14 French and 12 German divisions around which controversy has ranged.

What is important is that the defence community should be efficiently and amicably created; not that it should stamp out of the ground an international army. If it is to be given time to breathe and grow—if it is, indeed, to have a real chance of being created at all—there must be no more talk of reducing American and British forces in Europe so that Germans can take their place. The United States and Britain have staked everything on the policy embodied in the existing network of treaties; and they have a clear moral obligation to go on providing the shield of strength behind which the policy can be carried out. To regard the EDC as merely a contrivance for rearming Germans and reducing American and British forces on the Continent would be a great betrayal of the only constructive political idea that offers itself to the younger generation of Europeans.

powers than anybody had expected. The Bill lays them down with prim determination. Advertisements will have to be clearly distinguishable from each entertainment, and inserted only at the beginning or end of programmes or else in natural breaks; there can therefore be no association between a particular performer and a particular product—Gilbert Harding can appear only as Gilbert Harding, and not as an advertisement for dyspepsia pills. The ITA is also to have stern powers to regulate the amount of time taken up by advertisements, to vet scripts, to enforce competition between the programme contractors, and to ensure that they do not annoy the actors' trade unions by using too many American films. It will be able to fine a contractor £500 if he breaks any of these rules, and to withdraw his licence after three fineable transgressions. Most of these powers had been foreshadowed in some degree in the white paper, but in the agonising interval of indecision each of them has been given considerable additional edge. The contractors cannot now possibly be said to be sallying insouciantly into a field in which big businesses can indulge a sly liking for blue politics and bluer jokes; instead they will be operating in perpetual fear for their livelihoods.

The second innovation in the Bill is that the ITA is to receive an independent income of £750,000 a year from viewers' licence fees, and will produce some programmes itself; moreover—and this may be an important pointer to the future—it can receive direct fees for advertisements included in its own programmes. This welcome decision has been greeted by the flourishing of some extraordinary red herrings by opponents of the scheme, with triumphant cries of stinking fish. The line chosen in the past week has been

that this declaration of partial independence for the ITA means that viewers will now be paying for advertisements, and that the two to three million pounds a year that may be paid by the advertisers themselves will do nothing to save viewers from the burden of additional licence fees. This, of course, is deliberate nonsense; no abstruse calculations about the ITA's proposed £750,000 a year from licence fees, about its proposed £2 million of borrowing powers in the next five years, and about the mulcting of all licence fees for the equivalent of entertainments tax (with the glib assumption that the whole of this money would otherwise have gone to the BBC instead of ITA), can really make two plus two equal minus five.

Behind these misrepresentations—and others of longer standing but no greater worth—there have always been three genuine objections to the system of advertisers' choice. It is these genuine objections that need to be studied afresh in the light of the new Bill. First, some people in the Labour party have been honestly afraid that the sort of programmes advertisers will want will be programmes in which jokes against Socialism are regarded as rather funny and jokes against Sir Winston Churchill as rather bad taste; one uneasy memory here is that the funniest joke the BBC ever allowed against the Labour Party was when it put a certain Labour ex-Minister on one of its strictly balanced political panels, an action that some Tory-minded directors might be anxious to repeat and that no paper constitution could ban.

★

After reading the new Bill, however, these fears must surely be dissipated. It is a safe guess that the ITA, which has been born under a parliamentary cloud, is going to be even more eager to prove its lack of political bias—and of political ideas—than the BBC has been; and the programme contractors, whose livelihood the ITA can cut off at a whimper, are likely to be much more frightened of authority than individual BBC producers are. The recipe is for even greater political flatulence in the commercial programme than in the public service programme. This carries its own dangers for democracy, but they are dangers very different from those that the Labour Party has hitherto assumed.

The second objection to commercial television has come from the sponsors of culture, the sort of people who even now think before they might look—and then generally decide not to. They have feared that advertisers would debase public taste, and to this has been attached the inevitable sneer that all programmes would be "brought down to the American level." This view is usually based on an entirely estimable ignorance of the service that television at present provides. Nine-tenths of the programmes on BBC television have always been programmes that could equally appear on American screens; indeed many of them—including some of the best thought-out—have been borrowed or bought from America directly. This has been a natural development. America has been the great forcing house of television,

filling many more screen hours than Britain could ever afford. In consequence, the worst of American television has always tended to be worse than the worst of British television; while the best of American television has been promptly imitated here, although often not done so well. Once or twice a month the BBC has also put on an experimental programme, such as the present project for an opera in modern dress or the documentary programmes in which certain British producers have evolved an admirable technique; with its independent revenue from licence fees there is no reason why the ITA should not blaze at least as ambitiously—and sometimes as inanely—along the same trail.

★

There remains the third objection which has been levelled against the proposals in last November's white paper. This objection was that the scheme would prove financially insolvent. This danger must have been intensified by the stern restrictions to be imposed under the new Bill. In its last financial year the BBC seems to have spent about £10,000 a day, or £2,000 an hour, (including overheads) on its television programmes. The money that ITA will get from licence fees will be the equivalent of rather more than £2,000 a day. On this basis advertisement revenue would have to produce about £8,000 a day; assuming six minutes of advertising to each hour of viewing, and five hours viewing a day, this would suggest that the contractors will have to find, day in and day out, advertisers willing to pay fees not far short of £300 a minute.

Yet the commercial programmes will cover only just over half the country, and within this area not all viewers will pay to have their sets adapted—certainly not at once. The potential contractors and the advertising agents point out that total advertising expenditure in Britain is now over £500,000 a day, and claim that the excitement of the new medium will be sufficient to tap the necessary drop of water from this pool. They may be right: but optimism in entertainment is always being cheated, as the history of British films should show.

The fairest conclusion must be that if the scheme proves financially viable it can do no great harm; while if it quickly becomes insolvent, it may do a great deal of good. In such an eventuality the ITA would almost certainly tend to produce more programmes itself. To do this, it would have to reach out for a larger share of licence revenue; and the compensation provided to the BBC would then very probably take the form of permitting it to receive advertisements itself. The country would then have two independent television authorities, competing with each other both in popular appeal and for the attraction of public regard; this system would clearly be preferable to the present slightly enervating BBC monopoly. Those who believe that the Government's compromise solution will work should not shy from it; while those who believe that it will not work should vote for it more enthusiastically still.

The Danger From Djakarta

WHILE the prospects of war and peace in Indo-China hit the headlines, news of a different sort comes from Indonesia. The gulf between theory and practice has seldom been better illustrated than by the Indonesian Finance Minister's statement at the end of February on his country's need of foreign capital. Taken at its face value, this new outline of policy represents a reasoned—in some ways an imaginative—attempt to state and reconcile the interests of the foreign investor and the ardent nationalist. It lays down a number of principles which recognise the existence of a problem, even if they stand perhaps only a small chance of coaxing the capricious foreigner to open his purse strings. In a world where competition for capital is increasing, this is most welcome. But seldom have a politician's utterances fallen on deafer ears than on those of the foreign community in Djakarta.

Why should this be? What has been offered, and why has the gift been so cynically examined? The Indonesian government begins by laying down three conditions for foreign investment, with which there can be little serious disagreement in principle. The risk "shall lie with the owner of the capital"; the investment "shall be in conjunction with Indonesian nationals" and "in concert with the government or government(al) organs." The government then goes on to put its finger on one of the most important aspects of the whole question. "To promote this," it recognises, "a state of security is of the utmost importance." It adds that foreign nationals employed in Indonesia must be allowed to transmit part—though it does not say what part—of their income to their country of origin; that foreign enterprises must be permitted "to transfer profits, after tax... to the country from which the capital emanates"; that the return of the entire capital must be allowed "after it has been used in Indonesia for a reasonable number of years"; that, while "in general the government is more favourably disposed to industrial projects, rather than commercial, communications or banking enterprises," exceptions may be made in special cases, and there must in any case be "co-operation between foreign capital and the government." Then, as if to show how inexplicably wayward the foreign capitalist may yet be, the statement adds that, if he is still not sufficiently

attracted, "the risk will (in certain circumstances) be taken by the government"; "in this connection, capital can be obtained on loan at a fixed rate of interest and the enterprise will still be able to share in the profits."

What could be fairer than that? India was the first of the new governments in Asia to reverse its hostile attitude to foreign capital—though there has since been some backsliding—and now the Indonesians, like the Burmese, have begun to change their theories. The trouble is that it is not so easy to change their practice. Whereas in Delhi a stable and fairly determined government has been able to adopt a realistic policy and stick to it, in Rangoon and Djakarta somewhat different conditions have prevailed. And while the main difficulty in Burma now appears to be the country's slow return to a state of normal security, in Indonesia the Finance Minister's hands are tied by conditions inside the administration as well as outside it.

Pleas for foreign capital and promises to treat it fairly have a hollow ring when they come from a weak government largely dominated by men notorious for their anti-foreign and, in some cases, anti-western attitude. Many of them, in spite of this latest pronouncement, are still pressing for more employment of Indonesians in foreign firms, when that policy

has already been pushed beyond the bounds of common sense. Again, in spite of the promises of fair treatment to individuals, the entry even of key foreigners is obstructed by a mass of regulations which ignorant officials use like bludgeons.

There has always been widespread sympathy in the West for Indonesia's difficulties, ever since the struggle which led to independence in 1949; but the interests neither of Indonesia nor of its friends are served by glossing over the facts of life in that country. The picture they present, four years after the achievement of independence, is confused and somewhat threatening. The government's authority is being increasingly undermined by the continued unwillingness of politicians to bury their differences and by the head-in-the-clouds attitude of the main political parties. On the floor of parliament, happily insulated from the realities of life outside, Indonesia's leaders have lately battled through yet another phase of the army command intrigue. When not so engaged, the minds of many of them seem to run

on questions like the break-up of the Indonesian-Dutch union or the return of Irian (West New Guinea). Scarcely a word is said about living standards and productivity, about housing, communications, security, food supplies, transport, federalism—or the innumerable other practical problems which need to be tackled.

Meanwhile, in several important respects, there is a disturbing drift. With the fall in the price of rubber and other commodities, Indonesia's foreign trade balance has sharply deteriorated. In public affairs, there is too often creeping apathy, a sense of frustration, a growing corruption, and limitless red tape in the simplest matters of administration. And all the time the Communists, through the main trade union organisation, are consolidating their hold on a lazy and turbulent urban proletariat, at a rate which suggests that they may soon attempt a major attack on the government.

★

These are some of the reasons why, in present circumstances, the recent invitation to foreign capital is hardly likely to succeed. In fact, the government is neither willing nor able to provide the security which it recognises as essential if new investment is to be encouraged. But this is not Indonesia's tragedy alone. It is characteristic of many other countries where nationalism has got out of control during the past few years, and in South East Asia it represents a special danger. For Indonesia is by far the biggest of the South East Asian states; its population exceeds that of Indo-China, Siam, Burma and Malaya combined. And although the struggle in Indo-China has reached a critical stage, a Communist success in Indonesia, on the back doorstep

Open Prisons—II.

Convicts in Comfort?

ALTHOUGH the twelve open prisons in camps and country houses in Britain have not let loose a flood of dangerous escaping prisoners, and although they have saved the taxpayer money because they are so cheap to build, many people are still instinctively opposed to them. There is a dark suspicion in some minds that the wicked flourish there like green bay trees. This causes uneasiness on grounds that are partly rational and partly mystical. Common sense demands that prison should be sufficiently unpleasant to discourage crime. But quite apart from this rational demand for deterrence is the primitive demand for retribution—the widespread feeling that prisoners ought to suffer because sins must be paid for and that society ought to take the revenge that it rightly denies to the private individual.

The first sight of an open prison would not seem to promise either deterrence or retribution. The new

of the continent, could in the long run have almost equally important results.

Asians sometimes protest that the West attaches altogether too much importance to Communism. What matters to us, they say, is our freedom to choose what suits us best; and in Indonesia intelligent leaders deny that they are ever likely to choose a totalitarian system. In assessing Communist chances, therefore, it is fair to draw one sharp distinction: while the atmosphere in Djakarta and some of the larger towns is one of insidious and depressing decay, the countryside presents a much more heartening picture. The fact that the Communists are unpopular with the mass of the people must depress the party, if it is to apply Mao Tse-tung's precept that revolutions in Asia must be based on the peasants, not the townsmen. District residents and local government officials are doing good work, despite difficulty and hindrance. The smallholder and farmer, both in Java and among the vigorous people of the Outer Islands, still show the patience and steadiness on which the new nation was first built. Although in some places life and property are still unsafe, many of the rural areas are flourishing and happy.

The danger, however, is that the wide influence of events in the capital will infect the rest of the state. The voice of the rural districts is weak, and they are unfairly represented in the nominated parliament. It is in the interest of all who are concerned with South East Asia that the long-postponed elections should now be held in Indonesia within a reasonable period, possibly later this year. Until the development of democracy is carried a stage further, there can be little chance either that the country will attain stability or that the invitation to foreign capital can be taken seriously. Elections may not solve the problem, but it is now becoming clearer that without them there is danger ahead for everyone.

women's prison at Hill Hall, Essex, is housed in a magnificent Elizabethan manor, picked up for a song. The neat dormitories at Askham Grange remind one of a girls' public school, except that they are brighter and gayer; the women have been allowed to bleach and redye the institutional green curtains and distemper the once mustard-coloured walls. Falfield prison for men is the former home of an earl, a pile of nineteenth-century Gothic, complete with oak panelling, bad sculpture and rare trees; once it had "Welcome" carved over the gate, but the Prison Commissioners, with tactful realism, had this erased. There are no mailbags in these prisons. The men work on the land, or do a full day in an industrial shop; at Leyhill, for example, they work at printing, tailoring, woodworking, and boot-making. The women do laundry, sewing, cleaning and tend the grounds and chickens.

At the end of the day the open prison turns itself

into an evening institute. Attendance at classes is not in theory compulsory—except for illiterates—but the inmates know that they will make a poor impression if they stay away; and most of them like the classes, for they can study all sorts of pleasant subjects, from musical appreciation to basket work. Leyhill, whose students are in residence for at least three years, has to provide really advanced classes. Bristol University has been called on to teach philosophy there. The average level of education and intelligence among the prisoners at Leyhill is rather above the average in the world outside; it has more than its share of able professional people who have slipped into perpetrating ingenious large-scale frauds. At least one man has taken an external degree at Leyhill; and less academic prisoners can take the City and Guilds examination in various crafts, gaining certificates which make no mention of the technical school they attended. Often, therefore, the ex-prisoner emerges with hobbies and interests that he never had before, and better equipped to earn a living.

That prisoners should gain in any way other than morally may seem to be a denial of the principle that crime must not pay. But this is really rather a silly argument. If a man has learnt a trade he is less likely to live by dishonesty. The "total consequences of being found out"—loss of freedom, disgrace and deprivation, and not least the difficulty of facing the world again afterwards—will always ensure that any prison, even an open prison, is a grim place. To the already degraded, admittedly, such things may not matter; but it cannot be held against open prisons that they encourage the type of man who likes to winter in his favourite gaol, simply because that type is not sent there. For those who still have some self-respect, care must be taken to raise rather than lower it, and to avoid sharpening their hostility to society.

The statistics, for what they are worth, are on the reformers' side. Nine-tenths of those released from open prisons have not got into trouble again, compared with four-fifths of first offenders in prisons of all kinds. Admittedly, this is not conclusive evidence because the open prisons start with the advantage of better material; but it does reinforce a general impression in the prison service that reformation is more likely to be achieved in open conditions. The fair question, therefore, is not whether the experiment should be trimmed, but whether it cannot be extended.

★

The crucial point here, as an article last week argued, is that to admit less reliable types of prisoner to open camps might shake the public's tenuous confidence and thereby endanger the whole system. Obviously, too, prisoners in need of constant hospital or psychological treatment must be sent where this is available—and it cannot be provided in open camps. But it may well be worth considering whether the system should be

extended among three special groups of prisoners. First, most of those who have been convicted of violence and of sex crimes other than incest are at present automatically excluded. The only open prisons that take such offenders are Leyhill and the satellite camps of Maidstone and Wakefield—and then only after prolonged observation in closed prisons. A prisoner whose crime of sex or violence was not grave enough to earn him a sentence of more than a year must therefore serve all his time behind bars. Yet those, for example, who had used violence only when they were drunk might be a good risk during their enforced sobriety. So too might some of the homosexuals; those of the passive variety would possibly be a demoralising influence in a dormitory, and those who are a menace to children must be kept out of harm's way, but is it necessary to exclude them all?

Secondly, "ordinary" prisoners—that is those who have been in prison before—are still usually detained in gaols, unless there is a satellite camp nearby; yet many of the so-called "trainable ordinaries" can make quite civilised members of open prisons. The experience of Maidstone's satellite camp strongly supports this view; about half its inmates are usually selected "ordinaries" or corrective trainees, but the experiment has worked well.

★

Finally, most women prisoners might seem to be obvious candidates for open prisons, since there is little or no danger to the neighbours if they escape; unfortunately, however, although the general run of British women are apparently angels compared with the general run of British men (there are only 900 women in prison compared with 19,000 men) those who are not angels are often spitfires. Some women criminals are subject to outbreaks of rage and hysteria to which the only answer is the prison cell, and not all of those who behave reasonably can be relied on not to escape. Women are more likely than men to feel the pull of emotional ties—to take a trip, say, to visit a sick child, or to see what the old man is up to. The possibilities of an extension of open prisons are probably greater among men.

The official view is that no such extension, even among men, is possible—perhaps because the Prison Commission feels that it cannot afford to run too far ahead of public opinion; in pushing the system as far as it has done already, it has laid itself open to periodical attacks by the popular press that the gaols are "too cushy." It would be a healthy development if public opinion could move on a little, to a stage where the Prison Commission would be struggling to keep up with it. But first it must drop the demand for retribution and see the purpose of prison as being simply, in the words of the Prison Rules of 1949, to establish in prisoners "the will to lead a good and useful life on discharge and to fit them to do so."

Notes of the Week

Struggle after Berlin

BOTH here and in some German quarters, the Berlin conference is being called a sham fight, because, it is said, neither side really wanted to reunite Germany. This view presupposes that Mr Eden, if he had genuinely wanted to end the division of Germany, would have offered terms that Mr Molotov could have accepted; in other words, if he had really meant to win, he would have lain down on the floor to be counted out at the start. It ignores the fact that anything less than the conditions which Mr Eden put would have eventually given all Germany to Mr Molotov. What was done in Berlin was to try to secure the whole of Germany for the west, or, alternatively, to keep the Federal Republic intact. It is true that some people, both in Germany and France, would have been nervous if the first effort had succeeded; but that does not mean that it was never made.

It is now evident that the fight will go on, and that it is still anything but a sham. The Soviet ambassador in Berlin, Mr Semeonov, has rejected a proposal made by the western high commissioners, that they should discuss ways of removing interzonal restrictions. Mr Semeonov had repeated Mr Molotov's demand that the East and West German governments should form committees to settle questions of travel, trade, "culture" and other affairs. The Soviet aim, it is clear, is to secure recognition of their puppet government by these means. Little by little, the committees, if they were formed, might develop into that unelected all-German "government" which Mr Molotov tried so hard to induce the western ministers to accept in Berlin.

A similar bait for reuniting Berlin has been held out by the Communists in the east of the city. And so it will go on. The price of life with Mr Molotov is eternal vigilance. Having failed to liberate even the Potsdamer Platz, the western governments must now be on guard to maintain the ground they hold.

★

Some West German political leaders have been making efforts to prevent the public from settling down to the thought that their country is divided for the indefinite future. Herr Kaiser, the Minister for All-German Affairs, wants the Germans to bring pressure to bear on the occupation powers, and has even broadcast an appeal for a "popular movement" for unity. He is appalled by the indifference and selfishness of the west Germans, and fears the despair of the inhabitants of the Soviet zone. Herr Kaiser has often been out of step with Dr Adenauer, and his appeal could hardly have been made at a worse moment, before the Chancellor had his conciliatory and reassuring

talk with M. Bidault in Paris. Fortunately, there is no likelihood at the moment of popular demonstrations taking shape.

In the meantime, the *Bundestag* has approved a proposal by Herr Oberlaender, Minister for Refugee Affairs, that everyone in the Federal Republic should contribute a day's wages for Germans in the Soviet zone, and the Social Democrats are debating how to raise the standard of living in the Soviet zone. They have the idea that reunion may come step by step, if contacts are strengthened, and conditions equalised on either side of the Elbe. This is a patriotic motive, but it contains a germ of danger. If the west Germans make no political demands, at the same time as giving economic aid to the Soviet zone, Mr Molotov's joint committees may one day be in operation.

Legislation in a Hurry

WITH the publication of the Television Bill the Government has now brought out all the eighteen measures foreshadowed in the Queen's Speech last autumn. In addition, another two dozen routine or minor Bills have been published since the session began; and, altogether, thirty-two Bills have been given a second reading. This is commendable speed, and an extraordinary contrast with the fumbling pace of the Conservatives' legislative programme in their first months in office.

But progress is not being achieved without strain. Faced with a constant threat of paralysis on the floor of the House, Ministers are at last making proper use of standing committees. As is the way with belated converts, their enthusiasm has become almost excessive. In the mornings, four or more standing committees are at work, and the committee on the Rents Bill is working in the afternoon. Added to the normal work of the full House this imposes a physical strain on the members concerned (fifty in each committee), and it handicaps those with non-Parliamentary jobs. Conservative members are particularly hard-hit; with Government majorities of only one in the committees, they have to be in strict attendance. Despite this stern discipline, the Government has none too much time if it is to complete its ambitious programme before the end of July. The inevitable unexpected Bills, such as that on civil servants' pensions, are appearing; and some of those originally planned, and which no doubt looked innocent enough on paper, have proved embarrassments when brought into daylight. The Teachers' Superannuation Bill and the Industrial Organisation and Development Bill have both had to be sent on indefinite leave.

As the session proceeds Ministers will have to rely increasingly on the Opposition remaining reasonably placid. Labour leaders appreciate this, and they are frantically seizing on all possible (and some impossible) issues which might be controversial. In an effort to vamp up some enthusiasm they have even fallen back on the old dodge of forecasting an autumn election. Much can go wrong with the Government's hopes in the coming months, but if Ministers can keep politics as dull as they are now an early election must be the last thing in their mind.

A Chance for Kenya?

POLITELY but firmly, Mr Lyttelton has put his foot down in Kenya. As was expected, his talks with political leaders on the spot have resulted in important constitutional changes; as was widely hoped, these changes will bring new blood into the government—not only from the European population, but from the Asians and Africans as well. This development is to be welcomed. The bickerings and frustrations of the last few months have given a clear warning that the days of rule by officials were numbered, and that rule by officials and European settlers alone must never be allowed to begin.

An unfortunate, though perhaps inevitable, feature of the new structure is the proliferation of councils now to be set up. At the summit will stand a body to be called the "War Council" (the first admission, incidentally, from official sources that a war is going on in Kenya). This body will consist of the Governor, his deputy, the Commander-in-Chief, and one unofficial member (who will presumably be the moderate settlers' leader Mr Michael Blundell). It will deal with the direction of emergency operations—more energetically, one hopes, than the present rather bumbling "emergency committee." Next will come the Council of Ministers—"the principal instrument of government," according to Mr Lyttelton. It will consist of 8 officials, 6 unofficial members (3 Europeans, 2 Asians and one African) and 2 nominated members: it is an unwieldy looking body, but one on which the unofficial members will have to carry the full weight of ministerial responsibility. The African, for instance, will be Minister for Community Development. Below this an enlarged Executive Council will remain in being, though it is hard to see what functions it can usefully fulfil; possibly its principal advantage is that it will give positions of prestige to two more Africans and to one of the neglected Arab community. At the base will be the Legislative Council, whose composition will not be altered. Somewhere—on a flank—are to be three to five Under-Secretaries, two of whom will be Africans and one an Arab. These are political appointments, but their holders, for the time being, will not necessarily be—though they may be—members of the legislative or executive councils.

The importance of the changes (which do not, of course, please everybody) is not to be gauged by technicalities. Some of them are evidently designed to provide a training ground in the responsibilities of government. But an immediate and important gain is that the leaders of the different racial groups have had their heads firmly knocked together; although the Governor retains all his ultimate

prerogatives, these leaders now have to face the greatest test in Kenya's history. All unofficial members of the Council of Ministers will be required to subscribe to a statement pledging them, among other things, to "promote racial harmony and to develop opportunities for all loyal subjects." If they fail to build a working partnership, they will have no one to blame but themselves.

"Passing Cloud" in Cairo?

GENERAL NEGUIB's restoration to the Presidency has been followed by an anxious week for the Revolution Command Council. It has spent long hours at emergency meetings, first sorting out the relationship between president, prime minister and chairman of the junta, and secondly arguing about the route by which Egypt shall return to parliamentary government. All such debates were punctuated by announcements about unity, made with a frequency that caused unconcealed scepticism at all points outside the inner circle.

The outcome of the first discussion is not yet wholly plain. President Neguib resumed his previous functions as premier and chairman of the junta; Colonel Nasser reverted to the vice-premiership and all the other cabinet changes of an unfortunate week were unmade. The hierarchy is as before; what has not been announced is whether Neguib now has the measure of presidential power to which he laid claim before the upset, or whether the junta still works by majority vote.

One clear victory for Neguib, if it comes off according to present plans, is the arrangement for electing a constituent assembly. An election is said to be due on June 19th, and the assembly is planned to open on July 23rd, the second anniversary of the revolution. In contrast to Neguib, Nasser is said to have hoped for a body with only consultative powers, and to have preferred that it should be nominated, not elected. Ali Maher—who is fast adding to his experience of umpiring in crises—will do the job of drafting the constitution and holds Neguib's view (which he may well have prompted) that the body must be elected and

must be responsible for drafting a constitution and for acting as a temporary legislature. Neguib has said that parties will not be allowed to canvass support, but that there will be nothing to prevent individuals who once sported party labels from standing for election "if their consciences are clear."

When Neguib and Nasser together attended a rally of officers on Tuesday, they were given an ovation which suggests that one important section of Egyptian opinion is relieved at this turn of events. Certainly President Neguib's personal position *vis-à-vis* army, junta and nation has been strengthened by the whole affair. Whether the army's "sacred movement" as a whole has likewise benefited is still unsure.

Iran, Oil and the Consortium

A MINOR explosion of feeling in Iran last week reveals that the Iranians, though the only people who stand greatly to lose by failure to reach an oil agreement, still regard themselves as in a position to be choosy. Though they have just had to accept a further \$6 million grant from the United States, and will be insolvent again by May if no oil agreement is reached, they do not see themselves as prisoners of their plight.

During his first press conference on March 3rd, Sir Roger Stevens, the new British ambassador, reasonably and rightly replied to a questioner that the issue of compensation for losses incurred by the Anglo-Iranian Oil Company was "still standing." A leading Teheran newspaper at once retorted that any compensation for loss was due to Iran and that "if Britain is interested in a settlement it should not provoke the Iranian nation to rise against it."

The incident suggests that the international oil consortium, if and when it gets to Iran, will need to exercise considerable diplomatic talent. Much will hang, for instance, on its choice of personnel. Even Dr Mossadegh recognised that compensation must be part of any bargain, and not for one moment could eight companies each with a stake elsewhere in the Middle East agree to any arrangement that omitted it. But the issue will have to be settled as part of some "package deal" that contains obvious offsetting advantages; otherwise Iranians are capable of shouting it down.

★

This point is apt to get lost while inter-company arguments on technique take place in London. As these drag on, impatience mounts in Teheran, where it is clear to all foreign observers that the Zahedi government will find it easier to get agreement through if negotiations start before rather than after the Persian New Year holiday, which begins on March 21st. For the companies, the financial and technical arrangements involved are obviously most intricate; but if discussion on them is at any time allowed to deteriorate into a point by point haggle, the chances of success in Teheran will diminish. The British Government is keener than any oil company to help Iran out of its troubles and has a potential and usable influence with one of the companies, in which it is a majority shareholder.

Reshuffle in Iraq

DR FADHIL JAMILI, premier of Iraq since last September, resigned last week, but has been reappointed, and has shuffled his cabinet in order to meet two requirements. One was constitutional; he was employing six ministers without parliamentary seats and this is permissible only for six months. The other was dictated by the perennial shape of the Iraqi parliament, which, owing to the configuration of the country and the lie of the constituencies, always contains a heavy proportion of rich landowners. The support of Nuri Pasha's party is, as things stand, necessary to get any measure through parliament; and it is notable that Dr Jamili's new cabinet contains a greater proportion of Nuri's supporters than did its predecessor.

The change is probably designed to give a fair wind to some Bills on the statute book which have been hanging fire because the true-blue landowner thinks them not really necessary. They include a land-tax bill, which is by no means exacting but in which landowners see the thin end of an ugly wedge; and a land distribution bill for Amarra province that provides for the break-up of a certain proportion of each large estate. The new cabinet still contains five members without parliamentary seats. Whether constituencies can be found for them remains to be seen. It would be a sad pity if they were doomed to a fresh six months of patchwork operations.

Another of Iraq's conundrums is the social and economic question of how to time the spending of Iraq's sudden new wealth from oil so as to cause the least possible measure of human upheaval. The Development Board, though well supplied with technical advice, had been feeling a need for impartial judgments on this subject from someone with international experience. It wants help with such problems as ensuring that one development will not outstrip all others that should go with it, or that the volume of local employment nowhere oscillates unduly. The Board has induced Lord Salter to visit it this spring and to reconnoitre its difficulties. If all goes well, he will return for a period in the autumn; his standing and immense range of experience promise to stand Iraq in good stead.

Wooing the Ladies

ENTHUSIASTS for equal pay showed some imagination in the planning of their demonstration in and around the House of Commons this week, but Mrs Pankhurst would still have found them very tame. The principle of equal pay for men and women was approved in the House of Commons as long ago as 1920 and the question today is not whether, but when and how widely, it will be introduced throughout the Government service. On neither point was Mr Butler any more forthcoming than on previous occasions, but he managed to leave a faintly hopeful impression; whether the hopes that were raised have any basis in reality will presumably not become clear until the Budget.

That the controversy has been revived at all at this time is due largely to political pressures. Both sides have a sneaking suspicion, which they dare not ignore, that there

At the opening of the new Rolls-Royce factory

The first industrial TV broadcast of its kind was held at the opening of the new Rolls-Royce factory at East Kilbride, Scotland. Television cameras at the test beds three quarters of a mile away were linked by radio to two 27 inch direct viewing television receivers and guests were shown a Rolls-Royce Avon engine actually undergoing tests.

There are many circumstances where remote viewing by television can be of great value to industry. For instance, in the testing of any experimental engine the camera could be placed in a position that would be too dangerous for a human observer, the experiment being viewed safely on the screen of a remote monitor.

The Rolls-Royce demonstration was only one of the many ways in which Pye industrial television is helping British and American industry. For further information will you please write to Pye Limited, Industrial Television Division, Cambridge.

In basic form the equipment comprises a lightweight television camera and a viewing monitor; these are linked together by a single co-axial cable which may be any convenient length from a few feet to a thousand feet, depending upon the user's requirements.

The camera, weighing only 31 lbs. and measuring 16 x 6 x 14 inches approximately, carries three lenses giving a wide choice of viewing angles and features a newly developed low-cost camera "pick-up" tube possessing adequate sensitivity to normal industrial lighting. In practical terms, a clearly defined picture will be obtained with a scene brightness as low as 50 foot-lamberts—corresponding to the light reflected from an "average" subject placed 4 feet from a 200 watt lamp in a suitable reflector.

The viewing monitor displays a well-defined picture on a 14 inch diagonal rectangular cathode-ray tube with a built-in "black screen" to permit clear viewing with normal room lighting. A normal domestic television receiver may, without modification, be employed as an additional monitor if required.

Alternative versions of the camera and monitor provide scanning standards of either 405 lines or 525/625 lines and the equipment will operate on any normal AC supply voltage, with a total power consumption of only 350 Watts.

How to cross the Atlantic

Glayva
SCOTCH LIQUEUR

Edinburgh, rich in architecture and in the natural beauty of its setting, has been called the modern Athens. It has also many distinctive arts and crafts, amongst which is the making of "Glayva" a distinguished Scotch Liqueur which has made many friends far beyond its borders.

RONALD MORRISON & CO. LTD. EDINBURGH

are a lot of votes to be won by any party which can claim the lion's share of the credit for equal pay. The Tories, when in opposition, flirted with the unequally paid ladies, and now Labour has taken up the wooing. It was back-bench wooing at first, but it has now gained respectability. At first the subject was omitted altogether from "Challenge to Britain"; then, following protests, the party took the plunge and announced it would definitely "implement the policy of equal pay" when returned to power. Nobody quite knows what this means, but obviously it means that a Labour government could not stand still.

Back-bench Tory MPs have tried to match Labour's ogling but they have had the handicap of a stony-faced chaperon in the Treasury. They have, however, been able to point to Labour's flagrant inconsistency in making doom-laden prophecies about the Government's economic policies while urging Mr Butler to make a concession that neither Mr Gaitskell nor Sir Stafford Cripps could ever contemplate. This attitude may be important. If Mr Butler were to find himself with £30 million to spare he would now have a considerable political incentive to use it in this way—equal pay in the non-industrial civil service would cost £13.4 million a year and in teaching £17.2 million (of which £6.5 million would fall on local rates instead of the Exchequer).

A Bill for Trade Unions?

UP to the end of last week it seemed possible that the case of *Bonsor v. Musicians' Union* might go down to history with the Taff Vale case and other judgments which have been turning points in the history of trade union law. Mr Bonsor was a member of the Musicians' Union who had been expelled by a branch secretary because his subscriptions were in arrear, and for three years he could not get employment in his trade. He claimed that the branch secretary had exceeded his powers in the first place. The loss he had suffered was clear enough: the difference between what he did earn as an unskilled labourer—at one time he had to take employment scraping the rust from Brighton pier—and what he could have earned as a musician. He sued the union for damages, and came before the Court of Appeal to find what were his rights in law. It was obvious that no court could order the union to readmit him; it could only declare the original expulsion order bad. The Court of Appeal also ruled that, under a decision given in 1915, it could not order the payment of damages for the three years' loss of work; Lord Justice Denning dissented from this judgment, but the other members of the Court considered that they were still bound to follow the 1915 precedent, and that only the House of Lords could reconsider the law afresh.

Immediately after this decision was announced, it was learned that Mr Bonsor had died two days before; as a result the judgment becomes nugatory. It is possible that the executors of the dead man may apply to revive the proceedings, and that the case may then go to the House of Lords. If not, the position of an expelled member will remain governed by a decision given in 1915, and that no one can consider satisfactory. Too many circumstances have changed in these forty years.

To a large section of the population a right to be properly treated by the union is now more important, financially, than any right of property; the British Electricity Authority, for instance, have recently dismissed a man solely because he had been expelled from a union and the other men on the job would not work with him. Yet a trade union still remains, in law, an ill-defined association of men, half tainted by the early nineteenth century views on its inherent illegality. It is as though, in the commercial world, neither the Companies Act of 1862 nor any of its successors had ever been passed. Trade union officials have vastly increased powers but no increased legal responsibility to their members. There is a strong case for a Bill that would give every trade union member the kind of elementary rights that Table "A" of the Companies Act gives to members of a trading company. But it would be politically necessary that some trade union MP, or trade union peer, should introduce it.

Keeping Up with the Engineers

THE employers in the electrical contracting industry have finally thrown in their hand and made an offer of a wage increase of 2d. an hour, or 7s. 4d. on a standard working week of 44 hours. After last week's engineering award this was inevitable; but the guerilla strikers, who have seen other workers getting their 7s. rise without having to lose wages or contribute to strike pay, may still feel that a Communist-dominated union that has consistently refused arbitration has not served them well.

The court of inquiry into the wages on the privately owned buses has also followed the engineers' flag. It said that it could see no economic reason for varying the increase of 4s. (which was awarded by the Industrial Court in December and rejected by the union); but it added:

The matter, however, cannot be left there. Much has happened with regard to wages in the transport industry since that award, and we are of the opinion that a further increase should be granted... so as to make the total increase comparable with the increases... in other sections of the transport industry.

The principle of inflation by example has rarely been so clearly stated.

Although some individual engineering employers are still muttering hoarsely that they cannot afford the 5 per cent increase recommended to them, the signs are that they will be dragooned into line; the main question in this dispute is now whether the unions will insist that 7s. a week should be the minimum increase not only for skilled, but for unskilled workers (who would get 5s. 11d. under a 5 per cent award).

The other proposal of the engineering court of inquiry—that an "impartial body" should examine the effect of wage increases on the economy as a whole—has also made headway this week. The TUC has agreed to discuss the proposal with the Ministry of Labour, and also to discuss whether more industries should set up their own machinery for voluntary arbitration in wage disputes. It is still not clear whether Sir Walter Monckton is hankering after an "impartial body" which would make a once-for-all report (which is what the courts probably intended) or a continuing

organisation. He may feel that the real trouble about the seven shilling standard for 1954 is that it was originally set at the pistol point of a Christmas railway strike; and that some smaller standard might be set for future years if the original test award could be decided at some cool-tempered meeting, attended by union leaders who had no intention of striking. He is also known to be attached to the idea that the mighty men of industry and labour should get together as frequently as possible, and develop the most intimate contact. It needs to be re-emphasised that any such continuing and centralised body would involve a continuance (even if occasional diminution) of inflation by example, and a further departure from the principle that wages should always be related to an individual firm's need to attract new workers. It would be a very grave mistake.

Purged in Paris

THE struggle within the leadership of the French Communist party has now come into the open. At this week's meeting of the central committee, its secretary in charge of cadres and organisation, M. Auguste Lecœur, was violently attacked first by his colleague in the secretariat, M. Duclos, and then by all and sundry. M. Lecœur's removal from the secretariat was recommended and much emphasis was put on his unwillingness

THE ECONOMIST, MARCH 13, 1954

to indulge in "self-criticism." Unless at the last moment he submits with a spectacular *mea culpa*, M. Lecœur may well follow in the footsteps of the "renegade Marty" and find himself outside the fold, branded as a police agent.

Apart from charges of "opportunism" and breaches of the principle of "collective leadership," the chief complaint of his accusers is that M. Lecœur failed badly as the party's chief organiser. For some time the leaders have not been too happy about recruitment and other work in factory cells. True, the Communists have lost little of their popular support; for example, in the first ballot of the Seine et Oise by-election, the editor of *Humanité*, André Stil, maintained his position better than the other candidates and may well win the seat through the division of anti-Communist votes. But they depend mainly on the enthusiasm, cohesion and discipline of the factory workers. These leave much to be desired even in M. Lecœur's own fief in the mining Pas de Calais.

This is not the only reason for the disgrace. M. Lecœur is now being made the scapegoat for all unsuccessful strikes and demonstrations; he is simultaneously accused of social-democratic deviations and "revolutionary adventurism." This may well be an episode in the struggle for succession to Maurice Thorez. With Thorez an invalid, Duclos and Lecœur were the only active members of the secretariat. Lecœur, a northern miner's son like Thorez, may well have remembered that Stalinist bosses have always made their bid for power through the manipulation of party cadres. His bid has apparently failed. It remains to be seen whether he will be dropped like Marty, and whom he will drag down with him in his fall.

The Dollar Rate

Sir,—You will oblige me by explaining the reason for the maintenance of the present method of calculating the exchange upon London in the United States, which seems to me to be a very roundabout process when a very simple one would suffice. So long as the country was a dependency of Great Britain, or conducted its transactions in sterling money, the mode of reckoning the exchange by a fluctuating premium was right enough; but when the country adopted a currency of dollars, and made the dollar the integer of account, the exchange ought surely to have been reckoned from that date at so many pence to the dollar, the same as in all other countries that have a dollar currency. What does the quotation at New York of "exchange on London 8 premium" mean? It means 4s. 2d. sterling per dollar; but to obtain the result you have to start from the nominal par of exchange of 4 dols. 44c. per £, then add 8 per cent, which gives a net exchange of 4 dols. 80c. per £, which is equivalent to 4s. 2d. per dollar. How much easier it would be to call it 4s. 2d. per dollar at once! Have the Yankees any substantial reason for retaining the present method? If they have a particular penchant for the "premium," then they should make the par 4s. 2d., which is tolerably near the intrinsic par, and upon which a halfpenny per dollar, upwards or downwards, is exactly one per cent; or they should make it 5 dols. per £, which is nearer the intrinsic par, and upon which five cents, upwards or downwards, are exactly one per cent—a vast improvement upon the running decimal .044!—I am, Sir, your obedient servant, London, February 24, 1854. S. G.

The Economist

Spring Clean in Sofia

IN Eastern Europe a round of Communist party congresses is now in full swing. The ball was set rolling the week before last by the Bulgarians; it has now been passed to the Poles, whose congress started on Wednesday; later this month it will be taken up by the Rumanians and the East Germans; by the Hungarians in April, and finally by the Czechs in June. Last year the Soviet satellites, one after the other, adopted the modifications in economic policy decreed from Moscow. This year, one by one, they are giving their party machinery a good spring-cleaning and a good airing; they are throwing out the rubbish and making replacements where necessary. When the process has been completed, outside observers should have a somewhat better idea of the way events are shaping in the Soviet bloc.

Two points stand out in the reshuffling in the party hierarchy that has been announced from Sofia. First, Bulgaria's Communist boss, Viko Chervenkov, remains prime minister and leading member of the Politburo, but he has lost the post of first secretary of the Central Committee. He is, however, in good company; on becoming Soviet prime minister, Malenkov surrendered his leading position in the secretariat of the Central Committee to Khrushchev. Chervenkov, who may not have been over-enthusiastic about the new principle of collective leadership, has had to pay attention to it all the same. Secondly, the "national" Communists who suffered a violent eclipse after Kostov's trial in 1949, have staged a notable comeback, and now form

THE ECONOMIST, MARCH 13, 1954

a strong counterweight to the "Muscovites" in the central committee and the politburo. In particular, Anton Yugov, who was forced to lie very low for some years after Kostov's execution, and who has gradually come back into the limelight since Stalin's death, is now listed as third in the party hierarchy.

In his report to the congress Chervenkov revealed that, since the last congress in 1948, party membership had dropped by over 40,000 to 455,251. (Immediately after the war it jumped to about 500,000.) This, he said, was the result of a careful weeding out of "casual, rotten and dubious elements" who had sought to "conceal their dark pasts" inside the party. Even so, the party membership evidently still leaves a great deal to be desired. Chervenkov's attack on "slaves of the pen," "empire builders" and other undesirable characters could hardly have been more withering; and his strictures have been foreshadowed for months past in the party press. His report, together with the revisions of the party statutes, makes it clear that the purged, purified and reformed party is meant to play a more dominant role in Bulgarian life in the future. In particular party members in the villages will have to pull up their socks. Their work has been specially unsatisfactory, and a substantial increase in agricultural production is given top priority in the second five-year plan.

Latins and Colonies

TO chide the United States, and at the same time to appeal to its generosity, are the primary objectives of most delegates at the Caracas conference—as, indeed, at any meeting of the Organisation of American States. Dollars, in fact, are the only solid gains that such a conference can be expected to yield to any of the interested parties. However the voting goes on Mr Dulles's anti-Communist proposals, their principal target, President Arbenz's government in Guatemala, is unlikely to be toppled. The same is true of the debate on colonial issues; nobody seriously supposes that an OAS resolution will alter the status of the three Guianas or of British Honduras.

That, however, does not mean that the conference will pass over the colonial question quietly. Argentina's pressure for a sweeping resolution on this subject was, of course, to be expected; General Perón has never yet missed an opportunity of making political capital out of his pretensions to the Falkland Islands and Antarctica. But Argentina is confident that it will not be alone. Anti-colonialism is the one chord that vibrates in all the twenty Latin American republics, whether their inclination is left or right, for Perón or against him. Representatives of Dr Jagan's PPP party are in Caracas to persuade delegates that British Guiana is "an integral part of Latin America." (It is, in point of fact, no more Latin than Dar-es-Salaam.) Sad to say, Brazil, often a moderating force in the affairs of the western hemisphere, shows every sign of joining the anti-colonial hue and cry. Last October, just after the Guiana crisis, President Getulio Vargas declared that

America will not have accomplished its historic destiny until all residues of a bygone political age are no longer to be found in our hemisphere . . .

and Brazilian policy now appears to be founded on this sentiment. It is understandable that Dr Vargas is anxious

not to let General Perón monopolise anti-colonial solidarity. He also needs to distract Brazilian attention from last month's unpleasantness in Rio de Janeiro, where a "colonels' caucus" forced the President to drop both his Labour Minister, Senhor Goulart, and the latter's plans to raise wages. But must Britain always serve as whipping-boy for the internal conflicts of the Latin republics?

Light on the Grub Stake

FARMERS are expressing strong opposition to the development plan for Essex. They claim that the land which will be taken for development in the county in the next twenty years is producing food for 60,000 people and cannot be spared. No less than 1,400 objections have been filed in Essex; and in other counties, especially those in which towns are also to be expanded to relieve congestion in London, similar protests about the destruction of the "grub stake" of the people are in full spate.

Dr G. P. Wibberley, himself an agricultural economist, has introduced some sense into this emotionally cloudy issue in a paper recently read to the Royal Society of Arts. He estimates that about 560,000 acres of agricultural land may be lost in England and Wales in the next twenty years. On the figures available this would seem to represent about 2½ per cent of present agricultural production, allowing for the fact that the land to be taken will be above average in quality. There is nothing alarming in this prospect. The lost production could be made good many times over, if the market warrants, through more intensive farming or through the upgrading and reclamation of land. Indeed the latter possibility alone could, if necessary, increase total farm output by a third—according to a recent estimate of Dr Stamp, who is a leading conservationist.

The Government's present policy is to avoid development on the best farmland even if this involves some increase in building costs. This policy is faithfully followed in most of the county plans; yet, as Dr Wibberley points out, the cost of this policy has never been tested against the alternative costs of upgrading, reclaiming or improving land elsewhere. For instance, if the maintenance of land in agricultural use costs the country more than about £160 an acre (which it often does), it is probably more economic to replace the lost food production by an equivalent investment in hill farming. And even this calculation assumes that the maintenance of food production is the country's one overriding aim. Meanwhile all these local inquiries are going on without any economic yardstick to resolve disputes; when the authorities make the right decision—as they did recently at Swindon—they have to wade through emotions in flood.

Milk for Sale

ON April 1st the Milk Marketing Board will resume its full powers. It will assume control from the Ministry of Food over the supply and disposal of virtually all the milk produced in England and Wales (there are three separate boards for Scotland). Fortunately, its

monopoly will be less absolute than before the war in two ways. In order to meet the natural objections of the distributive trades a joint committee will be formed to "deal with problems of mutual concern," in other words with supplies and prices. The consumers' interest is to be less clearly protected, but since milk will continue to be subsidised the prices fixed by the board will require the Government's approval.

The board will face at once the awkward problem of a milk surplus. Stimulated by high guaranteed prices, the production of milk has steadily increased while the demand for liquid milk, despite the support of a large subsidy, has been static. The remaining milk, which in the coming year may constitute up to 25 per cent of the total output, must be sold for manufacture into butter and cheese, at very low prices. Somebody—either the producer, the consumer, or the taxpayer—must carry the loss on this section of the market. Before the war the board managed to pass the buck to the consumer of liquid milk, but that is less easy today and would make a mockery of the nutritional policy that has helped to produce the milk surplus.

The crucial question is therefore how far the taxpayer will be asked to underwrite the board's losses. The Government has agreed to continue to guarantee prices to milk producers; but it will pay the higher price attributable to liquid consumption in respect of only a limited (but variable) proportion of total output. Any losses made in the manufacturing market will be shared fifty-fifty between the board and the Government. Everything depends on how these guarantees are interpreted. It is right to give the board every incentive to develop new outlets through the sale of cream, the improvement of milk bars, and elsewhere. But the fact remains that milk production has already been pushed beyond its economic level as a result of farmers' pressure and of Ministerial weakness; and it would be the height of folly to go on producing extra milk which must be sold, mainly at the taxpayers' expense, at little more than one-third of its cost of procurement.

An Irish Election

THE lid blew off politics in the Irish Republic last week (writes our correspondent in Dublin) with the declaration of the polling in by-elections in Cork City and Louth. In both cases the seats were held by the principal Opposition party, *Fine Gael*. At the 1951 General Election Mr de Valera's government party had had a slight overall majority in Louth and what seemed to be a comfortable majority in Cork City. These have been now turned into substantial deficits; the swing in Cork was particularly large and is an ominous pointer to the trend of opinion in the vital urban areas.

Since the present *Dail* met in June, 1951, Mr de Valera has held a parliamentary majority of two, 74 votes to 72. He could still continue to juggle through the affairs of government with the aid of some deputies elected as Independents, but has wisely decided not to. The *Dail* is therefore to be dissolved on April 24th, three days after the presentation of the Budget, and a general election will be held on May 18th. The implications of this timetable are not clear. Mr de Valera in the past has believed in carrying

the fight to his opponents; and in present circumstances an electioneering budget would be perhaps too obvious a piece of tactics. On the other hand he may feel that delay will help to create divisions between the opposition parties. The two principal of these opposition parties, the conservative *Fine Gael* and the Labour party, worked together in the coalition of 1948-51; and it is noteworthy that the second preferences of Labour votes in recent by-elections have generally been cast for *Fine Gael*. But Mr de Valera has the advantage that the apparently increasing number of voters who are against him are an oddly assorted bunch.

Bao Dai or Mao Tse-tung?

NEGOTIATIONS about Indo-China—this is clearly the topic of the day in Paris. But in a confused situation it is difficult to distinguish what sort of negotiations, where and with whom, people have in mind. With Mao Tse-tung, Ho Chi-minh or Bao Dai? In Geneva, Saigon or in Paris? During the parliamentary debate on Mr Nehru's cease-fire proposal some critics, in particular M. Mendès-France, advocated immediate and direct negotiations with Ho Chi-minh. M. Laniel, the prime minister, while outlining the French terms for an armistice, saw more hope of an agreement at the Geneva conference table. Finally, some passages in the governmental motion approved by the Assembly were clearly aimed at forcing the hand of Bao Dai's representatives, who have come to Paris to negotiate a new treaty with France.

The inability of Bao Dai's regime to provide an attractive and popular counter to the Viet Minh has undermined the plans for a progressive evacuation and transfer of power. His prime minister, Prince Buu Loc, seems to think that to restore his prestige he must show independence and drive a hard bargain with the French. Many commentators in Paris, on the other hand, believe that it is not worth while straining the delicate pattern of the French Union to obtain the agreement of a tottering government. Without going so far, M. Laniel wanted, however, to warn the Vietnamese what could be the results of their refusal to co-operate with the French Union, and recalled that France would be then under no obligation to continue its struggle in Indo-China.

Fewer and fewer people in Paris believe that the Indo-Chinese burden can be passed on to the Bao Dai regime or that there can be a military solution to this war. Thus, though there is little doubt that the expeditionary corps can now cope with a Viet Minh offensive, the question is no longer whether to negotiate, but what terms to accept. M. Laniel stated for the first time the French terms for an armistice, putting the security of the expeditionary corps and the Vietnam units as his primary consideration. The Viet Minh is unlikely to accept the French preconditions. On the other hand, in Paris hopes are being raised that at the Geneva conference table American economic concessions to China could be traded for Viet Minh concessions to France. Many Frenchmen seem to forget completely that, whatever his desire to see France in EDC, Mr Dulles will have very little latitude in his negotiations with the Chinese. It is preferable to dash these illusions now than to face a period of mutual resentment and recrimination after Geneva.

Finns in a Rut

IT is always easy to be wise after the event, but the result of last week's general elections in Finland provokes one insistent question. The agitation for an early dissolution of parliament, which was successful in bringing forward to this month the elections normally due in July, was conducted by political groups of both the right and the left. What, one wonders, did they hope to achieve? The Finnish voter is the last person in the world from whom to expect a political landslide. The innate conservatism that braces him against external stress also leads him to vote doggedly, year after year, for his traditional party; even the Communists come under this heading. At the weekend, he went conscientiously to the ballot boxes—a poll of eighty per cent was recorded—and, in effect, confirmed the unsatisfactory *status quo ante*. Did anyone seriously expect him to do otherwise?

The only noteworthy changes in the new parliament are the slight gains made by the two biggest parties, the Social Democrats and Dr Kekkonen's Agrarians, at the expense of the Conservatives and the Swedish party. The balance of strength as between the two major parties remains an even one, and the Communists have held their position without loss. Thus, although the caretaker government of "technicians," headed by Mr Tuomioja, the head of the Bank of Finland, which took office in November after Dr Kekkonen's fall, will now submit its resignation to President Paasikivi, the prospects of a new government able to control a reliable majority are very small. There has, admittedly, been talk already of a Social Democrat-Agrarian coalition; but it is difficult to take this any more seriously after the elections than before. The two parties are divided not only by rivalries and suspicions of long standing, but also by their quite contradictory attitudes to the problem of reducing production costs, which is now crucial for Finland.

A further period of minority government, that would be welcome only to the Communists, is the most likely prospect. It can only be hoped that it will fare as well as that of Mr Tuomioja, which in its brief term of office has shown surprising vigour in tackling Finland's louring economic problems.

Num or Nonne?

THE coupons sent out to the eight million people who participated in the pools for football matches played on February 27th were accompanied by a statement from the Pool Promoters' Association attacking Mr Mulley's Bill which would force them to publish accounts; the statement declared that the Bill would add considerably to the promoters' costs, and it included such tendentious implications as that the eventual aim of the Bill was to suppress the pools altogether. Punters were asked to state on their signed coupons either that they opposed the Bill, or that "in spite of what you say" they supported it. Over 6,100,000 gave the answer that the promoters wanted, only just over

575,000 supported Mr Mulley, and just under 1,500,000 gave no reply.

Meanwhile the Gallup Poll had asked a representative cross section of punters the same question in a more straightforward way. His poll gave a precisely opposite result. Of those who go in for pools, 66 per cent were in favour of published balance sheets, 22 per cent were opposed to them, and 12 per cent "did not know."

Students of Latin will remember that some questions expect the answer "no" and some the answer "yes." Students of the constitution will remember that referenda have never been treated as a serious way of reaching democratic decisions in this country. Mr Mulley has now incorporated some amendments in his Bill which should ensure that the cost to the promoters will be kept down to derisory levels. The Government would therefore be well advised to give his Bill all the help it needs. All *prima facie* evidence shows that there is nothing really nasty in the promoters' woodshed, but their present tactics are merely helping grandmother's fancy along.

The Super-Normal Child

WHEN an administrator of the standing of Dr W. P. Alexander plunges dashing and unexpectedly into educational theory he is bound to cause a stir. Dr Alexander is secretary of the Association of Education Committees and his normal role is as spokesman for the local education authorities in negotiations with the Ministry of Education and on the Burnham Committee. In the latest issue of *Education* he advocates a revolutionary change in secondary education after the age of eleven. He wants to segregate the "super-normal" child (say, the top 5 per cent) in grammar schools, chop off the bottom 2 per cent and put them in special schools for the educationally sub-normal, and lump the whole of the remaining 93 per cent in high schools. It would be open to any child in these high schools (which would, in effect, be the present secondary schools) to sit for the General Certificate of Education. They could do so at any level, including a new and lower level which would be specially devised.

It is clear from these surprising proposals that Dr Alexander despairs of the present system—of the interminable controversies over selection at eleven, comprehensive schools, early school leavers who will not stay the grammar school course, and the insistence of employers and parents that as many of the young as possible shall have at least one examination label. But his suggestions appear to beg as many questions as they attempt to solve. Would it really be any easier or less controversial to pick the top 5 per cent than the top 15 per cent? The competition would certainly be fiercer for this holiest of holies. Would it be possible to give adequate teaching to the near-super-normal in a school of 600 in which there were as many near-sub-normal? Dr Alexander is aware of these difficulties, though his solutions are not reassuring. But is the present secondary system really working out as badly as the politicians pretend? If they would only leave it alone, with preferably another £20 million to pay more and better teachers, half the problems might disappear of themselves.

Letters to the Editor

The Law and the Homosexual

SIR—As you point out in your Note last week, informed opinion is pretty well agreed that the laws relating to homosexuality should be reconsidered. But the "stamp it out" school is strongly entrenched in high places, and one wonders whether it has ever considered the full implications of its views. Perhaps a few statistics will help to shake them.

The Home Secretary says there were 670 "unnatural offences known to the police in England and Wales" in 1952. There is no reason to suppose that homosexuality is less common in England and Wales than in the United States. For America we have Dr Kinsey's figures of actual homosexuality rates, as distinct from the number of offences discovered by the police. His statistics, carefully checked and collected by the most sophisticated techniques, have nowhere been seriously questioned, whatever one may think of his recommendations and inferences.

Nevertheless, let us err on the side of caution and halve his rates. If we then apply them to our own population by age-groups it may be reckoned that there were about 25 million "unnatural offences" in England and Wales in 1952 (or 50 million if each partner is counted separately). Again, 19 per cent of the male population will have before death committed an "unnatural offence" at least once, and perhaps 5 per cent of unmarried men will at any time be doing so regularly (still halving the Kinsey rates). That means there are 200,000 Englishmen and Welshmen who as recidivists should, according to some people, go to prison. The present total population of our prisons is one-ninth of this; the effect on the already overcrowded prison accommodation of any serious attack on these 200,000 is obvious.

Perhaps then at least proselytising should be punishable by prison? On the assumption that homosexual acts are mostly learned by young adolescents from older adolescents, it is these latter who must be imprisoned if any serious dent is to be made on proselytising. One adolescent in five (half the Kinsey rate) is involved, say 150,000 in their later teens. Suppose that 50,000 are seriously guilty of proselytising. This is twenty-five times as many as are at present sentenced to Borstal in a year. One might add that it would make serious inroads on the supply of national servicemen.—Yours faithfully,

STATISTICIAN

Middle-Age Spread in the Banks

SIR—Doubtless complacency is the besetting sin of many British institutions and you do well to print a very chastening article in your issue of February 27th. But surely your correspondent overdoes his chiding; he would have done better to argue his case more closely on a limited number of points.

Inevitably, the big changes that have taken place over the last fifteen years in the employment of bank assets have had repercussions on the structure of their earnings. Before the war banks were able largely to cover their overheads by employing around 50 per cent of their assets in remunerative advances, and consequently could provide a banking service to their credit customers at well below cost. In changed circumstances, not unrelated to loyal compliance with Treasury directives, banks are now unable to lend as freely and are now having, as your correspondent points out, to relate their charges more closely to the cost of the services they render. Customers look back nostalgically to the days when charges were often little more than nominal. Perhaps, indeed, the banks are to blame for having provided "free" services too long! By comparison with the past, present charges may appear high. But your correspondent brings forward no evidence to show that they are high by comparison with those in other countries, with those of the Post Office where comparable, or yet with other professions.

Perhaps, though, the mention of the word "profession" is unwise. For your correspondent seems to think of banking merely as "a great accounting machine of settlement and record." It is certainly this and much of the energies of bank clerks are absorbed in its vital routine functions. But the bank manager is something more than a superior clerk and a trader in money. Indeed, there seems to be an increasing demand for his services as a general business adviser, whose help is being sought by a widening range of customers, many of whom in the past had little need for professional services and now find in him a useful business G.P. Such a concept of his role is not altogether incomparable with "the creative fields of law, medicine, science, architecture and perhaps accountancy."

It would be a pity if this article deterred any young man of rather more than average capacity from entering banking. Prospects for such a young man have never been brighter than they

are now. A planned recruitment policy, the steady turning over of much of the routine work to short-service women, training schemes to hasten the process of learning from the experience and knowledge of others, all combine to make it possible for the man of personality and ability to reach a worthwhile position by the time he reaches his early thirties.—Yours faithfully,

Hertford

E. R. ROPER POWER

★

SIR—Your correspondent seems to be quite unaware of what has already been done in the way of mechanisation and improved organisation within the banks. It is remarkable to learn that (after a struggle) the passbook has given way to the statement of account, when I can recall this transition taking place with comparatively little difficulty no less than twenty years ago. The major part of bank book-keeping is, of course, already mechanised and many improvements in organisation have been apparent in the postwar years. In addition, a progressive policy of mechanisation and improved methods looks to be the general rule of present-day administration. It is not difficult to appreciate, however, that the application of mechanisation to the smallest branches would be uneconomic, and that the work of such branches, in a scattered rural area, could not be promptly dealt with by a system of centralised machining.

Non-narrative ledger and statement posting is now well established in many branches, but this innovation has certainly not been greeted with the public acclamation which your correspondent seems to expect.

Your correspondent appears to believe that male staff are extensively engaged on duties which could be mechanised. It would be interesting to know what these duties are. They are certainly not concerned with ledger or statement work, except perhaps occasionally in the very smallest offices.

I agree that the introduction of a non-transferable cheque would effect a saving in handling time in the offices of both the collecting and the drawee bank, though it would not, of course, affect the work involved in the process of clearing. The inducements suggested to secure the popular acceptance of such an instrument would, however, involve the co-operation of the Exchequer, and call for a system of differentiation in charging accounts which might well absorb much of the time saved by the use of the new form of cheque. I fail to agree that the banks' security procedure is cumbersome. Nor do I believe that their competitors in the field of lending offer a less cumbersome procedure, though my own experience suggests that it is frequently more expensive. There is, no doubt, some scope for mechanisation in the handling of cash, though I would consider that the opportunities in this direction in most branches are very limited.—Yours faithfully,

Sevenoaks, Kent

S. S. WESTOVER

Apartheid in the Universities

SIR—Mr D. W. Hertzog, in your issue of February 27th, deplores criticism of South African policies by "unenlightened outsiders who have nothing to lose." I should like to assure him that there are many not altogether unenlightened people within the Union who consider that were the Universities of Cape Town and the Witwatersrand compelled by law or financial discrimination to exclude or segregate their non-European students this edict would not only involve a vital interference with the autonomy of the universities but would be a suicidal policy for all South Africans whatever their colour or creed.

Quite apart from the almost insuperable difficulties of providing segregated university facilities in South Africa, the enforced separation of the most highly educated members of the different racial groups is likely to be disastrous to the development of a harmonious society. Your correspondent admits that contact in some form or other is inevitable. In these circumstances to segregate the potential leaders of the different groups in their most formative years is simply asking for trouble; for it prevents the growth of understanding and tolerance of different points of view and the dissipation of prejudice.

In the actual circumstances in South Africa, the enforcement of university segregation is likely to accentuate bitterness among the non-European groups. It is generally admitted that the Union already has more universities than it can adequately support. If these are to be multiplied to provide separate facilities for the different racial groups, the financial burden will be beyond the capacity of the country. The result will inevitably be that all or some of the institutions will be starved. Experience in South Africa and elsewhere shows that in practice it is the non-European institutions which are likely to suffer most. Consequently non-European intellectual leaders would be gathered together in small, poverty-stricken, segregated institutions where through intellectual isolation narrow bitter sectionalism is likely to develop and feed upon itself.—Yours faithfully,

SHEILA T. VAN DER HORST

Cape Town

Enterprise in the Air

SIR—Your article of February 13th contends that the British Government propose to grant a North Atlantic freight monopoly to Airwork, Ltd. In last week's issue, Mr Castlemaine takes exception to this statement. He explains that BOAC already provides 23 cargo-bearing flights per week. In the face of such fierce competition, Mr Castlemaine assures us that any suggestion of an Airwork monopoly "does not accordingly bear scrutiny."

To describe BOAC's services as "competition" surely ignores the wide gulf

between the types of freight traffic sought by BOAC on the one hand, and by Airwork on the other. BOAC, by offering frequent regular services in passenger/freight aircraft, is well placed to handle one type of cargo—low weight, small-bulk, high-speed "parcel" freight. Combination aircraft are structurally unsuitable for heavier, bulkier loads. Furthermore, the ground facilities and organisation are insufficiently specialised to take maximum advantage of the essential feature of all air-freight: not speed from port to port, but from consignor to consignee.

Whether or not this limitation of their facilities is of their own choosing, the fact remains that there is a gap in the services offered by BOAC. This situation was recently highlighted by the triumphant advertisements of an American airline: only they could be entrusted with the carriage of the British Show Jumping Team's horses across the Atlantic.

Despite BOAC's 23 freights per week there is this inability to transport bulky and awkward cargoes. And in this ever-growing field an undoubted monopoly has been granted to Airwork. Operating all-freight aircraft under monopoly protection, and drawing on the experience of Furness Withy in freight handling, Airwork should be in a position to gain an important share of the air-freight market.

Mr Castlemaine concludes that "Airwork would welcome an opportunity to share BOAC's transatlantic passenger and mail monopoly on the same terms as BOAC are already free to participate in Airwork's so-called cargo monopoly." It will be a great day for air-freight in general, and Airwork in particular, when passengers can be induced to travel as "fill" in all-freight aircraft. Certainly, fellow passengers as beloved as Foxhunter would be a real attraction.—Yours faithfully,

JOHN C. SEEKINGS

London, S.W.10

New Broom at the Town Hall

SIR—Your article in your issue of February 20th on the report on Coventry's administration was a destructive criticism. The last paragraph grudgingly admits that some good might perhaps spring from the experiments, but this is completely at odds with the rest of the article.

It shows no regard for many of the problems besetting local government, some of which can be ascribed to methods and organisation now in use. At least three of these seem outstanding. First, committee devotion to detail and reluctance to delegate clearly and regularly to chief officers is making such demands upon members' time that it is becoming very difficult to find new candidates for local councils. Secondly, the want of a central establishment section with adequate authority is giving rise to many staff problems which have effect on both the morale of the staff and on recruiting for the local government service as a whole. Such difficul-

ties are, for example, a lack of common grading for similar posts in different departments, of proper training schemes and of a promotion ladder common to all departments of the administrative staff. Thirdly, the over-stressing of the "master in his own house" theory has produced some chief officers who appear oblivious of common organisational problems, of theory of staff management and training, and who only too often are empire builders. In this attitude, they are frequently encouraged and supported by their committees with the inevitable waste of public resources, overlapping responsibilities and a failure to see council activities as a whole.

It is an ill service to local government if we do not re-examine the whole of our conceptions regarding conventions and local democracy. The major problem posed by this report is whether the complex conditions of the present are being met efficiently by a local government system, many of whose methods and ideas are of the last century. No other large and complex organisation, for example, can afford to be without effective co-ordination. Somewhere in local government responsibility for such co-ordination must be clearly defined and must clearly rest. This Coventry City Council is attempting to do. It may well mark a new approach to our theories of local government organisation and control.—Yours faithfully,

HENRY MADDICK

Britain's Maritime Tradition

THE NATION AND THE NAVY.
By Christopher Lloyd.
Cresset Press. 301 pages. 18s.

IT is, perhaps, a timely moment for the appearance of this fascinating study of British sea power and of the men and ships by which it was exerted from about 1500 to 1922. The Defence White Paper and this week's debate on the Navy estimates show that the role of the Navy in Britain's defence plans is ripe for reconsideration. Mr Lloyd is no extreme "navalist," but he does convey to the reader a vivid impression of the continuity of the British maritime tradition, of the consequences of forgetting or neglecting what is "not only a matter of professional pride and interest . . . [but] ought to be a subject of public concern." Only a very rash writer would today dogmatise from the past about the course of a future war—and Mr Lloyd does not attempt to do so. Yet he does make it plain that, however greatly the instruments of war may change, the fundamental need of the British Empire is still to defend this island base and its far-flung thousands of merchant ships. Moreover, his lively interest in the men who from the sixteenth down to the present century have manned British ships ("of which the Royal Navy is only the fighting part") serves to remind us that in all wars, including the last, it is the staunchness, loyalty and endurance of those men, rather than the novelty of the weapons supplied to them or their enemies, which is ultimately the deciding factor. The First Lord's speech this week, with his emphasis on the Navy's need to retain the services of its trained men, gives added point to this reminder.

As for the essential continuity of Britain's maritime history, Mr Lloyd sometimes hints and sometimes actually suggests that, although his story stops short of the recent struggle, there are many strategic and tactical points of similarity between it and earlier wars. Thus the English Channel served "in successive ages as a wall, a moat and a tank trap"; Vauban's views on the suitability of Brest as a base for commerce raiders coincided exactly with Hitler's; Rifleman Harris's heartfelt joy and relief on sighting the British men-of-war in Corunna harbour were echoed by men brought back from Norway, Dunkirk, Greece and Crete in 1940-41; the successful defence of British merchantmen has throughout the ages been by convoy and escort.

There is, however, one thread running through the book on which the author,

probably deliberately, offers no comment at all, but which cannot escape the attentive reader and is of great significance today. It concerns the repeated disasters to overseas expeditions when the planning and preparations were inadequate, when delays were caused by one inefficiency or another, when secrecy was compromised and, above all, when the naval and military commanders were at loggerheads. From the Cartagena expedition of 1741 under Vernon (the "angry Admiral" of a recent biography), here described as "the most disastrous expedition in history," to the Walcheren Campaign of 1809 (which was hardly less disastrous) the causes of failure were basically the same and the consequences identical. And the conduct of General Wolfe and Admiral Saunders in the capture of Quebec shines in happy contrast to the all too frequent bickerings between the leaders of less fortunate expeditions, right down to our own days.

Where so wide a field is covered it is inevitable that points of disagreement will arise. Some may consider that Mr Lloyd overrates the influence and capacity of that attractive intriguer Sir Sidney Smith. This reviewer at any rate does not agree that his small squadron "was able to save Sicily"; there was a large British garrison there at the time. Equally it is an overstatement that Nelson's tactics at the Nile were "unpremeditated." Lastly it may be captious to point out that Bermuda is not in the West Indies.

This is first and foremost a book for the teacher. It should be included in every secondary and grammar school library and used as the basis for what is so much needed today—a realisation of the foundations on which British wealth, greatness and security rest, and of the devotion of the men who created and preserved them. Mr Lloyd's clear and easy style makes it a pleasure to read and his touches of humour would enliven a subject which all too often appears to pupils as nothing but a drudgery of dates. Who, for instance, would not chuckle, and remember that "Admiral" first meant "flagship," when told that "we need not be alarmed when we read . . . that the admiral burst into flames after an internal explosion"? Mr Lloyd gently inters a few cherished but apocryphal stories like Drake's reply when told of the approach of the Armada, but he has done something of immensely greater value in analysing so clearly the British maritime tradition and in explaining it in so attractive a form.

THE ECONOMIST, MARCH 13, 1954

Exploiter or Pioneer?

WESTERN ENTERPRISE IN FAR EASTERN ECONOMIC DEVELOPMENT.

By G. C. Allen and A. G. Donnithorne.
Allen & Unwin. 292 pages. 20s.

MOST Asians see the Western business man as a past, if not a present, exploiter. Most Europeans, by contrast, see him as a courageous pioneer. The merit of this book is that its concentration on facts rather than opinions enables one to see the element of truth in both views. It is, therefore, important that the conclusion emerging from their facts is that the Western business man was always very much more pioneer than exploiter. Indeed the only sense in which he could be said to be an exploiter at all was moral rather than economic: the forcing of his own ideas of development on a Chinese society which, in its conscious policy, did not wish to accept them, however much in its day to day life it may have been tempted by the new conveniences.

Primarily the Western business man was a creator, the founder of a whole series of modern institutions, from banks to insurance companies, from steamships to a commercial code. The scope given to him was, however, very different in China and in Japan. In China he did more, because Chinese society resented him more; in Japan he did less, because everything he could do the Japanese were eager to do themselves. Until Chiang Kai-shek's burst of efficiency in the 1930s, China had a government which did not want to create a Western style society. It gave way to pressure, particularly armed pressure, because it could not help itself, but it was never prepared to co-operate. The first railway line was bought by the Government and torn up. The first attempt to mine the great iron ore reserves of Central China ended in the Government repurchasing the concession. There were no modern Chinese banks able to function in the same way as Western banks until the late 1920s. The Chinese business man was not even protected from elementary threats to life and property until after the end of the war-lord era.

Everything the foreign business man wanted, he had to do for himself, whether it was insurance or shipping, banking or efficient municipal government. Even the development of China's own exports was largely left to the foreign business man. It was he who created the market for soya beans and groundnuts, for example, and when, as with tea or with silk he was unable to obtain the regular standard of quality the overseas market demanded, China lost business to other countries. The extent to which foreign predominance was the result of the Chinese Government's inability to create the conditions necessary for a modern economy is illustrated by Shanghai. There the foreign concessions provided the Chinese business man with freedom and the rule of law, and he built up a considerable modern business apparatus.

THE ECONOMIST, MARCH 13, 1954

By contrast, in Japan, the Government was eager to take everything the West had to give. It used subsidies and Navigation Acts to build up steamship lines; it participated in the capital of the first Japanese exchange banks; it went on to the gold standard at an early date. It built railways and telegraphs; it was a persistent initiator of industrialisation; it was always willing to employ foreign experts or send Japanese abroad to learn. Its determination to create a Western style industrial society was so great that it was never necessary for the foreign business man to exercise any pressure upon it.

The moral of the authors' facts is clear. When the East was receptive, there was no need for the West to be rough. The proof is the more convincing because the authors so largely leave the reader to find it for himself.

Genesis of a Party

THE ORIGINS OF THE LABOUR PARTY.

By Henry Pelling.

Macmillan. 267 pages. 21s.

THIS book seeks to describe the various attempts at socialist and working class organisation which took place between 1880 and 1900, and to show how they led eventually to the emergence of the Labour party. It is not an easy task. The story is one of conflicting and mostly abortive attempts

rather than of continuous development; the nomenclature is involved; and there is a bewilderingly large number of organisations and characters to be assigned their proper place and influence.

Mr Henry Pelling surmounts these difficulties with considerable skill. He has imposed a good framework upon his material, and within this he is scholarly, perceptive and readable. He has a good eye for the brief but apposite quotation, and he mixes a generally sympathetic approach to his subject with an occasional note of irony. Some of the illustrations are well chosen—there is a delightful combination on one page of Keir Hardie looking his most plebeian and Cunningham Graham (painted by Lavery) looking his most patrician, both appearing under the label of "The First Socialist M.P.s"—but there are far too many reproductions of political art designs in the William Morris style.

Success came to the Independent Labour Party because it was the first socialist organisation which could secure a working arrangement with the trade unions. That is the main lesson of the book, and it is of course a point which has been the key to the whole subsequent development of the Labour Party. A close alliance, based on a degree of mutual tolerance, between the hard-headedness of the trade unions and the enthusiasm of the political idealists is the one thing that has made the Labour party a major force, and which keeps it so. Keir Hardie, despite his evangelistic

style of oratory, was quite cool enough to realise this. Indeed, he appears from Mr Pelling's pages as a good deal more than the warm-hearted proselytiser that he is commonly thought to be. "It was significant," we are told,

that whenever conference time came round he [Hardie] was careful to insert a note in the paper urging the branches not to follow the practice of binding their delegates to strict instructions, but to leave them free to be influenced by the debate, which would, of course, be dominated by himself and his colleagues. There was something of the shrewd party manager concealed beneath the cloth cap.

If there is a fault to be found with Mr Pelling it is that he does not give us quite enough analysis of the difference in outlook between Hardie and Burns, Hyndman and Shaw, and the other *dramatis personae* of his story. But this is a fault on the right side. It is better to have plenty of hard facts without quite enough generalisation than the other way round.

United Europe

L'EUROPE UNIE ET SA PLACE DANS L'ECONOMIE INTERNATIONALE.

By André Philip.

Presses Universitaires de France. 365 pages. 900 francs.

M. ANDRÉ PHILIP'S book covers a lot of ground, but all of it is known intimately to the author from his experience as minister in French

The Village Grocer's Cottage that has become a Treasure-house of Art

Over a century ago a small country grocer, known as "Father" Ganne, befriended a group of unknown and penniless artists who came to paint in his picturesque village of Barbizon, near Paris. He opened his house to them, allowing them to live and work there in return for an occasional few francs.

And so Millet, Corot, Rousseau, Ingres, Charles Jacque, Daubigny, Brendel, Diaz and others lived, drank and made merry at the Maison Ganne. In gratitude they adorned the furniture and walls with their paintings.

Today these masterpieces by artists who have since become world famous, are preserved intact at Barbizon, in their original setting.

JOHN O'LONDON'S WEEKLY has photographed a selection of these fascinating paintings—many never before seen in this country. In this week's special Barbizon issue they are reproduced in a 6-page feature which will delight every discerning reader. In addition, R. O. Dunlop, R.A., contributes an authoritative article on "The Barbizon School".

You will enjoy JOHN O'LONDON'S, too, for its informed commentaries on Books, Plays, Music, Art and Films, and its authoritative literary features. See your newsagent today—and place a regular order!

OUT NOW—4^p

COROT

MILLET

INGRES

governments since the war, as delegate at international economic conferences and as promoter of European unification at Strasbourg. He has written an admirably documented analysis of the world's material problems, a full account of the work already done to solve them and a vigorous argument for the integration of Europe . . . not a semi-autarkic Little Europe, but an outward-looking unit fit to co-operate with the British Commonwealth in the development of backward countries, which the author regards as the world's major political problem. The book suffers only from a surfeit of figures in the text; an inability to spell Barclays Bank; and an allusion to "un anglais [sic], Sir Boyd Orr."

M. Philip's central thesis is that the United States is not, and probably cannot be, the world's economic leader in the way that Great Britain was in the liberal nineteenth century, when the London money market was respected as a "supranational authority." For seventy-five years the British regularly invested 8 per cent of their national income overseas with the result that British (private) investment abroad is estimated to have totalled £3,763 million by 1913. The United States has never even set out on this road. Before 1939 American private investment in Europe consisted chiefly of minor medium-term loans of an unconstructive character. American private investment abroad between 1949 and 1951 amounted to only \$2,500 million against \$142,500 million at home. In spite therefore of the vast governmental allocation of \$25,000 million, largely in the form of gifts during the period which M. Philip applauds as the first serious attempt at planned supranational investment, it can hardly be said that the United States has yet tackled the basic problems of hunger and poverty in the densely populated, "new countries." The moral to be drawn is that Europe and the Commonwealth, themselves supported and in large measure militarily defended by America, should combine to invest in their own sphere, guaranteeing the associated or dependent people's markets by long-term contracts and supplying them regularly with machinery. This is the essence of the Strasbourg Plan of 1952.

M. Philip's section on the European Coal and Steel Community does much to bring that sometimes rather mystical organism down to earth. His account of the operations of the international steel cartel (EIA) in the bad old days, and the extraordinary sacrifice of French industrial development which it entailed, offers a striking contrast with present supranational policy. M. Philip hails the coal/steel treaty as the greatest European accomplishment so far, in spite of doubts of the High Authority's capacity to eradicate cartels and of the effectiveness of its consultation with workers and consumers. One of the tasks of the High Authority, he says, should be to promote industrial democracy by training the workers to participate in the Community's organs. Only

when it has created a public opinion favourable to itself and become, through its accessibility, a "house of glass" is the High Authority likely to succeed.

M. Philip, the Socialist Protestant, seems very largely in accord with Christian-Democratic objectives in the matter of supranational organisation. He is all against "planification technocratique" on the national plane (which drowns the workers themselves in a bureaucratic ocean); and against the idolatry of the state practised by anti-clericals. His book is a plea for perseverance on the part of all supranationally-minded members of parliament, civil servants and experts who have been struggling for years against their national governments.

Spenser to Donne

THE SHAKESPEAREAN MOMENT.
By Patrick Cruttwell.

Chatto and Windus. 262 pages. 18s.

"THE 1590s brought about that deep change of sensibility which marks off the later from the earlier Elizabethans, which alters the climate from that of *Arcadia* and *The Faerie Queene* to that which welcomed *Hamlet* . . . and which found its other great poet in the person of Donne." A book beginning, as Mr Cruttwell's does, with this well-established critical commonplace, is likely to be better or worse according to whether it acknowledges the complexity or asserts the absoluteness of the revolution with which it deals. Some handing over of the governance of literature there undoubtedly was, but the facts lie buried deeply in formidable archives—in the whole body of a literature richer, stranger and often more teasingly ambiguous than any other period of English literary history has produced. Mr Cruttwell finds the 1590s intensely confused precisely because the handing over was then taking place.

New and old were deeply entangled, and all generalisations must be loaded with exceptions. But there was an old, and there was a new, and the task of criticism is to analyse and distinguish. This is very sound. Interest quickens when the writer continues:

Of all the poetry then written, none shows better what was really happening than the Sonnets of Shakespeare.

The Sonnets use a form which was above all the chosen form of the old, but their content belongs progressively with the new. The beautiful youth is closely associated indeed with a golden past, and he is celebrated at first in a lyrical mode, as part of a world in which nothing is questioned, criticised or analysed. But this tone does not hold for long:

As the sequence proceeds, the texture of the poems, though the subject remains the young man, shows a slow thickening, an increasing complexity. . . . An all-inclusive self-examination replaces or reinforces the narrow theme of love; self-disgust, self-contempt, self-reproach are the usual tones of this introspection. . . . They widen in scope, till every interest of the writer's life is brought within their reach: his dreams of social success and

bitterness at social failure, the problems and rivalries of his career as an author, his perceptions of the evils and injustices in society, his private anguish at growing old and his private fear of death.

Eventually we have such sonnets as the 151st, and have exchanged the sustained lyrical idealism with which the sequence opens for a complex poem ranging in fourteen lines from religious solemnity to bawdy mockery. "We have come, in fact, from Spenser to Donne."

The sequence of the Sonnets, if it were an isolated phenomenon, might be judged entirely a product of the poet's personal fortunes; in fact, it perfectly miniatures "a shift of thought and feeling in society itself." The dynamic of that shift Mr Cruttwell declares to lie in "a spreading and a sharpening of the spirit of criticism"; and it is the operation of this that he endeavours to analyse in the remainder of his book. In places he may be judged a little insensitive to the earlier Elizabethan spirit, and even—as in discussing the *Amoretti*—insufficiently aware that it held complexities of its own. Nevertheless he has made a distinguished contribution to the critical appraisal of a fascinating literary epoch.

Welfare Universities

OXFORD TRIUMPHANT.

By Norman Longmate.

Phoenix House, 190 pages. 16s.

THE modern undergraduate has to some extent become the play-ball of political and educational theorists. Much sense, and even more nonsense, is talked about the effect on the older universities of dilution by public scholarships, stiffer entrance standards, state subsidies and the other egalitarian adjuncts of the welfare state; but the personal touch is often missing. For this reason a perceptive account of postwar conditions and attitudes written by a newly fledged graduate would have been welcomed.

Unfortunately, this book, which sets out to give the reader a worm's eye view of the postwar university fish in his post-war water, is distorted, garish, and often in bad taste. The author has adopted the method of describing the different facets of Oxford life one by one—dons, sport, societies, theatre and so on. He has tried to save himself from the fate of dullness that often befalls descriptive guidebooks by spicing his piece heavily with exaggeration, prejudice and sheer fantasy. Dons are described as a lot of useless old lazybones, and the supposed orgies of a bump-supper night (pictured in a rather nauseating tone of self-righteousness) might have come straight from the pages of Mr Evelyn Waugh.

No one, of course, will be taken in by this silliness, but it is a pity to see a good opportunity missed. It is possible, for example, to delve deeper into the religious problems of the modern undergraduate than by digging up an old questionnaire issued a few years ago by the magazine *Isis*. A subtler and more tentative approach would have yielded better results than the methods adopted in this opinionated and sometimes inaccurate book.

"...the best compilation of its kind
now before the public"

—LONDON EVENING STANDARD

THE NEW CHAMBERS'S ENCYCLOPÆDIA

The Major Encyclopaedia you CAN Afford!

THE New CHAMBERS'S Encyclopaedia is first choice to-day of thinking men and women because it is the only major encyclopaedia to be written COMPLETELY ANEW in the post-war era. It is, in fact, the world's most up-to-date encyclopaedia. Newly written, newly illustrated, it brings to your home the specialised knowledge of great Scholars and Authorities—the New CHAMBERS'S is a continuous source of education, enlightenment, pleasure and profit for years to come.

Valuable Free Supplementary Services
FOR YOU AND YOUR FAMILY

1 CHAMBERS'S Encyclopaedia World Survey. A volume in binding to match the Encyclopaedia and planned to keep you always abreast of current world events. It is an authoritative and impressive panorama of national and international happenings, and its 368 pages are profusely illustrated.

2 The Research and Information Bureau. It answers questions, provides facts and figures, suggests material for speeches, and supplements the vast store of knowledge in the Encyclopaedia. This service can be worth much more to you than the cost of the Encyclopaedia. It is provided free for 10 years.

New simple monthly subscription plan

I should like to have, without obligation, full particulars of the New CHAMBERS'S Encyclopaedia, including the valuable Supplementary Services and the simple monthly method of payment.

ACCLAIMED BY THE PRESS

"...fills the needs of the time for clarity and intelligibility."
The Observer

"One can state without fear of contradiction that the greatest publishing achievement in the English-speaking world, during the last decade, has been the new edition of CHAMBERS'S Encyclopaedia."
The Adelphi

"I know a number of encyclopaedias. I know none I like so much. It is so easy in the hand, and so easy to the eye: it is so lucidly arranged, so orderly."
John o'London's Weekly

"Altogether a remarkable achievement."
The Spectator

PRAISE FROM OWNERS

"...I have no hesitation in regarding your New CHAMBERS'S Encyclopaedia as the best in the English language."
R.H.B. (Schoolmaster)

"A valuable work of reference for many years to come, also a source of delight and entertainment in one's leisure hours."
F.M.S. (Engineer)

"...Of incalculable value to my wife and myself and also to the two junior members of my family."
B.D. (Business Man)

all around the town

East Side, West Side—piers, hundreds of them, provide New York with the greatest harbour facilities in the world. Ocean-going vessels, docking at the rate of 12,000 a year, have made the Port of New York a gigantic funnel through which pours about half of America's trade with the rest of the free world.

It's no accident that the financial and shipping districts are located side by side in downtown Manhattan: *they work hand in hand*. The "Big Three" of foreign commerce—the importer,

the exporter and the transporter—all depend upon commercial banks that are organised to serve the financial interests of customers on a national and international scale.

Such a bank is Chase National with headquarters in the centre of New York's financial and shipping districts. From here, Chase service reaches out through its correspondent banks (the most extensive system in the U.S.) into all 48 states. Overseas, Chase has branches and representatives' offices in Europe,

the Far East and Latin America and, in addition, maintains close working relationships with leading banks in the markets of the world.

If you do business in the States, why don't you talk to the people at Chase?

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

The McCarthy Drama

Washington, D.C.

WHEN, last November, President Eisenhower announced to the nation that he hoped that Communism in government would not be an issue in this year's elections, there were smiles of polite disagreement behind the doors of the Republican National Committee and even in some offices at the White House. As the President exerted his leadership in other fields throughout December, the professional politicians privately made it clear that they considered the "softness" of previous Democratic Administrations towards Communism far too valuable an issue thus lightly to discard. They would keep both it and the Administration's record on the stage, and emphasise whichever seemed the more useful as the election drew nearer. The drama of the last three weeks has been a commentary on the disastrous consequences of this opportunism and of the President's failure to enforce his view within the party.

The prologue to the performance was the chorus of "twenty years of treason" sung by Senators McCarthy and Jenner and other Republicans while on tour in February. The first act began with Senator McCarthy's attack on General Zwicker, and then on the United States Army as a whole, for the handling of the case of Major Peress, and ended with the humiliation of the Army's unhappy Secretary, Mr Robert Stevens. As the evidence is gradually unravelled it becomes increasingly clear that Mr Stevens was not the victim of a cool and deliberate decision by the Administration that the Peress case did not provide firm enough ground on which to join battle with McCarthyism; he was the casualty of a political stampede away from the effect which his courageous defiance of the Senator would have had on the façade of unity which the Republican party is still fighting desperately to maintain. Owing to a mixture of ill luck and ineptitude, the firm support of the President, which alone would have enabled Mr Stevens to resist the political pressures applied to him, was not forthcoming in time to prevent him from walking into the trap, prepared by Senators Mundt and Dirksen, of a private meeting with Mr McCarthy.

The official explanation that the Peress case was a bad issue on which to fight was a hasty afterthought. For one thing Mr Stevens had never intended to fight Senator McCarthy on the Army's handling of this particular case, but on the principle of civilian responsibility for the actions of the armed forces, and on the Senator's abuse of General Zwicker. For another, the Army did have a reasonable defence for its decision to commission and promote Dr Peress as a dental officer, although he had refused to answer

a questionnaire on his loyalty. An amendment to the conscription legislation passed last summer specifically requires that medical conscripts "shall" be appointed to ranks commensurate with their experience, and there has been a Supreme Court ruling castigating the Army for denying a commission in a similar case.

★

The curtain for the second act rose upon a crowded house for the President's press conference ten days ago, after a torrent of speculation about what he would say to redress the honour of his own service, and growing criticism of the handling of the McCarthy-Stevens controversy. Across the river in the Defence Department spirits were low and tempers high. When Puerto Rican Nationalists discharged a blast of gunfire into the House of Representatives, many army officers, reversing the usual Republican defence of Mr McCarthy, said that they agreed with the methods but not with the objective.

In this atmosphere the President's statement came as a leaden anticlimax. It began defensively and continued with a dubious assertion that the conscience of America "is reflected in the body of the United States Congress." Its only substantive declaration was that government officials would have the President's support in seeing that their subordinates were not bullied by congressional committees. Fortunately for Mr Eisenhower, Senator McCarthy replied almost within the hour with a series of remarks so insolent that the President could hardly let them pass. The Senator called the whole controversy "a silly tempest in a teapot" and specifically opposed the President's appeal for fair treatment of witnesses. "If a stupid, arrogant or witless man in a position of power appears before our committee and is found aiding the Communist party he will be exposed." As the *Washington Post* commented the next morning,

Senator McCarthy's arrogance may yet save President Eisenhower from the worst consequences of his own timidity. . . . His challenge gives Mr Eisenhower another chance to substitute leadership for the weaseling of yesterday.

The comments of many other newspapers followed the same line of reasoning, which was strengthened by the President's firmer stand at his press conference this week.

While this sorry drama was bringing catcalls from the critics, two sideshows were in progress. One was a juggling act in which the famous 2,200 subversive officials whom the Republican Administration was supposed to

have removed from government jobs since it came to office became 383 people who had left the government service and against whom there had been unproven charges of subversive activities. Even so the Civil Service Commission could not make its totals square with the figures published by the individual departments. The other was more serious. As Mr Dulles departed for the Caracas Conference to warn the Latin Americans of the dangers of Communist infiltration, the State Department announced that Mr Scott McLeod, Mr McCarthy's agent within its walls, had been relieved of his responsibility for its personnel and would henceforth be concerned only with its security. As the Defence Department's morale went down the State Department's went up, for this was a direct blow at Mr McLeod's position. He had loudly and publicly maintained that responsibility for security and personnel could not be separated, and there was an automatic reaction from Senator McCarthy.

★

The third act has not yet been performed, and no one can say whether it will provide tragedy or low farce, nor for whom. The official explanation of the President's general condemnation of sin ten days ago is that it was thought to be essential that he should make clear the grounds on which he would fight Senator McCarthy when the next challenge is presented. But it hardly seems to have achieved its purpose. The crucial question is whether the Senator will continue to pick over the bones of the United States Army or will now turn on Mr Dulles, against whom the McLeod case is only one of a number of grievances. Mr Dulles has recently shown himself to be a more skilful and more doughty opponent than the President, a judgment that would have been inconceivable a year ago. If Mr McCarthy decides to stay clear of the State Department, it will be a sign that he does recognise the limits of his strength. If not, Mr Dulles—apparently convinced by the cold reception of the Republican right wing to his handling of the Berlin Conference that it is a waste of time to try to be a popular Secretary of State—will almost certainly offer a resistance which may at long last draw the reluctant White House into battle.

There are as yet no clear indications of just how much harm the President's handling of McCarthyism in recent weeks has done to his standing in the country. Certainly the exposition of the lengths to which the Republican party leadership is prepared to go to maintain the appearance of a united party has chilled a great deal of the enthusiasm which went into the Citizens for Eisenhower, Democrats for Eisenhower and the Young Republicans eighteen months ago and provided the margin of victory over Mr Stevenson. The President has disillusioned a vast number of Democrats and independents who voted for him, partly in the belief that he could control Mr McCarthy as a Democrat could not, and partly in touching faith that he could stand above considerations of electoral and party interest.

But events are showing that the strategy of using Senator McCarthy for what advantage he can bring is based on another fallacy, that the only way the Republican party splits is by a defection of the right wing. The alarm and even fury of liberal Republicans, particularly of a number of respected figures in New York and elsewhere who are heavy party contributors, should be a reminder that Republicans can also defect from the other wing. This is

perhaps proved by the advice of *Time* magazine, which can hardly be said to be indifferent to the fate of the Eisenhower Administration:

Republicans and Independents can get disgusted enough to vote Democratic next fall. But where can McCarthy's followers go? Politically Joe is expendable, and the time to spend him appears to have come.

For the moment Mr Adlai Stevenson's intervention last Saturday has given the Republican party a chance to salvage part of its honour. In his speech to the southern Democrats gathered in Miami Mr Stevenson said, with unforced wrath, that "a group of political plungers has persuaded the President that McCarthyism is the best Republican formula for political success." This speech surprised and displeased many Democratic politicians, who felt that the Republican party should be left to wash its own linen, in public at least, but it gave the chairman of the Republican National Committee and the White House a cast-iron excuse to sidetrack Mr McCarthy by demanding free radio time so that the Vice-President, Mr Nixon, and not the Senator might reply on behalf of the party. By touching Republicans on their sorest spot with a scalpel which he can sharpen to a keener point than any other American politician, Mr Stevenson seems to have goaded the party into action. The result may not benefit the Democratic party but it certainly should benefit the prestige of the United States.

Subsidies in Sheep's Clothing

FROM A CORRESPONDENT IN COLORADO

SHEEP farmers are somewhat reluctantly supporting the President's proposals for a limited subsidy on wool, although they say frankly that they would have preferred an increase in the tariff. American wool production has fallen substantially during the past ten years and the growers naturally tend to blame the Reciprocal Trade Agreements Act. The President, however, has turned down the recommendation of the Tariff Commission for the addition of a fee—thought to have been 10 cents—to the present tariff of 25½ cents a pound.

The President pointed out that Congress was already considering a new scheme for wool, and that the benefits from an increase in the tariff would be far outweighed by the damage it would do to international trade and the common defence effort. Mr Benson, the Secretary of Agriculture, has firmly opposed more protection, on the ground that this would offend Australia, Argentina, and South Africa, and cause them to reduce their purchases of American goods. He is convinced, moreover, that any increase in the price of wool would simply encourage further inroads by the synthetic fibres.

Wool prices are now supported at 90 per cent of parity, that somewhat mythical figure that is supposed to assure the farmer a fair return. For 1953 the average support price was 53.1 cents a pound of raw or uncleaned wool, and for 1954 it will be 52.1 cents. The Commodity Credit Corporation loans the grower money on his wool at the support level; if the price goes up he can reclaim his wool and sell it, while if it falls he can leave it on the hands of the government, which absorbs the loss. This device has kept up the price of wool; it hovers just under the level at which it would pay the farmer to reclaim his clip. But although the CCC has been left holding a bag containing 100 million pounds of wool, the farmer has not been encouraged to expand his flocks.

The announced goal of the programme, which was first adopted in 1950, was a domestic production of 300 million

"Ah, It Smells Much Sweeter Now"

Herblock in the Washington Post

pounds of shorn wool a year. But it is now clear that this figure is never likely to be attained. The numbers of sheep, which were estimated ten years ago to total 50 million, have slowly fallen to about 28 million, and domestic production of shorn wool, at 230 million pounds last year, provides only about a third of America's annual consumption. (A small amount of "pulled wool" is also obtained from slaughtered sheep.)

It was no surprise, therefore, that the Republicans should consider it imperative to work out a new scheme for wool, but the nature of the programme has caused some lifting of eyebrows. Mr Eisenhower suggested that wool be permitted to find its own price level, buoyed up only by the present tariff on imports. At the end of each season, however, the government would distribute among the

growers a sum sufficient to bring their average return on each pound of wool to 90 per cent of parity. More recently, a figure of 100 per cent or more of parity has been mentioned as necessary to provide an adequate incentive. The money would be taken from general revenues, but would not exceed the amount of the unpledged receipts from the wool tariff.

Democrats rubbed their eyes and then delightedly pointed out that this is fundamentally the same plan which the Republicans howled down when Mr Benson's Democratic predecessor, Mr Brannan, suggested it. Mr Brannan's proposal was that the prices of all perishable farm products should be allowed to find their own level, to the benefit of the consumer, and that producers should be compensated later by direct payments from the Treasury. Even Mr Brannan never suggested this for storable commodities. Furthermore, the Democrats asked, had not Mr Eisenhower himself, in his election campaign, promised that the Republicans would solve the farmers' problems without "recourse to the moral bankruptcy of the Brannan plan"?

Opinion, particularly in the middle west, seems to be that the plan put forward for wool is also well suited to cure the ailments of other branches of the livestock industry. Mr Brannan, supported by Mr Kenneth Galbraith, the Harvard economist, has pointed out that it might be applied to butter, which, under the present support programme, is going into the government store at the rate of millions of pounds a week.

★

More political fun will be had by the Democrats when the wool Bill sponsored by Senator Aiken and Representative Hope, chairmen of the Senate and House agricultural committees, on which hearings have now been completed, reaches the floor of Congress. It embodies the President's proposals, but would limit the amount to be divided up among sheep farmers to about 70 per cent of the receipts from the wool tariff.

One objection raised by the growers, although they are not pressing it, is that since wool prices vary during the year, but the subsidy on each pound of wool would be fixed, some growers might ultimately receive several cents a pound more than others. Pulled wool and mohair or goats' wool, which is grown chiefly in Texas, would be included in the programme.

The real difficulty with this latest plan to expand American production of wool is the same one which has handicapped its predecessors: the reluctance of the industry to improve its own antiquated and uneconomic organisation. The woollen processing industry established itself on the eastern seaboard early in American history, and remains there although the Great Plains and the Rocky Mountains, 1,500 to 2,000 miles away, proved to be better adapted for raising sheep. Wool is shipped east in the raw or "grease" state and ranchers who have to pay the freight on millions of pounds of useless dirt have difficulty in meeting foreign competition. Meanwhile the railways, in order to meet water-rates from the west coast, send Australian wool trains roaring across the continent for no more than they charge to carry American wool to Boston from the ranches of Montana or Wyoming. If the new plan can build up domestic wool production despite these self-imposed disadvantages, it will have achieved a miracle.

American Notes

Best Tax Foot Forward

THE House Ways and Means Committee has completed a year's work on tax reform, but it was a Bill dealing with excise taxes which was given priority and which the House passed so expeditiously this week. This measure continues the high rates on tobacco, alcohol, petrol and automobiles which were voted three years ago to help finance the Korean war; if they were to lapse, as they are automatically scheduled to do on April 1st, the cost to the Treasury would be nearly \$1.1 billion a year. Most of what the Bill gives, however, it also takes away. The reduction of all other rates of excise to a flat 10 per cent—on telegrams and transportation, jewellery and furs, cinema admissions and electric light bulbs—will cost \$912 million a year. The net gain to the Treasury is a mere \$165 million.

Despite its protests that such largesse will add nearly \$1 billion to the prospective budget deficit of \$2.9 billion in the year beginning next July, the Administration appears to be resigned, as the President himself said, to taking "quite a lot of castor oil with the sugar coating." It has no choice but to hope that the House leaders are right in believing that by giving priority to reductions in excise taxes, the Republicans can take the steam out of the Democrats' demands for more costly increases in personal exemptions.

For similar reasons of strategy, the extension of the 52 per cent rate on corporation incomes, which brings in \$2 billion a year, has been added to the tax reform Bill. This may help to give an air of impartiality to a Bill which the Democrats attack as relief for "coupon clippers"; they would like to substitute for its relief of double taxation on dividends an increase in the personal exemption, which directly benefits the lower income groups and would encourage them to spend more.

The Administration will probably be lucky if, in an election year, tax relief costs it only \$1 billion. The danger that all these carefully laid Republican plans will go awry is particularly acute in the Senate, where the Democrats have an actual majority, and where Senator George's support has made tax relief on a substantial scale look respectable even to conservatives. A number of Republicans, moreover, are reluctant to let the Democrats take all the credit both for lowering taxes and treating the recession seriously.

Allies May be Excused

ALTHOUGH it was perhaps to be taken for granted that the President would not allow the Battle Act to cut off aid to five of America's chief European allies, the announcement that they will be excused from the Act's penalties comes at a time when the political reactions to it have significance for the future of east-west trade. The

Act entirely prohibits military or economic assistance to any nation which delivers arms to Communist countries but, when only strategic materials are involved, the President is allowed to continue assistance to the erring ally if he considers that it would be detrimental to the security of the United States to cease giving aid.

Obviously it would be detrimental to the North Atlantic Treaty Organisation, and therefore to the security of the United States, to stop military aid to France, Italy, Norway, Denmark and Britain just when shipments of arms are at their height. Of the \$7.7 billion worth of weapons and equipment that have been delivered to allied countries in the four years since the military assistance programme began, nearly half was sent in 1953, and \$6 billion worth has gone to Western Europe. Purely economic aid to that area is becoming negligible, and has already ceased entirely to Denmark and Norway, although for some time Europe will continue to earn dollars through military contracts, which are expected to yield \$500 million in the current year.

The five allies who have sent strategic goods behind the iron curtain are all co-operating in Nato's committee on trade controls and the objectionable deliveries, mainly of machinery and raw materials, are either to fill contracts entered into before the Battle Act was passed, or part of a two-way trade exchange which should on balance benefit the free world. The first applies to the most serious infringement, Denmark's sale of a tanker to the Soviet Union, and the second to Norway's shipment of aluminium to the Soviet Union under a 1953 barter agreement.

As dollar aid to Europe decreases, there can hardly fail to be an increase in the number of exchanges with the Soviet Union and its satellites which will benefit the free world, for most of the free world has to trade to live. The American Administration has for some time recognised the desirability of more east-west trade and has been fostering a congressional atmosphere favourable to more flexible regulations. This takes time in a country in which foreign trade is a luxury rather than a necessity, but an encouraging reception was given to Sir Winston Churchill's recent speech urging a relaxation of the restrictions on trade with iron curtain countries; his exception of Communist China from his recommendations was most welcome in America. It will be even more encouraging if Congress accepts without serious protest the President's excuses for the allies who have sinned against the Battle Act.

Ins and Outs

MR JOHN KANE, special assistant to the Secretary of the Army, left no doubts last week about his reasons for resigning. But Mr Roger Kyes, the Deputy Secretary of Defence, whose place is to be taken by Mr Robert Anderson, now the Secretary of the Navy, has denied that his resignation had any connection with the Administration's failure to reinforce the Army in its clash with Senator McCarthy. If this is so, and there is no evidence that it is not, the question still remains whether the government can be run in peace time by businessmen on short-term leave.

It was the Republicans' proud boast that they would put the best business brains at the service of the country, but

few are content to stay for long. Mr Kyes apparently never meant to remain more than a year, and is staying until May 1st only because the Secretary of Defence finds him so valuable. The Secretary of the Army, it is believed, meant to return to his textile company before long; now, of course, his sudden departure would embarrass the Administration. A few days ago, it was announced that Mr C. D. Jackson, special assistant to the President on psychological warfare, would return to Time, Incorporated, at the end of the month.

It is not surprising that men who have made their mark elsewhere—Mr Kyes was vice-president of the General Motors Corporation before he went to Washington, and Mr Jackson was the publisher of *Fortune* magazine—hanker to get back to their old pursuits, particularly when the government demands such sacrifices of them. Mr Kyes was compelled, like Mr Wilson, his chief, to sell all his General Motors shares, and Washington salaries are only a fraction of what such men can earn outside government.

Yet it is widely believed that newcomers to Washington take nearly a year to find their way about even a corner of the federal machine. By the time they become really efficient, their turn of duty is too often up. This situation may be the fruit of the Republicans' long exclusion from government service; it was the Democrats who were in power when a federal career became not only respectable, but exciting, for many young people. The fact remains that the Democrats, perhaps because they do not have such lucrative or important private jobs to return to, take a more professional view of their politics.

Strangling New York

THIS week's unauthorised but well-organised strike of New York longshoremen is only another of the stoppages which are to be expected as long as the dispute goes on over which trade union shall represent the dock workers. The dispute itself arises out of the attempt to clear the waterfront of the corruption and racketeering which have been slowly strangling the commerce of the port. According to the new Democratic Mayor, Mr Wagner, the city as a whole is being strangled by the meanness of the state authorities. Like his predecessors, he has been trying to persuade the Republicans who are in power at the state capital to fill the hole in the city's budget, but they naturally have no objection to seeing a Democrat in difficulties. They have already approved Governor Dewey's budget, nicely balanced at \$1.1 billion, and they are in no mood to upset it on Mr Wagner's behalf. All they offer is advice on how to economise—he says this can only be done by denying city employees the salary increases which have been given to state employees—and perhaps permission to increase some city taxes.

If he is allowed, Mr Wagner is willing to impose higher real estate taxes and a corporate income tax—which would fall on Republican businessmen. Even so, he would have liked an extra \$145 million for the city from the state this year, and a promise of more to come. This sum very conveniently matches the \$143.4 million which, it is argued, would be due to New York City if the state distributed its

FLY TO Bermuda

ON YOUR TRIP TO NEW YORK

Your first class fare to New York, via any international airline, can include a trip to Bermuda—at no extra cost!

So why not enjoy a holiday in Bermuda when business is over in New York! Bermuda is less than three hours away, daily flights are frequent, and you'll be in the sterling area so you can stay as long as you please. For complete rest, and enjoyment, there is nothing like Bermuda's pink sandy beaches, varied sports and peaceful, leisurely living!

TWA knows America

- and what this means to you!

Flying TWA you get full value for every precious minute of your U.S. trip. TWA knows America. Wherever you want to go in the States you will find friendly TWA people, ready to help you in every way possible. They know schedules, connections, people—the ins and outs of U.S. air travel. TWA offers you a knowledge of America that is *unique*. Why? Because TWA is the only airline flying from London to and across America.

There's a TWA service to and across America to suit your pocket book—from luxury coast-to-coast "Ambassador" Super Constellations to thrifty stretch-out-comfort Sky Tourist flights.

For your TWA booking, see your travel agent or phone TWA

THE ECONOMIST, MARCH 13, 1954

grants fairly. Of the \$614 million to be divided this year among local authorities, New York City will get only about \$260 million, although it is responsible for over half of both the state's revenue and the state's population. A particular point is made of the claim that over 40 per cent of the state's schoolchildren live in the city, but that it gets only 30 per cent of the total allotted by the state for education. Most of these arguments have been countered by a special state committee on the subject; where inequities are undeniable the Republicans blame them on formulae established when the Democrats governed the state. Additional state grants to the city would, it is said, mean additional state taxes and the Republicans of course prefer to make the Democratic Mr Wagner use the unpopular taxing authority, on overnight parking of cars, for example, which he still has in hand.

As always, the thread on which these arguments are strung is not economic but political. This is especially noticeable this year, when the governorship is to be contested in November, but, somewhat surprisingly, this has made Mr Dewey unusually sympathetic, in word if not in deed, to the financial problems of New York City and its citizens. For his position in the state has been weakened by scandals involving Republicans—the latest is now coming out through an inquiry into the management of race tracks; whether or not Mr Dewey himself decides to run again, his party will need every vote it can get.

A Piggy-back in a Poke?

New York

IT is a little surprising to find the head of the teamsters'—or lorry drivers'—union endorsing a scheme by which a motor transport firm would bring fully loaded trailers, 240 to a ship, hundreds of miles up the Atlantic coast by sea, without drivers, instead of attaching them to lorries. Something of the sort has, however, been done for some time on the west coast and on the Hudson and Mississippi Rivers; the union argues that the combination of low-cost water transport with the flexibility of door-to-door delivery would divert traffic from the railways and mean more jobs for lorry drivers in the long run. The rising cost of road transport is already reducing the competitive advantage of road over rail and it may be further reduced if anything substantial comes of the increasing interest being taken in another form of integration—lifts for lorries not on ships but on railway wagons. These "piggy-backs," or "trailers-on-flat-cars (TOFC)", although by no means universally accepted in the best railway society, have now become a major preoccupation of the railways, road transport companies, trade unions and railway equipment manufacturers.

The basic operation, already tested in a number of small-scale demonstrations, is a simple one. Freight is collected from the shipper in a lorry-drawn trailer; the entire trailer is backed onto a railway flat-car at the nearest railway station and taken for a train ride; and at the receiving depot another lorry is waiting to take the trailer, intact, to the consignee. By this means, it is claimed, the railways gain by the fuller utilisation of equipment, and by cutting handling costs; the road transport companies save on wear and tear and ever-mounting highway

taxes, and avoid the expense of extra crews for long distance road journeys; the shipper and customer get a faster and cheaper service; the general public benefits through a reduction of road congestion; and the General Motors Corporation can hope not only to bolster the profits of its Electro Motive Division by turning out more railway flat-cars and terminal equipment, but also, in the long run, to sell more automobiles.

To the railways piggy-backs mean a chance to lure back some of the traffic that they have been losing so heavily to the roads over the past decade. This could be achieved either by encouraging independent highway common carriers to use the railway flat-car service, or by extending the existing railway collection and delivery services to perform the entire operation from door to door, thus using piggy-backs as an offensive weapon against the motor transport companies rather than to the benefit of both. The opponents of piggy-backs within the railway managements claim that the introduction of special charges for this type of traffic would merely result in the diversion of existing rail traffic to piggy-backs, bring down the entire structure of railway tariff rates, and offset any gain from the roads.

This argument is only one of many uncertain features about piggy-backs. Another is the legal aspect, particularly as regards the maintenance of fair competition between various forms of transport. Meanwhile the economics of piggy-backs have taken a favourable turn with the development by the railway equipment manufacturers of new types of flat-car, long enough to load two normal-sized trailers, whereas existing flat-cars will only take one. Also envisaged are new terminal facilities, and the employment of hydraulic lifts to permit trailers to be loaded sideways on flat-cars, thus eliminating the tiresome and time-consuming "circus-fashion" end loading which has been necessary so far. Faster-than-normal freight trains made up entirely of piggy-backed trailers on flat-cars will probably also be necessary. But in any event a major shake up of the railways' tariff structure appears inevitable, and a lower cost of transport may well be the result.

SHORTER NOTES

Senator George's proposed constitutional amendment, a milder version of Senator Bricker's attempt to restrict the treaty-making powers of the President, has been dug up at the last moment after it appeared to have been buried for this session, if only by one vote. It is a Democrat, Senator Lennon of North Carolina, who has revived the issue, in the hopes that the narrow margin can be reversed when Senator Bridges, who is known to favour the amendment, and Senator Symington return from their European tour. Senator Symington, who is a possible presidential candidate, will have a chance to show his metal: if no Senator changes sides, he will have the deciding vote.

President Eisenhower has appointed a Negro, Mr J. Ernest Wilkins, to be Assistant Secretary of Labour in place of Mr Spencer Miller, who has resigned. This is believed to be the first time that a Negro has been appointed to so high a post in the federal government.

The World Overseas

Greece After Devaluation

IT is no longer possible to complain that the Greeks take no steps to put their economic house in order. The drachma has been devalued by 50 per cent. Almost all import restrictions have been removed. An effort has been made to bring down production costs by lowering the maximum interest rate from 16 to 12 per cent. The formidable task of cutting down the cost of the Civil Service has been begun—but by no means finished. The budget has been balanced, if only precariously. These steps, which have all been taken since Marshal Papagos's Greek Rally was swept into office fifteen months ago, have had a good deal of success.

The devaluation, carried out last April, has produced valuable dividends in the shape of higher earnings from both visible and invisible exports. During the first eleven months of 1953 the visible adverse balance of trade dropped from \$210 to \$151 million. The value of exports was \$116.4 million, and that of imports \$267.0 million, an increase of 9 per cent in exports and a decrease of 15 per cent in imports compared with the same period of 1952. A bumper harvest which made Greece almost self-supporting in cereals, contributed towards this improvement; in 1950 the country had to spend roughly \$40 million on imported cereals. No official figures are yet available for invisible exports since the devaluation, but the government may not be unduly optimistic in estimating that they will increase from \$80.6 million in 1952-53 to \$84 million in 1953-54. After the devaluation, the foreign currency which had been held back because of the unfavourable rate of exchange poured into the Bank of Greece. This will not happen again, but emigrants' remittances have increased considerably and last summer Greece's still infant tourist industry enjoyed something of a boom.

Internally, the devaluation has certainly led to some increase of confidence in the currency. The price of the gold sovereign, which in Greece is always a reliable barometer of public confidence, rose after devaluation by 66 per cent to about 300,000 drachmas; this was not as steep a rise as might have been expected, and the sovereign was kept at around this price until the end of the year. (Since Christmas it has risen again and this has caused some uneasiness in Athens; the Bank of Greece recently intervened to bring it back to 312,000 drachmas.)

The cost of living has risen, but the increase has so far been kept within reasonable bounds; according to the Bank of Greece index, by the end of the year it had risen by 18.9 per cent from its pre-devaluation level. Wholesale prices have gone up by about 30 per cent and retail prices, which were controlled by the government, by about 15

per cent. But here there may well be trouble ahead. The large stocks of foodstuffs and raw materials which the government had the foresight to lay in before the devaluation, at the old prices, will not last for ever. Moreover, apart from a temporary cost of living bonus of from 7 to 12 per cent of wages and salaries, awarded last July, the government managed for the first ten months after devaluation to avoid any general increase in wages. Early last month, however, it agreed to an increase for the Civil Service of 25 per cent for the lower grades and 20 per cent for the middle grades. This is bound to be followed by similar increases in industry, commerce, the banks, and possibly in agriculture as well; and a steep rise in prices can hardly be avoided, although it may not be equal to the wage increases. Already the opposition press is condemning the limited scope of the new step; according to one newspaper, the government's policy is turning it into "not merely the fellow-traveller, but the hod-carrier of Communism."

Mr Markezinis, the able Minister of Economic Co-ordination, has other important problems to tackle if progress towards economic expansion and financial stability is to be maintained. He is still committed to an immensely heavy defence budget, 40.6 per cent of the total budget. Even if Mr Canellopoulos, the Defence Minister, now on a visit to Washington, succeeds in wringing more military aid out of the Americans—and he can make out a good case for it—or even if Marshal Papagos should carry out his threat to reduce the size of the army, Greece's defence budget is still likely to remain disproportionately high. Economies have been made in the vastly over-blown Civil Service, but they are not yet nearly drastic enough. Measures to combat the extremely widespread tax evasion have been introduced, but like their predecessors they are not yet nearly effective enough. Indeed, the whole tax structure needs to be reorganised; at present indirect taxes which fall most heavily on the poorer classes account for about three-quarters of total tax receipts.

Above all, Mr Markezinis must somehow find means of closing the trade gap and this at a time when American aid is being drastically reduced and is scheduled to cease altogether in 1956. In 1948-49 Greece received over \$273 million from the United States, in 1951-52 \$150 million, and in the current year it is only getting \$21 million. It may turn out to be a grave misfortune that foreign aid should dwindle just when Greece has at last acquired a stable government able to use it to the best advantage. Mr Markezinis has drawn up an ambitious three- to five-year development plan covering irrigation and flood control; hydro-electric projects; and the development

of basic industries designed among other things to exploit Greece's deposits of bauxite, nickel-bearing iron ores and magnesium, and to expand the production of nitrogen fertilisers. The total cost of the programme is \$235 million, of which it is planned that \$131 million should be in foreign exchange; but Mr Markezinis estimates that when complete it will narrow the trade gap by \$90 million annually.

The trouble, of course, is to find the wherewithal to finance this ambitious development plan. Last summer Mr Markezinis made a grand tour of the United States, Canada and Western Europe in search of foreign currency. His visit to London was largely a failure. From Washington and Ottawa he seems to have secured only a promise that a mission from the World Bank should visit Greece. But he came away from Paris, Bonn and Rome apparently with contracts for the supply of capital equipment on long-term credit to the value of \$15, \$60 and \$15 million respectively. These contracts caused much jubilation in Greece, but there now appears to be some danger that Mr Markezinis was counting his chickens before they were hatched. Last Saturday Mr Markezinis announced that a domestic loan for 300,000 million drachmas would be floated next June; it will be used to finance long-term economic development projects. The government's best bet however is probably a loan from the International Bank. But if it is to get this it must do something about the foreign debt which has been in default since 1932 and now amounts to some \$260 million. This no doubt is why it has announced its intention of setting up three committees to study the matter.

It is obvious that there is a testing time ahead for the Greek government. Even if Mr Markezinis can put his development plan into operation and it works out as he would wish, it cannot begin to yield dividends until 1956. Meanwhile he must work towards closing the trade gap and developing Greece's productive resources as best he can. The trouble is—as the ECE's Survey for 1953 points out—that in order to achieve the first aim he may be forced to employ a more restrictive monetary policy than is compatible with achieving the second. It is, indeed, hard to see how a serious economic—and hence political—crisis can be avoided without substantial further foreign aid.

France's Worker-Priests

THE dispute between the Catholic Church and its eldest daughter over the worker-priests has evoked a strong echo even outside the family circle. It is a tribute to the importance of the Roman Catholic Church that any dispute within it is likely to be scrutinised almost as intensely as a quarrel in the Kremlin. The affair of the French worker-priests, however, may have been over-dramatised since the Vatican's interference has provoked the resentment of the most articulate group among the French Catholics, the intellectuals and writers. It is exciting but rash to represent these differences as a revival of the old tug of war between the Vatican and the Gallican Church and to speak of an impending schism. On the other hand, the problem of the worker-priests undoubtedly goes to the heart of the most vital issue that the Church must face in the twentieth

century—its relationship with the labouring masses which find themselves outside the pale of Christianity.

The French experiment, which the Vatican now tries to limit within defined narrow frontiers, began some twelve years ago when two young abbés published a book describing France as a land in need of missionaries to penetrate the 8 million-strong "heathen world" of the factories. With Cardinal Suhard's backing a *Mission de France* was founded at Lisieux, soon to be followed by a *Mission de Paris*. Both seminars prepared priests to work and live with the labouring classes. The idea behind this venture was the simple one that, in order to recover the lost souls of the forgotten men, it was necessary to get on terms with them as individuals; the missionary must contrive to become accepted as an equal by the dechristianised masses whom he was trying to convert; he must cease to be part of a different order, cease to be one of "them."

The venture had its risks and among the priests labouring and living with the workers many have joined in the political struggle of their brethren and a few have defected to Communism. This unfortunate example was given publicity on the occasion of the anti-Ridgway riots in Paris two years ago, when among the arrested there were some worker-priests. During last year's strikes, too, in several regions priests expressed their solidarity with the strikers. For some time warnings have been pouring into the Vatican that the Communist Manifesto was becoming the new gospel of the worker-priests; as early as 1951 French bishops were ordered not to increase their numbers.

Barrier of Mistrust

The Vatican's remedy, now obediently if not wholeheartedly endorsed by the French hierarchy, was to insist that worker-priests must fish for souls with a shorter line; they must work no more than a given number of hours a day and no longer be so far removed from their religious communities and spiritual supervisors. The accent is to be on the priest rather than on the worker. The Church authorities maintain that this is no more than a matter of adjustment in an admittedly difficult situation. On the other hand the opponents of the Vatican's policy argue that the new regulations strike at the root of the whole experiment since "visiting" priests will not be able to break the barrier of mistrust among the often anticlerical masses and without "naturalisation" they will not even get a hearing. Indeed, it is hinted that in forbidding full time participation in the workers' life the Vatican implicitly accepts the Marxist premise that one's outlook is really determined by the conditions of life and labour.

The anxious protests to which the new course has given rise in many Catholic quarters are both sincere and moving, but a breach within the Church is unlikely. It is not yet known how many worker-priests will defy the ultimatum to accept their new status, but for the Roman Catholics there is no salvation outside the Church and a splinter group has little chance of survival. It is on the political stage that the present quarrel may have grave repercussions. In the inter-war period the threat of Gallikanism came from the nationalist right-wing connected with *l'Action Française*. This time the outburst against the Vatican was strongest among left-wing Catholic circles. True, Dominican intellectuals have expressed their sympathy and M. Francois Mauriac has written beautiful pages of restrained indignation in the undoubtedly respectable

Le Figaro, but the main backing for the worker-priests came from the very same groups which are protesting against the swing to the right of the Catholic political party, the MRP. Both the MRP and the worker-priest movement were born out of the Resistance at a time when many thought that the Catholic movement would prove the vanguard of social progress. They now accuse the Church and its political party of betraying its mission.

Clearly the Roman Catholic Church, like most bodies, has its conservative and its liberal wings and it looks as though the conservative traditionalists have gained a point or two at the expense of their more progressive and adventurous colleagues. Meanwhile the problem which gave rise to all this remains: the problem of offering the very poor something more attractive than Communism. While it is for the Church to decide the best possible way for it to proceed, outsiders have a stake in its success or failure. The Abbé Godin, one of the founders of the worker-priest movement, proclaimed: "They (the Vatican) are at the brakes. We are the engine. The two are needed. . . ." It remains to be seen whether the machine can still move forward with the newly tightened brakes.

China's Agriculture—II

Tasks for the Transition

THE Chinese government does not hide the fact that in the long run it wants to establish large-scale collective agriculture side by side with large-scale industry. But China is still in the "transitional" period, and the relatively modest plan of collectivisation is due not only to the fear of peasant resistance but also to the immensity of other tasks facing the government in the countryside. In the immediate future the primary task is to expand agricultural production rapidly so as to satisfy the growing needs of industry and the urban population; to extend the area under cultivation through irrigation and other forms of land reclamation; to step up the supply of agricultural equipment and experts. In the meantime, while the ground is thus being prepared for further reforms and industrial outlets provided for surplus labour, the Chinese rulers hope to control the countryside through taxes and through the new state monopoly of the grain trade.

It is not easy to get a clear picture of agricultural development from the maze of official claims expressed in percentage increases over unspecified prewar years. On the whole it would appear that production has now recovered its prewar level. Official estimates of total grain production are given in the following table; last year the crop was apparently about the same as in 1952.

TOTAL GRAIN PRODUCTION (Million tons)

1949	1950	1951	1952
127	148	158	163

The rice crop has apparently reached the prewar peak of 52 million tons, while the wheat harvest has exceeded its prewar record of 22 million tons. The biggest achievements, however, are claimed for cotton production, which is said to have climbed from 400,000 tons in 1947 to 1.3 million tons in 1952 and 1.5 million tons last year—nearly twice as much as before the war. The cultivation of soya

has already been revived, but tea and tobacco are still lagging behind the prewar levels. Taking these figures at their face value the recovery has been remarkable, but demand is also growing apace. It has just been announced that already the state must provide grain for 200 million people in the towns or grain-deficit areas. The success of the ambitious plans of industrialisation will largely depend on a rapid increase in the supply of foodstuffs and raw materials.

The agricultural reform has not solved the problem of land hunger and production. Indeed, to the extent that it has broken up the large estates, it has proved an obstacle to large-scale cultivation. True, there were not as many large estates to be divided as in the Soviet Union, which explains why the reform was carried out in three phases, on the instalment plan, and concluded only at the close of 1952. The feature of the reform which was most welcome to the poorer peasants was the elimination of rents (the burden was estimated at about 25 million tons of grain per annum), but in some way or another the government also managed to redistribute 47 million hectares of land or nearly half the total cultivated area. Yet even the most equalitarian distribution of the available land could not cure the hunger, since it could provide only a tiny plot of less than one hectare for the average Chinese peasant family. True, a hectare under rice in China is more valuable than, say, a hectare under grain in Canada; but only one quarter of the arable land in China is under rice.

Pharaoh on the Yellow River

Thus a loose form of co-operation, allowing for the communal use of scarce equipment, is judged sufficient by the government at this stage. Before passing on to the next stage it is necessary to fight with nature for land. Before the war the total cultivated area amounted to less than 100 million hectares, and it is probably not much larger now. On the other hand, it is estimated that potential arable land is about three times greater. From the very beginning the new regime realised that its economic future is linked with the conquest of that land, and even before Stalin's death the Russians had promised to help in this job. But at first a defensive action was needed: dams and canals had to be repaired to prevent floods and other natural calamities. The biggest project on which work is now being carried out is the harnessing of the Hwang-Ho river. It was begun in 1950 in Pharaoh-like fashion, with 5 million peasants mobilised for the job; by the time work is completed in 1955 2.7 million hectares should be irrigated. In this and similar projects the Russians are to provide increasing numbers of both experts and excavators.

Land reclamation, the training of agronomists (there are now only 7,000 in China as against some 350,000 in the Soviet Union), the building of Chinese factories for fertilisers, tractors and other agricultural equipment—all this must take time. Meanwhile, the peasants must be prompted to produce more and not antagonised through reckless reforms. Even the "kulaks"—those who have managed to hang on to a bigger slice of land than most—are invited to join in the drive for higher production. They are allowed to hire some additional ground, and the tax norms were passed for three years in advance so as not to penalise the efficient producer. On the other hand, the kulaks obviously pay higher taxes in kind: 30 per cent of their total output against an average of 15 per cent for the medium peasants and 5 to 10 per cent for the poorer

Iron Hands

IN THE MANUFACTURE OF CHEMICALS—as in the manufacture of most other products—a vast amount of time, money and energy is consumed, simply in moving things from place to place. In fact, one of the most important steps that can be taken to raise productivity is to ensure that as much as possible of this mechanical, unskilled, unsatisfying and expensive labour is done by machines—by "materials handling" equipment, as it is called. Such equipment not only raises productivity but makes a man's working life easier and pleasanter. In I.C.I., mechanisation and materials handling have been developed to a stage that compares favourably with any heavy industry in the world. At I.C.I.'s limestone quarry at Tunstead, for example, electrically driven shovels, capable of handling up to 5 tons at a time, dig the stone blasted from the solid rock face and load it into 12-ton diesel lorries. These carry the stone in a steady procession to one of the finest automatic crushing plants in the world where it is mechanically crushed, washed, graded and loaded into railway wagons. At no stage in the process is the stone touched by hand.

In the very different 'Perspex' sheet plant at I.C.I.'s Wilton Works, the heavy, fragile plate-glass sheets, between which the 'Perspex' sheet is cast, are automatically washed, and dried with a blast of air, while the completed "sandwich" of 'Perspex' and glass plates is delicately lifted by rubber suction fingers and gently started on its carefully timed journey through long, automatic ovens. In every I.C.I. plant, the latest fork-trucks, drum-lifters and other machinery for making light of heavy work may be seen hard at the job of materials handling. Indeed, a recent report of a productivity team, recommending a wider application of mechanical handling methods, endorses the progressive policy of I.C.I., who for twenty years have been using—and developing—the latest equipment in the quest for ever greater productivity.

You're right ahead—with the New

1½ litre Saloon

You're right ahead with **POWER** and that in the long run contributes most to your motoring enjoyment.

No other 1½ litre car gives you the same spirited performance with such consistent reliability. You're right ahead with safe, sure road-holding at speed, and incomparable steering. These are part of the Riley tradition. And the long, low lines of the luxurious body proclaim to all that this is one of England's outstanding cars.

For the sheer pleasure of driving, there's nothing quite like a Riley 1½ litre Saloon—built to give you years of *Magnificent Motoring*.

Arrange for a trial run with your nearest Riley Dealer.

The brilliant New Riley
'PATHFINDER'

It's the most powerful, roomiest Riley ever. Your Dealer will be pleased to tell you all about this great-hearted car.

for Magnificent Motoring

Riley Models are fitted with safety glass all round.

Try the two-tankful test

Shell with I-C-A prevents pre-ignition and plug failure caused by engine deposits. Thousands of miles of road-tests have proved that it gives engines smoother running. These results are completely convincing—but we do not ask you to accept them. We

ask you to test Shell with I-C-A for yourself—at no extra cost. On your second tankful of Shell with I-C-A—the second one, because I-C-A must have time to work on your engine-deposits—you will notice *definitely smoother, sweeter running.*

WITH
ICA

It's a revelation

peasants. In addition to the fiscal system, the control of the market is another weapon in the governmental arsenal. Until recently 90 per cent of trade in cotton and 60 per cent of the grain trade was going through the hands of the state. Now trade in grain has become a state monopoly, though co-operatives and even private individuals can act as its agents.

Thus for the moment the Chinese Communists seem to be proceeding slowly, step by step, towards their ultimate goal. In agricultural policy they have apparently taken the wise course of biting off not much more than they can chew at a time. If their appetite does not grow too quickly with the eating, there is no reason why they should not be more successful in their handling of the countryside than their Soviet predecessors, from whose bitter experiences they can draw a lesson.

(Concluded)

Australian Trade Policy

FROM OUR MELBOURNE CORRESPONDENT

AUSTRALIA has now surmounted its payments emergency of two years ago, when severe import restrictions were imposed to check a rapid running down of overseas currency reserves. The crisis developed from a tremendous rise in imports following the inflationary effects of the wool boom which reached its peak in mid-1951. The Prime Minister, Mr Menzies, made it clear at the time that the restrictions would be eased as the balance of payments position improved; he has made good his promise.

The latest easing of the cuts, which will allow a rise in imports of more than £25 million a year from non-dollar countries, means that only a small proportion of essential goods will now be subject to quotas or other quantitative restrictions. The amazing recovery in Australia's overseas trade is shown by the conversion of a £A378.4 million deficit at June 30, 1952, to a surplus of £358.1 a year later—an improvement of £736.5 million. Overseas funds now stand about £A250 million higher than in 1952.

Together with the latest easing of import restrictions, the Federal Government has imposed higher tariffs on an important group of products—namely, paper and paper products, cotton sheeting, motor transmission assemblies, and certain tools. It would thus seem to be giving Australian importers something through a further relaxation of the cuts, but taking it back by restricting the local market for some imports by raising tariffs. The Government in its apparently contradictory actions, seems to be following a policy of protecting domestic industry on the one hand and attempting to placate the overseas supplier on the other. It must be fully aware that Australia's prosperity is still basically dependent on a healthy export market, which would be hard to sustain if import restrictions were continued indefinitely, particularly if their *raison d'être* had disappeared.

Australian manufacturers are uneasy about the high cost economy in which they operate. Through nobody's particular fault, Australia suffered a much more rapid rise in prices and costs in the postwar boom than most other countries. As a result of the automatic adjustment of wages to retail price changes (since suspended by the Arbitration Court), Australian wages rose by 153 per cent between 1945 and

1953 compared with a rise of only 58 per cent in Britain over the same period.

The result is that secondary industry finds it difficult to compete against comparable goods imported from Britain and other countries unless it is given a substantial measure of protection by means of either tariffs, import restrictions, or currency devaluation. The Federal Government has had no hesitation in choosing the machinery of the tariff to protect Australian manufacturers as long as the present disparity in costs continues. The new tariffs were imposed as a result of recommendations by the Tariff Board which was recently enlarged to cope with the greatly increased number of applications by manufacturers for protection. The Board's recommendations are made only after a careful and detailed examination of costs and efficiency of the industries concerned, with special emphasis given to the effect of any changes on the consumer. As governments rarely make significant alterations to the tariff without the support of the Tariff Board recommendation, there is a reasonable assurance that changes are not made capriciously.

Much as Australian manufacturers would have liked the import restrictions to continue in their initial severe form, the Government knows full well that this might well invite reprisals from other countries which might not be prepared to engage indefinitely in a one-way trade with Australia. This applies particularly to Japan, France and Italy whose large-scale buying of Australian wool in recent years has involved them in very large trade deficits with Australia.

The Government is aware that Australia cannot continue to sell if it does not buy, and that is apparently why it is relying on the tariff to protect Australian industries rather than employing methods which inevitably irritate other countries and provoke reprisals. So far, it must be conceded, other countries have accepted Australia's import restrictions with singularly good grace, but the time has come when the virtual one-way trade with some of Australia's very good customers must soon come to an end.

To nothing is the Australian economy more sensitive than a fall in wool values. The psychological effect of an easier wool market is immediate, and a fall in export income is speedily reflected in a restriction of purchasing power, lower turnovers and less employment. For this reason alone, Australian trade policy will be directed, in the Prime Minister's words, "to putting other countries in a position to buy from Australia by increasing purchases of their goods." This obviously means increased imports, but scientific use of the tariff may mean that Australia will be able to encourage those imports which will cause minimum dislocation to domestic industry.

Thirteen Times a Year...

Rice Surplus in Asia

AS the result of high prices, good harvests, and special inducements to producers, the world's output of rice has been growing steadily. It is now more than 10 per cent above the prewar level. Notable success has been achieved in those countries which normally import rice, and this fact, together with a marked tendency in such countries as India, Ceylon, and Japan to substitute wheat products for rice in the daily diet, has brought about a sharp fall in world trade in this commodity. In the past year this tendency has become intensified. In consequence surplus stocks have been accumulating, and it has been estimated that by July this year they may total 2.8 million tons, more than double the stocks held a year ago. In fact the problem is hardly less dramatic than the more publicised surplus of grain. Both these problems are being examined at the present moment by a working party of the United Nations Food and Agriculture Organisation (FAO).

Most of the problems connected with rice—which are succinctly analysed in a recent FAO commodity report—are localised in the area of South East Asia, where is concentrated the bulk of the world's output, consumption, and international trade. It is hardly surprising, therefore, that rice should play a vital role not only in the economics, but also in the politics, of this region. Notwithstanding

RICE PRODUCTION IN SELECTED COUNTRIES
(1,000 Metric Tons, Paddy)

	Average 1934-38	1952	Estimated 1953
<i>Normally exporting countries:-</i>			
Burma	6,971	5,841	6,300
Cambodia, Laos, Viet-Nam	6,498	4,604	...
Siam	4,357	6,602	7,600
Philippines	2,179	3,144	3,200
United States	956	2,182	2,383
<i>Normally importing countries:-</i>			
India	34,182	35,698	...
Pakistan	11,169	12,416	13,000
Japan	11,501	12,404	10,028
Indonesia	6,081	6,439	...

their common problems, their many joint endeavours such as the Colombo Plan, and a large measure of mutual understanding and sympathy, the exporting countries have not hesitated to extract their price in full measure from the importing nations, in the years when rice was in short supply. There has been much criticism in the past of Burma's price policies.

Now that the supply position has changed the importers are in their turn driving as hard a bargain as they can. In recent months the price of rice has been tumbling. Up to September last year Burma's rice was being sold on government-to-government contract at £60 per metric ton. Then in October an agreement was signed with Ceylon which reduced the 1954 contract price to £50 per ton, with annual reductions, until 1957, when the price will be £44 per ton. It has recently been reported that India has agreed to take up the balance of Burma's current carry-over stock (estimated at 700,000 metric tons) at a price of £48 per ton; but as there is an adjustment for settling Burma's prewar debt, the effective price is actually £33 per ton. Other exporters have likewise been forced to reduce their prices; perhaps the most interesting is the reduction to £47 per ton, from £54 per ton, of rice

bought by Ceylon from China under the rice-rubber deal. With stocks mounting in the exporting countries and domestic production rising in the importing countries, the outlook is for still lower prices.

While the outlook is foreboding for the rice-exporting countries, the people of South East Asia in general stand to gain by the lower cost of their staple food. The terms of trade have dealt many of these countries some heavy blows; it is time there was some compensation.

Questions about EDC

From what is said in public discussion of the Treaty for a European Defence Community it is clear that its provisions are not widely known. To analyse the Treaty in accurate, brief terms is impossible in a reasonable space. The most that can be done is to answer the kind of questions that are most frequently asked. Below an attempt is made to provide briefly such answers.

The first section deals with the questions that are asked about the EDC in general; the second deals with questions about German participation. It is clearly invidious to present the restrictions of the Treaty as affecting only the German government and its forces; for they also affect the governments and forces of the five other members. But as public discussion dwells far more on the safeguards against German resurgence than on the more important European purpose of the Treaty, the emphasis has been laid on what the Germans cannot do rather than on what the Treaty can do.

The EDC in General

1. *How are the national interests of members maintained?*
In the Council of Ministers, which decides policy, each Minister argues a national case. For the first three years one vote is as good as another, and the six ministers have to reach unanimous decisions.

The political assembly can reject the Community's budget, question appointments, and censure the members of the policy-making Commission of nine Community civil servants.

2. *Can the EDC be modified?*

Yes. Proposals to this end would be discussed on the motion of one government. They would be carried out if unanimously agreed.

3. *Is there an appeal against decisions of EDC bodies or against the behaviour of members' governments?*

Yes. The Council of Ministers controls the Commissioners who make and execute policy. A government can appeal to the Community Court for a ruling about disputes and alleged offences against the Treaty.

4. *What is really supranational about the EDC?*

The decisions executed by the Commissioners after the Ministers have agreed to them. The Commissioners owe no allegiance to national governments and are Community civil servants.

5. *Is there any democratic control over the Community?*

Yes. Ministers and Commissioners would be responsible to an Assembly which could reject the Budget and make recommendations about it.

6. *Where does military integration begin?*

At the level of the Army Corps. Divisions are recruited,

trained and officered on a national basis. All staffs at and above Corps level are international.

7. *Can the French withdraw troops for service overseas?*
Yes. By a request to the Council of Ministers, and with the approval of Nato.

8. *Can France maintain forces and arms industries overseas?*
Yes. Moreover, officers and men can be switched from EDC forces to national overseas forces and back again.

9. *At what stage do officers become European?*

At first all senior appointments will be held by officers trained in national armies (including the former Wehrmacht). But European staff colleges and training schools will gradually take over the higher training of officers and NCOs from all member countries. General de Larminat estimates that 40 per cent of the officers in the German contingent in EDC will have been trained on a European basis at the end of the first three years of the EDC.

10. *Who receives American military aid?*

The United States Government has agreed that it will be delivered to the EDC Commissioners and not to individual governments.

11. *Who prepares the arms programmes?*

The Commissioners, in consultation with Nato. Their object will be to standardise arms, equipment and infrastructure.

12. *Who prepares the Budget?*

The Commissioners, in the first stage, working on the same methods of estimated national capacity as Nato now uses.

13. *What happens if a member government leaves or tries to leave EDC?*

It is guilty of a breach of treaty and will lose all access to supplies, equipment and money, and will lose the benefit of guarantees against aggression given by Nato, by Britain, France and the United States. Moreover, the United Kingdom and United States Governments have declared that if any member of the EDC tries to break away they will regard this as a threat to their own security.

14. *When EDC forces are properly established can allied forces remain in Germany?*

Yes, they have the right to remain as defence forces. In case of a threat to their security or an attempt to subvert the constitution of the German Federal Republic the three western powers have the right, in consultation with the Bonn Government, to declare a state of emergency.

Restraints on German Rearmament

1. *What is the first step towards creating a German force?*

When the EDC Treaty comes into force, the Commissioners set up central bodies of European officers, with the task of building up European forces. A Central Staff of EDC assigns a delegate, who will be a general, to each member state. In Western Germany the delegate (a German) will raise the national contingent. He will be assisted by a group of officers of different nationalities.

2. *What will be the German command?*

The European general for Germany creates a European territorial command in the German region of the EDC-Nato area. For 18 months he will supervise recruitment of German troops under the supervision of the Commissioners. This means that Herr Blank's defence office

in Bonn will receive EDC directives through the General.

3. *When do German troops become formations?*

As soon as possible after EDC comes into force, a European troop command is established in the German territorial region. When German troops have been trained by screened re-enlisted officers and NCO's of the Wehrmacht, they are incorporated by decision of the Commissioners into German divisions.

4. *What is a German formation?*

A German division, like a French or Belgian division, is the "basic unit of homogeneous nationality" on which the EDC forces are built. An infantry division (or *groupe*) will consist of: Staff and HQ company; three infantry regiments of three battalions; one reconnaissance squadron; one tank battalion; one unit of self-propelled artillery. Supporting units of ordnance, medical services, provost, and personnel maintenance.

(The intention of the EDC is that this should be the largest number of Germans coming under purely German command.)

5. *How will German forces be armed?*

With EDC arms allotted by the Commissioners. The Commissioners control production, export and import of arms. Only they can place contracts with the European arms industries.

6. *Will Germany have new weapons?*

The Commissioners alone authorise and execute technical research of a military kind. National production of atomic, chemical, biological weapons, as also of long-range missiles and influence mines is forbidden in strategically exposed areas—i.e., Germany—unless the Council agrees unanimously to the contrary.

(Note. Articles 106 and 107 of the Treaty forbid the production of decisive weapons of war in Germany and are the greatest safeguard in the Treaty.)

7. *Will there be a German Air Force?*

Yes. There will be basic German air units of fighters, light bombers, reconnaissance and transport aircraft to the number of some 200. These units will be incorporated into higher formations with a European commander and staff.

8. *Will the Germans have a strategic bomber force?*

No. Nor will any other EDC member, except by unanimous agreement of the Council of Ministers.

9. *How do the German forces fit into Nato forces?*

All the European defence forces will be under the command of SACEUR (Supreme Allied Commanders Europe).

Article 69 says: "European basic units and their support units may be introduced into Nato formations, and conversely the basic Nato units may be introduced into the European commands." This means that American, British and Canadian formations, will be mixed up in Nato and EDC commands with German troops. Corps and higher formations will depend on common, international maintenance units and lines of communication. No division of the EDC army would be capable of independent action for more than a few days.

(Note. This is the other main safeguard of the Treaty.)

10. *Will there be a German general staff?*

No. There will be a German staff under European direction for the recruitment and training of German divisions. But operational, logistic, intelligence and equipment staff duties will be performed by international staffs.

Are you one of these?

IF A NATION gets the rulers it deserves—it certainly gets the newspapers it asks for. Today it is not uncommon for people to deplore the lack of taste in modern journalism—and yet to be taking the very newspaper which (theoretically) offends them. Such people should try the Manchester Guardian.

Those who profess principles should at least seek to exercise them. And to change to the Manchester Guardian means no sacrifice, no giving up of anything. Rather is it a gaining.

A month or two of the Manchester Guardian will cure the taste for anything but good taste. You will come to find that the Manchester Guardian has a charm and a wit of its own. You will come to admire its keen, clean writing and reporting. You will be proud to be seen reading and enjoying a newspaper which contrives always to be good, never to be dull.

If you have any difficulty in getting your Manchester Guardian regularly, please write to: The Manchester Guardian, Manchester.

The quest for know-how

NO. 1 IN A SERIES ON RESEARCH & DEVELOPMENT

The Simon companies serve many key industries in Britain and abroad, and contribute substantially to Britain's engineering exports. Selling their experience and skill in competition with every industrial nation in the world, their success depends largely on first-class know-how in many diverse technical fields. In the unceasing quest for knowledge—for better processes and better designs—the Simon Engineering Group has immensely expanded not only its own resources for applied research but also its intimate contacts with new and developing technology in other countries. The only know-how worth selling is the best there is.

THE BUSINESS WORLD

Electronic Abacus

OPINION is for the moment divided on the place of electronic calculating methods in ordinary business. A year or so ago, a suggestion that one of those thinking robots, the electronic brains, should be put to tasks so mundane as the counting of pounds, shillings and pennies for a weekly wage packet would have been greeted with general scepticism. Now that it has actually happened, preconceived opinions about the type of machine suitable for office and accounting work have received a severe jolt. For the past month, the wages of the bakery staff of J. Lyons, Ltd., and a good many routine office calculations besides, have been worked out on a full-sized electronic computer at Cadby Hall. To Lyons, the introduction of electronic computing on this singularly practical scale appeared the logical step to take if the company's accounting methods were to be kept streamlined and up-to-date. As other specialists in business methods did not see eye to eye with Lyons on this matter at the time, the company was driven to designing and building its own computer.

Is this the first step in an accounting revolution or merely an interesting and expensive experiment? There are those who do not believe in the desirability of introducing anything as esoteric as electronics into business routine at all. Others believe that there is a limited field for electronic methods, provided that they fit into, and do not disrupt, established business systems. But there is a third group—of which Lyons is one—who consider that a major revolution in office methods may be possible. This revolution would involve scrapping the greater part of the established punch card calculating routine and substituting a single "electronic office" where the giant computer would perform internally all the calculations needed for a whole series of book-keeping operations, printing the

final answer in and on whatever form was required.

The advantages that the computer has to offer are two; speed and some measure of intelligence. It is speed on a scale that baffles the imagination, where units are counted in millionths of a second and pulses travel through the labyrinthine circuits at the speed of light. As for the computer's intelligence, it can discriminate so that the same routine is not blindly followed on every figure that enters the machine. The co-ordinating sections of the computer will test one pattern of impulses against another, to decide what kind of operation needs to be carried out on any given piece of data. Combine this sense of discrimination with speed of operation, and it becomes apparent that the computer can store and can handle large numbers of separate items and can carry out when it becomes necessary any number of different operations upon them, without the need for any intervention by the operator.

★

Any business handling large numbers of figures would find such capabilities attractive. Electronic computers were essential for the development of atomic physics and are rapidly becoming a necessity for aircraft and missile development. Might they not also have a valuable, if less spectacular, contribution to make to improving business efficiency? Lyons has 33,000 employees, and when their weekly wage packets are made up, 20 different items have to be added or deducted before the net pay can be determined in numbers of notes and coins to be handed over. In addition, the company wants running totals of the amounts of coin needed, the number of insurance stamps, and of each of the 20 items that go to decide net pay. This can be done, step by step, on ordinary

office machinery—or it can be done in one step by the computer. That is the real difference between mechanical and electronic accounting. To put a computer to work of this kind may seem to some minds a gross under-employment of its capabilities. So it is; but the operation, handling a single wage every second instead of one every eight minutes by existing methods, represents a significant saving in time, in staff and in office space.

To save time and labour is always worth while. But what may be more important in the long run is the prospect of doing calculations on electronic computers that would simply not be possible by normal methods because of the time that they would take. This has opened up fresh fields in science; it may conceivably do the same in business. Lyons, for example, has 230 teashops carrying a wide range of perishable stocks. If stock control and ordering for these teashops is handled by the computer, it should be possible to have a much more accurate idea of the stocks carried and needed at any given moment, and the waste that is at present unavoidable could be cut down. Taken over a really wide field, it is possible, using a computer, to draw up a comparative analysis of the cost of producing individual items using different combinations of designs, of quantities and types of materials used, and of the methods followed. A final choice from a number of possible combinations is at present too often made by judgment or even guesswork because of the sheer size of the calculations involved in doing it any other way.

Many businesses, the banks among them, handle vast quantities of figures. It would be possible to handle all the account-posting operations of the banks by computers, which are quite capable of holding details of individual accounts in their memory stores and operating on them as required. Insurance companies handling large numbers of premiums and, in the United States, even national magazine companies with an impressive total of subscriptions, are considering the possibility of installing computers to handle their calculations.

American mail order companies dealing with exceptionally heavy seasonal peaks handle the extra volume of ordering, stock control and mailing on a computer, and one airline booking system is run in this fashion, giving an instantaneous check on the number of seats sold and seats available on any given flight.

For practical business purposes, it can be assumed that there is no limit to the computers' appetite for work; half a day should be sufficient to handle Lyons' entire payroll for the week. But there is this drawback: a full-sized computer contains 4,000 to 5,000 valves and thousands of other small electronic components. Although there are no moving parts to go wrong, the law of averages seems to dictate that some of the myriad components will occasionally fail, and scientists who work regularly on computers rely on the machine being available for at best only 80 per cent of its theoretical working time. Repairs are usually quick and easy, but it becomes obvious that should there be a major breakdown, business routine could be thrown into chaos, since by no stretch of imagination could the staff make up for the work lost on the computer. This is not a serious handicap where the computer is engaged on research, or on special jobs such as cost or mortality analysis. But it may mean that a minimum of two computers would have to be installed before essential routine functions such as account-posting or wage calculations could be entrusted to these techniques. This raises the question of cost. Ferranti Ltd., the principal suppliers of computers in this country, puts the installed cost of a full-scale computer at close on £100,000. Office machinery costs are high, but there are not many cases when they will run to as much as £200,000 for an installation.

Computer developments are being followed with interest and with some understandable apprehension by the companies that now supply the bulk of the business machines in use. If Lyons' example were to be followed widely, a big section of their market would be cut from beneath them. Their answer has been to

produce a poor man's computer, a machine that calculates electronically, but has neither the ability to store data nor the power to plan its own operations that are peculiar to a full-sized electronic brain. These less ambitious machines have their place in office routine, especially when the calculations involve sterling. The idiosyncrasies of British currency make calculations, carried out mechanically, slow and difficult, and they hold up the other high-speed machines in a modern office. Electronics eliminate the bottleneck. Both International Business Machines and Powers-Samas have had some success in selling these calculators. Lloyd's underwriters and Coventry City Council will both use the IBM machine; Sainsbury, and several motor manufacturers are using Powers-Samas. In the IBM machine each new set of instructions is fed into the machine on punch cards before the work starts; in the Powers' machine, the instructions are provided in the form of pre-set circuits and the operator switches from one to another. Their cost works out at between £100-£200 a month for rental or £6,000 for outright purchase.

These calculators are typical of the one-machine-one-job principle on which office mechanisation has so far proceeded, and it is a principle that some consider totally unsuited to electronic techniques. The business machine companies argue from their long experience of the market that more complicated and versatile computers are unnecessary unless the most abstruse scientific calculations are involved, and they offer instead—or will shortly offer—calculators that can be given a fixed but limited programme to follow, on the lines of the wage calculations now being done at Lyons. If necessary, the work can be put through the calculator more than once, and there will still be an impressive saving in time. But these limited programme machines will cost in the region of £25,000, and computer engineers do not believe that machines incapable of doing more than the one job will be worth that expense. The exciting feature of an electronic office is its flexi-

bility; the computer is an all-purpose machine that can switch from one type of work to another in the time in which it takes to erase the pulses of the old job from its memory. It will do all the work of a business, its scientific calculations, its routine office accounting, and its occasional costing analyses as each comes round, and it will take in its stride all the awkward exceptions that crop up in every batch of routine calculations. These are the arguments that led Lyons to opt for a full-sized computer, and experience during four years of often difficult experiment has not disproved them.

If Lyons' enthusiasm for the electronic office should prove infectious, a number of new names will enter the office machine business. Ferranti Ltd., has already sold eight computers to universities, the Government and industry, and plans to open a computer centre in London before the end of the year where the system can be demonstrated and computer time hired. English Electric Ltd. is putting into production a computer based on a design of the National Physical Laboratory. The National Research Development Corporation is sponsoring the smaller Elliot computer, British Tabulating Machine Company has plans for building a really small model. And, apart from this, it is not too difficult a task for a company to build its own computer. Finally, there is Lyons' own Leo—"Lyons Electronic Office." This has the distinction of being the only one of the lot specifically planned for office use, where information has to be fed in and out at higher speeds than in the laboratories. Lyons' possible willingness to supply versions of Leo to interested customers introduces competition from a totally unexpected source. It has a precedent in the introduction of the Powers punch card system into this country by the Prudential, and the subsequent creation of Powers-Samas to make the machines. The electronic office might mean a revolution in methods just as remarkable, and a great deal more violent, than that which followed the Prudential's experiment.

The Computer's Method

A computer "reads" from tele-tape or punch card, on which the information that it needs has been coded. The code marks are turned into electronic pulses. The pulses are held, like greyhounds in the traps, and let out, one by one, into a circuit. The position allotted to each pulse in the circuit signifies the digit it represents. This is the first step.

The co-ordinating unit of the computer controls a vast series of valve-operated "gates" at the entrance and exit to each operating circuit. These gates are normally shut. When the track is clear, the contents of the circuit are released through a "gate" into the memory store. The memory used by the Lyons computer is a tube filled with mercury (there are many other types). The pulses travel down it as ripples moving with the speed of sound. This is the second step. The memory is full of these captive patterns of pulses travelling round and round. The patterns, each representing a number, stay in the store until they are needed. When a number is needed from the store, the co-ordinating unit opens a gate as the number comes round, and it is released into the calculating section of the computer. This is the third step.

Each pattern of pulses is let into the calculating section through a separate gate. The calculating section contains a series of circuits for the different arithmetical procedures, adding, multiplying, etc. The calculation is broken down into thousands of small operations in which the individual pulse patterns are fed through the gates from their respective sources into, say, the adding section where they are "mixed" and the patterns re-arranged, to give the sum of the two numbers. These operations are going on continuously all through the calculating unit at tremendous speed, with the co-ordinator holding numbers in the calculating section for further operations, selecting fresh numbers from the store, and sending back those not needed until a later stage. These operations make up the fourth step.

The elements of the finished sum come out of the calculating section into an exit where the pulse patterns are held in much the same way as they were at the start of the process. When the calculation is completed, they go out through the last gate where the pulses are printed or cut into fresh cards in the normal fashion.

Ramp or Mouldy Turnip?

HELPED by the "guillotine," the rent sections of the Housing Repairs and Rents Bill are now passing through the committee stage in the Commons. Landlords can perhaps expect that by the summer they will have a possible right to their first rent increase for 14½ years. "The landlords," said Mr Bevan, "are being offered a mouldy turnip." But he struck his more familiar form later: "This is a landlords' ramp." Neither charge is correct, yet each has some inconvenient resemblance to the truth. The bill gives the landlords far less than they had hoped for—they will have nothing approaching the same freedom to fix charges that most other sections of the community now enjoy. And it will create a great many hard cases; if its provisions are fitted to any group of properties, the results bristle with anomalies. Therefore a group of

back-bench MPs is trying, in the Committee stage in the Commons, for amendments which will iron those anomalies out in the property owners' favour. But even as the bill now stands, many property companies will be able to add substantially to their rent rolls, and the lot of the property shareholder will be more reasonable than for many years past. Moreover, the bill will not pass as first drafted; some of the clauses to which property owners objected most strongly are being amended.

In the last year or two, the need for a drastic overhaul of rents on residential property has been increasingly admitted by both parties, though that will not make Mr Macmillan wildly popular for doing it. Many houses have been under control for nearly 40 years, save between 1920 and 1923. Since 1939, there has been

no adjustment, apart from payment for structural improvements and the right to pass on rate increases, and nearly all the landlord's costs have been rising against him. When he provides services, such as hot water, his predicament has been worse. To be rigidly controlled in an economy where other people are free is oppressive, and property owners have reacted to restraint in four ways:

- (1) They have sold residential properties and reinvested in business properties that are uncontrolled.
- (2) They have left building for letting to the Councils who have applied subsidies, and alone were allowed to increase, rents.
- (3) They have been unable to maintain houses and about 200,000 a year have fallen out of repair and use. These may have been the worst houses of which the country is well rid. But a Government which got 300,000 houses built in a year has really added only 100,000 to the net supply.
- (4) Many made private bargains under which tenants agreed to contribute towards the increased cost of services. Such agreements are not enforceable at law, but good tenants have often been willing to keep to them.

Having decided to act, the Minister had two obvious choices. A dash for liberty was one possibility, for housing is no longer wholly a sellers' market; but the idea found no favour because the shortage of properties for letting is still marked and tenants might have been put at the landlord's mercy. A straight percentage increase in rents and maintenance of control at the new level was another possibility and it would have been acceptable to most landlords; in Scotland that, with slight qualifications, is what the landlord is to get. For England Mr Macmillan has adopted neither; he has devised an ingenious obstacle race, designed to prevent any increase on certain houses and flats which are considered already adequately priced. Landlords of the other properties are to be enticed to spend money on them by the bait of a rent increase if they do so.

Some landlords will also gain a service increase as well as the repairs increase. Any existing bargain, under which the tenant makes a contribution towards an increase, receives the blessing of the law. Where there is no such private bargain, the owner may apply to the rent tribunal for an increase to meet the rise in costs since 1939. Landlords fear that the tribunals—who could hardly be accused of bias in favour of landlords—may not find it easy to fix the just increase; quite a specialised line has developed in beating landlords down at tribunal hearings, and an unsuccessful application in respect of one property might have adverse effects on a number of others. A loophole also exists because nothing yet in the bill fixes the method by which the cost of services—for example, a lift—is to be apportioned between flats in the same building. Then there is doubt whether the bill covers services traditionally given but not specifically covenanted in the lease—for example, the maintenance of a garden attached to a block of flats.

It is on the repairs increase that the worst confusion arises. The bill aims to encourage the landlord to spend money on the property to the tenant's advantage, and to reward in moderation the landlord who has done so.

The example shows the intricate calculation, based on three sets of figures—a qualifying repairs expenditure, a permissible rent increase and a ceiling limit. All are based on schedules of gross annual values and statutory repairs deductions laid down in the bill. Disparities of valuation between rating authorities are notorious, and this method cannot possibly provide uniformity of treatment between different areas. Yet no subsequent rating

Under Sections 18 to 44 and Schedule 2 of the Housing Repairs and Rent Bill, a landlord may increase the rent of a controlled dwelling:

(a) *Repairs increase for a dwelling house in good repair*: the landlord must spend on the dwelling either three times the statutory repairs deduction from the gross rating valuation in the 12 months preceding the rent increase or must have spent six times the repairs deduction in three years out of the four ending two months after the Act passes.

If he qualifies he may increase the annual rent by twice the statutory repairs deduction.

But the increase may not raise the rent, exclusive of rates and services, above twice the gross annual value.

(b) *Services increase*: if the rent contains any element for services rendered by the landlord to the tenant, he may apply to the rent tribunal for an increase to cover the increased cost compared with 1939.

Example: Block of 24 flats with hot water, partial heating, and lift, let at an average annual rent of £260 (including 1939 level rates):

1939 rent less rates	£
1939 cost of services	4,623
	1,041
1939 rent less rates and services	3,582
Qualifying repairs expenditure (3 year option: statutory repairs deduction × 6)	3,258
Actual repairs expenditure (three years to March, 1953)	4,668
Therefore the qualification has been satisfied.	
Maximum possible rent increase (statutory repairs deduction × 2)	1,086
Rent increase "stopper" (gross annual value × 2)	4,554
Permissible increase (difference between 1939 rent less rates and services and "stopper")	1,072

This is 23 per cent of 1939 rent less rates on these flats. In addition the landlord may apply to the tribunal for an increase to meet the difference between his 1939 cost of services (£1,041) and their present cost.

revaluation—if and when that happens—will change increases made on the basis of the existing valuations.

For the landlord there are two problems. Can he fulfil the qualifying expenditure? And will the ceiling frustrate the rent increase? The repairs expenditure clause contains latitude in point of time. The landlord could, if he wished, build up the qualifying expenditure at any time by slapping on unnecessary coat after unnecessary coat of paint and then notify the tenant of a rent increase. Such actions would not improve his relations with his tenants: good landlords will not try it and may therefore lose the opportunity of raising rents. But the Government amendment allowing the qualify-

ing expenditure to be spread over a choice of three out of the last four years instead of only over three years, reduces the number of such exclusions.

This amendment is reasonable, though it may still leave out certain types of property such as stone buildings that are expensive to build but do not call for maintenance expenditure sufficient to qualify. The fact that modern tenancies usually leave the landlord only the outside repairs to do has now been recognised; the bill is being amended so that where there is no specific provision to the contrary the landlord is to be regarded as responsible for two thirds of the repairs and the tenant for one third, the rent increase being abated accordingly.

A large number of houses will be excluded or partly excluded from rent increase by the gross annual value

* Revalued.

† Based on 1953 preliminary figures.

ceiling or "stopper." A glance at the expectations of a few landlords shows how capriciously the result can vary between no increase and a 40 per cent rise. A sample of 1,450 middle class and artisan dwellings owned by five different landlords and built in greater London between the wars shows only two houses and 32 flats out of the whole list qualifying for increase. On another estate belonging to one of the big groups there are 1,246 adjoining and similar flats of which 506 qualify for rent increases of between 33 per cent and 40 per cent, while 684 attract no increase.

The connection between twice the gross rateable value and a fair rent is not easy to see. Scottish landlords have been spared from it because the Scottish local taxation system does not provide the Scottish office with such a convenient yardstick. It is difficult to escape the conclusion that the "stopper" has been put in for the express purpose of preventing the well priced house built in the thirties from paying any rent

increase despite the change in values since 1939. That at least will be the usual result, while rents on pre-1914 dwellings will generally be raised. Most flat rentals which include services will also qualify. Property owners will fight against the "stopper" as far as they can. An attempt will be made to get it raised to 2½ times the gross annual value, but the chances are that the Government will make no concession, except probably on properties with the very low rating valuation of less than £16 a year.

The bill is likely to contain many imperfections when it becomes law. There is the issue of divided authority: the rent tribunal is the ultimate appeal for a services increase, the County Court for a repairs increase. There are the anomalies which will result in some good landlords getting less than they should while some owners

of antiquated property will do well. There is, above all, the failure to go quite far enough to encourage private enterprise to undertake any appreciable amount of building for letting.

With all those shortcomings it remains the fact that apart from a few groups who did their building just before 1939, property owners are on the eve of a real improvement in their prospects. The Government's intention was to offer English property owners the

approximate equivalent of the Scottish 40 per cent increase. Owing to the "stopper," the offer is less favourable than that, but the increase will be material. It will not lead to reckless dividend distributions by any of the responsible companies. Some of them need to revalue their properties nearer to present levels. Most of them ought to absorb much of the extra revenue in higher amortisation or replacement provisions. But moderate dividend increases have started and may continue. The accompanying table lists some of the companies in the field to illustrate the points for which investors will now be looking. For the first time since the war possession of a high proportion of rent-controlled residential properties becomes something of an attraction. Flats with services offer more scope than dwellings without and, within reason, the older the properties the more reasonable is the improvement in prospect.

Business Notes

Glasgow Oversteps the Mark

INVESTMENT markets have paused as they often do in the weeks before the budget. Often when they pause they also sag slowly downwards; this time they have not done so. Here and there in the industrial section there has been a little easing, but both ends of the markets' extended line are most firmly held by a strong gilt-edged market on one hand and a strong gold share market on the other. Tin mines, following the sharp rise in the metal and the co-operative statement of the American attitude to the regulation scheme provide an additional point of support. The market is by no means fool-proof for the non-professional investor, but the appearance is still that of a bull market pausing after a sharp advance. The reaction from the recent high points has been notably small. The *Financial Times* index of Government securities is less than a point below its recent high point of 101.14 in November last year. The Industrial index is five points below its recent peak of 140.2 a month ago, and the index of developing gold mines about three points below its highest point of 112.93 touched last week.

★

Demand for the sort of investments which appeal to pension funds (but not for all the wares in which the stock exchange trades) still seems far from satisfied. This, together with the re-investment, partly on account of banks and money market houses, of over £72 million resulting from the repayment of the unconverted portion of the National War Bonds, 1952-54, provides the background of strength for the gilt-edged market and for good industrial prior charges. Of these the £30 million ICI issue of 4½ per cent loan stock 1972-74 at par is one. Application forms have now been posted to shareholders and lists close on March 24th. Only 10 per cent is payable on application.

The institutions are still ready to buy. They have bought heavily the 2½ per cent serial Funding stock 1957; they have also bought long dated gilt-edged while the small issue of £2 million 4½ per cent New South Wales Electricity Commission stock 1966-68 was heavily oversubscribed. But they are not reckless buyers. It was obvious that in trying to cut below the 4 per cent coupon rate the City of Glasgow's advisers were taking a risk. The risk proved too great for the market and of the £5 million 3½ per cent stock 1971-73 offered at £98, 65 per cent was left with the underwriters. Dealings started on Thursday at a fractional discount. It says much for the underlying strength of the market that the general level of gilt-edged prices was not pulled down.

Puzzle in Commodities

ONE of the many puzzling features of the American recession is that commodity prices as a whole have been rising in the last three months. Since the beginning of December *The Economist* commodity price indicator has moved up from 92.1 to 97.3 (1952=100). The boom in cocoa, coffee and tea is largely responsible for this movement, but the general trend is also firm. Copper prices in London have recovered steadily, and tin, after several months of stability, has bounded upwards. Cotton prices have climbed quite sharply, and the fall in wool prices has

been very moderate. Wheat has lost some ground but maize is steady. Prices of lead and zinc, which suffered most from the fall in American activity, have rallied in the last two weeks. Rubber remains depressed, but sugar is reasonably firm while the weakness in copra, jute and sisal has occurred only recently. The strength of certain commodities is admittedly somewhat artificial. The huge surpluses of wheat and cotton are being countered by the American support operations. The surplus of tin is still being absorbed into the American strategic stock, and the jump in price reflects the hope that the tin agreement will now come into force. Copper would certainly be in surplus if the large Chilean stocks were to come on to the market.

Just why commodities have not reacted to the 10 per cent drop in American industrial activity is something of a mystery. There is a strong presumption that American imports of commodities have been falling in the last few months, but recent figures are too incomplete to be a reliable guide. Whatever the extent of the fall, it may have been

partially offset by an increase in demand from Western Europe, where industrial activity appears still to be reviving. Moreover, it may be that after the steep decline in commodity prices from their Korean peaks, prices and stocks now are rather low in relation to the general level of world production. And the shadow of recession has for many months encouraged consumers everywhere to buy only their minimum needs, so that although the volume of purchases is small, it is at least steady, and has helped to maintain market prices, particularly for spot supplies. The testing time now seems to be approaching, and it may be significant that American production of non-ferrous metals is being restricted still further.

Risks in South America

NO British business can be more widely experienced in the difficulties that encumber trade with Latin America than the Bank of London and South America. It suffers in all South American countries. Shareholders must remember those difficulties when they consider the mere maintenance of the 6 per cent dividend. The payment is more than twice covered by the disclosed profit, despite a decline from £361,094 in 1952 to £341,778 in 1953. But the disclosed profit is not a fully repatriated profit in sterling. Part of it is a currency profit which "is still awaiting remittance"—particularly in Argentina from which country the bank has had no remittance of earnings since mid-1951. Fortunately the latitude granted to banks in presenting their figures has enabled the board to make full provision for depreciation of capital employed abroad before arriving at the profit. Shareholders also have the chairman's assurance that their patience is appreciated but a cautious dividend policy is essential "until the present difficulties and uncertainties are ended."

A wide section of the business public will study Sir Francis Glyn's comments on trade with Latin America. They will find no facile suggestion that the difficulties and uncertainties are ending though there is progress of a kind in the full remittance of profits from Brazil at depreciated exchange rates. On the contrary the chairman records: "It will not be surprising if the British merchant and trader with long standing connections in this region (South America) now look to the future with some misgiving." He reports that in Argentina, which is far the most important potentially of the South American markets, imports from the United Kingdom in the first half of 1953 were only 181 million pesos compared with 432 million pesos from Germany and 430 million from the United States. Argentina also is a country that enjoyed marked economic recovery last year, which makes the continued refusal of the Argentine authorities to allow any remittance of profits all the more reprehensible.

Traders must be considering two questions: Is it worth while to try to give longer credits to match what the French and the Germans are said to have done even though Germany too has suffered credit losses in so doing. And should any response be made to the effort of several South American countries to encourage fresh investment by foreign undertakings now that they promise treatment quite unlike that under which earlier investors still suffer? Sir Francis Glyn

helps with the answer to both questions. Against the background that French and German credits to some South American countries extend up to 5 years, he cautiously approves longer British credits. He suggests that machinery should be found for financial assistance to credit worthy importing countries for from 2 to 7 years, from the normal credit market. He does not state what the present British limit is, but it is understood in the City that credits up to 3 years have been given and that some longer propositions are being considered. On the question of fresh investment Sir Francis gives a clear warning: the intending investor cannot fail to have noticed "the treatment of existing investments in many countries, and the many delays and administrative limitations, often arbitrarily imposed, to say nothing of the sudden depreciation of currencies that so often intervene."

Exports Down in February

BRITISH exports last month fell in real terms, not merely because February had 24 working days, two fewer than January. Provisional figures show that exports dropped to £201 million f.o.b. from £226 million, and the average daily rate of total exports fell to £8.7 million from £9 million in January and £9.2 million in December. The average value of exports, excluding re-exports, in January and February together was 7 per cent below that of the fourth quarter of last year, although it was still 3 per cent greater than in the corresponding months of 1953. Imports in February showed what appears to have been a largely seasonal fall of £40 million to £241.9 million c.i.f., and re-exports were unchanged at £8.2 million. Thanks to this sharp fall in imports, the gross visible trade deficit dropped to £32.7 million in February from £48 million the previous month. The average deficit of the two months, however, was 10 per cent higher than the fourth quarter average.

UNITED KINGDOM TRADE
(£ million—monthly averages)

	Imports c.i.f.	Exports f.o.b.	Re- exports f.o.b.	Gross visible trade deficit
1953, 1st half.....	282.0	209.3	9.0	63.8
" 3rd quarter ...	274.8	211.6	8.5	54.8
" 4th quarter ...	276.1	230.6	8.7	36.8
1954, Jan.-Feb.*	262.0	213.4	8.2	40.5

EXPORTS TO NORTH AMERICA

	USA	Canada	Total N. America
1953, 1st quarter....	12.7	11.3	24.1
" 2nd quarter ...	13.9	15.7	29.5
" 3rd quarter....	13.9	12.8	26.7
" 4th quarter....	12.4	12.5	24.9
1954, Jan.-Feb.*	11.4	10.2	21.5

* Provisional.

The fall in exports to North America continued in February, but despite the American recession the daily rate of shipments was practically unchanged. Total exports were £20.5 million compared with £22.5 million in January and the peak average of £29.5 million in the second quarter of 1953. Shipments to the United States fell by £1.3 million to £10.7 million and shipments to Canada by £700,000 to £9.8 million. The average for the two months was 1.4 per cent less than the fourth quarter average and 10 per cent below that of the corresponding months of 1953.

Competition in the Air

THE debate on civil aviation that took place in the House of Commons on Monday side-stepped the major issues raised by the Government's policy and pivoted instead on the subsidiary argument whether the nationalised corporations were being deliberately penalised in order to provide opportunities for independent air operators. What is in fact only a test case was turned into a matter of principle, with the result that the Minister of Transport was able to concentrate on points of detail without feeling the necessity of clarifying what precisely the Government considers to be the meaning of "competition" in civil air transport.

The test case involves the grant of licences to fly a freight service across the North Atlantic. As a correspondent points out in a letter on page 767, the traffic on freight services is quite distinct from the make-weight packages carried on routine passenger flights. The licensing body, the Air Transport Advisory Committee, has granted a franchise for such a service to one of the biggest of the independent operators, Airwork Ltd. When the application was made, the chairmen of the two nationalised corporations had already given the Minister an undertaking to postpone any plans that they might have had for freight services for twelve months, so that the independent operators had a period of grace. Subsequently, it appeared that the terms on which a licence could be granted to a second operator on any of these freight routes were drafted in such a way that it would be difficult, perhaps to the point of impossibility, for a second applicant ever to be able to make out a successful case. It is, of course, true that the interpretation of these terms of reference by the Air Transport Advisory Committee has not yet been tested—as it might have been if British Overseas Airways Corporation had sought permission to fly a freight service on the North Atlantic in competition with Airwork.

On the contrary, BOAC is discussing the possibility of an agreement with Airwork, and doing so with the obvious approval of the Government. But BOAC is not the only operator interested in North Atlantic freight. A second independent operator, Hunting Air Transport, applied for a licence at the same time as Airwork, but was rejected. If Airwork and BOAC reach an agreement on freight handling on this route, the odds against any other operator ever being able to make a case for a second service would not be other than dishearteningly long. How BOAC's interests emerge from the discussions is in reality a subsidiary point. What is more fundamental is whether competition can be said to exist when the first comer on any new route or service is granted what on all present probability would be a secure hold and even a permanent monopoly of that service.

Standard and Rover

THE proposed merger between the Standard and Rover motor companies has one or two special features that make it more than just another step in the process of concentration that has been taking place in the motor industry since the war. The postwar expansion of the two companies has been outside the passenger car field. Standard's fortunes are closely linked with the farm market; of the 545 vehicles a day now being turned out by the company, 245 are tractors, and the potential rate of tractor production is in the order of 300 a day. The same is true of Rover. Passenger cars comprise only a small and decorative contribution to its total production, the bulk of which consists of tank engines for the Ministry of Supply and of Land Rovers, and the company may develop a market for small, stationary gas turbines for pumps and other machines. The Land Rover has not been in production many years; it still has no serious competitors in non-dollar countries, and as a result Rover is working with a substantial back-log of military and civil orders both at home and abroad. The assembly plants are bursting at the seams, and Rover would be obliged to look somewhere or other for extra capacity.

The two companies offer, between them, a fairly wide range of car models. Rover's production methods are a compromise between hand-building and flow-production techniques; using a choice of 4- or 6-cylinder engines in the same body, these methods produce a quality car that retails, before tax, for between £820 and £915. Standard sell the 4-cylinder Vanguard for £555 and the baby Standard 8 for £339; production of the baby is considerably higher than that of the Vanguard. There may be room here for some rationalisation in engines, and Standard has a good deal of capacity that Rover could put to use as well as some very fine assembly facilities. At present, the two companies get their car bodies from different sources, Rover from Pressed Steel and Standard from Fisher and Ludlow, and from Mulliners. But it would be surprising if Standard continued to rely indefinitely on Fisher and Ludlow now that the company has become part of the British Motor Corporation.

The terms being disclosed are stated to be on the basis of 6s. 6d. for the Standard 5s. ordinary shares and 28s. for Rover's 8s. shares. Somewhat surprisingly, prices of both fell slightly when the talks were announced. Yet something of this kind was not unexpected. Standard has been without a chairman since Sir John Black's retirement was announced, and Rover's experience could under these circumstances be useful to Standard's new young managing director. The merger will leave the Jaguar company as the only substantial, independent manufacturing unit in the motor industry.

Banking in the Far East

BUSINESS men and investors with interests in the Far East have long been accustomed to look to the season of the annual meetings of the "Exchange" banks for much valuable information and helpful counsel. The message

with this power mower

EASY on your time,
EASY on your pocket,
the ROTOSCYTHE
does everything in
one operation,
and is so
EASY to
handle.

Why
choose this
particular mower?

For these

and 12 monthly payments of £2.7.8
(Cash price £32.5.0 plus £6.8.0 Purchase Tax)

ROTOSCYTHE REASONS:

- Light and easy to handle, the engine does the cutting.
- Cuts any length of grass by unique rotary action—your "after holidays" and "bad weather" troubles removed.
- Slices through all stalks, leaving a perfect finish.
- Collects all grass by vacuum suction.
- A full year's guarantee.
- Sucks up leaves, stalks, pine needles, etc.—no raking.
- It even removes moss by a simple adjustment.
- Gives an immaculate, smooth, banded finish.
- No regrinding, saving pounds each year.
- A free demonstration can be arranged.

POST THIS COUPON NOW for your FREE 20 page booklet "The Story of a Beautiful Lawn" full details of other Rotoscythes and the name of your nearest agent.

One, Two, Unbuckle My Shoe

MR CHARLES CLORE is the modern pioneer of takeover bids. J. Sears (True-Form Boot), of which he gained control just over a year ago, gives him his opportunity to prove their worth by showing how to redeploy the assets of a company which is certainly old-established and is probably old-fashioned. His statement shows that he is releasing the hidden reserves locked away in that company's freehold properties and building up a great liquid fund for later investment. Thus a footwear company becomes a general holding company with a large but residual interest in the boot and shoe trade. Neither Mr Clore's group nor the largely voteless minority shareholders, whom Mr Clore encouraged to come along with him holding part of their former interest, will receive any capital return. And since he pays out no part of this fund, Mr Clore retains control over the whole of it.

From the sale of some of the freehold properties of its subsidiary, Freeman, Hardy and Willis, J. Sears has realised about £4½ million. After repaying the debentures, there remains about £3 million in cash, approximately the sum paid by Mr Clore and his associates for the control of the Sears business. That fund may soon grow to over £4 million, for at least another £1 million may be realised from

THE ECONOMIST, MARCH 13, 1954

the sale of part of the remaining freehold properties, now valued at £4 million. How will the £4 million be used? The directors of the footwear business, of whom Mr Clore is the chairman, will have the first call "to carry through the programme of improvements and expansion." This programme will absorb only a small part of the money and the remainder will ultimately be invested in "sound and progressive businesses." Until Mr Clore finds those opportunities the fund may just earn deposit interest. Funds of £4 million do not come out of nothing. The footwear business to be carried on in the name of Freeman, Hardy and Willis will have to pay rents on the shops that once were freehold. Mr Clore still does not say how much the rent charge will be. But he does indicate that because of it this year's profits will be lower, though he hopes to be able to maintain the 50 per cent dividend.

The financial needs of the footwear business will take up only a small part of the £4 million fund and Mr Clore, still full of projects for further take-overs and property deals, is left with almost complete discretion over a fund of about £4 million, at a most fortunate moment when the Bank of England's directive on finance for take-overs has made it more difficult to raise money from conventional sources. Minority shareholders must realise that though they are still in the shoe business they are also in business with Mr Clore—wherever he may lead them.

Keeping Pace with Inflation

THE United States Debenture Corporation is a big and an expert investor. Its permanent funds in the market now exceed £8 million. Its investments (nearly three-quarters in this country and more than three-quarters in equities) yield a rising gross income. Equity stockholders have received the benefit, including a 100 per cent capital bonus in 1952: the ordinary stockholders' money return has steadily increased. The left-hand chart shows how it has risen.

But that is in depreciated pounds. In the right-hand chart the corporation attempts to show how far the ordinary stock has been a hedge against inflation. The money figures have been deflated by the movement in retail prices, which have risen about 125 per cent since 1930. This index is not the only yardstick; the corporation might have used others, such as wholesale prices (up nearly 230 per cent) or wages—up about 147 per cent. But these "real" figures suggest

that in exceptionally favourable conditions the equity holder has done a little better than keep pace with inflation. The average investor can hardly have been so fortunate. Even in the United States Debenture Corporation most of the equity holder's gain in real terms is at the expense of debenture and preference holders. The benefit for the £2 million ordinary capital would have been smaller had it not been geared up by heavy prior charges. The circulation of these charts to stockholders is a novel and welcome idea.

THE MONEY GAIN

Actual gross income, ordinary dividend and expenses 1930-1954.

THE REAL GAIN

Gross income, ordinary dividend and expenses, corrected for retail price index (1938=100).

THE ECONOMIST, MARCH 13, 1954

Every Sunday, nearly 3,000,000 copies of this famous newspaper are sold. The day following, accounts and order forms to hundreds of agents must go out...

Day of reckoning: Monday!

A BEHIND-THE-SCENES STORY ON the workings of a great national newspaper comes from Associated Newspapers Limited. Their problem was to streamline the office system by which they control the sales operation for the ever-popular "Sunday Dispatch." Statements to all the agents were being handwritten. It threw a heavy load on office staff.

Associated Newspapers Ltd. wanted a system that could guarantee that all figuring on sales accounts was finalized, and weekly accounts sent out, on the Monday following the paper's publication date.

After consultation with Burroughs, they installed Sensimatic Accounting Machines to handle the postings. These are used in conjunction with an ingenious method of invoicing, by which the agent receives, on one single form, a statement, a receipt for his payment, and an order slip for next week's copies.

Result: So fast do these Burroughs machines serve the office that it is now normal practice to get "Sunday Dispatch" weekly statements prepared

and dispatched on Mondays. Cash collection is swift and efficient and next week's orders come back in time for action by the circulation department.

One more result has been that Associated Newspapers Ltd. are now using Burroughs Sensimatics on sales

210 postings in 45 minutes—that's a normal rate of work achieved by Mrs. J. Dickens, seen preparing statements for newsagents in the offices of Associated Newspapers Ltd. Watching her use one of the Burroughs Sensimatic Accounting Machines is Mr. Paul Stark, the Burroughs man who helped solve "The Case of the Sunday Dispatch."

accounts for their latest paper, the "Daily Sketch."

What about you? If your business could benefit from faster, accurate figuring, call in Burroughs. They can offer advice on all the latest systems, for Burroughs market the world's broadest line of modern record-keeping machines: Adding, Calculating, Accounting, Billing and Statistical Machines, and Microfilming Equipment. Remember, once you have any Burroughs machine, Burroughs Service guarantees its efficiency in operation.

Call Burroughs today. Burroughs Adding Machine Limited, Avon House, 356-366 Oxford St., London, W.1. Sales and Service Offices in principal cities round the world.

FOR EXPERT ADVICE ON BUSINESS FIGURING CALL IN **Burroughs**

Spacious...Powerful...Economical

How brilliantly these two Vauxhalls meet the needs of motorists today. Velox and Wyvern alike are roomy, powerful, easily manoeuvrable cars, a pleasure to drive and completely comfortable for five or even six passengers to ride in.

They are handsome and beautifully finished, yet at the same time surprisingly economical both in first cost and in petrol consumption. Higher compression "square" engines boost power, run longer without overhaul, and reduce

petrol consumption. Expert and inexpensive maintenance is assured by Vauxhall Square Deal Service, operated by dealers in every part of the country with factory trained mechanics, low-cost, genuine parts and standard repair times.

For the owner who wants every penny of motoring value, these roomy, powerful, economical Vauxhalls are unequalled on the road today. Your Vauxhall dealer will be happy to arrange a demonstration run for you.

That's Vauxhall Value!

THE 6-CYLINDER VELOX

Maximum speed of 80 m.p.h. 28.68 m.p.g. at an average speed of 40-89 m.p.h.* Spacious 5/6 seater. Length 14 ft. 4 ins., turning circle only 38 ft. Price £535 plus £224. 0s. 10d. P.T.

THE 4-CYLINDER WYVERN

Same size body and the same modern styling as the Velox. Maximum speed of 70 m.p.h. 33.46 m.p.g. at an average speed of 30-51 m.p.h.* Price £495 plus £207. 7s. 6d. P.T.

Vauxhall Motors Ltd. Luton. Beds.

More Power to the Kitchen

MORE than half the electric vacuum cleaners sold at home and abroad by British makers last year were Hoovers, and the company also accounted for 60 per cent of home sales of electric washing machines and about two-thirds of those exported. Sir Charles Colston had these impressive records to show shareholders in his latest, and last, annual review this week—he is retiring from the post of chairman and managing director after 35 years with the company. He had also some encouraging financial results to report; the company has recovered from the trading setback of 1952, and shows a consolidated profit for 1953 of £3,095,000, slightly better than in 1951.

The experience of Hoover seems to have been broadly paralleled in the market for domestic equipment as a whole, though total output is not generally back to 1951 levels. Trade in most lines showed a recovery, almost entirely at home, last year, as will be seen from the table, though this

was less marked among some of the smaller items such as electric irons and kettles. Electric washing machines and television sets, however, are both in the stage of rapid initial expansion in the British market, and were hardly affected by the 1952 setback in trade. Refrigerators, too, are still in the stage of market expansion, but it has been a protracted one; production for the home market last year was still 25 per cent below the levels of 1950 and 1951.

Probus et Fidelis

LONDON is traditionally a meeting ground for the world's bankers, but it is not often that leading domestic and overseas bankers are gathered together at a single point—

as happened this week in tribute to the English Institute of Bankers on its seventy-fifth anniversary. By courtesy of the Lord Mayor, the occasion was fittingly celebrated at dinner in the Mansion House. At its foundation, in 1879, the objects of the Institute were somewhat wider than they are to-day; it provided a forum for the discussion of major problems of banking principles and organisation and a means by which the banks—the relatively numerous banks—could formulate action in furtherance of their common interests. The Institute's first president, Sir John Lubbock, later Lord Avebury, sponsored the all-important Bills of Exchange Act of 1882, often regarded even to-day as a model of what good legislation should be. He is also remembered as the originator of the Bank holiday. In modern times these more general functions have been taken over by other organisers of English banking, and the Institute's function in the sphere of bank education and provision of an examination system has become its primary function.

Although the range of its work has narrowed, the role of the Institute has steadily extended as the need for the training and education of bank staffs has become increasingly apparent. It is well recognised as an indispensable part of the machinery of banking, and much of the tradition of the English banks is attributable to its work. That tradition has now been enshrined in the grant of arms to the Institute—over the motto "Probus et fidelis." The Institute, if it chooses, can play an even more important part in the future than in the past. The problems of banking, and therefore of the Institute, continue to grow. As Mr Cameron Cobbold, Governor of the Bank of England, emphasised this week, the problems now being faced in central banking and monetary management are new problems; they cannot be solved simply by searching in dusty textbooks of the past.

Diesels on the Road

THE potential market in this country for diesel-engined passenger cars, which was discussed in two articles in these columns on January 2nd and 9th last, will shortly have its first real test. The Standard Motor Company has announced that from next month the Vanguard saloon and estate car will both be available with a variant of the diesel engine (of similar capacity to the Vanguard petrol engine) manufactured for the Ferguson tractor. The engine itself weighs 100 lb more than the petrol engine, but the concomitant stiffening of the chassis, together with the heavier battery and starter motor needed, gives a total weight increase of 2 cwt. The reduction in maximum speed is from 80 mph to little more than 60 mph, while the acceleration is no doubt considerably less lively. The increase in price is £180, making with purchase tax a total difference of £255. To set against these various disadvantages, there is probably a saving of one-third in the fuel consumption, which should be enough to cover the extra first cost in 40,000 miles of running; the life of the somewhat noisier engine should be longer, and maintenance costs should be less.

In the field of medium weight commercial vehicles, where the balance as measured by new registrations is still overwhelmingly in favour of the petrol engine, a substantial

change may soon become evident. The earlier articles referred to the new Ford "Cost Cutter" engine and to the obvious possibility that, as with the Fordson tractor, the diesel variant might be offered for road vehicles. The Ford Motor Company are now offering the diesel engine in vehicles with a capacity of 2 tons and of 3 tons, at an extra price of £100 (in the case of tractors, the price difference is £55). The engine is rated to give a maximum of 60 bhp against 70 bhp in the petrol version—in the tractor both engines are rated to give 40 bhp. A saving for the tractor over its whole life is claimed of the order of £700. On the road, goods vehicles pay a similar price per gallon for motor spirit and for diesel oil; even so, the fuel and other savings of the diesel engine should cover the extra cost a number of times in the course of its life.

Future of Banking

BY coincidence, several of the issues of banking controversy aroused by a recent contribution to *The Economist*—and further discussed in "Letters to the Editor" on page 766 figure also in a thoughtful paper read this week by Professor R. S. Sayers before the Manchester Statistical Society. Speaking on "Twentieth Century English Banking," Professor Sayers was ostensibly concerned in a retrospect of salient banking trends since the Baring crisis of 1890, but in fact he conjured up some intriguing pictures of what the future might hold. The English banks in this past half century have become even bigger and fewer, and therefore more uniform in their structure and methods of business. They have remained keenly competitive (though the range of rate agreements is somewhat more extensive than Professor Sayers suspects), but has this competitiveness sufficed to ensure their maximum efficiency? The answer, Professor Sayers thinks, is "not quite automatic." The British public likes its financial business to be transacted in an atmosphere of a "certain dignity and comfort"—which the banks supply by their "many fine and well-staffed offices" and by what Professor Sayers regards as "certain expensive habits."

More particularly, the biggest change in the banking system in this half century is that the banks' original and still crucial function of acting as intermediaries between private lenders and private borrowers in the capital market has become more and more overshadowed by their function of making payments and keeping accounts for the whole community. This "ledger clerk" function, together with the growth of uniformity and the familiar fact that the Government dare not allow any large bank to fail, has transformed the banks into public utilities (the capital of which, however, is not and should not be fixed-interest capital). The "ledger clerk" function, Professor Sayers suggests, is the crux of the question of efficiency; to remunerate it, a larger proportion of total banking costs is being shifted from the borrowing customer to the credit customer—to an extent sufficient "to check the growth of the banking habit and to alienate small customers." The remedy, Professor Sayers suggests, might be to "hive-off" this accounting work from the banks on to a "single and highly centralised and mechanised branch of the Post

Office," leaving the banks free to concentrate on their original function in the capital market.

Judging from Continental experience, Professor Sayers thinks that such a change might yield real economies and a reduction in charges to the public for the accounting function, but he admits that it might create difficulties in the discharge of the lending function. If, for that and other reasons, no such radical change lies ahead, Professor Sayers thinks that there would still be need for a drastic change in principles of bank charging. He suggests that the present trend towards increasing the proportion of costs borne by the credit customer should be reversed—because the lending services, as distinct from the "ledger" services, are the ones that only the banks can perform efficiently. The credit customer should not be penalised by the fact that the banks retain a function that others, so it is suggested, might perform more cheaply. Here is material in plenty to provoke new controversy; comment is perhaps best deferred until the banks themselves have disclosed their point of view.

SHORTER NOTES

The special procedure under Section 23 of last year's Transport Act, which allows for increases in railway charges to meet increased costs without the normal lengthy hearings, may be used by the Transport Commission for an application to increase London Transport passenger fares—probably certain of the lowest single fares and some season ticket rates. The London Transport Executive, at present fares, is making practically no contribution to the central charges of the Commission, which has therefore a strong case for an increase; it remains to be seen, however, whether the Government is yet prepared to make the Londoner pay for his ride.

Mr Peter Thorneycroft, President of the Board of Trade, made some significant comments on institutional equity investment at a dinner of the Institute of Actuaries last Wednesday which deserve quotation.

It is not the policy of the present Government to tell insurance companies how much they should invest in industry, still less to tell them the particular branches of industry they should select, though I welcome the fact that companies have found it sound policy to increase their equity holdings. I am confident that the importance of maintaining industrial expansion will continue to be in the forefront of your minds.

The prospect of an International Tin Agreement is much improved since the United States government announced that though it would not sign the agreement, it did not object to other countries doing so, and would hold its excess tin off the market. Acceptance of the agreement by the producing countries is virtually assured, and a majority of consuming countries is likely to respond to the American "all clear." The agreement, which is open for signature until June 30th, has been signed by the British and Belgian governments.

After the flurry of alarm caused by the American government's announcement that all its 14 weather-ships would be withdrawn from the Western Atlantic by the end of June, the matter has been amicably settled in Paris on the basis of the withdrawal of three American ships and a slight re-shuffling of financial liabilities. The other member countries have conceded the justice of the American case that United States internal weather bureaux got none of the benefits from the service that their European counterparts enjoyed, since Atlantic weather travels from West to East. Under the new agreement, which will run for two years, 80 per cent of the costs of the service will be shared between the members on the basis of the Atlantic crossings made by each country's airlines. The balance of

20 per cent will be allotted according to the "non-aeronautical" benefits received

As Germany's creditor position in the European Payments Union continues to increase, the Council of OEEC has decided that any surplus earned by Germany between now and May 1st will be settled as to 50 per cent in gold or dollars and 50 per cent by the granting of credit by Germany to the Union. The Council has also decided to increase the temporary extension of Austria's quota of \$70 million from \$31 million to \$60 million. Within the limits of this extended "rallonge" any surplus earned by Austria will likewise be settled 50 per cent in gold or dollars and 50 per cent in credit.

Company Notes

ASSOCIATED ELECTRICAL INDUSTRIES. The meat of AEI's full accounts for 1953 is contained in one short paragraph in the directors' report: "The steady increase in the production of the AEI group factories, resulting from postwar capital expenditure on replacements and extensions, has been fully maintained during the year." They add that "a satisfactory increase in the value of

export shipments continued, in the face of keen competition from abroad." This guarded statement leaves several questions to be answered at the general meeting. Are orders coming in as fast as they were? Does the reference to the "value" of exports mean that the volume of AEI's overseas trade also went up last year? Now that the prospect facing the capital goods industries is less certain a fuller exposition seems warrantable.

Apart from this statement the full accounts add surprisingly little to the preliminary statement (discussed in these columns last week) which showed that the ordinary dividend had been effectively raised from 10 to 11½ per cent. The advance in trading profits clearly stemmed from another increase in turnover, but it is not clear whether profit margins were

wider or narrower than in 1952. Whether or not gross profits of AEI have reached their peak the group's capital programme continues without interruption. Last year about £2 million was spent on fixed assets and outstanding capital commitments are estimated at £2,890,000, though it is not clear how much of this is being spent on new equipment and how much on replacements. At present the group seems to have enough liquid funds to meet its capital commitments without discomfort for the major item in its balance sheet, the holding of stocks, hardly altered last year. AEI's full accounts leave enough questions unanswered to provide the chairman, Sir George Bailey, with the occasion for an interesting speech at the meeting.

CANADIAN PACIFIC. The boom in Canada is a broken-back affair for Canadian Pacific Railway. Last year the increase in working expenses more than matched the rise in gross earnings from its railways so that net railway earnings fell slightly, from \$28,930,780 to \$28,884,572. The general freight rate increases at the beginning of the year, though they led to the rise in gross earnings, failed to provide any increase in the net figure because the volume of traffic

\$25 ordinary stock at \$42½ yields £6 9s. per cent.

declined (for like other railways CPR loses traffic to the road haulage companies, particularly on high value freights) and because operating costs (particularly wages) rose.

In past years buoyant earnings from the

undertaking's shipping and hotel interests have compensated in part for the disappointing railway results. But last year "other income," arising from these sources, fell from \$22,651,775 to \$16,802,051; within this total a profit of \$3,690,516 from shipping was turned into a loss of \$511,991, owing to a reduction in the volume of cargo and lower freight rates. CPR's net income fell from \$39 million to about \$31½ million, but the ordinary dividend was maintained at 6 per cent.

Perhaps the most disturbing feature of this unhappy experience is that CPR had last year to defer part of its maintenance programme. It is finding it increasingly difficult to attract capital to expand and improve its rail services, so that it is not at all surprising that the company continues to press for further increases in rail freights. With Canadian Pacific doing so badly at the height of Canada's boom, the outlook when prosperity fades is disturbing.

LEYLAND MOTORS. The full accounts of Leyland Motors and the statement by the chairman, Mr Basil Nixon, leave a gloomy impression. In the year to September 30th last, the volume and value of the group's turnover fell, trading profits and net profits declined, and the ordinary dividend was left unchanged at 25 per cent. Nor to judge by the tone of Mr Nixon's statement will there be any revival in trade and profits this year.

Speaking of the commercial vehicle industry he said: "Order books have contracted, backlogs are rapidly being cleared, delivery dates have shortened and competition both at home and abroad is keener." He also drew attention to the rise in costs at home, the penalty that high fuel taxes impose on heavy commercial vehicles and the sudden contraction of the Australian market, which is the group's most important overseas outlet. To meet these difficulties the group appears to be concentrating more than formerly on the production of lighter commercial and passenger vehicles. The demand for these, stimulated perhaps by the desire to keep fuel costs down, appears to be holding up better than that for the heavier vehicles in which Leyland specialised. The acquisition of Albion Motors helps the

Leyland group in this respect. Another way out of the difficulties facing the group is to broaden the basis of production. Shareholders will note that Leyland, in addition to extending its business in industrial power units for agricultural and other equipment, has widened its agreement with Associated Commercial Vehicles on the joint production and sale of trolley

£1 ordinary stock at 82s. 6d. xld yields £6 1s. per cent.

buses to cover diesel trains and rail traction units. But these new developments will not pour much oil on the "rougher water in a buyers' market" that Mr Nixon mentions. The best, it seems, that equity shareholders can expect will be the maintenance of the 25 per cent dividend and on this basis the yield of 6½ per cent at the current price of 82s. 6d. xld. seems narrow enough.

UNITED STEEL. The full accounts of United Steel Companies for the 53 weeks to October 3rd add just a

few details to the information set out in the company's prospectus when its 14 million ordinary shares were sold back to the public at 25s. each. About 30,000 equity shareholders will receive copies of this report. Among them are 131 shareholders holding more than 10,000 shares each. The Co-operative Insurance Society with more than 300,000 is the largest shareholder and three others (Morgan Nominees, London and Manchester Assurance and Prudential Assurance) own between 100,000 and 200,000 shares each. Most of the other large holdings of between 10,000 and 100,000 are owned by other institutional investors, including insurance companies and pension funds investors.

These shareholders will find in the full accounts that, as the directors fore-shadowed in the prospectus, profits after depreciation were just over £9 million. The directors also publish a breakdown of the group's gross trading account. Gross income was about £80.9 million. From this sum the cost of raw materials and general trade expenses took 60.3 per cent, wages 22.4 per cent and delivery charges 4 per cent, while dividends (after tax) absorbed only 1 per cent.

As the directors explained in the prospectus, profits in 1952-53 were exceptional; in the future, they added, a profit after depreciation of £6 million would not be unsatisfactory. From this profit they would be able to declare without any discomfort an ordinary dividend of 9 per cent. It is the political risk rather than the fear that the massive development programme (estimated to cost over £13 million) will act as a drag on these dividends that explains why the £1 ordinary shares now stand at 22s. 9d. xld., to offer a yield of 7.9 per cent.

LONDON STOCK EXCHANGE

Next Account begins: March 17th.
Next Contango Day: March 17th.
Next Settlement Day: March 23rd.

THE stock market gave a reasonably good account of itself this week. Gilt-edged stocks continued to improve, and this helped to keep equity prices reasonably buoyant. The terms of the Glasgow issue, of which it was later announced 65 per cent had been left with the underwriters, prompted a belief in the market that the end of coupon rates of 4 per cent was in sight. Hence, a steady demand developed for the high coupon stocks, both among the Funds and Dominion and Colonial issues. On Wednesday this demand broadened out to include the undated issues and on Thursday prices remained steady in spite of the failure of the Glasgow issue, which opened at ½ discount. In the banking section, National Bank of India were marked up sharply on the news of the capitalisation of reserves. German and Japanese stocks improved in the foreign market and some interest was taken in "iron curtain" issues. Then, on Wednesday German Potash leapt forward in response to a strong demand from Swiss buyers; Potash Sevens gained 6 points to 188.

Equity prices edged upwards this week. The strongest sector was that dealing in store shares, but paper, building material and electrical equipment shares were also firm. On the other hand tobacco shares were marked down sharply and motor shares were inclined to lose some ground. But in this sector Ford Motor advanced on Wednesday, following the absorption of a line of shares. After the announcement of the Standard-Rover proposals to merge, their shares were marked down slightly. Donaldson Line were marked up sharply in advance of the company's statement on its trade in the Pacific. The market in oil shares was dominated by the rise in Anglo-Iranian on Tuesday (when the Persian oil discussions opened) to 11½; this gain was not held and at the close on Wednesday the shares were quoted at 10½. Rubber and tea shares were irregular. Kaffirs remained reasonably firm, and on Wednesday morning the increase in the Rand native labour force brought in a few buyers.

What is the board's duty to the staff?

An enlightened board appreciates only too well its obligation to staff and senior executives. They know that with taxation at its present level no employee can hope to save enough to ensure a reasonable degree of security on retirement. They know that good staff can be attracted away by companies offering better security. Yet nothing is done to organise a properly constituted pension plan because of apparent difficulties and a knowledge that no ready-made scheme can provide a satisfactory answer.

The long experience of Arbon Langrish proves, however, that the application of specialist knowledge to individual cases can often cut right through apparent complications to provide a pensions solution which is less onerous for the firm and enables staff to work loyally without the distracting influence of a future insecure retirement.

A discussion with a member of the advisory staff of Arbon Langrish will be treated in confidence and is of course without obligation. Arbon Langrish are independent of any insurance company and are, therefore, free to give you unbiased advice and the most favourable rates.

The advice of Arbon Langrish

is available to principals, solicitors, and accountants, on all matters relating to pension plans, 'top hat' schemes and estate duty problems.

COMPANY MEETINGS

THE HONGKONG AND SHANGHAI BANKING CORPORATION

SATISFACTORY RESULTS DESPITE DIFFICULT TRADING CONDITIONS

LIQUIDATION OF CHINESE INTERESTS PROCEEDING SLOWLY

BRITISH PRESTIGE ENHANCED IN FAR EAST AND S.E. ASIA

MR C. BLAKER ON ECONOMIC NEEDS

The ordinary yearly general meeting of The Hongkong and Shanghai Banking Corporation was held on March 5th at the head office, 1, Queen's Road, Central, Hong Kong.

Mr C. Blaker, MC, ED, the chairman, who presided, said:

Ladies and Gentlemen, In the past the whole of the chairman's annual survey of events in the East was read by the occupant of this chair. This year, however, we have decided to modify the procedure and to distribute copies of the statement at the meeting, as we feel that you will find it more convenient to have the written text in your hands than to listen to it being read out to you. In making this change we are to a certain extent following the procedure adopted by many other banks and well-known companies who now issue their statements in printed form and only deal with routine matters on the actual day of the meeting. We hope that you will approve of the innovation.

I will now proceed with my formal duties and will call upon the chief manager to read the notice convening the meeting.

Mr Michael W. Turner having read the notice convening the meeting, and a representative of the auditors having read their report, the chairman continued:

The net profit for the year amounts to \$17,294,235, which is some \$27,000 less than last year. As in previous years, this profit has been arrived at after providing for taxation and after making transfers to inner reserves out of which provision has been made for all known bad and doubtful debts and contingencies. The balance of profit brought forward from last year is \$9,489,174 and the total available for appropriation accordingly amounts to \$26,783,409. In view of the expenditure which has been incurred during the year on new banking premises, it is proposed that a sum of \$4 million should be appropriated to write down bank premises, and, after allowing for this amount and the interim dividend of £2 per share, it is recommended that the final dividend should again be £3 per share, leaving a balance of \$9,859,542 to be carried forward to next year. As in the case of other organisations with interests in China, the cost of maintaining our offices there and of complying with the requirements of the Chinese authorities has been a considerable drain on the year's profits and this and other factors have been taken into consideration by your directors in recommending an unchanged dividend for the past year.

BALANCE SHEET FEATURES

A comparison of the balance sheet with that of the previous year shows that the totals of our assets and liabilities have remained virtually unchanged.

On the liabilities side the amount of Hong Kong currency notes in circulation has

remained unaltered throughout the year. Current, deposit and other accounts show a relatively small decrease of some \$3 million and acceptances on behalf of customers a fall of just over \$2 million. Various factors have contributed to these small decreases, which are in general due to the continuation of less active trading conditions.

The principal change in our assets has been a decrease of just over \$54 million in advances. This decrease arises mainly as a result of the low prices for primary products which have continued throughout the year, but it also reflects the general slowing down of trade in the territories in which we operate. This decrease in trade is further demonstrated by a drop of over \$31 million in our trade bills, which, however, is offset by a rise of \$37 million in our holdings of Government Treasury bills, resulting in the figure for bills receivable in the balance-sheet showing a net increase of some \$6 million. The increase in money at call, in cash in hand and in balances with other banks reflects the funds which have become available as a result of the repayment of advances during the year. In this connection it is interesting to note that the ratio of the bank's readily realisable assets—that is, cash, money at call, Government Treasury bills and trade bills—to the total liabilities to customers now stands at a figure of 65 per cent, which indicates a high and very satisfactory degree of liquidity.

CAUTIOUS FINANCIAL POLICY

Difficult trading conditions have prevailed throughout the year in the territories in which we are interested and under the circumstances our results can be regarded as satisfactory, but the outlook at present shows little signs of improvement. Your directors therefore feel that they are justified in continuing to pursue a cautious financial policy and that, in the interests of all, their first concern must be the security and strength of the bank.

Before I formally propose the adoption of the report and accounts I would like to say how much I appreciate the honour of serving as your chairman in succession to Sir Arthur Morse, who, as you know, held this post from the time when our head office was transferred to London in the war until he retired on March 3, 1953. He also held the more arduous one of chief manager. I am glad that only the lighter part of his duties has devolved upon me and that I have had at my elbow the vigorous and keenly perceptive personality of our new chief manager, Mr Michael W. Turner, who has throughout the past year handled with great ability the many problems with which he has had to deal.

I must also take this opportunity of thanking the bank staff as a whole, and especially our branch managers, for the effective way in which they have worked for the interests of the bank in the past year.

POSITION IN CHINA

Shareholders will no doubt want to know what is the position with regard to our offices and valuable properties in China and how our foreign personnel are faring. The latter are well and living conditions are reasonably good, but I am sorry to say that we have not yet been able to complete the closure of our offices which, as you know, we have been trying to liquidate for considerably more than a year. Some progress has, however, been made in Peking, where we have sold our office building, and also in Swatow and we hope that our Swatow agent will be repatriated in the near future. As to the main problem, we have made proposals direct to the local authorities, working in concert with the other British banks, and Her Majesty's Chargé d'Affaires has made representations to the Chinese Government on our behalf. In order to get a speedy and overall settlement we have offered concessions involving very considerable sacrifices, but negotiations have proved difficult and progress has been painfully slow. However, so far as we are concerned, the Chinese have nothing to gain by prolonging our complete liquidation and we are therefore hopeful that progress will be accelerated in the near future. Mr Yoxall, our Shanghai manager, is acting on our behalf in the negotiations proceeding there. He has our full support and confidence.

CHANGES IN LONDON COMMITTEE

Various changes in our London committee must be mentioned next. Sir Arthur Morse joined the committee on September 3, 1953, and became chairman on January 1, 1954, in succession to Mr S. A. Gray, who has done us good service in that capacity since July, 1948, and is now fully occupied with the increasingly onerous work of senior London manager. Mr Gray, however, remains on the committee. Mr C. A. Campbell retired from the committee—on which he had served since the days of Sir Newton Stabb—on June 30, 1953, and we are very grateful to him for his valuable services over such a long period of time. He was succeeded by Mr J. A. F. Binny, a director of the Westminster Bank.

There are also changes in the board of directors.

On September 1st we opened our new office in Paris at No. 22, Place Vendôme, but our Lyons office has not yet been finally wound up. On October 3rd we also opened a new building at Osaka, where previously we had operated from a small rented office, and on January 2nd of this year we opened a new building at Mongkok on the Kowloon side of the harbour.

That, I think, covers all the matters which I should bring to your attention, so I now beg to propose the adoption of the report and accounts as presented. After the proposal has been seconded I shall be pleased to answer to the best of my ability any ques-

tions which shareholders may wish to ask.

The resolution having been seconded the report and accounts were adopted.

CHAIRMAN'S STATEMENT

The following is the statement referred to by the chairman:

No survey of the year 1953—not even an eastern bank chairman's review of events in East Asia would be complete without mention of the memorable occasion of the Coronation of Her Majesty Queen Elizabeth, which was celebrated in an unparalleled way by all British subjects and by very many local residents of all nationalities here in Hong Kong, as well as in every other town where we have active agencies. There have been frequent expressions of loyalty to our Royal Family in the past, but never before have such widespread and genuine demonstrations of popular affection for the Monarch been shown by the British peoples throughout the world as were displayed last year on Coronation Day.

Although Coronation year did not unfortunately bring with it any noticeable abatement of the world-wide cold war, it did eventually see the cessation of open hostilities in Korea and the inception of an optimistic feeling that an improvement of the world political situation would gradually develop as the Korean problem became less menacing. In any case, we can fairly claim that British influence in the Far East and in the countries of South East Asia has gained in prestige. Moreover, although last year trade has again fallen off somewhat, national development programmes have everywhere in the east made progress and the way in which many of the countries in this area have co-operated in the interchange of ideas and of technical assistance will undoubtedly prove to be a matter of considerable importance and give greater cohesion when more stable conditions permit greater economic activity in this uneasy sector of the world.

SOUTH EAST ASIA'S ECONOMIC NEEDS

In each of the past four years my predecessor, Sir Arthur Morse, in his annual statement referred in one connection or another to the immense economic needs of the countries in which we operate. Their requirements were, he stated, higher standards of living, more extensive food and other agricultural production and, indeed, general development, such as the Colombo Plan prescribed, and which in most of these countries is gradually being put into effect through national development plans. These plans have, as is well known, stressed the importance of agriculture, together with basic economic progress, such as the expansion of power, of transport and of communication systems. The latter are prerequisites for coping with any large-scale output of agricultural products, minerals and the primary materials which these countries provide. Last year Sir Arthur referred to many aspects of this same problem and quoted an important phrase of the Paley Commission relating to the needs of a higher standard of living in the free world. In stating his view that the governments of the east should necessarily play their part he urged that "no attempt should be made to introduce industrialisation on a rapid or large scale," as "it would be far wiser to concentrate all available capital and energies on food and agricultural production and on those ancillary industries which depend upon the raw materials available in the country concerned." It was surprising to us to find that in a recent book which received considerable notice in the press, the first part of this quotation was picked out and used in isolation from the second part to support a dogmatic assertion that "already voices are being raised in the City against full-scale development in South East Asia." This is surely a misrepresenta-

tion of the City's attitude to the needs of South East Asia just as it is of ours. Sir Arthur was, of course, dealing with immediate and short-term plans, not with more distant developments when opportunities for large-scale industrialisation may well arise.

What was said last year seems perfectly in line with the plans of all countries in South East Asia. The Colombo Plan, in which most of these countries are partners, from its start emphasised the basic economic needs of the under-developed countries. It stated that "the central problem has been and still is the supply of food" and that "related to the problem of food is that of transport." Next came other basic industrial activities, particularly electric power.

Other authorities can be quoted. For instance, the Director General of the International Labour Organisation in a recent report stated that industrialisation in its wider sense would largely come to East Asia in the second stage of economic development. In the first stage, he said, development planning had little choice but to concentrate primarily on expansion of food production and on the development of basic resources, such as power and transport.

INVESTMENT CLIMATE

It is obvious that in the second stage of development when a wider form of industrial progress will be introduced, capital will be the paramount requirement, but as the President of the International Bank pointed out last September, "the availability of capital cannot by itself be expected to remove some of the most important obstacles to economic growth." Such obstacles are often referred to as the "unfavourable climate," which deters or scares off capital investment. Climate in this sense can to some extent be manufactured by governments, who have it in their power to make conditions attractive for investors. But to a large extent it is determined by the stability, or lack of stability, of the political and economic structure of a country. Where climate is unfavourable the injection of capital on a large scale (if it proves possible as a result of international action) may be indigestible, or even damaging to that country's ultimate good.

PRIVATE CAPITAL

As regards private capital, tendencies in certain eastern countries show a reluctance to permit its introduction by foreign concerns acting independently, but encourage or even obligate joint participation between foreign and domestic capital in new industrial projects. Examples of this can be seen, notably in India, Japan and Burma, but also elsewhere. Where governments favour widespread nationalisation of industries there is, of course, no stimulant to foreign investment. In many countries, and particularly in India, much thought is being given to ways of mobilising larger accumulations of domestic capital through savings, without which development plans will be handicapped. This is important because of the comparatively small amount of foreign capital which is finding its way to South East Asia. However, the low standard of living is an obvious handicap, and improvement in the quantity of savings can hardly be great until more general prosperity reduces the overwhelming poverty. But prosperity in the east is circumscribed by the exasperating problems of the wide fluctuations of prices of foodstuffs and of the raw materials produced in those areas.

PRICES

There are few people interested in world trade who are not aware of the fact that economic progress in the east cannot proceed

steadily without steady prices for its main primary commodities. An advisory committee on under-developed areas, in a report to the Director of the United States Mutual Security Administration last May, rightly stated that the objective should be "not rigidity of prices or demand, but an ironing out of wide fluctuations." But one step further is desirable: that these countries should be able to obtain their essential imports both of food and of consumer goods at prices reasonably in relation to the prices of their exports.

HONG KONG-CHINA TRADE

So far we have dealt in general terms with a problem which not only affects the east, but also is a world-wide one. However, it has very special application to present trends and developments in the countries where we have offices. We must next direct attention to these countries severally and to some of the problems which face British bankers and merchants who operate there.

First of all we propose to take Hong Kong and the vexed problem of trade with China. The facts about what is loosely termed "East-West trade" are well known to shareholders of The Hongkong and Shanghai Banking Corporation, but others are not so well informed. During the past year fantastic complaints have been heard about alleged British perfidy in trading with China. A great deal of this talk has been based on uninformed or misinformed premises. There are those who either do not know or who ignore the fact that, quite apart from the United Nations embargo on strategic goods, the British and United States Governments have agreed that there is nothing injurious to the allied cause in East-West trade being conducted in non-strategic commodities. This applies both in regard to trade with the Soviet bloc and with China. Sir Roger Makins, HM Ambassador at Washington, mentioned this understanding in a speech delivered at Los Angeles on October 5th last. I may say that Sir Roger did not omit to refer to Hong Kong's special position and to its needs. Our Governor here in Hong Kong has also spoken emphatically and made the position of the Colony crystal clear, particularly in a speech last November. Moreover, that prominent American official, Mr Harold E. Stassen, Director of the Foreign Operations Administration, has taken up the cudgels on behalf of East-West trade in non-strategic goods on more than one occasion.

Hong Kong has suffered more from the United Nations embargo than any other country in the world. But her trading difficulties are not due to the embargo alone. They have also been caused by restrictions on obtaining certain materials imposed by the United States and by import controls enforced by some of our neighbouring countries. However, most of the difficulties with the United States have now been cleared up, thanks to the excellent co-operation of American officials stationed in Hong Kong, and from time to time there has been some relaxation of the controls imposed by our neighbours. But the United Nations embargo still remains in force.

During the past months Foreign Office spokesmen have reiterated that the policy of HM Government is to encourage trade with China in all permitted goods. British firms have never deviated from their desire to sell more of such goods to China. They have been, and are still, willing to negotiate details here in Hong Kong, in the United Kingdom, in Peking, in Shanghai or wherever is most suitable to prospective Chinese customers. But the prevailing political tension is a serious handicap.

Official Chinese pronouncements have stressed the desire of the Chinese People's Government to develop international economic relations under peaceful conditions

with any country irrespective of divergent political, social and economic systems. Naturally we look forward to trade relations on normal lines as thus projected, but unfortunately until a political settlement is reached in regard to Korea, and the matter of "recognition" of diplomatic representatives is settled, it is hardly practical to expect the establishment of commercial relations on a basis satisfactory to both sides. The Geneva Conference to be held next month will, we hope, set the stage for bringing diplomatic, commercial and financial relations between our two countries back on to a regular basis, but it would be unwise to expect rapid developments. The Chinese Minister of Foreign Trade, in a recent speech to some British merchants, mentioned the importance of "normal conditions." Let us hope that before long both parties will agree on the interpretation of these two words.

It is a moot question as to what scope there is for the expansion of trade with China. Differing views are held, but we must not do any wishful thinking: a great deal depends on unforeseeable factors and future trends in international affairs. It is, however, obvious that when the embargo has been removed there should be a considerable increase in trade and no doubt there will be keen competition amongst business men of all nationalities.

CHINA'S DEVELOPMENT PLAN

From this point of view a very interesting step was taken during the past year in the announcement by the Chinese Government that a five-year development plan was being launched. Actual details have not been published, but it seems clear that the greatest importance is attached to the expansion of heavy industries and the most important industrial development, it seems, will continue to be concentrated in the North and North-East provinces. It was also announced last September that Soviet aid would play a "key role" in the case of 141 important industries. A further point, which, in the past at any rate, would have been of interest to British investors, is the rapid progress being made with railway construction, particularly across Szechuan Province and in North-West China in the general direction of the Russian Turkestan-Siberian Railway. To subsidise the new industrial plan an issue of the equivalent of £95 million of Economic Construction Bonds at 5 per cent is now being raised throughout the country under a quota system. Much more could be said about China, but reliable information is scarce so I will revert to the subject of Hong Kong.

HONG KONG

This is a suitable moment to express our gratification that Sir Alexander Grantham's term of office as Governor of Hong Kong has been extended to July, 1955. We were pleased when Sir Alexander's term was previously extended to July, 1954, and we are now doubly pleased at this further extension, because the whole community has the utmost confidence in His Excellency and knows that he will support the Colony's best interests, whether commercial, social or political, to the fullest extent of his great abilities.

Hong Kong has so often been the target of attack by certain individuals that last November we especially welcomed the visit of Vice-President Richard Nixon and we wish to place on record here the very friendly attitude which he took in his speeches and interviews. It is good to know that there are not a few influential persons in the United States who understand our problems and realise the importance of our maintaining our position.

Last year was a quiet one for the Colony,

but it cannot be said that it was a satisfactory one from all points of view, although considering the handicaps imposed by the embargo and other difficulties about which I have already commented, things proved better than many expected. Imports, which increased 2 per cent, amounted to the equivalent of about £242 million. Exports decreased 6 per cent and were about £171 million.

As compared with 1952 there was only a very small drop in the recorded tonnage of commercial cargoes discharged and loaded in the port, while shipping tonnage entered and cleared actually increased more than 2½ million tons. It is significant that this was largely due to the increase in Japanese ships from 56, which entered in 1952, to 359 in 1953. However, we must not forget that 2,620 British ships of nearly 5½ million tons entered Hong Kong in the same year.

I will not discuss the details of the trade of the year, but I will remind you that our prosperity is largely tied up with the prosperity of the surrounding countries and if—say, Indonesia and Thailand—are forced to restrict imports for balance of payments reasons as they were during the past year, then there will inevitably be adverse reactions on neighbouring countries such as Hong Kong. The causes of such restrictions are well known but they are often not easy to eliminate: they arise from low prices of basic commodities, high defence expenditures and administrative weaknesses. However, apart from the disappointments caused by the above-mentioned restrictions and the big handicap relating to China, Hong Kong has no reason to be unduly depressed. Although much more trade was done with China in 1950 than in 1953, yet, excluding China, the 1953 trade figures were slightly better than 1950, when trade seemed prosperous and many Hong Kong records were broken. The exports of locally manufactured goods, taking the year 1953 as a whole, improved no less than 31 per cent over 1952 and textile exports were two-thirds of the whole. Electricity production has continued on the up grade. The building industry and property transactions have been buoyant and there has been great activity on the Stock Exchange. On balance additional capital appears to have come into the Colony and bank deposits have increased. No doubt owners of such funds only await the propitious moment when they can profitably employ them in trade or industrial operations.

HONG KONG'S FINANCES

This statement was prepared before the budget meeting of the Legislative Council which took place on March 3rd, so it was not possible to take account of the Financial Secretary's speech in presenting his Estimates of Revenue and Expenditure for the year ending March 31, 1955. However, knowing what a conservative policy is followed by every Financial Secretary in this Colony, I am sure he has every intention of keeping us on a safe and steady course. But expenditures are mounting. We cannot afford to have any more fires of the magnitude of that at Shek Kip Mei, which I believe cost the Colony nearly £1 million, and Mr Clarke must be worried about the heavy disbursements which the Colony has ahead in connection with already approved public works and the badly needed enlargement of Kai Tak Airport. Our medical and educational departments (including particularly the university) bring heavy recurrent expenditures which, as the Financial Secretary hinted last year, may have to be given a limit if we want to avoid increased taxation.

Two matters which directly affect Hong Kong's status as one of the important cities in the world are the airport and the resettlement of squatters or refugees. The need for an airport suitable for the landing of "Comets" and other large modern commer-

cial aircraft is indisputable and we hope that a final decision will soon be taken to proceed with a suitable scheme as quickly as possible. We must not forget that HM Government have offered us an interest-free loan of £3 million for this purpose.

As regards squatters, the Governor's views on the importance of this matter are well known. No one can question the fact that the Government have done exceedingly well in the way they have tackled the problem, and it was pleasing that Vice-President Nixon made special reference to the "far-sighted, humanitarian and generous" way the squatter situation had been faced in Hong Kong. Refugees and others such as those living in squalid and overcrowded tenements are also a vast problem. These classes are estimated to number at least 100,000 families and the Government aim at resettling these large numbers in low-cost flats in permanent multi-storied apartments. Some progress is being made, but only the fringe of the problem has so far been touched.

In a small way we are ourselves attempting to ease the housing problem by building forty small flats for the Chinese employed in our head office. This is a tentative experimental idea we shall have to watch carefully.

ANGLO-JAPANESE AGREEMENT

The Anglo-Japanese Payments Agreement has proved a controversial subject ever since its signature at the end of January. One important and somewhat obscure factor at the moment is to what extent Japanese cotton goods will be able to compete in price with Lancashire goods in the Colonial territories and their entrepôt markets. Hong Kong and Singapore's internal markets are not likely to be much affected. The entrepôt trade as a whole is another matter and it is possible that there will be Japanese competition with Hong Kong export products although Japanese cotton goods should not seriously compete with the Hong Kong industry. However, there may well be benefits to be gained if Hong Kong and Singapore are used as marketing centres for a great variety of Japanese goods. The number of registered factories of all kinds in Hong Kong continues to increase and interesting developments are taking place. There are signs that new investors are realising that in spite of occasional checks there is still scope for the employment of capital in light manufacturing projects. There is ample labour in Hong Kong and there has been practically no labour trouble throughout the past year.

JAPAN

Having just referred to the Anglo-Japanese Payments Agreement, it seems apt to turn next to a consideration of affairs in Japan during the past year. The Payments Agreement was warmly welcomed in Japan as a definite help towards checking the serious sterling trade imbalance of nearly £109 million in 1953 and towards assisting the very difficult trading situation with which the country is faced. But Japanese business men are aware that their country's main problem is still by no means solved. The Government Economic White Paper published last July and a further one issued in November faced the facts squarely when it was acknowledged that owing to the trade gap the Japanese economy could not maintain itself on its present basis without United States special procurement orders, which last year provided over US\$785 million. As a result strenuous efforts are now being made to keep the 1954-55 budget under rigid control and a movement for retrenchment is well under way. At first demands were such as to bring the budget up to the equivalent of £2,000 million, but latest reports

are that it is being debated at a level just under £1,000 million.

The need for strong action to cope with the inflationary situation is shown by statistical figures indicating gradual rises, for instance, in bank advances, the note issue, cost-of-living and price levels, as well as an increase in production figures. Moreover, the chief of the World Bank Survey Mission to Japan, on leaving Tokyo on December 19th, issued a statement which neatly hammered home the following points: That inflation was one of Japan's most serious problems and required immediate solution by resolute action; that official plans to maintain a balanced Budget and to correct the overloan situation deserved applause; that there was a great need for capital investment, but particularly for an increase in the volume of domestic savings; that an increase in the food supply was a basic problem and that support for agricultural development merited at least as much attention as industrial modernisation.

Japanese difficulties deserve serious consideration. Japan has a population of some 88 million people in a country restricted since the war to an area half as big as the United Kingdom with only 17 per cent of the land arable. It would be impolitic not to try and ease their problems in the way the extended payments agreement has done and from the British point of view it is surely wiser to expand than to contract sterling area trade.

INDONESIA

Indonesia is another country which is, I am afraid, also suffering from economic maladies but of rather a different kind. Her Government, like Japan's, is struggling to put the financial house in order, but her considerable adverse balance of trade has no compensating windfall. Moreover, Indonesia, being a new state, has far more serious internal problems and her people have not yet developed a strong sense of discipline, as is shown by the widespread disorders in the interior and the unsettled labour conditions. Then again Indonesia's economy is predominantly agricultural with important oil resources and mineral deposits. The country's potential wealth is immense, but to exploit this properly much administrative skill and experience is needed. These are well-known facts. Many of them were enlarged upon in a recent report by the President of the Java Bank who is now Governor of the newly formed Bank Indonesia, which replaced the former bank on July 1, 1953, as the Central Bank of the country. The Governor particularly drew attention to the dangers of the large deficit in the Budget which for 1953 was estimated to be rupees 1,800 million (£56 million). He called for economies and a recognition of the realities of the situation. By increasing the margin required from all importers from 40 per cent to 75 per cent, it was hoped to check inflation and cut down imports, but unfortunately the final deficit in the Budget account appears to have been higher than was anticipated and the adverse trade balance will also be serious. The Bank Governor recently stated that on February 3rd, the bank still held cover of gold and foreign exchange equivalent to 24 per cent of its demand liabilities—a somewhat small margin above the statutory minimum of 20 per cent—and that in the past six months the cover had fallen over 11 per cent. He urged corrective action by increasing production, by stricter import controls as well as by measures to prevent exchange losses through the export inducement schemes.

While the Indonesian Government are preoccupied with their serious financial problems it is hardly likely that the import trade from neighbouring countries will improve, but their desire to increase this trade

was shown in the preliminary discussions which the Singapore Director of Commerce and Industry recently held in Djakarta with senior Indonesian officials.

INDO-CHINA

Like Indonesia, Indo-China is another country containing great natural wealth, but suffering from internal troubles which in this case have been much to the fore in world discussions during the past year. Let us hope that the Geneva Conference will bring a solution of the deadlock which has already lasted some eight years. Indo-China is a vital point in the strategic situation in South East Asia and the United States Government have thrown in an immense amount of aid, not only in the form of war-like materials but also in connection with road building, waterways, airfields, port facilities and for technical training. Some of these things may outlast the present conflict, but at the same time 70 per cent of the revenue of the country is being earmarked for war expenditure to the detriment of its economy.

The sudden devaluation of the piastre by the French Government last May from 17 to 10 francs, caused much resentment in official circles of the three States, but this was perhaps counter-balanced in the following month by the offer of more or less complete autonomy within the French Union. The export trade naturally benefited by the lower rate of exchange and rubber and coal exports have increased. On the other hand there has been a serious fall in the general purchasing power of the people owing to the fact that wages have not increased proportionately to the prices of consumer goods. Yet there is little doubt that if political troubles subsided there would soon be a rapid trade recovery in this country.

THE PHILIPPINES

If we next move in an easterly direction we shall find ourselves once again in a more stable locality. The Philippines is a country which is dependent on agriculture for considerably more than half its gross national production and for some 80 per cent of its export earnings. It is therefore very satisfactory and hardly surprising that a man who knows the agricultural scene and whose reputation for probity is high should have been elected President of the Philippines Republic last year. President Magsaysay has, however, set himself an ambitious target in the very inspiring programme which he revealed in his address at the opening of Congress on January 25th. The programme is far too long to quote but its theme was to help and encourage farmers, to put into effect a co-ordinated plan of economic development, to straighten out the finances and to secure a Government of integrity and efficiency. All who are concerned with the progress of this fertile country will watch with interest and sympathy the steps taken by the President to carry out this great task. The election result has been called the greatest victory against Communism so far seen in Asia. If the President can accomplish his programme, or the major part of it, this bold assertion may prove to be literally true.

One of the first steps of the new Government was to introduce proposals covering a five-year programme for the rice industry with a view to ensuring reduced prices and adequate output to feed the nation. Already, in fact, a great deal has been done in this direction by the American Foreign Operations Administration and indeed rice supplies adequate for internal needs were produced in 1953.

During the past year the Philippine administration made representations to the

United States Government for the revision of the Bell Trade Act, which will otherwise come into force on July 4th next, and a special Executive Committee has been set up in Washington to examine certain detailed proposals submitted by the Philippine Government. An important one relates to the currency question, which the Philippines claim the right to control and administer, including also the determination of the rate of exchange. However, decisions as to this and the other proposals made to the United States Government seem unlikely to be reached in the immediate future.

As regards trade, the final figures are not available, but it seems likely that the adverse balance will be at least pesos 100 million (£18 million) less than in 1952, when it was around pesos 147 million (£26 million). Export figures are likely to be pesos 90 million (£16 million) higher, owing to an improvement in some of the leading exports, such as sugar, copra and timber. Sugar exports were only 35,000 tons short of the United States quota of 952,000 tons.

The National Budget for the fiscal year ending June 30, 1955, shows a very small surplus, which it is hoped will be attained by increased income as a result of strict supervision over tax collections. There is a general fund deficit of pesos 304 million (£54 million) which President Magsaysay hopes to liquidate by setting aside an annual amortisation.

MALAYA—GENERAL TEMPLER

We now move down the South China Sea to Malaya, which cannot look back on 1953 with much regret at its passing, largely because the lingering slump in rubber and tin prices gradually spread gloom through a large section of the country. I will refer to these particular problems later. However, the emergency situation certainly improved. The personality and inspiration of General Sir Gerald Templer has been felt throughout the whole territory and has brought definite progress in the operational field. It is not surprising that there should be widespread regret at General Templer's forthcoming departure on promotion to an even more important assignment. But it is reassuring to know that the Templer plan of campaign has been thoroughly tried out and has already shown excellent results. It only remains for his successors to press onward with determination, perseverance and energy to a successful conclusion of the campaign. This will surely come, but it will come quickly only if the peoples of Malaya give full-hearted co-operation.

In speaking of General Templer's campaign I do not refer to the field operations alone, where his success has been most pronounced, but also to the activities aimed at obtaining the support of the "hearts and minds" of the people, where progress is slower but is sure. Then there is the political arena in which the High Commissioner has had to face troublesome problems of a very different nature needing careful and statesmanlike handling.

The overriding problem has been that of attempting to fuse the various peoples of Malaya into a Malayan Nation and of ensuring that the framework of the future State is based on sound foundations and that its structure will be built on realistic and efficient lines. General Templer himself pointed out the importance of the various steps which must, he said, be taken to ensure that "self-government is not a substitute for good government." Citizenship, elections, civic and administrative responsibilities—these are stages each of which needs time for digestion: otherwise stability will be endangered and the interests of the new country will suffer in the way we can see others around us are suffering at the present time.

I need hardly stress how important that word "stability" is, from whatever angle you may consider it. These political problems mainly affect the Federation and will soon be the burden of Sir Donald MacGillivray who will have the support and good wishes of all who have at heart the future well-being of Malaya.

SINGAPORE

Singapore is, of course, directly concerned with the outcome of the political developments in the Federation, and the Colony can confidently rely on the Governor, Sir John Nicoll, to see that their interests are fully safeguarded. Two bodies have been exploring important matters relating to the future of the Colony. The one is a joint co-ordination committee set up under the chairmanship of Mr Malcolm MacDonald, who, we are glad to know, will be staying in his present post of Commissioner General for South East Asia at least until the end of this year. The other is a commission under Sir George Rendel which has been considering the question of Singapore's constitution and has just issued its report. We all realise that much depends on the outcome of these deliberations. Constitutional and other relations between the Federation and Singapore must come up for reconsideration in the near future, and greater co-ordination is undoubtedly desirable.

I must next refer to the financial condition of Singapore and the Federation. The Colony is fortunate in that the revised accounts for 1953 are expected to show a surplus of M.\$33 million (£3½ million). The budget for 1954 allows for a deficit of about the same amount but last year the Colony felt able to give £1 million to HM Government and this year it has loaned M.\$30 million or about £3½ million to the Federation. Moreover a special reserve fund of M.\$100 million has been set up and a development fund of M.\$50 million but there still remains about M.\$130 million in the general revenue balance of the Colony. The emergency has necessitated heavy expenditures by the Federation and it is only right that Singapore should bear part of the burden, but as the Governor pointed out when he announced the loan, the Colony has its own heavy commitments and in ordinary times every dollar will be needed to provide more schools, hospitals, houses and other services.

THE FEDERATION

The Government of the Federation of Malaya, on the other hand, are less fortunate, but they started 1953 with a good revenue surplus and they have reliable friends who can come to their help. Their deficit for 1953 is expected to be about M.\$146 million (£17 million) and for 1954 the estimated deficit is M.\$222 million (£26 million). On the other hand, their surplus on January 1, 1953, was M.\$332 million (£39 million) a part of which was, however, not readily realisable. They raised M.\$100 million by the Security Loan floated last year and HM Government have promised a contribution of £6 million as well as additional help if the financial situation should deteriorate in 1954. In addition to this they have received from Singapore the 25-year loan of M.\$30 million, without interest for the first 10 years, and the state of Brunei provided a loan of M.\$40 million, so as to ensure that the development programme was not interrupted.

The Financial Secretary, Mr Himsworth, in his budget speech, showed that the Federation could get through to the end of the present financial year without increased taxation. In fact he stated that the Government did not propose either now or in the immediate future to make any increase in the company rate of income tax because it would be inflationary in an under-

developed country, and would tend to frighten off investment capital which was what the country required more than anything else. Mr Himsworth also announced that in order to pay for important capital development projects it was intended to raise locally a loan of M.\$100 million (£11½ million) in 1954 as well as one of about £6 million on the London market. The Financial Secretary made no bones about the need for stringent economy which we agree is certainly a matter of the very greatest importance. He further said that the main plank of Government's financial policy was "to get rid of this deficit and to bring the budget back into balance."

TIN AND RUBBER

By the fall in the prices of tin and rubber during the year the Financial Secretary estimated that the Federation's revenue had been reduced by 20 per cent. We need not intervene in the controversy and argue as to the best way to deal with these two commodities in regard to which the specialists themselves hold such widely differing views. But from a banker's point of view, as indeed must be except that of the speculator, stability of prices is of the utmost importance. If the majority agree that stability can only be obtained by international agreements, then such agreements deserve the fullest support from the industries and governments alike. The Randall report to President Eisenhower has unfortunately cast cold water on commodity agreements. Yet there is strong sympathy and support, on the part of individual Americans of prominent and influential standing, for the countries so critically concerned with these problems. For instance, Vice-President Nixon, who, of course, could not commit his government, showed his understanding of the fact that Malaya's prosperity and its problem of dealing with Communism were both bound up with rubber and tin. He realised, too, that other countries were also involved in a very similar way.

The trade of Malaya in 1953 naturally suffered from the recession in rubber and tin prices; imports dropped 16 per cent, but exports fell 23 per cent, being M.\$880 million (£103 million) lower than in 1952. However, in volume, rubber and tin exports were fairly well maintained throughout the year, and it is interesting to note that the Singapore Harbour Board returns for 1953 show that the net registered tonnage of vessels berthed at the wharves was a record at over 10,700,000 tons.

The mission to Malaya sent by the International Bank for Reconstruction and Development arrived in Singapore in January and will make recommendations regarding future economic plans and developments. For this reason I will not refer to the important subject of the diversification of production whether agricultural, mineral or industrial. One of the subjects with which the mission will deal is no doubt that of rice in regard to which the attitude of the government in continuing to handle the trade is giving rise to both questioning and opposition in the Federation.

NORTH BORNEO AND BRUNEI

After Malaya it is natural to consider North Borneo, which has often been called a land of promise as it indeed is. But so it taken to find the labour needed to turn the state of Brunei into practical value. The able oil wells in its territory, and the revenue resulting from oil production will be able to finance an ambitious five-year plan of development, but many problems arise when revenue is four times higher than expenditure. The loan to the Federation of Malaya of M.\$40 million, which was provided last

THE ECONOMIST, MARCH 13, 1954

November was a timely gesture to help in the struggle against Communism.

RICE

I have referred to the doubts in Malaya about Government control of rice, but when we look at Thailand and Burma it seems likely that Government monopolies of the rice export trade have come to stay. Both countries are very dependent on their large production of rice for their well-being. In the case of the former 90 per cent of farm land is estimated to be given up to paddy and 60 per cent in the latter. As a result of several unforeseen occurrences during the past year a buyers' market developed, and both countries found themselves considerably overstocked and therefore anxious about the financial outcome. One reason for this situation was a good rice crop in India, which led to a decision not to enter the rice market until prices were lower. The Philippine Islands were also able to supply their own needs. Indonesia bought considerably less than in the past few years and Ceylon obtained considerable quantities from China. However, towards the end of the year Japan became short of rice owing to damage to her crops by floods, and she then made contracts with both Thailand and Burma which somewhat eased the situation, and recently within the last few weeks a contract between India and Burma has at length been concluded. Total exports in 1953 are believed to have been about 1,300,000 tons from Thailand—the lowest figure for some years—and about 1 million tons from Burma. It is expected that in 1954 Thailand will have a disposable surplus of about 1,800,000 tons of rice and Burma about the same figure. Rice production is, of course, subject to wide fluctuations owing to crops being dependent on weather conditions. Prices therefore vary greatly from season to season and the holding of large Government stocks may at one moment seem likely to cause a serious loss and at another to be a wise policy, but the consensus of opinion outside official circles urges that Governments should relax their control over the trade and take the present opportunity of more plentiful stocks to revert to prewar practice. This is not a simple problem and the facts need thoroughly ventilating before a decision is reached.

THAILAND

On the financial side the feature of the year for Thailand has been the drop in the free market rate of the tical from about ticals 45 to about ticals 58.50 to the pound. Exchange regulations and imports were tightened up and eventually in November full scale import controls were introduced; however, the adverse trade balance for 1953 is likely to be large. Sterling balances of the Bank of Thailand have fallen off during the year, but US dollar balances have increased. The note issue is well covered, but the considerable deficit in the public finances which continues from year to year gives rise to anxiety. An unusual type of loan has recently been authorised whereby the government has borrowed foreign exchange equivalent to ticals 1,200 million (£27 million at the official rate) from the Bank of Thailand against 10-year bonds at 3½ per cent. This is to be used for capital outlay. It is reported that requests have been made to the International Bank for a number of loans, but no new agreements have been concluded. Meantime, the United States Special Technical Economic Mission continues its activities in the country and the Army and Air Force are being modernised with American advice and help.

BURMA

The political situation in Burma has changed little in the past year. Internal security has improved in some areas, but in

others there is considerable guerilla activity not unlike the situation in Malaya, but in the case of Burma the Communist affiliation seems more uncertain. The activities of the so-called Kuomintang forces unfortunately pinned down Burmese troops and so prevented their employment in the task of establishing order elsewhere. The ill-feeling aroused against the United States by the latter's connection with the matter resulted in the Burmese Government rejecting further United States aid—a loss of some US \$13 million to Burma. The finances of the Government show that there was a small surplus in the year 1952-53 but the budget for 1953-54 provides for a deficit of kyats 380 million (£28½ million) to be met out of cash balances. Social welfare and economic development are again heavily emphasised and the budget deficit is regarded by the Finance Minister as an "investment for posterity and better standards of living." On November 3rd a settlement was reached of financial questions arising out of the Anglo-Burmese Treaty of 1947. HM Government in fact accepted £7,300,000 against a debt of £26,700,000 payable by Burma. This was "a magnificent gesture," as a Burmese newspaper put it.

On Burma's National Day the Prime Minister made an important speech on the subject of an "interim Economic Plan"—called "interim" because of the expressed intention ultimately to organise all trade and industry into a socialised economy operated by the consumers and workers.

On October 1st the tariff preferences granted under the Ottawa Agreement of 1932 and the Indo-Burma Trade Agreement of 1941 came to an end and a new tariff came into effect. The distinguishing features are high rates on luxuries and nominal rates on essentials. Heavy imports were made prior to the introduction of the new tariff and rice shipments fell off towards the end of the year; consequently, the foreign trade balance for 1953 seems likely to show a reduced surplus of exports as compared with 1952 when the surplus was about kyats 342 million (£26 million).

Burma has rich potentialities and grandiose plans. As their Minister of Finance has himself stated—their aims should be "ambitious but feasible."

INDIA

In regard to India, a few of the features of the year from our point of view are the following. First and foremost there is the deplorable friction with Pakistan which has in recent months become more intense as a result of the offer of United States aid in equipping Pakistan's military forces. Whether this additional dispute will delay the appointment of a Plebiscite Administrator for Kashmir remains to be seen. The problem is intensely involved. Secondly, there is the five-year plan which is undergoing some revision in order to speed up the tempo of expenditure. Already a new five-year plan is being discussed. However, an additional sum of Rs.1,750 million (£131 million) is to be allocated to the original plan which is only half-way through its course. Mr Nehru has said that the plan is to be revised because of the question of unemployment which is increasingly serious. Indeed, this is an ever-growing problem. The continued disturbances in Calcutta seem to emphasise this and it is stated that as the population of the country increases additional employment is required each year for two million adults. The Director General of the International Labour Office has recommended that urgent steps should be taken for the expansion of rural industries and the growing of supplementary crops. Food crops were excellent last year and are estimated to have increased 11.8 per cent above the previous year, but it will be a long time before India can grow

too much food. Prices of food and the cost of living index in Calcutta, after rising in the summer, began falling towards the latter part of 1953 and ended at about the same level as the beginning of the year. One unfavourable feature is the stagnation of private capital investment in industry during the past year. In this connection an interesting memorandum on foreign investment in India shows that foreign capital is not being encouraged for purely trading activities but that it is in the sphere of industrial development that India is proclaiming her need for foreign investment. As I stated in an earlier paragraph, it appears that joint ventures are likely in future to meet the requirements of the present situation in India rather than direct foreign investment. In fact, such a system was recommended in the Planning Commission's original report on the first five-year plan.

Discussions with Ceylon on the problem of the Tamils in that country have improved relations between the two countries and the proposed meeting in Ceylon of the Prime Ministers of a number of Asian countries appears to be a good move.

CEYLON

One of the main events in Ceylon during the past year was the financial crisis which came to a head in July and was followed by riots and arson. The dangers of the situation had become apparent by the end of 1952 when an austerity programme was introduced and the rice ration was reduced. But this programme proved inadequate. External assets continued to fall and the trade deficit continued to grow. In July drastic measures were introduced: the food subsidies were virtually abolished, direct taxes were increased and additional duties were levied on luxuries. At the same time the Central Bank rate was raised from 2½ per cent to 3 per cent. By the end of the year the adverse balance of trade had been considerably reduced as compared with 1952, but external assets had continued to fall in a way which must be causing anxiety to the Government. A change of Government took place in October, when Sir John Kotelawala replaced Mr Dudley Senenayake as Prime Minister and Sir Oliver Goonetilleke then became Minister of Finance. Sir Oliver has realised the need to raise foreign capital to assist Ceylon's development plan. Feelers have been put out in London, and it has been announced by the Minister that the International Bank is about to provide a loan of Rs. 104 million (£7½ million) for a hydro-electric scheme. But despite this I may say that Ceylonisation shows no signs of diminution, and trade operations with a number of countries are confined to Ceylonese nationals. However, an important and impressive speech which the Minister of Finance made at the opening of the ECAFE Conference at Kandy on January 26th last gave indications of a possible broadening of policy to attract foreign private investment.

The foregoing survey of events in the East does not claim to do more than pick out a few of the highlights of political and economic affairs which seem to deserve the special attention of our shareholders. Asia is undoubtedly on the move. All the way from Ceylon to Tokyo there is an intense desire for speedy economic progress, as is shown by the development plans which most Asian countries are now attempting to put into effect. Coupled with this, there is a widespread realisation that the raising of low standards of living must come as part and parcel of agricultural and industrial development. British merchants and bankers established in the East cannot insulate themselves from these events. They too have a part to play in the further development of Asia.

THE EASTERN BANK, LIMITED

CONTINUED EXPANSION

The forty-fourth annual general meeting of The Eastern Bank, Limited, will be held on March 31st in London.

The following is an extract from the statement of the chairman, Sir Evan Meredith Jenkins, GCIE, KCSI, for the year 1953:

The balance sheet total of £32,458,611 is higher by £1,129,566 than that of 1952. Current, deposit and other accounts increased by £1,030,105; on the other side, cash and bills receivable show a fall of £657,596, and investments and advances have increased by £1,954,133 and £122,389 respectively. The increase of £68,485 under premises (after the appropriation of £30,000 from profits) reflects the continued progress of our building programme.

While the balance sheet figures in general show that the gradual expansion of recent years has been continued, it is worth noting that the value of confirmed credits opened by the bank—an item which it is not our practice to include in the balance sheet—has declined substantially from the peak figures of 1950 and 1951. This change is doubtless due mainly to the fall in commodity prices, and to the exceptionally severe restrictions on imports in many countries.

PROFIT AND DIVIDEND

The published profit is £127,512, against £126,722 for 1952. The appropriations from profit are £50,000 to reserve, which now stands in the balance sheet at £1,300,000; £30,000 to premises; and £27,500 to the final dividend, which your directors propose be raised from 4s. 6d. to 5s. per share, making, with the interim dividend of 3s., 8s. per share for the year.

The results of 1953 may be regarded as satisfactory. The adjustments which began in 1952 when the prices of agricultural commodities fell, continued throughout the year, and it is clear that strict import licensing will be needed for some time yet in several of the countries where we are established. On a longer view also the pattern of Eastern trade is changing. In all markets British exporters of consumer goods are encountering progressively stronger competition from exporters in other countries, particularly Japan. In several Eastern countries the development plans now in progress require a wide range of capital goods, and the services of experts, and new suppliers from most of the highly industrialised countries of the world are now in the field. As these plans mature, local industry will gradually use larger quantities of locally produced raw materials, with some effect upon the volume and character both of exports and of imports. Further, the banking systems of most Eastern countries are growing rapidly with increasing competition between individual banks, both indigenous and foreign.

CHANGING CONDITIONS

Though the rising expenses of our business, due to the sustained high cost of living in the East, have caused us some concern, we see no reason why we should not be able to maintain and gradually to expand our operations. There are in the East political risks but these have to be taken by banks as by other business concerns.

Our new branch at Cochin was duly opened during the year. The project for a branch at Al Khobar in Saudi Arabia has made no further progress. A sub-office has been opened at Steamer Point, Aden.

SIR CHARLES COLSTON ON IMPORTANCE OF INCENTIVES

The annual general meeting of Hoover Limited will be held on April 2nd at Perivale, Greenford, Middlesex.

The following is the review by the chairman and managing director, Sir Charles Colston, CBE, MC, DCM, which has been circulated to stockholders covering the year ended December 31, 1953:

It is with much pride that I am able to announce that 1953 has been the record year in the history of the company. We have succeeded in surpassing the remarkable records established in 1951, and have gone far ahead of the results obtained in 1952. The consolidated profit for 1953 is £3,095,000. This compares with the consolidated profit of £3,014,000 in 1951, and £1,602,000 in 1952.

In my review last year I explained some of the reasons for the setback that we experienced in 1952. I pointed out that the sellers' market had gone. At home the Government's deflationary policy had reversed the previous inflationary tendencies and this had inevitably reduced sales. Abroad, trade recession after the Korean boom and more intense competition, allied to the abnormal difficulties caused by import restrictions and the shortage of sterling, severely affected our export markets.

During 1953 competition has become even more severe. Germany has made a striking economic recovery and is once again becoming a formidable competitor. The success of the Hoover electric washing machine all over the world has led to a host of imitations of our type of machine, and so we have had much more severe competition to meet in many countries. This has made necessary an intensification of the activities of our sales organisations, at somewhat greater cost. Another adverse factor has been the generally higher cost of the materials which we use compared with 1951, but there is now a falling tendency in the prices of these materials which should benefit us in the current year.

One of the principal reasons for the reduced results in 1952 was the sudden closing of the Australian market at the beginning of the year. We had developed this into our most important export market. The remarkable expansion of our Australian business had made it as large as our total business before the war. During 1953 Australian import restrictions were somewhat eased, but the position is still very unfavourable compared with 1951. We have, however, more than made good the reduction in the Australian market by increased sales elsewhere.

RECORD TURNOVER IN THE HISTORY OF THE COMPANY

To give an overall picture, our total turnover in 1953, at home and abroad, was almost 20 per cent greater than the previous record turnover achieved in 1951. The calculation of turnover has been based on effective sales, that is to say, goods sold and

despatched to our subsidiary companies have been included only insofar as they in turn have sold these goods. We owe much to our superb sales organisations in Britain and overseas which, under the powerful direction of Mr F. H. Bunn, our general sales manager, seconded by his very able and energetic deputy, Mr S. Roberts, have co-operated with all other departments to attain these record results.

That we have succeeded in beating the record of 1951 in a year when conditions on the whole were more difficult is a measure of our achievement. This success is due to the magnificent team spirit throughout the undertaking. In Hoover Limited we believe that difficulties are a spur to greater effort, difficulties are there to be overcome. If difficulties are attacked in the right way they may be a blessing in disguise.

During 1952 we initiated a thorough review of our entire organisation. Even in an efficient undertaking there is always room for improvement. We have tightened our organisation, we have improved methods, we have effected economies and increased efficiency at the same time, and generally we have reduced administrative costs. We have set up a special section under Mr H. G. Meads, the secretary of the company, to give unremitting attention to these problems.

The company organisation is in a healthier state than ever before, and we are ready to face any difficulties which may come our way. Industrialists must not expect easy times. The company's plans are based on the assumption, a wise one I think, that we can maintain and enhance our position only by a virile and progressive policy and greater efforts in every section of our world-wide undertaking.

EXPANSION OF WASHING MACHINE SALES

Perhaps the most striking feature of the year's operations has been the continued remarkable expansion in the sales of Hoover electric washing machines which we manufacture at our factories in Merthyr Tydfil, Cyfarthfa and Aberdare, in the South Wales Development Area. Our new Mark II washing machine has justified our most optimistic expectations. It was launched in the home market in March, 1953, and was most enthusiastically received. Its larger washing capacity, the bigger and better wringer, the self-emptying device and other improvements in construction and style, almost without any increase in overall size, immediately established wide public demand. For a considerable part of the year the sales of the new model were governed by our production capacity.

The success of the Mark II washing machine is a tribute to the engineering skill of Hoover Limited. It confirms once again that originality and brilliance in design allied to high efficiency in production provide the basis on which a virile sales organisation can build an enduring mass market.

The Mark I Hoover washing machine is £8 less (apart from purchase tax) than the

Mark II machine. The Mark I model has amply proved its robust qualities and has continued in good demand alongside the Mark II model.

Our total washing machine sales in the home market were practically double what they were in 1951, and about 50 per cent higher than in 1952. This constitutes a rapid and continuous expansion which is impressive.

CREATION OF A NEW INDUSTRY

We have in fact succeeded in creating a new industry. Until a few years ago the number of electric washing machines sold in Britain was quite small. To possess such a machine was the privilege of the few. But the washing machine saves the housewife so much laborious work and, not unimportant, so much expense that every household should have one. It is a necessity, not a luxury.

I believe that Hoover Limited in creating and marketing an electric washing machine that does not take up too much room and does not cost too much money, while doing a superlatively good job of washing, has rendered a valuable public service.

In so doing the company has greatly strengthened and expanded its business. Our washing machine business is now substantially larger than our electric cleaner business on which Hoover fame was built. This is a case where a readiness to risk the shareholders' capital in a project which I was always convinced was absolutely sound, allied to skill and enterprise, has been rewarded. And this is as it should be.

Results over many years in the United States encourage me to think that we should be able to maintain a large annual volume of business in Hoover electric washing machines. In the United States the great majority of households, estimated at about 80 per cent, already possess a washing machine, and sales therefore are largely dependent on replacement demand. The washing machine has often to do so much heavy work that the rate of replacement is higher than in the case of some other electrical appliances. The annual retail value of sales of washing machines in the United States is extremely large. It was \$780 million in 1953. This was nearly three times as large as the volume of business in electric cleaners which amounted last year to \$267 million.

In Britain it is estimated that only about 15 per cent of our homes own a washing machine. It will probably take a good many years before the percentage of households equipped with this essential labour saving appliance approaches anywhere near the American percentage. If, say, 60 per cent of British homes eventually own a washing machine (and I think the percentage ought to be higher), the company's share of the annual replacement demand alone should substantially exceed our present annual sales. The outlook is similarly encouraging in many

THE ECONOMIST, MARCH 13, 1954

export markets. I feel, therefore, that our washing machine business is on a firm and lasting basis. I am confident that we shall be able to keep well ahead of our competitors.

During 1953 we sold about one and a half times as many electric washing machines in Britain as all other manufacturers put together. This dominating position has been achieved, not because we lack competitors. There are scores of them, and many of these manufacturers began producing washing machines years before we did. We have established our position on the merits and the price of our products. The Hoover electric washing machine has fully lived up to the Hoover reputation for quality, and indeed has done much to increase that reputation.

EXPORT MARKETS FOR WASHING MACHINES

As I have already mentioned, competition abroad has become much more severe. During the year we introduced the Mark II washing machine in our export markets with good results. We expanded our exports of washing machines compared with 1952, and exceeded the export figures of 1951 in spite of the severe import restrictions in our important Australian market to which I referred earlier. In the export field as in the home market our ascendancy is shown by the fact that we exported during the year twice as many washing machines as all other British manufacturers taken together.

DOMINATING POSITION IN ELECTRIC CLEANER MARKETS

In the earlier part of 1953 our sales of electric cleaners (like our other products) were adversely affected by the uncertainty as to whether there would be purchase tax reductions in the budget. We therefore welcome the removal of uncertainty this year by the Chancellor of the Exchequer's announcement well in advance of the budget that there would be no changes in purchase tax. This departure from precedent is an indication that the government are ready to consider very carefully the reasonable representations of industry.

Notwithstanding the loss of sales in the earlier months of 1953 owing to purchase tax uncertainty, results for the year as a whole were good. Our total turnover in electric cleaners and polishers (including service) was substantially ahead of 1952, and what is more interesting, we succeeded in passing the total of 1951.

The fame of the Hoover electric cleaners has been firmly established for many years. Our position in the industry was fully maintained during 1953. Both at home and overseas we sold substantially more electric cleaners than the total of all other British manufacturers. That we succeeded in doing so in spite of heavy competition is due to the merits of a superior product, marketed by a forceful sales organisation.

We have not rested on our laurels. Last November we brought out a new electric cylinder cleaner which has a number of attractive new features. It has been well received in the home market. We have gradually introduced it in our export markets with good results. This new model should provide useful additional business during 1954.

HOOVER ELECTRIC POLISHER

As I have pointed out on other occasions, the market for the electric polisher is not nearly so wide as that for electric cleaners or washing machines. The polisher is complementary to the cleaner. In hot countries where there are fewer carpets, the demand for cleaners is less and the demand for

polishers is greater. The Hoover electric polisher is an extremely attractive and efficient machine and worthwhile business in this product has been developed. During 1953 the number of electric polishers which we exported was nearly one third of our total exports of all our cleaner models.

THE NEW HOOVER ELECTRIC STEAM AND DRY IRON

In November, 1953, we introduced the Hoover electric steam and dry iron. This is an electric iron of a revolutionary type which has not previously been used in Britain. Two types of iron are combined in one, it is very efficient and yet lighter than the usual type of iron. Demand is brisk and sales have increased in step with our expanding manufacture of this new product.

As the electric iron was introduced almost at the end of 1953 it had little effect on the sales figures for the year. Indeed, owing to the usual teething troubles before launching a new product, there was a loss on the iron of about £60,000 during 1953. In the present year it is already making a useful addition to the company's income.

EXTENSION OF HOOVER RANGE OF PRODUCTS

The introduction of the Hoover electric iron is a continuation of the policy which the company has adopted since the war of steadily expanding its range of products.

Until the war we relied entirely on our famous electric cleaner. But it seemed wise to me that we should use our accumulated skill and experience in the technique of design, production and sales in a wider field. I am glad to say that this policy was warmly approved and has been consistently supported by my colleagues on the board. It is a policy which has proved triumphantly successful. Our business is seven times as large as it was before the war, and five times as large as it was in 1946.

This rapid expansion is based on the most solid of foundations—the quality of our products and the incomparable value that we offer, supported by a virile and united organisation in Britain and many countries overseas.

Before we launch a new product we must be convinced that in design and quality it will maintain and if possible enhance the Hoover reputation. We have steadily strengthened our Research and Development Department, which, under Mr W. C. Bell, is doing impressive work. Years of research and experiment go into each of our products. A vast host of customers all over the world have faith in us, and we keep faith with them.

In pursuance of this policy of planned expansion we began the manufacture in 1946 of the fractional horse-power motor. In 1948 we introduced the Hoover electric washing machine. In 1951 we introduced the Hoover electric polisher. In April, 1953, we launched the Mark II washing machine, which has proved a world winner. In November, 1953, we introduced the Hoover electric steam and dry iron. Throughout these years much intensive research work was done on our electric cleaners and we brought out a number of new models which have strengthened our lead in the industry. Development work is being done on a number of other appliances.

HOOVER PRICES COMPARATIVELY CHEAPER THAN PREWAR

This expansion has given us the advantages of highly efficient and economical mass production. Our expanding turnover has enabled us to build up a progressive Research and Development Department at moderate cost having regard to the volume of our pro-

duction. Our splendid sales-service organisation has had an increasing range of products to handle, with considerable resulting economies. The cumulative effect has been that in relation to the national price level our prices are far lower than before the war.

From 1938 to 1953 the price level in Britain rose by more than 120 per cent. Earnings rose by about 180 per cent. The prices of raw materials rose by more than 220 per cent. But if I take, so far as I can, comparable Hoover electric cleaners, the average price to the public (apart from purchase tax) has risen by only about 28 per cent, quite a remarkable achievement. Including purchase tax, the price has risen by about 70 per cent. I think it is fair to add that the 1953 Hoover electric cleaners are superior in many ways to their predecessors in 1938.

The Hoover electric cleaner (even if we add purchase tax) costs, relative to earnings, only about 60 per cent of what it did before the war. So we have been able to bring Hoover products within the range of a vastly greater number of households, thereby opening up a much wider market.

During these years we have also developed a large-scale export business. We have established or expanded subsidiary companies in France, Belgium, Holland, Germany, Switzerland, Italy, South Africa, Australia and New Zealand. In a number of countries we have made arrangements for assembly or manufacture. We are doing business altogether in about 90 countries.

EXPANSION FINANCED FROM COMPANY'S OWN RESOURCES

This immense expansion has been financed almost entirely out of the company's own resources as a result of the very conservative policy over the years of ploughing back profits. Since 1937, when the company was converted into a public company, we have issued only £175,000 in shares, which provided us with just under a million pounds, and that is all. Nor during 35 years have we borrowed from the banks, except for two quite short periods, including an occasion where there was a sharp increase in purchase tax and we obtained an overdraft in order to finance the payment of this tax before we collected it from our customers.

We have been able to finance our large expansion in spite of increasing tax burdens which have deprived us of resources which would have rendered possible a still greater extension of our range of products. It is gratifying to be able to record that the liquid position of the company, which has been

consistently strong, is stronger than ever before, and the cash resources at the end of the year of Hoover Limited (apart from its subsidiaries) amounted to £2,847,000.

FRACTIONAL HORSEPOWER MOTORS

We manufacture fractional horsepower motors at our very efficient factory at Cambuslang in the Scottish development area. As I have previously mentioned, FHP Motors are a highly competitive product. During the early part of 1953 sales fell. There was however a considerable improvement in the latter half of the year. Certain of our export markets were disappointing, but there was a substantial increase in our exports of motors to the United States where a useful market is being developed. Total home and export sales of FHP Motors and other industrial products were higher than in 1952, but were still about 10 per cent short of the total in 1951.

HOOVER PRODUCTION

Efficiency in production depends primarily on four elements—management, men, machines and materials. The most skilled operators cannot produce efficiently without adequate plant and materials. It is the function of management to ensure that the most modern and efficient plant and the right materials at the right prices are available; and on the basis of a large and assured flow of orders to devise the most efficient and economical production techniques. I believe that our plant and our production methods which are constantly being improved compare well with those of leading engineering companies in Britain and North America. Our production departments are under the skilled direction of Mr B. H. Dyson, our General Works Manager, ably assisted by Mr W. J. Dimmock, Works Manager of our Perivale group of factories which includes our High Wycombe factory; Mr T. E. Groutage, General Manager of our FHP Motor factory at Cambuslang in Scotland; and Mr A. R. Northover, General Manager of our group of washing machine factories in South Wales.

HOOVER SERVICE

With the rapid increase in the number of Hoover machines in British homes—these machines now run into millions—the activities of the Hoover Service Department, under Mr A. G. Colston, have been correspondingly expanded. The great majority of our customers throughout the country make regular use, year in year out, of the Hoover Service, and thereby Hoover machines in the home are maintained at a high level of efficiency. This has helped to earn for our products their enviable reputation for reliability.

SALES-SERVICE REPRESENTATIVES

Our Sales-Service representatives are the personal link between the company and our customers and make a tremendous contribution to the goodwill which we enjoy. They provide the most effective channel through which our sales organisation can bring to the notice of the housewife any new models of existing products and any new products which we introduce from time to time. Much of their success is due to the great care which we take in training them for their duties.

I cannot speak too highly of the loyal and enthusiastic support which we receive from our Sales-Service representatives. We have done our best to encourage them by paying them a good salary and giving them an incentive on their results. Very important, those who show that they have the right qualities are given attractive opportunities

for promotion. Most of the senior executives in our powerful sales organisation have risen from the ranks of our Sales-Service representatives.

The fairly general experience in industry, both in the United States and Britain, is that the average length of service of outdoor representatives is rather short. In many cases it is reckoned in months. We in Hoover Limited have endeavoured to build up a contented outdoor staff. The average length of service of Hoover representatives is about five years, but of course many of them serve much longer. They are a fine body of men and we are very proud of them.

It is interesting to compare the turnover of labour in industry generally. In British industry an employee stays in one job, on the average, for little more than two years.

The development of high morale in a large body of outdoor representatives, distributed all over the country, is one of the most difficult aspects of management. The measure of success we have achieved is due to our constant endeavours to encourage our staff and understand their problems, and the stress we lay throughout the organisation on the importance of team spirit.

Team spirit does not grow on trees. It is the reward of years of unremitting effort. Creation of the team spirit is one of the chief responsibilities of top management.

EUROPEAN MARKETS

I now turn to a review of our markets abroad, and I begin with the Continent of Europe. In France we are doing well and have improved both sales and profits. Our factory at St. Ouen, near Paris, completely manufactures our electric cleaner. The Mark I washing machine is manufactured on our behalf in France and similar arrangements have been made for the Mark II washing machine. The latter will be marketed shortly and should help to expand sales. Our business in France is now about as large as the company's whole business before the war. It has been placed under the experienced direction of Mr C. H. Crowlie, who has been with us for many years.

Belgian sales have been well maintained and have been considerably helped by the introduction of the Mark II washing machine. In Holland, business has been very difficult. Our market in Germany is developing in spite of strong local competition; it is believed there are useful prospects here of increased business. Conditions in Switzerland have become more difficult, but there has been an improved trend in recent months. Sales in Italy have increased, following the introduction of the Mark II washing machine. Exports to other European countries have been satisfactorily maintained. Results in Finland have been particularly good; we are now sending parts there for local assembly.

MANUFACTURING IN AUSTRALIA

Results in Australia were substantially better than in 1952 but still considerably behind 1951. As will have been seen, the fall in profits there was more than made good elsewhere.

The most important development has been the formation of a new subsidiary company in Australia, Hoover Industry Pty. Ltd., wholly owned by Hoover Limited, for the purpose of manufacturing our products. In the first instance we shall manufacture the electric washing machine. We have been led to this course by a number of factors. The severe import restrictions imposed at the beginning of 1952, although they have been somewhat relaxed, still seriously limit the volume of goods we can send to Australia.

Secondly, the cost of packing and transport is disproportionately high owing to the long distance and the fact that freight is charged on cubic content. Thirdly, import duties and heavy insurance charges are an obstacle in the way of maximum sales.

We have opened a factory in Sydney and it has now commenced the assembly of our electric washing machines. Gradually it will undertake production of the entire machine. Manufacturing in Australia will ensure savings in cost and should help us to expand sales. Another advantage is that we have an import quota for labour-saving appliances generally. Manufacturing the washing machine in Australia will enable us to concentrate our quota on other products and so increase the export of these products from Britain.

The capital cost of equipping the factory at Sydney will be offset by the reduction in our investment in goods in the "pipe line"—a considerable number of washing machines are normally in transit to Australia at any one time. The factory should be in full swing by the end of the year.

I should like to express warm appreciation to Mr Neil O'Sullivan, the Minister for Trade and Customs, and the other Australian authorities who have been so helpful. They have welcomed our proposal to manufacture in Australia and have endeavoured to lighten our task where possible.

In view of the importance of this manufacturing project we arranged for one of our directors, Mr P. J. L. Attwood, to spend a good deal of time in Australia so as to provide the necessary drive and impetus. He has done a magnificent job and we warmly congratulate him.

SOUTH AFRICA AND NEW ZEALAND

Business in South Africa has been well maintained at a somewhat higher level than in 1951. Electric cleaners and polishers and the Mark I washing machine have all made a satisfactory contribution to our sales. The Mark II washing machine was introduced towards the end of 1953 and should stimulate sales during the present year.

In former years we have been almost entirely excluded from the New Zealand market by rigid import restrictions. I am glad to say that import licences are now no longer necessary. We considerably increased our export of FHP motors, and we have made a new beginning with our other products. Trade is still hampered by shortage of UK sterling but there are now substantial possibilities in this market. To utilise these to the full we have formed a new subsidiary company, Hoover Sales and Service Limited, in New Zealand.

DOLLAR MARKETS

The dollar markets are well known to be difficult and it is therefore gratifying to be able to record progress. Our exports to the United States during 1953 were more than three times as much as in 1951 and more than four times as much as in 1952. There is scope for developing worthwhile markets in the United States for various types of FHP motors.

Results in Canada, a dynamic country and potentially a most important market, have continued to be disappointing. Exports to Canada during 1953 were higher than in 1952 but fell somewhat short of 1951 when the total was unimpressive.

ASIA

We have continued our strenuous efforts to develop markets in other parts of the world. We have sent our products to most of the countries of the Middle East. In the Far East, Japan is the only country where

we have made useful progress. Our chief export to Japan was the Mark I washing machine, and we also exported an increased number of electric cleaners and FHP motors.

I can illustrate in striking fashion the disproportion between population and the size of our markets in some countries. India, Pakistan and Indonesia together have a population estimated at about 500 million. The total of our washing machine sales to these countries last year was 405, which works out at one machine for each one and a quarter million of the population. At this rate we could sell about seven washing machines a year in London.

CENTRAL AND SOUTH AMERICA

In a number of Central American countries we have made some progress. We are endeavouring to develop the Mexican market.

In South America we are seriously hampered by import restrictions and shortage of sterling. In order to develop these potentially important markets it has become necessary to arrange local assembly or manufacture. In the Argentine the Mark I electric washing machine is now being manufactured. We are sending washing machine parts to Chile and Uruguay for local assembly. Business with these two countries and Peru has been maintained on a useful scale.

With a view to exploiting the potential of the South American markets to the full we have made provisional arrangements for one of our directors, Mr S. T. Matthews, who knows this territory well, to go there to be on the spot in order to stimulate developments. Trade ambassadors have no easy task these days and it is only by maximum efforts that we can maintain and strengthen our position in markets abroad.

FINANCIAL RESULTS

Our consolidated profit for 1953, as I have already mentioned, was £3,095,000. This profit was arrived at after deducting £716,000 for depreciation which is based on the present high cost of replacement. The corresponding amount deducted for depreciation the previous year was £571,000. The liability for taxation is £1,774,000. This includes an amount of £224,000 in respect of excess profits levy which terminated at December 31st last. Other things being equal, we shall have this additional amount available in respect of 1954.

From the balance of £1,321,000, the sum of £39,000 has to be deducted in respect of interests of outside shareholders. The profits retained by our subsidiaries amount to £239,000 thereby strengthening their position. This leaves a balance of profit to be dealt with in the accounts of Hoover Limited, of £1,043,000.

It is necessary to add the sum of £753,000, the balance brought forward from last year. This brings us to a total of £1,796,000.

We have transferred £200,000 to the general reserve of Hoover Limited, the same as for 1952, as against £125,000 in respect of our previous record year of 1951. This increases the general reserve of Hoover Limited to £1,125,000, which is very satisfactory.

We have decided to transfer £100,000 to reserve for the employees' free superannuation scheme as against nil last year. I have pointed out on more than one occasion that in this matter we treat each year on its merits.

DIVIDENDS

After making these transfers and deducting the dividend (less tax) on the preference stock and the interim dividend (less tax) on the

ordinary stock, we are left with a balance of £1,375,000. The board, after very full consideration, have decided to recommend a final dividend of 1s. 9d., less tax, on each ordinary stock unit, making a total for the year of 2s. 3d., less tax. On the basis of this distribution the dividend payable under the articles of association on the "A" ordinary shares amounts to 3s. 8.7132d., less tax, per share.

After providing for these dividends there is left to be carried forward an amount of £851,000, an increase of £98,000 over the amount brought forward from last year. The liquid position of the company is very strong, stronger than ever before. At December 31st last the cash resources of Hoover Limited (apart from its subsidiaries) amounted to £2,847,000 which exceeds the total issued capital of the company.

I stated two years ago in my annual review that "the board of directors of the company take the view that subject to the need for keeping the company strong and preserving its power to expand, it is our duty and should be our policy to do the best we can for our stockholders." Our reserves and cash balances show a position of great financial strength, and as already pointed out we have financed our expansion out of our own resources.

The total ordinary dividend for 1951 was 1s. 9d., less tax; for 1952, 1s. 3d., less tax; and the total dividend recommended in respect of 1953 as mentioned above amounts to 2s. 3d., less tax. The board are indeed gratified that it is possible to make good the reduction which the ordinary stockholders suffered last year (for the increase amounts to no more than that) and to justify the faith which they have consistently shown in the company. As to the future I repeat what I have said in previous years—it is the policy of the company to treat each year on the merits of the case and to do the best we can for our stockholders.

THE IMPORTANCE OF INCENTIVES

The dividend on the "A" ordinary shares was sharply cut last year to just under 11d., less tax, as compared with 3s. 3d., less tax, in respect of the year before. This particularly affected our senior executives, about 100 of them, who have holdings of these shares. There is a negative side as well as a positive side to any sound scheme of incentives. Our senior executives understand very clearly that they will suffer if the company does badly and will benefit if the company prospers. This provides powerful protection for the ordinary stockholders.

For various reasons beyond the company's control we suffered a setback in 1952. In spite of continuing difficulties we fought back and more than recovered lost ground. The incentive provided by the "A" ordinary shares has been the spearhead in this major achievement. It is therefore very just that the senior executives should be rewarded by the increase this year in the dividend on the "A" ordinary shares, and the ordinary stockholders will welcome the fact.

We have no doubt that the powerful incentive to our senior executives provided by the "A" ordinary shares has been one of the principal factors in the expansion of the company in recent years and the dominating position it has now achieved.

INCENTIVES TO STAFF AND WORKPEOPLE

In Hoover Limited we believe that incentive is the most potent weapon in the armoury of good management. We practise what we believe. Bonuses for the year amounted to £754,000, apart from piece work incentives and sales commissions. This exceeds the total of the net dividend on all classes of shares which amounts to £645,000.

We place great stress on the importance of incentives in all branches of our undertaking. Apart from sales commissions and piece work incentives, the remuneration of our factory, clerical and various other employees, including supervision, is linked to production efficiency in our overall efficiency bonus scheme. This has worked very effectively. We have instituted a variety of other incentives which all help to build up good morale throughout the organisation. Apart from good basic remuneration, these schemes ensure that the income of every person in the organisation, from the most junior to the most senior, is linked in some way to the efficiency of his department or that of the company as a whole.

EMPLOYEES' SUPERANNUATION SCHEMES

Including the amount of £100,000 transferred in respect of 1953, the total we have now provided for our free superannuation scheme in Great Britain amounts to £610,000. This is supplementary to the Hoover staff pension and group life assurance scheme, which was started in 1935. The Hoover Limited free superannuation scheme launched in 1947 covers all employees who do not come within the staff scheme. The pensions payable under the free superannuation scheme were increased by 10 per cent at the beginning of 1951.

INCENTIVES TO VETERANS IN PRODUCTION

Some years ago we decided that, in view of the shortage of manpower, it was desirable that men who are fit and efficient should go on working after they reach the age of 65. As an incentive to them to do so, the board instituted a system whereby employees for every year that they work over the age of 65 receive approximately 20 per cent additional pension up to a maximum increase of 100 per cent. The company's pension schemes are flexible. If necessary, a man can be retired at 60. But if he is fit we encourage him to go on as long as possible. Some men are better at 75 than others at 55.

Mr Harold Watkinson, Parliamentary Secretary to the Ministry of Labour and chairman of the Government Committee on the employment of older people, recently coined the phrase "VIPs—Veterans in Production" for those over 65 who remain at work. He commended firms who had adopted the policy of encouraging employees to continue work after 65 if fit, and I am glad that Hoover Limited has been one of the forerunners of this movement.

The very existence of the country depends on maximum production, and to retire men at 65 who are fit and willing to work is harmful both to the individual and to the national interest.

THE CHARLES COLSTON TRUST

My colleagues have asked me to say a few words about the Charles Colston Trust which I have not previously mentioned in my annual reviews.

I founded and endowed the Trust in 1948 for the purpose of assisting Hoover employees and ex-employees. It is administered by three trustees, Sir Harold Webbe, Mr Eric Davies and my daughter, Mrs Joan Kidde. The Trust has performed valuable service by helping employees and past employees, and the widows and children of past employees. I am happy that this work has been done unobtrusively and in a warm human spirit.

When creating the Trust I made it a condition that it should be wound up by 1968. It was my desire that a substantial portion of its resources should be used to benefit some of the men and women, or the families of men and women, who had worked with me

so faithfully and loyally for so many years. The capital value of the Trust has now reached over £400,000.

PROSPECTS FOR 1954

Sales for January and February, 1954, have been excellent, a very substantial improvement over the corresponding periods in the record years of 1951 and 1953. We shall have the benefit of a full year's sales of the new products which we introduced in 1953—the Mark II washing machine, the new cylinder electric cleaner, and the steam and dry iron. We expect also an expansion of our Australian business as a result of our commencing to manufacture the Mark II washing machine there. Assuming that there are no major upheavals in the world, we can look forward with a fair measure of confidence to a satisfactory improvement over the results of 1953.

RETIREMENT FROM THE POSITION OF MANAGING DIRECTOR

After the forthcoming annual general meeting, when I shall have completed 35 years in the service of the company, it is my intention to retire from the Board and the position of managing director. My friend and colleague, Mr J. A. Wykes, who has been deputy managing director for the last eight years, has been appointed managing director to succeed me with effect from April 5th next. With Mr Wykes at the helm we are confident that the leadership of the company will be in strong and safe hands.

I look back with gratitude on a long period of creative activity. For the last 27 years it has been my privilege to be the chief executive of the company. I have seen it grow from three or four men to the position which it holds today where we employ more than 12,000 people. I have enjoyed a rare measure of affection and loyalty, and I have been heartened in all difficulties by the spirit of unity in the company which has been the source of much of our strength.

If Hoover Limited by reason of its qualities of originality and vision, its skill and energy, has helped in some small measure to increase the fame of British industry in the markets of the world, and if I have been able to make some contribution to what has been achieved, I am content.

I should like to express my gratitude to the great fellowship of men and women who have worked with me, from Jimmy Wykes to the youngest apprentice.

I hope my colleagues on the board know how much their support and friendship have meant to me. I am especially grateful to my friends, Eric Davies and Harold Webbe, for their wise counsel based on a mature experience of men and affairs.

I desire to add a word of tribute to Mr H. W. Hoover, the chairman of the Hoover Company of America. I have worked with "H. W." on terms of growing intimacy for more than 30 years. His exceptional business abilities have been surpassed only by his great human qualities—his capacity for generous friendship, his steadfastness and faithfulness; above all, the wisdom and statesmanship so essential to a man who stands at the head of a great organisation. He is retiring from the board of Hoover Limited at the forthcoming annual general meeting. He has all our good wishes.

THE FUTURE OF BRITISH INDUSTRY

Hoover Limited, by reason of the united efforts of those who work in this great undertaking, has made a contribution to strengthening and increasing the prestige of British industry in the world. Other companies have done the same and more. That we have

succeeded in doing so in a hard, competitive era is evidence that the innate qualities of those engaged in industry, if wisely directed and used to the full, can enable us to hold a place in the industrial leadership of the world.

It is difficult to argue with geography. Britain does not possess the immense spaces or the vast natural resources of the United States or Soviet Russia. Their populations are far greater than ours, and as the years go by this disparity in population will inevitably grow. We cannot compete with these industrial giants in size, but in quality, if we do our utmost, we can hold our own.

Britain may be proud of the genius of her scientists and the skill of her technicians and craftsmen. We led the industry of the world for a century. We have a great heritage of experience and achievement.

We are blessed with a tolerant and mature civilisation. Our people, underneath their surface differences, are united as no other. If each of us gives of his best in a united effort, British industry may with confidence face the unpredictable future.

THE MONOTYPE CORPORATION

CURRENT TRADING IMPROVEMENT

The forty-sixth annual general meeting of The Monotype Corporation, Limited, was held on March 9th in London.

Brigadier Sir George Harvie-Watt, Bart, TD, ADC, QC (chairman), who presided, said:

The year now reviewed has been one of exceptional trading difficulty and we, in common with many other engineering and machine-making concerns, suffered a sharp recession in trading, especially during the first six months. This had an adverse effect on the company's output and its profits, compared with the year immediately preceding it. This possibility was not unexpected, being foreshadowed in last year's report. Since the end of the financial year, however, there has been an encouraging increase in our order book.

The results of our business show that the postwar period, 1948 to 1952, reflected the abnormal conditions obtaining throughout the world. There was then a shortage of printing machinery, but that has now been overtaken. Although the unpredictable checks on international trading still remain with us, I am glad to say that we maintain a good proportion of export business.

BALANCE SHEET FEATURES

Turning now to the balance sheet, you will notice a contraction in our net current assets of some £57,000. Fixed assets are up by £67,354 at £669,083. The main cause of this change is the cost of the new Matrix Building. In the balance sheet of the parent company the amounts due from subsidiary companies show an increase, which is brought about mainly by greater activity in Germany and France.

For some time we have been using the service provided by the Export Credits Guarantee Department of the Board of Trade. Our holding of tax reserve certificates has decreased from £527,000 to £210,325, mainly because we have paid out £242,000 during the year in respect of taxation assessed on the higher profits of the earlier years. Current liabilities, including provision for the payment of the final dividend, are down from £604,856 to £474,906.

You will notice that we have reallocated our reserves by consolidating them into one

figure. This is now shown in the accounts as a general reserve of £787,437. This regrouping, we feel, helps to simplify the presentation of the position.

DIVIDEND FULLY COVERED

This year we have placed nothing to reserve. The substantial allocations we made during the postwar years have enabled us, out of our own resources, to finance the large extensions and developments we have made. We feel justified, therefore, in recommending the payment of a final dividend of 6½ per cent, less tax, making 9 per cent for the year. The dividend repeats that of last year and is fully covered by results.

TRADING ACTIVITIES

Our new Matrix Building came into production during the late summer of 1953. It is proving of great value in the quicker and wider supply of Matrices. During the year the cutting of exotic type faces was extended to include Burmese. Equipment especially designed and made by the company and encouraged by the active assistance of the authorities in Burma was shipped to Rangoon and is operating to general satisfaction. The work was accomplished under the auspices of the American programme of technical assistance for under-developed countries.

Details of the "Monophoto" Type Composing Machine were released to the trade and technical press in December last. One of these machines has been with our friends in America, the Lanston Monotype Machine Company of Philadelphia, for some time, and has aroused much interest in the trade. Further machines of this type are now in process of manufacture. We continue to develop other items of interest to the printing trade.

Some months ago we put ourselves in a position to take on Government defence work of a type fitted to our machinery and a measure of this is now in process of manufacture.

Our general manager, Mr Silcock, maintains his contacts with customers all over the world. During the past twelve months he has visited the Lanston Monotype Machine Company in America as well as our subsidiary company and agencies throughout Africa.

NEW LONDON PREMISES

Our organisation in London has had to work under conditions of considerable difficulty since the destruction by enemy action of our freehold premises in Fetter Lane on the night of May 10, 1941. I am happy to say that formalities have now been completed and a licence obtained for rebuilding. Work has already commenced. On completion next year we shall be able to operate in London not only with greater effect but from the same location in the heart of the printing trade as that with which the company has for so many years been associated.

Sir Richard Snedden, CBE, was co-opted to the board in the course of the year and, in accordance with the articles of association, now comes up for re-election.

THE OUTLOOK

It would be unwise to attempt any forecast of the future. On present facts, however, I can say that for the first few months of the year ending September, 1954, our order book shows some improvement and our outlook is encouraging. We are active in all our territories and have no doubt of our ability to obtain a good portion of the business that may become available.

The report and accounts were adopted.

THE CHARTERED BANK OF INDIA, AUSTRALIA & CHINA

A CENTURY OF SERVICE TO TRADE AND INDUSTRY

MR V. A. GRANTHAM'S STATEMENT

The one-hundredth ordinary general meeting of The Chartered Bank of India, Australia & China will be held in London on March 31st.

The following is an abridgment of the statement by the chairman, Mr V. A. Grantham, circulated with the report and accounts for the year 1953:

The year 1953 was doubly auspicious for the bank. By the happiest of coincidences the centenary of Queen Victoria's granting to the bank a Royal Charter of Incorporation was celebrated in the coronation year of her great-granddaughter, Her Gracious Majesty Queen Elizabeth II. During the month of June British Commonwealth communities in the east held festivities in celebration of Her Majesty's coronation and many of the bank's buildings were beflagged by day and illuminated by night. Later in the year our branch managers invited friends of the bank to join them in commemorating the one-hundredth anniversary of the foundation of the bank.

These functions evoked many public tributes to the services rendered by the bank to trade and industry. We all have been deeply moved by the warmth of felicitations extended to the bank, on the occasion of its centenary, by a very large number of banking and commercial institutions throughout the world. Charter day, December 29, 1953, was commemorated in London by a service of thanksgiving held in St. Helen's Church, Bishopsgate, attended by the court of directors, the head office executives and a large company of the Staff.

SATISFACTORY RESULTS

The summoning of the one-hundredth annual general meeting of the stockholders might be regarded as affording an opportunity to speculate on the future of British banking in the east, but the temptation to do so is one which I must resist. In all the statements I have made to the stockholders as chairman, it has been emphasised that the Chartered Bank, established as it is throughout southern and south-eastern Asia and the Far East, has given many hostages to fortune and this is no less true at the present time.

Two years ago I explained how policy and organisation have been adapted to swiftly changing political conditions in the east, and I described the steps we have taken to preserve, so far as it lay in our power, the goodwill of the bank in situations which had become revolutionary in character. The success which has attended our endeavours so far is reflected in the accounts which accompany this statement and I must point out that the satisfactory results achieved have been largely due to the ability of the general managers in London, the skill displayed by the branch managers in the east and the devotion to duty shown by the bank's staffs everywhere.

THE BANK'S BALANCE SHEET

Compared with last year, there is a reduction of approximately £21 million in the total of the bank's balance sheet. The smaller figure this year is mainly due to the continued fall which has taken place during the year in the world prices of the basic eastern commodities.

On the left-hand, or liabilities, side of the

balance sheet, current and other accounts, fixed deposits and bills payable show decreases of £12,683,484, £2,367,130 and £446,244 respectively.

The substantial reduction of £6,750,644 in the figure for acceptances is largely due to the drop in commodity prices already mentioned; it also reflects increased competition from other banks in Japan, chiefly American, for this class of business.

On the right-hand or assets side, cash in hand, at call and at bankers remains at practically the same figure as last year.

Government and other securities (apart from those lodged against our note issue), bills of exchange (including United Kingdom, Colonial and foreign Treasury bills) and advances to customers and other accounts are down by £7,512,730, £3,875,312 and £1,999,074 respectively.

The reduction in Government and other securities reflects part of the drop in current and other accounts shown on the other side of the balance sheet.

The further contraction in advances follows the tendency shown by bank lending generally and is an additional indication of the deflationary trend which has persisted during the year.

The ratio of cash and call money to our "demand and time" liabilities, excluding notes in circulation against which security has been lodged, is 18.98 per cent.

POSITION MORE LIQUID

It will thus be seen that although the total of the balance sheet is less than it was a year ago there has been no diminution of liquidity; in fact, the position is more liquid.

Considerable expenditure continues to be incurred in meeting the cost of extensions and renovations to bank premises and in the provision of houses for our officers in the eastern branches; consequently, after allowing for £200,000 written off this year, the net figure for bank premises and furniture shows an increase of £115,793 over that of last year.

I now turn to the bank's reserve fund. Last year we augmented this fund by a transfer of £1 million from contingencies, subsequently capitalising £500,000 of that amount. This year we have transferred a further £500,000 from contingencies to reserve fund, thereby replacing the amount capitalised during the year and bringing our published reserve fund up to £5 million.

You will have understood from my more recent annual statements that we have been at pains, so far as is possible, to restore a reasonable relationship between our issued capital and reserve fund and the total of our balance sheet.

Considered as a whole I submit that our accounts display a well-balanced distribution of the bank's resources.

PROFIT AND LOSS ACCOUNT

The net profits for the year amount to £693,798, a decrease from those of last year of £4,984. I have referred in recent years to the general deterioration in working conditions in almost every Eastern country in which the bank operates and have stated that it would be foolhardy not to be prepared for some reduction in profits. These condi-

tions have persisted during 1953 and there has also been a further rise in working costs.

In the circumstances, therefore, I trust that the results achieved will be regarded as very satisfactory.

We paid an interim dividend in October last of 7 per cent, less income tax, absorbing £134,750, and it is proposed that, out of the balance now available, a final dividend of 7 per cent, less income tax, should be paid, costing £134,750 making the total distribution for 1953 14 per cent. It is probably unnecessary to remind stockholders that these dividends are paid upon an increased capital.

We propose to repeat the allocations made in each of the past three years to the pension fund and widows' and orphans' fund of £125,000 and £20,000, respectively. We have again applied £200,000 towards writing down bank premises and furniture account. It is proposed to transfer £75,000 to contingencies account and to carry forward to next year the slightly increased balance of £403,513. I trust the stockholders will approve of all our proposals.

BETTER ECONOMIC OUTLOOK

I felt bound last year to preface my review of the various countries in which the bank operates, in somewhat pessimistic vein, and you will have observed that in dealing with the profit and loss account I have again referred to a deterioration in working conditions in almost every Eastern country, which has been accompanied by a further rise in working costs.

Let me make it plain therefore that notwithstanding these factors I think we can regard the future with rather more hope than we did when I last addressed you.

In certain countries the economic outlook is undoubtedly better. In others there is a more settled political outlook. Some countries have still a very difficult road to travel but they may have passed through the worst of the storm. It is the position of Japan that causes me more concern than that of any other country for it is well to recognise that her well-being is vital to South East Asia as a whole.

Speaking very generally I think we may all have to work harder for less profit but I believe that the possibilities of making profits, even if smaller profits, are more assured than they were. We must always be prepared for the natural emergence of nationalism but on the whole those countries in which we work are realistic in their outlook and we can be grateful for the friendly relationship that exists between us and their governments.

INDIA

Last year I emphasised the importance to India's future of the Five Year Development Plan, first drawn up in 1951, and finally endorsed by the Indian Government in December, 1952. The country's most immediate economic problem is the necessity for an expanding production of foodstuffs to meet the needs of an ever-increasing population, and with this in view a substantial proportion of the investment proposed under the Five Year Plan is being devoted to agricultural development by such means as irrigation and improved methods of husbandry.

The Five Year Plan envisages a considerable expansion in the private sector of the Indian economy and the problem of financing this projected development has recently been the subject of investigation by a government committee. Save only for the statutory reserves which we are required by the Reserve Bank of India to maintain, we already fully utilise our local resources in financing India's foreign trade and in providing finance for jute and cotton mills, tea estates and other export industries. The whole of our business is based on liquidity and therefore we are not in a position to provide long-term finance. I am sure that it is essential to the stability of the Indian economy that commercial banks should continue to function on strictly orthodox lines.

AN IMPORTANT STAGE

During the course of the past year the Reserve Bank has widened the facilities available to the scheduled banks to discount their usance bills. This marks an important stage in the development of the Indian bill market and enables banks more easily to obtain funds from the Reserve Bank at need. The most urgent task in the banking sphere is to promote an increase in deposits by encouraging the population to entrust their savings to the banks rather than keeping their money idle at home. In Great Britain people are accustomed to make payments by means of cheques and in consequence total bank deposits are four times larger than the aggregate note circulation; in India, on the other hand, the use of banks and cheques is not widespread and total bank deposits are less than the currency in circulation.

After an unpromising period at the beginning of 1953, Indian trade and industry recovered the lost ground in the second half of the year. Following two good harvests and with adequate exchange reserves in hand economic prospects seem reasonably favourable and it is to be hoped that substantial progress will be possible in implementing the Five Year Plan on which India's future is so vitally dependent.

PAKISTAN

The past year has been one of extreme difficulty for Pakistan and the country has passed through a severe economic crisis. A year ago I drew attention to the fall in the international price levels of cotton and jute, Pakistan's export staples, which by causing a reduction in the country's export income compelled the government to curtail imports by cancelling the open general licence. It was particularly unfortunate that this setback coincided with a disastrous fall in food production, which forced the authorities to import considerable quantities of wheat in order to avert famine.

This imposed a severe strain on Pakistan's reserves of foreign exchange, but the situation was transformed by gifts of wheat from the United States in particular and also from the Commonwealth. The American gift had the effect not only of solving the immediate shortage of food, but also of presenting Pakistan with a substantial development fund inasmuch as the proceeds of the sale of the wheat in Pakistan are being placed to a special counterpart fund for use in connection with development schemes. Additional financial aid has also been received from abroad in the shape of loans from the United States and a credit for £10 million from Great Britain. The sterling credit, which was announced last July, is intended to finance the purchase in Great Britain of capital goods which will assist in solving Pakistan's food problem.

DEFERRED PAYMENT FOR IMPORTS

During the year suppliers of capital goods both in Great Britain and Japan offered to

ship machinery to Pakistan on a deferred payment basis. In most cases payment was to be spread over a period of five years and the Pakistan authorities published regulations outlining the procedure under which importers might take advantage of these offers. To obtain the appropriate forward exchange, however, it is first necessary for importers to deposit with the commercial banks the full rupee value of the goods to be imported, and so far few transactions of this nature have been recorded.

It is clear that until such time as substantial holdings of foreign currencies are accumulated there is little scope for any relaxation of import restrictions, but the measures taken by the present government have gone a long way towards restoring the country's economy and it is satisfactory that following the previous year's substantial deficit on its balance of payments, Pakistan accumulated a surplus in 1953.

NEW YORK

Our New York office is an indispensable part of the international organisation maintained by the bank. It continues to develop and consolidate our many and long standing connections in both the United States and Canada, and plays an important part in facilitating the business of our branches in Europe and the East.

Last year I emphasised the importance of the United States as a market for the products of the eastern territories in which the bank is established, and the international interest aroused by comparatively slight fluctuations in the volume of commercial activity in that country is a measure of the preponderant influence of its economy in the modern world. This influence has been demonstrated by the widespread publicity given to the recently published report of the Randall Commission on the foreign economic policy of the United States. Here it is sufficient to say that the report contains many recommendations whose adoption would assist the development of international trade, a matter of prime concern to this bank, but we must remember that the Commission's suggestions, however admirable, will not necessarily be accepted by the United States Government or put into effect.

During 1953, American economic activity reached record levels, and the United States Government appears to be proceeding on the assumption that no serious setback need be apprehended in 1954. I hope that this expectation will be fulfilled. The prosperity of the eastern territories in which the bank operates, no less than that of Western Europe, depends very largely upon the continued expansion of the American economy.

CONVERTIBILITY OF STERLING

In my annual statements I have frequently referred to the question of convertibility of sterling, and while I have been insistent upon the need for Great Britain, as banker to the sterling area, to have such convertibility I have advocated caution in any approach to the problem.

Today we are under greater pressure than ever before, both internally and from abroad, to see that convertibility is speedily reached, and it is therefore only right that we should take stock.

In the first place we must bear in mind that those countries in Western Europe that are nearest to fulfilling the conditions necessary for a return to full convertibility have problems entirely different from our own. Some of these nations neither have the internal liability of a heavy national debt nor external responsibilities in the sterling area. We, on the other hand, have heavy

internal liabilities and heavy external responsibilities, and it is these external responsibilities in particular that must make us think very carefully before taking the next step. If we had no such responsibilities we could afford to take greater risks, knowing full well that as failure would end in inflation of the currency in this country, the penalty for failure would be borne by ourselves. But as bankers to the sterling area we cannot risk the credit of our friends who bank with us, and we certainly dare not gamble on the possibility of inflation in this country being acceptable to other countries within the sterling area that are faced with conditions quite different from our own. So, though the truth may be unpalatable, we must realise that unless our own position is assured, we cannot afford to take risks that will involve others, and for our own position to be assured we must have a substantial surplus on our balance of payments and must be able to put into the common fund as much as we take out of it.

NEED FOR FREE EXCHANGES

It goes without saying that we all require a steady growth of world trade and world investment, and that we shall not fully get this until we have a proper system of free and stable exchanges, first and foremost among which must be a stable and convertible sterling, and it is all to the good that we have seen in this country some reduction in taxation and a considerable step towards freedom from controls, both of which factors must help to encourage that private enterprise and those private savings, without which we cannot hope to restore our position in the world. If we in this country could feel more sure that our resources, which we have so patiently built up, would not again be dissipated, we might feel that we were well on the road to convertibility.

In any event, we must have the full co-operation of the USA in any steps that we take, and while the report of the Randall Commission shows that our friends in America are fully alive to our needs, it also shows that we are not likely to get a quick remedy for our trouble from that quarter. Nor, as I said last year, do I feel that it would be easy to apply convertibility to so-called current sterling only.

HARD WORK ESSENTIAL

While our first problem must be to ensure the stability of the purchasing power of the £ at home so that there may be an end to the constant demands for higher wages that can only lead to our exports becoming uncompetitive, it must be clear that a policy embracing full employment and retention of all the benefits of a welfare state under all circumstances, cannot be compatible with complete convertibility and a fixed rate of exchange for the £ unless production within this country increases. In other words, however desirable these benefits may be, this country cannot have them unless it is prepared to work hard enough to pay for them.

As we are so dependent upon our friends in the Commonwealth and as a fixed rate of exchange is essential if we are to keep faith with them and retain the faith of the world in sterling as a world currency, we must operate in this country with this always in mind. I believe that our first steps must be to encourage private enterprise, ability and inventiveness by removing controls and reducing taxation. If this is done we may hope both for a better standard of living and a surplus in our balance of payments, and shall be able more confidently to proceed to the next step towards full convertibility. This next step may well be a determined effort to provide greater freedom of exchange within the sterling area.

THE MERCANTILE BANK OF INDIA

SATISFACTORY LEVEL OF TRADING OPERATIONS

CONSIDERABLE IMPROVEMENT IN WORLD AFFAIRS

SIR KENNETH W. MEALING'S REVIEW OF AN EVENTFUL YEAR

The sixty-first annual general meeting of the Mercantile Bank of India, Limited, will be held on March 30th in London.

The following is an extract from the statement by the chairman, Sir Kenneth W. Mealing:

The balance sheet total shows a reduction from the previous year, due to a decrease in special and temporary deposits, and this reduction is reflected in our holding of Government securities at nearly £7 million lower than last year. Despite difficulties due to drastic import and export restrictions imposed in some of the areas where the Bank operates and to lower commodity prices, the level of the Bank's trading activities remained unaltered, with bills receivable slightly higher and loans and advances showing a small decrease. At £194,687 the net profit is slightly lower than for the previous year, and your directors recommend a final dividend of 7 per cent. If this recommendation is approved, the dividend for the year will be 14 per cent, the same as last year, and I trust you will agree that the results of the year's working are satisfactory.

INTERNATIONAL AFFAIRS

The year 1953 has proved memorable not only in the international field but particularly to the United Kingdom. The cessation of hostilities (I regret I can put it no higher) in Korea; the improvement in the world food situation; the build up of the forces of NATO resulting in diminishing fears of a third world war; all these provide hope of better times ahead. In this island the happy and glittering pageant of the Coronation; the further improvement in the stability of sterling, and of the gold and dollar reserves of the sterling area; the further freeing of the people from rationing, and of trade and industry from restrictions; a return to a policy of incentives by a small but welcome degree of tax relief and a reduction in the food subsidies, these events leave happy memories of 1953 and, I trust, give us renewed hope and determination to meet the problems which lie ahead.

The acute world shortages resulting from the war and the consequent "sellers' market" no longer exist. Two great industrial countries, Germany and Japan, are competing increasingly in world markets and a bracing disinflationary wind is beginning to blow which only hard work and efficiency can temper. On the other hand, the world population is rising and with it commodity consumption should also rise; but the resultant trade will go to those nations producing most efficiently and cheaply. The world continues to be divided by the Iron Curtain, but the Western world's increasing freedom from wartime shortages and restrictions is showing results which must create increasing envy in those countries suffering in the cruel grip of despotic enslavement. The constant flow of refugees from Eastern Europe and the periodical liquidation of top party members in Iron Curtain countries bear evidence of this.

The enormous industrial potential of the United States has been largely employed in preparations for the armed defence of herself and the free world; but the cessation of hos-

tilities in Korea and the greater preparedness of NATO, together with less urgent need for economic help to other countries, has resulted in a business readjustment in recent months in the United States which, if developed, could have serious repercussions on other countries. However, President Eisenhower's Republican Government have made it clear that they have the resources and the intention of seeing that this recession shall not be allowed to develop into a slump, and it is to be hoped that the transition from an inflationary "boom" to stability of production and consumption can take place without incurring the rigours of a sharp trade depression. Perhaps the greatest single cause for anxiety and unrest since the war has been the shortage and rising prices of foodstuffs, particularly in South East Asia with its increasing populations. It is indeed satisfactory to be able to report considerable improvement in the outlook for food crops throughout the world, including South East Asia.

IMPORTANCE OF FOOD PRODUCTION

India's import of just over 2 million tons of foodgrains in 1953, compared with 3.9 million tons in 1952 and 4.7 million tons in 1951, coupled with a particularly good monsoon assuring bumper crops of all kinds in the immediate future, should ease the food situation and greatly reduce the need for importation of foodgrains into India during the coming year.

It is greatly to be hoped that this improvement may be reflected beneficially in the cost of living index, which for November, 1953, stood at 361, compared with 347 in November, 1952, and 333 in November, 1951 (1939 = 100), and thus prove an effective check on the inflationary trend. The Government of India, under the leadership of Pandit Nehru, are fully alive to the importance of food production and have concentrated on irrigation and hydro-electric projects, some of which have been completed, some are nearing completion and a number of others are in hand. In view of India's growing population and the fact that in some years the monsoon fails with serious results to food supplies, such schemes are clearly of vital importance.

FIVE YEAR PLAN

Another anxious factor in the Indian scene is the increase of unemployment, to which the growth of population inevitably contributes. The Five Year Plan now under way is designed, by the creation of hydro-electric power, new industries, better transport facilities, improvement and extensions in agriculture, not only to make India less dependent on imports from abroad, but to provide employment and raise the standard of living of the people. The inevitable time lag before this Plan can come to fruition and the rising unemployment in the interim have provided opportunities for opposition (particularly Communist) criticism of the Government and the Congress Party, but there is no doubt that any fair and unbiased assessor would give great credit to the Government for the vast undertakings it has projected and is doing its best to carry through for the benefit of the country.

One of the government's problems is the provision of finance, firstly to balance the budget and secondly for the plan. This has resulted in high taxation, both direct and indirect. High direct taxation, both personal and corporate, may be anti-inflationary, but it inevitably removes a great deal of surplus income which would otherwise become available as investment and risk capital. Thus the financing of the Five Year Plan is undoubtedly causing the government some concern. On the one hand, revenue from duties on imports and exports is declining and on the other hand the attainment of the target of investment for the private sector under the Plan seems unlikely fully to succeed. Risk capital is shy of high taxation and the passing of the Estate Duty Act in 1953 has not improved the climate either for foreign or Indian investment.

In general the year 1953 has seen a steady turnover of business, albeit on a lower level than in previous years. Cotton textile mills have been moderately active throughout the year and there has been a welcome increase in demand for Calcutta jute products by overseas buyers. The tea industry started the year in the throes of an almost unprecedented slump with prices well below cost of production, and finished the year with prices yielding substantial profits to set off the heavy losses which many companies suffered in 1952. To what extent tea companies will be able to replenish their working capital to a figure commensurate with their crop and intercrop expenditure remains to be seen, but in many cases this is of great importance if they are to be in a position to weather any future slump should one occur as severe as or of longer duration than, the last one.

In the first half of the year Indo-Pakistan relations appeared to be improving. In March a 3-year trade agreement was reached providing for the annual supply of 1.8 to 2.5 million bales of Pakistan jute to India and 80,000 to 85,000 tons of Indian coal to Pakistan, reductions in licence fees, export duties and surcharges on these commodities were mutually agreed.

In August a conference was held between the Prime Ministers of India and Pakistan in New Delhi on the vexed question of Kashmir, at which it was agreed that a Plebiscite Administrator should be appointed by the end of April, 1954. Later in the year relations deteriorated sharply on the issue of American military aid to Pakistan and it remains to be seen whether the Kashmir problem is any nearer solution; what is certain, however, is that the high military expenditure in both countries is unlikely to be materially reduced nor any lasting improvement in the relations between the two countries come about until the problem of Kashmir is resolved.

The principal event of the year in Pakistan was the change in the government last March. The Governor-General appointed Mr Mohammed Ali to be Prime Minister and he and his Finance Minister were faced with an exceedingly difficult task, for the financial position of the country was grave and serious food shortages, if not famine, in some parts of the country were imminent. The free gift of one million tons of wheat from the USA arrived just in time, for it not only relieved the immediate risk of famine but

averted a major outlay of foreign exchange for the purchase of cereals which would have increased the gravity of the financial crisis. The new government took drastic measures to curtail the imports of all but the minimum quantities of vital necessities which has turned an adverse trade balance (from June, 1951, to end of 1952 of Rs. 94 crores) to a surplus of Rs. 29.4 crores in 1953. This welcome improvement has, however, resulted in an inflationary trend caused by the increase in price of commodities in short supply as a result of the import restrictions, whilst this rising price-trend has spread to indigenous commodities, resulting in a general rise in the cost of living. Clearly the only solution in the long term must be an increase in Pakistan's income from exports—not easy to achieve in the face of lower world prices—and a great improvement in food production. In March, 1951, NTR Cotton was quoted at Rs. 148, in March, 1952, Rs. 91 and by March, 1953, Rs. 65, whilst the present price is quoted at Rs. 74½. In order to maintain prices for raw jute, the acreage under cultivation in East Bengal has been reduced from 1.87 million acres to 0.79 million acres for an estimated crop of 5½ million bales.

INDUSTRIAL DEVELOPMENT

Industrial development in Pakistan is proceeding. By the end of 1954 six jute mills will be operating and three more mills are to be added in 1955 and when all nine mills are in operation they are expected to produce 225,000 tons of jute goods yearly. This will complete the first phase of development of the jute manufacturing industry in Pakistan. Self sufficiency in cement production is expected to be attained by 1955, as there will be seven factories producing more than a million tons of cement in that year. A new paper mill to produce 30,000 tons of paper a year commenced production in October, 1953. Several new textile mills are projected with the intention of making Pakistan self sufficient in the cheaper lines of cotton textiles within the next few years.

Considerable progress has been made in the Rs. 11 crore development scheme for Chittagong Port, which is now expected to be completed by the end of 1955. Eighteen ships can now berth compared with six in 1947 and the average "turn round" has been reduced to about ten days.

It is proposed to remove the Chalna anchorage some 15 miles downstream to Mangla and to provide five mooring buoys. It is believed that some 1,800,000 bales of jute have been exported through Chalna in 1953, but it seems clear that the construction of a proper port to serve the hinterland of East Bengal through Khulna is likely to be a long term project.

In general it may be said that Pakistan has retreated from acute financial crisis and is slowly and steadily moving in the right direction. Progress has been made in framing the new constitution which in due course will result in new elections. There are to be elections in East Pakistan early in 1954 on the basis of adult franchise with an electorate of some 20 million. This will be the first election since Pakistan came into existence and may provide an indication of the future political trend of the country.

The heavy burden of military expenditure rendered the proposal of American military aid attractive to Pakistan, as the biggest drain on her limited foreign exchange earnings is the cost of imported armaments. Settlement of the Kashmir problem would undoubtedly bring welcome financial relief to Pakistan, and it would also open the door to friendship and mutual trade with India.

The statement then reviews in detail the position and prospects in the other areas in which the bank has interests.

CABLE & WIRELESS (HOLDING) OPPORTUNITIES FOR SMALL INVESTORS

The twenty-fifth annual general meeting of Cable & Wireless (Holding) Limited was held on March 5th in London.

Sir Edward Wilshaw, KCMG, DL, JP, LLD, FCIS (the Governor), who presided, reminded stockholders that some seven years ago the Telegraph part of the business was compulsorily acquired and they were left only with the other assets which they possessed and the amount of compensation then received.

Sir Edward continued: In spite of objections which had been raised in certain quarters to the continuation of the company as an investment trust company, and, after payment had been made to those in opposition on what were generally considered to be generous terms, those stockholders who remained with us and who showed their confidence have, I think, reaped a satisfactory reward by way of appreciation in the value of their holdings (94 in 1950 to 163/168 at the end of last month) and from the increased dividends which had been recommended (1947 4 per cent, rising to 9 per cent in 1953). In addition it is now proposed to give a free bonus issue of one ordinary share for each £10 of stock held.

TRUST COMPANIES IMPORTANT ROLE

The general policy of your directors is to blend a satisfactory present income with investments with a long-term potential, always having in mind that it is desirable to take an active part in the development of the Dominions, Colonies and this country's overseas territories, but we do not, of course, exclude development in foreign countries. It is our firm belief that investment trust companies such as your own, not only play an important part in the financial structure of the nation but, and this is more important, they provide a means of investing the savings of those who are only able to invest in small amounts. A good investment trust company gives the security essential to such small savers by the spread of its investments. We have in our portfolio a total of nearly 1,000 different investments which have the widest range not only in this country but overseas. Today already more than 10,000 stockholders, including a large percentage of women, are joint owners of our company, and more than 6,000 of them hold less than £200 stock each.

APPEAL TO SMALL INVESTORS

The more small savings can be encouraged the stronger will be the bulwark against disturbing influences. Too frequently such influences result only from lack of knowledge of, and therefore interest in, the part which capital in partnership with labour and management plays in creating new businesses—and employment. An indirect stake in the many enterprises which your company, through its investments, fosters and assists would, we feel, encourage a greater sense of responsibility. To this end, we are making it easier for small investors to buy shares in our company by arranging for the Stock Exchange to quote the company's ordinary stock on the basis of a £1 unit instead of, as hitherto, £100 stock, and this basis will come into force on Monday next, March 8th. We hope that the knowledge of this change will become widespread so that through your company many of limited means may become investors.

The report was adopted and the proposed bonus issue was approved.

THE CONSOLIDATED MINES SELECTION COMPANY

PROGRESS OF OFS INTERESTS

The following are extracts from the statement by the chairman, Mr A. C. Wilson, circulated with the annual report and accounts for 1953, which show a consolidated profit of £258,729 (1952, £253,843) before taxation, £95,031 (1952, £103,896):

Since the end of the war this company has, for its size, played quite an important role in the enormous development programme undertaken by the Anglo American Corporation of South Africa, Limited, group. Our shareholding in Anglo American has for very many years been our most important single investment, and, consequently, it has been the policy of your board to do all in its power to assist in bringing the group's enterprises to successful fruition.

Now that the new mines, particularly those in the Orange Free State, are producing or nearing the production stage, and are beginning to be recognised as an important factor, not only in the future economy of South Africa, but of the whole sterling area, stockholders can look back upon their contribution to these great developments with justifiable pride.

Even now some further time must elapse before rewards in the form of regular dividends are reaped. However, it can, I think, be said that the major problem of finding capital for these new mines has been successfully solved, and already profits are beginning to flow in on a rising scale.

FINANCE

Although our overall balance of "current assets" over "current liabilities" amounts to £200,000 at the year-end, we had drawn on our bank facilities to the extent of £156,000. Bearing in mind that during a period of great expansion we have not raised any additional permanent finance, I do not think that this position is unsatisfactory, but your board is giving consideration to the matter of fresh permanent capital. No major financing is contemplated, but it may be decided to make a small offer to stockholders to render our position rather more comfortable.

For once in a way the poor share markets experienced in 1953 have proved a double blessing to this company—you will see that our liability to excess profits levy is only £4,600. This figure might well have been considerably more because any profits in excess of those actually earned during the year under review would have attracted tax at a penal rate.

However, share prices in 1953 were not such as to encourage your board to be sellers. As a result we decided to hold on for better prices, thereby reducing our tax liability and at the same time reaping the benefit of the sharp all round appreciation which has occurred since the end of last year.

It is, I think, reasonable to expect that our income from our investment in the Far West Rand and Klerksdorp areas will show a gradual improvement and that we shall, before long, start to receive dividends from our Orange Free State interests. Against this one must set the possibility of some recession in commodities which might adversely affect the profits of copper and diamond mining.

However, the operating companies in these fields have been distributing considerably less than their total earnings and to this extent the repercussions of any setback should be cushioned. Generally, I think the spread of our investments gives us reason to face the future with confidence.

BANK OF LONDON & SOUTH AMERICA LIMITED

PROBLEM OF FINANCE FOR EXPORTS

SIR FRANCIS M. G. GLYN'S VIEWS

The ninety-second annual general meeting of the Bank of London & South America Limited will be held on March 30th in London.

The following are extracts from the statement by the chairman, Sir Francis M. G. Glyn, KCMG, circulated with the report and accounts for the year ended December 31, 1953:

Economic conditions in Latin America as a whole during 1953 present a picture of moderate prosperity. Remunerative prices and sustained demand have characterised the international markets for most of the Continent's primary products. Argentina had larger grain harvests and an abundant wool clip; rising coffee prices have benefited Brazil, Colombia and the other coffee-producing countries; cotton, cocoa, sugar, rice and other crops produced in the more tropical areas have been in general satisfactory; petroleum output continues to develop. The producers of minerals, particularly copper, may indeed have met with some difficulties in the course of the year, but it must be admitted frankly that these difficulties are much more those of high production costs than of low world market prices.

Despite conditions that, seen from this distance, are not unpromising though perhaps difficult, and in spite of increases in the United Kingdom's imports from the principal republics in 1953 there has nevertheless been a further decrease of the United Kingdom's exports to Latin America.

The principal causes of this decline are to be found among the year's events in Argentina and Brazil, two countries which together normally account for about half the United Kingdom's trade with Latin America. Although our imports in 1953 from these two countries were almost double the value recorded in 1952, Argentina and Brazil have both restricted their imports, and in consequence our exports to the two republics in 1953 were less than half their 1952 value.

In conjunction with these restrictions our trading position has also been affected by the vigorous activities of our European competitors, principally Western Germany, whose re-establishment in Latin American markets has been felt even by United States traders.

CREDIT FACILITIES

During the past year the question of finance for exports has assumed increasing prominence until it now seems to be of primary importance. In view of the emphasis at present being directed to the necessity of developing the resources of the Commonwealth, the question naturally arises as to whether the United Kingdom can and should take an active part in assisting the economic development of the Latin-American countries. The provision of credit facilities must play a considerable part, all the more so as the main bulk of the imports required there will be capital or semi-capital goods.

Machinery must be found for the provision of financial assistance for periods of, say, two to seven years to credit-worthy importing countries from the normal credit market. This surely is within the capacity of the London market if a quick and simple method of arranging it is devised. How much credit should be provided for the Latin-American continent is of course a different matter, but one thing is certain: that without credit facilities the normal flow of British capital

goods exports to that area will gradually dry up and its place will be taken by those countries—primarily the USA and Western Germany—who are in a position to provide the necessary credit and capital for further development. This is not a happy picture, and maybe it is correct that all our available resources should be directed to the Commonwealth, but it is as well to realise the position. Certainly, until some of the countries in Latin America take the necessary steps to control the inflation within their economies and regulate the situation of their balances of external payments, caution is surely required.

CONCLUSION

The dangers of attempting to reach any general conclusion about an area so vast as Latin America are well known; the widely differing characteristics of these countries, be they racial or climatic, economic or political, make it impossible to do more than summarise some impressions left by recent events and present conditions in the individual republics.

It will not be surprising if the British merchant or trader with long-standing connections in this region will now look to the future with some sense of misgiving; he must have long since realised that the halcyon days of his pre-eminence in this field are gone, and he would be a bold man who would suggest the likelihood of their return in the foreseeable future. Quite apart from the severe competition from other countries, he is faced in almost every country, and particularly in the older republics, with a rising sense of nationalism that expresses itself in a desire for economic self-sufficiency.

The expression of national feeling is nothing new in twentieth-century democracy, and indeed must be considered as almost inevitable so long as the countries concerned are willing to pay the corresponding price in their pursuit of an ideal which is in strange contrast with the political sense of internationalism which seems to be spreading throughout the Free World. But it is all the more disappointing to those of us in this country who are trying to release international trade and finance from the hampering restrictions made necessary by war, to meet at every turn a determination to confine trade to a bilateral national basis conditioned only by the immediate and often purely ephemeral circumstances of a country's economic situation.

POSITION OF INVESTORS AND EXPORTERS

The same factors will also have induced in the prospective investor of long-term capital a sense of caution as regards the future. While he will have observed with satisfaction that Latin American countries, almost without exception, still accept the principle of the unrestricted transfer of interest on new foreign capital and its eventual repatriation, he cannot have failed also to notice the treatment of existing investments in many countries and the many delays and administrative limitations, often arbitrarily imposed, to say nothing of the sudden depreciation of currencies, that so often intervene before the principle is translated into an accomplished fact. It may well be that the future investor in Latin America will look more to the complementary trading advantage that his investment brings, rather than to the normal interest return on his capital and its eventual repatriation.

The British exporter can still play a profitable part in the industrial and commercial progress of this region, and it is perhaps in this field that one can look to the future with most confidence. But the road is not an easy one, there is much hard competition to be overcome, and certain shortcomings in our own exporting processes must be eliminated if we are to obtain our fair share of this desirable export market.

If assurances are to be sought, let me offer to those who doubt my belief that, in spite of the vicissitudes with which we are from time to time confronted and which often seem to be more than merely temporary, traditional British banking, and especially, as in our case, in its international role, still has a part to play in the development of Latin America; and that we shall be expected to continue serving the various countries where we work, with as much advantage to both sides, as we have always done in the past.

BALANCE SHEET AND PROFIT AND LOSS ACCOUNT

After suffering a considerable reduction during 1952, it is encouraging to note from the balance sheet that the total assets and liabilities have increased by £15,437,525 to £161,132,751 despite the adverse effect of lower exchange rates in operation at some branches when the books were closed last December.

Current, deposit and other accounts are over £10 million up at £111,113,957, this increase being spread over nearly all countries where the bank maintains branches, while an expansion in our operations in Argentina accounts for the higher figure of £20,568,437 due to the Argentine Central Bank. The only other variation of note is the increase of £3,043,000 in documentary and other credits outstanding.

Cash in hand, at bankers and at call is £1,724,000 higher at £39,198,110, and despite the strong and liquid position thus disclosed, our interest-earning assets in bills receivable at £50,184,364 and advances at £34,165,758 have been expanded during the year by some £8,253,000 and £830,000 respectively, while investments in foreign government securities are also up by £930,000. There is a decrease of £7,138,000 to a total of £54,646,860 in bills for collection on account of customers, which is accounted for partly by a reduction in volume and partly by payment of bills, settlement of which was delayed last year.

THE DIVIDEND

Your board has given very careful consideration to the amount of the final dividend that they are prepared to recommend. In view of the absence of remittances of amounts at all on account of profits earned in Argentina since mid-1951, the position with regard to earnings in Chile and Uruguay and the heavy depreciation in the value of the Brazilian cruzeiro in the free market, they do not feel justified in recommending a higher rate of distribution for the year.

The net profit, after appropriations for taxation and inner reserves, is £341,778, which is less than last year by £19,316. However, I am glad to say that the remittance position is less unsatisfactory than in recent years, the Brazilian profits having been received in sterling in their entirety, although at varying exchange rates bearing little relation to the official rate.

THE DECCA RECORD COMPANY

PERIOD OF REMARKABLE EXPANSION

CONTINUED DEMAND FOR L/P RECORDS, NAVIGATOR AND RADAR SYSTEMS

SIR CYRIL F. ENTWISTLE'S REVIEW

The twenty-fourth annual general meeting of The Decca Record Company, Ltd., was held on March 10th at Winchester House, Old Broad Street, London, E.C.

Sir Cyril F. Entwistle, QC, MC (the chairman), presided, and in the course of his speech said: The balance from trading accounts amounting to £1,321,932 shows an increase of £121,518 over the previous year and is double the 1951 figure. In view of the very sharp advance in profits for the previous year I feel that you will regard the further increase reflected in the accounts under review as most satisfactory, particularly as the increases in wages referred to in my speech last year were absorbed without any increase in prices. After providing for maintenance of machinery, plant, tools, and charges for depreciation and interest, the profit for the year, subject to taxation, of £951,714 represents an improvement of £151,175 over the previous year. Taxation, including a full twelve months of excess profits levy, rose sharply, but despite this the net profit, after taxation, of £388,894 is larger than that of the previous year. We are recommending a final dividend of 1s. 3d. per share, less tax, making a total for the year of 1s. 9d. per share, less tax, compared with 1s. 6d. per share for the previous year, and this dividend is payable on the capital as increased by the issue of 200,000 shares in March last.

REARRANGEMENT OF CAPITAL STRUCTURE

At an extraordinary general meeting to be held immediately after this meeting proposals are being put forward for a rearrangement of the capital structure of the company. The proposals are to split each existing 5s. ordinary share into one ordinary share of a par value of 4s. and one 25 per cent cumulative preference share of 1s. and then to consolidate five 1s. preference shares into one preference share of a par value of 5s. The effect will be that the existing holder of 100 5s. ordinary shares will have 100 4s. ordinary shares and 20 5s. preference shares. These proposals, which we believe to be of material benefit to the shareholders, have been made in the belief that we can provide the dividend on the new preference shares without diminishing the amount distributed on the ordinary shares.

REVIEW OF OPERATIONS

Our record business has forged ahead with a substantial increase in sales both in the home and overseas markets. As a result of the efforts of our engineers we have been able to improve still further the already high standard of our recordings which we claim without diffidence to be the standard of comparison in the record industry. Despite increased competition we have maintained our long lead in the European classical recording field.

L/P RECORD SALES

It may interest you to know that we have already sold over 9 million long-playing microgroove records with sales for the current year substantially in excess of those of any previous period since their introduction. This total is equivalent to more than 40 million 78 r.p.m. shellac records, a tremendous production even for an industry which talks in millions. The long-playing

record business in this country although improving still lags behind other countries and is, we believe, in its infancy. I am glad to be able to report that both in the USA and Canada we have maintained our competitive position during the current year with increased sales. Sales of our television-radio department will show a further advance over those of the previous year.

THE NAVIGATOR

The business of the Decca Navigator has continued to expand, new hirings once more during the current year showing a greater rate of expansion than those of the previous year. The most important civil contract received during the current year was for 40 installations for British Railways, which, with the 26 ships previously fitted, will provide Decca navigator service for the entire British Railways fleet. European coverage of the system has been expanded by the opening of the French chain of transmitting stations. The large amount of effort in connection with research and development as well as sales on the air side of the business has continued. A new type of flight log has been flight tested in prototype form and is expected to prove the solution to the problems of restricted cockpit space and pilot preoccupation which arise in small aircraft such as helicopters, fighters and private planes. The instrument has aroused wide interest in countries in which it has so far been demonstrated. We believe the Decca system to be the only navigational aid available in Europe which does, in fact, provide accurate position-fixing, and an additional contribution towards safety in the air. A variation of the basic principle of the flight log has been incorporated in a new instrument, the Marine Track Plotter, which is intended for special marine operations. Production has already commenced and substantial export orders have been obtained.

"DECTRA" AND "DELRAC"

We have evolved a new long-range navigational aid, "Dectra," working on the basic Decca principles. This system will provide accurate tracking and distance indication for air routes up to 2,000 miles and should be particularly applicable to the north and south transatlantic routes. In the same field, but for longer-term consideration, a second system, "Delrac," has been devised to provide long-range area coverage for both aircraft and ships on a world-wide basis. You will appreciate that, while our solidly established marine business continues to expand, we have at the same time continued our research and development upon a heavy scale with a view to further expansion in the applications of the Decca system, for which we hope to reap our reward in due course.

RADAR

Decca Radar had a highly successful year with a large increase in sales. Since the beginning of the current financial year a further 150 shipowners or authorities have been added to the list, bringing the grand total of users of Decca radar to over 700 for nearly 3,200 vessels of all types throughout the world. Extensive deliveries have been made to the Royal Navy and to Nato countries under American offshore procurement. With the overtaking of the back-log of orders the rate of new fittings has slowed down,

but it has been maintained at a satisfactory level. A world service organisation which we believe to be unequalled has been established providing efficient Decca radar service either through our own subsidiaries or through agents in over forty countries. The current year has seen a considerable widening of the scope of our radar activities. Having secured a firm position in the marine field, we have pursued a policy designed to place the company in the front rank of world radar manufacturers not only for marine applications, but for an extensive range of civil and military purposes, both marine and air. The advanced nature of our radar design and the quality of our engineering has been noted by both the Admiralty and the Ministry of Supply and we have been entrusted with a range of development programmes advanced in technique and of importance to the security of this country. To execute these programmes we have had to extend an already large research and development organisation, and we are now in possession of well-equipped laboratories staffed with highly efficient personnel.

SEVEN YEARS OF PROGRESS

The following statistics illustrate better than anything I can say the remarkable expansion that has taken place in the seven years from the end of our financial year in 1946:

	1946	1953
Salaries and wages ...	£157,000	£1,592,000
Area occupied ...	sq. ft. 125,000	sq. ft. *630,000
Turnover ...	£1,026,000	£7,320,000
Exports and overseas sales included in the above turnover	£89,000	£3,458,000
	* 1954.	

During this seven-year period, despite the fact that £586,000 has been raised through the issue of new ordinary shares, the net amount distributed to the ordinary shareholders by way of dividend for last year is only £86,000 greater than for the year ending March 31, 1946. Taking into consideration the fact that over the same period wages and salaries increased by £1,400,000 it is quite apparent that the reward to shareholders is insignificant compared with the benefits derived through the large expansion of personnel employed by the company.

I referred last year to the great efforts the company has made in extending exports and overseas trade and the figures quoted showing a phenomenal seven years' expansion are ample proof of their successful outcome.

We are assured of another successful year's trading and have declared a first interim dividend on the ordinary shares of 3d. per share. This dividend is the same in amount as that for the previous year and as already indicated we have every intention of distributing on the ordinary shares in their new form for the year a sum at least as great as that for the previous year.

We have every reason to believe that we can expand our business both at home and overseas and look forward to the future with confidence.

The report and accounts were unanimously adopted and the retiring director was re-elected.

At a subsequent extraordinary general meeting the proposed rearrangement of the capital structure of the company was approved.

Thoughts are free from toll

WILLIAM CAMDEN (1551-1623)

To think is not expensive. It needs no apparatus, no personnel, no premises. The only equipment is in one's head; the gears and pinions of the brain, and the lever that sets them turning.

Everyone can be a thinker. Not a great thinker, perhaps; but the creator, now and then, of a thought that has great consequences. And that is the measure of a thought's greatness: the ripple that it spreads.

At the back of every new industry is such a thought. Can 'it' be made some other way instead? Marketed or assembled more simply? Processed or refined by that method or in this place, instead of as before? A progressive industry is the translation of these thoughts into machinery, buildings and organisation.

But the climate in which such thoughts can first arise, and can be expressed in action, is one of free enquiry and research. Without this, invention gives way to maintenance.

A trained man can be a technician; it takes a free man to be a thinker.

Esso Petroleum Company, Limited

Productivity

What are the railways doing to increase their productivity? Since 1948, when they were unified into a single national system, they have been doing a great deal.

In all departments there has been a strong drive for economy through standardisation and simplification. Simplified working has made possible the closing of 71 goods depots, 34 marshalling yards, 36 motive-power depots and sub-depots.

Despite restrictions on capital expenditure, progress has been made with mechanised handling. Modern techniques are now widely applied in goods depots. More and more, the engineering departments are turning to prefabrication. In the four years 1950-1953, pre-assembly methods were used for the re-laying of over 1,000 miles of track.

The efficiency of freight train operation is reflected by the number of net ton miles hauled per total engine hour in traffic:

	1938	1953
	100	134

Other statistics of operation show advances in efficiency. The following figures speak for themselves:

	1938	1953
AVERAGE WAGON LOAD THROUGHOUT	100	129
FREIGHT TRAIN LOAD	100	129
FREIGHT TRAIN MILES PER TOTAL ENGINE HOUR	100	104

Railway staff have undertaken to co-operate in the great productivity drive. Speaking at the annual dinner of the Institute of Transport, held on 26 February, SIR BRIAN ROBERTSON, Chairman of the Commission, said: "The time has gone when the representatives of management and of the workers can regard themselves as being in opposite camps, seeking constantly to gain a victory at the expense of the other. So far as the railways are concerned at least, there are not two sides any longer. Management and workers are alike faced with a grave common problem which will only be solved by joint effort. In the matter of leadership, I feel that I am entitled to look to the Trade Unions to do their share and to display those qualities of wisdom and statesmanship which this age demands from them."

The Commission know that the railways' productivity record is far better than is commonly believed. And they know, and railwaymen know, that their whole future depends on what they can do to improve on that record in the next few years.

ISSUED BY THE BRITISH TRANSPORT COMMISSION

Hidden Treasure

Nearly 1,000,000 is the estimated number of technical and scientific papers, books, articles and patents published each year throughout the world

And the regular, prompt, and accurate sifting of the relevant information from this mass is of vital importance to the progressive industrialist

Sondes Place Research Institute conducts market surveys, literature searches and patent investigations, and also operates by post a technical abstracting service—all of which, like the many other research and development services offered by the Institute, can be arranged to the specific interests of the individual user in any industry

Industrial research problems and techniques are discussed in 'Report'—the occasional bulletin published by the Institute. Write to us now so that we may put you on our mailing list

JOHN BULL PROUDLY PRESENTS

The Life-Story of Group Captain

BADER

D.S.O., D.F.C.

On Wednesday, March 24, JOHN BULL begins exclusive serial publication of *Reach for the Sky*, the thrilling story of the life of a very great man—Group Captain Douglas Bader, D.S.O. and Bar, D.F.C. and Bar, ace fighter pilot, legless leader of "The Few".

Paul Brickhill has written this superb biography; human, moving and sincere, it is a story of tremendous courage and triumph over adversity, which will almost certainly be the Book of the Year!

Reach for the Sky is typical of the books chosen for serialisation in this intelligent magazine. JOHN BULL's talent for spotting potential best-sellers, and presenting them to a wide and discriminating public, often in advance of book publication, has won it an enviable reputation. Order your copy today.

JOHN BULL

On Sale Wed., March 24—4d.

Thank you,
Malaya

A new chapter in the history of personal courage is being written. It is headed "Malaya". It is the story of people who have put duty before safety, who have stretched courage to new limits and who have lived and worked under the threat of disaster. But courage mounted in the face of threats: British leadership stayed firm in the time of greatest need. The many thousands of people who make up the firm of Dunlop thank Malaya for its tenacity. Malaya has saved one of the world's vital assets—rubber—and has upheld our way of life. Dunlop owes Malaya a deep debt of gratitude. We will repay—by directing knowledge and skill to find new uses for rubber and to create growing markets for an ever increasing range of products. Thus will we again contribute to prosperity for the peoples of Malaya.

DUNLOP makes things better for everyone

First

last

IMPORTANT PEOPLE visit a managing director's office. Its furnishing scheme should do more than form a stimulating background to discussion. It should convey at a glance the company's character and outlook—for first impressions not only count, they last.

We at Heal's have many such furnishing schemes to our credit—for conference and reception rooms as well as boardroom and executive's offices. We can undertake entire schemes in our design studio, or work to the plans of your architect. If you would like to see what we can do, tell your secretary to send for our new booklet, *Furniture for Special Needs*—better still, visit our new Contracts Showroom and look round for yourself.

a Poem in Pigskin

At Bury in Lancashire a small band of craftsmen is expressing an age-old tradition . . . in beautifully stitched and hand-finished briefcases which combine the capaciousness of a conjurer's hat with a handsome 'note-case' slinness.

This particular poem in pigskin has an inside story which is common currency among travellers in five continents . . . a 17" x 11½" briefcase with two interior foolscap compartments and zip-sealed section for overnight things. Capacious exterior zip pocket for newspapers, books, etc. English lever lock and fittings of solid brass. All-leather handle. In golden tan or Autumn tan pigskin at 12 guineas; smooth polished hide (golden tan, brown or black) or natural coach hide at 9 guineas. Matching zip folio cases, size 16" x 10½", available separately at £4 10s. Od., £2 15s. Od., and £3 0s. Od. respectively. Post free and tax free in U.K. (In U.S.A. \$36.25, \$27.25, \$13.50, \$8.25, and \$9.00 respectively, carriage and insurance free, 20% Customs duty payable in U.S.A.).

Zip Folio Case

Complete satisfaction guaranteed or purchase price refunded immediately. Obtainable at the Unicorn Showroom, 39, Burlington Arcade, London, W.1. Telephone: Hyde Park 8939 or by post from our works:

7 days quicker by Gloucester!

Britain's fastest delivery of
blackheart malleable castings

Any other foundry needs 9 days to anneal blackheart malleable castings. But Gloucester Foundry can anneal in 48 hours! The secret is the advanced new elevator-type electric furnace at Gloucester—the only one of its kind in Britain. This means you can have delivery of the first castings within 72 hours.

Gloucester Foundry is fully mechanised for high outputs of blackheart malleable and grey iron castings. Their foundry experts will gladly advise on the design of castings to make the most of the malleable technique. Call them in early while the job is still on the board.

PE TV
for Industry

At the opening of the new Rolls-Royce factory

The first industrial TV broadcast of its kind was held at the opening of the new Rolls-Royce factory at East Kilbride, Scotland. Television cameras at the test beds three quarters of a mile away were linked by radio to two 27 inch direct viewing television receivers and guests were shown a Rolls-Royce Avon engine actually undergoing tests.

There are many circumstances where remote viewing by television can be of great value to industry. For instance, in the testing of any experimental engine the camera could be placed in a position that would be too dangerous for a human observer, the experiment being viewed safely on the screen of a remote monitor.

The Rolls-Royce demonstration was only one of the many ways in which Pye industrial television is helping British and American industry. For further information will you please write to Pye Limited, Industrial Television Division, Cambridge.

In basic form the equipment comprises a lightweight television camera and a viewing monitor; these are linked together by a single co-axial cable which may be any convenient length from a few feet to a thousand feet, depending upon the user's requirements.

The camera, weighing only 31 lbs. and measuring 16 x 6 x 14 inches approximately, carries three lenses giving a wide choice of viewing angles and features a newly developed low-cost camera "pick-up" tube possessing adequate sensitivity to normal industrial lighting. In practical terms, a clearly defined picture will be obtained with a scene brightness as low as 50 foot-lamberts—corresponding to the light reflected from an "average" subject placed 4 feet from a 200 watt lamp in a suitable reflector.

The viewing monitor displays a well-defined picture on a 14 inch diagonal rectangular cathode-ray tube with a built-in "black screen" to permit clear viewing with normal room lighting. A normal domestic television receiver may, without modification, be employed as an additional monitor if required.

Alternative versions of the camera and monitor provide scanning standards of either 405 lines or 525/625 lines and the equipment will operate on any normal AC supply voltage, with a total power consumption of only 350 Watts.

What Sort of Parliament?

ACCORDING to current gossip at Westminster, Sir Winston Churchill and the Cabinet were willing to accept the case for an increase in MPs' salaries, but a clique of Tory backbenchers has howled them into inactivity. If so, two unfortunate consequences may follow. First, the Labour party, most of whose members are worse off than most of the Tory backbenchers, may seethe with indignation at what it will regard as the hypocrisy of a few rich men. Secondly, the country as a whole may be prevented from considering, in a proper spirit of impartiality, one of the most important and difficult questions facing any modern democracy: what sort of Parliament does the country want?

The sort that it has got at the moment is one where politicians still enjoy being MPs, but not as much as they did. It is a pity that the recent Select Committee on Members' Expenses seemed to deny this, and that from every page of its report dispirited ascetics stared at the reader with reproachful spaniel's eyes. A Parliament of spaniels would be a dreadful thing for democracy, but Britain has not really got one. By and large, it still has a rather better mixture than most other Parliaments in the world; in both parties, and both sexes, it has some hardworking and intelligent sheepdogs, some bulldogs, some bloodhounds, and a few yapping pekes. The problem is how the country can keep up this generally satisfactory supply.

If it is to do so, parliamentary remuneration must fulfil three conditions. First, it must be high enough to allow people of the right calibre to try their hand in Parliament without driving their families into discomfort. Secondly, it must not be in such a form that members are inoculated against the ills that fall on other sections of the community when either prices or taxes rise. Thirdly, it should not provide backbenchers with a positive financial incentive to stay in Parliament, even at the expense of toeing a party line which they know ought to be kicked. In general, the fewer "long-service" backbenchers there are, the better will the country be served.

The best way in which a Parliament can live up to these three conditions—no penury, no inoculation against general economic ills, and no unbreakable individual ties with politics—is by its members holding on to outside jobs, to which unsuccessful or unhappy politicians can return with profit and at will. Two objections have been put forward to this argument. The first is that the narrow Government majorities at the general elections of 1950 and 1951 have ushered in a long period during which membership of Parliament must be a full-time occupation. This objection is baseless, because it explicitly assumes that no more than 2 or 3 per cent of the electorate will change allegiance in the second half of the twentieth century. Certainly there is a case for some easing of the restrictive practices which create so much unnecessary work in Britain's Parliament, as in Britain's industries; but there is no case for taking the irrevocable step of putting Parliament on a whole time professional basis, in the

belief that present inconveniences are a symptom of the state of things to stay.

The second objection to a Parliament of flexible amateurs is more valid. Although members can combine such employments as company directors, lawyers, paid trade union officials and journalists with parliamentary duties—as, in fact, two-thirds of them do—it is not really possible to teach in a school or drive a railway train between division bells. It is therefore an immutable principle of modern democracy that parliamentary remuneration must be high enough to enable some men without immediate scope for outside earnings to find their feet at Westminster, to carry out their jobs properly there, and to work their way up to the top. The question at issue is whether the present scale of remuneration allows them to do so, while still not being high enough to induce men who can never rise to the top to go on bumping along the bottom—that is to say, while still not militating against the ideal that back bench politics should never be a lasting profession, but only either a stepping-stone to higher things or else a rather unnerving interlude in an otherwise normal life.

★

Any study of this question involves treading on delicate ground. At the moment members receive £1,000 a year. Apart from free first-class rail travel to their work, free stationery in the House, and free local (London) telephone calls from it, they must meet all expenses out of these salaries. They are helped to do this by the Inland Revenue's regulations about income tax. As a matter of administrative convenience the Inland Revenue assumes that each member will devote at least £100 of his annual salary to meet expenses, and members therefore automatically receive that amount free of tax. In addition, the Inland Revenue sends each member an annual form on which he can claim tax deductions in respect of other expenses up to (though not above) the full £1,000 of his salary. The form lists expenses under five heads, the principal of which are the "additional cost of living away from home when engaged in Parliamentary duties" (which usually means the cost of living in London while still keeping a home going in one's constituency) and secretarial expenses.

In 1952-53 only 5 members did not bother to fill in this form, and therefore satisfied themselves with the minimum £100 of tax-free income to meet expenses. No fewer than 135 members claimed and got tax freedom for the full £1,000, and the average claim allowed was £750. Although the tax authorities are bound to refuse claims for certain banned items of expenses—such as travel by car and the cost of living in one's constituency as well as in London—the chairman of the Inland Revenue told the Select Committee that "we probably question members of Parliament rather less than most people."

There is nothing improper in this, but the implication—derived from the average claim for expenses—that many members are supporting their families

on less than £250 a year does not hold water. What is true is that, in order to keep up the standard of living to which anybody who has become a member of Parliament quite naturally feels entitled, some politicians may have to skimp their duties. Once this is established, the case for some increase in remuneration really gathers preponderant weight. A hard-hearted insistence that salaries should remain at their present level will not do anything to get rid of the hard-pressed professional backbencher; he will stay on in a life from which he still derives excitement and prestige, cutting down on his political expenses and grumbling in the tea room. It is the younger politician with a young family, trying to work up to the top, who will enthusiastically spend himself into debt, and then throw up the sponge before he has made his mark; and this is a bad thing, for all sections of the community and for both parties.

But what form should the increase in remuneration take? It is necessary to be specific. At the moment, thanks to the dusty public reception of the Select Committee's report and to tempting analogies with the practices of private industry, some people's minds are turning towards a reimbursement of expenses—including secretarial assistance provided by the public and an additional subsistence allowance for members who have to live in London but serve provincial constituencies. The disadvantages of such disguised assistance are that it could grow without the public realising what was happening, and that part of it (including secretarial assistance) would not be spent on carrying out the duties of an MP in his constituency but on advertising to that constituency what a fine fellow he was. Perhaps there might be some experiment with the system (tried out in France) of paying a parliamentary typing pool out of public money, possibly attaching a separate pool to each party; but there should be no more than that.

★

If some small steps were made in this direction, however, there could be a compromise about the proposal to raise salaries to £1,500 a year. It might be wise for Parliament to vote that there should be such an increase, but that it should not come into effect until the next Parliament meets; this would have the advantage that MPs in the present Parliament would not quite so nakedly appear to be voting themselves more money, and it might do something to drive home the point that MPs' salaries should not rise automatically with the cost of living—as wages tend to do but many other types of income do not. At the same time, junior ministers should certainly get a salary as ordinary MPs; at the moment, they get only their ministerial emoluments and thus cannot claim income tax allowances for expenses incurred in their capacity as members. There is also a case for differentially higher salaries for ex-senior Ministers; it is in the country's

interest to keep in political life those men who have attained ministerial calibre, as distinct from the perpetual backbenchers, and the drop from £5,000 to £1,000 a year after electoral defeat can be cruel.

There remains the problem of pensions. In this field the Select Committee's recommendations were directly contrary to the country's interests. It proposed no official pension for members who had served for less than ten years, a pension of £350 per annum at the age of 65 for those who had served more than ten years, and of £500 for those who had served more than fifteen years; in fact, the most desirable scheme (from the public's point of view) would be one in which the pension actually went down if a backbencher continued to hang on to his seat. There is no hope of bringing such a scheme into effect, but pensions must not be allowed to pull Parliament in precisely the wrong

The Face of China

WHO and what are the western delegates going to face, when they sit down at the conference table at Geneva in a few weeks' time? Of the Communist delegations, the Russian group will be painfully familiar to veterans of previous marathon wrangles; and the North Koreans need hardly be considered, except for the fascination of seeing one dummy serving two ventriloquists. It is the Chinese faces that will be most eagerly scanned, for this will be the first full-scale incursion into the diplomatic world of the new species of Peking man.

A sad sequence of instances of the snubbing by Chinese Communists of even those people in the free world who have shown their willingness to give them the benefit of every doubt is already on record. It suggests that, as the men of Peking enter more and more into the main field of international relations—for the Geneva conference must be regarded as the beginning of a process of international acceptance of a power which cannot be ignored—they will prove not less difficult to deal with than the Russians, and perhaps even more so. So far, official western contacts with them have been confined to the never concluded negotiations for the opening of diplomatic relations between Peking and this country; to the appearance of a Chinese Communist delegation before the UN Assembly in 1950—when the arrogant General Wu forfeited whatever support he might have obtained; and to the endurance-test arguments at Panmunjom both before and since the Korean armistice. None of these precedents affords any ground for hoping that the presence of Chinese representatives in international conference will introduce an element of sweetness and light, or help to reduce the tension which exists between the West and the Soviet Union. On the other hand, in the days before the Communists came to power in China, Chou En-lai had

direction. A sensible compromise scheme would be one which ensured that no ex-member would get a gross income of less than £450 a year in his old age (or his widow less than £300); but which continued to leave pensions subject to a means test. If members' own contributions were sufficient to raise these figures to £500 and £350 respectively, and to meet certain hard cases, so much the better.

It is never pleasant or easy to pontificate about other people's pay; that is why wage arbitrators always deserve to be treated with both sympathy and cynicism. But the worst thing that the Government could do now would be to run away from the whole issue because of their own backbenchers' well-heeled scowl; those who were rightly irritated by the Select Committee's report (especially the form of pensions scheme it suggested) have a duty to proclaim this insistently and aloud.

a reputation for smoothness in his contacts with foreign diplomats and journalists in China, and if he himself comes to Geneva, there may be some softening of the personal asperity which has been all too common in dealings with lesser figures.

As the Geneva conference draws near, there is increased interest in this country in the old question whether Chinese Communism is the same as, or different from, Russian, and whether there is any prospect of detaching China from Russia by suitable diplomacy. In spite of the unpromising conduct of the Peking government in its foreign relations, there is still a widespread disposition to regard China as a more hopeful field than Russia for the exercise of a policy of conciliation. Past truculence is explained as an unfortunate effect of the Korean war and American non-recognition, and it is believed that there is a reservoir of potential goodwill in Peking if only it can be tapped. It is still held in some quarters that Chinese Communism, being based on a peasant revolution, is really quite un-Marxist; that its driving force is a nationalism which is liable to be as much anti-Russian as anti-Western; and that it is bound to develop on quite different lines from Communism in Europe.

How far does the evidence bear out these generalisations? They are certainly not in accord with the expressed views and purposes of the Chinese Communists themselves—that is, if a proper distinction is drawn between basic doctrine and temporary tactics. It is true that for a period of years after their initial failure to seize power in Shanghai and other cities, the Chinese Communists based themselves on peasant support and developed a technique of rural guerilla warfare which is now the model for revolution throughout Asia. But now that they are in power, with possession of China's industrial centres, the "leadership of

the working class," which always existed in theory, is to be reaffirmed, particularly by concentrating party recruitment in the towns instead of the country.

The party is already faced with the change in relations with the peasantry which inevitably comes when Communists take the first steps on the road to collectivisation. The moves made in China towards collectivisation, particularly in Manchuria, are conceived as a transition through several intermediate stages less abrupt than in the Soviet precedent. But what has occurred is already quite comparable to developments in the "people's democracies" of Eastern Europe, and collectivisation has gone further in five years than in Russia in the ten years after the revolution. In China, as everywhere else, agrarian reform has been a matter of Communist tactics, a bait to the peasants, who are attracted by the promise of land for themselves and do not realise until it is too late that the party's objective is always collectivisation, to be imposed as soon as possible. With all the propaganda about the "union of the four classes," there is in fact no policy for them except gradual liquidation, which is speeded up whenever the party is in a confident mood, and slowed down whenever serious economic difficulties are encountered.

American Activities

The notion generally promulgated amongst us of the people of the United States is that they are a filibustering, rollicking race—filling their newspapers with whole columns of boasting falsehood—haunting tavern bars—swallowing continually mint julep and other spirituous compounds—eternally chewing tobacco, and disfiguring every place they frequent with disgusting spittings—sacrificing their best statesmen and even the judges to party predilections—and forming at once a noisy, restless, anarchical, and aggressive community. So we think the Tory and genteel writers of England have loved to paint them, and so they are thought of by a large number of the public. To the British Commissioners appointed to attend the New York Industrial Exhibition, or rather to two of them—Mr Joseph Whitworth and Mr George Wallis, who have made special reports—we are indebted for a very different description of the Americans. They are more industrious than we are; they work longer and more continuously; English artisans come away from the States because they find the work too much for them; and American factories are regulated with as much care as the best factories of England. The bulk of the people are sober, steady, methodical, and energetic. Unless we direct all our energies to the work of self-improvement, the Americans will surpass us as much in ingenuity and skill, in intelligence and power, as they are certain to surpass us in numbers. . . . With a country offering to their energy almost unlimited means of subsistence . . . while they possess sharpened faculties, habits of industry, and mental energies far superior, taking them as a whole, to any of the yet half-enslaved, debased, and misled people of the Old World . . . they seem certain to become the greatest and most powerful nation that ever existed. England may hope to share in their greatness as hitherto, and may further hope that the two nations may grow together and be more and more closely united as they grow.

The Economist

March 18, 1854

Nor is the case very different with the intelligentsia, about whose widespread sympathy for the Communists a decade ago so much is made by British observers formerly in contact with Chinese universities. In those days the Chinese Communists pretended to them that they stood for democratic rights and freedom of thought, just as they pretended to the peasants that their agrarian programme was one of private ownership and to the small industrialist that they were his champions against the monopolies of the "Four Families." But none of these decoy programmes had anything to do with their real objectives.

China is too large to be a satellite of the Soviet Union in the sense in which the term can be applied to Poland or Czechoslovakia. Chinese national pride is a factor that is always present in relations with the Soviet Union and occasionally it leads to friction; there are signs that the Chinese are jealous of their sovereignty, and that the Russians have been careful so far not to infringe it. On the other hand, the emphasis laid by the Chinese Communist leaders on the international character of their movement and on its Soviet inspiration is maintained to a degree which cannot be explained merely as courtesy towards an ally.

The recent anniversary of Stalin's death called forth a most remarkable outpouring of eulogy from the Chinese press and radio, and a special meeting was held by the Party Central Committee at which his portrait was the object of homage paid to him as "the great leader and teacher of the world Communist movement." He was described as "the great standard-bearer for the liberation of mankind," and the builder of the Communist Party of the Soviet Union, "the most progressive, most experienced and theoretically best equipped party in the world." The highest claim made for Mao Tse-tung was that his theories were "a creative development of Stalin's teachings." Chen Yun explained that Stalin had shown "how to root out the exploiting classes, and particularly the last exploiting class, the kulaks"—a grim warning to the Chinese peasantry; and, turning to the international situation, he went on to tell how Stalin "freed the European and Asian peoples from the threat of fascist enslavement," so that today "the chain of people's democracies, from China and Korea to Czechoslovakia and Hungary, stand around the Soviet Union, forming the mighty camp of peace, democracy and socialism."

Too much importance should not be attached to oratory on a ceremonial occasion. But the sense of solidarity with the Soviet Union in an international ideological cause is most systematically inculcated in China and it would be unwise to assume that it is without depth. At Geneva, for the first time, the two principal Communist powers will be arrayed together at the conference table with representatives of the non-Communist world and the proceedings will be a test of their alliance as a diplomatic factor. It remains to be seen whether the partnership will prove as firm and immovable as the speeches made a fortnight ago in Peking would imply.

Suing the Samaritan

THERE is still a feeling, in some minds, that the man who brings an action for negligence against the hospital in which he has been treated is biting the hand that has brought him gifts. The strength of that sentiment is obviously diminishing, and logically it is not very defensible. The staff and premises of the hospitals are now provided by the public, exactly as those engaged in public transport are; and if an organisation which employs a bus driver has to see that he takes care, why not an organisation which employs a doctor or a theatre nurse? English (though not Scottish) courts now accept this general view, and—within limits—it is obviously a good thing that they should. But the spate of recent cases raises the question whether the present state of the law is in full accord with the long-term interest of the public.

Up to quite recently hospitals did not appear to be legally liable for what went wrong inside their walls. The classic case was *Hillyer v. St. Bartholomew's Hospital*, heard by the Court of Appeal in 1909. A Dr Hillyer went into the hospital as a non-paying patient for an examination to be made under an anesthetic. While on the operating table his arm was both burnt on a hot-water can underneath the table and injured by crushing. He claimed that he left the hospital in rather a worse condition than when he had entered it, and sued the governors of the hospital for negligence. Both the trial judge and the Court of Appeal rejected his suit. The courts said that the governors did no more than provide a place in which treatment could be given; once they had done so, and had engaged a competent professional staff, they were not liable for any carelessness by any member of that staff in his activities thereafter. It might fairly be said that the courts' judgments were a rationalisation of the nineteenth century view of charitable activities. Could the Good Samaritan have been sued for careless handling of the man he helped on the road to Jericho?

This conception—that the managements of hospitals are not liable for negligence although individual doctors or nurses may be—still holds good in Scotland. But English courts have gradually whittled it away; indeed their decisions provide a good example of how the courts can alter laws to accord with a change in social approach without ever confessing that they are doing anything of the kind. An important test case arose fourteen years ago. In June and July, 1940, a girl named Gold was given treatment in an Essex County Council Hospital for warts on her face. By mistake, her face was exposed to Grenz ray treatment by the radiologist without proper protection and it was permanently disfigured. She sued the county council and was successful. The courts declared that the radiologist was a full-time servant of the council and that the local authority was under statutory duty to maintain the hospital as a place for treatment.

This view was strengthened by subsequent decisions; and by 1951, in *Cassidy v. Ministry of Health*, Lord Justice Denning could say: "When hospital authorities undertake to treat a patient and themselves select and appoint and employ the professional men who are to give the treatment, they are responsible for the negligence of these persons in failing to give proper treatment." The courts in other words have reached the point of accepting the analogy between a surgeon and the captain of a ship, who has an independent command and yet who may still make his employer liable in damages if he is negligent in the course of his duties.

This changed concept of the function, and so of the duties, of a hospital authority opened the door to a vast increase in the number of claims against hospitals; and the arrival of legal aid brought people thronging through it. Some of the cases arise from simple forms of mishap. A nurse leaves a hot-water bottle against an insensitive limb for too long and a bad burn results. A nurse puts a tea-tray on a patient's bed without making certain that it cannot spill (that cost the Middlesex Hospital authority £100 a year ago). Other cases are more serious, but still plainly the result of errors. Last week's case of a child whose leg withered because it was enclosed in too tight a plaster seemed to fall in this category. These cases are a fair parallel with accidents on the road, and they are an abuse neither of the health service nor of legal aid.

★

But there is another class of case which raises quite other considerations. This is the action brought against the hospital, and often against the individual doctor in the hospital as well, based on disagreement with the mode of treatment they decide upon. There have been two important cases in the last few months. Towards the end of last year the Southend Hospital and a doctor were sued by the relatives of a man who died after a blood transfusion, because the post-mortem examination showed he had absorbed—possibly at the transfusion—a fatal virus. A month later Charing Cross Hospital appealed to the Court of Appeal against an award of £4,000 damages to a man who had lost the use of an arm after a blood transfusion; there the allegation of negligence had been that the technique used was dangerous. It was argued that an article in *The Lancet* had suggested that this technique might involve some risk, and that a doctor is negligent if he does not read his medical publications with proper thoroughness. In both cases the courts turned the claims down.

Once again, these decisions seem to be in accord with the public interest. Medicine is not an exact science. It is the empirical application of accumulated knowledge and experience to an individual and idiosyncratic human

body. It is bound to be an affair of calculated risk, and it must experiment if it is to progress. Not all the experiments that have produced the advances of the last two centuries would have been made if the surgeon or physician responsible had known that he might have had to account for any failure in a court of common law (and to a jury not wholly free from fear and superstition).

In broad outline, therefore, the present state of the law—that there must be damages for negligence but not for unsuccessful experiments—seems to accord with the public interest. But doctors still have two reasons for uneasiness. First, there must be borderline cases; and when damages are recovered now there is an implication that something like professional incompetence has been proved. Nothing can be done about this, unless the law is—undesirably—either tightened or loosened. Secondly, however, doctors are disturbed by the view that the Ministry of Health still seems to take about where the final burden of damages should lie.

The case of *Jones v. Manchester Corporation*, which was before the Court of Appeal in 1952, arose out of a death under an anaesthetic. The relatives sued both the hospital authority and the doctor who had given the anaesthetic. The trial judge held that the doctor was both lacking in experience as an anaesthetist and negligent on the particular occasion, but ruled that the hospital authority should pay the whole of the damages awarded to the claimants. The hospital authority appealed and asked that the individual doctor should indemnify it completely against all damages and costs, on the grounds that there is an implied condition in every contract of employment that the servant shall indemnify the master against everything the master has to pay out because of that servant's negligence. Lord

Justice Denning doubted that proposition of law; but, where there is a joint liability for damages, the court has power, by statute, to direct in what proportions they are to be shared. In this case, the courts decided that 20 per cent should be paid by the doctor and 80 per cent by the hospital. Where an award of damages for negligence is made against a hospital board, it is still the policy of the Ministry of Health that the board should endeavour to obtain some contribution from the individual doctor concerned.

This policy is indefensible. On practical grounds it is discrimination against a professional class. In effect, it compels each doctor in the public service to reduce his income by the amount he has to pay for an insurance policy indemnifying him against this personal liability. No public authority compels its vehicle drivers to pay out of their own pockets an insurance premium to cover their negligence as drivers (it is not hard to imagine the comments of the Transport and General Workers' Union if any government department were to try). Why compel a public servant who is in a profession to do so? On social grounds it is equally unwise, because it may induce some individual doctors to think first in terms of financial self-preservation rather than in terms of positive action as a curative agency. If the logic of the Ministry officials were to spread, if generals were to be made personally responsible for the pensions of those men killed in any battle they lost, Britain would have neither generals nor victories.

That is the dilemma. If there is a mistake, those who suffer from it should be compensated, by damages. If there are no mistakes, it will mean that the individual doctor has ceased to experiment. The remedy seems to be to leave the law as it is, but to change official views on individual liability for damages.

Dilemma for Europe's Socialists

THE weakness of parliamentary democracy in France and Italy is one of the most serious threats to the western alliance. Flanked on both sides by powerful rivals which reject democracy, the democratic parties of the centre seem incapable of agreeing in office except to do nothing; and latterly the Socialist parties in each country have refused to enter government coalitions even on this condition. In Italy the paralysis of parliament may give the Communists another chance of winning power constitutionally. But even if it is the right-wing extremists who take over, the western alliance may suffer almost as much from their chauvinist intransigence as from a Communist attempt to capture the state machine from within.

The inability of the Socialist parties to play an effective role either in office or in opposition is obviously one cause of the trouble. Nowadays even conservative circles abroad regret the absence of a strong democratic

Socialist movement, such as exists in Britain and Scandinavia, which could rob the Communists of working class support and buttress an enlightened foreign policy. Under Mr Marshall and Mr Acheson the United States made deliberate efforts to strengthen the non-Communist Left in France and Italy with this aim in view. Why then have such efforts so conspicuously failed? Is it, as so many believe, because the continental Socialist is hopelessly doctrinaire, Marxist and anti-clerical?

It is, of course, true that continental Socialists are more doctrinaire than their British counterparts; but so are continental Liberals and Conservatives. It is also true that continental Socialists are anti-clerical; but so are many centre parties in the Catholic countries. As for Marxism, it plays a much smaller role than would appear from the lip-service paid to Marx in party manifestos; indeed, such lip-service is inspired more by

fear of leaving the Communists as sole heirs of Marx's prestige among intellectuals and workers than through belief, or even interest, in Marxist theory.

There are obvious historical reasons why anti-clericalism is part of the democratic tradition in both France and Italy. The Catholic church has usually been conservative in times of great political conflict, if only because it has feared corruption of the faithful by free-thinking—the current Vatican discouragement of French worker-priests is typical. If it had behaved like, for instance, the non-conformist churches in Britain, continental Socialists might have recognised the same debt to organised religion as the Labour party feels. As it is, many continental Socialists are Christians without ceasing to be anti-clerical.

Although since the war progressive ideas have found considerable support inside the Christian Democrat parties, they have never determined their policy, except for a time in France. And in France, as elsewhere, the rigidity of the Catholic parties on such issues as education has repeatedly wrecked co-operation with the Socialists on other matters. It is easy to say that the Socialists should have yielded on this issue; but they could not have done so without losing support to the Communists. On this and similar questions anti-clericalism is popularly regarded as the acid test of progressive politics.

Moreover, in a country with a strong Communist party, the Socialists cannot afford to join a coalition with right-wing parties unless assured of a decisive influence at least over its social and economic policies. If the government fails to move left in these fields then, whatever its foreign policy, the Socialists must leave it, unless they are prepared to commit political suicide. Holland and Austria are the exceptions which prove the rule. In Holland the Socialists dominate the coalition; in Austria the presence of the Red Army has ruined the appeal of Communism, and international factors obviously impose national unity.

In France and Italy, however, the workers are far more conscious of the misery that persists among them than of the national danger. And the lack of civic virtues in both the administration and the administrated prevents the application of the only economic techniques which democratic Socialists have so far found effective. Here the French Socialist Party faces a particularly awkward problem: the civil servants form an essential element in its electoral strength, and it cannot easily lay the foundations for a Socialist policy by rationalising the swollen administration.

These generalisations are amply borne out by the postwar history of the Italian and French parties. During the war the confidence of the Socialist leaders was so low that Signor Saragat, as well as Signor Nenni, favoured fusion with the Communists. They were agreeably surprised in 1946 to surpass the Communists by winning 21 per cent of the popular vote. But Signor

Saragat, the anti-Communist leader, showed a remarkable consistency in doing the right thing at the wrong time. By splitting with Nenni before the issue with the Communists had been properly fought out, he decisively weakened what might have become an anti-Communist majority. And having formed an independent Socialist party he committed it to sharing responsibility in a Catholic government while it was much too weak to influence its policy. As a result his vote fell from 7 per cent to 2.5 per cent in 1953, and he lost more ground through the operation of the new election law. So he was compelled at last to abandon office, at the very moment when his support would have been most valuable. He now looks for a reconciliation with Signor Nenni; but though Nenni himself may some time wish to cut loose entirely from the Communists, his party machine is now so firmly controlled by crypto-Communists that he could not carry it with him without the consent of Signor Togliatti.

★

In France the Socialists avoided a similar disaster through wiser leadership. They lost heavily between 1945 and 1946; but, by leaving the government once it was clear they could not ensure a progressive social policy, they managed to rebuild their strength. They are now the strongest of all the democratic centre parties, with 14.5 per cent of the vote in the 1951 election, and still better results in last year's local elections. The party's secretary-general, M. Mollet, whose survival in that post over seven difficult years is itself evidence of his political flair, launched last summer a campaign to form a Democratic Front by local co-operation with the members of any party who would work for a progressive policy. This is, in effect, an attempt to apply the tactics of the united front from below.

M. Mollet has rejected the formation on the same basis of an alliance in parliament, for fear of becoming involved in the governmental merry-go-round. Some of his critics believe that his reason for this rejection is his strong personal support for the European Defence Community, to which most of the deputies who might agree with him on social policy are opposed. But even if EDC ceases to be an issue, M. Mollet's devotion to the western alliance might prevent him from supporting a government which, though progressive in domestic policy, followed the line of M. Mendès-France on defence and foreign policy.

However disappointing it may be to observers abroad, it seems unlikely that party interest will direct either the French or Italian Socialist parties back into a government coalition, unless their prospective partners undergo a convincing transformation of social outlook. And it is doubtful whether the interests of their countries or of the West as a whole would be well served by forcing the Socialists to commit suicide in office.

Notes of the Week

Night Offensive

THE Government's handling of the annual offensive of the Whitehall warriors showed considerable improvement on earlier postwar practice. The Labour Government developed a habit, which at first the Tories did little to break, of making the Defence White Paper not much more than a summary of the main features of the service departments' estimates; the wider strategy of defence policy remained largely hidden from view, either from a misplaced sense of security or because it was too slight to bear public examination. This, in turn, lessened the importance of the departmental estimates and the annual debates on them. This year's White Paper at last embodied a serious attempt to set out at some length the basis of British strategy, and so was able to leave to the departments a greater share of explaining the detailed plans of the individual services.

It would perhaps be an exaggeration to say that a new broom has whisked through the service departments, but someone has been wielding a brisk duster, and everything points to the hand of Sir Winston Churchill. His service ministers have reason to thank him, for they have been able to introduce their estimates to Parliament with more informative speeches than usual, and the ensuing debates were on the whole more interesting. There is never any lack of ex-servicemen (both regular and wartime) to carry on these discussions, and this year they were augmented not only by the customary pacifist diversions, but also by a Labour Left anxious to stage a political demonstration.

This fell rather flat. The all-night sittings gained a certain amount of publicity, but debates on service estimates usually run into the small hours of the morning without any special intervention from the Bevanites. It is doubtful whether the average elector knew, or cared, that a demonstration was taking place. But having cajoled the Labour leaders into forcing a critical amendment against the Defence White Paper, the Left wanted to sustain the momentum, as part of a general campaign for more vigorous Opposition leadership.

After-Breakfast Speeches

As usually happens when MPs emerge self-righteously from the House at or after breakfast time, the all-night sittings on the Service estimates have revived controversy about the way in which Parliament organises its work. The general public can never understand these nocturnal

marathons, and suspects that MPs are indulging in a peculiar form of masochism or, in the present case, trying to win sympathy for their pay claim. In part the public's suspicions are well founded; some all-night sittings are unnecessary, notably those on "prayers." But others are virtually essential to the effective working of Parliament. Labour has suggested that to avoid all-night sittings on the service estimates, two days should be set aside for each service in future. But if extra days were added in lieu of all long sittings on exempted business, particularly the Finance Bill, the session would have to be extended by several weeks; the only alternative would be for the Government to cut deeply into its legislative time.

What is needed is not the arbitrary banning of all nocturnal sittings but their reduction to those that are really essential. This week a step has been taken to stop all-night sittings on "prayers." Three years ago a few Tory backbenchers kept dozens of Labour's angry and weary old gentlemen up night after night on trivial "prayers." Now the poacher has turned gamekeeper and the Government has thankfully accepted a Select Committee's proposal that all such debates should end at 11.30 p.m., with the proviso that if the Speaker considers that the "prayer" concerned has not been discussed enough he need only adjourn the debate. This is a sensible move but there is unlikely to be much Labour enthusiasm for an unofficial Tory proposal to carry the idea much further. A group of Tory MPs is suggesting that Government business should be approved automatically whenever the Opposition cannot raise 40 members. It is possible that Labour members are being unduly stuffy in standing by the undeniable principle that it is not their duty to expedite Government business; but it is for them, and not for the Tories, to decide whether they are being unwise in getting too frequently in that business's way.

New Model Army

THE Government has come out of the tedium of these defence debates in the House of Commons, and from this week's epilogue in the House of Lords, with some refreshing proposals for giving a new look to service conditions. In the Commons' debate last week Mr Head was able to cap the recent pay increases for regular forces with the announcement of new travel and leave concessions for troops serving in Kenya and the Middle East. As from April 1st regular soldiers who are separated from their families will be allowed one free flight home a year after spending nine months in these theatres. After two years all parents whose children have been left at home will be

allowed to have them out for twenty-eight days' holiday a year. The Air Council has also announced some special concessions (such as furniture allowances) for RAF men serving overseas. Such concessions, designed to soften the rigours of service life, are badly needed. They will probably do as much as, or more than, straight pay increases to help to keep the regulars in harness.

A grimmer note was struck in the House when Mr Sandys, the Minister of Supply, announced that bacteriological experiments are to be carried out in Bahaman waters this year. These are not in themselves a novelty; research on germ warfare has been going on in this country for many years, but the empty spaces in West Indian waters offer more scope for investigations which no responsible government should hesitate to undertake. A bigger question mark hangs over the announcement that next year's estimates for Civil Defence are to be cut by £2 million. The cuts fall chiefly on equipment and materials, which are the only heads under which the civil defence authorities have been spending much money; so much equipment was bought to help Lancashire out of its 1951 textile slump that stocks are now overflowing. These estimates were probably mainly prepared before the recent Select Committee criticised the inadequacy of civil defence; although the burden of that committee's complaint was not that estimates were too low, but that expenditure never came up to them, the virtual standstill in the most important forms of civil defence expenditure seems bound to leave the civilian population with a distressingly naked look.

Voting Without Choice

THE 1,347 hand-picked candidates for the Supreme Soviet have duly polled 99 per cent of the votes in the Soviet parliamentary "elections." After an electoral campaign which sounded as if everything was in earnest, this was a useful reminder that the whole election is a mere formality. The candidates of the "Communist and non-party bloc" are selected from above, and once they have received official blessing need fear no qualms at the polls, since they are unopposed. The electors have the right, indeed the duty, to vote—but not to choose. The Supreme Soviet is supreme only in name and theory, while the real power in the country is wielded by the leadership of the party.

Yet, in spite of this, the candidates are bound to woo the electors and to behave as if they were seeking a real mandate for their policy. This is why the electoral campaign provides an excellent opportunity to hear the official view of all the Soviet leaders on a variety of topics. Malenkov, Molotov, Khrushchev, and others have all delivered major speeches in their constituencies, dealing with both internal and foreign policy.

On the home front, the speakers were sober and business-like. Malenkov once again swung his critical searchlight and sounded warnings against the tendency to rest on one's laurels. He emphasised that planners, instead of listing past achievements, must look forward to the great tasks ahead. The productivity of labour, he repeated, is the real yardstick of progress, and it must be increased rapidly in

all fields. As part of the campaign to raise the standard of life, the targets for consumer goods under the Five-Year Plan should be fulfilled this year, twelve months ahead of schedule. Much emphasis was laid in all the speeches on the new drive to step up food production, which is discussed in an article on page 873.

On foreign policy, the picture was more confused. The claim that all issues can be settled by peaceful means was repeated, "peaceful economic competition" was set as a goal and the resumption of international talks was praised. On the other hand, there was a note of disappointment in all the comments, and Molotov's reference to "plots against the peace-loving Soviet Union" was echoed by all. It was left to Marshal Bulganin to claim that the Red Army is the strongest in the world, and that there is no intention to let it fall behind. The general impression left by the speakers is that, in the Kremlin's view, the best way to negotiate with the West is with the dove in one hand and the H-bomb in the other.

Explosions in Palestine

UP and down the Arab-Israel frontier, the thankless job that is being performed by the UN Mixed Armistice Commission has once again become heavy and trying. In the south, a band of marauders on Wednesday attacked an Israeli bus on the road from the Red Sea port of Elat to Beersheba, which runs close to the Jordan frontier; eleven of the bus's fourteen occupants were murdered outright. On the same day, there was a clash between an Israel army patrol and an Arab band in the Hebron area.

Earlier in the week and much farther north, Syrian gunfire was opened on Israeli fishing vessels close to the eastern shore of Lake Tiberias—the Sea of Galilee—at a point where the Syria-Israel armistice line, coinciding with the old international frontier, runs only ten metres from the east shore of the lake. Israeli police vessels returned the fire with 57 mm. cannon. The findings of the Mixed Armistice Commission, already available on this last incident, were that Syria fired first but that Israel acted reprehensibly in using such weapons to retaliate. Unprecedentedly, the commission went beyond a simple finding of guilt, and recorded the legal rights of the disputants by setting down where the frontier runs. The satisfaction with which this innovation has been greeted in Israel suggests that there was some doubt before whether the line was a permanent one, or an armistice one capable of adjustment at an ultimate peace conference.

Events such as those of this week, and matching ones such as that at Qibya in October, unfortunately render any such conference as remote as the Greek kalends. In both Jordan and Israel there are elements that want one, and favour damping down the violent feelings that follow each outrage. But there are others, vocal in Israel this week as they were vocal in Jordan in the autumn, that favour hanging the consequences and organising reprisals. In the autumn, these elements in Jordan were held in check. There is bound to be great pressure on the Israeli authorities not to keep tempers so controlled.

Sharing Jordan Waters

STILL farther north on the inflammable Israel-Syria armistice line lies the site of another quarrel—that which came to a head in September over the diversionary channel on the Jordan that Israel wants to complete. Border quarrels that take a toll of human life naturally inflame tempers more than arguments about water, but the question of diverting the Jordan is likely to have more far reaching consequences. The Jews have long been draining the Huleh marshes, and by reducing evaporation there have increased the total amount of water in the Jordan. They have also lately constructed large parts of a diversionary channel below the lake that will turn at least part of the Jordan water into a course wholly inside Israel. Before being returned to Lake Tiberias, this water will feed the

projected power station that is shown on the accompanying map. The Syrians complained that the diversion would impair the working of some small mills below the point of offtake, and in the demilitarised zone. They therefore appealed to the Mixed Armistice Commission, which ruled on September 23rd that the 1.5 kilometres of Israel's channel that runs in the demilitarised zone must not be completed. There is, for the moment, stalemate.

The Syrian objection about the mills conceals a much greater Arab fear—that the ultimate purpose of the power station is to pump half the Jordan water by pipeline out of the channel, over the hills, and into the coastal plain. This fear is borne out by maps the Israel government has been using to appeal for American money; not all of the many planning units in Israel think so expensive a water plan is a good idea. If half the Jordan were so diverted, Lake Tiberias would become a salt marsh unless replenished by a diversion of the Syrio-Jordanian river Yarmuk, which is only a trifle smaller than the Jordan. But why, the Arabs ask, should they agree to such a concession? They need at least half the Yarmuk water for Arab purposes on Jordan's east bank.

Of course much the most economic use of the pair of rivers would be a joint scheme. There has therefore been American pressure to this end, and the UN Secretary-General has sent two irrigation experts to the spot; they are at the moment preparing a report on the matter. But both Jew and Arab prefer self-contained arrangements.

THE ECONOMIST, MARCH 20, 1954

Their trouble is that neither can afford them; only this week Israel's premier, Mr Sharett, pointed out to a meeting of army reservists that if Israel used force to complete the Jordan river hydro-electric scheme in spite of UN objections, it would antagonise "allies overseas." He meant allies from which it needs help with money.

Oliver Twists Ascendant

THE engineering workers' decision to reject the employers' offer of an increase of 5 per cent on consolidated time rates is one more blow for the system of mediation in wage disputes. The court of inquiry had suggested that the increase should be "something in the region of a third of the amount claimed." As the claim was for 15 per cent, the employers duly offered 5 per cent. Now the union leaders complain that the employers are treating the court's report as if it were an arbitration award, whereas it had suggested that negotiations should be resumed. Next Wednesday, therefore, at a special meeting of the executive councils of the 38 unions affiliated to the Confederation of Shipbuilding and Engineering Unions, they will decide whether to operate the ban on overtime and the restriction of piecework which were postponed when the courts of inquiry were appointed. It is probable that the engineers will be satisfied if they can edge up the offer only a little; that, across the whole field of industrial bargaining, the unions have now got the employers—and wage inflation itself—gently on the run.

While the engineers, having moved from strike threats to sensible and successful arbitration, have now come back to strike threats again, the Electrical Trades Union is following the same circle but the other way round. The union is spurning the 7s. 4d. a week—or 2d. an hour—which was offered them last week; it wants something extra to show for all those guerrilla strikes. After refusing to consider arbitration for many months, it has therefore asked the Minister of Labour to refer the case to the Industrial Disputes Tribunal; it can do so in the knowledge that its workers are still only at the first stage of the circle, which the engineers and electricians had reached last January. The builders are angry with their employers for suggesting arbitration on their claim for another 9d. an hour. This, they say, is destroying the principles of collective bargaining, and they threaten to take some sort of strike action if they receive no offer by March 25th.

One lone voice in the wilderness has been the Porter tribunal, which has now refused to grant increases to obtained last year by engineering workers generally; it declared that the reasons which might justify an increase in one industry might have no application in another. The sorry consequence of the recent history of wage arbitration is that such a pronouncement is genuinely and indignantly regarded by the unions as old-fashioned Bumbledon, and a gratuitous insult to ascendant Oliver Twists.

THE ECONOMIST, MARCH 20, 1954

Tough Assignment in Kenya

A WIDE measure of agreement has finally been achieved in the constitutional negotiations in Kenya, despite some frightening checks. Mr Lyttelton has been able to leave the colony in the almost certain knowledge that his original proposals will be accepted—willingly or grudgingly—by the leaders of all the racial groups except the Africans; and that the Africans on the Legislative Council have themselves evolved a face-saving formula which does not commit them to stopping any of their members joining the new government. This moderately happy ending to what Mr Lyttelton (of all people) has called the toughest assignment of his life should be greeted with widespread relief.

The original African rejection of Mr Lyttelton's proposals, which led to an untidy flurry of fresh negotiations, seems to have been prompted by resentment on two points. Mr Mathu, the African leader, clearly felt slighted at the lack of confidence shown in him by his European and Asian colleagues. He says he was not consulted during the negotiations between the Governor and the other racial leaders before Mr Lyttelton's visit, and has spoken of a "conspiracy" on the part of the European and Asian leaders to present the Africans with a *fait accompli*. The Africans also felt that their share of non-official representation in the Council of Ministers—one in six—was unfairly small. They held out for two seats, which they were willing to balance by the inclusion of an extra European. Mr Lyttelton circulated this proposal, and some others, among the leaders of the other racial groups. But when it became clear that no agreement was in sight, he reverted to his original plan. The Africans have, however, been given an official promise, according to Mr Mathu, that they will in future be elected directly, instead of through local government bodies acting as electoral colleges.

The various parties to the negotiations have taken their political lives in their hands to get this plan accepted. Mr Blundell and Mr Patel, in particular, have both shown statesmanship—and have still to complete the task of rallying their own racial groups behind them. It is unlikely that Mr Blundell would have been able to win support for any amendments to the plan with which he and those European leaders who agree with him have been stumping the country. The Moslems appear willing to go along with the Europeans.

BRITISH WHOLESALE PRICES
INDEX NUMBERS 1938=100

So probably will the Arabs. For the Hindus, Mr Patel has declared himself in favour of participation; but he may yet have trouble with the Indian Congress, which has not allowed its leaders much rope in the current negotiations. It remains to be seen which African will be offered, and will be prepared to accept, the honourable post of first African Minister between Khartoum and the Cape. If the right man can be found, Mr Lyttelton's changes may yet prove to have been the hoped for watershed rather than a false crest.

Those in Need

THE publication of the estimates for the Ministry of National Insurance and the Assistance Board for 1954-55 is a reminder that among the many claims for relief Mr Butler is now considering those of old age pensioners must rank high. On December 10th last year, Mr Gaitskell was told in a parliamentary answer that the immediate cost of restoring all insurance benefits, including pensions, to the real value they had at the inception of the scheme in July, 1948, would be £10 million a year less a saving of £3 million in national assistance payments; and that to restore the real value they had in October, 1946 (when the new retirement pensions came into force), would cost £51 million, less a saving of £13 million. A few weeks ago, Lord Beveridge told the House of Lords that to put all insurance benefits on a subsistence basis would cost immediately some £100 million to £150 million a year. It is not clear whether he allowed for any saving on assistance payments. Even so, the difference in the two estimates is enormous.

There are two explanations. First, the insurance scheme has never been on a full subsistence basis. At the end of 1945, when the rates of benefit were announced, they were only 2s. below the Assistance Board's scale, including its average allowance for rent. But by October, 1946, they were nearly 4s. below, and by 1948 they were 8s. below. Since 1952 the gap has been 14s., made up of 2s. 6d. (the difference between the present benefit of 32s. 6d. and the ordinary assistance grant of 35s.), plus 11s. 6d., which is now the Assistance Board's average rent allowance. Secondly, the Government used the retail price index—which is not meant to measure the cost of mere subsistence—in the answer to Mr Gaitskell. Between 1946 and 1952, this had risen by 38 per cent; the Assistance Board's estimate of the cost of subsistence, including rent, had increased by 55 per cent in the same period.

If Mr Butler decides to raise insurance benefits, he may think that all he should do this year is to restore their 1946 or 1948 purchasing power and increase the rates by 4s. or 1s. 3d. accordingly. If so, some three million of the existing four million pensioners will be that much better off. But the remaining million, who are most in need; will be no better off because they will merely exchange a few shillings worth of assistance for the same amount of pension. Next year, when the Government actuary has reported on the insurance scheme, a much bigger step will have to be taken if the Beveridge principle of benefits adequate for subsistence is to be adopted.

EDC Scoreboard

LAST week the Belgian Senate followed the example set by the Lower House last November and approved a Bill ratifying the European Defence Community treaty. In both houses the voting cut right across party lines; in both the Bill gained a two-thirds majority; but in neither was it greeted with much, if any, positive enthusiasm. One more hurdle—a revision of two articles of the Constitution—remains to be crossed before Belgium can legally become a member of the EDC. Since under Belgian law constitutional revision can be carried out only by a parliament specifically elected for this purpose, the present parliament has been dissolved and general elections fixed for April 11th.

In Western Germany, where parliamentary ratification of the EDC treaty was completed in May, 1952, the constitutional obstacles are now almost cleared out of the way; the *Bundestag* has voted for changes in the constitution and approval by the Upper House is a foregone conclusion. Holland alone has the distinction of having completed all the action necessary to legalise its membership of the EDC. In France, Italy and Luxemburg no parliamentary action on the treaty has yet been taken. Last week, however, Signor Scelba, the Italian prime minister, reaffirmed in the Italian Chamber his intention of presenting the EDC treaty for ratification at an early date. Its fate at the hands of the Italian parliament is by no means certain; but it is at least something that the Italian government no longer feels bound to make ratification of the EDC treaty dependent on what Italians consider to be a satisfactory solution of the Trieste problem.

Thus the ratification score of the treaty, which was signed in May, 1952, creeps very slowly upward. The obstacles confronting the proposed defence community are so formidable that, in a sense, it is surprising to see the process of ratification going on at all. But it is at any rate encouraging that most of the signatories are using neither the heartsearchings of the French, nor the shrill propaganda from Moscow, as an excuse simply to wait and see.

France Rehearses

THERE have been so many tactical exercises in preparation for the EDC battle in the French Assembly that the roles of most of the contestants are already well known. Last week's congress of the Radical party proved an almost exact repetition of a similar meeting held last autumn. Once again M. Daladier exclaimed, in effect: "over my dead body"; once again M. René Mayer led the pro-EDC troops, and once again the counter-attack was led by the veteran leader, M. Herriot (who seems to be one of the few western politicians to have fallen for Mr Molotov's bait of "Europe for the Europeans"). It was largely due to the prestige of the old warrior that the stalemate was prolonged and the final resolution merely reiterated the preconditions laid down previously, for the mood of the congress has swung, if almost imperceptibly, in favour of M. Mayer.

The victory of Mme Peyroles, a Christian-democratic

partisan of EDC, in the Seine-et-Oise by-election was another heartening sign for the "Europeans." They could draw comfort from it not because EDC played an important part in the vote, but because anti-Communism proved a stronger factor among the electors than divisions about EDC. Mme Peyroles won in the second ballot in spite of a record Communist vote, because, while the Socialist candidate remained in the field, all the other non-Communist candidates resigned in her favour. There is, then, a growing feeling in Paris that the tide is moving at present in favour of EDC.

Yet the success of a first night cannot be accurately guessed from dress rehearsals. There is a general impression that the government is trying to prepare all the psychological effects for the actual performance by announcing in quick succession diplomatic victories on several fronts: German concessions on the Saar, stronger British guarantees, and further American help to end the war in Indo-China. Thus MM. Laniel and Bidault look to Mr Eden, Mr Dulles and Dr Adenauer to help them prepare the stage effects. But when will they be ready for the final performance? Despite the differences both within the parties and inside the cabinet itself, it was thought in Paris this week that the most likely date for the EDC debate would be mid-May, on the assumption that the Geneva conference duly opens on April 26th. All French calculations are now clouded by anxiety as to the outcome of the battle at Dien Bien Phu. Whichever side loses in that remote and desperate struggle will have also lost a vital round of the Geneva bargaining before it begins.

Soviet Trade and Sealed Envelopes

THE Russians are missing few opportunities of pressing their new trade offensive. They can hardly be dissatisfied with their achievements so far, for, while persuading the West to reconsider its strategic controls, they have themselves conceded nothing in return. But this is only the breakthrough, and, as the proceedings at the "Little Geneva" meeting of the UN Economic Commission for Europe (ECE) show, they now intend to exploit their advantage to the full.

It was obvious from the start that the Russians regarded the ECE meeting as an important occasion, for they sent a Deputy Minister of Foreign Trade, Mr Kумыkin, to present their case. Yet the West was taken by surprise when the Soviet delegate tabled his resolution calling for the revival of the long-dormant ECE Trade Committee to discuss not only the "removal of obstacles to international trade"—Soviet terminology for the strategic controls—but also long-term multilateral trade and payments agreements. The British representative, Lord Reading, was right in arguing that ECE, with its wide and mixed membership, has no competence to discuss the Nato countries' security system; but the West might regret the verbal manoeuvre by which the Soviet draft was altered. Even the tight wording of the agreed resolution will not necessarily frustrate the Russian plan to make a propaganda platform of ECE; and it might be a disadvantage to the

BRITAIN'S demand for electricity is greater than it has ever been; more factories and farms, more homes and offices are all using more—and they will require still more electricity in order to raise output and increase our standard of living.

To meet these needs, 40 new power stations have been brought into operation since British Electricity was established and the amount of power available has been increased by 50 per cent. But generating plant, which *could* work to capacity all day and night is *in fact* only required to give full output for short periods once or twice during the day.

If electricity were more widely used by factories, farms, shops, homes, offices and for street lighting—this would keep the generating plant more fully loaded. The demands on the power stations coming from these different classes of consumers would be diversified. That is to say the loads would not occur simultaneously but, in the main, at different times of the day—and continuous full output from the generating plant would reduce the cost of electricity.

western governments, should they want to ask questions about the autarkic Soviet bloc. The last has certainly not been heard of the Russian proposal for long-term trade and payments arrangements.

Many people now expect that attempts will be made to infiltrate trade questions into the discussions at the coming "Big Geneva" meeting. This may be the explanation of the mysterious sealed envelopes which contained hurried instructions calling off, at the eleventh hour, the invitation to a number of British traders to visit East Berlin for talks with the Chinese representatives there.

Bigger School Bill

INCREASES in the education estimates are inevitable so long as the local education authorities have to provide for a growing school population. In the coming year there are, however, two other reasons for the rise, which brings

the total net cost falling on ratepayers and taxpayers from £362.8 million to £392.3 million. One is the increase in teachers' salaries, which comes into force on April 1st. The other is the cumulative effect on loan charges of the postwar school building programmes; in 1954-55 these charges are estimated at £22.4 million, compared with £18 million in 1953-54 and only £11.9 million in 1951-52.

Still Swinging Right

THE Conservatives held on to their seats at the by-elections at Arundel and Harrogate last week, with slight increases in their share of the poll. Although the swings towards them were smaller than at Ilford, Haltemprice and Bournemouth, they can still look at the scoreboard with considerable satisfaction. As the accompanying table shows, all six by-elections so far this year have been in safe

Tory constituencies, and all except one have been in straight fights between the two main parties. Although far fewer people bothered to vote than at the general election

	Conservative Vote as % of Total Poll	Gain in Share of Poll over General Election %
Ilford, North.....	59.8*	+4.2*
Harwich	59.1	+0.2
Kingston-upon-Hull, Haltemprice.	61.8	+3.7
Bournemouth, West	69.7	+4.2
Arundel and Shoreham	68.5	+1.2
Harrogate	70.8	+0.2

* There was a Liberal candidate at Ilford at both the by-election and the general election; the Liberal proportion of the poll increased by 1.5 per cent, so that the Labour loss was 5.7 per cent of the poll.

(the proportion of the electorate voting varied between 45 and 59 per cent, compared with between 78 and 85 per cent in the same six constituencies at the general election) there has been in each case a swing to the Conservatives.

Snakes and Ladders

IN Mr Macmillan's view the Town and Country Planning Bill, which was given a second reading in the Commons on Monday, will not weaken in any way the system of planning control over the use of land. The Government means to preserve this intact, and the Bill will simply amend the financial framework within which planning must operate. The Opposition, however, was on firm ground in insisting that planning and finance are in practice closely interrelated. The Macmillan recipe is to limit the payment of compensation for planning restrictions to a minimum, while abandoning any attempt to tax future unearned increments in land values.

It was this latter point—the failure “to safeguard the public interest in land values created by community endeavour”—on which the Opposition concentrated its fire and decided to divide the House. The battle was a troublesome one for the minority of Labour members who understood it; fortunately, however, the majority of the faithful thronged into the division lobby without realising that the new measure will in fact be less costly to the Exchequer, and consequently less beneficial to the landlords, than Lord Silkin's unlamented scheme. The real danger is that the attempt to keep down the cost of compensation, by pegging it to 1947 development values, may eventually wreck the Macmillan experiment. One Labour backbencher, Mr MacColl, likened the new scheme to a game of snakes and ladders, under which an owner who can sell his land privately reaps the full market price for its development value, while if his land is compulsorily acquired or its use restricted he will get only the compensation claim (if any) established under the 1947 Act.

The drawbacks of a dual land market are already apparent. When good agricultural land is wanted for public development a great fuss is made by the farmers, but the same land will be sold privately without any difficulty unless the planning authority objects. Private trans-

actions are oiled with an adequate profit. The situation will become much more anomalous as the pattern of land values moves away from the 1947 base. The Bill's success turns in any case on the willingness of the Treasury to pay compensation freely. If inequities later force the Government to pay higher compensation (as they probably will), the cause of planning may be undermined.

It would be wrong and impossibly costly, as the Uthwatt Committee demonstrated, for the local authorities to pay compensation at market value in each individual case. But compensation could be more generous if it was tied in with a new attempt to collect betterment. The effect of close planning control may considerably enhance the value of a limited quantity of land, and drive the two land markets further apart. Equity apart, a homogeneous land market is an indispensable guide to rational planning. By stinting compensation and forgoing betterment, Mr Macmillan seems to be laying up a host of problems for his successors.

German Tax Cuts

A NEW phase in West German recovery has begun. The eagerly awaited bill for taxation reform has now been presented to the *Bundestag* by Dr Schäffer, the Minister of Finance. It does not satisfy the German business world, particularly the shipbuilders, who resent the removal of the concession of tax-free investments in their industry. To British eyes, however, his proposals look generous, and may well greatly increase German competitive power. It is true that Dr Schäffer has not touched the jungle of different taxes that disfigure the German fiscal landscape, nor has he been able to do much to curb the powers of the *Laender*. But his tax cuts and the removal of some of the special concessions are well designed to promote efficiency and to revive the market for industrial capital with the aim of reducing production costs. High interest rates on borrowed money and lack of risk capital from the public at home and abroad have proved a handicap which the Germans are determined to overcome. Dr Schäffer's proposals should help, as the main tax cuts will leave the Germans DM 2,300 million (£195 million) more to invest—or to spend—every year.

Compared with 1951 (that is to say, including the minor cuts made last year) the reductions in income tax for a married man with one child range from an average of 23-30 per cent for most grades to 61.5 per cent for the lowest income group. Following Christian-Democrat policy, the biggest incentives are given to large families and to the medium and small private business man. The highest rate that a man will pay is to be 55 per cent of his income, and that only on incomes over DM 600,000 (about £50,000) a year. The inheritance tax has also been drastically reduced.

German company directors have hitherto planned largely with an eye to avoiding taxation, which was fixed very high after the war by the occupation authorities, and a vast amount of unproductive time has been spent on searching for the numerous legal loopholes provided. Moreover, tax evasion has been widespread. Now it is hoped that economic principles will guide industrialists, and that tax arrears will be collected. These hopes may be justified. Dr Schäffer has reduced corporation tax to 45 per cent, and retained last year's concession whereby profits distributed in dividends are only taxed at the rate of 30 per cent.

THE ECONOMIST, MARCH 20, 1954

He showed moral courage in warning the *Bundestag* that a nation that had had a government "of criminals" which had started a war and allowed it to end in collapse—and which is still dependent to a certain extent on the generosity of others—cannot tax itself less than its victors. It is hard to make comparisons between the German and British systems, and Dr Schäffer, though doubtless accurate, was vague. He declared that the total burden borne by West Germany is still above that of "other nations," but that some of the new German rates will be below those of other "rich countries." The key to Dr Schäffer's ability to make these reductions lies in his estimate that the German gross national product will continue to rise in 1955 by five per cent.

Uno's Roubles Trickle Through

IT was as long ago as last July that the Soviet government announced, with a fair flourish of trumpets, its willingness to contribute at last to the United Nations technical aid programme, which it had boycotted for several years. The offer of four million roubles (nominally \$1 million) was, however, hedged about with conditions which at one time made it seem doubtful whether Uno would ever see the colour of the money. It was to be in Russian currency—valueless outside the Soviet empire—and restricted to use only by the technical assistance branch of Uno itself.

UN officials were obliged to point out that the rules of the technical aid programme, which is jointly operated by Uno, Unesco, the ILO, and the international food and health agencies (FAO and WHO), require that contributions must be shared between the participating bodies. Discreet negotiation with Moscow brought no immediate easing of the Soviet conditions, and although the roubles were nominally intended for use in 1953, at the year's end they still lay in the Russian state bank.

Now, apparently, the Russians have given way sufficiently to get the money moving. It is reported that they have agreed, in principle, that the specialised agencies may have their share of the roubles; and that they will permit the conversion into other currencies of part of their contribution, so as to cover the expenses of Soviet technicians assigned to underdeveloped countries. Further hitches may well arise before any Russian technicians are lent to—or accepted by—such countries; but the United Nations may be complimented on the quiet tenacity which it has shown in translating a somewhat evasive gesture into a possibly quite instructive reality.

A Look Before the Leap

THE decision to hold an official inquiry into alleged connections between the People's United Party in the colony of British Honduras and the Communist-infected government of neighbouring Guatemala comes none too soon. The colony is due to hold its first general elections based on adult suffrage in five weeks' time; and the PUP is the only organised party with any influence outside the capital, Belize.

Before the crisis in British Guiana the party's leaders had been advocating withdrawal from the Commonwealth and closer association with the Central American republics,

THE ECONOMIST, MARCH 20, 1954

but lately their public aspirations have been reduced to a demand for self-government. Unlike their Guianese counterparts, they are not Marxists, but devout Catholics; but their discontents have made them a desirable ally for the Guatemalan government, with its century-old claim to sovereignty over the colony.

Politically, the dangers of Communist domination in British Honduras are not so great as they were in British Guiana, since under the new constitution the People's United Party would have to win eight of the nine elected seats to gain a majority on the Legislative Council, and no formal provision has been made for ministerial responsibility. Nor are the other Latin American states likely to support Guatemala with more than words, for they like its politics as little as they like colonialism. But the threat of Communism could be economically disastrous for this poverty-stricken colony. The forests, which were its chief wealth, have been seriously overcut; and since the war it has been hard hit by the devaluation of sterling. An agricultural development programme is just beginning to make headway, and an International Bank mission is expected in Belize in June. But any major projects must depend on overseas capital, and at present events seem to be moving towards the familiar deadlock in which economic development is difficult without political stability and political stability is elusive without economic development. Whatever the constitutional outcome, Mr Butler and the United Kingdom taxpayer would be wise to treat British Honduras no less generously than British Guiana in the matter of economic aid during the next few years.

Profit from No Profits

LAST week Mr Woodrow Wyatt sprang upon the House of Commons "a Bill to control non-profit-making theatrical companies," and in spite of the lone voice of Mr Silverman (who said he had enjoyed some recent visits to the theatre) was given leave to bring it in. The Finance Act of 1946 laid down that any play produced by a non-profit-making company whose objects and aims are partly educational may be exempt from tax. Mr Wyatt's case was that this provision, intended to encourage the performance of worthy but unprofitable plays, had been used, legitimately but unfortunately, to build up the theatrical empire of Mr Hugh (Binkie) Beaumont.

Mr Beaumont is the principal director of H. M. Tennent Limited, a commercial company, and also of Tennent Productions Ltd., its non-profit-making associate. The latter company, as a condition of its exemption from tax, pays no directors' fees, and any profits it makes must be ploughed back into production. But the commercial company, Mr Wyatt asserted, draws from Tennent Productions management fees of £40 a week on each play—fees which in a year of several non-profit-making productions could probably bring in as much as £10,000. The arrangement also enables the Tennent companies to keep in their employ a galaxy of leading actors and actresses—such as the three knights and a dame now appearing in "A Day By The Sea"—and thus to make good profits for the theatres. Other production managements therefore find it difficult to woo the best performers and the best theatres away from Mr Beaumont's group. This powerful hold Mr Wyatt's Bill seeks to lessen by breaking all ties between non-profit-making companies and commercial concerns.

The theatregoer can have little complaint against Mr Beaumont, who has rescued the intellectual play from the makeshift austerity of the little theatre and made it attractive with resplendent productions. But should not the verdict on whether a company's aims and objects are "partly educational" be transferred to some more widely recognised dramatic critics than Her Majesty's Commissioners of Customs and Excise?

Explosives in the Grate

THE story of the proverbial gift horse has always been curiously incomplete. Like the Cheshire cat it was all mouth and no body; and it assumes that a horse must always be an acceptable present. What happens if somebody receives an unwelcome gift of a horse and the animal kicks? Last week the Court of Appeal had to decide. In 1951 a Mr and Mrs John Wilson had ordered coal and received a fragment of explosive—according to the coal merchants as a gift—along with it. They claimed that they were entitled to recompense for the damage caused by the resultant explosion in their grate.

The coal merchants disagreed. They said that under the Sale of Goods Act they contracted only to sell coal of a merchantable quality, and their liability must be limited to the commodity in which they dealt. If, by chance, explosives were included with it they must be in the nature of a gift. This line of reasoning once convinced the Court of Session in Scotland; but it has now failed to carry with it the Court of Appeal in England.

It is no answer, Lord Justice Denning said at the beginning of last week, to explain that there was nothing wrong with the coal as coal; there was a great deal wrong with the consignment. Was there not the famous case of the solicitor who broke a tooth on a stone in a bun? Was not the stone, from the point of view of liability, a part of the bun? The coal merchants must pay. A verdict of common sense? The answer might be contempt of court in Scotland, but perhaps Scottish householders would be well advised to order their coal south of the Border; or is that advice in itself a slight on the economic independence of the Northern Kingdom?

Letters to the Editor

Risks in Germany

SIR—You say in your leading article of March 13th that the projected European Defence community is "a great political experiment in damping down and extinguishing the Franco-German feud, and in building a viable and strong Western Europe." Two years ago you said that it had produced a chain of events—which British policy made no serious attempt to control—resulting in a series of related explosions of political exasperation which had put the French and German Parliaments into diametrically opposed positions.

I think your previous verdict is the correct one. The bitter memories and suspicions to which you refer have not been stirred up by malicious or ignorant individuals, but by the proposal to create not only a European Defence Community but a continental super-state, under German domination. The negotiations over EDC have made the relationship between France and Germany worse, and the division of Western Europe greater, than they have been since the war. How, in these circumstances, can you maintain that a "Little Federation" would contribute to the building of a viable and strong Western Europe? It would further divide that already truncated continent. It would be based on an awareness of mutual suspicions rather than common interests. And it would not provide the Germans with the raw materials, the markets or the outlets for capital investment which they now require.

You write as if there was no alternative to the total acceptance or rejection of EDC in its present form. But there is an alternative. Britain could still assume the leadership of Western Europe, and of a European Defence Organisation which would become an integral part of Nato. Those of us who believe that this is the right course for us to take, and the only way out of the present morass, are more numerous than you seem to think.—Yours faithfully,
House of Commons ROBERT BOOTHBY

SIR—I have tried, in the last few months, to master "the indigestible and complicated treaty" which gives birth to EDC. May I suggest that this complexity is so great, and difficulties of interpretation and reconciliation are so many, that one cannot see how the smooth operation of the treaty will be possible. As it is, it cannot but appear "as a contrivance to rearm the Germans." It will no more lead to a European Union than the Coal Community does so far.

Short of a bicameral European Parliament and a responsible cabinet, entrusted

in simple terms with the legislative and executive tasks of European defence, there is no hope for real integration. Such a scheme would provide "time for experimentation and compromise." It would be possible to take a pragmatic approach—and legislate, step by step, to solve concrete problems.

But this may be too late, or too early.
—Yours faithfully, ROGER PINTO,
Professeur à la Faculté de Droit
University of Lille

Television Aunt

SIR—As you rightly say, the TV Bill gives us the worst of all worlds. Under the government's original proposals we should at least have got the programmes the advertisers wanted; under this Bill we shall get the programmes nobody at all wants—produced by the "programme contractors," tailored to suit the advertisers (nobody can possibly stop this while they supply all the programme contractors' incomes), and then frowned upon, argued about and blue-pencilled by the "Television Aunt."

But why do you assume so confidently that we have only to sit back for an acceptable public-service system to emerge from the chaos? Experience of family relationships suggests that nothing is so precarious as the power and authority of an aunt. As the years pass, nephews assert themselves and aunts decline. So it will be with the programme contractors and the ITA if the opponents of commercialism are content to cling to the ground which they have nobly won (without the slightest help or encouragement from *The Economist*) and relax their pressure.

And why is the claim that the Bill would subsidise advertisers "deliberate nonsense"? The Bill makes provision for up to £10 million to be taken from the general taxpayer. This large sum will take off the shoulders of the programme contractors all the less profitable activities in the scheme—transmission, studio facilities, and even the "balancing" programmes—that is, those programmes of a serious character which the commercial interests will not produce because it does not pay them. In the United States, fairly enough, the advertisers have to foot the bill for all these items. Here, the taxpayer is made to carry the can, so that advertising rates may be lower and/or programme contractors' profits higher.

Note, moreover, that the subsidy comes from the taxpayer, not the licence-holder. Why should those who cannot afford TV sets be forced to pay for the entertainment of those who can? And why should the government tax the BBC £2 million a year from its licence

revenue, and not merely exempt from tax but actually subsidise its commercial rival? Is this fair competition?—Yours faithfully,
CHRISTOPHER MAYHEW
House of Commons

[We disagree with almost every line of this letter—from the first line which congratulates us for "rightly" passing a wrong-headed judgment that we did not in fact perpetrate, to the last line which attacks the Government for a subsidy that (as our article tried to explain) is not in fact being granted.—EDITOR.]

The In-and-Out in Cairo

SIR—Your article of March 6th seems to me seriously misleading in certain parts. In writing that the first influence in restoring Neguib to power was "the mob," you miss the essential fact that there were no disorders such as one associates with a mob, but there was a widespread feeling of sympathy and sadness in Egyptian and foreign circles at Neguib's resignation. This was the first genuine and spontaneous expression of public opinion on an internal matter that modern Egypt has shown and as such is of historic interest. The army leaders concerned in the Cavalry and the Frontier Force were, I believe, conscious of expressing the strong feeling of their families, their friends and of their immediate circles and also, for the first time, those of the man in the Cairo street and in the country village, as well as their own personal and political allegiance. Secondly, in your enumeration towards the end of your article of the achievements of the Neguib regime, you entirely ignore the deposition of the king, the confiscation of all the princes' property and fundamental agrarian and educational reforms. Whatever one may think of their wisdom these are spectacular achievements which do attract public acclaim. Your conclusion seems to advocate the obvious advantages of prolonging dictatorship in Egypt. Surely, however, Great Britain must support responsible, democratic government overseas even when it is fraught with all the problems that beset it in Egypt? Surely also some form of elected assembly is the only proper body which could ratify a new agreement with Great Britain with some hope of a broad basis of continuity, comparable to that given by the group of elder Egyptian statesmen of all parties who signed the Anglo-Egyptian Treaty of 1936?—Yours faithfully,

Cairo

BRITISH RESIDENT

Electronic Abacus

SIR—May I draw your attention to an entry in the Oxford English Dictionary: Computer, bad spelling of computer.

The word is likely to be used a great deal in future, and since I have recently written on computing machines, I would like to lead a campaign for rationalising the spelling of the word computer.—Yours faithfully,

R. V. BOWDEN
College of Technology, Manchester

Is money spent on advertising money well spent?

This largely depends on *where* it is spent as wastage can and does result from an unenlightened choice of publications in which the advertisement appears.

If your product sells to women with a specific and concentrated interest in their homes and families your problem is quite simple. *GOOD HOUSEKEEPING* is your obvious choice—the only magazine supported by the *GOOD HOUSEKEEPING INSTITUTE*—the famous authority on homes and homecraft.

GOOD HOUSEKEEPING is in fact as much a specialist magazine for the home as a yachting journal would be to a yachtsman, or a gardening paper to the enthusiastic gardener. Always remember this when planning advertising campaigns.

Light Problems..

FLOODLIGHT FL6
5,000 Candle power

STORM LANTERN
300 Candle Power

TABLE LAMP TL104
300 Candle power

Buyers throughout the world are faced some time in their lives with providing portable light for a particular purpose or job where there is no electricity or other form of power to hand. We know because they write to us and put their problems before us. They write to us because the name *TILLEY* is recognised throughout the world as being synonymous with all that's best in portable paraffin pressure lighting. If you want 5,000 candle power Floodlights to illuminate your Club House, aerodrome or cattle compound, Trackwork Lamps for railway repair or tunnel inspection or just portable Irons for safari, Storm Lanterns for camping or Hanging Lamps for a marshall yard—write to us. Of course, we also make Table Lamps, Heaters, Wall Lamps and an infinite variety of other lamps for industrial users—all burning ordinary Kerosene under pressure and all recognised as the best of their kind in the world.

When we can help you please write to:—

THE TILLEY LAMP COMPANY LTD.

Dept. EX/EC 15, SACKVILLE ST., LONDON, W.1.

"This South African Sherry is better than ever!"

Yes, it's remarkable how they manage to keep on shipping finer and finer wine year after year.

How do they do it?

Simply by taking infinite care and not trying to hurry the job. These lovely South African sherries we are enjoying in this country now are the reward of the infinite patience displayed back through the years by those Wine Farmers at the Cape.

You seem to know a great deal about it!

You remember I went to South Africa last year. I happened to meet a man who took me round the wonderful Wineries there where millions of gallons were being matured for the British market.

How long do they mature them?

The best wines are kept seven years at least before they are shipped. The South African Wine Farmers are determined—in spite of the demands from all over the world—to hold back and let the good stuff mature properly. You see their climate and soil are simply ideal for wine-growing, but it is necessary not only to produce lovely wine but, if you establish a name and reputation, to provide for keeping up the quality over the years.

These South African people certainly keep on improving their wines—especially their sherry. It's a credit to them.

That's what comes of selecting and maturing and waiting and keeping on doing that, and the longer it goes on the better the quality becomes.

I must say this is one of the finest Sherries I've ever tasted.

Well, keep on drinking the best South African Sherries and you will find the quality will astonish you."

(LONDON) LIMITED

ZEITSCHRIFT für das gesamte KREDITWESEN

(THE JOURNAL OF FINANCE AND CREDITS)

Editors: Erich Achterberg and Volkmar Muthesius

The "Zeitschrift für das gesamte Kreditwesen" is the leading financial and economic journal in Western Germany having international significance and circulation.

At the end of April we shall be publishing a large Special Number in English, containing contributions from German and other bankers and economists on credit problems of current interest and international significance.

The price of the Special Number is DM 2,—plus postage.

It will be distributed in all countries. In addition it will be handed to the people taking part in the Credit Conference at Cologne in May of this year. It is accordingly an excellent publicity medium for banks in every country that engage in foreign business.

Inquiries as to suitable advertisements will be welcomed. Please address them direct to the publishers:

VERLAG FRITZ KNAPP (Publishers) FRANKFURT on MAIN GERMANY

Packages will be punished!

This may not be standard practice in most warehouses—but it does happen. And if it happens to your product, then let us hope it is packed in a "Fiberite" case.

Forty-five years' experience has taught us that packing cases must face a wide variety of buffets and blows. This experience, coupled with constant research, enables "Fiberite" cases to withstand these hazards.

THAMES BOARD MILLS LIMITED
Purfleet, Essex and Warrington, Lancs

Books & Publications

Let There Be Chlorella

THE LIMITS OF THE EARTH.

By Fairfield Osborn.

Faber. 175 pages. 12s. 6d.

LET THERE BE BREAD.

By Robert Brittain.

Spalding and Levy. 263 pages. 12s. 6d.

IF there is one game which really rejoices the heart of the technician, it is that of Fool-the-Prophet. This, that, or the other thing, says the Prophet, is manifestly impossible: iron ships will not float; the aeroplane is a militarists' toy; corn will not grow beyond such and such a parallel; and the implications for humanity of these impossibilities are, indirectly, this, that and the other. Then the backroom boys get together, and presently, to a universal shout of "Down you go!", another prophecy is relegated to the historical sottises.

No prophet has been more well and truly fooled than Malthus; and his story is undoubtedly a warning against taking present techniques, present knowledge, and even the present limits of imagination for data as unalterable as the boiling point of water at sea level. Mr Fairfield Osborn and Mr Robert Brittain are both wide awake alike to the present Malthusian danger and to the relevance of technical progress. "The Limits of the Earth" recalls Michael Roberts's "Estate of Man." It is a broad account, continent by continent, of the human heritage—land, minerals, water, forests, power—of the potential and actual income derived from that heritage, of the pace at which it is being eroded and the manner in which it may be maintained; an equally broad presentation of demographic trends; and a discussion of "horizons and mirages"—the promising and the not-so-promising prospects opened up by recent scientific advance. Over the large number of similar books published in the last two decades it has the advantage of up-to-the-minute information, of an easy though over-emotional style, and of an awareness that economic, as apart from technical, problems are genuine and not the product either of imbecility or of villainy. Refreshingly, indeed, there is no villain in Mr Osborn's book—not even the colonial exploiter, not even the religious bigot; there are only people whose eyes need to be opened. "The Limits of the Earth" is not the most authoritative, scholarly and informative work on the subject; but it will awaken and stimulate a class of reader which would never tackle, for instance, Dr Dudley Stamp's "Our Undeveloped World."

The author of "Let There Be Bread" could perhaps be described, unkindly, by a quotation from Mr Osborn: "the inveterate laboratory optimist who, disregarding all economic and social ramifications, airily leaps the gulf between the test tube and the realities of mass production." His book has all the charm of science fiction; it is enormous fun; and it is, of course, perfectly possible that advance on one, or another, or a combination, of the technical frontiers which he describes may in due course make today's neo-Malthusians look as silly as Malthus did in, say, 1880.

That "rather nauseating slime" the alga Chlorella Pyrenoidosa, for instance, has properties and potentialities as a source of proteins, fats and carbohydrates which might, if exploited, increase the earth's carrying capacity as much as did the primeval transition from hunting to agriculture. The artificial oases, reforestation schemes, techniques of dew exploitation and of ion exchange, now in the pilot-plant stage on the desert fringes of the Middle East and North Africa, may point to an entirely new assessment of what constitutes arable acreage. Perhaps the Amazon is a frontier as promising as the prairies. Perhaps even the Arctic—but no; the enthusiasm with which Mr Brittain describes the technique of raising fruit trees and field crops in the Yamal Peninsula and similar places (including the Dali-esque technique of fur-lined hot houses) fails to carry over to the reader. Perhaps the bugs will be worked out of thermal exchange before coal, oil and uranium give out; perhaps the mineral resources of the sea will replace, in time, the exhausted ores of the land.

But none of these possibilities shows, as yet, the least sign of crossing "the gulf between the test tube and the realities of mass production." Even at the purely technical level they are about as relevant to today's and tomorrow's hunger as the blueprint of a jet fighter would have been to the RAF in 1940. Economically, socially and politically they encounter precisely those obstacles which now prevent the hungrier peoples from using known and proven techniques to feed themselves adequately, from migrating to the lands of surplus, or from keeping their own natural increase within reasonable bounds. It is in overcoming these obstacles, rather than in turning Alaska into a breadbasket for the further accumulation of surpluses, that the best hope lies of fooling the prophets once again.

Anatomy of Courage

REACH FOR THE SKY: *The Story of Douglas Bader, DSO, DFC.*

By Paul Brickhill.

Collins. 384 pages. 16s.

MR BRICKHILL has written a vivid, racy and moving book. In undertaking the life story of Douglas Bader, he has chosen a subject that admirably suits his style and gifts, and one moreover that he is exceptionally well qualified to handle, for, like Bader himself, he was both a fighter pilot and a prisoner of war. Few biographers can have succeeded in laying themselves so closely alongside their subjects; few men alive today can have been taken apart quite so thoroughly as Bader. Yet the "domineering, dogmatic, breezy" nature of the man enables him to survive this ordeal—as he has all others—with flying colours.

Mr Brickhill gives us glimpses of the "gritty and indestructible" small boy fighting his way through prep school (and carving his name on the headmaster's prize marrow for a "dare"); of the "sort of god" who shone at every game both at public school and at Cranwell; of a young man who at 22 was already one of the finest aerobatic pilots in the RAF and was standing on the threshold of International rugby. Then, suddenly and overwhelmingly, the crash—senseless, unnecessary, the result of just one "dare" too many. Words spoken by a nurse outside his hospital room—"There's a boy dying in there"—filtered through to Bader as he lay in a not unpleasant haze of semi-consciousness. To him they acted as a challenge, and one that he instantly accepted. His triumphant struggle to walk again on two tin legs is told simply and directly, without sentimentality, but with a very real understanding of the immense mental and physical strain involved. And here, as elsewhere throughout the book, the reader will suddenly find himself caught by a vivid and telling phrase—as for example Mr Brickhill's description of Bader "waggling his toes in his mind," a delightfully precise description of a sensation familiar enough to everyone with bits missing.

The story of Bader's return to the RAF and of his astonishing career as a fighter pilot and pre-eminent leader of the "few" is known in outline to most people; as a former chief of Fighter Command has said, it constitutes "an example which as the years roll on will become a legend." It is a story to which Mr Brickhill does full and exciting justice as he does also to Bader's subsequent experiences as a prisoner of war. For those who like their action hot and strong, this book will be thoroughly satisfying. Beside it, Dan Dare and Rupert of Hentzau fade into the merest amateurs of adventure. But, great as were Bader's wartime achievements, they are nevertheless only an aspect of that steady and enduring courage that enables him, in daily cold war, to convert crippling adversity into a 4 handicap at golf, a game of squash, or a job that takes

him constantly all over the world. His genius for war, whether hot or cold, amounts to an infinite capacity for not knowing when he is beaten; and the force of his example is and will continue to be a valuable means of saving many of his fellow men from despair—provided of course that it is not rammed down their throats by kind relatives with more limbs than sense. To everyone interested in the anatomy of human courage this excellent book can be most heartily recommended.

Antipodean Paradise?

ECONOMIC STABILITY IN NEW ZEALAND.

Edited by R. S. Parker.
New Zealand Institute of Public Administration, Wellington. 146 pages. 13s. 6d.

"THE . . . unwillingness to abandon the attempt to achieve a stability which is general and absolute goes some way towards explaining why New Zealand maintains a higher degree of economic control than almost any other western democracy." The comment is from Mr L. C. Webb's contribution to this collection of papers on the problems of maintaining economic stability which were delivered by university economists and civil servants at the 1953 convention of the New Zealand Institute of Public Administration. They are all informative and reasonably lucid and one of them, Mr Webb's "The Making of Economic Policy," should be of general interest.

Among the doubtfully compatible aims suggested by "stability," public opinion in New Zealand ensures that priority is given to full employment. As Mr Webb says, "stability of prices, wages, and returns to primary producers has implied little more than a process of equitable upward adjustment." These papers generally assume that the electorate would not regard "full employment" as permitting the small margin of unemployment necessary to avert competition for labour and consequent inflation. This belief derives added force from recent electoral trends in Australia. Mr G. J. Schmitt points out that one of its consequences would seem to be that

Irrespective of whether or not we have sufficient overseas funds available to pay for all the imports that the community wants to buy at any time, Government must keep the supply below the demand so as to maintain excessive demand internally.

Mr Schmitt (a Treasury official) later indicates that he himself has some doubts about this reasoning. Although the general view is that "excessive demand" must be protected by import control, he is inclined to believe that regulation of the exchange rate and tariff would achieve the same object by keeping the cost of the locally produced article below that of the imported.

Professor H. Belshaw argues for a balance between security and growth. He compares the ideal state of stability

to a serpentless and appleless Eden and, though he is far from suggesting that New Zealand is any such immobile paradise, his comment on the ideal may have some bearing on the approximation that has been attained there—"There is clearly a lot on the credit side and we feel awfully safe; but we are also frightfully bored."

An Engineer's Approach to Economics

THE MECHANISM OF ECONOMIC SYSTEMS.

By Arnold Tustin.
Heinemann. 161 pages. 25s.

MR TUSTIN, professor of electrical engineering at Birmingham University, has written a very important book. Ever since the publication of Wiener's "Cybernetics," economists, in discussing "built-in stability," have been trying to profit by the knowledge of engineers. That they have not been spectacularly successful is due partly to the difficulties inherent in the study of economic behaviour and partly to the fact that texts dealing with control mechanisms are inevitably written in the terms of electrical engineers. Thus the economist is confronted by the two-fold task of understanding engineering as well as the particular mathematics used by control engineers.

In this book Mr Tustin deserves gratitude for enabling the economist to acquire the general techniques without becoming an engineer into the bargain. His book is mercifully free from jargon. This, however, is not to say that it is an easy book; very few equally rewarding books are easy to read, and to reap anything like the full benefit from current ideas the reader will need patience and hard work. Mathematically, the book is largely self-contained for those who are moderately familiar with trigonometric functions and certain parts of advanced calculus. Additional help is provided by an adequate bibliography. The economist wishing to specialise in this field will probably find the time needed for working through it well spent. For him the most important chapters will be those dealing with "the engineer's approach to system behaviour" and "models required for economic prediction and regulation."

The general reader will absorb some of the current ideas on stability and control. It will show him how much more there can be in economic dynamics than is commonly thought, that simple statements about the stability of given systems are inadequate and, perhaps even more important, that the magnitude of a correction required (such as "pump-priming" for which the author would substitute "exciting the dynamo") may be very small in relation to the other quantities involved—provided the timing is right. Two points merit emphasis: one is the fact that, in spite of the growing literature on dynamics, location, etc., economists

have preferred to deal in almost any dimensions rather than time and space. The other is the engineer's emphasis on "what should we do in order to . . ." which the economic theoretician is in danger of forgetting. "Control" is at present a bad word; yet the idea of automatic equilibrium is inherent in both theory and practice while recent developments have made it clear that it would be a very lucky accident if an economy were capable of coping with disturbances through its own inherent forces.

It is still a moot point, however, whether analogues can be more than suggestive analogies. Mr Tustin recognises only some of the difficulties when dealing with economic issues proper. Here he is somewhat naive (for instance, in his discussion of expectations) and his exposition, lucid and workmanlike on technical topics, borrows too much from the "economese." One special topic that deserves inclusion in the next edition is that of inventory control, an important practical problem to which economists are beginning to pay attention.

In spite of these blemishes, Mr Tustin has succeeded in what he set out to do—making new ideas accessible to students of another discipline.

Portrait of a Colony

SIERRA LEONE: A Modern Portrait.

By Roy Lewis.
Her Majesty's Stationery Office. 272 pages. 25s.

WITHIN his terms of reference Mr Roy Lewis has written a magnificent book on the people and problems of Sierra Leone. It is one of a series on the British dependent territories, published officially, and designed to present a balanced picture of each area, filling the gap between travellers' chit-chat and official statistics. Mr Lewis could not have carried out his mandate better. With some remarkable photographs, the result is a first-class piece of public relations.

Occasionally, it is true, in his sympathy with the people he is describing, Mr Lewis becomes almost more African than Africa. As he says, "The dea dea sings its kroo kroo note," and this perhaps too often. His anthropology may sometimes become folklore, and he describes the past rather than the future. Occasionally too, the economist in him makes a rather awkward landing from a minor flight of fancy. "The sun goes down in a chiaroscuro of scarlet and madder and rose, innumerable swamps lace the hollows and will grow rice excellently." Two chapters giving the reconstructed life histories of little boy Borboh and little girl Mariama could have been omitted. They may remind those learned in African literature of the intrepid explorer Angus Buchanan, who when writing up his desert experiences in his book "Sahara" inserted a chapter ostensibly written by a camel.

But these are trivial criticisms of a book which makes an honest attempt to understand and analyse a section of African life and is not just another study of Britain in Africa. It is distinguished by a truly imaginative insight into the two major tragedies of Sierra Leone. Caught up by history, the Creoles of Freetown with all their supposed advantages of education and their English connections are being submerged by rising tides of tribesmen from the hinterland. The friends of Britain feel deserted and betrayed, as they find that democracy means the loss of their privileges; unable to impose their leadership, they blame Britain for depriving them of it. Secondly, the entire country—the size of Ireland, as Mr Lewis reminds us—is faced with the problem of how to eat and export without exhausting the land. Sierra Leone has often seemed a tragi-comedy of good intentions. There is more than a century of sad experience between the idealism which freed the slaves and brought the colony into being, and Mr Graham Greene's "The Heart of the Matter." But the administrators, the agriculturalists, the engineers, the teachers, of today are not really very far from the Wilberforce tradition.

Psychology Pruned

USES AND ABUSES OF PSYCHOLOGY

By H. J. Eysenck.
Penguin Books. 318 pages. 2s. 6d.

WHAT is psychology? In 1890, in his classical textbook, William James defined it as "the science of mental life, both its phenomena and its conditions." Thirty years later his eminent admirer, McDougall, pronounced the narrower definition "the positive and empirical science of the human mind." Dr Eysenck restricts it further—"a psychologist is concerned with the scientific study of human behaviour." Although he is by no means a behaviourist the trend is clear. Only such behaviour as can be measured is, he implies, the proper subject-matter of psychology as a natural science. All the rest of human experience, subjective or communicated, must remain outside the scope of this science as so defined; but as new methods of study become available the field of science enlarges.

Much of this book consists therefore of a description of the new measuring rods which have been invented to analyse human behaviour, of what exactly they measure and of how reliably they do so.

"Tests" sound a dry subject, but it is surprising how many of the topics the author discusses have lately been in the public eye: tests of intelligence and the selection of school children for grammar school education; the alleged decline in national intelligence because of differential fertility; selection boards for officers and civil servants; vocational guidance and selection for jobs; incentives; the reliability and validity of examinations and interviews; public opinion polls and sampling techniques;

the results of treatment of various kinds for nervous and mental disorders.

It is all very well done. Dr Eysenck's standards are rigorous and his criticism pungent, and he has a lively style which makes the book easy to read. Certain aspects of the "country house" technique of assessing character receive a drubbing, and he pours scorn on the unvalidated speculations of some of Freud's followers, particularly in the field of what is called cultural anthropology. The virtues of applying the method of scientific experiment are illustrated in each topic he deals with and he describes its present limitations. His purpose in showing up unwarranted inference and slipshod method is clear: it is to protect the rather slender stem of his science from too great a weight of attractive but rotten fruit.

Foreign Economic Affairs

INTERNATIONAL ECONOMICS.

By Charles P. Kindleberger.
Richard D. Irwin, Inc., Homewood, Illinois. 563 pages. \$8.00.

THIS book is an undergraduate textbook covering the whole field of international economics. Part I concentrates mainly on foreign exchange markets. Part II gives the core of the theory of international values and the inter-relation of national economies through foreign trade. Part III deals with short-term and long-term capital movements between countries. Part IV gives some discussion of the dynamics of the international system, with chapters on cyclical and secular disequilibria in the balance of payments.

The author's vivacity and independence of mind will help to hold the student's attention. Many features commend themselves. The clear emphasis placed on the fundamental role played by the allocation of resources is a great merit in the chapters dealing with the pure theory of international values. Two short chapters on the development of under-developed countries contain a better analysis and more stimulating ideas than many more pretentious works on this topic. Students will doubtless find useful the reading references given for every chapter, although these are strictly limited. On the subject of the "transfer problem" a reference to Mantoux's "Carthaginian Peace" would surely have been in place.

Professor Kindleberger indicates in the preface that the book is based on his notes for courses given to undergraduates. This doubtless makes his subject come more alive; but it appears to have led to a somewhat casual and even colloquial form of exposition which may leave the reader confused about the meaning and proof of the propositions advanced. For example, in tackling the famous knotty problem of explaining the famous "factor price equalisation" proposition in international trade theory, the author makes no reference to the basic assumption regarding the forms of the technical

production functions; yet without this assumption the proposition does not apply. Professor Kindleberger has a great belief in the value of geometry in the teaching of economics. Although this view is shared by others, at times the idea seems to be pushed so far that the student may believe that economics is geometry; and there are some comparatively simple subjects (such as that of quotas) which appear to have been rendered more difficult by their presentation through this medium.

The author is certainly not alone in suggesting that customs unions between "similar economies" are more likely to bring benefit than those between complementary ones. The prevailing confusion on this point is partly verbal; but it is partly a real confusion of thought which, it is to be feared, may be further propagated by some of the passages in the book under review. Professor Kindleberger himself seems at some points to be aware of the limits to the gain that can be derived from trade between similar economies all lacking the same essential materials ("Europe cannot lift itself by its own boot straps"). As regards the important practical implications of this point, it would perhaps have contributed towards a balanced view if the discussion on European co-operation had been supplemented by some consideration of other regional groupings such as the British Commonwealth and Nato.

The Growth of Integrated Oil Companies

by J. G. MacLean & R. W. Haigh, 728pp. 96s.
A book for both the student of applied economics, and for the business executive, in large firm or small, facing the practical results of integration. An obvious *sine qua non* for Oilmen.

Management Succession in Small and Growing Enterprises

by R. C. Christensen, 217pp. 26s.
" . . . (does) the business community a double service, by stating the problem of executive succession and by providing object lessons."—The Director.

Nationalization in Practice: The British Coal Industry

by W. W. Haynes, 413pp. 32s.
A painstaking, but really readable doctoral thesis by an impartial American. " . . . objective and fairminded."—New Statesman.

The Budget Cycle in Public Finance in the USA

by O. Bakker, 163pp. 17s. 6d.
An invaluable account of US practices in this field by the Dutch authority, aided by the Rockefeller Foundation, and now published in book form.

The first three of these books are products of the Harvard School of Business Administration. Descriptive catalogues of the School's complete list may be obtained from their Sole Agents:

Bailey Bros & Swinfen, Ltd
46, St. Giles High Street, London, W.C.2

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Duty of an Opposition

Washington, DC

THIS is a critical year for the Democratic party. Even the slightest setback at the election in November, in which all the seats in the House of Representatives and thirty-five out of the ninety-six in the Senate will be at stake, would be serious. Such a reversal of the normal rule that the party in office loses ground in an election in which the Presidency is not directly involved would ruin the Democrats' claim that they are still the "natural majority" and that the result in 1952 was a "temporary aberration." On the other hand, even the slightest confirmation of that rule will give the Democrats responsibility for running Congress during the latter half of Mr Eisenhower's Presidency, a triumph that some of the more unenterprising of the party's leaders would rather do without. They have not forgotten the use Mr Truman made in 1948 of the Republican control of the legislature; this enabled the President to campaign, with signal success, against a "do-nothing" Congress.

The Democrats' chief concern at the moment is to maintain an appearance of unity, which means that on many issues they must remain relatively quiet. Fortunately for them, the chief issue concerning Negro rights, racial segregation in elementary schools, is still before the Supreme Court rather than before Congress. Moreover, the dispute over who should benefit from off-shore oil reserves, the nation or a handful of lucky states, has also been in a judicial stage. Not a word was breathed about either of these controversial questions, which divide the northern liberals from the southern conservatives, when a party rally was held recently at Miami. Instead, emphasis was laid on the economic issues on which Democrats feel themselves to be at one in opposing the policies of the Administration.

On one such issue—that of resorting to deficit financing in order to fight off a depression—the New Dealers have found an impeccably conservative spokesman in the person of Mr George, the stately Senator from Georgia. Senator George, whose defeat Mr Roosevelt once tried to engineer because of his opposition to the New Deal, is leading the battle for an increase in the amount of personal income exempt from tax, from \$600 to \$800 this year and to \$1,000 next year. This is a direct challenge to the Republican Administration's theory that concessions made to business in depreciation allowances and to shareholders over the taxation of dividends will "trickle down" to the consumer by way of increased capital expenditures and hence more employment. Moreover, the Administration's attack on high rigid supports for agricultural prices and its recurrent snip-

ing at public electricity projects, which offer special advantages to rural co-operatives, provide issues on which both wings of the party can join forces.

At Miami the Democrats were able to display not merely the semblance of a policy but the personality of a leader. The only trouble was that the leader did not refer to the policy, nor did the policy-makers show much enthusiasm for the tactics of the leader. While Senator Russell and Senator Lyndon Johnson made it clear that they wanted the party to concentrate on economic problems, Mr Adlai Stevenson ignored these in favour of a critical examination of Mr Dulles's definition of the "New Look" in foreign policy and defence and a firm intervention in the current dispute between Senator McCarthy and the Administration. Although he holds no public office, Mr Stevenson has been shown by public opinion polls to be still by far the most popular Democrat. Last time he was genuinely conscripted as candidate against his wishes; there is little doubt that in 1956 he will actively seek the nomination. But he will not get it without a fight for, despite the lead he at present holds, other names, particularly that of Senator Symington of Missouri, a former Secretary of the Air Force, are already being canvassed.

★

The main difference between Mr Stevenson, supported by Mr Mitchell, his nominee as chairman of the party's National Committee, and the southern Senators arises over the attitude to be adopted towards President Eisenhower. The Democratic leaders in Congress argue that the Republican party should be left to destroy itself by its internal feuds without comment from the outside, and that Mr Eisenhower's personal popularity is still so great that it would be a mistake to pin personal responsibility on to him for the policy of his advisers and for his own failure to assert his will. Mr Stevenson, on the other hand, thinks it is unworthy of a great party to remain silent on a major national issue, such as McCarthyism, and that the time has passed when the President should remain immune from criticism.

These differences in tactics reflect, to a certain extent, the differences between the battles which Mr Stevenson and the Senators will have to fight. Mr Stevenson is inevitably thinking of 1956, when in all probability he will have to fight Mr Eisenhower again, while those Senators who have to seek re-election this year are thinking of next November or, in the case of the Southerners, of next May. Owing to the dismal failure of the Republicans to follow up Mr

Eisenhower's successes in the South, the one party system still largely prevails in that region, with the result that the primary elections, in which the Democrats choose their candidates, provide the decisive arena of conflict.

The extreme example of a man with a local preoccupation is Senator Lyndon Johnson of Texas, on whom, as minority leader, any concerted party action in the Senate largely depends. Six years ago he scraped through the primary with a majority of 87 votes and with the help of a political machine which Mr Shivers, the Governor of the state, is now proceeding to destroy. Mr Shivers himself and most of the Democratic officials in the state are firm supporters of Mr Eisenhower, and Mr Shivers has specially distinguished himself by advocating the death penalty for membership of the Communist party. In the circumstances it is not surprising that Mr Johnson has been opposed to any firm Democratic stand on the subject of McCarthyism and to any frontal attack on the President.

Indeed, to avoid trouble, Senator Johnson, until a few days ago, had not even called a meeting of the caucus, which concerns congressional action on issues that are to be fought on party lines. Even then the agenda was characteristically confined to two subjects: full support was to be given to a fellow Democrat in trouble—Senator Chavez, whom a Senate subcommittee wants to unseat because of electoral irregularities in New Mexico—and all Democrats were to vote in favour of linking the Bills to give statehood to Hawaii and Alaska, even though some would do so because they wanted both Bills to pass and others because they wanted both Bills to fail. This is a time when Democratic fences are being energetically mended by Senator Kefauver in Tennessee, by Senator Douglas in Illinois, and by Senator Humphrey in Minnesota, as well as in Texas and elsewhere, and when local considerations take first place in the thoughts of many in the party. The basic causes of Democratic division has not disappeared with the end of Democratic rule. But until November they are likely to be soft-pedalled by mutual consent.

Lone Star Fanatics

FROM A SPECIAL CORRESPONDENT

TEXAS millionaires are familiar, and colourful, phenomena with fortunes built on oil and on the special tax allowances for depletion of underground resources which leave them with more spending money than most millionaires have nowadays. As long as they amuse themselves by buying Cadillacs, colleges and an occasional piece of a legislator, their activities are of little serious concern, but recently a small group of them has been trying to influence national opinion in a way that brings these Texas millions to bear not only on the whole United States, but indirectly perhaps on the whole world. For in American political life a point of view fuelled by an almost inexhaustible supply of money and geared efficiently into the system of mass communications can develop power out of all proportion to its validity or to the intellectual and numerical strength of those who originally sponsored it. And the strength of those who originally sponsored it. And the peculiarly Texan point of view which is now being spread all over the country is a nationalist one—indeed, an ultra-nationalist one, as might be expected from a state famous for exaggeration in all things.

Not all Texas millionaires are so narrow-minded or so at odds with the world, but unfortunately it takes only a few to do a great deal for isolationism, xenophobia and reaction. How it is being done, by use of the airwaves and the other media of propaganda and by pouring money into political campaigns for favoured candidates, has recently been shown by two careful studies of the golden Texas patriots carried out by the *Providence Journal* and the *Washington Post*.

★

The *Journal* concentrated on Mr H. L. Hunt, one of the richest men in the United States and a specialist in spreading his opinion by mass communication. His pet hobby is Facts Forum, now nearly three years old. This organisation, tax exempt as a non-profit-making educational institution ostensibly promoting impartial discussion, and entitled to free time on the air as a non-partisan public service project, takes its name from one of the four weekly wireless and television programmes which are put out over hundreds of stations. But it also disseminates Mr Hunt's thinking in a monthly newsletter which goes to 60,000 people, in discussion groups with 125,000 members, by freely circulating books which suit Mr Hunt's political taste, by encouraging writers of letters to the press, and by conducting polls with questions as weighted as the discussion programmes often are.

The *Washington Post* studied three other Texans as well as Mr Hunt—Mr Sid Richardson, Mr Clint Murchison and Mr Hugh R. Cullen. The last-named is a specialist in political intervention by direct financial means. It should be noted in passing that no public record shows any unusually large amount of money coming to Senator McCarthy from Texas. His stated campaign expenses are not great and his other activities are financed by smallish contributions from Americans everywhere. But in 1952 Mr Cullen scattered about \$50,000 over the country in contributions to campaign funds. His money went into the presidential fight and into various Senate and House contests. He supported men on the far right of both parties; not all his entries were successful—General MacArthur did not win the Republican presidential nomination—but the record was not bad. It was Mr Murchison and his wife who in 1950 had contributed \$10,000 to help beat Mr McCarthy's enemy, Senator Tydings, in Maryland. This notorious success immeasurably fostered the growth of McCarthyism; after that other politicians panicked when Mr McCarthy frowned. Surprisingly Mr Murchison is an internationalist, yet he was a generous patron of McCarthyism again in 1952.

There are now enough beneficiaries of this Texas political force in Congress to exercise an influence on the legislative programme which is the greater while both House and Senate are as evenly balanced as they are at present. Because of this even balance and because the Republican party is feeling its way through a miasma of McCarthyism, this political force may also be able to exercise a decisive influence on the choosing of the members of the next Congress. In the coming election, ideas like Mr Hunt's and money like Mr Cullen's will presumably pour into campaigns against liberal Democrats and into Republican primary contests where there is a chance of advancing reactionary candidates at the expense of moderates. One of the places to be watched most keenly is Maine, where the Republican Senator, Mrs Margaret Chase Smith, is seeking renomination. She initiated the anti-McCarthy "declara-

tion of conscience" in 1950, still the most forthright and courageous manifesto by anyone in her party.

It is its strategic application that makes the influence of these Texans and their money so incalculable. For example, the Democratic leader of the Senate, Mr Lyndon Johnson, is a Texan, facing an election this year, and Washington believes that his militancy in leading a liberal and international opposition is weakened by pressures from home. It is significant that he was absent from the Democratic fight against the confirmation of Mr Robert E. Lee to membership of the Federal Communications Commission, which regulates broadcasting. Mr Lee is a friend of Mr McCarthy and once worked for Facts Forum, as did Mr McCarthy's wife. If another Texan, Senator Tom Connally, then chairman of the Senate Foreign Relations Committee, had sought to run in 1952 he would have been fighting isolationist money. After attempting to change his internationalist spots, something which could not be done successfully in public, he chose to retire. The new Texas influence chalked up a victory by default.

★

The point of view with which these Texans are infecting public opinion is worse than McCarthyism. It is McCarthyism with a fear-ridden penumbra of negation, prejudice and compulsory conformity on many issues which the Senator himself touches only incidentally, if at all. From Facts Forum and other literature of the movement, the elements of the creed can clearly be seen. These Texans are convinced that the ascendancy of Soviet power was plotted in Washington during the Roosevelt and Truman Administrations and that the Korean war was a deliberate Democratic betrayal of American fighting men. They oppose the United Nations and believe that all liberals are promoting collectivism in the United States and that the channels of information and education are controlled by the left. Advocates of freer immigration are considered to be aiming at the adulteration of the American electorate by Socialist hordes from eastern Europe. The New and Fair Deals are damned comprehensively as unconstitutional and subversive, and as having fixed an alien philosophy on America. Intellectuals are dangerous and anti-McCarthyites shield spies.

Mr Hunt sincerely believes that a struggle is in progress in the United States between the extremes of right and left. For him and his friends the stake in the battle is not political power, sought for specific purposes or even for absolute satisfactions, but political influence apparently without any positive aim except, perhaps, to checkmate and extinguish an opposing political force. These men hoped for a Republican President and Congress in order to keep the undersea oil-bearing lands out of federal control, but apart from that they betray remarkably little self-interest in their political activity. In American folklore, the robber barons acquired Senators and Congressmen to protect their railways, their industries, their tariffs. But the Texan oil kings do not seem anxious to impose even their negative philosophy on others. All that they desire passionately is that others should not impose a positive philosophy on them or, if they can prevent it, on any American. These millionaires from the Lone Star state want only to shine in a political sky clear of all constructive ideas.

Such reactionary anarchy could never become a practical programme for either party but it could set up an effective obstacle to any programme either party might advance.

Held widely enough these frustrating attitudes could produce something very close to political paralysis. As awareness of the menace from Texas grows, attempts to expose and undermine it are growing too, in Texas and elsewhere. But nowhere is there yet visible a counter-movement even nearly as well-equipped with money, as shrewdly led, as determined or, most important, as fanatical as this assault on the mind of the public which has given a new significance to the Texas millionaire—or to a few of them at least.

American Notes

Warming Up at Caracas

MR DULLES left the atmosphere at Caracas warmer than he found it, nor because he put heat on the delegates to the tenth Inter-American Conference—which would probably have burned up all their friendly feelings toward the United States—but because his tactful and understanding readiness to make concessions spread a glow through the meeting. This warmth may not survive the detailed negotiations that are to come, but meanwhile the anti-Communist resolution on which the United States set such store has been passed more satisfactorily than at first seemed possible, with only Guatemala voting against it and Mexico and Argentina abstaining. It is not clear, however, whether this is the happy outcome of the changes which the United States accepted in the wording of the resolution itself, or of the hopes fostered by Mr Dulles of more sympathetic economic treatment once the hemisphere had made a contribution to the cold war.

The resolution declares that if the international Communist movement came into control of any American State, it would be a threat to the independence of all of them. It thus applies the Monroe doctrine to the modern method of attacking a continent by Communist infiltration, as well as to the nineteenth century method of doing it by establishing colonies. The main objection to the resolution, that it would authorise the United States to interfere in the internal affairs of its neighbours, was met by an amendment affirming the right of each American State to choose its own form of government; and Mr Dulles carefully refrained from pointing at Guatemala, even though everyone knew that the Communist influence there (discussed in an article on page 874) is stronger than is comfortable so close to the Panama Canal.

If an attempt is made to implement this rather vague promise of collective action, the difficulties may begin, just as they may begin in another sphere when economic discussions start in the autumn. Nevertheless the unexpected invitation from the United States for this later conference to meet in Washington went far to convince the delegates that the Republican Administration was more ready than had been realised to consider Latin America's economic difficulties. By the autumn, Congress must have removed at least the more immediate of the uncertainties about foreign trade policy and the Administration will know better what it can offer. In the meantime, in a field where Congress does not have to be consulted, Mr Dulles has

won an advantage, how extensive is not yet known, over the Treasury. He was able to announce that the Export-Import Bank was once more prepared to consider the long-term loans for development purposes that Latin Americans want and that almost ceased during 1953. Moreover, Congress is in the process of encouraging, by tax concessions, the private investment abroad which the Administration prefers, and the Latin American countries have been invited to negotiate bilateral tax treaties which would minimise double taxation and thus speed the flow of private American capital still more.

Investigating McCarthy

AFTER an attempt to avoid biting the hand that has fed it, the Senate's Permanent Investigating Sub-committee has been forced by the Republican leaders in Congress to investigate, with full publicity, its own chairman, Senator McCarthy. The unjudicial methods that he has made notorious will be turned to his advantage, for he will serve both as witness and as prosecutor, but at least he will not be judge. Senator Mundt is to act as temporary chairman, and a new staff is to be engaged specially for this inquiry. This could hardly be avoided since the charge to be investigated is that Mr Cohn, the committee's counsel, has been bringing pressure to bear on the Army, with Senator McCarthy's connivance, by threatening to investi-

gate it to the point of disruption unless special privileges are given to Mr Cohn's colleague, Mr Schine, who was conscripted late last year.

It might seem that this charge, and even more Mr McCarthy's counter-charge, that the Army tried to divert his attention to the rival services, might more suitably be investigated by the Armed Services Committee. But its chairman, Senator Saltonstall, much as he would enjoy making Mr McCarthy uncomfortable, hesitates to do so because he is running for re-election this year in Massachusetts, where many Catholic voters are sympathetic to McCarthyism. He was undoubtedly relieved that the right of congressional committees to regulate themselves, which is so frequently insisted upon, made it imperative that the Investigating Sub-committee should itself deal with its chairman and counsel. Mr Saltonstall's committee can, however, hardly avoid giving some consideration to the serious damage which these reciprocal accusations of blackmail are doing to the morale of the Army.

It is this damage, and the President's inability any longer to suppress his indignation at such attacks on his own service and his official family, that explain in part why the right of Senator McCarthy to conduct his inquiries as only he sees fit is at last being challenged. But the investigation of the Senator is also being pressed, rather ominously with his own co-operation, because unless the Army's charges against him are answered he will become, as even his friends agree, a liability rather than an asset to the Republican party next November. For the mothers of America are one of the groups of voters who are supposed to be attracted by McCarthyism, but few mothers of American soldiers will

WHO'S IMPORTING WHAT?

Do you sell, use or compete with merchandise imported into the United States? Do you seek new supply sources, news of competitor's doings, profitable new accounts? Have you services to offer the import trade? If so, get the powerful profit-help of the New York Import Bulletin every Thursday morning. It gives detailed lists of all imports each week by types, quantities, name of importer... every item on incoming ship manifests.

Each week, for instance, this new Import Bulletin tells you the number of vessels arriving at major U.S. port areas, the cargoes they carry, and names of all persons or firms to whom all shipments are consigned. Gives you, too, such vital factors as latest reports on import controls, customs ruling, tariff developments, import supply and demand, currency matters, foreign trade statistics, import promotion.

To get this most complete compilation of import facts, implications and forecasts available to help you make money, mail the coupon below for special trial subscription: 13 weeks for only \$6.00. (Payable in your own currency, if you prefer; send to either the New York or Canadian office of Import Bulletin shown below.)

be attracted by a man who tried to get his protégé excused from overseas duty and commissioned out of turn. Nevertheless, even though vigour has now been put into the weakly growth of Republican resistance to Mr McCarthy—one of its offshoots was the Vice-President's broadcast last Saturday—there is still time for the case against the Senator to be settled out of court, if both he and the Army can be induced to let themselves be appeased.

Recession Still Rolling

THE President's insistence, in his broadcast, that no depression exists and that therefore there is no case for further tax reductions at this time shows that the Administration is determined not to be stampeded by the continued decline in industrial production in February and the consequent rise in unemployment. Indeed, in the view of Mr Burns, head of the Council of Economic Advisers, the fact that production is lagging behind sales and that inventories are being reduced is a sign that the economy will work itself out of its recession, if only Americans keep on buying. Total business inventories, seasonally adjusted, have already fallen from \$82 billion in September to \$80.7

decide how to deal with the economy on the basis of the March figures. These will not be available until April, but many economists would like to see the trend in April and May before making up their minds.

The figure to which the President particularly referred was that of unemployment, but when April comes it may not be easy to assess. The new estimates of the Census Bureau, which are based on a sample which includes new industries and gives a wider geographical coverage, continue to differ embarrassingly from the old. In January the new

sample suggested that unemployment was 728,000 higher than expected; in February, the new method showed an increase of 584,000, the old of over a million. The totals for that month—3,600,000 for the new estimates, 3,385,000 for the old—are now not very far apart, but the decision of the Administration to withhold them both for ten days while a panel of experts checked them shows that it is conscious that such divergences cast doubt on its most vital statistical series. One of the immediate tasks of the Administration is to introduce order and meaning into its unemployment figures.

The Secretary of Labour, nevertheless, has confidence that the rate of decline in factory employment is slowing, and in this he is supported by reports that new claims for unemployment insurance in the states are lower than they were in January and February. Moreover, unemployment, however calculated, is still substantially below the 4.7 million reached in February, 1950, when the labour force was smaller. The encouragement provided to those who believe that purchasing power and sales will continue to hold up would be greater if consumer credit outstanding had not fallen, in January, for the first time in almost two years. The Federal Reserve Bank of Chicago estimates that consumers are paying out 11 per cent of their income after taxes on hire purchase, and finds them reluctant to add to this burden.

Whose Tax Relief?

THE House voted overwhelmingly last week for cuts in federal sales taxes, with only three members opposed to 411 in favour; and while *The Economist* is in the press the Democrats in the House may have carried their motion to graft an increase in the amount of personal income exempted from tax onto the monumental tax revision Bill. It was to stem this tide that the President spoke on Monday night, a cruel piece of mistiming, for the last harried citizens were still filling out their returns for this year.

The President's main point was that it would be irresponsible to plunge even more deeply into deficit financing in a time of relative prosperity; the most modest Democratic proposal would add \$2.3 billion a year to a deficit already estimated at just under \$4 billion for the fiscal year beginning in July and would excuse over 4 million taxpayers from paying any federal income taxes. But the Democrats' suggestion of recouping some of this loss by striking out provisions to relieve the double taxation on dividend income also strikes at the heart of Republican tax philosophy. The Bill in question represents the first redrafting of the federal tax laws in over eighty years and even its critics admit that much is done in its 875 pages to simplify and modernise the antiquated and obscure. It embodies, with only two exceptions, the tax proposals of the Administration, as well as a good deal more. Its aim—aside from closing a few notorious loopholes, and providing some tax relief for hard-pressed groups, such as those living on small retirement incomes, working mothers with small children, those with catastrophic medical expenses, and single heads of households, who cannot now claim the income-splitting privileges enjoyed by married couples—is to create a more favourable climate for business and thus encourage expansion and initiative. Business losses, for example, could be carried back two years, instead of one; the government, instead of the taxpayer, would have to bear the burden of proof in determining whether retained profits were excessive; tax deductions for money spent on research would be permitted either in the year the money was spent or over a longer period. To encourage development in backward countries income from investment abroad would be more liberally treated and taxed at a lower rate than domestic income. Corporations undergoing reorganisation would be given more favourable tax conditions; so would trusts and estates.

The most important provisions, however, are those allowing assets—machines, buildings, and so forth—to be depreciated more rapidly, and the concessions made to shareholders to lighten the double taxation of dividends. Together these are estimated to cost over \$600 million in the first year, nearly half the whole cost of the Bill, and much more in later years; their justification is the stimulus that will be given to modernisation and expansion and the provision of risk capital.

Price of Admission

THE prospects of making Hawaii the 49th state this year are once more receding. The Democrats in the Senate have succeeded in linking the admission of Republican Hawaii to that of Democratic Alaska, and the price may be more than the Republicans are able to pay. This, at least, was the confident expectation of some 19 southern Senators, who voted with the majority in the belief that two territories would be easier to keep out than one. The Southerners fear any enlargement of the Senate, which might make it more difficult for them to sustain their opposition to laws enforcing Negro rights. Multi-racial Hawaii, which is likely to send two Republican Senators to Washington, is particularly suspect.

Mr Knowland, the Republican majority leader without a majority, has understandably laid the matter aside for a

fortnight to let more pressing business through. But even if the Senate can be persuaded to open the door to both Hawaii and Alaska, the House may not. The House has passed a bill admitting Hawaii, but has refused to do anything for Alaska. The Republicans no doubt are to blame, originally, for putting their own political interests first. But Democrats who sincerely favour statehood for both territories must have known that by linking the two they were jeopardising the chances of any action being taken at this session.

SHORTER NOTES

A \$350 million a year scheme to make government service more attractive and therefore more efficient is being pressed by the President. It follows the example of the most progressive private employers in offering voluntary group life insurance and health insurance; it provides unemployment insurance for all federal workers, and through reclassification of jobs and adjustment of salaries, promises average wage increases of about \$150 a year, although most of the rises are destined for workers in the upper brackets whose responsibility has outweighed their pay. But Congressmen are showing more interest, in an election year, in a general pay increase, perhaps for all civil servants, perhaps only for the postal employees who are the most politically telling of federal workers.

A number of small wholesale distributors of greeting cards will be able to send joyful messages to each other. The Federal Trade Commission has decided that, although they bought their cards through a jointly owned corporation, they were not guilty of conspiring to suppress competition. But the makers of coffins, or "burial caskets" as they are known in the United States, have gloomier news; the FTC has charged them and their trade association with agreeing to maintain "uniform, artificial, and non-competitive retail prices."

Americans smoked 7 billion fewer cigarettes in 1953 than in 1952, the first drop since the nineteen-thirties, with the exception of 1944. Cigar output in 1953 was, however, the highest for over 20 years. The official reasons for the decline in cigarette smoking—lower incomes, higher prices, larger cigarettes, a higher percentage of the population in the older age groups—did not mention the medical evidence that cigarette smoking causes cancer, which the industry believes to be mainly responsible.

The frozen food companies, long regarded as the housewife's best friend, are now prepared to take her out of the kitchen altogether. They are offering a sufficient variety of pre-cooked dishes, which need only be heated on a hot plate in the dining room, for her to be able to please any husband, however great a gourmet he may be, seven days a week; Normandy trout in champagne is one of the suggestions.

The World Overseas

Growing Pains in West Africa

FROM OUR CORRESPONDENT IN THE GOLD COAST

AS colonial territories approach self-government in the twentieth century, they face difficulties and hazards which were unknown in earlier periods. Most of them spring from the new levels of expectation which the western welfare state has created in the minds of the local electorate. The people not only expect independence, a vague term, in any case. They also demand health services, better education, improved diets and an increasing standard of living. And they demand all these things without any understanding of the fact that they are unobtainable without an increase in real wealth and the services of efficient and well-trained administrators.

This gap between expectation and likely performance is formidable in itself. It is accentuated by the normal climate of opinion in the colonial world. The dominant ideas reflect the typical education given to colonial students in England, and even in the United States. They tend to be dogmatically left-wing on all matters concerning the creation and ownership of wealth and the future relations with the metropolitan power. In practical terms, they are hostile to foreign enterprise and distrustful of foreign administrators. While the people at large expect programmes which only western standards of wealth and administration can secure, the educated minority from which the local government must be drawn, tend to distrust—because they are western—the very sources from which capital and administrators can be drawn in the short run. For the small group of active Communists, who are usually to be found in countries moving towards self-government, this divided state of mind is a welcome phenomenon. By preaching fixed hostility to all western forms of aid and association, they not only strike a local chord of prejudice, they help to increase the risk of local economic collapse and political disorder in which, according to their calculations, their opportunity for a *coup d'état* must count.

These confused but potent currents of opinion were well illustrated in the crisis in British Guiana, where the political incompetence and extravagance of the local political and fellow-travelling leaders quickly threatened publicist and economic viability. It is therefore all the more encouraging to observe that in another former colony moving to independence, the facts of experience and a quality maturing judgment have led to a very different development. In the Gold Coast four years ago, it might have seemed that the stage was set for a drama of the type experienced in British Guiana. The dominant ideas in the Convention

People's Party were left-wing. Dr Nkrumah had the reputation of having Communist sympathies. The small African middle class in the Gold Coast repudiated his party as a band of extremists and hooligans. The party programme was based upon immediate independence, and there had been little in the preliminaries to the elections of 1950 to suggest that the CPP might not be irrevocably committed to left-wing extremism. Indeed, Dr Nkrumah was serving a sentence at the time for fomenting violence.

This period of turbulence has to be borne in mind in judging the significance of political events in the Gold Coast in the last nine months. It is clear that three years of practical experience of government under the able and patient guidance of the Governor and the British *ex-officio* ministers and officials have been sufficient to offset most of the articles of faith with which the party came to power. In the process of introducing an ambitious programme of extended education and of widening the scope of the social services, the African ministers have realised the cost of welfare and administration in terms of the country's revenue and the need for trained officials to carry on the whole programme of welfare. Independence without a rise in living standards may, they see, prove a Dead Sea fruit. But independence does not bring about such a rise automatically. On the contrary, there is some risk of deterioration and such a possibility might give the local Communists—who are already active in the trade unions—their opportunity. The problem is, therefore, seen no longer as independence, but independence with prosperity and progress—a condition which implies both an increase in wealth and effective administration.

This is the realisation that explains a number of acts of policy on the part of the Gold Coast government in the last nine months which accord rather uneasily with the original—and traditional—programme of “ending colonial servitude,” but accord very well with the dictates of common sense. The starting point is the conviction that independence is now assured. (Any suggestion from London that this is not the case would naturally restore all the old suspicion and extremism.) The practical policies are concerned with making independence effective—and comfortable. In July last year, the Gold Coast government announced its readiness to offer secure employment without discrimination in its own Civil Service to all British colonialists who opted to continue to serve in the Gold Coast by accepting the Gold Coast's alternative offer of

(By courtesy of the Trustees of the National Maritime Museum, Greenwich.)
ENGAGEMENT BETWEEN ANSON'S "CENTURION" AND THE TREASURE SHIP "CAVADONGA", 30TH JUNE, 1743, by Samuel Scott

BEFORE THE THUNDER and smoke of battle, the tensest moment: the ships sliding towards each other over the hissing sea, the guns run out, the crews still...and waiting. When someone murmurs the blasphemous grace "For what we are about to receive..."

Yet the men that died from round shot, from steel, were few compared to those who died from scurvy, the real scourge of the sea in those far-off days. And it was not only at sea that men died through lack of proper food, or from diseases caused by dirty food.

Today we know far better what to eat. And how to treat our food. How to keep it fresh and free from contamination. Much of our food today is protectively wrapped...from the baker, from the factory, from the shops. Wrapped, it may be, in packaging made by Bowaters. For Bowaters make wrappers and containers of many kinds—for food protection and a thousand other purposes in commerce and industry, all of them contributing, in their several ways, to the health, pleasure and efficiency of modern living.

Bowaters

compensation. In this way, the African ministers are seeking, without any fear of being labelled "dupes of the imperialists," to keep the best and most experienced British officials during the critical years of early independence.

Recently, the government announced an equally practical and rational policy to meet the problem of maintaining and increasing Gold Coast resources. The ministers recognise that although the government has sizeable resources there is as yet no local class of investors or entrepreneurs and they have accepted Professor Arthur Lewis's recommendation that the assistance of foreign capital should be sought. To foreign enterprise the government offers an open field—save in the sphere of public utilities—and guarantees that investors will be allowed "to transfer without restriction profits arising from non-resident capital investment or to repatriate foreign capital invested in the Gold Coast." It further intends to write into the Constitution the guarantee that no nationalisation will be undertaken without fair compensation.

In the immediate practical sphere, it announces its intention to give every possible assistance to would-be investors in arranging for sites, for land purchase, for the provision of services and for the housing of staff. It is also ready to use its quite considerable capital reserves to help in the financing of ventures which may need preliminary assistance. In return for these guarantees, it asks only one thing—that all firms should undertake to train African staff for all types of work and responsibility. As an encouragement, all money spent on such training would be deductible for purposes of company income tax—which runs in the Gold Coast, as in Britain, at 9s. in the pound.

Communist Blandishments

Dr Nkrumah and his colleagues are aware that these eminently reasonable and practical measures for increasing the wealth and stability of the country will be denounced by the extreme Left as "betrayal" and "selling out to the capitalists." The cabinet has become increasingly uneasy in the last year at the amount of attention the Communists have been devoting to the Gold Coast, showering it with bursaries and scholarships all designed to lure potential leaders to indoctrination on the other side of the Iron Curtain. In the autumn, one of the leaders of the trade union movement was suspended from the CPP on suspicion of fellow-travelling. Recently Dr Nkrumah formally announced that no known Communist would be employed in certain branches of the Civil Service—the so-called "sensitive" branches, such as administration, education, labour, information, the police and the armed forces—and that the government would also take action to diminish the flood of propaganda literature and invitations reaching the country.

These, then, are the indications of sobriety and moderation in the conduct of government policy in the Gold Coast. It is to be hoped that they receive at least a part of the attention that has been devoted in the British press to the recent inquiry into corruption. An exclusive reporting of unfavourable happenings tends to create in the African mind the belief that although the Gold Coast government has progressed in understanding and good will, there has been no comparable development in Britain. Such a suspicion would now be more likely than any other single factor to discourage the government from holding its present enlightened course.

India Takes to Politics

FROM OUR BOMBAY CORRESPONDENT

INDIA is deceptive. The Communists did not, in fact, win in Travancore-Cochin; and Sikh communalism was rebuffed, not destroyed, in Pepsu (Patiala and East Punjab States Union). The recent elections in these two states have been treated rather like English by-elections, as tests of the national standing of the marginal parties. But both states are small, and communally, economically and politically untypical.

Communally, Pepsu has a Sikh majority, divided into nationalists and Communists (*Akalis*) who are themselves divided into a right and a left. Travancore-Cochin is one-third Christian; they are mostly very pro-Congress Roman Catholics, but with a minority of prosperous Syrian Christians who provide many of the State's Communist leaders. Economically, Pepsu has a tenancy problem almost solved; while Travancore-Cochin has a labour problem that is almost insoluble. Pepsu's tenancy disputes have been particularly bitter because many of the tenants are ex-owners whose landlords were forced on them by their princes within the last 60 years or so. But the legislation of the last two years will make most of them owners once more; they will now be able to buy out their landlords compulsorily for a maximum of £15 per acre. Already feelings

have quietened enough for it to be no longer necessary to perch armed police on the top of every bus.

One-fifth of the population of Travancore-Cochin is landless; employment is uncertain and the local government has not yet exercised its right to fix a minimum wage. There is little hope that land redistribution would help, for only a few dozen people own more than 100 acres, and geography is against much extra

irrigation. The state's main industry is coir, on which 600,000 people depend. But coir exports have fared ill, and naturally Communist support is strongest in the coastal coir belt. Bitterness has been sweetened by the Centre's failure to provide enough rice for a people who do not eat wheat.

At the last elections Congress did not win a majority in either state. In Travancore-Cochin it was able to govern through an ineffective coalition. In Pepsu it fell to a civil servant under President's Rule, to restore law and order, free services from corruption and interference, and pass long-needed reforms. As a result the public, acclimatised to order and stability, has given Congress a majority large enough to govern (37 out of 60). Congress votes went up from 400,000 to 700,000, and the Communist *Akalis* suffered a definite, though limited, defeat. They lost seven seats, and this defeat may be serious because it follows a

long period of dithering and the recent loss of control over their temples' funds.

Travancore-Cochin voted itself into a deadlock. The Congress did best; it got 45 per cent of the vote, against 35 per cent last time, and 1,763,000 against 1,118,000 votes. The Communists went up only from 15 to 17½ per cent and the Socialists from 14 to 16 per cent. Yet, because of the electoral alliance between the Socialists and the United Party of Leftists, which prevented split voting, Congress got the same number of seats as last time but in a somewhat larger house. The United Front of Leftists is a queer cocktail of Communists, Kerala Socialists (who want a separate Travancore-Cochin plus Malabar) and of Revolutionary Socialists who despise Communist bourgeois conservatism. The Congress, plus their possible allies, and the United Front, plus the Socialists, each have exactly half the house: 59 seats. For a stable government there must be either President's Rule which will be criticised as undemocratic, or a Congress-Socialist coalition. But the Socialists distrust Congress; moreover, their local leader, Mr P. T. Pillai, has for Congress that distaste that only an ex-Congress Chief Minister can have. In the event a minority Socialist government led by Mr Pillai, has been formed with the Congress in benevolent opposition.

The main lesson of these elections, however, goes deeper than who forms the government in Travancore-Cochin or Pepsu. It is that India is taking to politics like an old democracy. In both states some four-fifths of the electorate voted; in both states the main loss was suffered by splinter parties and independents. Politics are settling down to a fight between big parties, and voting shifts are only marginal, but can sometimes change the government.

Russia's Battle for Bread

FOR the second time since Stalin's death the Soviet leaders have now sounded the alarm about the poor state of agricultural production. Indeed, there is an even stronger note of urgency in the new directives issued by the Central Committee than in a similar communiqué issued last September. Then, after listening to a gloomy stocktaking by the Party secretary, Nikita Khrushchev, the Committee announced a new policy of incentives to the peasants through tax relief and higher prices. In Khrushchev's picture the emphasis was laid on the poor state of livestock and on shortages of coarse grain and other fodder. But at least there was the consolation, often reiterated in official statements, that the bread problem had been solved once and for all. This claim is no longer made.

The new communiqué is, in fact, a call to the battle of the grain. It is now admitted that production of bread-grains, as well as coarse grains, is insufficient. Many collective farms, after fulfilling all their deliveries, have not enough grain to pay the members for their labour. In spite of this, supplies to the state are not sufficient to cover the rising needs of the economy; to build up reserves and to provide exportable surpluses, "the need for which is growing." The blame for this situation is put on the planning authorities (the *Gosplan*) and the responsible ministries which, through their "incorrect policy," have allowed the total area under grain to decline and to fall

below the prewar level. But beyond the *Gosplan* it is Stalin himself who is really incriminated.

The insistence on agriculture is natural, since the fulfilment of the pledge to the consumer of better days—on which the new regime has staked its fate—depends largely on increased agricultural production. Grain has a decisive role to play in the campaign, both directly and indirectly, as food for livestock and Russia's staple export. Yet, of all the economic objectives, the grain target of 180 million tons* by 1955 seems the most difficult to reach. Doubts about its feasibility were expressed in these columns when it was first announced; they have been now strengthened when with only two years to go the grain harvest is still below 130 million tons. And yet Nikita Khrushchev still hopes to step up the yield by the fantastic amount of 50 million tons in two seasons, and the new drive is supposed to help in this task. The treatment prescribed in September is still to be followed—both the short-term prescription of incentives and the long-term one of mechanisation. On top of this, however, a new emergency remedy is now advanced: the conquest of virgin and waste lands in North Caucasus, the Volga region, the Urals, and in Kazakhstan and Siberia.

Altogether 13 million hectares of new land capable of producing some 19 million tons of grain are to be brought under cultivation within two years. The gravity of the situation is shown by the fact that even land left waste after the war as being uneconomical is now to be exploited again. But the real field of action for the new policy lies in North-East Kazakhstan and Western Siberia. Kazakhstan alone is to account for half of the total increase. Ponomarenko, the former minister of culture appointed as Party secretary in Kazakhstan to supervise the campaign, has just proclaimed in an electoral speech that in 1955 nearly 10 million tons of grain are to be produced there on 6.3 million hectares of new land, and by then Kazakhstan should have as large an area under wheat as the Ukraine, Russia's traditional granary. Extensive, highly mechanised cultivation is to prevail on these new lands. 120,000 tractors (in

15 hp units) have been earmarked for this operation, that is, nearly as many as the average annual supply to the whole Soviet countryside. State farms are likely to predominate, since three-quarters of the total grain production is to be marketable, while for normal collective farms the proportion is less than half.

The whole new policy sounds like a mixture of long-term planning and panicky improvisation. The acceleration of the eastward shift and dispersion of agricultural centres, and a parallel movement in industry, could be justified on both strategic and economic grounds. On the other

* All figures are inflated as they refer to the biological crop.

hand, the pace advocated and the alarm sounded indicate a state of emergency. Throughout the Soviet Union a propaganda campaign is being carried on to mobilise young agronomists, technicians, engineers and mechanics for the eastward migration. The Ukraine already boasts of 40,000 "volunteers," Russia claims some 100,000, and more are to come not only from the farms but from the factory benches as well. The young men are offered some material incentives such as three months' compensation from their former jobs and higher monetary rewards. Yet these alone could hardly induce them to undertake what is really a pioneering task. The first batches to reach the new regions were faced with a sub-zero temperature, and in the first period it will be necessary to brave the inhospitable climate in tents and feed in field kitchens. In the early days of the Soviet regime volunteers could be found for similar assignments by appealing to the revolutionary fervour of the Communist youth. But Stalin found slave labour more reliable than enthusiasm. Can the post-Stalinist regime revive the early enthusiasm, having promised to put away the police baton?

Historically it may not turn out to have been so absurd that reports of farmers' meetings overshadowed the Berlin conference in the Soviet press and the new decree has taken up more space than comments on Geneva. The battle of the grain may well go down as an important episode in the post-Stalinist struggle for survival. The Kremlin will certainly do everything in its power not to lose on this vital sector, but the changing tactics, the hazardous attacks, the throwing of shock troops into the fray, all show that it is far from certain of victory.

Guatemala's Communists

FROM A CORRESPONDENT

THE situation in Guatemala is a complex one. The country is still in the throes of a social revolution not unlike those that have swept Mexico and Bolivia. But here, unlike Mexico and Bolivia, the Communist party has increasingly influenced the development of the revolution; and it may yet succeed in establishing the western hemisphere's first fully Communist regime.

Guatemala still remains essentially divided into two nations. The Indians make up the overwhelming majority. Few of them speak Spanish; most are, in varying degrees, still basically pagan; and their meagre economy is one of subsistence agriculture. The other Guatemala is that of the *Ladino*, the Spanish-speaking townsman, generally descended at least in part from the conqueror of the Indian. The *Ladino* has hitherto owned most of the land, has created the towns, and has had the chief interest in the country's principal crops—first cochineal, and more recently coffee. The revolution is in part an attempt to integrate these two Guatemalas. It has introduced universal suffrage, modern labour legislation, the beginnings of education for the Indian and, during the past eighteen months, a land reform whose aim is to transform the Indian tenant into a landholding peasant.

The Communists did not father any of these reforms, but they are busy taking credit for them. Having a great deal of audacity, and, unlike all the other political elements,

THE ECONOMIST, MARCH 20, 1954

knowing exactly what they want, they have taken the lead away from the three other coalition parties—which have no distinguishable principles, and exist largely because they receive sizeable government subsidies. The Communists have been able to place their members or friends in key government posts. They are generally believed to control the social security institute, the national radio, and much of the agrarian department; the last is particularly important because it is carrying out the land reform, and the Communists can thus claim credit with the peasants for the distribution of land.

The core of the Communists' strength is the trade union organisation that has grown up since the overthrow of the Ubico dictatorship in 1944. Several non-Communist labour groups existed until 1951, when Colonel Arbenz Guzman succeeded Dr Juan José Arevalo as president; but the Arbenz administration has thrown its full weight in favour of the completely Communist-controlled General Confederation of Workers, to which virtually all the labour organisations are now affiliated.

President Arbenz himself is, in fact, the Communists' most important ally. They allied themselves with him several years before he came to power, and have apparently convinced him that they are the only true supporters of the revolution. Foreign observers estimate that the Communists gained more during the first six months of his administration than during the full six-year term of Dr Arevalo. However, the army officers as a whole still represent a considerable stumbling block on the Communists' road to full power. The party may also have difficulty in the future with the peasants, who will resist any attempt to replace the smallholdings they have just received by "co-operative farms"—the local version of collectives.

It is still too early to tell whether army and peasant resistance will check, or even slow, the Communist drive. No matter how the issue is resolved, the result may well be the shipwreck of the Guatemalan revolution. In terms of global chess, this country of only 3½ million people is a mere pawn; a pawn that might be sacrificed to assist the onward march of the Red King and Queen. The Guatemalan Communists may be expected by their masters in Moscow to serve as bridgehead for further revolutions in Latin America; or they may be considered to have done their duty if they merely arouse Latin American feeling against United States "interventionism."

Progress in Turkey's Villages

FROM A CORRESPONDENT

IN the last four years a reorientation of agricultural policy, plus American financial aid, have changed the Turkish countryside almost beyond recognition. In that short space of time the production of cereals has nearly doubled, and the number of tractors has leapt from 6,000 to over 35,000. Improved and extended roads are busy with lorry traffic. A considerable number of villages have acquired running water, and hydro-electric stations and dams are rapidly coming into existence.

While the statistical aspect of these changes is daily detailed in the press, the town-dweller becomes increasingly aware of them in other ways. Every town has its market

THE ECONOMIST, MARCH 20, 1954

days for the rural population of the vicinity. Here, up to quite recent times, more bargaining than actual shopping went on and certain commodities, such as sugar, were doled out by the spoonful. Except before a wedding, or some such important event, many peasants bought little except salt and gasoline. The peasant woman's necklace of gold coins represented at one and the same time the acme of sound investment and of conspicuous consumption. Today, the visitor to one of these market places is amazed at the variety of goods offered for sale. Gay-coloured cotton prints and rubber boots are much in evidence; mysterious-looking agricultural implements jostle with more familiar bicycles and battery wireless sets; there are plenty of gaily-painted metal trays and pots and pans, pink-and-white striped sweets and tinned biscuits. There is no doubt that these little shops reflect a new purchasing power.

Up to the eve of the elections in 1950, many Turkish intellectuals assumed, perhaps a trifle naively, that the development of the village had kept pace reasonably well with that of the city. That this assumption was rosier than the facts warranted was revealed when, in preparation for a multiple-party form of government, greater freedom of the press was granted. In all fairness, however, it must be pointed out that the People's Party administration had inherited the results of such widespread neglect and privation that the tasks at hand were almost superhuman. There were 35,000 villages, most of them isolated from the nearest town or from other farming communities, to be modernised. The necessity of maintaining a large standing army during the second world war cut across reform programmes and drained the country's resources of both manpower and production. Nevertheless, two important reforms were initiated by the İnönü government which are only now beginning to bear fruit: the Land Distribution Law of 1945, and the formation of a network of "village institutes" with the object of training young villagers so that they may return and teach in their villages. These institutes are still the subject of much controversy, but they have undoubtedly played a constructive role in the development of the villagers.

More Land Cultivated

In the period 1950-53 the extent of land under cultivation has increased by nearly one-third. Some eighty Land Distribution Commissions, functioning in as many districts, have distributed six and a half million dönüms (a dönüm is about 940 square metres). In 1952, 41,500 families received 3,773,000 dönüms of arable land, and 1,265,000 dönüms of pasture land. These lands were state, provincial or municipal lands not in public use, reclaimed waste lands, or lands belonging to obsolete pious foundations. Privately owned land in excess of 5,000 dönüms or, if uncultivated by the original owner, of 2,000 dönüms, is also liable to be redistributed. Uncultivated land is first worked by tractor-equipped government squads before being handed over to the beneficiaries. The latter are granted a loan repayable in twenty years, for the management of their land and a further three-year loan for the installation and equipment of their farm. Last November President Bayar announced a new Agricultural Bank credit at 3 per cent interest for the building of farms, silos, depots and other installations.

The state buys the farmer's crops through the agency of the Office of Soil Produce (Toprak Ofisi) at a price somewhat higher than the market price. It sells its surplus stocks

abroad, at normal prices. The Office of Soil Produce recently announced that of the crops purchased in the last seven months, three-fourths had already been sold. There have been adjustments in both purchase and sale price, but the government feel that the disparity will eventually be compensated by the increased volume of foreign trade. The sums paid by the Office to the farmers have increased from £T22,800,000 in 1949-50 to £T519,165,000 in the last seven months.

In his opening speech to the Grand National Assembly, early last November, President Bayar gave some rather startling comparative figures. The production of cereals, he said, had risen from 7,764,000 tons in 1950 to 13,600,000 in 1953. Cotton production had risen by 60 per cent, from 104,000 tons in 1949 to 165,000 in 1952. Tobacco had gone up from 82,000 tons in 1951 to 120,000 in 1953, seeds for industrial use from 1,700,000 tons to 2,415,000 tons. Cattle increased from 55 million head in 1950 to 62 million head in 1953; and from being a wheat-importing country Turkey is now close to becoming the fourth greatest exporting country. While no one claims that the agrarian standard of living in Turkey has in four years risen to a satisfactory level, yet the fact remains that, taking into account the growth of population, food production per head has doubled in that period.

A State Football Pool

BY A CORRESPONDENT

ONE of the biggest money-makers in Norway is the state football pool (*Norsk Tipping*) which was set up after the war. Turnover for the five years 1948-52 amounted to £10,660,000 and profits were £3,150,000. Last year profits came to £1,250,000; thus for the whole six years since the pool started its profits have amounted to £4,400,000.

For a small nation—Norway has only about 3,350,000 inhabitants—this is a considerable sum of money. The direct beneficiaries are sportsmen and scientists, for by law the entire profits are distributed to sport (which in Norway means amateur sport only) and scientific research. Up to the end of 1953, sport had received £1,480,000 and science £2,920,000. These extra-budgetary grants made possible by the institution of the state football pool have enabled sport and science to recover much more quickly from wartime neglect than would otherwise have been possible.

Most of the allocation to sport has been used to build playing fields. Grants have been made to hundreds of sports clubs with the proviso that the club members themselves should make an equal contribution in the form of voluntary labour in their spare time. The cash value of this voluntary labour was estimated at £850,000 in the first four years. Whilst the grants to sport are made through the state sports office, the grants to science are determined by three specially constituted councils for general, technical and agricultural science. These councils, aided by an elaborate system of specialist sub-committees, decide suitable research projects. The Norwegian Atomic Institute's uranium reactor—the first to be built by a small power—was financed partly by football pool profits.

The sub-committees created to help allocate pool profits

have in a number of cases developed into permanent research institutes with independent constitutions. In the technical field, these institutes are being financed by particular branches of industry, sometimes by means of a compulsory levy. Near Oslo work has now started on building a research centre to house many of the new technical research institutes, and industry is contributing generously to this project. As in sport, so in science, the football pool profits have been an incentive to self-help.

The football pool itself is a very compact and efficiently run organisation constituted as a limited company under the auspices of the Ministry of Church and Education. Only half the money staked by clients is returned as prizes. The other half, after deducting expenses, is all clear profit. Expenses have been kept down to a minimum in a number of ways which distinguish the Norwegian pool from British pools. The weekly coupon offers only one kind of forecast—a simple 12-results; checking is therefore very easy and only a relatively small staff is needed. The Norwegian pool can operate nearly the whole year, basing its coupons on Norwegian games in summer and on the very popular English League games in winter; this helps to reduce expenditure on overheads. Furthermore, there is no direct mailing of customers. Agents are used—usually shopkeepers—who receive the coupons in bulk, hand them out to customers, and return the completed coupons to the pool company. The agents also handle the money. The pool is thus spared much of the detailed work which British pool companies dealing direct with their clients must do.

The fact that the maximum prize for a winning forecast is only £2,500 does not seem to deter participation in the pool. About 500,000 Norwegians fill in the coupon weekly. There are few ways of getting rich quickly in Norway, and a tax-free £2,500 is quite an attractive proposition. The total prize-money is divided into three equal proportions, for distribution to first, second and third dividend winners. Coupons have to be filled in in triplicate, one for retention by the client, and two for the football pool company, which in turn deposits one copy with a public notary. The company's accounts are audited by the state auditing office.

The Norwegian state football pool's success is no doubt largely attributable to the fact that it is a monopoly. It is assured of the custom of the whole nation without the need to advertise. It can offer clients a coupon with only one type of forecast without danger of losing customers to other companies with more versatile and interesting coupons.

Nor does the state pool have to raise top dividends artificially in competition with other pools.

The Norwegian public appear perfectly happy with the present arrangement. They believe that the pool is efficiently run, that dividends are fairly determined, and that running costs have been pared to a minimum; and they know that the only profit-takers are sport and science. Nor do they think it improper that the Ministry of Church and Education should run what is virtually a gambling institution. For many years the Ministry of Social Affairs has, through another state corporation, had a monopoly of the wine and spirits trade, and the general view seems to be that in gambling, as in drink, a public monopoly is the best safeguard against abuse.

The Real Wealth of Nations

NO one can deny the rapid strides made in recent years in the science of national income accounting. But, in spite of the development of new techniques and the refinement of old ones, there are still a number of problems outstanding. Not the least of these is the difficulty of finding a satisfactory method by which the national product, and its components, in one country may be compared with those of another. The real difficulty is that the economist, unlike his more fortunate colleagues in other branches of science, is cursed with a measuring rod that is as fickle as it is malleable—money. But recently Dr Milton Gilbert, of the Organisation for European Economic Co-operation (OEEC), and his collaborators, have, after a lengthy study, found a way which permits direct comparisons to be made. This is no mere academic refinement, for nowadays the national product is a cardinal fact in the economic calculations of governments; it is the principal measure of the productive power of a country. Moreover, there is constant need for a yardstick such as the national product when problems like the sharing of defence burdens in Nato are under discussion.

In the past international comparisons have been made in an unsatisfactory manner. The least misleading comparisons are those which, for example, compare the percentage of the gross national product (GNP) going into, say, investment in the United Kingdom with that in the United States, or when the percentage change in the GNP over a certain period in one country is measured against changes in another. But, valuable as these comparisons are for some purposes, they are only relative judgments; they tell nothing about the absolute size of the national product. So, if, for instance, defence expenditure in the United States is 14.6 per cent of GNP while that of Italy is only 5.8 per cent, though it is a significant fact in itself it does not tell the whole story; it leaves out the important point that the American national product is several times larger than Italy's.

Frequently in the past an attempt has been made to convert, at the current exchange rate, the value of GNP in several countries into a common currency, usually dollars. But this is a faulty and often a misleading method. Besides making the assumption—nearly always false—that the official exchange rate is appropriate, this method also ignores the overriding fact that most goods which go into the national product are not traded internationally and, therefore, are remote in the extreme from any connection with the rate

of exchange. Though many methods have been tried to eliminate the grossest distortions of the exchange rate method, no really satisfactory answer has, or indeed can, be found.

Dr Gilbert has chosen a quite different approach. Instead of trying to doctor the national figures by some statistical trick, he has started from the beginning and recalculated the gross national product in five countries (chosen because the statistical material was available) on the basis of a uniform set of prices. But which prices should be used—American, British, French, Italian or German? The answer is that there is no single answer; for each pair of countries compared there are two answers. Thus comparisons of the national product (or its components) of, say, the United States and France, will show one set of results when calculated on the basis of American prices, and another, different answer, when calculated on French prices. Neither can claim to be uniquely right.

It is a laborious method; it made necessary the collection of price, quantity, and value data for no less than 250 items in all five countries. There were, moreover, problems of great complexity. Chief among these was the difficulty of defining identical products in the various countries, and making adjustments for differences in quality. Though the investigators exercised care and great ingenuity, the conclusion cannot be escaped that in many instances more or less arbitrary rules of thumb principles had to be used. Can anyone feel satisfied with "a kilo of automobile" as a unit? In addition the subjective element plays a large part in the valuation of many items. For these and other reasons the results of the present study must be treated with care.

The most striking fact emerging from the report is the much better showing made by the four European countries when compared with the United States on the revised

"real" product measure than under the conventional exchange rate method; the combined European national product (for convenience sake the two answers for each country are blended by a geometric average) is 50 per cent of the American as compared to 35 per cent when the old method is used. Likewise the national product per head of population when calculated by the revised method gives better results for Europe than was previously believed to be the case. Nevertheless even this "prosperity by recalculation" does not hide the substantial difference between

Europe and America, though, as the authors say "the European countries are not as weak nor as inefficient from an economic standpoint, relative to the United States, as has often been thought."

Interesting results are also obtained when comparisons on the new basis are made of the individual items that go to make up the gross product in the five countries. Whatever prices are used, American or European (and, it must be admitted, by the old exchange conversion method), the proportion put into investment in Europe compares lamentably with that in the United States. In 1952, for instance,

the rate of investment in Britain was 38 per cent (by United States prices) or 41 per cent (by British prices) of the American rate. The figures bring out, furthermore, the poor showing made by Britain as compared to the other European countries, except France, in this respect.

Perhaps the greatest practical interest of the study lies in the figures showing the part defence expenditure plays in the GNP of the five countries. The recalculated method tends to show a bigger defence burden in the United Kingdom, relative to the United States, when valued by American prices than is shown by the conventional method. But France and Italy, on the other hand, appear in a rather less favourable light. However, if the calculations were to be based on European prices a substantially different result might have been obtained. Moreover, it can be argued, as the report admits, that "the percentage of defence expenditure to gross national product is the more significant measure of the burden of defence." Though the new recalculated figures are hardly likely to eliminate the disputes which are a common experience in the annual Nato burden-sharing exercises, they will at least add two more objective criteria by which the burdens may be compared.

In the end can one say that OEEC's new method has really solved the difficult problem of comparing national products in different countries? Even the authors admit that the technique is not yet perfect; but apart from this, it must be doubted whether a finally satisfactory method has been evolved, or is indeed possible. True, the present study goes to the root of the problem, but in so doing it exposes more problems than it solves. Perhaps this is the major achievement for, if nothing else, the report shows very clearly the fallacies of former methods. It is nevertheless a courageous pioneering effort.

man and tree

If nature is kind, a man may live in health
to a hundred years, a tree to a thousand.
Man's knowledge of the chemistry of health
is increasing. Through science man is gradually
making nature kinder and more predictable.

Fisons are in the business of chemicals.

THE BUSINESS WORLD

Dead Man's Gift Horse

THE law and practice governing the valuation of gifts *inter vivos* for estate duty purposes has undergone considerable changes in recent months, and this week has produced a further and major change. For nearly three-quarters of a century it has been recognised that the collection of the duty would be largely frustrated if the "undressing" of estates before death was permitted without restriction, and, since 1881, property passing on death has been deemed to include "property taken under a disposition *inter vivos*." To begin with, gifts made within three months of death were included; the period has been lengthened until today it extends to five years except for charitable gifts where one year is enough. The whole art of avoiding estate duty by making a gift is not to die too soon. And just as estate duty is charged on the value as at the date of death of the assets which actually pass, so it seemed natural enough that the same basis should apply to assets which are "deemed" to pass. But this is a tricky field, and the Inland Revenue's announcement on Wednesday involves a little legal and historical introduction.

When a gift attracted duty if it was made within three months of the death of the donor, any difference between the value of the property at the date of gift and its value at the date of death was not likely to be material. But with the lengthening of the period to five years—the length of a war or a trade cycle—difficulties and anomalies were bound to flourish. The property given might be sold before the death of the donor, at more or less than its value when he gave it; it could be converted into other property; it might even cease to exist. The *Strathcona* decision of 1929 firmly established the rule that it was the property taken under the disposition—the original gift, no more and no less—that must be valued at the date of death; the fact that it might have been sold or converted by the donee before the death

occurred was to make no difference. This rule has three main consequences. First, where the gift is in the form of shares, any bonus shares issued after the date of the original gift do not form part of the property given and are themselves exempt from estate duty; this is the force of the *Oldham* decision of 1940. Secondly, property that ceases to exist between the date of gift and the date of death—for example, a racehorse which dies—cannot be deemed to pass at all. Thirdly, and perhaps most important, any donee who sells his gift before the death of the donor is indulging in a most hazardous gamble; property worth, say £4,000 at the date of gift might be sold for £6,000 and yet be valued by the time of the donor's death at £20,000.

To meet this third difficulty, the Board of Inland Revenue last summer announced that, on a legal reconsideration of a section which had been on the statute book since 1894, they proposed to amend the official practice governing the valuation of gifts which had been sold between the date of gift and the date of death. The future practice of the department, as then defined, would be to claim duty, not in respect of the property originally given, but in respect of the proceeds of the sale or exchange or the reinvestments thereof.

These new rules seemed to give a valuable protection to a donor who wished to sell a gift before the five years were up. A needy nephew could dispose of the valuable white elephant from his wealthy uncle without fear that if the uncle were to die within five years, he might have to pay a high rate of duty on a value considerably above the price he obtained. But the short-lived rules of 1953 were not free from ambiguity; it was not clear, for example, whether they gave the taxpayer the option of taking the value of the gift at the date of its sale (Revenue practice) or its value at date of death (*Strathcona* decision) as might suit him best. In a

supplementary statement the Inland Revenue declared that their new practice offered no option, but until their new statement appeared this week, it seemed that they might well be forced to prove the standing of their rule before the Courts. The words "if the donee can show satisfactorily that at the donor's death the proceeds of sale are represented by property or investments . . ." would certainly have given rise to difficulties. If the proceeds of the sale had been reinvested in investments which depreciated the "satisfactory" evidence would no doubt have been forthcoming; but if they had appreciated, would every donee have found it possible to disentangle his affairs?

The Revenue could not be expected to play "heads you win, tails I lose," in this way, and a retreat from their new practice was foreshadowed by their arguments in the recent case of *Earl of Iveagh v. Commissioners of Inland Revenue* decided last month. In that case, Mr Justice Upjohn accepted the Crown's contention that where property is released from a settlement, and the person effecting the surrender dies within five years, the property so released falls to be valued at the date of death, whether still held by the donee or not. No mention was made of the new Inland Revenue practice, and the *Strathcona* decision was supported. That decision applies to absolute gifts; until recently a different rule was adopted where the gift took the form of a settlement. In such a case the gift was held (*in re Payne*, 1940) to be the corpus of the trust fund at the date of death. One consequence—paradoxical in comparison with absolute gifts—was that bonus issues of shares did not serve to reduce the value of the gift and ranked accordingly for estate duty. This rule has been overthrown by the recent decision in *Sneddon and Others v. Lord Advocate*. In that case, the donor had given to trustees of a trust fund the sum of £5,000 in cash which they had invested in shares worth £9,250 at the date of the donor's death. The Lords held that it was necessary to look at the moment when the gift was made to see what the chargeable property was, and they found that the gift was one of £5,000. They concluded that the *Payne* case was wrongly

decided, and that in future no distinction should be made between absolute gifts and settled gifts. They also considered the meaning of the expression "property taken" under a gift *inter vivos*, and as a result of their findings the Revenue now recognises that the new practice introduced last summer must be abandoned.

In future, therefore, where a donor dies within five years, estate duty will be payable on the property originally given, provided that it still exists at the date of death. It will make no difference if the donee has, in the meantime, sold or otherwise disposed of it. The value will be the value at the date of death, not the value at the date of gift or of intermediate sale. The rule will apply equally to property given absolutely and to settlements, and both forms of gift will now be capable of benefiting from the *Oldham* decision. Complications resulting from the differences in value at the date of gift and the value at the date of death will remain.

The law aims at preventing the avoidance of duty by withdrawals from the donor's estate: the amount withdrawn is the value of the property taken at the time the gift is made, and it would be logical, as Lord Morton hinted in the *Sneddon* case, if gifts *inter vivos* were valued as at the date of the gift, and not as at the date of the death of the donor. Moreover, if the value at the date of gift were taken for the purposes of estate duty, the recipient would at least know the amount on which he might have to pay duty, although he would still be uncertain of the rate of duty or whether the donor would survive for five years. But such a change would be dangerous in principle, since it would pave the way for the taxation of gifts as such, without any reference at all to the death of the donor within five years or any other limited period. Fortunately the administrative difficulties in the way of the effective enforcement of any tax on gifts in general are so great that the Inland Revenue is not likely to look with favour on such a development. In the meantime, the only sound advice must be: Give cash, unless the property given is likely to depreciate or is in the form of investments likely to be decimated in value by bonus issues; and be as certain as you can to survive five years.

Uranium and the Investor

URANIUM is not a scarce mineral. But it can be produced economically only from high grade accessible ores or from lower grade ore in conjunction with the extraction of another mineral. Uranium producers elsewhere must envy South African producers, for there many of the gold mines, finding life none too easy, have found a new opportunity in uranium. A new bud, full of promise, has been grafted on an old root; the cost of grafting has not been borne by the mines themselves and they have the joy of tending the vigorously growing plant.

At least £50 million will be invested in the uranium

industry in South Africa. Already something more than £40 million in capital expenditure has been arranged for the 23 mines so far selected to take part in uranium production, and by 1958 this new output may yield about £40 million a year in gross revenue. Investment in ancillary industries and public utilities servicing the uranium producers will also have to be made. And the list of selected mines may grow. The location of those already chosen is marked on the accompanying map and such facts as are known about their plans are listed in the accompanying table. Rumour adds six other mines (Freddies North, Loraine, Vaal Reefs, Harte-

beestfontein, Merriespruit and St. Helena). One of these must have been the extra mine which Dr Van Rhijn, the Minister for Mines, let slip this week when he gave the number in the OFS as eight and the total as twenty-four.

This new industry has three distinguishing features. It is blanketed—perhaps excessively—in secrecy. It is part of another industry—goldmining. It works in close partnership not only with the South African government but also with the governments of Britain and the United States, on whom the real financial risk reposes.

Uranium has been known to exist in small quantities in South African gold deposits for at least 30 years. And for over three years it has been known that the South African Atomic Energy Board was making arrangements with the British and American governments to erect plants to extract uranium oxide (U₃O₈) from the slimes

acid needed for uranium extraction, it might be no better a proposition to produce uranium in the Rand and Orange Free State than in other parts of the world. But at the gold mines the facilities are ready. The ore containing gold and uranium has to be mined and crushed and the extra effort of recovering uranium makes little call on labour forces. Uranium is an off-shoot of gold, and it poses a pretty problem in the economics of joint product costing. But there are already a few examples where uranium has become the main business and gold the by-product. Uranium has brought new life to one dying mine, Dominion Reefs, which is to resume the mining of ore not payable on its gold content alone and to draw its profit from the uranium in its slimes and dumps. Another mine, West Rand Consolidated, secures a higher profit on its uranium than on gold. This story has a moral for investors. Uranium pro-

duction at this mine has actually reduced current earnings from gold by inducing the managements to bring to the mill ore that is rich in uranium but poor in gold; its life as a gold producer has correspondingly lengthened. So investors should gain in the long run.

The customers for South Africa's uranium are the same rich uncles—the British and American governments—who are finding the £50 million needed to build the extraction plants. It may be inferred from

* Sulphuric acid producer.

† Company will treat old slimes.

‡ Price payable for uranium has been increased since these official dividend estimates were published.

§ Planned monthly capacity of plant at West Rand is 40,000 tons and at Harmony 45,000 tons; unconfirmed monthly capacity at Vogelstruisbult is 25,000 tons, Luipaards Vlei 30,000 tons and at Virginia 50,000 tons.

(a) Stilfontein, will treat slimes of Ellaton, New Klerksdorp, Afrikaner Lease and Babroscos; the amount of costs of plant entered against these mines is included in the £4 million entered against Stilfontein.

(b) Slimes will be pipelined at a cost of £225,000 to the Randfontein plant.

which come from the ores after the gold has been extracted. Yet, even now, the facts usually needed to assess the future of an industry remain hidden. Neither the price of the product, nor the reserves, nor the actual output from the mines have been released. And lest any guess might be attempted about reserves, mines which have brought to the crushing mill gold ore of a less than payable grade but rich in uranium have been forbidden to publish their reserves of this type of ore. The grade of ore, too, is secret. The outside world, including investors, is left squinting through the few chinks that have appeared in this curtain of security.

Uranium in South Africa rides on the back of the goldmining industry. Without that industry, with its mining and crushing plant, technicians and labour force, and without the pyrites ready at hand to make sulphuric

British and South African official figures that Britain has been contributing about a third of the capital outlay. Britain and the United States buy the uranium and thorium oxides in still unspecified proportions—though South Africa may have atomic energy plants itself one day, and the Atomic Energy Board has reserved the right to hold back part of the production for domestic needs. Between the British and American governments and the mines the Board acts as a handling agency, passing on working capital and the price received to the mines and forwarding the product to the two governments.

The board, however, is not merely a passive agent. It is an important body with the Minister of Mines at its head, representing the Government, the Department of Scientific Research and the mining industry. It has complete control over production, exploitation and

research—powers amounting to monopoly and almost to nationalisation. The gold mines are therefore divorced from the main risks and act almost as the board's agents. The board, acting on the advice of its geologists, chooses the mines for uranium production and it fixes the terms by individual 10-year contracts with each of them. A little is known about the nature of these contracts. The price of the uranium oxide is calculated to cover the redemption of the cost of the extraction and sulphuric acid plants within ten years of the date of full production, together with interest on the capital over the period, direct production costs and a reasonable (though unspecified) margin of profit. It

is from these profits that the South African government will draw its own share—in the form of lease and income taxes, uranium being aggregated with gold for tax. Clearly these arrangements imply that the Board buys uranium from the mines at various prices. But it permits no glimpse at the accountancy by which it works out its selling price to the two consumers.

Uranium ore of a low grade is to be found all across the goldfields of the Rand and the Orange Free State. The Board's geologists have tested over 400,000 ore samples and selection of the 23 mines must have been based first on a satisfactory grade of ore available in quantity at the mines. Secondly perhaps an eye was kept on the future. There is no intention of starving this promising young industry by skimming off all the cream. With a lesser degree of certainty it can also be presumed that, as the issue of leases has been going on

for over three years, most of the older gold producers must already have been considered and that most of the early additions to the list will be drawn from developing mines of the Orange Free State and the

Klerksdorp area. The selected mines lie in five clusters—in the Orange Free State, the Klerksdorp area, the Far West Rand, the West Rand, and the East Rand. This clustering, arising because the mines are tapping the same reefs, has meant that extraction plants can be erected to treat the ores of more than one mine; the Stilfontein plant, for instance, will service four other mines in the Klerksdorp area. Slimes can be fed into extraction plants by pipeline. High engineering priority is granted to the accepted projects, and so far the Board has revealed no limit (except the geological test) to the number it will accept. The true limit to the rate of expansion may well be the availability of equipment. What sort of picture can the investor form from these patchy glimpses of a new industry? He can examine the profits so far published. As can be seen in the accompanying table they are advancing steadily.

PUBLISHED PROFITS FROM URANIUM

(£ '000s)	1952	1953				
	4th Qtr.	1st Qtr.	2nd Qtr.	3rd Qtr.	4th Qtr.	
West Rand	138	138	157	187	389	
Daggafontein	...	...	120	228	257	
Blyvooruitzicht	...	...	22	95	147	
West Reefs	...	...	...	...	228	
Stilfontein	...	...	...	...	45	

These profits are encouraging portents. But they do not imply fantastic increases in dividends. The recent activity in Kaffirs was not simply a uranium boom; it came from uranium progress and good gold values from the developing mines of the Orange Free State. For example, the exceptionally sharp rise in Free State Geduld in recent months springs mainly from a fine borehole assay. The investor can also see that important

ancillary developments will have to occur in South Africa where the whole economy may benefit. One of these is the construction of six sulphuric acid plants (with a total capacity of over 1,000 tons of acid a day) paid for by the British and American governments. Another will be linked with the additional demand for about 70,000 kW of electricity; the International Bank and the Commonwealth Development Finance Company have already contributed to this programme.

The investor is thus confronted with an industry where the known facts are few and the presumptions many. He does not even know South Africa's potential rank among the uranium producers of the world. How will it compare with Canada, with Australia, or with the Belgian Congo, where Britain has a big indirect interest

in the industry through Tanganyika Concessions? The Union's ambassador to America has hinted that South Africa may one day lead them all. A prospective gross revenue of £40 million a year from uranium looks small compared with the annual revenue of over £140 million from gold but it may transform a struggling gold industry into the honoured partner of powerful governments. The investor has a stake in an industry where the capital costs and main risks are borne by the American and British governments and which is rigorously controlled by the South African government. He is backing his faith that those governments, which need uranium urgently, will not skimp its development; but they will not pay more than a reasonable living wage to the producers.

Business Notes

More Credit for Industry

INDUSTRY'S demands for bank credit, after declining during the first two years of the "new" monetary policy, are now turning upwards again. This trend, had been suggested by the monthly figures of the clearing banks, and is now plainly demonstrated by the latest quarterly analysis of bank advances which include all advances made in Great Britain by members of the British Bankers Association. During the three months to February this year, aggregate advances rose by almost £102 million, to £1,842.6 million; they are still £26 million lower than at the corresponding date last year, and no less than £213 million below the peak touched two years ago, but the latest increase—though partly seasonal—much exceeds the rise in the corresponding quarter of each of the previous two years.

The nationalised electricity and gas industries have used the proceeds of their last year's issues principally in repaying their earlier bank borrowings and are now leaning upon bank credit again; during the past quarter the utilities group, other than transport, has increased its bank indebtedness by £45 million. This movement, however, is only slightly larger than last year's; the quarter's expansion in the demands from all other borrowers is much greater than in the corresponding quarter last year—it amounts to £56.7 million, compared with under £10 million. A portion of this difference may, however, be attributable to the needs of other nationalised industries in anticipation of market borrowings. The "transport and communications" group increased its bank indebtedness during the quarter by £4.3 million, whereas last year it repaid £4.2 million.

Even if this category is also excluded from the reckoning, it is evident that borrowings by the private sector have risen

by more than £50 million, or nearly four times as much as they rose in the corresponding quarter last year. This contrast is partly attributable to a sharp change of trend in the big category of personal and professional borrowings; these had contracted without pause since August, 1951, but have now risen by £7 million; last year they dropped by roughly that amount. Among the business and institutional categories of borrowers, all save three have increased their demands. The most notable exception is iron and steel, which has reduced its indebtedness of nearly £7 million, whereas last year it borrowed an additional £14 million. The other declines are fractional—£0.6 in churches, charities, etc., and £0.5 in food, drink and tobacco (which last year, however, repaid loans to the extent of £5 million). The biggest increases occurred in miscellaneous textiles (£5.9 million), agriculture (£5.1 million), engineering (£5 million), but this contrasted with an increase of £12 million last year), and retail trade (£4.4 million, in contrast with a decline of £5 million). The "other financial" group expanded markedly, by £17 million, doubtless partly in consequence of bank lendings to the new Commonwealth Finance Development Company as well as to the other specialised financial institutions.

Hint from the Bank?

OFFICIAL tactics in the short loan market are not, perhaps, an infallible guide to the authorities' attitude towards wider issues of monetary policy, but those in the stock markets who lately have been "talking" Bank rate down again would do well to take note of recent experience in

the money market. Throughout last week—during the very period when the talk about Bank rate again became prominent—the discount houses were kept on a short credit-rein, and the stringency was such that on three occasions market houses were forced “into” the bank for borrowings on the penal terms.

This credit pressure so impressed the discount houses that they reduced their tenders for the Treasury bills offered on March 12th by 3d. per £100. That was an unusually wide adjustment. And it was made in spite of the strong competition that the discount houses have lately had to face at the tenders. In consequence, the average rate of discount at which the week's bills were allotted rose to £2 2s. 2.61d. per cent, compared with £2 1s. 3.83d. per cent. This change in the trend of Treasury bill rates was followed by a reversal of the cut made in commercial bill rates four weeks previously. The market's agreed quotation for two and three months fine bank paper was raised from 2½ to 2 3/16 per cent, though rates for longer bills were not altered. Credit conditions in this past week have been less difficult.

The amounts of the market's penal borrowings at the Bank that caused these noticeable results were quite small, and if the borrowings had been confined to a single day little notice would have been taken. But the quick repetition of them is unlikely to have been purely fortuitous. In this context, it is worth recalling that the market was twice forced into the Bank in early February, shortly after the cuts in the American and French bank rates started discussion of the possibility of a move in London.

Convertibility—Shadow or Substance

BRITAIN'S official attitude towards convertibility has changed radically since the early days of the Commonwealth “plan,” despite the recurrent affirmations that the objectives then adopted are still in view. America's cold-shouldering of the “plan” and Western Europe's fear that any dash for sterling convertibility would disrupt the mechanism of OEEC, has made Britain lean increasingly towards the view that the major currencies should preferably keep in step in any march to convertibility, and should not press forward if the advance had to be safeguarded by an intensification of discriminatory restrictions upon trade. Those who find these changes of emphasis difficult to follow will do well to study a refreshingly lucid article by Sir Dennis Robertson in the current issue of *Optima*, the review published by the Anglo-American Corporation of South Africa. Sir Dennis's object is not to reflect or trace the shifts in official opinion; but the outcome of his independent appraisal of the likely worth of any quick advance to general convertibility for non-resident sterling comes close to what seems to be the British government's present view.

He detects a danger that monetary authorities may be swayed too much by considerations of prestige, and he therefore emphasises that the pursuit of currency convertibility as such may easily mistake the shadow for the substance—which would be lost if convertibility were to “set on foot a general movement back to restrictionism” in trade. But Sir Dennis admits that there are disadvantages in thus protecting the present structure of trade: there is a

risk, for example, “of the countries of Europe ‘developing into a lot of old flower-women, each pestering the others to buy her early violets, and all finding themselves without the means to buy their daily bread.’” After this penetrating and characteristic judgment, Sir Dennis finds reason to welcome the activities of the “gad-flies”—the tempestuous Dr. Erhard and the ubiquitous Dr. Jacobsson—in constantly reminding Europe and “Sterlingaria” that “mutual trade is not the be-all and end-all of their existence.” Sir Dennis is temperamentally and intellectually inclined towards the world of convertibility and multilateralism; for that very reason he does not want the wider objectives to be missed because of any over-zealous and doctrinaire pursuit of a narrow technical objective.

A very different view has this week been argued by another Cambridge Professor of Economics, Mr Austin Robinson, in an article in the current issue of the “Three Banks” Review. After a detailed analysis of Britain's imports since the war and in comparison with prewar, he doubts whether “the abundant good fortune of 1953 is here to stay,” and considers that except when Britain is lucky with its terms of trade it cannot expect to receive and pay for a volume of imports much exceeding four-fifths of the prewar volume. He admits that there may be some justification for running risks in the hope of promoting an expansion of world trade—provided that others will fully co-operate. But he does not rate the chances highly, and so is led to sponsor a sombre policy of import “planning” with the object of cutting down Britain's need for imports and especially its agricultural imports. In such a programme, needless to say, convertibility would have no place: Professor Robinson would relinquish substance as well as shadow.

“Free” Sugar Sags

IN the first two months of the International Sugar Agreement the spot price of raw sugar sold on the “free” world market was quite a little above the floor price of 3.25 cents a lb, f.a.s. Cuba. This month, however, the price has sagged, and on one day it broke through the floor to 3.24 cents a lb. The agreement is certainly helping to stabilise the price now, but it would be rash to assume that it can continue to prevent the surplus of sugar from breaking the market. It is argued, particularly in Cuba, the largest exporting country, that additional support is needed, and the government there is under increasing pressure to introduce the device of a single seller. But even in Cuba support for this device is not unanimous, for it is doubtful whether it could assist the country for long. To centralise Cuban sales might raise the price, but the single seller might become a single holder, accumulating stocks while other countries enlarged their sales at Cuba's expense. An incidental, but important, effect would be to jeopardise futures trading on the “world” contract in New York.

The International Sugar Council, which lowered the effective quotas of the exporting member countries by 15 per cent to a total of 3,930,000 tons in 1954, can now only make a further reduction of five per cent, equal to about 230,000 tons. Whether five per cent would be sufficient to bring supply and demand into balance is conjectural, partly

because the Council has withheld publication of its estimate of the requirements of the free market in 1954. But it is possible that a cut of that amount might be effective. Demand from several countries has been more active so far this year; India has announced its intention of buying 500,000 tons in the next twelve months, and Russia has come into the market for useful quantities. On the other hand, European demand for “free” sugar has been reduced by the bumper harvest of beet sugar in Europe, and Britain's domestic requirements from the free market have disappeared for some time, owing to the purchase of one million tons from Cuba and the expansion of supplies from the Commonwealth.

The March of the Multiples

NOW that figures for the retail year 1953-54 have been completed with the publication of the January returns, there can no longer be any doubt about the astonishing expansion of the multiple shops. The chart, which is based on the index of retail sales (1950 = 100) measures the sales of all the big shops together. Excluding food, their sales showed a small but comfortable improvement on 1952, when business was only beginning to gather momentum after the previous year's slump. There was an average improvement of roughly 5 per cent, while sales by the smaller independent shops rose by 4 per cent. Food

sales were up 7 per cent. Another sign of the return to normal was the rise in stocks. At the end of January they were up 5 per cent on the year; they had shown a drop of 9 per cent during 1952-53. The shops may not have intended to expand stocks to this extent, but the mild winter upset estimates of sales. Indeed, the size of stock may be the reason why deliveries from the wholesalers to the retailers in January were well below average, showing a drop of nearly 8 per cent on the previous January.

When the figures are broken down according to the type of shop the marked expansion of business by the multiple

shops emerges impressively. Taking all the non-food departments together, their sales were 6 per cent higher than in the previous year, while department store sales and those of the independent shops rose only 4 per cent and sales by the co-operatives only 3 per cent. In some departments the multiples' sales rocketed, while those of their competitors showed only a moderate improvement; in most cases the increases that they recorded were above average and the only fields where they are not yet so firmly established appear to be hardware, radio and electrical goods and chemists' goods, where the trade is dominated by the department stores and the small, specialists' shops together. In the food departments, the multiples have even matched the postwar expansion of co-operatives' business; both recorded increases of 7 per cent in last year's sales.

This expansion in the multiples' trade has been progressing steadily ever since supplies of consumer goods became easier to obtain. Their merchandising was hit especially hard by shortages and they had been operating in low gear almost uninterruptedly since 1939. But in 1952 their sales increased 3 per cent, in a period when those of the department stores dropped 3 per cent below their 1951 level and those of the co-operatives by 4 per cent. The multiple shops have thus been steadily advancing while much of the improvement recorded by their competitors during the last year has merely gone to make up the ground lost the year before. The managements of the other big shops are not blind to these developments, and this year should show what steps they are taking to combat the aggression of the multiples.

Progress of Synthetic Fibres

BY the end of this year, world capacity for the production of synthetic fibres, excluding rayon, should rise to some 655 million lb a year from about 472 million at the end of 1953. This compares with an estimated world output in 1952 of 320 million lb, which was itself almost twice the 1950 figure of 170 million. These estimates are published by the Commonwealth Economic Committee in its latest summary, *Industrial Fibres*. The largest relative increases in capacity are in Europe and Japan, although the absolute totals are still puny compared to that of the United States, where planned capacity at the end of last year was 373 million lb and should be 495 million, nearly five-sixths of the world total, by the end of 1954. Nylon still accounts for the bulk of world production and still enjoys an unsatisfied demand. Its use in staple form is growing steadily; of the total nylon capacity of 179 million lb in America at end-1953, staple fibre accounted for 43 million, compared with an output of 25 million in 1952.

In Britain, the production of pylon will treble to 30 million lb a year by the end of 1954, and will rise further next year when the former Bemberg plant at Doncaster comes into operation; production of the polyester fibre, “terylene,” now 1 million lb a year, should rise to 11 million by the end of 1955 and 22 million in 1956. British capacity for producing “ardil,” which is made from the natural protein of groundnuts, will remain at 20 million lb this year. Production in Germany, almost entirely of perlon (nylon 6), is expected to rise from 20 to 25 million lb by

the end of 1954, while production in France, again mainly of nylon, should double to 23 million lb. Japan, in contrast to other countries, is concentrating on the vinyl acetate fibres such as vinylon; its vinyl capacity should increase from 12 to 30 million lb a year by the end of 1954, while that of nylon and other new synthetics should rise by only 1 million to 7 million lb.

So much has been made of the threat of the newer synthetics to the natural fibres that it is well to remember that their production is still relatively small. The total capacity of 472 million lb at end-1953 is equal to about 18 per cent of world wool consumption, and less than three per cent of cotton consumption; it is equal to about 12 per cent of rayon output. Some of the newer fibres are meeting difficulties in use, but the greatest handicap to the expansion of these synthetics generally is price. The Committee points out that nylon staple, for example, costs upwards of four-and-a-half times the price of viscose rayon staple. Prices can no doubt be reduced as the scale of production increases, but substantial reductions can probably come only from the discovery of cheaper methods of obtaining their chemical bases.

The Law of Domicile

A NEW and simpler code of law governing the domicile of British subjects is proposed by the committee on private international law set up by the Lord Chancellor. In its report on Domicile* the committee shows that it has reached the conclusion that the laws of this country are unsatisfactory and that, subject to Commonwealth consultation and if possible joint action, those laws should be replaced. Such a change would be a matter of moment both to the Treasury and to the taxpayer for, although freedom of the subject to change his domicile has been much eroded this century, when it does occur it is increasingly important. Domicile governs liability for all death duties save those on landed property. It affects all income tax except tax on income originating in the country imposing the tax (and even part of that liability may be modified by double taxation conventions). Three aspects of the present law come under scrutiny.

(1) Domicile of choice: If a man moves from one country to another he may abandon his "domicile of origin" which came to him from his parents like the colour of his eyes and acquire a different "domicile of choice." The committee proposes that the question of whether in fact he has changed domicile shall in future be decided by a simpler test: Where does the evidence show that the man intended his home to be? "Home" is a difficult word to define; it is arguable that the committee has paid too much attention to the actual setting up of an establishment, and not enough to the underlying intention to become part of another state or community. But still the proposal is a big advance on the present mass of judge-made tests which by now have become almost artificial, particularly the assumption that a man who abandons his domicile of choice must have reverted to his domicile of origin.

(2) The domicile of a married woman is normally that of her husband. If the marriage comes to grief it is at present

* Cmd. 9068. Stationery Office. 6d.

difficult for her to break away from the domicile imposed on her by marriage.

(3) The legal doctrine of "renvoi" comes under scrutiny. This applies when the court of one country has to apply the property laws of another. It is a doctrine which has become as abstruse as a problem seen to infinity in mutually reflecting mirrors.

The proposal to simplify these doctrines will be welcome. Probably it cannot claim high priority in the parliamentary programme, but it is to be hoped that the Lord Chancellor will at least be able to find it a place on the conveyor belt.

DSIR's New Budget

IN contrast to the rather doleful note with which in recent years the annual reports of the Department of Scientific and Industrial Research have recorded its straitened financial circumstances, the 1952-53 report published this week is able to describe in some detail the considerably greater official support that has now been promised. Late last year the Government agreed that the department should be allowed to carry out the postwar development programme originally agreed upon in 1946 but postponed ever since. This programme includes:

An increase in staff (now about 4,000) by about 150 non-industrial and 50 industrial staff a year from 1954-55 onwards for five years (an increase of 80 was sanctioned for 1953-54).

A gradual increase in income, to bring DSIR's income to about £6 million a year by 1959, plus capital expenditure during the five-year period of "rather more than £6 million." The benefit of increased income will be rather more than the bare figures show, since during the period DSIR will cease to bear its present heavy financial responsibilities for nuclear research in universities.

A slight relaxation of control over DSIR spending; though its funds will continue to be voted annually by Parliament, there will be a provision that any shortfall of spending in any year of the programme may be made good in subsequent years.

Expansion in the current year has been concentrated upon the Mechanical Engineering Research Laboratory at East Kilbride and the Hydraulics Research Laboratory at Wallingford. A new Water Pollution Research station will soon be ready at Stevenage; work is soon to begin on adequate accommodation for the Radio Research Board, and on a new 1,300-foot tank for studying the design of ship's hulls and propellers at the National Physical Laboratory, which alone may cost some £2 million.

Calling for Cotton

LANCASHIRE spinners and the Liverpool market must be relieved by the Government's decision to allow the Raw Cotton Commission to sell "on call" the cotton that it will deliver against forward contracts after public trading formally ceases on August 31st. Until the end of October the Commission will supply contracting-in spinners with

most growths of cotton, provided they are available. After October it will supply those growths that are marketed early in the year, such as East African, Sudan and Peruvian, up to the normal dates of arrival of the new crops in 1955. By buying on call—that is, paying the price ruling on the day on which delivery is demanded—spinners will not need to hedge and the Commission will follow its usual practice of not hedging its stocks. This will appreciably ease the pressure on the Liverpool market, which will then be taking up the hedges transferred from the Commission's cover scheme. Public funds will still be exposed to the risk of a fall in the market price of cotton sold forward, but this risk seems justifiable for the specific purpose of smoothing the return to a free market.

The Commission intends to offer spinners the choice of two call bases: the price on the Liverpool market, or the sterling equivalent of the price on the New York market. Spinners may well prefer the Liverpool basis. The fear that the United States may introduce an export subsidy on the next season's crop is still widespread, and the Liverpool market would tend to fall by almost the full extent of that subsidy. The New York market, on the other hand, would be much less affected, and might even rise a little. To the British Government an export subsidy would be a mixed blessing, for it would tend to depress export prices of all growths, particularly American-type cotton grown outside the United States. Hence the Commission's loss in selling to spinners who called on the Liverpool basis would be larger than the loss, or possible gain, on sales called on the New York basis. That may explain why the Government has given spinners the option of continuing to price the cotton they call on New York. But it is difficult to see why spinners should choose that option.

"Indicator" for Tanker Freights

IN pricing petroleum products, the "freight element" in oil costs has obviously to be taken into account; but the fluctuations of tanker freight rates, particularly in the spot market for voyage charters, make this element particularly hard to assess. Last year the major oil companies abandoned the "award" system of calculating this freight element, which had been based upon a six-monthly assessment of a notional time charter rate by a panel of London tanker brokers. The Shell group has now asked the panel to prepare quarterly a new tanker freight "indicator," upon a rather less subjective basis.

The new "average freight assessment" is to be a weighted average of the charter rates, long-term as well as short-term and spot, at which all tankers in world service are trading (except in certain special trades), all company-owned tankers being included at the long-term rate. This is a more formidable statistical undertaking, but if properly constructed should provide a more accurate index of the general level of freights at which oil is being carried during any quarterly period. The great majority of independently owned tanker tonnage in the world is in fact on long-term charter for periods of five to ten years or even longer, so that the new weighted assessment should retain considerable stability, even though it also takes account of rapid fluctuations in the marginal short-term market. Since some 90 per

cent of the world tanker fleet is either owned by the oil companies or on long-term charter, the weighting of the indicator may be a less difficult task than might appear, and the indicator a more useful measure for petroleum pricing.

Issues from the Trusts

SEVERAL investment trusts have taken advantage of the lifting of the ban on trust issues to offer small quantities of equities to the public and to place debentures privately. The capital sums involved have not been large; the biggest issue of equities recently was by Merchants Trust, which offered 37,500 £10 ordinary shares at £14 each. Five Scottish trusts in the Caledonian group, under the chairmanship of Mr T. P. Spens, have now come forward with their offer. The trusts intend to make "rights" issues of £10 ordinary shares, which later in the year will be converted into £6 of 5 per cent preference stock and £4 of ordinary stock. Until the conversion is made the shares will carry a dividend of 5 per cent; after that the directors anticipate that they will be able to maintain the current rate of dividend on the increased ordinary capital. The details of the separate issues are listed in the following table.

Investment Trust	No. of Shares Offered	Nominal Value	Issue Price	Current Rate of Dividend
Second Scottish Western	10,000	£10	£12	14%
Third Scottish Western	5,000	£10	£10	10%
Sec'd. Caledonian	5,000	£10	£10	10%
Third Caledonian	5,000	£10	£10	10%
Second Clydesdale	5,000	£10	£14	17%

The particular interest of these issues is that the directors have stated that the new money will be used to extend the trusts' portfolios of United States securities. Since the war, the Scottish trusts have bought more heavily of the limited supply of dollar stocks available to British residents than most other investors, the London trusts not excluded. In one group, at least, their faith seems unshaken, in spite of the running off of the dollar premium. The reasoning behind the present flow of new trust issues obviously is first that the removal of the Treasury ban is tempting, second that the amounts involved are small, and third that on the new money it should be possible to maintain the trusts' existing rates of dividend. Evidently, there are some judges who hold that Wall Street's resumed advance has not carried it to the top of a bull market.

Steel versus Aluminium

ABOUT half the aluminium used in the world may be counted as competitive with steel and iron castings, but the amount of iron and steel "displaced" is probably

less than 2 per cent of world production. Such is the estimate of the Economic Commission for Europe, in a study "Competition between Steel and Aluminium" published recently. The report notes that the most significant area of competition between the two metals is in thin flat products; but even here competition extends over only about 3 per cent of total world consumption. In 1953, about 2.6 million tons of aluminium were produced, and over half a million tons of secondary aluminium produced from scrap. By 1960, on published plans, primary aluminium output may rise to some 4½ million tons—compared with an estimate of about 310 million ingot tons for steel.

Competition from aluminium is likely to increase, the commission suggests, in

- (i) motor vehicles, particularly the economical models built in Europe, probably in body sheet as well as in engine and chassis castings; it is already being used to an increasing extent in bodywork for lorries and buses;
- (ii) building and civil engineering, particularly in pre-fabrication and scaffolding, but also in roof coverings and window frames.

But the economic use of aluminium in containers is already at a peak, while potential increases in aluminium rolling stock for railways may be limited by a "somewhat conservative approach to design." A continued growth in its use seems likely for kitchen equipment and furniture—probably at the expense of sheet steel.

Essentially the question is one of price; the difference has narrowed over the last 30 years until aluminium is now about twice the price of steel, volume for volume. It may narrow further, though more slowly. But the capital cost of producing aluminium, volume for volume, is about four times that of producing steel. This may enable aluminium producers to pursue a more flexible price policy than steel producers in times of recession. But, it means that substantial reductions in other items of cost, such as electric power, will be needed to make aluminium more competitive in price.

Another Steel Sale

THE Iron and Steel Holding and Realisation Agency has announced its eighth disposal of shares in a nationalised undertaking. Half the capital of Darlington and Simpson Rolling Mills has been sold back to its original owner Crittall Manufacturing Company (the window-frame makers) on a no-profit no-loss basis. The remaining half is owned by the still nationalised Dorman Long and Company. Before resale the capital of Darlington and Simpson was reorganised. When nationalised it consisted of £350,000 5½ per cent first preference stock, £350,000 6 per cent second preference stock and £380,000 ordinary stock. For these stocks (excluding Dorman Long's half of this equity) £1,196,333 compensation was paid. Now the preference stock has been eliminated. There is £600,000 of ordinary stock and £700,000 5 per cent debenture stock. Crittall Manufacturing bought half the equity for £311,125, the same price as they were paid in 1951.

In exchange for its preference holding the Agency received £185,208 in cash and the debenture stock which

*Available through Stationery Office, 9s.

will be sold. Assuming they obtain no better than par for the debenture the transaction will yield £1,196,333, the same price as was paid. The other half of the equity does not enter the calculation. It was taken over as part of Dorman Long and will presumably be sold in the same way. It is worth recalling that the agency's first sale was also the return of a part interest in a nationalised steel company to a consumer of its products. Last autumn British Ropes bought back their interests in Templeborough Rolling Mills. That transaction, like others, showed a profit to the Agency. Now apparently it is prepared to deal at approximately the nationalisation price.

Microbus versus Dormobile

RATHER in the way that British ballet dancers once found it essential to adopt Russian names before they could expect acclaim, it seems that distinction in a German-built vehicle may achieve recognition more easily than in a British. The Volkswagen "Microbus De Luxe" is a case in point. This excellent variation on the brilliant Volkswagen car, which is now available on the British market, has received much favourable publicity. With a kerb weight of 21½ cwt, an air-cooled flat four engine of 1,192 cc, developing nearly 30 bhp, the roomy vehicle will carry eight persons at a maximum speed of 50 mph, and a petrol consumption claimed, no doubt reasonably, to be 30 mpg. Import duty and purchase tax, which together amount to some £400, build up the selling price in Britain to the formidable total of £979.

But is this so much better a technical accomplishment than the "Dormobile" 12-seater on the Vauxhall Wyvern chassis? This fairly new vehicle, with a body developed and built by Martin Walter of Folkestone, has the Vauxhall 4-cylinder engine of 1,507 cc developing 40 bhp, with a maximum speed established in a road test by *The Motor* of 58.6 mph, and a petrol consumption (mean of mpg at steady speeds of 30, 40 and 50 mph) of 38.5 mpg, and of 25.3 mpg on 516 miles of road testing. The body can easily be converted into roomy sleeping quarters for two; the kerb weight is 22½ cwt. If the motor industry awarded "Oscars," the Dormobile would surely have as strong a claim as the Microbus. Moreover, owing to the peculiarities of British taxation, the Dormobile, as a 12-seater, ranks as a public service vehicle and suffers no purchase tax, so that its retail price in the home market is no more than £545. But even in neutral markets, where the price comparison is not vitiated by such artificial factors, there seems little reason to expect the German to be preferred to the British product.

Fall in Raw Jute

THE fall in raw jute prices in Pakistan has not yet been checked; firsts are now being offered at about £88 a ton, c.i.f. Continent, compared with about £102 a ton in mid-January. The decline was set off by selling pressure from speculators, who apparently considered that foreign

Is their future YOUR future?

They've come a long way in the three years they've been married. He's got a much better job for one thing. More pay. Better prospects. And you should see the beautiful home they're building up! Do your products enter into their plan of things? Now? Sometime in the future?

With its vigorous, realistic approach, the Daily Mirror appeals particularly to young families like these. In fact, the majority of the 4½ million people who buy it every day belong to this all important younger generation. All important, particularly to you, for with long buying years ahead of them and the ambition to possess better and lovelier things, they can have a great influence on your future prosperity.

With the biggest daily sale on earth, the Daily Mirror offers you the most powerful mass market coverage in the history of daily newspapers at the lowest square inch per thousand rate of all national dailies. And—Daily Mirror readers are young readers. Your customers today—next month—next year.

More steel... less fuel

A steel furnace built in 1946 needed 66 therms to produce one ton of steel. The latest type of furnace in 1953 needed only 37 therms. The new open hearth furnaces are three times as big and cut fuel consumption per ton of steel by almost half, as compared with the 1946 unit.

This change is the impressive result of continuous research aimed at reducing the fuel bill by cutting down heat wastage.

The steel industry is not only producing more steel for our needs at home and the raw steel for 40% of our exports; less fuel per ton is being used in the process.

STEEL

is at your service

demand for hessian cloth in the Calcutta market for jute goods was disappointing, and realised that a shortage of raw jute is unlikely this season. It was accentuated by the report that Pakistan intended to produce 6 million bales of jute next season, although the later official figure of 4.2 million bales steadied the market for a time. Though the Calcutta mills are well sold forward, the goods seem to have moved mainly into the hands of local speculators, who have recently been re-selling to American and other consumers at prices below those asked by the mills. European mills are thus finding it even more difficult to compete with Indian goods in world markets, so that the demand for raw jute has fallen. In addition, the Jute Control in Britain has bought little from Pakistan since the announcement that imports of raw jute are to be restored to private trade.

The future course of raw jute prices seems to hinge on two main uncertainties. One is the demand from India, which is believed to be fairly short of the qualities obtainable only from Pakistan. The other is the size of the 1954/1955 crop in Pakistan. The government may wish to reduce the planned output of 4.2 million bales if prices fall much lower, but it would probably be difficult in practice to restrict further what would in any case be one of the smallest crops on record. Of greater importance is the weather during the growing period of the next few months. The official estimate of the current (1953/54) crop is 2.5 million bales, although private sources maintain that the actual output will be about 4 million bales. The carry-over in Pakistan at the end of June is tentatively estimated at about 900,000 bales, and the Indian carry-over at about 1.3 million, of which stocks at the mills would account for

some 900,000 bales. It is thus unlikely that supplies will be tight between the two crops, unless Indian demand for Pakistan jute proves to be unexpectedly good.

Mr Funston's Visit

LAST week's visit of Mr Keith Funston, president of the New York Stock Exchange, to London, was a social occasion. It included lunch with the Stock Exchange Council and a courtesy call at the Bank of England. Wall Street's happy habit of having a highly paid non-broker chairman makes such liaison visits by a man of broad views worthwhile; Mr Funston also visited Cambridge, and the financial centres of Amsterdam, Brussels, and Paris.

In Amsterdam there was a business occasion for the visit. Royal Dutch is being listed in Wall Street. Mr Funston would like also to encourage two-way traffic in investment between the London and New York financial markets which might involve the listing of some London securities. No formal listing in London of American securities is needed since London stock exchange members are entitled to deal in securities listed on any recognised stock exchange. But any hope of increased traffic must still be deferred. The two per cent British stamp duty is an obstacle to any measures designed to encourage Americans to undertake increased portfolio investment in British companies except for a few shares like Shell, which are

British Shipping and Overseas Trade

DURING 1952 the net earnings of foreign exchange by British shipping amounted to £221 million, compared with some £60 million in 1947. This is the conclusion of the second postwar inquiry of the General Council of British shipping, published last week. The General Council counts freights earned on export and cross-trade shipments against all shipping disbursements abroad, thus excluding, as a transfer between British pockets, the £218 million paid in freights on import shipments. Its figure of net earnings is not comparable with Government

figures of invisible earnings for shipping, since these exclude the earnings of tankers and include payments by foreign ships in British ports.

The growth in tanker operations since the war, incidentally, is largely responsible for the fact that nearly half the gross earnings of British shipping in 1952 came from trades not touching the United Kingdom, compared with just over a third in 1936. The Liverpool Steamship Owners' Association in its annual report this week, has published the fourth of its analyses of the employment of shipping in British overseas trade, also for the year 1952.

As the charts show, the tonnage of shipping entering British ports in 1952 with cargo (not the actual tonnage of cargo) was much the same as before the war, but the tonnage cleared with cargo was substantially lower. This fall reflects mainly the decline in coal exports, once the main employment of British tramp shipping; and the fact that the tankers that swell the total of entrances into British ports often depart in ballast.

British ships carried about 60 per cent of the country's imports and exports, less than in 1929 but about the same as in 1935; the postwar decline since 1947 reflects the resurgence of foreign shipping competitors—though in 1952

Germany and Japan were still virtually non-existent as competitors in the United Kingdom trades. Since then, competition has sharpened.

Changes in the significance of the different trades to British shipping since before the war are illustrated in the second chart. These changes reflect mainly the altering pattern of British trade—but also the extent to which British ships have been able to participate in it. British ships still make up nearly 90 per cent of all the tonnage using Commonwealth ports, and have broadly maintained their share of total trade elsewhere, though not of trade from the oil areas of the Middle East.

available in bearer form but have to be placed with an authorised depository; and the interest which British residents may take in American securities is limited by the present exchange control rules which only permit investment in dollar securities of dollars resulting from the sale of other dollar securities.

Investment in India

THE annual report of the National Bank of India confirms the experience reported by the other eastern "exchange" banks in 1953. The continued weakness of most commodity prices has eaten slightly into the bank's advances and profits; its dividend is maintained at the recent rate of 16 per cent. Moreover, Mr J. K. Michie, the chairman, states that while the claims of shareholders are always in the board's mind he "could not encourage" any expectation of the same rate being maintained on the larger capital that the board proposes to issue by capitalising £570,000 from reserves.

Mr Michie shows considerable satisfaction however with the economic trends in the countries in which the bank is mainly interested—and particularly in India, Pakistan and Ceylon. He considers that the "outstanding achievement" in India had been the increase of five million tons in food production, and also emphasises the benefit of the remarkable recovery in tea prices to India's economy. But he shows some caution in his observations on capital investment in India. While he welcomes the projects sponsored by the Government and the International Bank he opposes any direct participation by the banks in long-term investment schemes.

Buoyant Small Savings

THE improvement in small savings that began last year has now become more marked. In the first nine weeks of 1954 new savings exceeded withdrawals by £27.9 million.

This is indeed the season in which the public makes good its thriftless pre-Christmas habits; but the net saving in savings certificates, the post office and trustee savings banks and defence bonds in this period was this year the highest since 1949, and compares with a surplus of only £7.0 million in the first nine weeks of 1953 and £2.0 million in 1952. It is particularly encouraging that a specially good showing is now being made by the savings banks' net deposits, which a year ago were lagging considerably behind the recovery in net sales of national savings certificates. New deposits in the post office savings bank alone increased by £4.5 million in the first nine weeks of 1954—whereas they declined by £10 million in the equivalent period of 1953. It seems that the deterrent effect of the tax probe has lost its force. There is still a shortfall of £66.8 million in new savings as against repayments in the current financial year which began on April 1st; but this is nearly £46 million smaller than in the same part of the previous financial year, and is indeed the lowest gap recorded at this period of the year since 1949. Commenting on this revival, Lord Mackintosh, the chairman of the National Savings Committee, pointed out that the total of national savings now exceeds £6,000 million, representing about £120 a head of the population.

SHORTER NOTES

Shell's new refinery at Geelong, near Melbourne, was opened on Thursday by the Governor-General of Australia, Field Marshal Sir William Slim. The refinery has a capacity of 1½ million tons a year and will be fed with crude from the Middle East and British Borneo. A "cat cracker" will be added during the next fifteen months, with a capacity of 650,000 tons a year. The two stages at Geelong will cost about £A20 million—an appreciable slice of present expenditures by the oil industry in Australia which involve about £100 million and include the new Anglo-Iranian refinery at Kwinana.

A cinema full of shareholders—which Sir Eric Bowater proudly called "one of the largest attendances at an annual general meeting of shareholders ever held in this country"—this week heard him announce that the group intended before the end of the year to capitalise £1,800,000 of capital reserves by distributing one new £1 ordinary share for each £3 of ordinary capital. The new capital resulting from the exercise of options will rank for this distribution. About 1,000 shareholders were brought by special train to attend the meeting, and afterwards were taken over their newsprint mill at Kemsley, near Sittingbourne.

A new stage is announced towards the resumption of normal trade relations with Persia. The Export Credits Guarantee Department is resuming insurance on exports to Persia. This credit insurance was stopped shortly

after the evacuation of Abadan and held in abeyance while diplomatic relations were broken. A small trade with Persia continued without insurance cover. Insurance is now resumed with a "ceiling" on the department's total liability. The ceiling figure is not disclosed, but it is related to the government's total insurance liability on Persian trade not to any group of commodities. There is also a limitation about terms of payment. This is not an unusual type of limitation for the department, which is always ready to look with more favour on a "cash against documents" deal than on 90-day credits.

Technicians of the North-Western Gas Board, after two years' experiment with a process patented 30 years ago but never carried beyond the experimental stage, have

doubled the rate of carbonising coal for gas-making in pilot plants at Partington and Rochdale. The method consists of injecting gas into the base of the standard vertical retort during carbonisation; it seems possible that it may enable low-grade coals, normally considered unsuitable for gas-making, to be carbonised.

"The tonnage or orders on hand is lower than at any time since the end of the war and has fallen by one-third over the last two years," said Sir Ellis Hunter last week at the annual meeting of Redpath Brown, the structural engineering subsidiary of Dorman Long. This experience, he added, was common to the structural engineering industry as a whole; and though the rate of ordering improved slightly late last year, the industry has little cushion left to protect it from any further recession in trade.

Company Notes

INTERNATIONAL NICKEL. The International Nickel Company of Canada is a giant, delivering almost as much copper as it does nickel. Last year the company again established new records in production and deliveries; the value of its net sales advanced from \$314½ million to \$338½ million. While the price of nickel remained steady, demand remained strong; there was some falling off in the demand for military, atomic energy and stockpile requirements (which take about half of the free world's supplies) but there was still a shortage for civilian purposes.

	Years to Dec. 31,	
	1952	1953
Mined ore:—	Tons	Tons
Underground	10,198,068	11,095,199

Total	13,248,593	13,667,095
Metal deliveries:—	lbs.	lbs.
Nickel	249,017,358	251,417,772
Refined copper	234,323,432	234,349,415
Mill and foundry products	92,350,688	99,491,148
	Ozs.	Ozs.
Platinum metals	287,135	270,562
Gold	42,396	38,410
Silver	1,076,327	1,106,733

Thanks, however, to further increases in the cost of labour and materials and to an increased provision for depreciation (reflecting in part the switch over from surface to underground mining) net earnings fell—from \$58.9 million to \$53.7 million. Earnings on the common shares were thus reduced from \$3.90 to \$3.54 a share and the dividend was cut from \$2.60 to \$2.35 a share. The dividend has thus been reduced by rather less than the fall in earnings.

Further than that the company could hardly go. Plans for development still require the backing of ploughed back profits. Last year the group spent \$21 million on capital account and this year it will spend over \$30 million. Among the

developments planned is the erection of a plant for the recovery of nickel and high grade iron ore from pyrrhotite; ultimately

	Years to Dec. 31,

Common share at \$08½ yields 6½% p.a.		

the company expects to recover one million tons of iron ore a year. The development programme is backed by a contract with the United States government to deliver 120 million lb of nickel and 100 million lb of electrolytic copper between the beginning of this year and the end of 1958. They are also based on the continuing process of exploration; at the end of last year proved ore reserves stood at 261½ million short tons, compared with 256½ million at the end of 1952.

This year International Nickel expects to work at full capacity and to sell all the nickel it can produce. The demand for nickel is still inflated by the needs of the rearmament programme. In the longer term it has to face the prospect of a fall in these demands and the need to sell in the civilian market when, to quote the chairman, "the world will have at its disposal nickel from new producers as well as increased amounts from established producers."

MELLOR BROMLEY. Mr Charles Clore has the habit of lobbying thunderflashes through the windows of board rooms, making the directors sit up

and take notice. Recently his thunderflash exploded in the board room of Mellor Bromley, manufacturers of knitting, dyeing and finishing machines. Acting through Bentley Engineering, which also builds hosiery machinery, he and his associates in Investment Registry made first an offer of 11s. 6d. for each of Mellor Bromley's 2s. ordinary shares and then raised their bid to 15s. The directors of Mellor Bromley decided to fight back and turned down the offer.

They chose the obvious weapons of retaliation. The ordinary dividend is to be increased from 36½ per cent to 55 per cent and £300,000 is to be capitalised from reserves so as to make a 100 per cent share bonus. In a long statement they point to the expansion of the company's earnings and assets over the last five years and add that net profits in the year to February 28th last amounted to about £515,000, compared with £487,871 in 1952-53; these earnings, they explain, cover the new dividend of 55 per cent about three times.

The directors then own up to conservatism in the past; their critics would argue that this conservatism was excessive. They state that they "consider it their duty not to assist bidders to reap rewards of many years' progress by taking advantage of the circumstance that shares stood at a low price because of conservative dividends paid. They are now in a position to adjust the situation because they consider that capital expansion of the group has now reached a stage when it is no longer essential to plough back such large sums year by year, and because they have faith in the continued earning capacity of the group."

Two questions can be asked about this statement and dividend decision. Would it have been made if Mr Clore had not been pressing? And does it kill the possibility of a bid altogether? At least it did not hoist the shares above Mr Clore's 15s. bid. After the directors' statement they rose 1½d. to 14s. Mr Clore has still not disclosed whether he will make a direct bid to the shareholders.

BRADFORD DYERS. The directors of the Bradford Dyers' Association have shown some imagination in the layout of the company's conventional accounts, spotlighting the important accounting ratios. But the accountant's efforts have not been backed up either by a directors' report or chairman's statement explaining what these figures mean in terms of industrial progress, and share-

£1 ordinary share at 35s. 0d. yields £8 11s. per cent.

holders will have to wait for the speech of Mr James Ewing at the meeting. It should be important because Bradford Dyers, acting largely on commission, occupies a dominant place in the dyeing sector of the textile industry, and has increased its dividend from 10 per cent to 15 per cent.

Meanwhile shareholders are left to draw their own conclusions from the fact that while trading profits earned in Britain have risen from £1,084,064 to £1,672,135 profits earned overseas have fallen from £1,032,901 to £725,385. The advance in profits at home is some measure of the recent recovery in the textile industry; indeed, part of the company's capacity at

home may have been hard pressed to meet all the demands made upon it. But does the decline in overseas earnings mean, for example, that the company's subsidiaries ran into trouble in Canada? And surely shareholders deserved a fuller statement on the appropriation of £400,000 to write down the book value of shares in subsidiary companies than the meagre reference that this appropriation eliminated "the amount by which the cost of shares in certain subsidiaries exceeded the nominal value of the shares." Why, moreover, did the book value of stocks fall (from £3,100,568 to £2,686,986) when there is every sign that the factories at home were more fully employed than they were in 1952?

SWAN HUNTER. The order books of the shipbuilding industry are now beginning to thin out, and, to judge by the preliminary report of Swan Hunter, its profits are beginning to thin out too. Swan Hunter's profits fell last year from £2,529,830 to £2,184,868. The boom in shipbuilding is over and buoyant profits can hardly be expected in the period of technical and commercial adjustment which must follow. In spite of the decline in net profits (by £127,199 to £1,028,273) Swan Hunter has raised its ordinary dividend. The latest full year's dividend is 20 per cent. In 1952 the company paid a full year's dividend of 18 per cent; but it also paid a special jubilee bonus of 10 per cent. The directors evidently meant what they said when they described the jubilee bonus as a once and for all payment.

This year there is to be a 100 per cent bonus issue, and the directors have given a warning that it does not imply an increase in the amount of the equity dividend. The market assumed that the directors again meant what they said, and the £1 ordinary stock units were marked down 2s. 6d. to 63s., to offer a yield of £6 7s. per cent.

THE ECONOMIST, MARCH 20, 1954 LONDON STOCK EXCHANGE

Next Account begins: March 31st.
Next Contango Day: March 31st.
Next Settlement Day: March 23rd.

The stock market again had a cheerful appearance this week. The centre of interest was the gilt-edged market where the advance in prices was helped by the savings figures, the latest Exchequer returns and the continued investment of the £72 million paid out on maturing war bonds on March 1st. Most of the demand was for the undated and very long dated stocks, and by the close on Wednesday old Consols had risen to 64½ and Gas Stock (1950-95) to 86½. The strength in the Funds was also reflected in the demand for Corporation issues and on Wednesday the new Glasgow went to a premium (of ½) for the first time since its issue. The outstanding feature of the foreign market was again the advance in the German loans, on further reports of Swiss buying.

Immediately after the weekend some industrial equities were unsettled by end-account selling and tobacco, store and textile shares tended to give way. Engineering, paper and shipping shares, however, continued to advance and once end-account selling had dried up most of the other groups began to improve again; in particular, textile shares made a good showing on the first day of the new account. By the close on Wednesday, the Financial Times ordinary share index had risen to 137.6, compared with 136.1 the week before.

The chief feature at the end of the old account in the oil market was the strength of Royal Dutch which rose to 41. On the first day of the new account interest switched to Anglo-Iranian which were marked up ¼ to 10½. Rubber and tea shares were quietly firm. At the end of the old account Kaffirs staged a good rally under the lead of the uranium issues and then on the first day of the new account some switching from the OFS developers to the older producers was reported.

* In consequence of official purchases of tender bills in connection with cash subscriptions to the Exchequer Stock issued in October, it was impossible to calculate the division between tap and tender bills until all the bills purchased had passed their original maturity date.

THE MONEY MARKET

The market lowered its bid for the £270 million of Treasury Bills offered last week from £99 9s. 8d. to £99 9s. 5d., raising its rate of discount to roughly 2½ per cent and the average rate on all bills allotted by nearly 1½d. to £2 2s. 2½d. per cent per annum. But despite the reduction in the bid, and despite a slight rise in total applications to a new record figure of £414.6 million. The market's proportion fell only from 53 per cent to 45 per cent.

The market's buying rates for commercial bills were adjusted to maintain differentials; the rate for two and three months bills was raised from 2½ to 2½ per cent, thus reversing the reduction made a month previously. The tightening of rates was a reflection of the stringent credit conditions obtaining in the preceding week, the implications of which are discussed in a note on page 883 of this issue. During the week covered by the Bank return credit conditions became slightly easier. On Thursday before the week-end heavy tax transfers forced the market into the Bank for the third time in seven days, but on Friday the authorities made small purchases (mainly direct from the market) which saved houses from penalty borrowing. Small official purchases were also made on Monday, but in the rest of the week market supplies of money were adequate.

The Bank return shows that the outflow of notes last week was less than £1 million; earlier in the week the fiduciary issue had been increased by £50 million, to £1,625 million, to strengthen the reserve of notes in the banking department against the usual pre-Easter efflux.

THE LONDON OMNIBUS

A VEHICLE
OF
INFORMATION

LATE IN THE 90's this double-decker steam omnibus served the public up and down the Thames Valley.

Buses come and buses go. But one London Omnibus has been serving the public for over 200 years the—"omnibus" collection of all kinds of insurance policies for all kinds of people offered by the London Assurance. Here are a few of them:

SCHOOL SUMS

When fathers start adding up school fees they are sometimes nonplussed. By taking out an Educational Policy long before school bills get really formidable, they find this problem greatly simplified.

WHO PAYS THE PLUMBER?

Now that plumbers' bills are flooding in, you may have that sinking feeling. To insure against this seasonal risk we have a policy. Without making heavy weather of it it's all covered and many other items, under one roof, in our Householder's Comprehensive Policy.

P.S. There's a special one for business premises.

'TOP HAT' EVENINGS

Directors and senior executives, unlike those they employ, are often left to provide for the evening of their much-taxed days as best they can out of savings. The London Omnibus carries a 'Top Hat' scheme; which fits almost any one who wants a 'Top Hat'.

FURTHERMORE . . .

If you would know more about any of the policies outlined here, if we can provide information about any other policies or about insurance problems generally—pray make what use of us you wish. Our address is 1 King William Street, Department V6, London, E.C.4.

1853

1953

The Chartered Bank of India, Australia and China was incorporated in England by Royal Charter on 29th December, 1853, and during the ensuing century its system of Branches has been progressively extended to most centres of commercial importance throughout Southern and South Eastern Asia and the Far East. At all these Branches a complete banking service is available and, in particular, facilities are provided for the financing of international trade in co-operation with the Bank's offices in London, Manchester and Liverpool, its Agencies in New York and Hamburg, and a world-wide range of Banking correspondents.

necessary conditions have been attained. Considerable hope was placed by us on the United States Randall Commission in the expectation that its report would bring about some relaxation of those restrictions which operate so much against an increase in our trade with that country. The Commission's report has somewhat dimmed our hopes and, while it would be wrong to strike at this stage a too pessimistic note about the outcome, it does not seem as if we shall derive much benefit from the rather mild recommendations of the Commission. We must, therefore, and particularly in view of increasing German and Japanese competition, improve our competitive power, for this is the surest way by which we shall be able to secure exports and so enable us to procure those imports of food and raw materials necessary for the standard of living which we enjoy and all wish to maintain. It would be disastrous if, by a continuing stream of wage advances, we priced ourselves out of our export markets. With all the factors, except salaries and wages, which go to make up the cost of living now on a more even keel, is it too much to hope that in these also we may be approaching a period of reasonable stability? The almost parallel lines on any graph comparing the increase in prices and wages should surely be enough to bring home to us all, most forcibly, the basic distinction between "money incomes" and "real incomes," and convince us that no lasting improvement in our standard of living can be achieved without increased efficiency and an increased rate of productivity.

It is also essential that we should devote an increasing proportion of our resources to the provision of new capital investment, and for this increased savings are vitally necessary. The traditional "saver," who in the past was the chief provider of risk capital, has all but disappeared. Inflation and heavy taxation are mainly responsible for this, and I am sure that if the Chancellor were able to offer some relief in the great burden of taxation in his next Budget the savings figures, which have shown up rather better in recent months, would still further improve.

SCOTTISH INDUSTRY AND COMMERCE

Turning now to the state of industry and commerce in Scotland, I feel that there are good grounds for reasonable pride in the past year's achievements. The level of employment, while continuing to be a little below the figure for the United Kingdom as a whole, is relatively satisfactory, but there are tendencies which give cause for concern. Coal production, on which so much of our economy depends, is not showing the increase we expected, having regard to the mechanisation installed in the pits and substantial capital expenditure in other directions.

Shipbuilding and our other heavy industries continue at a high level of production, but order books are running down and the falling off in this respect is a danger signal. It clearly points to the need for every effort being made in these industries, as indeed in all others, to keep our prices on a keen competitive basis.

The Scottish Council (Development and Industry) continues to do good work in obtaining new orders for Scottish industry and in attracting new industries to achieve a greater diversity of our economy. Much has already been done in this direction, and it is pleasing to hear of the satisfaction which has been expressed about the quality of Scottish labour. We hope that many more enterprises from the other side of the Atlantic will thereby be encouraged and attracted to join those already here, and most welcome they will be.

I would like here to refer to the continued high exports to America of Scotch whisky, and also of our Scottish woollen products from the borders and elsewhere. Both these industries deserve the thanks of all of us for

their great contribution to the dollar position.

The Scottish council are promoting another Scottish Industries Exhibition which will be held in Glasgow from September 2nd to 18th of this year. The promoters claim that it will be not only a trade fair comparable with any of the great international trade fairs but also a pageant of Scottish industry, and I commend it to you who are present and also to the wider audience whom my words might reach through the press.

AGRICULTURE

The past year has been a reasonably satisfactory one for our agricultural industries. There has, however, been brought into sharp relief the problems which lie ahead now that food rationing and price control are coming to an end. In the future, Government assistance will be shown as a cost of Government support to British agriculture and not, as it has been in recent years, as a cost of living subsidy to the consumer and, with some British farm prices higher than world prices, we must expect this item of our national expenditure to be scrutinised with a very critical eye. Nevertheless, I am sure that farmers can face the future with reasonable confidence. It has been repeatedly stated by the Government that it is their intention to encourage and support maximum food production at home, and sufficient incentives to this end must always be given. In return, farmers must make the fullest possible use of our land resources, and it can be no part of Government policy to support the easy-going or inefficient farmer.

Meat marketing is proving a thorny problem, but it is hoped an efficient and workable system may soon be found, safeguarding the interests of both producer and consumer. There must be some difficulties in the first period of decontrol and derationing, but these can be overcome with goodwill on the part of all the interests concerned.

CHAIRMAN'S OVERSEAS TOUR

Mr Murray, our chairman of directors, has recently returned from an extensive tour of Australia, New Zealand and Canada, where he had an opportunity of meeting many of the leading bankers and business men in those countries.

Unfortunately, between Australia and Canada Mr Murray developed pneumonia, so that his Canadian tour was seriously curtailed, and he was only able to visit Toronto and Montreal.

I feel sure that, as a result of the chairman's tour, the very cordial and friendly relationship which exists between us and our friends in the countries which he visited has been further cemented and improved.

I also was fortunate to meet many leading bankers and business men, mostly Scottish Canadians, during a short private visit to Canada at the end of November.

TRIBUTE TO OFFICIALS AND STAFF

The staff continue to give their usual loyal and efficient service in the affairs of the bank, and the directors desire to place on record their sincere appreciation of the valued services rendered by Mr Watt and Mr Ballantyne the general managers, the other officials and staff at head office, London City and West End offices, Glasgow, Dundee, Aberdeen and all the other branches.

APPROVAL OF ACCOUNTS

I now beg to propose that the report, containing a statement of the accounts and balance sheets, be approved.

The report was approved, and the governor, deputy-governor, extraordinary directors and the retiring ordinary director were re-elected.

BIRMINGHAM & DISTRICT INVESTMENT TRUST, LIMITED

INCREASED INCOME

The seventieth annual general meeting of this company was held on March 16th in London. Mr J. S. Wills, who presided in the absence abroad of the chairman and managing director, Mr H. C. Drayton, in the course of his speech, said:

The income from our associated companies is very slightly up and that from our general investments rather more so, the total of £561,000 being some £24,000 in excess of that of last year. Your board are again recommending a dividend of 20 per cent on the ordinary stock.

IMPROVED NATIONAL ECONOMY

The past year has been chiefly notable for the continued and steady improvement in the economy of this country. The gold and dollar reserves of the sterling area have increased during the twelve months ended February 28, 1954, by \$480 million, and above all there have been further relaxations in the controls which had been with us since the end of the last war. Of particular interest to this company are the new directions to the Capital Issues Committee to enable investment and unit trusts more easily to raise capital. Also, in the matter of investment abroad, controls have been eased to ensure that at least some British capital can participate in the growing economies of overseas countries. The easing of the regulations relating to the investment of funds in Canada is a case in point; unfortunately a belated relaxation, but nevertheless very welcome when one considers the immense possibilities of that country.

Our associated omnibus company, the "Midland Red," is a considerable source of revenue to us and we view their future with confidence. Here, though, I feel I must once again register my protest against the penal and discriminatory tax on motor fuel. It seems to me to be inexplicable that an industry vitally necessary for our economic well-being as an exporting nation should suffer an impost which adds so considerably to the cost of our national products.

CURRENT YEAR'S PROSPECTS

With regard to the prospects for the coming year, I feel that I must speak cautiously, as so many factors seem to be warring against one another. On the one hand, international relations seem to be less strained, or—shall I say—less likely to lead to unfortunate "incidents"; plans for developing the Commonwealth and backward areas arising out of the Colombo Plan should by now be well advanced; and the abnormal conditions resulting from the "Korean" war have largely been eradicated.

On the other hand, however, more intensive competition in markets in which British exporters have had since the war, more or less a free hand, increased consumer resistance, and above all the failure of the South American countries to put their finances in order all operate against the economic progress of this country. British industrialists face many difficult problems today but I myself feel that, given a free hand, and the resources, they will find their own solutions.

So far as this company is concerned, I do not think there will be any remarkable change in income but I shall be disappointed if we are unable to lay before you accounts as favourable as those before you now.

The report was adopted.

The ROYAL BANK of SCOTLAND

REPORT BY THE COURT OF DIRECTORS OF
TO THE ANNUAL GENERAL COURT OF PROPRIETORS ON TUESDAY, 16th MARCH, 1954.

The Court of Directors now submit to the Proprietors Group Accounts comprising the Balance Sheet and Profit and Loss Account of The Royal Bank of Scotland as at 10th October, 1953, and the Balance Sheets and Profit and Loss Accounts of its Subsidiary Companies, Glyn, Mills & Co. and Williams Deacon's Bank Limited as at 31st December, 1953.			
The Net Profit of THE ROYAL BANK OF SCOTLAND for the year to 10th October, 1953, after providing for taxation and making transfers to Property Maintenance Reserve and to Reserves for Contingencies, out of which Reserves for Contingencies provisions have been made for all bad and doubtful debts and fluctuations in the value of Investments, amounted to			
Interim dividend at rate of 8½ per cent. actual paid at Midsummer, 1953, required	£361,250 0 0		£621,256 10 3
Less Income Tax	162,562 10 0		
Interim dividend at rate of 9½ per cent. actual paid at Christmas, 1953, required	£403,750 0 0		£198,687 10 0
Less Income Tax	181,687 10 0		
There have been:			
Contributed to Staff Pension Fund	75,000 0 0		
Contributed to Staff Widows' Fund	15,000 0 0		
Carried to Inner Reserves	110,506 10 3		£621,256 10 3

The Reserve Fund is £4,877,216.
A dividend of 18 per cent. per annum having already been paid, the Court of Directors do not recommend any further dividend for the year. The Bank's holdings of British Government Securities consist entirely of dated Stocks.
The Directors record with deep regret the death of The Hon. Michael Claude Hamilton Bowes-Lyon, D.L., who had been Deputy-Governor since January, 1950. In the virtue of the powers conferred upon them by the Royal Bank of Scotland Act, 1873, the Directors elected Mr. Alexander Maitland, Q.C., D.L., as Deputy-Governor of the Bank.
Mr. John McArthur Thomson, D.L., Cashier and General Manager, retired in June last after almost fifty years of highly valued service. The Directors appointed Mr. William Alexander Watt and Mr. Walter Robert Ballantyne, Assistant General Managers, to succeed him as Cashiers and General Managers.
The Governor, the Deputy-Governor, the Extraordinary Directors and the Senior Ordinary Director (Mr. Kenneth Murray, W.S.) retire at this time and are eligible for re-election.
The Directors record with regret the death of Mr. S. W. Murphy, C.A., who had been Joint Auditor of the Bank since 1940. To fill the vacancy the Directors appointed Mr. C. G. M. Pearson, C.A., of Messrs. Maxtone Graham & Sign, C.A., Edinburgh, to act along with Mr. James Haldane, C.A.
Mr. C. G. M. Pearson, C.A., of Messrs. Maxtone Graham & Sign, C.A., Edinburgh, to act along with Mr. James Haldane, C.A.
Mr. Haldane and Mr. Pearson are willing to continue in office and will be re-appointed pursuant to Section 159 of the Companies Act, 1948.

Edinburgh, 22nd February, 1954.

STATEMENT OF ACCOUNTS, 10th OCTOBER, 1953.

CAPITAL STOCK, Authorised and Issued	£4,250,000	
RESERVE FUND	£4,877,216	£9,127,216
NOTES IN Circulation	140,285,238	
DEBITORS and other Accounts including Reserves and Provisions for Contingencies and Taxation	222,082	
DIVIDEND—Christmas 1953, less Income Tax	1,600,358	142,107,658
AMOUNTS due to Subsidiary Companies		7,254,620

LIABILITIES for Acceptances, Confirmed Credits and other Obligations

Notes: The profits of Williams Deacon's Bank Ltd. and Glyn, Mills & Co. have been taken into the Royal Bank of Scotland profit only to the extent of the Dividends declared. The Companies are non-trading and have made neither a profit nor a loss for the year ended 10th October, 1953. Foreign Currency Balances have been converted into sterling at the rates current on 10th October, 1953. Provisions have been made for taxation on all profits to date.

Statement required by the Eighth Schedule of the Companies Act, 1948.
The Directors of the Bank have, in terms of Section 155 (1) of the Companies Act, 1948, investigated the possibility of making the financial year of each of the Subsidiaries coincide with its own. The proposal of the Subsidiaries has been to make up their Accounts as at 31st December in each year, and it is considered impracticable to alter this arrangement. The Royal Bank of Scotland has, since 1978, made up its Accounts annually on the second Saturday of October, and any alteration in this long-established and convenient procedure would involve administrative difficulties in the conduct of the Bank's affairs. The Directors are satisfied that the foregoing considerations constitute good reasons for not making any alteration in the financial year of the Bank or of the Subsidiaries.

AUDITORS' REPORT.

We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our Audit. In our opinion proper books of account have been kept by the Bank so far as appears from our examination of these books, and proper returns adequate for the purposes of our audit have been received from Branches not visited by us. We have examined the above Balance Sheet and Profit and Loss Account which are in agreement with the books of account and returns of the Bank. In our opinion and to the best of our information and belief the accounts are true and fair in the case of the Bank's affairs as at 10th October, 1953, and in the case of the Profit and Loss Account of the profit for the year ended on that date. We have examined the Group Accounts (comprising the above Balance Sheet of the Royal Bank of Scotland as at 10th October, 1953, and the annexed Balance Sheets of its Subsidiaries, Glyn, Mills & Co. and Williams Deacon's Bank Ltd., both as at 31st December, 1953) with the audited accounts of the Banks dealt with thereby, which accounts, with the exception of the Royal Bank of Scotland, have been audited by us. Subject to the foregoing, in our opinion, the said Group Accounts have been properly prepared in accordance with the provisions of the Companies Act, 1948, and, on the basis authorized therein, give a true and fair view of the state of affairs and of the profit of the Royal Bank of Scotland and its Subsidiaries.

JAMES HALDANE, C.A., Auditor.

NOTES.

1. Securities to the nominal value of £791,845 (1952—£542,500) have been lodged as security for Government accounts and for guarantees issued to Indian Government Departments.
2. Bills receivable revalued at £129,531 (1952—£155,814) of which up to 8th March, 1954, £92,245 have run off.
3. Forward contracts outstanding for the purchase and sale of Bills and Telegraphic Transfers £33,045,236 (1952—£40,829,126).
4. Liabilities have been incurred in respect of building contracts for new premises amounting to approximately £227,000 (1952—£263,107).
5. There are contingent liabilities in respect of confirmed credits outstanding amounting to £7,975,079 (1952—£9,233,020).
6. There are contingent liabilities in respect of guarantees entered into in the ordinary course of business.
7. Overseas Current Assets and Liabilities have been converted at the rate of 100s. per Indian Rupee, 100s. per Ceylon Rupee, 100s. per Burma Kyat, 25s. per Pakistan Rupee and £1 per 20 East African Shillings, and other currencies at the rates of exchange ruling on 31st December, 1953.

REPORT OF THE AUDITORS TO THE MEMBERS

We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our audit. In our opinion proper books of account have been kept by the Bank so far as appears from our examination of those books and proper Returns adequate for the purposes of our audit have been received from Branches not visited by us. We have examined the above Balance Sheet which is in agreement with the books of account and Returns. In our opinion and to the best of our information and according to the explanations given to us the said Balance Sheet gives a true and fair view of the state of the Bank's affairs as at 31st December, 1953.

We have also examined the annexed Consolidated Balance Sheet and Consolidated Profit and Loss Account of the Bank and its Subsidiaries dealt with thereby with the audited accounts of those Companies. In our opinion such Consolidated Balance Sheet and Consolidated Profit and Loss Account have been properly prepared from such accounts in accordance with the provisions of the Companies Act, 1948, in the manner thereby authorised for Banking Companies and, on this basis, give a true and fair view of the state of affairs and of the profit ascertained in the manner therein indicated of the Bank and its Subsidiaries so far as concerns members of the National Bank of India, Limited.

NATIONAL BANK OF INDIA, LIMITED

SATISFACTORY FIGURES, DESPITE DIFFICULTIES

MR J. K. MICHIE'S STATEMENT

The annual general meeting of the National Bank of India, Limited, will be held on April 6th in London.

The following are extracts from the circulated statement by the chairman, Mr J. K. Michie, relating to the accounts for the year 1953:

Throughout 1953 the world continued to struggle, if haltingly and painfully, towards a more natural balance in the conduct of international commerce and in this country the movement has been assisted by the decontrol of certain imports, the gradual derationing of consumer goods, and the reopening of terminal markets.

On the other hand, some primary producer countries still hold the view that by bulk selling through government controlled bodies rather than by using marketing systems through which sellers and buyers would be in daily touch, they can sell their produce more effectively and at the same time ration their sales in accordance with their views of international values. Generally speaking bulk selling flourishes only in a sellers' market and temporarily anyhow these conditions have disappeared. But the greatest remaining obstacle to the free flow of international trade undoubtedly is the absence of free convertibility of currencies.

AN UNEASY YEAR

1953, therefore, was an uneasy year, though with certain bright spots in our particular geographical field, and I am pleased that we are able to show figures which, while reduced both in respect of balance sheet totals and of profits, are nevertheless satisfactory.

Turning to the accounts for 1953, the total of the consolidated balance sheet shows a reduction of £7,014,168 to £136,452,974. The figure relating to the National Bank of India, Limited, alone has fallen by £7,318,127 occasioned entirely by a drop in total deposits which was accompanied by a corresponding fall in outstanding advances. After making full provision for taxation and other necessary reservations net profits are £376,266, a reduction of £5,178 as compared with 1952 results.

DIVIDEND DECISION

We decided to continue for 1953 our recent rate of dividend distribution of 16 per cent. I wish to point out, however, that on a pre-profits tax basis this costs practically 20 per cent. While over the war years our shareholders suffered less than most in fluctuating dividends and consequently in temporarily reduced share values, we are nevertheless very conscious of their loyal acceptance of our dividend policy since then. We are also aware that certain aspects of our capital structure are out of line with modern needs and practice, and we are proposing at an extraordinary general meeting which will immediately follow the annual general meeting to ask you to pass certain resolutions.

These measures have two purposes, the first to take our shares out of what is known as the "heavy" category and so encourage the smaller investor, the second to bring the capital more into line with realities while maintaining an adequate reserve fund.

As you know, the expenses of running a business continually tend to rise; then competition in all our areas is steadily increasing; and lastly, in this uncertain world it would be most injudicious of me to make any firm prophecy of what will be done or of what

will be possible some months from now; but in putting before you these proposals in regard to our capital we do it in the hope that there will be some increase in the amount to be distributed to the shareholders. I do not, however, encourage any expectation of the same rate being maintained on the increased capital.

GRINDLAYS BANK

Grindlays Bank, Limited, shows a smaller profit for 1953. They are opening in the Rhodesias and that means an increase in expenses which will not be balanced by revenue until the new branches are more firmly established.

Our Finance and Development Corporation continues to expand its business on sound lines.

A special feature of our expansion has been the long-delayed opening of our West End branch at 13 St. James's Square, which started business on December 7th. I understand the improved facilities thus afforded to our trustee and income tax departments are appreciated by our customers and a steadily increasing number of our overseas clients will doubtless use St. James's Square for their ordinary business. Our staff will welcome any shareholder or customer who wishes to see this fine office.

INDIA

The outstanding achievement by India in 1953 was the increase by 5 million tons in her food production. This has been the result of nation-wide efforts begun some years ago and pursued with vigour, coupled with the end of a series of poor monsoons particularly in Southern India. This does not mean she has achieved self-sufficiency, for it is estimated that this increase hardly meets the needs of her present population on the basis of 1939 consumption per capita, but buttressed by her purchase of rice from Burma, it at least puts her in a position in which she can buy further requirements at her own time.

Generally speaking, India has had a satisfactory year, above all in the remarkable change for the better in the fortunes of her tea industry. A year ago it was just emerging from a crisis and prices were rising. Since then the rise has been almost continuous, and as I write Indian "common" teas are being sold in London at 4s. 4½d. per pound against 2s. 9½d. a year ago and a depression "low" of 1s. 6d. (in September, 1952). As the statistical position appears to be strong there is good reason to be quietly confident of a continuance of good returns, though costs of production are on the up-grade. As is not unnatural, this condition of semi-scarcity has benefited common and medium quality teas much more than it has the higher grades.

A DEVELOPMENT AND FINANCE CORPORATION

Among Government projects it has been announced that a Development and Finance Corporation is shortly to be formed and it is understood the Corporation will be supported by the International Bank for Reconstruction and Development. Its function will be to develop industries for which sufficient private capital is not forthcoming.

We welcome sound ventures of this kind, for, particularly when capital is shy as it is

in India at the moment, they fill a distinct gap.

At times it has been suggested that banks should undertake finance of this nature and the original German system, whereby the banks invested directly in industry and had nominees on company boards, is sometimes quoted as a pattern. I do not think the experience of the German banks was particularly happy and the position of being simultaneously part owner and banker is a distinctly invidious one, not only in itself, but vis-à-vis other constituents; but the overriding objection is that a bank's deposits are largely "at call" and for that reason alone it is quite wrong to commit them to long-term capital investment.

The Finance Minister has just presented his Budget in which he proposes no new direct taxes but takes the bold step of budgeting for a deficit of £187,500,000 (capital expenditure is estimated at £296,250,000) partly because in his words "the period of inflationary stresses is now well behind us." This is a welcome reassurance.

PAKISTAN

Most recent figures show that Pakistan after some travail has again achieved a favourable balance of trade. Because the effort was somewhat long delayed the methods perforce had to be drastic. Imports were cut to the bone and duties on luxuries much increased. Concurrently there has been no disposition to withhold from world markets supplies of her available products, principally cotton and jute, and her available resources have continued to be invested in textile and jute mills and other industries which are now steadily going into production. In manufactured jute goods Pakistan aims at a total production of 200,000 tons by 1956. They also hope to replace by local production their present considerable imports of textiles.

A better monsoon should ease Pakistan's food position which is her principal preoccupation on the economic side. Altogether the picture is a brighter one than it was possible to present a year ago.

Unfortunately, the flow of trade between India and Pakistan remains weak and there are many mutual questions still awaiting settlement.

BURMA

Burma had a somewhat mixed year. The Government has made great strides in extending "law and order" and deriving from that the cultivation of rice increased considerably. 1953 also saw the initiation of many capital projects which over a period of years will cost large sums in foreign currencies. These projects are largely designed to increase production and generally to make the country more self-supporting. It is good to see that the improvement of Rangoon and other ports and of inland water and other transport is high on the list, for these are urgent measures if her increased surpluses are to be exported.

The source of the money needed to finance these schemes must come mainly from Burma's rice exports for which, until a year ago, she was realising high and increasing prices. Since then, however, the trend of world rice markets has been reversed, and until quite recently Burma was the possessor of an unsold balance from the 1952-53 crop of about 750,000 tons. The bulk of this has

now been sold to India though much of it has still to be shipped.

CEYLON

The Government has grappled manfully with the twin problems of her external balance of payments and her internal budget solvency and in 1953 had the help of buoyant tea prices and a steady yield from rubber under her barter agreement with China, but prices of her other main products, copra and coconut oil, have fallen steeply. Indirect aid will come this year through the fall in the cost of rice imports, a saving which may well total over £5 million over the year.

Economic help in the form of loans is likely to be afforded from both the USA and the UK to assist Ceylon to complete certain capital projects on which she has embarked, and a continuance of a sound budgetary policy will I am sure bring back her finances to equilibrium.

As India is doing, Ceylon also hopes soon to have a Development Corporation from which funds will be available for sound industrial development; but as with India, Ceylon's major problem is a rapidly rising population and a much less rapidly increasing food production.

THE "COLOMBO PLAN"

To the benefit of all four countries which I have mentioned, the "Colombo Plan" continues to function with growing momentum and increasing sums are being spent, supplied partly by the countries themselves and partly by the UK, the USA, Canada, Australia and New Zealand.

Very rightly agriculture and electric power are two first priorities and encouraging progress has been made in both fields, but much more is wanted both in money, that is, internal savings and external aid, and in human effort including considerable technical assistance from outside sources, if the programme is to achieve and maintain the required momentum and results.

CONVERTIBILITY OF STERLING

After dealing with conditions in East Africa and other countries in which the Bank carries on business, he continued: A subject and a query never far from the minds of bankers and business men is convertibility of sterling—when and how—and the possibilities have had considerable discussion, for about the desirability there is no divergence of opinion. In my opening remarks I said something of the advantages that would accrue to international trading. Every shipowner, I am sure wishes to see convertibility and every primary producer should wish to see it.

"We are told we are creeping nearer to the goal by achieving a more favourable balance in gold and dollars but the "powers that be" are shy of committing themselves beyond that—why? I also believe that "convertibility" unless it is total is of little use to us. I do not believe that a currency—any more than a man—can function happily or effectively half slave and half free and currencies have a way of escaping when there have to be bars, for money has a liquid character and like water somehow contrives to find its own level. My belief is that we shall get convertibility at no early date, my hope that it will be possible sooner than I expect.

Again I wish to express sincere thanks to a loyal and enthusiastic staff. I personally have met a great many of them and know they have a keen interest and great pride in the bank.

Finally, with such a management and staff and our resources and organisation behind them, I look forward to the immediate future with confidence.

SCOTTISH AMICABLE BUILDING SOCIETY

ANNUAL GENERAL MEETING

NEW SAVINGS OF £5,879,464

The sixty-second annual general meeting of the shareholders of the Scottish Amicable Building Society was held in Edinburgh, on Monday, March 15, 1954. The Rt Hon Lord Inverclyde, KStJ, DL, president, occupied the chair. After welcoming the shareholders and thanking them for their attendance, the president, in the course of his speech, said:

Despite the continued state of tension in world affairs, during the past year one seemed to sense a gradual and slightly more cheerful tone prevailing throughout the country than has been apparent for many years. Irrespective of world affairs, there is one subject which is always of general interest—not more so in any country than in Britain—and that is Housing.

I do not think there is one amongst us who does not wish to see all classes satisfactorily housed; because of that general feeling, Her Majesty's Government, although they have created a housing record, have shown that they appreciate there is a need for a change in their future housing policy. Their declaration that they would be prepared to permit the building of new houses for owner occupation has been welcomed, not only by those who for so many years have wished to become owner occupiers, but by those who for so many years have been gravely concerned at the cost of housing subsidies.

The president stressed that the people who wished to do so, should have the opportunity of providing a house for themselves. The housing industry surely should respond to the Secretary of State's appeal and build soundly constructed houses of the smaller type—to suit the income of people with £8 to £10 weekly. There is already evident a very pleasing tendency for this type of house to cost less.

A SLOGAN—WORK AND SAVE

The president continued—savings are of first importance to our country—as important now as at any time during the war years—and capital is vital for the development of industry not only in this country but in our Empire. If, in the years which lie ahead, people would adopt as their slogan "Work and Save," I feel there would be a revival of hope and confidence which would result in our working together in the rebuilding of our country's prosperity.

In this connection, it is gratifying to find that so far as this society is concerned, there is an increase in share investments and deposits for the past year of £1,391,871.

When I first became associated with this Society in 1941, then as trustee, the total assets were £5,390,500: today the assets total £20,783,266. This is an achievement which is very gratifying to all of us. You will not, however, desire me to dwell on this but rather to make some reference to the results of the past year.

New investments during the year amounted to £5,879,464. The sum advanced during the year amounted to £2,661,876. Mortgage assets now total £15,685,492, showing a net increase of £698,751.

At this point I should like to compliment our borrowers on the manner in which they have fulfilled their obligations. It is interesting to note that against mortgages of £15,683,235, borrowers' interest in arrear and interest accrued at the end of the financial year amounted to only £2,257.

THE ECONOMIST, MARCH 20, 1954

The total assets, as I have said, amount to £20,783,266, an increase of £1,494,086.

IMPRESSIVE LIQUID ASSETS

Investments are in trustee securities, purchased at par or under, which, together with cash at bank, amount to £4,743,712, equivalent to 24.1 per cent of the total sum standing at the credit of shareholders and depositors. Office premises stand in the balance sheet at £236,666 against a conservative valuation of £600,000.

After placing £5,000 to depreciation, the profits available for allocation amount to £460,680 14s. 10d. as against £429,878 7s. 7d. for the previous year. The directors, after placing £77,000 to reserve funds, equivalent to 16.7 per cent of the divisible profits, recommend allocating interest to unadvanced shareholders at the rate of 2½ per cent (income tax paid) for the year ended January 15, 1954, leaving a balance of £28,319 9s. 9d. to be carried forward.

The President stated that these figures were very impressive and showed extraordinary progress and development, reflecting a most successful year.

It is obvious that the investors retain absolute confidence in the Society and, from the report just submitted, it is also obvious that a substantial number of friends have been acquired as new investors and borrowers.

In moving that the annual report and accounts be adopted, Lord Inverclyde paid tribute to the management and staff for the efficient manner in which they have carried out their respective duties.

Mr John Cameron, DSC, DL, LLD, QC, Dean of Faculty, a trustee, seconded the motion and the report was unanimously adopted.

EASTBOURNE MUTUAL BUILDING SOCIETY

ASSETS EXCEED £6 MILLION

The seventy-seventh annual general meeting of the Eastbourne Mutual Building Society was held on March 17th at Eastbourne.

Mr Laurence A. Caffyn (the chairman), in the course of his speech, said: It has always been my pleasure at these meetings to tell you of the growth and stability of the Society, and this year is no exception. The figures this year are as encouraging as ever.

The total assets of the Society have increased by £471,000. This increase is not a record, but the total assets of the Society as at December 31, 1953, are £6,279,787, the highest ever recorded. There are now 12,351 members and depositors in this Society. In the year 1953 alone the Society added to its number nearly 300 investing shareholders.

One of the principal aims of the building society movement is the encouragement of thrift, and your board has laid special emphasis on this aspect of its work throughout the year. The Eastbourne Mutual will accept investments from 10s. to £5,000. The return offered by the Society to its shareholders is 2½ per cent, and the income tax thereon is paid by the Society. Home ownership is also recognised as a particularly good form of saving. Nine hundred and twenty advances totalling over one million pounds were made during the year to help people to buy their own homes.

The results of the year's trading have also been satisfactory. If 1954 continues as it has started, we should have another happy meeting a year hence.

The report was adopted.

THE ECONOMIST, MARCH 20, 1954

ENGLISH ELECTRIC COMPANY

RECORD TURNOVER—EXPORT PROBLEMS

MEANS TO IMPROVE COUNTRY'S ECONOMIC POSITION

The thirty-fifth annual general meeting of the English Electric Company, Limited, was held on March 17th in London.

Sir George H. Nelson, FCGI, MIMechE, MIEE (chairman and managing director), in the course of his speech, said:

Once again I am able to announce a further substantial increase both in production and turnover which fully justifies the additional manufacturing facilities already in operation and further extensions at present in hand. This increase in production has of course been associated with a still further increase in the number of our employees.

The orders in our books ensure the maintenance of our 1953 volume in 1954, but, while home orders in 1953, as a result of marketing our new products, exceed those of 1952, competition from overseas manufacturers in the export markets for our well-established products has greatly increased, prices and contract conditions are much less attractive, and the volume of orders for export markets in 1953 has fallen by comparison with 1952.

The balance on our trading account is £6,489,863 and, after charging depreciation of £1,262,460 and adding interest and dividends on trade investment, less income tax, namely, £50,845, there is a net trading balance, before taxation, of £4,779,920 compared with £4,359,034 in 1952, being an increase of 9.6 per cent.

Breaking down these 1953 earnings in the same way that we have done for some years, you will see that every £100 we received from our customers in 1953 was expended as follows: Materials, including bought and finished articles, £50; wages and salaries, £29 12s.; depreciation, maintenance, power, heat, light, rent, rates, insurance, etc., £13 5s.; interest on debentures, bank overdraft and bills, £1; taxation, £4; savings retained in the business, £1 7s. and net dividends on preference and ordinary stocks, 16s.

THE ECONOMIC POSITION

In looking to the future I still believe, in spite of greatly increased competition in overseas markets, that if we maintain our efforts the economic position of the country can continue to improve by the following means:

(1) By maintaining our technical lead; (2) by increasing production; (3) by providing a lower cost; (4) by providing incentives for extra output.

The managements of industry must give their workpeople every opportunity to earn reward for extra effort, and additional earnings should arise solely from this avenue based on a stabilised basic wage, for increases in wages unrelated to output make no contribution to the improvement of the economic position of the worker or of the country.

Much of the engineering industry, and certainly your company, provide generous incentives. Obviously the application of incentives must vary with different industries, but in your company opportunities are available for very substantial additional earnings in return for extra effort.

CANADIAN MARCONI COMPANY

During the year we had the opportunity of purchasing the control of the Canadian Marconi Company. This transaction means that the historic association between the English and Canadian Marconi Companies

has been restored; the close collaboration which has always existed between them will be strengthened and the Canadian daughter company will receive every sort of assistance to expand the range and scale of its products in the interests of Canada.

EXPORT BUSINESS

Our Company, as exhorted by successive Governments, has made every endeavour to expand its overseas business to meet our country's need, by entering markets in which we have hitherto taken no direct part, and nothing has given us greater satisfaction and stimulation than the receipt of orders in the United States of America which contribute dollars needed by us to pay for our essential purchases from USA.

RESEARCH AND DEVELOPMENT

Expenditure on research and development in our normal business is even greater than in previous years and continues also to be maintained at a very high figure in the defence field; the latter, of course, arises from the very heavy burden of expenditure on national defence which, unfortunately, it is still necessary for the country to bear.

OUTSTANDING ENGINEERING EVENTS OF 1953

"THE CANBERRA."—You will have shared the pride of every employee of this Company in the continued achievement of the "Canberra" jet bomber, which, since I addressed you in March last year has set up six new world records, so raising its total to thirteen.

STEAM TURBINES.—A number of large turbo-generating units were commissioned overseas during the year, including the third and fourth 66MW sets at the J. Clark Keith Generating Station of the Hydro Electric Power Commission of Ontario, three more of the 10 30MW sets at Vierfontein, South Africa, and the third 30MW set for Pretoria Municipality.

WATER TURBINES.—At present we have orders for 37 major units totalling over a million horsepower.

An order for two very large water-wheel generators was awarded to your Company by the United States Army Corps of Engineers, for the power station at McNary Dam, USA. We have also secured in Canada an order for what we believe to be the most powerful water turbines in the world, namely, four units of 175,000 h.p. for the Quebec Hydro Commission's Bersimis power station. These turbines will be built in one of the factories of our associated company in Canada.

TRACTION.—This year's traction production includes 25 streamlined passenger or freight 2,400 h.p. electric locomotives with rheostatic braking, for the Victoria Government Railway, Australia. They are giving every satisfaction in service.

In the Diesel electric field 10 1,500 h.p. locomotives powered by the Company's 12SVT engine have been shipped to the Queensland Government Railways and are working between Brisbane and Cairns, a run of 1,000 miles in each direction.

We have commissioned extra high voltage airblast circuit-breakers in Canada, Tasmania and for the BEA. Large oil circuit-breaker installations have also been commissioned at home and in various parts of the world, including Australia, India, South Africa and Kuwait.

The report and accounts were adopted.

MARCONI'S WIRELESS TELEGRAPH COMPANY, LIMITED

RECORD TURNOVER

SIR GEORGE NELSON'S SPEECH

The fifty-sixth annual general meeting of this Company was held on March 17th in London.

Sir George H. Nelson, FCGI, MIMechE, MIEE, the chairman, in the course of his speech, said: I am glad to report again a very satisfactory year's working. The turnover is the highest recorded in the history of your company. The profit is £887,283, which is £285,579 more than the previous year. Your directors recommend a dividend of 7 per cent, less tax, on the ordinary shares.

AERONAUTICAL: The demand for our airborne and ground communication equipment and navigational aids by leading airlines, aircraft manufacturers and airport companies at home and overseas remains at a high level. The progress made in advanced development in systems and methods of air communication should ensure substantial business in these fields for years to come.

RADIO COMMUNICATIONS: Your company is, as you know, one of the few—perhaps the only—commercial communications manufacturing organisation which devotes real effort to the study of radio propagation.

TELEVISION

In television we can look back on this year with exceptional pride, for it was our television cameras and control equipment which were used exclusively by the BBC for their superb televising of the momentous Coronation service in Westminster Abbey. Tens of millions of viewers will never forget those wonderful scenes taken and transmitted with such fidelity by our equipment. We also carried out at very short notice indeed the installation of a television transmitter in Ottawa to enable the people of Canada's capital to view the film of the Coronation on Coronation Day itself.

The year has also seen the inauguration of a television service for Italy for which your company was honoured with the largest single television export order ever given to one manufacturing company.

Our chief source of pride is the award of the order for vision and sound transmitters for the future BBC London station at Crystal Palace. We are confident that the new station, which is due to open in 1956, will be an example to television engineers for years to come throughout the world.

We are proud to have contributed a great deal of special equipment to the *Gothic* for her present Royal Tour, including the installation of a transmitter of unique power for a merchant vessel. It is the transmitter which has kept Her Majesty in touch with home.

During the year we have completed the programme for equipping with radio beacons no less than 45 lightships and lighthouses in the United Kingdom home waters.

Your company is also responsible for the design, manufacture and supply of equipment to The Marconi International Marine Communication Company, the major supplier of communication and navigational aid equipment to the Merchant Navy. Our marine radar equipment—the Radiolocator—is acknowledged as being unsurpassed in quality, performance and, of greatest importance, of all, reliability.

Our research and development in the year under review have been on a greater scale than ever before. The report was adopted.

JUTE INDUSTRIES

DECONTROL OF RAW JUTE

ASSURANCE OF PROTECTION

INCREASED HARD CURRENCY EARNINGS

MR W. G. N. WALKER'S STATEMENT

The thirty-third annual general meeting of Jute Industries, Limited, was held on March 15, 1954, in the board room of The Association of Jute Spinners and Manufacturers, 5 Cowgate, Dundee, Mr W. G. N. Walker (chairman and joint managing director) presiding.

The Secretary (Mr W. A. Jeffray, CA) read the notice convening the meeting and the report of the auditors.

Addressing the meeting, the Chairman said: With your permission I will take the accounts and the report of the directors as read. (Agreed.)

JUTE CONTROL

On February 16, 1954, an announcement of the greatest importance to your company was made in both Houses of Parliament. The statement in the House of Commons was made in the following terms:

"In accordance with the Government's policy of restoring trade to private channels, it has been decided that the purchase and importation of raw jute by the Jute Control shall cease at an early date following discussion with the industry, which my noble friend (Lord Woolton) will institute immediately. Public trading in imported jute goods must continue meanwhile until appropriate measures to safeguard the United Kingdom jute manufacturing industry under conditions conducive to efficiency can be worked out and introduced. The Government is giving full consideration to this problem, but cannot promise any early solution."

The Government's decision to safeguard the United Kingdom jute manufacturing industry is the culmination of representations made to this end by the industry over the past 30 years.

Up to the declaration of war in 1939 the UK jute manufacturing industry was the only jute manufacturing industry in the world which was not protected by its own government against the importation of Indian goods. The result of this in the inter-war years was the creation of a depressed area in Dundee and district, where unemployment was very high, wages were low, profits were negligible, and little, if any, money was available for modernisation of machinery and for research and development of manufacturing processes. The advent of control in the war years gave a measure of protection which has existed until now.

We, in Dundee, are grateful to the government for facing up to the situation and deciding to protect the industry on a basis conducive to efficiency. In doing so the possibility of large scale unemployment has been removed and the strategic necessity of maintaining a healthy and progressive industry in the UK has been recognised.

While I do not wish to reiterate what I said at some length in my speech to you in March, 1951, I should, I think, remind you that it was the existence of a healthy and versatile home industry at that time which alone obviated a major packaging crisis when India cut off supplies of standard goods to the United Kingdom. The following quotation from my speech in 1951 is pertinent in that it is the assurances asked

for then that have now, in effect, been given by HM Government:

"The merchandising part of our business which deals in Indian imported goods has already suffered a severe blow at the hands of India, who has let down the United Kingdom, her second largest customer; the longer India leaves this country without jute goods the more harm she is going to do to herself. India cannot expect to use the United Kingdom as a market for the surplus production which she cannot sell elsewhere. A large quantity of imported goods will always be required, but surely in the national interest the time has come when our government, having, I hope, learnt a lesson, should give the home-producing industry an assurance that manufactured goods will only be imported as a balancing factor to cover the demands which cannot be met by the home-producing industry rather than home production being a balancing factor to cover the demands not met by imported goods."

Although the decision of HM Government to continue the present method of safeguarding the home industry may only be an interim one, it appears to be the only practicable course open at the moment. It is also probably, from the point of view of the consumer, the cheapest method of affording effective protection, while at the same time ensuring supplies.

During the period of control a remarkable spirit of co-operation has grown up between the various sections of the industry, and between employers and employees. This unity of purpose has enabled the industry to pull together and to carry through an impressive programme of re-equipment and modernisation. With long-term assurance of protection the industry should be able to look to the future with more confidence than has existed in the past.

PROFIT MARGINS

It is difficult at this stage to interpret the Government's definition of efficiency, but it is clear that any safeguards given will not be an umbrella under which the inefficient can shelter. The existing methods of Government price control on margins may be retained, but this would be a small price to pay for long-term security.

As the future prosperity and earning power of your company may depend on margins allowed by HM Government I should, I think, analyse the effect which these have had on our profits over the last five years. The figures which I will give you embrace the major manufacturing activities of your company, and account for rather over two-thirds of the group trading surplus shown annually.

INDEX OF PRODUCTION AND PROFITS

Year ending Sept. 30	Level of production	Profit, less Inland Revenue depreciation allowance	Profit per unit of production
1949	100	100	100
1950	115	101	100
1951	139	115	100
1952	131	111	104
1953	161	131	85

* Trade recession.

The figures for the year ending September, 1949, are expressed in each column as 100, and for comparative purposes those for the

four subsequent years have been related thereto.

During the latter years we would not have been able to maintain satisfactory profit figures had it not been for greatly increased production and by the introduction of the latest machinery which lowers conversion costs. It can also be deduced that, comparing 1953 with 1951, while production has increased by 16 per cent, profits have decreased by 9 per cent and the profit per unit of production has decreased by 22 per cent. Under the present method of control of profit margins only the efficient can live and there is thus a very real incentive to maximum efficiency and minimum production costs with resultant benefit to the consumer and the nation.

RAW JUTE

The handing over by the Government of raw jute to private purchase will throw considerable extra financial burdens on to your company. We do not expect to feel the effect of this for some months, nor is it possible to give any indication of the sum which may finally be involved. Suffice it to say that, at present raw jute price levels, each week's raw jute held by us requires approximately £100,000 of finance.

During the financial year under review, raw jute supplies were adequate both as regards quantity and quality. The position today may not be quite so favourable, due to Pakistan having restricted her 1953-54 crop by more than 50 per cent. In quantity there is probably sufficient to meet world's requirements, but there are signs that the higher grades may be in short supply before the next crop comes to be marketed.

It would appear from reports received here that Pakistan is to restrict the crop now being sown: it is hoped that she has taken into consideration her good fortune in having had favourable weather for her last three crops—unfavourable weather for the next crop could under the circumstances, have serious repercussions.

Pakistan's policy of restricting acreage sown under jute has, together with the exchange value of her rupee, had the effect of keeping Pakistan raw jute prices approximately 15 per cent above the price at which Calcutta mills can buy the equivalent quantities of Indian-grown raw jute in their internal markets. Pakistan's action has handicapped her customers—the jute spinning and manufacturing industries of the world—and has made it increasingly difficult for them to compete in world markets with Indian produced goods. While this is a delicate subject, it is my duty to draw Pakistan's attention to the results of her policy.

EXPORTS

The products of your company have always played a large part in indirect exports. Since the restrictions on direct exports were removed in 1951, we have made considerable progress in this direction. I am glad to be able to report that jute piece-goods exports of our own manufacture have increased by 22 per cent in 1953 compared with 1952, and that the level is still rising month by month.

cent of our exports in 1952 went to hard currency markets, the 1953 percentage rose to 79 per cent. We are now a large earner of hard currency.

Your directors have not been lulled into a false sense of security by easier conditions in the home trade, and have exports very much in mind. With this end in view they have decided to reinforce their efforts by floating a new subsidiary company—JUTE INDUSTRIES (EXPORTS) LIMITED.

CAPITAL COMMITMENTS

The capital commitments at September 30, 1953, amounting to £628,000 will have been to a very large extent incurred during the present financial year. While some of this expenditure is purely replacement of machinery which is no longer serviceable, the greater part of it should further increase production and efficiency.

No commitments have as yet been incurred in connection with the erection of manufacturing premises on the site of 21 acres acquired in an area earmarked for industrial development to which I made reference last year.

DEMAND

The demand for your company's products is well maintained and every effort is being made to increase production and use the machinery and labour force at our disposal to the best advantage. Subject to unforeseen circumstances results next year should again be satisfactory.

CAPITAL STRUCTURE

The capital of your company was reconstructed in 1929 when the issued capital was written down from £4,500,000 to £1,650,000. Your directors are of the opinion that the time is approaching when steps should be taken to bring the issued capital of £1,650,000 more into line with the capital now employed, and also to modify the highly geared nature of the present capital structure. To effect this it will be necessary, subject to the consent of the Capital Issues Committee, to capitalise certain of the company's reserves. I shall be communicating with stockholders on this subject at a later date.

Finally, I am sure you would wish me to convey to all executives, management, staff and employees at home and overseas your most sincere thanks for their work over the past year. Their keenness and enthusiasm in tackling the many difficulties which constantly arise is worthy of the highest praise.

The report and accounts were adopted.

SITTANG VALLEY RUBBER ESTATE, LIMITED

DIVIDEND 20 PER CENT

The nineteenth annual general meeting of the Sittang Valley Rubber Estate, Limited, was held on March 11th in London.

Mr E. G. Estall, chairman, in the course of his speech, said:

The net profit of over £39,000 is only some £5,000 less than the preceding year. This is mainly brought about by an increase in the crop to 1,331,652 lb, which is more than 66 per cent over that harvested for the previous year, and against an estimate of only 1,250,000 lb. Your directors have recommended a distribution of 20 per cent, less mended a distribution of 20 per cent, less tax at 9s. in the £, and this actually absorbs £2,733 more than the company has earned.

Mature Rubber.—The whole area of 4,274 acres was under tapping at December 31, 1952, with the exception of 33 acres on

Rainfall.—149.91 inches of rain were recorded for the year under review which was nearly 21 inches more than that for the previous year, but no less than 87.88 inches fell during the 1952 monsoon.

Local Situation.—Conditions in Burma generally remain unchanged.

Currency Restrictions.—I would once more remind you of the impossibility of remitting surplus assets in Burma to the UK. As mentioned in my previous review, all London expenses plus any dividends declared can be remitted, but there is tremendous delay.

Mr W. J. C. Richards then addressed the shareholders and gave a review of conditions at present prevailing in Burma.

The report was adopted.

BORAX CONSOLIDATED, LIMITED

GOOD RESULTS

The fifty-sixth annual general meeting of this company was held on March 17th in London, Mr D. Abel Smith, MC (the chairman), presiding.

The following is an extract from his circulated statement for the year ended September 30, 1953:

The results for the year under review have been good; in fact they have only twice been bettered in the history of the company. The overall demand was at a very healthy level but wages and some costs increased again. If the results of the first quarter of the current trading period are maintained, we should again have a satisfactory year.

The trading profits of the group are £1,385,539 against £1,337,297 last year. Investment income is £314,786 compared with £325,912 in 1952. Taxation accounts for £673,303, compared with £757,089 in 1952, leaving group net profits of £617,192.

After deducting from the profits of the group the profits retained by the subsidiaries (less the dividends they have paid to the parent company) the net profit of Borax Consolidated, Limited, is £556,448 against £445,866 last year.

CREDIT FACILITIES, USA

During the year an agreement was arrived at with our bankers in the USA, whereby they make available to the company credit facilities up to \$2,800,000, the present equivalent of £1 million. These facilities are at our disposal for a period of ten years, to the end of May, 1963. The company has made arrangements for its stock in the United States Potash Company to be held as security by the banks, but of course will continue to enjoy the income from that investment.

Although the company has a considerable cash balance now, your directors considered it desirable and advisable to arrange for these additional facilities in the USA, where our largest activities are centred. At the present moment we have no immediate expansion or diversification programme in hand, but considerable thought is being given in that direction and it may well be that we shall require substantial funds in the USA over the next ten years. Your board considers the credit agreement very advantageous.

Adverse selling conditions, together with increases in labour and certain other costs during the year, affected the profits of the United States Potash Company and the directors of that company have wisely considered it best in the long-term interest of the stockholders to omit the extra dividend—we would call it the bonus over here—when declaring the December, 1953, dividend.

The report was adopted.

BRITISH HOME STORES

MR HORACE MOORE'S STATEMENT

The twenty-sixth annual general meeting of British Home Stores Limited was held on March 17th in London. The Rt Hon The Earl of Lisburne, JP, presided in the absence of the chairman through illness.

The following are extracts from the circulated statement of the chairman, Mr Horace Moore:

Profit before taxation was £1,203,406, an increase of £21,232. Profit after taxation was £428,406, which compares with £394,674 in the previous year. I am pleased to report that once again cash turnover was higher than in any previous year. While trading profits were ahead of 1952, our results were affected by some adverse factors, the most important being weather which, from a seasonable point of view, was the most contrary in our experience. The goodwill which we have built up over years is one of our most important assets, and we continue to foster this in all possible ways. We have continued our efforts, in collaboration with our manufacturers, to produce ever improving standards and values in our goods, and we find a growing demand from the public for the new and different.

While progress in connection with the restoration of bombed stores and the extension of existing facilities has not been as great as we would have liked, I am able to report a somewhat better forward position than a year ago. In November, 1953, we opened our new store at Exeter. We anticipate opening around the middle of this year the first section of our new Sheffield store. Construction has commenced in Coventry, and after demolition we shall proceed with building in Cardiff.

Both these stores will be among our largest units, but will not be completed during 1954. The Sheffield and Coventry stores will replace existing small temporary stores in these towns. We are hopeful that by the end of the current year work will be in progress on two other major stores, and further headway will be made in the extension of selling space in existing stores.

PURCHASE TAX

While we welcomed the purchase tax reductions made last April, we look forward to the day when it will be possible to remove altogether this arbitrary tax. We do consider that some scheme should be devised whereby when reductions are made the losses do not, as at present, inevitably fall on the retailer.

The taxation changes announced in last year's Budget reduced to some extent the enormous weight of taxation under which businesses have been operating. The reduction in the rate of income tax gave some relief to all, while the abolition of the excess profits levy was particularly appreciated. You will observe that for the year under review a provision has been made of £95,000 for excess profits levy which is the same as in the previous year.

I would like to take this opportunity of thanking our many suppliers for the valued support given to us. We have continued to pool our ideas and experiences in the constant endeavour to deal with the rapid translation of public demand into merchandise of sound value and appeal.

It gives me great pleasure once again to express the appreciation of the directors of the effort of all our employees throughout the year. I thank them for their loyalty and co-operation.

We are, I think, fully conscious of our problems and we shall spare no effort in our endeavour to bring the results of the current year to a satisfactory conclusion.

The report was adopted.

JOHN WHITE FOOTWEAR HOLDINGS, LIMITED

YEAR OF CONTINUED PROGRESS

INCREASED PROFIT AND DIVIDEND

SATISFACTORY HOME AND EXPORT TRADE

MR JOHN WHITE'S STATEMENT

The twentieth annual general meeting of John White Footwear Holdings, Limited, was held on March 17th at "Prospect House," Higham Road, Rushden, Northamptonshire, Mr John White (chairman and managing director) presiding.

The Secretary (Mr L. W. Bradshaw) read the notice convening the meeting and the report of the auditors.

The following is the statement by Mr John White, founder, chairman and managing director of the company, in respect of the company's trading year, 1953, which had been circulated to shareholders with the report and accounts:

I am pleased to report that 1953 has been a year of continued progress for your company.

FINANCE

The group trading profit is £255,062, an increase of £59,394 over 1952, and, accordingly, your directors are pleased to recommend an increase in the ordinary dividend of 5 per cent, making a total for the year of 31½ per cent. The amount of carry forward on the profit and loss account has increased to £361,907.

Consideration is being given to the advisability in future years of a more approximate equalisation of interim and final dividends. Any increase, therefore, in next year's interim dividend should not be taken as an indication of a higher total dividend for the year.

The consolidated balance sheet shows stocks at £531,949, a decrease during the year of £39,338. This figure is £346,355 lower than the 1951 figure, when it was thought advisable to create a stock reserve of £100,000. I am pleased to report that these stocks have been carefully and profitably liquidated and the present figure represents our normal trading requirements; and I think it should give shareholders great satisfaction that this reduction has taken place without the necessity of drawing on the stock reserve which was created. In view of the more normal trading conditions and stable prices now ruling, your directors feel that this specific reserve is no longer necessary and it has accordingly been transferred to profit and loss account.

In my statement last year, I referred to a possible revaluation of our fixed assets. A professional valuation of the group's freehold properties has been carried out and their present market value, to a going concern, has been certified at "not less than £330,000." This figure has, therefore, been incorporated in the accounts and the resulting surplus of £165,522 over the existing book values has been transferred to "capital reserve." It is thought prudent, however, to leave the company's plant and machinery at their present written down value. Their true value is, of course, greatly in excess of that shown in the balance sheet.

HOME TRADE

Your company's trade in the home market has again been maintained very satisfactorily. Of particular interest is the fact that this

year, a much greater percentage of our turnover has been in the higher-priced ranges and I feel that this shows a strong preference by the public for a fully guaranteed shoe, built to a dependable standard. Nevertheless it is becoming apparent that we are entering a period of greater competition, and our new season's range has been designed to include a selection of styles at prices that will enable our customers to meet any form of competition that may arise, from whatever source and however keen this may be.

During the year under review, our excellent contacts with our friends in the retail trade were further maintained by special regional displays in large population centres, where we were able both to show the complete range of our many up-to-date styles and strengthen our existing good relations with our retailers. These shows were highly successful both from the point of view of the numbers attending and the orders booked. Over three hundred new accounts were opened during the year under review.

A marked feature of the autumn season was the development of a completely new range of shoes soled with "Plexor"—a new sooling material which has been proved to have three times the life of leather. I have great pleasure in reporting that our friends in the retail trade took up these Plexor-soled shoes with great enthusiasm and they have proved a tremendous success. "Plexor," which is exclusive to John White Footwear, Limited, has established itself as a valuable asset, both to the company and to our customers.

EXPORT

The optimism expressed in my last report regarding our export business has proved to be well-founded. All previous records have been broken, particularly those to dollar countries.

It has been our endeavour throughout the year to concentrate upon the better grades of footwear and in this respect I am pleased to report that results are most encouraging. In every market except where there is some particular restriction such as import licences, we show substantial increases over last year. Although it is apparent that competition is becoming more intense, 1954 has opened satisfactorily, a large dollar order being booked during the first few days of the year. It will be apparent from these remarks that export has hitherto constituted a very important part of our trade, nevertheless we feel there is still considerable scope for increasing this, and plans are now being considered to improve our distribution throughout the whole of the overseas markets. It is, in fact, our purpose to ensure that we are adequately represented wherever there may be a demand for British footwear.

ADVERTISING

Our steady use of national advertising in Great Britain has made the public more aware each successive year of the value of the John White signature on footwear—and I have great pleasure in reporting that, once again, our survey shows that the John White name is recognised and appreciated by an even

greater number of the public than ever before. We have also continued the policy of supporting our overseas agents with advertising campaigns which cover the widest possible circulation and for which we use every practical form of modern publicity.

The most helpful and outstanding campaign during the year under review was undoubtedly the launching of the range of shoes soled with "Plexor"—a new, modern material. Many forms of strong and informative advertising were used, both to the trade and to the public—in order to get their full understanding and acceptance of this attractive new material. We were not only very successful indeed in selling hundreds of thousands of "Plexor" soled shoes, but this completely new venture was also successful within a matter of a few months, to which our advertising helped very considerably.

PROPERTY AND PLANT

During the year our stockrooms at Hazelwood have been largely extended and in the coming year we plan to carry out much-needed extensions to our transport department. All our properties are in excellent state of repair and I have every reason to be proud of the conditions we are able to offer to our workpeople. Our plant and machinery are the best available and the most modern in design.

DEVELOPMENT OF PRODUCTION UNITS

I am pleased to report that production has now commenced at the new closing factory at Corby, that I mentioned in my last report. Here we have a most modern factory of some 10,000 square feet floor space situated in an area where there is an abundance of female labour. In equipping this factory we have been able to make use of the most modern machinery available and the layout is also on the most modern lines. During the past year we pioneered a training scheme which enabled us to start production at Corby with a nucleus of skilled local girls—and we are already well on the way to building up a first-class team of 150 to 200 operatives. This will eventually result in the production of some 15,000 pairs of closed uppers per week in this unit alone.

This extra production of closed uppers, which are already coming through the factory, will overcome a serious bottleneck of many years' standing, and by this means our overall capacity will be considerably increased. This factory brings our total number of individual manufacturing units to nine; the general layout of each of them being unique in the trade inasmuch as each of them is capable of producing its own special type of manufacture, and is also so versatile that at a few days' notice production can be changed to an entirely new type of construction to meet the needs of the changing seasons or our customers' requirements.

SOCIAL AMENITIES AND CULTURAL DEVELOPMENTS

During the past year a works brass band has been formed. This has already attained a very high standard indeed and holds

ECONOMIST, MARCH 20, 1954

promise of a very successful future. Our operatives have taken a very great interest in this new venture and to create still further cultural interest among the employees a male-voice choir is now being organised. Both the band and the choir will in due course compete for national honours.

We also have a very fine sports ground which offers facilities for many kinds of sport and amenities for healthy recreation among our employees and their friends. The sports committee has a very full programme planned for the coming season, which includes visits by various teams from firms engaged in shoemaking and leather and allied trades. It is our intention to foster a spirit of friendly competition between our employees and those of kindred trades.

APPRECIATION

Once again I must express my very sincere thanks to all the workpeople, managers, executives and directors—whose loyalty and ability have so largely contributed to the company's continued progress and success.

The report and accounts were unanimously adopted and the dividend as recommended was approved.

The retiring director, Mrs A. White, was re-elected and the remuneration of the auditors, Messrs W. J. Thompson and Company, having been fixed, the proceedings terminated with a hearty vote of thanks to the chairman, directors and staff.

BIRMINGHAM CITIZENS PERMANENT BUILDING SOCIETY

ASSETS NOW OVER £5 MILLION

The annual general meeting of the Society was held at the Imperial Hotel, Birmingham, on March 10, 1954.

The chairman, Mr George Howe, presided, and in moving the adoption of the report and accounts said:

The year under review is one which again records excellent progress. The total amount invested with the Society from members and depositors during 1953 was £945,325 and after allowing for the withdrawals there is a balance of £3,858,562 due to share members, an increase of £363,048 and £1,007,018 over the previous year. Interest at the rate of 2½ per cent tax paid by the Society has again been paid, equivalent where tax is paid at the rate of 9s. in the pound to a gross return of £4 10s. 10d. per cent.

Advances during the year amounted to £1,041,576. The balance now due was £4,597,938, an increase of £377,810. Applications to finance new houses and from sitting tenants formed a substantial part of the mortgage advances. Investments in Government securities and cash at bank amounted to £436,642, which represents 8.6 per cent of the total assets. The profit and loss account shows a gross income of £215,042. After allowing income tax and profits tax £47,765, management expenses £28,747, and other outgoings, the net profit was £116,496, which together with £13,567 brought forward from the previous year has been allocated as follows: £91,064 interest to shareholders, £15,000 transferred to general reserve account and £10,000 to mortgage contingency reserve. Total reserves and carry forward are £178,999. The total assets now amount to £5,052,180, an increase of £425,953.

The report and accounts were adopted and the retiring directors, Messrs L. Goode and W. Turner, were re-elected.

THE SCOTTISH PROVIDENT INSTITUTION

MUTUAL LIFE ASSURANCE

STRONG FINANCIAL POSITION

In submitting the report and accounts for 1953 and the results of the quinquennial investigation as at December 31, 1953, to the annual meeting of The Scottish Provident Institution held in Edinburgh on March 16, 1954, the chairman, Sir Hugh Rose Bt, TD, drew attention to the continued expansion in new business. Each successive year of the quinquennium had established a new high record, the business of 1953 being more than double what had been transacted in the final year of the previous quinquennium. The total premium income now exceeded £3 million; the mortality experience was exceptionally favourable; the ratio of expenses to premiums was lower than in any year since 1918 and the interest yields, calculated on the total funds, had risen to £5 3s. 10d. gross and £4 1s. 6d. net. The total assets now exceeded £34 million, having increased by almost £2 million in 1953. This was indeed solid progress, steadily maintained.

RESULTS OF QUINQUENNIAL INVESTIGATION

The substantial surplus disclosed had enabled the directors to change the method of allotting bonuses in the common fund from a simple to a compound reversionary system. In this fund participation in surplus commences when the premiums paid, if accumulated with compound interest at 4 per cent, would amount to the sum assured. The first bonus addition is for the period from the outset to the date of allotment. Thereafter the policy shares quinquennially in respect of each year survived. The rates of premium charged are very low, being only a little more than the without-profit rates of other offices. In spite of these low rates, the excellent results had made it possible to declare bonuses at 22s. 6d. and 20s. per cent per annum for "Old" and "New" Series policies respectively. Endowment assurances with profits receive immediate bonuses at 38s. per cent per annum compound. All classes will, for the present, be entitled to intermediate bonuses at the same rates as those declared. The results in the common fund were especially gratifying as they afforded renewed evidence of the soundness of the principles on which the Scottish Provident had been established 117 years ago and strengthened the conviction that the "Distinctive System" of the Institution was the ideal system of whole-life assurance. Recent reductions in the rates of premium for new assurances kept the Scottish Provident in the forefront of the leading life assurance companies.

MILLARD TUCKER REPORT

In drawing attention to the specialist service which the Scottish Provident provided in setting up and assisting in the running of pension and life assurance schemes of all kinds, the chairman spoke of the large amount of business now transacted in this way. He referred briefly to the recent publication of the report of the committee set up by the Government under the chairmanship of Mr J. Millard Tucker, QC, to review the income tax law relating to pension schemes and to consider how the benefits of such arrangements could be made available to self-employed persons. He also expressed the hope that the Government would find it possible to implement the main recommendations in the report at an early date.

In concluding his remarks Sir Hugh Rose referred again to the excellence of the results he had been privileged to present and to the notable strength of the financial position which enabled the directors to look with confidence to the future bonus-earning power of this old-established mutual life assurance office.

The report was adopted.

CHURCHILL & SIM, LIMITED

(Timber Agents and Brokers)

DIVIDEND MAINTAINED

The accounts of Churchill & Sim, Limited, for the year ended December 31, 1953, show a consolidated net profit before taxation of £70,517. A final dividend of 19 per cent is being paid on the ordinary shares, making a total distribution of 25 per cent for the year, which is the same as in 1952.

The following statement by the chairman, Mr John C. Sim, was circulated with the accounts:

In the year under review the parent company's earnings have been well maintained although the consolidated profit of the group is lower than for 1952. Had it not been for a loss incurred by one of the subsidiary companies, the year's results would have been approximately the same as those of the preceding year. Reorganisation of this subsidiary is already far advanced. The possibility of such a loss was foreseen by your board some time ago, and was one of the reasons for which such a large contingency reserve was built up.

You will see from the accounts that this loss has been absorbed in the trading profit for the year. Your board consequently consider that the amount of the contingency reserve is now larger than necessary, and they have accordingly transferred £30,000 from contingency to general reserve. A further £10,000 has been allocated to general reserve from profits, bringing the total of this reserve up to £150,000.

DIVIDEND AGAIN 25 PER CENT

Your directors recommend a final dividend of 19 per cent on the ordinary shares, making a total distribution for the year of 25 per cent, the same total as for the preceding year.

Turning now to the course of business in 1953, I regret to say that Government restrictions have greatly curtailed your company's plywood turnover, but these restrictions will shortly be removed, giving the plywood trade greater freedom than they have enjoyed since before the war.

In November last the Government announced that consumption licences for softwood would no longer be necessary. The removal of this restriction on reselling in this country has virtually restored freedom to the softwood trade.

STEADY DEMAND FOR HARDWOODS

There has been a steady demand for hardwoods during 1953, and there are indications that this will continue, although some of the light hardwoods, which have been used in place of softwood, will have to find their proper level now that softwood consumer licensing has been abolished.

Your company has been largely instrumental in restarting public timber auctions which until the outbreak of war had been a familiar feature of its business for over 100 years.

A welcome feature of the year's trading has been the much fuller use made of the company's financial resources. This resumption of a traditional service to the trade is reflected in the large increase in the item "Bills Receivable" in the accounts.

In conclusion, I should like to welcome Mr Wallace, who returned to duty as the company's secretary during the year, and again to record the board's thanks to the assistant directors and staff, without whose conscientious work and loyal service your company could not have attained the results now before you.

At the annual general meeting held on March 16th the directors' report and accounts were adopted.

THE ATLAS STONE COMPANY

The twenty-third ordinary general meeting of The Atlas Stone Company Limited was held on March 17th in London, Mr Bernard Davis (chairman and managing director) presiding.

The following is an extract from his circulated statement: Our trading profit for the year amounted to £50,734, as compared with £73,499. There is a net available balance of £74,284, out of which your directors recommend a dividend of 10 per cent, less tax, leaving £64,201 to be carried forward.

The contraction of our profits has been due to a number of circumstances, the most important being the fact that certain contracts for which we had prepared ourselves to manufacture, did not materialise. Furthermore, the continuation of import restrictions coinciding with a tendency in the home trade to reduce stocks, the time lag between the promised release of more steel for licensed building and the placing of the order for roofing the buildings concerned, the increased cost of labour and raw materials and the severity and long duration of winter conditions in 1952-53, which, of necessity, added to our production difficulties.

New contracts have been obtained for the supply of large quantities of concrete units for coastal sea-wall defences, which provide continuity of production. At the same time your directors continue to be actively engaged in seeking new avenues for extending the company's business.

Results for the last two months of the

past financial year and the first two months of the current year show a satisfactory increase, as compared with twelve months ago.

The report was adopted.

SECOND BRITISH ASSETS TRUST LIMITED

REPORT AND ACCOUNTS FOR YEAR ENDED DECEMBER 31, 1953

CHAIRMAN'S REVIEW

The seventy-fifth annual general meeting of Second British Assets Trust Limited was held in Edinburgh on March 18, Mr Alastair C. Blair, chairman, presiding.

Under-noted is the chairman's review:

We have again had a satisfactory year, both our income and our valuation being higher than a year ago. The rise in income is due to continued industrial activity in America and to the more generous dividends of many British companies. While 1954 may see the beginning of a transition from cold war economy to something a little more flexible, we do not anticipate a major economic setback either here or in America, and I am hopeful that our revenue may be maintained for another year. We shall, however, have to provide for a full year's profits tax in our next accounts, as our deficiencies in liability over past years have now been entirely used up, but we hope it may be possible to divide a similar amount next year.

The valuation of our investments shows an appreciation over the book value at which they stand in the balance sheet of 44.5 per cent as against 41.2 per cent last year. As usual the London premium on dollar investments has been ignored.

The directors propose the capitalisation of £200,000 of undivided profits from the £700,000 standing at the credit of general reserve, to be devoted to the issue of ordinary stockholders of the remaining 200,000 ordinary shares of £1 each which were created as part of the scheme of arrangement in 1951 against the time when a bonus issue might become possible. This will provide one £1 bonus share for each £2 stock held, fractions being sold for the benefit of stockholders and the shares, upon issue, being converted into stock transferable in 5s. units. A resolution to approve the capitalisation will be put to the stockholders after the 1953

THE ECONOMIST, MARCH 20, 1954

accounts have been adopted, and if possible, renounceable allotment letters will be posted to ordinary stockholders on March 19th.

This is the last annual meeting at which Mr W. H. Fraser will be present as a director, and it is with great regret that we say farewell to him. During fourteen very busy years his wise counsel and his genial personality have been of inestimable value to the board and to the company. We hope that he will have many happy years of a more leisured life.

The report and accounts were adopted, and the capitalisation proposals were approved.

BARRACKS FABRICS PRINTING

POSITION OF EMINENCE MAINTAINED

The seventeenth annual general meeting of The Barracks Fabrics Printing Company, Limited, was held on March 17th at Macclesfield, Major K. G. Wilby (the chairman) presiding. The following is an extract from his circulated statement:

The net profit for the year ended December 31, 1953, is £90,590, after deduction of directors' emoluments and depreciation. Taxation again takes a very heavy toll at £36,150. The balance brought forward from last year's account was £34,025, making an amount of £68,465 to be dealt with. Your directors recommend a first and final ordinary dividend of 33 per cent, which, with the preference dividends, will absorb £23,650. To ensure some measure of dividend stability it is proposed to create a dividend equalisation reserve by the transfer of £25,000 from the profit and loss appropriation account. This will leave a balance of £19,815 to be carried forward.

I am pleased to report that business has continued to improve during the year under review. Our Stand at the British Industries Fair was most successful and although it is impossible to prophesy any cycle of trade, there is no indication at the moment of any falling off in the demand for the company's productions.

I have pleasure in tendering my thanks to the employees of the company, without whose loyal co-operation your company could not maintain and enjoy its eminent position in the section of the textile trade in which it specialises. The report was adopted.

SALES PROMOTION AND MERCHANDISING. An advertising agency needs a man to set up and manage a department which will devise plans to further the profitable sale of its clients' goods and services, through the means usually classified under "sales promotion"—product improvement, sampling, trade and consumer offers, point-of-sale effort, and so on. This man must have a be inventive, really knowledgeable of such activities from the retailer's angle, and must be able to work smoothly with teams outside, with prospects of advancement governed by the success of the sales. Pension and profit-sharing plans. Write fairly fully to 25 Saville Row, London, W.1.

INTERLING CONVERTIBILITY. British Exchange and Trade and Financial matters are all treated simply but expertly in our monthly bulletin. For specimen copy and subscription rates apply to: E. J. Publications, 8 Great Winchester Street, E.C.2, LONDON.

THE BRUSH GROUP of electrical and diesel engineering factories has a vacancy for a **GROUP CONTROLLER OF ACCOUNTS** at its head office in London. Candidates should be Chartered or Incorporated Accountants with a wide knowledge of industry, desirable. An understanding of standard costs and budgetary control is essential. Salary by arrangement and the appointment is pensionable. Reply in confidence to D. S. A. E. Jenour, The Brush Group, Duke Street, St. James's S.W.1.

THE CHARTERED INSTITUTE OF SECRETARIES. Directors and similar executive posts are invited to communicate with the Secretary of the Institute, 11 New Bridge Street, E.C.4. **QUALIFIED ACCOUNTANT** required suitable commercial employment in the London area. Reply Box 501. **FOR SALE.** The Economist, July, 1947-December, 1953. For details write Box 495.

ECONOMIST, MARCH 27, 1954

All over the country it's a Daimler CONQUEST

£1066 (plus £445.5.10 purchase tax) and all this

All over the country proud owners of the Daimler 'Conquest' are congratulating themselves on the wisest choice they ever made. Very shrewdly, and for a medium price, they have picked themselves the finest combination of motoring qualities on the market today. Here is what the 'Conquest' has to offer:

Performance. Top speed over 80, cruising 70; acceleration through the gears 0-30 in 5 secs., 0-60 in 20.4 secs., 10-30 in top 9.7 secs., Petrol 26.5 m.p.g. at 30 m.p.h., 21 m.p.g. at 60 m.p.h. ('Motor' and 'Autocar' road test reports).

Special Mechanical Features. Pres-selector fluid transmission; automatic chassis lubrication; 75 b.h.p., OHV, 6 cylinder engine; laminated torsion bar suspension; water heated induction manifold; 11" brakes with 148 sq. ins. surface; 33 ft. turning circle.

Fine Quality Fittings and Finish. High

quality real leather upholstery; deep pile carpets; polished walnut dash and woodwork; built-in heater and ventilating system; chrome-plated framing to windows.

Comfort and Luxury. Armchair comfort in deeply cushioned seating with adjustable armrests; unobstructed flat floor and ample leg room front and rear; front hinged wide doors for easy entrance; pivoting ventilating windows front and rear; large luggage boot 4' x 3' and separate spare wheel compartment; lockable glove box and 5 cubby holes for parcels in dashboard and doors. Wide range of beautiful colour combinations. **Long Life and Easy Maintenance.** Precision engineering and rigid standards of manufacture and inspection ensure characteristic Daimler feature of long life. The mechanical perfection of fluid transmission and epicyclic gear box plus full

automatic chassis lubrication achieve the ultimate in owner convenience and ease of maintenance.

Only by seeing and driving the Daimler 'Conquest' can you appreciate the reasons for its recognised success.

Write to Bureau 53, The Daimler Co. Ltd., Coventry, for the name of your nearest distributor and make arrangements to try this magnificent car as soon as possible.

Also the new Conquest 'Century' Saloon. Special series 100 b.h.p. engine, twin carburettors, 90 m.p.h., even quicker acceleration, bigger brakes, telescopic adjustable steering, improved seating and more leg room in rear, together with many other extras, including two suitcases specially designed to fit large luggage boot. These are included without extra charge in the basic price of £1172 plus £489.9.2 p/t.

OUT OF PEDIGREE COMES PACE

WANTED. Young woman as Marketing Assistant to Sales Director. Applicants need not have a degree but must possess a flair for statistics and the ability to handle figures and interpret them in an intelligent and interesting manner. Previous experience in handling statistical data for sales control and development purposes an advantage. Full details of career and salary required to be addressed, in writing, to the Sales Director, L. Rose & Co. Ltd., Grosvenor Road, St. Albans.

NEW Business Negotiator required for long-term subscriptions to continuous market research service. Applications invited from men over 45 with top level marketing experience who must prove ability to interpret marketing problems and conduct initial negotiations with managing directors and senior sales and advertising executives of leading consumer goods manufacturers. If you are seeking an opportunity of building up a long-term future with an expanding organisation write giving full details, in confidence, to Altwood Statistics Limited, Chantrey House, Eccleston Street, London, S.W.1.

ACTUARY. fully or partly qualified, required by London Stock-brokers with expanding institutional business, to prepare recommendations for investment and speedy and concise reports on industries and individual companies. Similar experience in a Stock-broker's office or in the Investment Department of an Insurance Company or Pension Fund is considered necessary. Age 28-40. Salary £1,200-£1,500 according to qualifications and experience. Write Box "O.S." c/o J. W. Vickers & Co., Ltd., 7/8 Great Winchester Street, London, E.C.2.

BARRISTER. widely experienced in many fields—Economics, Politics, Trade Union matters. Skilled negotiator, draftsman, speaker, committee-man. Fluent French. Interesting offers. Box 497.

THE Economist's Bookshop. 11-12 Clement's Inn Passage, London, W.C.2. invites you to submit lists of books on Economics, History and Social Sciences, you may wish to sell (periodicals excluded). **LAKE DISTRICT.** Leathes Cottage, Borrowdale, Keswick. Good cooking, open fires and central heating. H. & C. all bedrooms. On bus route. Centre for the high hills, near Derwentwater.

Character shows...

46% of our readers insist on "getting things straight"

THE NEWS CHRONICLE stakes its all on presenting the facts factually, and *both* sides of an issue. A great many people, it seems, would resent it if we *didn't*.

As a result of a survey, we've found that nearly half our readers (there are over 3,000,000*) define their liking for the paper in terms of *confidence*: they mention its "truth," "fairness," avoidance of bias. They like its informative news reporting.

Readers who want the facts, and can see the point

of an argument, are customers who can see the point of an advertisement. And readers who have absolute confidence in their chosen newspaper will extend it, willy nilly, to the products they see advertised in it.

In a new booklet, we've examined the *character* of News Chronicle readership in greater detail. If you would like to know more about the sort of people they are, the jobs they hold, and their remarkable *responsiveness*, ask to be sent a copy.

* Hulton Readership Survey, 1955

NEWS CHRONICLE

The findings in this booklet are based on a survey conducted originally for our private editorial use—but some of the information, we thought, would be useful to advertisers or their agents. Copies of the booklet may be obtained by writing or telephoning to the Advertisement Director, The News Chronicle, Bouverie St., E.C.4. Central 5000.

Laboratory check on a magnetron intended for use in radar equipment.

PROGRESS IN ELECTRONICS

THE possibility of using radio to detect and locate unseen objects has intrigued scientists since the turn of the century, but it was not until the advent of the multi-cavity magnetron during the late war that the history of modern radar began.

Radar targets are located by a beam of radio waves which upon striking an object are reflected to the sender. The direction of the beam when it is reflected, and the time taken by the waves on their outward and return journeys, indicate the exact position of the target.

For the system to be sensitive and accurate, the range of the transmitted beam must be long and its width narrow. This requires a powerful source of radio waves of very short wave-length but, unfortunately, such "microwaves" cannot be provided by an ordinary electronic valve. Faced with these difficulties the early radar pioneers developed the multi-cavity magnetron — a special valve which proved to

be more powerful by a factor of hundreds than any other microwave generator then available.

Today, magnetrons are playing an essential part in radar navigation. Ships and harbours are no longer hidden by fog and mountain peaks cease to be obscured by cloud. The cathode ray tubes of air and sea navigators present pictures of the way ahead even when visibility is zero.

Radar science is still undergoing ingenious and complex development. In the field of meteorology it is used for detecting and "tracking" clouds, as well as obtaining upper air measurements of wind velocity. A different role is also being played by the magnetron in accelerating electrons for the production of high-energy X-rays. In these and other microwave applications Mullard are contributing to further progress with the large-scale manufacture of high quality magnetrons and similar electronic devices.

The Railway £1

"A legitimate increase in prices to cover costs that would pass without comment in a dozen industries becomes a gross extortion when the railways seek to make it."

Who wrote these words? They were not written or spoken by anyone concerned with the managements of the railways. They appeared in a leading article in *The Economist* for 21 April 1951. They might be written with equal truth today.

When the price of transport goes up it appears to the transport user as the last straw. The last straw? That, indeed, is literally what it is: the *last*. For the price of transport is never the first to go up. Increases in railway charges have not preceded the increases in other costs. The rises in railway charges have always followed those other rises, and have largely been caused by them.

The British Transport Commission claim that even at their new level the railways' charges for freight transport represent fair value for money.

What does fair value mean? Official statistics of wholesale prices tell us that the 1954 £1 can buy, in terms of the 1938 £1, 6/3d. worth of goods. But for every 1954 £1 spent on freight transport, the railways give, in terms of the 1938 £1, 8/- worth of service.

8/- against 6/3. Would anyone say that that is unfair?

Horizontal Weather

DEVOTEES of Lewis Carroll will remember that in the first chapter of "Sylvie and Bruno"—when the mob was shouting "Less bread! More taxes!", and the Chancellor was finding this very remarkable, especially at that time of the morning—a Professor bundled excitedly into the room and announced that the barometer was beginning to move. "Which way?" asked the Warden, "Up or down?" "It is moving sideways," said the Professor. "And what sort of weather does that mean?" asked the Warden, "Listen, children. Now you will hear something worth knowing." "It means horizontal weather," said the Professor, and made straight for the door.

Except for the shouts of the mob outside—and perhaps even without that exception if one moves among very exalted mobs indeed—this seems to be oddly prophetic of the state of the British economy on the eve of the budget of 1954. The best guess that any professor can make—and perhaps next week's Economic Survey will make it—must be that horizontal weather probably lies ahead. There is at the moment no very potent excess of demand that needs to be whittled down; and no obvious slack in the economy that can be taken up. If Mr Butler were to rise to his feet on Tuesday week, announce that he had no budget changes to make, and then sit down again, he would be applying to the facts of today the principles that every Chancellor since 1947 has adopted. He would leave the economy plodding as closely as anybody can guess along its present chosen course between the primrose path and the waste land.

It may be that this is just what he will do. The principal deterrent must be that to the sunshine Chancellor of the last two years such a budget would look dreadfully dull. It should also look worse than dull to the public, once they realise what it would mean. For Britain stands today in the closing stages of a financial year in which everything—the terms of trade, the trend of production, even in these last few weeks the course of savings—has gone magnificently right; and yet the recipe seems to be that the burden of taxation cannot be one whit relieved.

This bleak prospect is partly the consequence of high defence expenditure, and partly of flabby farm policy; but it is mainly a reflection of the small rate of increase in annual production that the British people has grown to regard as normal. Except in years when there is some slack in resources to be taken up (which only happens when production has fallen below par in the year before), the "normal" rate of increase in real income which British economists now write into their forecasts is around 2 to 2½ per cent, or about £250 million a year. About half of this must always be written off against the increased consumption that flows from the increase in incomes itself; and the scrag-end that remains can nearly always be shown to be barely sufficient to pay for the increased army of schoolchildren and of old age pensioners, to expand Britain's external surplus, and all sorts of undeniably worthy things like that. In Western Germany, Dr Schäffer can draw up his budget on the assumption that the real

national income will rise by 5 per cent a year, but in Britain this is too optimistic by two and a half.

It is true that, measured over long periods of the past, an average rate of increase of real production per head of somewhere around 2 per cent a year has in fact been normal both in this country and in others for which data exist. But this long-period average has been made up of rapid increases in good years offset by actual declines in bad. In years of full employment, such as we have been enjoying, much more than 2 per cent should be possible. And, in any case, Britain has never before found itself in its present predicament, when a spurt of super-normal progress is the only way of escape from being crushed by the economic burdens closing in upon the community. If there is anything at all in the doctrine of conscious purposive direction of economic affairs (to which everybody nowadays pays tribute) then its primary task should be to find ways of speeding up the rate of progress. If there is any budgetary device that could be used to encourage such a spurt, then it should be applied—even if it means a departure from the strict principles of the last six years.

★

This is not, of course, to say that any tax relief that can be made to look like an "incentive" to somebody is good. The test should be a severe one: will it directly lead to an increase in the real national product? A reduction in income tax, for example, is an "incentive"—but to increased consumption far more than to harder work or to saving or productive investment. The only sort of tax relief that can be relied upon to stimulate investment, and investment only, is something that is applied directly to the process of spending money on productive capital assets. Thus a repeal of the 2½ per cent tax on undistributed profits, which has been suggested and which is perhaps desirable on general grounds, is not direct enough to satisfy the test. It might lead companies to save more; but the indications are that they are not now held back from capital expenditure by any lack of liquid funds, which are (perhaps temporarily) rising. Similarly, a reduction in Bank Rate would give a far more effective stimulus to spending on stocks and even (since investors feel richer when they look at the level of their share prices) on consumption than to long-term capital investment. The same objection applies even more strongly to last year's expedient of bolstering up total demand in the hope that businesses will then instal new plant in order to meet it. If it works at all, this is much too indirect and expensive.

What is needed now is a direct encouragement to the spending of money on capital, whether additional or in replacement of existing obsolescent assets. The suggestion recently made in the *Financial Times* by Mr Roy Harrod that businesses should be allowed to choose their own rates of depreciation has a great deal to commend it in principle. But it would be administra-

tively difficult, and it is hopeless to expect the Inland Revenue to accept anything so indiscriminate and expensive. The official mind will naturally turn to the initial allowances, which are now only half what they were between 1949 and 1951. But the initial allowance is not a reduction in the tax burden on industry; broadly speaking, it only shifts the payments in time. An interest-free loan from the Exchequer is, indeed, better than nothing—especially as, when an individual business's total investment is rising, it tends to be continually renewed. But what would be far more effective would be an increase in the basic depreciation percentages themselves—that is, a shortening of the assumed life of the capital assets. If he wants to do something this year to stimulate investment, that should be the first thing for the Chancellor to do; it has the advantage that it can be made selective. The stimulus would not achieve much without a change in British industry's general attitude towards investment. But it would be a step in the right direction, and the Government should not be afraid of making any such concession a large one.

★

If this stimulus is chosen, the rest of the economy is not likely to get great cheer from the budget. There are some dribbles and dregs that the Government might like to distribute. It probably wants to increase national insurance benefits to compensate for the rise in the cost of living since the inception of national insurance in 1948, this would only cost less than £10 million this year. It ought to want to implement the Tucker Committee's recent proposals for fairer tax treatment of private pension schemes, which would not cost very much initially and would remedy a serious injustice. It may want to introduce schemes for very gradual approaches towards the repayment of postwar credits and towards equal pay for men and women in the public service—with provisions for speeding the advance later if by any chance a swing towards world deflation were to create some slack later in the year. But these oddments cannot be exciting—and the Chancellor should not wince from making them more bitter by declaring that, after the Government Actuary's review at the end of this year, national insurance contributions may have to go up.

In sum, the economists are quite right in warning Mr Butler that he should not introduce a budget that will be popular with the public at large; but they are wrong if they are also telling him that he should not risk proposals that might raise real investment in the year ahead. There is a distinction between profligacy and progress, between accepting the risk of having to invest part of the gold reserve and accepting the risk of eating part of it. There is a moral as well as an analogy to be drawn from the adventures of Sylvie and Bruno in Lewis Carroll's dreamland. On his next appearance after his forecast of horizontal weather, the professor was stumbling fearfully along with an umbrella tied to the front of his boots.

Throwing Away the Trump

ON Monday the House of Commons staged a most pitiful affair. With only a couple of honourable exceptions, the speakers in the debate on trade with the Communist bloc showed themselves only too ready to heap up popular illusions, banalities and gross factual errors. Most of them took as their basic assumption the still quite unwarranted idea that Soviet long-term policy (as opposed to tactics) has changed so dramatically as to change the whole world situation with it. The air was full of technicolor visions of limitless markets in the east. Even the hoary fallacy that attributes all responsibility for the low level of east-west trade to the western strategic controls was revived, in flat defiance of the statistical evidence of shortages of grain, timber and other East European exports.

But there was much more wrong with the debate than these individual errors, however depressing their cumulative effect. Two things were lacking, of such importance that their absence made the debate sound like a symphony played without either strings or brass. First, almost all the speakers talked in terms of trade with Russia and its European satellites. China was mentioned by a few; but not one appeared to realise the futility of discussing the trade of the Russo-Chinese bloc piecemeal, although the outstanding characteristic of the bloc is now its close, "monolithic" integration. The stationing of Peking's trade commissioners in East Berlin symbolises the fact that from there to the East China Sea stretches a closed economic society, trade with any part of which is, quite simply, trade with the bloc itself.

The second point, however, is even more vital. The debate in the Commons showed a total inability to grasp the magnitude of the issue at stake. East-west trade cannot be discussed merely as a matter of commercial policy, or in terms of adjustment to a more comfortable international atmosphere. It is central to the whole problem of ensuring the security of the free world.

There are no such illusions about its unimportance among the shapers of policy on the far side of the iron curtain; the intensiveness of Soviet propaganda on the subject is enough evidence of this. But that evidence is hardly needed. The Communist bloc is now planning for a period of a good many years during which China is to be both industrialised and equipped with an arms industry and modernised armed forces, while Russia improves its internal supplies of consumer goods and food. The bloc's need for supplies of a wide variety of goods and equipment from the outside world is therefore much greater than before.

China is the weakness. Economic integration, in Communist minds, by no means implies "to each according to his needs"; and although China is said to be receiving many million roubles' worth of Soviet aid, its experience in recent years has shown that such aid

must be bought dearly, and that for the most part it must balance its own books. China's earning capacity in the outside world is now small. It has orientated over three-quarters of its trade towards the Soviet bloc; its own growing industry has first call on the coal and raw materials formerly exported to Japan; and its recent periods of isolation from the world have led many old customers to find alternative sources of the minerals and agricultural products that it used to sell. Last year China's export earnings in the free world added up to only about £110 million. Its only other considerable source of foreign income is remittances from Chinese overseas; this might be reckoned at £40-50 million a year, although it is probably diminishing. Taking into account a deficit on invisibles such as shipping, China can find at the most £150 million a year to spend in the free world, unless it drastically reduces its shipments to Russia and the European satellites.

And it is at this moment, when the Communist bloc finds itself in such real need of supplies from outside, that it is argued that the West should not merely demolish its control of strategic exports, but even provide large credits to enable the bloc to carry out its plans. The prevalence of such ironically muddled thinking indicates that it is high time to restate the basic principles involved throughout the whole question of east-west trade.

★

The first of these is the indisputable fact that for trading nations such as Britain the extension of international commerce is always a welcome development—other things being equal. But the other things must be truly equal.

Second, trade with totalitarian countries can never be separated from politics, if only because to a totalitarian regime trade is a major political weapon. The Russians, for example, have no need to impose special embargoes or controls, because their entire trade is tightly controlled; they have no use for a Battle Act, because anything their satellites export to the west requires their specific approval.

Third, trade in items of no strategic importance is obviously desirable and, provided it is two-sided, should be vigorously pressed. Friction at the borderline between strategic and non-strategic categories is equally obviously harmful to the solidarity of the free nations; and any work of revision that reduces such friction is to be welcomed.

Fourth, it is one thing to act vigorously wherever trade is possible; it is quite another to be deluded into overestimating the potential scale of the trade. In particular, there is no rhyme or reason in diverting a dis-

proportionate part of the British export drive to such a marginal and unreliable market as the Communist bloc while failing to make the most of opportunities in far more promising fields.

Fifth, the western controls—far less sweeping than their Soviet counterparts—on military or strategic exports to the Communist states will remain necessary until there is clear evidence that these states have abandoned their attempts to disrupt and dominate other nations, particularly by fomenting and backing “liberation movements” in Asia. There is still no such evidence.

The last point is now the crucial one. In a few weeks’ time, at Geneva, western statesmen will face the task of getting the Communist powers to see reason as regards a settlement in the Far East. If they accept the argument (used this week both in the House of Commons and in the Moscow paper, *Kommunist*) that trade must be kept separate from politics and that it is immoral to use economic bargaining counters, what inducement to good behaviour can they offer to the Chinese and Russians? What, indeed, remains except the threat of military force? It seems fair to ask whether those who now urge the West to discard its one peaceful trump—trade—before the Geneva game even begins, have pondered the fact that they are in effect insisting that western diplomacy must rely on naked force alone.

It should be clearly realised that any substantial easing of controls or commitment to credits effected

before the Geneva conference reaches agreement will amount to presenting China with a trump, even if it is ostensibly directed to Russia. For the Communist bloc, as already shown, is one economic system. Nothing, in fact, would please the Russians more than a chance to pass on to China the benefits of credits received from the West; for this would enable them to pose as the donors. They have already bent all their efforts, with much success, to the canalising of China’s foreign trade through their own network. If, however, the Chinese are already restive at the limitations to Moscow’s ability to supply their needs—and there are signs that they are—is the West going to solve the Russians’ problem and help them tighten their grip on China?

An exactly opposite policy would seem indicated. The free nations—who, for once, ought to be entirely agreed on this—should insist on dealing directly with the Chinese, either in China or in Western Europe, but not in East Berlin or any other Russian garrison town. If credits are to be given, they should be given directly to China, not passed through Big Brother’s itching hands. China cannot be promised the moon; there are, in Southern Asia, for example, other nations with a far stronger claim on western generosity, which itself cannot be limitless; but the time for plain speaking has surely come, and it should be made perfectly clear to Peking that its prospects of external aid depend solely on its good behaviour, not on the ingenious manipulation of the Russo-Chinese economic system.

Farming Policy in Transition

SUPERFICIALLY at least, the most surprising fact about the farm price settlement is that agreement should have been reached so quickly between the Government and the National Farmers’ Union. The concordat between Whitehall and Bedford Square was this year put to the severe test of coping with the consequences of decontrol, of falling world prices, and of the emergence of surpluses of some foods. The Treasury was determined that the large bill for the support of British agriculture should be reduced. The farmers were resolved to keep the gains won during the period of shortages.

The price agreement is inevitably a compromise, the actual consequences of which—either for Treasury or farmers—are by no means clear. The farmers have made some prudent concessions to the logic of events. They have accepted arrangements which, for the first time in fifteen years, presage some slight reduction in the level of farm prices and (eventually and contingently) in the extent of the taxpayers’ liabilities. But the Government too, while standing firm in principle, has made substantial concessions in practice.

The principles on which Government guarantees to

agriculture should in future be based are admirably set forth in the White Paper (Cmd. 9104). First, physical expansion as such is no longer to be the main goal of policy. Aided by favourable weather, the net output of British agriculture climbed last year to its highest point ever—56 per cent above the prewar level. Further expansion is regarded as still desirable in principle. But the primary objective must now be “to secure a more rapid improvement in economic efficiency by raising quality, catering for consumer choice, and reducing unit costs of production.” It is admitted that these economic factors have been neglected in the rush to expand production. In future, agriculture will be expected to comply with the economic tests to which other industries are subject.

Secondly, Government guarantees will in future be related to market conditions as well as to the schedule of farming costs and profits. It is a pity that this need was not recognised earlier. The cost-plus method of fixing individual prices has caused British agriculture to become dangerously unbalanced—for instance, the country is now swimming in surplus milk—and the adjustment is bound to be painful for some producers.

It follows that the Government will no longer set production targets for individual commodities. The level of output must be settled in each case by market demand on the one hand and by productive efficiency on the other, and neither factor can be determined by public action.

Thirdly, the cost of subsidising British agriculture is to be progressively reduced. This cost is estimated at roughly £200 million for the financial year now ending, after subtracting the element of consumers’ welfare embodied in the subsidies paid on bread and milk. In other words, this is the amount by which the Government thinks that farmers (as opposed to consumers) would be worse off if there were no guarantee. It is the Government’s hope that “the progressive improvement in efficiency will provide a basis for steady reductions in the cost to the Exchequer.” Should this optimism prove misplaced, the farmers are left to draw their own conclusions. It is clear that this year’s changes are meant to be only the first small bite at the cherry of agricultural subsidies.

These principles are unimpeachable. Their translation into practice, under the confused conditions of the twilight of rationing and control, is less easy and also less satisfactory. In a free market, the Government cannot know what prices consumers will pay; its guarantees must therefore be worked out on a new basis, and separate arrangements have been made for each commodity. The result is a complex mosaic of guarantees, the main features of which are set out below.

The most satisfactory form of guarantee to the Exchequer—and the least demoralising to agriculture—is that of the genuinely minimum price. Under this device, farmers depend for their prosperity upon their

own efforts and skill, but are protected against a serious depression of the market. This principle has been applied only to potatoes and, less clearly, to eggs. For other products the farmers insist that competition from imports will consistently force down market prices below the point of a fair return to the home producer. The argument is not proven, but the Government has agreed to go on underwriting prices which will probably be considerably higher than the market level—in other words to guarantee maximum rather than minimum prices.

★

There has, however, been an attempt to reduce the costliest guarantees, which are those for milk, cereals, and pigs. In each of these cases supply is now tending to outstrip demand. For milk there is a very modest price cut of 1d. a gallon, coupled with the limitation that the guarantee will apply only to the present level of output; this means that any further increase in milk production will entail a proportionate reduction in the guaranteed price. Producers of wheat, barley and oats are treated very leniently; there is to be no quantitative limit to the price guarantee and only a slight reduction in prices which will not operate until 1955-56. Pig prices have been cut the most (by about 5 per cent), but the dual guarantee to pig producers (explained below) will remain a very expensive liability; even the guaranteed individual price for pigs, which is supposed to meet extreme contingencies, is expected to be consistently above the market level.

These price adjustments are anything but draconian. They have been represented as saving the Exchequer,

Guide to Farm Prices

Under the Agriculture Act, 1947, which had the support of all parties, the Government pledged itself to maintain permanently some type of financial guarantee to British agriculture, to protect producers from large price fluctuations and to ensure them an adequate minimum income. The guarantee applies to all the principal farm products except fruit and vegetables, i.e. to about four-fifths of net farm output. The precise guarantees are settled at an annual review after consultation with the National Farmers’ Union. Guarantees for livestock products relate to the current year (with minimum prices coming year (with minimum prices fixed for 3-4 years in advance) and for crops to the following year’s harvest (e.g. on this occasion to 1955-56).

Until decontrol, the Government laid down fixed prices at the annual review at which it would purchase the farmers’ entire output. Following decontrol,

however, farmers will sell their output in the open market at current prices. For the time being, the Government guarantee will be given in 4 different ways:—

(a) *Minimum or support prices.* This method applies to eggs and potatoes, and is designed to protect the farmer from low prices resulting from periodic gluts. The Government pays the difference on any sales taking place below the minimum price.

(b) *Deficiency payments schemes.* This method applies to cereals (wheat, rye, barley and oats) and to fat stock (fat cattle, fat sheep, fat lambs and pigs). The Government establishes a standard price and pays each producer the difference (if any) between this price and the average realised market price multiplied by the volume of his sales. The guarantee is collective; it safeguards the incomes of producers as a whole

and the individual producer may get more or less than the standard price, depending on his skill and luck. Otherwise standard prices are similar in principle to minimum prices, except that they have been fixed high enough to give a more extensive type of protection.

(c) *Guaranteed individual prices.* This represents a second and subsidiary guarantee applicable to fat stock (except fat cows). It guarantees a minimum price for each individual transaction which is additional to the collective guarantee. Its purpose is to protect farmers from an alleged danger of exploitation by butchers’ rings at small country auctions.

(d) *Fixed guaranteed prices.* This form of guarantee—which was the general form before the return to free markets—will continue to apply to milk and sugar-beet.

It is true that some of the concessions made this year have been designed to ease the transition of agriculture to a changed environment. Others reflect the legacy of the Government's past mistakes. For instance, having exhorted cereal producers to grow more only two years back, it is difficult to apply an economic brake

This is a familiar story. It may recur each year until the myth that the Farmers' Union can swing a general election is finally exploded. But at least the right precedents have been set this year for use by the first Government with the necessary courage. The proper type of permanent guarantee to British agriculture is becoming clear. It should involve direct subsidies for helping the smaller and poorer farmers and for raising the standard of farming techniques; and with these should be coupled the guarantee of a genuinely minimum price for a wide range of commodities. This would be support enough. It might still cost the taxpayer up to £100 million a year. It would guarantee the farmers a minimum income—not, as this year's settlement continues to do, substantial profits—and leave the rest to them. No farmer can reasonably ask for more.

Instead, the agreement covers American military and

Naturally no one supposes that these measures are going to turn Japan into a first-class fighting power overnight. Whatever happens, it will be at least two years before the country can even possess an adequate force to hope to defend itself on land against, say, an attempted Communist invasion from Korea. And this presupposes American air and naval support, with the Japanese primarily responsible only for their own

What is feared, however, is the eventual outcome of the decision. This, it is felt, is the thin end of a peculiarly unpleasant and dangerous wedge. For anyone who had personal experience of the Japanese lunge through Asia twelve years ago, either as a combatant, a civilian or subsequently a prisoner of war, it seems even more wrong to rearm the Japanese than the Germans. For anyone, like the Australians, who escaped disaster by a very narrow margin in 1942, logic and reason are added to emotion and distrust as motives for opposing Japanese rearmament of any kind (Australian attitudes are discussed on page 958). The American guarantee of Australia and New Zealand has gone a long way towards mitigating these fears; indeed, without it, Washington's general defence policy in the western Pacific would have to be agonisingly reappraised. But, as the debate on the EDC in Europe shows, treaties alone cannot by any means exorcise the kind of fear that the French have for the Germans, or that some of Japan's neighbours have for Japan as a result of grim experience.

Against the somewhat academic background presented by these arguments, the broad reasons for

In the long run, Japan's own role in the Pacific will be to counterbalance the power of Communist China. And the importance of this role will grow as China becomes stronger militarily. The only alternative is for the Japanese to be gobbled up by the Communist bloc, which would be an unthinkable disaster. Although at present most Japanese are as inhibited about their own rearmament as are many of the critics of America's latest move to give them military help, a new phase is opening in their relations with the West. They are no longer to be a conquered people, but partners in the fight against Communist expansionism. If so, the first step must be to enable them to defend themselves. .

The House of Commons seems to employ the Wednesday pretty much as schoolboys employ half-holidays, to perform mischievous tricks. . . . On Wednesday some of its members indulged in investives against the "rapacity of those" who . . . obtain the fair market price for the rent of stocking-weaving machines. . . . We . . . say unhesitatingly that if the Legislature is to be called on to interfere and adjust the rent of frames, the reasons are much stronger why it should interfere to adjust the *rent of land*. In the present state of the minds of the bulk of the working classes, we cannot imagine anything more mischievous than for the House of Commons to assume the authority of regulating or abating the rent either of frames or of land. That was, however, its half-holiday\ amusement on Wednesday; and we are not surprised . . . that Mr Fitzroy . . . on the part of the Noble Lord the Secretary for the Home Department, consented to the second reading of a bill for lowering the rent of frames. It is quite natural, consistent, and therefore proper, in those who make laws to fix the rent of cabs, also to make laws to fix the rent of frames and the rent of estates. We objected to the first, because we can find no limit to the interference of the Legislature if once it be allowed to fix the remuneration of any kind of services which one man renders to another. If it fix the rate of cab hire, it must, in justice, fix the extent of cab employment. If it fix the rate of hire for frames, it ought also to ensure the owners continual payment. If it fix the wages or reward of any kind of labour, it ought also to fix the price of bread, though that imply a control over the seasons. If it interfere to limit the profit of the humble capitalist, why should it not interfere to limit the rent of the lordly landowner?

March 25, 1854

Notes of the Week

Nato and Enosis

FRIENDSHIP between Greece and Britain is one of modern Europe's traditions, and friendship between both these states and Turkey is also close. Are relations between these three Nato allies now to be queered by angry Cypriots? All three are exposed to this danger unless one or more of them takes steps to check it.

The claim of the Cypriot Greeks to *enosis*, or union with Greece, is well known. They are Greek by church, race and language, but constitute only eighty per cent of the island's population. The remainder are Turks who, as so many minorities do, prefer the sovereignty of a third party to that of the local majority. The *enosis* campaign has been sharpened during the last five weeks, when Archbishop Makarios of Cyprus has been on a visit to Greece. Anti-British demonstrations have taken place in Athens and Salonika, and, upon the Archbishop's arrival in Rhodes, damage was done to the British consulate there.

On leaving Athens, he broadcast to his supporters an assurance that the Greek government would bring the Cypriot claim to union before the United Nations. Simultaneously, the Greek Prime Minister issued a moderate statement on the Cyprus question; it was the policy of his government, he said, to "render the best possible service to the strengthening of security in the south-eastern basin of the Mediterranean, the preservation of the unity of the

democratic front, and the protection of traditional Greek-British ties." His tone contrasted sharply with that in which Mr Eden, upholding the British contention that the Cypriots can have, if and when they choose to, self-government within the British Commonwealth by the road offered to them in 1948, curtly informed a questioner in the House on March 15th that "Her Majesty's Government cannot agree to discuss the status of Cyprus" with the Greek Government.

Cyprus is important to Britain only on strategic grounds. In the same week as Mr Eden's statement, British military chiefs from London and from the Canal Zone met here on the site of a potential headquarters for Nato forces in the area. All modern experience suggests that the danger of turning a deaf ear to talks such as Greece would entertain is to convert friends into enemies and bases into beleaguered citadels. If, by sitting tight, Mr Eden allows the Cypriot complaint to go to the United Nations, he puts all question of friendly talks with Greece out of court. The Greeks, for their part, will gain nothing for the Cypriots by a *démarche* at Uno, because, in law, the British position is impeccable. It would be wisest not to let matters reach this pitch. The four Nato members with interests in the Eastern Mediterranean—Britain, Greece, Turkey and the United States—would do better to concert their attitude to sovereignty in Cyprus round a table than to argue it out before the Assembly.

Drama and Deadlock in Egypt

THE confused drama that took place in Cairo on Thursday must await comment; the record of political manoeuvre, retraction and reshuffle in Egypt in recent weeks is enough to discourage any early judgment on events of which, at the time of writing, only the barest reports are available. But whether or not the junta of army officers is able or willing, in the event, to maintain its decision to restore full freedom for political parties and to wash its own hands of power in July, it cannot, without danger, defer action on an equally pressing matter—the deterioration of law and order in the Canal Zone area.

Within the last fortnight, four members of the British forces have lost their lives and others have disappeared or been wounded. The attacks have not all been one way; an Egyptian police officer was also killed in circumstances which led to the arrest of two British soldiers. There is evidence that the Egyptian authorities can stop these activities when they want to do so. There is also much evidence that public opinion in Britain has had enough of a situation in which Egyptians in authority simultaneously practise exploratory talks and encouragement to Egyptian gunmen. Mr Eden was therefore under great pressure to stop the former until the Egyptian government gives him cause for confidence by stopping the latter; and he announced that he was doing so in the House of Commons on Monday last. Nothing was being gained by letting matters ride, and his policy is a good one, provided that it includes an intention to resume talks if the attacks stop.

For who gains by a stalemate? Not Britain, which must thereby go on paying an exorbitant money cost for security

in the Eastern Mediterranean; and certainly not Egypt, which, if it holds elections this summer, must either reach a settlement before then or else reduce them to an ugly competition in vilification of Britain. Elections held in such conditions would destroy all prospect of votes for parties with a constructive policy in the field of development and welfare. They would finally wreck the high hopes which caused the country to acclaim the young military reformers eighteen months ago.

Leaks from the Caucus

MR MORRISON's complaints about "leaks" to the Press from Labour party meetings have served only to remind the public of the dangerous extension of caucus rule on both sides of the House of Commons. Having seen the whole Press arrayed against him, from *The Times* to the *New Statesman*, Mr Morrison has had a lesson in democracy that he—of all people—should not have courted. The Press has a duty to throw the clearest light it can on the regrettable process of secret disagreements, secretly arrived at, through which his and his opponents' party juntas now fumble towards the policies that they present to the public as the only true course of reason and light. It is true that the Labour members who are most ready to tell stories out of school are often left-wingers with a personal grudge against the party leaders; but if newspapers fail to correct for this bias—and most of them try to—the moral those leaders should draw is that differences of opinion on matters of public concern should be discussed more openly.

In reports of wildcat schemes to aim at injunctions against certain newspapers Mr Morrison's name may have been taken in vain, but it is horrifying that the thought should have occurred to anyone. The whole incident ended in an embarrassing anti-climax for Labour, with the National Executive solemnly putting out a statement reaffirming that its meetings are "private and confidential." This was news to nobody. On the contrary, it is the main criticism of both party machines that at "private and confidential" meetings important issues of public policy are not only being discussed but decided.

The Conservatives show disquieting signs of picking up Labour's bad habits. At recent meetings of the 1922 Committee there have been inquests into "leaks"; members have shaken their heads reprovingly and then gone out to leak about the inquests themselves. Mr Butler is even reported to have warned the Tory back-benchers that their indiscretions might lead ministers to abandon the habit of confiding in the back bench committees. There are obvious tactical problems that the parties can legitimately try to consider secretly (if they can get away with it), and ministers (like journalists) should sound out the views of back-benchers as frequently as they can; Tory ministers do this all too rarely. But there can be little justification for the use made of a private committee meeting this week by the Minister of Education. Having already conferred with the teachers, she told Conservative MPs of an important proposal for changing the Teachers' Superannuation Bill; apparently new entrants are not to contribute as much as was originally intended towards covering the accumulated actuarial deficiency in the fund.

Inevitably the news "leaked," but if there is to be an "inquest" it should be into why such an important development was not first announced to the House of Commons.

Wages Reconnaissance

THE clouds of wage disputes are a little less threatening this week. The general attitude among most of the unions affected seems to be that they ought to be able to get a little cream on top of the seven shilling standard for this year's wage increases; but that if they must resort to strike action to secure it they will have been manoeuvred into a mistake. As *The Economist* goes to press there are signs that the film technicians may decide to withdraw the ban on overtime with which they have backed up their astronomical claim for an extra 30s. a week, three weeks' paid holiday and other benefits. Two events have made them more ready to listen to the request of the Minister of Labour: first, the curt action of the employers in dismissing 2,000 laboratory workers—to which the union replied by calling out 4,000 more; and, secondly, the threat of unemployment for between 4,000 and 5,000 other workers in the film industry, who have been given notice that production cannot be continued if there is a breakdown at the processing end. The cruel fact is that the film industry is not a prosperous one, and an interruption to production would not hit the employers really hard.

The shipbuilding and engineering workers are also somewhat quieter for the moment. The executive councils of the 38 unions affiliated to the confederation have endorsed their leaders' decision last week to reject the proffered increase of 5 per cent. But instead of immediately renewing their threat to ban overtime and restrict piece-work, they have instructed their leaders to ask the employers whether or not their offer is final. The general unions—always the most conservative element in the confederation—proposed that there should be further talks, if necessary with the help of the Minister of Labour, and that the confederation's executive should be empowered to conclude a peaceful settlement. This resolution was rejected, but many members were clearly unhappy at the prospect of talking themselves into taking drastic action in order to improve on an offer that they consider to be not too bad. The trouble is that if the employers refuse to discuss a better offer, the confederation will probably be compelled by face-saving considerations to operate the ban that it has threatened for so long.

Until this dispute is settled, the TUC's economic committee will not consider the proposal that its general council has recently been discussing with the Minister of Labour—the appointment of an impartial body to consider the impact of wage increases on the national economy. It is worth noting that this vague idea, first suggested by the court of inquiry into the engineering dispute, is now referred to by the TUC general council as "an inquiry." This suggests that it is being interpreted, after the discussions with the Minister, as something like a Royal Commission which would make a once-for-all report, rather than as a standing advisory body. It is still difficult to believe that this could do much good; but—unlike a continuing body—it could not do much harm.

After Dien Bien Phu ?

THE outcome of the battle for Dien Bien Phu is more likely to affect the nature of any truce in Indo-China than to determine whether there is to be a truce or not. The peculiarly bitter and vicious siege of this French strong-point looks like proving at once the biggest and the most decisive single engagement in the seven-year war. Although the French deliberately entrenched themselves in great strength in Dien Bien Phu at the end of last year, it was something of a surprise that the Viet Minh commander equally deliberately decided to attack in force, thus embarking on the kind of set piece battle which he normally avoids.

It is difficult not to associate this Communist initiative with the forthcoming Geneva conference. If the intention was to cast a decisive influence over the proposed discussions on Indo-China by involving the French in a heavy defeat and a disastrous loss of prestige, another wave of attacks on Dien Bien Phu must be expected. It is no small thing, on the other hand, for the French to have shown a world which nowadays so often doubts them that they can

still recapture the spirit of Verdun.

Both sides in Indo-China may now be assumed to want a truce, if they can get one on satisfactory terms. The Communists want, above all, to put an end to American intervention on China's southern doorstep; they also hope to gain by political means what they have so far failed to obtain by the sword. In France the movement in favour of a negotiated peace is mounting steadily. The least enthusiasm is shown in London and Washington, where the inherent difficulties are strongly recognised. The chief of these is that, owing to the guerrilla nature of so much of the fighting and the lack of adequately defined front lines, at least the outline of a political agreement must be drawn up at the same time as the terms of a military cease-fire. There can be no intervening period as in Korea. If there is, the Communists will end by getting all Indo-China. That is too high a price to pay for stopping the war.

The Bill for France's Arms

LAST week the French National Assembly voted the military credits for the fiscal year 1954. For the first time the Socialists as well as the Communists voted against the defence budget. As a whole this is a transition budget

in more senses than one. Though the Minister of Defence, M. Pleven, took pains to emphasise that these are not accounts in preparation for EDC, military integration in Europe would obviously have a great effect on French budgeting. Moreover, this is still a "pre-atomic" budget; France is not expected to enter the nuclear field before next year. And uncertainty as to what land equipment is most suitable to new conditions may partly account for a cut in the expenditure on the land forces. Out of a total estimated expenditure on the home forces of Fr. 829 billion, the share of the army has fallen to Fr. 280 billion, while that of the air force has risen to over Fr. 270 billion. It claimed that France will have 38 Nato squadrons (or 80 planes) at the end of this year, and 51 squadrons (or 1,000 planes) at the close of 1955.

It is difficult to get a clear picture of the real French burden from the complicated accounts of expenditure. The military credits voted for 1954 amount to Fr. 1,110 billion. Out of this only Fr. 925 billion will be financed by French taxpayers. On the other hand, if American aid to the associated states of Indo-China is included as well as the American shipments of equipment, the defence expenditure of the French Union amounts to Fr. 1,445 billion.

The striking thing about these figures is that this year the United States is to shoulder almost four-fifths of the financial burden in Indo-China, the French contribution being in fact limited to Fr. 136 billion out of a total of Fr. 626 billion. In other words, the end of this distant war would bring only a small direct financial relief to the French exchequer. On the other hand, the French price in blood and men cannot be forgotten; it was argued during the debate that the French officers and NCOs from Indo-China could provide the nucleus for ten European divisions. Furthermore, all those French critics who would like to end the war in Indo-China, but at the same time are in favour of EDC, implicitly assume that the end of that war would not involve a drastic cut in American aid.

Key to the Saar

WHENEVER Dr Adenauer leaves his coalition without his dominating influence, it becomes all too clear that patriotic politicians will be hard to control when he is forced by age to retire. The inclination to make high-sounding declarations instead of leaving steady negotiations to be pursued quietly has reappeared while the Chancellor has been visiting Greece and Turkey. It is evident from statements made by the leader of the Free Democratic Party and others that they suspect Dr Adenauer of preparing to renounce Germany's claim to the Saar. The opposition leader, Herr Ollenhauer, has not been alone in recalling that the Bundestag as a whole recorded in a resolution that the Saar is and remains German.

The critics are speaking without knowing exactly what Dr Adenauer said to M. Bidault when he last met him, or what is in the French memorandum that the French foreign minister presented on that occasion. All that has been announced is that the two agreed to take as the basis of negotiations the plan formulated by a Dutch Socialist delegate to the Council of Europe, Mr van der Goes van Naters,

and subsequently adopted at Strasbourg. It is an interim plan for partial "Europeanisation" of the Saar, which tries to overcome the unfortunate fact that no political European government exists, or is likely to exist, in the foreseeable future.

Behind all the complexities of proposals for the Saar is a vital issue that is seldom mentioned. The key to intransigence on both sides over the Saar is in fact the Oder-Neisse line. For the Germans think that terms they accept regarding their western frontier will be taken as a precedent when it comes to settling their infinitely more important claims in the east. Hence they will not agree to a permanent abandonment of the Saar. On the other hand, the French from the outset have declared that, once Germany was deprived *de facto* of the Oder-Neisse territory at Potsdam, it became a dissatisfied nation, which must be kept weak, while French power must be strengthened. At one time, the French wanted to detach the Ruhr from Germany as well as the Saar. By the foresight of M. Schuman and M. Monnet this hopeless plan has been transformed into the coal-steel community. Now the only hope for Europe rests on the possibility that a compromise may be reached over the Saar which leaves the final solution for the day when a supranational political government really exists, some peaceful settlement of German claims to the lost lands of the East is achieved.

EDC and the Antis

IT has been a bad week for the prospects of both Europe's projected communities. Dr Adenauer, M. Bidault and the other foreign ministers of the Six will not now be meeting in Brussels on Tuesday for their already much delayed talks on the political community. No new date

for this meeting has been announced, and it would seem that the wheel has come full circle: whereas a year ago it was argued that progress with the defence community (EDC) must wait on the political one, it is now the other way round. As to the defence community itself, there is little encouragement to be got from the proceedings of the French Assembly's foreign affairs committee, or the deadlock in the negotiations on the Saar. It can only be hoped that the optimism Lord Salisbury showed on Wednesday as to full agreement on Britain's association with the defence community will be justified as quickly as he implied.

Meanwhile a vigorous thrusting of spokes into the wheel continues. But the "international conference of countries concerned in the EDC," which met in Paris last week under the tenuous presidency of M. Herriot, might have been more aptly and less ponderously described as a caucus of "antis." This curious congeries of Gaullists, Daladier Radicals, British Bevanites, and Communists, with its doors open even to fraternal delegates from the Pieck regime in Eastern Germany, should have succeeded in making one thing perfectly clear: that no constructive alternative to EDC commands a coherent majority in France or anywhere else in Western Europe. One glance at the strangely assorted faces that it brought together sufficed to show that the minds behind them were agreed on one thing only—a sometimes malicious and sometimes sterile opposition.

Interdependent Commonwealth

SOME interesting ideas for a new approach to colonial affairs, which have been simmering for some time in the minds of a group of back-bench MPs, are likely to come to the boil next week. Mr Alport has put down a

motion in the House of Commons which recommends that the work of the Colonial Office and the Commonwealth Relations Office should be redefined, in a way that would reflect more accurately the changing needs of the Commonwealth. Two tentative suggestions have been made. One is that the Colonial Office, as such, should be abandoned as an anachronism and merged with the Commonwealth Relations Office; the other is that the Commonwealth Relations Office should be merged with the Foreign Office and its name transferred to the Colonial Office. The idea in either case would be to replace the concept of subordination by that of interdependence; that colonies which feel that they are in the lowest class—a long way from untrammelled independence—should be made to look as nearly as possible like those in the top one.

This is at once the strength and the weakness of these proposals. Countries like the Gold Coast, whose road to independence is clear ahead, are not now unduly worried about the trappings of the transitional period. Colonies outside this category fall into two groups. First, there are those which will eventually move along the Gold Coast's trail, but have not yet accumulated the local expertise and economic stability necessary for self-government. In these colonies official communications must still be funnelled for some time to come through the Governor rather than a High Commissioner; the distinction between directive and diplomacy will have to stay, whatever the London office is called. Secondly, there are those whose strategic importance and small size make it necessary for the British Government to retain its prerogatives in matters of foreign policy, defence and security; there is a strong case for saying that the logical line of advance here is towards the Channel Islands or even the Northern Ireland type of constitution, rather than towards dominion status—and thus for a gradual shift of responsibility in London from the Colonial Office to the Home Office.

The most obvious case in point is Malta, which has already asked to be moved from the Colonial Office to the Commonwealth Relations Office. But it has done so mainly for the snob reason that it wants to be separated from the main body of colonies. A general post would not satisfy it at all. That there should be people in Parliament thinking about these problems is very much to the good; but their zeal for reform should not lead them to suppose that all that is needed is to change the name of the rose.

Propaganda on the Screen

THE Labour party's carefully prepared film for its political programme on television last week provided seventeen minutes of acute embarrassment and rather under three of very effective emotionalism. It should serve as an object lesson of how this unnerving—but, for the future, important—mode of injecting propaganda into three million homes can and cannot efficiently be used.

The film, called "A Student's Journey," showed a hesitant young man asking six rank and file Labour supporters why he should join the party. The whole form of this script was a mistake, because it gave the impression that only the callow come into Labour's fold and because the television camera is always apt to show unpractised

THE ECONOMIST, MARCH 27, 1954

performers in an unfairly unfavourable light. Thus, the earnest and bespectacled scientist, who talked about sociology and correlations, was undoubtedly dismissed in most of the three million homes as a "soppy thing." The farmer was too obviously speaking from a prepared script; even the background noises in this part of the film sounded less genuine than they were—one had the impression that Mr Morgan Phillips was sitting behind the screen, saying "Moo." The hospital sister, who wasted time explaining that she was very busy and therefore could not spare much time to talk, was another tactical mistake; everybody is scared of being bullied by brisk and busy hospital sisters, and one of the party's troubles is that marginal voters are also unworshipfully afraid of being bullied by Labour's gentlewomen and gentlemen in Whitehall.

The housewife, who leaned over her ironing board and said that Labour had kept up rationing and controls, and the bus driver, who appeared to belong to the party because his father had belonged to it before him and because he believed in high Tory protectionism, also cannot have won many votes. The whole burden of the film was therefore thrown back on the miner, and on his inevitable homily about the bad old days. Speaking through coal dust which hid an unpractised actor's face, he was an unmitigated success. On reflection, his harrowing experiences of the 1930s may not seem to have much relevance to current controversies. But political programmes on television are not primarily aimed at those who reflect; across the country last Friday night television sets were turned off with the judgment "I can see why that fellow belongs to the Labour party, but those others . . ." It will be interesting to see how the Conservative party, which cannot so easily pluck at people's heart-strings and which has found in the past that even its own brand of suavity looks slightly jagged on a medium where announcers have elevated suavity to a fine art, responds to this challenge in its own carefully prepared programme, which is to be televised from Mr Eden's drawing-room.

Mr Macmillan's Opportunity

MR MACMILLAN has yielded gracefully to the argument that he should act soon to reform the system of local government. This week he persuaded the Commons to reject a private Bill which would have made Luton a county borough. The objection he offered was the familiar one: that piecemeal changes of this sort would prejudice the task of comprehensive reform. But the Minister recognised that this excuse, which has been used ever since 1945 to prevent any change at all in local government, has worn very thin indeed. He therefore promised Luton and other towns with similar aspirations that next session the Government will either produce a plan of its own or will cease to block their proposals.

This, it should be noted, is not a direct promise that a Government Bill will be forthcoming. But the zeal with which Mr Macmillan contemplated the task—viewing it as "a great prize" for whoever grasps it—suggests that his statement may be a more reliable comment of things to come than Mr Bevan's equally vehement statement, during his

Starch

does surprising things IN SUCH SURPRISING PLACES

Example:

STARCH IN TANNERIES

Glucose, made from starch, is used by tanneries in a number of curiously different ways. Its main use in vegetable tanning is in the finishing processes. It is used, in addition to other leather dressings, to increase the suppleness and tensile strength of the leathers. In 'chrome' tanning glucose plays a more direct part: it is used for the reduction of bi-chromates of sodium or potassium, in the presence of sulphuric acid, to form basic chromium sulphate — the main tanning agent in the 'chrome' tanning process. Glucose is also used for making a mulling solution in which sole leathers are often steeped before they are cut into soles. Mulling makes the leather easier to cut and less liable to damage during cutting. The tanning trade buys most of its glucose in the form of

solid glucose 'chips.' 'Buffalo' Glucose Chips, produced by Corn Products Company Limited, the Industrial Division of Brown & Polson, are well known throughout the tanning industry.

Brown & Polson Industrial Division produce 200,000 tons of starch products a year: more than 400 different products, which are helping more than 80 different industries to reduce production costs, to make better products, or even to make products that could not otherwise be made at all. We have spent more than 100 years in building up this large and varied business. We have learnt a lot about the industrial uses of starch products, and our advice is freely at your disposal.

CAN STARCH HELP YOU?

When you read in these advertisements how starch products are helping other industries you may see new possibilities of turning them to account in your own business. We shall be glad to discuss them with you.

tenure of office. Mr Macmillan must know that local government reform has made notable reputations for statesmen in the past—for Goschen in the last century and for Neville Chamberlain in the 1920's. Like Chamberlain, too, Mr Macmillan has distinguished himself by the number of Bills—11 in all—which he has already promoted during this Parliament, and which he has given as his excuse for the continued delay over local government reform.

It is unfortunate, however, that the Minister still puts so much weight on the possibility of reaching agreement among the local authority associations as a prelude to reform. Such agreement is hardly likely; and in any case the plan which the counties and county districts recently put forward is a half-hearted and emasculated compromise. When the county boroughs have had their say, there will probably not be very much left of it. Mr Macmillan would be far wiser to turn for inspiration to the proposals of the Local Government Boundary Commission, which the Labour Government so cavalierly dismissed. Those proposals would admirably meet the needs of towns like Luton, by creating a new type of local authority half-way between borough and county borough. Certainly the commission's plan could be improved—for instance by cultivating a closer union between town and countryside. That is the challenge to Mr Macmillan's statesmanship—provided, of course, he does not move on to higher office shortly after making his most encouraging statement, as Mr Bevan did.

Pagoda-Building at Geneva

COMMUNIST China's propaganda, which may only echo faintly in the West but reverberates like a mighty gong throughout Asia, is now devoted to presenting a version of the coming Geneva conference that firmly ignores the facts. At Berlin, Russia and the three western powers agreed that they would invite to Geneva the nations that had taken part in the Korean war and those interested in Indo-China, China being of course included along with nearly a score of other states. Now, however, Peking—with support from Moscow—is hammering home the idea that Geneva is essentially a meeting of the "Big Five," and that China will be there as a host, not a guest.

This is much more than mere formalism. In Asia, prestige is a very powerful weapon; it was skilfully exploited by Ming and Manchu long before Mao Tse-tung was heard of. It is told that the Buddhist kingdoms of South-East Asia learnt to beware of several ingenious devices by which China sought to assert its suzerainty over them. One trick was for a new Chinese ambassador to, say, Mandalay to bring in his retinue a team of carpenters, who, the night after his arrival, built extra wooden storeys on to the house where he was lodged, so that in the morning his roof was higher than that of the Burmese king; this was a clear proof of suzerainty, and the king must choose either to accept it or to force its removal, which involved the risk of war.

At Geneva, the Chinese clearly mean to go in for pagoda-building of this kind, and the western delegates, however harassed by their own peoples' impatience with wrangles over procedure, will have to stand constantly on guard against it. For there is no secret as to Peking's ultimate

intentions. What the Chinese are saying shows that they see Geneva as a virtual substitute for the United Nations; the conference, far from being restricted to Korea and Indo-China, will, they insist, open up a perspective of further "Big Five" meetings that will deal with all major international problems. The western governments will have to be both firm and resourceful if they are to maintain their thesis that China must earn its place in the sun by improving its behaviour.

Formosa in Straits?

IT was a foregone conclusion that Chiang Kai-shek would be re-elected as president in Formosa, and it may not seem to matter much whether he is president or not. But his defeat on the first ballot in the Assembly, whether or not it was an arranged demonstration of democracy, together with the hostile comment by Dr K. C. Wu in America, indicate a division of opinion among the Nationalists which may reflect a corresponding cleavage among their backers in the United States. Has the exiled regime a better chance to survive if it looks for new leadership or if it carries on under the old management? The advantages of making a fresh start, and bringing forward new men untainted by past failures and young enough to grapple with the new problems, must be weighed against the argument that the known name must be kept on the letter head, and that the man who governed China for twenty years has still more advertisement value—and more prestige for reconciling factions—than any newcomer. For better or worse the latter course has been followed.

The situation of Formosa is at present one of stalemate. Nothing has happened in the past year to bring any nearer the dreamed-of day of return to the mainland of China. But neither has anything happened to throw doubt on the American determination not to yield Formosa to the Communists. The Nationalists regained much prestige by the decision of 14,000 Chinese prisoners in Korea to go to Formosa instead of returning to the People's Republic—a result which, in view of the neutral supervision over the

final choice, was a heavy blow to the Communist claim of virtually unanimous popular support. Nationalist China will not be represented at the Geneva Conference, nor will the possession of Formosa be on the agenda, but South Korea will be there, and the close relations now existing between Seoul and Taipeh make it probable that the first appearance of the Chinese People's Republic at an international conference will be an occasion for a very vigorous political attack on it, not from a Western, but from an Asian, quarter.

Denationalising Welfare

Arguments about public finance, opinion in this country ranges itself in the main behind one or another of two broad propositions. The first is that it does not really matter (in principle, one's own taxes are apt to be a special case) how much the state takes out of the citizen's pocket, so long as the citizen body as a whole gets value for money in return and so long as the final distribution of income represents an improved measure of social justice. The second is that there exists a well-defined danger point, corresponding to a certain percentage of the national income, beyond which any increase in taxation—no matter how equitably and expediently raised and used—is bound to bring economic stagnation, monetary inflation or both.

Mr Colin Clark has for many years been the enfant terrible of the second school, buttressing his argument with historical and statistical evidence ranging as far back as ancient Rome. In a stimulating booklet,* he has now mapped out what he would like to do about it. In brief, he suggests that, except as general rule-maker and rescuer of last resort, the state should bow itself out of the "insurance" business and, so far as possible, from the whole administration of the social services. Unemployment insurance should be handled by the unions; the Friendly Societies should take back health; the Churches should take over education, with conditional subsidies. All this would make it possible almost to halve taxation, bringing the total just inside what Mr Clark regards as the safety limit. This smaller sum should be raised by a reformed income tax or surtax, a very few indirect taxes, and a land tax which should replace rates. On balance, the average wage-earner would be better off than he is now (despite the disappearance of some currently "free" services); while the skilled, professional and business taxpayer would regain a differential that would make skill and enterprise worth while.

Mr Clark has never lacked courage, nor the capacity to take ordinary human beings' breath away. He has also always managed to compress his researches into a form where he has insufficient space to look too closely at the political implications or economic weak spots of his own proposals. But as a first sketch of an impossible structure, from which a few practical bricks may be taken if the political trend should continue in the direction in which high taxation is impelling it, this startling booklet deserves attention.

* "Welfare and Taxation." By Colin Clark. Catholic Social Guild (125 Woodstock Road, Oxford). 80 pages. 3s. 6d.

The Doctor's Life and Labour

GENERAL practice must be rapidly acquiring the reputation of being the most surveyed of all occupations. A committee of the Central Health Services Council is at present studying it on behalf of the Ministry of Health. The British Medical Association published a report on it last September. This week, the Nuffield Provincial Hospitals Trust published* the results of a three years' survey by Dr Stephen Taylor, the former Labour MP for Barnet. These and other surveys all appear to have had a twofold origin. The introduction of the health service, to begin with at least, depressed the status, financial and professional, of the general practitioner compared with that of his colleagues in the hospitals. Secondly, early in 1950 the *Lancet* published a report by a New Zealand doctor—Dr Collings—on the state of general practice in Britain; this painted such a gloomy picture that it provoked other surveys to see if his generalisations were valid.

Fortunately, both the British Medical Association's surveyor and Dr Taylor declare that they were not. Both are agreed that about a quarter of all general practices are of a high standard and about a half sound and reliable. The unsatisfactory quarter, says Dr Taylor, "shows substantial room for improvement; it includes a final twentieth for which it is hard to find excuses." Numerically, this submerged twentieth is serious. According to Dr Taylor, it means that the work of 1,000 doctors may be so bad as to constitute a risk to some two million patients.

His report is addressed directly to doctors themselves. Using his eyes, ears—even his nose—and his keen sense of what is valuable in medical practice and what is superfluous or irrelevant, he gives a vivid picture of the working day of the general practitioner. What is more, he shows, in considerable detail and with illustrations, how, by paying attention to organisation and accommodation, many doctors could raise their standards—though he wisely does not equate good premises with good doctoring. The worst general practices are to be found in the industrial areas of the great towns, where doctors usually live away from their work; the best in the country towns, where the doctor is a part of the community. All doctors should read this report both as a tonic in itself and as a prescription for better practice. Patients will find out how doctors earn their £60 million a year; moreover, by learning what are good standards of practice, they will come to expect them and thereby help to foster them.

Technical Aid and the Colombo Plan

THE increase in Britain's contribution to the United Nations Specialised Agencies was generally welcomed on both sides of the House when a supplementary estimate for it was voted last week. Party division of opinion was mostly a matter of emphasis; Labour members were more concerned to welcome the extra £150,000 provided,

* "Good General Practice." By Stephen Taylor. Oxford University Press. 604 pages. 12s. 6d.

Conservative members to stress the need for laying it out on the right lines. The welcome was occasionally qualified—Sir Richard Acland, for instance, describing the improvement as from a "very mean" to a "mean" contribution—but the bipartisan approach to the task of international development was more marked than the party divergences. It generally is when aid is going up.

The debate did something to clarify points previously in doubt. The relationship between the UN Technical Assistance and Expanded Technical Assistance programmes on the one hand, and the Colombo Plan on the other, is still in process of being worked out. United Nations technical aid is primarily concerned to supply experts, and only 25 per cent of any sums expended under the technical assistance programmes can be used to provide capital equipment. The administrators of the Colombo Plan face no such legal limitation and can allocate funds at their discretion. Mr Dodds-Parker reported that "a substantial amount" of technical equipment from the Colombo Plan was being allocated to projects launched by the Specialised Agencies in the Colombo countries. He did not, however, have time to specify, at Sir Richard Acland's request, the steps taken to ensure that every such opportunity of combined action should be grasped.

The international approach to development has obvious advantages. It is much less apt to rouse the recipients' often inveterate suspicion of hidden imperialistic aims than any scheme that seems to be principally sponsored by a single power. On the other hand the regional and political solidarity which the Colombo Plan both expresses and encourages has its own value; and it is, of course, easier for Britain to participate in it than through channels—such as the World Bank—which assume that there is one trading world instead of one and a half. The dovetailing of United Nations technical assistance and the Colombo Plan's capital development should benefit both; but it would be wise to issue some further report on how this dovetailing is to be achieved. With so little money to spread over so wide a field, overlapping would be inexcusable.

Shuffle and Cut in Warsaw

THE reshuffle in leadership which followed the Polish Communists' party congress last week truthfully reflected the spread of "collective leadership" from the Soviet Union to the satellites. Boleslaw Bierut could no longer remain the boss both of the Polish party and of the government, because in Russia the control of the two levers of command is no longer in the hands of a single individual. With no Stalin in the Kremlin, little Stalins cannot be tolerated at the periphery. The Bulgarians fell into line recently, and only the Rumanians are still out of step. But if "collective leadership" is now the official pattern, the division of powers is not the same in all the countries. In Bulgaria, as in the Soviet Union, the premier seems to be the *primus inter pares*; but in Poland, as in Hungary, Mr Bierut relinquishes the premiership and clings to the secretaryship of the Party.

In another respect Poland seems to depart from the Soviet model. In Russia Malenkov, the premier, and Khrushchev, the chief secretary, are probably now of com-

parable stature; in Poland the new premier—Jozef Cyrankiewicz, a former socialist—is not much more than a figurehead. Moreover, he is now closely jostled by two "first deputy premiers"—Mr Minc and Mr Nowak—who will keep an eye on him. But their primary task will be to watch over the new economic policy of concessions to peasants and to consumers in general. Mr Minc, who had long opposed rapid collectivisation and a reckless industrialisation drive, comes into fashion at last with the economic "new look."

Another deputy premier now appointed is Jakub Berman. It is significant that Minc and Berman—both of them are Jews and suffered an eclipse at the time of the Slansky affair and the doctors' plot—are now coming back into the limelight. Will Warsaw alone be spared a "Moscow trial"? (The former leader Gomulka has not been brought into the dock, five years after his disgrace). The Kremlin attaches a great importance to its chief satellite, and no less a person than Mr Khrushchev was sent as its delegate to the congress. It was, very noticeably, left to him to call the Poles to vigilance against external and internal foes—giving the impression that the "fraternal" delegate from Moscow was urging the Polish comrades to "fraternal" strife. In spite of their present orderly reshuffle, Polish Communists may still be required to make bloody offerings on the Soviet altar.

No Army of Sin

MR NUTTING'S reply to last Friday's debate on the rights of children fathered by American servicemen was satisfactory. In the first place, he stated that the report mentioned in a recent court case (and derived from an American newspaper)—that there were 70,000 such children in Britain—was a gross exaggeration. In fact, the American authorities have traced only 1,200 inquiries from unmarried mothers in search of their children's fathers; and only 100 of these are still outstanding.

Secondly, he confirmed the Attorney-General's recent promise of reforms. As the law stands, American troops (like our own) are immune from being forced by British courts to make payments under an affiliation order, but (unlike our own) they are also immune—thanks to a Congressional order—from having allowances deducted directly from their pay. When the Visiting Forces Act, 1952, comes into operation (as it soon will) the position will be improved. Affiliation orders will then, in the last resort, be enforceable against anybody in this country by commitment to prison—a provision which will presumably apply to present as well as future orders. But the powers of British courts do not stretch beyond British territories. The Government hopes to reach a satisfactory arrangement with the American service authorities under which they will keep erring servicemen who have left the country up to the mark. The unavoidable loophole will be that once these men are demobilised there can be no means of enforcement short of an international and multilateral convention—which no one wants. It should be recognised by all who urge the case for reform that American practice in respect of troops serving overseas is certainly no worse than our own.

Letters to the Editor

Risks in Germany

SIR—Sir Robert Boothby's use of sweeping phrases is becoming a tiresome technique. For what is there of substance in either his criticisms of the European Defence/Political Community or his "alternative"?

His term "super-state" is clearly meant to give a bad impression. It is in direct contrast with the term "Community." To slip in the phrase "under German domination," is the wildest prejudgment. True the EDC Treaty does not make German domination definitely impossible. No form of words could do that—even with the resources of six languages. But nothing on paper could go further in hampering such a development and nothing else yet seen has gone as far. What the Treaty cannot provide for, can and must be covered by the very closest British connections. This applies equally to all European federal institutions.

"It would further divide an already truncated continent." More striking divisions than those between the sovereign states of Europe when left to take their own ultimate decisions could not be found. Strasbourg obviously is not a sufficient answer. Realising this, six nations have begun the first movement of its kind in history. At last independent Powers are subjecting themselves to an Authority which will override or co-ordinate, as necessary to the common interest, their several aims and policies. This group will form the core about which indeed a "viable and strong Western Europe" will be built. Only so can we create not merely the military but also the economic and political strength from which to negotiate the reunion of Germany and an all-European settlement.

As to the state of relations between France and Germany, a Saar settlement must be the acid test. We shall soon know its result.

We are offered a "European Defence Organisation" as "an integral part of Nato." If Sir Robert and his company think that such an alliance, after the conventional form, would be better able to contain an independently rearméd Germany, within or without Nato, then they show a brand of political naïveté which ought by now to be an anachronism.

One comment on Professor Pinto's letter. The Political Community's fate is now tied to that of the Defence Community. Only when the latter is in being can the greater scheme go on.

The moral is plain. There must be a minimum of delay with both.—Yours faithfully,
London, S.W.3

JOHN WHITEHOUSE

Suing the Samaritan

SIR—An interesting footnote to your article of March 20th would have been comment on the scale of damages awarded.

For example, on Friday last it was reported that a man aged 50 was to receive £8,254 for the loss of his left arm. With this he could buy an annuity of £500 or more. How would this compare with (a) the compensation he would receive if he lost his left arm in the course of his employment and (b) with the disability pension awarded to, say, a sergeant-major who lost his arm in action?—Yours faithfully,
Cheltenham

C. F. WOOD

SIR—May I draw your attention to an inaccuracy in the third paragraph of your article of March 20th. In the case of *Gold v. Essex County Council* the little girl's face was exposed to Grenz ray treatment without proper protection by the radiographer and not, as stated, by the radiologist. The court declared that the radiographer was a full-time servant of the council. Although the decision in this case doubtless helped to pave the way for Lord Justice Denning's judgment in *Cassidy v. Ministry of Health*, it in no way altered or modified the law applicable to doctors (including radiologists) as laid down in *Hillyer v. St. Bartholomew's Hospital*.

I may, perhaps, be permitted to add that the decision of the Court of Appeal in *Hillyer v. St. Bartholomew's Hospital* was an inconvenient one and gave rise to a diversity of judicial statement. The House of Lords had decided in 1866 in the case of *Mersey Dock Trustees v. Gibbs* that persons performing a public duty, even though gratuitously, are as liable for the negligence for their servants as are other employers. The Court of Appeal realised that the *Mersey Dock Trustees' case* was applicable to the case before it, but feeling that the result would not be a desirable one in the circumstances under its consideration, circumvented it by ingenious legal argument. This attempt to protect charitable hospitals served only to produce confusion into the law.

Owing to the recent increase in the number of actions for negligence brought against hospitals and doctors the law is rapidly becoming clarified. This, no doubt, is a source of satisfaction to the lawyers; unfortunately it does little to relieve the chronic anxiety engendered by the litigious sword of Damocles hanging over the head of each and every member of the medical profession.—Yours faithfully,
London, S.W.1

I. CRAWFORD JONES

Living Costs in Cities

SIR—The figures you quote under the above heading, as published by the Statistical Office of the United Nations, are clearly at variance with relative salary standards, at any rate so far as London and New York are concerned. To suggest, as the figures do, that New York salaries can be compared with those in London on a basis of about \$3.7 = £1 is contrary to the experience of employers. To obtain employees of comparable status it is commonly believed to be necessary to pay certainly not less than \$5 (and probably more) for each £ of the corresponding London salary.

Could the explanation be that the "spending habits of international civil servants" are on a more generous scale in relation to the ordinary man in London than in New York? Of salary levels in the other cities I have little knowledge but I suggest the figures should be regarded with great suspicion.—Yours faithfully,
London, S.W.1

K. A. USHERWOOD

Explosives in the Grate

SIR—In June, 1920, Mr Duke raised an action in the Court of Session in which he sued Mr Jackson for £750 in the name of damages for injuries sustained by him as a result of the explosion of a detonator included in a bag of coal that Mr Jackson had supplied to him.

Mr Duke attempted to exploit concurrent remedies. He laid his action: first, on the common law of negligence, and he was allowed to go to proof on this issue; and, second, on breach of warranty under the Sale of Goods Act, 1893, Sec. 14 (1), and he was held not to have averred a relevant case.

Apart from the fact that his allegations failed to comprehend a complaint of the quality of the coal supplied, the Court held that he had no remedy under the subsection of the section of the Act that he pleaded. The coal, unlike the bun, could have been consumed without physical injury to and, being of excellent quality, for the greater comfort of the pursuer (anglice plaintiff). The Court was much influenced by the thought that the coal itself was not permeated by detonating material, and could have been safely used. No doubt, although the report is silent on the point, the learned Judges contemplated a variety of possible actions under the same Act, e.g., one based on the inedibility of bananas because they were imported in the company of a venomous snake which was included in the sale price and the crate in which the bananas were packed.

To your suggestion, which must be economically offensive to you, there is the alternative—that English lawyers would be well advised to import their law from North of the Border; or is that advice in itself a slight on the law of South Britain?—Yours faithfully,
Edinburgh

Divorce in Morocco

REVOLUTION AU MAROC.

By Robert Montagne.

Editions France Empire, Paris. 415 pages.
690 francs.

TWO quotations, one from this frank and interesting book and the other from General Catroux's recent "Lyautey le Marocain," will at once acquaint the English reader with one important strain in French thinking about Morocco. General Catroux remarks that his countrymen have allowed their "gift for technical excellence to outweigh the art of winning souls." Professor Montagne, developing the same theme, adds:

If out of sheer discouragement we now abandon all effort to win adherents, and to make use of the minds our teachers are striving to train in our image, we shall have assented in advance to the ultimate wreck of our labours. And where will all the fine plans of our technicians be then?

In Morocco, as at every point where the white settler has taken root in Africa, both European and African are on edge. Last August, France's banishment of the Sultan drew attention to the state of their tempers; it has since prompted Professor Montagne to try to do two jobs—to analyse why the gulf between the communities has grown so wide, and to emphasise how great a change of heart will be needed on both sides if it is to be narrowed again. He is well qualified for the job: he was one of Lyautey's "kindergarten"; he speaks both Arabic and Berber; also—in contrast to most Frenchmen in North Africa—he has lived in the Middle East and so possesses a yardstick which they lack for measuring the strength and likely trends of Moroccan nationalism. He must have felt impelled by August's events to pour out his uneasiness, for his book was on sale in Paris by December. Yet it does not suffer from being written at speed; it gains in candour and uninhibitedness, and the Sultan's dethronement was clearly only the spark that touched off some mature ideas.

The pattern of modern Moroccan history that he traces is not the complacent one familiar to Frenchmen. Lyautey did his main work in a decade—the twenties—in which the number of influences afoot was blissfully simple. There was the Sultan's absolute government or *Maghzen*, and there were the tribes. Lyautey, bent on avoiding the control by conquest which he had thought a mistake in Algeria, built up the *Maghzen* into an ally; his scheme was foolproof so long as Sultan and Resident-General were at one. For reasons of

economy and also by the fortuitous circumstance of France's preoccupations elsewhere, he never sought to deprive the tribes of the kind of influence that their biggest chieftain, the Pasha of Marrakech, still exercises today. Simultaneously Lyautey, charmed by the dignity of Moroccan mediaevalism, left it inviolate and ordered the building of French towns as entities apart. He personally had the imagination to adjust these theories to meet changing circumstances. Not so his successors, who perpetuated them to the letter, finding their tastes for centralisation suited down to the ground by his conception of absolute rule via the Sultan's edicts or *dahirs*. Living in their comfortable segregation they failed to grasp that two new forces had upset the old balance held by the Resident-General between the Sultan and the tribes. These forces were nationalist youth trained in French schools, and a large detribalised proletariat attracted to the towns by French enterprise. The French residents, therefore, were thunderstruck when, in 1944, Morocco asked for independence. From that date "the divorce of the couple Sultan-Resident was consummated; the 'Plan Lyautey' was over."

The next nine years were to see an odd realignment of the forces at work—a foregathering of Sultan with nationalists, and Frenchmen with the most reactionary of the tribal leaders. M. Montagne describes the many extraneous factors that helped this process: the Atlantic charter; Arab League propaganda; the arrival of postwar French investors lacking in knowledge of or thought for Moroccan claims to notice; the divisions of opinion in France; the growing insistence of technical departments on having the last word; the volatility of the Sultan's character. In the end he depicts a Resident-General powerless and bound like Gulliver by a thousand Lilliputian strings, many with ends in France, and no longer master of events once the "fiction of the *dahir*" had broken down.

During the narrative there emerge some interesting portraits: the familiar one of the magnetic Lyautey, an unedifying one of the ex-Sultan, and a terrifying one of the French community in Morocco. This he describes as by its very success accentuating the gulf between Europe and Islam, and between Arab feelings of inferiority lead to creating just the conditions in which nationalism in violent forms. Yet a majority of its number seem oblivious to the duties, as opposed to the rights,

that are incumbent on them if they claim co-citizenship:

It is no exaggeration to say that only a handful of Frenchmen have made personal efforts to bridge the gulf which is developing between the young generations of the two communities.

The last chapters, which propound ways out of the dilemma, describe a wealth of paradoxes. They show France vaunting prowess in giving Moroccans schooling but making little effort to provide them with outlets for their talents; they show local Frenchmen falling back upon support of Islamic reactionaries and at the same time offering representative institutions to a broadened electorate. They recommend abandoning the idea of co-sovereignty but pursuing that of co-citizenship; yet all the evidence in the book goes to show that the chances even of the latter are growing less, not greater, unless local Frenchmen set the example of an all-round change of heart and habit of which there is, in this record, scarcely a sign. Ending as it does on a hopeful note about co-citizenship, the book reminded this reviewer of a long problem in algebra to which he once appended the right answer supplied from elsewhere although his own calculations produced no such result.

At one point in last summer's argument the ex-Sultan is recorded as saying, "Do you really think that deposing me will solve the Moroccan problem?" He has the last word.

Poet and Priest

GEORGE HERBERT.

By Margaret Bottrall.

John Murray. 154 pages. 15s.

AT Bemerton the ecclesiastical scene is very Anglican. The church is ancient, perfect, and as tiny as it was hundreds of years ago; to the rectory, already towering above it, large and tasteless additions were made during the last century. Here in 1630, having set the world behind him, George Herbert came as parish priest. A dedication more out of the way than it would have been in the succeeding century, it was yet judicious and convenient. In one direction an easy walk brought the parson to Salisbury and the musical society which he loved; equally accessible in the other was Wilton, one of the great houses of England. Reasonably, he might give no more of his time to the three hundred parishioners of Bemerton St. Andrew and Fugglestone St. Peter than to the scarcely less numerous household of his kinsman Lord Pembroke.

There were six servants and a curate; a second curate was brought in when Herbert felt increasingly the weight of the malady to which he presently succumbed—for in that new way of life to which he had given himself Providence chose to sustain him for a little less than three years. It seems an unremarkable history. Yet Herbert's sanctity was no literary legend, founded upon his own

writing and Izaak Walton's; rather it was matter of universal observation and convinced report among those with whom he lived and worked.

Mrs Bottrell's portrait of this rare spirit of the Laudian church is only less excellent than her examination of his poetry. Superficially, *The Temple* is notably "quaint": it was under this aspect indeed that a critic so sensitive as Coleridge records himself as having for long regarded it. But Herbert's imagery—in fact the whole movement of his mind—appears the less idiosyncratic the more we learn to recognise its basis in the Bible and in liturgical tradition. Viewed in this context, it gains in simplicity, becomes less "metaphysical," less substantially of the school of Donne and more discernibly in the line of Wyatt, Sidney and Jonson. Alike on these literary affinities and on the sheer individuality of his verse Mrs Bottrell writes with great discrimination. Her book makes no claim, it is true, to the deep and apposite learning with which Professor Rosemond Tuve has lately illuminated aspects of Herbert's art. But it is a well-balanced and perceptive appraisal of both the man and his work.

Apostle of Federalism

THE COMMONWEALTH OF MAN.
By Frederick L. Schuman.
Robert Hale. 526 pages. 25s.

PROFESSOR SCHUMAN, an author of voluminous text books on international affairs, and an American teacher of the subject of high repute, is best known in this country for two works on the diplomatic history of the 1930s, and for an ambitious account of the Soviet Union, "Soviet Politics at Home and Abroad," published in 1946. His new work shows that he has retreated from the positions he held a decade or so ago. Of his Soviet book he now writes:

While still useful, I trust, as a history and evaluation, [it] is now "dated" in that it assumed the possibility, however remote, of an ultimate "liberalisation" of the Soviet regime and supposed that the policy-makers of both Moscow and Washington might conceivably so behave as to avoid the probability of mutual self-destruction.

On his "Europe on the Eve" he now says,

In my earlier volume I expressed belief in the theoretical possibility of "collective security"; in the light of subsequent events and reflection, I now regard this belief as mistaken. "Collective Security" in all imaginable contexts is unworkable.

And a chapter or so is devoted to a powerful argument supporting this view.

It cannot be denied that Professor Schuman in his new role as an apostle of world federalism by agreement is not altogether unlike the Professor Schuman of an earlier vintage. When, for instance, he writes à propos of the Italo-Ethiopian War, "Moscow, under the guidance of the genial Maxim Litvinov, was fully committed to 'collective

security,'" he is writing a sentence in which almost every word is wrong. Furthermore his method of argument with a battering-ram occasionally lands him in some very odd places. He writes, for instance, that it is a

Self-evident conclusion, validated by all historical experience, that foreign intervention in a civil war fought by well-organised opposing factions on the territory of a major national community almost invariably results in the defeat of the faction accepting foreign aid.

It would be interesting to have General Franco's comment on this generalisation.

It would be wrong, however, to let the verge of hysteria to which Professor Schuman's obviously sincere hatred of war, persecution, and other ugly things sometimes leads him put one off reading this book. Thinking on international affairs in the western world, particularly in the United States, has been so affected by the "cold war" that we have tended to lose sight of the real objectives of the policies to which we are increasingly committed. It is worth while being reminded not only of Russia's unfitness to unite the world by force and of its probable inability to do so, but also that the United States also has not developed to the point where a wholly Americanised world is conceivable. What Professor Schuman has to say about the United States and the United Nations is particularly well worth study. One may feel that his belief that the various movements for world government present the only hope of avoiding war is mistaken, and that the self-restraint of existing national units, and the development of healthy collaboration among them, would be a more attainable route. But his point of view, which is illumined by wide learning, deserves attention and respect.

Old English

THE STRACHEY FAMILY.
By Charles R. Sanders.
Duke University Press (Cambridge University Press). 367 pages. 45s.

THE Strachey family, as the author says, "like life itself," and like all families, begins and ends in mystery; but the life of this paradoxically English and un-English family, as Mr Sanders has painstakingly and punctiliously unravelled it, is an adventure story. Followers of Galton will be struck by the steady emergence, through nearly four centuries, of many common traits: music (the first known Strachey group provided a musician in Elizabeth I's era); foreign travel (a Strachey provided the raw material for the storm scene in *The Tempest*); and literature—to say little of an inordinate love of animals (especially cats) and an eccentricity which alone would have warranted foreigners' descriptions of the English as mad, without any help from the Herveys.

Locke owed a lot to the Stracheys, some of it intellectually. India, when

the English were first there, saw Stracheys settling and administering affairs. In the eighteenth century a Lady "of the Strachie"—that phrase itself taken from Malvolio in *Twelfth Night*—entertains herself and her friends with performing animals: "the Bear being Laim am afeard cant perform But the doggs and mutkees is in good condishon and will I hopes be approved with the music." The first Sir Henry Strachey, owner of an estate in Florida, experienced at first hand the American revolution and had a hand in drafting the terms of peace offered to General Washington. But the Stracheys really shone in the nineteenth century, beginning with Richard's extraordinary mission to Persia (there is a glorious Persian painting of him, reproduced in the book, as hung in one of the palaces of the King of Persia), and ending with that "Olympiad" of Stracheys, which included Lytton and St Loe of *The Spectator*, and which largely made "Bloomsbury" famous in the first quarter of the present century, in music, literature and, symbolic of our era, a knowledge of Freud.

Mr Sanders brings out, though not fully enough to interest economists, the link between the Stracheys and Nassau Senior: St Loe married the only child of "Minnie," Senior's daughter, and that child, Mrs St Loe Strachey, mother of the Rt Hon John Strachey, MP, is still with us. Mr Sanders reproduces the "painting" of Nassau by Watts, but does not perhaps know that it was only a sketch and was never finished. There is also a charming childhood photograph of John with a dog, though we are told he prefers cats in the long family tradition. Mr Sanders's study is indeed a record of outstanding individual accomplishments: one well worth reading by Englishmen who understand their present, and envisage their future, as an unfolding of their past. Like most American books it has admirable indices, genealogical tables and index; and, like all such American books, it is a pity that it must cost so much in Britain.

Mountain Torrent

AGAINST THE STREAM.

By Karl Barth.
S.C.M. Press. 253 pages. 16s.

IN this translation of Karl Barth's shorter postwar writings the editor, Mr Ronald Gregor Smith, mentions a suspicion that Barth's theological structure remains alien and remote, like his own Swiss Alps, grand, impressive, full of splendid light and shade, but cold and—in their highest reaches at least—uninhabitable. He would himself like to persuade readers that Barth's theology is more like the towns and villages of Switzerland than its mountains: life flows into them from the mountains, but they are themselves most up-to-date and efficient, and life flows from them all around. It may be significant that the former simile is easier to develop than the latter, and although the translators—

THIS ROMAN MILESTONE is a reminder of the days when the cost of travelling from point A to point B was measured mostly in bodily effort. In these mechanised times, motoring costs depend upon two factors: the road conditions, and the car itself—with the second factor a great deal the more important. Ford of Dagenham have always produced cars which keep motoring costs down to an absolute minimum, and this is more than ever evident in the current range of Ford 'Five-Star' cars. It is a range which caters for every pocket and every preference, and the 'Five-Star' car which you choose will take you from A to B efficiently and economically; it will speedily prove to you that yours is the finest car of its class, from A to Z... from Anglia to Zodiac.

To those living in a trance

ONE may be hypnotised in more ways than one. A daily newspaper can exert a hypnotic spell which can gradually lull the mind into a trance. When this is likely to happen—it is time to turn to a newspaper such as the Manchester Guardian.

Please do not think, however, that you will be turning from the dangerous—to the dull. The Manchester Guardian is a stimulating newspaper. Its pages will enliven you. Its writings will delight you.

First and foremost the Manchester Guardian believes in telling the truth. It will not bow to the private prejudices, whims or weaknesses of the reader. It comments—but does not court the popular view. It reports—but does not pry.

Can you take it? Are you willing to change from the hothouse of sensationalism and sentimentality—to the keen, fresh air of reason and good writing? If so, the Manchester Guardian is your newspaper!

If you have any difficulty in getting your Manchester Guardian regularly, please write to The Manchester Guardian, Manchester.

he late Mrs E. M. Delacour and Mr Stanley Goodman—have done a good work in rendering Barth's "massive and complex" German into easy English, the suspicion is not wholly eliminated.

In the main these translations deal with social and political issues. The key essay on "The Christian Community and the Civil Community" makes it clear that the state, no less than the church, is a divine institution. There is much in this essay that is common ground with Dante and Hooker. But when we leave the philosophical uplands and ask what course of action the church is to take in particular circumstances, the answer is by no means always clear. Barth protests that the Christian answer will be made known, and can only be made known, as the circumstances unfold. In the light of his personal record, he can certainly not be accused of running away from the issue when it arrives. But many would appreciate clearer guidance before the event.

One's attention is particularly drawn to "The Christian Community in the midst of political change," and to an article on "The Church between East and West." The one practical conclusion that firmly emerges is that Christians should not attempt to form a political party of their own; and there will be few in this country disposed to challenge that conclusion. In order to understand Barth's attitude to current events, we must understand his view of revelation, and we must be grateful to the editor for including an essay on that subject. There are also interesting pieces on the Jewish problem and the Christian call to poverty. The collation has been given its title by Barth himself because it may appear to be moving against the general tendency of current political thought. Barth thunders nobly, but when the echoes have died away we are often left wondering what it is he has said.

Commonwealth Bloc?

COMMONWEALTH STOCKTAKING.
By L. St. Clare Grondona.
Butterworths. 389 pages. 35s.

MR GRONDONA'S painstaking analysis of the Commonwealth's resources is in a sense a companion volume to Mr L. S. Amery's treatise, "A Balanced Economy," which was reviewed in *The Economist* of February 20th. By contrast "Commonwealth Stocktaking" is non-controversial; it is factual, and the reader—save for a brief summary at the end of each chapter and a short concluding summary—is left to draw his own conclusions. But there is no doubt whatsoever that the author would like to convince his readers that he has made out a case for a largely self-sufficient, exclusive, Commonwealth trading bloc.

His method is to analyse the Commonwealth's resources commodity by commodity, bringing out such factors as the share of the Commonwealth in

total world production; its dependence on dollar sources of supply; the alternatives at hand for increased Commonwealth output; and many other significant facts (although still not as much as there might be about relative costs). The conclusions are well illustrated in colourful diagrams. As one might expect, in each instance the facts presented support the general conclusion that

if full advantage is taken of the immense variety of resources in the Sterling Commonwealth as a whole... it can ultimately overcome its dollar difficulties while preserving its competitive position vis-à-vis the rest of the world.

That dollar-saving investment can be made in the Commonwealth is not in doubt; but to say that the bloc will maintain its competitive position in the world is to make quite unwarranted assumptions about the productivity of these investments. The memory of East African groundnuts persists.

Mr Grondona admits that "no reasonably balanced system of Commonwealth economy is practicable without the inclusion of resources with which Canada is richly endowed." One can agree with him that Canada's departure from the sterling Commonwealth is an "unfortunate aftermath of the Second World War"; but one cannot expect Canada to return to the sterling fold just for old times' sake. There are other self-governing Dominions, notably the Union of South Africa, which—if pushed—might tend to gravitate towards the dollar pole.

But in unfolding the extent and variety of the Commonwealth's resources, the author has done a service by showing the great possibilities there are for investment in this area. Opportunity, however, is not enough. Imaginary bloc-building will never be a convincing exercise until somebody works out from what other forms of production all the necessary capital should be diverted, and at what exchange rate for sterling all the new production called into being would be competitive with foreign production already in full flow; if Mr Grondona turned his painstaking abilities to this task he would probably convert many of his own supporters into bloc-busters overnight.

Strange History

AMERICAN-RUSSIAN RELATIONS, 1781-1947.
By W. A. Williams.
Rinehart, New York (London: Macmillan). 367 pages. 35s.

THIS is an odd book—though no odder than its extraordinarily unattractive format might suggest. Its title is misleading. Although it begins with Catherine the Great's refusal to recognise the newly independent American Republic, the period between 1781 and 1905 is compressed into 47 pages while the great bulk of the remaining 236 pages are devoted to a detailed examination of the years 1914 to 1939. The period since 1939 is treated in a 25-page "Coda,"

whose brevity may be excused by the lack of source material but whose priorism is principally valuable as providing a clue to the unacknowledged premises underlying the rest of the book.

It may be going too far to say that Mr Williams's account of the strained and involved course of Russo-American relations in the twentieth century is Marxist, but it certainly reflects two characteristics of Marxist writing—a readiness to reduce the complexity of historical forces to a few abstract factors, and, paradoxically, at the same time to idealise the role of a few chosen individuals. Mr Williams's heroes are two characters who worked assiduously during this period for the establishment of good relations between America and the Bolshevik regime. The first of these was an old "Bull Moose" Chicago Progressive by the name of Raymond Robins, whose astuteness in international affairs may be measured by the fact that he was one of the principal lobbyists for the Kellogg Pact. Sent to Russia as a member of the Red Cross Commission in 1917, he quickly became and remained an assiduous advocate of American support for the revolutionary government. Matching Robins in importance was Andrew Gumberg, a Russian American from New York's East Side, who first returned to pre-revolutionary Russia as the agent of a New York business concern and became (apparently as one of the few, if not the only, Russian-speaking Americans in Moscow) a go-between with the revolutionary government. He reappears at intervals in the rest of the period as a skilful lobbyist for the various economic interests that traded with or invested in Soviet Russia.

Mr Williams's account is largely built around the papers of these two figures, but he has also had access to the State Department and national archives for almost the whole of the period before 1939 (an interesting contrast, incidentally, with the complete ban that is still imposed on comparable British documents of the same period). This has enabled him to amass a great deal of fresh and detailed information about the springs and course of American policy towards Russia during these years. In this respect Mr Williams's book is of undoubted value. What it entirely lacks is a sense of proportion. There is virtually no attempt to relate the memoranda of diplomats to the climate of public opinion. Moreover, Mr Williams seems unaware of the possibility that there may be a dark side to the moon; the inaccessibility of Soviet sources for this period seems to cause him no qualms. In his indifference to the activities, and almost to the existence, of an American Communist Party during the twenties and thirties, he retains much of the starry-eyed innocence which was a characteristic of American liberal thought at that period. Indeed, perhaps the most singular thing about Mr Williams's singular book is that it appears to have been written after World War II instead of before.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Old Look Through New Eyes

Washington, D.C.

THE debate over the Administration's defence programme and the issues it may pose for the United States and its allies is presented below, in miniature, in a series of quotations.

The Policy

Mr John Foster Dulles, the Secretary of State, in New York on January 12th:

"We need allies and collective security. Our purpose is to make these relations more effective, less costly. This can be done by placing more reliance on deterrent power, and less dependence on local defensive power. . . . As long as our basic policy concepts were unclear, our military leaders could not be selective in building our military power. If an enemy could pick his time and place and method of warfare—and if our policy was to remain the traditional one of meeting aggression by direct and local opposition—then we needed to be ready to fight in the arctic and in the tropics; in Asia, the Near East and Europe; by sea, land and air; with old weapons and with new weapons. . . ."

"The basic decision [taken by the President and his advisers] was to depend primarily upon a great capacity to retaliate, instantly, by means and at places of our choosing. Now the Department of Defence and the Joint Chiefs of Staff can shape our military establishment to fit what is our policy, instead of having to try to be ready to meet the enemy's many choices. That permits of a selection of military means instead of a multiplication of means. . . ."

"We do not, of course, claim to have found some magic formula that ensures against all forms of Communist successes. It is normal that at some times and at some places there may be setbacks to the cause of freedom."

The Criticism

Mr Adlai Stevenson in Miami on March 6th:

"All this means, if it means anything, that if the Communists try another Korea we will retaliate by dropping atom bombs on Moscow or Peking or wherever we choose—or else we will concede the loss of another Korea. . . ."

"What if we are confronted with something less than a clear case of overt aggression? What if we had relied exclusively on a policy of 'massive retaliation' since the close of World War II? Would we have resorted to global atomic war in order to meet the Communist threat in

Greece and Turkey? To counter the Berlin blockade? To resist aggression in Korea? If the answer is 'no,' then the so-called 'new look' in foreign policy is no 'new look' at all, but merely a continuation of the policy of adapting our methods of resistance to the method of attack. . . . Instead of greater freedom of choice, does this decision to rely primarily on atomic weapons really narrow our choice as to the means and places of our retaliation? Are we leaving ourselves the grim choice of inaction or a thermo-nuclear holocaust? Are we indeed inviting Moscow and Peking to nibble us to death?"

Mr Lester Pearson, the Canadian Secretary of State for External Affairs, in Washington on March 15th:

"The key words . . . are 'instantly,' 'means' and 'our.' From our point of view it is important that the 'our' . . . means those who have agreed together, particularly under the North Atlantic Treaty, to work together. . . . It seems clear that this 'new defence policy' makes diplomacy not less but even more important. . . . Diplomacy includes . . . the search for agreement between friends on policies and tactics and timing, so that 'our choosing' will mean an agreed collective decision. . . . Indeed, such agreement, after consultation and discussion, is, to put it bluntly, necessary, if this policy of preventing aggression by the threat of immediate and overwhelming devastation is to work collectively."

The Explanations

The Vice-President, Mr Richard Nixon, on television on March 13th:

"We found that in seven years of the Truman-Acheson policies six hundred million people had been lost to the Communists and not a single Russian soldier had been killed in combat. . . . So we adopted a new plan, and that plan, summed up, is this—rather than let the Communists nibble us to death all over the world in little wars we would rely, in the future, primarily, on our massive, mobile retaliatory power which we could use at our discretion against the major source of aggression at times and places we chose."

Mr Dulles at his press conference on March 16th:

"If you will read my address of January 12th, you will see that what I advocated there was a 'capacity' to retaliate. In no place did I say that we would retaliate instantly. . . . The question whether or not you retaliate instantly and where you retaliate is a matter to be dealt with in accordance with the facts of each situation."

Mr Dulles in an article written for the April issue of "Foreign Affairs":

"Initially this re-shaping of our military programme was misconstrued in various respects. Some suggested that the United States intended to rely wholly on large-scale strategic bombing as the sole means to deter and counter aggression. What has already been said should dispose of this erroneous idea. The potential of massive attack will always be kept in a state of instant readiness and our programme will retain a wide variety in the means and scope for responding to aggression."

Admiral Carney, the Naval Chief of Staff, to the Naval War College, Newport, Rhode Island, on February 16th:

"Not being aggressively inclined, we simply do not know when war will occur, what will precipitate it, nor what it will produce nor how long it will last. The only truly sound conclusion to which we may come is that not being an aggressor nation we dare not entrust our safety to any single rigid and unalterable course of action. Rather we must—costly as it may be—be prepared for numerous contingencies. . . . If we are honest with ourselves we will acknowledge that there are big wars, little wars, general wars, localised wars, Marquess of Queensberry wars and savage, ruthless wars, atomic wars and, perhaps non-atomic wars. . . . it is entirely possible that we might see a limited use of atomic weapons . . . or a nuclear stalemate with both sides refraining for fear of retaliation."

Admiral Radford, the Chairman of the Joint Chiefs of Staff, before the Senate Appropriations Committee on March 15th:

"Our planning does not subscribe to the thinking that the ability to deliver massive atomic retaliation is, by itself, adequate to meet all our security needs. It is not correct to say we are relying exclusively on one weapon, or one service, or that we are anticipating one kind of war."

Mr Dulles in the "Foreign Affairs" article:

"The heart of the problem is how to deter attack. . . . The essential thing is that a potential aggressor should know in advance that he can and will be made to suffer for his aggression more than he can possibly gain by it. This calls for a system in which local defensive strength is reinforced by more mobile deterrent power. The method of doing so will vary according to the character of the various areas. Some areas are so vital that a special guard should and can be put around them; Western Europe is such an area." President Eisenhower at his press conference on March 17th:

"All that the 'new look' is, is an attempt by intelligent men to keep abreast of the times . . . to call it revolutionary or to act like it is something that just suddenly dropped down on us like a cloud from heaven is just not true."

Summing-Up

Mr Walter Lippmann in the "New York Herald Tribune" on March 18th:

"The official explanations of the 'new look' have become so voluminous that it is almost a career in itself to keep up with them. . . . As the explanations and restatements come flowing in, it seems to me fairly certain that the New York speech, which started it all, was a case of excessive salesmanship. . . . There is no doubt that the words of the text convey the impression that something momentous and novel has been decided. But everything that has been said since then . . . makes it plain that there has been no radical change in our strategic policy."

Oil in Deep Waters

FROM A CORRESPONDENT IN TEXAS

CONGRESS has at last succeeded, with the Submerged Lands Act, passed last May, in satisfying the Supreme Court that the states, and not the federal government, have jurisdiction over the natural resources under the water off their shores, from the low-tide mark to their "historical limits"; these are usually three miles out to sea, but are three leagues, or about 10½ miles, in the cases of Florida and Texas, which were subject to Spanish law before they joined the United States. These two states, with Louisiana and California, were the immediate beneficiaries of the Act, for all have, or, in the case of Florida, are thought to have, oil deposits under their offshore lands. Other states immediately challenged the right of Congress to surrender to the people of these few lucky states the valuable assets over which, the Supreme Court had previously held, the federal government had paramount rights and which therefore, it was argued, should be exploited for the benefit of the nation as a whole.

But last week the Supreme Court refused to allow Alabama and Rhode Island to contest the validity of the Act; they were concerned about the threat to their fishing rights as well as about what they claimed was an unconstitutional abdication of national sovereignty by Congress. The Court's opinion was expressed in such decisive terms that it seems to settle the issue finally and, furthermore, to leave the Republicans free to transfer to the states more of the public lands—the national parks, for example—should they wish to do so, as their critics allege they do. For the Supreme Court ruled, by 6 votes to 2, that the power of Congress over the public lands is without limitation; the two dissenting judges, Justices Douglas and Black, were troubled about, among other things, the possible effect of the ruling on the federal government's ability to protect the nation's shores.

★

While the Supreme Court decision has probably ended the controversy over the principle of ownership of the undersea oil, there are still many practical legal questions to be settled, especially along the shore of the Gulf of Mexico; some of them can hardly fail to end up in the courts. The exact line of the historic limits will have to be drawn, for between that boundary and the edge of the continental shelf the states' claims have all been ceded to the federal government, and large deposits of oil, difficult as they may be to develop, are believed to exist in the huge area involved. Should the three-mile and the 10½-mile measurements be taken from the mainland or from the outlying islands? Should the line be drawn straight or follow the contour of the much-indented coast?

In any case it will be necessary to determine whether the low-water mark, from which the measurements begin, is that which prevailed when the individual states came into the Union, or the progressive mark which has been established by siltation. There is a wide difference between the two, especially in Texas and Louisiana. A minor problem has arisen between these two states as to where the ocean boundary between them lies. Texas claims a line along the undersea channel of the Sabine River, while Louisiana wants a line directly out to sea. However, Texas

and Louisiana think they can reach agreement. Nor is litigation anticipated on the submerged boundary line between the United States and Mexico, which was definitely fixed by treaty in 1848.

These problems are not yet delaying the development of the submerged oil lands owned by the states, for most of them are well within the undefined boundaries and can safely be leased. There has been renewed activity in all of these states since the basic legal position began to become clear with the passage of the Act. But the Department of the Interior, which acts on behalf of the federal government in these matters, has not yet worked out a procedure for granting leases beyond the states' historic limits and in California state laws, designed to protect the beauty of the coastline, will have to be changed before the undersea oil can be fully exploited.

Leasing of oil lands off the Texas coast began in 1922, was held up while the Supreme Court decision against state ownership was in force and was resumed after the passage of the Submerged Lands Act. Since then the Texas General Land Office has leased more than 400,000 acres for \$33 million. The area to be leased is divided into tracts of several thousand acres, each of which goes to the highest bidder; bids vary from about \$700 to \$5 an acre, according to the estimated oil-bearing potentialities of the tract. In addition to the bonuses paid for the leases, which now amount to more than \$40 million, the state will get a royalty of one-eighth on all production; all of this money goes by law into the Texas public school fund.

Altogether over 800,000 acres of undersea land along the Texas coast have been leased, but much of it has been abandoned; a month ago slightly more than 500,000 acres were under lease. This probably means that more than one-fifth of Texas's underwater oil reserves have been leased. Present geophysical exploration enables oil-bearing structures to be ascertained with high accuracy, especially with the salt-stock type of structure that prevails along the Gulf coast. About \$300 million has been spent by oil companies in exploring for oil along this coast, mostly in Louisiana, where offshore development is ahead of that in other states, with 28,000 barrels a day being produced at the end of 1953.

This is partly because proved oil formations in Louisiana were known to extend from the mainland under the sea and partly because of the state system of leasing. In Louisiana annual rentals of half the original bid are paid, so that few companies can afford to hold leases on tracts that have not been proved. Texas leases are for five years at \$2 an acre a year, so that a company is under no immediate financial compulsion to drill a well. Actual production from the Texas submerged areas is still very small and comes primarily from wells on the beach which extend

under the tidelands through a process of directional drilling, a method also used in California.

This drilling at an angle may be widely employed in order to keep down the cost of underwater operations. Wells on the beach will be driven under the ocean as far as is feasible and even where drilling is done in the open sea from a platform it will be possible to probe a considerable area from a single base. The old bugaboo of the accidental "croked hole" or "dogleg" well is being put to scientific use and an extensive new technique of drilling is being developed.

Other new techniques, expensive and experimental as well as extensive, must also be developed. Some engineers think that future underwater drilling will be from individual anchored platforms which will be supplied by tenders, while others believe that the operations will be from big floating communities on which workmen will have their permanent homes. In the shallower areas an artificial island may take the place of the floating platform. The cost of offshore drilling, even in shallow water, is at present estimated at several times above that of drilling on dry land. An underwater oil field will have to be very rich to be worth developing at all, and the rule of diminishing returns will apply more rapidly there than on land.

If, when several wells are drilled in different directions from a single floating platform, one should catch fire, the others might also be affected and the risk of losing the expensive equipment would be great. That equipment would almost certainly be lost in any case sooner or later in the hurricanes that frequently traverse the Gulf of Mexico. No present-day offshore drilling establishment could withstand one of these storms. Another risk that cannot be accurately calculated is that, if a well gets out of control, oil will be sprayed on the water and might spread to the Florida beaches; the damages claimed by municipalities and hotel owners could ruin the oil company responsible. It is not surprising, especially at a time when the existing supply of oil is outrunning the demand, that many in the oil world wish that the need to keep up with their competitors was not forcing them into the deep waters of offshore undertakings; they envy the small oil companies and independent operators who cannot afford to put out to sea.

American Notes

Instant Retaliation?

THE unexpected force and range of the hydrogen bomb set off in the Marshall Islands on March 1st have underlined the massive, indeed the appalling, nature of the retribution which an aggressor might suffer. Fear that such horrors might be unleashed automatically, under the doctrine of instant retaliation, has forced the Secretary of State to promise America's allies that they will be con-

sulted first. But Mr Dulles has been less successful with Congress, which scents a threat to its own powers to declare war.

The President innocently started the trouble when he appeared to enlist on the congressional side in this historic argument; with his mind on Indo-China he gave a sweeping assurance that he would not involve the country in any war which Congress had not declared. The virtue of the new policy lies in surprise and flexibility; these might be lost if Congress, which might not even be in session, invariably had to be consulted before the Administration could act. Mr Dulles, therefore, proclaimed his own view that under the North Atlantic and Rio Treaties, which regard an attack on one signatory as an attack on all, the President had been authorised to treat an attack on London or Paris exactly like one on New York.

This argument is not attractive to the House, which must give its approval when war is declared, but had no part in approving the treaties. The Senate itself may view it as an example of the encroachment on congressional rights which recently brought an amendment restricting the President's powers to within one vote of being passed. Mr Dulles, who was in the Senate in 1949, when the North Atlantic Treaty was debated, apparently had forgotten that the Foreign Relations Committee at that time insisted that the treaty gave the President no powers to act without congressional sanction which he did not possess already.

The President prudently has refused to be drawn into any hypothetical discussions, but he has left no doubt that, if the United States were attacked, he would not wait for a formal declaration of war. Mr Dulles, for his part, has conceded that the President would not necessarily use in every case the powers his Secretary of State believes he possesses to punish aggression, but only when an attack on an ally threatened the United States. With obstinate realism, however, Mr Dulles insists that any attack in Europe comes under this head, and that failure to move instantly to protect American air bases abroad might jeopardise America's capacity to retaliate. In fact, five of America's wars, including that in Korea, have been fought without any declaration by Congress. But it is this, of course, which rankles.

Plans for Spending

THE refusal of both businessmen and consumers to take the signs of recession as seriously as economists think they should be taken—a refusal which may in itself be enough to prove the economists wrong—was demonstrated last week by two official predictions for 1954, which have in past years proved very accurate. The Department of Commerce and the Securities and Exchange Commission published their regular annual survey of businessmen's plans for capital expenditure on new plant and equipment. This shows that they intend to go on expanding and improving their facilities at a satisfactory rate even though many industrial plants have not been working to capacity lately. The Federal Reserve Board, or rather the University of Michigan Survey Research Centre on its behalf, found that consumers planned to go on buying houses, cars and other durable goods even though fewer of them than usual expected their incomes to go up, and more than usual expected their incomes to go down, during the year.

Neither businessmen nor consumers are planning to spend as much as they did in 1953, but both surveys show results very like 1952, the previous record year for both groups of spenders. The difference, of course, is that then spending was rising to 1953's high levels, while now it is falling and the plans, always subject to change in any case,

on new plant and equipment began to drop in the last are in a less encouraging psychological setting. Spending quarter of 1953 and the prospect is that it will go on falling throughout 1954. The decline in planned expenditure for these purposes is particularly marked in the durable goods industries, largely as a result of less spending for defence. The planned increase in commercial outlays is explained mainly by the spread of suburban shopping centres.

While most businessmen expect their sales in 1954 to be as good or better than in 1953, manufacturers of durable goods think that their total sales will decline by 8 per cent, which fits in with the plans of consumers. Just under 8 per cent of them expect to buy new cars this year, compared with over 9 per cent a year ago, 6.8 per cent to buy new houses compared with 8.8 per cent, 27 per cent to buy household equipment compared with 32 per cent in 1953. But many of these plans are based on an expectation of falling prices during the year. If this challenging expectation is not fulfilled, businessmen may find their sales disappointing, which in its turn might make them curtail their capital expenditure. Nevertheless both these surveys offer reassurance that the average American is not thinking the country into a depression and that no disastrous decline is coming in either private investment or spending or personal consumption; these two groups, with government expenditures, which are also to be maintained at a high level this year, are together the measure of the national prosperity.

No Change in New Mexico

SENATOR DENNIS CHAVEZ of New Mexico was confirmed in his seat this week by his Democratic colleagues, but his state remains indicted for the most flagrant disregard of the elementary rights of voters. An investigating committee, which has been at work almost ever since Mr Chavi-

won by a narrow 5,000 votes in November, 1952, over his Republican opponent, Mr Hurley, found so many irregularities and malpractices that it concluded that it was "impossible to distinguish the free and honest vote."

Over 55,000 voters had been deprived of the secret ballot; in many precincts there were no voting booths. Some ballots had been fraudulently altered, others had been prematurely destroyed. There had been intimidation of the large Spanish-speaking population and a number of aliens had been allowed to vote. These were the findings of the Republican majority, but there is no reason to believe that New Mexico's election machinery is any less black than it is painted. On the other hand, this is probably nothing new in the state; the new factor is the anxiety of the Republicans to secure a forty-eighth Senator. It will be interesting to see whether the state cleans house before next November.

Mr Chavez owes his own escape partly to the fact that no charges of fraud were made against him personally, and even more to the existence of a Democratic majority in the Senate. The Republicans, who possess only 47 Senators to the Democrats' 48, owe their technical control to the vote of Senator Morse, an independent, but on an issue of this kind Mr Morse had no compunction at voting against the party he walked out of nearly two years ago. He was joined by five of his former colleagues. The Republicans would have been delighted to unseat Mr Chavez, for the Republican Governor of New Mexico has the power to fill any vacancy, and one more Republican Senator would bring actual, as well as nominal, control. But this the Democrats were determined to prevent by bringing the issue to a vote at once, instead of allowing it to drag on, as the Republicans would have liked, until after the elections in which it is conceivable that the Republicans may increase their strength.

Surplus Headaches

THE borrowing authority of the Commodity Credit Corporation, which supports farm prices by loans on crops and outright purchases, has now been increased from \$6.75 billion—virtually all of which is tied up in support operations—to \$8.5 billion. The Department of Agriculture hopes that this will prove sufficient to carry out this year's loan programme, but its optimism is tempered by the apparent determination of farmers to produce almost as much this year as they did in 1953, despite the heavy cuts ordered for wheat, cotton, and maize. Only a drought, it seems, can prevent the further swelling of the surplus problem.

The Administration's farm programme relies, for a solution, on the reduction of price supports at home, coupled with an intensive drive to dispose of present surpluses abroad, either through sales—the dispatch of agricultural marketing missions is apparently imminent—through gifts, or through barter agreements, if only the appearance of dumping can be avoided. Since the end of January over \$10 million worth of agricultural commodities have been exchanged, chiefly for fertiliser needed in Korea, and there is much hope of the scheme, which has already been given a trial run, for selling surpluses for foreign currencies which in turn are used to pay for the production of arms needed

by allied nations. The Administration is asking for power to use \$2.5 billion of its surpluses in these ways and to relieve want abroad.

Congress is a trifle suspicious of this vast grant of authority, but its real rebellion is against the Administration's flexible price support proposals, which are designed to discourage the farmer from producing more than the market can absorb. Farm Senators of both parties are trying to attach to the Administration's wool bill a rider which would continue the present high rigid support system for another two years. It remains to be seen whether the President, under political pressure, will stand as firm as his Secretary of Agriculture, who insists that, whatever the political cost, any move to extend the present surplus-creating system must be vetoed.

Meanwhile, Mr Benson is on the verge of an experiment to see how far lower prices can tempt Americans to consume their own surpluses. He can vary the supports for dairy products at his own discretion, and on April 1st the price of new butter to the consumer is to fall by 8 cents a pound. In addition, traders will be offered butter from the government's \$200 million store at cut-rate prices. If the combined reduction is enough, Americans may once more have butter, instead of margarine, on their bread.

SHORTER NOTES

THE defeat, by 210 votes to 204, in the House of Representatives of the Democratic attempt to raise the amount of personal income exempt from taxation was an outstanding victory for the President, but it does not end the fight over this highly political amendment to the tax reform bill. The battle will be continued in the Senate where the proposal was first put forward by Senator George.

For the first time in 19 years the prime rate on business loans has been reduced by the banks, to 3 per cent from the 3½ per cent to which it was raised nearly a year ago. This reduction is in keeping with the general easing in money rates and reflects the plentiful supply of funds available to borrowers. The seasonal decline in the demand for loans has been much greater this year than last.

With the surprise sale of Colonel McCormick's Washington *Times-Herald* to the liberal *Washington Post*, members of Congress will no longer be able to read the views of the Republican nationalists with their breakfasts—or with any other meal, since neither of the two evening papers in the capital takes an extremist point of view. The amalgamation of the two morning papers meant the immediate disappearance of the *Times-Herald*, except for its masthead. It had been losing money and the *Post* is understood to have paid about \$8.5 million for it.

Mr George F. Kennan, late of the State Department, who had considered running for Congress as a Democrat from a Pennsylvania district, withdrew when he found there were rival candidates for the Democratic nomination. He felt that his personal commitments, to give lectures and write a book, would not leave him time to fight in a primary election but only in the main campaign next autumn.

asbestos cat

Only an inhabitant of the lower regions could possibly have any use for an Asbestos Cat. But if our export department received an order for one, they would scarcely turn a hair. Seriously, the uses of Asbestos in industry are growing at a fantastic rate.

Apart from its first great natural property, the fibrous structure of asbestos renders it easily adaptable to many uses, often in combination with other materials. It can be spun, woven and moulded. We, ourselves, turn it into many products. Amongst these are Caposite and Caposil, both Preformed and Plastic heat insulations, also Capasac Moulded Brake Linings and Asbestolux Incombustible Building Board. It is available as yarn or cloth, as mattresses for locomotive boilers and also has its uses in those transports of delight, the jet liners.

Asbestos may solve some problem that's proving a bit of a headache in your branch of industry. If you think so, consult the people who know best about Asbestos...

**SUPER COMFORT, SUPER SPEED,
SUPER LUXURY**

**Now you can fly
to Canada by TCA**

SUPER Constellation

OPENING MID-MAY, THE ONLY.
SUPER CONSTELLATION SERVICE
TO CANADA FROM LONDON
OR GLASGOW

FROM MID-MAY you will be able to travel to Canada by one of the world's finest aircraft—Trans-Canada Air Lines Super Constellations. This service, a real experience in speed and comfort, will leave London for Montreal four evenings a week—nightly from July 1. You're in Canada next morning.

On this new TCA Super Constellation service you have a choice of accommodation: either First Class in exceptional conditions of privacy and luxury, or Tourist Class in spacious and extremely comfortable surroundings.

May we suggest you get full details of TCA's Super Constellation service from your Travel Agent as soon as possible. You can book by TCA right through to all Canadian and major U.S. cities.

FARES

FIRST CLASS	TOURIST
LONDON — MONTREAL (return) £248-3-0	LONDON — MONTREAL (return) £103-5-0
GLASGOW — MONTREAL (return) £235-19-0	GLASGOW — MONTREAL (return) £172-6-0

Approved IATA on-season Fares effective April 1st.

TRANS-CANADA AIR LINES

ONE OF THE WORLD'S GREAT AIR LINES, NOW GREATER THAN EVER

Serving Europe, Canada, U.S.A., Bermuda, Nassau, the Caribbean and Mexico—more than 19,000 miles of air routes

NEW DUAL-CLASS SERVICE

FIRST CLASS—The most luxurious accommodation ever provided for the air traveller, with a private lounge to yarn and stretch in, fine food, superb wines, and a special staff to answer your every need.

TOURIST—The finest of its class, setting a new standard in comfort at the lowest fares. Specially designed seats, quick, attentive service, complimentary meals. Excellent bar service at reasonable prices.

FIRST CLASS CLUB LOUNGE. An intimate and beautiful room, specially designed by Henry Dreyfuss, where you can drop in for a drink or a rubber of bridge.

SIESTA SEATS—for First Class passengers—soft and deep, they tilt right back to let you stretch out full length and snuggle down, with your feet comfortably raised.

SPACIOUS TOURIST ACCOMMODATION. Two pleasant cabins, charmingly decorated, lots of elbow room, deep-cushioned seats, comfort you've never known before.

The World Overseas

Pakistan Puzzle

FROM A CORRESPONDENT

WHATEVER political deductions may be drawn from the East Pakistan provincial elections, they have shown that two time-honoured assumptions concerning the use of the ballot box in South Asia require reconsideration. The rout of the Moslem League suggests that whether the party in power does (as is often alleged) or does not use the administrative machinery of government to promote its electoral prospects, it is no guarantee of success at the polls. No kind of duress can have been employed by a governing party which has been as ignominiously defeated as the Moslem League. Secondly, it can no longer be said with confidence that personalities count for more than programmes in electioneering—at least in one corner of South Asia. If they had, the League should have made a much better showing, for almost the entire Karachi Cabinet took a hand in the East Bengal campaign, not to mention such formidable lay figures as Miss Fatima Jinnah, sister of the revered Qaid-i-Azam.

It might, indeed, have been better if the strong men of Karachi had been less in evidence, for their intervention did not always lead to the desired results, as Khan Abdul Quayum Khan—Industries and Food Minister at the Centre and, in his own right, the leading personality in the politics of the North-West Frontier—discovered at one memorable meeting. The fact that the Prime Minister of Pakistan is a native of East Pakistan, and that the Karachi cabinet as a whole is heavily weighted in favour of the Province, failed to compensate the League for the lack of effective local leadership. Nurul Amin, provincial Chief Minister and head of the League organisation in East Pakistan, was defeated in his home town by a teenage student leader who secured a majority of over 6,000 votes in a poll of just over 29,000 votes. Other ministers have suffered the same fate.

The electoral coalition which swept the former governing party from office consisted mainly of Moslem groups not belonging to the League, teaming up with Hindus, Communists and other left wing elements brought together under the familiar title of a "United Front." Their chief spokesmen throughout the contest have been two former Chief Ministers of undivided Bengal who were bitter rivals for power under the old regime. The octogenarian Maulvi A. K. Fazlul Huq, who has been a sort of Polonius in the politics of Bengal ever since anyone can remember, has never at any time belonged to the League. He declined the governorship of Sind a few months ago, and is a practising lawyer who in his eighty-fifth year is the leader of the bar at the Dacca High Court. The younger Shaheed

Suhrawady—member of a gifted family—was the last premier of undivided Bengal. He fell out of favour with the League, on the eve of partition, because he proposed that Bengal should remain united as a sovereign independent state. For a time he stayed on in India and, working with Gandhi at Noakhali, did much to protect minorities. Later he established himself in Pakistan where he has been a severe critic of the League government's failings. He was leading defence counsel in the Rawalpindi conspiracy case.

Neither Huq nor Suhrawady have the slightest affinity with Karachi; both have many Indian friends and strong ties with Calcutta, and indeed have maintained regular touch with their former home. This does not mean that either

would wish to see East and West Bengal reunited, nor would the millions of Moslem electors who have supported them at the polls. But both stand for a much looser type of federation between East and West Pakistan than has hitherto been contemplated by the dilatory Constituent Assembly in Karachi, and they insist upon the recognition of Bengali as one of the State languages. Both demands carry the support of the 9 million Hindus who are the largest and financially most significant minority among East Pakistan's 42 million inhabitants. Fazlul Huq has stated his terms for co-operation with the Centre as follows: Bengali and Urdu to enjoy equal rights as state languages; East Pakistan to be autonomous in all matters except defence, foreign affairs and currency; the election of a new constituent assembly and the drafting of a fresh constitution recognising East Pakistan's autonomy. Meanwhile, the provincial Assembly has been dissolved and "Governor's rule" proclaimed throughout East Pakistan.

has not done. India is deeply distressed and disturbed about the threat to its safety which it sees in American military aid to Pakistan. Demands for more arms, for the refusal of all foreign aid however unmartial, more self-sufficiency in arms, fewer foreign technicians and wider public training in defence have come from reasonable men and responsible newspapers. But the Prime Minister and the Finance Minister have stood firm on the view that India's true strength lies in a better life for its people. They will encourage rifle clubs; they already had plans for an electronic factory costing £7.75 million. But that is all. Defence expenditure has gone up by a mere £10.25 million and, far from refusing foreign aid, the Finance Minister has included £36 million of it in his budget estimates. The government is prepared to take more risks than just inflation in order to raise the standard of life of its people.

Still Making Holland

A YEAR ago last February, when flood waters broke through the sea defences and engulfed 350,000 acres of land, the Dutch government appointed an expert committee to report on an ambitious project of sealing off the four large estuaries of Zeeland. Last week the Maris committee came out strongly in favour of the plan. The news has been widely welcomed in the Netherlands, and a Bill giving effect to the proposals is expected shortly.

The task confronting the committee was to choose between one of two proposals: the one to heighten and strengthen the existing dykes so as to afford adequate protection; the other to close in the sea arms. The decision to support the latter, though it is the more ambitious project, was taken after carefully weighing the relevant factors. For instance, it was estimated that the initial cost of the bigger scheme, though expected to reach £,500 to 2,000 million guilders (£150-£200 million), would not be much greater than putting the existing sea defences into order, and subsequent maintenance costs would be less. Another consideration was the loss of farming land which would result from the widening of the dykes, whereas to seal off the estuaries would actually increase the area of cultivation, although this was not the prime object of the scheme. Furthermore, the building of a complete new line of forward sea walls means in effect that the coast will be protected by a double line of defences.

The construction of the new project is expected to take up to 25 years. Four major barrages of a combined length of about 20 miles will be built, and many tricky technical problems are anticipated. As the result of recent experience in repairing gaps torn by last year's floods in the sea defences, new techniques have been developed which, it is hoped, will ease construction problems.

Among the many benefits expected from the scheme—in addition to the greater security provided for the six million inhabitants who live on land which is below sea-level—is a solution to the growing problem of the salting-up of agricultural land. Every year some 80,000 acres of farm land is impoverished by salinity. Some authorities guess that, by sealing off the sea and creating inland freshwater lakes, the effective gain of land might be as much as 15 per cent. It is said that, while God made the world, the

Dutch themselves made Holland; and it seems that their creation is to continue.

One factor which the committee had to keep in mind was the possible adverse effect on shipping, particularly the ocean vessels using the Western Schelde up to Antwerp. Treaty rights protect Belgium's access to the sea, and consequently the Maris plan does not extend to this estuary of the Schelde. But shipping which goes by the

roundabout route to the Rhine through the estuaries will gain, because the present hazardous route made dangerous by tidal waters will be safer.

In fact, the only disadvantage of this imaginative proposal is the effect on Zeeland's oyster beds and the mussel industry, which earn together 9 million guilders annually. Closing off the sea must inevitably mean the extinction of this industry, unless it can be shifted to a new site. But this is a comparatively small price to pay for the greater security and the many other advantages of the plan.

Blueprint for Singapore

FROM A CORRESPONDENT

SINGAPORE has followed closely behind the Federation of Malaya in producing recommendations for the revision of the constitution of the colony. The committee under the chairmanship of Sir George Rendel have vied with the Federation in publishing a concise, clearly worded and sensibly balanced document. Local comment has so far been almost non-existent. The blaze of headlines following its publication has left little in its trail but remarks by those who are disappointed on one minor point or another. It seems as though the boldness of the step forward has taken even the vocal minority by surprise.

If the proposals are accepted, the future government of Singapore is to become a miniature House of Commons. There will be a Legislative Assembly numbering thirty-two, of which twenty-five will be elected by popular vote. Party government is advocated, with the leader of the majority party becoming the Leader of the House. The Council of Ministers, or Cabinet, will contain nine ministries of which

six will be held by elected members. It will be government on the principle of collective ministerial responsibility.

As the report itself admits, the proposed constitution appears at first sight to be top heavy for so small a territory; there are many generals in a tiny army. It is impossible to predict how the parties will line up, but thirteen elected members would give a majority. In such a case six ministers and one junior minister for finance would absorb more than half the side.

It is admitted that the system of voluntary registration of electors has proved a failure and automatic registration is to take its place. This does not, of course, mean that there will necessarily be more actual voters than in the past. But unless the number of voters does substantially increase, the process of election will become a façade rather than a reality. It may become a farce, in which case it will be a dangerous farce. The responsible nominated elements in the present government will be replaced by members who have become representative by default. The whole standing and prestige of the Council of Ministers and of the government itself will depend on the common man making use of his new found "freedom"; so far there is no evidence that he will.

No Imported Aldermen

The present potential electorate is put at 300,000. Of these so far only 70,000 have registered as voters, and only a moderate proportion of these have bothered to vote. It is possible that with the new constitution in view this apathy will be progressively overcome. The average constituency will number only 12,500 voters, and, unless the number of votes cast is stepped up, it may be that two or three candidates will share two thousand votes or so. Voting qualification is simple; residential qualification is required but with no stated residential period. Voters should not acknowledge allegiance to any foreign power nor should they hold foreign passports.

Local government will be conducted by a new city and island council consisting of twenty-four elected councillors who in turn will elect eight aldermen. Thus at the outset it will call for no less than sixty-four responsible persons to occupy the seats on this body and in the Assembly. Taking into account the candidates who will be defeated in the elections, this will make a heavy demand on those capable and willing to accept these seats. Throughout these proposals it would seem that, in regard to both voters and candidates, the availability will be tightly stretched. The qualifications for candidates include a residential qualification of seven years out of the last ten. Whilst this is a wise precaution to check the import of budding politicians, it narrows down still further the supply of suitable candidates.

All in all the commission have done a remarkable job; they have made the fullest possible use of the material at their disposal, but there is little margin for contingencies. If matters work out as they expect, or one should say, hope, the proposals could mark a very practical step forward and a bigger step than most people thought was possible. However, unless local apathy is overcome, unless the right type of candidate is elected, unless the good of the Colony comes before party and unless it is fully realised that not only the welfare schemes but also the very existence of the Colony depend on trade, we shall have exchanged the substance for the shadow.

Dr Adenauer Talks Finance

DR ADENAUER'S sight-seeing in Greece and Turkey has alternated with talks on economic affairs, as well as discussions on Western Germany's future role in defence. Both the Greeks and Turks would like to know whether Federal Germany is prepared to grant them long-term credits for financing their development projects, as it has been proved impossible to pay for capital equipment out of current Greek and Turkish exports.

A few months ago, a Greek mission was prematurely assured in Bonn that Krupps and other engineering firms were ready to supply DM 200 million worth of equipment on credit up to eight years. The ministries concerned were rebuked by the *Ausfuhr-Kredit A.G.*, which had not been consulted. This non-governmental finance corporation is only authorised to grant credits for four years, although the term is extended when exporters bear a further year. Since this episode, the Germans have been searching for some way to fulfil the Bonn engagement. One possibility is that a loan from the International Bank may be granted to the German Reconstruction Credit Corporation, which would then float a bond issue for long-term export financing. There are, however, many handicaps still in the way of this proposal, including the problem of fixing an interest rate that would be high enough for investors and still low enough for the exporters to bear.

In Ankara, the German visitors will have discussed difficulties which are familiar to British exporters. German firms are owed over £150 million, which cannot be transferred owing to Turkey's foreign exchange shortage. In the European Payments Union, Turkey has what seems to be a chronic deficit, as is to be expected from a country that has a different trade structure from the highly developed members of the union. Attempts by the authorities on both sides to sell more Turkish wheat to Germany have not been very successful, first because the Turkish price was too high, and latterly because of lack of port loading facilities.

Various suggestions for making a new start are being mooted. One is that Turkey should leave the EPU and revert to bilateral trade with Germany; but German government policy is to abolish existing bilateral agreements and not to make new ones. Many German exporters simply propose that Turkey's debts should be turned into a German State loan to Ankara. Yet another idea, according to the *Handelsblatt*, is that, by a triangular arrangement, the International Bank should enable German exporters to be paid. The *Bank deutscher Laender*, it is suggested, might pay the Turks' German creditors DM 100 million, which is the sum that Germany is due to pay into the World Bank; and that institution could then lay claim to the equivalent in Turkish pounds that has been deposited in Turkish banks for payment to German firms, but which cannot be transferred. The Bank would not take over this sum, but lend it to Turkey. Unfortunately for this ingenious idea, the Turks have taken offence at the Bank's alleged interference in Turkish economic affairs, and the Bank's mission in Ankara has just been closed. It will be surprising if Dr Adenauer, who is no Dr Schacht, has evolved any solution for this problem, desirable though it is to strengthen the Turkish rampart in Europe's and Asia's defences.

Coal Prices and Cartels

THE High Authority is about to begin in earnest the task of really freeing the coal market of the six-nation coal-steel community. When the common market for coal opened in February of last year, a number of restrictions were swept away—tariffs, import and export quotas, and the most flagrant discrimination in transport charges between the member countries. But a host of obstacles to a genuinely free flow of trade in coal still remain. Maximum prices are still fixed, although by the High Authority and no longer by individual governments. Subsidies and rebate systems still flourish throughout the community, and above all there remains a web of purchasing and marketing organisations which dominate the coal trade—bodies like “GEORG” in Western Germany, “Cobechar” in Belgium and the French “ATIC.”

If the High Authority were to lift the maximum prices it fixed a year ago and set free the price of coal, it would, as matters now stand, simply be handing over the job of price control to the private purchasing and marketing agencies. It has therefore chosen to open talks about the future of these monopolistic bodies with governments, trade unions and producers. While awaiting the outcome of its talks, the High Authority has again fixed maximum prices, but only for the most vital categories, such as coke and coking coal, and only in the most vital coal producing areas—the Ruhr, Nord and Pas de Calais. These areas are the pace setters where price is concerned, and other regions can be expected to follow suit.

For the French mines, the Authority has fixed prices at more or less the same level as last year, since the nationalised French coal mines, the *Charbonnages de France*, are still running a total annual deficit of some £22 million. In the Ruhr, however, the High Authority has ruled that the maximum price for coal should be reduced by DM2 per ton. The authorities at Luxemburg reason that since on April 1st the German coal industry must stop the practice of granting discriminatory rebates to certain German consumers—fishing vessels and railways—it ought to apply the money so saved to a general price reduction.

“Not a Pfennig off the Coal”

This decision is highly popular with the bulk of German industrial consumers, who have not been subsidised, and with such major importers of German coal as France. Hitherto the French government has subsidised imported coal and coke at something like an annual rate of £16 million, but partly as the result of the forthcoming cut in German prices, this subsidy is expected to fall to £8 million by the end of 1954. On the face of it, there seems no logical reason why the price of Ruhr coal should not be lowered; it still costs DM10 per ton more than American coal delivered at Hamburg, and domestic stocks are mounting. However, the Authority's decision has been greeted with indignation by the Ruhr coal industry itself, which contends, just as the German steel industry did last year, that every pfennig is needed for investment purposes.

The problem of cartels is likely to prove even more contentious. Ideally, the High Authority would no doubt like to remove, at one stroke, the monopolistic bodies that

now control the coal market, not only because the Treaty expressly forbids them, but also because without exception their custom is to align prices on those of the high-cost producer—a practice that defeats the low-price policy laid down in the Treaty. Unfortunately these domestic cartels are the device used everywhere in the community to protect the high-cost firms and to safeguard the jobs that go with them. The root problem is the inequality between mines, whether due to natural causes or inefficient management. To abolish cartels, without first framing some more rational and non-restrictive scheme for dealing with these disparities, would be to provoke the abrupt and “harmful shifts of production” that the Authority must avoid.

The Authority has not yet devised a precise, long-term policy for solving the problems that have given rise to domestic cartels. But it seems to officials at Luxemburg that the answer must lie first of all in stimulating higher productivity, and secondly in a gradual shift of production from the high-cost to the low-cost areas—a process that the Treaty calls “readaptation.”

Shifting Families and Furniture

Last week the High Authority set on foot its first practical experiment in readaptation, with a loan of £500,000 to the French government for the purpose of transferring 5,000 miners from pits in the Centre-Midi to Lorraine. The French government will contribute an equal sum, and the fund will be used to transport the men, their families and furniture and to provide them with a lump compensation of £200. The need for the shift has arisen partly because the electrification of the Rhone valley has reduced the demand for coal in this region, and partly because productivity in the old mines of south-central France compares very unfavourably with that in the new mines of Lorraine. Although the original intention of the French government was to finance the reorganisation itself as part of the modernisation programme, it has received help from Luxemburg on the ground that the common market has hastened the need for action. The scheme is entirely voluntary; but the non-Communist trade unions, with whom the High Authority has collaborated closely, believe that the higher wages to be earned in Lorraine plus the better working conditions will act as sufficient inducement to lure redundant miners from the south.

Probably the key to the success of this enlightened move is the provision of housing. French labour has been immobilised even more effectively than British labour by the scarcity of proper dwellings in the regions where the demand for labour is greatest. French labour has remained congealed in high-cost areas, and the products of high-cost units have tended to determine the general level of prices. Indeed, only when dwellings do become available will it be possible to attack uncompromisingly cartel practices and other forms of restriction in French industry. To help finance the Lorraine project, the French government asked the High Authority for a loan of £7 million. The meagre half-million pounds which has been offered will not go far, and presumably a housing programme of adequate dimensions must wait until the High Authority, in its turn, negotiates a loan from the United States. Obviously the High Authority will do its utmost to support the project, both morally and financially, for it is a test case. The principle of readaptation is the essence of the Schuman Plan.

“The Hill of Mullock”

Early prospectors called Broken Hill the “Hill of Mullock”. Mullock means waste rock. That was what it seemed like to the men who had staked out their claims on its barren slopes. There were seven of them who had formed the “Broken Hill Mining Company”. They sank their shafts without return. They sank more shafts until their money ran out. Their dreams of riches remained unfulfilled. The Hill lay broken backed against the sky, symbol of the miners’ breaking hopes. In bitterness they realised that they must raise more money by creating new shares in their company, but the shares they issued were held to be of such small value that they changed hands on the turn of a card. By a twist of the cards of fate those shares soon afterwards were worth millions. Seeking in the waste of old diggings (“fossicking” in the Australian usage), a member of the syndicate named Rasp found a piece of ore rich in silver chlorides. That was in 1884. The hunt was on again, and a few months later another

member found an even richer piece, assaying 800 ounces of silver to the ton. Then the dreams came true. From all over Australia, men set out for the Hill to stake their claims to riches. They found them one hundred and fifty feet down the main shaft where the miners struck a lode of silver chlorides fifteen feet wide. Broken Hill was no longer mullock. From the first forty-eight tons of ore there came 35,000 ounces of silver. But other riches were there: soon, lead and zinc ores were mined and, during the next thirty years, the mining companies at Broken Hill became famous throughout the world. To smelt the lead concentrates, a smelter was built at Port Pirie in Australia. In the United Kingdom, a vital industry was created to process the zinc concentrates produced at Broken Hill. Now, at Avonmouth in the West of England, the largest zinc smelter in Europe produces the entire output of primary zinc of the United Kingdom as well as sulphuric acid and other related products.

Lead, Silver, Zinc

The formation of the Consolidated Zinc Corporation Limited in 1949 united the bond of common interest between Imperial Smelting Corporation Limited of Great Britain and the Zinc Corporation, Limited of Australia. The two companies have for many years been associated in the development of the

non-ferrous metal production of the Commonwealth. Their activities are the mining of lead, silver and zinc ore in the Broken Hill Mines of Australia and the production of zinc metal, sulphuric acid, fluorine chemicals and zinc pigments in the United Kingdom.

AN ALL BRITISH ACHIEVEMENT

THE BUSINESS WORLD

Freer Gold and Sterling

THE steadily extending area of economic freedom has this week been pushed outwards at two more important points, leaving the realm of financial restriction in Britain appreciably smaller than it was and the scope for the international functioning of the London market appreciably wider. The first of these relaxations of financial control has permitted the re-establishment of a gold market in London, after a closure lasting over fourteen years. The second has achieved an almost world-wide extension of the area within which sterling can be automatically transferred.

These developments, it is important to emphasise, have not been put forward or justified as steps towards the convertibility of sterling into dollars. On the contrary, the Treasury announcement specifically pointed out that the reopening of the gold market "will afford no additional element of convertibility." But, despite this disclaimer, it is evident that both moves are strictly in line with the wider objectives of convertibility. They are further illustrations of the empirical or functional approach that Britain is now adopting towards these objectives. The risks of a plunge into dollar convertibility still look as great as ever; but in the meantime the British authorities are taking every possible step to promote the international usage of sterling, and its maximum convertibility into non-dollar currencies.

The new freedom, though welcome and significant, is therefore carefully circumscribed to ensure that it does not afford avenues through which additional strain might be put upon the sterling area's gold and dollar reserves. Dealings in the reopened gold market will not enjoy the complete freedom of prewar days. Nor will the widened transferability for sterling permit it to pass from a non-American to an American account. The gulf between the dollar group and the other currencies still yawns. But by unifying the status of sterling

held by non-dollar countries, this week's liberalisation makes the problem of ultimately throwing a bridge between the dollar and the non-dollar worlds look less intractable.

Both the synchronisation of these two developments and their actual timing were determined by the fact that gold had for some months past lost its premium in the world's free markets and that the various varieties of free sterling had come to be quoted within touching distance of the official parity. The disappearance of the gold premium ensured that gold would not be quoted in the reopened London market at any sterling price that appeared to show a depreciation of the pound in terms of gold; in the past, the possibility of such a semblance of depreciation had been widely regarded as a serious objection to any reopening of the London gold market. Similarly, the fact that most of the many varieties of sterling had appreciated so as to show only a narrow range of discounts on the official parity had substantially removed the danger that their unification might seriously depress the value of "free" sterling in overseas markets.

Judged in terms of the size of turnover likely to result from it, the reopening of the gold market is outstanding among the renewed freedoms in the commodity markets that have been reintroduced since the end of the war. The market that came to life again with the "fixing" of gold in the traditional setting of Rothschilds' offices last Monday had necessarily been closed at the outbreak of the war, when the Bank of England, acting for the Exchange Equalisation Account, became the sole buyer and seller of gold in the United Kingdom. But despite this closing, London continued to be the principal clearing house for gold transactions in the world; and in 1952 bullion firms in London were allowed by the Bank of England to act as agents for the sale of newly mined

Commonwealth gold to buyers outside the sterling area, against payment in United States dollars. In this way the London houses regained contact with the free gold markets of the world. Indeed, some of them had succeeded in keeping in contact throughout the postwar period, and had played a considerable part in the international traffic in "free" gold.

★

Such activities have proved to be a useful preparation for last Monday's reopening in London. The reopened market operates under the general supervision of the Bank of England, and dealings in gold are restricted to authorised dealers. These comprise the Bank of England, all banks authorised to transact foreign exchange business, and the four specialised bullion firms—Johnson Matthey & Co., Mocatta & Goldsmid, Pixley & Abell, and Sharps & Wilkins. The actual market in gold is made by these four specialist firms, together with N. M. Rothschild & Sons and Samuel Montagu & Company (both of them authorised banks and, therefore, authorised dealers in gold), whose representatives meet daily and fix the price of gold according to the play of supply and demand, as before the war.

Any person or institution, whether resident or non-resident in the sterling area, can sell gold in the market. But the only people who can buy are:

(a) those non-residents who can pay in American or Canadian sterling;

(b) non-residents who hold a new kind of sterling, known as "registered sterling," which can be acquired only against US or Canadian dollars or against gold by someone who resides outside the "American account" area and also outside the sterling area; and

(c) residents of the sterling area who receive special licences from the Bank of England and who will be allowed to buy gold for trade purposes to the same limited extent as they have hitherto been permitted to buy direct from the Bank of England under the Treasury Export Scheme.

The supply of gold reaching the market will mainly be newly-mined metal from the sterling area. The South African gold, for example, which used to be sold direct to the Bank of England under the "memorandum of agreement" regulating the exchange and gold sales arrangements between South Africa and the United Kingdom, will henceforth be sold through the market. Any resident of this country who acquires gold and who is called upon by the exchange regulations to surrender it to the authorities will fulfil his legal duty by selling it at the market price to an authorised dealer in gold, through whom it will be canalised to the market. Some dishoarded gold may also come to the London market, but the volume of such offerings is unlikely to be substantial at anything like the current market price. Some non-residents for whose account gold is held in this country might, however, decide to sell their

gold in order to establish a registered sterling account, confident in the knowledge that such sterling can be used later for the re-purchase of gold and will, meanwhile, be earning interest and not incurring the safe-keeping charges attaching to a deposit of gold.

Last Monday, when the market re-opened, the price was fixed at 248s. 6d. per fine ounce. The subsequent trend was towards lower prices and on Thursday morning the price was fixed at 248s. 3½d. These figures compare with the price of 248s. at which the Bank of England was previously prepared to buy gold offered to it, though it gave no unconditional undertaking to do so. The "mint" parity of gold, based on the sterling-dollar parity of \$2.80 to the £ and the U.S. price of \$35, and without allowing for transit costs, is 250s. per fine ounce. Another basic point is the shipping parity of 247s., this being the price at which it will pay to purchase gold in London, ship it to New York and sell it to the United States Treasury.

The shipping parity is the "floor" below which the sterling price of gold cannot fall so long as the US Treasury buys at the present official price and so long as the sterling dollar rate remains anchored to the present parity. The London market price could go higher than the mint parity; theoretically, indeed, there is no determinable ceiling to it since there are no monetary authorities in the world that are now prepared to sell gold at a fixed price and without restrictions as to destination or amounts. It is, however, difficult to conceive conditions in which the London price of gold would rise to a substantial premium on the mint parity, now that hoarding demand is at such a low ebb and now that the potential supplies, including those that may come from Soviet Russia, are known to be considerable. It is significant, however, that the British monetary authorities are prepared to allow the re-opening of a market in which the value of sterling in terms of gold can be measured day by day within a range of prices that is not directly limited. It prompts the intriguing question whether elasticity for the bullion market may not be the harbinger of similar elasticity in the foreign exchange market.

The other move towards freedom, which synchronised with the re-opening of the gold market, was a considerable extension of the multilateral transferability of sterling. The early history of British exchange control was an experiment in bilateralism, whereby sterling owned by residents of any country outside the sterling area was available only for payments to another resident of the same country or to a resident of the sterling area. In the postwar years this system has gradually been given a greater element of multilateral transferability by the setting up of the transferable account system, which until the beginning of this week extended to eighteen countries.

Before a country could become eligible for membership of the transferable account group it had to declare its readiness to accept sterling from any other transferable account country as well as from the sterling area

in settlement of current transactions. It also had to undertake not to transfer sterling to other transferable account countries except as the counterpart of *bona fide* commercial operations.

Non-resident sterling held by non-dollar countries other than these eighteen was still formally subject to the bilateral system. But the conditions imposed upon transferable account countries and the restraint of bilateralism upon the others tended to be honoured in the breach rather than in the observance. The writ of Britain's exchange control rules was bound to become largely ineffective because their application depended upon the action of these other countries, whose authorities were in many cases wholly opposed to the principles involved in the co-operation expected from them. The "fifty-seven" varieties of sterling had in fact become largely interchangeable; through well-established and active free markets overseas they were even readily convertible into dollars—at discounts that had recently become negligible. In addition, of course, the British authorities made many concessions by *ad hoc* permission for multilateral payments.

The changes that took effect last Monday incorporate in the transferable account area all non-sterling countries outside the American and Canadian account countries (with three minor and temporary exceptions, Hungary, Turkey and Persia). Moreover, all restrictions on the use of transferable account sterling have disappeared. Its use will no longer be confined to current transactions, but will be permissible for capital purposes as well. But, of course, it cannot be used to buy gold in London. One outcome will be that the designation of sterling accounts by reference to the country of the holder will disappear. There will no longer be French, Belgian, or Argentine accounts. They have all become merged into a single category "transferable accounts." Whereas in the past transferable accounts could be maintained only in the names of banks, now they can be kept by any individual or firm in the transferable account area.

The official barrier between transferable accounts on the one hand and American and Canadian accounts on the other is still, however, fully maintained—as it must be until the day of full convertibility of sterling into dollars. But these changes, apart from recognising the wider transferability of sterling that was already taking place by special sanction or by evasion, bring about a most welcome simplification in the administration of exchange control. It should help merchants, and particularly exporters from the sterling area. The status of sterling will be enhanced, and its use as an international currency should be further extended.

After this simplification of the exchange control, virtually all sterling arising from current transactions will conform to one of three basic types. There is, first, the sterling held by residents of the sterling area, which remains subject to the full rigours of exchange control. Secondly, there is American or Canadian account sterling, which is fully convertible at the rate of the day. The third category, the newly extended transferable sterling, virtually covers the rest of the world. There will be some special and less important categories. Under the heading of current sterling there will also be the new "registered" and convertible sterling already described in the explanation of the re-opened gold market. Finally, the new arrangements make no change in the blocked sterling accounts consisting of capital proceeds of legacies, matured bonds, and sales of securities by non-residents. The proceeds of such transactions continue to be immobilised; they are transferable only in the guise of "switch" or "security" sterling on the overseas markets. As, however, this type of sterling can now be exchanged into dollars at not more than 1½ per cent discount, this continuing distinction between current and capital sterling is more apparent than real. No one will dissent from the official comment on these developments in the gold and exchange markets—that "they mark a stage in the strengthening of London as an international finance centre and of sterling as an international currency."

Reading the Tea Leaves

THIS week the price of common tea at the London auctions has reached a new peak of 4s. 6½d. a lb, and a further increase in retail prices seems inevitable. There are cries that the government should reimpose controls and subsidies to protect the consumer against "unjustified" prices—and very different cries from Ceylon that the London trade is "combining to depress prices." The British public drinks almost half the world's tea and needs an extra cup to soothe its present confusion and suspicion. Why is tea so dear? Is this what a free market means? They forget that the weather can have a marked effect on production, and that the tea ration was sometimes cut.

As recently as 1952, a surplus of low grade tea depressed the market, until common tea was selling in London for as little as 1s. 6d. a lb, far below the cost of production and shipping. The market reached the trough when the sale of tea in Britain failed to rise after the end of rationing in October of that year. Retailers had stocked up in expectation of a rise in demand, and instead the wayward housewife lived off her private hoard. Not until the end of the year was there a recovery in sales, a rough balance of world supplies and demand, and the first recovery in prices.

Tea growers in North India, the largest producing region, agreed to restrict output in 1953 to try to avoid

a repetition of the previous year's disaster, when many companies were impoverished and some lost their entire working capital. Restriction by finer plucking was soon rendered unnecessary, however, by bad weather, and the scheme was gradually relaxed. As production in North India fell, tea prices rose almost without a break. There was a net gain of 15 million lb to 1,085 million lb in the total production of the four main exporting countries last year, but this was quite inadequate to match the rise in world demand.

Consumption in Britain is rising, partly because sugar is now freely available. America, the second largest consuming country, is also drinking more tea, for a good selling campaign has been helped by the high price of coffee. It is chiefly the strength of American demand that has pushed prices to new peaks in the last month or two. Australia and other Commonwealth countries, and Egypt, have been buying more tea; like the United States, they seem far less price conscious than British buyers. The rise in prices has been aggravated by the apparent need of many countries to build up stocks after a period of falling prices, and by the smaller stocks now carried by British blenders and dealers, who are not prepared to finance a stock of prewar size at postwar prices.

Any appreciable easing of tea prices seems unlikely in the next few months. Shipments from the North Indian crop are tailing off, and the new crop will not arrive in London in quantity until September. Until then the trade will have to make do from stock and from the smaller supplies arriving from Ceylon and other areas where tea is harvested all the year round. By the summer, however, prices may be under pressure.

Certainly, present prices will tempt the growers to harvest all the tea they can, even at some sacrifice of quality. Much will depend upon the weather, but North India will be unlucky if it suffers another bad season this year. Another uncertain factor is Russian buying. The new trade agreement between Russia and India does not include any fixed quantity of tea; Russia may buy 30 million lb and more or it may buy nothing.

The possibility of a continuing shortage of tea would be less if production in Indonesia, which now produces only half as much as before the war, were to recover, but this seems most unlikely. Nor are higher retail prices in Britain likely to have a major effect on consumption. People do not buy appreciably less tea when prices rise; they buy a cheaper quality instead.

★

Greater long-term significance, so far as the price of tea is concerned, attaches to the rising trend of consumption in the producing countries themselves, and to their production costs. Consumption of tea in India alone is believed to have doubled in the last fifteen years until it has reached some 200 million lb a year. Cuts in Indian wages, following the decline in tea prices, have now been restored, and the gardens will be pressed for further wage increases and larger social benefits. It is estimated that the cost of producing and shipping common Indian teas to London, excluding capital charges, is now a little over 3s. a lb; the average cost for all Indian teas is probably about 3s. 6d. a lb. Production costs in Ceylon may be slightly lower. But though such costs will tend to set a high "floor" to tea prices, this does not imply that in the long run the net profits of the producing companies will necessarily be appreciably larger than formerly.

At the moment, however, tea producers are enjoying an undreamt-of prosperity, and it seems likely to last for some time. In theory, tea shares should be in strong demand at rising prices. In fact the market is stagnant after its rise and tea shares can change hands only in small amounts. Here lies their main weakness as an investment; the market is too narrow to take substantial quantities of shares on its books. Business tends therefore to be by negotiation, in which buying and selling orders can be closely matched.

The capital structure of

the industry also gives little help to the investor, for the number of companies is large and their individual capital as a rule is small. Their swing from prosperity to depression can be sudden; as one turns they all turn, causing buying or selling pressure over a long list of shares, few of which enjoy a free market. The investor in tea shares must be prepared, therefore, for low marketability, but he gains—in good years—a high yield. He has to understand that his risks are high—that a couple of bad years can wipe out the working capital even of big and prosperous companies, as the Nedem Tea Company (operating in the Dooars area of India) showed in 1951 and 1952 when it lost almost £590,000, leaving at the end of 1952 current liabilities of nearly £750,000. Yet this company's entire issued capital, ordinary and preference, is only £540,000. In the last twelve months

profits remitted suffer a 66½ exchange transfer tax and that the proceeds resulting from the sale of an estate may not be remittable at all. Most forms of political risk are at their lowest in Pakistan, but there the higher rupee exchange rate puts the tea producers at a competitive disadvantage against which they have so far battled successfully. In neither India nor Ceylon can risks be wholly absent, though the British-owned tea plantations have not yet been under severe political pressure. An export duty is imposed by both countries; at present it is 45 cents a lb. in Ceylon and 4 annas a lb. (equal to 25 Ceylon cents) in India.

★

The prior charges of the tea-producing companies will, in general, make little appeal to the sensible investor; if it is not equity capital which he is prepared to risk, he has no business in the tea market at all. This objection hardly applies to the convertible loan stocks which a few companies like Jorehaut and Jhanzie have in issue, for those stocks are potential equities, with the added attraction that they should earn their keep in hard times. There remains the possibility of taking a less direct interest in tea through one of the few companies which both grow and distribute it; of these, Brooke Bond and J. Lyons are the obvious examples.

The accompanying table lists a few shares of each tea district to illustrate the features which matter. A high yield per acre and a low capitalisation per acre are of the greatest importance in a rising market, for they imply that an increase of a penny per lb. will have a big effect on earnings. In a falling market a high liquid capital per acre is a tower of strength. The drawbacks of this form of investment remain substantial, but British risk capital has been willing to face them and to play a large part in development of tea—still the cheapest beverage. Even now, when the flow of that investment is reduced to a trickle, not a year passes without some British capital going out to finance the tea gardens.

a good proportion of those losses should have been recovered. In North India, tea is a seasonal crop and most balance sheets are drawn to December 31st, when the peak of crop financing is over. Hence balance sheets are apt to show a degree of liquidity which may give an unduly rosy impression.

The investor who is still prepared to take the plunge into the teapot must then consider the kind of risk he is prepared to take. Something will depend on the quality of tea produced by the company he selects. The marginal product is common tea from Cachar and Sylhet, and low-grown teas from South India and Ceylon. It is in that product that the steepest and widest price fluctuations occur. High grade Assam tea and high grown Ceylon tea always find a market. Oddly enough, the highest grade of all Indian teas—Darjeeling—suffers most of the disadvantages of the common teas because it happens to be a low-yielding crop expensively produced.

Then there is the political risk. It is at its worst in Indonesia, where investment in tea is little better than a currency gamble. Much remains obscure about Indonesia's new currency law, but it is certain at least that

Business Notes

Sterling, Gold and Throgmorton Street

TO external and unfamiliar objects the Stock Exchange, which represents the sum of investors' transactions, presents a pragmatic attitude. A gold market was to be restarted, the first halting steps to reduce exchange controls were to be taken; therefore the "authorities" must be feeling sure of themselves; therefore a strong market should be justified. The first reaction from last week's announcement from the Bank of England was a rise in the gilt-edged market, a rise in the exchange value of the pound and a fall in the premium that British residents have to pay for the privilege of buying dollar securities. All these hasty conclusions have had to come under closer revision since. They may all have been wrong save one. Last week's actions were a sign of strength.

The initial rise in gilt-edged tailed off, as well it might, for there was nothing in the move towards freedom which required a fresh view of interest rates. After a quick slide back gilt-edged remained reassuringly steady. By Tuesday the London rate for the pound had improved to its best this year—\$2.81½. There is one substantial reason why that rate should improve. Holders of dollars have to buy sterling if they wish to buy gold in London. They cannot buy for that purpose the transferable variety. Nevertheless, the rate for transferable sterling in various continental centres weakened only slightly after the announcement, falling from \$2.78 1/16 to \$2.77, and it then recovered to \$2.77½. Confidence lies behind those movements, for a wide variety of inferior qualities of sterling has been amalgamated into transferable sterling. Confidence was also reflected in the improved rate in security sterling represented by a fall from 2 per cent to below 1½ per cent in the premium which British residents have to pay for the opportunity to buy dollar stocks. No change in the switching arrangements is involved; the Bank of England does not even recognise the existence of security sterling. But investors are convinced that the drive to freedom will go on.

Chemicals and Ceylon

TO domestic and familiar objects Stock Exchange reactions are quick and decisive. The investor, batting on a fundamentally sound wicket, has had two main offers before him this week—Imperial Chemical Industries' issue of £30 million 4½ per cent unsecured loan stock 1972-74 at par and the Ceylon Government's 4 per cent issue of £5 million 1973-75 stock at £97. Ceylon offered a public issue of a trustee stock; ICI made a private offer limited

to stockholders only—though this list is as long as any. Both were of the type which might be expected to appeal to pension funds.

The Ceylon issue did not disgrace itself; the yield of £4 ¼s. per cent was attractive; the sinking fund with the governor and deputy governor of the Bank of England as trustees was welcomed and although Ceylon is not a crown colony the yield had been rightly calculated as not much different from the crown colony basis. The issue was over-subscribed, larger applicants receiving 60 per cent of their requirements. The result of the ICI offer was not known when this issue of *The Economist* went to press but it was merely a question of how many times the £30 million offer had been over-subscribed and how great a problem allotments would present. Already it is being foreshadowed that when dealings start in the middle of next week the issue will prove to have been one of the great successes of capital issue history. The stags will certainly be sellers but a premium of at least one and perhaps two points may be expected.

Freer Marks and Guilders

HARD on the heels of the announcement of the extension of sterling transferability last week-end comes news of two important measures of exchange liberalisation taken on the Continent. Germany has granted holders of current mark balances a measure of multilateral transferability closely resembling that now enjoyed by holders of current sterling balances; and the Netherlands, which has for some time permitted foreign residents to convert guilders into any non-dollar currency, has made substantial relaxations in its controls on exports of capital.

The German action of granting automatic mark transferability outside the dollar area comes as no surprise; the Bank Deutscher Laender had announced proposals to this effect already some weeks ago. The measure follows naturally from the steadily increasing degree of transferability that the German authorities have recently granted to holders of bilateral accounts; but this particular relaxation is especially significant as non-residents are for the first time permitted to pay their mark earnings—receipts of interest and other "invisible" items, as well as those from both sales of goods—into free accounts that can be automatically exchanged into any other non-dollar currency (and in the case of North American residents into dollars as well). Previously, all mark earnings had to be paid into blocked accounts that were convertible only at the discretion of the Bank Deutscher Laender. The move from

administrative to automatic transferability has thus in effect been made at one sweep.

The easing in the control of exports of capital announced by the Netherlands is especially welcome as the country had already abolished all exchange controls on current non-dollar payments. The concessions now announced permit residents of countries participating in the European Payments Union to transfer the proceeds of sales of property or securities held in the Netherlands. These proceeds had previously to be reinvested within the country. In addition, all non-residents may now buy foreign as well as Dutch securities on the Amsterdam stock exchange. And, finally, residents of the United States, Canada or Switzerland may now withdraw freely from the Netherlands securities issued in either guilders or foreign currency.

The Netherlands Bank has taken these measures primarily in an attempt to check the growing Dutch surplus with the EPU—which by the beginning of March was within \$16 million of the limit of the Dutch quota of \$355 million. As a further step to this end, the Dutch authorities are henceforward to permit new capital investment in Holland only when it is effected in dollars or Swiss francs. The Dutch Government is thus wisely seeking to avoid being forced into the position now occupied by Germany of acting as Europe's fairy godmother by virtue of potentially unlimited credit extension through EPU. The amount of credit granted by Germany through the Union has now topped \$500 million. The German authorities could learn some important lessons from the recent Dutch moves that might succeed in checking the growth of a surplus that is the main stumbling-block in the present negotiations on the future of EPU. It is the failure to reach agreement in these negotiations that has been holding up the overdue meeting of the Ministerial Council of the OEEC.

Towards Freedom in South Africa

FROM a market angle the South African budget was a stimulant; gold shares and South African industrials rallied—industrials for the obvious reason that the 6d. in the £ compulsory savings rally is to be abandoned, gold shares in spite of the fact that they receive no direct assistance from the budget. The upward move in gold shares may still be reasonable. It is inherent in Mr Havenga's budget that inflationary pressures in South Africa have now been eased and that in his view something like a stable basis for the economy has been reached. He also foreshadowed that import controls would be abolished in "the not too distant future." And he reported his expectation of an improvement of £100 million a year in South Africa's balance of payments. Such an improvement would have to come largely from the product of the gold and uranium mines.

The gold mines obtain no tax relief this year because they were specifically exempted from the special levy of last year which is now abolished. But the whole emphasis of the budget is now on incentives to savings and output. A year ago it was on the peril of inflation. That does not mean that the investor's path in gold is now free of pitfalls. The news from Freddie's North and Freddie's South this week clearly

shows that teething troubles among the developing gold mines of the Orange Free State have not yet all been overcome. Market rumours of an impending adverse statement brought the price of Freddie's North down from 10s. 3d. to 7s. 9d. and of Freddie's South from 9s. 1½d. early in the week. On Monday night the fears were confirmed. These two companies, both of the Johannesburg Consolidated group, are finding it necessary to merge and to seek fresh capital. They are evidently obliged to look outside the "Johnnies" group for part of that capital. It is disclosed that discussions are proceeding with Anglo American Corporation of South Africa, De Beers Investment Trust, and Anglo Transvaal Consolidated Investment Trust. The discussions may involve the funding of the existing short-term loans of £3½ million for each of the two companies into shares. This was fully as bad news as the market had expected. Both shares fell further to 7s. on Thursday morning.

Synthetic—But Not Rubber

THE Colonial Secretary went to some pains on Wednesday night to allay the rubber growers' suspicion that a synthetic rubber industry might be established with government assistance in this country. The Board of Trade might not see eye to eye with Mr Lyttelton's description of "the bastard synthetic rubber which . . . like many evils . . . has come to stay," or that Government sponsorship would be considered "in the background of our imperial interests and of our imperial obligations to countries like Malaya," but it is for the time being true that the rubber industry has nothing to fear.

The "rubber-like polymers" that will come out of the three new plants announced last week by Imperial Chemical Industries, Dunlop and Monsanto Chemicals which caused a flurry of alarm in the rubber industry will be synthetic but not rubber in the ordinary meaning of the term. The bulk synthetics produced in the United States are in direct competition with natural rubber, these new polymers are not. They are made out of the same two chemicals, butadiene and styrene, as synthetic rubber, but the chemical industry classifies them as plastics; and their applications are much more specialised. A high proportion of the output of the new plants is expected to go into a leather-like material for shoe soles that should wear as long as the shoe itself. This is extensively used in the United States, but it is quite distinct from the synthetic rubber soles already being used here on "rubber" soled shoes and boots. The polymers also give a flexible substance (like rubber) that is oil resisting (which rubber is not) for which there is a wide demand in engineering. They can be made into strong and flexible glues, into reinforcing resins, paint additives, and surface coatings for paper and textiles.

★

ICI intends to produce about 10,000 tons of these polymers, which for chemicals of this kind represents a very sizeable rate of output and suggests that the company must have a number of new applications in mind. Monsanto will produce 4,000 tons, and Dunlop only 2,000, most of it

probably for the company's own use as a reinforcing agent. These last two plants are expected to cost £500,000 apiece; ICI's investment is a great deal bigger, and a figure of as high as £7 million has been suggested. These plans are directly related to a further announcement, made by Forth Chemicals later in the week, of plans to double the company's styrene-producing capacity. The two basic materials for the new polymers, styrene and butadiene, are both petroleum chemicals stemming from the gases released during the catalytic cracking of crude oil. Forth Chemicals, which is owned jointly by Monsanto and the Distillers-Anglo-Iranian subsidiary, British Petroleum Chemicals, is the only producer of styrene in the country, and almost all its estimated 8,000 tons capacity has been earmarked for use by Monsanto to make the plastic, polystyrene. This capacity is now to be doubled. ICI is the only source in this country of butadiene, but it can be imported from the Continent, and possibly also from the United States. It would appear that Forth Chemicals, or rather Monsanto, is providing the necessary styrene, and ICI the butadiene, for the three new plants.

This shortage of basic materials lies behind the continued postponement of schemes for a bulk synthetic rubber industry in this country. Dunlop has frequently flirted with the idea, and already imports quite substantial tonnages of one type, butyl rubber, for inner tubes. But so far, every company that owns a cat cracker—ICI as well as the oil companies—prefers to work up the gases and their intermediate products into the more profitable end products for which there is still a big market, rather than to sell them less advantageously as raw materials for a synthetic rubber industry.

Slow Sales of State Lorries

THREE-QUARTERS of the State-owned lorries offered in "transport units" without premises at the third sale held by the Road Haulage Disposals Board have been sold, and a decision remains to be taken upon a few more. These are the latest results available from the disposals board and the British Transport Commission, which last week remarked that the proportion of acceptable bids for "vehicles only" units was considerably better than in the first two sales. Only 81 units, comprising 258 vehicles, remained unsold because no acceptable bids were received, though there were no bids whatever for 13 units totalling 63 vehicles. Prospective road haulage operators, it would appear, have now begun to pitch their bids more in line with what the board and commission consider realistic, the first two sales having made it evident that these are not knockdown "Government surplus" auctions. But it was also stated last week that the sales of transport units with premises at this third sale were still "very unsatisfactory"; no bids at all were received for 63 of the 180 units offered.

So far, the disposals board has offered 1,664 transport units, comprising 10,048 vehicles; it has sold about half the units, but these have included fewer than a third of the 7,500-odd vehicles upon which decisions have been announced. The board holds that there are so few prospective buyers for transport units including premises that it

would not be worth while offering these again at supplementary sales, as some of the "vehicles-only" units will be offered. There might, however, be a demand for some of the vehicles concerned if these were offered in units without premises; premises might be sold by private treaty. The board is expected to offer a fourth list of units during the next few weeks; later sales will include a large proportion

	Units	Vehicles
Offered in first three sales:		
Without premises	1,142	7,121
Without	522	2,927
Total	1,664	10,048
Highest tender accepted	813	2,192
All tenders rejected	582	4,565
No bids received	70	682
Withdrawn	2	2
No decision announced	197	2,607

of very small transport units, including some units and vehicles, not necessarily arranged as before, that were left unsold in the first three sales. The task of selling some 30,000 vehicles to haulage operators and bringing into being an effective privately-owned road haulage system, however, is still hardly begun.

Atomic Estimates

THE expenditure of the Department of Atomic Energy is, for the first time, shown in some detail in the 1954-1955 Civil Estimates. Excluding the expenses of weapons production and research, the department expects to spend a total of £53,675,000 during the coming year—which may be compared with £46½ million in the current year. It seems clear from the estimates that this represents only certain administrative and other costs of the establishments, capital outlay on plants and buildings, and such items as a £5 million loan for the production of uranium. The department employs nearly 19,000 people, industrial and non-industrial, and its wage bill amounts to £11.7 million. Other current expenses are impossible to calculate, for the stores, materials, and services for the establishments are given as "net of receipts not disclosed for security reasons," that is, of payments from the Ministry of Supply for weapons and military research. The net figure of £4 million pertains to civil research and development into atomic energy that the department will undertake during the year. To this must be added another £6.2 million for other current expenses including £3.3 million for electricity and water (which the atom plants consume in prodigious quantities), and £1.8 million for work done on the department's behalf by industry and the universities.

The most interesting figures are those for capital construction. The department will spend a total of £14.4 million on land and building work during the year, and a further £13.1 million on plant. Of the building, £12.4 million will be spent on work already in hand, but projects estimated to cost £17.7 million will be begun during the year, most of it accounted for by the £15 million breeder reactor at Dounray.

- See old Smithy's got his promotion
- preposterous!... which Smithy?
- Always offers you Courvoisier
- oh, of course... I must write and congratulate him.

The BIG Yellow 'CATS'
ARE PURRING BEFORE THE HEARTH

Before new hearths and homes can arise, row upon row, Caterpillar earth-movers must get to work. On building sites up and down the country, where soon there will be houses, hospitals, offices, schools and factories, you can see the distinctive yellow of the 'Cats' (world-famous nickname for these world-famous machines) and hear the powerful, purposeful throb of their engines. These are busy times for the 'Cats', speedily doing the spadework for Britain's building developments.

We suggest
that you throw out
the sponge

We suggest that the linings of many furnaces are, in effect, sponges—heat sponges: they soak up heat that should go into the charge. On batch-type furnaces this is not only a waste of fuel but a waste of time and quite unnecessary. It can pay very handsomely to get rid of this heat sponge. And it can be done very simply—by using M.I.-bricks for the lining instead of ordinary refractories: they require only a fraction of the heat (and fuel) to bring them up to the same working temperature. M.I. refractories are low heat-storage hot-face insulators which can be used as direct furnace lining up to 1540°C (2800°F). They may be used in either new or existing furnaces. Either way they permit faster throughputs and lower fuel consumption, whilst with new furnaces the whole structure is lightened, with savings in steel, foundations and floor space.

MORGAN
Refractories

are worth far more than they cost

Ford Pays More

LAST year the Ford Motor Company tightened its grip on the car market, gaining handsomely on its British rivals. It now commands about a quarter of the market, compared with a probable figure of slightly less than 50 per cent for British Motor Corporation. The value of its sales rose from £84 million to £106 million; it sold 234,379 vehicles and tractors, compared with 164,760 in 1952, when production was disturbed by strikes and the laying down of new assembly lines. The 42 per cent increase far exceeds the 16 per cent rise in the volume of production reported by the industry as a whole.

The expansion in profits is equally impressive. But a direct comparison between 1952 and 1953 is of little value because earnings for 1953 include the unspecified profits accruing to Briggs Motor Bodies in the six months after its purchase by Ford. Moreover, no figure is given for the pre-acquisition profits of Briggs. The group's net profits last year were £5,131,327; the year before Ford earned a net profit of £3,029,526 while Briggs earned £769,617. The advance in net earnings masks an even bigger increase in trading profits; the 1953 profits are struck after charging £10,693,000 for taxation (including £2,766,000 for EPL), compared with a tax charge of £5,750,000 in 1952. Last year Ford's total income was of the order of £18.4 million, compared with £12.4 million in 1952.

Bigger profits, as the market expected, have brought bigger dividends. The directors have now recommended an ordinary dividend of 12 per cent on a capital of £19,512,124, as increased by the 100 per cent share bonus and the £1,512,124 issued when Briggs was acquired; this dividend absorbs £1,287,800. The year before the company paid a dividend of 15 per cent, absorbing £708,750, on the original capital of £9 million. The effective increase in the dividend is from 7½ to 12 per cent, and after this announcement the £1 ordinary shares were marked up by 4s. 9d. to 49s., to yield 4.9 per cent. The disappearance of EPL ought to leave the way clear for larger distributions in the future.

Market hopes rest on the belief that Ford has toughened itself more energetically than its rivals against the competitive struggle ahead. Last year it bought out Briggs (securing its body supplies), completed its range of models and reduced its selling prices. It is typical of the company's attitude that on the day of its preliminary report it announced cuts in its export prices, designed specifically to counteract the growth of German competition. The cuts ranged from £6 on the Anglia to £22 on the big Zephyr. Beneath its newly strengthened muscles lie the bones of a giant, keeping costs down by highly mechanised production, by vertical integration, and backing up sales by an unrivalled repairs and service organisation.

Another Copper Refinery

ROAN Antelope Copper Mines is to build an electrolytic copper refinery at Ndola, Northern Rhodesia. This will bring the number of electrolytic refineries serving the

THE ECONOMIST, MARCH 27, 1954

Rhodesian copper belt up to three. The Anglo-American group has Rhodesia Copper Refineries serving Rhokana and to some extent Nchanga; the Selection Trust group has an electrolytic refinery at Mufulira with a planned capacity of 70,000 tons a year and already up to about half that level. The new Roan refinery will cost about £3 million and have an estimated capacity of 50,000 to 60,000 tons a year with the possibility of an extension up to 110,000 tons a year at the cost of a further £1½ million. It will be powered by the Rhodesia Congo Border Power Corporation. Details of the financing are still to be decided: Roan will take up the equity of the refinery company and the balance of the money will be raised as loan capital from outside parties. The estimated additional income is given at £1 million a year.

To all appearances this move completes the supply of electrolytic refineries for the copper belt. The four big mines are all to some extent covered. But appearances can be misleading. Rhodesia Copper Refineries belongs both to Rhokana and Nchanga, but in practice it has treated far more ore from Rhokana than from Nchanga and it would not be surprising if sooner or later the Anglo-American group required a second electrolytic refinery. The emphasis today is all on electrolytic copper and rightly so. The difference between electrolytic copper of a purity of not less than 99.90 per cent and really good blister assaying 99.2 to 99.5 per cent is vital in many important uses. Certainly blister copper will always be good enough for some uses like copper sulphate, but all mines are likely to have some blister available for those markets.

One interesting aspect of the development is that Roan has always claimed that its blister is of exceptionally high quality, implying that it was within measurable distance of electrolytic purity. The company may not have changed its mind on this point, but blister copper is not good delivery against the London Metal Exchange contract, and the normal price differential today is about £15 a ton.

Austin's New Nash

THE huge initial costs of tooling for any new American automobile make full-scale trials of the market for any radically new model an enormously costly operation; but manufacture in Europe requires a far smaller investment. This is presumably the consideration that led the Nash-Kelvinator Corporation to arrange for its new small "Metropolitan" car to be built in Britain, by Austin and Fisher and Ludlow, now linked in the British Motor Corporation. Body tooling for a new model, in the United States, would probably cost some £2 million; here it may be in the region of £750,000, and Nash has moreover accepted the BMC 1,100 cc engine already in quantity production for the A40 as a proved and economical power unit.

The initial Nash order is for 20,000 units. The operation is presumably costed on the basis that on this volume it will yield neither profit nor loss, but amortise the tool costs—which might add \$150 or more to the retail price of the car. If the first 20,000 Metropolitans sell readily—and a substantial proportion will of course be absorbed in stocking up the Nash dealer organisation—the price might

THE ECONOMIST, MARCH 27, 1954

then be reduced by the amount included to amortise tooling. The basic retail price reported is \$1,480; and some such reduction may be needed if the Metropolitan is to sell freely on the American market, since the larger basic models of Chevrolet and Plymouth sell at about \$1,700.

But if the Metropolitan should succeed and suggest to the American industry that a car comparable in size to the medium European cars could be sold in high volume in the US market, the implications for imported cars there might be serious. Such models might be made in Detroit, and if so, might become available in competition in part at least of the neutral markets of the world. Motor manufacturers outside America have hitherto derived a considerable advantage from the fact that the higher standard of living and lower cost of fuel in the USA have kept the size, weight and fuel consumption of US cars well above what is generally acceptable elsewhere. To meet direct competition from Detroit, on a comparable car produced in quantity—and perhaps when dollars are no longer short—would be an unenviable prospect for any other motor maker anywhere.

Insurance Dividends

RIGHT at the head of the list of recent dividends and bonuses to policyholders from the insurance companies stand the payments just declared by the Prudential Assurance Company. Not merely because the "Pru" is the biggest of them all but also because its payments are so liberal. Its reversionary bonus on premium paying participat-

ing industrial policies is raised from 28s. to 30s. per £100 assured and on British ordinary policies (other than group pensions policies) from 34s. to 38s. per £100 assured. Following these increases, the tax free dividend on the £1 "A" ordinary shares (which is derived from the profits of the ordinary, industrial and general branches) has been raised from 21s. to 22s. 6d. a share. The tax free dividend on the 4s. "B" ordinary shares (which is derived from the profits of the general branch alone) has also been increased, from 2s. to 2s. 6d. a share.

Ordinary Shares	Dividends		Market price	Yield
	Previous Year	Latest Year		
	s. d.	s. d.		£ s. d.
Britannic 5/-	2 9½	3 0	5½	5 3 11
Equity & Law £5 (30/- pd.)	5 0½	5 0½	13½	3 9 3
Legal & General £1 (5/- pd.)	6 9	6 9	10½	3 5 1
Life Assoc. Scot. £40 (£10 pd.)	40 0	40 0	41½	4 16 5
Northern £10 (£1 pd.)	18 0	20 0	27½	3 15 10
Pearl £1	12 0½	12 0½	21½	5 0 4
Prudential "A" £1	21 0½	22 6½	38½	5 7 0
Prudential "B" £1 (4/- pd.)	2 0½	2 6½	4½	4 12 2

*Equivalent rate after share split; actual rate was 21½ on each £1 share
†Tax free.

The "Pru" has, thus, again been able to blunt the edge of the cautionary remarks made when its articles were modified in 1952. Then, the directors stated that they did not expect that the profits from either the ordinary or the industrial branches would expand sufficiently to allow more than 90 per cent of the surpluses to be allotted to policy holders while making "proper provision" for shareholders. Profits have expanded more quickly than the directors thought and the latest distributions divide the surplus in the ratio of 91.2 per cent for policyholders (against 90.6 in 1952 and 90.0 in 1951) and 8.8 per cent for shareholders (against 9.4 and 10.0).

Not all the insurance companies have been so liberal as

How British Trade Goes

DESPITE the American recession and the disappointing trend of total exports, Britain's trade deficit did not materially worsen in the first two months of this year, and the deficit with the non-sterling countries narrowed. Credit for this must go to a largely seasonal fall in imports in February, to a further improvement in the terms of trade, and to the fact that, so far, the American recession has not really lapped other shores.

The fall in exports to the non-sterling area in January and February was accompanied by a much larger fall in imports from that area. As a result, the deficit in trade with the non-sterling area fell again in January and February by £11 million to a monthly average of £21 million, which was £6 million below the average for the first quarter of last year. The remarkably moderate drop in exports to North America was more than offset by the drop in imports, so that the North American trade deficit fell by a further £5 million to an average of £15 million in January and February.

Trade with the OEEC countries and their possessions has remained almost steady. Exports to the rest of the non-sterling world fell by only £1 million a month in January and February, but imports fell by £6 million a month.

the "Prus," though last year their surpluses must have felt the benefit of higher interest earnings and of the business secured during the earlier inflationary period (the effect of which takes some time to seep through to the distributable surpluses). And, to judge by the increase in the dividend on the Prudential "B" shares, the general branches may have been more profitable than they were. Interest rates are now lower; industrial and ordinary policies are not so easy to sell as they were, even the competition for pension funds business is keener. But the margin of cover for insurance dividends is also highly satisfactory.

Running Down Coal Stocks

So far this year, coal consumption in Britain has been about 1,200,000 tons higher than it was in the same weeks of 1953. An increase of about 2½ per cent is not surprising, since the weather, on average, has been about two degrees colder, and industrial activity is running at a markedly higher level. It is, indeed, no more than the increase in production that the National Coal Board mentioned at the beginning of the year during its negotiations with the miners, though remaining careful to make no promises to the country's consumers. But the miners, and coal production, are not keeping pace.

Output from the mines in the first 11 weeks of the year was only about 190,000 tons more, or less than half of one per cent better, than twelve months before, and since open-cast production has been lower the total output shows hardly any increase. Stocks have therefore been run down considerably more than in early 1953, though they are held closer to the point of consumption. On March 13th there were 13,392,000 tons of coal in distributed stocks and 1,802,000 in the industry's own stocks, compared with 12,756,000 tons distributed and 3,750,000 in colliery dumps and opencast stocking grounds a year before. These stocks are entirely adequate to end the winter, but the industry will be much less comfortably placed to begin building stocks during this summer than last.

The Board's talk of an increase of 5 million tons was originally directed to its financial implications—this, roughly, appeared to be the extra tonnage required if the Board was to pay the miners' higher wages without a general rise in the price of coal. Its experience so far will not have been encouraging; whether this will persuade it to make more of its "changes in the price relativity" between different types of coal is not yet clear. Its marketing department has been moving up the price of anthracite coals, which are among the most costly to produce. The Board's intentions concerning the price of carbonisation coals remain hidden, and the cause of some apprehension to the steel industry; but from the gas industry, the other major consumer, there came this week one robust voice calling for an end to control of supplies and price for both coke and coking coals. This was in "Focus," a bulletin circulated within the North-Western Gas Board; it argued that when demand for coke is high a price for coking coals freely "related to cost" would ensure that the gasworks and coke ovens, who unlike some of its other consumers really need this coal, could make sure of getting it.

Air Freight Concessions

THE international airlines are today as divided over the question of whether air freight rates should be cut in an attempt to attract more traffic, as they were two years ago over tourist fares. So far there has been no general cut in rates, but significant concessions have been announced and the shipping agents are now co-operating to take full advantage of them. Next month, provided that the United States government does not raise legal obstacles, a 30 per cent reduction is to be made on consignments weighing 200 kilograms and over carried on the North Atlantic route only. A 25 per cent concession for all consignments weighing 45 kilograms and over has been in force since 1947. The new concession represents a compromise between the rate cutters, headed by Pan American World Airways which threatened to introduce an all-round 30 per cent reduction in the rates it charged, and the no-change group.

All airline rates, freight as well as passenger, are fixed by the International Air Transport Association, and governments insist that operators flying into their territory observe IATA rates. But it is becoming demonstrably impossible to control freight charges. Any operator is free to file a special "commodity" rate and thus undercut the general freight rates. Unless objections are raised to this rate by other airlines, which does not usually happen, IATA simply rubber stamps the new commodity rate as the one at which airlines flying on that route are permitted to carry that particular cargo. This procedure makes it possible to offer substantial inducements to shippers, but it is cumbersome, and percentage discounts on big consignments are, from the shippers' point of view, more attractive. Seventeen of the big British shipping agents have now formed a company, Groupair (Cargo) Ltd., so that they can consolidate the small packages passing through their hands into consignments big enough to qualify for the bulk discounts.

The company published its first list of rates over the week-end. The normal freight rate from London to New York, for example, is 17s. 3d. a kilo, and the rate for consignments of more than 45 kilos, 13s. a kilo. The consolidated rate offered by Groupair is 15s. 7d. a kilo for small packages, with big parcels travelling at the normal IATA rebate. To Johannesburg, the IATA charge is 23s. 1d. a kilo, the consolidated rate, 20s. 9d. a kilo, and the bulk rate, 13s. a kilo. Rates for freight consolidated to qualify for the 30 per cent rebate for 200 kilo packages on the North Atlantic have not yet been published, because it is still not certain whether they can come into operation. If they are approved, there will be four different general cargo rates on the North Atlantic, the basic IATA general rate, the consolidated rate, the IATA rate for consignments weighing between 45 and 200 kilos, and the IATA rate for consignments of 200 kilos and over—and, on top of this, the multiplicity of special commodity rates filed by different airlines.

Recovery in Rubber

AFTER falling just below 16d. a lb in London early this month, natural rubber has since risen to about 16½d., thanks to the improvement in New York; this springs

tonnage oxygen and steel

OXYGEN IN BULK has already proved its value in steel making. As new processes are adopted, medium purity or "tonnage" oxygen will help to make more steel better and cheaper.

Big scale use of tonnage oxygen in the basic steel-making processes means a new plant somewhere. Each case calls for careful study—and costs will be lower in the long run if the method of supply is exactly matched to the project.

British Oxygen are established builders in their own workshops of high purity oxygen plants—including the very largest. Having worked closely with the steel industry on research and experiment in the tonnage oxygen field, British Oxygen are equipped and ready for every practical application.

PAL

At Manila, when the PAL airliner from London touches down, the word is "Welcome Home." Based on Manila, and operating frequent services to Hong Kong, Taipei and Tokyo, Philippine Air Lines are expert in far-eastern ways and means. That is one good reason for flying east under PAL's wing, but there are others.

With PAL you fly long stages, stopping only at focal points of the international network. There is plenty of room for every passenger in PAL's

big Douglas DC-6 and DC-6B aircraft, and full-length sleeping-berths are available. And the same plane takes you, with de luxe service, all the way from London to the Far East.

PAL fly from LONDON to MADRID . ROME . BEIRUT KARACHI . CALCUTTA . BANGKOK MANILA. From BANGKOK to HONG KONG, and from MANILA to HONG KONG, to TAIPEI and via OKINAWA to TOKYO. And via HONOLULU to SAN FRANCISCO.

Fly east with PAL who know the East so well.

partly from the New York dock strike, which has led to a shortage of prompt rubber, and partly from a decision that is believed to have been taken on the sale of low-grade natural rubber from the American stockpile. In December, sales of this rubber to American manufacturers were cut from a maximum of 10,000 tons a month to 5,000 tons, but existing contracts were to be honoured so that sales would continue at the existing rate until the end of March. Forward deliveries, however, were limited to the month following that in which the sale was made, and requirements in excess of 10,000 tons had to be bought on the open market. This rule has had the desired effect of narrowing the discount on the low grades. The American manufacturers probably hoped to persuade the authorities to modify their attitude. The recent increase in American purchases may indicate that they have failed. The New York market, which owing to the freight differential should in theory be $\frac{1}{2}$ d. a lb above the London market—but has in the past often been depressed to parity—is now $\frac{3}{4}$ d. above London; and the small advance in the London market has encouraged a slightly better demand from British and Continental buyers.

The reduction in the planned output of GR-S synthetic rubber in America in the second quarter has also been interpreted as favourable to natural rubber. The Reconstruction Finance Corporation's announcement was made three weeks after it had published its estimates of output and sales for that quarter. Owing to the declining trend of sales, output of GR-S will be cut by about 7,000 tons to 106,300 tons to prevent government stocks from exceeding the limit of 85,000 tons. Sales in June are estimated on the basis of firm orders placed by large consumers at only 32,500 tons, compared with 38,700 tons in January. This could imply a proportionate fall in total consumption of rubber in America, a proportionally larger usage of natural, or a mixture of the two. Total consumption in February fell slightly to 95,100 tons, but the proportion of natural rubber used rose further to 49 per cent. World consumption of natural rubber in January rose by 15,000 tons to 137,500 tons, while production dropped by 7,500 tons to 160,000 tons, still leaving a sizeable surplus of 22,500 tons. The surplus may fall appreciably with the seasonal decline in production between February and April, provided that total consumption in America recovers.

Titanium from Japan

A BRITISH company has concluded a contract to import titanium sponge from the rapidly expanding Japanese titanium industry, which claims to have become the world's second largest producer—after the United States—of this tough light metal. About 2,500 tons of titanium sponge was produced in 1953 by the two plants now operating in the United States, and there was some production from the pilot plant that Imperial Chemicals has built in this country; the Japanese output is reported as 70 tons, of which 44 tons was exported to the United States. The production of titanium ingots from the sponge produced in the primary refining process is itself a formidable undertaking; the Japanese producers, who are for the present selling the crude sponge, seem to be encountering some difficulty

in finding customers who can handle this secondary job.

The Japanese have been talking of an output rate of about 50 tons a month this spring, though their present production is probably no more than a quarter of this; and planning a further rise to 100 tons a month by April, 1955. This may be compared with firm American plans for about 800 tons a month by the end of 1955, and the hopes expressed recently that output might be supplemented to reach more than 3,000 tons a month by 1956; and also with ICI's plans—about 12½ tons a month from the pilot plant this summer, and by the end of 1955 a plant designed to produce about 125 tons a month and to process the metal through to ingot and rolled products. Another British company has recently been formed to fabricate titanium billets into rolled and forged products.

In the United States, as in Britain, arguments continue to be voiced that the present rate of development for titanium—for which demand seems certain to increase as aircraft approach the "heat barrier"—is not rapid enough, and the Japanese producers are therefore hoping to export nearly all their eventual output. For the present, however, the shortage in the United States seems largely to be vocal or on paper. At the same time that Senators were hearing scare stories of long-term shortage from consumers, those same consumers were receiving circulars from the Government imploring them to buy more and clear some of the accumulating stocks. In Britain, the Ministry of Supply has not found it necessary to buy up to the limit of the contract for experimental supplies of titanium that it has with one of the American producers, and a review of supply prospects over the next few years has strengthened official confidence that the capacity planned by ICI for 1955 and after will be sufficient. One contribution to the wider use of the metal has come from the Titanium Metals Corporation of America; it has reduced its current prices—about £7 a lb—by 12 per cent, as a result of production economies in its present conventional refining process.

More Credit for Exporters?

THE British exporter has his problems, but he must count himself well served in the facilities which he enjoys for credit insurance. A government department vies with private enterprise to insure his credit risk, the Export Credit Guarantee Department being in partial competition with firms like the Trade Indemnity Company. Special arrangements have also been made to provide finance for export industries. This week brings news of another venture, the Manufacturers Export Finance Company, to supplement the work of the Export Credits Guarantee Department; it will allow the exporter to get the bulk of his money before the credit to the foreign buyer expires.

The proposed company will have an issued capital of 250,000 £1 shares 4s. paid. Most of the capital is to be subscribed by firms in the engineering industry and only 20 per cent by the firm of Heller and Partners, merchant bankers. It is hoped that bank credits of at least £2 million will be available to the new company at rates of about 4½ per cent, and that the total charge payable by the foreign buyer for the new company's facilities would not exceed

6½ per cent exclusive of the ECGD's charge. What the new company offers to do is, in effect, to discount the ECGD bill. It will find the prompt cash, but to the extent only that the British Government has insured the transaction; it facilitates extended credit to the foreign buyer, but for no longer than the credit insurance runs.

The need for this new facility will now be put to the proof. If it scores a real success, it will do so without any direct connection with the large merchant banks and acceptance houses. This will be a considerable achievement for the engineering firm of Tangye. The only one of the manufacturing companies supporting the plan which has revealed its identity. Have the great houses of finance and industry missed a fine opportunity—or will the gaps in the British credit machine be proved to be not so wide after all?

SHORTER NOTES

Dorman Long was most active in the 53 weeks to October 3rd. Improved raw material supplies contributed towards the increase in production. Its exports of rolled steel increased and a further improvement in the results of its constructional and engineering activities took place. The group's trading profits advanced from £6,579,693 to £7,863,972. This profit, however, includes over £1,800,000 from the premiums on steel exports; these premiums are now rapidly declining. Its order book for heavy steel products and constructional work is still strong, but there has been some contraction in the demand for re-rolled products. Dorman Long spent about £4½ million on capital account in the year under review and has now entered the third stage of its development programme, which will cost more than £36 million.

The Standard Motor Company has now virtually abandoned the one-model policy that it pioneered after the war. A 10 horse-power version of the new Standard 8 has gone

into production, with a number of refinements, such as a rear-opening boot and a higher degree of interior finish, but the same wheelbase. The basic price is £409 (£580 10s. with tax) compared with £339, or £481 7s. 6d. with tax, for the lower powered car.

Van den Berghs and Jurgens, a subsidiary of Unilever Limited, will sell Stork, its first quality margarine, at 1s. 9d. a lb after rationing ends on May 8th, and Echo, its second quality brand, at 1s. 4d. a lb, 2d. cheaper than the controlled price of the existing national grade. The company is by far the largest manufacturer of margarine in Britain, and its prices are likely to set the standard for the industry. The controlled price of butter is 3s. 8d. a lb.

There are three links in the chain of Dowty Equipment's latest proposals. The full year's tax free ordinary dividend is raised from 22 to 33 per cent. Dowty Equipment, now controlling ten subsidiaries, is to form a new holding company, Dowty Group, Limited, and will offer three fully paid 10s. shares in this company for every 5s. ordinary share in Dowty Equipment, which has an issued capital of £300,000. If these proposals go through, the new company will offer by "rights" in the ratio of one for three 1,200,000 new 10s. shares at 10s. 9d. Two new factories will be built and in the future the company's interests in hydraulic equipment for general industrial purposes may become of more importance than its interests in aircraft landing gear and components.

Gallaher, the tobacco company, has raised its equity dividend from 17 to 20 per cent. The latest final dividend of 15 per cent is to be paid on an ordinary capital of £4,937,500, as increased by the issue of £437,500 capital when the company acquired Cope Brothers last January. The group's net profits in 1953 advanced from £744,167 to £913,438.

were marked up by 9d., to 34s. 9d., to offer a yield on the hypothesis of a 3s. dividend—and it is nothing more than a hypothesis—of 8.6 per cent.

HARRODS. The unusual feature of Harrods accounts is that trading profits are shown before charging wages and salaries and other operating expenses. In the year to January 31st these profits rose by 17 per cent, from £5,863,306 to £6,880,891. But operating costs rose as well, with wages and salaries increasing from £2,903,022 to £3,268,931, so that profits before tax rose by only £366,833 to £1,786,424. In his statement the chairman, Sir Richard Burbidge, makes it clear that the advance in profits stemmed from a rise in the volume of sales. Prices were lower but the Harrods stores served far more customers.

Trade was slack at the beginning of the financial year and then began to pick up as the Coronation approached. This was as the directors expected but they were surprised when the improvement gathered momentum through the second half of the

year, rising to a peak at Christmas. Sales over the whole year established a new record, enabling the group to absorb any losses on stocks when purchase taxes were reduced. Not all departments shared in this improvement, for the mild autumn weather adversely affected the sale of winter clothing. In explaining the happy outturn Sir Richard singles out the reduction in taxes in general as well as in

£1 ordinary stock at 45s. 6d. yields £6 12s. per cent.

purchase tax and the relaxation of controls. The middle classes had a little more money in their pockets and the Harrods group, particularly in London, was an obvious beneficiary. At the same time the company's buyers had a greater freedom of choice to meet these revived demands.

The revival in trade is reflected in the balance sheet by the increases in stocks (from £3,144,864 to £3,449,602) and in debtors (from £1,822,232 to £2,229,267). Hence there was some reduction in the group's liquid assets, reflected in the sale of part of its gilt-edged holdings. But the group's liquid reserves are still ample and on this score, associated as it was with an increase in profits, the directors could have

had no qualms in raising the equity dividend from 13½ to 15 per cent. Sir Richard implicitly avoids the question whether this is all that shareholders can expect in the future by refusing to make any forecast about prospects.

HADFIELDS. Hadfields is not in the first list of steel companies to be sold back to the public, and the chairman, Lord Dudley Gordon, in his statement with the full accounts, says "it is too early to estimate when this operation will take place." Judging by the pace of the steel share offers, the Iron and Steel Realisation Agency may remain the only shareholder in Hadfields for some time. But the accounts of the group are of some interest in showing how well the manufacturers of forgings and castings have fared and are likely to fare in the future.

In the 53 weeks to October 3rd last, the group's sales rose again and its trading profits advanced from £1,038,383 to £1,344,155. In the same period its stocks rose in book value from £2,642,425 to £2,913,325. In part this expansion in sales was the inevitable counterpart of the group's development programme, which has largely been financed by loans from the Agency. At the beginning of October these loans totalled £3,205,000, compared with £2,605,000 the year before.

The increase in the value of sales by the Hadfields group was due to a small extent to a rise in prices but sprang in the main from a further expansion in output. Towards the end of the financial year the value of orders received began to decline but "the backlog of unfulfilled orders made it possible to maintain and increase the rate of output from the works." The group has still enough orders on hand to keep its works fully employed in the current year. But, in drawing attention to the growing threat of foreign competition, the chairman reveals the anxiety that some directors of steel companies must feel about the thinning out of order books.

LONDON STOCK EXCHANGE

Next Account begins: March 31st.
Next Contango Day: March 31st.
Next Settlement Day: April 6th.

CONFLICTING influences were at work in the stock market this week. Just before the weekend gilt-edged prices responded to the new arrangements for sterling but then the demand for the Funds was restrained by the large sums tied up in the heavily over-subscribed ICI issue, and prices faltered. Later in the week, however, gilts took another turn for the better. The renewal of demand was also reflected in advances in Dominion and Colonial stocks. Interest in the foreign market was concentrated almost exclusively on German issues which surged forward on a wave of buying orders; by the close on Wednesday the Young loan was quoted at 133 and the Dawes loan at 88½. Some switching out of Japanese issues into German stocks was reported and they lost some ground.

No marked trend became apparent in equity prices, though the market was turning a little firmer on Wednesday. The market was dominated by shares that responded to various dividend announcements. Motor shares, for instance, improved after the announcement of the increase in the Ford dividend. Tobacco shares were in rather better demand and on Thursday Gallaher put on 1s. 3d. to 26s. 6d. in response to the higher dividend. Electrical equipment, textile and brewery shares tended to droop. Engineering issues made rather a mixed showing, but Dowty Equipment put on 4s. to 61s. 9d. when a bigger dividend was announced. Unilever NV went ahead on buying from Amsterdam and then fell back when Amsterdam became a seller.

Oil shares moved somewhat irregularly, but Anglo-Iranian continued to edge upwards, to close on Wednesday at 10½. Kaffir shares were unsettled by the reports of the merger and capital reconstruction of Freddie's North and Freddie's South, which lost heavily, and losses were scattered throughout the list. Kaffirs, along with South African industrials, took a turn for the better when the details of the South African budget became known.

Company Notes

DEBENHAMS. The directors of Debenhams, controlling the largest chain of department stores in this country, appear to be sticking to their guns, fighting off any suggestions that the company's extensive properties should be hived off into a separate company. In his last statement the chairman, Mr G. M. Wright, argued very strongly against this policy, and the associated one of selling off the freeholds and taking the properties back on leases. Those ideas were associated with the belief that Mr Charles Clore and his associates already hold about 10 per cent of the equity. To do what Mr Clore might be expected to do would be one way of keeping him at bay. Another would be to pay extravagant dividends so as to hoist the shares beyond his reach. But the latest interim dividend from Debenhams suggests that the board is still opposed both to extravagant dividends and to saddling its stores with heavy rent charges.

The directors have now declared an interim dividend of 9d. on the 10s. ordinary shares. It is liberal but not extravagant. Last year they paid an interim dividend of 6d. and followed it up with a final of 1s. 6d. on the 4s. shares, which were later written up to a nominal value of 10s. by a bonus issue. The presumption is that, though the company's financial year has still four months to run, profits earned by the Debenham group are at least as buoyant as those recently reported by other department stores. Profits should now be responding to the coming into full operation of Debenham's new businesses and war-damaged stores.

The latest dividend has thrown estimates of the full year's payments into the melting pot. Before the announcement the market had set its sights on a full year's dividend of 2s. 6d. a share (or 25 per cent). Now it has to consider the possibility of a payment of 3s. (or 30 per cent). After the announcement the shares

EXCHEQUER RETURNS

For the week ended March 20th, there was an "above-line" deficit (after allowing for Sinking Funds) of £68,768,000 compared with a deficit of £5,255,000 in the previous week and a deficit of £28,221,000 in the corresponding period of last year bringing the cumulative surplus to £145,408,000 (£166,425,000 in 1952-53). Net expenditure "below-line" absorbed £27,717,000, which brought the total cumulative deficit to £278,033,000 (£412,644,000 in 1952-53).

In consequence of official purchases of tender bills in connection with cash subscriptions to the Exchequer Stock in October, it was impossible to calculate the division of tender bills until all the bills purchased had reached their original maturity date.

Financial Statistics

THE MONEY MARKET

CREDIT conditions in Lombard Street remained comfortable in the week covered by the Bank return. On Thursday before the weekend considerable Government disbursements gave rise to a sizable surplus of funds, and some overnight money was still unlent at 1 per cent. On the succeeding days credit was slightly more usable but still adequate for market demands. After the weekend the market was still able to balance its books without aid from the authorities, though credit was no longer in surplus. Throughout the week, May and June bills changed hands at 2½ per cent, though on Thursday of last week some business was done in April maturities at 1½ per cent whereas on Wednesday the market sold some June maturities at 2½ per cent.

The steady rise in the size of total applications that has been taking place at recent Treasury bill tenders was checked last Friday, when applications for the £260 million of bills on offer dropped by £49 million to £365.6 million. The upshot was that although the market maintained its bid at £99 9s. 5d. for the reduced offer its allotment rose from 45 to 60 per cent. The offer at yesterday's tender was restored to £270 million.

The Bank return shows an outflow of notes of £3.1 million in the week to Wednesday last. Government securities in the banking department fell by £2.4 million and other securities also fell on balance by £2.5 million. Moreover, public accounts rose by £5.3 million, and as other accounts fell only fractionally bankers' deposits fell by fully £11.7 million from last week's high level to £281.0 million. The market gold price of 148s. 3d. per oz has been used in the Bank return.

The man of means who isn't as young as he was

Just as some people put off the making of a will, so others (even the most farséeing ones)
fight shy of getting to grips with the problems which the family or the business will have to face when estate duty
demands come home to roost. These problems—so deeply personal and so complicated—
are not usually solved by standard, ready made, insurance formulæ.

The long experience of Arbon Langrish proves that the application of specialist knowledge
to individual cases can often cut right through apparent complications to provide a solution—a solution which
enables the Man of Means, who isn't as young as he was, to face the family and the business
with a heartening confidence and to feel himself a freer man.

A discussion with a member of the advisory staff of Arbon Langrish will be treated in confidence
and is of course without obligation. Arbon Langrish are independent of any insurance company and are, therefore,
free to give you unbiased advice and the most favourable rates.

The advice of Arbon Langrish

is available to principals, solicitors and accountants, on all matters relating to
estate duty, settlements, gifts and pensions.

NOTICE OF OFFER FOR SALE

CANADIAN AND ENGLISH STORES LIMITED

(Incorporated under the Companies Act, 1948)

Authorised:	SHARE CAPITAL	Issued:
£500,000 in 2,500,000 25 per cent. Non-cumulative Preference Shares of 4s. each		£500,000
£250,000 in 1,250,000 Preferred Ordinary Shares of 4s. each		£250,000
£250,000 in 1,250,000 Deferred Ordinary Shares of 4s. each		£250,000
£1,000,000		£1,000,000

(No Company in the Group has any outstanding Mortgages, Debentures, Loan Capital or Bank Overdraft).

Offer for Sale by

WHITEHEAD INDUSTRIAL TRUST LIMITED

of 1,250,000 Preferred Ordinary Shares of 4s. each at 22s. per Share

(ranking for the full amount of all dividends thereon in respect of the year ending 31st January, 1955).

DIRECTORS:

THE RIGHT HON. LORD MILNER, P.C., M.C., T.D., D.L., LL.D., Summer Hill, Roundhay, Leeds 8 (Chairman).
HARRY BROOKS, Rocklands, Bollin Hill, Wilmslow, Cheshire (Managing Director).
NORAH BROOKS, Rocklands, Bollin Hill, Wilmslow, Cheshire (Director of Pooles Central Warehouse Limited).
HYMAN CASSELL, 16 Harrod Drive, Birkdale, Southport, Lancashire (Managing Director of Pooles Central Warehouse Limited).

BANKERS:

MIDLAND BANK LIMITED, Stockport Road, Levenshulme, Manchester 19.

SOLICITORS:

To the Offer: RICHARDS, BUTLER & CO., Trafalgar House, 11 Waterloo Place, London, S.W.1.
To the Company: HALL, BRYDON & CO., 56a Mosley Street, Manchester 2.

ACCOUNTANTS REPORTING TO WHITEHEAD INDUSTRIAL TRUST LIMITED:

FRANKLIN, WILD & CO., Orient House, 42-45 New Broad Street, London, E.C.2. Chartered Accountants.

AUDITORS:

F. W. POPPLEWELL AND SON, 48-50 Mosley Street, Manchester 2. Chartered Accountants.

BROKERS:

KEITH BAYLEY & RIGG, 15 Copthall Avenue, London, E.C.2, and The Stock Exchange, London, E.C.2.

SECRETARY AND REGISTERED OFFICE:

RICHARD OGDEN, A.C.A., 2-40 Station Road, Wigan, Lancashire.

REGISTRARS AND TRANSFER OFFICE:

WHITEHEAD INDUSTRIAL TRUST LIMITED

Mitre House, 177, Regent Street, London, W.1.

Licensed Dealers in Securities. Directors: A. J. Whitehead, J. D. Kyle, C.A.

The Offer for Sale shows (inter alia) that:

1. The Company owns the whole of the Shares of Pooles Central Warehouse Limited and of the Common Shares of M.R.A. Holdings Ltd. These Companies, either directly or through subsidiaries, carry on in England and Canada the business of departmental Store Proprietors and House Furnishers.
2. The net profits of the Group for the year ended 31st January, 1953, calculated on the basis stated in the Accountants' Report and subject to taxation, were £391,273 or, after charging Directors' emoluments and Registrars' Fees in accordance with the arrangements now in force, £364,225. On the basis of the interim monthly accounts of the Companies included in the documents open for inspection under the Offer for Sale the net profits of the Group for the year ended 31st January, 1954 (subject to taxation) will be in excess of £500,000.
3. The Directors, after consultation with the Auditors and in light of the information shown by the monthly accounts, are satisfied that the audited accounts for the year will show a net profit of not less than £500,000 (subject to taxation) as compared with the estimate of £450,000 made in the Offer for Sale in November last.
4. In view of the expansion which has taken place during the last few months and of the further expansion which is anticipated to result from the loans Mr. H. Brooks has contracted to make, the Directors estimate that, in the absence of unforeseen circumstances, the net profits of the Group for the year ending 31st January, 1955, calculated on the same basis as for the previous year, will be not less than £700,000 (subject to taxation).
5. If this estimate of profits for the year ending 31st January, 1955 is realised, the Directors, in the absence of unforeseen circumstances, will recommend the payment of the non-cumulative dividend of 60 per cent. (less tax) on the Preferred Ordinary Shares for the year, and will also consider the payment of an additional dividend on such shares. The Directors intend to pay, on account of the non-cumulative dividend of 60 per cent., an interim dividend of 30 per cent. actual (less tax) in the month of October next.
6. At the offer price of 22s. per share the Preferred Ordinary Shares show a yield of 10.9 per cent. on the fixed non-cumulative dividend thereon.

The list of applications will open and close on Thursday, 1st April, 1954.

ADDRESS IN FULL.....

THE BOWATER ORGANISATION

AT THE ANNUAL GENERAL MEETING of The Bowater Paper Corporation held at Sittingbourne, Kent, on the 18th March, 1954—attended by a record number of shareholders who subsequently toured the Kemsley Mills—the Chairman, Sir Eric Vansittart Bowater, reviewed the affairs of the Organisation.

Commenting that the Accounts of the Corporation and its subsidiaries disclosed a very strong financial position, Sir Eric said it might perhaps be thought by some that the proposals with regard to an Ordinary dividend were lacking in generosity, but in continuing the established conservative policy in this connection regard had been had amongst other considerations for the outstanding Options for a further 1,800,000 Ordinary Shares exercisable by May 31st of this year, for the necessity of maintaining the many plants to an entirely up-to-date and competitive level, and on this occasion the alteration of the date to which the accounts are made up, which would now coincide with the calendar year.

Although not previously the practice to pay interim dividends, in view of the current financial period now being extended to 15 months it would be the intention on this occasion to pay an interim dividend during the latter part of this year, provided the earnings at the relative time justify that course. The continuance or otherwise of paying interim dividends thereafter would be considered in the light of the then prevailing circumstances and conditions.

Sir Eric also announced that subject to the consent of the authorities it would be proposed, after completion of the forthcoming issue of new capital under option, to distribute to shareholders by way of a scrip dividend some part of the now very substantial reserves of the Corporation on the basis of one new £1 Ordinary Share for every £3 Ordinary Stock then held.

In the maintenance of a leading position in the industry, the organisation had, in the years since the end of the war, spent or would be spending on development and expansion throughout the world approximately £45 million, of which only some £24 million had been provided by the issue of new capital—mainly in respect of the new mills in Tennessee which would come into operation in May next—and the balance of this expenditure had been or, it is expected, would be provided out of the Organisation's own resources.

The Organisation as a whole entered the new year with full order books; indeed the production of all its mills, including the new mills in the United States, had been sold for some long time ahead, mostly under long term contracts. Prices for both finished products and raw materials would seem to have reached a reasonable degree of stability, whilst preliminary figures in respect of the current financial year show their earnings to have been maintained at a reasonable level, and if these conditions continue, as they well may, the Organisation might justifiably look to the future with some confidence.

STEEL COMPANIES, LIMITED

REVERSION TO PRIVATE OWNERSHIP

COMPANY'S WIDE VARIETY OF PRODUCTS

POLICY OF IMPROVEMENT AND DEVELOPMENT

SIR WALTER BENTON JONES ON EXPORTS

The thirty-fifth annual general meeting of The United Steel Companies, Limited, will be held on March 29th at the Chartered Insurance Institute, 20 Aldermanbury, London, E.C.

The following is the statement of the chairman, Sir Walter Benton Jones, Bt, which has been circulated to shareholders:

At the time of the last annual meeting the company had only one shareholder—namely, the public authority called the Iron and Steel Corporation of Great Britain. Now it has about 30,000. Of these, probably some 5,000 have been shareholders before, but the remaining 25,000 are new.

AN HISTORIC EVENT

The reversion to private ownership makes this thirty-fifth annual meeting an historic event. Moreover, many shareholders are newcomers and some may not even be familiar with company procedure. I may be excused, therefore, if I make my statement in a personal form, and if I repeat some things which are already known to former shareholders.

Every limited liability company is required by law to hold a general meeting of its shareholders once a year. At this meeting the directors are required to present accounts and a report of the past twelve months' working; they are also required to confirm the appointment of new directors, if any, made during the year, to reappoint directors retiring by rotation and to appoint auditors for the ensuing year.

The directors are appointed by the shareholders and the chairman is chosen by the directors themselves from their own number. The chairman presides at general meetings of shareholders, and it has become a custom for him to give a verbal address at its annual meeting, or more recently to issue a statement in writing beforehand about the company's affairs, and to express views on general topics which may affect the company's business.

The Iron and Steel Act, 1953, transferred on July 13, 1953, all the securities of iron and steel undertakings held by the Iron and Steel Corporation of Great Britain to a new body called the Iron and Steel Holding and Realisation Agency. It is the duty of the Agency to restore all these undertakings to private ownership. Since the accounts were closed on October 3, 1953, our company has been so restored. It was among the very first to be restored. Our ordinary shares were offered for sale on October 23, 1953, but it was not until the last instalment of the purchase price had been paid on January 28, 1954, that the number of holders could be finally ascertained and a beginning made of entering their names and holdings in the company's register. The number was approximately 30,000. To register such a large number of shareholders and send them 21 days' notice of a meeting takes time and

this is why the meeting is later than it would be in normal circumstances.

SHARE AND LOAN CAPITAL

The following is the form of our share and loan capital as reconstructed on October 23:	
14 million ordinary shares of £1 each, fully paid	14,000,000
Old Preference shares:	
5,097,000 4½ per cent cumulative preference shares of £1 each, fully paid	5,097,000
New Preference shares:	
4 million, 5½ per cent redeemable cumulative preference shares of £1 each, fully paid	4,000,000
£10 million 4½ per cent debenture stock, 1968-78, £23 per cent paid	2,300,000
	£25,397,000

The ordinary shares, and with them the voting power, are now all in private ownership. Both classes of preference shares and the debentures are still in the ownership of the Agency.

The directors' report which you have already received tells you what the output of primary products has been and comments on the accounts and the disposal of the surplus resulting from the year's operations.

NINETEEN YEARS' PROGRESS

The offer for sale dated October 23, 1953, included a copy of a letter from me addressed to the agency. This letter gives a short history of the company's development policy, capital expenditure, working capital, profits, and prospects. It is so recent that I need not go over the ground again now, but for your convenience I attach a copy of it.

As you will see from the letter, the most interesting feature of the company's affairs is the development since 1935, 19 years ago. There would have been considerable development in the ordinary course, but rapid growth in the demand for steel has called for large extensions.

It is perhaps not generally appreciated that until 1936 steel production in the United Kingdom had never exceeded 10 million tons. In 1953 it was 17,609,000 tons, which is three-fourths more than in 1936. This bare statement of the increase in production of crude steel is only part of the picture. Raw materials and every stage of operations up to the finished products have been correspondingly expanded. Our works have taken part in this expansion and, like many other iron and steel works, they bear little resemblance to what they were 19 years ago.

SPECIAL FEATURES

The name of our company tells you that we are makers of steel, but I would like you

to know more than this. There are four main and special features about our company. First, our operations have been rationalised—that is to say, each works specialises in different products. Secondly, by far the greater part of our iron ore comes from quarries and mines at home which we own and work ourselves. And although we no longer own coal mines we make nearly all the coke used at our own iron works, and in making it we provide very large quantities of a variety of products which result from the carbonisation of coal. Thirdly, we are one of the largest makers of alloy steel—that is, special high-class steel, including stainless steel. Fourthly, we make a large variety of products.

You will find these features elaborated in my letter, but I feel sure you would be interested to learn more about the variety of our products. Iron and steel are household words, but by themselves they mean no more than coal or wood or stone. No steel works turn out just steel, all work it up into some forms of semi-finished or finished products. Our company has a number of works and among them they turn out many varieties of products, some large and heavy, some small and light and some very small—for example, wire much thinner than a hair. It also recovers and turns into useful channels many products which are neither iron nor steel but which arise out of the process of making iron and steel, including the making of coke. Apart altogether from steel-making we own and operate large engineering works.

A list of products with no indication of their uses lacks interest and so I am also attaching a simple story about the uses of some of our products written by a member of our staff. Much of the story illustrates the uses of steel generally, but it is an attempt to illustrate in addition the uses of many products in which we specialise. I hope you will read it.

Everyone should realise how much steel contributes to our everyday life and how the making of many things begins with steel already partially processed by steel makers.

It follows that steel makers should be free to develop and exercise their ingenuity and skill not only to secure economy in what they are doing now but also to keep on adding to and improving their products. Imagination and ideas originate in individuals; they fructify more easily and more quickly in an atmosphere of perfect freedom.

What I have told you so far and what you can read in my letter tells you about our present state. The remainder of my statement is about the future.

THE FUTURE

In the long view the demand for steel will continue to grow. More and more uses will be found for it; more and more people will use it. This is illustrated by

the growth of the production of iron (from which steel is made) since 1870 when it was surprisingly small. In 1870 the world production of iron was just under 12 million tons. In 1953 it had grown to more than 163 million tons.

Steel must remain the most important material in the world if for no other reason than that the raw material from which it is made, iron ore, is one of the commonest and the most easily smelted of all the metallurgical ores. "The earth giveth much mould whereof earthen vessels are made but little dust that gold cometh of." But we are concerned with the immediate future, and this depends upon the country's need and its ability to sell abroad.

NEED TO EXPORT

We are told that we must export more and more to pay for imports of food and raw materials and so maintain the standard of living we have voted ourselves. The Chancellor in his Budget speech of 1952 put the increase required in the export of goods at around £300-£350 million per annum, and this is now regarded as the actual surplus on our overseas current account which is needed to provide for our commitments and for some increase in the gold reserves.

It is essential that all engaged in industry should understand what this figure means. We are so accustomed to hearing and reading of millions of pounds that large figures alone may mean little.

Perhaps it would help you to appreciate how large £350 million is if we compare it with the capacity of our own company. We employ 30,000 people who, with equipment which cost nearly £60 million, produce 24 million tons of steel a year. We spend £52 million on raw materials, supplies, services, and general trade expenses, including delivery charges. When the raw materials have passed through our works they emerge as steel products worth £80 million. Thus, it can be said that we add £28 million to their value by our efforts, and that this £28 million is an addition to the country's wealth. On this showing, it would take about a dozen United Steel Companies, all working full time, to add the £350 million we are talking about in the form of goods.

INCREASED PRODUCTION ESSENTIAL

Of course, this does not mean that the country should try to settle the national account wholly by exporting steel. It is not in the country's interest that we should export all our steel in the form in which it leaves our works at a value of, say, £35 a ton. If we look at the trade and navigation accounts we find that about a million tons of machinery was exported in 1953, most of which consisted of steel in one form or another, and brought in over £400 million of much-needed foreign exchange. The value of the steel has been increased, but only by the use of manpower, and it is manpower that is especially scarce. If, however, we say that £350 million is the value created by a dozen United Steel Companies, this would mean employing another 360,000 men and £720 million worth of capital equipment, neither of which is readily available. Even if it were possible to use every man registered as unemployed it still would not give us the men we would need. Clearly, therefore, we can only get our increase of £350 million if we all produce more somehow.

Whether the sum required is £350 million or some other figure, it has to be provided by increased production. We cannot add this cost to the price of things we export because foreign buyers would not pay, and as our labour force is fully occupied we must all produce more without increasing the number of persons employed.

ABILITY TO EXPORT

Much is being said about foreign competition as if it were new. But other things have to live. Foreign competition is a thing and it is coming from the same quarters as of old. We have held our own before and we can hold our own again.

We hear a lot about long deliveries. This is not a reflection on British efficiency as is so often supposed. We are being told almost daily that we cannot hope to sell unless we can give prompt delivery, or at any rate as good as other countries offer. For some years we have been unable to offer quick delivery for the very simple reason that our order books have been so full that buyers have had to await their turn. Obviously, countries which have been out of the market for a time but are now able to manufacture again are in need of orders and can promise immediate delivery. If our orders become less we shall catch up with deliveries and we shall be able to offer quicker delivery for new business.

Then it is said that our people do not work as hard as their fathers and grandfathers. Is this said because they have more amusements and more recreations? But is it not part of a higher standard of living, for which we are all striving, that we should have more recreation? And is recreation inconsistent with hard work? Surely it is not. The assertion that the modern generation does not work as hard or as earnestly as previous generations is irritating to the industrious and fails to stimulate the lazy. Moreover, it gives a wrong impression to foreign buyers. But it is not true. In our own works we can say with emphasis that among the younger men as well as among their elders there is just as much interest in their work, just as much application and just as much imagination as ever there was, and there can be no reason to suppose that in this respect our works are any different from other steel works or for that matter any other kind of works.

LARGER OUTPUT PER PERSON

We see then that the need to produce more goods to be used for export in order to pay for our imports of food and raw materials is a matter of arithmetic and cannot be disputed. The ability to do this depends upon the rate at which we work and the money we can spare to make new machinery, and upon a larger output per person employed. But it takes time and costs money to make new machinery and so our ability to increase exports quickly depends upon a quick increase in output per person—greater productivity as it is called nowadays. The call for greater productivity is not just passing the buck on to those who work with their hands. It does not necessarily mean more sweat; what it really means is the full and better use of time. If each of the 22 million in civil employment in the United Kingdom and those who manage and steer them were to save or employ to better advantage 14 pennyworth of time every day, and this could be applied to production, we would create £350 million more wealth each year.

In the postwar years throughout the country large sums have been invested in new plant and improvements to existing plant, and in many industries we are well equipped to compete in foreign markets; but there is more to do, there always is, and in the meantime all have to concentrate on producing the maximum our plants are capable of producing.

So far as our company is concerned, we believe our plant and our resources are in good shape, but we shall continue to follow a policy of improvement and development.

On
with

The
lated
Drayton

Although the eighth annual dividend of £16,159 lower than the previous year, the total dividend of £749,479 is the highest in the group. This result is due to a smaller charge for taxation.

After providing for the preference dividends and ordinary dividends of 25 per cent, which together absorbed £195,684 (net), there remains the sum of £553,795 for appropriation.

Your directors decided to add the sum of £350,000 to general reserve, bringing it up to £1,850,000, and to recommend further strengthening the auxiliary pension fund by £50,000.

There remains £153,795 to add to the balance of profit and loss carried forward, bringing this to a total of £956,744.

The totals of the current assets and liabilities in the consolidated balance sheet are still substantial and reflect the high level of activity during the year. The overall picture is one of considerable strength.

CHANGING CONDITIONS

Although the overall results are gratifying, several of the group's activities have been adversely affected by changing conditions.

The general slackening of demand for coal has created a buyers' market which has affected the turnover of our coal department. A trend towards oil burning has caused a decline in demand in several of the traditional markets for South African coal.

The profits of our London Shipping Companies were on a lower scale than in the previous year, and unfortunately freight rates have remained very low and show no signs of improvement in the near future.

Temperleys, Haslehurst and Company, Limited, London, and our engineering subsidiary, Alldays and Onions, Limited, of Birmingham, have more than maintained their positions during the year, but our other companies in the United Kingdom, and particularly the trading sections of the parent company and our wholly-owned subsidiary Alexander Young (London), Limited, have experienced less favourable conditions.

A reduction of trade in some territories has been compensated, fortunately, by improvements elsewhere. Our companies operating abroad have again contributed the major portion of the group's income. Activities in Southern Africa in particular have continued to progress and expand, and I anticipate satisfactory trading from them in the current accounting year to June 30, 1954.

As announced on December 18th last, the directors decided subject to the requisite resolution being passed at the annual general meeting, to capitalise £243,000, part of the amount standing to the credit of the share premium account, by the issue to holders of ordinary shares registered as at the close of business on March 23, 1954, of one ordinary share of 5s. credited as fully paid for every five shares held. Consent from the Capital Issues Committee has been obtained.

I believe that our organisation is capable of overcoming existing and foreseeable difficulties, and is flexible enough to adjust itself to changing conditions and to make good use of any opportunities for suitable expansion.

THE ASSURANCE COMPANY

AS EXCEED £125 MILLION

INTERMEDIATE BONUS INCREASED

MR G. P. S. MACPHERSON'S ADDRESS

The eighth annual meeting of the Standard Life Assurance Company, held in Edinburgh on March 15, 1954, was presided over by Mr G. P. S. Macpherson, OBE, TD, CA, in the chair.

The general manager and actuary having read the auditor's report, the chairman said:

My Lord, ladies and gentlemen,—May I take it to be your wish that the directors' report, which is in your hands, be held as read?

FUNDS AND INCOME INCREASE

I am sure you will agree that the report and accounts now before you give an encouraging picture. The new life assurance business written last year amounted to £35,601,000, a figure which for the eighth successive year constitutes a record in the history of the company. Included in this sum is a total of £17,333,000 of group life assurances. Our new annuity business, at £8,562,000 per annum, also constitutes a record.

In the revenue account of the life assurance and annuity fund, you will see that our premium income has increased by over £2 million as compared with the previous year and now amounts to over £17,500,000. As a result our expense ratio, that is the ratio of commission and expenses of management to premium income, is at the very low level of 8.6 per cent. This compares with last year's ratio of 8.9 per cent, which itself was the lowest ever achieved in the history of the Company, so that the further reduction to 8.6 per cent cannot but be a matter for satisfaction.

Our interest income, amounting to over £4,700,000, has also shown a substantial increase and represents a net rate of interest on the fund of 4 4s. 11d. per cent, an increase of 3s. 8d. per cent over the rate earned in the previous year.

In the balance sheet you will see that the book values of our total assets, at over £125 million, have increased by more than £14 million over the previous year's total. During 1953 a substantial rise took place in the value of Stock Exchange investments generally, so that the margin between the market values and book values of our assets is now much greater than it was in November, 1952.

40 SHILLINGS PER CENT INTERMEDIATE BONUS

A year ago we were reviewing the results achieved by the company for the triennium ended November 15, 1952. In spite of the low level of Stock Exchange values at that time, the great strength of the company enabled your directors to increase the rate of compound reversionary bonus from 33s. per cent to 37s. 6d. per cent for each year of that triennium. They also stated that until further notice the rate of intermediate bonus would be at this higher figure. The next full declaration of bonus falls to be made as at November, 1955, but in view of the excellent results shown by the company in this first year of the new triennium, the directors have decided to raise the rate of intermediate bonus from 37s. 6d. per cent to 40s. per cent. The new

rate will apply as from March 15, 1954, in respect of the period since November 15, 1952: this will allow those policies which become claims before the end of the present triennium to receive a further share in the prosperity of the company.

MILLARD TUCKER REPORT

The outstanding event relating to life assurance business in this country since I last addressed you has been the recent appearance of the Millard Tucker Committee's Report on the Taxation Treatment of Provisions for Retirement. The Committee has dealt fully and in detail with a very difficult subject in a way which compels admiration. It has exposed with great clarity the existing anomalies, although it must be confessed that in some passages of the Report complete consistency appears to have been achieved only at the expense of administrative simplicity. When, and to what extent, legislation based on the Committee's recommendations will come into force we do not know. However, all whose retirement benefit schemes we already administer can be assured that when the time comes we shall do all we can to enable them to bring their schemes fully into line with any new legislation. We expect, also, to be able to offer attractive contracts under the new arrangements to those who have hitherto been precluded from making full provision for their retirement.

MINIMUM PREMIUM PLAN

Apart from the retirement benefit side of our business, we are anxious that people should not lose sight of other requirements for which life assurance is necessary. People marry and want to buy houses—we can help them in this, both by advancing part of the purchase price through our affiliated company, The Heritable Securities Association, and by arranging for repayment of the loan by means of a policy effected with the Standard. People raise families and require life assurance to protect them and provide for their education. Partnerships continue to be formed and life assurance is required to provide for payment to the heirs of a deceased partner. Life assurance is still the most satisfactory method of providing for payment of death duties. Life assurance as we have known it for generations will continue to provide, as in the past, the cheapest, the most satisfactory and sometimes the only answer to a wide variety of financial problems.

When effecting a life assurance policy, however, a man may be in a dilemma. He has to decide whether he will take a policy which shares in the profits of the company, or one which does not. It may be that there is only a limited amount of money available and he requires the greatest cover which this money can afford, in which case his selection would be a without profits policy: on the other hand, his knowledge of the bonus prospects of the company may lead him to believe that in the long run it would be to his advantage to effect a with profits policy even although it gives less initial cover. Prior to the last war the Standard helped to meet the diffi-

culties involved in selection by issuing a contract which combined the merits of both types of policy. The premium was only slightly higher than the without profits premium but the policyholder received an appropriate share in the profits of the company. Circumstances brought about by the war necessitated our withdrawal of this most useful scheme, but we have now decided to reintroduce it in this country in a slightly different form. We believe that this policy, which will be called the "Minimum Premium Plan," will exactly meet the needs of many types of proposer.

OVERSEAS EXPANSION

Our business overseas continues to expand. Canada, the largest of our overseas organisations, produces a considerably higher proportion of our business than formerly. Our Canadian funds now exceed \$100 million.

Our two other active overseas organisations, in the West Indies and in Uruguay, are also expanding.

INVESTMENT IN INDUSTRY

This year for the first time the assets of the company exceed £125 million. The Standard was established in 1825 and celebrated its centenary in 1925 by becoming a mutual company. During the past year our funds have increased by an amount equalling the total size of the company at the time of mutualisation. Of those growing funds a significant part is applied by the directors in assisting British industry to obtain the equity capital which is vital to this country's economy, and as you will observe from the balance sheet the Standard has now a substantial sum invested in ordinary stocks, largely in British industry. The fortunes of some 350,000 policyholders are bound up directly with the prosperity of the Standard. To all of them everything that affects the Standard is of importance, and in particular the profitable investment of the company's funds. To all of them the efficiency, profitability and dividends of the companies in which we are invested are matters of concern. From the profits flow the dividends and, when British industry is busy and profitable, the resulting increases in dividend improve the rate of interest earned on our funds. The favourable rate of interest earned on our funds last year, to which I referred earlier, enhances the security behind all our contracts and is a major source of the surplus accruing to our with profits policyholders.

You will wish me before I close to pay tribute to all members of our staff—to those in the field engaged in fostering and extending the company's connections and to the inside staff who give them such able support. I do so with very great pleasure; for only by their active and efficient co-operation could the results shown in the report have been achieved. I am certain too that all members of the staff at home and overseas would wish to acknowledge their debt to Mr Reid, our General Manager, Mr Döw, his chief of staff, and the other officials of the company for wise guidance, technical skill and consideration of their interests.

Congratulations and thanks are also due from policyholders. However strong the present financial position of the Standard is, its strength as a continuing company depends upon the quality of its management; in that respect the directors are confident that those

insured with the Standard served. I now move the formal report, revenue accounts and submitted. The report was adopted.

SCOTTISH AMICABLE LIFE ASSURANCE SOCIETY

RECORD NEW LIFE BUSINESS

The one hundred and twenty-eighth annual general meeting of the Scottish Amicable Life Assurance Society was held in Glasgow on March 24th, Sir Lynden Macassey, KBE, QC (President of the Society), presiding.

In moving the adoption of the report and accounts, Mr J. B. Findlay, DL (chairman of the ordinary directors), said that once again the Society had achieved a record figure for new "ordinary" life assurance business—almost £8 million of new sums assured (after deduction of reassurances)—and that the clearest measure of the growth of the Society's group business in recent years was provided by comparing the group life sums assured in force at the close of 1953 (£18,400,000) with those in force three years previously (£8,500,000)—and by making a similar comparison between the premium income for group pension business which now exceeded £2,200,000 per annum and was rather less than £1 million per annum three years ago. The total premium revenue amounted last year to almost £5 million and showed an increase of £625,000 over the premium revenue for 1952. Similarly, the total funds at the close of the year amounted to almost £34,500,000, having risen by approximately £4 million during the year under review. During the three years which had elapsed in the present quinquennium, premium revenue had increased by more than 80 per cent, while the Society's funds had risen by more than 40 per cent. 1953 had been a most successful year for the Society. Interest earnings had risen, the rising trend of expenses relative to the growth of business had been reversed, and mortality experience had been exceptionally favourable. The Society's rate of interim bonus had been increased as at July 1, 1953, to 35s. per cent per annum compound, and it was already clear that this rate of bonus was fully covered by the profits earned during the first three years of the present quinquennium. The hope was expressed that, if present trends continued, the bonus declaration two years hence would prove most satisfying to all the Society's participating members.

THE MILLARD TUCKER REPORT

A few weeks ago there was published the report of the Millard Tucker Committee on the Taxation Treatment of Provisions for Retirement. Among the various matters considered by this committee, the one which had aroused most interest was the possibility of allowing to self-employed persons, to controlling directors and to part-time directors taxation concessions, similar to those available to employed persons, for setting aside out of gross income the sums required to provide pensions for their later years. While the committee were not unanimous in their views on this matter, the majority recommendation was in favour of allowing full relief of income tax and surtax on premiums paid, within certain prescribed limits, to secure deferred annuities commencing at a selected pension age. The benefit would take the form of an annuity and, apart from permission to commute a portion (normally one-quarter) of this annuity for a tax-free

lump sum, the annuity would require to be non-assignable and non-commutable. These proposals, if they were implemented, would clearly be of great value to a large number of directors and self-employed persons who found themselves unable to provide, out of taxed income, for eventual retirement. On the other hand, many of those affected by these proposals might regard it as unwise to place their savings beyond their reach in times of need or emergency—as would be the case if these savings were from the outset invested in a non-assignable and non-commutable annuity. The alternative course open to those who held this view was to provide for their retirement in the traditional way of effecting an endowment assurance, and by applying the proceeds, if they wished, to secure an annuity commencing on retirement. This alternative course would attract the substantial degree of income tax relief normally allowable on life assurance premiums and would leave the policy entirely free of any "tie" or taxation liability in respect of the proceeds at maturity. Even when the proceeds of the endowment assurance were applied to purchase an annuity, the Millard Tucker Committee unanimously recommended that such an annuity should in future be taxable only on its "interest content," which was unlikely to exceed one-third of its annual amount. For this reason it would seem that the traditional approach to the personal pension problem had greater merit today than ever before for many categories of self-employed persons.

RETIREMENT PROVISION A PERSONAL PROBLEM

The majority recommendations of the Millard Tucker Committee in relation to directors and self-employed persons applied to retirement provision and not to life assurance, in the normal sense of the term. Thus, even if these proposals were implemented, there was no valid reason why the provision of family protection should be delayed, even by those who intended to adopt the "Millard Tucker" approach to pension provision if this became available at some future date. Directors and self-employed persons might well feel confused at this present juncture by the uncertainties of their future position so far as retirement provision was concerned, and the Society's branch officials throughout the country would be very pleased to discuss the problem in all its aspects as affecting any individual case. This was, after all, a very personal type of problem and no generalised solution could possibly be found. Apart altogether from its possible effect upon the self-employed, the Millard Tucker Report might have major repercussions on many aspects of the Society's business. Thus, for instance, the committee recommended considerable changes in the law and practice relating to retirement benefit schemes of every type. Comment on these recommendations might well be reserved until the form of any subsequent legislation was known, but it was to be hoped that uncertainty might be removed by an early announcement of the Government's intentions in this respect. One recommendation, however, to which reference had already been

ch only ment was hoped, to implemented.

The report and accounts ..

HASTINGS & THANET BUILDING SOCIETY

The annual general meeting of the Hastings and Thanet Building Society was held on Thursday, March 18th at the Queen's Hotel, Hastings.

In moving the adoption of the report and statement of accounts for the year ended December 31, 1953, Mr Harold Lester, JP (the chairman), said: The accounts show that our financial edifice rests upon a firm foundation. Our assets have increased to over £16,400,000, and last year we advanced over £2,470,000 to aid home ownership. Our reserves have been strengthened by over £50,000, the total being greater than £900,000. These figures speak of strength and stability. This has been appreciated so much that during the year we were entrusted with over £2,500,000 for investment and safe keeping.

It should be borne in mind that all the money which flows into building societies for use in house purchase for owner-occupation makes for a reduction in those heavy subsidies, which for each single dwelling house, built by the local authority to let, commits the taxpayer and the ratepayer to more than £2,130 over the subsidy period of 60 years.

Lord Mackintosh, chairman of the National Savings Movement, remarking upon the £1,500 millions saved by building society members, said: "It is still true to say that money is as safe as a house."

In seconding the motion, Mr Henry J. D. Fuller (the deputy chairman) said: I would like to emphasise the highly satisfactory number of applications for loans on new houses which the society is now handling. The freedom which the Government has given to the people to have a house built to their own design and requirements has been readily exercised by them, and building societies welcome the restoration of the opportunity to channel savings into homes.

The possibility that a scheme of guarantee, sponsored by the Government with the aid of local authorities and building societies, will be brought to fruition, is already engaging the closest attention of the board. Such a scheme, continued Mr Fuller, would give prospects to many potential home-owners possessing only a modest capital stake. Any expansion in this direction, however, will need to be matched by an expansion in the volume of savings entrusted to building societies. For a variety of very good reasons, building societies today are acclaimed by people in all walks of life and of all shades of political opinion as one of the finest mediums for the investment of sums both large and small.

The report and accounts were adopted and the reappointment of auditors was confirmed. The meeting terminated with a vote of thanks to the management and staff, agents and solicitors.

meeting of the church Street, showing are extracts from the statement by the chairman, Sir John Hay:

LABOUR

Experiments, particularly in the postwar period, have served to demonstrate so far that there is very limited scope for the mechanisation of rubber estate operations. Advance towards a more economic disposition of labour has been made by way of changes in methods and improvements in organisation. Within the history of this company very substantial economies have been effected in this direction and today labour requirements for a given acreage are about one-third of what was formerly thought to be necessary. But this saving has been offset to a considerable extent by the quite legitimate raising of the standard of living of labour, and consequently money spent on wages and labour amenities still bulks very largely in total expenditure. In these circumstances it is inevitable that rates of wages, subject to the overriding consideration of their not falling below a certain minimum, must be related to the price of rubber. To act otherwise would be in the interests neither of labour nor of the industry. Wages divorced from the price of rubber would be either too low to do justice to labour in a time of prosperity or be so high as to be uneconomic in a time of adversity. It is unfortunate for those engaged in this industry that its fortunes are so notoriously variable, necessitating frequent adjustments in wages with all their unsettling effects. While rubber was rising in the years 1950-51, we went through the process, agreeable to all parties, of adjusting wages upwards, but when the price took a downward turn and fell from a height of 73d. to 16d., we had to follow the much less agreeable course of adjusting wages downwards. The downward process has naturally been resisted by labour's representatives, but after discussion or resort to arbitration an acceptable settlement has on past occasions been reached. In respect of the last adjustment, however, the trade union representatives have sought to upset the arbitrator's findings, but the great bulk of labour has accepted the cut without complaint. Trade unionism is a postwar development in Malaya. It is something which has been imposed from without, rather than a spontaneous, upward growth from within, and perhaps it is not surprising if, when confronted with a difficult situation, it exhibits some of the shortcomings and weaknesses of a forced and unnatural growth. Membership of the employers' association and of the trade unions is voluntary. The preponderating majority of large estate owners is within membership of the employers' association, but the trade unions only embrace a minority of estate workers. Those who are interested in the relationship between labour and the industry should carefully note the following facts: that the present rate of wages being paid by members of the employers' association is quite substantially in excess of that being paid by estate owners outside the association; that adjustments in wages have only been in respect of cash payments; that labour receives on an improving and increasing scale payments in kind in the form of housing, medical

NTATIONS, LIMITED

MALAYAN RUBBER PRODUCERS

AL MEASURES FOR IMMEDIATE RELIEF

SIR JOHN HAY'S STATEMENT

services, maternity benefits and educational facilities. Among progressive employers these are supplemented beyond the requirements of the law by extended educational and recreational facilities, grants of land for growing vegetables, raising cattle, etc. It may be stated with some confidence that the established rate of wages now being paid and the general treatment extended to labour by progressive employers in Malaya equal, if not surpass, the best standards observed by any other rubber-producing territory. This paragraph on labour would be incomplete without a reference to the workers' staple diet.

RICE

In respect of this commodity a dramatic and, to the consumer, welcome change has taken place. From a prolonged postwar condition of shortage we have passed to a condition of abundance, and rice is now in surplus supply. Despite this change, the Malayan Government has decided to continue its control over the purchasing and distribution of rice and to take this occasion to build up what is officially and somewhat fancifully described as a "strategic stock." It is contended that this decision is a serious blunder, depriving the worker of the benefit of lower prices which should follow an abundance and continuing the high cost of living at a time when Government should be exerting itself to lower it. It is maintained, and with some show of reasoning, that the Government-to-Government purchases of rice are conducted on the Malayan side with a lack of a trader's shrewdness, that the cost of marketing and distribution is higher than it would be if it were conducted by private enterprise under competitive conditions; while the decision to build up a "strategic stock" is entirely misconceived, involving an extravagant expenditure of capital which Malaya can ill-afford.

THE OUTLOOK

With the termination of purchases for stockpiling, demand for rubber is now limited to consumptive requirements. Supplies of both natural and synthetic are more than adequate for normal needs, and consumers are not inclined to buy for stock. They are content to follow a hand-to-mouth policy. The terms of trade with America as between synthetic and natural have moved in favour of the latter. Whereas at the beginning of 1953 consumption of synthetic and natural was running at 60 per cent of the former and 40 per cent of the latter, consumers' purchases are now approaching a 50-50 basis. This would seem to suggest that natural rubber has reached a price level competitive with synthetic, and as long as supplies are plentiful the price of natural rubber is not likely to fall or rise significantly below or above its present figure. It is hardly surprising that such a disagreeable conclusion, with all its harsh implications, should not find a too ready acceptance, and that the belief should be entertained that shelter from the economic storm might be found under cover of some scheme which, by miraculous means, would raise the price of natural rubber without rendering it uncompetitive with synthetic. Recent events have given little encouragement to persistence in that belief.

For the natural rubber producer in Malaya the immediate prospect is particularly bleak. He has to compete with a Government-

owned synthetic industry in America which pays no taxes and is not regarded as being altogether free from the taint of subsidisation. He has also to compete with other natural rubber producers, such as Indonesia and Ceylon. The Indonesian Government, recognising the need for assisting the natural rubber producer, has for the time being suspended all charges for export duty, while Ceylon is sheltered from world prices through the medium of a barter agreement with China under which she enjoys for a considerable proportion of her rubber a price which is the equivalent of nearly double the present market price. For the Malayan producer there is no relief. On the contrary, his burden is made heavier by a savage increase in land rents—in our case to the extent of 85 per cent. If he has the misfortune to be registered in this country he has to continue to pay over 67 per cent of his profits in taxes. Although thus unfairly handicapped, he maintains a standard of living for his workers which does not fall below the highest of any other rubber-producing territory and out of his meagre residual resources he must, if he is to be efficient, strive to find the money necessary for the replacement of his old plantings with high-yielding stock. The Malayan rubber producer may well conclude that the Governments of Malaya and the United Kingdom are making demands upon him which are impossible of performance. The situation demands an immediate reduction in taxation. It is appreciated that Malaya has a heavy burden to carry in the form of expenditure on combating Communism, and expenditure during the period of the emergency has been very heavy indeed. But this is a burden which should not be placed disproportionately on creative enterprise. It is a burden which should be distributed fairly over the whole community. It is vain for the Government of Malaya or of the United Kingdom now to plead that they cannot afford any relief in taxation. The truth lies in the opposite direction, namely, that Governments cannot afford to continue taxation at its present level, to do so would permanently impair the competitive efficiency of Malaya's chief industry and imperil the whole economy of the country. The United Kingdom Government has not only its obligations to Malaya as a still dependent territory: it has also a beneficial interest in its dollar earnings. In 1951 Malayan rubber earned 320 million dollars. For 1953 estimated earnings fell to 85 million. This steep decline is accounted for mostly by the fall in price, but not wholly. Other territories, more far-sighted in rubber matters, have followed a course calculated to encourage rubber exports.

MEASURES FOR IMMEDIATE RELIEF

For the relief of the Malayan rubber producer there are a few very simple practical measures which should be taken immediately. They are:—

- a reduction in export duty to its historical rate of 2½ per cent;
- payment of such duty to be treated as if it were a payment of income tax in the computations for relief for double income tax.
- the removal of controls and restrictions in Malaya, other than those deemed necessary for security, which militate against a reduction in the cost of living.

HADFIELD'S LIMITED

SATISFACTORY RESULTS

The sixty-sixth annual general meeting of Hadfields Limited was held on March 25th at East Hecle Works, Sheffield, Lord Dudley Gordon, DSO, LLD, MIMechE (the chairman), presiding.

The following is an extract from his circulated statement:

The board is greatly strengthened by the appointment of Mr D. D. Hawley, MC, as a director of Hadfields Limited. As sales director he will control the department of which he has been a member for over thirty years and of which he has been the chief since 1951.

The report and accounts are of vital interest to every employee of the company because each one of them has by his daily work contributed as a team to the results which have been achieved and is dependent for his living on the successful combined effort of all. The complete document is therefore submitted to each employee of the company as in previous years.

The 1953 Act lays upon the agency the duty to secure the return to private ownership of the undertakings whose stock it holds. So far as Hadfields is concerned, it is too early to estimate when this operation will take place.

BURDEN OF TAXATION

The report draws attention to the accounts, particularly in the profit of £10,000 in the

period, the total for the year was up to expectations, though slightly below the previous peak.

Though the total orders received showed this slight decline, certain important specialities such as fully-hardened steel rolls, together with large composite back-up rolls, showed an increase.

KEENER COMPETITION

So far as the current year is concerned, it can be said that the contracts in hand together with those expected should keep the works fully employed. Provided a high level of productivity is maintained, results should continue to be satisfactory. It is of interest to report that figures given as to numbers employed in my last year's statement have been fully maintained and indeed slightly increased. The efforts required to secure new contracts will be severe and have to contend with the keenest competition in price, high quality and in promptness of delivery. This competition will be encountered particularly from foreign competitors many of whom are experiencing shortage of work and are making every effort to improve the quality of their products. It can be overcome only by the maintenance of a high rate of output coupled with the closest attention to detail to reduce cost and still further improve quality.

The report and accounts were adopted.

TEMPERANCE
PERMANENT BUILDING
SOCIETYMR CYRIL W. BLACK ON SOCIETY'S
PROGRESS

The one hundred and thirty-first annual meeting of the Temperance Permanent Building Society was held on Thursday, March 18th, at Caxton Hall, London.

A CENTURY OF SERVICE

Mr Cyril W. Black, JP, MP, FRICS, chairman of the Society, in the course of his speech, said: Vast changes have occurred in the life of the nation since William Shaen and his friends laid the foundations of the Society a century ago. Great as was their vision, they could hardly have conceived of the social progress that has taken place during this period, nor realised the extent to which the development of the Building Society Movement has assisted in raising the standard of living in this country. Not only have the conditions in housing improved to a remarkable degree, but the seeds then sown of independence, of self-help and of thrift have borne fruit, the value of which it is impossible to estimate.

Our Society has played a worthy part in this progress and we are proud to be able to claim that during the whole of this long and eventful period no one has ever lost a single penny as a result of investing in the Society.

INCREASE IN OUTPUT

The increase in the value of sales, which is the most important factor in achieving the improved profit, is due to a small extent to higher prices, but it is mainly due to an increase in output, and it is on increase of output that we must depend if we are to maintain our present position. It is clear that the maintenance of increased output must depend in the long run on a sufficient flow of new orders. During the latter part of the period under review there was some falling off in demand so that the value of orders received began to decline but the backlog of unfulfilled orders made it possible to maintain and increase the rate of output from the works. It should be added that though there was this falling off of the rate of orders received during the latter part of the

ASSETS EXCEED £30 MILLION

The year 1953 has been another one of modest expansion and, in the main, of consolidation. The emphasis has been upon strength rather than size. The total assets at December 31st last reached the record figure of £30,437,950, an increase during the year of £1,231,104. The amount standing to the credit of shareholders and depositors was £28,331,093, an increase of £1,088,097.

The development of our business makes it possible for us to continue to receive in-

vestments in either shares or deposits. Investments in the Society have the very great advantage of involving no expense either on investment or withdrawal; they can be realised at short notice and without fear of depreciation, the rates of interest are generous, and the security afforded unsurpassed.

The total amount advanced during the year was £3,475,540, of which approximately 77 per cent was in respect of mortgages where the advance did not exceed £2,000. The great bulk of our mortgage business is in respect of small properties, for which there is a ready demand, and which are not subject to excessive fluctuations in value.

RESERVE LIQUIDITY

Appropriation to general reserve, contingency account, total of these accounts and the balance profit carried forward to £1,750,106—more than 6 per cent of the aggregate share and deposit capital. Cash and investments at the end of the year exceeded £4 million, representing a very satisfactory degree of liquidity.

PERSONAL SAVINGS AND HOME
OWNERSHIP

We are now in a period in which house building everywhere has undergone a great impetus. Public attention is increasingly focused upon the problem as to what is the proper balance between local authority houses with subsidised rents and private enterprise houses which are built without subsidy and are usually offered for sale. Local authority houses are in many cases being occupied by families who could well afford to buy their homes, and whose rents are being subsidised by tax payers and rate-payers who are much less well off than they are. Every new local authority house carries a minimum subsidy of about £35 per annum, for sixty years—more than £2,000 per house to be provided out of the Surety fund.

ment should ensure, in some cases, that tenancies of council houses are only offered to families who really need them, and that, at the same time, increased facilities are made available for house purchase. A necessary step which the Government should take is to introduce a system of guarantees whereby credit-worthy families can purchase their homes with much smaller cash deposits than are at present required, the necessary mortgages being granted by the building societies, the excess over the normal loan limits being guaranteed by the Government and Local Authorities. Such a scheme, which, incidentally, I have been advocating for a number of years past, is now being discussed between the Government and the Building Society Movement. I hope that before we meet again in annual meeting the scheme will have been launched and many more families will, in consequence, have benefited by having the undoubted advantages of home-ownership brought within their reach.

In any event, the facilities offered by building societies for savings and investment and for the promotion of home-ownership are needed today, perhaps even more than in the days when the foundations of our Society were laid. Personal savings serve a national purpose of paramount importance, and in encouraging the habit of regular thrift we render a service not only to the individual but to the whole community.

With pride in the achievements of the past, we face the future with confidence, ready to contribute in still greater measure to the social progress and prosperity of the nation.

The report and statement of accounts were adopted.

G. R. HERRON & SON
(HOLDINGS) LIMITED

(Wool Merchants and Topmakers, Wool Combers, Wool Scourers, Fellmongers and Leather Dressers)

CHANGED TRADING CONDITIONS

BOARD'S CONSERVATIVE POLICY

MR F. J. HILL ON THE OUTLOOK

The fifty-first ordinary general meeting of G. R. Herron & Son (Holdings) Limited was held on March 24th at Winchester House, Old Broad Street, London, E.C.2, Mr F. J. Hill (the chairman) presiding.

The secretary (Mr C. C. B. Rice) read the notice convening the meeting and the report of the auditors.

The following is the statement by the chairman which had been circulated with the report and accounts:

In my statement which accompanied the accounts for the previous financial year, I referred to there being good prospects for the company's trading year which ended on October 31, 1953. As it turned out, the first six months—namely, November, 1952, to April, 1953—recorded steadily rising prices for tops and in that time your company actually effected a greater volume of sales than in any similar period of the company's history. Not only was the volume of trade a record, but also business was done at very satisfactory margins of profit. During the last six months of the financial year, however, a complete reversal took place and the steady rise in values came to an end followed immediately by a fall in sales and acute nervousness in regard to prices.

The cessation of hostilities in Korea and general fear that a trade recession in America was imminent may be looked upon as the main causes combining to bring about so drastic a change. Later on bear selling appeared which depressed the price of tops still further, although the value of wool, sustained by Russian and Continental buying, remained at a high premium over what buyers were prepared to pay for it in the top.

In spite of the downward trend of business which began in May, all our mills maintained their maximum output for the whole of the year, thus registering an all-time record, but unless there is a revival in trade, the time is fast approaching when the bulk of our outstanding contracts will have been processed, with a consequent shortage of work in progress.

ACCOUNTS

In April, 1953, the authorised capital of the company was increased to £500,000, and 1,512,000 fully paid ordinary shares of 2s. each were issued free to shareholders in accordance with their holdings, the issued ordinary capital of the company thereby being increased to £302,400.

The directors' report deals, of course, with the parent company's affairs which are the concern of this meeting, but in order that shareholders may have a clear view of the trading results of the group as shown in the consolidated profit and loss account, I set out hereunder the main details. After charging all expenses, but before providing for taxation, the company's group trading has resulted in a profit of £261,843, or an increase of £71,049, compared with the previous year.

After providing for all taxation, including

future income tax liability, 1954-55, the net surplus of the group amounts to £142,262, to which must be added the amount brought forward in the group from last year £50,654, making a total of £192,916, which the directors recommend should be dealt with as follows: Transfer to general reserve, £101,200, and dividend on preference and ordinary shares, £24,084, leaving the sum of £67,632 to be carried forward in the group as shown in the consolidated balance sheet.

DIVIDEND

Having regard to the present unfavourable outlook generally, your directors have considered it necessary to pursue a cautious policy and have therefore had to revise their earlier ideas in respect of a final dividend. It is now proposed, therefore, that a final payment of 6 per cent be made which, with the interim distribution of 6 per cent paid on October 30th last, totals 12 per cent for the year, both interim and final dividends being calculated on the increased ordinary share capital.

If comparison is made with the previous year, it will be seen that although the rate of ordinary dividend now proposed is lower, the total amount to be distributed is actually higher by 20 per cent. This, of course, is owing to the dividend being calculated on the doubled ordinary issued capital.

MILLS AND MACHINERY

The whole of the mill equipment has been maintained in first class order and thought is continually given to finding ways and means for reducing costs of production.

Work is being carried out at Central Mills which will, when completed, provide increased warehouse accommodation and office space. These extensions are essential not only for our present needs, but to take care of any future expansion of our business. The work is of a capital nature and will cost some £37,000.

CURRENT FINANCIAL YEAR

Since the end of the financial year under review, the situation has further deteriorated; sales of tops are running at only about half of what they were a year ago, and owing to the intense competition for the small amount of business available, profit margins are substantially lower. Unless a material improvement takes place, which is not apparent at the moment, it is inevitable that our profits for the current year will suffer a considerable reduction.

Once again I have pleasure in paying tribute to the excellent work and service given to the company by the management, staff and all workers employed in the mills.

The report and accounts were adopted and the dividend recommendation approved.

The retiring director, Mr T. W. Sugden, was re-elected and the other formal business having been duly transacted, the proceedings terminated.

THE ZAMBESIA
EXPLORING COMPANY

The annual general meeting of The Zambesia Exploring Company, Limited, was held on March 19th in London. Capt Rt Hon Charles Waterhouse, PC, MC, DL, MP (chairman), presided.

The chairman's review, circulated with the report and accounts, stated that during the year 1953 operations continued on a steady and satisfactory basis, as evidenced by the fact that the company and its subsidiary, The Zambesia Investment Company, Limited, realised a total net profit of £71,401 in the current year.

The profit before taxation was £101,443 for the parent company and £79,244 for its wholly owned subsidiary, The Zambesia Investment Company, Limited, making a total of £180,687. After providing for current taxation, allowing for adjustment of taxation of previous years, transferring £25,000 from general reserve, and bringing into account the balance brought forward from 1952, a balance of £113,544 remained available for appropriation in the parent company. An interim dividend of 4 per cent, less tax, had been paid, and provision made for a final dividend of 11 per cent, less tax, making an unchanged total of 15 per cent for the year.

The profit of the subsidiary company, after taxation, which amounted to £40,864, had been added to the balance carried forward, which had been increased thereby to £103,575. The net undistributed profits of the subsidiary company could be regarded as the equivalent of a transfer to reserve by the parent company, and the total reserve of the parent and subsidiary companies together had increased from £526,843. The report was adopted.

BROOK
VITAL NE

The twentieth annual general meeting of Brook Rubber Plantations, Limited, was held on March 19th in London.

Sir Lionel Smith-Gordon, Bart (the chairman), presided, and in the course of his speech, said:

The trading profit was £51,702 compared with £111,964 last year, and £147,840 the year before. This reduction in the profit is due to the fall in the price of rubber, notwithstanding an increase in crop of some 388,000 lb, or, say, 15 per cent.

Last year I informed you that it was our intention to increase the rate of replanting to 200/300 acres per annum, but the serious fall in the price of rubber has forced us to modify our ideas. We are, however, convinced that replanting with modern high-yielding material is essential—and, I would go so far as to say, necessary for our survival—and we propose to proceed for the present at the moderate rate of 60/70 acres per annum.

As regards the current year we are still working at a small profit, which just about covers the expenditure on the replanted areas. What we require is a better price for our rubber, and this depends largely on developments in the synthetic rubber field. There are many who hope that the sale of the synthetic plants in the USA to private enterprise, will give natural rubber a fairer field in competition with synthetic, but we must realise that the latter has come to stay and the competition we have to face will always be very formidable.

The report was adopted

INDIAN IRON & STEEL COMPANY LIMITED

COMPLETION OF MERGER

MR T. LESLIE MARTIN ON LABOUR TROUBLES

The adjourned thirty-sixth ordinary general meeting of The Indian Iron & Steel Company, Limited, was held on March 10th in Calcutta.

Mr T. Leslie Martin, the chairman, in the course of his speech, said: The most outstanding events during the last financial year were the completion and coming into effect of the merger and the finalisation of our loan agreements with the World Bank and the Government of India.

The previously issued capital of Rs.1,50,00,000 in preference shares and Rs.2,55,25,960 in ordinary shares has now been increased to Rs.2,69,95,400 in preference shares and Rs.5,18,37,080 in ordinary shares by the issue of Rs.1,19,95,400 preference shares and Rs.2,63,11,120 ordinary shares to the shareholders of the Steel Corporation of Bengal in exchange for their holdings.

The profit and loss account is of necessity by reason of the merger a very composite affair comprising: firstly, 12 months' activities of the pre-merger Indian Iron and Steel Company to March 31, 1953; secondly, the profit margins to December 31, 1952, receivable from the Steel Corporation of Bengal under the 1937 Agreement which are, of course, offset by reason of the fact that they have been charged in the 1952 accounts of the Steel Corporation before arriving at profits for that year taken over; and, thirdly, the trading results in steel of the Indian Iron and Steel Company for the post-merger months of January, February and March, 1953.

Since the trading in steel for these three months is additional to the previous activities of the company, certain additional provisions in respect of the quarter have had to be made. The former normal depreciation charge of Rs.40 lakhs is accordingly increased to Rs.50 lakhs by the inclusion of Rs.10 lakhs, being one quarter of the Rs.40 lakhs previous annual allocation of the Steel Corporation of Bengal, and a sum of Rs.3,62,000 is set aside for the rehabilitation of the steel plant at the stipulated rate of Rs.14,48,000 per annum.

THE DIVIDEND

Finally, to the net profit as above determined is added the balance of the net profit of the Steel Corporation of Bengal for the year 1952 taken over, and after allowance for the dividend payable on the preference shares we arrive at the amount of profits available for distribution on the amalgamated ordinary share capital.

An ad-interim dividend of Re.1 per share has already been paid to you. Though this has been described as an ad-interim dividend, we made it clear at the time of declaration and have again referred to this point in the directors' report that no further recommendation in respect of dividend will be made for this year.

The realisations on the sale of steel for the months of January, February and March, 1953, have been based on the prices fixed for 1952, since the question of the revised prices to apply as from January 1, 1953, is still under the consideration of Government. Pending the adjustment of the income from the sale of steel for those months, it has not been possible, having regard to the rights of the shareholders to a reasonable return upon their investment, to place to reserves

any amounts other than the stipulated provisions against the rehabilitation of the plant.

FINANCIAL POLICY

The directors are of the opinion that it is imperative, in view of the tremendous liabilities the company has to shoulder in order to carry out the expansion scheme, to set aside as much as possible out of earnings to pay off its commitments as quickly as possible and also to provide for the large sum of finance, approximately Rs.7½ crores, which it has agreed to contribute from the company's own resources to supplement the loans granted by the World Bank and the Government of India. As a commencement, and with this object in view, we propose to carry to reserve the net difference, after providing for taxation, between the former and the increased retention prices of steel for the three months January to March, 1953. Until we are informed of the decision of the Government of India in the matter we are, of course, unable to compute what this is likely to be.

In the terms and conditions on which the loans by the World Bank and the Government of India have been granted and in their respective amounts, there has been no material departure from what was conveyed to you in my last two speeches and as set forth in the circular letters addressed to you during the course of negotiations. As regards our ability and desire to maintain dividends at a reasonable level, provide the company's contribution towards the cost of the expansion and to repay the loans in the stipulated instalments, this will depend wholly upon the revised retention prices recommended by the Tariff Commission and sanctioned by the Central Government. So far as we know, no final decision in the matter has as yet been taken.

The continued liquidation of our financial commitments will, also, be governed by the retention prices which are fixed after the scheme of expansion has been completed and brought into economic operation. We hope that the principles by which retention prices were fixed prior to the merger, with such modifications as may be necessary and as may be appropriate and justified by later circumstances, will continue to be applied until both these loans and our other loans have been fully repaid out of earnings. It was on this understanding that the company agreed to expand its undertaking and was willing to accept the consequent heavy financial liabilities. The company feels that it is entitled to assume that the Government will, during the continuance of the repayment period of the loans, adhere to the principles laid down in the Report of the Tariff Commission, 1952, and accepted by the Government, which imply that there shall be no departure, to the disadvantage of the company, from the principles that applied in the case of Tatas prior to the merger.

INTOLERABLE CONDITIONS

I shall now refer to the intolerable conditions under which we have had to work during the year 1953. You will all be familiar, from what was published in the Press, with the attitude labour adopted at the Burnpur works during the major portion of the year, a full eight months to be exact. At first, a

lock, and a... It became... were losing... battle and steps... the management gradu... mality in the works and office... Since then, and up to the present time, all has been fair sailing.

It is difficult to assess accurately the loss sustained by the nation as a result of this unfortunate dispute. The loss of revenue to the company amounted to Rs.1,60,00,000, the loss to workers on wages and bonus Rs.30,00,000, the loss to railways on inward and outward freight Rs. 70,00,000. India's future and prosperity demands an immediate review of the whole system of its handling of the labour question and the institution of laws and regulations which will provide a full day's work for a fair wage.

PRODUCTION OF PIG-IRON

The trading results for the year 1952-53 will, I hope, be considered satisfactory. The production of pig-iron has been somewhat less than that of 1952, owing to the fact that one blast furnace at Kulti was off for relining for a period of four and a half months. During the years 1954 and 1955, both the large Hirapur furnaces will be out of commission for several months for relining; one in 1954 and the other in 1955. This will inevitably have a material effect on the production of steel during these years.

The report was adopted.

NORTHERN ASSURANCE COMPANY LIMITED

ORION INSURANCE COMPANY LIMITED

The directors of the Orion Insurance Company announce that, having regard to the material expansion in the company's business in recent years, it has been decided to establish the office of a General Management of the Company.

Accordingly, and with effect from April 19, 1954, Mr T. R. Easton and Mr J. Greenshields, MC, TD, have been appointed the first joint general managers of the company.

Mr T. R. Easton, who joined the company on its formation in 1931, has held the office of manager since 1944: he is also a director of the Sphere Insurance Company. Mr J. Greenshields is at present an assistant general manager of the Northern Assurance Company.

By special arrangement with the directors and management of the "Northern," and with their best wishes, Mr Greenshields is being allowed to relinquish his duties with that company in order to take up his new appointment.

The directors of the "Orion" wish to place on record their appreciation of the friendly and helpful consideration which the board and management of the "Northern" have shown towards the "Orion" in enabling them to appoint Mr Greenshields to his new office.
