EUCLID

22

TONS CAPACITY REAR-DUMP WAGONS

Will increase your profits!

EUCLID 22-ton capacity Rear-Dump Wagons—powered by Rolls Royce diesel engines—are now built in Great Britain.

The additional capacity of this larger EUCLID means not only *more* loads, but *far bigger loads in less time*—operating costs are reduced—profit is increased.

22-ton capacity EUCLID Rear-Dump Wagons are available for early delivery—place your order now—all orders completed in strict rotation.

EUCLID 22 and 15-ton capacity Rear-Dump Wagons, EUCLID Bottom-Dump Wagons and EUCLID Tractors & Scrapers are all available for Sterling.

A complete After Sales Service is maintained for all EUCLID earthmoving equipment by the distributors

*Why can't you remember
where you put things, Angela?*

In the tool bag at the back of the cycle, or on the shelf in the garage, there is (or should be) a narrow little box for mending punctures. It contains a tube of rubber solution. Albright & Wilson's part in this is to provide the carbon tetrachloride which is often used as the non-inflammable rubber solvent. Carbon tetrachloride has other useful functions. It dry-cleans your clothes. It extinguishes fires. It cures liver fluke in sheep. It is one example, from among many, of the way chemicals by Albright & Wilson serve industry and the general public.

Portrait of the impossible

It couldn't be done, said experts in other countries, when the Reed Paper Group prepared in 1929 to make kraft paper on a new, wide machine—far wider than any other mill had ever used and nearly 100 yards long. But after two years of patient and searching experiment British paper technology and craftsmanship had triumphed, and Aylesford Kraft began to flow into the world, as it flows to-day from modern machines like the one shown, in reels up to twenty feet wide. To make possible this everyday miracle and to maintain the unvarying strength and quality for which Aylesford Kraft is now well known,

only the finest and purest kraft pulp is used. Imported from Sweden, Finland and North America, its quality and moisture-content carefully controlled, the pulp is restored, before the great machines take over, to precisely the consistency that produces the best kraft paper. From them, as a result, comes the true kraft paper that is unsurpassed in its fitness for so many purposes—for bags, wrappings, multi-wall sacks. This is why Aylesford Kraft is now in such widespread demand that more kraft paper is being made at Aylesford than at any other mills in Europe.

There is no better Kraft than AYLESFORD KRAFT—made in Kent by British craftsmen

Wages Cauldron

IT is always difficult to strike a mean in a *mêlée*. That is the dominant conclusion that emerges from the present efforts of both the engineering unions and their employers to pretend that there is such a thing as a homogeneous engineering industry; and to haggle about a uniform settlement for a jumble of plants and trades that start from varying states of present prosperity and that face apparent future prospects with greater variations still. On the one hand, there are a number of unfederated engineering firms, with the opportunity for tying wage bargaining to increases in productivity that plant negotiations sometimes afford, which have been willing to grant wage increases of seven or eight shillings a week; on the other there are the apprehensive manufacturers of textile machinery, and some others, who have come to the unwilling but genuine conviction that it will be better to stand up to a long stoppage than to grant any increase at all. These elephants of federated capital and labour are now obliged to straddle in public between these two extremes; and somebody is obviously going to be hurt.

The nation is going to be hurt too. The field of industrial relations is now filled—or about to be filled—with a score of different skirmishes fought under more than a score of differing strains. Since nobody has yet dared to think out a strategy for wages policy, the outcome of these clashes is likely to depend on the tactics of the different parties involved; and each individual victory, deserved or undeserved, for one side or the other must increasingly tend to be seen as a victory for stability or for inflation. So far, they have all been victories for inflation. It is therefore important to try to make some sense out of the tactical attitudes with which the Government, the independent members of arbitration tribunals (who are now a power in their own right), the employers and the trade unions seem to be entering 1954.

There is little doubt about the Government's attitude. Its labour policy is still fabian: it wants to avoid a pitched battle for as long as it can. Ministers know that the cauldron of industrial unrest is bubbling, but they hope that they can continue to sit on top of it until such a seat grows unbearably hot. At worst, they hope that they will be able to abandon this perch with dignified and advertised reluctance, not to jump off it with a start. There is this much to be said for the Government's policy: it is very unfortunate for them that Labour should have run through its term of office without being compelled by economic circumstances to stand up to the unions, and that the first test should come in the first postwar tenure of office by a Tory government. It is therefore very important to the party that Sir Walter Monckton should be widely regarded as a sympathetic mediator, not as a doctrinaire supporter of the boss; so far he has succeeded in this, perhaps too well.

The independent experts on arbitration tribunals, for their part, have stumbled into a crisis in their affairs almost in a fit of absence of

mind. They have found that such considerations as the level of exports now restrict them to recommendations that the workers consider insulting. Average awards in the last quarter of 1952 were still around 7 or 8 shillings a week, but the December issue of the *Ministry of Labour Gazette* alone lists nine awards of or under 4 shillings a week or 1d. an hour (and in the boot and shoe trades, where wages slide with the cost of living, it actually records some decreases).

The employers are plainly divided. For some employers prices are now a more important handicap in export markets than delivery dates, and an interruption of production would not be unwelcome. For others a stoppage, and the bitterness that would follow it, still seem to be greater evils than the seven-shilling standard for wage increases that the railway settlement appeared to set up. And behind their calculations may lie the belief—never publicised, not always thought of, but perhaps secretly felt—that if they are really priced out of export markets, the Government will not stand idly by; it might come to their rescue by whipping up orders in soft currency markets through sterling releases, or even—in the end—by another devaluation.

The trade unions have the advantage that they decide on their policy after weighing the position of the other three parties in the field. The disturbances of the past few weeks are merely signs that many of them have drawn the obvious conclusion: since any arbitration tribunal that is adjudicating in cold blood is now likely to recommend an increase that the workers would regard as derisory, they feel that arbitrators must be induced to adjudicate in hot blood instead. As far as can be seen, there is no overwhelming insistence on strike action swelling up from the grass roots, as there was, for example, in such periods of major labour unrest as 1911-12 and 1919-21. What is plainly swelling up, however, is acute dissatisfaction among workers in certain trades and grades that others have done better than they, and a most dangerous assumption that wage earners have a right to an annual increase in wages of which tight-fisted employers are now trying to deprive them.

So long as the union leaders are convinced that the opposition is irresolute, and that their own followers may not be, it is quite clear that hints about militancy represent the easiest policy for them to adopt. Many union leaders recognise that the easiest policy is not the proper policy in the national interest; last year's chairman of the Trades Union Congress, Mr Tom O'Brien, who has a natural aristocrat's preference for appearing courageous rather than for being popular, came very near to saying as much this week. But most trade unionists must be expected to follow their own immediate interests instead; it is as senseless to preach at them as it is to preach at those other seekers after self-interest in an age of inflation, Mr Samuel and Mr Clore. The unions may not be quite sure that

long drawn-out strikes would pay; but they still have every reason to believe that the threat of strikes will. And at the moment they can confine their threats to actions that they know their members would take without great sacrifice—strikes over Christmas week (when many workers would prefer to be at home anyway), one-day strikes, bans on overtime and the rest.

★

Such, in outline, seem to be the tactics of the participants in this muddle of disputes. An important development in the past week has been that one group of unions has been clever enough to recognise that it is wrangling in the presence of a judge. "To have public opinion on one's side," said Mr Jim Matthews, the leader of the engineering section of the National Union of General and Municipal Workers, this week, "is half the battle"—and, in any long drawn-out dispute, it is likely to be the second half of the battle, the half that counts. Mr Matthews was speaking immediately after he had managed to drive this point home to the other members of the Confederation of Engineering and Shipbuilding Unions. Mainly on his urging, these unions have agreed to a postponement of their proposed ban on overtime from January 18th, and will await the reports of the two courts of inquiry that are now meeting in public at the College of Preceptors in Bloomsbury; this is a sensible tactical decision in a dispute in which public opinion is going to be all-important, and in which the union may gain valuable points by pretending that—compared with the employers who rebuffed Sir Walter Monckton's attempts at mediation last week—they are apostles of reason and light. The employers, after first denying that they were "considering the possibility" of any offer, later undertook to accept the findings of the courts of inquiry—provided the unions did the same.

Among the other major unions involved in a dispute, the Communist-influenced electrical trades union—with its programme for guerrilla strikes next week (in sections that are likely to annoy the public most) and for a one-day strike on January 18th—seems to be more willing to risk public opposition; the employers are trying to get the dispute referred to arbitration. The National Union of Mineworkers has agreed that its claim for an increase for its lower-paid workers should be referred to the industry's traditional conciliation machinery. Other unions are still standing in the wings. The building workers are demanding an increase of 9d. a hour; since an arbitration court has already rejected their earlier claim for a rise of 6d. an hour, they are unlikely to agree to arbitration this time. The Electrical Power Engineers' Association has set up an action committee to take "immediate and drastic steps" to improve the status and salaries of technicians in electricity supply—and so on, down a long list.

Throughout all this two points stand out. The first

is that the long postwar process whereby wages have consistently risen by more than productivity will have to stop sometime; and that when it does stop there will certainly be strikes. It may be said that Britain can afford a little wage inflation provided that its foreign competitors inflate by a little more still—but 1954 does not look like being an inflationary year abroad. It may then be said that if a recession is coming, the unemployment that it brings will freeze further wage demands in their tracks. But if there is a moderate recession—with its attendant and bitter battle for markets abroad—then Britain cannot afford any wage inflation at all on recession's eve. It is always easy to find arguments for postponing the struggle until, say, after the next devaluation but one.

But, secondly, a stand will serve no purpose if it only leads to a surrender. Before any employers'

association made up its mind to carry its resistance to a demand for higher wages to the point of facing a strike, it would have to be quite united and determined in its own ranks, and confident that it had as good a claim on public sympathy as the unions. Whether, when the clash comes, these conditions will be present, no one can say. For, despite the traditional assertions of the Labour press, there is no General Headquarters of the capitalist world where decisions are taken on who shall stand and who shall yield (nor, for that matter, is there on the Labour side). Much will depend on individual tempers in specific cases. The only thing certain is that the clash cannot be much longer delayed, for the pressure among the unions to demand big increases is not far short of an irresistible force, while the facts of economic life are rapidly taking on the shape of an immovable object.

Mr Dulles and Mr Nehru

THE discussions at present proceeding between the United States and Pakistan have been stigmatised by Mr Nehru as a step towards war. Mr Nehru is notoriously sensitive about pacts of any kind, and in this case it certainly seems that he is both exaggerating what is in the wind and misjudging the Indian interest in the matter. There appears to be no question of a formal arrangement between the United States and Pakistan on the lines of the pacts with America's European allies. What is proposed is aid for Pakistan's defence effort, comparable to what the Americans have done for Iran and not to what they have been doing for France or Spain. Mr Mohammed Ali, the Pakistani Prime Minister, has declared that there will be no American bases in Pakistan. It is true that circumstances may alter and that, after a few years, Pakistan might change its mind and ask for something more; but if so, it will be the result of Communist behaviour in neighbouring areas—in the Middle East, for instance, or Tibet or Burma. And then Mr Nehru might be quite glad to have his left flank, the age-old path of the invaders of India, adequately covered.

Behind the expressed reasons for Indian resentment there may lurk less conscious grounds. Some Indians have never fully reconciled themselves to Pakistan's independent existence. Much was made, before the partition, of the Moslem provinces' lack of viability, and there is a certain tendency in the larger country to await the inevitable failure of the Pakistan experiment, and therefore to resent anything that seems to postpone it. A weaker form of the same emotion—and one that can be found on both sides of the border—is to believe that India and Pakistan, even if they are permanently separate, are permanent enemies, and that therefore any help to one must do harm to the other. But the outside world certainly cannot accept any such deplorable

assumption. Once the Kashmir dispute is settled, there are no two countries in the world that have less excuse for hostility than India and Pakistan.

These emotional attitudes deserve mention since, unworthy as they are, they colour the background. But in the foreground Mr Nehru's objection to the proposed agreement between the United States and Pakistan is based on entirely different grounds. It challenges his pet precept of neutrality by threatening to establish on his doorsteps (he has two, the one in Bengal as well as the one to the west) his pet aversion, a block or league. Mr Nehru regards foreign military aid as a derogation from independence; he has said once more a week ago that India will never accept such aid; and he is irritated when other Asian countries do so. He rejects Mr Mohammed Ali's argument that a better armed Pakistan will be so much the better placed to defend the whole of the Indian sub-continent. This is, for Mr Nehru, to argue on false principles: the key to India's security, according to him, is a policy of not taking sides in the cold war.

It is perfectly true that neutralism is one thing for a small country and quite another thing for a big country, and that the motives for it in Asia are different from the motives for it in Europe. But the events of this century show that large neutrals are just as incapable of keeping out of wars as small ones—if for different reasons. The United States, the large neutral *par excellence* in 1914, was no less determined then than India is now to keep out of wars, but the conflict was too important, and the United States was too vitally interested in the result, to do so. The same is true of India in relation to any war or serious disturbance of the balance of power in the Middle East or South East Asia.

A Pakistani-American agreement is not just that and

nothing more. It is part of a new scheme for the defence in depth of the Middle East, where the earlier Anglo-Franco-American scheme for collective defence in association with Turkey, Egypt and other Arab states foundered partly on Arab xenophobia and partly on the Arab-Israeli problem. Such a vital spot in world strategy, the place where the Russian balloon may dangerously bulge, cannot be left unprovided for in western strategic plans. Mr Dulles, having returned from a tour of the Middle East and beyond which took him as far as Karachi and New Delhi, is engaged in trying the obvious alternative to the still-born MEDO—a Pakistani-Iranian-Turkish entente designed, with American aid, to act as a crust to prevent the Russians from breaking through into the soft Arab crumb and the warm Indian waters.

Perhaps the most striking difference between the new plan and the old—and certainly the most striking for Mr Nehru—is the association of an independent South Asian state with Middle Eastern defence. This is a political novelty rather than a strategic one, for from the military point of view it merely serves as a reminder that the British army in India used to be the vital source of strength in Middle Eastern affairs. A second important difference—if the scheme comes off—would be the abandonment of neutrality by Iran; not, it is true, in favour of an alliance with Great Britain, the United States or any other western power, but nevertheless with a member of the British Commonwealth and a member of Nato. This prospect may make Mr Nehru wince but it can do India nothing but good. Those who remember how first Hitler and then Stalin were allowed to pick their ripe pears one by one have for some time been uncomfortably aware that Iran looked like a particularly ripe pear. If Moscow picked it and reached the Persian Gulf, there would soon be Russian submarines in the Indian Ocean. Any strengthening of the ties between Iran and its non-communist neighbours is to be welcomed by all non-communists.

★

If the strategic arguments point clearly in Mr Dulles's favour, the political considerations are more intricate. Mr Nehru's indignation may not be soundly based; but there is no doubt about its vehemence or sincerity. Moreover, the Indian reaction may not be confined to verbal protests. There has already been talk of taking aid from Moscow, and the fact that Mr Nehru treats India's Communists with exemplary sternness and is denounced by Soviet and Chinese propaganda as a specially noxious kind of Social-Democrat does not necessarily mean that he cannot make overtures to Moscow and Peking, or that they would not be glad to respond. Mr Nehru has the greatest confidence in his own wisdom and agility, and though he could not enter into any real alliance with Communists without splitting his Congress party from top to bottom, he is fully capable of making some highly embarrassing feints in

that direction—which he (or his successors) might eventually find had gone further than he ever intended. It would not be wise to underrate the harm that could be done by an indignant India.

Nor is it easily possible to exaggerate the embarrassment that any such development would cause to the British Government. Mr Nehru would get plenty of support in this country, not only from his friends on the Left, who like pink-tinged neutralism for its own sake, but also from the other end of the political spectrum, from the Commonwealth school, which reckons the rest of the world well lost if thereby any quarrel within the Commonwealth can be averted. The strength of this feeling in official circles has often been demonstrated in recent years. It has enforced on the British Government a policy of nervous neutralism in the Indian-Pakistani quarrel, and it has led to attitudes being struck at some episodes of the Korean imbroglio that have given the impression of preferring the friendship of India to that of the United States. The acid test for true Commonwealth believers used to be "Will Smuts approve?" for some of them it has now become "Will Nehru be angry?"

But another section of the advisers of Her Majesty's Government, those whose concern is with world strategy, cannot but applaud Mr Dulles's objects. The Middle East has, ever since the Russian menace loomed large, been the obvious and yawning gap in the defences of the free world and quite particularly in those of the British Commonwealth. Those who understand how vital it is, and how weak, have been holding their breath for fear of what might happen. If the gap could be plugged, and the United States committed to keeping it plugged, the sigh of relief would be audible the length of Whitehall.

Here are the makings of a pretty dilemma. The temptation, of course, is to let the Americans take the lead and draw Mr Nehru's fire. In the early stages that, no doubt, is wise; it would be a pity to make an enemy of India and then not get the alliance of the Moslem states of the "crust." But if the game looks like being won, Britain cannot afford to be left out of it. There is no occasion for any jealous feelings about an American entry into this part of the world, but equally little occasion for tolerating any exclusion of Britain from an area in which, until yesterday, it was the only great power. Before long, then, the British Government may have to make a choice. Shall it antagonise Mr Nehru, or abdicate its role in the great strategic area of which the Persian Gulf is the centre? It will not be an easy choice. But those who will have to make it may find one reflection decisive. Both Mr Dulles's attitude and Mr Nehru's are based on sincerely held views of the possibility and the morality of remaining neutral in another world war. Very few people in London want to pick a quarrel with Mr Nehru; but even fewer find his view of how to prevent war more convincing than that on which the whole of British foreign policy is based.

Civilians Defenceless

IF an old-fashioned atom bomb, like the one dropped on Hiroshima, burst over central London during the daytime, the experts believe that it would kill about 40,000 people, injure thousands more, and make as many as 100,000 people homeless. It would leave devastation in an area of some three or four square miles below the explosion and damage over some ten or twenty square miles; and would start hundreds of fires by its heat flash. What organisation would there be to put out the fires, to dig out the trapped, tend the wounded, house the homeless, or feed the hungry? What measures could be taken to restart transport, water supplies and other vital services? According to a report of the Select Committee on Estimates published at the end of last month: almost none.

The master plan for civil defence, approved in 1948-49, was to have cost £260 million in the four years starting in April, 1951. The part that was to run concurrently with the three-year defence programme of £4,700 million was to have cost £225 million. But in the first two of the three years Parliament was asked to vote only £58 million, and of this only £33 million was spent. As the chart shows each of the nine Government departments concerned has spent only a fraction of its estimate.

Although there has been some improvement in the last year, the civil defence plan is simply not being carried out.

What have been the reasons for this failure, and what can be done to rectify it now? The departments' excuses for not carrying out their plans were mainly that these plans had been changed—because of new assessments of the effects of atomic warfare and because the capital investment programme had been cut. But the select committee quite rightly decided that there was more to their failure than that.

There has not been that leadership, direction and guidance from the Official Committee on Civil Defence . . . which those responsible for carrying out the work needed.

It is impossible to avoid the conclusion that busy men at the Home Office and other Ministries have regarded civil defence as a bore—as, indeed, has the general public.

The committee found that nothing has been spent in four years on capital works to keep the railways or the electricity and gas industries going in wartime; and only minute sums have been spent on shipping, water supplies, sewerage and sewage disposal. The electricity and gas industries have taken no measures to build up their strategic stocks, to protect irreplaceable plant or to adapt their distribution systems for possible wartime strains—for no better reason than that, after interminable negotiations, it is still not decided how the various undertakings should be reimbursed. Plans to strengthen the bulkheads of merchant ships have been held up by failure to settle the question of tax exemp-

tion. Years ago it was decided that new blocks of flats ought to be built with strengthened basements—yet the London County Council has been waiting for two years to proceed with the first experimental scheme. A new respirator was designed two years ago, but is still only in pilot production. The first radioactivity meters were not ordered until 1951-52, and there are not yet enough to train the trickle of civil defence recruits. Control rooms have yet to be built. Only one item of equipment has been produced in adequate quantity—and that for reasons that have little to do with civil defence.

When textiles slumped two years ago the Government placed heavy orders for uniforms, so that in 1952-53 alone £4½ million was spent on them, 28 per cent more than the estimate. Uniforms may contribute something to morale and (very important) to recruitment; but by no stretch of imagination are they as essential as operational equipment. In face of a threat of immediate unemployment, all obstacles are swept aside; when all that is at stake is protection against atom bombing, very little is done.

It is useless to indulge in recrimination. There is something that the Government can claim on the other side of the medal: Britain still has a better system of civil defence training than any other country, and recruitment has improved since Sir David Maxwell Fyfe started his present nation-wide series of speeches. The urgent need now is to search for remedies. An organisation that can lead to such failures is clearly due for radical revision—at the top, in its operational spearheads,

CIVIL DEFENCE PLANS UNFULFILLED

Malaya Without Templer

THERE is some danger that the appointment of General Sir Gerald Templer, now the High Commissioner for Malaya, to command the British Army of the Rhine with effect from June may give a false impression of the situation in Malaya. General Templer is to be succeeded by his present Deputy High Commissioner, Sir Donald McGillivray, a civilian, and it might be thought that this reversion to previous practice, with supreme operational control of the armed forces vested in the separate hands of a General Officer Commanding, Malaya, shows that the government thinks the emergency is over. Indeed, even if that is not the view in London, the switch back to a civilian could of itself lull the public into an unjustified complacency.

What are the facts? And is it wise to make a change of this nature at the moment? As for the personalities concerned, there can be little cause for criticism. General Templer was appointed in the first place for two years only, and his term runs out next month; to stay on until June is already an extension. Moreover, it was always understood that on relinquishing his post in Malaya, General Templer would return to the Army; and to be given the most sought-after military appointment—regarded by some as a likely stepping stone to that of Chief of the Imperial General Staff—is a fitting reward for the courage, energy and ability he has shown in Malaya. Sir Donald McGillivray has behind him the benefit of a brilliant career in the colonial service and two years' experience in Malaya itself at the head of the Administration; it is also to his advantage that he will come to his new job at a much earlier age than is usual. Operational command of all the security forces engaged against the terrorists will be given to Lieutenant-General Bourne, at present GOC Eastern Command, who made his name as British Commandant in Berlin at the time of the air lift. An important and valuable change compared with the powers of previous commanders in Malaya, other than General Templer, is that General Bourne will also have full operational control of the police.

There are two types of argument against the removal of General Templer at this stage: on the one hand, it can be said that he himself is now at the height of his usefulness; and on the other, that, if he must be called away to other duties, then someone else should be put in his place with the same powers, the same primarily military background and the same type of general experience as himself.

The supposition in each case is that the emergency still calls for drastic treatment. But whether this is true or not, it seems unlikely that experience gained over the past two years would really outweigh the value of a fresh impact by a new man of the right type. General Templer achieved his own greatest success in the first few months

that he held office. Indeed, the outcome may show that the new vigour, the new ideas and the new sense of hope and confidence that he radiated saved Malaya in 1952. They suited the nature of the problem; it was mainly a question of creating high morale and of making a fresh start. Today, while morale is much better than it was, there is much to be said for making yet another start, but this time more political in emphasis. And if that is to be done, General Templer is handicapped by the fact that everyone knows who he is; that he has become associated with a phase that is virtually over; and that, however serious the emergency may yet become, a new figure is required to rally a volatile public opinion behind the government.

★

The argument for replacing General Templer with someone else of the same stamp is less easily refuted. But it rests all the same on facts which are far from proven. It rests on the view that the emergency is still the dominant feature of the Malayan scene and that the recrudescence of Communist incidents during the past two months, particularly in Johore and Negri Sembilan, proves that the shooting war is still only just under control. It is no more possible today than at any other stage in the five and a half years' struggle to say that the menace of the Communist guerrillas has been eliminated. On the other hand, few in Malaya would deny that the tide has turned. It appeared to turn about eighteen months ago, and nothing that has happened lately is enough to reverse this general judgment. The task that will confront General Templer's successor will not be—so far as can be foreseen—at all similar to that which faced him when he arrived in Malaya. That is some measure of the change that the last two years have wrought, not only in Malaya, but in South-East Asia as a whole. In spite of the recent Communist successes in Indo-China, there is no longer a mood of fatalism; the Communist drive goes on, but in many places it has already lost a good deal of impetus and the free world has shown that it can and will fight back.

In Malaya, this fighting back has put the enemy on the defensive. It is true that the Communists have for some time switched over to a policy of delivering their main attacks against certain types of collaborator with the government, of trying to win over, rather than terrorise, the people of Malaya, and of disengaging by withdrawing deeper into the jungle. But can one readily believe that they would have chosen to do any of these three things if their former policies of indiscriminate terrorism had been successful? It is generally accepted in Malaya, and not without reason, that the Communists have been forced to adopt this more limited policy by the pressure of the security forces. Nor have

and everywhere else. At the top it is unnecessarily complex. There is the committee of Ministers (from the nine departments shown in the chart) to decide such major questions of policy as the level of capital expenditure. Below them is the committee of officials, usually the deputy permanent secretaries from the same departments; this approves or disapproves of the plans drawn up by the Joint Planning Staff, which is composed of less senior civil servants from the same departments. Civil defence is thus embedded in thick layers of civil servants.

From these committees sundry papers are shuffled out to all or some of the nine departments, which may subsequently issue circulars to the local authorities. This is confusing for the local officials, and it can lead to some vital function being overlooked. For example, the select committee found that no one had been charged with the duty of collecting above-ground casualties (as distinct from those buried) and taking them to the first-aid stations on the periphery of a devastated area. The decision to bring so many departments into civil defence is inevitable, because their war-time and peacetime functions overlap. But there is a clear need for a central clearing house for all civil defence business, through which instruction to local authorities should be channelled, and which would have the task of keeping the departments up to the mark and the various parts of the programme in step with one another. The Home Office, which has the general duty of co-ordinating and carrying out the programme, could undertake this task; but if so, its civil defence sections will have to become a much more important part of the department. There is a case for forming them into a separate sub-department, like the Ministry of Home Security in the last war, and for appointing a vigorous junior Minister, preferably a serviceman, to look after them.

★

The establishment of a clear chain of command from the Home Office downwards will not do much good, however, if it is to be a chain stretching down into a vacuum. Unhappily, it is now obvious that peacetime recruitment of civilians is not going to be sufficient to man the civil defence corps that will be needed to absorb the first atomic attack of any major war. As the select committee suggested, the main reliance may temporarily have to be laid on the military; and particularly on the recruitment of mobile columns—that is, on convoys equipped with rescue and firefighting equipment, first aid, emergency feeding apparatus and everything else that would be needed to deal with a sudden air attack. The intention, long ago, was that in war-time a number of these should be stationed on the outskirts of towns likely to be attacked. At present, however, there is only one small experimental column; it is manned—as a strictly temporary measure, in the absence of full time civilian recruits—by national servicemen, on whom civil defence has no permanent

claim. The committee suggested that there should be thirteen of these columns in peacetime—one in each region—and that they should be composed of national servicemen, who would also form a civil defence reserve after their period of service.

The chiefs of staff do not seem to care for this idea, and it is true that civil defence should largely be manned by women and men who are unfit for active fighting. But the soldiers do not seem to have considered the effect on their own forces of a collapse on the home front. The alternative now seems to be between the absorption of a small part of the peacetime intake of national servicemen and a sudden call on the fighting services, at the outbreak of war, for larger numbers of fighting men to clear up the chaos that would be caused by an air attack. After war had broken out there would probably be no lack of women and older men ready to join the civil defence corps; it would take a very short time to train them and they could progressively relieve the younger men for actual fighting.

★

This does not mean, of course, that in the meantime attempts to build up local civil defence forces should be abandoned; and it is a black mark against the select committee that it came near to suggesting that they should. Obviously the mobile columns cannot be everywhere at once, and local people must be able to take action before other help arrives. It is therefore more, not less, urgent than ever that the civil defence corps should continue its recruiting campaigns. Its strength has been steadily increasing; but it is still a very long way from its goal of 600,000 members in peacetime, and many of its nominal members (anomalously left on the rolls) seem to have joined only to get rid of door-to-door canvassers, and never report for training. Better publicity is needed, especially publicity that is fairly rammed into people's eardrums. It is extraordinary that the BBC has not done more, for example, by televising the Home Office films about civil defence and the effects of an atom bomb.

There is at present a very general idea that civil defence against the atom bomb is a farce—like the pikes with which the Home Guard was supposed to resist the German parachutists in 1940. (Undoubtedly, a contributory cause of this fatalism has been that there are no shelters; the resources are being spent instead on houses, which are worth more in terms of votes.) There is a danger that the muddle revealed by the report of the select committee will add to this general fatalism. It can be argued, too, that when Parliament meets the report will merely become a stick to beat the Government. Perhaps an all-party committee to give belated consideration to civil defence measures would help; at present there is reason to fear that essential services and even government cannot be carried on effectively if the bomb comes down and that the civilian population lies virtually defenceless.

they been particularly successful in carrying out their new and lesser aims. They are still apparently compelled to make indiscriminate sallies for arms and ammunition. They still find in many places that only by fear can they force villagers to produce the food they need. And even in the deep jungle they are now no longer out of range of the government's striking power. If, in these circumstances, the number of incidents has lately increased, it may reasonably be argued that this is seasonal, or chance, or a temporary move to sustain a dwindling, rather than to demonstrate a rising, morale among the guerrillas.

That is one side of the picture, and the lesson of it is that the need for a primarily military High Commissioner has passed. The time has come instead to exploit the jungle victory and to switch the main attention of government to the civil side. It is the moment to press forward with a programme which will at once meet the mood of growing restlessness among the political leaders and snatch the bulk of the people of Malaya from their prevailing apathy. The task, in all conscience, is hard enough: to go sufficiently fast on the road to self-government to satisfy the firebrands and yet not to go so fast as to surrender the country to needless confusion; to awaken the democratic instinct

among the masses and yet not to hand any one community over to the tender mercies of another; and, by no means least, to plan economic development on an imaginative scale and yet not to be made bankrupt by the collapse of the prices of rubber and tin. It is a task for which the highest political and administrative qualities are required, in conditions for which, on the whole, a civilian is likely to be more fitted than a soldier.

The other side of the picture, however, must not be forgotten either. And it is here that General Templer's departure, right though it may be, must not be misunderstood. The Communists may be now on the defensive, but their power for harm is far from broken. Their killer squads are still in being, their training is even more thorough than it used to be, and their organisation is probably as efficient as it has ever been. Above all, the hard core of Communist leaders still in the jungle has been toughened by experience into remorseless and implacable enemies. As General Templer has reminded the world on several occasions, the emergency may not end completely for a long time yet. And so long as it remains smouldering, every step taken in Malaya must be considered with that fact in mind. General Bourne, when he arrives, will have his hands full and should be assured of full support from London.

Notes of the Week

Amended Challenge

THE Government enters the new year facing four by-elections—due to two new peerages, an appointment to a statutory board and a retirement through ill-health. All four, however, occur in constituencies with comfortable Conservative majorities. No Conservative MP, whatever his claim, can expect ennoblement in this Parliament unless his seat is safe. Arithmetically the gain or loss of a seat is not of much moment, as the Government found after winning Sunderland South, but a single Conservative defeat in a by-election could drastically alter the temper of the Commons. Labour leaders might like more time to caulk the seams of the party boat before launching a serious parliamentary offensive; but if they won a by-election, the surge of enthusiasm among their supporters would compel them to make a real effort to drive the Government from office.

In one respect Labour is better placed for an early election than for another two years in opposition. This week Transport House has republished "Challenge to Britain," revised to conform with the decisions of the

Margate conference. It now bears the title "A programme of action for the next Labour Government." Amplified by the addition of the statement on foreign and Commonwealth policy approved at Margate, it can become an election manifesto at any moment.

Among the alterations of substance (as distinct from drafting) the new Challenge declares that the next Labour Government "will immediately implement the policy of equal pay for equal work" and will restore the real value of all national insurance benefits to the level ruling at the inception of the scheme; the latter step will be followed by annual reviews designed to keep benefits in line with the cost of living. As some pretence at a policy for meeting these onerous commitments, an earlier threat to "consider" a capital gains tax has hardened to a firm promise of "appropriate forms of direct taxation of capital over and above a certain minimum." The pledge to agriculture now promises that price changes designed to affect the balance of production will be made only at five-yearly intervals, and that the intervening price reviews will be concerned solely with changes in costs. Much detailed thought—as well as many emotions—have gone into this document; but the party still stands sharply divided about the philosophical foundations of its policy.

Equal Pay

BOTH Labour and Conservative parties have long been committed in principle to establishing—subject to economic and financial circumstances—equal pay for equal work in the Government services. Experience has made that commitment mean very little. The Labour party, however, has now given it a new precision and substance. The new edition of "Challenge to Britain," incorporating a decision of the Margate conference, declares that

A Labour Government will immediately implement the policy of equal pay for equal work for men and women and in this way give a lead to industry generally.

This is not a definite promise to provide absolutely equal pay at once, but it must be interpreted as a commitment to begin at once to move quickly towards it.

The Conservatives may well feel bound to promise as much in their next election programme or even to do something earlier, though the women's vote and the feminist vote are by no means the same thing. The merits of the case seem clear; unequal pay for equal work cannot be defended on any ground of equity. The familiar argument in its defence—that men have dependants and women have not—does not apply to unencumbered bachelors and heavily encumbered female breadwinners; logically applied, this argument would call for a complete revolution in the system of wages—a revolution that the traditionalist defenders of inequality would be the first to oppose.

How far the establishment of equal pay for equal work would in fact benefit the general run of women workers is another question. The employment of women in some jobs does carry certain disadvantages to the employer; and a rate of pay that overvalued—or appeared to overvalue—their services might well restrict opportunities that have been opened to women because of their comparative cheapness. Where genuine identity both of job and of performance is established, however, there is no more excuse for regulating its reward according to sex than for making it depend on height, weight, or hair colour.

No government can enforce the principle of equal pay for equal work throughout the economy, but its attainment in the public services would reverse the present institutional bias towards inequality. There may be other anomalies on whose rectification £30 million a year needs even more urgently to be spent; there cannot be many.

Atomic Diplomacy

THERE is no cause for disappointment at the slow pace of the exchanges that have followed Mr Eisenhower's atomic energy proposal of December 8th. On the contrary, this is a crossroads to be approached in low gear. Some of the extremely complex issues involved have already been discussed in *The Economist*. Since the supreme objective is to draw the Russians into at least a limited form of practical co-operation, there is every reason to avoid giving them a feeling that they are being rushed. The procedures

chosen by the President and his representatives have been well suited to this situation. The American ambassador in Moscow visited the Soviet foreign ministry the day before the President's speech, to give notice that it was coming and to ask that it should be carefully considered. Mr Eisenhower himself pointed to private talks under the aegis of the United Nations as being the best means of ironing out the obvious difficulties. Last week, Mr Bohlen again called on Mr Molotov to say that the United States was ready to begin discussions whenever the Russians pleased. Now Moscow has accepted the suggestion of preliminary meetings in Washington.

This use of customary diplomatic methods and of courteous discretion—Mr Bohlen's visit on New Year's Eve was not announced until three days later—is both sensible and creditable. It should assure the Russians that the proposals are sincere, and that they are not merely being manoeuvred into another *nyet* for propagandist purposes. Mr Eisenhower's refusal to beat the drums of psychological warfare deserves all the more praise in view of the obvious value such tactics would have in domestic politics. The shape that formal talks will take is not yet clear; it may not be clear until after Mr Molotov has appeared in Berlin; but what is clear is that everything possible is being done from the American side to give the talks a good send-off.

Challenge from M. Monnet

INFORMED comment in Paris, Luxemburg and London now throws further light on M. Monnet's proposals for closer association between Britain and the European Coal-Steel Community. The proposals do not, of course, call for full British membership of the Community, but they face the Government with far-reaching political questions.

On the technical side Britain, as a beginning, would be expected to enter into a tariff agreement to liberalise the flow of trade in coal, steel and scrap between the two areas. The principle underlying this liberalisation would be to promote greater competition and not to create cartel arrangements between the two parties. In the second place, the commercial relations between the coal and steel industries of Britain and the Community should be regulated by a set of rules governing investment programmes, prices, commercial practices and trade cycle policy. These rules need not be identical with those contained in the Treaty on which the Community itself is based.

Out of these technical questions there arises a third and political negotiating point. The existence of a set of rules suggests the need for a permanent co-ordinating body. While this might well be composed of technicians and industrialists, M. Monnet has all along insisted—and it is the core of his policy—that the function of co-ordination should be vested firmly and constitutionally in the hands of men who speak as responsible political representatives of governments.

The British Government faces a decision of great difficulty. Its economic advisers, both inside and outside Whitehall, will quite rightly want to base policy towards the Community on calculations of gain and loss to this coun-

try's economy. To do that accurately is difficult, and may remain so for some time, even though it can be claimed that the common market has produced encouraging developments such as the expansion in the coal trade of the Community illustrated in a chart on page 85. On the other hand, its political advisers have to weigh the obvious weakness of going to Berlin with the British attitude to this and other plans for an integrated Europe still falling short of what M. Bidault—and presumably Mr Dulles—wants. It is in the power of the British Government during the next six months to make or break the integration policy. It would be wiser—despite the obvious difficulties—to take in principle a favourable political decision about the coal-steel community even though more detailed agreement must depend on economic arguments that are still unresolved.

The Teachers' Turn?

THE usual covey of teachers' conferences at each new year has produced the usual clutches of all-too-justified complaints about the teachers' lot and modern teaching problems; but only the Incorporated Association of Assistant Masters has caused any real feathers to fly. It did so with a quite serious discussion of a threat to strike. While it is extremely improbable that the grammar school masters will ever bring themselves to this dramatic gesture, which would mean handing in letters of resignation for the succeeding term, they have as undeniable a right as—and a rather better case than—most industrial workers to do so; many engineers are much better paid for much less skilled work. Meanwhile the new salary scales for teachers have been carried through the Burnham Committee by majority decision and await ministerial approval. All four secondary school teachers' associations opposed the proposals, but were outvoted on the teachers' side by the National Union of Teachers. On the local authority side the Association of Municipal Corporations, contrary to the advice of its own education committee, also rejected the new scales on the grounds of their cost and of their repercussions on other staff. This makes a complicated pattern of diverging interests.

The grammar school teachers are handicapped by the decision at the time of the 1944 Education Act to merge the primary and secondary school scales, in order to achieve "parity of esteem." Since then every increase for the grammar school teacher has meant a heave right down the line to the infant school. Various palliatives exist in the shape of special allowances for university degrees; these help the new recruit, but they do little for the experienced teacher. The Association of Secondary Schoolmasters is aiming at an assured salary of £1,000-£1,100 (apart from special allowances) at the top of the scale. This is far too high for primary school teachers, but it is not practical politics at the moment to divide grammar school salaries from the rest. The answer must be to devise new means of recognising teaching ability and intellectual quality that do not depend on the "class" of school. It is up to the grammar school teachers to suggest some.

Surplus of Doctors?

ONLY a few years ago, it was generally believed that there were not enough doctors for the health service to be a success. Last week the *British Medical Journal* sounded a warning that too many doctors were being trained, and a committee of the British Medical Association has suggested that a working party should be set up to examine how many doctors are likely to be needed in the future.

Whether this warning is justified depends—as so often—on how the words "surplus" and "shortage" are defined. There is a shortage of doctors in the colonial service and in the armed forces; but the British Medical Association would naturally resent the suggestion that these shortages, which largely reflect inferior conditions of service, should be relieved by creating a little unemployment at home. The number of consultants is also below the total once envisaged by the Ministry of Health; but the strict control now imposed on hospital budgets—and likely to be imposed for as long as can be foreseen—blocks any sizeable outlet for the services of would-be consultants. There are still some areas officially designated as under-doctored by general practitioners; but for some time there have been complaints from newly qualified doctors that they cannot find a reasonable opening in general practice.

The truth seems to be, not that the chances of young doctors finding employment are becoming slim, but that they are less likely to find the sort of employment that will give them the standard of living they have been led to expect. In the hospital service, moreover, there is the added difficulty that junior doctors who find the path of promotion blocked cannot, like their contemporaries in the Civil Service, be content to remain in their junior posts; the registrarships are regarded as training periods only. Yet the hospitals need registrars for essential work, and those who are forced to leave at the end of their training are immediately replaced. That competition for senior posts should be keener than it was in the first years of the health service is all to the good, as indeed is the competition for vacancies in general practice. But medical students are costly to train, and there is a case for inquiring whether some of the potential professional manpower they represent should be diverted elsewhere.

Impartiality in the Sudan?

THE Sudan has passed with honours its first small test in the exercise of self-government. A second and more delicate one lies ahead for its new prime minister, Ismail el Azhari, whose first undertaking upon his election last Wednesday was that his actions would be governed by "national interests, not party politics."

The first test arose over the new Parliament's election of speakers. The Senate, which contains 32 National Unionist members (that is members of the party that upholds the orthodox Khatmia sect, and that favours some unspecified link with Egypt) as against an opposition of 18, elected a National Unionist speaker who, as a result of long years of

asbestos cat

Only an inhabitant of the lower regions could possibly have any use for an Asbestos Cat. But if our export department received an order for one, they would scarcely turn a hair. Seriously, the uses of Asbestos in industry are growing at a fantastic rate.

Apart from its first great natural property, the fibrous structure of asbestos renders it easily adaptable to many uses, often in combination with other materials. It can be spun, woven and moulded. We, ourselves, turn it into many products. Amongst these are Caposite and Caposil, both Preformed and Plastic heat insulations, also Capasco Moulded Brake Linings and Asbestolux Incombustible Building Board. It is available as yarn or cloth, as mattresses for locomotive boilers and also has its uses in those transports of delight, the jet liners.

Asbestos may solve some problem that's proving a bit of a headache in your branch of industry. If you think so, consult the people who know best about Asbestos...

There is a local office to administer your estate

THERE are often very real advantages to be obtained when an estate is administered by those who have first-hand knowledge of local conditions and who are easily accessible to the dependants.

The Executor and Trustee Department of Lloyds Bank has 28 offices in England and Wales. When Lloyds

Bank administers an estate the affairs are handled not by a remote organisation but by personal contact through the appropriate local office of the Department.

For information about the Executor and Trustee services of Lloyds Bank in your district, please enquire at any of our branches.

work as a civil servant, has some experience of impartiality. The smaller National Unionist majority in the lower house put in an ardent member of its party committee. Both appointments required the sanction of the Governor General's five-man commission that consists of two Sudanese, one Egyptian, one Englishman and one Pakistani. Upon receipt of opposition complaints that neither speaker would be impartial, the Governor General had the support of this body not only in sanctioning the Senate's choice, but also in vetoing the more colourful one made by the House of Representatives. It gave the latter verdict by three votes to two: its Egyptian and Sudanese National Unionist members voted together and in the direction that was to be expected; its British, Pakistani, and Sudanese Umma party members upheld the Governor General. The House accepted the verdict and has now made a second choice—an ex-judge with National Unionist sympathies. Parliament consequently sailed ahead on an even keel, elected its first prime minister and gave him, from the opposition benches, moderate and laudable assurance that "our opposition will be constructive" and that "we will support you so long as you aim at the Sudan's independence."

The first big test of Ismail el Azhari's capacity to act along national as opposed to party lines will come when Parliament is asked, as it must be under the Anglo-Egyptian Agreement of 1953 on the Sudan, to approve the appointment of the two Sudanese members of the Governor General's commission. These, who were chosen by Britain and Egypt in agreement, do not both belong to his party, which is bound to press him to help change its adversary. His majority is not so large that he can afford to do this and retain opposition support; yet the temptation to please his party and the Egyptians will be very great. An acid test of his statesmanship will be his assessment of the value of maintaining a Governor General's commission of a shape that promises impartiality. As now constituted, it is a body that an astute prime minister could use as a brake upon the extremist wing of his followers and, if need be, too-pressing Egyptians also.

FOR the better ordering of the working day, and for the comfort and delectation of secretaries, there is nothing to equal The Economist Diary. Its lay-out has been designed specially to enable the busy man's appointments to be organised in an orderly manner. And in the same volume are 72 pages of facts and figures which together form a reference book of world-wide range.

The volume is bound in red leather and measures 10 in. by 8 in. Price (U.K. only): 41/- including postage and purchase tax. Overseas prices vary widely; a schedule will be sent on request. Full details of The Economist Diary are given in an illustrated pamphlet available from: Diary Department, The Economist, 22 Ryder Street, St. James's, London, S.W.1. Telephone: Whitehall 1511.

Apartheid in the Universities

THE policy of *apartheid* in South Africa is now to be enforced in the field of education. In an address to students of Stellenbosch University, of which he is Chancellor, Dr Malan gave notice that the government will end "as speedily as possible" the mixing of races in certain universities. The action becomes necessary, according to him, because "this glaring anomaly in our education system . . . cannot continue without having the most harmful results."

Until recently generations of South Africans had accepted the view that separate educational facilities were necessary and proper in the primary and secondary grades, but that some mixing of the races at the universities was tolerable. Practice differs between the universities; in Natal numbers are sufficient to justify parallel but separate classes for white and black; in Cape Town and the Witwatersrand African, Asian Coloured and European sit down side by side in apparent innocence of the schisms in the outside world. Social contacts are, however, largely by mutual consent, kept at a minimum. Now the non-European students will be expelled from the "white" universities and put into equal but separate institutions. The Minister of Education promises that he will ensure adequate alternative facilities; but race relations are bound to suffer by this new isolation of contacts between the races. Moreover, the cost of providing and staffing rival institutions will be prohibitive, for the present proposal will throw a heavier burden on the predominantly white taxpayers.

This unnecessary act was prompted, presumably, by a tendency among students to act contrary to the government's *apartheid* policy. For example, Nationalist opinion was scandalised when the 4,000 students at Cape Town University, only 6 per cent of whom are non-Europeans, elected two Africans to the students' representative council. As there is a high proportion of Nationalist-minded students among the whites, it is little wonder that the government felt the time had come for action. Dr Malan's party is determined to give education special attention in its *apartheid* plans. Another deplorable step in this direction was taken this week when control of Bantu education was taken away from the Provinces and centralised under the Native Affairs Department.

Eggs and the Taxpayer

BRITISH hens understandably mistook the December mildness for spring and have been hard at work. They are also laying particularly well because since feeding-stuffs became so cheap they have been particularly well fed. As a result, the retail price of eggs has dropped to the unseasonable average of 3½d. each; and Danish eggs, of which imports are now restricted, have been sold at 2½d.

Although the British people are getting eggs more cheaply in their role as consumers, they are paying more heavily for them in their role as taxpayers. The support price paid to farmers is now 4s. 7½d. a dozen for ungraded eggs; and as the Government must make up the difference between this and the market price, it has recently been

losing as much as 2d. on every egg (about £700,000 a week on present output).

It is one of the weaknesses of the interim marketing scheme now in operation that it imposes no control on distributors' margins, and these can now be widened at the taxpayer's expense (especially as direct sales from farmer to retailer are forbidden). Other weaknesses of the scheme derive from miscalculations. The support prices were generous enough at any time, but they did not allow for the fall in feedingstuff prices that has put still more profit in producers' pockets. And, of course, it was not foreseen that the support price would come into operation during the winter months. It now looks as if this year's cost of keeping up the prices paid to the producer of eggs may be greater than last year's cost of keeping down the prices paid by the consumer; and that was £25½ million.

From now on, cheap eggs should cost the taxpayer progressively less as the support price (which is seasonally adjusted) falls; and before April 1st, when private traders will be allowed to import eggs from the Continent, the Government will have had a chance to cut the support prices at the February price review. It should also seize the earliest opportunity to amend the present marketing scheme.

Capital from the Landowner

It is not generally realised that the private landlord is still of prime importance to the efficiency of British agriculture. Over 60 per cent of holdings are still farmed on the landlord-tenant system, under which the landlord normally provides the fixed capital and the tenant the working capital. Modern production methods require a very high investment per acre of both types of capital; but since even the efficient tenant, whose own resources are often strained to the full, cannot farm successfully without an ample provision of fixed equipment, the landlord has the larger responsibility and the greater initiative. But can he afford to exercise them?

In an interesting recent paper read to the Farmers' Club, Dr E. H. Fleming Smith argues that he can, if he chooses to do so. Dr Smith points out that British agriculture used to enjoy a fairly ample supply of cheap capital from landlords who took their return in social or even political advantage. This source has mainly (although not wholly) dried up. It has been replaced by a system of taxation reliefs and public grants which, carefully manipulated, enable the landlord to charge the taxpayer with most of his new investment. For instance the expenditure of £1,750 on a new farm cottage attracts a grant of £15 a year for 40 years (£600 in all), together with taxation relief which—at the present standard rate—amounts to £788 spread over the years. One handicap of this generous system of assistance is that the less a landlord has, the less he will receive. The surtax payer invests extravagantly, but some poorer landlords must keep their tenants starved of capital.

It is, or should be, an essential condition of this public assistance to agriculture that it is well used. For instance the fact that agricultural holdings are favourably treated for death duty purposes has attracted a certain amount of temporary and fluctuating capital to the land;

as Dr Smith suggested, it would be better to restrict these reliefs to capital that has been employed in agriculture for a reasonable time. It is even more important that rents should be fixed by reference not to the owner's tax schedule or to traditional practice, but to the farm's potentialities. Failure to do this may deprive the community of the extra food production that it has done so much, by subsidies and concessions, to make possible. The golden rule, in Dr Smith's words, is that rents should be such "that the good farmer can do well, the average farmer obtain a reasonable living, whilst the inefficient farmer heads steadily for bankruptcy."

South America has a North

ANY increase in British attention to the Latin American markets where so much ground has already been lost must be commended. The tour now being carried out by the Minister of State at the Board of Trade, Mr Heathcote-Amory, is therefore a welcome sign of new activity, and all the more so since it appears that the Minister is speaking to his hosts in the kind of clear, courteous but firm

What to do About Strikes

Both law and nature warrant the inference that some remedy is available for that dissension in the North which begins to be an alarming national evil. By universal consent all hope of finding a remedy by the law is discarded. Neither masters nor men appeal to it. . . . There seems to remain, therefore, only the authority of well-weighed public opinion which can interpose with any chance of success, and the Press, as its representative, seems called on to arbitrate between the conflicting parties and, if possible, restore the harmony which is equally desirable for the interests of individuals and for the public welfare. . . . We do not see . . . why some of the masters, men of known good sense and moderation—and many such exist—and some of the men, equally men of known good sense and moderation, might not talk over the matter together, excluding delegates on the one hand and obnoxious masters on the other; . . . and taking into their councils some men of known and distinguished ability, who are neither masters nor workmen, come to some conclusion concerning the best course to be pursued for all, and recommending that to the general adoption. As long as workmen discuss the matter only with workmen, and masters only with masters, each confined to his own sphere of ideas and his own associates, there can be no chance of coming to an agreement. . . . Government might depute someone to attend such a conference to give advice, and to gather for the Government information of what it could do now to promote peace and prevent quarrels in future. It might learn, perhaps, how it could, by removing all remaining restrictions on industry, and so increasing wealth and the demand for labour, by altering laws of partnership, and by other means, promote that change, now in progress, which will end in the bargains of all classes being made on the same principles of higgling and free competition, when the master spinner shall no more quarrel with the working spinner than he quarrels with his cotton merchant or his German customers.

Coal Trade in the Coal-Steel Community

The chart shows how the exchange of coal between the six member countries of the Coal-Steel Community has increased by nearly 20 per cent. since they abolished all tariffs and quota restrictions on its movement within the Community.

language that gets results. But it is regrettable that he found it necessary to curtail an already brief programme; and it is doubly regrettable that, while Brazil and the River Plate countries are receiving the second ministerial emissary sent by the present Government, it has not yet been able to pay a similar compliment to the smaller republics further north.

It may be thought by the Minister's advisers that the fourteen northern republics (notably Colombia, Cuba, Mexico and Venezuela) with their dollar-hard currencies and relative lack of payments problems, are a straightforward commercial target where businessmen do not need political support. It is true that the Crosland mission, a year ago, showed what good work a party of visiting businessmen could do in this area. But Britain's competitors on the Continent have not hesitated to send ministerial—and even royal—spokesmen to the Caribbean and Central American republics; and they appear to have profited accordingly. This is not only an often forgotten second dollar area; it is a region of over forty million people which is growing, in terms of population, wealth, and economic activity, at an astonishing speed. It is also a region where the personal touch means a great deal; and a commercial nation neglects it at its peril. The Board of Trade should know this.

Good News from the Danube

LAST week Mr Djuric, the new Yugoslav secretary of the Danube Commission, announced that the Danube was now open as an international waterway to shipping of all countries. This is the happy outcome of Moscow's decision to abandon its vendetta with Yugoslavia in the Danube Commission. Ever since 1948 the Yugoslavs on the six-nation commission have found themselves obstructed and overridden at every turn; power was concentrated in the hands of the secretary, who was always a Russian and who could always count on a "Cominform majority." Only last July, when in many other directions the Russians were making conciliatory gestures, new rules of procedure designed to strengthen the Soviet Union's dominant position were adopted by the commission against strong Yugoslav opposition.

But at the next meeting, in the middle of last month, all was suddenly sweetness and light. It was unanimously decided that the post of secretary should rotate annually among all the members of the commission, and that he should no longer enjoy such far-reaching authority. A Yugoslav was made secretary, while Hungary and Bulgaria, which have also received something of a raw deal in the distribution of the chief offices, got the presidency and the vice-presidency. The commission also adopted a long-standing Yugoslav suggestion that the headquarters of the commission should be transferred from the Rumanian port of Galatz to the much more central Budapest.

These developments are unlikely, of course, to make any immediate and striking difference to the amount of traffic on the Danube. But they form an essential preliminary to the restoration of the river as an international waterway. If the commission is really going to stick to its own business and leave ideological differences on one side, it is possible to envisage Germans and Austrians sitting on it. Nor is it likely that the restored amity on the Danube commission

foreshadows, any more than recent frontier agreements and exchanges of ambassadors, any striking change in Yugoslav-Cominform relations. It is possible that the next step in the gradual lowering of tension between Yugoslavia and its neighbours will be overtures for a resumption of trade relations; but if so, the overtures will have to come from the Cominform side.

Fewer New Books

FOR the first time since the war fewer new books were published in 1953 than in the preceding year. According to the *Bookseller*, there were 18,257 new titles last year, compared with 18,741 in 1952 and with 17,137 in 1937, the peak of the prewar publishing boom. New editions and reprints, by contrast, increased from 5,428 to 5,523 last year; in 1937 there were 5,810.

There is no evidence, however, that last year's slight faltering in new titles was due to competition from television; for there were again increases in the types of books that the viewing classes are most likely to read. Fiction, despite publishers' grumbles that sales are in the doldrums, slowly continued to draw closer to its prewar peak of over 5,000 new titles a year; and new children's

books rose to just under 1,600, almost exactly the same as in 1937. Educational books, on the other hand, which had already increased above the prewar peak, dropped again towards it, and religious books also fell. Compared with output before the war, travel and adventure books are still sharply down, but technical books and books on industry and commerce have soared.

It is probable that last year's figures reflect nothing more than the publishers' cautious reaction to buyers' markets. The cautious publisher may bring out fewer new educational books, on the assumption that this will lead to increased sales of old ones. This logic, however, cannot be applied to fiction. It is impossible to predict which new works will be financially successful; and the only hope of finding a winner lies in increasing, not in decreasing, the number of new titles. In poetry and drama, the laws of logic and economics fortunately seem to play no part at all; it is pleasant to record that no less than 578 new volumes were produced in the course of last year.

Letters to the Editor

Dividends and Taxes

SIR—The letter from Mr Roy Jenkins, MP, in your issue of December 26th, makes one despair that Labour politicians will ever deal fairly with private enterprise. Officially the Labour party policy is that the bulk of the business in this country should continue to be conducted by private enterprise (if that was not their policy they know that they would have practically no chance of getting into office again) but they seem determined to do their utmost to destroy it.

Investors in ordinary shares are not an isolated group, they are the same group that invest in gilt edged and fixed interest securities. If ordinary shareholders, who have to bear the losses in bad times, are not going to be allowed to benefit from good times, and if they are not going to be allowed profits from good companies to set off against losses in bad companies, the eventual outcome will be that they will cease to invest in ordinary shares. Industrial companies will then have to finance themselves by issues of fixed interest securities (mainly in debentures) and by borrowing from the banks. This in the end would bring bankruptcy, as in bad years they will not be able to pay their debt interest and not only that, but even in good times, as their proportion of risk capital declined, directors quite rightly would cease to take risks. If that happened the capitalists would not be the only sufferers.

The proper way to carry out a semi-equalitarian policy is by taxing the individual, as has already been done, and not by vindictive legislation against ordinary shareholders. Since 1935 *The Financial Times* ordinary share index has risen by 30 per cent and this during a period of severe inflation. Can this be considered an adequate reserve with which to face a slump? In 1929-32 shares dropped 60 per cent in value. In fact, of course, in terms of real money, ordinary shareholders have lost heavily both in capital and income since 1935.—Yours faithfully, C. L. OVERTON

Wirral, Cheshire

SIR—Mr Gifford's letter advances the argument somewhat. My main object was to propound the view that there has been a significant change in the dividend policy of the average company. This is not apparently accepted by the spokesmen of the Treasury. They seek to explain it all away by reference to the amount of capital employed. But Mr Gifford does not agree with them. He does not dispute the charge. Instead he seeks to justify it.

This he does in two ways. First he argues that shareholders do worst in a slump. They should therefore be

allowed to do well in a boom. The statistical basis of the premise is doubtful. In the most famous of downswings—in America between 1929 and 1932—wages fell by 60 per cent and dividends by 57 per cent. But, more importantly, there is now widespread confidence that those days are over and that remedial government action will avoid any such collapse in the future. So far as many of the best-established companies are concerned much of the risk has been removed from the equity. Dividend reductions are extremely unlikely for many years to come. If a ceiling is suggested, a floor is already in position.

Mr Gifford's second point is that now, even if the "takeover" bid were unheard of, directors would be forced to generous distribution policies by the form of the dividend limitation measure proposed by the Labour Government. This was a short-term scheme for the specific emergency of rearmament. As such it was perhaps as arbitrary as, although much less harmful than, Mr Butler's excess profits levy. It was certainly unsuitable, in my view, for long-term use. But to imagine that directors can insulate themselves against similar difficulties in the future by now distributing as much as possible is surely foolish. The Labour Party can hardly be expected to stand aside, making no protest and planning no counter-measure, while part of its redistributive work is undone. If the business world does not like the compromise of high company earnings (even after tax) and proportionately low distributions it can no doubt make an end of the latter. But it must not then be surprised if the next Labour Government is less tolerant of the former.—Yours faithfully, ROY JENKINS

House of Commons, S.W.1

Atlantic Assembly

SIR—Your modest proposal, in your issue of December 26th, for an Atlantic Assembly is to be welcomed.

One doubt remains. This country has not allowed itself to become too much involved in the affairs of Europe and the reason given (some would say the excuse) is its position as head of the Commonwealth. This is a valid reason; but would it not equally apply to an Atlantic Assembly, which includes the Nato countries, but excludes such members of the Commonwealth as India, Australia, New Zealand and South Africa? It is now an axiom of British foreign policy that this country is the centre of three concentric circles—Europe, the Commonwealth, and the United States, having a special relation-

ship with each. Does not an Atlantic Assembly based exclusively on Nato, with Canada the sole Commonwealth representative, invite the criticism that we are sharpening the outline of two of the circles at the expense of the third? The inclusion of observers from the other Commonwealth countries might meet this objection.

The two great merits of your proposal should be emphasised. First, the Atlantic Community is something of a misnomer with its many misunderstandings and misrepresentations. In 1951, fourteen American Congressmen met a delegation of the Consultative Assembly of the Council of Europe; some plain speaking followed. An Atlantic Assembly would ensure regular meetings between parliamentarians of the old and new worlds, and might help to clear away misunderstandings, especially on economic problems. The second advantage would be the publicity that would be given, especially in this country, to a meeting of parliamentarians. Conferences on Nato held recently at Oxford, the Hague and Copenhagen have caused hardly a ripple of comment in the British press. The International Press Institute in its report called "The Flow of News" emphasises the importance of foreign news on the grounds that relations between governments are more than ever strongly influenced by the people's view of their own interest; this view is largely shaped by their information. The report states that 82 per cent of British newspaper readers were unable to answer correctly the question "What is Nato?"

That much of Nato's work is at present secret we must accept. But a clearing of the air on many economic matters, so closely connected to military decisions, could do nothing but good.—Yours faithfully,

B. D. BARTON

London, W.1

Minor Setback in Sales

SIR—Your correspondent Mr Bernard Berg suggests that the Board of Trade retail trade figures for October, 1953, unduly favoured that month because it contained five Saturdays as against only four in October, 1952.

In fact, however, these comparisons are based on standard numbers of weeks representing each month. For October, the 1953 figures used were those of the four weeks ending on the Saturdays dated October 10th, 17th, 24th and 31st, while the 1952 figures used for comparison were those of the four weeks ending on the Saturdays dated October 4th, 11th, 18th and 25th.

Furthermore, the published percentage changes in money sales are based on average weekly sales for each of the two months being compared, so that an appropriate adjustment is made where, for example, a contributing retailer's figures cover five weeks for one month and only four for the other.—Yours faithfully,

DONALD BARBER

Understanding the Union

SOUTH AFRICA IN A CHANGING WORLD.

By Edgar H. Brookes.

Oxford University Press. 151 pages. 12s. 6d.

THE SOUTH AFRICAN WAY OF LIFE.

Edited by G. H. Calpin.

Heinemann. 200 pages. 12s. 6d.

AFRICAN ASSIGNMENT.

By Major-General Francis de Guingand.

Hodder and Stoughton. 291 pages. 21s.

WHEN the Union parliament last October temporarily shelved the coloured voters issue, a section of the British press was deprived of its daily recreation of beating everything South African with the big stick of *apartheid*. In this, the close, season it would not be a bad thing if these self-styled experts brushed up their secondhand knowledge with a few of the elementary facts. These three books, each in its own way, contribute towards a better understanding of South Africa and South Africans.

By far the best of the trio is Dr Edgar Brookes's significant little book "South Africa in a Changing World." Indeed, it would not be an exaggeration to say that it is the most thoughtful and enlightening study of the Union's problems for at least a decade. Moreover, since the book is written by an ardent and undoubted liberal, who for many years championed the Africans as their representative in the Senate, even a Fenner Brockway need not feel ashamed in its company.

It is easy to predict that it will have a wide impact in South Africa, since the author's reputation as a scholar, politician and expert on native affairs is such that even the Nationalists listen to him with respect. But some of Dr Brookes's most telling arguments are directed at the overseas critics of South Africa. How many people abroad understand the true character of the Afrikaner? How often do they allow for his history, his pride, his traditional resentment of outside interference, his devout Nonconformism, and above all his deep love of his own country? Too often the British press, whether out of ignorance or malice, depicts the Afrikaner as a crude, insincere, and heartless person; but as Dr Brookes shows, there is a warm and endearing side to his character.

On the other hand, Dr Brookes is the truest negrophile. Not only can he appreciate their virtues, he is also painfully aware of their faults; yet he loves the Africans all the same. He is scornful of the "sentimentalist" and the "poser" who refuses to face unpleasant facts, who "intoxicated with his own benevolence

and condescension, a prisoner to his own vanity . . . becomes a man without a following." One wonders which of the many examples of "lesser men who adopt, unasked, the role of professional friend" Dr Brookes has in mind. But if the arch-liberal feels that he has been cheated, that after all this book is only thinly disguised South African reactionaryism, then he should read the last chapter first. Surely no more sincere and moving love for the African people has elsewhere been expressed.

The collection of essays written by a heterogeneous group of South African authors is one of a series prepared under the auspices of the International Studies Conference. If the reader is expecting a cross section of life in South Africa he is doomed to be disappointed; and, regrettably, this series cannot even claim to portray completely that indefinable thing the South African way of life. For where in this collection of somewhat erudite essays is the true warmth and vitality of the South African character? Overseas readers will find most interest in the essays by Dr S. J. du Toit on the Afrikaans-speaking section and by Mr Selby Ngcobo on the Bantu peoples. The former exemplifies the Afrikaner's inescapable fascination with the past. To Dr du Toit, and indeed to all Afrikaners, the Great Trek and the Anglo-Boer war are not mere chapters in a history-book, they are turning points in the life-span of the Afrikaner nation. Foreigners should never forget this. Mr Selby Ngcobo's chapter is full of interesting details about life among the Bantu people; but one wonders whether a man educated at Yale, whose intellectual life at least is now with the Europeans, can speak with authority for the Bantu.

Major-General Sir Francis de Guingand is a distinguished soldier who after the war took up a business appointment in South Africa, where at present he resides. The greater portion of this book is an account of his experiences, some exciting, some amusing, but mostly rather humdrum, as an officer in the King's African Rifles in Central Africa from 1925 to 1931. In the last part of the book, however, General de Guingand, like so many of his former colleagues, departs from the relatively straightforward narrative and plunges into politics. Not untypically for a man whose lifelong experience is of the good comradeship of the regiment and the officers' mess, he is a generous, if rather naive, political commentator. His commendable aim is to see South Africa presented in a fairer light; but in so doing he has to bend over backwards to dodge

unpleasant facts. Would that it were possible to reduce the tangled mass of South Africa's problems to the terse, unequivocal language of the "military appreciation."

Towards Total War

A HUNDRED YEARS OF WAR

By Cyril Falls.

Duckworth. 419 pages. 30s.

PROFESSOR FALLS'S hundred years of war begins on the Alma and ends on the Yalu. The contrast between the Russian guardsman firing a smooth bore musket and the Chinese airman flying a MIG jet fighter is so sharp that it is tempting to talk of the revolution in war. Mr Falls corrects this glib assumption by carefully heading his first chapter "The transformation of war," in which he remarks that

since the sixteenth century it would be hard to find any period of fifty years at the end of which an army, with contemporary weapons and tactics, could not with ease have utterly destroyed an army with those of the start of the half-century.

The methods of waging war are, in fact, ceaselessly being transformed. In the last hundred years this continual evolution was speeded up, but the strategic objectives often remained the same and old-fashioned tactics merely turned up in a new guise. The air became another arena for battle; railways and the internal combustion engine

THE BACKGROUND OF BUSINESS

By H. V. R. GEARY

9s. 6d. net

This book attempts to give an up-to-date and comprehensive description of the workings of the commercial world. Although written primarily as a textbook for students, it is hoped that the clarity of its exposition and the general interest of the subject will also attract the man of affairs and the casual reader.

MAJOR GEARY edited Volume VII (Industry and Commerce) of the OXFORD JUNIOR ENCYCLOPAEDIA

OXFORD UNIVERSITY PRESS

"What's past is prologue"

BRITAIN has more electrical generating plant than it has ever had before; there is more electricity for everyone.

Britain's demand for electricity is also greater than it has ever been before; the factories, the farms, the homes and the offices are using more electricity—and asking for still more.

To meet these needs, British Electricity has achieved new records of construction each year. The sum of these to date adds up to the grand fact that Britain has 32 more power stations and the power available has been increased by more than a third in the past five years.

But all this fine plant is giving full output only for short periods once or twice a day. Continuous full operation would reduce the cost of electricity production. The most effective way to obtain more economical electricity generation is to expand the use of electricity for all purposes—in the home as well as in the factories, in office buildings and on the farms, and for street lighting. Every extra unit of industrial production, every new technique in armament, every provision of new houses—or of new services in old houses—every development in rural and farm facilities . . . calls for more and more electricity; so that in addition to the six million horsepower installed in British Electricity's first five years, 10 to 11 million horsepower of new generating plant is needed in the second five years to keep pace with our national and personal requirements.

ELECTRICITY PROSPERITY

Capitalism for the millions

There has been much talk in this country about attracting "small savings" direct into industry through the Stock Exchange.

So far, however, we have done nothing but talk.

In a fortnight's time, the New York Stock Exchange is to launch its "pay-as-you-go" plan for small investors.

The plan has split Wall Street and the U.S. banking community. It is opposed and criticised. It is hailed as the way to produce a true property-owning democracy. It will, it is said, bring costly disillusionment to the small man.

The first full and authoritative discussion of the plan, its merits and demerits, how it will work, what it will cost, appears in the coming issue of the Investors' Chronicle.

This is "must" reading for all forward-looking investors, industrialists, politicians, trade unionists and others interested in modern capitalism.

Make sure you don't miss it by ordering your copy NOW.

CANADIAN OPPORTUNITY

Montreal manufacturer of light engineering equipment would like to make arrangement with British firm for the sale or manufacture of British products in Canada.

Manufacturing in Canada may be partial or complete and re-design for Canadian standards can be undertaken by the Canadian Company.

Write to Box No. 418

Are you one of these?

IF A NATION gets the rulers it deserves—it certainly gets the newspapers it asks for. Today it is not uncommon for people to deplore the lack of taste in modern journalism—and yet to be taking the very newspaper which (theoretically) offends them. Such people should try the Manchester Guardian.

Those who profess principles should at least seek to exercise them. And to change to the Manchester Guardian means no sacrifice, no giving up of anything. Rather is it a gaining.

A month or two of the Manchester Guardian will cure the taste for anything but good taste. You will come to find that the Manchester Guardian has a charm and a wit of its own. You will come to admire its keen, clean writing and reporting. You will be proud to be seen reading and enjoying a newspaper which contrives always to be good, never to be dull.

If you have any difficulty in getting your Manchester Guardian regularly, please write to: The Manchester Guardian, Manchester.

Trafalgar Square, London.
Obtainable from most good hatters.

Electrical heating problems are bound up in What kind of life you get at what temperature

It is an established fact that resistance wires of similar basic composition can have different lives under equivalent conditions of working temperature.

The production of a wire giving long life within its admitted range of working temperature can be achieved only by a specialised melting technique and by strict control in the subsequent processing.

These two essential manufacturing characteristics are fundamental, in conception and in practice, to our production of resistance wires for high temperatures. They are factors which can only come from long experience of this exacting work and constant development of technique.

gave the general staffs new problems in organising supplies and in moving troops; weapons became obsolescent more quickly. Above all else war became more costly and more extensive, so that the limited battles between armies and navies were replaced by an all-in and all-out combat between the great industrial powers. The peasant ploughing on the hillside, indifferent to the battle in the meadows below, has probably never been anything more than a myth, but until the present century that labourer could never feel that his contribution to a war was more telling than that of the soldier in the field.

In his skilful narrative Mr Falls never loses sight of this thread of relentless change. Nor does he evade his task by bumbling airily about principles of strategy. Having sketched in the political and strategic background of the wars that were fought, he analyses the course of all the major campaigns and battles—and some of the minor ones as well; his analysis is necessarily brief and for this reason his opinions may very occasionally seem slightly at fault. By putting his emphasis on tactics he rightly avoids the mistake—to use his own words—of going “through contortions to prove that battles and wars are won by any means except that by which they are most commonly won, which is fighting.” Within the limited compass of four hundred pages, his opinions can therefore never be anything more than sound; but his skill is such that even the most cursory reader can see, for instance, in the American Civil War and the Russo-Japanese War the lessons in tactics that had to be so painfully relearned in the Boer War and in the last two Great Wars. And while the reader is carried forward on the inexorable march towards total war—and the atomic bomb—he is shown, in Napier's phrase, “that war, however adorned by splendid strokes of skill, is commonly a series of errors and accidents.”

War is also commonly a series of terrors and horrors. And it is Mr Falls's belief that over the last hundred years war has grown not merely more destructive but more horrible as well. Few will dispute this judgment when they remember the pattern bombing attacks through clouds or Belsen or Hiroshima.

Making Knives

THE STORY OF CUTLERY.

By J. B. Himsworth.
Ernest Benn. 208 pages. 42s.

THE history of the manufacture of cutlery in this country follows a remarkably consistent line of development from the thirteenth to the latter part of the nineteenth century; a development marked by the steady tightening of a merchant system of organisation and the gradual accumulation of craft skills. In Queen Victoria's reign the artistry of the cutlers reached its apogee, and has gradually been superseded by more mechanical methods catering for less elaborate tastes.

Mr Himsworth entered the cutlery trades sixty-four years ago when the transition from traditional to modern methods had just begun. He is thus well qualified to write about the golden years of English cutlery, and it is fortunate that nineteenth-century methods and masterpieces should be recorded while they remain, in his person, within living memory. The memory probably leads him to do less than justice to many contemporary products; but the connoisseur will readily forgive him.

Collectors, art critics and the general reader should be grateful for having their attention drawn to Victorian pocket-knives, scissors and razors on which were lavished virtuosity and taste which have never been surpassed by workers in domestic crafts. The author perhaps assumes greater technical knowledge than such readers may possess. They may wonder, for example, why it was possible to achieve results with a burnishing-iron which cannot be reproduced on a modern polishing wheel; but the way is made easier by some admirably clear diagrams, and the whole book is beautifully illustrated. The reviewer missed his favourite flower-decked embroidery scissors, and that triumph of manipulative ingenuity, the 19-piece pocket-knife; but as half of the book is devoted to illustrations it would be churlish to complain.

The story of cutlery stretches back, of course, far beyond the nineteenth century, and the writer begins his tale at its earliest point in the Stone Age. The choice of the largest possible historical canvas necessitates broad sweeps of the brush; but the results may fascinate the curious while provoking the pedant. Those interested in social or economic history may regret that more space is not devoted to the people who made and used cutlery over these centuries, and, in particular, that the problems of the recent transitional period receive such cursory treatment. There are some charming sketches of local lore sprinkled throughout the book, and a few disjointed, at times misleading, statistics; but, in the main, the book is not designed for the donnish.

It is a long short-story—an appetiser with a price commensurate with that of other *apéritifs*.

Factual Economics

THE LIVELIHOOD OF MAN.

By Honor Croome and Gordon King.
Christophers. 317 pages. 10s.

THE appearance of yet another book claiming to introduce the reader to economics usually causes mixed feelings, but the “Livelihood of Man” is warmly welcome both as an addition to the current range of textbooks and as a book with a distinct character of its own. It is intended for the senior forms of grammar schools and for those studying for professional qualifications, although both will need to supplement it with more orthodox textbooks, particularly in regard to theory.

The scope of the book is wide, covering the organisation of production (which includes such topics as types of enterprises, division of labour and markets), the banking system, international trade and public finance and employment policy. The authors see themselves as innovators in blending a sound factual background with an introduction to theory at this level. Certainly throughout the book the factual side is strongly emphasised and very well presented, and it is supported by some useful historical background, a very objective treatment of policy and a good selection of maps, diagrams and statistics. But although the book is up to date in its outlook some statistics are unnecessarily old, for example 1949 figures for the United Kingdom's balance of payments and a 1950 balance sheet for a clearing bank.

Besides this strictly factual part, the book contains its share of mythical illustration needed to bring out such principles as the law of diminishing returns (where a convincing factual example would have been a real innovation). Its elementary treatment of theory is generally satisfactory, though rent is not very well dealt with, and there is a notable black spot in the treatment of elasticity of demand. But the factual side of the book is both the biggest and best part, and it should succeed in giving its readers a firm grounding in the working of the economic system and in making economics an interesting subject for them.

Shorter Notice

HORNED MOON.

By Ian Stephens.

Chatto and Windus. 288 pages. 21s.

This book is by the ex-editor of former India's great English language daily—the *Statesman*—and it is therefore written on a firm foundation of knowledge of local languages, religious personalities and racial prejudices. It is a jaunty book and is written as if he enjoyed writing almost as much as travelling. It is therefore both accurate and extremely readable.

Yet it misses a high place in both the classes to which it could claim to belong. As a travel book its best section and best photographs describe the semi-vertical world in which the upper Indus and its tributaries run through Pakistani-held Kashmir; but it falls short of passages in books by both Eric Shipton and H. W. Tilman about the same valleys. As a political book it also has shortcomings. Although it sets out the data of the Indo-Pakistani quarrel among its ruins and massacres, broken lives and United Nations umpires keeping watch in their white jeeps, it never conjures up the dimensions of the problem from the standpoint of people in third countries (which most of its readers will be). The Kashmir dispute ranks with those in Korea and Palestine as one of the world's three most likely causes of war. Maybe it would be difficult to proclaim its true proportions in a book that seems to feel a need to leaven each little lump of serious thought with snatches of minor conversations or passages on the scenery. But Mr Stephens would have done well to try. His technique is much more fitted to the lesser topic of “Pakhtoonistan,” with which Central-Asian pipe-dream he deals most adequately.

Damming Up the Northwest

FROM A CORRESPONDENT RECENTLY IN OREGON

IN the Pacific Northwest President Eisenhower's "indispensable ingredient" of sound planning and aggressive enterprise, "a persistent and reasoned faith in the growth and progress of America," has for some time been running head-on into another of his principles, his determination to decentralise government by handing over as much as possible to local and private agencies. This determination led last August to the Administration's new policy on the development and distribution of hydro-electricity, which

put the primary responsibility for supplying power on to local communities and private companies. But the economy of the four northwestern states, especially of Washington and Oregon, has expanded in the last thirteen years at a rate far above the national average, almost entirely as a result of the cheap power made available by the government's dams on the Columbia River and its tributaries. These are still by far the greatest undeveloped source of hydro-electricity in the country; potential capacity is put at over 30 million kilowatts, and less than a quarter of this has been harnessed so far. To the Northwest the federal government's apparent intention of withdrawing from further power development looked like a threat to dam up the region's growth.

The threat is to the area's agricultural as well as to its industrial expansion, for the huge federal multi-purpose dams provide not only the power which has attracted industry to the Northwest but the water that makes it possible to cultivate the parched inland plateau. As a result both trade unions and farm organisations are deeply

concerned at the implications of the government's new policy, as indeed is almost everyone else in the region. The Democrats are naturally doing their best to spread this concern as widely as possible and to crystallise it into anti-Republican votes next November. The catalyst they are using is the controversy over whether the development of one of the most important dam sites in the Columbia Basin, Hells Canyon, should wait until the federal government can undertake it, or should be carried out sooner, but less satisfactorily, by a private company.

Such an issue, which can be used to point up how the long-term interests of the area may suffer if the federal government is allowed to bow out, is vital to the Democrats because next November comes too soon for the government's withdrawal—and it has not yet said that it will withdraw entirely—to have had any harmful effect on industrial employment or farm production. There is still irrigating capacity unused, particularly from the Grand Coulee development, and during the next few years various hydro-electric projects now under construction, such as

From map prepared by US Army Corps of Engineers. Many smaller federal, state and private projects not shown.

The Dalles, the Chief Joseph and the McNary dams, will be coming into production. Unless there is an unusually severe drought, this should be enough to prevent a repetition of last winter's power shortage for some time.

But already the Bonneville Power Administration, which distributes the electricity generated from the federal dams and provides some 60 per cent of the power used in the area, is unable to take on new electro-process consumers, such as aluminium companies, which want large blocks of

power. New industries are especially needed in the State of Washington, which is overdependent for its employment on the government—on defence contracts at the Boeing aircraft factory and the navy's shipyards in and near Seattle and on the atomic energy installations at Hanford. Even normal growth of existing industries, and of population (from 4.7 million in 1950 to about 5.7 million in 1960), make a power shortage inevitable in the Northwest by, or soon after, 1960, unless additional capacity is installed.

The annual energy requirements of the region increased from 7 billion kilowatt hours in 1940 to about 40 billion last year; the Bonneville Power Administration estimates that they may reach double that amount, about 80 billion, by 1960, and that by then 750,000 kilowatts of new capacity will be needed a year. These estimates are, of course, based on the supposition that there will be no lasting economic recession, either nationally or locally—but in the booming Northwest, even more than in the rest of America, it would be heresy to suppose anything else.

★

A recession would not only reduce the demand for electricity, but also make it more likely that the necessary new dams would be built by the federal government, as pump-priming public works. For the impending shortage is the result not of bad planning, but of Congress's refusal to provide money to implement the plans. An integrated programme was worked out in the nineteen-thirties, and has been brought up to date since, for the orderly development of the region's resources and for the building of dams to a schedule that would have kept supply in step with demand. But since 1946, when the wartime need for extra electricity was over, the programme has been suffering from creeping paralysis, until now there are no new projects even under Congressional consideration; several that have been authorised, the series on the Snake River above the McNary dam for example, have not been begun and those under construction have been delayed.

This is not the fault of the present Administration; post-war Democratic Congresses showed little enthusiasm for such schemes and not even President Truman pressed them very hard. But the Republicans came to office just as the delay became disastrous. For these big dams take at least five years and probably longer to plan and build and they must be begun at once if electricity is to come from them by 1960.

Even if President Eisenhower were to press for funds for some of the authorised dams, Congress would probably not give him the money. For the desire to economise on federal spending, stronger than ever this year, is by no means the only obstacle. Representatives from rich eastern industrial districts and from poor southern agricultural ones agree in failing to see why their constituents' taxes should subsidise competition from a region that is already doing better than the rest of the nation. They are therefore very ready to listen to the protests of the private power companies' lobbyists and of the other local spokesmen who oppose the big federal dams.

The strongest objections come from fishermen—not only from the commercial companies but from the sportsmen. One out of every five Oregonians has a fishing licence and that means too many votes for any northwestern politician

to ignore. The Army Engineers, who are responsible for recommending dam sites, chose Hells Canyon rather than Nez Perce, said to be as satisfactory otherwise, because the latter would have kept the salmon from their spawning grounds in the Salmon River. Similarly a potential dam site at Kooskia is not being considered because it would interfere with Indian interests: another nearly extinct survival of early America, the elk, would have its traditional feeding grounds flooded by a dam at Glacier Park. The Libby dam has been held up because its lake would spread over the Canadian border and international negotiations are necessary.

These enormous upstream dams, of which only Grand Coulee and Hungry Horse have been built, are storage dams, where water can be held to supplement the flow through run-of-the-river dams at Bonneville and elsewhere during the autumn and winter. The Columbia and its tributaries are fed by melting snow and when the level of the water is low the downstream generators cannot work to capacity. Thus the full potentialities of existing dams cannot be relied on all the year round unless more storage dams are built. This is the basis of the argument against the taking over of the Hells Canyon site by a private company. The three small dams which this company proposes to build would have a much smaller storage capacity, although only a slightly smaller installed capacity, than the big federal dam. But if permits are granted soon, they could be in operation well before 1960, while the federal dam is not even authorised yet.

★

This Hells Canyon project is only one example of the spurt of dam-building activity among private companies and local public power authorities (plentiful in the State of Washington) who are trying to show that they can beat the shortage now that the federal government is ready to let them. They have always argued that there would never have been a power shortage in the Northwest at all if federal interference had not made it impossible for private companies to plan an orderly commercial development.

Until now, nevertheless, the private and local public companies have never proposed building the much-needed multi-purpose dams, presumably because their cost, from a quarter to half a billion dollars, was too great. Even the present Secretary of the Interior admits that these are still the responsibility of the federal government, for the purposes for which they exist officially, improved navigation, flood control and irrigation, are "non-reimbursable," that is, unprofitable. The latest suggestion, however, which the six leading companies in the Northwest are now thinking of carrying out jointly, is that such dams might be built in partnership with the federal government, with the private companies being responsible for the profitable side of the undertaking, the generation of electricity. This partnership idea has the support of the region's four State Governors, and apparently also of the Secretary of the Interior; they are prepared to press for federal legislation, if necessary, to implement it. But even if enough money is found in this way to overcome the immediately impending crisis, it would not be an answer to the question of who, if not the federal government, is going to do the long-term planning, without which the full possibilities of the Columbia Basin cannot be realised.

American Notes

The General and the Particular

THE broadcast which the President made on Monday night as a curtain-raiser to Thursday's Message on the State of the Union might, in the opinion of some observers, have been made more effectively as an epilogue. Then it would have been possible to discuss the Administration's aims in concrete terms rather than in high-minded generalities, dealing, perhaps, with the projected \$5 billion cut in military spending which is already perturbing some people. Instead, the President was confined to listing the accomplishments of a year which even he himself conceded has been spent mainly in laying the groundwork for future action.

The tactics of the President's advisers may have been faulty, but the strategy was evidently to focus public attention on the State of the Union message, and to remind the voters, in the politest possible way, that they have an interest in seeing that Congress deals promptly with the Administration's programme. Whether this will live up to its advance billing as "dynamic and progressive" will become known while *The Economist* is in the press. But the President's promise of government concern with slums, bad roads and schools, and inadequate protection against ill-health, unemployment and poverty in old age shows that the Administration is taking a view of its social responsibilities which will appeal to independents and the Democrats whose support is necessary if the next session is to be fruitful.

Nevertheless it may prove difficult to mobilise public opinion effectively behind a programme which is going to seep out over a period of five or six weeks. The impression is that the Message on the State of the Union will contain no surprises and only the highlights of a programme; the controversial decisions on agricultural policy, the Taft-Hartley Act, taxes, social security and housing will be spelled out in a series of supplemental messages.

★

A minor flare-up over the allocation of defence contracts shows how great the gulf may be between political reality in particular cases and the President's deeply felt thesis that no American can prosper if others fall behind. No assurance was more welcome than the promise that the Administration was using every legitimate means to sustain prosperity and would continue to do so. But there has been an angry response from the South to the re-invigoration of an old scheme for channelling some defence contracts into the three dozen areas, chiefly in New England, which suffer from long-standing unemployment, and stimulating the building of new plants there through the use of tax incentives.

The original plan was launched in 1952, but the Truman Administration did not press it for fear of widening its breach with the South, which objects to sharing with the

older textile centres the business its new factories have won away from them. Senator Knowland, the Republican majority leader, has joined the southerners in demanding reconsideration of a step which might endanger bi-partisan support for the Administration. This early collapse of party discipline is a bad augury for the next session unless the President continues to show that he means to lead his party in practice as well as in principle.

Jobs for Few Boys

THE Administration continues to be bombarded by increasingly querulous Congressmen seeking places on the federal pay-roll for deserving Republicans although most of the 2,365,000 government jobs are under the civil service. Pledged as it is to reduce the number of government employees—and nearly 185,000 have gone since last January—the Administration can find places for Republicans, in the main, only by withdrawing jobs from the civil service. The President has taken the view again and again, however, that the sanctity of the civil service must be respected, although policy-making posts ought to be manned by men loyal to the aims of the new Administration. The fruits of such an approach have been meagre: the Civil Service Commission has agreed to remove only just over 700 "policy-making" jobs from under the civil service, rather less than half the number requested. It has, however, apparently approved the appointment of new personnel officers in each agency, themselves outside the service, whose unofficial job is to appease Congress by finding room for other Republicans.

A more promising target has seemed to be the 134,000 jobs under Schedule A, a mixed bag of positions outside the career service from which the President stripped security of tenure last June. The Department of Justice has been the most zealous in taking advantage of the President's order, something which is not surprising in view of the fact that the Attorney-General, Mr. Brownell, is the President's chief dispenser of patronage. In his dismissals, Mr. Brownell has run afoul of the Civil Service Commission, which thinks he has gone too far, but he has been almost too successful in the courts. A federal judge has ruled that the President has unlimited power to transfer jobs from protected to unprotected classifications and therefore to replace their holders—a ruling which, if it is not upset on appeal, or over-ruled by Congress, in theory jeopardises the whole civil service, although no Administration would dare to revert to the spoils system. It caused such alarm among government employees, already unnerved by security tests, McCarthyism, and the baleful eye of the Republican member of the Civil Service Commission, that the President had to issue a statement that he would not take advantage of the decision. But if it is sustained, Mr. Eisenhower will find it harder to resist his party's demand for spoils.

If Mr. Brownell wanted to prove that it is not partisan advantage but the improvement of the civil service which he has at heart, he might follow up his initial victory with an attack on the system of preferences for ex-servicemen which makes it almost impossible to get rid of incompetents. But the Department of Justice has tended to shy away from any legal test of veterans' rights, no doubt out of a

Consumers' Incomes in 1950

The figures for these charts were taken from preliminary estimates in "Income Distribution in the United States," a recent supplement to the *Survey of Current Business*. Prepared in the office of Business Economics of the US Department of Commerce, this supplement initiates a new series of statistics on the distribution of personal incomes by size. In the charts, "family" means "consumer unit," whether a family group or an individual living alone.

healthy respect for their powerful lobby. Perhaps the task force just appointed by the new Hoover Commission to examine the civil service will produce a report bold enough to encourage Mr Brownell.

Republican Appeasement?

PRESIDENT EISENHOWER'S reported statement this week, to Congressional leaders, that the United States will retaliate directly against Red China, if the Chinese renew the Korean war or intervene in Indo-China, was a direct answer to the Democrats. For, picking up where the Republicans left off a year ago, they had been accusing the President of appeasement of the Communists because he is bringing home two of the eight divisions of American troops in Korea. His statement, which had been implicit in earlier remarks both by him and by Mr Dulles, makes it clear that he is no more ready than was Truman to countenance aggression in the Far East, but that he intends to choose his own ground on which to fight. Nevertheless the withdrawal of the troops, as both President Rhee and General Chiang Kai-shek realise with chagrin, also makes it clear that the United States has no intention of starting to fight again unless the Communists force it to do so.

Further details have thus been filled in of the President's new defence policy, the outcome of combining a desire for economy with a growing belief that an armed truce can, and must, be expected all the world over for many years. This seems in effect to mean that the President plans to maintain a strong mobile striking force, armed with the latest weapons, centred on the United States, but with outposts within easy reach of the Communist perimeter—in Japan and Europe particularly. But the perimeter itself will be manned by, and such fighting as has to be done (in Indo-China for example) will be the responsibility of, local troops.

These troops will continue to be supplied with weapons from the United States, but on a smaller scale. Indo-China directly and through the French has had almost \$2 billion worth in the last four years, and 30 per cent of the current year's foreign aid funds are earmarked for the Far East. The military aid director from the Defence Department told reporters at the beginning of January that there was still some \$1.1 billion worth of aid to be delivered to foreign military forces under existing appropriations. These deliveries will take about two years to complete but, when that is done, the main American contribution to these forces will have been made and only replacements will still be offered. This means that from now on Congress need only be asked for "relatively small contributions for military aid," which is in practice all there would be any likelihood of Congress providing.

From Steer to Steak

M EAT, which was 1953's toughest farm problem, came to the President's rescue at the year's end, for it was largely thanks to meat that he was able to say in his broadcast this week that "the fantastic paradox of farm prices

on a toboggan slide, while living costs soared skyward, has ceased." For the November downturn in the cost of living, the first for eight months, resulted mainly from a decline in meat prices, while the December upturn in farm prices, the first for seven months, came from a rise in the prices received for meat animals. This probably means that in December the fall in the cost of living was halted; if so, this will bear out the Department of Agriculture's recent contention that retail meat prices do in fact reflect the prices paid to farmers and that the middlemen are not the scalpers that farmers and housewives like to think they are.

The Department of Agriculture's study was initiated in September, on Congressional insistence, as part of the attempt to satisfy the disgruntled cattlemen who were struggling with a drought on top of a two-year decline in the price of beef; it had fallen by about 20 per cent in the past twelve months. One of the reasons, the department found, why housewives did not seem to be benefiting much was that prosperity has given them the habit of buying only the best. The steers which western cattlemen were being forced, by lack of fodder, to flood on the market were low-grade animals more suitable for sausages than for steaks, and were seldom seen on fresh meat counters. The department's other explanation was that meat middlemen's costs were fixed, except in so far as they have increased like other people's; wages of everyone from slaughterer to butcher's boy had gone up and so had transport and other charges. This in fact means that meat handlers' profits on each pound sold have probably gone down, since the margins allowed for marketing costs, on choice beef at least, did not rise last year. However, on all cuts of beef the margin in 1953 was 25 cents a pound, compared with 20 cents in 1949; the share of the retail price going to the farmer declined over the period from 70 per cent to 64 per cent.

Actual retail profits on beef should be substantial, for total consumption a head went up from 55 pounds in 1951 to 75 pounds in 1953 and is only expected to fall slightly this year; the average price of a pound of beef was about 70 cents last year, compared with 90 cents in 1952. Such a demonstration of the stimulating effect of falling prices on consumption may make the cattlemen temper their demands for government support to keep cattle prices high. In any case the decline in cattle prices appears to have been arrested, as has its basic cause, the steady increase in the number of cattle on farms which began as a result of 1950's high meat prices.

Rain, Rain, Go To—

I T must be refreshing for a federal bureau to be told that it is not spending enough money. A committee of private meteorologists has concluded that the methods of the US Weather Bureau will always be twenty to forty years behind the times if it does not secure a larger appropriation; it has "carried frugality to the point of diminishing returns." The bureau costs the American people 18 cents a head a year to run, compared with 20 cents a head in Britain, 47 cents in the Soviet Union, and 50 cents a head in Canada. The committee also recommends that the

bureau strive to bring in younger experts, pursue a more vigorous programme of research, and decentralise its activities. Its first electronic computers will be installed this year.

It is the arguments of the other countries represented on the International Civil Aviation Organisation, however, not those of its own advisory committee, which have persuaded the Administration to modify its decision to withdraw its weather ships from the Atlantic. One of the American complaints has been that the cost was excessive since the weather moves, in general, from west to east and Europe therefore secured most of the benefits of the observations taken.

This characteristic of the weather is the basis for the headline catching suggestion of Captain Orville, the head of a new committee to evaluate methods of controlling the weather, that some day it may be possible to cause drought or torrential rains over Russia, while the Soviet Union could retaliate, in the newly literal cold war, only over Alaska or western Canada.

Mr Orville, it is clear, is no scoffer at the claims of the professional rainmakers, who in 1952 shot silver iodide into

"That Man With The Corns Will Have To Go"

Herblock in the Washington Post

the clouds over 400 million acres, mostly farms and ranches in the drought-ridden west. This is approximately a fifth of the area of the continental United States, but the cost is so low—1 cent to 17 cents an acre—that even farmers who are still sceptical may consider it worthwhile to be on the safe side. The weathermen are also being called upon to refill city reservoirs (although New York City abandoned the experiment because it brought so many damage suits from resort owners and farmers), to find water for hydro-

electric plants, to increase the mountain snow-packs and fight forest fires.

Scientists remain fiercely divided on whether rainfall can be increased as much as the rainmakers claim, and some believe that it will never be possible to conduct a really conclusive test until there is federal control. At present one man's rain may be another's silver iodide. It will be one of the main jobs of the Orville Committee to determine whether federal legislation is desirable or necessary. The weather clearly moves in inter-state commerce, but the rainmakers prefer the easier rein of state control, and ten states have already passed such legislation. Three have gone further and laid claim to all the moisture suspended over their land.

Lift for Letters

FLYING the first-class mail, which is a commonplace in Europe and Canada, is still in the experimental stage in America. In October, four airlines agreed to carry first-class letters and postcards between Chicago and New York and Chicago and Washington whenever they had space available at 20 cents or less a ton-mile, compared with the minimum of 45 cents a ton-mile for regular air mail. Although the cost to the Post Office is no greater than sending the mail by train, letters have been arriving a day earlier and an extension of the scheme to western cities is now being considered. Only the railways object, although the airlines have some qualms about the effect on their regular airmail revenue when the public begins to realise that a 3-cent stamp may be as speedy a messenger as a 6-cent one.

But even the regular airmail rates are being scrutinised by the new team at the Post Office, which has a \$440 million deficit to liquidate, as well as a mission to improve postal services which it considers are twenty years behind the times. Regular air mail is carried by 27 airlines at rates fixed by the Civil Aeronautics Board, which vary from 45 cents a ton-mile for the big four to as much as \$2.58 a ton-mile on remote, non-competitive routes. Such variations seemed unreasonable, and not long ago the Post Office announced that on competitive routes it would give its business to the lines with the lowest rates, particularly as the outright subsidies paid to some lines are now the responsibility of the CAB. The effect of this order was to send six smaller lines to the CAB with a petition to allow them to reduce their rates, lest the big four swallow up the lion's share of the traffic. Not only has this been granted, but the CAB has announced, as the Post Office had hoped, a full re-examination of the mail rate structure of the thirteen trunk airlines.

On short hauls, arrangements are being worked out with buses. But however great the savings, they are not likely to bring lower charges. The Post Office has raised all the rates it is allowed to alter, and still hopes that Congress will act on its appeal for increases in the rest, although this is not likely until after the election. It may be as long as four or five years before the bulk of long-haul first-class mail is carried by air at rates, for letters, somewhere between the present 6 cents for air mail and 3 cents for first class.

The World Overseas

Iran Tries to Catch Up

AFTER just under a year of ruptured relations, the Iranian Embassy has this week reopened its doors in London. As a gesture in favour of better relations in 1954, *The Economist* greets the newly arrived diplomats by the name that they prefer—as Iranians instead of Persians. (The choice of word does not alter its belief that the speaker of a language has a right to choose his own vocabulary, and that Persia is as good an English word as Germany or Greece.) The Iranians are welcomed but not envied, for the decisions that lie ahead of them are awkward ones; they are decisions which, if they are to restore Iran's financial and political stability by restarting revenue from oil on any scale, are bound to touch Iranians in general upon the raw to an extent which Westerners, with their very different scale of values, find it hard to conceive.

Two and a half years ago, when Iran handed power to Dr Mossadegh, it held a comfortably strong hand in the realm of oil negotiations. Its desire for a bigger say in the management of its biggest industry was backed by the whole of Asia and a sweeping majority of the rest of the world. Since then, it has weakened this hand by following the blind impulses of an old man who disdained all considerations other than that of getting rid of the profitable British in the south as he had got rid of the unprofitable Russians in the north, and who was ignorant not only of oil technicalities but of the basic facts of world trade. As a result, Iran today is in poor case. With few backward looks, the world oil trade has moved on without it; as long ago as 1951, world oil production, including Iran, was 10.7 million barrels daily in the first half of the year, and in the second half 10.8 million barrels, excluding Iran. Today, again excluding Iran, there is an immediate world surplus productive capacity of crude oil amounting to about 1.5 million barrels daily. For a would-be seller, pushing back into a buyers' market is never an easy or convenient operation.

Secondly, not only Abadan refinery but the field and pipeline apparatus at its back have suffered deterioration to an unknown extent. Corrosion is notoriously quick to affect idle catalytic cracking plants; long pipes such as the crude oil lines from field to refinery or—from Agha Jari and Gach Saran fields—direct to the loading jetties at Bandar Shahpur, are likely to become coated with sulphurous and other deposits if little used; power houses and transport fleets need regular overhauls that have not been forthcoming for lack of spare parts. The whole apparatus will be expensive to put back into working order, and the Iranians, as a result

of the depredations on their Treasury caused by Dr Mossadegh's barren policy, have no funds with which to do the job. In a word, the world is in no hurry for Iran's oil; the real need for haste is all on the Iranian side.

Yet there are some formidable bars to any Iranian step in the direction that would bring advantage. Even as a result of the experiences of the last two years, the heart that beats beneath the well-cut suit of the educated citizen is the same as ever. The chief emotions that regulate it are two: a national pride that is based on an eleventh-century epic—the *Shahnameh*—which all can quote with polished ease and disconcerting confidence, and an overwhelming imagination that sees lurking in every proposition the involved and cunning motives that grace its own thoughts. All Iranians therefore love to parry but hate to thrust. They prefer never to have to make any concrete proposals for action. Yet they are in, or near to, a pass in which no other course is possible. For why should the West do the proposing? Its experiences in this field have been bitter and fruitless, and by its standards the matter presses only in so far as the western powers and oil companies wish to see a stable Middle East, and therefore want to encourage Iran to recover prosperity.

Any proposals made by Teheran, however, must take into account some home truths that have been too little publicised up to date. If help—financial, technical or with marketing—is needed to get the industry onto its feet again, the first condition for which the helper will ask is some guarantee that any investment he may make is not going to expose him to losses. He is going to ask for iron-clad assurances that he is secure over a given period, that he will not suddenly find his rights questioned or his money in jeopardy. When Mr Harriman made his proposals in 1951, he ranked arrangements for efficient operation before the compensation issue because, as he repeatedly put it to the Iranians, "before compensation is worth talking about there must be ability to pay."

Apart from the difficulties of finding willing investors, the facts that Iranian pride now has to swallow are that without a foreign purchasing organisation Iran cannot make big money; that no suitable purchasing organisation will come forward unless it can fix prices that do not jeopardise the other oil operations of its members; that no one will want to go to the trouble of creating such an organisation unless there is some guarantee of an efficient operating organisation inside Iran, entailing, no doubt, guarantees of no political interference on the technical

side; that all the companies capable of giving such help have, in various other countries, big investments of much the pattern of those the Anglo-Iranian Oil Company made in Iran, and that none are going to join in a settlement that might jeopardise the basis of their operations elsewhere; and that the compensation issue is therefore an essential part of any settlement. Another fact, obvious to any westerner, is clear only to a modicum of Iranians; this is that, vociferously though Iranians say they hate the British, the compensation claim will be milder if the previous owner of the concession gets some of the new rights. The pace at which these thoughts will mature and blossom into action depends more on Iranians than on any foreigner. A brake upon the process will be applied by Tudeh partisans, by reactionaries such as Mullah Kashani and by would-be prime ministers such as Mr Husain Makki; all these will try to influence the issue so long as they are vouchsafed freedom to shout.

China Through Soviet Eyes

SINCE Stalin's death there have been great changes in Sino-Soviet relations. Not only was the Soviet aid to China's industrialisation stepped up, but the whole treatment of Chinese topics by Moscow's propaganda has altered. Up to last March Mao Tse-tung could not be placed on the same pedestal as Stalin. With the latter's departure, however, and the struggle among his successors the star of Mao has been rising on the Communist horizon. Four years ago Mao and Chou En-lai were going to Moscow as junior partners. Today China and its leaders are presented as equals. The new approach was well illustrated by the telegram sent to Mao last month on the occasion of his sixtieth birthday by the Central Committee of the Soviet Communist party. Such warm and eulogistic greetings have not been sent from Moscow for many a year. Mao is shown not only as a practitioner, but also as a theoretician of Marxism and Leninism, and thus implicitly as a potential arbiter in disputes within the Communist bloc.

Indeed Mao's birthday was celebrated in Russia with probably greater pomp than that of any living Soviet leader. Mao's selected works are now being published simultaneously in China and the Soviet Union and the appearance of the fourth volume has given all Soviet papers the opportunity to praise his great achievements. The Soviet illustrated weekly *Ogonyok* devoted much of its space to Mao and his country. A full-page portrait of the Chinese leader is accompanied by a short story in which Mao is covered with a mantle of greatness reminiscent of Stalin. Indeed, since other Chinese leaders do not get the same amount of publicity, it could be said that the post-Stalinist ban on the "cult of the individual" does not apply in the case of Mao Tse-tung.

Comment on the affairs of China is by no means limited to praises of its leader. An increasing amount of space is devoted to China's economic development, to its industrialisation drive and to Soviet participation in it. The evidence, however, is too fragmentary to allow a definite assessment of the scale of Soviet assistance. Outside sources have put the number of Soviet experts working in China at as high

as half a million. The figure sounds fantastic and it probably includes the old White Russian emigrés in Manchuria and Shanghai. On the other hand, a heavy two-way traffic is going on between the Soviet Union and its ally. In addition to planners and highly qualified experts, skilled Soviet workmen are now also sent to China. They are particularly active in coal mines and in the building of steel mills and power stations.

Chinese specialists and workmen travel in the opposite direction. Chinese students now form the largest foreign group in Soviet universities. Chinese engineers and apprentices are spread throughout Soviet metallurgical plants. They are particularly numerous in the Krivi Rog; this can be gathered from the fact that they have their own bands and choirs there. With official delegates, planners and experts travelling to and fro, the newly launched daily Moscow-Peking express, which takes nine days over the journey, is not likely to lack passengers.

The crucial issue, however, is how much of the scarce Soviet heavy equipment can be spared for China's Five-Year Plan. Last summer the Russians agreed to help in 141 major construction projects. As if to underline its growing interest, the Soviet Union last month sent an important delegation to the ceremony celebrating the completion of two steel mills and one blast furnace at Anshan, China's steel centre. The delegation was headed by Russia's top metallurgist, the recently appointed vice-premier, I. F. Tevossian. But clearly everything cannot be settled in the festive mood of ceremonial openings. The bulk of Soviet aid is concentrated in North China and particularly in Manchuria, which is playing in China's industrialisation the same role as the Donbas played in the Soviet. But even there investments must take longer to mature than in other parts of the Soviet bloc. Soviet planners cannot afford to supply too much heavy equipment for the insatiable Chinese market. A Chinese delegation has just reached Moscow to discuss the trade agreement for the current year and both sides will bargain hard. But there must be veiled with Chinese ceremonial. They will be pushed into the background since each side is aware that it cannot afford a break in the present international situation. At this stage it would be idle to expect a breakdown in the Moscow-Peking traffic.

Italy and American Aid

[FROM OUR ROME CORRESPONDENT]

ITALY, stripped of its colonies by the Peace Treaty, has no Indo-China. Its quota of American aid is therefore considerably lower than that of France. Until June 30, 1950, it was just over half of the French share; thereafter it declined and for fiscal year 1954 (ending June 30, 1954), it will be about \$325 million—less than 30 per cent of what France will get.

At present, the main source of dollars is the Defence Support Programme, which makes available raw materials, mostly from dollar sources, to industries engaged in producing goods and armaments for the defence programme. These supplies are paid for in lire by the Italian manufacturer and the proceeds administered by the Italian Government as counterpart funds. These are used mostly for the

opening up of the south and other backward areas, but also as a means of financing the modernisation of certain industries, particularly steel, at a low rate of interest. The loans are then repaid direct to the *Cassa del Mezzogiorno*, the Government Corporation for the Development of the South. Although nominally made available for military purposes, defence support aid can best be regarded as a contribution to the improvement of Italian industry and agriculture.

The administration of counterpart advances has been to

some extent thwarted by the cumbrous and bureaucratic Italian banking system through which they are issued, and they have tended to benefit mainly the state corporations and industrial monopolies which dominate the Italian economy. But there is no question about the magnitude of the effort involved. Some £60 million has been made available to the *Cassa del Mezzogiorno*, and that sum, added to the Italian Government's own contribution, has resulted in land reclamation, road and house construction and the provision of public utilities in the south on a scale dwarfing the achievements of any previous regime. Similarly, it is largely thanks to American assistance that Italy now has a steel industry which stands a chance of competing with its British and German competitors, at least in the home market.

Equally important has been the American contribution to Italy's chronic unemployment problem. The *Cassa's* schemes and other public works have of course provided work, directly and indirectly, on a vast scale. To some extent, these results are offset by the need to lay off workers from the heavy industries which Mussolini's policy of autarky had so rashly inflated, since part of the dismissals were due to the introduction of more modern plant.

But the main stimulus to industrial production will in future come from offshore orders. Those so far placed amount to almost \$400 million and it is estimated that, over the next two years, they will constitute 56 per cent of total Italian arms production. They will provide employment this year for 30,000 workers and gradually for as many as 90,000. Work has been spread over all industrial areas, from Milan and Turin down to Naples. The main items to be produced are ships, ammunition and aircraft, but there are to be a good many civilian vehicles and a good deal of electronic equipment as well. The bulk of the money will be received only after delivery; \$10 million was paid in the US fiscal year 1953; \$155 million is expected this year.

Italy's dollar gap, curiously enough, is now the least important aspect of its total deficit, though in the immediate postwar years its dollar gap was just as wide as its neighbours'. The tourist trade is now flourishing. Last year Italy had eight million visitors, including half a million Americans. Dollar imports are declining. Machinery and cotton are available from non-dollar sources. Moreover, Italy has just concluded an agreement with the Russians for, among other things, grain and petrol, and it has had a bumper domestic wheat crop. Lastly its miscellaneous exports to America are slowly rising, and as usual there is a net balance on invisible transactions with the dollar area.

The only fly in the ointment is the deficit with the European Payments Union (EPU) running at about \$1 million a day; but rather than close this gap by reducing imports from the EPU countries Italy has chosen instead to reduce its imports from the United States. Presumably the justification for this choice is that only a portion of the EPU deficit has to be paid in gold, while the rest is a credit granted by its EPU partners. In its latest report* on Italy, the OEEC suggests that the deterioration of Italy's trade balance with EPU is due very largely to the impact of the trade liberalisation programme. Italy has liberalised as much as 99.45 per cent of its imports from the EPU area and, in consequence, they have increased substantially. On the other hand, because of the failure of both France and Britain to ease their import restrictions correspondingly, Italian exports continue to suffer.

As will be seen from Table II, Italy obtained \$245 million (including spending by US troops) in the American fiscal year 1953 and hopes to pocket \$325 million in 1954. In the fiscal year 1953 its deficit on current account with the dollar area (Table I) was in the neighbourhood of \$130 million and its gold and dollar payments to the EPU were perhaps \$80 million. Broadly speaking, therefore, American aid plus military expenditure in Italy was more than enough to cover its total gold and dollar deficit with these two areas.

TABLE II—US AID AND MILITARY EXPENDITURE
(Receipts in million dollars)

	Fiscal year 1953	Fiscal year 1954
1. Onshore procurement.....	10	150
2. Defence support programme.....	190	125
3. Infrastructure.....	10	15
4. Troop spending and US forces construction.....	35	35
TOTAL.....	245	325

Lastly, Italy uses American funds to stop the gap in its national budget. In the fiscal year 1953 the deficit was (if banking and funding operations are excluded) 643 milliard lire out of a total expenditure of 2,530 milliard. (One dollar = 625 lire.) Of this deficit 120 milliard was provided by American counterpart funds, derived from the Defence Support Programme. Last year the figure was over 200 milliard. The balance of the deficit is met by the issue of public loans and advances from the Bank of Italy. Strictly speaking, the schemes undertaken with counterpart funds are not necessary. To that extent, Italy could diminish its budget deficit. But, from the broader

* "Economic Conditions in Italy" published in Paris by the Organisation for European Economic Co-operation.

political point of view, Italy can only survive as a democracy and ally of the West if it is helped to raise the deplorably low standard of living in the south and lay the foundations for the wider industrialisation of the country as a whole without which it will be condemned to lag permanently behind its more prosperous neighbours.

Whether American aid has achieved its main objectives, however, is doubtful. Admittedly, economic and political collapse has been avoided and industrial production is increasing steadily. But the lack of a strong centre majority is increasing the pull which the extremes are able to exert. Italy can only emerge as a modern state, with the influence which its intelligent and numerous population deserves, if it can evolve a modern administration, banking and retail system and a measure of free competition which state control of industry and finance and the growth of monopoly (the two factors are closely interrelated) have combined to stifle. Unfortunately, there is no party with all or even most of these aims on its programme. And American aid, by working through existing Italian machinery, has to a large extent consolidated the existing stratification. It is this basic lack of a flexible economic system which makes Italy one of the weakest members of the Western camp.

Oil Prospects in Australia

FROM OUR MELBOURNE CORRESPONDENT

AUSTRALIANS may perhaps be forgiven for showing such unrestrained enthusiasm at the discovery of oil in the remote Exmouth Gulf region of Western Australia, for up to the present not a single oil seepage had been discovered in the country's three million square miles. Although the strike may not have surprised the geologists who have spent many long years conjuring up the possibilities of the likely oil-bearing regions of the Commonwealth, it nevertheless came as a tremendous surprise especially to investors who saw their holdings of Ampol shares taken to fabulous heights.

A major oil discovery in Western Australia would undoubtedly transform the whole pattern of the Australian economy. In 1952, Australia imported 5.7 million tons of petroleum products of a value of £79½ million. If the Exmouth Gulf discovery leads to the development of a field producing oil in large commercial quantities, Australia might find itself an exporter, instead of an importer of oil, with a consequent direct saving in foreign exchange.

In addition, a major discovery of oil would of itself bring many millions of new capital to the country for the development of the field (or fields) and all the ancillary services connected with the refining and distribution of the product. But dreams must remain dreams until there is further evidence that oil is really in Western Australia in the quantities that the promoters and investors hope for.

But pending the announcement of further developments from Exmouth Gulf, it is interesting to survey the painstaking efforts by geologists whose work in recent years made possible the discovery of the first oil flow in Australia last December. Much of the credit for the "find" is due to Dr H. G. Raggatt, secretary of the Commonwealth Department of National Development and Mr J. M. Rayner, the chief geophysicist of the Commonwealth Bureau

of Mineral Resources, who five years ago were struck by the similarity between parts of Western Australia and certain oil bearing areas in the United States in which no sign of oil was apparent at the surface.

These men were convinced that two districts in Western Australia—the north-west area between Carnarvon and Onslow, and in the Fitzroy Basin area of the Kimberleys—were those most likely to yield oil in the Australian mainland. They were satisfied that these areas were worth examination, including the use of the geophysical techniques which had been so successfully used in the United States. The faith of the geologists and geophysicists has been amply justified by the discovery of an oil flow after only two months drilling. "Miraculous" was the official description given to the finding of oil at the first try, for even with the improved exploration methods of today, the average of successful "wildcats," that is, wells drilled in unproven areas, is only one in five.

At the other end of the Australian continent, at Roma, in Southern Queensland, the search for oil, begun half a

century ago, is continuing. Natural gas was accidentally discovered in 1900 when deepening an artesian bore and since then more than 50 test wells have been drilled. Commercial production has never been achieved despite the discovery of many traces of oil and gas. The company at present drilling at Roma, Australian Associated Oil, recently encountered oil sands, but no oil has been produced because of lack of pressure in the formation.

It is in New Guinea, not the mainland of Australia, that the experts are predicting that oil will be discovered in large quantities before very long. The search for oil in New Guinea has been proceeding since 1919 and today two major oil companies, Anglo-Iranian and Standard Vacuum, are jointly engaged in testing at Omati, in Western Papua. They are operating through two subsidiaries, Australasian Petroleum Pty., Ltd., and Island Exploration Pty., Ltd., and a fifth interest in the enterprise is held by Oil Search, Ltd., an Australian company.

These two companies have persisted in their current search since 1938 and have so far spent about £11 million. They are planning to spend another £2.5 million next year. Seven holes have been drilled to an aggregate depth of over 61,000 feet. Gas was recently encountered at the Omati test at 13,700 feet but with the jamming of a bit in

the drill pipe it has temporarily been impossible to determine its significance. In the meantime, Australian investors have been fired by the prospects of the Western Australian experience being repeated in New Guinea and have been taking the Oil Search shares from 6s. to 20s. Oil fever is new to Australia. Another favourable development anywhere on the mainland or in New Guinea would cause the Stock Exchange boom to revive with renewed frenzy.

Zik's Comeback

FROM A CORRESPONDENT IN NIGERIA

THE significance of Dr Azikiwe's overwhelming victory in Nigeria's eastern regional elections can be appreciated only by recalling the circumstances that led to the dissolution of the eastern House of Assembly. When the first elections were held under the Macpherson constitution, in 1951, Dr Azikiwe stood, not for a seat in the eastern region—his own home and the birthplace of his party, the National Council for Nigeria and the Cameroons—but for one of the Lagos seats in the western region. He and other members of his party won the five Lagos seats; but only two of them could be chosen to represent the region in the central House of Representatives, and the Action Group, which won a majority in the western region as a whole, chose not to elect Dr Azikiwe. Nigeria's most prominent politician and nationalist, therefore, remained free from any responsibility for making the new constitution work.

A year ago, he staged a constitutional crisis in the East, evidently in order to pave the way for his own return to power. In the eastern region his party had secured a majority, not so sweeping as that won at the recent elections

but one that was rapidly increased by the adherence of independents. The National Council consequently formed the regional executive council, and three members of the party were sent to the central Council of Ministers in Lagos. But towards the end of 1952, after various private party meet-

ings, these central and regional Ministers were suddenly attacked by their own party, for not—it was alleged—following party policy. The Ministers themselves stood firm, but when the eastern House of Assembly refused to consider any government business its dissolution became inevitable. In the meantime, the three central Ministers, whose expulsion from the National Council had been secured by Zik, formed a new party in opposition, and it is this party—the National Independence Party—which has just been so heavily defeated at the polls. Dr Azikiwe resigned his Lagos seat to stand for election to the eastern House, and his party has won 72 out of the 97 seats. Thirteen of the 97 are allotted to the Cameroons, so that the opposition

to the National Council, consisting of the National Independence party and the United National party in alliance, have only 12 seats between them. Moreover, Mr Nwapa, one of the leaders of the breakaway party and Minister of Commerce and Industries in the central Council, was badly defeated, though Professor Ita, another leader, was returned.

The result of the election, however, represents more than the return of Zik—who may shortly be seen in the central government. At the London conference on the constitutional crisis last August, Mr Nwapa and his party were in favour of a strong central government with reduced control by the regions. Their defeat, therefore, emphasises once again how strong are the tendencies in Nigeria towards regionalism and against a unified federal state.

In a week or two this main issue of Nigeria's future will again come to the fore when the constitutional conference is reconvened in Lagos. The agreement so hardly won at the London conference last August over the principle of a federal Nigeria may be lost if a compromise cannot be reached over the Lagos award. It will be remembered that last August the northerners, who for some years had apparently acquiesced in Lagos's inclusion in the western region, suddenly demanded, largely on economic grounds, that Lagos should be the federal capital. The Action Group is convinced that this sudden change of heart was in revenge for the Lagos crowd's booing of the northern members of the House of Representatives last March when the latter succeeded in postponing the decision on self-government by 1956. It may be, however, that the northerners had become very doubtful of the good will of the western and eastern regions in a federation, and that the Lagos issue precipitated their distrust. Mr Lyttelton's decision also hastened the disruption of the alliance formed against the North by the Action Group and the National Council last March. The latter accepted Mr Lyttelton's decision that Lagos should be the federal capital, and the Action Group held this strongly against them. The alliance was formally ended towards the end of November, but long before that both parties had been attacking each other in the Press.

Agitation over Lagos

Ever since the London conference the Action Group, led by Mr Awolowo, has turned its entire party machinery on to agitating for a reversal of the Lyttelton award. Every day committees, tribal unions, town councils and societies—all supporters of the Action Group—pass unanimous resolutions that "Lagos belongs to the West." Even the Yoruba members of the National Council opposition in the Western House support the Action Group on this, against their party's directive. The issue is primarily one of powerful Yoruba nationalism against the concept of a united Nigeria. Nor is it without some economic justification.

In a balanced and well-prepared memorandum the Action Group has pointed out that the bulk of the western region's trade comes to Lagos and would largely be lost to that region if the city revenues went to the Federal Government. It stated that goods for the North can pass through Apapa docks without let or hindrance, and that Warri, Burutu, and Port Harcourt are ports which also serve the North. It further suggested that Kafanchan in the North would be a more central and more strategically safe site for the federal capital. Alternatively it suggested that Apapa, the dock area, and Okoyi, the largely European residential area near

Lagos, should be made federal territory and Lagos itself remain in the western region. The National Council, in reply, has pointed out that if the revenues of the West are badly affected, the Federal Government can always make a grant or readjust the allocation of the revenue. The Northern People's Congress in faraway Kaduna has simply stated categorically that it is not prepared to reverse any of the decisions taken at the London conference.

At the Lagos Town Council elections which took place early in November, the Area Council, a branch of the Action Group, won two-thirds of the seats, ostensibly on the slogan, "Lagos belongs to the West." But a few days later at the by-election to the Western House of Assembly, caused by Dr Azikiwe's resignation, the same electorate, with its usual whimsicality, put in a National Council candidate who was backing Lagos as the federal capital.

Disillusionment in Rumania

BY A CORRESPONDENT

A GLANCE through the Rumanian press since the announcement of the new economic policy, on August 22nd last year, shows how little has really changed. It is true that the main theme of the Rumanian press nowadays is "the Party's and the Government's care for the well-being of the working people." There is much talk of being of the working people. There is much talk of raising agricultural output and consumer goods production, and "decrees" follow "ministerial decisions" designed to improve the standard of living. Nevertheless, the old difficulties with this same "working people," which, in the last instance, decided the Kremlin to reverse the emphasis of its policy, are still there. There are complaints about the failure of several important coal mines to fulfil their targets. In light industry seasonal textiles are not being turned out in sufficient quantities or at the right time. In agriculture the autumn sowing and ploughing was, as in previous years, behind schedule and the collection plan for autumn agricultural products was not fulfilled in many districts.

Thus the "incentives" offered to the Rumanian working people within the framework of the new policy do not seem either adequate or effective. Why are the Rumanians so dissatisfied that they continue their passive resistance, in spite of the measures lately taken by the Communists to improve their lot? The main reasons do not lie in any politically organised opposition to the regime; but rather in the discriminatory nature of the recent palliatives and in the mistrust aroused by Gheorghiu-Dej's speech announcing the new policy.

Something for Everyone

To the peasant, the Rumanian Communists have offered a series of concessions including the cancellation of arrears on the last year's delivery quotas; exemptions and reductions of taxes; and the promise that more industrial goods will be directed to the countryside. To the workers, the government has granted an income tax reduction of about a quarter for salaries of 400 lei a month, and about a third for those of 1,000 lei a month; a decree to "improve the wage-system, etc.", and a promise of better fuel supplies. For everybody there was a "major" price reduction (whose

real importance is difficult to estimate as certain essential products such as white bread were more expensive in November than in August); a reduction in the cost of medicines, and X-rays provided by the supposedly "completely free health service"; and credits for the construction of individual dwellings.

These measures sound generous enough on paper, but in practice they are so arranged as to benefit only a small minority in each category. The new policy discriminates against the hitherto "neglected" independent peasant in favour of the collective farmer, although it is the farmer who produces "75 per cent of the quantity of marketable grain," as Gheorghiu-Dej admitted, and it is his confidence and co-operation the Communists want to win. Generally speaking, the benefits envisaged for collective farmers are double those proposed for the independent peasant; thus the temporary nature of the new policy and the Communists' determination to go ahead eventually with collectivisation are emphasised. Among the workers, those who benefit are first and foremost the stakhanovites and shock-workers. According to the decree on building credits "the stakhanovites, 'medalists', State Prize winners, shock-workers, inventors and innovators" are to be given priority. It is only after many more categories have been dealt with that the turn of "those who live in unhealthy dwellings" and of "large families occupying insufficient space," is reached. But even if the ordinary worker came higher on the priority list, can he, earning as he does only an average of 400 lei a month, apply for the necessary credit of 25,000 or 35,000 lei and accept an obligation to repay the whole sum at 10 per cent interest over fifteen to twenty years? If he does, he must deprive himself and his family of approximately a quarter of his inadequate salary.

Revealing Figures

At first Gheorghiu-Dej's speech of August 22nd gave the impression that things were about to change for the better. But the Rumanians were soon disillusioned when they compared the few actual figures given by the Prime Minister, which represented the new targets for 1955, with the initial 1955 targets as established in the 1950 Five Year Plan. These showed that it is the targets for light industry which have been curtailed, and not, with the exception of electricity, those of heavy industry. In oil production the original targets are even to be exceeded by one million tons. According to Gheorghiu-Dej about 1,200 million lei will be invested in the textile and footwear industries by 1955, which will double the volume of footwear previously produced. But by the same year the output, according to him, will be 10 million pairs instead of the 20,700,000 initially planned to be produced with half the investments.

An article in *Scanteia* on September 10th commenting on the decisions of the Central Committee gave an illuminating insight into the nature of the changes in Rumania. It stated that those who "ask the State to invest in the construction of even more factories are completely wrong"; and it went on to explain that "the experience of the Soviet people—the builders of Communism" . . . shows . . . "that it is possible, with the same machinery, the same quantity of raw material and the same number of workers, to obtain more products, of a better quality and at a lower price." This is called "the use of internal reserves," and it offers the key to Rumania's "new economic policy."

"We could afford one more clerk,"

argued the chief accountant.

"What has that to do with Powers-Samas punched-card accounting?"

"Simply that the annual cost of Powers-One equipment would be little more than the salary of one ordinary clerk. We can buy the unit or rent it." "With the attendant advantages..." "Of more efficient running, less paper-work and considerable assistance in solving our staff problem." "Then let's have the Powers-Samas people in. The arithmetic so far is very convincing."

There is a range of Powers-Samas punched-card equipment for every type of application.

THE BUSINESS WORLD

Debate on Death Duties

TO disentangle the skein of death duty law and practice in this country is as laborious and as painful as picking oakum. Yet in recent months a number of institutions have eagerly taken on the convict's task, by submitting memoranda* on estate duty anomalies to the Chancellor. This revival of interest in death duties was prompted by an announcement made by Mr Maudling in the closing stages of the debate on the 1953 Finance Act. He then told the Commons that the Chancellor had "started a review of the death duties and of these anomalies that are arising, and particularly of the anomalies that are said to arise in the case of Section 55."

Section 55 and other sections of the 1940 Finance Act (passed without much debate at the time of Dunkirk) are loosely worded but rigorously applied provisions designed to prevent an owner from escaping the full levy of death duties by transferring his assets to a private company over which he retains control. It is true that his shares in that company would be added to his estate in assessing death duties but, without special provisions, the value set on these shares would usually be lower than the actual value of the assets they represent. The primary object of these provisions was to prevent evasion. Legislation that unplugged these loopholes again could hardly be justified without far stronger evidence than the industrial and professional bodies have been able to produce. Their evidence and recommendations have been submitted to an informal committee of Treasury officials (in con-

sultation no doubt with their colleagues in the Inland Revenue) appointed by the Chancellor to examine the anomalies in the law. It may be doubted whether the Chancellor or the Economic Secretary foresaw that the occasion would be so joyously taken up by industrialists and accountants. They have laid down a barrage of memoranda aimed not merely at the difficult technical anomalies but also at the whole structure and level of death duties.

But if the critics have taken a generous view of their briefs, they have also thrown into sharp relief the difference in the incidence of death duties on a shareholder in a public company and one in a private company (whether he controls that company or not). The distinction is vital. The method of valuing quoted shares is simple and definite; the Stock Exchange list is the authority. But shares in a private company can be valued only after a pull-devil-pull-baker argument between the Estate Duty Office and the executors of the estate. Moreover, when an owner of quoted shares dies, his executors may have to sell his shares but they will not normally affect the company by so doing; its assets remain intact. If a shareholder in a private company dies the business may lose not only his managerial services but also may be forced to accept the intrusion of an outside interest, possibly destroying the family's control.

The critics have centred their attack on this point. They have argued that the threat as well as the imposition of death duties stunts the growth of family businesses in this country. Unfortunately, there are few, if any, statistics on the role that the family business plays in the British economy; and, to illustrate the effect that death duties can have upon their growth, those bodies submitting evidence have had to rely upon the random

*They include, amongst others, memoranda from the Federation of British Industries, the National Union of Manufacturers, the Engineering Industries Association, the Institute of Chartered Accountants in England and Wales, the Institute of Chartered Accountants in Scotland, the Institute of Directors and the Institute of Taxation.

evidence of case histories submitted by their members. At a guess there are about 50,000 completely independent director controlled limited companies owning, perhaps, about one twelfth of all issued shares. But the importance of the family businesses threatened by the death duty axe should not be measured by their size but by the fact that they remain the source of recruitment for the great industrial enterprises of the future.

Official statistics on the effect that death duties may have upon such small businesses are not entirely lacking. A report on Estate Duty and Family Businesses published in July, 1951 (Cmd. 8295), suggested that only in about one case in a hundred were "non-trade" assets "insufficient" to pay the whole of death duties incurred. This conclusion has been severely mauled by the critics, who have argued that executors, when they come to pay death duties, can hardly be expected to sell off all personal assets before they begin to realise some trading assets. The critics suggest that it would be fairer to say that at least one quarter of the businesses with assets worth more than £10,000 would have their activities affected by death duty payments. And it is certain that the exhaustion of liquid assets (or the need to secure a loan) to pay death duties would alone be sufficient to retard the activities of such a business. And obviously, prudence may impel a family (with few assets outside the business) to hold in liquid form resources that might otherwise have been employed in the business or to secure these funds from such finance companies as "Edith."

Payment of death duties would present plenty of problems even if the sum to be paid were determinate. But this is not so. The over-riding principle governing the valuation of shares in a private company for death duty purposes is that they should be valued at the price they would fetch in an open market (which is hardly likely to exist) from a willing buyer (who is hardly likely to be there) at the time of the death of their owner. In arriving at this value the courts have effectively ruled that attention should be paid to the limited market that the shares may command; but it is specifically provided that no reduction in the valuation should be made on the assumption that all the property has to be placed on the market at the same time.

Without the test of the market place the value put on unquoted shares is little more than a guess based on hypothetical considerations. It usually turns out to be a compromise price reached after months of haggling between the Estate Duty Office and the executors. Normally in fixing the value of unquoted shares owned by a minority shareholder the Estate Duty Office, having taken note of any previous valuations or prices fetched in an actual sale, will base its valuation upon yield considerations. If the estate is large rather more attention will be given to asset values. If, in this atmosphere of the Oriental bazaar, the Estate Duty Office and the executors fail to agree, appeals can be made only to the High Court. Few executors have the courage, or the patience, or the money to take cases to

appeals. But, as a recent case—the first for more than 15 years—showed, an uncompromising attitude of the Estate Duty Office can on occasion drive the executors in despair to the courts. The facts of this case, *In Re Holt, deceased*, would appeal to an Arab trader. While the executors revised their valuation of the shares from 11s. 3d. to 17s. 2d. each, the Estate Duty Office cut its first estimate of 84s. 2d. to 34s. and then to 25s. Finally, Mr Justice Danckwerts valued them at 19s. each.

This case was seized upon by the critics of the Estate Duty Office as clear evidence that an independent tribunal should be set up, to which appeals on the valuation of unquoted shares could be made, leaving the courts to settle points of law. This suggestion is not new. It was made before the Evershed Committee on Supreme Court Practice and Procedure. In reluctantly rejecting the proposal, the Committee remarked:

Fears were expressed that, with the establishment of the new body, the Estate Duty Office might become generally uncompromising in its attitude so that in the great majority of disputes the subject would feel compelled to go to the tribunal, whereas, in some of them, negotiation as at present would suffice.

In answer to these fears, it has been pointed out that income tax inspectors are not usually more adamant because appeals against their findings can be made to the General or Special Commissioners.

The proposal that an appeal tribunal should be set up has been backed by suggestions that probate on personal estate should be granted on the payment of a deposit (say, 25 per cent) of the duty on personal assets. In turn, this has been linked with the more far-reaching proposal that the proceeds arising from assets realised within one year of death should be substituted for probate values (as at the time of death) and the duty adjusted accordingly. There is no doubt that executors may have great difficulty—and may even face personal loss—in settling an estate while Stock Exchange prices are falling sharply. But this proposal, which would apply to quoted and unquoted shares alike, could cut as deeply at the heart of estate duty practice as another suggestion that the present system of charging estate duty at the highest rate (after allowing for "marginal relief") over the whole of the estate, should be replaced by a sliding scale of duties charged on each slice of the estate, analogous to surtax assessments.

The critics are, perhaps, on firmer ground when they turn their attention to the 1940 Finance Act. Family businesses almost invariably fall under the shadow of the provisions of this Act. Most of them are private companies, under the "control" of not more than five persons. Section 46 applies specifically to such a company. It provides that if at any time one of the shareholders has transferred property to the company and if he has received any "benefits" from the company at any time within five years of his death, then when he dies part of the net assets of the company (based on a formula relating these "benefits" to the company's net

income) are deemed to be part of his estate. And the company itself is liable for the duty on this part of the estate. While admitting that this provision has been so effective in preventing avoidance of death duty liabilities that it has seldom been applied, the critics urge that it can seriously disrupt or prevent a *bona fide* reorganisation of a company. They suggest that the law should be amended so that this provision will be applied only when there has been a deliberate attempt to evade death duty payments, or that the Estate Duty Office, if informed of a reorganisation of a company's structure, should use its discretion in operating this clause.

Section 55 has also been under heavy fire. It has the effect of allowing the Estate Duty Office to value the interests of "controlling" shareholders in companies under the control of not more than five members as if they were personally owned assets and not share investments. These interests must be valued on the basis of the slice they represent in the company's assets (including goodwill), and not on the basis of their yield as investments. The first criticism aimed at this section is that the term "controlling shareholder" is too widely defined. Control is deemed to have been exercised if at any time within five years of his death the deceased shareholder had voting control, or if he had the right to receive a half or more of the debenture interest payable and dividends declared by the company, or if he owned (or had the option to own) one half or more of the com-

Diesels on the Road - II

Diesel Engines for the Motorist?

IN Britain, as a previous article showed, the majority of heavy goods vehicles now being built are equipped with diesel engines. In medium-sized lorries, of between three and four tons unladen weight, petrol engines have still a slight lead. But below the three-ton limit, in this country, the diesel engine has as yet made little impression. On the Continent, however, three motor car manufacturers now have diesel-engined cars in series production—the Mercedes 170 S-D, the Hansa Borgward 1800 c.c., and the Fiat 1900 c.c. Compared with petrol-engined cars, these cars offer a saving in fuel of more than a third, at the cost of a higher initial price, greater weight, a lower maximum speed and much more sluggish acceleration. Though it is believed that Standard may soon offer a diesel engine as an alternative in a passenger vehicle—perhaps its estate car?—most British motor manufacturers are still cautious about the chances of the diesel, even in commercial vans.

In British goods vehicles of less than three tons weight, the battle is not by any means one-sided. Reference was made in the earlier article to the very economical Bedford truck with a petrol engine of 110 bhp and a total unladen weight of less than three tons (thus bringing it within the limit for which a road

speed of 30 mph is allowed) and to the new Ford "Cost-Cutter" engine. In connection with the latter, interesting figures have recently been published by *The Commercial Motor* of tests with a lorry, comparing the classic Ford V.8 engine, now superseded, the new "Cost-Cutter," and the Perkins P.4 diesel, which can also be fitted. The 4-cylinder "Cost-Cutter" gives 45.3 ton-miles per gallon, against 23.2 for the V.8, with performance a shade better and lower maintenance costs. By comparison with the Perkins diesel, on a test run with one stop per mile, the "Cost-Cutter" gave 12.9 mpg, against 19.65 with the Perkins diesel. But the "Cost-Cutter" gave significantly better performance—reaching 30 mph from rest in 21.9 sec., against 29.6 sec. for the diesel; and the petrol engine was 2½ cwt. lighter, so that, for the same all-up weight, the pay load would be almost 5 per cent higher.

Where the memoranda have been confined to a review of the anomalies in the law on death duties, most of the criticisms and recommendations have some substance in them. Most of them are worth careful consideration by the Chancellor and his advisers. But this informal committee of inquiry cannot be expected—and almost certainly will not attempt—to deliver judgment on proposals that could rend the whole fabric of death duty practice. If death duties are high and sometimes arbitrary, that does not carry such grave economic effects as excessive and inequitable taxation on incomes.

In the struggle for fuel economy, the Americans (who have less cause for interest in the diesel engine, because of the much lower level of fuel prices in the USA) continue to make remarkable advances with the petrol engine, and are achieving results with large passenger cars that are well ahead of those of similar vehicles in Europe. There is a general tendency to use

hemispherical combustion chambers and high compression ratios, both of which give greater thermal efficiency and thus both higher power and lower fuel consumption per horse power hour. A fleet of Cadillac cars driven in and around Detroit on continuous test to an exacting time-schedule is reported to be recording over 23 mpg; and Mr. Zeder of Chrysler has reported results of a test engine, operating at a compression ratio of 12.6 to 1 and recording 0.355 lb of fuel per bhp-hour, which, as he argues, "makes any diesel with which we are acquainted seem a veritable glutton for fuel."

★

The economic case for a diesel-engined car in Continental markets is stronger than in this country. Petrol there is often even more expensive than in this country, and diesel fuel is often substantially cheaper than petrol. The Mercedes diesel is an alternative to the petrol engined 170 S-V., and comparison of the two is illuminating. Both engines have a capacity of 1,767 cc; the petrol engine develops 45 bhp at 3,600 rpm, the diesel 40 bhp at 3,200 rpm. The top gear ratio is the same for both (4.125 to 1); the diesel car is quoted as 1 cwt heavier than the petrol version. For the petrol version, a maximum speed of 72 mph is claimed, with a cruising speed of 68 mph; for the diesel, the maximum speed is 62 mph, which is also quoted as the cruising speed. Fuel consumption of 30 mpg at a speed of 43 mph for the petrol version compares with 46 mpg of diesel fuel at 37 mph—a comparison less favourable to the diesel than one would have expected. The difference in acceleration and hill climbing ability between the two models is more pronounced than the difference in maximum speeds. The difference in retail price between the two models is 1,000-DM (say £90) or 12 per cent. The Borgward diesel saloon is powered by an engine of similar size and output to the Mercedes, and no doubt gives similar performance. The Fiat 1,900 cc diesel saloon has a rather larger engine, though the power claimed is no greater (40 bhp at 3,200 rpm); but the considerably higher maximum speed of 75 mph is quoted for it, plus a fuel consumption of 40 mpg. To British tastes, this would seem to be a rather more acceptable compromise than the two German cars offer.

What developments can be expected? In order to better the position of the diesel engine in competition with the petrol engine, savings in weight and cost are obviously needed, even at the sacrifice of some of the fuel economy. A substantial saving in cost could of course be expected if diesel engines came into production in quantities of the same order as petrol engines. The fuel injection equipment, in particular, has not yet been subject to the development of mass production technique, which could certainly yield major savings. Thus, for example, the retail price of a new fuel pump for a Fordson diesel tractor is about £50, while the whole tractor sells for about £500. But in the meantime, reductions in cost are likely to be dependent upon such reductions as can be achieved in total weight.

There are three sources from which reductions in weight may be forthcoming: first, from an increase in engine speeds, so that greater output can be obtained from a given size and weight of engine; secondly, by the adoption of air-cooling instead of water cooling; and thirdly from a range of detailed developments, in particular the more selective use of materials, and the utmost reduction of weight of each individual part.

In both the first two fields, German practice seems to be ahead of that in any other country. During the war, the Germans had the most compelling of reasons to seek the maximum of fuel economy; and the range of conditions to be dealt with, from the deep freeze of the Russian campaign to the heat of tropical Africa, gave advantage to the use of air that "neither boils nor freezes." One firm in particular, Kloeckner-Humboldt-Deutz A.G., has built over 65,000 air-cooled diesel engines in 1, 2, 3, 4, 6 and 8 cylinder types carrying on development initiated during the war, but it has not yet developed higher engine speeds to the same extent as other firms. The Deutz engines have speeds of up to 2,250 rpm, while speeds approaching 3,500 rpm are being used in air-cooled and water-cooled engines that are being developed, and the three motor car engines mentioned all exceed 3,000 rpm.

TRACTORS MANUFACTURED IN BRITAIN
(Monthly averages)

	1951 (12 months)	January to August, 1952	September, 1952 to September, 1953
Home deliveries:—			
Total	2,454	2,671	2,774
Diesel-engined	249	622	1,964
Per cent diesel	10.1	23.3	70.8
Export deliveries:—			
Total	8,995	7,922	6,422
Diesel-engined	1,496	1,539	2,284
Per cent diesel	16.6	19.4	35.5
Total, all tractors	11,449	10,574	9,202
Total diesel-engined	1,745	2,156	4,325
Per cent diesel	15.2	20.4	46.9

A parallel method of improving the power-weight ratio by increasing the number of power strokes per minute is to use the two-stroke cycle instead of the four-stroke cycle. This involves the use of a blower or supercharger to drive air under pressure into the cylinder and push out the exhaust gases, so that the single up-stroke of piston can accomplish that which in a four-stroke engine is performed by the upward exhaust stroke, the downward suction stroke and the upward compression stroke. The most notable two-stroke Diesel engine in British road vehicles is the super-charged Foden engine, of which there are both 4 and 6-cylinder versions developing about 85 bhp and 130 bhp respectively at a speed of 2,000 rpm, with a weight of about 9 lbs per bhp. A new diesel has been designed for automobile use by Professor List of Graz, using a supercharged

two-stroke cycle in a water-cooled engine offered in 2 cylinder, 3, 4 and 6 cylinder form, developing 18-20 bhp per cylinder, and with a top speed of 3,150 rpm. In the two-cylinder form, developing 36 bhp, its weight is 9½ lb. per bhp; in the six-cylinder form, giving 120 bhp, the weight is said to be no more than 6 lb. per bhp. The fuel consumption shows figures rather above the average for a diesel engine, being in most conditions just above 0.5 lb. per horse power hour. The Turner Manufacturing Company of Wolverhampton, which makes a diesel agricultural tractor, has taken a licence and is preparing to put these engines into production.

The figures achieved by the List engine suggest that for a medium-weight passenger car, using a three-cylinder engine (which in two-stroke form would compare for balance with a 6-cylinder four-stroke) it should be technically possible to achieve a road performance closer to that offered by petrol-engined cars than the three passenger cars already in production now achieve. With air cooling, a closer approximation still should be possible, at the expense of more noise—for the water jacketing of the cylinders is an excellent sound-damper. This might be offset to some extent by the use of sound-absorbing materials (not to be confused with anti-drumming, or sound-averting materials), of which the automobile industry has hitherto made very little use. There would remain the question of cost. If production

quantities were substantial, the low weights claimed for the first engine should offer costs similar to the production costs of a petrol engine, except for the fuel equipment.

The figures set out in the table, showing the production of diesel and other tractors in the UK, may point an interesting moral. After September, 1952, onwards, there was a really dramatic change in the position of the diesel engine compared to its competitors—a change which must presumably be attributed to the advent of the new Fordson tractor offered alternatively in petrol, diesel, and vaporising oil form, the diesel version being now priced at only £55, or 25 per cent more than the other two versions. The figures even suggest that the advent of the tractor may have positively stimulated and expanded a market that was flagging and showing some signs of saturation. The gain has mostly been at the expense of vaporising oil tractors, rather than the petrol version; and the tractor, with its long hours of utilisation at loads which for considerable periods will be near its peak output, is a peculiarly apt subject for diesel power. Nevertheless, it is conceivable that the advent of a diesel-engined car at a price and with a performance reasonably comparable with that of a petrol-engined car closer than is generally thought, and the degree of success it could achieve, if the comparison were close enough, might be dramatic.

Business Notes

Higher Bank Dividends

INCREASES in dividends by two more of the clearing banks have given the bank share market its most exciting week for a long time. The situation there has, indeed, been even more piquant than that created twelve months ago, when the National Provincial Bank first broke away from the pattern of long stabilised rates, by raising its final dividend by 1 per cent and thus paying 16 per cent for the year 1952 instead of the customary 15 per cent. The hopes then raised for the 1954 dividend season were heightened still further last October when Barclays, the only clearing bank that had not reduced its dividend during the 1931 crisis, launched its capital reorganisation and simultaneously announced a 2 per cent increase, to 16 per cent, for the full year 1953. Then, at the end of last week, Martins Bank opened the season with a still larger increase, from 15 to 17½ per cent, and to a level above that ruling before 1931 (when the payment was reduced from 16 to 14 per cent). Thereupon the market optimists

pitched their hopes still higher, on the argument that even the pre-1931 levels need no longer be regarded as a probable halting point; and shares prices moved up correspondingly.

The District Bank's announcement on Tuesday lent some colour to this view, since the dividend was raised from 18½ to 20 per cent; this bank, alone among the clearing banks that reduced their payments in 1930-1932, had restored its 1929 rate (of 18½ per cent) by the eve of the war. But this cheering news could not disperse the shock to market optimism that came from the Westminster Bank, which elected to maintain its dividend at the customary 18 per cent (it was 20 per cent in 1929). And on Wednesday evening there was even some further—though surely irrational—disappointment at the National Provincial's decision "merely" to maintain its half-year's payment at the increased level (making 17 per cent for the year, compared with 16 per cent in 1952, 15 per cent in 1932-51, and 18 per cent in 1929). The record to date, as the accompanying table shows, is that four of the "Big Seven" banks have raised their dividends, one has made no change, and two—the Midland and Lloyds—will be disclosing their decisions just after this issue of *The Economist* goes to press.

Full comment upon the banks' earnings experience is therefore best deferred until next week. But it should be remarked forthwith that it is well that one at least of the banks should be out of step with its fellows—however painful that may be to shareholders of the Westminster Bank whose dividend, highest though it is among the Big Five, has been equally eroded by the fall in the value of money over the years. Nothing could be more harmful to British banking than for the banks to act strictly in concert in matters of dividends; and even the appearance of concerted action would be damaging. Though the circumstances that

BANK PROFITS, 1951-53*

	1951	1952	1953	Change in 1953

surround the big banks must be broadly similar, different managements will view them differently, and upon each alone is the responsibility for decision. Force of example and the pressure from shareholders on grounds of "equity"—measured by the experience of other shareholders—are not in themselves sufficient arguments for uniformity of policy in this matter. But, if it would be wrong for bank directors to be guided by these specious precepts, it would be equally wrong for them to subordinate their duty to shareholders, as proprietors of the business, to some imagined duty to look to wider considerations such as political expediency.

£7 million for Dunlop

THE first big industrial financing scheme of the year comes from the Dunlop Rubber Company which is to raise £7 million by a preference share issue. Occasion has also been taken to streamline and expand the whole capital

structure. The scheme analysed below is open to only one important objection. The directors have given only the vaguest of indications of the purposes of the £7 million issue. The money is being raised because of the continued development "of the business in existing products and in entirely new products." The chairman will presumably have more to say about these developments both at the class meetings on January 29th and in the prospectus itself, but shareholders who cannot attend the meeting will have to lodge their proxies without knowing what is intended.

It may at least be inferred that Dunlop is not at present going to launch out into the synthetic field on a large scale; the new issue is not big enough. The present pilot plant, using purchased styrene and butadiene may, however, require further investment; the group has done extensive research over part of the field of plastics, and some of its existing natural rubber factories, including the foam rubber side, may need capital.

Capital Reorganisation

THE Dunlop Rubber Company's present capital structure is an unhappy legacy of the 1920's. The plan for revising it are necessarily complex in detail, and formidable in legal niceties, but they are simple in conception and admirable in purpose. The three ranks of preference shares, all with high dividend rates, are to be converted and consolidated at a lower rate of interest into one class of preference capital. Secondly, the disparity between the company's issued capital and the real capital employed in the business is to be corrected by a free issue of ordinary shares which in effect writes up the clumsy 6s. 8d. shares into 10s. units by a 50 per cent scrip bonus.

The conversion of the "A," "B," and "C" cumulative preference shares (which rank in that order) into the single class of 5½ per cent £1 cumulative preference shares is made possible by the capitalisation of £2,875,000 from reserves. The ratios in which the shares are to be converted are set out in detail in the table at the bottom of this page. These ratios have been calculated so as to ensure that preference shareholders will receive a higher gross income than before. As compensation for their loss of priority the first and second ranking shareholders gain more than the "C" shareholders. The alteration in their voting rights gives them a higher proportion of votes than before, but the equity vote (even if the preference dividend were in arrears) would remain predominant. The new preference capital is repayable on liquidation at 22s. a share or the average market price over six months, whichever is the

DUNLOP'S CAPITAL STRUCTURE

Present capital structure			Proposed revision	New capital structure			Present gross income per 1,000 shares	New gross income per 1,000 shares
Denomination	Issued capital	Votes per share		Denomination	Issued capital	Votes per share		
6½% 'A' £1 cum. pref.	1,000,000	1 for 2	Converted in ratio of 11 shares for 8	5½% £1 pref.	1,375,000	1 for 2	65	72½
7% 'B' £1 cum. pref.	1,000,000	1 for 2		5½% £1 pref.	1,400,000	1 for 2	70	77
10% 'C' 16s. cum. pref.	2,400,000	1 for 4		5½% £1 pref.	4,500,000	1 for 2	80	82½
6s. 8d. ordinary.....	12,853,969	1 for 1	By cash issue.....	5½% £1 pref.	7,000,000	1 for 2	...	...
			By bonus issue.....	10s. ordinary	19,280,954	1 for 1	...	...

higher, compared with the existing rates of repayment of par on the "A" and "B" shares and £1 on the "C" 16s. shares. Once the scheme has been approved, the company intends to make the £7 million issue for cash in the new preference shares. The terms of the issue have yet to be decided but, if the stock markets retain their buoyancy, this issue should command full subscription lists even if the price was pitched at a small premium.

The bonus issue is hardly a sweetener for ordinary shareholders. Although the nominal capital is written up into 10s. units the company is careful to point out that this does not necessarily imply any increase in the amount to be distributed in dividends. Shareholders will note with satisfaction the hint which the board gives that reserves will again be increased in respect of 1953. They will also see that though the conversion scheme adds a large amount to the nominal preference capital it will add only £25,125 to gross annual preference dividend payments. When the whole scheme is carried through the company will have in issue £14,275,000 in preference shares and £19,280,954 in ordinary shares, leaving £6,444,046 in unclassified shares available for a further issue. Issued preference capital must not exceed 75 per cent of the paid up equity capital or 50 per cent of the equity capital and reserves, whichever is the lower. This limit will almost be reached when the new cash issue is made, so that, without another alteration in the company's articles, or a big addition to reserves, the next capital issue by Dunlop would have to be in equity shares.

Red Gold to the Rescue

THE gold and dollar reserves of the sterling area have taken the impact of the end of year payments on the United States and Canadian lines of credit and the ERP loan much more successfully than could have been anticipated before the recent flow of Russian gold to Britain set in. Despite the debt service charge of \$181 million, the reserves declined by only \$43 million during December, and stood at \$2,518 million at the end of the year—an increase of \$672 million on December 31, 1952. The improvement slackened off markedly in the second half of the year—until the Red gold began to arrive. It is estimated that total receipts of Russian gold in November and December have been around \$70 million—of which some \$15 million had already gone into the reserve in November. As defence aid totalled \$20 million in December and receipts in respect of the November surplus with the European Payments Union were \$4 million, the "true" dollar surplus with North America and other areas can be put at about \$60 million. This is the high season for sales of sterling commodities, and prices have been holding firm. Nevertheless, the dollar surplus is still surprisingly high for a month in which American industrial production was almost certainly still falling.

This sparkling picture is slightly marred by the deficit of £3.1 million incurred by the sterling area with the European Payments Union in December; but this deficit, which will involve a gold payment of nearly \$4½ million in the middle of the month, was almost wholly accounted for by

the interest payment in December on the United Kingdom debit balance with the Union. This is, however, the season in which the sterling area should be running a surplus with Europe on commercial account, not merely striking a

balance. There are signs that the relaxation of import restrictions in Australia has already worsened the trade balance with Europe considerably; but the full effects of Britain's liberalisation at the end of October have still to be felt.

The Cost of Rail Peace

THE increase in railwaymen's wages—or as much of it as is yet known—has been enough to tip over an accumulation of other increases in railway costs into the expected application for higher freight charges. The Transport Commission has asked for an increase of 10 per cent in railway, dock, and canal freight charges from February 1st (subject to a limit of 10s a ton on certain expensive forms of rail traffic). This should bring in about £23 million a year from the railways, £1 million from the docks, and £2 million from canal charges. The Minister of Transport has referred the application to the Transport Tribunal.

The Commission's arithmetic is fairly clear. Increases in the prices of coal and steel last year cost it between £4 and £5 million annually, while the fall in the price of steel scrap cost another £2 million. Depreciation and interest charges are both rising—each, perhaps, by £1 million a year—because the new equipment that is slowly being brought into use costs more, efficiency apart, than the equipment it replaces. The Commission is also increasing the maintenance charges that it charges to revenue. The 4s a

And the Deficit

THE present deficit on the above-line account is £545.7 million (£20½ million worse than last year), which compares with the estimated budget surplus of £109 million (£21 million better than last year). But, for the reasons noted, this is not too depressing a comparison, especially when it is borne in mind that the capital items in ordinary expenditure—notably the expected running down of stocks

—have not given the relief for which the Chancellor budgeted. On the other hand, the capital items below-line have given very large relief. Net below-line expenditure, which in the full year was expected to rise by £25 million, has in the nine months dropped by no less than £143 million, chiefly in consequence of a steep decline in the borrowings of local authorities. Obviously these authorities are turning to outside finance on a much more substantial scale than had been expected. The upshot, on the Exchequer account as a whole, is that the total deficit for the nine months is £122 million less than in 1952-53, whereas the budget provided for an increase in the total deficit by £4 million.

The Changing Motor Industry

THE resignation of Sir John Black from his post as chairman and managing director of the Standard Motor Company comes at a time when the industry could least dispense with his services. Sir John belongs to the generation of production engineers who took over control of the industry from the motoring pioneers who founded it, and who brought the manufacture of cars to a high pitch of efficiency where production methods and organisation had become as important as the car itself. They have been responsible for the developments that have raised the output of passenger cars from 341,000 a year in 1938 to 580,000 last year and the indications are that production in 1954 might reach 700,000.

A sharp expansion of output followed the freeing of the industry's materials from control early last year, and the rising trend of production is bringing it face to face with the problem of finding markets for the large number of vehicles that it has been geared to produce. The export markets last year took roughly 296,000 cars; the home market, previously the dumping ground for vehicles that could not find a sale abroad, is today discriminating and competitive. There is a marked tendency in the industry towards concentration into a handful of major groups, which differs from the amalgamations of the thirties in that it is generally directed towards gaining a greater degree of control over sub-contractors, with the object of eliminating those suppliers' margins and of building up rates of output high enough to meet competition abroad. The purchase of two independent body builders, Briggs, and Fisher and Ludlow, by Ford and by the British Motor Corporation respectively, are leading examples of this trend. But the slow and painful process of the Austin and Nuffield groups towards integration shows that this cannot be done with the stroke of a pen and managerial skill may well be the deciding factor in any single company's future performance. The Standard Motor Company's part in this new trend has not yet become clear. The company still relies heavily on outside suppliers, but it has the compensating advantage, rare in the motor industry, of long-term contracts with major customers like Harry Ferguson.

Lucky Dip in Purchase Tax

THE reductions in purchase tax made this week are bound to divert speculation about the Chancellor's budget plans from its normal channels. A few weeks ago, retailers' representatives approached him with the suggestion that their losses on tax-paid stocks would be lessened if changes in purchase tax were in future to be announced in January, when retail stocks touch bottom, and not in April when the shops normally expect to be full of spring and summer goods. But the changes announced this week seem to have little, if any, bearing on that problem. What Mr Butler has done is to give concessions in addition to those granted in his 1953 budget (when all tax rates were cut by a quarter from 100, 66½ and 33½ per cent to 75, 50 and 25 per cent, respectively) to one or two highly taxed and

hard-pressed luxury industries, along with the retrograde and inexplicable step of extending tax to certain goods that have till now been tax free.

He has reduced the rate of tax on craft industries such as jewellery and precious metal, pottery and glass, prints and engravings by one-third, from 75 to 50 per cent. Since art knows no frontiers, the concession works equally to the advantage of trades making objects of dubious æsthetic worth like plaster ornaments and gipsy hoop earrings. The Chancellor has also taken the opportunity to do some re-shuffling of individual articles from one tax bracket to another. Electric space and water heaters, previously taxed at penal rates to curb excessive power consumption at peak hours, will in future attract the same rate of tax as other gas and electric equipment, namely 50 and not 75 per cent; so will mirrors, garden ornaments, walking sticks and fancy umbrellas. Umbrella parts, which for some unexplained reason have until now attracted tax at the rate of 75 per cent, become tax free. The rate of tax on fabric lampshades is halved, from 50 to 25 per cent. So is the tax on washing machines that are heated, but not operated, by gas or electricity (those with gas or electric driven motors continue to attract tax at the rate of 50 per cent).

The Cost of the Concessions

THESE reductions are not expected to cost the Treasury more than £2 million in revenue in a full year, though very little in 1953-54. In 1951-52 (the publication of more recent returns has been delayed) purchase tax as a whole yielded nearly £340 million, only £46 million of which was contributed by goods attracting tax at the rate of 100 per cent. The sweeping concessions made in the 1953 budget were expected to cost the Exchequer £60 million in a full year; revenue from goods in the top tax bracket may since have been bringing in tax at the rate of about £35 million a year. The 1951-52 returns demonstrate, however, that most of the revenue in this class comes from goods not covered by this week's concessions—furs, cosmetics and toilet preparations, calendars and postcards reproducing pictures less than 100 years old and greetings cards printed in three or more colours. These are the only items that still attract tax at the rate of 75 per cent (furs get a minute concession from the "D" allowance for clothing). Separate returns cannot be identified for every group, but in 1951-52 toilet preparations brought in £28 million of the £46 million yielded by the 100 per cent tax, compared with little more than £11 million from jewellery and fancy goods together.

In reaching an estimate of £2 million for the probable

cost of the changes, the Treasury will of course have taken into account the extra revenue that will come in from the new tax of 25 per cent imposed on floor coverings such as tiles and wood blocks, which have until now been tax free. These coverings have been enjoying a tiny vogue, and to tax them at this late stage seems inexcusable.

Another Fight for Control

A NEW round in the struggle for control of Trinidad Petroleum Development Company is to begin next week. It will be fought out not with the accepted (or at least familiar) weapons of bid and counter-bid, but in legal argument before a Canadian court. The company is a successful, and therefore presumably well-managed, oil producer within the Commonwealth, but by the luck of history it is 50 per cent owned by British Controlled Oilfields, a far from successful company registered in Canada; the other 50 per cent of the ordinary (in addition to a large non-voting preference issue) is widely spread among investors in this country including institutional investors. The time seems to have come when British Controlled Oilfields ought to prepare to die. After a very chequered career, it has no important asset other than its investment in Trinidad Petroleum Development which is worth at present prices about £2½ million and might realise more as a single bloc owing to the control element. The latest balance sheet shows the whole of the ordinary capital and part of the preference capital of British Controlled Oilfields to have been lost. The logical proceeding is to liquidate, to sell the interest in Trinidad Petroleum Development to the highest bidder, to pay off the outstanding loan stock and to distribute the residue to the preference shareholders who might thus receive about 14s per \$5 share compared with a present market price of 9s 3d.

That is doubtless why a second petition has been made to the Canadian courts for winding up BCO. It is to be heard next week. The first petition sponsored by Henry Ansbacher, the merchant bankers, was made last July but subsequently adjourned. It was adjourned after a surprising agreement was reached between Messrs Ansbacher, representing an undisclosed number of preference shares, and the voting trustees of the ordinary shares, whereby BCO, instead of being wound up, was to be reconstructed with a single class of capital, of which the present ordinary was to have 10 per cent and the preference the remainder. It was also part of the bargain that Messrs Ansbacher should nominate members to the BCO board and thus obtain a substantial degree of control over TPD. Indeed, this control over TPD (which of course requires that BCO be kept in existence) is the only prize that would explain the otherwise inexplicable offer of 10 per cent of the equity to ordinary shareholders who have lost everything.

All this can be done, without the initiating party having to reveal how many of the preference shares (which are in bearer form) he really represents. It may, in short, be a take-over without a real bid, and the upshot might be that a group of financiers could assume control of a prosperous and well-managed oil company in a British colony at a very small expenditure of their own or anybody else's money. Whether this is to happen now rests with the

Canadian judge. The best solution would seem to be to put British Controlled Oilfields into liquidation, with the appointment of an impartial liquidator whose only duty will be to realise as much for the assets as he can.

Futures Trading in Grains

FUTURES trading in coarse grains inevitably made a shaky start in London this week after a lapse of fourteen years. Practically no interest was shown in either maize or barley and prices were largely nominal. Maize was quoted at about £26 8s. a ton, c.i.f., for March, the first shipment month, and was 8s. lower for May; barley, which was not traded in London before the war, was quoted at about £18 a ton, c.i.f., for March and 10s. lower for May. These prices are below current prices in the actual market, but the discounts are smaller than that for wheat on the Liverpool market, which resumed trading in wheat futures last month. The outlook for prices of maize and barley is less bearish than for wheat; the surpluses are smaller and both grains are in more active demand. This may help the London market to get into its stride rather more quickly than Liverpool, but the process will not be speedy.

The price of maize is dear compared with other coarse grains owing to the American support operations, which have taken the bulk of the surplus off the market. The official stocks, however, are hardly a threat to prices at present, for the United States is now the only substantial source of supply. Russia has recently withdrawn from the market, Argentina has little of its old crop left, and its new crop will not be available until May or June. The supply of barley is more, broadly based, and less strongly held than that of maize and prices, having had a severe shake-out last year, have been fairly stable for some months. But in Britain the price is overshadowed, if not directly threatened, by the large quantity of domestic barley taken off the farms at the support price by the Ministry of Food, which is now offering this barley for sale at prices which are based on the world market.

Trading in wheat futures in London is expected to begin in a few months' time; the resumption of futures trading in coarse grains in Liverpool is still under consideration. Both markets face formidable difficulties in re-establishing effective hedging facilities now that virtually all the world's exports of grain is handled by government agencies. The need for these facilities, and for the influence they should exert on world prices, is plain, but it is perhaps an open question whether they can be provided in existing conditions.

Savings Turn the Corner?

AT last there seem to be signs that the National Savings Movement has turned a corner in its dismal postwar path. Last year was the fifth in succession in which encashments of the investments covered by the National Savings Committee—Savings Certificates, Defence Bonds and

savings bank deposits—exceeded the new investments and savings were a minus quantity. But the withdrawal of savings was smaller than in the previous year.

The table below shows the net addition to or withdrawal of savings in each year since the war. The net figure excludes both the accrued interest remaining invested and the interest paid out on encashed certificates. The bad figures for the last three years might have been even worse were it not that the substantial repayments of defence bonds on maturity are excluded. They are rightly excluded, for they are not repayments at the demand of the investor, but it is likely that some of the money reappears to swell the new savings figures.

Two factors give encouragement for the future of savings. The years immediately following the war were a period of inflation, discouraging to savings. Also large sections of the population had either lost their homes or had been married from the barrack room and had never set up homes of their own. Such people had every justification for using their savings to equip their homes. These influences must

* Includes certain other Govt. stocks on the Post Office register.

now largely have been worked out. Only the housing drive is still gathering momentum and new houses do call for heavy personal expenditure of the kind for which savings are used.

A further point is that the National Savings Committee's field covers only a part of the individual savings of the general public. Other important sectors include life insurance and shareholdings and deposits in the building societies. It is too early yet to form a picture of what has happened there. Throughout the difficult postwar years they have presented a consistently brighter picture than the so-called "National Savings." Early indications are that 1953 will again be found to have been a good year for both of these channels of saving.

Coal Prices and Steel

SIR HUBERT HOULDSWORTH recalled this week, during a press conference sandwiched between wages negotiations, that the National Coal Board had been considering further adjustments to "the relativity" of certain coal prices long before the miners started arguing that they were subsidising the steel industry. Last year, of course, the board did begin to "open the concertina" for house coals, increas-

America?

Fly in a big, spacious, double-decked Clipper

There's a first-class Pan American service to America every day—and each one is carried in a big, double-decked, four engined Clipper. There's room to move around: in the main cabin your wonderful meals aloft by Maxim's of Paris are served—"on the house," of course.

Downstairs is a fully-stocked lounge bar, where drinks are also complimentary.

If you wish to save over £65 on the return fare, you can take 'The Rainbow' Clipper Tourist service (not illustrated): frequent flights in Super 6 Clippers, the most modern airliners in tourist service. Free meals, 300 m.p.h. armchair comfort.

For further information, including details of speedy onward connections at New York to other American cities, South America and Australasia (on one ticket bought in London for sterling), consult your Travel Agent, or Pan American, 193/4 Piccadilly, London, W.1 (REGent 7292). Also at Prestwick Airport (Prestwick 79888, Ext. 402).

BIG OPPORTUNITY for the Industrialist

Revolutionary Process for the Asbestos-Cement Industry

THE ASBESTORITE Process now makes it possible to produce Asbestos Cement roofing materials without the highly complicated plant and high capital outlay hitherto associated with the industry.

FLEXIBILITY The plant, which is available in two sizes, makes it possible to produce profitably even on a comparatively small scale. High transport costs can thus be eliminated by local production—on a scale to grow with the demand.

LOWER MATERIAL COSTS Asbestos costs represent one-third of the cost of the finished product. The Asbestorite process, because of its ability to handle fibres not usable by the conventional process, can produce asbestos cement at a lower cost.

The Patent Holders are prepared to supply the plant and to negotiate with regard to the franchise for any area which is still open. They are also prepared to consider the manufacture of the machinery under licence.

THE TIN

that never was

TINS AREN'T TIN at all, but steel. The tin is a paint-thin coating on a steel container. We call the metal **tinplate** (and the opener a **tin opener**!) but it is still steel.

Tinplate making is one of the oldest crafts in Britain: the origin of the name " Britain " means " land of tin ". The industry has grown mainly in South Wales over several hundred years by traditional methods of hand-rolling. Over the past fifteen years modern continuous plant has been brought into service in this country to cope with the vastly increased demand. At Ebbw Vale in Monmouthshire and later at Trostre in Carmarthenshire immense continuous mills have been installed.

Tinplate is counted by a "basis box" of approximately 100 lbs. These new mills have made possible an output which in 1952 reached a total of twenty million basis boxes of tinplate, or about one million tons.

STEEL is at your service

ing the price of its best coal and reducing the price of the worst stuff it sells. The board holds its financial responsibility as being to break even on its whole output, after paying interest and possibly setting something to reserve; it has never committed itself to the aim of breaking even upon its outputs of the main groups of coals that it sells, though some such broad principle may now be in its mind.

Only occasional and fragmentary estimates may have ever been published of the board's financial results on particular groups of coals. In its annual report for 1952 it stated that anthracite was produced at an aggregate loss (though about a quarter is exported, some of it to Canada for dollars) and Sir Hubert mentioned early last year that 30 per cent of coking coal was produced at a loss (before charging interest) of 7s. a ton or more. It is well known that some of the best coking coals, from Durham and South Wales, come from pits with some of the highest costs in the industry; these coals are among the highest in price, too, but the board has never stated whether it makes a profit on coking coals as a whole. The board's prices are based mainly upon an "objective" scientific grading (which will of course broadly correspond to the preferences of the industrial consumers who use coal more or less scientifically); these rankings are adjusted first to take account of differences in average cost between coalfields, and secondly to suit "market considerations." Market considerations, presumably, would suggest that there would be room to raise prices for the best coking coals, whether or not the board should wish to break even on them. These high-cost coals are becoming scarcer and more costly to get out of the ground, while the volume of home demand for all types of carbonisation coals is tending to grow, and overseas customers would be glad of coking coal from Britain. Moreover, the steel industry, which wants the coals from which metallurgical coke can be made, has announced that in the next five years it expects its annual demand to grow by about 5 million tons.

Outlook for Wool

DOMINION wool growers should be reasonably well satisfied with the results of the first part of the 1953-54 wool-selling season, but they may be apprehensive about the outcome of the second. In the early months of the new season demand was extremely keen and prices of most grades of wool were firmly held at approximately the closing levels of last season; prices of crossbred wool, supplies of which were particularly short, were well above those levels. In the middle of November demand slackened and prices generally fell by between five and ten per cent. In December the market rallied, mainly owing to increased buying by Russia and other East European countries. When the auctions closed before Christmas prices were firm, and practically all the wool on offer had been sold. The estimates of the London Agency of the New Zealand Wool Commission show that the recovery did not offset the earlier decline, but average prices in December were still only slightly below the season's opening levels, and crossbred 58's were actually 4d. higher.

Prospects for the remainder of the season are unlikely to be quite as good. The re-building of stocks in the wool-manufacturing industries appears to be virtually completed,

and the recovery in production to have levelled off. The mild autumn has not encouraged the buying of woollen goods, and even a cold New Year might not bring buyers flocking into the shops. The United States has bought little wool from the Dominions so far, and the present level of activity in its wool industry does not suggest that its purchases will increase substantially. Japan is

buying rather less this season, owing to its shortage of sterling. Though the statistical position of wool would seem to preclude any radical decline in prices, much may depend on the demand from Russia and East European countries, which has been an important support to the market so far. Growers must hope that the Soviet *bloc's* new-found solicitude to consumers is here to stay.

A Surplus of Oil

WORLD oil output today is much less than could be produced from wells now in production ; there is a surplus of tanker capacity ; and though new refineries continue to be built, some of the marginal units are finding a market for their products partly because Abadan is out of commission. Though world production has risen by about a third since 1948—to a level of 654 million metric tons last year—the rate of increase in the last two years has slowed to what the industry considers a “ more normal ” rate of about 5 per cent a year. Oil, which for many years has been a new fuel encroaching upon the preserves of others, is itself now losing established markets to natural gas ; the shortages of coal and electricity generating capacity in many countries have abated ; and the increase in fuel demand from industry is tending to slacken—probably more as a result of a slower increase in general industrial output than as a result of any general improvement in the efficiency with which industrialists use fuel.

Most producing areas shared in the increase of crude oil output, except Venezuela, which recorded a decline of 2½ million tons in output (though it remained the world's largest exporter). Output in the United States rose by only 2.6 per cent, but with an increase in imports to a rate of about 50 million tons a year consumption there rose by 5 per cent. In the Middle East, production continued to rise rapidly; it was 121.6 million tons in 1953, more than twice the level five years ago, in spite of the loss of 32 million tons a year through the lack of Persian output. The Middle East today produces more than 20 per cent of world output, and nearly half of total output outside the Iron Curtain; last year's

increase in its output came primarily from Iraq, Kuwait and Qatar. Russian output in 1953 has been given as 52½ million, about 10 per cent higher than in 1952, and roughly the same rate of increase was recorded for the whole Soviet bloc, which produced in all about 66 million tons last year. Rumanian oil output, in particular, appears now to have surpassed its prewar peak; and a trickle of oil exports is now coming from behind the Iron Curtain to nearby markets such as Finland. A world market that is at present very amply supplied with most petroleum markets does not provide the most auspicious background for negotiations to get Persia's oil flowing once more.

The Sabre's Successor

It looks as if the successor to the North American Sabre (F.86) as standard day fighter for the United States Air Force may be another aircraft from the same stable. The fighter shown in the two drawings, the North American F.100, is believed to be the only one of the many fighter prototypes flown in the United States during recent years that has been ordered in quantity. Powered by a Pratt and Whitney J.57 engine of 10,000 pounds thrust, it was intended from the outset to fly consistently at the speed of sound (760 m.p.h. at sea level). It is likely to be the first service aircraft to do so, since other fighters reach these speeds only during a dive. The first production aircraft have already been completed.

The F.100 is a typical "American" aircraft, and it follows the American tradition of thin, sharply-swept wings and bulky fuselages. If wings of this type are to be sufficiently strong, they must be almost solid, so that most of

the fuel must be carried in the fuselage. In a typical British aircraft, the conditions are usually reversed. More fuel is carried in the wings and less in the fuselage (no British designer likes the idea of placing fuel so near the engine), and the design presents a smoother "envelope." Although it is unlikely that any British aircraft yet has a high-speed performance as superb as that of the F.100, the low-speed handling characteristics of British fighters are probably better—and their runway requirements therefore less exacting. In Europe, where airfields may be bombed or over-run by enemy troops, this is a factor to be taken into account. There is also some uncertainty at this stage about whether the F.100 is able to reach its maximum speed at high altitude.

Sterling for Egypt

A FURTHER release of Egyptian blocked sterling balances has been made under the terms of the Anglo Egyptian Financial Agreement of 1951. When that agreement was signed the amount held on Egypt's No. 2 account—that is, the blocked account—was about £230 million. The agreement provided for the release of £10 million from the No. 2 to No. 1 account each year until 1960, but the timing of the release each year was to be at the discretion of the United Kingdom Government. In addition, it was agreed that an additional £5 million would be released in any year in which the balance in the No. 1 account fell below £45 million; that balance has in fact been consistently lower than this for some time, so that the £5 million additional release has been made automatically on the first day of each year. Recently, the Egyptian Government asked for immediate release of the full £15 million for 1954, but the United Kingdom Government, while releasing the £5 million, is exercising its right to postpone the transfer of £10 million to a date of its own choosing. Last year the £10 million was transferred at the beginning of the year. In 1952 it was not paid over until April. Allowing for the £5 million already transferred, the amount left in the No. 2 account is now £165 million. Total transfers of £30 million were made in 1951 and £15 million each in 1952 and 1953.

Dearer Aluminium

THE £6 increase to £156 a ton in the price of aluminium ingots may not affect the consumption of this metal in established markets, but it will probably handicap the development of marginal but potentially important markets, such as structural engineering, and its use for box-making, for which aluminium has lost ground to tinplate. The increase reflects the appreciation of the Canadian dollar against sterling, and increases in costs since private trading was resumed on July 1st, when the price was reduced by £11 to £150 a ton. Four-fifths of Britain's requirements are imported from the Aluminum Company of Canada. The output of British Aluminium, the only home pro-

ducer of ingots, and one of the two largest fabricators, covers just under half its needs, and it imports the remainder mainly from Canada. The new price quoted by Aluminium Union, the trading company of Alcan, is therefore the effective market price in this country. When private trading was resumed, the company undertook not to charge more than the Ministry of Materials would have charged as a public trader, and the increase has been approved by the Ministry. In theory the company's undertaking might be considered to apply until the Ministry's options to take up Canadian metal expire in 1970, but it would be unrealistic to expect the undertaking to continue beyond 1955, when the Ministry's firm contracts with Alcan end.

The prices of aluminium products have been raised by between five and six per cent, compared with the four per cent increase in the ingot price, owing to previous increases in manufacturing costs. This comes just when the industry appears to be recovering slowly from the recession that it experienced for most of last year. In the last quarter demand improved, particularly in transport and construction, the industry's staple markets, and in packaging. But the fabricators are still working below capacity, and perhaps the best that they can now hope for is that their total sales in Britain should not suffer from higher prices. Deliveries of virgin ingots to consumers fell by 58,000 tons to 139,000 in the first ten months of 1953, and imports also fell by 58,000 tons to 141,700; production of virgin ingots, however, rose slightly by 2,200 tons to 25,300. In the overseas markets, a decline in sales to some countries has been much more than offset by larger shipments to others, particularly to the United States, where aluminium has been short. Total exports of aluminium products rose to a value of £13.5 million in the first eleven months of last year from £9.6 million in the same period of 1952, and exports to the United States jumped to £4.6 million from

Company Notes

CARRERAS. Superficially the preliminary report from Carreras for the year to October 31st shows little change from the previous report. The group's profits before tax have risen by a mere £3,140 to £2,907,672. And the full year's dividend on the ordinary and "B" ordinary shares (the latter have no votes) has been left unchanged at 17½ per cent. This dividend absorbs £716,158 out of a net profit of £1,331,950. Thanks to a fall in the British tax provision (from £1,529,416 to £1,422,432) the net profit is £94,413 higher than in 1951-52.

While the repetition of the equity dividend came as no surprise, the mere stability in the group's profits may cause disappointment in view of the group's successful launching of Dunhill cigarettes on the market. Total British sales and exports of tobacco and cigarettes in the year to October 31st were little different from those in the previous year.

Total costs, too, may have shown little change. Packaging costs ought to have been down last year, but this could have

been counterbalanced by a rise in wages, advertising expenditure and the price of leaf tobacco. In the stock market there does not seem to be very much hope that tobacco profits will rise sufficiently fast to carry equity dividends up with them, for the yields offered both by Carreras's and Imperial Tobacco's shares are well above those offered by other leading industrial equities. At the current price of 6s. 6d. the 2s. 6d. Carreras "B" shares yield 6½ per cent. The recent mergers of tobacco firms, foreshadowing perhaps stiffer competition, support this cautious view.

★

WEST RIDING WORSTED AND WOOLLEN. The full accounts of West Riding Worsted and Woollen Mills for the year to August 31st contain almost all the salient features of a recovery in trade. The group's trading profits have shot up from £904,539 to £1,707,146 and its net profits have more than doubled, from £344,057 to £762,455. These advances have been followed by an effec-

£554,000. But foreign competition is extremely keen, and it will probably be impossible to pass on the increase in prices to many overseas consumers.

Capital Issues in 1953

AS in almost every year since the war, the new issue market in 1953 was dominated by the demands for new capital by the Government and the nationalised industries. The table of capital issues published on page 124 shows that total new borrowings directly from the public by cash and "rights" issues amounted to £975 million, compared with £678 million in 1952. But no less than £767 million of this sum was borrowed by the Government, largely through the issues of Exchequer stocks and the issues by the Gas and Electricity boards.

British industry, in raising about £110 million, appears to have knocked just about as firmly on the door of the capital market as it did in 1952. This total is dominated by a few big issues, notably by the debenture stock issued by Anglo-Iranian at the beginning of the year and by those made by aircraft companies. The "new basis" figures, which include stock exchange placings and introductions, also show that the private companies (threatened by the death duty axe) were as eager as ever to secure a quotation for their shares in the stock markets. The only really unusual features of the new issue market were the return of the British local authority as a borrower on the stock exchange and the heavier calls that were made on British savings by companies, notably several banks, in the Commonwealth.

tive increase in the ordinary dividend from 16½ to 22 per cent—a dividend that the chairman, Sir John Keeling, characterises as "conservative in relation to the profit earned."

The return to more prosperous conditions is reflected equally clearly in the consolidated balance sheet. There, the book value of stocks is shown to have increased from £3,325,853 to £4,603,199. Sir John points out that this increase sprang from "the somewhat higher value of wool, the larger turnover of the group and the stock of the new operating subsidiary"; this new subsidiary is E. Wadsworth and Sons which was acquired towards the end of the financial year. With such heavy commitments in stocks the group is one which must have considered whether the wool tops futures market provided a useful hedge. Sir John, however, does not say whether or not the group has gone into this market or even if it intends to do so. His only comment is the cold one that it has "yet to be proved that a futures market in wool will be of the same value to the wool textile industry as the futures market for cotton has been to the cotton industry."

The increase in stock commitments has imposed a further strain on the group's

liquid balances. Its bank overdraft has risen from £82,531 to £404,768 and its cash balances have fallen from £318,777 to £228,779. These movements seem to be the inevitable outcome of a year of trading which Sir John believes has "possibly been more normal" than at any time since

the war. But he still cocks a cautious eye at the future. A cushion of £310,000 has been provided in stock reserves against any fluctuations in wool prices. And Sir John confines his comments on current trading conditions to the innocuous remarks that so far the trading results have been "satisfactory" and that the full year's outturn should not be "disappointing."

**ASSOCIATED BRITISH MALT-
STERS.** After the rise in net profits to £118,027 for the year ended August 31st, compared with £90,775 in the previous year, Associated British Maltsters might well have been expected to pay a higher dividend. The net cost of the 10 per cent distribution is less than a quarter of the net profit. The chairman, Captain H. N. Hume, shows that he has set aside

the temptation to pay more for an unusual reason: he expects the price of barley, the company's raw material, to fall. The reversion to a free barley market will in his view bring three consequences. First, in order to clear storage space supplies are likely to be pressed on the market. Secondly, the "gentleman's agreement" between the brewers and the farmers to hold the price of malting barley at not less than 126s. per quarter is in his view unlikely to be renewed. Thirdly, if the expected fall in prices takes place the company will have less money locked up in stocks and debtors and the overdraft will be further reduced with a consequent saving in interest charges. As the company's capital commitments have run down a substantial reduction in the bank overdraft has already been achieved. On August 31st the bank overdraft showed a reduction of £1,010,000

at £1,043,000, capital commitments having been reduced from £146,600 to £72,000, the lowest figures for some years. It seems clear that the company, whose business is to supply malt to brewers, still has to reap the long term benefits of lower barley prices. Barley from the 1953 harvest was again of good quality.

LONDON STOCK EXCHANGE

Next Account begins: January 13th.
Next Contango Day: January 13th.
Next Settlement Day: January 19th.

STRONG markets have again predominated on the Stock Exchange. Government securities, fixed interest groups and industrial equities have all gained ground. The *Financial Times* industrial ordinary index broke through its last year's high point of 1953 and at 131.9 has reached its best level since the flexible bank rate was reintroduced in November, 1951. Naturally some profit-taking has appeared, but it was not until Thursday that it became sufficient to start a decline in prices.

Gilt-edged have remained a strong market with good investment demand for the medium dated stocks. Bank shares have moved irregularly as might be expected over the period of the dividend declarations. Despite the disappointment caused by the absence of any further German offer on the Potash bonds they have on balance advanced. The 7 per cent issue is one point higher at £151 and the 6½ per cent issue two points up at £139.

Demand for industrial equities has remained good, though selective. Dunlop have lost their volatility since the terms of the capital scheme were disclosed but on balance are 3d. higher at 57s. The stores group has been active during the period of the sales. Great Universal ordinary have advanced, but on Thursday signs of irregularity developed here too. Woollen shares have also been rising though the cotton group has been declining.

On publication of the Lancashire Steel offer terms the discount on United Steel widened to 10½d.

The recent burst of activity in the gold share market has died down and price movements over the last few days have been mainly downwards. Rubber shares remain inactive but the brisk demand for tea shares has been maintained and prices have continued to rise.

* In consequence of official purchases of tender bills in connection with cash subscriptions to the new Exchequer stock, it is impossible to calculate the division between tap and tender bills until all the bills purchased have passed their original maturity date.

THE MONEY MARKET

AFTER surmounting the year-end more comfortably than usual, Lombard Street ran into more difficult credit conditions later in the week covered by Wednesday's Bank return. On Saturday official help was granted—mainly direct to the market—for the first time for some weeks, to relieve a stringency caused by heavy outside calling; and on Monday heavy payments to the Exchequer made credit so short that, despite considerable official purchases from both the banks and the market, one or two houses were actually forced to seek a little aid on penal terms. This was the first time that the market had been "in the Bank" for nearly four months. Conditions eased somewhat on Tuesday, and on the following day the authorities had to mop up a surplus of credit by buying bills from the market.

The market maintained its bid at £99 9s. 4d. for the £250 million of bills on offer at last week's Treasury bill tender, but as total applications fell by over £22 million, the market's allotment rose from 63 to 73 per cent. The offer at yesterday's tender was reduced to a maximum of £230 million.

The Bank return shows a reflux of notes of £28.1 million, making a total of £48.5 million since Christmas, or slightly more than last year. The fiduciary issue was reduced by £50 million, but the reserve in the banking department is still over £33½ million. Government securities in the banking department rose by only £16.7 million, despite the transfer of £50 million of securities from the issue department; public accounts fell by £3.4 million, and bankers' deposits by £2.6 million despite the note reflux.

MARKED PROGRESS

INCREASE OF CAPITAL APPROVED

THE HON G. C. GIBBS'S SURVEY

The annual general meeting of Australia and New Zealand Bank Limited was held on January 1st at 71 Cornhill, London, E.C.3.

The Hon G. C. Gibbs, CMG, chairman of the bank, who presided, said:

I have also to report that Mr C. E. Murch, head-office manager, recently retired from our service on account of age. He joined the Union Bank of Australia, Limited, some 47 years ago, became assistant manager in 1936, and was appointed London manager in 1944. Mr Murch has served this bank as head-office manager since its inception, and has given much valued service. He will be greatly missed by his many friends in the City. Mr J. S. Hardie, deputy head-office manager, has been appointed head-office manager in succession to Mr Murch.

AUSTRALIA

The high wool prices of 1950-51 were accompanied by a great expansion of purchasing power in Australia which resulted in heavy imports and severe loss of liquidity in the economy. Mainly because of the strength of the banking system this loss of liquidity did not lead to disruption of business, but, to prevent continued inflow of goods, the Government decided to impose import restrictions. The past year has seen real progress towards more stable conditions. Advantage has been taken of the breathing space afforded by import restrictions to reduce stocks gradually and restore the liquidity of traders and manufacturers to a reasonably safe level on an orderly basis. This reduction in imports has been accompanied during the past trade year by a pronounced expansion in export receipts. Rural production increased strongly in favourable seasonal conditions, and, with good prices in overseas markets, the value of exports rose to £A871 million, an increase of 29 per cent above the previous season.

During the financial year 1952-53 Australia purchased \$30 million from the International Monetary Fund and drew a further \$37 million under loans from the International Bank. The capital inflow on Government account was offset by a net outflow on private account amounting, according to preliminary estimates, to some £A37 million. This is in marked contrast with the net inflow of more than £A500 million during the preceding four years.

The substantial improvement in the balance of payments during the financial year resulted in an increase in Australia's overseas currency resources of £A186 million to £A548 million in June, 1953—a very favourable contrast with the loss of £A481 million in the preceding twelve months. The material improvement in the balance of payments had a marked effect on general liquidity within Australia, which was reflected in an easing of demands on the banking system. Repayment of bank advances and a substantial growth in deposits reversed the trends of the previous year.

The decline in pressure for bank advances has been followed by a further relaxation of the selective advance policy laid down by the

Central Bank. Advance control, which had been gradually eased, virtually came to an end in October, 1952, and since then has been confined to a provision to ensure that large advances would not be extended in a manner contrary to Capital Issues control. Relaxation in official lending policy has been accompanied by a more liberal policy regarding liquid resources of the banking system.

Important amendments to banking legislation were passed in April, 1953. The special account provisions are now less onerous. They are based on the position of the trading banks at October 10, 1952, instead of as previously on the position early in the war, which had little relationship to current conditions. The trading and central banking sections of the Commonwealth Bank have been separated, but the policy of the Commonwealth Trading Bank will still be determined by the Commonwealth Bank board. The law now also requires the Commonwealth Trading Bank to comply with special account and other requirements of central bank policy. Another provision which is of particular importance to the trading banks removes restrictions on investment in Government and other securities, thereby placing the responsibility to a large extent on the banks themselves to maintain a satisfactory liquid position.

Although the acreage planted to wheat was lower than in the preceding year, the yields were among the highest recorded. The rise in wheat output has been accompanied by a similar increase in meat production. Wool production increased by 14.6 per cent to reach the record level of 3,851,000 bales.

The rise in rural production has been accompanied by an improvement in output of the basic industries. Concentration upon lighter industries and service trades had left the basic industries short of labour and unable to operate at full capacity. Following the deflationary trends of 1952, there has been a marked improvement in the labour force available to them, with a consequent increase in production. Output of coal and steel has responded, loss of time resulting from power shortages has largely disappeared and transport services have made some improvements, to the advantage of industry as a whole.

Australia's known resources have recently been extended significantly by discoveries of uranium and other minerals. The search is still proceeding and the employment of new and more accurate methods of exploration makes the prospects of discovering mineral deposits, if they are there, far more likely than in earlier years.

The latest development is the discovery of oil in the north-west of Western Australia, announced as recently as December 4th last. The significance of the strike has yet to be assessed in the light of further testings.

NEW ZEALAND

New Zealand suffered much the same kind of reaction as Australia following the sharp rise in export income in 1950-51. A heavy

deficit in the balance of payments in 1951-52 raised bank advances to record levels. The Central Bank imposed additional controls upon advances and instituted a system of exchange allocation to restrict the volume of imports. Merchants liquidated excessive stocks without forced sales or similar measures involving business dislocation, and bank advances declined sharply. Internal stability at high levels of employment has been achieved, and, with good export receipts in prospect, the outlook for the present year is favourable.

The system of exchange allocation played an important part in correcting New Zealand business conditions and imports declined to about £NZ172 million in 1952-53 from the exceptionally high level of 1951-52. Import restrictions have been eased as the internal position has shown signs of greater stability. While imports were reduced, export receipts were well maintained and the overseas assets of the banking system rose by £NZ43 million during 1952-53 to reach £NZ117.6 million in June, 1953, making good most of the decline of the previous year.

The Murupara paper and pulp project is being pressed rigorously forward and in addition a high rate of developmental expenditure is planned by the Government for hydro-electric schemes, land settlement, state housing, transport and community services. The total programme amounts to £NZ68 million. Some borrowing overseas has been arranged, but it is expected that capital requirements will continue to make heavy demands upon current income.

Market yields rose in the later months of 1952, those for long-dated Government issues reaching 4 3s. per cent in December, 1952. With the development of more liquid conditions they declined and since May have remained more stable at about 4 per cent. During 1952 the Government did not have recourse to the market, but drew upon departmental sources to finance its projects. The scale of present development schemes, however, necessitated an approach to the market in 1953. A loan for £NZ20 million partly to redeem a maturing issue was opened in May, and issued at a discount giving an effective yield of 3 19s. per cent over the nine-year term. The loan met with success, as did a further loan for £NZ10 million opened in September on the same terms. A loan for £10 million English currency offered on the London market last month was heavily oversubscribed.

Between August, 1952, and May, 1953, the minimum balance which the banks are required to keep at the Reserve Bank was increased from 7 per cent to 20 per cent of their demand liabilities and from 3 per cent to 10 per cent of their time liabilities. This technique for controlling the volume of bank credit, which has not previously been employed in New Zealand, has immobilised a material proportion of our assets, upon which no interest is paid.

ACCOUNTS

The accounts now before you reflect both the steady consolidation of the Bank's busi-

ness following upon the merger, and the improvement during the past year in Australia's and New Zealand's overseas trade balances, to which I have made reference. An increase over the year of £A26 million in deposits, bills payable, etc., and a decrease of nearly £A28 million in loans and advances to customers are an indication of the extent of the reversal in Australia and New Zealand of the trends noted a year ago, when heavy payments for imported stocks, a slackening in domestic trade, and the severe import restrictions then in force made a considerable impact on our figures for deposits and advances. Modest increases in our bills receivable and acceptances for customers figures this year illustrate the same tendency.

A noteworthy feature of the balance sheet is the great improvement shown in our liquid position in comparison with the previous year's figures. This improvement is in line with the general restoration of liquidity, particularly in Australia, and is illustrated by increases of over £A16 million in our cash balances, and of nearly £A13 million in Treasury bills. It is gratifying that the latter traditional item of short-term banking investment again appears in our accounts. The decrease of £A11 million in balances due to other banks is also a sign of improved liquidity, arising as it does from the fact that during the year under review we have repaid the special borrowings from the Central Bank

in Australia which have been a feature of our accounts in recent years.

Your directors have taken this opportunity to strengthen the bank's published reserves by making a transfer from profit and loss account. The balance to the reserve fund now stands at the equivalent of £6 million English currency, while the balance to be carried forward in profit and loss account more than covers the cost of a year's dividend.

BRANCH REPRESENTATION

We have continued our programme of merging branches in certain places where we had two branches, and altogether 56 such mergers have been carried out since October 1, 1951. During the same period, 64 new branches have been opened and further new branches are planned.

The report and accounts were adopted and the dividend, as recommended, was approved. Votes of thanks were passed to the chairman and directors and to the management and staff at home and overseas.

EXTRAORDINARY GENERAL MEETING

An extraordinary general meeting immediately followed the annual general meeting, when resolutions were passed increasing the authorised share capital of the Bank from £17,000,000 to £22,500,000 English currency.

MCDUGALLS TRUST LIMITED

MR KENNETH MOORE'S REVIEW

The twentieth annual general meeting of McDougalls Trust Limited was held on December 31st at Thames House, Queen Street Place, London, E.C.4.

Mr Kenneth A. E. Moore (the chairman) who presided said: The excellent results shown by the accounts for the past financial year are due partly to an increase in the sales of McDougalls Self-Raising Flour and partly to the fact that all the companies in the group had a very good year.

The group profit of £498,000 is, I need hardly say, an all-time record. Out of this, taxation absorbs no less than £321,000 or, say, 64 per cent. The unkindest cut of all is that, having by much sweat and toil on the part of management, staff and workpeople, substantially increased efficiency, production and profits since the standard years of 1947-49, we have incurred a liability to excess profits levy—surely the most deplorable tax ever imposed in peacetime on industry struggling to improve its productive efficiency. Fortunately, it comes to an end this very day.

Of the increase of about £150,000 in group profits roughly £100,000 accrues to the Exchequer.

We are very glad on this occasion to have felt able to recommend a total dividend of 12 per cent on the ordinary share capital, as compared with the rate of 10 per cent paid in respect of each of the preceding 16 years. The increase is a token of the remarkable development of the business during that period, which has hitherto been masked by war and postwar controls and restrictions of one kind and another.

As mentioned in the directors' report, Government control of the flour milling activities of the group came to an end on August 29, 1953, after being in operation for no less than 14 years. I need hardly say that we are delighted once again to have our freedom in the selection and purchase of

wheat and in the production and sale of an article of the highest quality.

The fresh winds of competition have been a stimulus to all engaged in the conduct of the business, and I am glad to say that, in the first three months of the current year, production and sales of McDougalls Self-Raising Flour have advanced to a new high level. Our mills and packing plants are, in fact, running to capacity and are hard put to it to meet orders. Various steps have already been taken, or are in train, to increase our packing capacity, and, since the date of the accounts, we have acquired another business which, when certain extensions have been carried out, will help in this regard.

The consolidated balance sheet before you today sets out the financial position of the group at the end of Government control. It shows, amongst other things, an excess of current assets over current liabilities amounting to over £800,000. The current assets include more than £500,000 of cash and tax reserve certificates, but I should be failing in my duty if I omitted to point out that, in due course, we shall feel the full strain of financing wheat stocks at much higher than pre-war prices. At present part of that burden is still carried by the Government, but one must assume that to be a passing phase only. For this reason, and because of the notable development of the various facets of the business since pre-war days, we may need at some time in the future to seek increased capital. We must be prepared to take that fence when we come to it, but in the meantime you may rest assured that the business has never been in better shape, and that we are entitled to look to the future with every confidence.

Our most sincere thanks are due to management, staff and workpeople for their contribution to our progress in the past and recent years. You will be glad to know that it has had tangible recognition in various forms, including increased bonuses and a supplementary pension scheme for those who have given long and loyal service.

The report and accounts were adopted, and a special resolution amending article 89 of the articles of association was duly passed.

HAWKER SIDDELEY GROUP LIMITED

SIR THOMAS SOPWITH, CBE, REVIEWS STATUS OF BRITISH AIR POWER, CALLS FOR BOLDER RESEARCH POLICY

The eighteenth annual general meeting of the Hawker Siddeley Group Limited was held on January 6th in London.

During the course of his speech, Sir Thomas Sopwith, CBE, the chairman, said:

Certain special features in this year's accounts have been explained in the directors' report, and I therefore propose to confine my financial survey mainly to the more general aspects.

The trading profits of the Group for the year ended July 31, 1953, after deducting reserve for increased replacement cost of fixed assets, amounted to £5,033,744, as compared with £5,184,552 for the previous year. Both production and sales of the United Kingdom subsidiaries show an increase on last year. Our Canadian company, A. V. Roe Canada, Limited, has shown a very marked increase in production arising from its important contribution to the Canadian defence programme.

Turning to the consolidated balance sheet, you will observe that after the provision of £1,775,551 for depreciation, fixed assets show an increase of nearly £8 million. In addition to the acquisition of certain Crown assets in Canada, other substantial expenditure has been incurred in the United Kingdom. It is the policy of your board to keep abreast of scientific and technical developments and constantly to modernise capital assets so that our resources are in line with latest developments in production technique.

With these considerations in mind, we have this year set aside an additional sum of £1 million out of the profits of the year to reserve for replacement of fixed assets and development, thereby increasing this reserve to £6 million. Last year I said that high taxation restricted both expansion and replacement. Whilst your board welcomes the reinstatement of initial allowances, this is merely a slight palliative in relation to the fundamental problem. Taxation allowances are still related to historical cost and take no cognisance of the increased cost of replacement. The already high level of taxation without appropriate reliefs based on replacement costs results in too large a slice of profits being taken away in taxation and it adds to the burden of industry faced with the constant renewal and improvement of capital equipment.

Your board is recommending a final dividend of 9 per cent, less tax, making with the interim dividend already paid a total dividend for the year of 15 per cent, less tax. This compares with a total distribution last year of 10 per cent, less tax.

Sir Thomas then moved on to discuss the many products and activities of the group—the Vulcan Bomber, the Hawker Hunter, the Sea Hawk, the Gloster Javelin, the CF. 100 long range fighter, the Sapphire and Orenda jet engines, the Sapphire motor car, diesel engines, guided missiles, alloys, and Hawksley houses. He reviewed the current status of British aircraft and called for bolder research policy. He concluded with these words:

"We are now moving rapidly into an age of new weapons, of atomic and thermonuclear power. Let us be bold. Let there be no hesitation. Let us stride into the future confident that we are already wrestling from it that pioneering leadership which has ennobled us in the past."

The report and accounts were adopted.

THE BANK OF CEYLON

IMPORTANCE OF AGRICULTURAL EXPORTS

SIR ERNEST DE SILVA'S SURVEY OF CEYLON'S ECONOMY

The fifteenth annual general meeting of The Bank of Ceylon was held on December 19th, in Colombo. The chairman, Sir Ernest de Silva, Kt, presided, and the following is an extract from his circulated statement:

Last year has again demonstrated beyond doubt the country's absolute dependence on her three main agricultural exports—tea, rubber and coconuts, and on foreign sources for our requirements of food, clothing and materials for housing. Equally emphasised has been the need for a greater diversification of our economy.

The Korean boom was largely responsible for our export prices rising earlier and faster than import prices, with consequent inflationary monetary pressure on our economy. Ceylon, in this period, enjoyed unbounded prosperity, with high prices ruling for almost all her exports and with the terms of trade in her favour. Even before the signing of the Korean Truce and with the prospect of world peace this country faced increasingly unsettled trading conditions. Export prices fell earlier and faster than import prices, and the terms of trade were definitely moving against us.

CEYLON'S FOREIGN TRADE

Ceylon's foreign trade in the first nine months of 1953 recorded an adverse balance of trade in merchandise, though it showed an improvement over the comparable period in 1952. There has been a similar improvement in the terms of trade. In spite of the steady improvement in the terms of trade, Ceylon still has an unfavourable trade balance, but the position is expected to improve when the new Budget has its full effect.

Tea exports for the nine months of 1953, both in quantity and value, were higher than in the corresponding period of 1952. Increased supplies have not affected prices, which, on the average, have been higher than in 1952. Throughout the world the tea-drinking habit is spreading, assisted by the dearth in coffee, which is increasingly becoming a luxury.

Rubber exports are faring well, thanks to the Ceylon-China Trade Agreement. One beneficial outcome of the China trade, as far as this industry is concerned, is the rubber rehabilitation scheme, financed out of profits on the China trade. The scheme provides for the replanting of uneconomic lands with high-yielding grades.

There was an appreciable decline in the total exports of coconut products during January to September of this year when compared with the same period last year. The stock position of consumers of coconut oil and copra in Western countries is reported to have been good and a policy of caution in the uncertain times ahead have made buyers provide only for their immediate needs. Both commodities are in good demand in Asian countries, including China, which is now an active buyer in the Far Eastern markets and especially in Ceylon. The demand for desiccated coconut was generally good and shipments in September reached a record peak due to large orders from the Continent. The seasonal trend indicates improved prices for the end of the year.

FOREIGN CAPITAL AND CEYLON'S NEEDS

While foreign capital is likely to be of considerable help to our balance of payment

position, it is doubtful whether there will be a substantial inflow in the next few years. It is not merely a question of conditioning our political and economic climate to foreign capital. The fundamental question from the point of view of the nationals arises. Is foreign capital to be allowed in for the country's benefit or for its exploitation, and is it to be for the benefit of the people of this country or for the benefit of non-nationals? It is not enough that the country's economy gets the benefit of foreign capital. The benefit should accrue to the nationals as well. Otherwise any uncontrolled influx of foreign capital may mean a reversion to the old colonial policy of exploitation. What is required is a proper understanding of what type of foreign capital is beneficial to the people of this country and what is not. With this distinction in view the Government could with profit give every encouragement to the influx of foreign capital.

FINANCIAL POSITION OF THE BANK

The accounts indicate that the Bank's gross profits during the period under review suffered a slight diminution from the peak profits earned in the boom year 1951-52. It will, however, be observed that the net profits are higher than last year's. In keeping with the general economic trend of this country the total balance-sheet figures show an overall reduction of Rs.69 million from the figures of last year. Of this figures Rs.53 million are accounted for by the drop in the item, liabilities of constituents for credits, guarantees, acceptances and other engagements. This decline is due to a large reduction in outstanding credits guaranteed on behalf of foreign banks, particularly in connection with the Ceylon-China trade, which is now on a Government to Government basis involving no engagements on the part of this Bank. This does not, however, mean that the volume of commercial credits opened during the course of the year declined; on the contrary, the turnover under this particular head has shown an improvement over the year 1951-52. The material short-fall is therefore about Rs.16 million on account of a decline of a similar amount in the volume of demand deposits on the liabilities side under the item "Current savings and fixed deposits, contingency fund, provision for taxation, and other accounts."

This diminution in the volume of demand deposits is not peculiar to your Bank. As stated earlier the volume of demand deposits in the whole banking system has declined appreciably. You will be pleased to learn, however, that your Bank now controls 31 per cent of all demand deposits in commercial banks and approximately 38 per cent of the total deposits of all commercial banks. These percentages show an improvement on the figures for the previous year.

Cash assets show a fall of Rs.15 million, but it may be stated that the Bank carries in its portfolio sufficient Government securities maturing very shortly, which together with advances of a very liquid nature ensure a highly satisfactory liquid position for the Bank.

The increase in the figure for advances to customers amounting to Rs.6 million is due to the increase in credit facilities extended to the export trade under a scheme which ensures for the Bank not only a safe investment, but also a liquid one. Finance for the import trade shows a decline and this is explained by restricted imports and inventory.

I may state in this connection that the textile trade in particular is passing through times as adverse as those experienced in 1951 to which I made reference in my statement of that year. You will be pleased to learn, however, that the present stringent conditions have not in any way affected the capacity of your Bank's customers to honour their obligations, for the past due items in the books of the Bank in connection with facilities granted for the financing of imports are quite small.

You will be interested to learn that the total loans and advances granted by your Bank constitute over a third of the total loans and advances granted by the entire banking system.

In the expansion of well-secured loans and advances the Bank's Credit Investigation Department referred to in my last year's statement has played an important role. As anticipated, it was a little difficult at first to persuade borrowers to provide information which had not previously been furnished to banks in this part of the world. Customers, however, soon found this department of positive value in keeping their own houses in order and are now much more ready to furnish any information the Bank may require to assess the risks involved, the purpose of the loan, the applicant's capacity to make repayment according to an agreed programme and other factors which are essential prerequisites of prudent lending and wise borrowing.

Shareholders will have observed that the directors have recommended that the final dividend of 6 per cent and bonus of 3 per cent which has been paid for several years be now converted into a dividend of 9 per cent for the reason that there is little material difference between a bonus and a dividend.

SUBSTANTIAL RESERVES

A transfer of Rs.1,150,000 from inner reserves has been made to the permanent reserve, which, with the Rs.350,000 transferred from profits this year, will show the quite satisfactory figure of Rs.4,500,000. Your Bank has reached, after 15 years, the position of being the leading bank in the island largely through a happy combination of circumstances. It was started just before the outbreak of World War II and it has grown in strength through the war and postwar boom years. Further, this Bank being the only indigenous commercial bank of any importance has had the whole-hearted and undivided support of both the Government and the people of this country. This has enabled your directors to put away a major portion of the profits into inner reserves which are substantial, so that the Bank today is strong enough to face the future confident of its strength and ability to withstand even lean times.

We shall continue to have always in view the part your Bank was intended to play in placing the Ceylonese entrepreneur in a position in which he can compete on equal terms with his non-Ceylonese counterpart, and also in carrying the banking habit to all parts of the country. The Government and the people of this country, I am sure, will continue to assist in making the Bank stronger, for its capacity to fulfil the objectives for which it has been established will be dependent on its position both absolute and relative in the banking system of this country.

O.K. BAZAARS (1929) LIMITED

(Incorporated in the Union of South Africa)

NET PROFIT AGAIN LARGER

The twenty-fourth annual general meeting of O.K. Bazaars (1929) Limited was held on December 31, 1953, at Johannesburg, Mr Michael Miller, the chairman, presiding.

The following is the directors' report, which had been issued to shareholders with the accounts for the year ended June 30, 1953:

To the shareholders: Your directors submit herewith in respect of the year ended June 30, 1953:

- (1) The directors' annual report;
- (2) The balance sheet and profit and loss account of the company;
- (3) The consolidated balance sheet and profit and loss account of the company and its subsidiary companies.

DIRECTORS' REPORT

Capital: The authorised and issued share capital of the company has not been altered since last year.

Parent Company's Accounts—Profit and Dividends: The net profit for the year under review, after providing for all expenses and taxation, was £730,551 as compared with £721,093 for the previous year. The amount available for a final dividend on the ordinary shares and to be carried forward is £3,066,756 (as against £2,703,557 last year) arrived at as follows:

1952		1953
£	Balance brought forward from previous year, after deducting a final dividend of 30 per cent paid on January 31, 1953.....	2,508,348
2,008,573	Add: Profit for the year.....	730,551
721,093		3,238,899
2,729,666	Add: Dividends from subsidiary companies out of profits accrued prior to June 30, 1951, net surplus from sale of shares of certain subsidiary companies and amount overprovided for taxation in previous years.....	—
1,160,550		—
3,890,216	Add: Surplus from the sale of an investment in a subsidiary company.....	15,396
—	Deduct: Transfer to general reserve.....	—
999,120		3,254,295
2,891,096	Deduct: Preference dividends..... £57,400	
	Interim dividend of 20 per cent declared June 26, 1953, since paid..... 130,139	187,539
187,539		3,066,756
2,703,557	Balance available as abovementioned.....	
	Your directors recommend the payment of a final dividend of 30 per cent (making a distribution for the year of 50 per cent) to holders of Ordinary, "A" Ordinary and "B" Ordinary shares.	195,209
195,209	This will absorb.....	2,871,547
2,508,348	Balance to be carried forward.....	

CONSOLIDATED ACCOUNTS

Shareholders are referred to the consolidated accounts of the company and its subsidiaries, which present a picture of the activities of the group as a whole. The group net profit, after deducting all expenses, taxation and the interests of outside shareholders, is £834,749, which compares with £812,933 for 1952. Capital, reserves and surplus total £7,666,597 at June 30, 1953; the 1952 figure was £7,196,591. Trading stocks at £4,491,996

were £138,327 more than the previous year.

DEVELOPMENT

The company opened branches during the year under review at Parow (Cape Province), Vanderbijl Park (Transvaal), Hillbrow (Johannesburg), and Bulawayo (Southern Rhodesia), and in the current financial year will open a branch at Kroonstad (Orange Free State). Your directors expect the branch at Worcester (Cape Province), referred to in the chairman's statement last year, to be completed before the end of 1954. The extension to the Johannesburg store envisaged last year has progressed sufficiently to enable the company to trade in the basement, ground and first floors of the new section. In the forthcoming year the old shop will be modernised. The alterations to Paramount Stores, which provide additional trading space, have now been completed.

Since 1942 the company has been trading in leased premises at the corner of Harrison and President Streets, Johannesburg, under the style of "Cash and Carry." The period of the lease has now been extended and the shop premises have been renovated and remodelled. The name of this branch will be changed, with effect from December 1, 1953, to "O.K. Bazaars Harrison Street Branch."

owned subsidiary company; its profit for the year was £14,763.

Sowden and Stoddart, Limited.—Your company holds all the ordinary shares in Sowden and Stoddart Limited, whose profit of £16,950 for 1953 was not as good as in the previous year.

Dok Products Limited has the exclusive franchise for bottling the aerated water known as "Pepsi-Cola," and has now acquired a similar franchise for the beverages bottled under the name of "Canada Dry." The imposition by the Government of an excise tax on aerated waters adversely affected the whole of the mineral water industry in the Union, with the result that the trading profit made by Dok Products Limited was less than that of last year.

CTC Bazaars (South Africa) Limited.—The company continues to hold 54 per cent of the issued ordinary share capital of CTC Bazaars (South Africa) Limited whose trading result for 1953 showed an improvement on 1952. This company proposes to reduce its dividend this year from 12½ per cent to 10 per cent in order to build up its reserves.

Federated Shippers Limited.—Your company received a maiden dividend of £15,000 during the year under review from Federated Shippers Limited.

Fresta Holdings Limited.—Your company has increased its investment in Fresta Holdings Limited by £25,000. This company, through subsidiaries, operates a large store for Europeans and five trading stores for natives in the Orange Free State goldfields area.

DEBENTURE BONDS

A 6 per cent debenture issue for £1,200,000, redeemable at 2 per cent per annum commencing in 1958, was arranged through Syfret's Trust Company Limited. As security, certain fixed properties of the company, registered in the names of subsidiaries, were mortgaged. Whilst your directors were and still are of the opinion that mortgage bonds are not the best method of raising funds, they considered that in the present circumstances it was prudent to adopt this method of financing the company. Coincidental with the passing of the debenture bond, it is necessary for the company to alter its Articles of Association in so far as the provisions relate to the borrowing powers of the company. An extraordinary general meeting of the company will be convened for the purposes of submitting for the sanction of shareholders a special resolution adopting new borrowing powers.

GENERAL

This year, as in previous years, bonuses were paid to the staff.

The directors take this opportunity of thanking the senior executives and other members of the staff for their continued enthusiastic co-operation and loyal and efficient services.

RESOLUTIONS OF SUBSIDIARY COMPANIES

In terms of Article No. 90 of the company's Articles of Association, your directors report the following resolutions which were passed by the subsidiary companies:

- (1) O.K. Bazaars (Randfontein) Limited: September 5, 1952.

"That the directors of the company be authorised to borrow from time to time for

Early in the new year a start will be made on rebuilding the Durban store on the existing site and the adjoining stand purchased for that purpose some time ago.

The company acquired during the year under review the property in Vereeniging, where it has been operating on a lease basis.

OTHER INTERESTS

Raphael Bros., Limited.—There has been an improvement in the trading of this wholly

the purposes of the company such sum or sums of money as they deem fit without limit or restriction."

(2) O.K. Estates Limited: June 5, 1953.

"That the company's Articles of Association be amended by deleting Article 10 thereof and substituting the following Article 10:

"10. Clause 51 of 'Table A' shall not apply. The directors may from time to time raise or borrow from members or other persons, companies or corporations, any sum or sums of money for the purposes of the company with or without security, for such period, and upon such terms as they in their sole and absolute discretion may deem fit; provided that the aggregate amount at any time borrowed or raised by the company's

holding company and all its subsidiary companies for the time being (excluding moneys borrowed or raised by any of such companies from any other of such companies, but including any outstanding guarantees or suretyships given by the said holding company or any of its subsidiaries for the time being for the share capital or indebtedness of any other company or companies whatsoever and not already included in the amount of the moneys so borrowed or raised) shall not without the sanction of an ordinary resolution passed at a general meeting of the holding company exceed the total of (i) the nominal amount of the issued and paid up share capital for the time being of the holding company, and (ii) the aggregate of the amounts standing to the credit of all capital and revenue reserve accounts (other

than reserves created by the writing up of any assets) any share premium accounts and the profit and loss accounts as set out in the consolidated balance sheet of the holding company and its subsidiaries certified by the holding company's auditors and as attached to or forming part of the last accounts of the holding company which shall have been laid before the holding company in general meeting at the relevant time, but no lender shall be bound to see that this limit is observed."

Clause 86 of "Table A" is amended accordingly.

On behalf of the board,
S. COHEN }
M. MILLER } Directors.

The report and accounts were adopted.

FIRST GARDEN CITY, LIMITED

GROWTH OF LETCHWORTH

CHAIRMAN'S SPEECH

The fiftieth annual general meeting of First Garden City, Limited was held on January 7th in London, Sir Eric Macfadyen, MA, JP, chairman, presiding.

The following is an extract from his circulated speech:

The year 1953 was the golden jubilee of the town of Letchworth and the company. First Garden City, Limited, was formed to provide a working model of Sir Ebenezer Howard's conception of a 'self-contained town in which overcrowding and unwholesome industrial conditions were to be avoided, and many of the advantages of life under rural conditions were to be ensured for the workers in industry.

The original plan ensured that development should proceed on coherent and far-sighted lines. To this day the most valuable site in the town, from the profit-earning point of view, awaits development. The estate comprises 4,710 acres, of which 3,010 acres are included in the agricultural belt which surrounds the 1,700 acres set aside for the town.

We let our first factory site in November, 1903. Today Letchworth can boast of some 60 large factories, besides many small workshops, covering heavy steel foundries, motor vehicles and motorised implements, furniture, water heaters, chains, presses, scientific instruments, farm and garden tools, printing machines, printers and bookbinders, parachutes, perambulators, calculating machines, corsets, embroidery, knitted goods, bacon, margarine, etc. Between them they find employment for some 11,000 workpeople, and as a result of the exceptional diversity of industrial activity the town has been practically immune from unemployment, even in times of depression. Letchworth is now two-thirds full; I foresee that very

shortly the problem may well be how to stop it growing too big.

The report and accounts were adopted.

FREE, RODWELL & CO., LIMITED

A SATISFACTORY YEAR'S TRADING

The sixty-first annual general meeting of Free, Rodwell & Co., Limited, was held on January 4th in London, Mr Eric C. Dawnay, TD (the chairman), presiding.

The chairman in his circulated statement paid a tribute to the services rendered to the company by the late chairman, Sir Cecil Rodwell.

The statement continued: I am pleased to be able to inform you that the company, and its subsidiary, has made a trading profit of £51,482 for the year under review, which is approximately £20,000 greater than in the previous year. The net profit of £31,000 is up by £15,283 on the preceding year. You will recollect that this is the first full financial year of your company in which its subsidiary, Maltings (Peterborough) Limited, has operated. That company made a profit of £2,900. I think that you will regard the past year's trading as satisfactory.

From a perusal of the consolidated balance sheet you will observe that the company's position remains strong, and that current assets at £717,847 exceed current liabilities of £548,767 by £169,080.

Your board recommends that a final dividend to holders of ordinary stock of 13 per cent, less tax, be declared and paid, making a total dividend for the year of 20 per cent, less tax.

Owing to the difficulties in foreseeing the profit which the company may make in a full year after only six months' trading, it is proposed, in future, to pay not more than a 5 per cent interim dividend, unless conditions make the payment of such a dividend of this amount imprudent.

The company's staff has worked well and loyally during the year, and it is my wish to record a tribute to their efficiency and efforts on behalf of your company.

The report was adopted.

HOULDER LINE LIMITED

FAVOURABLE TRADING RESULTS

The annual general meeting of Houlder Line Limited will be held on January 29th in London.

The following is an extract from the statement of the chairman, Mr Walter C. Warwick:

In my statement last year I referred to the substantial deterioration that had taken place in the general freight markets. Unfortunately this tendency has continued during 1953, as is indicated by the index figure for tramp freight rates which in January last was 79.3. Since that time this low figure has shown small fluctuations from month to month, the index figure for November being 73.8.

This decline both in freight rates and volume of tonnage is to a lesser extent affecting the liner companies and there seems little reason to expect any material improvement in general trading prospects in the near future.

Unless substantial relief of the taxation burden is afforded it is no exaggeration to say that it must spell the doom of British shipping as our rapidly diminishing capital resources render it impossible to face up to any substantial ship building programme in the future.

Having regard to the many difficult conditions we have had to face during 1953, shareholders will, no doubt, appreciate the favourable trading results that have nevertheless been achieved. We are well able to maintain our modest dividend distribution of 7½ per cent less tax, and the financial position continues sound and satisfactory.

There must have been much Victorian speculation as to where the arrow "FELL TO EARTH".

Woven Glass Fabric was not a shot in the dark. We realised that it had unique properties which would have a revolutionary effect on industrial production. Today its virtuosity is being proved by technicians and creative designers in many varied fields. Could it be the means of opening a new approach to your research and development?

THE UNIVERSITY OF MANCHESTER

SIMON FELLOWSHIPS

The University is offering one or more Simon Fellowships for advanced study or research in the Social Sciences, this term being construed in a wide sense. The Fellowships are tenable for one year with a possible extension to two years. Values within the range £700-£1,100 per annum (Simon Research Fellowship) or within the range £1,150-£1,500 per annum (Simon Senior Research Fellowships), according to qualifications and experience. They are open to members of the public services as well as to persons with academic experience. Applications should be sent not later than March 1, 1954, to the Registrar, the University, Manchester, 13, from whom further particulars may be obtained.

UNIVERSITY COLLEGE OF SWANSEA

Applications are invited for appointment to the Chair of Political Theory and Government. The appointment will date from October 1, 1954. Initial salary £1,700 per annum with superannuation and family allowances. Full particulars may be obtained from the Registrar, University College, Singleton Park, Swansea, to whom applications must be sent by Monday, February 15, 1954.

PRINCIPAL of large progressive London importers and merchants requires mature able man as personal staff officer. Good industrial or commercial experience essential. Work will be hard and interesting and post holds exceptional opportunities and will be well paid. Writers of good initial letters will receive *pro forma* application form.—Box 419.

MARKET RESEARCH.—British Nylon Spinners Limited require an Economist for an appointment in their Market Investigation Unit at Pontypool, to undertake statistical interpretations and preparation of forecasts, including the study of consumer habits. A good degree in Economics is essential and candidates must have a liking for analytical work. Some previous industrial experience would be an advantage. Apply to Personnel Manager, British Nylon Spinners Limited, Pontypool, Mon.

CANADA.—Englishman (42) seeks opening with prospects. Qualifications: Chartered Accountant; Bachelor of Laws (London); knowledge French, over 25 years' experience accountancy profession in England and as accountant and executive in commerce and insurance abroad. Available for interview in London during next two weeks, then Montreal.—Box 421.

The better life of Mrs. Jones

Mrs. Jones looks down the rows of bright, hygienically sealed tins and packets on the grocer's shelves. In a glance she sees what she wants, the names to ask for, and exactly what to expect from what she buys. Follow Mrs. Jones home. She has a vacuum cleaner, a washing machine, a modern cooker, perhaps a refrigerator. Her home is full of inventions to save her work.

Grandma Jones was confronted by sacks, tins, boxes of lones anonymous products exposed and manhandled at every stage from raw materials to final consumption.

Yes. House-keeping is far easier for Mrs. Jones than it was a generation or two ago. This is not merely a matter of higher incomes. All these good things of life have been made known to Mrs. Jones by advertising. It is advertising that creates mass demand and makes mass production with lower costs possible. Goods which without advertising could only be custom built for a wealthy few are now within the reach of millions. The superficial statement that advertising is an uncompensated cost which can only increase prices is far from true. Advertising means better goods for more people. And to touch on a deeper question, the stabilising effect of advertising on demand is a powerful influence against the sales depressions and consequent unemployment which are a constant danger in the trade cycle.

**Advertising means
better goods for more people**

High Stakes in Germany

NOTHING is certain about the conference that begins in Berlin ten days hence save that it will be hard to follow. Had the western governments stuck to their guns and not been distracted by Sir Winston Churchill's wish to reconnoitre the Soviet lines in person, the exchanges would have been about the unification of Germany in freedom. As it is, the way is open to discussing everything under the sun: the claims of China, the pooling of atomic materials, east-west trade, Mr Molotov's fears of America and America's fears of Mr Malenkov and rival plans for the organisation of Europe. It would be wise to reckon that talking may go on for three or four weeks without revealing whether any basis of agreement on Germany can be found. If the Russians have their way it will drag on much longer.

However that may be, the important thing for the western powers is that public opinion should keep its eye steadily on the ball marked "plans for German unity." Others will be kept in the air to confuse the mind; but this is the one to watch. If it falls to the ground that—so far as Europe is concerned—is the end of profitable discussion. Progress may be made in other directions: for example, there is every reason to encourage Soviet-American contacts on plans to pool atomic materials, and to encourage the discreet and courteous diplomatic methods by which progress has so far been made in this matter. Otherwise, the Berlin conference should be judged useful or futile, according to the progress that it achieves on the problem of Germany. And such a judgment will be difficult for ordinary people unless the issues involved are firmly kept in view.

The basic principle of the western governments is that Germany should be united in freedom by the methods of the free democracies. (The distinction between "free democracies" and "people's democracies" is one that the Russians will try hard to blur.) They therefore put first the establishment of conditions in the Soviet Zone that would enable 18 million Germans to vote secretly and without fear. In the opinion of politicians in western Germany, this would require at least six months of free contact between east Germans and west Germans and the dismantling of the police and party system in the east. Germans there must be convinced that there would be no reprisals against anti-Communist voters, and that—for example—house warders who spy on flat-dwellers would be removed. This seems to some people a lot to ask; but it is the minimum requirement for a truly representative all-German government.

After elections in these conditions—so runs the western case—the all-German government would take part in negotiations for a peace treaty with the four occupying powers. From the first the question would arise: what are the frontiers of the Germany with which peace is to be made? What is to be done about the Saar and the Oder-Neisse frontier with Poland? The Russians would be in a poor position to argue for the present eastern frontier and to ask for a

western guarantee of its permanence. For the freely elected all-German government would presumably contain hardly any Communists to support the abandonment of German territory.

The third main feature of the western case is that the new united Germany should be as free to join alliances, or to abandon sovereign rights together with other countries to a European organisation, as the Federal Republic would be under the Bonn Convention and the European Defence Community Treaty. It should be free to join France, Italy and the Low Countries in a European community, and to join the United States and Britain in an Atlantic community.

The Soviet conditions are, of course, quite contrary. Their purpose is different; their order of events for the unification of Germany is different; and the results of their application would be fundamentally and critically different. First and foremost Mr Molotov puts a peace treaty based on the Potsdam agreement of 1945, which would involve the western powers in confirming the Oder-Neisse line and the "neutralisation" of Germany. If they refused, then they would be represented as sacrificing the opportunity of agreement with Moscow to their desire to rearm the Germans as allies. Then a provisional government would be nominated, not elected, by the Grotewohl-Ulbricht clique in Eastern Germany working with West German politicians. These would not be the supporters of Dr Adenauer. Such a body would be unrepresentative, for events have shown how hollow is the claim of the Soviet Zone government to represent the 18 million East Germans, and how overwhelming is the majority of 50 million West Germans who support Dr Adenauer.

This "provisional government" would then prepare "free elections" and would give its views on the peace treaty agreed between the occupation powers. By various means these elections would be weighted in the Communists' favour; and, most important of all features in the Soviet plan, western troops would have had to withdraw from Germany while the Soviet troops made a short retreat across the Oder.

The purpose of all this has been made clear by a Soviet commentator in these words:

It is necessary to exclude any foreign interference in order to make the all-German election truly democratic. Elections are a purely German affair. Elections should be carried out with a view to eliminating any pressure on the electorate by the big monopolies. On the contrary, they should ensure freedom of action by all democratic organisations. The preparation and holding of these elections should be left to a provisional, all-German democratic government.

If Mr Molotov and his German allies had their way, the peace treaty would contain clauses prohibiting industrialists (that is to say, supporters of Dr Adenauer) "militarists," and "Hitlerites," from having any hand in the working of the new German state. Anyone propagating "anti-peace views"—that is to say, criticising Communism or the Soviet Union—would be

proscribed, whereas such so-called "democratic organisations" as the Communist-controlled Free German Youth and East German trade union headquarters would put up candidates. The "provisional government" would then draw up a constitution to be confirmed by the electors. The same Soviet commentator has made it clear that this would mean a root and branch revision of the present West German Constitution, which is denounced as "permeated by an undemocratic spirit" and as "consolidating the hegemony of monopoly capital and the Junkers who were the backbone of German militarism." Herr Selbmann, one of the East German Communist ministers, has exuberantly crossed the t's and dotted the i's of these pronouncements by declaring that the Red Flag must wave over Germany.

★

That, indeed, is the heart of the matter—what flag will wave over united Germany? A Soviet flag that already exists or a European flag that has yet to be created? That is really what the Berlin conference will be about. For it is obvious that a state set up according to Soviet ideas would be prohibited from joining the European Defence Community or Nato and would have to break from the coal-steel pool. True, it would have an army; the Russians have one ready in their zone, 75-85,000 strong, trained and controlled by Communists and collaborators. The presence of the Americans and the British would be deemed superfluous to safeguard the neutrality of a state protected by a Communist-controlled army.

That would be the end of the story: allied withdrawal and the gradual attraction of all Germany into the Soviet sphere. Some think this is an exaggeration; but the evidence for the conclusion in Soviet and East German sources is ample and candid. The Russians are struggling to win Germany; the Western ministers cannot allow them to succeed. If they stick firmly to their insistence on free elections they keep Mr Molotov in a position of embarrassing weakness. Almost certainly, he cannot accept the demand; but to refuse it is to expose him and his case before the eyes of all Germany. His line of escape is to demand that it should all be "left to the Germans"; so his allies in Eastern Germany have for weeks been searching frantically for West German politicians who will talk with their nominees—about almost anything. So far the effort has failed; but if Mr Eden and his colleagues falter, if public opinion behind them gets bored with the principle of "free elections first," then German collaboration will begin.

Why, it may be asked, should Germans not get together, as Mr Molotov is likely to suggest? Why not let Easterners and Westerners consult, to arrange elections and negotiate on technical matters including, as the Social Democrats have proposed, the vital matter of establishing a common currency between the two Ger-

manies? The question may well be heard from such quarters as the British Labour Party. The answer is two fold. First, such collaboration would hold up indefinitely and finally make impossible Western Germany's integration with the West; it would destroy the position of Dr Adenauer who opposes such methods even at the risk of appearing opposed to German unity.

Can Labour Face Itself?

THE mood of Parliament, when it reassembles on Tuesday, is easy to foresee. On both sides there is, below the surface, more apprehension than lust for party warfare. This year is likely to provide the decisive test of both parties in their present roles, of modern Conservatism in office and of the postwar Labour party in opposition. Since 1951 the Government has had too much good luck and the Labour party has been too turned in on itself, on its own doubts and disputes, for either to be fairly tested. For the Government, tougher times are now almost certainly at hand. As an environment for economic policies that can be at once successful and popular, even the mildest American recession would be distressing compared with the improving terms of trade, joined to continuing American prosperity, that have been enjoyed for the past two years. On the other side, the Opposition is now as united as it is ever likely to be. The policy approved at the Margate conference last year will have to serve, for good or for ill, as the basis of Labour's appeal to the country at the next general election.

The revised version of this "Challenge to Britain," now published, rounds off the process of rethinking and reshaping policy that began as long ago as 1948, when the Labour Government had already exhausted the impetus of the ideas of 1945. The outcome is bare in new ideas, but it reflects considerable ingenuity in embracing new compromises. The question that will now be tested in Parliament is whether the compromises are more than paper work, whether the party can make them in fact the guide lines of its actions in the day-to-day business of opposition. This is a matter more of spirit than of detailed prescription. The essence of the "Challenge to Britain" is that it proffers the country more from the same machine. It does not propose to change the machine; it does not express the revolutionary purpose that powered the Socialist movement in the days of discontent—the spirit that the movement's emotional conservatives, such as Mr Bevan, wish at all costs to sustain.

This is the fundamental sense in which the compromises of "Challenge to Britain" are far nearer to the Right than to the Left. The right-wingers are those who believe that the present apparatus of the mixed economy and the welfare state is adequate for the purposes of British socialism. They want to modify it a bit. They want to work the machine differently (but not all that differently) from the way the Tories work

Secondly, it would mean the gradual slipping of the links that bind Germany to America, Britain and France. For the idea would quickly spread that Germans could deal with Germans, outwit both the Russians and the Atlantic group, take up a middle position in Europe, and return to the dangerous and tragic path that they have followed for nearly a century.

it. They claim to be able to get more out of it—equal pay, bigger pensions, and so on. But that is all. They do not propose to nationalise more industries. They do not follow through the theory and emotions of socialist gradualism. That would require a further instalment of the measures of 1945, when the Labour party was able to be, briefly, all that it wished. With large changes in the ownership of industry and in the basic structure of the social services, Labour in 1945 felt itself to be the agent of a revolution without requiring its leaders to be even the mildest of revolutionaries.

The programme of action for the next Labour Government contains nothing of revolution. It is a large programme only in the social benefits—or bribes to voters—that it holds out. Unlike that of 1945, it is not a programme of change in the economic and industrial machine, or at least it proposes no changes that are both fundamental and definite. If the last Labour Government presided over a revolution by consent, the next will be—or will have got itself elected as being—mildly reformist. This is the fact but it is not the mood of politics in 1954. The Labour party has a divided view of the fact. The majority of the party wants a reformist policy; yet also loathes it and wishes it away.

★

Labour's electoral interest lies, plainly, in having its reformist moderation recognised and understood by the public at large and especially by marginal voters. But this external face on things conflicts utterly with the internal attitude that pays the policy-makers in dealing with their own followers. The emotions and idealisms of the Labour movement remain more revolutionary than reformist. Though the head thinks otherwise, the party's heart is still more in turning the boss out of the factory—in "taking over the levers of economic power," as the left-wingers see it—than in legislating for bigger pensions. In truth, Labour's declared policy is now to leave the economic structure of the country much as it is, but within the movement this is a disagreeable truth that few Labour politicians like to mention or perhaps even to admit to themselves.

The penalties of the divided attitude are plain. They have been demonstrated many times in the House of Commons during the past two years. The party's negative criticism is divorced from its positive policy. The passions that good sense submerges, in a document

like "Challenge to Britain," are allowed all the more to sway party meetings and parliamentary debates. The party whose colonial policy the Conservatives have taken over tries nevertheless to criticise that policy as if the Conservatives were repressive monsters. The party that proposes to leave almost all industry in private hands nevertheless talks in Parliament as if all dividends represented the blood-sucking machinations of private monopoly capitalism. And so on. It may promise to follow its right-wing leaders in office, but the Labour party cannot consistently repress its left-wing feelings in opposition. Much of the time it would like to talk as if the Tories were reactionaries and it was itself revolutionary. Since in practice that would be too silly, Labour in opposition generally succeeds in being neither reformist nor revolutionary but more often irresponsible and incoherent.

★

This has been the painful experience of the past two years. The question is whether any improvement can now be hoped for. The Bevanite quarrel is at last subdued and the right-wing's reformist policy is definite and accepted. Perhaps more important, the party's policy-makers must now be beginning to count the cost of the bigger pensions, free doctors' prescriptions, more education and the like to which

Made in Sheffield

BY A SPECIAL CORRESPONDENT

BY all the laws of geography and economics, Sheffield—the fifth city in England and producer of half of the total value of Britain's steel—ought not to exist at all. Nature can rarely have designed a moorland valley less promising for industrial development than the nook in the Pennine hills where Sheffield has grown. It has never been a market centre; it lies, almost surrounded by bare uplands, on the route to nowhere. True, it had water power, iron ore and millstone grit which enabled it to grind knives long before the mechanical age; and later the existence of local coal helped it to hold its own throughout the vicissitudes of the nineteenth century. But these natural endowments are almost commonplace in the north of England, and in other areas one need not burrow through the Pennines to reach them.

Sheffield's trump card has been a social asset rather than a natural one. It is the local skill in handling metals that has always kept Sheffield just one jump ahead of its rivals. The city's leading industries at the present time—steel and engineering, cutlery and

that policy has committed them. The answer is probably more than £300 million a year, and within the lifetime of the next British Government the annual cost of the existing social services will also rise by some £250 million because there will be more old people and more children of school age. Together, these are formidable extra demands on the British economy. The Labour party no longer pretends to have any miracle-working devices of nationalisation or the like that would enable the country readily to enjoy such benefits. They have to be got, according to Labour's own policy statement, out of the economy as it is—in essentials—and in the teeth of very difficult external circumstances. Labour's ability to keep its promises plainly depends on its ability to make that economy work better. And, equally plainly, this will not be achieved by men who behave in opposition as if they wanted to put every existing policy in reverse.

In its great days, in the triumph of 1945, the British Labour party claimed to be facing the future. The political need of 1954 is that it should face itself, that it should admit the truth about itself. The policy on which it now stands before the country is one of making relatively few changes, and the convincing technique of opposition is therefore not a broad but a narrow-fronted attack. Labour is entitled to question the present Government's understanding and administration, not its motives or most of its principles. In that way, and that way only, Mr Attlee and his colleagues could rehabilitate British politics and themselves.

silverware—seem to be located in Sheffield for one reason only: they are all highly skilled manufactures in which the things that Sheffield men can do to the raw material make it worth while carrying that material half across England to do it.

The city has inherited a great tradition; the label "Sheffield Made" has great selling power. But in a competitive world no city can live on its reputation alone, without earning it afresh year by year. Up to date, Sheffield has succeeded in doing this. "Make a better mousetrap," said Emerson, "and the world will make a beaten path to your door." For two centuries Sheffield has been making a succession of better and better mousetraps, and sure enough the path has been beaten to its door. The railway companies were compelled to tunnel under the Pennines and lay difficult routes up the steep valleys specially to link London and Manchester by main line to a city that grew so obstinately out of the way; and today the city's importance is taken completely for granted by people who never realise what a minor miracle its mere survival

implies. But the rest of the country might probe that miracle to its advantage.

Although famous for its cutlery, Sheffield is really dominated by steel making and engineering. It has had to fight to retain and develop these industries ever since Bessemer's invention shifted cheap steel-making from the coalfields to the ports and Thomas's invention shifted it again to the phosphoric orefields of Lincolnshire and Northampton. It has won through partly by the location of open hearth steel plant close to an engineering market which in turn gives it back scrap; and partly by a specialisation on alloy and high-grade steels that it regards as normal and its rivals regard as odd. "The stuff other places turn out" says Sheffield, "isn't real steel; it's just iron with a handful of carbon thrown in." And South Wales dismisses Sheffield with "Not real steel-makers like us; they just fiddle around with little bits of fancy stuff."

Wartime expansion in this kind of specialised steel-making was very great, so Sheffield has little share in the current programme to extend Britain's total steel capacity. But earlier misgivings about possible over-expansion appear to be quite forgotten. Little of Sheffield's steel goes abroad in the raw state; nearly all of it goes to engineering firms, where it is incorporated, in smaller or large quantities, into every variety of product from safety razor blades to marine propeller-shafts. This means that its ultimate market is impossible to analyse, and in particular it is the merest guesswork how much Sheffield's sales depend, at second or third or fourth hand, on exports or on rearmament. But clearly, in both cases, the answer must be a great deal. The future of special and alloy steels, therefore, depends to a disturbing extent on factors outside the industry's control, and this has flung into Sheffield's face the familiar challenge to innovate or die. Hence, for example, the ever increasing sums spent on research and the determined efforts to make fine springs that can challenge the old Swiss-Swedish monopoly in the British watch and instrument market.

★

The centre of gravity of Sheffield's economy, in terms of employment and output, lies in its vast number of engineering works, which make everything from giant marine machinery, guns and crankshafts to dentist's files and the proverbial pin-head. Their organisation, their problems and prospects, are bound up with those of steel-making at one extreme and of the cutlery and handtool trades at the other. Cutlery is the city's oldest and best known industry. In this town it means not only knives and forks, but scissors, saws and scalpels and endless other implements. Before the war, about one third of Sheffield cutlery went abroad, mostly to the British dominions and colonies; now foreign sales are nearly two thirds, a reflection of purchase tax at home and a postwar boom in markets abroad. But the foreign market is getting tougher, and herein lies the second challenge to Sheffield's prosperity. Quality

goods, which are the mainstay of cutlery exports, continue to find markets, but in small batches of "exclusive" lines and only at a cost in salesmanship, display-packaging and advertising that was undreamed of a few years ago. Sheffield's answer must lie in "new ideas, specialities, trying this here and that there and being ready to scrap what doesn't go and try something else"; the words are those of a cutlery manufacturer whose own chief success has been in exporting Victorian-style table ware, made up in sets suitable to American eating habits.

★

Good cutlery manufacture has always involved a multiplicity of separate processes and skilled handwork, a state of affairs leading naturally to a proliferation of small units, outworkers and small masters, with all that that means in under-employment, low earnings and out-of-date methods. Here again the bewildered economist who visits Sheffield is on familiar ground, with something to complain about but no clear idea of how to put it right. Easy talk about standardisation and production flow is meaningless to a firm that lives by snatching orders for an exclusive batch of serrated steak-knives for Minnesota or of pearl-finished pocket knives for the East Indies. Exhortations to imitate the Swedes or the Germans, who are investing fabulous sums in new plant, draw hopeless shrugs from the owner of a small family business with a long history but a short bank balance. Co-operation either in production or selling seems to be almost unthinkable between these Yorkshire individualists, whose designs and techniques are so competitive. The casual observer can easily be persuaded that the industry has no future worth the name; and cutlery, silver plate and hand tool makers are disturbingly willing to pause in the middle of still-booming business to agree with him. But, tucked away in back rooms or little side streets, these Jeremiahs are developing on the quiet some revolutionary techniques. The future, though puzzling, may not after all be darker than it seemed to be in 1913, when Brearley, right here under their noses, invented stainless steel, the stuff that seemed as if it would make cutlery last for ever.

There is nothing showy about Sheffield. Unlike the typical mercantile city, it has no fine public buildings, no great tradition in art or music. Leeds, its jealous rival, wears a dignified, metropolitan air by comparison. Sheffield, under its pall of smoke, has no true city centre, its warren of hilly streets shows no discernible civic pride, and its Corporation has not even managed to make a worthy collection of Old Sheffield Plate before the last beautiful pieces vanish from the antique market. If the city has a heart, it lies in the Public Library, whose importance as a focus of interest and enlightenment is quite unusual even in the north. Between its seven river valleys high stony spines run right into the heart of the town, offering little foothold for building and crowding both factories and working-

class houses into shocking congestion in the valley bottoms. There is room for a British Corbusier to make his name in Sheffield; and a bold city council, which envisages the possibility of building fourteen-storey blocks of flats in the very heart of the city on these commanding sites, would dearly like to find one.

But in two most enviable respects Sheffield is unique among British cities. The first is the beauty of its natural setting among the hills. It is "a dark picture in a golden frame"; the clamour, congestion and dirt where its people work strike a startling contrast with the finest scenery in England where they spend their evenings and week-ends. There are considerable

Dealing with China

AS the foreign ministers prepare to come together in Europe, the Far East seems relatively quiescent. But this appearance could hardly be more misleading. In fact, the Far Eastern tensions are much the tighter: in Indo-China the only open war in the world is still being fought, and in Korea two great armies, totalling a million and a half armed men, still glower at one another across a tenuous dividing line. The undeclared war of 1950 has not yet been closed by anything resembling a peace settlement, not even by the kind of makeshift settlement that has held for the past few years in Europe. Even if the crisis that threatens next week, when the time limit for detaining prisoners is reached, can be successfully overcome, the Korean situation will remain ugly. And the problem of Korea obstructs the settlement of the whole nexus of other Far Eastern problems: not only those familiar Chinese puzzles, Formosa, trade, and the UN seat, but also the security and stability of Japan, Hongkong, and all South-East and Southern Asia, including India.

As matters now stand, three different debates on Korea and its context are in prospect. The Russians have served notice that they will raise at Berlin the question of Communist China's right to join the other four powers in council; merely to refute this claim will involve the West in a restatement of positions on Korea. The Indians have called for a special meeting of the UN Assembly; this, they apparently hope, will at least free India of its responsibility towards the prisoners. Meanwhile, the allied nations that fought in Korea still seek to bring into being the political conference envisaged in the armistice terms of last July.

For this meeting the Communists have shown no enthusiasm. They could have had a Korean conference, on the lines set out in the armistice terms, as long ago as last October. They have preferred to block all progress by insisting on conditions that they already knew to be unacceptable to the UN side. They have not been budged from their stonewalling attitude even by

grouse moors and no less than fifty-two farms actually within the city boundary, and the playground of the Peak District lies at its doorstep. The second unexpected attraction of Sheffield is the indefinable air of romance that haunts the ugly, smoky streets. This is partly the effect of the dramatic glare of furnaces against the night sky; and partly of the names of its great workshops—Firth, John Brown, English Steel and the rest—names that have made history and are making it today. But most of all there is the throbbing realisation that this is a community devoted to making important things, and making them in an inventive and exciting way.

the exigencies of the agreed timetable, which required the conference to come into being before Christmas if it was to take up the matter of the prisoners. They have treated the UN Assembly with contempt; they have met UN restraint with insults, and UN concessions with intransigence. In sum, while repeatedly claiming, as Chou En-lai did last week, that their most urgent wish was a Korean conference, they have behaved as if it was the last thing they wanted.

Why, indeed, should they want it? It is hard to see what they could hope to gain at such a conference. A united, Communist Korea would not be granted them; a divided Korea they already have. Now that the economic strain of supplying a fighting front, and keeping North Korea afloat under a hail of bombs, has been lifted from China's shoulders, the Peking government probably finds it convenient to keep its toughest troops and most successful generals away from home. There is thus no reason to suppose that Peking would welcome a settlement that obliged it to withdraw its armies from North Korea, where a rising against the enfeebled Kim Il Sung regime might follow.

Vastly more attractive, from the Communist viewpoint, is the idea of China's participation in a global Big Five conference. This would, indeed, kill a number of highly desirable birds at one fling. It would force the United States and France to recognise Mao's government. After that, possession of the veto-wielding seat at Uno would surely follow; and Peking would doubtless take the first opportunity of branding Chiang Kai-shek as a rebel and demanding that Uno should forbid any member power to help him. A Big Five meeting would, moreover, acknowledge China not only as one of the Great Powers but also as the one and only great Asian power—and hence the natural father of the family for which India can, apparently, provide nothing stronger than maternal benevolence.

Mere attendance at a five-power conference would, therefore, set the Peking government a long way on the road to its essential objectives, objectives to which the fate of Korea is irrelevant. But five-power talks would also have an important negative quality for China. The kind of global ding-dong that Malenkov and Mao seem to have in mind would provide the Communists with ample room to swing all their pet weapons—vague but attractive slogans, obsessive repetitions of old accusations, and so on—without any risk that they would have to take on binding commitments. It is not difficult to foresee that China, at the end of any such conference, would still have forces in Korea without giving definite undertakings about South East Asia or Japan.

Nevertheless, it is persistently argued in many quarters that the western powers have a moral and juridical duty to accept China as one of the inner council of five, and that common sense also dictates this course. But these arguments will not hold water in present circumstances. Peking's juridical claim to the privileges assigned to China in the UN Charter is overridden, for the time being, by the simple fact that it has been declared an aggressor by the UN Assembly and has not yet yielded up its booty. Its moral claims meet the same obstacle. As to common sense, a settlement with the new China must indeed be reached before a settle-

ment of the Far East as a whole can be remotely possible. Lately, the free nations' views on this matter have come appreciably closer together, although Sir Gladwyn Jebb's references to it on Wednesday seemed conspicuously ill-timed to encourage this unity. But it is not yet fully grasped that such a settlement can be reached only by hard bargaining. If the Peking government is handed all it wants on a plate what inducement can thereafter be offered to make it respect its neighbours' privacy?

To speak of hard bargaining is not to rattle a sabre. Since the armistice, the UN side in Korea has given sure proofs that it has no intention of reopening the war. Not only have the Americans curbed the restive Mr Rhee; they have also publicly announced a reduction of their forces in Korea. This is exactly the opposite of what an intending attacker would do. Bargaining, on the other hand, calls for both restraint and firmness. If lasting peace is to be brought to the Far East, the free nations will have to match the almost limitless stubbornness of the Communists with an equally inexhaustible patience. To shift the debate, out of sheer impatience, from the apparently sterile Korean talks to a five-power "talkathon" would be a disastrous move.

Notes of the Week

Aiding Parliament's Digestion

WHEN Parliament reassembles next Tuesday Ministers will have to keep their Bills moving briskly through the machine if they are to avoid congestion later. The programme for the session, on which a good start was made before Christmas, is the most ambitious yet attempted by the present Government—as ambitious, perhaps, as some Governments might care to risk with far larger majorities. Of the Bills already launched those dealing with rents and with safety regulations in mines and quarries are of great complexity, while the proposals for leasehold reform will give the lawyers many happy hours. There are, however, at least three more substantial Bills still to be published, covering the new organisation for atomic energy, commercial television and town and country planning.

Irrespective of the degree of controversy involved, here are at least six Bills, not to mention two Scottish equivalents, which will require much detailed study by Parliament. Since financial business will demand increasing

attention from now on, the Government cannot hope to complete the programme by the end of July without making fuller use than hitherto of standing committees. It has been understandably loth to use this procedure, especially for controversial measures. Since these committees (normally of 50 MPs) must exactly reflect the party strengths in the full House, the Government's majority in them can only be one, and this can be wiped out by sudden illness. But no vote in standing committee is final; it can always be reversed during the report stage on the floor of the House.

Wisely, if belatedly, therefore, the Government has now taken the plunge; and the Rents and Repairs Bill—controversial, in all conscience—is to go to standing committee. Presumably the even more complex, if less controversial, Mines and Quarries Bill will follow it. Both measures should be ready for committee by the end of next week. The Rents Bill has received a second reading and the money resolution, which has had to be discussed with the local authorities, will come before the House next Wednesday. The second reading of the Mines Bill will be taken on Thursday and Friday. With these measures shunted out

of the chamber MPs will be left a little freer to debate the non-legislative problems that are bound to arise—economic, industrial, diplomatic and colonial. As so often, however, one very delicate matter is apparently to be left to the House of Lords; a discussion has been arranged there for next month on the increase in cases of homosexuality.

Mr Eden Broadcasts

THE broadcast talk on international affairs given by Mr Eden on Monday evening was a victim of the rather shabby Fleet Street convention that what has been heard on the wireless need not be prominent in the headlines. It is, therefore, worth recording three highly important points that he made. First, he insisted on the value of Nato as a deterrent to aggression. "Whatever happens," he said, "we cannot give up this alliance, which is the foundation of our safety and threatens no one." The Foreign Secretary referred also—which is unusual among ministers—to Nato's "immeasurable possibilities for future peaceful development between the Atlantic countries."

Then Mr Eden insisted that if Germany is to be united "the first essential is free elections throughout the country. That is a position we can never abandon." (Why this apparently formal point is of such vital importance is examined in a leading article in this issue.) He added that the Russians might ask for guarantees of their security against a united and revived Germany, above and beyond the treaties that already exist; if so, said Mr Eden, "we are quite prepared to examine new ways of removing their fears." This might be described as the Churchill cadenza in the Berlin concerto. Finally, the Foreign Secretary appealed for a spirit of compromise in Berlin on both sides, while admitting that it is extremely difficult to know just how much time to allow for the spirit to show itself. He observed, quite rightly, that if negotiation shows that Mr Molotov's instructions permit no compromise time is against us. That is to say, projects vital to the security of the West—like the European Defence Community—are held up.

It was a good and firm speech rather than a talk to a mass audience at a peak hour. Ministers and their advisers still give insufficient attention to the technique of popular presentation; and it is time that television as well as sound broadcasting should be used for important occasions. To see a statesman on the eve of an important mission is as important as hearing him; and Mr Eden has been too long out of the public eye.

Reluctant Guerillas

MOST of Mr Frank Foulkes's guerillas have been obeying orders and striking as and when instructed. They may not have done so with the enthusiasm that their Communist leaders would have wished them to display, but

it would be absurd to assert that the strike, as a strike, has been a failure. It would, however, be equally absurd to say that it has yet done much to make the workers' wage claim a success. The absence for a day from construction sites of a maximum of 2,000 contracting electricians does not spell ruin for anyone; this week's antics have not noticeably impeded the national investment programme, the development of atomic energy, the generation of electric power or even the transmission of television programmes from the Lime Grove studios at Shepherd's Bush. The employers have therefore been far less deeply impressed than Mr Foulkes and his lieutenants had expected, and the few contractors who were directly affected were wise to refrain from the lock-out reprisals that they had said they were going to take.

On the other hand, the strike has had some side effects that ought, to say the least, to make the leaders of the Electrical Trades Union pause to think. Whatever Mr Stevens, the union's general secretary, may say, there is no doubt that many members of his union were reluctant to obey his orders. At Scunthorpe last week a majority of the electricians concerned were apparently anxious to remain at work. Asked to explain this, in London a week ago, Mr Foulkes at first denied that anyone at Scunthorpe had been asked to strike this week. His next public appearance, oddly enough, was at Scunthorpe, where he finally persuaded his errant followers to cease work on Tuesday at one construction site and on Wednesday at another. He exercised his persuasive gifts behind locked doors, so that no one can say for certain how the trick was done. But Mr Foulkes must now know, even if he did not know before, that there is a limit to the intransigence that can be infused into people who earn good money working for a good employer.

Engineers and Overtime

THE engineers' wage dispute has now been transferred to the calm, judicial atmosphere of the College of Preceptors in Bloomsbury. The Confederation of Shipbuilding and Engineering Unions has postponed its threatened ban on overtime and piecework and has joined instead in reasoned argument with the employers, represented by Mr Macarty of the Engineering and Allied Employers' National Federation. One of the main features of the argument is that the unions' spokesman, Mr Brotherton, objects to the emphasis that Mr Macarty is laying on the engineers' earnings instead of on their basic wage rates. Mr Brotherton said that it was wrong to suggest that because earnings, which include overtime, have risen, the engineers do not deserve a rise in wages. Although this would, in any event, be an obvious tactic for the unions to adopt, it is a tactic rooted in a genuine feeling along the work benches; ever since the engineers won for themselves the right to work no more than eight hours a day they have been jealous in their insistence that overtime should be treated as the workers' concession to the employers.

This is likely to be a crucial disagreement not only in this enquiry, but in many other industrial disputes now coming up to the boil. Since 1938, wage rates in industry as a whole have kept in remarkably even step with the cost

of living; in fact in 1953 average wage rates seem to have been about 129 per cent above the 1938 level and average consumer prices 128 per cent above it. But in these fifteen years weekly earnings rose by some 200 per cent, while gross dividends rose by only between 40 and 50 per cent. Gross profits, as defined for tax purposes, rose most sharply of all up to 1951; since 1951 they have been falling, although they are probably still between 225 and 250 per cent above the 1938 level. When allowance is made for the greater increases in prices of raw materials and of capital equipment than in those of consumer goods, however, real gross profits have almost certainly fallen behind real earnings in the race. At the engineers' court of inquiry this week the chairman, Lord Justice Morris, asked both sides whether, as a general principle, they thought that there should be any direct relationship between wages and profits. Anybody who attempts to answer this question should define very carefully what "profits" are.

Italy Drifts Towards Anarchy

THE Italian political crisis has become one of the blackest spots on the European scene. Its implications are worse than those of the perennial trouble in Paris because the Italian Communist party is larger than the French and appears to be gaining ground, and because the extreme Right is not held back by the tradition of moderation which prevails in France. Hence the chances of the Italian centre being crushed by its upper and nether millstones are now more immediate and dangerous than those threatening the group of deputies who keep reshuffling themselves in Paris.

At the time of writing Signor Fanfani, the most prominent leader of the left wing of the Christian Democrats, has been asked to try to form a government. This is a logical first step, since it was the left wing of Signor Pella's government that brought him down, by rejecting what it regarded as his drift to the right and his increasing dependence on the Monarchists. If Signor Fanfani fails, it is hard to see where President Einaudi is to look for his next potential premier, except presumably even further to the right than the point that Signor Pella had reached when he resigned. This would certainly fan the flames of industrial unrest on which the Communists have already been blowing with success. If Signor Fanfani succeeds, he can hardly expect to do more than conduct another tight-rope act. And it is hardly likely to last long, unless he can rally the support of all the Republicans, Liberals and right-wing Socialists as well as the right of his own party, the Christian Democrats—a task in which both Signor De Gasperi and Signor Pella failed.

The elections last June, as was foreseen at the time, produced a result that has left Italy practically ungovernable by normal parliamentary compromise. There can be no question of accepting the recently completed recount of votes, which gives the centre coalition—after all—the crucial margin of extra seats it needed for a majority. To do so would be legal, but the Left would turn the country upside down rather than accept it now. Hence, the call for new elections may grow. If Italy has no alternative but to run for the second time within twelve months the risk of left-wing gains, the sooner it does so the better.

Russians to the Polls

IT has been announced this week that Soviet citizens will go to the polls in March to elect new deputies for their parliament or Supreme Soviet. In Stalin's time parliament was a mere puppet institution, registering and fulfilling orders from above, and it is unlikely to acquire any real power in the near future. Hence little importance would normally be attached to the routine renewal of its membership after the constitutional four years' term of office. In the present state of complete uncertainty about Soviet intentions and the balance of power in the Kremlin, however, selections or omissions, breaches of the established ceremonial and the electoral campaign itself may provide significant clues to political conditions.

The general pattern is well defined, and usually there is little room for surprises. In the selection of the 700 deputies to the Soviet of the Union (1 for 300,000 citizens) and of about as many to the Soviet of Nationalities, little is left to the whim of the electors. Over 95 per cent of them go to the polls, but there are no candidates to choose from. There is only one list of official party candidates or "non-party" candidates who had received official blessing. Shock-workers, heroes of labour, local officials get their share of seats; but a sufficient number is scrupulously kept for all the important personalities of the regime. It will be interesting to see whether any now fall by the wayside. Even the attribution of constituencies is significant, since hitherto there has been a hierarchy of electoral districts with Stalin's own at the very top. The electoral platform has also been used for important political speeches. Yet the use of the limelight may prove most interesting. Will it be concentrated "collectively" on a dozen rulers or on one person?

There has been no attempt as yet to restore the "cult of the individual." True, Malenkov, Khrushchev and Molotov appear more equal than the others, but neither has yet made an open attempt to gain supremacy. Only last week the Czechs took note of Malenkov's birthday, but without undue pomp. The Rumanians apparently received last-minute orders to cancel any special programmes. Probably there is a tacit agreement among the leaders not to resurrect the nauseating Stalinist rituals. But will the agreement last?

Lord Simon

COMPARATIVELY few great lawyers can become great statesmen unless they are allowed to act at unhurried moments of world history; America has perhaps suffered more consistently from this than Britain has done. But Lord Simon, who died this week at the age of 80, was a tragic British case in point. Like so many lawyers in politics his actions were guided by two or three major emotions (which are often the same things as principles), but on everything that did not conflict with these he was more than ready to search for the other person's point of view.

He was therefore precisely the wrong man to be Foreign Secretary between 1931 and 1935. His guiding principles were respect for freedom of the individual and a hatred of war (partly because it was bound to lead to long-term interference with freedom); these led him to resign from Mr Asquith's Government in 1916 rather than agree to conscription, and later—in the MacDonald era—they impeded him from taking decisive action at the Foreign Office while the spark of Japanese aggression and the pale flame of Hitlerism grew to the fires that were to consume Europe and Asia. When he moved to the Exchequer he was less obviously adrift; but he had not the economic understanding to initiate a strong policy, and—unlike that other logical lawyer, Sir Stafford Cripps—he could not be a Keynesian because his advisers were not trained to submit Keynesian briefs (which he might well have understood). If war had not broken out in 1939, he would presumably have succeeded Mr Chamberlain as Prime Minister in the early forties; he would have been an able one in any period of normalcy, but his brand of normalcy had disappeared some time between 1913 and 1931.

Because free trade was not one of his immutable principles, he is sometimes regarded as the assassin of the Liberal Party; in fact, however, the Liberal Party declined because the wing that could have been most progressive clung to the one principle that was most outdated, while those that were wise enough to compromise with this principle were usually weak enough to compromise with other forces beside. In each field, therefore—as an international statesman, as a party man, and as a leader of opinion—Lord Simon had a great enough intellect to be a great failure; and therein lies the tragedy of 1931-35.

Local Democracy in Action

THE referendum has never occupied more than a marginal place in British political practice, but it has served to harass local authorities who promote Parliamentary Bills. Under present procedure the local council must first submit its proposed legislation to a town meeting, and any clause that is voted down can be referred to a poll of the local electorate. In theory, this procedure is eminently democratic, besides giving the council two chances to convince the citizens of the wisdom of its proposals. In practice, it has run up on an obvious shoal: very few people bother to turn up to vote, and those who do usually vote "no."

The recent vicissitudes of the Birmingham Corporation

THE ECONOMIST, JANUARY 16, 1954

Bill will strengthen the case for a revision of this procedure. The town meeting which rejected parts of the Bill was reasonably well attended; there were about 1,800 people there, compared with 20 in a recent town meeting at Liverpool. In the subsequent referendum nearly 30,000 people voted, but this was still only 3.8 per cent of the electorate. The voters turned down five of the six clauses under consideration, and conceded approval only to a proposal to restrict the use of loudspeakers in the streets. Thus Birmingham has lost some important parts of its Bill, including the controversial clause that would have given the council a limited control over the letting of rent-controlled houses, but also including some about which controversy seemed rather factious. The poll was exorbitantly expensive. It cost nearly £8 to open a single polling station, and some ballot boxes contained only two votes; the average cost to the council of each vote cast was about 2s. 9d.

A number of useful local measures have been lost in this way through the opposition of very small and unrepresentative groups. But it does not follow that the procedure should be condemned for this reason. British political institutions require very little—perhaps too little—attention or effort on the part of the ordinary citizen. In the United States, for instance, state and local referenda are numerous and attract relatively high polls; admittedly, even there, those who turn up often vote no. But British local authorities are meant to be primarily administrative, not legislative, bodies. To make it too easy for them to introduce legislation might be to open a dangerous road to administrative interference with personal freedom. Before abolishing the town meeting and the town poll, it would be well to see if they cannot be made more effective.

Watching the American Spad

THE Kremlin is now watching the American economic scene with great care and mixed feelings. Soviet economists are apparently no longer convinced that the United States will this year be in the throes of a grave depression. Writing in *Pravda* a few months ago the veteran Soviet economist, Professor Varga, argued that the American economy was on the eve of "the crisis." But another Soviet observer, writing in a more recent issue of *Voprosy Ekonomii*, the monthly published under the auspices of the Academy of Sciences, says more cautiously:

Today it is still difficult to determine whether the drop in the industrial production of the United States marks the beginning of an economic crisis, or whether it is just one of those fluctuations from which the capitalist economy suffers in the intervals between crises.

This cautious line now prevails in most comments on the vagaries of American industrial behaviour. The Russians have a word for a slump, which means "crisis," and they use it to describe the state of agriculture in the United States. They also have a word for recession. Yet in their almost daily references to American industry Soviet commentators use neither but prefer the non-committal word *spad*—a fall or drop. They clearly do not want to run the risk of offering the wrong diagnosis on an issue so important to the framing of Soviet policy. It is something gained that a *spad* is called a *spad*.

THE ECONOMIST, JANUARY 16, 1954

Cloak and Dagger

IT is not always easy to grasp what is meant by "tension" between governments. It is clearly something less than imminent danger of war, but it is also something more than the suspicious co-existence of rivals; and a distinction has to be drawn between tension likely to cause world conflict and tension likely to cause only local fighting. There is tension in Kashmir, on the Israeli-Jordan border, in and around Trieste, in Siam; but it is less serious than tension in Berlin, in Korea and on the Chinese border with Indo-China. What exactly is the difference?

Serious tension exists where official representatives or unofficial agents of great powers are liable to take action that will make patience snap and judgment falter. It is most dangerous where their forces are in direct contact. The East German Vice-Premier, Nuschke, told a press conference in Berlin on Monday that "world war" would have resulted if the anti-Communist revolt of June 17th in the Soviet zone had succeeded in arresting the East German government. He stated that Marshal Bulganin, the Soviet War Minister, and Marshal Sokolovsky, his deputy, had said as much to him during a recent visit to Moscow. That Nuschke should have been put up to make such a grave statement at this moment is a sign that the Russians intend to use the Berlin conference as an occasion for demanding a ban on cold war.

The demand is loudly and frequently made in Soviet and satellite newspapers and broadcasts that the operations of "American espionage centres" in West Berlin should be checked. They seem to inspire fear greater than the activity, perhaps, justifies. Yet it would be unwise to ignore the possibility that those in Moscow who arrested and prosecuted Beria genuinely believe that there was some long-standing link between his police organisation and western agencies, and that conspiracy in Western Europe and conspiracy in the Soviet Union are connected. If this is so, the implications are disturbing. There is a strong case for using against the Communists their own weapons of conspiracy and agitation. (Did not the East German government call on West Germans to rise and overthrow Dr Adenauer?) But there is an even stronger case against allowing secret, and therefore partly independent, organisations (some of them German) to do what they think fit regardless of agreed western policies. They need the most scrupulous control by responsible authorities if they are to be an asset rather than a liability in negotiating with the pioneers of the cold war.

Malta's Coalition

THE new Maltese Government, the composition of which was announced this week, will again consist of a coalition between Dr Olivier's Nationalist Party (which won 18 seats in the general election just before Christmas, compared with 15 seats in the election in 1951) and Dr Boffa's Workers' Party (which won only three seats, compared with seven in 1951). The opposition will contain only the Labour Party, which has increased its representation from

14 seats to 19; the Constitutional Party, which won four seats in 1951, has been wholly eliminated, despite its hold on the press.

Dr Olivier, who is again to be Prime Minister, started the present constitutional wrangle soon after the Coronation by presenting a memorandum to the Colonial Secretary, in which he demanded that Maltese affairs should be transferred from the Colonial Office to the Commonwealth Relations Office. During the elections he went on record as objecting to Mr Lyttelton's counter proposals that Malta should come under the Home Office, on the grounds that these do not go far enough; and he may find it difficult (even if he wants to) to go back on a public judgment forced from him in the heat of the day. On the other hand, Dr Boffa's Workers' Party, which still holds the balance of power even though it has become a rather more junior partner, has said that it will be satisfied if Malta's affairs come within the purview of either the Home Office or the Commonwealth Relations Office. It is to be hoped that this more flexible view will gain the day. The opposition wants an even closer link with Britain, and has suggested that Maltese representatives should be elected to Westminster on the analogy of the French metropolitan colonies. This idea is inapposite; but the new government would be foolish to ignore the wishes of so many fellow countrymen for a close British connection, and it may therefore conclude that it is in no position to reject Mr Lyttelton's offer out of hand.

London in East Anglia

THE London County Council's schemes for disposing of the surplus population on its housing list are becoming bolder and stranger. It is at present negotiating about possible joint housing schemes with eleven towns, of which all but one are more than 40 miles from London. Some of these towns are railway junctions—such as Swindon, Ashford, Bletchley, and Grantham—where the prospects of industrial development to provide work for the incoming Londoners are reasonably good. But negotia-

tions are also in progress with small and remote towns in East Anglia, such as Thetford, Sudbury, Haverhill and Bury St. Edmunds.

The LCC is willing to discuss the possibilities of joint development with any provincial town that is interested in the idea. The ancient wool towns of East Anglia—whose population is static or declining and trade stagnant

—can discern benefits as well as drawbacks in a wholesale influx of Londoners; and they have been among the first

to rise to the bait. Moreover, the usual opposition from farmers to schemes of development (which has already caused trouble at Swindon) is less marked in the Brickland where soils are poor.

Londoners may find themselves travelling yet farther afield. The latest town to respond to the LCC's open invitation is Nantwich in Cheshire, more than 150 miles from London. The local council is willing to accommodate up to 6,000 Londoners, who would be drawn from those on the LCC list who are willing to live anywhere. Since there are good local facilities and also a local shortage of labour, this particular scheme appears to be economically sound. But the dangers of letting the vagaries of local politics decide which towns shall or shall not be expanded—perhaps sometimes with too hopeful an assessment of the scope for industrial development, or too philistine a disregard of the destruction of old-world character and the social transformation entailed—will need to be carefully watched.

Sinews for the Arab League?

THE Arab League Council, now meeting in Cairo, is dominated by two popular beliefs. One is that neutrality can be afforded by states that are militarily weak but rich and covetable. The other is that to admit foreign bases is to invite rather than discourage attack. Not all the Arab states advance these views with equal vigour; Iraq, Saudi Arabia and Lebanon are less sure than Egypt about the advantages of having no outside allies. But once the two notions are wrapped in the warm and familiar folds of Arab solidarity, they lead without a tremor of doubt to the conclusion that the more closely a league huddles together, the greater its chances of neutrality. So the air is full of new but vague statements on the virtues of "complete unity."

The nearest to concrete proposals are those advanced, in private talk with other delegations, by Iraq's prime minister, Dr Fadhil Jamali, who wants to have common representation abroad, and to unify ministries of defence, education, foreign affairs, and even finance. If unification is not possible all at once, he adds, let two or more states point the way. Hitherto, grave objections have been raised whenever any such partial federation has been proposed. Arab sponsors of closer links between Iraq and Jordan, or Iraq and Syria, have always been shouted down by fellow Arabs. The barriers were largely dynastic, and now that King Farouk has gone and King Ibn Saud and King Abdullah are dead, they might be thought to have fallen; but a new one—alas—has arisen in their place. The Arab states today can be divided into "haves" and "have nots"—into an oil-rich group in the east and hungry cousins in the west. So far, ideas for joint development have tended to come from the latter and to be countered, by Saudi Arabia in particular, with the answer that all wealth is earmarked for home needs for years to come.

Iraq is by far the most developed state in the "have" group and proposals coming from it are to be taken the more seriously. If ever they reach maturity, they will have real substance. At present they are tender shoots and run the risk of being smothered beneath a dead-weight of negative resolutions condemning the west, or Israel.

Appalling Frankness from Mr Djilas

THE style of the celebrated Yugoslav leader Milovan Djilas—a cross between James Joyce and Karl Marx—does not usually assure him a large audience. His recent articles in *Borba*, however, are said to have aroused great interest and lively discussion. It is not difficult to see the reason for this or for the stern rebuke that they have drawn from the Communist party's central committee. Embedded in the dialectical obscurities there are a number of statements which, coming from the pen of the party's leading theoretician, could hardly fail to flutter the doves.

Mr Djilas (whose attitude, incidentally, over the Trieste dispute has been strongly anti-western), maintains that Yugoslavia has reached a stage in which no one party, group or even class can be the "exclusive expression" of a whole society. He castigates the "petrified brains" which cannot realise that everything "from morale to philately" need no longer be controlled from one centre. He asks, too, whether frequent and compulsory local party meetings are really necessary; in his opinion, they should be held only "at long intervals."

Mr Djilas is not really doing much more than restate bluntly the directives of the sixth party congress of November, 1952. But his articles are hardly likely to encourage the "militant approach" to Communist objectives which the party leaders demanded last June in the "Brioni letter," which represented an attempt to stop the rot in Communist morale that set in as a result of the party congress's liberal directives. And when he insists that the chief and inescapable problem is now the "fight for freedom of discussion everywhere and in all places . . . freer elections . . . and more adherence to the law," he may have logic and good sense on his side, but he is taking many of his colleagues further than they are as yet prepared to go.

The trouble over Mr Djilas arises out of the predicament in which the Yugoslav Communists find themselves. How can they give the regime a basis of wider popular support without thereby destroying their own power? Grappling with this problem, their thinking is bound to be uncertain and their attitude towards the rank and file is likely to oscillate between attempts to ginger up the comrades and warnings that they must not get above themselves. Mr Djilas's indiscretions should be regarded as an incident in the painful process of sorting out Titoite ideas. That he could make them at all shows the difference between Titoism and Stalinism; the treatment he now receives from the party should show more clearly the depth of this difference.

For Burma's Defence

TO say that the difficulties now being raised by the Burmese about renewing their defence agreement with Britain have not caused some disappointment and surprise in London would be ingenuous. The old agreement, dating from the transfer of power in 1948, expired on January 4th. In the early days of independence many Burmese were known to regret the fact that the British still had a military

**Can you use Lustrex
in your industry?**

Versatile plastic
offers new
opportunities to light
engineering and
electrical industries.

HAVE you considered using plastics for industrial purposes? Do you know that hard-wearing, economical components for more and more industries are being made from one particular, highly-successful plastic? This is LUSTREX*, Monsanto's polystyrene—and an extremely useful and versatile material. Lustrex is light, yet strong. It is easy and inexpensive to fabricate and, for many purposes, is the most economical of all plastics. It can be moulded into intricate shapes, for any type of component. It has excellent insulation characteristics, low loss and low power factor and strong resistance to acids and water. It is supplied in a wide range of standard colours and, in addition, can be easily produced by your moulder or supplier in any shade you wish.

Where LUSTREX is already used

Lustrex is used in refrigerator and radio cabinet fittings, coil formers, brush backs, instrument panels, packaging, cutlery handles, buttons, houseware, domestic appliance parts, wall tiles, camera, battery and torch cases and other applications where bulk quantities of standard mouldings are called for.

Lustrex is one of Monsanto's wide range of chemicals and plastics for industry. If you have an industrial problem which chemicals might help you solve—get in touch with Monsanto today!

The choice for a lifetime

In the natural process of trial and error you'll find good reasons why so many men get a lifetime of pleasure from Player's "Medium".

Now available in 2 oz. round airtight tins, as well as the flat pocket tins and 2 oz. pouches.

PLAYER'S MEDIUM
NAVY CUT TOBACCO

[NCT 78H]

Glayva
Scotch Liqueur

Little glasses which hold a wealth of pleasure and satisfaction when filled with Glayva.....

RONALD MORRISON & CO. LTD., EDINBURGH

The salesman's way to Australia and New Zealand

... via America!

Keen businessmen today fly westwards to Australia or New Zealand... on one ticket through the States or Canada, Honolulu and Fiji! Only 4 days for the whole trip, or break your journey en route. Free dollar allowance for North American transit travel. Speak English all the way. Sleep like a top across the Pacific in a full-length sleeper (provided free for every passenger on BCPA aircraft). Only health requirement is a valid vaccination certificate.

Book through your Travel Agent or through B.O.A.C., our General Sales Agents in the U.K. (Tel: VICTORIA 2323).

THE AIRCRAFT

Luxurious Douglas DC6's — fast, smooth, quiet, fully-pressurized to fly at fine-weather heights.

THE ROUTE

First, across the Atlantic to Montreal or New York. Then, by domestic airline to Vancouver or San Francisco; finally by BCPA to Sydney or Auckland. One ticket takes you right through!

THE SLEEPER

Provided free for every passenger on BCPA aircraft. Genuine full-length luxurious bed, not a converted seat.

THE FARES

London — Sydney:
£304 single, £547.4.0 return.
London — Auckland or Wellington:
£299 single, £538.4.0 return.

FLY BCPA 
ACROSS THE PACIFIC

BRITISH COMMONWEALTH PACIFIC AIRLINES LIMITED

mission in their country, designed though it was solely to assist Burma in building up its own forces; for a time the mission was therefore snubbed and restricted in its activities. Lately, however, the Burmese tendency to look to Britain for support when in trouble, and the realisation that the mission had carried out its duties with correctness, friendliness and a high degree of technical skill, had entirely changed the atmosphere. Although discussion was expected about the precise form in which the agreement would be renewed, no overriding difficulty was expected when negotiations started in November.

It now appears, however, that the Burmese government feels that to sign a new defence agreement on the model of the old would lay it open to too much criticism from the left. This is understandable considering the sensitivity of Asian opinion, yet at the same time unreasonable in the light of the facts. It must, nevertheless, be accepted, since neither party will benefit from an agreement that the other cannot or will not honour in the spirit as well as the letter. The Burmese, moreover, have deliberately let it be known that they do not regard their new approach to the defence agreement as modifying their friendly attitude towards Britain, where their further proposals are awaited with interest.

The Burmese are on weaker ground in their specific complaint that arms ordered in Britain have not been delivered within reasonable time. True, in the early stages of the Korean war Britain had to retain for its own use some of the equipment that might otherwise have gone to Burma. But the British feel that they have, on the whole, done well. Certainly there are excellent reasons why the Burmese government, facing rebels within and a powerful neighbour without its frontiers, should receive promptly the equipment it needs.

Keeping Them in Their Place

THERE will be cheers for the remarks of a county court judge this week when he turned down a claim by the South Eastern Electricity Board against a consumer. He said, in effect, that he preferred the evidence of the consumer to that of a mere meter, adding

the Board are a public authority and it is their duty to be careful and accurate and see that they do not charge too much.

This snub to bureaucracy will be particularly applauded by those who have recently applied for new licences for their motor cars. They have been astonished and angered by a question appearing on the application form for the first time, which asks them whether they have a radio set fitted to their car, and if so whether it is separately licensed. This information is, of course, totally irrelevant to the identification of a motor vehicle, which is the purpose of the form. It is designed to help the Postmaster General to trace those who have dodged taking out licences for their car wireless sets.

But what right have the motor licensing authorities to act as snoopers for somebody else? Their powers of compulsion, it should be pointed out, are formidable. They can refuse a car licence if the questions are not answered, and impose a penalty of £50 or six months' imprisonment

for deliberately false answers. These coercive powers ought to be restricted to the purpose for which they were originally intended. It is quite wrong that they should be used on behalf of another authority and with a totally different purpose in view.

Loss of Life

LOOKED at from one angle, the decline in mortality in the last hundred years is presenting Britain with an increasing band of grandparents to support. Looked at from another angle, it has provided an increasing army of workers to support them. In the December Bulletin of the Ministry of Health, statisticians of the General Register Office calculate how many years of working life (conventionally defined as life between the ages of 15 and 64) are lost by death today compared with those lost in the third quarter of the nineteenth century.

In 1952 the death-rate per thousand of the population at all ages was less than half what it was in 1848-72. But, as the accompanying diagram shows, the decline in the

loss of working years has been far greater still because the biggest fall in mortality has occurred at early ages. In childhood, mortality for males in 1952 was only 5 per cent of what it was in 1848-72; at ages 15-44 it was 18 per cent, and from 45 until the age of retirement 57 per cent. On the other hand, over the age of 65 mortality for males is still 83 per cent of what it was in the earlier period.

The Bulletin also contains a comparison of causes of death. The loss of working life in men due to tuberculosis is shown to be only one-twentieth of what it was in 1848-72, whereas, owing mainly to improved diagnosis, cancer is recorded as causing a much greater loss of life than it did a hundred years ago. In spite of the increase in road deaths, violence other than suicide causes a much smaller loss of working life than it did in 1848-72. Nevertheless, violence, intestinal infections, tuberculosis and suicide overshadow all other causes of death in the younger age groups. If a further big saving in years of working life is to be achieved attention will have to be concentrated on them.

Civil Servants

New Plans for Farming?

THE National Farmers' Union has repeatedly urged the Government to produce new and more definite plans for British agriculture. The latest request comes from its general secretary, Mr J. K. Knowles, who in a speech this week asked for two plans—"the sorely-needed long-term policy for production and a bold, imaginative national plan to end the prodigal waste of valuable agricultural land." The request for a production plan is somewhat naïve. The amount of food that it is desirable to grow in Britain cannot be divorced from the prices at which it will be produced. In the free market which is now to be restored, the taste and the pockets of consumers will influence the market for home-grown food in a way that no Government could predict. If the Government were once more to set farmers definite production "targets," it would commit itself (morally if not legally) to underwriting the market to an unlimited extent.

What farmers can reasonably request is that the Government should make clear the extent to which it will support the prices of individual products. The Government's price guarantees can then aid the farmer in planning his future output. In some instances, the price guarantee will need to fluctuate in accordance with the amount produced, but this is a factor of which the farmer must take account. In practice, farmers can be sure of an expanding market for most products so long as they do not price themselves out of it.

The request for a plan to prevent the so-called "prodigal waste" of agricultural land is surprising in view of the great care that is already taken to examine every proposal for development from the agricultural standpoint. It is Government policy to protect agricultural land, and the Ministry of Agriculture (not to mention local farmers' groups) exercises a vigorous and often an excessive influence on the decisions of local planning authorities. Presumably what Mr Knowles has in mind is some national plan which would stipulate the total quantities of land to be devoted to the various possible uses. It is doubtful whether such a plan would benefit agriculture. It is certain that the present state of administrative wisdom is not equal to producing a binding plan of this character.

Bank v Rank

THE spectacle of the Bank of England demanding, in outraged wrath and the full panoply of legal powers, the obliteration of Mr Rank's Million-Pound Note from the public hoardings advertising his film of that name, leads more to ribaldry than to edification. The rule against colourable imitations of currency is, indeed, a necessary one; without it, the forger's life would be altogether too easy, since he could be caught only when actually passing off his products. It is necessary, too, to interpret the rule with some severity; the trusting public, despite all shocks and warnings, does repeatedly take that which looks faintly like something for something itself, accepting dud half-crowns, split banknotes, indeed almost anything carrying more superficial conviction than a slip from the game of Mono-

poly, with a complacency worthy of an old-fashioned slot machine. Every country has regulations similar to those under which the Bank of England has acted. In the United States, indeed, even postage stamps come under the ban—so that the purveyors of stamp catalogues and schoolboys' albums must, if they illustrate American stamps at all, show them in two separate halves. (Otherwise, presumably, they might be cut out, coloured, and stuck on an envelope.)

The Bank's action therefore lacks precedent neither in kind nor in degree of absurdity. Nevertheless one is puzzled to know what misuse, direct or indirect, it expected to see made of the posters' currency. The mental picture of a miscreant creeping up at night, cutting out a specimen, and using it to emulate Mr Gregory Peck's triumphant demonstration of creditworthiness, is not altogether convincing; a forger inspired by the film to tackle something more ambitious than a fiver would hardly get much technical aid from the poster; nor could any palmer-off of Kiddies' Kurrency from the Christmas toy department seriously attribute his downfall to Mr Rank's bad example. More probably the Bank's motive was simply that of all priest-hoods infuriated by a profanation of the mysteries. Some things are sacred. If a ten-pound note is sacred, a million-pound note is a hundred thousand times more so. Mr Rank, and the erring artist, may count themselves lucky not to suffer, in a cauldron of boiling oil apiece, the old-established penalty for coining.

Wealth Without Strikes

Sir,—

Within the last twenty-five years the wages of young women employed in card-rooms (a class of hands called "tenterers") have advanced fifty per cent, *without any strikes or any combinations*. Tenterers are now receiving thirty per cent more wages for 10½ hours per day than they formerly did for 13 hours per day. This is a fact that should teach a lesson to the turn-outs of the present day. I do not deny that more work is done now than formerly; but the extra production is owing to *improvements in machinery*, the labour of the "tenter" being as light as it ever was.

A MANUFACTURER

Ashton-under-Lyne, Jan. 11, 1854

We have already stated that the masters had proved by the rise in wages that they were ready to agree to such a rise when circumstances authorised it. In fact, the competition amongst them—their anxiety to do more and to get more—will generally ensure a rise in wages. Our correspondent lays before the public proof that this has actually taken place. He proves, too, that the rise is in the main the result of improved machinery, which masters are continually introducing, and thus sparing their people irksome toil, while they contribute to increase their pecuniary rewards. That the condition of the great majority of the factory hands has been much improved there can be no doubt; nor can there be any doubt that it has been mainly brought about by the immediate instrumentality of the masters. They crowd their mills with new machinery, and they cannot fail to distribute the advantages which their greater knowledge and ingenuity obtain over all their hands. The example set before the workmen by this letter should make them moderate their impatience to share their masters' power and wealth. Strikes kill the geese which lay golden eggs for them.

The Economist

January 14, 1854

"FIRST APPEARANCE OF MR. SAMUEL WELLER", says the title of this illustration in *Pickwick Papers*. And such is the artistry of 'Phiz' that we know Sam would be the kind of man Mr. Pickwick found him to be—cheerful, cheeky, a willing servant and a true friend.

'Phiz', born Hablot Knight Browne, illustrated ten novels by Dickens between 1836 and 1859. He modelled his pseudonym on 'Boz', the nom-de-plume under which Dickens published

his first major work at the age of twenty-five.

It can be said of all the classic figures in literature, whose names are as familiar as our own, that without paper they could never have lived. Nor, indeed, would these famous characters have given delight to so many people all over the world had not the paper-maker made it possible to produce inexpensive editions in vast quantities.

Wherever words are read, they are read by the hundred million on paper made by Bowaters.

Letters to the Editor

Atlantic Assembly

SIR—I welcome your recent interest in the idea of an Atlantic Assembly. I was encouraged to make this proposal in the Commons in July because of the response to the suggestion I made in a speech at Strasbourg in May or June that the Council of Europe should turn itself into a Council of the Atlantic. I have made similar speeches during the past year in this country, in France and in the United States, and the criticisms from British and continental members of parliament and from British, continental and American audiences have been similar. The left and centre have, on the whole, supported the proposal because they see the chance of educating Western parliamentarians by their debating together common problems, e.g., trade with China. Opposition has always come from the extreme right. In Britain and the USA it has been from the isolationists of the right. On the Continent the clerical parties of the extreme right have opposed the proposal because they see any close association with a populous and a predominantly Protestant North America as weakening the very strong position they have in an exclusively European organisation.

The suggestion for transforming the Council of Europe into a Council of the Atlantic is not, of course, the same as having an assembly of the North Atlantic Treaty Organisation. This would give rise to serious difficulties such as the exclusion of the German Federal Republic and Sweden, who are members of the Council of Europe but not of Nato.—Yours faithfully,

GEOFFREY DE FREITAS
House of Commons

German Illwill to Britain

SIR—With regret I read your Note of January 2nd. You base your criticism upon some stupid remarks of a rather unimportant provincial paper and upon the assertion, that "even well-intentioned otherwise intelligent men believe that Britain declared war on Hitler for the sake of the export market." Please take it from me, a rather widely experienced politician and scientist, who has been since 1945 at not less than 500 political meetings in all parts of Germany, that I have never met such an opinion. Most leading men in Germany of today have been members of the German "resistance" under Hitler and longed between 1933 and 1939 with growing impatience for any symptom of foreign opposition to Nazi politics. So I may say that Britain's decision in 1939 was more than

understood by the majority of the people now responsible for public affairs.

The steady refusal of the foreign powers especially of the British Government to recognise this German "resistance" even after July 20, 1944, and to make use of it was not only morally wrong, and cost the world millions of lives and vast sums but, of course, also cooled the very strong pro-British sentiment here.

After the collapse of Hitler, Germany became a divided and occupied country. Is it so difficult to understand the feelings of a great and proud nation? Even those of us who at first welcomed the occupation as a liberation from an intolerable tyranny and as an end to terrible crimes were disappointed when the liberators refused for years to behave as such. Until 1949 I had innumerable experiences of antifascists being treated by the occupation authorities with the same distrust and want of respect with which they would have treated the Nazis. I was in England in 1937 and as an ardent democrat I felt deep disappointment about the numerous admirers of Hitler in your country; imagine my feelings when after 1945 the same people undertook to "re-educate" me! The British have been the slowest to recognise the change in our country and the new forces that were at work here. The Americans have been much readier to learn. Moreover, they did not take part in the inconsiderate dismantling of German factories; they sent food when our population was starving, money to rebuild our industry and sometimes even to repair the damage wrought by the British reparation demands; and last, but not least, in the Berlin blockade, the Americans forced upon the hesitating British the decision to support the city.—Yours faithfully,

Berlin-West F. FRIEDENSBURG

Inflation and Pensions

SIR—I suggest that the difficult question of the revision of public service pensions which have been robbed by inflation of much of their purchasing power can be solved easily with more comprehensive thinking than it has yet received. The following is an attempt to set out the salient points.

In this matter the same general considerations apply to all public service pensioners whether they have served in the fighting or civil services, and they are different from the considerations applying to other pensioners. For instance, public service pensions can properly be considered apart from old age pensions, but not soldiers' apart from civil servants'.

In general, the public services have

never offered as good pay as private industry, and they used to get the recruits they needed only by offering compensations for this disadvantage. One of the principal compensations was the expectation of a pension providing a reasonable standard of living after retirement, varying, of course, with the service, branch and rank. This compensation has now largely disappeared. Nobody can confidently entertain this expectation, so long as the Government neglects to revise pensions which have been robbed by inflation of much of their purchasing power. Public service pensioners in straitened circumstances have become living warnings not to enter the public service. Recruitment is bound to suffer in consequence, and it has started to suffer already. For instance, the quality of the intake into the fighting services' colleges is causing uneasiness, according to a recent letter to *The Times* from Lords Cunningham, Alanbrooke and Portal, and the Civil Service Commissioners have reported a falling off in the quality of entrants to the administrative class. The Government should restore confidence in its pensions as a matter of prudence.

One of the main inducements which the Government held out in order to attract these pensioners to its service was the expectation of a pension providing a reasonable standard of living after retirement. But owing to inflation their pensions no longer provide this. The Government should revise them as a matter of honesty. The alternative is cheating.

The only effective way of revising them is to raise them to the current rates which the recipients would receive if retiring now, with a guarantee of similar revision if the current rates are raised.

The Government Actuary should estimate the net cost of such revision. It is much less than is often supposed, because many of the smaller pensions have already been raised under provisions for increases in necessitous cases, and the Exchequer has only to find the net cost, i.e. the gross cost less income tax, which is deducted at the source from public service pensions.

Mr Butler may or may not be able to find the whole net cost in the next financial year. If he cannot, he can undoubtedly find it in instalments, the first instalment in the next financial year. If instalments are necessary, it is the older pensioners with the shorter expectation of life whose pensions should be revised first.—Yours faithfully,

Arundel G. D. ROKELING

The Morality of Money

SIR—A number of conclusions can be drawn from your article in the issue of December 26th; but one seems both clear and practicable; it is that the ceiling of £2,000 of earned income, above which no Earned Income Relief is granted, should be abolished.—Yours faithfully,

Yorkshire P. R. R. COAD

Books & Publications

Realism and the Dollar

BRITAIN IN THE WORLD ECONOMY.

By Sir Dennis H. Robertson.

Allen and Unwin. 92 pages. 7s. 6d.

IN these four lectures, delivered at the University of Virginia last March, Sir Dennis Robertson brings his powers of scrupulously fair appraisal and darting wit to bear on the principal problems of British capital investment and sterling-dollar relationships. As usual Sir Dennis packs as much into 92 pages as other economists would sprawl over four hundred. As usual the difference between any ordinary economist's compressed material and Sir Dennis's is the difference between a dog biscuit and sparkling wine.

In his first lecture, Sir Dennis appears in an unusual role: he tries, as others have tried before, to translate recent national income statistics into real terms. He suggests that about £5,000 million of the £10,000 million of British investment between the end of 1945 and the end of 1951 may have represented new capital formation rather than replacement; and compares this with about £7,000 million which he believes a "shrewd observer in 1946 would have discerned as necessary to equip our industrial population per head as well as it had been equipped before the war." His estimate of the fixed investment needed for replacement is rather smaller than one would have expected (he arrives at a "wild guess" for depreciation by adding the official figures for central and local governments, farmers and professional persons to only one and a half times the figure for normal allowances to private traders and companies and one and a half times that for public corporations); but few would quarrel with his conclusion that the scale of the investment effort has been "unsatisfactory" though "not I think, a disgraceful one." On the direction of the effort—for example the extravagant electricity programme—and the present pattern of savings ("fraught with danger to the future") he has sharper things to say.

Sir Dennis's analysis of the history of the sterling area since the war concludes that as between the "White Dominions, the major Asiatic members and the mother country the honours or dishonours have been about easy"; this may be a little too fair to some of the dominions, but nobody who reads his analysis need doubt which these are. He shows some sympathy for the view that it has been a principle of the sterling area that "the little black children, who were often the best

earners, could be smacked on the head if they showed too great a propensity to spend dollars, while the grown-up white daughters, who were often pretty extravagant, could only be quietly reasoned with"; but he believes that for all primary producers *respice finem* is a golden rule. West Africa may justly count itself an ill-used exception here.

When Sir Dennis turns to the problem of sterling-dollar relationships, he suggests to his American audience that perhaps "a quarrel and a baby are not the only things which it takes two to make, but that dollar shortage also falls into that interesting category." He quietly outlines the temptation for non-dollar countries to "gang up and practise the division of labour on a less bewildering basis" than rapid changes in American technology would make necessary in a unified trading world; and he thinks that richer countries have a greater responsibility than poorer ones to resist the temptation to go on blacking their own shoes when it is obviously uneconomic for them to do so. Moreover, although he believes that the disaster of 1929 to 1932 was "produced by a constellation of causes which may never recur, and aggravated by mistakes which need never recur," he finds "it hard to see how an economy like that of the United States is ever going to render itself immune from little hiccoughs of stock-taking and indecision like those of 1938 and 1949." These hiccoughs reverberate "like thunder right through the free world's economic system, intensifying dollar shortage from a sullen ache to a raging fever. Here, it is urged, is another reason for planning to detach oneself, so far as is possible, from [America's] orbit."

Sir Dennis's own prescription is not for such detachment, but he proceeds to a masterly analysis of the circumstances in which a little discrimination (including tariff discrimination) by the sterling area and Western Europe may do more good than harm. He is afraid that a unilateral dash for technical convertibility of sterling might lead to a slower advance to what he plainly regards as the more important objective of removal of import restrictions, and he would not "care to talk in terms which suggest that complete and irreversible non-discrimination is much, if any, nearer than the day of complete free trade." These are the confessions of a renowned economic liberal who has adjusted—but never warped—his convictions to accord with the realities of the modern age.

Rulers and Ruled

THE FOUNDERS.

By Philip Woodruff.

Jonathan Cape. 402 pages. 30s.

MR PHILIP WOODRUFF, who has written some excellently informative novels about district administration in India and the dispensing of justice, has been chosen by his former colleagues in the Indian Civil Service to write a history of the men who built up and sustained the British Raj. His method is to present a large number of little biographies, some of the subjects being chosen because they were outstanding, some because they were typical. He diversifies this by accounts of how they struck non-service travellers in India, such as Bishop Heber or the Frenchman Jacquemont. Primarily it is a history of the civilians. The birds of passage are out of the picture, and so are the soldiers except those like Malcolm who distinguished themselves in organising the government of those who had been conquered. Even Napier gets little space.

The present volume starts with the East India Company's voyages at the beginning of the seventeenth century and extends to the Mutiny. It is agreeably written, and the men on both sides, the rulers and ruled, appear as flesh and blood. The situations are human: Mr Woodruff's talent as novelist reinforces his diligence as historian. As his book is also comprehensive, it will take its place as a standard work. But it is more readable than original. It changes few reputations, does not offer many new facts, and does not recast the history of British rule or start new lines of speculation.

When the time comes for another edition, Mr Woodruff might be induced to give an account of the scholarship of some of the civil servants. Until they were overwhelmed with files they produced a steady volume of work upon Indian history, ethnography, literature, philology and metaphysics. Mr Woodruff neglects this. Even Sir William Jones gets only two brief references in the book, and most of the other scholars are not mentioned. Mr Woodruff notices the beginning—in 1833—of the association of Indians in the services; but he says nothing of the employment of Anglo-Indians in the early days, and their subsequent virtual exclusion from the higher offices. Apparently it was the revolt of Bolivar in South America which told against them; the company drew the moral that the real threat to its power might come not from Indians but from half-castes. Should there not also be a more detailed study of the links between the British civil servants in India and in their home country? In the different periods most of them used to reflect in their actions and influence the views which they had absorbed as young men in England a decade or two earlier. How Bentham and utilitarianism influenced India calls out for investigation. But Mr Woodruff mentions Bentham only once.

The next volume of the book, to be published this year, will carry the history down to the year of Indian independence. It will tell the story of the continuing dominance in the civil service of the group from the Punjab. The rise of this peculiar sub-species is described in the last chapters of the present book. It thus ends rather astringently. Urbanity was not the chief characteristic of the Punjabi officer.

D-Day and After

NORTH-WEST EUROPE, 1944-45.

By John North.

Her Majesty's Stationery Office. 270 pages. 10s. 6d.

THIS volume forms part of a series, whose publication the Government has encouraged with commendable sense, to provide a short and semi-official account of military operations in the second World War that will give the general reader something to go on until the official histories are completed. Volumes on the Italian, Norwegian and Crete campaigns have already been published, although, curiously enough, no volume on the Western Desert—the only purely British major feat of arms in the war—is shown as in course of preparation.

Mr North's is clearly the most important contribution for it deals with the decisive campaign of the war. A vast amount of documentary scholarship has gone into his book; he has not only had access to all the official documents but has clearly used them very thoroughly. He has, moreover, made a real effort to try to draw the general reader into the problems of military and strategic planning—there is for instance an excellent section describing all the factors involved in the decision to launch D-Day on June 6, 1944. He also deals fairly with the conflict of opinion in high places, in particular with the differences between Generals Eisenhower and Montgomery about the right way to execute the break into Northern Germany.

Unfortunately the book is marred by two faults. One is the "journalese" in which it is written, with a love of flashbacks and coloratura in the wrong places. This makes it less easy to follow the course of operations than in the austere prose of Mr Chester Wilmot—himself a journalist—although Mr North's judgments are more interesting and possibly more profound than Mr Wilmot's. The other is the complete lack of any useful campaign maps; the only ones in the book are slightly inaccurate and totally inadequate topographical maps, and the general reader must carry in his head a mass of detail about the centre line of VIII Corps or the position of the reserves in the Ardennes if he is to retain any coherent picture of the campaign. Here is a case for revision in the subsequent editions which the book's scholarship deserves.

The King's Friend

CHANCELLOR THURLOW.

By Robert Gore-Browne.

Hamish Hamilton. 383 pages. 25s.

SOME of the readers of this lively biography will know Sir Lewis Namier's "Structure of Politics at the accession of George III"; or Professor Pares's Ford Lectures on "King George III and the Politicians." Here they will see one of the "politicians" in action.

In 1761, a KC with a good practice, Thurlow entered Parliament as member for Tamworth. This was an appropriate reward for an ambitious man dependent on his own exertions; he had rendered useful pamphleteering service to Lord Townshend whose family controlled this pocket borough. No nefarious bargain was struck. His patrons were Whigs; Thurlow was inspired by that rustic kind of independence which was often labelled Toryism. In actual fact he always remained an independent, regardless of the colour of his political associates, though this did not ensure his popularity with contemporary "columnists" or nineteenth century biographers. The bitter epitaph written in Thurlow's lifetime is matched over fifty years later by the ponderous historical displeasure of Lord Brougham who, nevertheless, credits him with exceptional powers of concentration and quick, clear comprehension. These qualities and his pugnacious rhetoric rapidly expanded his renown in the Courts and the Commons. Mr Gore-Browne does full justice to the triumphant industry that brought him the Attorney-Generalship and to the heavy burden that this appointment laid on him. Asked how he got through it, Thurlow replied "just as a picket-pocket goes through a horsepond—because he must get through." Thurlow "got through" to the Woolsack by 1778.

Lord Thurlow was one of "the King's Friends." This title, considered honourable by the King, was a contemporary term of abuse employed by those who were "agin the Government," not so much because they were "Whigs" as because they were "outs" who wanted to be "ins"; and who, if they got in, would be equally prepared to be "friendly" to the King—but at their own price. But, to the King, his "friends" were those who were prepared to ensure that the Crown's Government was carried on. Mr Gore-Browne puts Thurlow vividly into an eighteenth century picture truthfully painted with the materials provided by the latest research. The result is fair to King and Chancellor; for the picture is based on genuine contemporary evidence and not on the escapist Jacobite fancies of a disillusioned later age.

The Chancellor was no better and no worse than more modern lawyers who have invested their legal skill in politics. He did his best, honestly enough, for a monarch who had the always difficult task of finding ministers who would hang together. Thurlow was one of "the professionals"—capable careerists like Jenkinson (first Earl of Liverpool),

William Eden (first Lord Auckland), Wedderburn (Lord Loughborough), not to mention Canning. Indeed, this book makes it perfectly clear that young Mr Pitt, coming on to the parliamentary stage in a leading part, soon proved himself a better "expert" than any of them; not because he at once rescued "party government" from the clutches of "the Patriot King" but because he had the advantage of being able to use, with a cold efficiency that alienated Thurlow, his exceptional powers of political management at a time when the American disaster had discredited most political competitors.

Lord Thurlow had no wish, and certainly not the capacity, to dispute the leadership with Pitt. He knew his own limitations. He was good at pulling down or propping up political trees, but he did not always see the way out of the political wood. He was a good judge of men and his various attempts to harness them to the King's interest were often less self-seeking and more patriotic than his rivals allowed.

Light on Kashmir

A CONTINENT DECIDES.

By Lord Birdwood.

Robert Hale. 315 pages. 21s.

THIS somewhat disjointed book, the language and meaning of which is occasionally unnecessarily obscure, is valuable for two reasons. First, it recapitulates in some detail the series of constitutional parleys and negotiations which began with Mr Amery's declaration of June 14, 1945, in the House of Commons, and the simultaneous release of the Congress leaders from prison, and ended with the transfer of power to the independent sovereign states of India and Pakistan on August 15, 1947. In doing so Lord Birdwood has performed a useful service to students of events which, though proximate in time, have become heavily overlaid by conjecture and prejudice in a space of less than ten years. And in the second place there is a section on Kashmir that is notable for the light thrown by a professional soldier upon the purely military aspects of a campaign which began and has continued as an exercise in what the author calls "controlled warfare." Thus it is no bad thing to be reminded of the patience and persistence of successive attempts by the British Government in the 1945-47 period to preserve the essential unity of the sub-continent, for, in spite of the fact that partition is very recent history, it is widely assumed that the British Government accepted it as an easy way out of the Congress-Moslem League impasse. Likewise it will come as news to most people that on the technical level, after the stabilisation of the line of fighting in Kashmir, Pakistan enjoyed considerable strategic advantages, notwithstanding India's superior strength in numbers and armament.

The Kashmir chapters are, in fact, worth far more than all the rest of a rather laborious book. They sug-

gest that by virtue of his intimate knowledge of the State and its terrain, his acquaintance with the military and political leaders on both sides, his first-hand knowledge of frontier campaigning, his denigration of the "war of deception" (relying upon fictitious military formations operating in support of both contestants) and his transparent honesty in trying to arrive at a fair assessment of the dispute, Lord Birdwood possesses many qualifications necessary to write a full length authoritative account of the Kashmir war.

It is to be hoped that before long he will consider the possibility of doing so; for the synopsis which he has now given of the genesis of the quarrel and its enlargement to a threat to the peace of South Asia tells us a great deal more about the affair than the ordinary man can ever glean from the archives of the Security Council, the Dixon and Graham reports, or the voluminous correspondence which has passed between New Delhi and Karachi. Not all Lord Birdwood's political judgments will be accepted at their face value, but as an expositor he has succeeded in making the military and economic issues in Kashmir real and living, whereas most of us have been content to dismiss them as impersonal, obscurantist and insoluble.

A Problem of Digestion

AUSTRALIA AND THE MIGRANT. Papers read at the Nineteenth Summer School of the Australian Institute of Political Science.

Angus and Robertson. 186 pages. 12s. 6d.

AUSTRALIA'S way of dealing with immigration has always been that of the boa-constrictor. Periodically she swallows an enormous meal in a few years, a meal which produces a perceptible bulge in her population outline, and then spends a decade or two digesting it—not without sundry eructations. Such gulps of new population occurred between 1875 and 1890 after the gold discoveries; then came another gulp in 1908-14; then between 1922 and 1929 another 300,000 migrants were admitted; and in the five years 1947-51 a further 571,000 were taken in. On previous occasions, there has followed a pause for digestion, and most of the speakers at the summer school of the Australian Institute of Political Science, which was devoted last year to the discussion of migration, concluded that a similar pause must again ensue. The Australian Government has reduced its intake by half, and those now entering the country are very largely the dependants of those who migrated after 1947.

Owing to the fall in the net reproduction rate between the wars, this very large intake in the last five years has done little more than restore the population pattern and strengthen the cadre of the generations of working age. Without such immigration, Australia's population by 1960 would have risen to

only 8,793,000, according to Mr W. D. Borrie, with a proportion of 9.6 per cent of people over 65. It has this year passed that figure, and if the net intake were kept at the 1949 figure, would reach by 1960 10½ million, with 8.4 per cent over 65. Yet, though Australia has been enriched by so many people of working age, with a high ratio of males, it is generally agreed that the effect has been inflationary—in spite of the direction of many migrants into occupations where labour bottlenecks developed, so that, for instance, a heavy drop in steel production was averted. Australia was, at its current rate of consumption, quite unable to supply or borrow all the capital needed to settle such large numbers, which raised the annual increase to over 3 per cent a year. The balance of payments was strained. While population increased by 20 per cent, food production increased by only 10 per cent. Professor Karmel estimates that the capital goods needed are about £1,700 per migrant, i.e., in addition to the additional sums needed to feed and clothe him from current production. The inevitable conclusion was that Australia could have a reduced standard of living and a sustained programme for rapid population increase or a high standard and an intake, in present world trade conditions, of not many more than 80,000 immigrants a year. A forty-hour week, high wages and high costs do not consort well with prolonged nation-building.

This is a very useful set of papers, which throws much light on the hard realities of migration and population. It makes the little publicised point that Australia could probably attain the highest standard of living for individuals with an almost purely pastoral economy and a population of 2,000,000.

Shorter Notice

FARM POLICIES OF THE UNITED STATES 1790-1950.

By Murray R. Benedict.

The Twentieth Century Fund, New York. 548 pages. \$5.00.

At a moment when the government's responsibility for agriculture is again about to come up for full discussion in the United States it is useful to have a clear and authoritative survey of what has been done or advocated in the past. Mr Benedict writes not only about policies on matters directly agricultural, such as soil conservation, marketing, rural housing and methods of supporting farm prices, but also about the influence of farmers on policies in general. He treats 1870 as an important watershed: before that farmers thought of themselves as the nation; after it, as a special interest group on the defensive against bankers and monopolists. The book gives very useful summaries of the scope of the alphabetical agencies and examines the effect on the practice and outlook of farmers of the New Deal policies. Nor is space spent on rejected policies space wasted, for an idea about farming seems, from Mr Benedict's history, to be unkillable, and many old friends are sure to crop up again now that the Republicans are trying their hand at legislation.

The lightning fast and velvet smooth HUMBER SUPER SNIPE

White-wall tyres, optional extra.

For Transcontinental performance

The car that smashed the London-Capetown record, the Humber Super Snipe speeds you across continents as casually as it takes you over to the club for a round of golf. Quite the most poised and comfortable of all the really fast cars. Ring your distributor or dealer for a trial run . . . into a New Era of Finer Motoring. Even at very high speeds the immensely powerful Humber Blue Riband o.h.v. Engine scarcely raises its voice above a whisper. In the gruelling Australian Reliability Trial, a Humber Super Snipe was placed first in its class; was the first British car home, and the only make to gain three places in the first nine. All five Humber Super Snipe entries completed the 6,500 miles course. 1985 plus P.T. £411. 10. 10.

THE ROOTES GROUP

THE CASE OF THE SATISFIED SALESMEN

Marmite, in its handy wide-topped jar, is now a familiar sight in grocers' shops—and in kitchens—up and down the country. The Marmite salesmen mightn't have done such a fine job without efficient backing from headquarters...

Customers could never complain of a bottleneck (nor could the head office!)

AT THE WAR'S END, the Marmite Food Extract Co. Ltd. were faced with a problem—and an opportunity. For years, supplies of Marmite had been far below demand. Raw materials were short, and most of the output went to the Armed Services. Then the situation changed. It was time for aggressive selling. The sales-force was ready; new

Seen operating a Burroughs Typewriter Accounting Machine in the offices of the Marmite Food Extract Co. Ltd. is Miss Doris Miller. This is one of the fast and versatile machines that are helping to keep the salesmen (and their customers) satisfied.

territories could be opened up; new demand could be created and satisfied.

But, in support of this sales campaign, could the office departments cope with the great volume of figuring work involved? To plan its production in advance, the company realized that it must have detailed statistics on the selling operation—sales analyses by travellers, by areas, and by class of outlet, would have to be prepared day by day.

Some years earlier the company had used Burroughs machines to cut six weeks off the time needed to make up the books at the year's end. Now, with this new problem, Burroughs were consulted again. After investigation, Burroughs specialists recommended the installation of Burroughs Typewriter Accounting Machines on which complete records of sales, purchases, and other data could be classified in many different ways.

Result: So smoothly and quickly do these Burroughs machines serve the

company's offices that a fact-and-figure picture of the whole sales operation is always on hand. Details of sales in any kind of shop in any county can be produced at a moment's notice—a great help to the company in planning production and distribution in advance.

What about you? If your business could benefit from faster, accurate figuring, call in Burroughs. They can offer advice on all the latest systems, for Burroughs market the world's broadest line of modern record-keeping machines: Adding, Calculating, Accounting, Billing and Statistical Machines, and Microfilming Equipment. Remember, once you have any Burroughs machine, Burroughs Service guarantees its efficiency in operation.

Call Burroughs today. Burroughs Adding Machine Limited, Avon House, 356-366 Oxford Street, London, W.1. Sales and Service Offices in principal cities round the world.

Republican Marching Orders

Washington, DC.

WHEN the legislators came back to Washington last week they were greeted, in the President's report on the State of the Union, with Mr Eisenhower's views on why the Administration had already earned the confidence of the nation and on how Congress might, with a little application, come to do so as well. The central claim made for the Administration was that in its first year of office it had brought about a major strategic change in the world situation:

That precious intangible, the initiative, is becoming ours. Our policy, not limited to mere reaction against crises provoked by others, is free to develop along lines of our choice not only abroad but at home.

The applause had no sooner died away after this assertion of victory on the psychological battlefield than commentators were remarking that the success was not only intangible but illusory. Since in the most critical spheres, both in Europe and in the Far East, American policy rests on nothing more impressive than the strength and resolution of France, many people in Washington feel that the President's claim is a little premature.

Mr Eisenhower himself gave two instances of the new freedom that had come to American policy. In the first place, the Joint Chiefs of Staff had completed and the National Security Council had approved a new strategic concept. This policy, which bears a close resemblance to the ideas of the late Mr Taft, involves the progressive disengagement of American troops from the periphery and their use as a highly mobile strategic reserve ready to retaliate against any aggressor, as Mr Dulles later said, "by means and at places of our own choosing." For political reasons the ground troops will for the time being be kept up to strength in Europe. But the main emphasis is to be on the Navy and Air Force, and manpower will be saved in the Army by using tactical atomic weapons as conventional equipment.

Many Democrats could be heard complaining after Mr Eisenhower's speech that the new strategy was a result of the Treasury's pressure to balance the budget rather than a display of American initiative, and might have serious consequences for foreign policy. But there is not very much the Democrats can do about it if the Joint Chiefs of Staff succeed—as they have not always done before—in preserving solidarity before the interested congressional committees.

Like the repeatedly expressed willingness to negotiate over Germany, Mr Eisenhower's proposal for a pooling of

atomic material for peaceful use, which was the second main instance he gave of American initiative, effectively counteracts the impression of rigidity which American policy has given to the world in the past. But this represents not so much the winning of the initiative by the United States in the cold war as the regaining by an American Administration of the initiative normally reposing in a sovereign state. Mr Dulles's policy has of late been showing a flexibility and enterprise notably lacking during the period when the unpopularity of Mr Truman and Mr Acheson made them the captives of their critics. His freedom, however, must be fought for against Congress and the outcome may well be determined in the first few days of the session by the fate of the Bricker Amendment, which would cripple the President's authority in foreign affairs.

★

The degree of support which the Administration may hope to get from its own party in Congress will, of course, depend to a certain extent on the importance which Republicans up for re-election next November attach to the President's personal approval. Mr Eisenhower himself has made his opinion abundantly clear in a passage from a prepared statement to the press which may find an honoured place in Democratic campaign literature if the Republicans fail to back their President. In it he said:

I am convinced that those who fight for the programme that I shall soon submit to the Congress will deserve and will receive the respect and support of the American people. In any event, unless the Republican Party can develop and enact such a programme for the American people it does not deserve to remain in power.

Now Mr Eisenhower has submitted his programme and the Republican Congressmen have a prospectus of what they must do to be saved. It seems incredible that they can do it all in this session, for there are no fewer than twenty-one separate proposals, with the likelihood of at least ten special messages, not to mention the regular Budget Message and the Economic Report.

Having patiently endured for twelve months the taunts of Democrats and columnists at his apparent failure to provide leadership, Mr Eisenhower is now proposing relentlessly to feed the mature reflections of all his policy commissions into the erratic congressional machine. Nothing is to be left out: housing, health, public lands, natural resources, national highways, farm policy, foreign trade and amendments to the Taft-Hartley law on labour

relations. Together, these policies represent what one radio commentator, Mr Eric Severeid, has called a "re-definition of normalcy." The Republican economists, bankers and big business men who mainly make up the collective personality that is called the President are determined that the Republicans in Congress, many of them spiritual *emigrés* who would like nothing better than to repeal the New Deal or even the twentieth century, shall endorse once and for all a modern conception of the government's function in society.

Mr Eisenhower did not neglect to give his congressional audience some opportunities to cheer. He declared himself "flatly opposed to the socialisation of medicine"; he called for continued aid to the Nationalist government of China; by announcing that the casualties of his security check now amounted to 2,200 he vastly pleased those Americans whose confidence in the safety of their nation rises with the total of its servants who are found to be unsuitable; and he produced thunderous applause by his suggestion that Communists convicted of conspiring to overthrow the government by force or violence should automatically forfeit their American citizenship.

★

But the President's positive proposals were listened to mainly in silence. They seemed to have three main objects. The first is to turn from temporary or highly controversial devices adopted in moments of crisis towards considered long-term policies. He hopes, for example, to bring foreign economic aid to an end, continue technical assistance under the Point Four scheme on a permanent basis, and include military aid in regular defence appropriations.

Economic relations with the allies are to be on the basis of "trade not aid" and, with the Randall Commission now preparing to report ahead of time, the President has obviously promised that its recommendations will be thrust on Congress at this session. Also Mr Eisenhower is hoping to infect Congress with sufficient courage to shift, however gently, from the follies of the present farm policy, which piles up unwanted surpluses of a few basic commodities, towards a flexible system that would bear some relation to the requirements of the market.

The President's second objective is to document by legislation on social welfare his principle that

in a modern industrial society banishment of destitution and cushioning the shock of personal disaster on the individual are proper concerns of all levels of government, including the federal government.

This essentially liberal programme is couched in the conservative language that stresses the proper sphere of the states, local communities and private initiative. It thus contrasts strikingly with the truculent manner in which Mr Truman used to hurl proposals at Congress in the certain knowledge that they would perish in its committees. But Mr Eisenhower and his advisers believe that striking results can be obtained if the federal government uses to the utmost the power to help and to prod.

Finally, the President will, in his Economic Report, explain the measures which his advisers confidently believe will enable them to prevent a depression and will ask for legislation in those cases which require it. In the last analysis it will be on the success of these policies that everything else will depend.

Streamlined Frontier

FROM A SPECIAL CORRESPONDENT

THE absence of any mention of Alaska in the President's State of the Union Message wiped out the hope, bright last summer but already faded, that the Territory of Alaska, on the northwestern tip of the American continent, might be recognised as a full-grown state during this year's session of Congress. The close balance of party power in the present Congress explains why the President has no wish to see Alaska fully represented there just now, for the area is expected to elect Democrats. The President's official excuse for leaving out Alaska seems, however, apparently to be that the Republicans, unlike the Democrats, do not think that the Territory is ready for statehood. There is little doubt that the majority of Alaskans, the small businessmen, the salaried workers and the wage-earners (and the politically ambitious), disagree with this view, but the local opponents of statehood are conservatives of a type who carry weight in Republican circles—long-time residents, big businessmen and absentee property owners.

These opponents argue that Alaska cannot afford to support a state government, which would have to undertake functions now financed by the federal government. For

the current biennium the territorial budget is \$25 million and it is estimated that among the additional annual costs of statehood would be \$2,500,000 to protect fish and game, \$2 million to educate the natives, \$1,287,000 to provide a system of courts, prisons and police, \$460,000 to care for the insane and \$7 million to build and maintain roads. All of these expenses are now charges on the federal government. These estimates are, however, questionable and proponents of statehood also maintain that not all of these functions would necessarily be delegated to the new state. But the fact remains that statehood would cost Alaskans, and particularly Alaskan businessmen, money.

The advocates of statehood build their emotional appeal on a revival of the revolutionary rallying cry, "End taxation without representation," but their practical argument is that a state government could foster a tax structure which would attract investment capital and thus help to defray the increased cost of that government. There is no doubt that Alaska offers opportunities to private investors. Its industrial potential is without parallel in the world today. The raw materials known to exist there include iron, chromium, cobalt, molybdenum, nickel, tungsten, copper, lead, zinc, antimony, mercury, platinum, tin, titanium, cadmium, coal,

petroleum, natural gas, fluor spar and sulphur. The vast stands of evergreen timber in southeastern Alaska, the rain-soaked fringe of timbered hillocks and islands along the edge of British Columbia, could produce in perpetuity one billion board feet of lumber a year; less than one million board feet is now being cut a year. And Alaska's rivers, if harnessed, could generate eight million kilowatts of hydro-electric power.

Nor is there any doubt that Alaska needs private investment to fill the gap that is already being left by the slackening of government defence spending in this strategic northern area, which lies across the polar air routes and almost touches the Soviet Union, and was the scene of the only battle fought on the American continent in the last war, on Attu. Over \$1.5 billion of government money has been poured into Alaska since 1940, but the network of radar stations and airfields, of military and naval bases, and of roads to link them, is now nearing completion.

This government spending brought a boom that blew up Alaska's mining, fishing and trapping hamlets into "cities": Anchorage, with a population of 3,500 in 1940, is now a metropolitan area of 35,000 inhabitants and Fairbanks has 15,000. Even so, there are only about 8,000 people in either Juneau, the territorial capital, or Ketchikan, the world's salmon capital, while Nome, on the Bering Sea, one of the relics of the gold rush that made Alaska famous over fifty years ago, is now a village of 1,200 inhabitants. Altogether Alaska has a civilian population of only 130,000 in its 586,400 square miles of mountain and tundra and forest which, as the map shows, would stretch more than two-thirds of the way across the United States.

The territory that Seward bought from the Russians in 1867 for two cents an acre is still a frontier, the last frontier of the United States, but it is a streamlined frontier. For in Fairbanks, one hundred miles south of the Arctic circle, the five o'clock traffic is jammed for blocks behind stop lights and parking meters line the pavements where only ten years ago sordoughs tied up their dog teams. The log cabins lit with paraffin lamps are still there, but they lie in the long shadows of 14-storey apartment houses, bristling with television antennae.

★

The main necessity for the twentieth-century pioneer in Alaska is a fat pocket book. Prices are awesome—\$2.50 (nearly £1) for a haircut, \$200 a month for a three-room apartment. This inflation is not just the result of the money the government has been pouring into the territory, and the huge wages it pays, but of high costs of transportation over long routes. Virtually everything, from paper clips to steel girders, must be shipped to Alaska from American and Canadian ports on the Pacific coast, mainly from Seattle, 1,500 miles away. Freight charges by sea are high and even higher on the 470-mile long, government-operated railway, linking the port of Seward with Anchorage and Fairbanks. Still more costly, of course, is air freight, though it is much used for light, perishable and emergency cargoes. Freight also comes by lorry over the Alaska Highway across the Canadian Yukon and British Columbia, but this method brings in pounds where the ship-rail route brings tons.

Altogether there are little more than 1,500 miles of highways in Alaska. Many interior camps and villages are

accessible only by air, slow river barges or, in winter, by tractor trains that travel over frozen ground. This transport problem cuts into development possibilities in two ways. Not only must equipment and supplies be brought in at almost prohibitive cost, but because of the limited, and in most cases non-existent, market in the territory, almost everything produced has to be shipped back to the United States for sale.

The severity of the climate adds to the working difficulties and the hazards of investment; winter temperatures of 50 to 60 degrees below zero are not uncommon, even though by no means all of Alaska is an Arctic wasteland. The US Navy, which spent eight years exploring for petroleum on the northern rim of the continent, had to base its plans on the expectation that its installations might be wiped out in five minutes by the caprices of the climate. Investors take the view that they should be entitled to an easing of tax burdens since wood pulp milling, for example, is a more hazardous venture in Alaska than in Georgia.

But in spite of these geographical obstacles there are investors who have decided that Alaska is not too costly to be worth exploiting. The only tin produced in the United States is being mined north of Nome. The Aluminium Company of America wants to build a plant near Skagway and Canadian and American engineers are sampling a mountain of iron in the same district. In the middle of this year a new wood pulp plant is to be opened near Ketchikan; its output will eventually be over 500 tons a day. Japanese industrial representatives are already trying to arrange to buy lumber for reconstruction purposes in southeastern Alaska and Japan might also provide a market for the ample coal reserves of the interior.

American Notes

Middle Way in Field and Factory

THE President began his series of detailed proposals to Congress for the good of the nation with the two, on agricultural price supports and labour policy, which will directly affect two large and unreliable blocks of voters—the farmers and the trade unionists. And since the middle course which the President is characteristically steering on both these questions, between farmers and taxpaying consumers, between workers and industrialists, is more likely to lose than to gain votes, these are both proposals on which the President will have to fight if he wants them enacted. Even then he is unlikely to win, to judge from first reactions in Congress.

The President made it clear at his press conference this week that he does intend to fight for his farm programme and he has done his best to make it politically feasible. The surplus stocks of commodities now in government hands would be removed from the market, which would mean that price supports would be little, if at all, lower next year. For under the flexible system which is the basis of the Presi-

dent's proposals the level of price supports would fall only when supplies were over-plentiful. Steps would also be taken to ensure that the adjustment to a lower price level would be gradual.

The need for a new start in agricultural policy has been made obvious by the prohibitive cost of the present programme; in any case the present legislation expires this year. But the Taft-Hartley labour law is permanent and so far has not in practice shown any vital defects. Even the trade unions have never seriously argued that it would bring the "slavery" they allege unless there was an economic depression; the fear that such a depression is now imminent may, however, give fresh urgency to criticism of the Act. Meanwhile the lack of detail in the labour message, much less specific than the farm one, suggests that the President does not feel so strongly about it. All the signs are that Congress will avoid a decision on it; this should not be difficult in view of the heavy programme to be gone through before July.

No Labour Dispute

THE only entirely new proposal in the labour message is that the government should hold a secret vote of all the workers in any plant in which there is a strike, to make sure that they really want a stoppage. This will hardly appeal to the trade unions, nor will the evidence that the President is now leaning to the side of the states in the controversy over which law should prevail when state legislation conflicts with the Taft-Hartley Act. A recent Supreme Court decision on picketing came down decisively in favour of the federal law, which is usually more liberal, but the President has not yet made up his mind on how much the legislation should be changed to cover such conflicts of jurisdiction. Certain proposed relaxations in the law when applied to construction, and other industries where employment is casual, would benefit a few unions, but another so-called improvement, the requirement that employers should also sign anti-Communist affidavits, is welcomed by labour only with sardonic laughter.

The President's other election promise to labour, to repeal the "union-busting" clause of the Act, would be redeemed by the proposed changes in the provisions governing the holding of elections during strikes, to decide which union should represent the workers in a factory. The President also recommended a relaxation, although not an abolition, of the ban on secondary boycotts and recognised the growing importance of welfare and pension funds in collective bargaining by asking Congress to examine them thoroughly.

The combined product of the sixteen proposed changes, none of them fundamental, is a programme that clings firmly to the middle of the road and as a result pleases no one. It is even less attractive to the trade unions than the one which failed to get as far as Congress last summer, but nevertheless it is little more satisfactory to businessmen than was its predecessor. For once both sides agree: there is no dispute between labour and management about the inadequacy of a middle road approach to amending the Taft-Hartley Act.

Minority Rule

THE death of Senator Taft and his replacement by a Democrat, and elections to the House, have made the Administration even more dependent than it was in the last session upon Democratic support. Then, as the chart shows, Democrats provided the margin of victory in more than half of the divisions on important issues. This week the Republicans would not have been able to control the Senate save for the vote of the maverick Senator Morse, for he is the 96th in a body of 47 Republicans and 48 Democrats. They would not have been able to retain control of

WHO SUPPORTED THE ADMINISTRATION IN THE 1953 SESSION OF CONGRESS?

the all-important committees if the Democrats had not agreed to allow them to do so.

Under the law each member of the majority party is entitled to two committee assignments and fourteen of its Senators may be given three each if this is necessary to produce a majority on every committee. But even this concession has had to be unofficially enlarged by an agreement allowing the Republicans to give four more of their members three committee posts each. The position of the Eisenhower Republicans, who in the Senate at least are only a minority of a minority, is much worse; and in neither chamber do they hold many of the positions of real power, the chairmanships of committees.

The Democrats, however, are showing little jubilation at their strength; it is, indeed, a puzzle how to use it, assuming, what is seldom the case, that the party might vote as a unit. Many of their leaders believe that, with the President's popularity back at its original peak, outright partisanship would be political suicide. In any case, Democrats can hardly vote against causes they believe in simply because the Republicans' leader has embraced them. In the view of Mr Lyndon Johnson, the Democratic leader in the Senate, the right thing to do is to lie low, support the President's foreign policy and trust that, with time and a little judicious Democratic help, the Republicans will destroy themselves in the bitter differences over taxes, farm policy, and international trade, which are already beginning to appear. For conservatives from the South, who have no

real opposition at election time, this may do, but liberals from the North, who have to fight for their seats, wonder whether Democratic voters will think that they have earned re-election by rescuing a Republican President from his own party.

McCarthy Joins the Team

THE elevation of Senator McCarthy to a place on the Rules Committee, which among its other duties supervises the funds for the Senate's investigators, has come as a rude shock to those who hoped that the growing irritation with the Senator from Wisconsin among both Republicans and Democrats meant that he was about to be brought to heel. One of the most effective ways of doing this would have been by restricting his supply of money. The Administration, however, apparently believes it can tame Senator McCarthy by a judicious blend of kindness and threats, and that it cannot afford to incur his enmity.

Senator McCarthy's anti-Communist crusade has been a thorn in Republican flesh for, while his methods brought discredit on the whole party, when there was credit to be gained it was seldom shared with the Administration. The annoyance of other committee chairmen with his trespasses upon their preserves provided an opportune moment to encourage him to look for fresh pastures.

That there has been a deal of any kind is hotly denied by the Senator. But his newest investigations are to be concerned with the compromise settlement of tax cases under the Truman Administration and corruption among Democratic officials in Alaska. One of the factors that is said to have influenced the Senator to change course was the threat that any new anti-Communist leads discovered by the Administration would be given to the Jenner subcommittee on internal security; this, unlike Senator McCarthy's committee, has a charter to investigate subversion and can be trusted to do it in a more respectable fashion. It was represented to Senator McCarthy, apparently, that under a Republican Administration the search for traitors in government was a dying trade, and that a rich vein in cases involving Democratic corruption and favouritism would be opened up for him if he co-operated with the Administration. Perhaps the Senator can be trusted not to bite the hand that feeds him headlines, but only political expediency would seem to prompt the experiment. Presumably this is the first example of the President's new-found determination to keep the Congressional members of his party in line by using all the means at his disposal.

Men Without a Country

NONE of President Eisenhower's proposals to Congress was received with more enthusiasm than his suggestion that Americans convicted of conspiring to overthrow the government should lose their citizenship. None is inspiring more second thoughts or causing more bewilderment among Congressmen and constitutional lawyers.

THE ECONOMIST, JANUARY 16, 1954

Under present law, Americans may lose their citizenship for a number of reasons, such as swearing allegiance to a foreign power or voting in a foreign election, committing treason or trying to overthrow the government. The President would broaden the last cause to cover conspiring to overthrow the government and apply it to such Communists as may be convicted in the future under the Smith Act. Senator Margaret Chase Smith has already introduced a Bill to carry out the President's wishes.

For a naturalised American, loss of citizenship means deportation. For a native-born American, it means loss of a passport and the right to travel; he would be a stateless alien, a man without a country, not allowed to vote, hold public office, serve on a jury or, in some states, to enter certain professions. As an alien, he would have to register with the police and be finger-printed. There are real doubts, however, about the constitutionality of depriving the native-born of citizenship which will not be resolved until there is a court test. There are even stronger doubts about the urgency of such ferocious legislation except as proof, if proof be needed, that the Administration is second to none in its detestation of Communism.

Already, convicted Communist conspirators are punished with fines and long prison sentences; like ordinary criminals, they lose their civil rights, such as the right to vote or hold public office. To deport the foreign-born and create in America a tiny band of stateless aliens may give emotional satisfaction in some quarters, but it is more likely to confirm Communists than to cure them. It is a cause for regret, as the *New York Times* observes, that when the President made this ill-considered proposal he did not also see fit to stress the dangers to individual liberties created by the search for internal security.

How Much Unemployment?

THE official attitude to the December employment figures, as indeed to most of the recent disquieting economic indications, was that they might have been much worse. But unfortunately everyone knows that in fact by now they are worse, and that the January count will probably find over two million out of work. Since there is always a seasonal fall in farm employment in winter, the most disturbing feature of the December figures was the failure of non-agricultural employment to rise; in a month in which the Christmas rush brought an increase in the number of jobs in retail trade, this could only mean a substantial fall in factory employment. Since then there has been a further series of layoffs as a result, not merely of seasonal factors, but of declining traffic on the railways and reduced demand for automobiles and other manufactured products. The Studebaker plant, for example, is working at only just over half strength, and the Baltimore and Ohio Railroad has laid off 6,000 workers. There has been a sharp rise in the number of claims for unemployment benefit.

Even now the number out of work is well below the 5 per cent of the civilian labour force that was unemployed as recently as 1950, and looks infinitesimal compared with the 17 per cent of 1939. But another unsatisfactory feature of the employment statistics is that for the last two months

THE ECONOMIST, JANUARY 16, 1954

the total civilian labour force, at 62,614,000 in December, has been running at a slightly lower figure than for the same months of the previous year. Since the number of

people of working age is increasing, this can only mean that the full extent of current unemployment is being hidden because some of those who have lost their jobs, housewives and old persons in particular, are staying at home instead of looking for work. This concealed unemployment, about which labour spokesmen are especially concerned, also appears in shorter working hours and lower overtime earnings; these, and the fall in employment, explain the drop in personal incomes in November. It is encouraging that this does not seem to have damaged Christmas trade. Shopkeepers, feeling that customers are, after all, still in a spending mood, hope that the January sales will clear their shelves for new spring goods. The inventory reductions that began in the autumn are the reason for the subsequent rise in unemployment, and the sooner that stocks can be cleared to make way for new orders, then the sooner will the end be in sight of what is now generally accepted as an inventory recession. Many Americans will, incidentally, be particularly pleased if Mr Colin Clark's forecast of a coming depression can thus be disproved, for they have been affronted by his lack of faith in their economic vitality.

SHORTER NOTES

President Eisenhower has avoided an inevitable battle with Congress by dropping his request for the repeal of the automatic increase in the social security tax; this rose on January 1st from 1½ to 2 per cent and, as far as the lower wage-earning groups were concerned, more than cancelled out the benefits of the fall in income tax rates. Congress is, however, being asked to make general revisions in both the social security and the tax laws during its current session.

Correction:—In the discussion of the Federal Reserve Board's new index for industrial production, on page 27 of the issue of January 2nd, the base of the old index was incorrectly given as 1937 to 1939; it was in fact 1935 to 1939.

The World Overseas

Second Line in South East Asia

RECENT developments in Indo-China have raised the question of the capacity of Siam to resist a further advance of Communism into South East Asia if its neighbour were to fall under the sway of Ho Chi Minh. Vietminh forces are already on the frontier of Siam, and the extension of Communism from Vietnam to Laos by the creation of a Laotian People's Army has given the conquering creed a foothold among a people closely akin (as the Vietnamese are not) to the Siamese.

It has been claimed that any attempt to defend Siam after failing to take action to stop Communism in Indo-China would be like the guarantee given to Poland in 1939 after Czechoslovakia had been abandoned to Hitler. It is not, however, simply a question of whether to resist an earlier or a later phase of a hostile expansion. Siam certainly provides a better political ground for organising resistance to a movement with a nationalist and Pan-Asian appeal than do the states of Indo-China: for it succeeded in maintaining its independence throughout the colonial era, whereas Indo-China came under French rule. Ho Chi Minh has gained the support of a large part of the Vietnamese people as leader of a struggle for national independence; in Siam, on the contrary, there has never been any foreign rule against which to revolt, and Communism must rely on other forms of appeal than that of liberation from an alien yoke. This contrast has its consequences also outside South East Asia, wherever there are strong sentiments of antipathy to European colonial empires; thus Mr Nehru, whose moral support has been given to the Vietminh against the French, cannot deny the purely Asian and national character of the Siamese government, however much he may dislike its policies.

As against this political advantage in Siam's position must be set the traditional tendency of its policy towards neutrality, or inclination to the immediately stronger side in Great Power conflicts. In the early years of the century Siam maintained itself by adroit balancing between British and French interests. Later, when Japan invaded South East Asia and it was clear that Britain did not have sufficient forces on the spot to afford protection, Siam went over to the side of Japan and was rewarded with slices of territory from Burma and Malaya. The annexations had to be renounced at the end of the Pacific war, but by its policy Siam escaped the ravages of a resisted Japanese invasion, and also those of Allied counter-invasion; for Japan surrendered before the fighting front had reached the Siamese border.

Nor did Siam suffer any really unpleasant consequences afterwards for having been on the losing side; for the United States never regarded itself as being at war with Siam (in accordance with the American constitutional doctrine that the United States cannot be at war except by an Act of Congress) and Britain could not afford to be too severe with Siam if America was being lenient. As a result of

all this, which is a matter of recent memory, the Siamese are disposed to rely on suppleness rather than strength to get through difficult situations, and much of the popularity of Marshal Pibul Songgram, who returned to power by a *coup d'état* in 1947 after a temporary eclipse, is due to admiration for his apparent skill in steering Siam through the Pacific war. It may, therefore, be argued that if a Chinese, instead of a Japanese, army were standing on the Mekong, the Siamese response to the threat would probably be the same as it was in 1941.

There are, nevertheless, reasons why neither the govern-

THE ECONOMIST, JANUARY 16, 1954

ing political group nor the Siamese people in general would have as much incentive for submission to a Chinese-Vietminh invasion as they had for giving way to Japan. The control imposed by the Japanese on Siam was of an external and non-ideological kind; there was no considerable Japanese community within the country, and Japan was only too glad to allow the existing holders of power to carry on, provided they were willing to take their place in a Japanese-controlled "Greater East Asia." But in present circumstances a Chinese ascendancy would certainly mean both a domination by the local Communists at the expense of Marshal Pibul and his followers and a transformation in the relations of the large Chinese minority with the native Siamese; it would involve political and social changes reaching down into every village.

Siam ranks second after Malaya among the South East Asian countries in the numerical ratio of the Chinese community to the total population—though there is controversy as to the exact figures—and Siamese nationalism, as it has developed over the past twenty years, has been strongly antipathetic both to the economically powerful Chinese minority and to China as its potential backer. For the Siamese, therefore, apart from a few convinced Communists, the ideological issue can be reduced to a national resistance to an anticipated Chinese ascendancy operating through the Chinese community inside the country.

How much of a Fifth Column?

All this, of course, cuts both ways. It makes nationally conscious Siamese more inclined to resist than if they were faced with a merely external domination of their country, but it also means that in a crisis China would have an important fifth column of supporters within the frontiers, both on ethnic and on ideological grounds. Just how far the Chinese in Siam would in the event rally to Peking is a matter for speculation. There are certainly many among the younger generation who have become infatuated with the glory and greatness of the new China, to which they regard themselves as belonging, and would welcome and work for an extension of Peking's power over the whole region. On the other hand, their community in Siam is predominantly bourgeois in its social composition, and news from China has not encouraged them to look forward to subjection to a Communist regime.

In the last resort, however, the degree of Siamese national resistance to any southward move by Communist China would depend on the degree to which effective aid from America could be expected in an emergency. It is not likely that this would be forthcoming, or promised, in the form of troops, as it was in Korea. It would not be sufficient merely to provide arms, since the Siamese would be numerically inferior to Vietnam, even without a direct Chinese intervention. The recent remarks of Mr Dulles about the new American policy of relying on capacity for retaliation rather than local defence as a deterrent to aggression suggest in this case direct action against the bases and communications of an invading force rather than backing arms and men into Siam. But there would still have to be something solid to defend, and politically this is a matter of the internal stability of the country. It might also be the pivot for a wider grouping; the Siamese representative in Phnompenh, the capital of Cambodia, has just proposed that Siam, Cambodia and Laos should form a defence union, presumably leaving Vietnam to its own

devices. This suggestion has not been welcomed by the French, but in view of the extremely artificial character of "Indo-China"—formed by the union of three separate nationalities under French rule—such a regrouping of states is by no means out of the question. The problem is where and how Communist power could still be contained even if Vietnam were to be lost.

Writers in Soviet Russia—I

The Mark of the Collar

THE cares of the mind follow those of the body. The Soviet public has been lately promised greater material comforts, better clothing and food. Now in turn, it is promised better food for thought and better quality entertainment. It is freely admitted that the literary output of the Stalinist regime was scarcely superior to its production of consumer goods. The stereotyped plays, the prefabricated novels, the fifty shilling poems and criticism made to measure offended not only the intelligentsia but also the millions of new recruits to culture.

"Can one compare Soviet society with Tsarist Russia? And yet our classical authors wrote better. . . . Why have we no Gogols or Chekhovs?" a real or imaginary Lenin-grad engineer asks Ilya Ehrenburg, the well-known Russian writer. The gist of Ehrenburg's answer is that it is difficult to produce masterpieces depicting a changing scene, like Soviet society in transition. A third of a century has passed since the Bolshevik revolution, but during that time all energies were harnessed to economic development. In societies, as in human bodies, rapid physical growth is often accompanied by mental stagnation. This, however, does not explain everything. Like the domesticated dog in La Fontaine's fable, the Soviet writers try to hide the root of the trouble, the mark of the collar on their necks. They cannot write better because they are under a restraint which makes Tsarist fetters look gentle by comparison.

Amenities for Authors

True, they are well looked after, and many budding western authors may look with envy at some of the amenities. The Soviet writer has no need to aim below the belt of his reader. He does not compete with cheap thrillers or semi-pornographic trash. Materially it could be said that the Soviet writer fares better than Soviet literature. His earnings are good. Despite the notorious overcrowding, accommodation will be found for him in the town as well as room in a writers' home in the countryside. He is likely to own a car, which is a luxury for the Soviet citizen. What is more important, he is assured of good channels of expression and a wide public. There are many literary weeklies in all the republics; in Moscow alone there are three fat monthlies devoted to new writing and criticism. The 500 professional theatres and the thousands of amateur companies cry out for new plays. Books are translated into scores of languages. Stalin-prize winners, those Soviet best-sellers, are published in millions of copies. Novels enjoy a circulation of which a Tolstoy or Dostoyevsky could not dream, because in their time Russia had only a small educated élite, while now it has almost no illiterates and writers can keep in contact with their new readers through lecture and discussion tours.

But writers have had to pay a price for these benefits. The price has been a strait-jacket of absolute conformity not to revolutionary principles but to the latest directives of the Party. Gogol prefaced his *Government Inspector* with the motto: "Don't blame the mirror if the mug is ugly." Stalinist rulers, however, thought otherwise and have transformed writers into "beauticians," into Max Factors of Soviet society. Even when wrinkles are allowed, they must not exceed the duly prescribed quantity. In following the zigzags of the Party line the writer must tread carefully, for fear of falling into the pitfalls of modernism, formalism or any other dangerous deviation.

Such ruthless control was not imposed all at once. In its early days the regime gave writers great latitude as long as they did not indulge in open counter-revolutionary activity. Many freely linked their fortunes with that of the revolution. Admittedly, some could not fit into the new pattern and, like the poet Sergiy Yessenin, sought a way out in suicide. But when the most celebrated Soviet poet, Vladimir Mayakovsky, committed suicide in 1930 it was already because the air of the Stalinist regime was stifling. In Stalin's struggle against the opposition and in the following purges many writers fell by the wayside. Those who, like the novelists Babel or Pilniak, refused to abandon the primary duty of a revolutionary writer, to unmask injustices and cry them from the rooftops, paid with their lives. This method of selection favoured the survival of the skilful, the opportunists, the chameleons. A few were allowed to withdraw into silence or to limit their activity to translations from foreign languages. For the majority, even the historians, there was no such easy way out. By the late thirties Stalin had reduced Soviet literature to a crude utilitarian weapon of propaganda.

"Something is Missing"

On the eve of the war and during the fighting this weapon was used chiefly to foster national patriotism, to rally the troops for the holy war and to boost the morals in the rear. But after the end of the conflict there were signs of relaxation. Poets were allowed to echo the sorrow of widows and mourning mothers. Humourists dared to mock. As a hangover from the honeymoon period many modern western books were translated and plays produced. But Russia could not afford to do nothing but mourn its dead. Writers had to be mobilised for the task of reconstruction, while the cold war made flirtations with western ideas dangerous. Literary individualists could not be allowed to break the ranks and an immediate return to prewar regimentation was ordered. The new period was called "Zhdanovism," after Andrei Zhdanov, who in 1946 launched the attack against "modernists," "escapists," "bourgeois deviationists" and "grovellers before the West." Plays had to be withdrawn, books rewritten; the strait-jacket was reimposed.

But even Soviet leaders must have become aware that the crude utilitarian weapon was no longer appropriate for its purpose. It was suitable when millions of semi-literate *muzhiks* were making their first acquaintance with the written word, but in the meantime the industrial revolution had produced a large intelligentsia. Millions went to schools and colleges and they were brought up on Marxist criticism and Russian revolutionary tradition. The works of foreign and Russian masters have poured out in millions of copies from the State publishing houses, and with such reading made compulsory the Soviet public could not be

deceived for ever by the artificial concoctions of their own writers. Many must have wondered like Ehrenburg's correspondent from Leningrad "... Why was it written? Apparently it has everything, but something is missing. The book does not grip your heart and the men are not shown as they really are."

When propaganda has this effect on the recipient it ceases to be effective. So once again Stalinism was torn by its contradictions. It could not educate its subjects and treat them as illiterates; it could not offer them the tools and methods of critical thought and then prevent them from being applied to their own environment. The disparity between literature and reality became too flagrant. In 1952 a first attempt was made to throw off the Zhdanovist yoke. Critics began to discuss the role of positive and negative heroes in Soviet life and letters. This apparently abstract and innocuous debate was in fact threatening, though in veiled and cautious terms, the basic axiom of all Stalinist writing, that "all is for the best in the best of Soviet societies."

Georgi Malenkov clearly stood behind this anti-Zhdanovist trend, since it was he who, at the Party congress held in the same year, told writers not to forget the black colours on their palette when painting a picture of Soviet life. The writers hesitated to take the risk, and their caution proved wise. For soon after the Congress the vigilance campaign was restarted with renewed vigour, and "Zhdanovism" is the natural companion of vigilance. It was not until Stalin died that Malenkov could try again to inject some fresh blood into the shrivelled body of Soviet literature.

(To be concluded)

Rebuilding North Korea

IT seems to have been decided, whether by the Russians or the Chinese, that at all costs North Korea must not be outdistanced by its southern rivals in the race to post-war recovery. Which of the two masters cracks the whip is not yet clear, though since the purge in North Korea last August Chinese influence seems to have grown. Soon after the truce was signed Kim Il Sung went to Moscow to discuss Soviet aid. An agreement giving North Korea assistance to the tune of 1,000 million roubles (nominally about £90 million) was signed in September. It looked as though China had been outbid; but in November it came up with an offer of 8 million million yuan (nominally about £100 million), a shade more than the Soviet offer.

Meanwhile, all the east European Communist governments had "spontaneously" rallied to the cause. Czechoslovakia undertook to build, "without compensation," a number of factories, including an automobile factory, which by 1957 is expected to produce 6,000 cars annually. Poland is to erect a locomotive repair factory and to repair other plants and mines. Hungary, besides supplying technical aid and materials, will build an organic chemical factory. East Germany, Rumania and Bulgaria—and even Albania—have likewise undertaken to give material and technical assistance. In the main the Russians are devoting their energies to renovating heavy industry with special attention to the Yalu generating plants. But China, being late in the field, is stuck with light industry and agriculture.

This windfall of "aid from our fraternal countries,"

seems to be causing headaches in Pyongyang. After his visit to Moscow Kim Il Sung had decreed the orthodox Stalinist priority for heavy industry. But by December he had changed his tune. Outlining the three-year reconstruction programme now beginning, he said

the main feature of Korea's postwar reconstruction is to expand many factories of light industry ... with a view to raising the people's living standards.

This can hardly be North Korea's "new course" because it never had an old one. A more plausible explanation is that the Chinese, who may still have secret fears of Soviet encirclement down the Korean peninsula and certainly have fresh memories of Soviet imperialism in Manchuria, have now firmly assumed command in North Korea.

The Swedish Economy in 1953

IT would be hard to find fault with the steady, almost routine, progress of the Swedish economy in 1953. Indeed, the Organisation for European Economic Co-operation (OEEC) had little else to advise in its recent country study except "caution in future internal financial policy."

The year has seen no sign of a revival of the inflationary pressures of 1951. Money demands appear to be approximately in equilibrium with the available real resources, and as a result prices have remained fairly stable. There has been a tendency for the wholesale price index to fall but as yet this has not affected the cost of living. On the cost side, the wage level has remained constant, and so far as can be judged, the forthcoming round of annual wage negotiations, will not result in any marked rise in the wage level; there is in any event little scope for a rise. Contrary to expectations private investment demands have been at a high level, and as the government has no intention of cutting its own programmes, a threat to stability might develop from this quarter. Moreover, a decline in private savings suggests that private consumption expenditures have increased; but the danger of inflation arising from over-blown home demands on the economy's resources, must be taken in conjunction with the equally possible recessionary trends in the outside world.

Industrial production up to the end of October was, on the average, at the same level as in 1952; but fortunes were not equally shared by the different industries. The pulp and paper industries have done well, with shipments for export some 50 per cent and 30 per cent respectively better than last year. Prices, which had earlier fallen as a result of competition in export markets, had recovered by the end of the year. The timber industry likewise did better than expected as prices, which had fallen during the early part of the year, staged a sharp recovery during October. On the other hand the metal using industries, particularly those which serve the export market have been less well placed. It is in this sector that Swedish costs, which have risen more than the average world costs, are a handicap. The building industry, stimulated by low rates of interest and the government's own building programme, has gone from strength to strength. Agricultural production likewise has had a good year. As a result both of

good harvests and increased acreage output is expected to be higher than in 1952.

In foreign trade the year has witnessed a reduction in the Swedish balance of trade, due mainly to a fall in the value of imports. The volume of exports has increased; but owing to more competitive conditions abroad the total value has fallen. As for invisible transactions, the income of Swedish shipping, though affected by the low level of freights, has with the other invisible items been sufficient to cancel out the visible deficit. In consequence Sweden's holdings of gold and foreign exchange have increased. Particularly striking in the Swedish trade figures during 1953 is the decrease in trade with the Soviet Union and the East European bloc, which had by June fallen by more than 50 per cent. On the other hand the trade balance with the dollar area had improved materially.

Sweden's policies still continue to be based on the maintenance of the welfare state. Full employment is the major preoccupation of the government and, indeed, unemployment continues at a low level. But during the year steps were taken to expand the armoury of controls—monetary and fiscal—to maintain the economy on an even keel. Monetary policy has come to play a bigger part, though so far the Swedish authorities have not fully resorted to the interest rate mechanism. On the whole a policy of

THE SWEDISH ECONOMY

	Period	Unit	1952	1953

cheap but scarce money is being followed, with the result that the Riksbank has had to resort to a policy of direct as well as moral control over the operations of the banks and other financial institutions.

An economy in which foreign trade plays such an important part—foreign trade is more than 50 per cent of the gross national product—has of necessity to shape its policies according to the trend of events in the world at large. At present Sweden's economic policy appears to be better adjusted to a recession in the world than to a continuance of the *status quo*.

Spaniards and the Bases

BY A CORRESPONDENT LATELY IN SPAIN

THE conclusion of the recent United States-Spanish agreement has been joyfully hailed by official circles in Madrid as a major success for Spanish policy. In the country at large there is a feeling of "wait and see." The two principal fears are of inflation and of the impact of the Americans and their ideas.

If you ask a Spaniard in any walk of life what he thinks will happen when the Americans come, the answer, nine times out of ten, will be that the price of everything will go up. The Government is well aware of this prevailing fear of inflation and besides planning, in co-operation with the American authorities, to take steps which it hopes will prevent it, it has instigated a campaign of speeches by government officials and of articles in the controlled press of a "soothing syrup" variety. The editor of a provincial newspaper with a large circulation expressed in private conversation his serious fears of inflation on the very same day that his paper had carried an editorial expressing the government line that there would be none. Those who can afford to do so are building up stocks because they are convinced that by next year things will be double the price. Among the moderately well to do the atmosphere is beginning to be a little reminiscent of the panic buying in Spain in the early days of the war. There is a gloomy awareness, too, that the days of cheap domestic labour are likely to be numbered, partly because of the unpopular American habit of paying more than anyone else can afford, but perhaps even more because it is felt that the Americans will bring with them an increased tempo of industrialisation with its consequent drain on the labour market.

In business and financial circles full information on how it is proposed to spend the \$85 million to be devoted to economic improvement has been anxiously awaited; but it is felt that some degree of inflation is unavoidable. Little doubt is felt that there are bound to be shortages of those materials, such as cement, which will be required for building the bases and the much-needed housing programme will probably be among the first to suffer. Already the black market price of cement has risen considerably.

Pride—and Prejudice

The Government is well aware, too, of the dangers inherent in the impact of American personnel on the Spanish public, and it is probable that the delay in the negotiations was in part due to this problem. To a people with as fierce a national pride as the Spanish, the situation will be fraught with explosive possibilities and already tales are circulating of incidents which have occurred in the north of Spain when Americans from their base in France have crossed the frontier.

"There won't half be trouble if the Americans start trifling with our girls," said one working-class young man in his native Andalusia. "In this country we know each other from childhood, marry and stay faithful until we die. We don't want American customs here; it would have been far better to have continued making slow but steady progress on our own." Another Spaniard was convinced that General Franco had arranged that only married Americans, accompanied by their wives and families, should man the bases. Church circles also fear the introduction of moral

THE ECONOMIST, JANUARY 16, 1954

laxity. The problem assumes far greater proportions in country like Spain, whose outlook on women, particularly in the south, derives from its Moorish past and where deep-rooted natural instincts on the subject are supported by the strong influence of the Church.

There has naturally been a great deal of speculation on the whereabouts of the naval and air bases. American sources have recently given the naval bases as El Ferrol, Cadiz, Cartagena, Mahon and Palma, but at the time of writing this information has not been confirmed by the Spanish Government. Many natives of El Ferrol who are also supporters of General Franco will be gravely disappointed if their native city, which is Spain's finest naval base, is indeed to be at the disposal of the U.S. fleet. El Ferrol is also Franco's native city and for this reason they have boasted that he would never allow it to become an American base.

Spaniards have been conditioned by a long series of disappointments not to expect too much from American aid. When at last they did secure an American loan in 1951 proceedings were at snail's pace and credits under the loan have still not been entirely exhausted. It was, therefore, less of a disappointment than it might otherwise have been to find that the credits to be made available under the agreement were comparatively small. The cynical view of American aid taken by most Spaniards is reflected in an amusing film "Welcome, Mr Marshall," which was shown throughout Spain in 1953. A Spanish village, keyed up to a fever of expectancy after elaborate preparations to receive a Marshall Aid delegation, has its hopes dashed when several large American cars speed through the village, the last bearing a placard on which is written "Goodbye."

"American aid will never reach us, it will only serve to make the rich richer" is the usual reaction of any working-class person. This view is endorsed by authorities who should know, to the extent that they think it will be a very long time before the working-class is likely to benefit and that meanwhile the intervening period of inflation is likely to prove the reverse of beneficial to those who already find mere existence a hard struggle.

There are optimists among General Franco's opponents who believe that the coming of the Americans will inexorably, though gradually, force the regime to adopt more democratic methods. The American version of these, however, has suffered in reputation in Spain, as elsewhere in Europe, because of Senator McCarthy. A story has been

THE ECONOMIST, JANUARY 16, 1954

circulating in Madrid that the Spanish Government intends to impose restrictions on the American model to prevent Americans who had ever been freemasons (who with "liberals" are anathema to the Franco Government) from entering the country; the story may not be true but it is an interesting comment on the hopes of the optimists.

It would be difficult to imagine two countries more different in outlook than Spain and the United States. Spain is *par excellence* the country of spiritual values and of Don Quixotes tilting at windmills, albeit with a shrewd streak of Sancho Panza's realism thrown in. The more practical and materialistic standards of the United States hold little appeal. When surprise was expressed at the tardiness of Spanish companies in tendering for construction work at the American bases, the explanation said to have been given was that it is not considered courteous by Spaniards to hustle. The American impact on Spain should indeed prove interesting to watch.

India and Africa

FROM OUR BOMBAY CORRESPONDENT

MANY sinister and excited explanations have been offered for India's interest in Africa. The facts are, by comparison, quite drab. All that Indians do is to apply to Africa a few simple principles which they originally learned from England, by which they obtained their own independence and which, for them, have been proved beyond argument by the success of August 15, 1947. These principles are all very Victorian. Votes for all, the right to self-government, the right to agitate, condemnation of terror, racial and religious equality, it all sounds like a Liberal programme of the 1880s. Even Mr Nehru's lectures on the need for colonialism to give way to the new nationalism often sound oddly like the lectures to the Hapsburgs about Slavs and Italians of which Englishmen were so fond before 1914.

The key to all Indian views on Africa is the belief that one white man equals one black man, and only one black man. This belief, which India shares with all the newly freed countries of Asia is, perhaps, the most deeply held of all Indian attitudes to the world, for it is a belief enforced upon India by its interest, its history, and its ideals alike. Indians have indeed experienced the bitterness of racial discrimination in their own country sufficiently recently for the memory still to be raw. When Mr Nehru says that he wishes to interfere in nobody's internal affairs, but that racial discrimination always and everywhere touches India, to every Indian he is merely repeating a truism. Indians are, moreover, hardened in their hatred of discrimination by their knowledge that, in their own country, they are doing their best to get rid of it.

From the belief in racial equality flows all the rest of Indian attitudes. In British West Africa, where whites have no privileges, Africans are ministers, and the goal is obviously Dominion status, there Indians have only approval for British policy, and quite accept that time is required for a final consummation. The moderation of Mr Nkrumah is admired and the compromise reached at the London conference on Nigeria was regarded as much more sensible than the cry of "Independence by 1956." Indians already look forward to the day when they will welcome these West African colonies into the Commonwealth.

Indian hostility arises only in those areas where there is a resident white population, and where it is felt that these resident whites are being given an undue share of privilege and power. In these cases every Indian identifies himself at once with the African (not, be it noted, with the local Indian). No Indian stops even to wonder whether, perhaps, Africa is not still at the stage of India a hundred years ago, and whether foreign rule there may not, perhaps, still have something to offer; or if he does, he blames the colonial power and the settlers that it should be so. If the Kenyan African or the Tunisian Arab is not ready for self-government in the Gold Coast style, then Indians feel it must be because their people have been deliberately kept back. And they find this keeping back not only wrong but foolish; for they fear that the South African nationalists and the French colons are bulldozing a path for Moscow.

The Common Sense of the Common Man

Indians indeed feel that the future of the white settler lies not in privileges but in leadership. They do not accept that it must for ever be his right to guide and to rule; they do accept that he has a great contribution to make and that the African may well, for years to come, repay that contribution by support. Once again the Indian view stems from India's own experience. The Indian Constitution, by one of the great decisions of history, gave a vote to every Indian, literate or illiterate, touchable or Untouchable, Brahman or tribesman. The faith thus shown by the educated in the common sense of the common man was amply rewarded in the last elections: it is still the educated who rule India. They feel that if the white settler in Africa would show similar courage he might reap a similar reward.

Indians take exactly the same view where their own Indian immigrants in Africa are concerned. India gives them no support in any demand they may make for privileges. Once they emigrate they are expected to become good citizens of the country of their adoption and to ask for no more, though no less, than other citizens of those countries. India will indeed, as in South Africa, support them against discrimination directed against them simply because they are Indian. But India favours the common roll for all citizens, not the separate electorate by which Indians as well as Europeans are at present over-represented in East Africa. Indeed, the unfortunate Indian in Africa gets nearly as many lectures from Indian editors for failing to identify himself with the Africans as does the white; nobody asks himself whether this failure may not mean that the process of identification presents real difficulties. Indians do not even stop to ask whether, perhaps, their civilisation is not greater than that of the Matabele—that is simply not relevant.

If Europe in Africa is sometimes judged harshly in India it is because it is judged by precisely those standards of European Liberalism which India has learnt to admire. Nobody cares about what France has done to develop Morocco; what they want to know is whether French conduct in Morocco conforms to the rule of *Liberté, Egalité, Fraternité*. Nobody cares about the economic advantages of Central African Federation; it is attacked because it goes against the will of the African majority. But the origin of all offence is, of course, apartheid—for in apartheid Indians see, raised into a system, that belief in the superiority of the white race which to them is so utterly unacceptable.

Ibañez Disappoints Chile

FROM A CORRESPONDENT

CHILE'S constitution, presidential in form, is modelled on that of the United States, but rests on a system of proportional representation of incredible fairness and complication—which produces more splinters than even France can boast. The election of General Carlos Ibañez del Campo as president a year ago was primarily due to disillusion with the traditional parties and to the reputation as a strong man he had gained during his previous term of office, which ended in 1931. Those of his supporters who expected miracles—and many did—will necessarily have been disappointed by his year of office.

The first, and radical, difficulty of the Chilean economy is that some 70 per cent by value of its exports are composed of copper and nitrates. As the producer of 12-13 per cent of the world's copper, Chile has on several occasions recently tried to sustain a weakening market by withholding supplies or by threatening to sell them behind the iron curtain. By refusing, from early in 1953 until last month, to reduce its selling price below 35½ cents per pound in spite of the fall in the world price, Chile assumed the position of the marginal supplier; the world only bought from Chile when others had sold out, or if buyers could afford to mix high-priced copper with lower. In the event Chile sold at 35½ cents about 105,000 tons out of a 1953 production of some 225,000 tons; this meant both a reduction in total foreign exchange receipts, and the embarrassment of holding 120,000 tons in stock. In sum, Chile under Ibañez has made the same desperate effort as other Latin American countries to hold the exceptionally favourable terms of trade of early 1951, while little enough has been done to lessen the dependence of both fiscal and foreign exchange budgets on receipts from copper sales.

Chronic Inflation

But if the reliance of Chile on copper and nitrate exports is a trick of fate and of geography, the same cannot be said of the chronic inflation which is General Ibañez's second problem. Inflation has been endemic in Chile ever since the War of the Pacific in 1870. By 1890 the Chilean peso had lost half its 1870 value; by 1910 it was worth half as much as in 1890, by 1930 only a quarter as much. Since then, progress has been more rapid; official cost of living figures (March, 1928 = 100) reached just over 300 by 1942, 600 by 1947 and 1,200 by 1951. In May, 1952, the index was 1,602; a year later it was 1,767; by August, 1953, it had reached 2,084.

This fever might have been justified if it had helped to cure the patient of some ill, or had proved a vehicle of inspiration. But in the last decade the national income figures show no significant degree of redistribution between different groups of earners, nor has the growth of the economy been impressive. On the contrary, figures from the UN Economic Commission for Latin America show Chile as having, for that continent, a relatively low figure of investment—13 per cent of the gross product, by comparison with Brazil's 20 per cent and Mexico's 16½ per cent. Real income per head in Chile has remained about the same since 1945, while that of other countries with a far higher rate of population increase has shown a sub-

THE ECONOMIST, JANUARY 16, 1954

stantial increase. Chile thus risks being caught up by neighbouring countries that had been far behind it. Nor is this all. Agriculture in particular has decayed, and a report by experts of the FAO and the International Bank emphasises that until inflation is halted it will be of little use to put into execution their detailed recommendations; the effect of these would be to improve rural living standards and to revive the production of foodstuffs which Chile now has to import. Until last July the government, by providing preferential rates of exchange to keep essential goods cheap, succeeded only in stimulating the consumption of imported goods while inhibiting their production at home.

The pathology of inflation in Chile has embraced all the classic causes at one time or another; but by now it is much more a political than an economic problem. Those whose wages there is talk of freezing can always show that the cost of living has gone up. When attempts have been made in the past to limit credit, not only have the banks failed to co-operate, but commerce and industry have protested loudly. Twice, in 1945 and again in 1950, coalitions have not been compact enough to get away with anti-inflationary measures.

A Leaf from Peron's Book

On taking office at the end of 1952, General Ibañez spoke much of the "chaos" in which Chile found itself; but in spite of the "extraordinary powers" he secured, little was done until recently. The economic plan announced last July brought about some necessary adjustments in the exchange rate, and abolished preferential rates, while at the same time a wage increase was awarded to lower-paid workers to compensate for dearer imports.

The government has also taken what seems to be a leaf out of the Argentine book by intensifying psychological warfare against inflation through a tighter control of prices and the institution of new "economic offences." Such action is admittedly legitimate when the main impulse towards inflation is psychological rather than economic; it may have some justification at the present time, when world prices are falling. On the other hand, the terminology of the new crimes is somewhat reminiscent of Peronismo, and so were many of the references to inflation in General Ibañez's speech marking the anniversary of his accession. He spoke, for example, of an "exaggerated upward tendency of prices stimulated by certain unnameable interests which live by inflation" and of conspiracy by "factors extraneous to the Plan." Coming after an enumeration of achievement which consisted almost entirely in the creating of new state agencies, such a tirade might be mere rhetoric. But the president, repeating his earlier complaint that he is a "prisoner of the laws," seemed to hint that he would have done plenty had he been allowed to. Finally, he referred to the "proliferation" of parties, and called for "a new political discipline" to arrest it.

For several decades Chile has been one of the two most genuinely democratic nations in Latin America. But some months ago a Senator pointed out that inflation could make an end of Chilean democracy. The electorate had voted for General Ibañez because they were disillusioned with the old parties, grouped round the Radicals, who had governed Chile for so long. If the General, with all the special powers granted to him, fails to put things right, then a political vacuum may be left which others may try to fill.

THE ECONOMIST, JANUARY 16, 1954

THE GOOD NEIGHBOURS

NINETY-THREE thousand people, drawn from all parts of the world, work for Dunlop—"good neighbours" to those whom they serve. They work in 61 Dunlop factories, producing goods that are part of the wealth of the world; they work in warehouses and depots in the international chain of Dunlop supply points; they work in offices, on rubber plantations and in research laboratories.

Others, possessed of the practical wisdom that research and experience have given to Dunlop, go out into the world to offer that wisdom wherever it will be of help. Everywhere the door is gladly opened to these men from Dunlop—by car and cycle designers, aircraft constructors, mine managers, doctors, engineers, architects, furniture stylists, by almost everybody who is concerned with industrial, domestic or scientific progress.

Of the advances which benefit mankind in its work and its leisure, many have been made and will continue to be made by the inventiveness, enterprise and effort of the men and women who make up the worldwide Dunlop organisation.

makes things better
for everyone

DUNLOP RUBBER COMPANY LIMITED · ST. JAMES'S HOUSE · ST. JAMES'S STREET · LONDON, S.W.1

and

NOW IN BRITAIN FROM CANADA...

Mr. H. V. Petersen, Vice-President of The James Fisher Advertising Agency, to service British clients and to counsel U.K. advertisers interested in the Canadian market.

For 35 years, The James Fisher Company Limited has been established in Canada. The clients of the firm include a number of world-renowned British Companies.

The policy of our Organisation is for one of our executives to visit Britain regularly in order to discuss problems with our United Kingdom clients. We feel that understandings are more completely and quickly reached in this way. It is a service our clients in Britain have always seemed to appreciate.

With the increasing interest that U.K. Companies are taking in the Canadian market, we feel we could be of help in supplying information and giving them advice. With this in mind, Mr. Petersen, who has been in the advertising business in Canada for over 30 years, will be available at the May Fair Hotel, Berkeley Square (Mayfair 7777), from January 18th until February 10th.

● Please do not hesitate to call should you wish information on the Canadian market.

THE BUSINESS WORLD

Aden and Abadan

"THE British team," records the latest issue of the *Little Aden Mercury*, "needs considerably faster and younger players to meet the Somalis on anything like an even footing." They had, indeed, been soundly trounced by six goals to two. The same issue of this lively camp newspaper reports, with dramatic photographs, one of the big "lifts" that are almost a daily occurrence—a 32-ton section being delicately centred to complete an oil distillation tower 136 feet high and weighing 145 tons, under the expert care of "Sundown" Gilpin and Babe Carter, whose nationality calls for no guesswork. The open-air cinemas provide English, Italian and Arabic films; a tombola is advertised in the Levantine employees' recreation hall, softball under floodlights at 7.15 p.m., and swimming, safely protected from the sharks, after the ten-hour working day.

This may sound remote from oil. It is, in fact, an inseparable part of the construction of a refinery in what, only thirteen months ago, was a desert stretching down from protecting rock pinnacles to the beach. The job is multi-national. American and British contractors are working jointly on the construction of the refinery, with a British team building the harbour. The British labour force is nearly 1,400; over 800 Levantines and nearly as many Italians; over 500 Somalis and nearly 500 Indians; there are 270 Americans who give the impression of having built oil refineries all their lives, and a hundred or more Dutch specialists on dredging and pile driving. To these 4,500 men, with their multiplicity of crafts, must be added 9,500 Aden nationals, most of them recruited from distant settlements in the Protectorate with nothing but their health and their hands.

Provision for such a mixed, artificial community which by the end of this year will be dispersed, leaving a mere 250 British and 1,500 Arabs and Indians to

work the refinery, is bound to be expensive. Of the total cost of £45 million to which the Anglo-Iranian Oil Company is committed in this venture, perhaps a quarter will have nothing directly to do with oil—housing, contributions to public roads, services of all kinds including a splendid hospital, and the wholesale moving and rebuilding of an Arab village are some of these extras. The company is building not only a refinery, but also a township. The argument for doing so is clear; comfortable beds and air-conditioning, good food for all races and colours, first-class medical attention, and opportunities to play hard as well as work hard—all these are the calculated price of getting the refinery "on stream" by the due date of December 1st. It will not be the contractors' fault if they fail to collect their bonuses for getting the job finished earlier.

★

The timetable for the development of the Aden project is of much interest. By 1950, Anglo-Iranian had decided that a big new refinery should be set down somewhere between Suez and India. In March, 1951, the Persian Government took into its own hands all responsibility for oil operations in Persia and by October of that year all the British staff had left Persia. At almost the same moment, reconnaissance parties were visiting Aden, and they chose a site at Little Aden, on the west side of the bay opposite Aden itself. Further surveys followed, and later in 1952 an agreement was concluded between the company and the Aden Government. Eventually, on November 1, 1952, the enormous work of construction began.

It is tempting, on the evidence of this timetable, to regard Aden as being part of the company's reply to the loss of Abadan. But it is indeed a partial and a limited

reply. Abadan had increased its production, until it was closed down, to nearly 32 million tons a year; Aden will handle 5 million tons. Nor will it turn out highly specialised products. "Elementary" is hardly the right word to apply to any oil refinery, but Aden is simpler than most. There are American refineries that leave no more than 20 per cent. of a barrel of crude in the form of fuel oil. Aden is being designed with its two distillation units to convert 60 per cent. of its 5 million ton throughput of crude into 3 million tons of marine bunker oils, the principal market for which lies on the doorstep across the bay. Gasoline, kerosine and diesel oil will be produced for the Red Sea and Indian Ocean markets. One of the remarkable features of Abadan, when it was in full operation, was that any surpluses of fuel oil from the refinery process could be "re-cycled"—that is to say, pumped back into the crude oil wells, and when the demand for the lighter products was pressing, this practice involved no waste and no marketing problems. But at Aden crude from Kuwait will have to be shipped, and processed in a refinery designed primarily to produce the fuel oil that Abadan provided in such abundance.

This is not to say that Aden is uneconomic. At present the oil berths at Aden are in part provisioned from the Kent Refinery at the Isle of Grain; tankers pick up crude oil from Kuwait, carry it to Kent, and fill up for a large part of their return journey with fuel oil for Aden. Such a return trade can hardly have formed a permanent element in the original calculations for the Kent Refinery, and this unexpected market has no doubt been welcome. But with Aden in production by the end of this year, and Abadan perhaps in partial working order by that time too, the possibility of temporary embarrassment in fuel oil supplies at that time is evident.

*

But this is an embarrassment that must fall more heavily on the Persians than on anyone else. If in future the demand for oil throughout the world is going to increase by about 5 per cent each year, instead of the 10 per cent bonanzas that were recorded in the immediate postwar years, the accommodation of considerable supplies from Persia, though easily possible in the longer run, may not be so simple on the shorter run. World oil production is already in a posture of controlled surplus, in the sense that it could pour out another 75 million tons a year from its existing capacity, without any contribution from Persia. Persia's neighbours across the Gulf have been counting on the continued expansion of demand to take up the phenomenal increases in output and capacity which made the loss of Persian oil such a comparatively light burden in the European and Eastern markets. It is not to be expected of Kuwait, Saudi Arabia and Iraq—or of the companies that operate in those countries—that they will be prepared to make major sacrifices or inhibit their future

growth for the sake of restoring Persian output on a full scale.

In recent discussion about the resumption of Persian oil production, the greatest emphasis has been put on the problems of marketing. They may, indeed, be awkward for a time—for the European refineries now exporting fuel oil to unexpectedly distant markets, and for the major groups (always under suspicion in the Department of Justice) who attempt the complicated co-operative operation of syphoning Persian oil once more into the markets of the Eastern hemisphere. Their task may not be made any easier by the need for the Persian Government to be able to show quick and rewarding results once production is resumed. But the inescapable fact is that no large markets exist for all the oil that Persia may again produce which remain uninfluenced by what the major companies may do or have reason for complaint at the way the companies have served them since 1951. Thirty million tons of oil is an ocean that would swamp the world; if Persia is to work towards that output it will take years, not months, before markets are ready for it.

There has, however, been much less emphasis on the conditions that must be secured before oil begins to flow through Abadan. If it is assumed that the National Iranian Oil Company remains the "owner" of the Anglo-Iranian company's assets in Persia—in other words, if an explicit understanding about compensation can be reached, for the first time since expropriation three years ago—it will be necessary to furnish a large number of foreign technicians to operate the industry. Such a group could easily encounter political trouble in getting production under way at the controlled speed that orderly marketing conditions outside Persia would require. A lot of money will have to be found—conceivably as much as the Aden refinery is likely to cost—to restore the Persian installations. Such a group would have to be guaranteed virtual extra-territorial independence, and would have to be assured that they could exercise power without threat of local political interference. And since, in crude shorthand, the world has shown that it can get along without Persian oil at a pinch, and the resumption of shipments must imply co-operation among companies that have established bulk outlets, it must be part of the bargain that the Persian oil industry must be operated by the highest technical and commercial skill—and this can only be found outside Persia itself.

These will not be easy conditions to accept or defend in Persia. But the building of the Aden refinery must rub home in the Persian mind the lesson that the oil industry itself learned at a much earlier time. Oil is an international commodity, influenced in various parts of the world by the policies of the major groups, but controlled by none. If any source of supply is cut off, others are almost instantly ready to fill the gap. Abadan has lost what Aden will gain in economic advancement. It will be a permanent loss if the lessons of the last three years are not properly learned.

The Bank and Commodities

IT is just over seven years since the first international commodity market in Britain was freed from its wartime shackles. Rubber was chosen in November, 1946, for the first attempt to reconcile the freedom of commodity operations with the requirements of sterling exchange control. It was an experiment devoid of serious risk, for rubber is almost wholly a sterling area product and the restoration of freedom in dealing involved little chance of dollar losses. Even when rubber bought by merchants in London involved payment in dollars, it could be assumed that at an earlier stage dollars had been offered against sterling in order to secure the commodity. The broad outline of the exchange control arrangements for dealing with rubber has been followed in the subsequent schemes (all told they now number ten) which were evolved as, one after another, the commodity markets regained their freedom; but a firm background of experience and waning faith in high places in the efficacy of controls have allowed greater risks to be successfully taken.

There are three main features in all these commodity schemes: First they are exclusive. The privileges accrue only to firms which can show a continuing interest in the import or marketing of the commodity concerned. It was probably inevitable that the facilities should have been granted only to firms which are subject to the discipline of a recognised trade association and the Bank of England has left the market authorities in no doubt of its dislike of all monopolies save its own. Still the exclusive nature of the schemes calls for vigilance. Secondly, the granting of the necessary financial authorisations is delegated by the Bank of England to the authorised banks. The ultimate control of the Bank of England is exercised only *post facto* on the basis of monthly returns made by the participants of each scheme. Thirdly, there remains a relic from the high summer of market controls. Monthly returns of the open position have to be made to the Bank of England and the Bank can call for remedial action if unwarrantable speculation exists.

*

Although the main outline of the schemes remains unchanged, the detailed provisions have had to be adjusted to each commodity. With rubber it was possible to allow participants in the scheme to buy and sell where they wished, irrespective of the currency of settlement and to hold stocks in any part of the world. The normal exchange control regulations had to be obeyed in that sales to residents outside the sterling area, though made without formality, had to be settled in sterling from a non-resident account appropriate to the country of the buyer or in the currency of the buyer's own country. But participants are free to deal

and to clinch offers to buy and sell without each transaction having to run the gauntlet of exchange control.

Tin is also essentially a sterling commodity and the risk of dollar losses was small. That risk increased appreciably when lead and copper were freed, but it was deliberately accepted on the ground that any possible loss would be more than compensated by the merchandising profits earned in London. The effect of freedom of commodity arbitrage on the general structure of metal prices was also expected to be favourable. The metal market like rubber has been given the right to buy and sell in any currency area; it can procure the imports required for British domestic consumption and also supplies intended for resale to third parties.

*

Important divergences in the actual operation of the commodity schemes began to appear as commodities with more substantial element of dollar cost were freed. In these later schemes it was generally considered necessary to set limits to the scope for free arbitrage—in other words, to set limits to the potential convertibility of the sterling involved in such dealings. In the coffee market, which was reopened for third party transactions in July, 1947, and in cocoa, to which freedom was restored in January, 1951, there is limited freedom for arbitrage dealing. The general arrangement is that purchases can be made for consumption in the sterling area in the cheapest available markets, but for resale outside the sterling area the rule is "dollar for dollar." This general rule is, however, subject to some administrative relaxation and for some time past participants have been allowed to pay dollars for these commodities, not only when they are consumed in the sterling area, but also when they are resold to members of the European Payments Union. This is one of the few relics of the short-lived general authorisation for commodity arbitrage between the dollar and the EPU areas sanctioned in August, 1952. These two commodities have been kept on the free arbitrage list between the two areas partly because the net cost of dollars is small but also because the re-exports to EPU countries bring in a certain amount of gold and also help to discharge the United Kingdom's debt to EPU. The situation may have to be reconsidered if and when the United Kingdom gets into overall credit with EPU and when the net dollar cost of such arbitrage would be balanced by unrequited export reflected in the accumulation of a credit balance with EPU.

Still less freedom to convert sterling is allowed for sugar and for grains. A market for raw sugar was reopened in November, 1952, but freedom to buy in any part of the world is confined to that small part of British refiners' requirements which is re-exported in

the refined form. If such sugar has to be paid for in US dollars or by a sterling credit to an American account, it can only be sold outside the sterling area against payment in US dollars or in sterling from an American account. The dollar element in sugar is so prominent that free arbitrage in London would tempt faithless holders of sterling to make switch transactions in Cuban or other dollar sugar. Government trading still caters for the whole of the imported sugar used by the British refiners in their home trade, amounting to at least three-quarters of their total consumption of imported sugar. This is partly due to the high dollar content of imported sugar, but partly also to the fact that the free market mechanics of fulfilling the guaranteed market for Empire sugar have still to be worked out.

The most important step in the freeing of commodity markets was taken last June when freedom was restored to dealings in grain—an importance due not only to the large trade involved but to the predominance of the dollar countries as suppliers. In grain also participants are free to buy in any part of the world, irrespective of the currency in which payment has to be made, provided that the grain is destined for consumption in the sterling area. If dollar grain is sold to a buyer in the sterling area other than the United Kingdom, evidence must be obtained that the transaction has been approved by the local exchange control authorities. If dollar grain is resold outside the sterling area, payment must be made in United States or Canadian dollars, or in sterling from an American or Canadian account. The restoration of freedom of dealing in grain, therefore, provides an interesting exception to the normally accepted design for convertibility, namely, that it is a privilege to be offered first to non-resident sterling. In this context sterling owned by residents can be used to buy dollar grain without restriction, while sterling owned by non-residents does not share the privilege.

★

The exchange arrangements made for the reopening of terminal markets are also fairly simple. Here, too, it has been necessary to restrict convertibility. The normal procedure is for operations on the terminal markets in wool, wheat and later cotton, to be settled not by taking or making delivery of the forward purchases or sales, but by paying differences between the prices at which the operations are arranged and those ruling on the settlement date. Provision has been made under exchange control that all such differences can be met in the currency of the operator. If, for example, a United States firm deals in the terminal market for wool and a difference is due to it, that difference will be paid in dollars or by crediting an American account. If, however, the non-resident dealer takes delivery whether of wool or wheat, or later, of cotton, he will be able to re-export only subject to the usual restrictions on export licensing and on payments. In particular

it is stipulated that any such commodity which may have cost dollars can only be re-exported against the receipt of dollars or American account sterling. The Bank of England has nevertheless been most considerate at an administrative level, more so than the central banks of some other countries.

★

It is generally agreed that the freeing of the commodity markets and the attendant "bending" of the exchange control mechanism to that development has been a great success. Acts of commodity shunting with loss of dollars have certainly occurred, more often in the period when sterling was under pressure than now. But the markets have brought back to London a considerable volume of entrepôt trade with its accompanying profits and ancillary activities. They have brought down the level of sterling commodity prices and removed the handicap of relatively high raw material prices from which British industry was previously suffering. The marrying of exchange control to the free commodity markets has provided a good example of evolutionary adjustment so characteristic of British administration. The fears of heavy dollar losses that prevailed when commodities with a considerable dollar element, such as lead and copper, were freed, have proved utterly groundless. To the astonishment of some faint hearts, foreigners appear to regard sterling as a good currency to trade in and to hold; there has been no flight through sterling into dollar commodities.

Most of the commodity schemes have so far not been tested in the atmosphere of a real dollar famine. The postwar markets for rubber and tin have certainly lived through most anxious periods for the sterling economy, but rubber and tin are sterling commodities. Recently, greater risks have been taken with commodities like grain with a high dollar element, but during a period when sterling has been a hardening currency. It is only right to remember that the cleverly devised combination of free markets and exchange control has not been fully tested in the atmosphere of trade recession or of a weakening sterling exchange.

Outlook for Exports

The quarterly reports issued by The Economist Intelligence Unit may or may not confirm your hunch about sales prospects abroad. But these reports are the result of careful analysis of sound opinion and reliable information on matters of concern to those doing business with other countries. Also they are concise and up to date, and each one contains a statistical summary and charts to show business conditions and trends at a glance.

Separate reports are published every quarter on fifty territories. Particulars and specimen reports may be obtained from:

Business Notes

Few Headlines from Sydney

THE flow of news from the Sydney conference of Commonwealth Finance Ministers has so far provided a rather disjointed—and, at times, seemingly, a garbled—story of its proceedings. And, even after the issue there on Wednesday night of the first official communique, the account is still somewhat blurred. But it is evident that the talks have traversed the ground mapped out beforehand—some of it was indicated in these columns a fortnight ago—and that there has been some frank speaking along the route. That is as it should be, since the main purpose of this gathering was to compare the several points of view of the members of the sterling family and to preserve a common approach to basic objectives rather than to reach clear-cut decisions.

It has now been reaffirmed that the best approach to the ultimate goal of lasting stability for the sterling area's balance of payments is by way of well-conceived development of Commonwealth resources. The need to press this effort forward was evidently underlined by the estimates put before the conference of the trend of sterling area trade, which showed that, while the system's imports are rising significantly after their constriction during the emergency of 1951-52, its exports are tending to decline. According to the cabled reports, in the twelve months to mid-1954 the total imports of the sterling area from the rest of the world are likely to cost £160 million more than in 1952-53, while total exports may yield £30 million less, with the result that the surplus realised in 1952-53 is likely to be approximately halved. This rising trend of imports, which is apparently expected to become more marked in the current half year, seems to have been partly attributed to re-stocking; but it would be unwise to treat it as an ephemeral trend. The greater, therefore, is the need to stimulate exports; and particular emphasis seems to have been put upon the desirability of increasing them to the non-dollar, non-sterling countries—among which the Western European countries and Japan are especially important.

seas members seemed to have built up. These members certainly protested at the austerity of the conditions upon which the Treasury has tried to insist before conceding access to the market; and it is evident that, in face of these arguments, Britain's representatives have given some ground. It is not clear, however, how large a concession has been made; it is probably less than the overseas commentators at present suppose. Mr Butler is reported to have promised at the conference that there would be easier access to the London market than in the past; but the nature of this easing, if disclosed, has not been explained in the cabled reports. It seems probable that Britain still adheres as firmly as before to the fundamental condition that British capital cannot be spared (and perhaps diverted from home investment) unless its employment in the overseas Commonwealth genuinely promises a strengthening of the balance of payments of the whole group. But, while insisting on this basic condition, Britain may have agreed to some modification of the way in which it is applied to particular loan requests—recognising the difficulty of the Dominions, and notably of Australia, of relating their borrowings to specific projects. Light on this and other points, however, must wait upon the text of the final communique, from the conference which is expected this weekend.

Meanwhile, on one vital matter the reporting has been quite clear. The conference, donning rather rose-hued spectacles, has noted "signs that world trade and payments are moving towards a new postwar equilibrium, and that the difficulties of achieving convertibility and freedom of trade from import restrictions are being reduced to proportions that the sterling area may be able to handle with a high prospect of success." But, after this burst of high confidence, it wisely and bluntly emphasises that there can be "no thought" of fixing any date for full convertibility until the attitude of the United States has been clarified.

Exports Mark Time

THE provisional trade returns for December confirm what had been all too apparent before—that the value of Britain's exports in 1953 would be no larger than in 1952. In dismal fact the total was precisely the same, at £2,582 million f.o.b., and would have fallen short of the 1952 figure but for a saving spurt in the last quarter. Export prices fell by about four per cent last year, so the volume of exports was that much larger than in 1952—a crumb of comfort from what should have been a year of advance in the export trade, but was actually a year of marking time. The provisional value of exports in December was £224.6 million f.o.b. This was well below the abnormally high figure of

Easier Access to London?

THIS survey of the prospective balance of payments seems to have furnished the prelude—certainly a logical one—to the problem of development, which plainly bulked very large in the discussions. Mr Butler's several enthusiastic statements made *en route* for Sydney seemed, as reported, to have been increasingly calculated to make overseas members of the family suppose that the gates of the London capital market were to be thrown wide for them. The actual talks in Sydney, it is to be hoped, have since dispelled the more extravagant hopes that some over-

£239.9 million in November, which also had 25 working days; but allowing for the extended Christmas holidays this year, December's exports were creditable. On a working day basis, total exports including re-exports averaged just over £9.2 million, compared with nearly £10 million in November and a third quarter average of £8.5 million. The decline compared with November also reflects a fall of £1.9 million in re-exports to £7 million in December; for the whole of 1953 re-exports were £105 million, or £39 million less than in 1952.

The decline in exports to North America continued in December, when they fell to £22.7 million from £25.1 million in the previous month; a recovery of £1.1 million to £12.4 million in shipments to the United States was more than offset by a sharp fall of £3.4 million to £10.4 million in shipments to Canada, which may have been

UNITED KINGDOM TRADE

due to the freezing of the St. Lawrence river. The average for the fourth quarter, at £24.9 million, was just £1.8 million less than the third quarter average, but £4.6 million below the record average of the second quarter. For the year 1953, however, exports to North America were £39.9 million, or 14 per cent, higher than the total of £275.7 million in 1952. Shipments to Canada rose by no less than 21 per cent to £156.8 million, and shipments to the United States rose by nine per cent to £158.8 million.

Imports in December, at £281.5 million c.i.f., were £9 million higher than in November, bringing the monthly average for the fourth quarter to £276.8 million. This was just £2 million above the third quarter average but two per cent below that for the first half of the year. Total imports in 1953 were £3,347 million c.i.f., which was £132 million, or four per cent, less than in 1952. But the volume was roughly 10 per cent higher, thanks to the steep fall in import prices. The net result of these changes in Britain's trade was a fall of £93 million in the gross visible deficit to £660 million in 1953. In the second half of the year the deficit declined to £277 million from £383 million in the first half.

No Yardstick for Steel

INVESTORS who approach the Lancashire Steel share offer with open minds must almost inevitably decide that the 4,500,000 £1 5½ per cent redeemable cumulative preference

shares offered at 21s. are an attractive investment worth a small premium. Redeemable from 1973 onwards at 22s., they are covered (including the redemption premium) over 2½ times by tangible assets of nearly £13 million. The dividend is covered 4½ times even on the reduced profit estimated for the year ending next October. At 21s. the shares offer a yield of over £5 9s. 6d. per cent. It is almost equally sure that investors who consider the 4,500,000 £1 Ordinary shares offered with the forecast of an 8 per cent dividend will decide that they are a shade too dear at 22s., and that there is a fair chance of picking some up at a small discount after dealings have begun. That is not the view of the highly skilled advisers on the issue. But Lancashire Steel at 22s. yield just over 7½ per cent. United Steel at 9d. discount yield nearly 7½ per cent and look cheaper. Only if that discount should narrow before the lists close would the conclusion be falsified.

That reveals the kind of weakness under which Iron and Steel Holding and Realisation Agency must labour until more steel shares are in public hands. At present no yardstick, except United Steel, exists by which the right price can be gauged. The business of Lancashire Steel is not wholly comparable with that of United Steel. Lancashire Steel is a partly integrated business with a dominant position in the manufacture of certain end products, particularly wire and wire nails. When another £6 million has been invested in the steel-making end of the business it will be largely self-contained, with a capacity of about half a million tons a year. United Steel, on the other hand, probably still stands below its right price because the "stags" are still selling.

Comparative failure on the equity side of the issue may therefore be inevitable. The failure can only be comparative, for the issue is already on paper fully subscribed. By the same device as was used with United Steel the underwriters have flanked their underwriting with firm applications for the same amount of stock, and those applications rank *pari passu* with the public applications. But if there is not a large public response there will not be cheap shares on offer when dealings start. The underwriters will not be reckless sellers. Former shareholders of the company and small investors are to be favoured. To help the "stag," whose help will certainly be needed, the period over which the money may be paid up is long.

Since the agency is reselling at a profit of more than £1 million above the nationalisation price, and since it is proposed that the company shall divide its profits more liberally in future, it should, in fairness, also be added that the profit estimate allows for a sharp fall in earnings. The annual average gross profit for the past 6½ years was £2,090,770, the estimate for 1954 is only £1,600,000. Out of the reduced profits the proposed dividends allow almost 45 per cent of net earnings to be retained in the business.

Bank Dividends Round-up

THE two remaining dividend decisions from the big banks were announced at the end of last week. The Midland Bank, as expected, is keeping the Westminster Bank company by holding its payment at the long customary rate, whilst Lloyds has followed the pattern set by the

National Provincial and Barclays by raising its dividend by 2 per cent. The third of the three northern banks, Williams Deacon's, has followed the others (Martins and the District) in paying more, and so has Glyn, Mills and Co., its sister bank in the group headed by the Royal Bank of Scotland—which, like the Commercial Bank of Scotland, itself announced a 1 per cent increase a few weeks ago. The Clydesdale and North of Scotland Bank, the only one of the Scottish banks that makes up its accounts on December 31, has, however, kept to its customary rate; it is controlled by the Midland Bank. The urge to raise bank dividends has now spread also to Ireland—the Provincial Bank and the Hibernian Bank are both paying more.

Bank shareholders who have been accustomed to assume that there is unlikely to be much variation in the broad trading experience of the big clearing banks will naturally focus now upon these differences in dividend policy and in published profits. As the accompanying table shows, aggregate profits of the Big Five have risen by 6.6 per cent, or by slightly less than they rose in 1952; but the range of movement has been greater this year than last—from the 2 per cent increase shown by the Westminster to the 15.8 per cent of the National Provincial. The true current earnings experience of all the big banks has certainly been perceptibly better than in 1952, but the improvement is probably more reliably indicated by the average change in the published figures than by the movements shown at the extremes of the ranges, and it also seems likely to have been a smaller one than the banks enjoyed in 1952. Last year was the first in which the average level of loans and advances outstanding through the period felt the impact of the new monetary policy; this average fell sharply, for the first time since the war. Also on the average, however, the banks were employing a higher level of deposits, so that the fall in advances was more than offset by increases in money market assets and in investments; and, despite the autumn reduction in Bank rate, the average rates earned on these assets were slightly higher. Against these gains, and some other more modest ones, there has to be set a substantial increase in the interest cost of deposit accounts and some further rise in staff costs. The net gain is unlikely to have been large.

Reasons for Disparities

IT should be noted, too, that since the banks show their dividends net, a substantial part of the increase shown in published profits is attributable merely to last April's reduction in income tax, so that published profits this year have borne a smaller charge for tax deducted from dividends at the 1952 rate. The profit increase shown by the Midland Bank is, indeed, almost exactly accounted for by this technical adjustment, whilst the increase in the net cost of the Westminster's unchanged dividend actually exceeds its increase in disclosed profit. It seems highly improbable that these two banks did not, in fact, enjoy some increase in true trading profits during the year; the explanation appears to be that both their profit announcements and their decision to leave dividends unchanged were strongly influenced by the desire to fortify inner reserves.

One consideration may have been that, until the recent

increases in distributions by the other banks, the dividend rates of these two banks were the highest among the Big Five (and the Westminster's 18 per cent still is the highest). But it may be significant that, of the four banks that changed their basis of investment valuation during the gilt-edged slump of mid-1952, the Midland and Westminster's showed the largest depreciation—in proportion both to their total portfolios and to their published reserves. On

BANK PROFITS, 1951-53*

	1951	1952	1953	Change in 1953
Barclays	1,908,437 14	2,137,722 14	2,300,150 16	+ 7.6
Lloyds	1,815,858 12	1,964,665 12	2,083,781 14	+ 6.1

"Big Seven" Total	9,758,153	10,410,814	11,131,302	+ 6.9

* Figures in italics are percentage rates of dividend.

this evidence, it seems permissible to guess that they now regard a strengthening of the inner position as of higher priority than any increase in dividends. The Midland Bank has, indeed, this year also ploughed back into inner reserves almost the whole of its undistributed (published) profits. Most of the other banks, however, have concentrated upon raising the published reserves, though Lloyds divides its allocations between the two.

The Steel Industry and Schumania

FORMAL response to M. Monnet's invitation to Britain to enter into closer association with the European Coal and Steel Community is a matter for the Foreign Office, which will presumably seek such advice as it requires from the British steel industry through the new Iron and Steel Board.

The industry, which has supplied certain of the British observers at Luxemburg and has been studying the operations of the community closely ever since the pool came into being, has itself perhaps somewhat mixed views. It combines a feeling that M. Monnet's invitation to discussion cannot be declined with some scepticism about the extent to which the Plan is working effectively for steel, even in the countries that have become full members of the community; it argues that once negotiation has been agreed

upon it will be up to M. Monnet to say what he suggests for the immediate future, while suspecting that what he will be satisfied with now will not be all that he would eventually hope to secure from Britain; and it is prepared for some alignment of commercial practice, well short of what the full members of the community have promised, while questioning whether those promises will ever, fully, be honoured.

Among observers in the British steel industry, therefore, the disposition is to study not only the immediate concessions that might be required by (and from) Schumania as the prerequisite of closer association, but to consider all the aspects of British practice on which the community might eventually be concerned to express an opinion or suggest a change. The High Authority on occasion has argued that the British steel industry gets its coal too cheaply—though arguing in other quarters at the same time that the export price of British coal should be brought down to that same “too cheap” internal level. It has also looked askance at the cheap price that the British industry pays for scrap, while attempting to set up a similar central buying agency that would enable it to obtain an equally advantageous position in bargaining over scrap prices. These are immediate points of detail; in the background and the future loom the larger questions of sharing control of investment plans, and perhaps of co-ordinating prices—which might, eventually, raise the question of production quotas.

IMF and Convertibility

THE International Monetary Fund is giving persistent and significant attention to furbishing its weapons for the great convertibility battle. The latest sign of preparation is a statement last week-end by the executive board which extends the technique of “standby” credits inaugurated in October 1952. It has for some time past been assumed that it is through these “standby” credits that the IMF will one day provide a cushion of international reserves on which the shock of convertibility might spend itself without causing undue disturbance to the countries concerned and without calling forth excessive defensive measures in the form of import restrictions. When the new facilities were devised it was suggested that the standby arrangements or confirmed credits could not be made for more than six months at a time, though subject to subsequent renewals with the approval of the executive board. In last week-end's statement the board points out that “if a member believes that the payments problems it anticipates (for example in connection with positive programmes for achieving and maintaining convertibility) can be adequately provided for only by a standby arrangement of more than six months, the fund will give sympathetic consideration to a request for a longer standby arrangement in the light of the problems facing the member and the measures being taken to deal with them.” There have been suggestions from Washington that this might mean an extension of the length of standby credits to a period as long as two years and that in the specific context of sterling convertibility such facilities might be made available to the tune of \$2,000 million.

In the Washington discussion such big figures may indeed have been mentioned but it would be unwise to regard them as more than illustrative suggestions. Ideas on this issue have not crystallised. All the indications are that in judging applications for standby credits the International Monetary Fund will be unwilling to apply any rigid criteria. The initiative taken from Washington should be viewed against the background of the general conclusions of the Commonwealth Conference of Finance Ministers, summed up in Sydney at midweek. This brings into prominence the fact that “sterling reserves must be substantially increased before they can withstand any real drain or before convertibility can be considered.”

It is not only the International Monetary Fund that is preparing for the plans that will ultimately lead to convertibility. The other Bretton Woods institution, the International Bank for Reconstruction and Development, is also strengthening its resources. It has this week made an issue in the New York market of \$100 million 15-year 3½ per cent dollar bonds. This offer is the fourth and the largest public issue of World Bank bonds to be made in the United States.

Riddle of the Comet

THE chain of events that led the British Overseas Airways Comet to crash into the sea last Sunday with the loss of all on board may never be known with certainty unless some of the sunken wreckage can be examined; if not, it may only be possible to narrow down the list of possible causes. The record of air transport shows many inexplicable disappearances of airliners on routine and apparently uneventful flights; only a few weeks ago the report on the disappearance of a York aircraft in the North Atlantic uncovered no cause for the tragedy. But when the aircraft involved is the Comet, an airliner involving wholly new methods of propulsion and about which there has been much controversy, any uncertainty of this kind imposes an intolerable burden of suspense both for the airlines flying the machine and for the manufacturer that designed it.

This is the second case of sudden failure in a Comet during flight. The crash near Calcutta early last year could only be explained by the court of enquiry by an exceptionally savage storm into which the aircraft flew, but this week's accident must have raised doubts about this explanation that will not be allayed until the detailed examination of the wreckage from the Indian crash is completed at the Royal Aircraft Establishment at Farnborough. This is going on side by side with destruction tests on the first prototype Comet. The work should bring to light any basic weakness in the design, if such weakness exists, but it will not be completed before the middle of the year.

Whatever the investigators discover, Sunday's disaster raises another, broader question that concerns all air passengers and not only those who have been prepared to give pioneering support to jet flying. Under the Warsaw convention, to which most nations subscribe, the airlines' liability towards the dependents of passengers killed in

flight is limited to a lump sum of just under £3,000. A draft protocol designed to raise this by 60 per cent to nearly £5,000 has been circulated to the signatories, but no action is expected before next March. Many passengers no doubt take the wise precaution of insuring themselves before a flight, but air transport is now a firmly established industry. How long can it expect to limit its liability towards those who entrust themselves to its care to such a low figure?

Steel Capacity and Demand

DURING the last quarter of 1953 Britain was producing steel at the rate of about 18½ million ingot tons a year, and output this year might well reach 18½ million tons—if there is a demand for it. For the first time since the war steel output in 1954 will be governed by the volume of demand—and by the pattern of demand for different steel products. The industry, certainly, has a comfortable margin of imports. It brought in the equivalent of more than a million ingot tons of steel last year to supplement its own production of some 17.6 million tons in delivering much more steel to home consumers than they had ever had before during peace, and in slightly increasing its

exports. Should demand at home and abroad slacken, these imports, which are mainly semi-finished steel, could be reduced considerably before British output need be slowed down.

Some margin of imports is essential, in order to keep a balance between crude steel-making capacity, finishing capacity, and the pattern of consumers' demand for particular finished steel products. In Britain, for example, though the home output of steel plate is now 67 per cent

higher than before the war, and rose by 10 per cent during last year, demand has increased even more. The steel industry is convinced that a large part of this increase in demand is a temporary "hump," arising from the catching-up of arrears in building railway wagons and from a level of postwar shipbuilding that is unlikely to last. It is therefore still resisting pressure to instal an extra plate mill—which would in any case take another two years—and holds that the current shortage should be covered by imports.

This view is reasonable, in that trade between steel-producing countries offers an opportunity of pooling spare capacity. It would certainly be very costly for any country to attempt to match its capacity exactly with its pattern of home demand there at any one time, particularly a time of "hump demand." But the argument should not be pushed too far: though the balance between steel demand and capacity will differ in different countries, it would be expecting too much that other producers will always be able and anxious to export just the products of which Britain is temporarily short. The decision whether to produce or import must be based on estimates of costs and future demand; so far the consumers who complain that the British steel industry is planning too conservatively in steel plate have not produced any evidence on these crucial points.

War at the Pump

MOTORISTS who have followed the progress of the oil companies' sales campaign for premium petrols during the past year must have derived considerable amusement this week from the spectacle of three of the major distributing companies busily gilding their premium lilies. The new campaign is concerned with the chemical "additives" that are introduced in minute quantities into petrol to improve its performance. Not all companies back the same mighty atoms. Shell premium petrol now incorporates tri-cresyl-phosphate, which combines with the lead compounds deposited in the cylinder head by the tetra-ethyl lead in the petrol. These new lead-phosphate compounds have a much higher ignition temperature than the ordinary lead deposits which—according to the company—have a tendency to become red hot and ignite the petrol mixture in the cylinder head before the cylinder has had time to reach the top of its stroke, and also to short-circuit sparking plugs. This sloppy timing has caused some trouble in highly-tuned aero-engines using high-octane petrol, and the additive was developed specifically to counteract it. But the same formula seems to have effects in car engines using petrol of much lower octane rating, especially engines designed for high compression ratios, and has proved popular with motorists in the United States.

The Esso company has added a different chemical to its Esso Extra. This is a naphthalene solvent oil designed to remove the gummy substances that the petrol deposits on valves and piston rings, and it can be described, very roughly, as an engine cleaner. The Regent Oil Company has not yet issued a detailed description of the additive that provides "voltane control" for its new TT petrol, but it appears designed to give a more rapid spread of flame inside the cylinder head. The price of the new blends

remains unchanged at 4s. 6½d. for Esso Extra and 4s. 5½d. for Shell and Regent premium blends. Users of those companies' cheaper petrols have to get along as best they can with gummy engines, glowing lead deposits and slower flames in the cylinder.

A change in formula such as the introduction of chemicals to clean or protect certain parts of the engine, seems a comparatively minor justification for the kind of sales campaign that the three companies launched last week-end. But it seems that Shell's outstanding success with its new additive in the United States has provoked another phase of intense competition throughout the European markets in turn. Whether all motorists are sufficiently engine-minded to appreciate the subtle improvements that an additive brings remains to be seen; but it is worth remembering that this degree of "quality competition" in the market for premium petrols has emerged in less than a year of free choice.

Three Strong Drinks

THE dramatic boom in the cocoa, coffee and tea markets has now carried prices to record heights. In all three commodities production has either fallen short of the previous year's crop or has failed to keep pace with the growth of demand. The drop of 23 million lb to 476 million in the output of tea in North India, the world's largest producing area, has been more than offset by a rise of 31 million lb in Ceylon and South India, but this has not been sufficient to meet the increased demand, particularly from Britain and the United States. In consequence the price of common teas in London has jumped by 11d. in the last three months to 4s. 3½d. a lb. Cocoa prices have climbed

steadily this season on reports of smaller crops, and have soared since the revised estimate of the main crop in the Gold Coast was published on December 21st. This crop, which normally accounts for one-third of the world's supply, was estimated to be 31,000 tons below the original forecast, and nearly 40,000 tons below last year's crop of 244,000 tons. Accra cocoa is now 105s. higher at about 450s. a cwt, c.i.f. The shortage of supplies has been

intensified by the sharp rise in consumption of cocoa products in Britain since sweet rationing ended last February: imports of cocoa beans into this country in 1953 were 20,000 tons larger than in 1952.

Prices of coffee have been extremely high since frost damaged the 1954/55 crop in Brazil, which produces half the world's supply. They have recently bounded upwards as buyers have reluctantly come to accept the last official forecast that the 1953/54 exportable surplus in Brazil will be about 13.2 million bags (of 60 kilos each), some two million bags below expectations; "superior" grade coffee has risen by nearly 50 per cent in the last six weeks to 686s. a cwt, f.o.b. Santos. There is little prospect of any improvement in supplies of all three commodities before the summer, and stocks in most consuming countries are low. The recent increase of 4d. a lb in retail prices of tea in Britain has already been swallowed up, and it is an open question whether blenders can hold their present prices until North India tea begins to arrive in quantity in September. Prices of cocoa products in several Continental countries have already been raised, and British manufacturers may follow suit. There is less of a squeeze in coffee in this country; stocks are reasonably ample and the trade is still able to draw upon supplies of cheaper East African coffee from the Ministry of Food. In the United States, which drinks two-thirds of the world's supply, the retail price has risen to \$1 a lb, and this may eventually check consumption. The headlong advance in all three markets may prove to have been overdone, but even allowing for some consumer resistance, no radical weakness in prices seems likely for some time.

Commodity Shunting Again

LESS is heard of "commodity shunting" now that sterling is a stronger currency. But the old problem has cropped up again in the Lebanon and the Treasury has had to step in. Beirut is the natural port for a large part of the middle eastern trade. From there goods are forwarded to other destinations. But Syria is not a sterling country, nor is Palestine, nor Egypt. On the other hand, Jordan, Iraq and the rich sheikdoms of the Persian gulf are sterling area countries. A market in non-transferable sterling has grown up round a rate of about \$2.64-2.69 to the £ compared with the official rate of about \$2.81. Naturally importers in the Lebanon have been serving their own market and the markets of the other non-sterling middle eastern countries with British textiles, sugar and other goods bought with the cheaper type of sterling. The goods have been consigned to sterling area destinations "via Beirut" and the destinations altered or the goods retained in Syria after landing. Thus exchange has been lost to the country without the knowledge of the British exporter, who believed the destination to be genuine.

Now the Treasury has used its mailed fist covered in a velvet glove. As from February 1st all exporters consigning goods through the Lebanon to sterling area destinations will have to supply an extra copy of the shipping documents of specification marked "for exchange control purposes only. Often that is all that will happen, for there is no wish to hamper legitimate trade, but if the Treasury entertains sus-

How soon will they get to your market?

The younger generation move fast. They're always looking ahead. That's why they are so vital to you and your business. Right now they may not all be rich enough to buy your products, but they are planning for the future and if you give them the ambition to own them, sales are assured when they have got on enough to shop in your market.

By approaching the problems of our time realistically and presenting the news in a vital up-to-the-minute style, the Daily Mirror appeals outstandingly to the vigorous 'keen to get on' younger generation. In fact, the majority of the 4½ million people who buy the Daily Mirror every day are young people. People with long buying years ahead of them.

With the biggest daily sale on earth, the Daily Mirror offers you the most powerful mass market coverage in the history of daily newspapers at the lowest square inch per thousand rate of all national dailies. Daily Mirror readers are young readers. Your customers today—next month—next year.

Light Problems..

FLOODLIGHT FL6
5,000 Candle power

STORM LANTERN
300 Candle power

TABLE LAMP TL106
300 Candle power

Buyers throughout the world are faced some time in their lives with providing portable light for a particular purpose or job where there is no electricity or other form of power to hand. We know because they write to us and put their problems before us. They write to us because the name TILLEY is recognised throughout the world as being synonymous with all that's best in portable paraffin pressure lighting. If you want 5,000 candle power Floodlights to illuminate your Club House, aerodrome or cattle compound, Trackwork Lamps for railway repair or tunnel inspection or just a portable Iron for safari, a Storm Lantern for camping or Hanging Lamps for a marshalling yard—write to us. Of course, we also make Table Lamps, Heaters, Wall Lamps and an infinite variety of other lamps for industrial users—all burning ordinary Kerosene under pressure and all recognized as the best of their kind in the world.

Keep this advertisement. When we can help you please write to:—

DAV. 6

A NEW SOURCE OF OXYGEN

The importance of oxygen as a factor in the smooth running of many works is fully recognized. It is as vital as the power supply, and any interruption of its availability can cause a costly breakdown of production. It is an important on-cost factor, too, and you may well be surprised when you review your consumption figures.

Our Oxygenators, which can produce both oxygen and nitrogen, are available in capacities that cover every requirement, and we are confident that your time will be well spent in investigating the possible economies which can be derived from the installation of this equipment in your works.

Full details, in our latest booklet just received from the printers, will be gladly sent on request.

BUTTERLEY

OXYGENERATORS

OXYGEN DIVISION

THE BUTTERLEY COMPANY LIMITED
20, Ashley Place, Victoria, S.W.1. Telephone: Victoria 8023-4-5

Makers since 1790 of railway and other bridges; constructional steel work; axle bridging; overhead cranes; railway wagons and mine cars; iron castings; lamp piling; mining and sheet metal machinery; wrought iron bars; sewage ejectors; pumps and air compressors; wool washing machinery.

Slow Motion

"CREEP" IS NOT A WORD normally associated with jet propulsion. Yet metallic creep—the slow stretching of a metal under stress at high temperature—is a major problem in jet engine design, and it enters increasingly into many branches of engineering. Creep can increase the diameter of hot steam pipes under the constant pressure from inside. The fast-spinning rotor of an electricity generator may, if it becomes hot enough, distort under the creep caused by centrifugal force. Unless this has been taken into account in designing the generator, its rotor may ultimately foul the generator's shell. Even at ordinary temperatures, lead creeps at quite low stresses and unless appropriate steps are taken, lead sheeting can flow slowly down a roof.

To provide much-needed information on creep, I.C.I. have built a special testing station at Witton, near Birmingham. At this I.C.I. station, the latest techniques are being used to record the changes in metals under stress at various temperatures and over very long periods. The tests are carried out on sixty machines. Metal test-pieces clamped between steel jaws are loaded by a force of up to 5 tons to the square inch, while the test temperature, which may be as high as 1000°C, can be maintained for years on end. Special instruments can detect length increases as small as one fifty-thousandth of an inch in the test-pieces. Air conditioning keeps the windowless building at a steady 67°F. night and day. Humidity is controlled. To minimise vibration, the testing machines are mounted in concrete rafts independent of the building foundations. Tests carried out in this I.C.I. research station are providing invaluable information on metallic creep, needed by the designers and engineers who are building I.C.I.'s great new plants and factories, and by the users of the wrought non-ferrous metals marketed by I.C.I.

Imperial Chemical Industries Limited.

pictions, it may go much further: it may call on exporters to produce evidence that the declared destination was the true one. It may also require exporters to pre-enter goods with the customs in advance of shipment and to make much more comprehensive declarations about the transaction. This new regulation has clearly not blocked all the possibilities of sterling leakage in the Middle East. But Beirut is the natural sea terminus of the trade. Shipment by way of Damascus or Alexandria would be possible but might eat into the profit of the astute trader too deeply to make evasion worthwhile. And the Treasury will be watching eagerly for any sudden jump in shipments to those ports.

New Life Assurance Business in 1953

NEW records in the volume of life assurance business in this country were again achieved last year. Sums assured in 1953 by British offices at home and overseas and by the Commonwealth offices operating in the United Kingdom will comfortably exceed the 1952 record of nearly £800 million. The 58 offices whose results are available—they account for fully 90 per cent of ordinary life business—wrote, as is shown in the accompanying table, £775

* Approximation. (a) Including overseas business. (b) Excluding group life and pension business. Total new business was: 1951, £107.6 million; 1952, £112.0 million; 1953, not yet available.

million last year compared with £732 million in 1952 and £706 million in 1951. The rate of expansion in 1953 was thus about 6 per cent. For all offices the expansion in 1952 was about the same; the increase in 1951 was as much as 17 per cent. These figures exclude for most offices the important staff scheme pension business that is written by deferred annuities. They are not necessarily comparable between the different offices.

Overseas new life business (including that in the Republic of Ireland) is transacted by only a handful of British offices. It has been accounting in recent years for an increasing proportion of the total. In 1952 new sums assured overseas were £107½ million according to the statistics recently published by the life offices associations; this was about 13½ per cent of the year's total new ordinary life business. From the scanty information that is at present available about the 1953 overseas new business, it would seem likely that last year's proportion will have been rather bigger. New life assurance and pension business under staff schemes continued to increase last year; the incomplete figures so far published suggest that the rate of expansion in these "scheme" contracts was considerably greater than in "individual" policies. Industrial (now labelled home service) life assurance new sums assured in 1952 by the 14 companies and 115 friendly societies transacting this business were £267.6 million. The Industrial Life Offices Association has recently announced that 11 offices (including some, but not all, of the giants of the movement) in 1953 assured in new industrial business about £222 million, compared with £217 million in 1952.

The prospects for the life offices' new ordinary life and annuity business nowadays depend largely on the buoyancy of business profits. Last year's figures might therefore well be surpassed in 1954. When the intervening change in the price level is taken into account, life assurance new business in this country shows little if any increase on that written in 1938: there ought, therefore, to be some scope for further expansion.

Good Year in Lombard Street

GOOD margins on Treasury bills, a firm to rising bond market, and the turn secured on bills held at the moment of September's reduction in Bank rate made 1953 a profitable year in Lombard Street. The three largest discount houses—which also happen to be the three with end-year balance-sheet dates—have all passed on something of their increased profit to their shareholders. Only one house has indeed made a straight increase in its distribution; Alexanders has raised its final dividend by 2½ per cent to 12½ per cent and has added a cash bonus of 5 per cent, bringing the total distribution for 1953 up to 25 per cent—compared with the 17½ per cent paid in every year since the beginning of the war. The disclosed profits of this house increased by nearly 60 per cent, from £176,550 in 1952 to £281,600 in 1953—the best since 1946.

The Union and the National both maintained their dividends at 10 per cent for 1953, but the former paid it on an increased capital and the latter supplemented it by a bonus issue that seems likely to raise the effective distribution in future. The Union Discount—the largest of the discount houses—had already last September made a two-for-twenty-five bonus issue to ordinary shareholders that capitalised £410,667 from the share premium account and reserve; although its dividend has been maintained at 10 per cent since the war, the Union raised its effective distribution even more substantially two years ago as a result of the one-for-three share bonus issue of July, 1951. Net profits increased by £45,000 in 1953 over the previous year, to reach the record level of £367,000. The profits of

the National Discount increased by considerably more than this—from £297,132 to £369,648—but comparisons between companies are particularly odious in this sphere, where published profits are notoriously subject to the vagaries of reserve policy and the differing incidence of taxation. The bonus issue takes the form of a capitalisation of £758,885 from the share premium account, to be distributed to "B" stockholders in the proportion of one-to-three. These shares will not, of course, rank for the final dividend for 1953.

SHORTER NOTES

A Canadian court this week decided to put British Controlled Oilfields, which owns half the equity of Trinidad Petroleum Development, into compulsory liquidation. The two petitions for liquidation were dealt with together, and

though the liquidator appointed is the nominee of the first petitioner, Henry Ansbacher and Company the second petitioner was allowed his costs. It is still the desire of Henry Ansbacher's group that the proposed reconstruction of the BCO capital should precede liquidation. This would give the equity holders 10 per cent of the assets although their capital is wholly lost and the second petitioner regards the plan as undesirable and inequitable.

★

In the article "Diesel Engines for the Motorist?" in the issue of January 9th, the diesel version of the Fordson tractor was incorrectly described as being 25 per cent more expensive than the petrol or vaporising oil versions. The actual prices for the tractor are: diesel without ancillary equipment, £496 5s.; petrol or vaporising oil versions, £441 15s.

Company Notes

LOBITOS OILFIELDS. Stock markets are probably right in thinking a bird in the hand worth two in the bush. They acted on that assumption when Lobitos Oilfields, in place of the usually terse interim dividend statement, announced its intention of doubling the ordinary dividend and making bonus issues of equity shares and debentures. Surprise and delight were reflected in the marking up of the company's £1 ordinary stock units by 13s. 9d. to 52s. 6d. The "bird in the hand" was certainly plump. In 1953 the group's profits before tax were of the order of £1 million and unless any "unforeseen circumstances" occur the directors intend to make a full year's equity distribution of 23 per cent, compared with 11½ per cent in 1952. In addition the holders of the company's £2 million ordinary stock units are to receive—if the Treasury agrees—a £1 million bonus issue of equity stock (which at the end of the operation will all be quoted in 5s. units) and a £1 million bonus issue of a 5½ per cent first mortgage debenture stock.

Yet a glance should be spared for the "birds in the bush." For one thing, this announcement implies a very sharp reversal in the company's policy. Earlier it had concentrated upon the reinforcement of its liquid balances in order to meet the increased demand for working capital, the cost of "major refinery replacements," and the building of new tankers so that "its fleet would consist of an adequate number of efficient modern vessels." The directors now believe that "demands for additional working capital have temporarily declined, and they have decided that it would be wise to delay the expenditure of the reserves on the objects for which they were created, as they are satisfied that for sound technical reasons it would not be appropriate or necessary at the present time to undertake major refinery replacements, and that on account of the present high cost of shipbuilding they would not at present be justified in acquiring new

tankers." Accordingly the immediate need to reinforce liquid balances, which total about £1,700,000, has diminished, "although eventual capital expenditure will require funds in excess of this figure." The wording of the whole of this announcement suggests that only temporarily has the company's policy been put into reverse. But what would happen to the 23 per cent dividend if at any time the company decided to go ahead with development and expansion? It seems a questionable policy to issue a first charge debenture as a bonus. Certainly it is a true bonus for the debentures will be saleable in the market and their existence may not much reduce the market value of the equity. But is it wise for a company with the volatile earnings of an oil producer to raise debentures unless necessity drives? The company, if eventually it decides to go ahead with its deferred capital programme, may have to knock on the door of the new issue market. The proposals therefore seem to take an unhappy form; but their object is clear. Lobitos can hardly be classed among the "take-over" shares (though the rumours have gone around—and have been denied) but the directors appear to be doing their best to ensure that it will not become one.

RADIO RENTALS. The low yield on Radio Rentals's 5s. ordinary shares—it is only 4.6 per cent at the current price of 43s. 9d.—can be justified on two counts. First, the group's net profits will immediately benefit from the demise of EPL: in the year to August 31st EPL took £104,144 out of a total tax bill of £403,421. Secondly, the latest set of the group's full accounts makes encouraging reading. Following a marked increase in the number of the group's subscribers (renting radio and, more particularly in the Coronation year, television sets) the group's trading profits have risen from £1,000,459 to £1,357,365. In turn, its net

profits have risen from £99,893 to £125,362 and the ordinary dividend has been raised from 35 to 40 per cent.

The chairman, Mr H. F. Hunt, assures shareholders that while the renting of television sets was stimulated by the Coronation the demand for sets since has been "very steadily sustained." Another reason for the increase in profits is that the number of subscribers in many regional areas has grown large enough to make the renting of television sets profit-

* Including "radio and television sets and accessories on, or for, rental" at cost £5,027,438 (against £3,756,430) and after depreciation £2,212,648 (against £1,536,707).		

able—a typical example of large scale economies. Mr Hunt adds that "trading in the current financial year to date shows a reasonable improvement" on the latest financial year's results. The rate of expansion last year is indicated by the increase in the group's investment (at cost) in radio and television sets and accessories from £3,756,430 to £5,027,438.

Yet, these figures in themselves carry a warning. They should warn shareholders that the group has to lock most of its money away in equipment, on which the depreciation charges are high; the group's rate of depreciation on television sets is still "a little higher" than the rate allowed by the Inland Revenue for taxation purposes. In a slump a hire purchase company finds its trade falling and its bad debts piling up. A renting company in similar circumstances finds its rents falling and returned equipment piling up in its showrooms.

CHARTERHOUSE INVESTMENT TRUST. Last year the investment trust movement could have had few worries. Equity prices in the stock market were rising and equity dividends had finally broken away from the moorings of voluntary dividend restraint. It is not therefore surprising that the directors of the Charterhouse Investment Trust have reported that the market value of the trust's quoted and unquoted securities on the date of the last balance sheet, November 11th, was 27 per cent higher than their book value of £943,597, compared with the comparable figure of 15 per cent in 1952. Nor is it surprising that the chairman, Mr H. N. Hume, describes the revenue of the trust as "buoyant." Following the increase in the investment income of the trust (from

£140,946 to £169,015) the directors have decided to raise the ordinary dividend from the 8 per cent payment made in the last seven years to 9 per cent. The rise in stock exchange prices has enabled the Charterhouse trust to liquidate some of its holdings and to build up quite substantial cash balances in preparation for a fresh bout of re-investment in the next few months. This must presumably have reduced current income since the end of the financial year. Charterhouse has not made any decision yet whether to take

advantage of the lifting of the ban on investment trust issues in order to enlarge the trust.

The Charterhouse group is something more, however, than an investment trust. It is an issuing house and it has considerable investments, through the Charterhouse Industrial Development Corporation, in the unquoted securities of private companies. Referring to the new issue business of Charterhouse Finance Corporation, Mr Hume admits that the prospects do not appear too bright. The fall in raw material prices and the easing of the burden of stocks has obviously enabled British industry to build up its cash balances—and therefore it has much less need to go to the market for money. Mr Hume adds that the introduction on the Stock Exchange of the shares of private companies, threatened by the death duty axe, is usually handled by stock-brokers without the assistance of issuing houses. He is less explicit about the activities of the Charterhouse Industrial Development Corporation, but he admits that the type of investment which this subsidiary holds is slow to yield a tangible return and that though the true worth of the Corporation's holdings of unquoted securities as a whole exceeds their book value of £2,271,696 there are some holdings which "may ultimately prove to be overvalued."

★

CAPITAL ISSUES IN 1953. In the table entitled "Capital Issues in 1953" which appeared on page 124 of last week's issue, the debenture total for companies for 1953 (new basis) was shown as £85.8 million instead of £61.6 million. The total of which this item forms a part should therefore have been £182.5 million instead of £206.7 million.

LONDON STOCK EXCHANGE

Next Account begins: January 27th.
Next Contango Day: January 27th.
Next Settlement Day: January 19th.

THE stock market was unsettled after the weekend by the opening of the "guerilla" strikes in the electrical industry. Most of the selling orders, however, had been absorbed by the close on Monday and the market brightened up again on the last day of the old account. This generally firm tone was carried over into the new account. Gilt-edged stocks lost about ¼ of a point on Monday but these losses were more than regained in the following two days. The rise in gilt edged and industrials gathered momentum on Thursday. On Wednesday, the 4½ per cent Electricity stock rose ¼ to 104½. The most active market was in German issues. These stocks were bought at the end of the old account in advance of the formal debt settlement offer and were then marked up again on the first day of the new account following the higher prices established overnight on Wall Street for the dollar bonds. The Young loan, which was quoted at 102½ when the market opened on Monday, had risen to 109½ (after touching 111) by the close on Wednesday; in the same period the Dawes loan rose from 73½ to 78. The Potash bonds and the City loans made similar strong advances.

Industrial equities generally followed the lead set in the gilt-edged market. Prices of the "blue-chips" moved irregularly at first (although engineering and electrical equipment shares held firm). Then prices rallied on the last day of the old account. This rally broadened out into a more general advance on the first day of the new account, with stores and textiles shares in the van. Tobacco shares (which had been rather dull on Monday) and radio and television shares also made a good showing. The general air of buoyancy helped to keep oil shares firm but it did not lead to any marked increase in business. Tea shares were again very active and strong in response to the fresh rise in the price of the commodity. The Kaffir market was hesitant at the end of the old account and the rally on the first day of the new account soon died away.

(1) Relates only to prices in capital cities for Austria, France, Greece and Turkey. Cost of living in Paris based on 1949 = 100, and in Western Germany on July-December, 1948 = 100. (2) Index numbers of unit value which compare the current value of trade with its value in 1948; they are influenced by changes in the composition of trade as well as price movements. Index numbers for Germany based on 1950. (3) Notes only for France and Austria. (4) Holdings of the government and central bank at end of period; figures for Greece are gold reserves only. (5) Average of second quarter.

Financial Statistics

EXCHEQUER RETURNS

For the nine days ended January 9th, there was an "above-line" surplus (after allowing for Sinking Funds) of £98,161,000 compared with a deficit of £33,410,000 in the previous week and a surplus of £125,657,000 in the corresponding period last year, bringing the cumulative deficit to £447,532,000 (£399,474,000 in 1952-53). Net expenditure "below-line" absorbed £15,752,000, which brought the total cumulative deficit to £746,390,000 (£845,665,000 in 1952-53).

* In consequence of official purchases of tender bills in connection with cash subscriptions to the Exchequer Stock issued in October, it was impossible to calculate the division between tap and tender bills until all the bills purchased had passed their original maturity date.

THE MONEY MARKET

LOMBARD STREET has weathered the first week of heavy revenue transfers without serious dislocation. Special purchases by the authorities—made both directly and indirectly through the banks—were necessary on Saturday, Monday and Wednesday, but only on Monday did they assume even moderately large proportions. In the rest of the week covered by Wednesday's Bank return credit supplies from maturing bills were large enough to meet the considerable demands for funds.

At last week's Treasury bill tender the market maintained its bid at £99

proud heritage and that the present generation is fully able to add in their time to the glories of the past.

We now realise we need not be down and out, given the enthusiasm and endurance, each in our own differing spheres, to give of our best.

With the general and progressive freeing of commodities, the individual—the housewife in particular—has an important responsibility in keeping down the cost of living. She is entitled to and should take every advantage of open competition in the purchase of the food and other commodities which she has to buy.

To do so may necessitate her going to several shops instead of to one to obtain the best value and, given the opportunity and encouragement, no one is better at getting her full money's worth than the careful British housewife. She has the power in her own hands, and it is her duty and to her advantage to use it to the full and thereby add her contribution to increasing the value of the pound and the purchasing power of her husband's pay packet.

The Government is to be congratulated on its general policy of decontrol and the orderly way it has been carried through. Our thanks and appreciation are due to those who have given so much time and constructive thought in evolving practical schemes to put this into effect and, by rebuilding the futures markets for cotton, grain and other raw commodities, enabling us once more to play our proper and essential role in the entrepôt of commerce and the ironing out of wide fluctuations in the prices of primary commodities.

NEED FOR GREATER PRODUCTION AND EXPORTS

The need for greater and greater production and more and more exports is as urgent today in our convalescence as it was at the height of our financial illness, but there the Government, while offering every verbal encouragement, does everything to make it not worthwhile or less worthwhile by taxing industry and, more particularly, individuals at proportionately higher rates in accelerated ratio to their increased effort.

Last year's Budget was a step towards restoring incentives, but, until a man earning up to, say, £20 a week can be assured that the tax-gatherer will leave him with at least fifteen shillings in the pound at his top rate of tax and the man in the higher categories, who by his ability and energy earns considerably more, is left with a minimum of five shillings in the pound, again at his top rate of tax, there is no realistic incentive for either to exert himself to the full. This could be brought about in both cases in various ways, but perhaps the simplest method would be by adjustments in the earned income allowance and by lifting the limit now imposed.

The older generation which is slowly passing out of the productive field has acquired from the past the habit to work almost regardless of the net reward—this habit dies slowly.

The coming generation looks at things from a different angle and weighs up the extra effort required against the net remuneration and so often comes to the more logical conclusion that the energy or risk, or both, are inadequately rewarded and would rather have a more leisurely time with, if possible, a pension and so avoid the restraints inherent in saving from taxed income.

HIGH TAXATION THE NEGATION OF THRIFT

High taxation is the negation of thrift, the fairy godmother of extravagance and the advocate of "let us eat, drink and be merry,

for tomorrow we die," as die industrially we surely shall unless efficiency, energy, the will to expand and the elimination of waste are encouraged.

The present day-to-day mentality is fostered by the knowledge that, before we die and certainly when we do die, the results of our life-time of toil and thrift will be seized by the tax-gatherer and that the industrial structure which we have laboriously built up will suffer for the lack of the financial support which has been removed by the Inland Revenue and, finally, by the Death Duty Department who shed no tears over the hardships they leave behind.

All this is abundantly clear in the case of the small private businesses which make up so large a part of the industrial economy of the nation and provide so much employment but it is equally true, though the process is slower and less dramatic, in the case of the larger public companies.

Sufficient funds are not left in industry after paying the high taxation to replace their worn-out assets, the tools by which they earn sufficient to pay wages and instal new machinery. To purchase and pay for the new or modernised factory, the only alternative to incurring a fresh debt by issuing debentures is to invite the public to subscribe new risk capital.

Even if the public has the cash available, after paying their own high taxes, there is little encouragement to put depleted savings into business which, if it is successful and makes a profit, has again to suffer penal taxation and in an atmosphere where it is considered, by some, to be almost immoral to make a profit at all.

The same disincentive affects everyone, be they shareholders, executives or employees; all are frustrated by the lack of inducement to fulfil their true functions to the best of their ability.

The shareholder, the man who puts up the capital to make the project possible at all, is discouraged from risking his money on a "heads you win, tails I lose" taxation proposition. The executive has little encouragement to accept higher responsibilities with attendant worries, seldom getting away from them when he leaves his office.

for so little increase in his net reward and the workman by working harder or longer on piece rates or over-time merely works himself into a higher income tax group, so that his extra effort does not make a proportionate difference to his net pay-pocket.

EXTRA SKILL AND EFFORT SHOULD BRING EXTRA REWARDS

It is rightly accepted by all, particularly by the trades unions, that extra skill and effort should bring extra rewards and effect is given to this in industry by increased rates for overtime and piece rates, but the Treasury has deliberately set out to nullify this whole conception in demanding, by taxation, a higher percentage of earnings in almost direct ratio to those rewards for increased effort.

The continuous calls from the Government to industry to exercise more "drive, courage and vision" sound rather insincere when these are the very commodities that deliberately they choose to tax almost out of existence.

If the incentives to earn more were restored and taxation adjusted so that a greater and not lesser proportion of that increase could be retained by the earner, then, and then only, would there be a voluntary and eager increase in effort and output. The spirit of adventure would be rekindled and, as in days gone by, another new generation of men would arise who, by boldness, foresight and toil would work themselves from the desk and bench to be the founders of new and great industries, to the benefit of the country and the countless thousands who would be found employment.

The Australian Government has brought in a "Stimulus" Budget providing substantial reductions in company taxation and in income tax. It is designed to give the utmost possible encouragement to individual effort, to business enterprise and to individual and collective savings.

It is to be hoped that our next Budget will follow similar lines, having had a lead from a younger member of the Commonwealth family.

But how is all this to be done? A large proportion of our taxes goes in the servicing

of the national debt on which our national credit depends and on defence. In these critical days, only a madman would advocate risking our national security by reducing our armed forces below the safety limit, but the determination of where this limit lies must be left, and properly left, to those qualified by a full knowledge of the over-all position. All we can urge is that we get full value for the vast defence expenditure.

Apart from these two items of Government expenditure, the rest, however desirable,

must not exceed our ability to pay for them, and must pass the acid test of whether they produce really worthwhile results.

One pound of our income can only be spent once. We have the choice of saying "Whitehall knows best" and let Whitehall spend that pound for us, or we can insist that we know our own individual needs better than the gentlemen of Whitehall and demand to be allowed to spend it as we think best and wisest. What is certain is it cannot be spent twice.

SOUTH DURHAM STEEL & IRON COMPANY

RECORD LEVEL OF PROFIT

BENEFITS FROM POLICY OF EXPANSION

FURTHER IMPORTANT DEVELOPMENT SCHEMES

MR B. CHETWYND TALBOT ON EFFORTS TOWARDS SELF-SUFFICIENCY

The fifty-fifth ordinary general meeting of South Durham Steel & Iron Company, Limited, was held on December 23, 1953, at Cargo Fleet Ironworks, Middlesbrough.

Mr B. Chetwynd Talbot, chairman and managing director, who presided, said:

Before I comment on the activities of the South Durham Group for the financial year which ended on October 3, 1953, I should place on record that the whole of the assets and activities of the Cargo Fleet Iron Company, Limited, were transferred during the year to the parent company. Though the Cargo Fleet Iron Company, Limited, will cease to trade under its own name, no changes will arise either in the internal running of the company or the usage of its world-renowned name on its steel products.

The gross profit of the South Durham Group before depreciation charges, taxation, or other deductions amounted for the year to £2.25 million, representing an increase of £720,000 as compared with the previous financial year and £900,000 as compared with the 1950-51 financial year.

SUBSTANTIAL CAPITAL EXPENDITURE PROGRAMME

The record level of profit earned during the last financial year is principally due to the policy of the company over the last seven years to expand production of steel products and to ensure a high level of efficiency is secured from the capital invested in the undertaking. During the last financial year £1,585,363 was invested in capital expenditure account alone, of which sum £1,050,000 was set aside from the net profits retained and from the depreciation of £451,005 charged in the accounts, to which reference is made in detail at a later stage. The total of the Group's expenditure under this heading during the last three financial years is brought to an amount of no less than £4.7 million. It has been possible for South Durham to find from its own resources and by way of retainable profits £3.7 million of this amount and it has only been necessary to borrow in the form of loan £1,050,000 from the former Iron and Steel Corporation of Great Britain.

The further development of the activities of South Durham and its controlled companies does not terminate at this point. Schemes approved by the Government amounting to £7.5 million are being ener-

getically executed and capital expenditure on these schemes during the immediate three years will be substantial. The major part of this expenditure represents the building of additional coke ovens, ore handling and preparation on the most modern lines, two blast furnaces of large capacity, and plate mill expansion. These developments will play an important part in enabling the industry to become self-sufficient in the production of its raw materials for an ingot output of 20-million tons put forward as the national level to be achieved by 1957/58.

DEPRECIATION CHARGE

I mentioned at the commencement of my statement that our gross profit for our last financial year amounted to £2.25 million. Our total depreciation charge for the year amounted to £451,005 and on the programme of the further capital expenditure referred to, depreciation charges will increase during the ensuing four years at a rate of approximately £100,000 per annum, amounting by 1956/57 financial year to a total of £850,000.

HEAVY DEMAND FOR STEEL PLATES

I am pleased to be able to put on record that as far as the North East Coast is concerned the plate shortage is now being rapidly overcome. Our heavy plate mill which, after complete reconstruction, came back into production in the summer of 1947 has played an important part in meeting the heavy demand which has been experienced for steel plates. Plate production from this mill since reconstruction in 1947 will exceed 1 million tons by mid-January, 1954. The reconstruction of our medium plate mill contained in our development programme already mentioned will be executed to avoid interference with output and on completion in 1956 this mill will surpass in efficiency any similar mill in Europe.

EXPORT ENDEAVOURS

At our steel pipe works we have developed electric welding to the highest world standards and substantial dollar-earning contracts have been secured in world markets in which steel pipes of American manufacture previously held a monopoly.

During the year under review we have succeeded at our Cargo Fleet Works in rolling broad flange beams in our range of sizes which are comparable in weight with American and Continental practice. As the handicap on the matter of comparable weights has been overcome, it is our intention to endeavour to increase our exports, particularly in dollar-earning markets.

TRIBUTE TO MANAGEMENT AND EMPLOYEES

In conclusion, the board place on record their appreciation to the management and all employees of the company for the part they have played during the year in the successes which have been achieved.

The report and accounts were adopted and the other formal business duly transacted

THE CHARTERHOUSE INVESTMENT TRUST

A NOTE OF WARNING

The twenty-ninth annual general meeting of The Charterhouse Investment Trust Ltd., will be held on February 3rd in London. The following is an extract from the circulated review by the chairman, Mr H. Nutcombe Hume, CBE, MC:

It is a great pleasure to your directors to be able to report a substantial increase in the profits of the Group and of the Trust itself. The profit of the Charterhouse Industrial Development Company and its subsidiaries (Charterhouse Finance Corporation, Charterhouse Australia and Charterhouse Canada) is also in excess of the estimate given in the prospectus at the time of the preference share issue.

It is in no spirit of pessimism that your board think the outlook for industry generally in this country must be viewed with caution. Everything points to a great increase in competition for world markets, and unless this country can maintain and increase its sales to overseas customers, one of two things must happen; either we must endure a much lower standard of living or we shall lose population by emigration or even by starvation.

These words may sound dramatic, but the simple truth is that we have to import a substantial proportion of the food we need to live and of the raw materials for industry; and we can only pay for that food and those raw materials if we can make and sell abroad goods which the overseas buyer wants at prices he is prepared to pay.

FINANCE ESSENTIAL

In this vital field of export, finance is essential and the services of the City backed by knowledge and experience are indispensable, especially to new entrants into this most important field.

No one has yet devised, and I do not believe anyone will ever devise, a substitute for the process which fertilises with capital the less well developed parts of the world and by raising the standard of life of millions of people in those areas establishes a market for the goods made in industrialised countries such as our own. Risk taking is the very essence of progress and we should be grateful to those who in the past took great risks financially and otherwise in developing the trade of this country. Present taxation both here and overseas makes the taking of such risks relatively unattractive financially but that does not alter the fact that if we are to survive as a great nation the process must go on.

There is, I think, some evidence that the body of opinion which believes that profits are not quite respectable or that they should be divided in some different proportions between the capitalist and others, is losing support and that fundamentally everyone capable of coherent thought realises that the stimulus of profit making is good and not bad. I am quite sure that the vast majority of employees at every level prefer to work for a company which makes good profits, for this more than anything else provides them with a sense of security.

In July, 1953, we opened in Toronto the offices of Charterhouse Canada Limited. It is early yet to report progress, but there are excellent prospects in Canada and several proposals are in hand. We are now "in the black" in Australia despite a difficult trading period over there and I am satisfied from a personal visit in February last that Charterhouse Australia Limited should continue to develop satisfactorily.

MARTINS BANK LIMITED

STATEMENT OF ACCOUNTS, 31st December, 1953

LIABILITIES	
Capital paid up	£4,315,096

THE ROYAL BANK OF CANADA

CONVERTIBILITY CLOSER

MEANS OF AIDING BRITAIN IN FREEING POUND

MR JAMES MUIR URGES DOLLAR COUNTRIES TO REDUCE TRADE BARRIERS

The eighty-fifth annual general meeting of shareholders of The Royal Bank of Canada was held on Thursday, January 14th, at the head office in Montreal. Mr James Muir, the president, in the course of his address, said: The attitude of our Government is generally one that favours freedom of international trade and exchange. Pressure for special treatment, even when backed by evident hardship on the part of some producer groups, has been met by clearly moderate concessions. Moreover, our monetary authority has adopted a policy appropriate to a nation that must maintain a competitive position in foreign markets. Not the least important aspect of this policy has been the active encouragement by our central bank of a money market in Canada. The Bank of Canada's activities and its co-operation with financial institutions in this respect have led to great improvement.

MONEY MARKET NEEDED

But today something more is needed. It is time now for the chartered banks and all other financial institutions in Canada not only to support the efforts of the central bank but to take positive steps to increase their own initiative and activity in the development of a Canadian money market. Such a market is not only a symbol of economic maturity and strength, but is, in fact, prerequisite to continued progress in a country, like Canada, whose economic future depends on the expansion of world trade and investment.

But ours is a difficult and complex problem. We have only to consider the plight of those firms and those workers who have developed a sizeable economic stake behind the protection our own laws have already provided. Any attack upon the high-cost economy strikes directly at them. Without prejudicing their moral case for aid in the general process of adjustment, we can, I think, recall with advantage Adam Smith's admittedly extreme example of the effect of protection upon the national economy. Grapes, he said, could be grown in Scotland under glass, and very good wine could be made from them at 30 times the cost at which equally good wine could be imported. It would have been a tragedy for the world, as well as for Scotland, if that country's natural advantage in producing a wholly different beverage had been weakened by so extreme a national policy!

Clearly, a far less painful resolution of our dilemma would present itself if we found the delivered price of our exported products were suddenly reduced through lower tariffs abroad, or if we found our whole foreign market suddenly expanded through the restoration of convertible currencies throughout the world. I turn now therefore to the other devices for overcoming the evils of the high-cost economy: namely, the general liberalisation of world trade and the free convertibility of currencies.

DOLLAR AREA'S ROLE

We seem nearer to convertibility today than we have been since the imposition of wartime exchange control throughout most of

the world; but the prerequisites to convertibility have not changed.

Since the end of the war the world's hopes for convertibility have waxed and waned with Britain's exchange reserves. Today, with reserves at \$2,520 million and steadily improving, Britain can afford once more to consider freeing the pound sterling with the great advantage that now she will move from a position of strength rather than weakness.

I think we can say that Britain and her partners in the sterling area, as well as most of her Nato partners in Western Europe, have not only accepted convertibility as desirable in principle, but have in fact subjected themselves to the discipline in their domestic monetary and fiscal policy which is one of the prerequisites to convertibility.

I believe the time has come for the dollar area to show evidence of good faith by reducing trade barriers both in the form of tariff duties and in the form of Customs formalities and red tape. The dollar area must in addition show willingness to undertake certain responsibilities in the international monetary field.

STERLING BALANCES

There is the problem of the sterling balances with their constant threat to the stability of the pound; and there is, in addition, the problem of sterling area exchange reserves, which, though improving, are still considered insufficient by informed opinion abroad to lend wisdom to an immediate dash for freedom. On both counts, it is the dollar countries that can overcome the, doubtless well-founded, fears of our friends abroad.

Once these fears are removed, and given a continuation of the present rate of progress in dollar-short countries, the two great economic blocs in the western world will be able to move as an economic as well as a political body towards the twin goals of welfare and freedom.

CANADA'S HIGH-COST ECONOMY

Startling and unpleasant as it may be, however, there is evidence also that Canada is tending to become a high-cost economy in which natural and artificial barriers prevent us from achieving the degree of flexibility and mobility required for orderly adjustment. One marked evidence of this inflexibility is to be found in the failure of retail prices to reflect the general fall, since 1951, in the prices of raw materials.

This, as I pointed out last year, may be called a "concealed inflation"; it is the inflation not of final prices but of production and distribution costs.

We must reverse this process and achieve increased flexibility in our economy if we are to make those price adjustments which are necessary both to maintain stability and prosperity at home and to insure our competitive position in world markets. But we should also further in every possible way the present movement in western nations towards a world of liberalised trade and convertible currencies; for it is only in such a world

that we can reap the full fruits of our competitive position.

I have emphasised the seriousness of the problems we have to face both in the immediate and in the more distant future. This does not mean that I have anything but the most abundant faith in our ability as a nation to solve our problems; but I have thought it better to risk some over-emphasis than to encourage false hopes. The economic policy required to solve these problems will involve the sacrifice of expediency to sound principle in a number of matters where the choice must be politically very difficult. But the ultimate reward is great: no less in fact than the growth of Canada to the economic stature she needs to take her place among the great nations of the world.

ASSETS EXCEED \$2,895,000,000

T. H. Atkinson, the general manager, in commenting on the bank's financial statement, noted "a quite substantial increase of \$204,399,315 in assets, which now total \$2,895,856,189. This is the highest figure ever reached by a Canadian bank and places The Royal Bank of Canada well up in the list of the largest financial institutions of the world. Deposits are reported at \$2,734,644,076, an increase of \$207,133,639, as compared with the previous statement. This increase has been accompanied by the expansion in the number of accounts on our books. We are now conducting over 2,350,000 accounts, and it is of interest to note that the number of deposit accounts in Canada has more than doubled since 1942."

Mr Muir, the president, directed the shareholders' attention particularly to the bank's reserve fund, now totalling \$70 million, which, he said, "is now, for the first time in our history, twice as large as our paid-up capital. This year's increase in this fund results from the appropriation or transfer to it of not only a part of the year's earnings, but also of \$12 million from our reserves for contingencies."

Branches of the bank now number 793, of which 70 are in countries outside Canada.

The report and accounts were adopted.

STERLING ESTATES, LIMITED

INCREASED INCOME

The twenty-sixth annual general meeting of Sterling Estates, Limited, was held on January 13th, in London, Mr Douglas Overall, JP, FAI (the chairman), presiding.

The following is an extract from his circulated statement for the year ended September 30, 1953:

The gross rental income of the parent company totals £132,887, an increase of £4,658 over that of the previous year, notwithstanding certain reductions in rental income by reason of sales at the close of that year and transfers of property to subsidiary companies in the year under review amounting to some £4,700. Income from the subsidiary companies at £14,234 shows a substantial increase which is partly due to income tax repayments in respect of relief for maintenance expenditure in previous years. Income from your associated company is increased at £4,850 with a resultant total income for the year of £151,982.

Ground rents, interest charges, other outgoings and general expenses total £63,334, leaving a net revenue, subject to taxation, of £88,648. This revenue showing an increase of £6,978 arises solely from rental and

investment income, there having been no sales of property during the period under review.

Your directors recommend the final dividend be raised from 5½ per cent to 6½ per cent (less income tax), making a total of 9½ per cent, as against 8½ per cent for the previous year.

The report and accounts were adopted.

BASS, RATCLIFF AND GRETTON, LIMITED

MR C. A. BALL'S STATEMENT

The sixty-seventh annual general meeting of the ordinary stockholders of Bass, Ratcliff and Gretton, Limited, was held on Monday, January 11, 1954, at the registered offices of the company, High Street, Burton-on-Trent.

The chairman, Mr C. A. Ball, presided, and was supported by the following members of the board: The Rt Hon Lord Gretton, OBE, Mr A. G. Manners, Mr W. P. Manners, Mr P. D. Manners, Mr F. F. Toone, Mr W. R. Soper, Mr I. M. Lewis, and Mr R. D. R. Bateman, MBE, ACA, with Mr T. H. Charles (secretary), and Mr I. M. Taylor representing Messrs Whinney, Smith and Whinney (auditors) in attendance.

The secretary read the notice convening the meeting, and the auditors' report.

The chairman said:

Gentlemen, I have to submit for consideration and adoption, the report of your directors, together with the audited statement of accounts for the year ended September 30, 1953.

These were sent to you on December 19th last, and have, therefore, been in your hands for the statutory period, and with your agreement I propose to take them as read.

In the directors' report you will see that reference is made to the retirement of Mr Arthur Manners, and it is with the very greatest regret that my colleagues and I have to record this.

He joined Worthington's more than half a century ago, and was in due course asked to accept a seat on the board, being appointed a director on November 29, 1902.

His father was at that time the chairman, and upon his death, Mr Arthur Manners succeeded him in that position. He was appointed chairman of this company on October 8, 1945, which office, as you know, he held at the time of his retirement on September 30th last.

At all times his long experience, guidance, and his advice have been of incalculable help to the board, and I feel sure that all the stockholders will join with us in wishing him many happy years of retirement.

NO MEAN ACHIEVEMENT

You will see that the trading profit for the past year shows an increase, and this is no mean achievement having regard to the heavy taxation of various sorts to which our product and our profits are subject, and the still rising costs which we have to face.

The substantial transfers to reserves are fully explained in your directors' report and in the notes on the accounts, and I do not think there is any useful comment I can add thereto.

I should like once more to record our appreciation and thanks for the services and co-operation rendered during the year

by officials, staffs and operatives of our group.

I now beg to move that the report of the directors, and the balance sheet for the year ended September 30th last be adopted; that the half-yearly dividends paid on December 31, 1952, and June 30th last on the 5 per cent cumulative preference stock of the company, and the interim dividend of 10 per cent on the ordinary stock paid on June 26th last be approved, and that a final dividend be and is hereby declared of 33 per cent on the ordinary stock, making with the interim dividend of 10 per cent paid on June 26th last, a total dividend of 43 per cent for the year, all less income tax, such final dividend to be payable on or after January 16, 1954.

The Rt Hon Lord Gretton seconded the resolution, which was carried unanimously.

RETIRING DIRECTORS RE-ELECTED

The retiring directors were re-elected—Mr W. P. Manners on the proposition of Mr W. R. Soper, seconded by Mr R. I. Tooby; Mr W. R. Soper on the motion of Mr A. G. Manners, seconded by Mr C. G. Welch.

Mr I. M. Lewis, Mr R. D. R. Bateman and the Rt Hon Sir James Grigg, elected directors during the year, were re-elected—Mr I. M. Lewis on the proposal of Mr W. P. Manners, seconded by Mr F. Hanson; Mr R. D. R. Bateman on the motion of Mr F. F. Toone, seconded by Mr J. F. Rose; the Rt Hon Sir James Grigg on the proposition of Mr P. D. Manners, seconded by Mr S. C. Robotham.

The remuneration of the auditors, Messrs Whinney, Smith and Whinney, was voted on the proposal of Mr I. M. Lewis, seconded by Mr E. C. Walters.

Imperial by Default

ONE of the disadvantages of disillusion is that politicians are never likely to be lucid in expressing it. It is therefore not surprising that the communiqué issued by the Commonwealth Finance Ministers last week-end was a jumble of careful contradictions, in eight pages of double talk and bad grammar. The Ministers renewed their vows of fidelity to the principle of non-discrimination in trade, but intimated that discrimination was to remain as their house-keeper. They proclaimed their confidence that there would be no American recession, and then hinted at the preparations they had made to withstand one. They announced that more savings would be made available by the United Kingdom to finance Commonwealth development, and then called a press conference to emphasise that Britain did not intend to cut down spending in order to bring those savings into existence.

Fortunately, however, the present state of Commonwealth economic thinking is not—indeed it could not be—as silly as the Ministers have made it sound. The mere fact that the communiqué was so muddled suggests that one clear-cut misconception may at last have been left behind. Hitherto, ever since the Commonwealth awoke to the awkward realisation that it would have to have some sort of coherent trading strategy for the nineteen fifties, the Finance Ministers have been bedevilled by the false belief that that strategy must be based on a deliberate choice between two contradictory policies: a single trading world on the one hand, or a cosy imperial bloc on the other. In fact, however, the logical policy has always lain between. The objective now must be to maintain the advantages (while trying to tone down the disadvantages) of a close sterling area connection for the time being, and to emerge gradually towards a single trading world as and when opportunity offers. Last week's communiqué suggests that the Ministers now recognise this in practice, but have not yet got round to admitting it in cold print.

If so, a watershed has been crossed. The advantages of an advance to a single trading world, with sterling convertible and import restrictions either totally abandoned or entirely non-discriminatory, are familiar to everybody who has read Adam Smith. The disadvantages of too speedy an advance are familiar to everybody who remembers 1947—though there have been strange lapses of memory, from time to time, at the Bank of England. There are three pre-requisites before such an advance can be completed. The first is that dollar reserves outside North America will have to be increased, perhaps by increasing the dollar-borrowing and dollar-lending capabilities of the International Monetary Fund or by some device of that kind. The second is that there should be some assurance that any recession in America will not cut back American imports as sharply as in 1949. But it is not enough to provide reserves for the bad year; the really difficult thing is to ensure that in the good and average years the sterling area shall be able to balance its dollar account without restrictions.

The third and most important condition is therefore that America should gradually increase its imports from other countries by more than other countries increase their imports from it; any American demand for reciprocity in this matter will merely be a demand for shifting the postwar tendency to payments disequilibrium from a lower to a higher level of world trade.

This week-end the report of the Randall Commission on America's foreign economic policy will be published. It remains to be seen whether it will propose more, and whether Congress—many months of wrangling later—will enact more, than mildly useful measures of reciprocity. If it does, and if the American recession holds off, then the sterling area is likely to attempt some advance towards freer payments and trade. Such an advance might even eventually embrace something that is called convertibility. The Bank of England agrees with Humpty Dumpty that a word can be made to mean just what one wants it to mean. But perhaps the Treasury still remembers what the King's men had to do to Humpty Dumpty, shortly after he said that.

★

These, however, are battles for the hypothetical future. Even if some advances are eventually made the sterling area must plainly remain, for a long time to come, as a largely discriminatory trading bloc. The task in the interim must be to see that the system works. It will work only on certain definite conditions, which can be tersely stated even though they are often diffusely misunderstood. The sterling area must not become a club that requires its members to adjust their trading policies for the purpose of bolstering up other members' declining industries and increasing consumption, while purchases of food and raw materials from outside the area are financed largely by gifts or loans. It must not become a charitable institution in which a few spendthrifts live off other members' abstinence and hard (or relatively hard) work. And it must not kick constantly against the pricks of the price system, because this is an exercise that will lead only to bad temper and eventual secession.

These conditions are important; unless they are fulfilled, an Empire crusade—now translated into the verbose out of the vernacular—will merely become another Empire crisis. The way in which the sterling area should not be run was demonstrated in 1946-51. During those crisis-ridden years Britain encouraged certain overseas dominions to indulge in a wild spending spree; it did so because, thanks largely to the discriminatory import licensing in force, much of that wild spending bolstered up employment in Lancashire and other centres of declining British industries. But the wild spending resulted directly, and the diversion of British resources to satisfying it resulted indirectly, in a large payments deficit for the sterling area as a whole. Admittedly, this deficit could be covered in some of those years out of generous American assistance, which will soon come to a stop; and it was bolstered by the

dominions' drafts on their war-accumulated sterling balances, which have now been drawn down. Perhaps, therefore, to return to the pattern of 1946-51 would in any case be impossible. But there were disturbing signs at Sydney that some people would rather like to try.

The second condition of the sterling area's continued effectiveness is that the degree of abstinence and discrimination that its members are required to practise should be seen by all of them to be to their advantage. In the recent past it has not worked to the advantage of the colonies, who have piled up surpluses while the independent dominions have piled up deficits; and there were hints in last week's communiqué that in the near future it may not work to the United Kingdom's advantage either. There were vague suggestions in that communiqué of an increase in the flow of British capital to the overseas Commonwealth; admittedly there were emphatic statements at the subsequent press conference that this flow would not be at the expense of consumption in Britain—but this suggests that it may be at the expense of productive investment in the United Kingdom itself, which would be rather worse. It should be a cardinal principle of sterling area economics that the limited amount of investment that the Commonwealth can afford should be directed towards the most productive fields; this probably implies some increase in development of basic resources in the dominions, but it should also imply a cut in industrial investment there. It would be a pity if the new phase of imperial development proved merely to be a phase in which the colonies taught their grandmother how to suck bad eggs.

★

The third principle for the sterling area today is that when its trade is sticky it must adjust its prices; this is inconvenient because many Commonwealth countries feel that when their prices are sticky the Commonwealth should adjust its trade. The problem can best be exemplified by a concrete difficulty that arose during the discussions at Sydney. The Australians complained that they had a surplus of wheat, but that other countries were continuing to buy dollar wheat just because it was cheaper; they added, quite properly, that Australia had often bought British machinery in the past even although it was dearer than American machinery. But this awkward problem of cost disparities has arisen because Australia and Britain have inflated more thoroughly than America and Canada; and the obvious moral is that they must inflate less thoroughly in the future. It is incumbent upon the sterling area to recognise this.

But it is also incumbent upon other countries to recognise that the moral cannot be pushed too far. Adaptability there must certainly be in the Commonwealth if there is to be life and progress. But that does not mean that large changes can be made overnight in countries where those who would be hurt by them have votes. It may be possible to avoid further inflation; it is ridiculous to suppose that all the inflation that has

already occurred can be rolled back, for that would mean cutting wage rates. Or again, if America does have a recession, the Commonwealth governments will do all they can to protect themselves, even if that means running counter to long-term principles. It is not therefore so silly in practice as it appears to be in theory for the Commonwealth countries to agree to buy each other's dearer products instead of other people's cheaper products—as appears to have been discussed at Sydney. The economist who, with his eyes on long-range targets, denies that there can ever be a logical case for wider merging of preference within the sterling area may be just as far from the mark as the politicians who, to relieve a temporary emergency, creates a permanent encumbrance.

These, then, are the guiding lights of policy, not for

The President's Late Start

PRESIDENT EISENHOWER has now been in office for a full year. This would normally be long enough for at least provisional opinions to be forming of the quality of his performance as a statesman. Yet in most people's minds judgment is still curiously suspended. This is because in many ways Mr Eisenhower is only now making a start, while in other ways he seems to be making his way back to the starting point from false beginnings. Many of the new starts that are being made, moreover, bear much more resemblance to Roosevelt's New Deal and even to Mr Truman's Fair Deal than could ever have been deduced from the language used by Republicans during the campaign of 1952. The Republicans' first year, in fact, has been largely spent in finding out what cannot be done; they have still to show what they can do. With many Presidents and Prime Ministers to say this after twelve months would be to pass a fatal verdict. It is Mr Eisenhower's great strength that, in spite of it, he still enjoys by far the greater part of the worldwide good will with which he came into office.

It is perhaps natural that the difference between January 1953 and January 1954—between the false start and the real one—should seem most manifest to the outside world in foreign policy. A year ago the advent of the Republicans was awaited with considerable apprehension throughout the free world. This was not because they were ignorant amateurs—on the contrary, both the new President and his Secretary of State were full of experience in this field. It was because the Republicans, during the campaign, had declared themselves just as determined to change the Democrats' foreign policy where it was good as where it was bad. There was to be a complete re-shuffle, and America's allies could not help feeling frightened about what might be lost in the process. Mr Dulles himself

a Commonwealth economically strong enough to do what it likes but for a Commonwealth that still has to walk very warily. The sterling area's gold reserves are still inadequate, its susceptibility to American recession is still immense, and many of the goods that it manages to sell in the American market are still liable to sudden and regressive American tariff changes. Like everybody else, it can only set full sail for prosperity on the high seas of a freely trading world; but in present circumstances the high seas would probably make it sick. If there was some recognition of this in the Sydney communiqué, some hankering after a quieter—though less profitable and less invigorating—haven, liberals should keep a curb on their criticism and illiberal temper their acclaim.

had been saying things that sent shivers down the European spine.

These fears have been largely—almost entirely—allayed. From the start, Mr Dulles in the State Department proved to be a much more prudent and accommodating figure than Mr Dulles on the political platform. Indeed, the word began to go round quite early in the summer that it was at least as easy to deal with the new Administration as with the old—some said easier. In the last few months, Mr Dulles has seemed to realise that, when he speaks, he addresses the whole world, not merely the Republican party. Starting with his notable address to the United Nations in September, he has been making the most praiseworthy attempts to draw the great alliance of free nations together again after the all but disastrous cleavages to which party politics (of several nationalities) were exposing it during the summer months.

It would be wrong to give the impression that American foreign policy has gone indistinguishably back to where it was when Mr Truman and Mr Acheson left office. There are differences. The President can say, as he did two weeks ago that

the initiative is becoming ours. Our policy, not limited to mere reaction against crises provoked by others, is free to develop along lines of our choice not only abroad, but also at home.

And Mr Dulles can make it clear that the end of the Korean fighting and the growing strength of the free world are making it possible for the United States to rely on mobile striking forces, based chiefly on the American continent, and equipped with the latest nuclear weapons. These forces will be used to "retaliate, instantly, by means and at places of our own choosing," not necessarily at the point of attack, against any aggressor. These are proclaimed, for domestic political

purposes, as strikingly novel doctrines. But if Mr Eisenhower and Mr Dulles have more freedom for manoeuvre in their foreign policy than Mr Truman and Mr Acheson did, it is mainly due to two pieces of good fortune: the defence programme that was started in 1950 is now coming to maturity; and they are not, as their predecessors were, the victims and prisoners of embittered and unprincipled political and personal attacks. Initiative and flexibility they certainly have; but neither can fairly be claimed to be a Republican invention.

★

In domestic matters, as in foreign affairs, President Eisenhower seems also to be back where he started a year ago, after in the intervening period falling below the level expected of him; indeed in many ways he is now even further back, where his predecessor left off. Just as Mr Dulles has returned from a disturbing flirtation with "liberation" to a more highly developed form of Mr Acheson's "containment" as the best way of checking Soviet expansion, so President Eisenhower, in the legislative proposals which he is now pouring on Congress, has returned from the conservative ways of traditional Republicanism, down which he seemed to be wandering during and after the election campaign, to liberal paths which lead in the same direction as the New Deal, to the road that he was chosen to follow by those who, eighteen months ago, saw in him the only hope that the Republican party could be saved from itself.

Mr Eisenhower's concern with the human problems of the individual American and with prosperity for all Americans; his conviction that a serious economic recession can, and must, be avoided; his social welfare proposals; even his controversial agricultural programme—all these have a Rooseveltian look. As the details are filled in, however, the content of the proposals becomes distinctly Republican. For Mr Eisenhower hopes to reach his objectives gradually, with the help of state and local governments and of private enterprise, rather than by driving straight ahead with all the force that the federal government can build up. This, and the conciliatory way in which his requests are being put to Congress, contrasts favourably with Mr Truman's regular truculence. Nevertheless, as the President has now recognised himself, something more drastic will be needed if Congress is to accomplish more this year than it did last, when little except the absolute essentials were dealt with.

It is of course true that an inexperienced President, leading a party that has been out of office for twenty years, needed time to learn his job, to recruit officials and to reorganise departments, so that he could count on loyalty and efficiency—that there was some lack of both in Washington cannot be denied—and to obtain expert advice on what ought to be done. But taking a year to do this has meant losing the first enthusiasm of victory; it has been further dashed by the President's evident lack of happiness in his job. It has

also meant losing a valuable year of Congressional time, a year not overshadowed by a coming election as the present one is.

This loss has been especially unfortunate because the very narrow Republican majorities in Congress, now almost non-existent, and the conservative outlook of the Republican leaders there, and particularly of the powerful chairmen of committees, have made the President dependent on Democratic votes for most of the important victories that he has had. Such Democratic support will be harder to come by in an election year, and the conservative Republicans may also be even harder to bring to heel, for they are convinced that, being more knowledgeable politicians, they are better able than the President to judge what the voters will want next November.

★

Mr Eisenhower agrees with them that the voters will want even more economy in government and a glimpse of a balanced budget, and he has made concessions to the view, although he disputes its validity, that Communism in government will still be an issue at election time. To the regret of those who feel that amputation would be a better treatment for the McCarthy disease than plastic surgery, the President still seems to be trying to put a respectable face on the Senator, most noticeably by asking for anti-Communist legislation during the present session of Congress.

This Mr Eisenhower may well get, and he has said that at last he is prepared to use pressure to get a great deal more. He is already mobilising his most valuable political asset in any struggle with Congress, his overwhelming personal popularity, which has been dissipated hardly at all in the past year. He has begun to rally public opinion—voting opinion—behind him through his press conferences and wireless appearances. If he will really use all the weapons at his command, there are few American observers who doubt that he can impose his wishes on Congress.

But they are much less sure whether the will is there, for Mr Eisenhower (it is not such an odd thing to say of a twentieth-century general as might seem at first sight) is not a natural fighting man; he is not a good insister. How far he is prepared to go in deliberately incurring the hostility of powerful members of his party as the price of getting his own way still remains to be seen. But it cannot remain in doubt much longer. If the greater part of the President's programme is to be enacted, the maximum pressure will have to be applied unremittingly every day between now and the summer, and results will soon have to be visible. These next few weeks will be decisive. To a remarkable extent, the world, like the American people, is still ready and anxious to give Mr Eisenhower the benefit of the doubt. He has already been given much more time than is allowed to other politicians. He will be straining his good fortune and his goodwill if he asks for much more.

Behind M. Bidault

THE Berlin conference means more for France than for any of the other participants. It is safe to say that, whatever happens in Berlin, the internal politics of Great Britain, the United States and the Soviet Union will be affected very little or not at all; there will be no change in the position of Sir Winston Churchill's government, or President Eisenhower's or Malenkov's. But this is not the case with France. The moves of the pieces on the French political chessboard will be governed to an appreciable extent by the results of the conference. For the future of Germany is a dominant issue in French politics. Either the conference will produce a *détente* (whether well or ill founded is here irrelevant) in international affairs, or the international temperature will remain very much as it is. Translated into terms of French politics, this means that the European Defence Community will either become a less urgent issue or continue to overshadow the business of governing France. And the permutations of the parties are likely to be one thing if Germany and the EDC are to the fore, but quite another thing if they are not.

The principal effect of the German question in French politics has been to draw a line across the parties between nationalists and internationalists. The internationalists, supporters of the EDC, are to be found mostly in the centre; the nationalist colours have been sported mostly by the Gaullists and the Communists. (The latter, despite their subservience to Moscow, have performed the not inconsiderable feat of posing as nationalists, because opposition to EDC has been accepted as equivalent to nationalism.) This joining of the extremes against the centre has been not only incongruous but also a major source of damage to the French political system, for the association of Gaullists and Communists has been an association for opposition only; there has been no question of their forming an alternative government, and the constructive moves of President and politicians have therefore been confined to a rather cramped centre.

There have already been some signs of a reversion to what is a more normal pattern for a parliamentary democracy—the pattern of right against left, as opposed to the pattern of a centre fighting on two fronts. On the left the Communists, following a line also evident in Italy and elsewhere, have shown themselves ready to revive a form of popular front; the failure of the demonstrations against General Ridgway in May, 1952, and M. Billoux's confession that his advocacy of violence had been a mistake were followed by overtures by M. Duclos to the Socialists. For their part the Socialists have made suggestions, in political and trade union circles, for a reforming and democratic front of the left parties—though they would not admit the Communists to it. And, thirdly, there has been an attempt to rally

all the more active and younger leftward-inclined elements of all parties round the person of M. Mendès-France. So far none of these schemes has come to anything; the German question—which is also the Russian question—cuts across them all, and activity has been in suspense since a four-Power conference became a probability. But if it could be disposed of, the forces of the left might well be drawn together in one form or another.

There are similar symptoms of consolidation on the right. Here the attitude of the Gaullists has been crucial; it has also taken many people by surprise. It was at one time believed that the Gaullist RPF, though nationalist, was also a *parti social* and therefore leftward inclined; it was also expected that the party would modify its hostility to the EDC and to the sacrifice of France's national army when it decided to enter the "system" and to play the party game. But these beliefs and expectations have been proved false. The Gaullist deputies elected in 1951 have turned out to be conservatives rather than social reformers; as they have gradually given their support to a succession of Prime Ministers, the governments of the last eighteen months have become more and more conservative. First a dissident group of Gaullists gave outside support to M. Pinay. Next, this group joined the government of M. Mayer, when he succeeded M. Pinay at the beginning of last year. At the same time the orthodox section of the RPF began a similar conversion from opposition to cabinet, giving its support to M. Mayer and then joining M. Laniel's present team.

★

But if the right has been strengthened in this way, it has not been consolidated. Nor does it look like being consolidated so long as international tension keeps the German problem and ratification of the EDC treaty at the top of political programmes; for the Gaullists, while joining the "system," did not abandon their opposition to the EDC. The Gaullist deputies may have felt that they were belying the earlier popular and revolutionary current in General de Gaulle's movement; they may also have felt the pricks of conscience in joining the "system" which their rally had been formed to denounce and destroy. Whatever the reasons, they have apparently felt the need to stress their remaining link with General de Gaulle by emphasising rather than soft-pedalling their hostility to the foreign policy of the groups with which they have allied themselves in the chamber and the cabinet. A coherent right is, therefore, still a shadowy thing and, like a coherent left, its emergence as a stabilising political force waits upon the outcome of the Berlin conference.

The German question, therefore, stands in the way of the evolution of French politics towards two blocs, one of the right and the other of the left, but if there were a real change in the atmosphere after Berlin, then the way would be clearer for the growth of the two blocs—provided the centre parties which have most to lose by such a redistribution of power did not prevent it.

These parties—notably the MRP and the Radicals—will be in an unenviable position, for they risk dismemberment. The MRP is a mixed party of progressive intellectual internationalists, respectable bourgeois Christians, and right-wing business interests. The Radical-Socialist party is no less of a Janus. Its liberal economics draw it to the right away from the Socialists, but its anti-clerical tradition pulls it to the left towards the Socialists, and its whole history in the Third and Fourth Republics has been a series of shifts to the right, tempered by jerks to the left. Both the MRP and the Radicals could put serious obstacles in the way of the development of a two-bloc system. The MRP may refuse to join a right-wing bloc because of unwillingness to abandon its policy of European integration, while the Radicals may fight shy of entering a left bloc with the Communists.

This, then, is the situation at which M. Bidault will from time to time glance over his shoulder as he sits at the Berlin conference table. His future and that of his MRP party are involved in the outcome of the conference, as is the fate of the Laniel government, of which he is a member. It is far more difficult for him than for Mr Dulles or Mr Eden to be single-minded and resolute, for there are openings in the French

position into which Soviet diplomacy and propaganda have been probing for a long time. There is the general French distrust of any rearmament of the Germans; there are the particular sectional dislikes of a defence community that is insisted on by the United States, that appears likely to engulf the French, that might allow Germany to dominate the West European group; there is the fashionable hankering after an old-style Franco-Soviet understanding in face of resurgent Germany; and, above all, there is the baffling and instinctive tendency of French policy to hesitate over that unification of Germany, which has been an agreed western aim for so long.

This is not to say that M. Bidault's loyalty to his colleagues is in question; but it will be wise to keep three facts in mind during the next few weeks. The first is that M. Bidault has been given the support of the Assembly on condition that French policy is "independent." The second is that, while M. Bidault may agree with Mr Dulles and Mr Eden on the long-term strategy of relations with Russia, he has a significantly different position on the tactics; for while they are (or ought to be) in a hurry, he can escape from his dilemma only by procrastination. Indeed, he has undertaken to be "infinitely patient." The third is that, even when it comes to the substance—as distinct from the time table—M. Bidault cannot be as dogmatic as his western colleagues. Molotov's instructions may this time be sufficiently flexible to enable him to make proposals that Mr Dulles and Mr Eden could reject, but that M. Bidault might feel bound to consider for reasons of domestic politics. It is a possibility to be watched for carefully.

A Phoenix Too Frightful?

THE Minister of Works had some harsh things to say last week to the City of London about the standards of design displayed in its rebuilding schemes. He told the City's planning authorities, over lunch at the Lord Mayor's table, that he believed that only prompt action could avert the sorry spectacle of "fat and familiar, mediocre and characterless neo-Georgian architecture rising from Hitler's ruins to betray the confident spirit of the new reign."

Although Sir David Eccles addressed himself to the City fathers, his warnings will—or should—reverberate around the council chambers of the other great cities of Britain. His speech came at an opportune moment. In Coventry, Plymouth and other blitzed centres, rebuilding started earlier than in the City. The first fruits of their reconstruction can now be witnessed, and judged. They are not, for the most part, architecturally impressive; if the worst errors have generally been avoided, the full opportunity has rarely been seized. It is not a happy thought that upon their present direc-

tion and quality will hinge the new look of Elizabethan England.

What has gone wrong—the powers, the plans or the people who administer them? The first answer must be that there is no lack of powers to control redevelopment or of plans to guide it. Local authorities possess an amplitude of both. They can refuse to sanction any development that is unsuitable or displeasing. They can use their powers of compulsory acquisition to enforce whatever pattern of land use is considered appropriate. If private developers refuse to co-operate, the local authority has the ultimate sanction that it can itself carry out any development that is necessary to the success of its plan. These powers are subject to the important qualifications that the central Government may refuse to approve their use, and that no local authority can in practice dispense with the all-important co-operation of private developers. But the controls remain formidable.

The fault must therefore lie with the manner—and

atmosphere—of administration. This is not entirely the local authorities' fault. Planning powers can be used with good effect to improve the street pattern and the flow of traffic, to safeguard amenities and to control the density of population. But their use for æsthetic purposes, other than for the prohibition of the more obvious eyesores, is anything but easy. Planning control is mainly negative in character and utilitarian in its objectives. It is one thing to control the building of an office so that it receives adequate air and daylight. It is quite another to make the building conform with some standard of external design. Who in such matters is a sound arbiter of elegance? Even Sir David Eccles's distaste for neo-Georgian architecture offers no absolute standard. Neo-Gothic is far, far worse.

It may be argued that although nobody can be a final arbiter of taste, a civic authority is likely to be a very feeble one. There is some element of truth in this. The attitude of many councillors towards architectural innovations is not unlike that of Sir Alfred Munnings towards modern painters, only less explicit. A suspicious conservatism may be a desirable attitude in the heyday of a great tradition, but it is not helpful to a society that is struggling to free itself from a century of bad taste. A good local authority architect can, of course, educate his council in the rudiments of design, but it is not general for an architect to head the planning department.

★

This does not mean, however, that re-building would proceed more smoothly if the local authorities left the job to private enterprise. In the first place, the case for public control rests not on any supposed virtues of public taste, but on the fact that the civic authorities, and they alone, can impose the unity of design without which a street or a square becomes an amorphous collection of unrelated buildings. Architectural unity is not, of course, always successful; it may produce dull and monotonous results—as many large schemes, both public and private, bear witness. But some minimum of co-ordination over the different buildings in a street block is certainly desirable, and in a typical central area, where are concentrated the principal civic buildings, the big stores, theatres, hotels, and public meeting places, there is a need for closer co-ordination still. In the absence of large private landlords no one can attempt this except the local authority.

Secondly, the execution of the local authorities' plans depends on the active participation (and not merely the passive compliance) of a heterogeneous group of private developers. The attitudes of these developers have varied widely. Generally, only the larger businesses and financial institutions have the means and the interest to join in large schemes of reconstruction. One result has been to squeeze out the small shops from the new city centres in favour of the big department stores. Big businesses can afford to employ competent architects and with some of them it is a point of pride to set a

high standard of taste. But not all firms live up to this standard. If a city council cannot hope to get away with schemes that are too ambitious or *avant-garde*, it equally cannot hope to get anywhere at all unless it is prepared to say "no" quite often to private developers.

The need, then, is not merely for good taste and resolute planning, but also for an atmosphere in which these can be enforced and in which co-operation is regarded as a vibrant civic duty instead of a bore. The progress of reconstruction in three of the principal blitzed areas—Coventry, Plymouth and the City of London—provides contrasting case studies of these requirements.

Of the three, Coventry has undoubtedly been the most successful. Its original scheme for a new civic square open on one side to the new cathedral and leading on the other side into a new shopping precinct, accessible to pedestrians only, was not beyond criticism; it may have been a charming idea to let Lady Godiva and Peeping Tom mark the hours on the clock in the main square, but the effect of one doll leering at a pinker one invites ribaldry rather than a sense of history. Nevertheless, Coventry's modest success has been primarily due to an atmosphere favourable to planning; a public alive to the singular renown accruing from a ferocious *blitz*, a council willing to support its architect through thick and thin, a political atmosphere in which the objections of private developers could be successfully overcome. The city itself has built one commercial building that no other developer would undertake on appropriate terms, and it has waited patiently in order to find firms that would comply with its architectural specifications. The plan also had the benefit of a fortuitous send-off in the form of a gift of flowering shrubs from Holland; these were planted round the blitzed square, and from that moment public interest in a finer Coventry suddenly came alive.

Other cities have been neither so fortunate nor so pertinacious. Plymouth is a city that led the way in the speed and boldness of its postwar planning. In consequence of this, and of a local surplus of labour, it has accomplished more in terms of bricks and mortar than any other blitzed city; but it has lacked the patience, good taste or firmness to insist on a harmonious design. Ugly concrete masses, coldly faced in Portland Stone, mar the effect of the principal new shopping street, the Royal Parade. The council was determined to avoid delays and conflicts; it passed its plans in a hurry without even consulting the Royal Fine Arts Commission. The new Plymouth stands as proof that even a Labour Council may abrogate the principle of public control in the search for quick returns.

The City of London is on the other side of the political fence. Of all authorities, it is probably the most cautious and conservative, and the least anxious to offend; its plan was sent back by the wartime Minister of Town and Country Planning with the complaint that it showed excessive deference to property interests. That deference is still much in evidence. The City has taken power to acquire all

the land in its extensive blitzed areas, but its policy is to assemble land in units that are suitable for development by private enterprise. It feels faintly improper and Socialist because it owns five temporary shops; but emphasises (quite properly) that it has no desire to undertake any development on its own account, except for purposes of street improvements. It relies instead on its dual power of control in its capacities as ground landlord and planning authority, but it seems loth to use either to much effect. Yet there are large private funds waiting to be invested in schemes of rebuilding, and the City need have no fear that a strong control over design would drive out enterprise or sensibly reduce its own ground rents.

It was this lack of co-ordinated purpose that the Minister of Works was plainly intent upon criticising at the Lord Mayor's lunch last week. Sir David rightly rejected any suggestion that he should use the system of licensing to force Whitehall standards of design upon the City developers. His suggestion was that co-ordinating bodies should be set up to supervise the general design of each area of the City. If these bodies were to include the younger and less honorific architects, they might achieve useful results. But experience in other cities, and in the City itself after the Great Fire, suggests that the best results flow from giving broad powers to a single architect-designer,

working perhaps in conjunction with a committee that would restrain his excesses but not hamstring his genius. This may come perilously near to saying that the only real salvation for the City is to find another Wren; but a lesser Wren would do.

It is not too late to recreate the vision of a glorious Phoenix risen from the ashes. But if the vision is to inspire and not to frighten, the British public—both those who undertake development and those who merely have to live with it—must escape from present apathy. Some city councils (such as the City of London) should be bolder in their planning and others (such as Plymouth) more patient in execution. And the Government itself will need to be more helpful than in the recent past. Recurrent cuts in capital investment have not merely held up the plans; they have made the planners disillusioned. The Government's long refusal to let local authorities spend one unnecessary penny of public money has severely cramped their style. It has forced them to acquire land so slowly that they are having to pay for the very values that their planning has created. It has cut from the plans the little frills and pleasantries that might make all the essential difference between public apathy and public appeal. It is all to the good that Ministers should lecture the local authorities; it would be better still if they also delivered some lectures in Whitehall.

Notes of the Week

Hand-washing in Korea

THE Chinese introduced "brain-washing" into the problem of the prisoners of war in Korea; the Indians are ending it with a washing of hands. By handing the prisoners back—as prisoners—to the armies who originally held them, General Thimayya has got out of an awkward predicament. His *terme* of reference under the July armistice required him to release, as civilians, all prisoners for whom no other disposition had been agreed 120 days after the neutral commission had taken custody of them. The 120 days end this weekend, and, strictly speaking, the commission has failed to carry out its obligation, for it has not formally released its 22,000 charges. General Thimayya has preferred to place the onus of declaring these men free on the shoulders of the two military commands. The United Nations side has accepted it gladly, and rightly.

But while the Indian commander's action, which, he knew, meant release for the prisoners, may be justified,

the same cannot be said of his words. For General Thimayya has seen fit to tell the UN Command that it had no right to free these men. This statement was both a distortion of the armistice terms, and a grotesque attempt to prolong the neutral commission's theoretical authority—while the general was simultaneously cutting short its practical authority. His action must be interpreted merely as an expression of the Indian government's anxiety to shake off all further responsibility in the matter of the prisoners. Mrs Pandit's request for a special session of the UN Assembly points in the same direction.

India's attitude is wholly understandable; in Korea it has learnt, as other nations have done before it, that the role of policeman-peacemaker is a thankless one. But to resort to such Brahminical subtleties as calling the Assembly together to rule on a situation from which India will meanwhile have extricated itself is not, perhaps, the best way of satisfying all parties. It must embarrass the UN allies; and it has already been condemned by the Communists. It is a great pity that the excellent record of General Thimayya's force in Korea should be overlaid by such undignified manoeuvring.

Two Thoughts for Berlin

ATTITUDES towards the Berlin conference next week range from calm scepticism to an anxious search for ways around deadlocks that have not yet occurred. It is all somewhat like the eve of a contest for a world title, with both contestants saying they will win and sports writers advising on tactics and form. It is, perhaps, sufficient at this stage to point out two matters on which there is confusion.

Some ask: if the outcome at Berlin is further delay in the creation of a European Defence Community, what does it matter? It is not enough to reply—important though the answer is—that Western Europe needs German divisions for effective defence. It has also to be recalled that this treaty and the Bonn Conventions ending the occupation of Western Germany are inextricably interwoven; Dr Adenauer's government was to win independence by entering the defence community. If there is none to enter, how long is his government to wait for independence, and in what form and on what terms is it to be granted? Opponents of EDC have yet to produce a reassuring statement on this point.

There appears to be further confusion in the suggestion that if the four powers fail to reach broad agreement on methods of attaining German unity, efforts to reduce the dangers and inconveniences of the present division might be made by committees of experts. This, it is suggested, would "leave things as they are," but would offer some hope of progress in the future. In fact, however, any prolongation of the Berlin talks in technical committees would have on the French Assembly and on German opponents of Dr Adenauer almost precisely the same political effects as some measure of agreement about Germany by the ministers. It would encourage delay, discourage the policy of integration in Western Europe, and presumably, impel Mr Dulles towards his "agonising reappraisal." Some people would like that to happen; what matters is that those who do not want it to happen should be aware of the devious and unexpected ways in which it might happen. There is all the difference between modifying western policy in exchange for Soviet concessions, and putting off the EDC for no gain at all. The first is genuine compromise; the second is retreat—which might become defeat.

Tête-à-Tête on the Atom

MR DULLES has had two discussions in Washington with Mr Zarubin, the Soviet ambassador, about the procedure of negotiation on President Eisenhower's offer of an international pool of atomic materials. Now it is announced that he will have further procedural talks with Mr Molotov during the Berlin conference, but that he will not take his atomic experts with him to Berlin. It is not difficult to deduce that no rapid progress has been, or will be, made. Nor is it surprising. In dealings with the Communist powers, whatever the issue, tedious experience has

shown that preliminary talks are liable to last as long as full-scale conferences.

In this instance, the main difficulty can be easily identified. The Russians have made it clear that they are less interested in the Eisenhower plan than in the opportunity of reviving their own—unrelated—atomic energy proposals, so often rejected by most other nations. They will presumably try to make progress towards the President's objective depend on retreat towards their demands. Deadlock might be prevented if two sets of talks were initiated, one on the Eisenhower plan and one on the Soviet proposals; but this would involve concessions on both sides. It would not prevent the Russians from trying later to bend the two parallel lines together again.

Meanwhile, there is consolation in the fact that the atom talks, unlike the issue of China's status as a power, need not be seen as a disrupting factor at next week's conference. On the contrary, Berlin is in some ways the ideal place for them. Not only will Mr Dulles be able to talk directly, and privately, with Mr Molotov; Mr Eden and M. Bidault will also be within beckoning distance. The Eisenhower plan is not a subject that need cause alarm to the British by being handled, at least in the first stages, by the Americans and Russians alone; but full and prompt information is always reassuring, and in Berlin there should be no difficulty in getting it.

Quiet Flows the House

EVENTS conspired to bring members back to a temporarily placid House of Commons. Unwelcome spectres might be haunting the corridors, but for the moment neither side seemed prepared to usher them on to the floor of the House. Mr Butler was still in Sydney, so economic controversies were muted. Mr Lyttelton, Labour's chief whipping boy before Christmas, was in Nigeria, so no colonial crisis could be manufactured. The imminence of the Berlin conference made serious discussion of foreign issues unprofitable. The mounting tally of wage disputes might have caused a flurry; but Mr George Isaacs is still a fan of Sir Walter Monckton, and he firmly led the Opposition on to the responsible path of restrained watchfulness.

On the economic front, however, Parliament's present passiveness is unlikely to outlast Mr Butler's return. One of the first questions put to Sir Winston Churchill after re-assembly was about the Government's plans for combating the effects of any American recession. Sir Winston conceded that "our economic plans should certainly be adapted to meet any changes of conditions which can be foreseen," but added—in the best Treasury style—that "it is not thought that it is desirable to announce in advance specific measures against hypothetical situations." This is not comfortable ground for Sir Winston and he is never likely to be expansive, but Mr Butler seems certain to be pressed—perhaps from both sides of the House—for something much more precise. It is obvious that the Government has plans for use in case of recession and equally obvious why it does not want to talk about them; quite apart from the fact that any plans published now would be unlikely to be relevant to whatever odd things do occur, it

is generally recognised that if ministers sound a shrill alarm they might endanger confidence and be accused of trying to influence current wage disputes. But Parliament invariably argues on these occasions that the country expects, and needs, advance recipes for crises.

With wider controversies beyond their reach, MPs were left with a narrow argument about the level of Government assistance to local authorities, to enable them to give a temporary lease of life to houses that are scheduled for slum clearance but are not yet due for demolition. The Government's decision to pay one-half the annual loan charges and £3 per house per year was challenged by the Opposition as inadequate, but not even two such protagonists as Mr Macmillan and Mr Bevan could bring much bite to the discussion, as became clear when the Government secured a majority of 44 in the vote on the relevant resolution. In theory, the Government's margin should have been reduced by by-elections and ministerial absences almost to a single figure. But Labour has not yet been brought to the simmer, let alone to the boil.

Fanning the Sparks

THE Electrical Trades Union and the National Federated Electrical Association have continued their loud, public quarrel this week. The union called a nationwide, one-day strike on Monday; and most employers locked the strikers out on Tuesday. The main results have been that the Parliamentary Secretary to the Board of Trade was unable to open the Catering Exhibition in a seemly manner, that a great deal of important wiring at construction sites has not been completed, and that both parties to the dispute are a good deal angrier than they were a week ago. One important cause of this anger was the dismissal on Tuesday of 26 employees of W. H. Smith Ltd., electrical contractors at the Shepley Industrial Estate near Manchester. These employees had joined in Monday's strike of contracting electricians although, their employers maintain, they were not engaged under contracting electricians' agreements. The company had given due warning of its intention to dismiss men who stayed away from work on Monday; it says that 25 other members of the union were at work that day and it saw no cause, on Tuesday, to abandon its plan.

This is only one, although probably the most bitter, of the many local quarrels that have developed out of the main national contest. Only in Scotland, where both parties have sent their dispute to arbitration, has reason prevailed. On Monday some Scottish electricians obeyed the instructions of their leaders, who were directing affairs 400 miles away in Hayes Court, Bromley; but on Tuesday their employers did not lock them out. Relations were then described, by the Scottish employers, as "amicable," and both sides now seem to feel that they have indulged for long enough the belligerent whims of the English. In the meantime, in England, Wales and Northern Ireland, the union has continued the series of "guerrilla" strikes it began last week. The headquarters of each side has maintained, in its daily bulletin, that the other is coercing its members into reluctant obedience to the dictates of a tyrannical national executive.

Faced with all this violence the Minister of Labour, Sir Walter Monckton, has wisely refused to intervene; and Sir Waldron Smithers has been told, by the Prime Minister, that the Government does not intend to introduce legislation to ban strikes that are not approved by a secret ballot of the workers concerned. It is certainly not in the national interest that the electrical workers should win this strike; they have tacitly admitted, by rejecting arbitration, that they have a bad case. But the electrical employers, and some normally responsible sympathisers with the proposal of Sir Waldron Smithers, would be wise to recognise the distinction between a proper show of firmness towards exorbitant demands and a rather petty disposition to ruffle the ordinary trade unionist's temper.

Grains and Nonsense

THE Ministry of Agriculture has now announced the seasonal schedule of guaranteed prices which will be paid for home-grown cereals harvested this year. The new schedule is important, for this is the first year in which the new type of price guarantee to agriculture will operate. Under the old system, farmers sold all their grain to the Government at fixed prices; under the new system, they will sell their grain in the open market but each farmer will be compensated, in the form of subsequent deficiency payments, to the extent that his realised price falls short of the standard price determined by the Government.

The system changes, but the extravagance remains. Indeed, it is to be intensified. The new standard prices are as high as the old fixed prices, and in the case of oats they are higher. This means that the farmer can be sure that on a declining market he will be no worse off than under the old system, while on a booming market he will reap the extra profit of above-standard prices. At the moment the market is declining. World grain prices are steadily falling, and this week the Department of Agriculture in the United States announced that it is to reduce export prices in an effort to dispose of its large wheat surplus. The further world prices fall, the heavier will be the cost to the British taxpayer of supporting home production. This cost is already formidable. It is believed that the food subsidies are now again running at an annual rate of about £300 million, the greater part of which represents subsidies to home agriculture.

The new schedule shows that the lesson of the prewar Wheat Act, under which the price paid was related to the quantity produced, has been forgotten. The standard prices will lose all point if they are always above the market; and the benefits of a free market will lose most of their potency now that they are to be combined with a system whereby the guaranteed prices that will rule up to June, 1955, were determined in March, 1953. The farmer now has a triple guarantee in terms of price, quantity, and long-term market. One at least of these guarantees will have to be made less absolute if the justifiable policy of stability for British agriculture is not one day to be overthrown by an equally justifiable taxpayers' revolt against the present system of cast-iron and costly protection.

The Case of Comrade Djilas

MR DJILAS has paid dearly for the intellectual exercises whose main content is briefly summarised on page 241. He has not been expelled from the Yugoslav Communist party, but he has been stripped of all his party offices. He has already had to resign the presidency of the new Federal Assembly, to which he was unanimously elected last month, and it seems unlikely that he will retain his position as third vice-president of the Federal Executive Council. But he would have fared much worse had he made his deviations in any Soviet satellite country. He is alive, even if he is not kicking. He has not been forced to make a humiliating confession and recantation of his errors; he appears to have stuck to his guns on all essentials. Moreover, in the radio and press reports of the proceedings before the central committee there has been no suppression of his point of view.

This comparatively lenient treatment may be due to the close personal friendship between Marshal Tito and Mr Djilas; or to a cold calculation that it would be unwise to make a martyr of such a popular leader; or even to a genuine determination that political and ideological differences should be treated with moderation and fairness. What is clear is that the Marshal has been taken aback by the "incredibly large number" of Yugoslavs who have adopted his philosopher's ideas; and that he has no intention of allowing the development of a loyal opposition. To what extent Mr Djilas consciously and explicitly contemplated the creation of any such opposition is obscure, but he has apparently now admitted that his writings could provoke a split in the party.

Mr Djilas's colleagues plainly feel that his trips abroad in western countries have had an unfortunate effect on his thinking. It will be interesting to see whether their contacts with western Socialists are pursued with as much enthusiasm as in the past; the culprit, at any rate, will probably be kept at home. But as far as one can tell, there is no reason to think that the Djilas episode betokens a move towards Moscow. In his articles he more or less argued the Yugoslav Communist party out of existence; and that was quite enough to bring about his fall.

Mixing with Demigods

SINCE Beria's fall Soviet policy has followed a wayward course, as if its directors could not decide whether to go back to the path traced by Stalin or to continue along a new line. In some fields, especially over the question of nationalities, Stalinist practices have been resurrected; in others, the new regime continually breaks away from the established pattern. Last week marked such a complete break with precedent, when all the leading members of the presidium (formerly Politbureau) of the party, including premier Malenkov, first secretary Khrushchev and Molotov, took part in local party meetings in Moscow. In Stalin's time members of the Politbureau were demigods hidden from public view by the walls of the Kremlin, from which

they emerged, led by their master, only on special ceremonial occasions. This time, however, they split up into small groups, each attending a different Moscow district, and discussions were apparently carried on in the constructive spirit of "criticism and self-criticism."

Obviously, even local meetings in the capital are attended only by a certain élite of workers and officials. The new rulers have still a long way to travel if they are to return to the practice of the early days of the revolution, when all leaders spoke frequently at popular mass meetings. It has not been revealed what ideas Malenkov and his colleagues had to offer last week to the Moscow delegates, but the very fact that they had agreed to attend was significant. Stalin considered that VIPs cannot stand up to close contact and scrutiny, and during the last twenty years he rarely allowed his colleagues to abandon the splendid isolation of the Kremlin.

These local party meetings may also be the prelude to another "democratic" step. Assizes of this kind are held in various parts of the country. Two republican party congresses are also to be convened in the near future. Will they be followed by an All-Soviet Congress? The last one took place some 15 months ago after an interval of 13 years. Yet so much has happened in the last year that the rulers may soon call a new congress and use it for proclaiming the new line and selecting a new leadership.

Spanish Morocco and the Sultan

THE news from Spanish Morocco is a reminder that the French government may some time have a bill to pay for its failure to consult the Spanish government and square the Spanish Zone when it so hastily changed Sultans in August. The Spanish government protested at the time, quite legitimately, for by a treaty of 1912 with France it is responsible for law and order in the Spanish zone, and no power so placed likes to be confronted, without notice, with such an upset. But its protest was not vehement, for it had no mind to stir up the Arab extremists in its own zone. Since then, it has nursed its grievance in silence. But it has in no way tampered with a local situation in which the Khalifa, or representative, of the Sultan in the Spanish

zone has not recognised the new Sultan, and is still having prayers said in the name of his exiled predecessor.

This disharmony between the two zones is awkward for the French, who have their own hands full with a steady trickle of terrorist attacks, chiefly on pro-French Moroccans, and of mysterious reprisals against Moroccan nationalists. These they attribute to "outside"—that is, to Arab nationalist—influences, which are naturally more potent if nationalist headquarters in Cairo has a friendly outpost in the Spanish zone. Hence M. Bidault's vehement reaction to the news that a gathering of Spanish Moroccan notables was due last Thursday. France's concern lest this should turn from a display of loyalty to the old Sultan into some move to endow the Khalifa with separatist powers was vigorously expressed to the Spaniards in Paris, Madrid and Tangier.

Maybe the notables' meeting will confine itself to expressing thankfulness for General Franco's Spanish Moroccan policy. This is notoriously more liberal than the policy of the French in their much more advanced French zone, though not as liberal as the nationalist firebrand, Abdel Khalek Torres, would wish. If the meeting goes further, and expresses loyalty to the exiled Sultan, the Spaniards can hardly do otherwise than explain that they have no control over a free expression of local opinion. The French are in no position to retort, for this is the very explanation that they themselves gave over the change of Sultan. During this slight and unfortunate coolness between European protectors the Moroccan nationalists sit pretty.

Jobs for the Juniors

IT is surprising that British Cabinet Ministers since the war have remained, on the whole, an even-tempered lot. Britain's ministerial structure has failed to adjust itself smoothly to the expansion in the demands made upon it, and there have been five or six men in each postwar government who have been grossly over-worked. One remedy that has sometimes been proposed is that more responsibility should be devolved on junior ministers. This view has now received a powerful and experienced sponsor. Mr Herbert Morrison's new book on the British constitution is due to appear in the spring; and, in advance of publication, he has let it be known that it will contain what appears to be a junior ministers' charter. Mr Morrison believes that junior ministers are often "frustrated and embittered" when their senior ministers, or higher civil servants, exclude them from responsibility. He proposes that in every department certain duties should be specifically allocated to the junior minister and that he should be entitled to see and comment upon all except especially secret departmental papers.

The degree to which responsibility might be compartmentalised differs with each department and a limit would presumably be set by the constitutional necessity for the senior minister to remain answerable for all the work of his department. It is noticeable, however, that there is already a trend in the direction Mr Morrison suggests. The Board of Trade has a Minister of State (until recently a Secretary) responsible for overseas trade, the Treasury has an Economic Secretary, and the recent amalgamation of

ministries has produced a Parliamentary Secretary for Civil Aviation. In addition, a private members' Bill in the present session proposes that there should be a specific Parliamentary Secretary for Fisheries in the Ministry of Agriculture and Fisheries.

Even where it might be impossible to give junior ministers explicit functions their standing in departments needs to be clarified. At the moment the responsibility they carry depends largely on the readiness of their senior ministers to delegate authority; in both the Labour and Conservative administrations this has varied greatly from one department—and from one man—to another. Moreover, junior ministers have a second cause for irritation, in addition to the frustration of which Mr Morrison writes. They not only deserve a higher status; they also need more pay.

Kalahari Cattle

STRETCHING north from the Union of South Africa and covering the south-western part of the Protectorate of Bechuanaland, lies the great arid mass of the Kalahari desert—one of the last empty spaces in the world. If the recommendations of a mission headed by Mr Arthur Gaitskell, which reported last week, are put to the test, and if the tests succeed, this land will be transformed into one of the Commonwealth's largest ranching areas. The mission believes that such a scheme might add a million head to the world's cattle population and an extra forty or fifty thousand tons of meat a year to its food supplies.

This may be too optimistic an estimate. The difficulties are formidable. Supply routes and communications with markets are rudimentary and wasteful; tests have yet to be carried out for water supplies; most of the food for the

ranchers will have to be imported; and there is little spontaneous demand for a pioneering venture of this sort from the population of the protectorate itself. To develop such a territory means a hard life and little initial return for labour. But the mission felt that pasture conditions, at

What Shape is a Window?

In the case of a Vybak flexible window the answer is—any shape at all. In a car hood, for instance, it folds with the canvas and spends much of its life bent double. Yet—when the hood goes up it is as straight and clear as ever, with no sign of a crack.

This means greater safety and convenience. In a 'convertible' a Vybak rear window for the first time allows the interior driving mirror to be used even when the hood is up. It is only one of many advances springing from Bakelite Limited's development and research. The history of plastics is already a long one, but new pages are being written every day—by the organisation whose pioneering efforts were mainly responsible for the general adoption of these versatile materials.

PROGRESS IN ELECTRONICS

THE utilisation factor of an electrically powered machine is often dependant upon the flexibility of its motor. Until quite recently all motors were controlled by conventional electro-mechanical equipment. To-day, however, an increasing number are controlled by an electronic valve known as a thyatron. The thyatron is a device which can convert alternating current to direct current and, at the same time, can regulate the amount of current—and thus the amount of power—released to the motor. The great advantage of the

thyatron is its extreme flexibility which permits infinitely variable control of motor speed and direction. It thus enables full advantage to be taken of recent developments in the field of automatic control with all its attendant economies in overheads and manpower. Mullard produce a wide range of thyatrons for a great variety of applications. In addition to motor control, Mullard thyatrons are today leading to increased efficiencies in lighting and heating systems, in servo-mechanisms, in resistance welders, relays and regulated voltage devices.

and the

Inventors' Club

For many years the horseless carriage was confined to wealthy eccentrics and serviced by blacksmiths.

Only mass production following on a gradual mass demand made possible the lower prices which brought motoring to the millions.

The shortest bridge between invention and big-scale demand for the product is advertising. Without advertising, production increases very slowly and many inventions would probably not be developed at all.

Advertising is rarely an uncompensated extra cost which raises the price of goods. On the contrary advertising, by creating popular demand, makes possible the big-scale production which brings prices down.

least, could compare with many of the world's existing ranching areas. It puts forward a plan, and an initial pilot scheme, that offers scope for the pioneering spirit within a framework of communal development—a working partnership between the rancher, the protectorate government (which could supply the land), and the Colonial Development Corporation (which could supply much of the capital and management).

On further investigation—which is now in progress—all this may prove to be merely another groundnuts dream. But if the investigation proves favourable, it is politically important to take a chance and put the pilot scheme in hand. The mission recommends that community development should be based on terms of complete racial equality between the ranchers. "We believe," its authors say, "that this immense Kalahari land, happy in being without history . . . can be moulded into a steady and enduring model in miniature of African, Coloured and European partnership in the fullest sense of the word." This is a challenging statement. Bechuanaland lies between the Union and the new Federation of Rhodesia and Nyasaland. It lies accordingly between a state which has adopted the policy of *apartheid*, and one which is explicitly based on the principle of partnership between the races. In a crucial part of Africa, a body of independent experts believe, Britain may be given a chance to put the ideal of partnership to a working test.

Halt to the New Towns?

ONE would like to feel sure that the progress in the New Towns recorded in their annual reports for 1952-53* will be allowed to continue. The leading new towns—Crawley, Harlow and Hemel Hempstead—have at last gathered a certain momentum which, without official hindrance, could carry them forward at a comfortable rate, while several of the others are getting well under way. Harlow is now building at the rate of 2,000 houses a year and could continue to do so. Hemel Hempstead is not far behind with its houses and Crawley has made more progress with industrial development. There are still many frustrations: schools lag behind the numbers of children; grants for new playing fields have been withdrawn; and the rules about providing community centres have become more strict. But the corporations' real difficulty is that they feel uncertain of continued government backing and complain that they have insufficient financial independence.

There are signs that the lukewarm support that the Treasury has hitherto given to the new towns is already falling off. Some towns complain of serious delays in getting sanction for commercial development, although it is only through extensive commercial development that they can hope to earn much revenue. Peterlee has been refused permission to build standardised factories in advance of agreement with specific industrialists, although this is the surest and most profitable way of attracting industry. Other new towns are similarly hamstrung. Yet the new towns are precluded by the Act from raising loans independently of the Treasury

* Reports of the Development Corporations. HMSO. 15s.

and cannot, as Welwyn and Letchworth could in the old days, mortgage their property or float a private loan.

Thus, if the Treasury will not provide the money, the new towns must either stop operations or lease or sell land on terms which involve both loss of control and loss of profits in years to come. There may be a case for Treasury restrictions on public loans to the new towns; but, if so, they should be allowed to raise money by other means. Otherwise a Development Corporation becomes even less independent than a local authority and has more complicated problems of co-ordination.

Butter for Soviet Guns

THE principle underlying the Atlantic allies' policy toward east-west trade in the cold war is to deny the Communist world those resources that would strengthen its war potential and capacity for aggression. Hitherto it has been interpreted to mean the denial of items such as tanks, large ships, certain machine tools, copper and so on. The more temperate critics of this policy have come to accept these embargoes as reasonable, generally speaking, and as a necessary adjunct to the build-up of the North Atlantic Treaty Organisation, which is the military answer to the Communists' unrelenting emphasis on armaments. It has, however, usually been held that trade with the iron curtain countries in consumer goods is an entirely different matter and should, indeed, be encouraged.

The weakness in the argument is that the more Soviet resources are withheld from the production of food and consumer goods, the greater is their application to the production of heavy industrial goods and armaments. Only recently a series of declarations by Soviet and satellite leaders has strongly suggested that they have pushed neglect of food and consumer goods to dangerous limits and that the moment has come when morale throughout the area demands greater material encouragement. The immediate task of the Soviet leadership, therefore, is to increase popular consumption without any major reduction of their plans for further industrialisation and heavy arms expenditure.

At least in the short run, it seems that their own resources will not stretch far enough. In their most wishful moments they can hardly have hoped that the "Western Imperialist Fascists" would at this point step in and help to solve the problem. But this, in fact, seems to be a real possibility.

Some days ago Mr Stassen, director of the American Foreign Operations Administration, argued that increased east-west trade would help to promote democratic ideas behind the iron curtain. West Europe's recovery, he said, had reached a point at which trade would be economically as well as politically profitable. This is a point of view that has become fairly general since the Russians began to express such a lively interest in western consumer goods, and there is much to be said for it. But any political and economic advantages to be gained from such an increased flow of trade to the east ought, so long as the cold war continues, to be weighed very carefully against the political and strategic drawbacks of supplying goods that the Soviet regime urgently needs because of its past, and indeed present, excessive concentration on heavy industry.

The Future of Chiang Kai-Shek

THE recent visit of General Hull to Formosa to arrange for the transfer there of the Chinese anti-Communist prisoners who are being released in Korea has raised afresh the question of American relations with the Nationalist regime on the island. A succession of prominent persons, including Vice-President Nixon and Senator Knowland, have recently visited Taipeh, and the Nationalist Government has profited from the attention given by the United States to the Formosan problem. It seems, however, that supporters of the Eisenhower Administration differ a good deal over the policy to be pursued.

There are two main schools of thought. One, of which Senator Knowland continues to be the champion, still regards the Nationalists as capable of a come-back on the mainland of China, and opposes any withdrawal of recognition from their regime as the legal government of China; those who favour this policy regard the cold war as near enough to actual war to justify such defiance of accomplished facts. A second school (to which it is reported that Vice-President Nixon has adhered since his return from his Asian tour) believes that the Communists are too firmly established in Peking to be overthrown except through a major war, that it will be necessary to have some kind of political and economic relations with them, and that American policy will have to be modified.

If the second line of American thinking prevailed politically, it would bring American policy much nearer to the British attitude, which is insistent on the need to bring Communist China into Uno when the time is ripe. On Formosa, however, British policy still appears to be at odds with even the second school of American planning. For there is general agreement in Washington that containment, including the holding of Formosa, must be continued, whatever may be done about the recognition of Peking, whereas Britain has never been in any way committed to the defence of Formosa. If "realism" is to be the basis of British Far Eastern policy, it must be recognised that both the Communists' control of the Chinese mainland and their inability to control Formosa without war against America are parts of the same reality. Has the Foreign Office any ideas about an alternative refuge for Chiang and his soldiers?

Validating Charities

MORE than a year after the Nathan Committee published its report on charitable trusts, a Bill giving effect to one of its many recommendations has had its second reading in the House of Lords. The Bill is designed to safeguard the future of charitable trusts that might be declared invalid because of two income tax decisions given in 1949. In these two cases—the Oxford Group and Ellis cases—it was held that because the charities concerned had non-charitable as well as charitable objects, they could not claim exemption from income tax. The initiative to have these trusts declared

invalid thus came from the Commissioners of Inland Revenue. But they paved the way for other litigation by interested parties (disappointed heirs and so forth) to have similar trusts and bequests invalidated, and it was to protect these trusts, which include thousands of church trusts, that the Nathan Committee recommended legislation.

The new Bill applies only to trusts taking effect before December 16, 1952, when the Nathan Committee's report was published and the Government made a statement that the necessary legislation would be introduced. Those who drew up trust instruments to take effect after that date had ample warning not to include non-charitable objects among their trusts' purposes. For the earlier trusts the Bill provides that they are to be treated as charitable trusts and as having at all times been so. This means that any money spent on non-charitable purposes was properly spent and cannot be recovered. But after the Bill becomes law the trusts' objects are to be restricted to what is legally charitable.

The Bill covers trusts where the charitable and non-charitable purposes are mixed together: for instance, where money was left simply for the purposes of a parish and might, therefore, be spent on both charitable and non-charitable objects. But the Bill does not apply to trusts that had already been treated as invalid before December 16, 1952, unless they were so treated solely for income tax reasons. Limited protection is also provided for people's claims to property which is the subject of a trust that, but for the Bill, might be declared invalid. But no one can reclaim income tax already paid because a trust has been invalidated. Nor does the Bill validate charitable trusts deemed invalid because, for instance, their purposes are uncertain; the beneficiaries of Caleb Diplocks who have drawn up wills that were intended to mean one thing, but in fact meant another—or else nothing at all—get no help from this Bill.

COMMODITY PRICE INDICATOR
1952 = 100 MID-MONTH FIGURES

Delayed Data

THE appearance in January, 1954, of the Registrar-General's report on morbidity for 1949 and of the Survey of Domestic Food Consumption and Expenditure for 1951—to take only two recent examples among many—prompts a certain exasperated speculation about the usefulness of material so long delayed and the reasons for the delay itself. The most obvious candidate for stricture—Her Majesty's Stationery Office—is not, in fact, to blame; the enormously increased load which it has had to carry ever since the war years has been successfully distributed by means of long-term contracts with the commercial printing trade, and there has been no lengthening of the average period between receipt of material and publication. Certain particularly monumental problems—the Census of Distribution was an outstanding example—have called for special treatment; in that instance two-thirds of the cost of orthodox printing was saved by resort to other techniques and the delay involved in investigating and using these was compensated by the early issue of summary tables.

In general, the bottlenecks lie further back, in the departments themselves. Here publishing policy is autonomous and inevitably depends on the nature of the department's work and the views of its Minister. Delay may occur in collection, editing, or authorisation. Obviously, there is a limit to the amount of energy and resources which can be withheld from administration and devoted to the compiling of records and statistics; and the imputation of leisurely inefficiency is as unnecessary as it is facile. Nevertheless it might be wise for departments to reflect on the purposes which their publications are supposed to serve, reconsider their priorities, and stop biting off more than they can chew. Administrators themselves must have information, though that need not be in a form suitable for general circulation; complete historical records are highly desirable and need not be compiled under stop-press conditions; but as material for informed opinion on the current workings of a semi-planned social democracy, for the intelligent interpretation and criticism of policy, official reports lose nine-tenths of their value when they appear years after the period to which they relate. Food consumption and food prices are at present a burning political question, concerning which an inordinate amount of nonsense is talked. It is not much consolation to know that authoritative figures will be available for the rectification of that nonsense in—if all goes well—the winter of 1955-56.

Stalemate for Science Teachers

IT is clear that a great deal of log rolling is going to be necessary before the schools can recruit sufficient science teachers. Last week the Federation of British Industries held a conference of industrialists and educationists to discuss the present shortage. For the schools Dr Barton, the Headmaster of the City of London School, examined the deficiency, present and to come. For industry Dr Dunsheath emphasised that the factories are going to need more, not less, scientists in the near future. For

the universities, Sir Charles Morris, Vice-Chancellor of Leeds University and a member of the committee that recently reported on the shortage of science and mathematics teachers, poured very cold water on the suggestion that university science faculties might be expanded.

This is stalemate. It implies that the standards of teaching in the schools will continue to go down. Sir Charles suggested that schoolmastering should be made more attractive in terms of prestige and cash. It is, indeed, important that the rewards of science teachers should be more closely related to alternative occupations; but unless more scientists are trained this will merely spread the shortage somewhere else. In America—where school salaries are relatively even worse than in Britain—there is a chronic shortage of teachers, with its most critical manifestation in classes dealing with the birthrate bulge. But advanced teaching in science and mathematics, which would be within the province of English sixth forms, is normally studied only in college in America. The universities in this country would certainly—and rightly—oppose such a change in territorial boundaries. But this system has at least enabled the Americans to educate more and still more scientists and technologists without running into the British dilemma.

Britain and Russia

But now, how stands our position with regard to Russia? What are our inherent sympathies and what our natural and inevitable rivalries with her? In the first place, the two nations are radically different and unharmonious in race. . . . Individualism is our characteristic; the absence of it is theirs. We are essentially and strongly European; they are to a great degree Orientals and Asiatics. We are passionately fond of freedom; they are above all things submissive and loyal to established power. The free institutions which we so much prize have no charms for them—if we except a few enlightened and Europeanised nobles. There is no likelihood that they and we will ever be ranged side by side in the cause of constitutional rights. On the contrary, Russian ideas of politics are the very reverse of ours; Russian influence will always be exercised in an opposite direction to ours. Russia, by right of birth, principle, and creed, is the apostle and bulwark of European despotism: Great Britain, by inherent taste, by hereditary tradition, by the baptism of her past history, is the preacher and defender of European liberty. Our missions are discrepant and intrinsically hostile. The great battle between old and new ideas, between progress and stagnation, between high civilisation and aggressive barbarism, between power and freedom, between Might and Right, will see the Anglo-Saxon and the Slavonic Empires ranged in the front of the opposing hosts. France we may reasonably hope will be on our side; Austria is on the side of the Czar; the rest of Germany oscillates and wavers. Thus, however friendly and tranquil may be our political relations with Russia, the ideas, the predilections, the destinies of the two nations condemn them to a perpetual, though it may be a peaceful, antagonism. . . . Our rivalry with Russia, then, is intrinsic and enduring: that with France casual, fortuitous and passing. An alliance with Russia can rarely be more than partial, vigilant, and doubtful—based on false assumptions or on wilful blindness, and liable to constant menaces and interruptions.

Letters to the Editor

German Illwill to Britain

SIR—Herr Friedensburg's letter should give much pleasure to those who wish to see Anglo-German relations poisoned. His list of British sins against Germany is wildly misleading and it is deplorable that a person of Mr Friedensburg's standing should give it currency. As I was an assistant to Mr Bevin during the period referred to, and also a soldier in the liberating armies, I hope I may be allowed to answer some of his points.

At the time of the Berlin blockade, Mr Friedensburg writes: "The Americans forced upon the hesitant British the decision to support the city." It is, however, common knowledge that the air lift was initiated by the British; it might almost be said to have been a personal decision of Mr Bevin's. It was the British who took the leading part in launching the air lift and British planes carried at least half the load during the early period until the United States was able to bring into play its vastly superior resources. To talk of the "hesitant British" is an unfounded and undeserved insult, as Herr Friedensburg—who was a Bürgermeister in Berlin at the time—should know. He next asserts that only the United States sent food to Germany after the war. But the United Kingdom contributed supplies to Western Germany to the value of over £200 million. This, moreover, was before the Marshall Plan, when Britain, having exhausted almost all its overseas assets during the war launched by Hitlerite Germany, was managing to survive only by means of the American Loan, which is now being fully repaid, principal and interest. Britain even introduced peace-time bread rationing so that grain could be sent to the German people—Nazis and anti-Nazis alike. Under the Bizonal Fusion Agreement which came into force in December, 1946, Britain provided 50 per cent of the support given by the two Anglo-Saxon powers to the two zones.

Herr Friedensburg asserts that Britain alone was responsible for dismantling. However, dismantling was first a quadripartite, and then a tripartite, policy. The Americans carried out considerable dismantling in their own zone and completed the programme much more quickly than was possible for the British in their zone. By far the greater part of the plant to be dismantled in accordance with the tripartite policy was situated in the British zone because it is the most industrialised part of Germany. The British often delayed action in order to consider German alternative proposals.

Herr Friedensburg complains that the German liberation movement was not properly recognised, and that Germany

was not treated as a liberated country. This again was Allied policy carried out by SHAEF under General Eisenhower, but Herr Friedensburg manages to blame Britain alone. Moreover, the German anti-Nazis like Herr Friedensburg, gallant as many of them were, were far too few and ineffective to justify treating Germany as a liberated country. I do not think any apology for the treatment of Western Germany by the Western Allies is required. When I recall my feelings, as a soldier with the liberating army, entering and surveying Belsen concentration camp, I am amazed by, and rejoice in, the charity shown to the German people by the Western Allies after the war.—Yours faithfully,

CHRISTOPHER MAYHEW
House of Commons

SIR—Herr Friedensburg may have read your Note of January 2nd with regret but many of us who have read his letter in your issue of January 16th will have felt considerable irritation. Whilst few would wish to underestimate the great help that the Americans have afforded to Western Germany, it would be as well for German politicians to remember that at the most critical period immediately after the end of hostilities, from May, 1945, until December 31, 1947, the British Government paid an amount exactly equal to that of the American Government in sending essential supplies to the German people—and this at a time when the British people were very strictly rationed.

Those of us who have had some contact with the German people recognise their great qualities and their capacity for hard work. At the same time it appears that German powers of self-deception are almost limitless; they seem incapable of looking at a problem without bending it to their own preconceived point of view, effectively preventing any understanding of a point of view other than their own. This failing has not only brought disaster to Germany but also to Europe. One has only to glance at the recent book of Dr Erhard, the Minister of Economics, entitled "Germany's Return to the World Market" to see how far it is possible to distort the facts in the interests of presenting a case—although in fairness it must be added that this book was published at the time of elections and almost certainly with those elections in view.

The credit that Dr Erhard himself takes for the great success of the export programme leads him to deny the enormous effort made on behalf of Western Germany by the three Western Allies. It leads him to hide the fact

that the whole basis of the present German export programme rests on the Trade and Payment agreements which were originally negotiated on a basis of equality with the various powers by the Western Allies and which provided a pattern for the Federal Government later to assume, thus making possible an expanding volume of trade.

The British, American and French members of the Western German Delegation sat down to negotiate these agreements on behalf of a vanquished people, whose leaders had plunged Europe into war. Yet a wholehearted effort was made, not least by the British members, to get the best possible terms to help the German people in defeat and a glance at the long list of agreements negotiated at that time reveals the extent of that assistance. The concessions granted to Western Germany by countries which had no reason to love Germany were made with the knowledge that they themselves were in many instances receiving help and, loyally supporting the lead given by the Western Allies, they played their part in helping to bring about a German recovery.

The other complaints in Herr Friedensburg's letter are so astonishingly spurious as to deceive no one, lest it be himself.—Yours faithfully,

M. R. L. ROBINSON
London, S.W.7

Doubts About America's Deflation

SIR—I have followed with interest your recent comments on the business outlook in the United States. One of the factors in the situation which gives me the most concern is the much greater decline in government expenditures than in taxes. The present tax and expenditure plans of the Administration lead me to estimate that the government cash deficit of \$6 billion for the calendar year 1953 will change to a cash surplus of \$1 or \$2 billion in the calendar year 1954. All of this swing of \$7 to \$8 billion will occur in the first half of the current calendar year. Because of the seasonal impact of tax collections, the swing from the second half of 1953 calendar to the first half of 1954 calendar will be, under present plans, from an \$8 billion cash deficit to a \$9.5 billion cash surplus.

The other thing that disturbs me is that there has been practically no net tax relief given thus far to wage earners in the lower brackets, say \$4,000 or under, because the increase in the Social Security withholding tax will have offset, or more than offset, the reduction in income tax. This seems to me to be bad economics as well as extremely bad politics. It is, of course, true that if signs of a more active recession appear in the next two or three months Congress will take steps to increase expenditures and reduce taxes; but politically this will not be of any help to the Administration—it will actually hurt it—and economically these measures might not make themselves felt in time to prevent

Starch

does surprising things IN SUCH SURPRISING PLACES

Example:

STARCH IN FOUNDRIES

Bonding materials made from starch are widely used by foundrymen as binding agents in the making of sand cores. These 'cereal binders', as they are called in the trade, are economical in use; they help to make firm, clean, permeable cores which break down easily after casting; and they fortify moulds against erosion. The first cereal binders ever offered to the foundry trade were the Kordek and Kordol range developed 20 years ago by Corn Products Company Limited, the Industrial Division of Brown & Polson. Today, Kordek and Kordol are the most widely used cereal binders

in the industry, and their names are household words among foundrymen everywhere.

Brown & Polson Industrial Division produce 200,000 tons of starch products a year: more than 400 different products, which are helping more than 80 different industries to reduce production costs, to make better products, or even to make products that could not otherwise be made at all. We have spent more than 100 years in the building of this large and varied business. We have learnt a lot about the industrial uses of starch products, and our advice is freely at your disposal.

CAN STARCH HELP YOU?

When you read in these advertisements how starch products are helping other industries you may see new possibilities of turning them to account in your own business. We shall be glad to discuss them with you.

**"This South African Sherry
is better than ever!"**

Yes, it's remarkable how they manage to keep on shipping finer and finer wine year after year.

How do they do it?

Simply by taking infinite care and not trying to hurry the job. These lovely South African sherrys we are enjoying in this country now are the reward of the infinite patience displayed back through the years by those Wine Farmers at the Cape.

You seem to know a great deal about it!

You remember I went to South Africa last year. I happened to meet a man who took me round the wonderful Wineries there where millions of gallons were being matured for the British market.

How long do they mature them?

The best wines are kept seven years at least before they are shipped. The South African Wine Farmers are determined—in spite of the demands from all over the world—to hold back and let the good stuff mature properly. You see their climate and soil are simply ideal for wine-growing, but it is necessary not only to produce lovely wine but, if you establish a name and reputation, to provide for keeping up the quality over the years.

These South African people certainly keep on improving their wines—especially their sherry. It's a credit to them.

That's what comes of selecting and maturing and waiting and keeping on doing that, and the longer it goes on the better the quality becomes.

I must say this is one of the finest Sherrys I've ever tasted.

Well, keep on drinking the best South African Sherrys and you will find the quality will astonish you."

ASSOCIATION
(LONDON) LIMITED**

the decline from deepening in this coming six months.

It looks as if the Administration is going to rely very heavily on an easy money policy and this may help security prices; but I doubt whether it will be a deciding factor in stimulating the economy otherwise.—Yours faithfully,

BANKER

New York

Civilians Defenceless

SIR—The article in your issue of January 9th includes separately two statements that ought to be read together. You say that it is now clear that peacetime recruitment will never be sufficient, but you add that in wartime there would be recruits in plenty, and that it would take a very short time to train them.

By contrast, the basic training offered in peacetime a few years ago (and presumably still being offered) was so long drawn out as to suggest that the volunteer's time was valued at nothing by those who exhorted him to sacrifice it. I have seen volunteers who joined full of zeal fade out in disgust at their most precious possession being squandered in a training programme that contrasted so wretchedly with the urgency of the national appeal to which they had responded. Will the people who are wanted most, especially those who already have a store of basic knowledge gathered from practical experience in the last war, be attracted and retained by a tempo that has made it difficult for even the novices to maintain their interest?—Yours faithfully,

O. M. MEARES

Atlantic Assembly

SIR—Mr Barton, in your issue of January 9th, quotes the report of the International Press Institute that 82 per cent of British newspaper readers were unable to answer the question: "What is Nato?"

It was to seek a remedy for this urgent difficulty that the British Atlantic Committee was formed last year, with the support of the TUC, FBI, NUT, the Friends of Atlantic Union, the English-Speaking Union, the Association of Local Education Authorities and a number of other bodies competent to assist as channels for the dissemination of information, especially in schools and the services. The committee have already circulated to teachers its own bibliography of Nato publications, and with a view to encouraging the formation of similar committees in all Nato countries, the Copenhagen conference was organised last August. It is not quite correct to state that this conference "caused hardly a ripple of comment in the British Press," as there was some good coverage, especially of General Gruenther's address; nevertheless, it remains broadly true that the intentions of the committee are regrettably limited by lack of public support and above all of financial support.—Yours faithfully,

DAVID V. KELLY

British Atlantic Committee

Books & Publications

The Grand Alliance

AMERICA, BRITAIN AND RUSSIA:
Their Co-operation and Conflict, 1941-46.
By W. H. McNeill.
Oxford University Press. 838 pages. 63s.

THOSE who believe in the natural virtue and sociability of men have never been at a loss to identify the institutions which corrupt and set them against one another. What Monarchy and the Church were in the eyes of eighteenth century republicans, what capitalism still is to the devout of the Marxist congregation, the nation state is well on the way to becoming for disheartened liberals.

The vision of international co-operation has tormented the imagination of this century to a degree that startles the historian accustomed to the political assumptions of the world before 1914. Practical co-operation between nations, as distinct from promises and hopes, has never been carried so far as in the Grand Alliance which won the Second World War. In the history of that alliance there is available evidence unequalled for the light which it throws upon the possibilities and limitations of common action between sovereign states. The true character of this remarkable experiment, the lessons to be drawn from it, the arguments which it provides for the rival advocates of international or supranational organisation have not yet been fully recognised. War is the great mother of political and social innovation; yet most people are reluctant to look to the history of the war years for a better understanding of postwar problems. Even when this reluctance is overcome, the bewildered enquirer is likely to find the evidence so scattered and often contradictory as to confuse him. In deciding to commission a history of the Grand Alliance, therefore, Chatham House have made one of the most valuable contributions possible to the study of recent history and of international relations. They are to be congratulated on finding in Mr McNeill, Assistant Professor of History at Chicago, an historian whose powers are fully equal to the great events he surveys.

His book is a *tour de force*, remarkable for the author's easy mastery not only of his sources but of the complexities of the pattern he unfolds. For the first time we are given a synoptic view of the interplay of strategy, politics and economics over the whole scene, in the Pacific as well as in the European war. Within this framework, which is never allowed to sag or slip, Mr McNeill finds a place for every one of the thousand odd problems that the Allied leaders had to face, from the recognition of General de

Gaulle and the Warsaw rising, to the relations of Chiang Kai-shek with the Chinese Communists and the claim of the United States Navy to run the war in the Pacific as its own private affair. His judgment is dispassionate, his regard for the evidence scrupulous; yet his writing is never colourless. He has an eye for the clash of personalities behind formal arrangements and is frank as well as fair in tracing the crosscurrents of suspicion, and professional as well as national rivalry.

As Mr McNeill fully recognises, the evidence on the Russian side is meagre, yet he has wisely made the subject of his study tripartite and not simply Anglo-American co-operation. Equally wise was the decision to carry his account beyond the end of the war into the period when relations between the great powers finally broke down. In this way he establishes that continuity between wartime and postwar international politics which is often neglected, and underlines the extent to which almost every one of contemporary problems has its roots in the years before 1945.

Collingwood once said that the most difficult part of the historian's task is to hit on the right questions to ask. At each main stage in the relations between the three allies, Mr McNeill halts his narrative to ask what were the different objectives which Stalin, Roosevelt and Churchill had in mind. By doing this, by patiently exploring the genuine conflicts between national preconceptions, he frequently succeeds in stripping away the arbitrary character given to other people's actions in more partisan accounts. From page to page the reader alternates between despair at the obstinate diversity of national interests and admiration for the handful of men who laboured to create sufficient common purpose to hold the alliance together.

Mr McNeill's own conclusion is unobtrusive but irresistible.

It is a sad commentary on the intelligence and goodwill of mankind that no alliance of independent states has ever survived decisive victory; and that successful confederations have drawn their initial strength from the existence of a common enemy. Without an external threat to inspire fear, it seems that positive aims, no matter how good in themselves, will not suffice to bind together men whose loyalty is traditionally dispersed among different governmental units.

What further conclusion is to be drawn from this sombre verdict is a matter for debate. The fatal mistake is to underestimate the difficulties that lie in

the way of international co-operation, to suppose, as Roosevelt did, that they can be overcome by goodwill alone.

Of the three men who play so great a role in these pages, in the end it is Churchill who emerges as the wisest. For if Roosevelt was the victim of too easy an optimism, Stalin was trapped by his own suspicions. Churchill gauged far better than Roosevelt the workings of Stalin's mind; yet he had the imagination, which Stalin lacked, to perceive the force and the opportunity represented by Roosevelt's idealism. The tragedy of Churchill's situation was that he did not possess the power to prevent mistakes whose consequences he already foresaw.

This, together with many other judgments, may have to be revised in the course of time, and much new evidence will certainly become available; but it is unlikely that the intellectual grasp or quality of judgment of this pioneer work will soon be bettered.

Battle for Crete

CRETE: *Official History of New Zealand in the Second World War, 1939-45.*

By D. M. Davin.

Oxford University Press. 647 pages. 30s.

THE battle for Crete in 1941 was the first large-scale airborne assault in history, and was indeed the only attack of this kind directed against the British during the war. It has received less than its share of attention. It was probably the only major battle of the war which was not witnessed by war correspondents (for some unexplained reason they were all shipped off to Cairo before the fighting began) and the records are from the nature of the fighting and of the evacuation, scanty and often conflicting. The New Zealand War History authorities have now, however, produced an admirable account of the whole campaign, in which New Zealand's forces played a crucial role. The book is not only exceptionally well written—it is by a New Zealand novelist who was himself a platoon commander in the battle—but is also a first-class piece of military scholarship.

The campaign, fought out in the brilliance of the Mediterranean spring amid rocks and olive groves, was as dramatic as it was spectacular. At first everything seemed stacked against the defenders. No adequate defence preparations had been made in the preceding months; the bulk of the troops had been hastily evacuated from Greece and had not even a minimum scale of arms and equipment; there was little artillery and only a handful of tanks. The *Luftwaffe* had complete domination of the air. The British supply problems were rendered acute because the only ports were on the northern shore, facing the enemy aerodromes in Greece and Rhodes. Yet the Germans, by a massive blunder of reconnaissance, threw away much of this advantage. They dropped their main body of parachutists and

glider troops into the very areas most strongly held by British forces. They also launched their seaborne invasion at night, the one time when the Royal Navy was free from interference by enemy bombers—and so ensured the destruction of their main armada. All turned on the struggle for the main airfield at Maleme. Only after intense fighting there did the attackers gain a grip which they were able to use to bring in the reinforcements that turned the scale.

Could Maleme have been held? Had it been held, would the island have been saved? These are the two main questions which any historian of the Crete campaign must seek to answer. Mr Davin comes to the conclusion that despite the degree to which the odds were tipped against the New Zealand 5th Brigade, which was responsible for the defence of Maleme, the airfield might have been held had the right tactical decisions been taken once the battle was joined. He holds this view despite the lack of preparations and the administrative blunders of the British Higher Command. The two I tanks, for instance, which could have mounted a decisive counter-attack by day, were found to be worthless when the moment came. In one the ammunition did not fit; in the other the turret jammed. Even so, Mr Davin argues, had the battalion commander not decided on the first night that he would have to withdraw, and had the brigadier mounted a counter-attack more energetically, the parachutists might have been wiped out before dawn brought their reinforcements.

But would this have determined the outcome of the battle? Even if Maleme had been held, would that have saved the island? Mr Davin's answer is that it might have done so. Hitler, with the Russian campaign looming up, might have cut his losses and called off the attack. But surely the other factors, which this book also lists, would have been bound to swing the German decision the other way. Surely Hitler's instinct would have been to shift the main point of the attack on the second day to one of the other two airfields, at Retimo and Heraklion, the more so because the seaborne armada was at that time still unchallenged, and the enemy presumably had no reason to believe it would be sunk. All the Germans had to do, moreover, was to prolong the pressure until the British supply system, exposed throughout to air attack, caved in. Hitler, who had swept aside every obstacle in his path up to that time, was not likely to accept a rebuff, of which British propaganda could have made much, within a few weeks of beginning the march against Russia.

As events turned out, Crete proved to be in one very real sense a defeat for the Germans. We lost the island, but we inflicted such heavy casualties on the German forces that Hitler was never willing again to launch a major airborne operation. Costly and futile though the resistance in Crete may have seemed to many at the time, it may well have saved Malta—and with Malta, North Africa.

Conventional History

A HISTORY OF FRANCE.

By Lucien Romier. Translated and completed by A. L. Rowse.

Macmillan. 487 pages. 30s.

LUCIEN ROMIER achieved distinction as an historian by his searching and original investigation into the causes of the French Wars of Religion. Stressing the inadequacy of the biographical approach, he gave a brilliantly successful analysis of the strains in the French social structure, combined with a detailed and perceptive study of conflicting ideologies and political manoeuvres. Between the wars M. Romier devoted himself to political journalism in *Figaro*; but before his death he returned to history and wrote this general account of the development of France. It is not surprising that this attracted the interest of Mr Rowse, also a scholar in sixteenth century studies and the author of a sketch of the history of his own country.

It is disappointing to discover that M. Romier has only a traditional and conventional story to tell. The strength of his earlier work lay in the combination of an analysis of society with a close study of politics, revealing the hiatus between intentions and results. But here he traces the course of French history largely in terms of the personalities and policies of the kings, sandwiching in brief descriptions of the social background and of intellectual and artistic achievements. Two themes in particular have interested him: the growth of internal order under kings of whom the greatest were St. Louis and Louis XIV, and the recurrent strains imposed by external dangers and internal privileges. Within this framework M. Romier has many shrewd and sensible observations to make. He describes with equal skill the flowering of French culture in the time of St. Louis and in that of Louis XIV. He is firm but just on the legal chicanery of Philip the Fair, the corruption of Mazarin and the financial speculations of the early eighteenth century.

Yet deft and competent as the book is, it has none of the freshness and originality of M. Romier's earlier work on the sixteenth century. Indeed the account given here of that period is perhaps the duller part of the book, as if the author had been unable to fit his own researches into the conventional pattern. By concentrating on the kings he has not left enough space for society. The problems of rural property are almost ignored, and the long and important history of the sale of offices, at one time a source of political strength and later of fatal weakness to the regime, does not receive sufficient emphasis.

In his translation Mr Rowse preserves the vigour but not the distinction of the original. As published in France the work ended at 1789. Mr Rowse has brought the story down to 1944 by using some material of the author's and by adding some chapters of his own. But the unity of the original would have been better served had this version also closed with the fall of the *Ancien Régime*.

Old View of West Africa

THE NEW WEST AFRICA.

Edited by Basil Davidson and Adenekan Ademola.

Allen and Unwin. 181 pages. 15s.

WITH an introduction by Mr Ritchie Calder and a conclusion by Mr Basil Davidson, this disappointing book consists of four essays by African and British writers on the past, present and future of British West Africa. Mr Okafor starts off with a rapid sketch of the historical background, stressing all the achievements and none of the failures of West African societies before the European penetration. Then follows a chapter by Mr Thomas Hodgkin—the best—consisting of a thoughtful analysis of the origins and development of present nationalist movements; one's only criticism is that he underestates the emotionalism of colour in these movements and consequently overrates their purposefulness. The fourth essay is by Mr F. le Gros Clark, on the technical conditions of economic progress in West Africa.

This, however, is quite overshadowed by the third essay, by Mr Henry Collins on economic problems, which contains the main thesis of the book. This thesis has already been elaborated by Mr George Padmore in "Britain's Third Empire," and also, more succinctly, by Mr Awolowo, the West African Action Group leader, when he wrote that Britain is striving to "exchange political dependence for an economic stranglehold." Mr Collins says that

While the older economic relationship is preserved, a new system of exploitation has been superimposed in which the State itself, through the mechanism of the Marketing Boards and the sterling area, takes a hand in the profitable game of milking the colonies.

Britain should "cease wasting enormous resources unproductively on armaments and begin to produce, instead, the equipment with which to pay off the accumulated sterling balances of the colonies." Again, "The Marketing Boards merely constitute the mechanism through which some of the burden of rearmament is shifted on to the backs of the West African peoples." And Mr Basil Davidson himself seems to subscribe to this view, concluding that Britain cannot afford to liberate her colonies while wedded "with the greatest capitalist nation of all, with the United States of America."

This book is not the new West Africa of its title. It is merely the old, old view of West Africa as the victim of capitalism—a view becoming shoddier every day.

Rebellion and Moderation

THE REBEL.

By Albert Camus.

Hamish Hamilton. 273 pages. 18s.

POSTWAR France with its disbelieving, disillusioned youth, was a fertile ground for philosophies of despair. Albert Camus, the distinguished novelist, playwright and thinker, became one of its major prophets. In a previous book

—"The Myth of Sisyphus"—M. Camus postulated man's inability to come to terms with the universe, but found consolation in man's dignity in his Sisyphean task. This was sufficient to reject suicide as a way out, but not enough to provide a code of conduct in a world where man is permanently faced with mass murder. Therefore, M. Camus has now attempted to seek the roots, scope and limits of man's rebellion through an analysis of two centuries of human revolt.

In such a tour of the historical horizon much is naturally superficial and oversimplified. Yet, as was to be expected from M. Camus, there is also much original thought, particularly on literary revolt, and many moving passages, although the mixture of formal logic and brilliant rhetoric with which it is written loses much on crossing the Channel. It seems, however, that rhetoric in this case is not the result of some Gallic failing but springs from the inherent weakness of M. Camus's approach—an attempt to explain rebellion outside its social context, in the rarefied air of pure thought. This becomes most apparent when the crucial issue is tackled: the right to kill; the problem of ends and means. M. Camus castigates political murder (indeed the mainspring of this book was probably one rebel's horror at the number of corpses with which the Stalinist road to a "better society" was strewn), but tries to find a justification for his favourites—the Russian terrorists of fifty years ago—in purely subjective terms: they knew the value of human life and were willing to pay with their own. The defendants would have rejected their lawyer's pleading. Political assassination can seek justification, if any, only in its end, in Marat's cry: "I want to cut off a few heads to save a great number."

Having rejected the religious or historical tests, M. Camus reaches the end of his journey without an alternative yardstick. He wants both to preserve the spirit of rebellion and to mark its frontiers. Rebellion and moderation make difficult bed-fellows and M. Camus offers nothing to bind them together. He, therefore, artificially introduces such concepts as the "Mediterranean heritage," as if the southern sun provided a magic solution. Unable to accept society as it stands, unwilling to accept inhuman methods of change, M. Camus the thinker avoids the issue by leaving the stage to the *littérateur* and to the language of poetry.

Industrial Case History

WHAT NOBODY TOLD THE FOREMAN.

By Max Cohen.

Spalding and Levy. 218 pages. 8s. 6d.

THIS is a depressing though entertaining little book, a near case history of industrial bloody-mindedness. One can hardly believe that its author's experiences, first as a cabinet maker and then as a carpenter, are entirely typical; indeed, it is hard to credit that in scores of different jobs held over the best part of a working lifetime any one individual should have had such unmitigatedly

awful luck. Every boss for whom Mr Cohen worked was a bully, a blockhead, a swindler, or all three together. Every foreman was a moronic slavedriver. His picture of normal economic life shows a jungle at once rank and feeble; crass inefficiency, purblind greed, total lack of scruple tempered by almost total lack of initiative. His account of wartime emergency work does nothing to alter that picture; while the army turns out to have been even worse, as sheer crackpot lunacy is worse than mere feeble-mindedness. The only efficiently performed job with which Mr Cohen was associated, it seems, during the whole of his career was the construction of the Admiralty Redoubt; his comment on this takes the form, characteristically, of a sneer at the courage of the War Cabinet.

And yet this long-drawn-out grizzle, this effusion of ill-nature—none the better for being punctuated with such crashingly silly generalisations about employment policy, militarism, Russia, and the morality of the "monied classes" as are commonly found flowering along the Party line—has both the merit of a certain dry humour and narrative skill and the diagnostic usefulness of an unmistakable fever-rash. Here is a type; here is an outlook; here, however selected and highly coloured, are the experiences producing that type and that outlook—which the British economy, whether socialist or capitalist, certainly cannot afford. It is high time that somebody told the foreman; and also, possibly, the Board of Directors and the British Productivity Council.

A STUDY OF TRADE BETWEEN ASIA AND EUROPE

146 pages. 11s. (11s. 5d. incl. postage)

An important United Nations study prepared jointly by the Secretariats of the Economic Commission for Asia and the Far East, the Economic Commission for Europe and the Food and Agriculture Organisation. This study examines the history of trade between the two regions and considers methods by which Europe can assist the countries of Asia and the Far East in their economic development and improved living standards. It also proposes ways in which Asia and the Far East can assist Western European countries to solve their post-war economic problems.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Fresh Start for Farmers?

Washington, D.C.

THE President's new farm policy is based on two convictions, that the farmer's decisions on planting ought to be somewhat affected by the laws of supply and demand, and that food must not be destroyed. While the second principle receives general assent, the first is strangely unpalatable to many of the foremost advocates of free enterprise, and both are bedevilled by the existence, in the bins, cribs and even the caves and ships, of the Commodity Credit Corporation, of enormous stocks of many commodities. This year's wheat and cotton harvests, for example, could be utterly wiped out without domestic consumers noticing the difference. While 250 million pounds of butter are slowly deteriorating in store in order to keep up the price, American families are getting used to eating 29-cent margarine instead.

All this is the result of setting out to remove major fluctuations from farm prices by combining high price supports and controls on production, and of then not enforcing the controls. Drastic restrictions on production are rejected by the President, who bases his own scheme on the assumption that the problem is not one of general overproduction, but simply of a lack of balance between various crops created by the particular system of supporting farm prices that is in force.

Whereas with some commodities the Secretary of Agriculture is able to vary the guaranteed price according to his estimate of supply, he has been obliged to support wheat, cotton, maize, peanuts, rice and tobacco at 90 per cent of parity every year. Parity in this context reflects the belief for which farmers have obtained general acceptance that the prices they got forty years ago were "fair" in relation to prices they had to pay then and that the same order of fairness statistically expressed in a parity price formula is their due today.

Yet even with these artificial aids it has not been possible to hold farm prices steady; many small farmers cannot qualify for support loans and everywhere storage space is running out. Moreover, the parity formula still in use for wheat, cotton, maize and peanuts takes no account of changes in price relationships between different farm products since 1910-14. It ignores alike the coming of tractors and the smaller part that cereals play in people's diet when standards of living are rising.

The basic changes that Mr Eisenhower and his advisers wish to make will occur automatically if the present Agricultural Acts, passed in 1948 and 1949, are allowed to come into effect. In January, 1955, all commodities are due to go under a flexible system, under which support prices

will vary from year to year between 75 and 90 per cent of parity according to the supply position. From January, 1956, the parity formula for all crops will be based on the average level of farm prices in the immediately preceding ten years instead of that prevailing from 1910 to 1914. This formula favours meat animals and dairy products but should discourage the overflowing granary. If it were extended all at once to grains, it would mean a 16 per cent drop in the support price for wheat and a fall of 11 per cent in that for maize.

★

The chief contribution, therefore, that Congress could make to the President's proposal is to let well alone where the main provisions of the present law are concerned. There are, however, some amendments and innovations that will require legislation. The \$6.75 billion which the Commodity Credit Corporation can use to support farm prices will be nearly exhausted by June, and an increase in the corporation's borrowing authority is needed.

Mr Eisenhower also wants the change to the new parity formula to be carried out by stages, so that there will not be a drop of more than 5 per cent in any one year. And he is to ask for some variations of treatment between commodities. Maize, for instance, never sat very happily within the old system because it is itself a cost of production to farmers. Congress is therefore asked to permit its price to slide more rapidly down the scale than will be allowed for other crops.

The most original feature of the scheme is designed to ensure that the change to a flexible system shall not be too painful. Two and a half billion dollars' worth of the existing surplus is to be renamed an emergency reserve and will therefore not be counted as part of the supply when support prices are calculated next year. Otherwise, without a doubt, prices would have celebrated their new freedom by diving down the whole way to 75 per cent of parity. The President has asked for broad discretionary authority to manage these reserves, but with safeguards to prevent their disturbing normal trade.

In particular, he wants to be allowed to use a billion dollars' worth of surplus food over the next three years to strengthen the economies of friendly countries. Plans are also being aired for using part of the surplus to pay for services in countries where there are American bases. One policy that would have been highly displeasing to friendly countries has been firmly rejected. There is to

The Agricultural Problem

be no two-price system for wheat, something which would have incurred accusations of dumping.

Once the President had announced his farm programme the congratulations he received from his followers for having given a lead were rapidly succeeded by signs of a marked reluctance to follow. The House Committee on Agriculture has always been a pillar of rigid support prices. In the Senate, where committee hearings started this week on the President's message, Democrats and Republicans alike challenged its central assumption that the balance of production will be righted by the farmer himself if he is not shielded totally from the arguments of the market.

Mr Benson, the Secretary of Agriculture, was forced to admit under close questioning that, apart from hogs, there are no alternative products, not themselves already in surplus, to which wheat, maize and cotton farmers can turn. Many Senators argue that production will go up instead of down if prices fall, because farmers will be trying desperately to maintain their incomes. Mr Benson places much reliance on recapturing overseas markets by a dynamic export drive made possible by lower prices. But most of the committee members, both Democrats and Republicans, believe that high, rigid supports alone can sustain farm income and that the scheme has never been given a chance because the previous Administration did not apply production controls strictly.

This means that Bills to extend the present rigid system for at least another year, and probably longer, will be introduced both in the House and Senate and almost certainly carried. In this case Mr Eisenhower will be faced with the question of whether to veto them and allow his own ideas to come into force by default of fresh legislation. This would mean abandoning the various detailed amendments to the Acts of 1948 and 1949 that he favours, including those designed to make the transition less painful. Whatever happens, both the Secretary of Agriculture and the President deserve more credit than they will probably get from their own party for having attempted to apply on the farm the Republican election pledge to rely more on private initiative and less on government control.

American Notes

Bricker's Ball and Chain

MR EISENHOWER has publicly refused to compromise, in any vital respect, with Senator Bricker's attack upon the President's treaty-making powers, although it has the nominal support of most of the Republican and some of the Democratic members of the Senate. Negotiations are still going on between the Senator, the Attorney-General and the Republican Congressional leaders who are anxious to avoid a show-down, but the probability is that the first test of the President's determination to lead his party will come in the next fortnight, and on an issue quite outside his own lengthy programme of legislation. Should Mr Bricker's amendment to the Constitution pass

the Senate by the necessary two-thirds majority, it would still have to be approved by the House and by three-quarters of the states. Both are likely to follow the Senate's lead.

Senator Bricker's supporters, who include many bar associations and patriotic and ex-servicemen's organisations, and others disturbed by the trend to internationalism, fear that treaties, which under the Constitution are superior to state law, may be used, given the combination of an unscrupulous Administration and an unwary Senate, to introduce radical social doctrines and undermine the rights

"I'll Compromise And Make The Chain A Little Longer"

Herblock in the Washington Post

of the states and of individual citizens, both of which are guaranteed by the Constitution. The resolution therefore provides that treaties which conflict with the Constitution shall be invalid, and that they may not affect internal law unless they are implemented by legislation which would have been valid in the absence of a treaty—the notorious "which" clause. Not only would this introduce the House of Representatives into the treaty-making process, but also it would mean that, when treaties touched matters reserved to the states, the consent of state legislatures would have to be obtained.

The President showed a heartening grasp of the danger and how it could be dramatised when he insisted that he could not represent 48 individual sovereignties abroad. The amendment would also give Congress the power to supervise executive agreements, which do not even require the assent of two-thirds of the Senators present, as treaties do. This is a sore point, much exacerbated by the belief of many Congressmen that, unlike Mr Roosevelt, they would not have been hoodwinked at Yalta. However, if as many as 10,000 executive agreements were needed in connection with the North Atlantic Treaty, this provision

might prove as paralysing to an already cumbersome system of conducting foreign affairs as the "which" clause.

Any surrender on these two provisions, in the interests of cementing Republican unity, would make future Administrations prisoners of obstructive forces and the failure of Mr Brownell's efforts at compromise has thus not been wholly unwelcome. But the Administration has been very slow in making its position clear and rallying public support. Sixty-three Senators, however lukewarm they may have become, are publicly committed to Senator Bricker and expect the Administration either to save their faces by sponsoring some innocuous substitute, or to reward them for their pains if they desert him.

Ike's New Deal Benefits

ANY fears that a Republican Administration would pull down or even seriously alter the New Deal's structure of social security evaporated with the third of the President's messages to Congress. The federal old age and survivors' insurance scheme is based upon the idea that benefits should be related to past earnings and that the whole plan should be paid for by taxes on workers and their employers and, eventually, by interest on the reserves built up. The President proposes to fill up the gaps, remedy injustices and take account of the rising cost of living, but the system is to remain basically unchanged. This has delighted the trade unions, who feared that the Administration might be converted to the view of the Chamber of Commerce that a low, uniform pension for all over 65, directly related to current tax receipts, would be simpler to administer and a discouragement to extravagance. Under the President's proposals, an additional 10 million workers would be brought into the system, making coverage almost universal; benefits would be increased by from \$5 to \$10 a month for those who have already retired and by more for those who retire in the future; the disabled and those who are prevented from working by long illnesses would not be penalised as they are now; and old people would be allowed to earn up to \$1,000 a year without sacrificing any of their benefits. More money will flow into the system, if Congress agrees, both because more workers will be included and because the tax-base, the income on which employees and their employers pay the social security levy, would be raised from \$3,600 a year to \$4,200. Earnings have risen so much since the base was last enlarged that at the present limit only 40 per cent of all male workers pay tax on their whole income. The new base would mean that employees earning \$4,200 or over would pay \$84 a year instead of \$72, and this may make some Congressmen hesitate. But a programme which has the support both of the Democrats and of Mr Reed, the Republican chairman of the House Ways and Means Committee, is clearly considered a political winner in election year and is unlikely to encounter any serious obstacle. The Chamber of Commerce will have to draw what comfort it can from the proposal that federal grants to the states for public assistance should be related to income per head, rather than be governed, as they are now up to a very generous level, by the aid which a state chooses to give to its indigent old. This should instil more responsibility in certain state governments and help the federal government to estimate its liability more accurately.

Welfare Without the State

IN the field of medical care, unlike that of social security, the Administration has had to blaze its own trail, for opposition to the "socialised medicine" favoured by the Truman Administration was so intense that nothing could be done to ease the ever-growing burden of medical costs. Even after the President's message, the trail is not very distinct, but the direction it will take is clear. "Freedom, consent and individual responsibility are fundamental to the American system," he observes, and recommends that Americans wishing to assure themselves of good medical care should join the voluntary, non-profit health insurance plans which have sprung up. Private insurance of hospital costs, which is the most common, pays for 40 per cent of all the private hospital care.

The defect of many of these plans, apart from their cost, is restriction of benefits. Even with insurance a serious illness may be a financial catastrophe. To enable these plans to offer wider coverage to more families, the President proposes a re-insurance scheme, with a capital of \$25 million, to meet the additional risks. Exactly what the Administration has in mind will not be known until its draft Bill is sent to Congress. But Representative Wolverton has already introduced Bills along similar lines. These would enable private schemes which had taken out re-insurance to collect two-thirds of the medical and hospital bills in excess of \$1,000 incurred by any single subscriber. Fees would have to be adapted to the subscriber's income.

The American Medical Association, which conducted such a virulent and successful campaign against government health insurance, has no comment as yet. Neither have the private insurance organisations, which may have strong views about the adequacy of a \$25 million re-insurance fund when private medical costs are put at over \$9 billion a year, and which may also suspect the scheme as the thin end of federal control.

The President's other proposals concern the need for more federal research into cancer, heart disease and other serious afflictions; more money for rehabilitation of the disabled; and broadening the terms of the Act under which the federal government supplies funds for hospital construction. Mr Eisenhower would like to use federal money to encourage the building, as well, of health centres, nursing and convalescent homes, which would be less costly than fully equipped hospitals and would relieve the pressure on hospital beds.

Psychological Wars on Wheels

THE General Motors Corporation's programme for spending one billion dollars in the next two years on expanding its capacity is publicised as a declaration of faith in continuing prosperity, to meet the needs of a constantly growing market and to provide more jobs for the trade unionists who are the most outspoken prophets of a coming slump. But the corporation's psychological warfare is directed not only against fears of an economic depression but against the ambitions of its competitors. In the auto-

mobile field, even the largest of these, the Ford Company, is a David to the General Motors Goliath—in spirit as well as in size. Mr Henry Ford has already announced that he expects his models to displace the GM Chevrolets this year as the best sellers in the cheap car field and that his company will not be among those that will be producing below capacity in 1954. So far, although cutbacks are becoming general in the industry, he has kept his word.

The Ford Company, however, as a private concern, has an advantage over its competitors in that it need not give so much consideration as they to the effects of cut-throat competition on dividend payments and share values. In 1953, while the General Motors Corporation was responsible for 45.6 per cent of the year's huge output of 6.1 million automobiles, the Ford Company, with 25 per cent, increased its lead over the Chrysler Corporation, which produced only 20 per cent of the new cars compared with 22 per cent in 1952. The "big three's" share of the total automobile market rose to over 91 per cent and they were already driving smaller companies to the wall, even though competition only became fierce in the second half of the year. Last summer's merger of the two smallest independent companies, the Kaiser and Willys Corporations, has just been followed by a similar arrangement between the Hudson and Nash Companies. If this is approved by the stockholders, the new American Motors Corporation will be, by a small margin over the Studebaker company, the fourth largest in the industry; but 1953's combined output for the two merging companies was only 212,000 cars.

The automobile dealers, restless at the way cars are piling up in their showrooms, are also waging psychological war, against the manufacturers. Dealers find themselves squeezed between the low prices they can get for used cars and the high allowances they must make for old models traded in for new automobiles. And now they are also being squeezed between new 1954 cars and unsold 1953 models. At the dealers' annual convention recently, manufacturers were told that they had little hope of selling their planned production of 5.5 million cars in 1954 unless prices were reduced. But so far there is no marked tendency towards lower—or higher—prices and even re-styling is not general in the industry this year. The Chrysler Corporation, however, has made its contribution to the psychological war, in this case against the buyer, by lifting its mudguards so that the customers can see the wheels go round, something that seems almost indecent in an American car.

Last Round to "La Ronde"

N EARLY three years ago the French film "La Ronde" was denied a licence to be shown in New York, on the ground that it was immoral, although it was exhibited in many other states usually considered less sophisticated. Last spring the highest court in New York upheld this use of the police power. But this week, when the Supreme Court reversed the decision—as well as that of a court in Ohio upholding the ban on "M"—the final, and vital, round went to "La Ronde." In their unanimous decision, the Justices referred to their verdict in the case of "The

Miracle," which found that the guarantees of free speech contained in the First and Fourteenth Amendments to the Constitution covered motion pictures.

This seems to be the censors' Waterloo. From now on a film will have to be very offensive indeed for a state to hope to ban it without infringing the Constitution. It will not be enough for a picture to incur the displeasure of any powerful local orthodoxy, which in New York means the Roman Catholic hierarchy. Six states and some fifty cities have censored films.

This new blow for film freedom comes at a moment when the American industry itself is beginning to feel the need for more latitude. Members of the Motion Picture Association have submitted for over twenty years to a code of film standards so exacting that soldiers in the front line are not allowed even a faint "damn." Last spring the seal of approval was withheld from "The Moon is Blue" because it dealt with seduction (America has no A certificate). Not surprisingly, it played to packed houses. The RKO Company, just before Christmas, similarly defied the code in the case of "French Line" starring the now repentant Miss Russell, but it has since bowed to the threat of a boycott by the Catholic Legion of Decency. More important than this incident—involving an inferior film—is the considered letter of Mr Sam Goldwyn to Mr Eric Johnston, suggesting to the Motion Picture Association that it is time to recognise that American audiences and American films can now dispense with some cotton wool and rose-coloured spectacles. Indeed, faced with the competition of television and foreign films, Hollywood may have no recourse but to break into the adult market.

Let the Giver Beware

THE generosity toward the unfortunate which has always been an outstanding American trait has made charity big business. But the more than \$4 billion contributed each year also attracts racketeers and unscrupulous promoters, who flourish in the many states which do not protect their Good Samaritans from exploitation. Shocking facts about a number of nationally known charitable appeals have been brought out by a committee of the New York legislature which is drawing up a law requiring full accounting from private charities.

The National Kids Day Foundation, for example, whose name alone might have caused a shiver of mistrust, collected nearly \$4 million in five years, of which all but \$300,000 lined the pockets of professional fund-raisers. An ex-servicemen's organisation, which used the name of the President, without permission, to impart an aura of integrity to its publicity, received \$21 million and spent nearly \$17 million on fund-raising and administration; not a penny in direct aid reached any ex-serviceman. On an even lower level, there is, particularly at Christmas time, much stoking up of the notorious "boiler rooms" where professional pleaders, working on commission, exercise their arts on the unsuspecting over the telephone.

According to an estimate of an expert of the Russell Sage Foundation, fraudulent charities siphon off about \$100 million a year; still more is lost by ill-run charities which cannot keep their costs down to the 15 per cent or so of

receipts which is the practice of the efficient. The multiplicity of appeals even from these deserving organisations is a continuing grievance with many Americans and is not likely to be cured by separating the sheep from the goats. After the first world war the idea of the community chest caught on, the aim being to collect, in a single campaign, funds for all deserving local charities.

But despite the quotas and the social and business pressures to subscribe a "fair share," the chests proved unable to meet even local needs in full, while the big national organisations such as the Red Cross continued to make separate appeals. In recent years communities have joined to create United Funds, which raise money for the national good causes in return for a promise of exemption from special drives, except for capital funds or in cases of emergency. But a number of the largest national organisations co-operate, if at all, under protest, in the belief that their causes and their funds suffer if they submerge their identities in a single standard impersonal appeal.

SHORTER NOTES

The first shipment of iron ore from Venezuela's mountain of solid iron, Cerro Bolivar, which has been developed by the United States Steel Corporation, was due to arrive in Pennsylvania this week. Production from this new source of supply, which cost the corporation \$170 million in roads, railways and port facilities, is expected to reach five million

tons next year and 10 million tons—10 per cent of America's iron ore needs—within a few years.

★

Concerned with the falling sales of regular cigarettes, 14 major tobacco companies have formed a Tobacco Industry Research Committee to undertake extensive research on the effects of tobacco use, although they coupled this announcement with a statement stressing their doubt that smoking induces lung cancer. It is believed that the tobacco companies have received unofficial approval from the Department of Justice for this joint action, which technically contravenes the anti-trust laws.

★

The fact that steel production is now running at only about 75 per cent of capacity is not as disturbing as it might seem at first sight. For capacity since January 4th has been 124,330,410 tons of ingots and steel a year, an increase of 6,782,940 tons over the 1953 figure on which calculations were previously based. The steel industry has doubled its capacity since 1940.

★

Married women outnumber single women by more than two to one in the labour force, according to a special survey taken last April, and the number of working wives is going up, unlike the figure for single women.

Does Neguib see Clear?

FROM OUR CORRESPONDENT IN CAIRO

THE dissolution of the Moslem Brotherhood by the Council of Revolution is evidence of other things besides the complex strains to which the present regime is subjected. These are undoubtedly important enough in a country where the restoration of any degree of stability compels unpopular policies. The group of officers who set out to extricate Egypt from its lamentable past has long since discovered how numerous are the enemies its virtuous intentions can earn for it. But behind its plight and its latest act of authority lies the vaster, deeper strain which Islam feels at this point on the Mediterranean coast where history and geography give it close association with the industrial civilisation of the West.

A cultured observer of the problem pointed out that whereas Turkey broke with its Moslem past, Egypt is trying the much more difficult and enduring route of adjustment. Indeed, the Egyptians might reasonably be accorded the more sympathy for their effort, and because so many of their idiosyncrasies in the international field stem from this present maladjustment.

The Moslem Brotherhood and kindred organisations are the extreme wing of resistance to those conditions in the modern world which are dragging the urban Moslem areas into a westernism that is in many ways incompatible with a strict interpretation of the Moslem way of life. Western influences have everywhere weakened the social structure of Islam in urban areas and consequently weakened religious authority. Everywhere there are religious leaders and movements which seek to bolster their declining influence by adopting an extreme nationalism which has nothing in common with Islam's fundamental tolerance.

For the governments of the area, such movements become a difficulty and then a menace, for they make fanatics of simple-hearted people and out of fanatics manufacture, sometimes by accident and sometimes by design, terrorists who "with the sword of the destroying angel" wished "to hew their way through the wood of God's world." They become an impediment to social progress and at times an obstruction to government itself.

These movements were, and are, the backwash of progress. In Egypt the power of the Brotherhood became a major encumbrance after the second world war and was enhanced by the temporal ambitions its leaders acquired. Neither the parties nor the King in the old regime could work with them, and Mahmoud Fahmy el Nokrashi paid with his life for suppressing them in 1948. The Free Officers Movement, which ultimately organised the *coup d'état*, sympathised with the Brotherhood because the

officers, too, were bitterly opposed to the Palace and the old regime, because they had seen Brotherhood volunteers at the Palestine front, because they, too, hankered after a purer religion. What they did not realise was that their more practical and secular aims were in conflict with the very nature of the Brotherhood. They were looking forward to a progressive agricultural and industrial Egypt; it was looking back over its shoulder into the Islam of Africa and Asia.

Stripped of the propaganda and emotion which confuse it, the policy of the present regime is to achieve a settlement with the West, because only by such a settlement can Egypt's material progress take place. The Brotherhood was in conflict with this broad aim everywhere—from its cells in workers' syndicates which bedevil industrial relations in foreign firms, to its refusal to compromise with Britain over the Canal Zone. Even the demands which from the outset it imposed upon the constitution-making committee were incompatible with the needs of a country that has a substantial Christian and foreign population. In the circumstances, Neguib had either to capitulate to religious reaction or break with the Brotherhood.

It chose the latter course, but whether in full recognition of the fundamental conflict remains to be seen. Since the dissolution was announced the suggestion seems to be that the action was taken only against a faction preaching violence. This may be intended only tactically to reconcile the mass of Brotherhood members to the act; or it may mean that the Council of Revolution believes that the virtues of the movement can be salvaged and the subversive and terrorist cells destroyed. That the Council believes it can purify the Brotherhood is possible. Its own direct, hang-the-consequences approach to some problems has an emotional affinity with that of the extreme Moslem nationalist, who might well have confiscated all the wealth of the royal family out-of-hand, have expelled the Turkish Ambassador in brusque contravention of diplomatic usage, or have come to a stubborn halt when a settlement with Britain seemed at hand. Furthermore, for a regime which has been compelled to sacrifice the support of so many sections of the community, the prospect of retaining the support of the rank-and-file membership of the Brotherhood must be attractive.

The error of such a policy would seem to be that the Brotherhood is aggressive Islam, not so much content to set an example of personal devotion as to drive the community into demanding a state of a reactionary pattern. Eventually, one feels, even a purged Brotherhood would

again become a hindrance to the present leaders. The difficulties of the present regime spring less from lack of popular support than from the impasse in their relations with the West which prevent their making adequate progress on the immense material problems which the country has to face. Egypt's destiny is to be complementary to Turkey in the Eastern Mediterranean, and the refusal to admit this destiny, and to pursue it, obstructs the regime at every turn. The support of the Brotherhood or any other movement is only important because, in present circumstances, material progress is inevitably slow. Were it greater and more rapid, it would win for the regime that mass of people who are content to live peacefully and quietly in the grace of God and the government.

The Link with Islam

Do the men who dissolved the Brotherhood now see their way ahead? Their long communiqué explaining the act ended as follows:—

The Revolution will not allow a reactionary tragedy to be re-enacted in Egypt in the name of religion, and will allow no one to tamper with the future of this country in pursuit of his private desires, regardless of what pretexts he advances, or to exploit religion to further his own aims. The measures of the Revolution will be decisive and will be carried out in daylight before the eyes of all Egyptians. God is the giver of success.

If they were merely smacking down a rival for power, they have achieved little beyond making themselves one more enemy. But if they were for the first time admitting the conflict between themselves as representing modernisation and the Brotherhood as representing reaction, they have undergone an important psychological change. The closing words of the communiqué suggest that they want, in contrast to Turkey, to keep their link with Islam; this would be possible, but the only way to win and hold the support of devout and God-fearing masses would be to produce more results than have yet been produced on the home front. To obtain these it will be necessary to seek Western help and to stop using the manufactured "public opinion" that can be so easily roused in Cairo. If this is the way the Council of the Revolution's mind is working, its dissolution of the Brotherhood is full of meaning and points to a more coherent policy.

The Ideas of Mr Djilas

TIMES change and Communists must change with them. This simple and not very profound idea is the text developed at length by Milovan Djilas in the series of articles which have now led to his downfall. In Mr Djilas's view the "socialist reality" is constantly developing and changing, creating new conditions and throwing up new forces. But in Yugoslavia today this continual evolution is not being reflected in thought and political organisation. In consequence there is "a conflict between life and inherited patterns, between dogmatism and reality." In other words, the Yugoslav Communist Party has failed to work out the implications in thought and practice of the great social and economic changes that have been, and still are, taking place. It has not been sufficiently alive to the fact that all its time-

honoured theories are being shaken "in everything but their foundations"; that "only the basic materialistic (Marxian) principles" remain. Even the cherished slogan of "class warfare" has lost its potency because in the new Yugoslavia the class structure of society has been revised; the class struggle has been degenerating into one between the bureaucracy and the people.

Above all, Yugoslav Communists have failed to realise that the role of the party is not what it was. Yugoslavia is progressing not by revolution, but by peaceful evolution, and Mr Djilas believes that to struggle for power in a revolutionary fashion is now both "pointless and unrealistic"; it could even be interpreted as behaviour of a counter-revolutionary nature. During the revolutionary period the interests of the party coincided with those of society as a whole. But this is no longer so. Now it is necessary to work for the weakening of the monopoly control of any political movement over the life of society, because if any party or group assumes the exclusive right to "manage" society, it will end by "enslaving" it.

Fight for Freedom of Thought

Mr Djilas believes that what he calls the "socialist consciousness" is not represented today only by the Communists but by "the broad strata of society in various forms and intensity." The Yugoslav Communists, therefore, must make up their minds to work with all those who are in favour of a democratic, socialist and independent Yugoslavia whether or not their ideas are identical with the socialist dogma "produced by this or that official." They must no longer regard themselves as occupying a special and privileged position in society; they must no longer occupy themselves with "dogmatic moralization and empty idle and senseless discussions, while life passes by." Their first task must be to "make possible the expounding of ideas, to secure that no one be really persecuted because of his ideas"; so that the bureaucratic and obsolete forces in society can be "pressed back in democracy." In Mr Djilas's view

There is no and can be no other way out but more democracy, more free discussions, freer elections of social, government and economic organs, more adherence to the law.

At the same time, Mr Djilas maintains flatly that there can be no democracy—even that there can be no Yugoslavia—without Communists; but that does not mean that they must work and organise in the same manner as before. He seems to envisage the Alliance of Communists ceasing to be a party in the ordinary sense, and turning instead into "a real and live alliance of ideologically close people." The good and gifted Communist would be known not from his function in the party committee or in the government, but from his ability to influence (not compulsorily drag) the ideological and political life of the people. This conception of Communists who concentrate on the "internal ideological life" is not altogether consistent with Mr Djilas's earlier condemnation of Communists who regard themselves as "the priests and gendarmes of socialism." Indeed his efforts to avoid the consequences of his own arguments are clearly not very satisfactory; the place he has marked out for the party in the new Yugoslavia is impossibly lofty and idealist for practical men, who have tasted power.

No Horatius for Italy

FROM OUR ROME CORRESPONDENT

SIGNOR FANFANI has now managed to form a government and thus becomes Prime Minister of Italy at the age of 46. But no one could pretend that his prospects of staying long in office look good. Indeed, the laborious and unedifying negotiations before and after Signor Pella's resignation have brought home sharply to European opinion a fact that has been fairly obvious to observers here since the defeat of the moderate coalition under Signor De Gasperi at the elections last June. The bridge on which Italian democracy is warding off attacks is perilously vulnerable, and the defenders offer a terrifying spectacle of disunity and disorder. There is definitely no Horatius in sight.

Yet Italian statesmen are lacking neither in insight nor stature. Why, then, have they failed so lamentably of late? The short answer is that the main centre party in Italy, the Christian Democrats, embraces such a wide variety of conflicting currents that it is in perpetual danger of splitting. In particular, it is difficult to reconcile the interests of Catholic trade unions, which have recently joined the Communists in a token strike for higher wages, with those of rich industrialists and landowners. The party is, therefore, bound to suffer from a split mind when it comes to the choice of the allies whom it must have to bring its 45 per cent of parliamentary seats up to a majority. To make matters worse, the other three centre parties, with which Signor De Gasperi went to the polls last June, were so soundly beaten that they have ever since been chary of allying themselves too closely with the Christian Democrats.

A Serious Miscalculation

Such an unpromising situation makes the failure of the moderates to throw up a Horatius easier to understand. Who would qualify for the post? First, there is the dominating figure of Signor De Gasperi. His failure to secure a majority at the last elections ruled him out as Prime Minister. But it was hoped that as its leader he would take the party in hand firmly enough to give it a coherent policy. In that aim he has failed lamentably. When he himself was unable to form a government last summer, he torpedoed an attempt by the right-wing Signor Piccioni to reform the coalition with the other centre parties. The deep rift caused by this manœuvre persists to this day.

Signor De Gasperi did, however, back the temporary solution of a caretaker government of experts under Signor Pella, who had no following in the party caucus. But Signor Pella, backed by the Monarchists and right-wing Christian Democrats and reaping popularity from the Trieste crisis, quickly gained a position in which he could snap his fingers at the party machine. De Gasperi thereupon decided, just before Christmas, to emphasise the distinction between the government and his party. His calculation was that Signor Pella would obligingly carry on till about next autumn, when the party, its ranks consolidated and its funds augmented, would go to the polls and be returned with an absolute majority. But Signor Pella, to no one's surprise, struck back. Surprised, Signor De Gasperi hastened to compromise. An understanding would

have been reached had it not been for Signor Fanfani's insistence on the retention of his nominee at the Ministry of Agriculture. Signor De Gasperi yielded to his pressure, and Signor Pella resigned.

The extent of the disaster provoked by Signor De Gasperi's mistaken tactics remains to be seen. But it is difficult to see how fresh elections in the near future can be avoided; the Left will probably then increase their vote, and huge numbers of voters, disgusted by the recent political intriguing, will no longer support the Christian Democrats. Signor De Gasperi's prestige, like that of his party, has suffered seriously.

Next in line as a successful moderate leader is Signor Fanfani, the new Premier. He is an able and dynamic administrator, a sincere philanthropist, a vigorous advocate of social reform. But he is ambitious, and models his flexible choice of methods and associates on that of the Jesuits. From the left wing of the party, he has gravitated into the position of a successful politician, whose insistence on agricultural reform has tended to take the form of building up a clientele among the farmers and landowners. It is hardly surprising that he is widely disliked and distrusted. The point on which he forced Signor Pella's hand seemed too much one of patronage rather than of principle, and his approaches to the Monarchists ignore Signor De Gasperi's wise contention that an alliance with that party is playing the game of the Communists' popular front tactics.

Lastly, Signor Pella is a possible Horatius. A non-party man, he has built up for himself a tremendous following in the country. In Italy there is a traditional sympathy for the able expert who has no political axe to grind. It is particularly strong on the Right and among people who tend to vote for emotional rather than for clear, if interested, motives. It is significant that the Monarchist Party, who fall into this "non-political" category, supported Signor Pella. It is certain that, if he were to form a party and go to the country on a programme of "efficient government versus the parties," he would receive a huge volume of support. But it is doubtful whether such a move is practical politics. And if he were successful, the West might not have special cause to rejoice. The parallel with the early twenties, with its weak centre and turbulent left, leaps to the eye.

Ukraine in the Limelight

CELEBRATIONS have begun this week to commemorate the 300th anniversary of "union" between Ukraine and Russia. During the next three months all sorts of meetings, parliamentary sessions and other ceremonial functions are to be held throughout the two countries. The Soviet government and party have already issued lengthy theses on the subject, and a conspicuous place has been found in the Soviet Pantheon for Bohdan Khmelnytsky, the Ukrainian Cossack leader who helped to bring about the union.

Obviously the new regime would not create so much ado about an historical date if the celebrations could not be used for an immediate practical purpose. From the published texts it would appear that by emphasising the

"brotherly ties" and presenting Russia as the saviour and benefactor of Ukraine, an attempt is being made to strengthen the hand of the Russifiers who had been threatened by the spring tide after Stalin's death. Then, while Beria was still in power, Russification was attacked and a more liberal policy towards the minority groups was foreshadowed. Now the line is being reversed and Ukraine is naturally at the centre of the conflict, since, with a population of 40 million, it is the biggest minority group. It is also economically the most important, as it still produces about one-third of Soviet coal and steel, and is a major granary and the chief sugar supplier.

The new version of history has strong racial, Slavophil undertones. It is now claimed that Russia "from its very beginning was a centre of attraction and support for its brethren fighting against foreign oppression . . . the Ukrainian people have tied their fate for centuries with their blood brothers the Russians." This is a far cry from the early Communist denigration of Tsarist conquests. Then it was merely pointed out that the Ukrainians had exchanged one form of exploitation for another, that Polish nobles had been replaced by Tsarist landlords. The new line must please the chauvinist and centralist elements in the army, police and the party.

But neither the line nor the balance of forces is yet clear. Another, though certainly not the last, reshuffle in the Ukrainian leadership has been announced. It all started after Stalin's death, when under Beria's guidance an open attack was launched against the policy of Russification. The first secretary of the Ukrainian party, Melnikov, was then sacked, but his protector and predecessor,

the all-Soviet party boss Nikita Khrushchev, was probably the chief target. Khrushchev and the diehards, however, hit back and it was then the turn of Beria's supporters to tumble. In particular, Meshik, the minister of the interior and a Beria man, followed his master before the execution squad. Last week the Ukrainian premier Korotchenko was kicked up into the presidency, a more decorative but less important post in the Soviet republics. But the operation is not yet complete. Many followers of Beria must still be clinging to their jobs, while the disgraced Melnikov has not yet returned from his diplomatic exile in Rumania.

The purge proceeds on an instalment plan because Beria's policy must have found a particularly favourable ground in Ukraine, which has always been a centre of nationalist discontent. By encouraging economic development Stalinism has made its own task more difficult. Each year some 35,000 Ukrainian students graduate from higher

educational establishments, and about 70,000 from technical schools. This ever-growing native intelligentsia resents Moscow's iron hand. Now, under the cloak of anniversary celebrations, the diehards are trying to reinforce the Russian grip.

Peking's Trade Headache

A REPORT, originating from an Indian source, suggests that the Chinese Communists are anxious to expand their trade with the free world. There is no confirmation from any other quarter of such intensified interest in Peking in expanding its non-Communist foreign trade, although it has long been clear that the Chinese are far from satisfied with their present trade channels with the West.

If the Chinese are, however, genuinely wanting to do more business with Britain they have the key in their own hands. They have Hongkong on their doorstep, ready, willing, and fully equipped to do legitimate business with them; there are the "old China hands," with their long experience and expert knowledge, who are ready, given the chance, to renew old business contacts; and they are at liberty to communicate directly, or through agents, with firms in this country. But up to the present they have deliberately fought shy of these channels, preferring instead to use trade mainly for propaganda purposes. Their official journal *China Reconstructs* recently claimed that China was willing to do business with any country "on the basis of equality and mutual benefit"; yet they continue to hound British firms in China, humiliate British businessmen, and make it as difficult as possible for Britain to trade with them.

Soviet Double Dealing

Even if the strategic controls on exports to China were relaxed it is improbable that the market for the West's exports will be very extensive. There is ample evidence that the Communists are experiencing a severe shortage of foreign exchange, and so far there is no sign that Soviet aid will include convertible currencies. A recent directive from the Peking government to its foreign trade commissioners illustrates their plight. Every effort must be made to facilitate the collection and dispatch to the ports of exportable products; outlets must be sought on foreign markets; and the policy of "better price for superior goods and low price for inferior goods" must be strictly enforced. Besides this resort to the price mechanism, private merchants are to be allowed "a reasonable profit" as an inducement to earn foreign currency for the state, and, as if to discountenance past excesses, the directive urges officials collecting goods from the peasants to treat them fairly and politely.

As something like 72 per cent of China's foreign trade is now directed inwards to the Soviet bloc, Peking is naturally finding itself short of its traditional foreign currency earners, such as soya beans, oil seeds, bristles, and feathers. They cannot be pleased, moreover, when these exports are re-exported from the Soviet Union and eastern Europe to the West at cut prices. Confirmation of China's foreign trade difficulties comes from Japan, where it has been made known that China cannot for the time being supply any soya beans. Another sign is the embargo recently announced by Peking on the export of certain oil seeds.

ARE YOU A MAN OR A HOUSE ?

Your Grandfather may have started your firm, and insisted on maintaining the furnishings in the sombre style to which he was accustomed.

But surely if you are Managing Director it is time you put your foot down on something other than Victorian Haireord ? This isn't a vulgar incitement to revolt, to introduce riotous colours and bizarre furniture. Far from it. Have a word with Mr. Peter Catesby and his staff. They respect tradition.

They can transform a board-room into a pleasant, modern place without losing a bit of its dignity. They will even retain Grandfather in his gilt frame — if you insist.

More steel... less fuel

A steel furnace built in 1946 needed 66 therms to produce one ton of steel. The latest type of furnace in 1953 needs only 37 therms. The new open hearth furnaces are three times as big and cut fuel consumption per ton of steel by almost half, as compared with the 1946 unit.

This change is the impressive result of continuous research aimed at reducing the fuel bill by cutting down heat wastage.

The steel industry is not only producing more steel for our needs at home and the raw steel for 40% of our exports; less fuel per ton is being used in the process.

STEEL

is at your service

THE BRITISH IRON AND STEEL FEDERATION

Denmark Remembers

THE release, just before Christmas, of four Danes who had been sentenced to long periods of imprisonment for war crimes, including murder, set off a dramatic wave of protests throughout their normally placid country. Former Resistance groups were joined by other organisations in their denunciations, and over 50,000 individual protests were addressed to Hr Hedtoft, the Social Democratic prime minister. Last week representatives of all five democratic parties pressed the minister of justice, Hr Haekkerup, for an explanation in the *Folketing*. The minister defended himself by pointing out that out of 13,500 persons originally sentenced for treacherous acts during the Nazi occupation, all but sixty had been progressively released by governments of both the Left and the Right; but he gave way to the extent of announcing a suspension of the work of the board concerned with pardons.

The emotion aroused in an unemotional country by this affair calls for some attention. In Italy, France and elsewhere the problems presented by the release or continued imprisonment of men who served the Gestapo or betrayed their occupied countries in other ways have been confused and obscured by party passions and personal recriminations. In Denmark the reverse is the case; on the whole, so little feeling has been excited that the release of most of the minor war criminals passed almost without notice. Only now, when men convicted of the most revolting crimes have been freed after serving a fraction of their sentences, has indignation boiled over. It is an important piece of evidence in the unending controversy, in this and other countries, over penal principles in general. Even the combination of eight years of peace, a quietist national character, and a humanitarian penal tradition, has not sufficed to make Danes swallow without protest the release of their blackest offenders. Are there limits to human patience, even among the mildest of peoples, beyond which sheer revulsion must be pacified by the infliction of genuinely stern punishments?

Investment Policy at Luxemburg

THE Assembly of the coal-steel Community met last week in special session to debate the High Authority's investment programme in which it lays down certain broad objectives to be pursued over the next five years. The Assembly, or Parliament, of the Community is composed of 78 delegates chosen annually by national parliaments from among their own members. Ordinarily it meets only once a year to consider the annual report of its executive body, the High Authority; it then has the power to oust the Authority by passing a two-thirds vote of censure. On this occasion, however, it was called together simply to elicit views on the crucial problem of investment.

Constitutionally, the High Authority can do little more in this field than to review and express its opinion on the investment programmes of firms in the Community, recommend certain general policies and make a financial contribution to projects it deems worthy of help, either by granting loans to firms or by offering to guarantee loans that they may contract. However, this limited power is greatly rein-

forced by the knowledge that the Authority will serve as the channel for any American funds invested in the Community. An American loan—some reports speak of as much as \$500 million—is expected very shortly.

In its report to the recent Assembly meeting the High Authority suggests that the following five priorities should guide its decisions in the matter of allocating funds and support for investment programmes submitted by individual firms. (1) Coal production should be modernised with the special objects of raising the average output per manshift from 1,400 to 1,500 kilos at least, and of increasing the production of coking coal by from 20-22 million tons annually. (2) More and better housing must be provided for miners—60,000 dwellings need to be reconditioned and another 40,000 should be built. (3) Thermal power stations at the mines should be modernised and expanded. (4) The productive capacity of the coke ovens needs to be increased by 9 or 10 million tons annually; production costs should be lowered. (5) The iron ore mines should be modernised and their productive capacity increased from 62 to 80 million tons annually.

All five of these priorities are based on an estimate by the High Authority's experts that by 1957-58 the demand for Community steel will be 50 million tons a year, compared with current production of 42 million. In order to produce this tonnage at competitive prices the steel industry must have at its disposal adequate supplies of raw materials at lower prices than now prevail.

Fear of Unemployment

The Assembly gave its full support to this statement of investment policy, but not before various critics had made it plain that certain of the objectives struck them as being much more important than others. They wanted the emphasis placed on high productivity and lower costs rather than on greater production. In particular they felt this policy should apply to the coal industry, where any setback to demand would create a disproportionately large unemployment problem; for this reason they advocated that scarce resources should not be used to expand coal production to the point where every possible boom demand could be met out of domestic output.

In the same spirit of caution, some Assembly members urged that special attention be given to schemes for retraining redundant workers and placing them in new jobs—this process is called "readaptation" in Community jargon. M. Monnet reassured them on this score by saying that of the \$48 million that the High Authority will have collected by June from its levy on production in the Community, \$7 million will be set aside for readaptation; another \$35 million will be used for the credit fund to guarantee loans, \$5 million for administration and \$1 million for technical and economic research.

Finally, while approving the priorities that the High Authority has recommended as between the steel, coal and iron ore industries, members of the Assembly wanted to know more about the bases on which funds would be allocated to the individual firms themselves. Would it be considered more profitable to help a high-cost producer to lower his costs or to expand the output of someone who is already a low-cost producer? The Authority replied that a series of comparative cost studies had been put in hand and that a detailed set of investment principles must await its findings.

"Just the Art of Being Kind"

FROM OUR JOHANNESBURG CORRESPONDENT

PUBLIC interest in South Africa has switched from politics to cricket, but the politicians will be coming in to bat again at the end of January when Parliament reassembles. Dr Malan, who will be 80 in May, has handed over the leadership of the Cape Nationalist Party to Dr Dinges. This was a blow for Mr Strijdom, the Transvaal Nationalist leader, who favoured Mr Louw. When Dr Malan retires, probably this year, the line of succession would appear to be: Mr Havenga, swiftly followed by Dr Dinges. Mr Strijdom is very ambitious and is unlikely to take this lying down. A struggle for power within the Nationalist Party might precipitate a *toenadering* between "moderate" Nationalists and those United Party MPs, believed to number about 19 if the five recently expelled "rebels" (who retain their seats) are included, who think the United Party's only hope lies in compromising with the Nationalists.

Some powerful Nationalists, including possibly Dr Malan, would like to put a brake on Mr Strijdom's ambitions. There is traditional Cape Nationalist jealousy of Transvaal Nationalism. Mr Havenga wants financial stability, more capital from overseas, and an end of English-Afrikaner political bickering, which he feels is harming South Africa and endangering "white civilisation." Dr Dinges is possibly less concerned about English susceptibilities than Mr Havenga; but he does want to be Prime Minister one day, instead of Mr Strijdom. It was Dr Dinges who started the attack on the Coloured Vote which led to a clash between the Government and the Appeal Court. Dr Dinges probably feels he has burned his fingers sufficiently in that direction. If the Coloured Vote issue could be got out of the way, by agreement with a section of the United Party, Dr Dinges (and Mr Havenga) would feel much happier.

Trouble Over a Tea-party

A section of the United Party has never been able to understand what all the fuss over the Coloured Vote was about. It feels that the removal of the Coloured voters from the common roll would be a small price to pay for what it calls "racial peace," meaning a get-together with "moderate" Nationalists to defeat Mr Strijdom. The alternative seems to be not only a continuation of English-Afrikaner bickering, but also a prolonged sojourn in the political wilderness for the United Party. This section views with impatience and distaste Mr Strauss's allegedly high-handed treatment of some United Party stalwarts who had tea with Dr Malan and discussed with him their differences with Mr Strauss over the Coloured Vote. One United Party supporter has described the manifestoes and counter-manifestoes accompanying Mr Strauss's expulsion of the rebels as revealing "incredible petty differences." Complaining that "this sordid squabble... has profoundly shaken faith" in the United Party, he asks whether there really were any fundamental differences of policy between the United Party leadership and the rebels, and inclines to think that there were not.

The correct answer seems to be that there were, and are, but that the United Party leadership signally failed to define

them. Mr Strauss has taken a fairly clear stand against expediency, in the shape of sacrificing the Coloured voters to please the so-called "moderate" Nationalists. But this stand is largely vitiated by his failure to disagree emphatically enough with the Nationalists on other issues, and especially a non-European policy as a whole. Mr Strauss boasts that he is "neither conservative nor liberal." He opposes *apartheid*, but supports segregation. He denounced the Nationalists for provoking the non-Europeans, but supported their legislation, including the notorious Flogging Bill. Many United Party supporters wonder why, when their leader swallows camels, he should strain at a gnat like the Coloured Vote and expel some leading United Party members for questioning the wisdom of his choice.

United Party spokesmen who have stood staunchly by Mr Strauss during the great schism of the past few months are unfortunately no clearer about their ultimate objectives than he is. They excel in denunciations of the "rebels" and of the Nationalists; but when asked what it is that they themselves stand for, they appear to experience great difficulty in returning an unambiguous answer. Mr Henry Tucker, the chairman of the Transvaal United Party, recently attempted to define United Party policy. The Nationalists, he said, sought only Afrikaner domination. The Federal Party was simply reviving the useless "imperialist struggle" of 50 years ago. And the United Party? Mr Tucker preferred, somewhat astonishingly, to answer in rhyme:

So many faiths, so many creeds;
So many paths that wind and wind,
While just the art of being kind
Is what the whole world needs.

Some people, and not only the "rebels," are beginning to think that it is the United Party as led by Mr Strauss that winds and winds.

Mr Strauss's problem is that a sharply defined policy which differed clearly from the Nationalists' policies would almost inevitably be more liberal; and he fears, perhaps rightly, that this would estrange voters. On the other hand, vague goodwill as limned in rhyme by Mr Tucker is hardly enough to stop the Nationalists. Hanging over the country's head are stormclouds like the Nationalist plan to uproot hundreds of thousands of protesting non-Europeans in the large urban centres, in the name of *apartheid*. Faced by such specific threats to racial peace, the United Party simply dithers. It prefers to think of "racial peace" as meaning good relations between English and Afrikaners, with the entire non-European problem disposed of by "lifting it out of the arena of party politics"—whatever that might mean. Mr Strauss thinks such good relations can be achieved only by the country consenting to put him in power, instead of Dr Malan or any other Nationalist. The United Party "rebels" think it can best be achieved by an alliance with "moderate" Nationalists—at the cost of sacrificing both Mr Strauss and the Coloured voters.

But neither policy seems likely to achieve racial peace in South Africa. Mr Strauss is a man without a policy who may soon find himself without a party. The struggle for power within the Nationalist Party, which has already begun, may encourage *toenadering*. But even a regrouping of the white political forces will not solve South Africa's black problem. At best, it will check Mr Strijdom without appeasing the non-Europeans led by Mr Luthuli. The missing factor in the equation is a Smuts, whose broad vision would seem to have died with him.

harvests and health

The snake was an ancient symbol of Time
and the turning year, with its earth-seasons
of spring planting, summer growth,
autumn harvest and winter sleep.

And the snake of Esculapian has,
since classical times, been a symbol of healing.

Agriculture to produce man's food,
and medicine to care for his health...

The improvement of crops
has been the main business of Fisons
for a hundred years and more,
almost since the science and production
of chemical fertilizers began.
And, in recent years, Fisons have struck roots
in the field of chemicals for medicine.
Fisons today contribute to the harvests
and health of the world.

FISONS LIMITED · Harvest House · Felixstowe · Suffolk.....

A series of high speed flashes from six Mazda electronic flash tubes enabled Roger Wood, F.I.B.P., F.R.P.S., to take this remarkable photograph.

THE SAME RESEARCH and manufacturing resources which produced the first jet engine of Whittle design and the electrical power system of the Comet are also behind Mazda lamps.

For half a century BTH has maintained its reputation for leadership in lighting. During that time many of its developments have become standard throughout the world.

Here are three examples from literally hundreds of recent achievements in the field of lighting.

Almost every

important

lighting development

in the last 50 years

owes something

to BTH

200,000 FEET OF FLEXIBLE LIGHTING

A fluorescent lighting system that can readily be switched around to meet changes in the layout of the factory floor. This is one of the contributions to industrial lighting made by the development, by BTH, of universal lighting trunking.

In addition to carrying lamps, reflectors and auxiliary gear which can be sited anywhere along the production line, the trunking also carries other services, such as fire alarms, visual signals, clocks and "Music-While-You-Work".

There are now two hundred thousand feet of Mazda trunking in factories all over the country.

Increased productivity is dependent upon developments such as these; that is why BTH Research is always seeking new ways of providing more efficient and more economical lighting.

EXPLOSIMETER

The explosimeter is a device used on board tankers and in refineries to give warning of any dangerous concentration of inflammable gas. A vital part in the operation and reliability of the equipment is played by a special lamp which forms a ballast in the circuit.

The manufacturers of the explosimeter asked BTH if such a 'lamp' could be manufactured for them in this country. The challenge was accepted and within a matter of weeks tests had been completed.

The samples proved satisfactory, and yet another type of lamp was added to the many thousands (yes thousands — did you know that?) of different types of lamps already manufactured by BTH.

ON THE BALL

The traditional method of floodlighting football fields and arenas has been to mount batteries of high powered projectors on a series of tall and costly towers; BTH lighting engineers were convinced, however, that an entirely new approach should be made to the whole problem.

It took two years to perfect the design of a glare-free projector which could be mounted only a few feet above the heads of the spectators. The results have been nothing short of spectacular. Players and supporters alike have acclaimed the new Mazda system which, by halving costs, has at last put floodlit football within the reach of every professional club and many amateur clubs.

THE BUSINESS WORLD

Profits Turn the Corner

THE slump in profits is over. No crystal ball was needed to predict this event three months ago; it was then forecast in these columns that company accounts published in the last quarter of 1953 would still show a drop in profits, but that the fall would be smaller than that revealed by accounts published in the earlier months of 1953. Facts can now replace guesses. The accounts of 661 public companies received between the beginning of October and the end of December show an average fall in trading profits of just over 5 per cent compared with their results for the previous year; reports published between July and September had shown an average fall of nearly 12 per cent, and those published between April and June one of 10 per cent.

The trading years of most of these 661 companies ended in the summer. The sample includes 539 industrial companies, of which 159 drew up their accounts to June, 118 to July and August, and 141 to September. So their financial years began in the dusk of the recession and ended in the dawn of the recovery. The year to last March showed a setback of 4½ per cent in industrial production. In the year to last June industrial production was about one per cent lower than it had been in the previous twelve months. But in the year ended September, for which more than a quarter of these industrial companies reported, industrial production was about 3 per cent up on the previous year. Again, wholesale prices of "materials used by industry" declined in 1953, whereas they had collapsed in 1952; hence, there was no repetition of the losses on industrial stocks caused by lower prices, and some sectors of industry which had borne the brunt of inventory losses in 1952 often found recovery in 1953.

The winter of 1953 will not, however, be remembered as the time when profits turned the corner so

much as the time when equity dividends were freed from the bonds of voluntary restraint. It was Mr. Clore and Mr. Samuel who threw up the windows in the boardrooms to blow the cobwebs away. Directors would have banged those windows shut again if a cold wind had come in. Instead, the breeze raised temperatures and thawed the dividend freeze. But it has not been a heavy thaw. The gross trading profits of the 661 companies have fallen from £238.2 million to

£225.8 million, but thanks to the writing back of substantial sums over-provided for tax in earlier years, their total income has fallen by only £4 million to £260 million. And, following a fall of about £11 million in taxation on the current year's profits, the net earnings available for equity distribution have risen from £59.4 million to £68.7 million. Out of these earnings the companies paid in net ordinary dividends £27.6 million, compared with £24.5 million in the previous year.

These dividends are, however, entered in the accounts after deducting income tax at the standard rate; it follows, therefore, that about £1½ million of the apparent increase of £3 million in equity dividends reflects the reduction in the standard rate of taxation from 9s. 6d. to 9s. in the £. More money—not a lot more—has gone into the shareholders' pockets, but over one-third of it has come from Mr Butler's tax concession (which applies equally to other incomes as well as dividends). Ordinary dividends before tax have been increased from £46.7 million to £50.2 million, equivalent to 15½ and 15¼ per cent respectively on the companies' issued ordinary capital, and representing in each case no more than a return of just under 6 per cent on their "net

worth." Nor have the companies been uniformly liberal. Equity dividends declared by companies in three industrial groups (tobacco, miscellaneous manufacturing and silk and rayon) and in the two plantation groups (tea and rubber) are smaller than they were a year ago; the dividends received by shareholders in the clothing and footwear companies caught in this sample show no change at all, though profits are higher.

A marked change in the working capital commitments of industry has helped in unfreezing dividends. Stocks held by the 661 companies were £19.6 million lower than a year earlier, and in the same year "debtors" were reduced by about £3 million. Funds

were thus released for fixed capital investment, though not, it seems, urgently employed, also to reinforce liquid balances. These 661 companies reduced their bank overdrafts by about £8 million, added about £11 million to their investment portfolios and about £36 million to their cash balances. The December quarter companies pursued liquidity rather than new investment in stocks and plant or dramatic increases in dividend payments.

★

The differing experience of these industrial groups in last quarter's analysis is set down in detail on pages 269 and 270 of this issue. With the exception of the tobacco and oil groups, the sample is sufficiently wide to justify generalisation. Against the general trend, ten of the twenty-three groups have reported higher trading profits. These ten groups can be divided into two categories. First, there are the capital goods groups—notably building, shipbuilding and motor and aircraft manufacture—which continued to prosper throughout the 1951-52 recession and whose profits have so far been bolstered either by the indirect aid of the Government (through, for instance, the defence and housing programmes), or by the continued existence of demand accumulated from the war years. In the second category (which includes the brewery, clothing and footwear, shops and stores, "other companies," chemicals and paint, wool and other textile groups) fall those industries that suffered a loss in trade and losses on stocks in 1951 and 1952 and have since benefited from the recovery in demand.

For some industries the recovery has been slow and painful; companies, for example, in the cotton and silk

and rayon groups still report a fall in profits. Nor, on the other hand, can the boom in all sectors of the capital goods industries go on for ever. Indeed, light and heavy engineering companies (grouped in this analysis as "engineering" and "iron and steel") have reported a drop in earnings. Profits earned by these companies climbed so high that a fall was inevitable, but this decline must have been associated with a slackening in orders. It may be significant that the engineering and iron and steel groups—to say nothing of the shipbuilding group which still shows a rise in profits though orders are waning—show increases in stocks and work in progress concurrently with a fall in profits. But a rise in stocks is not always involuntary; the wool group seems to have reached a deliberate decision to re-stock to meet future demands.

Profits as a whole have turned the corner, not with the slick precision of the racing motorist, but rather with the uneasy fumbings of the learner driver. They should accelerate now that a further increase in industrial production has shifted them into a higher gear. But the quickest get-away is likely to be shown by companies in the consumption trades which were badly hit in the recession; profits earned from the sale of capital goods will respond less readily, if at all. The brake on earnings in general, which is likely to be applied by rising costs (especially wage costs), by stiffer competition in the world's markets, or by the backwash of an American recession, may not occur until after the end of March. There should be impressive profits announcements during the next six months, and some further increase in dividends. But these six months will not be a time for counting blessings so much as a time for trying to penetrate the future—which may not be easy.

Safety in the Mines

It is said in the coal industry that on at least one occasion in the thirties a colliery management was convicted of a breach of a particular mining regulation that had in fact been amended out of existence some time before—and nobody noticed. The tale may be apochryphal. But the safety code in British coal mines is still formally based on a 43-year-old statute which in some respects was out of date when it was passed, and which has since become so encrusted with amendments and new interpretations that on many occasions mining practice even an expert may have to guess what the law really says. The Coal Mines Act of 1911 was designed for an industry in which coal was won at the point of the miner's pick and composed of 3,000 mines owned by some 1,500 companies. The Mines and Quarries Bill that came up for second reading in the Commons this week is designed primarily as a

framework for safety regulation in an industry in which 80 per cent of coal is cut by machine, composed of 900 pits with one owner, the National Coal Board—which, incidentally, has its own safety organisation, employing about three times as many officials as the mining inspectorate.

It was the steady change in organisation over 30 years, even more than the transformation in technique, that made the 1911 Act obsolete. Even when it was passed, in the days when a typical colliery company owned one or two mines, the Act's neat division of responsibility for safety in mining between a trinity—owner, agent, and manager—had to be strained to suit the facts. The assumption that an owner bore no responsibility for the technical operation of a mine was always in part a legal fiction—for even the decision that coal shall be worked at a given cost, in a given mine,

is a decision that governs technique. But between the wars, as more and more of the country's coal production began to be concentrated into the hands of large combines that set up common technical services for the mines under their control, the legal convention, under which the single mine manager—captain of the ship—took undivided responsibility for all technical operations within the pit, corresponded less and less adequately with mining realities. With the biggest amalgamation of all, the National Coal Board, the common services proliferated, particularly in connection with the massive technical reorganisation of the industry; and, inevitably, more of the decisions were taken out of the manager's power. Yet these changes in the making of decisions were not accompanied by a re-allocation of legal responsibility for the possible consequences of those decisions. In practice, as Knockshinnoch tragically showed, the effect was sometimes to remove the real responsibility from the manager but to put it nowhere else.

The new Bill goes as far as the Ministry of Fuel and Power could be expected to go in letting mining responsibility fall where the power is exercised. It does not, as has been proposed, adopt any principle that the man responsible for a decision, far up perhaps in the Coal Board hierarchy and far away from the mine where safety may be affected, shall take full responsibility. But it allows the owner—and though the Bill deals with other mines and quarries, these provisions are essentially addressed to one owner, the Coal Board—to appoint specific persons to secure the fulfilment of his responsibilities for safety under the Bill; it leaves prime responsibility with the mine manager "subject to any instructions given to him by or on behalf of the owner"; and further it safeguards the manager by giving him a right to refuse to execute instructions from above until these are confirmed in writing by a specially authorised, and qualified, superior. The legal responsibility is thus still focused on the individual manager; but if his superiors in the line of production management or experts on the technical staff are authorised by the Board to take overriding decisions, they may have to bear the legal responsibility for doing so.

★

This redistribution of mining responsibility is the most important way in which the new Bill brings mining safety laws up to date. To meet the technical changes that have occurred and will go on, it couches many of its main safety rules in terms of principle, leaving the details to be filled in by regulations made by the Minister. This will involve the Ministry, if and when the Bill becomes law, in producing a body of regulations that will reproduce the existing safety code in mining, amended and in some respects extended as it sees fit in the light of modern mining conditions. This delegated legislation—not, by the way, to be subject to Parliamentary prayer, though the Minister is enjoined to consider objections from the persons affected—can

thus be amended at his will to suit the development of mining technique. Parliament, like the mining interests who were consulted last year before drawing up this Bill, is thus being asked for broad approval of a safety code it has not seen yet—and of which, for example, the cost cannot yet be estimated.

The financial memorandum to the bill states "as this is essentially a revision of the existing Acts, it will not result in any foreseeable increase in expenditure." That is true for the Government. For mining operators such as the National Coal Board, there seems no doubt that it will mean a considerable increase in expenditure. The widened legal responsibilities laid upon operators for the prevention of dust and the safeguarding of underground haulage systems, for example, may be costly; moreover, some of the bill's provisions may have the effect of placing the mineowner almost in the situation of an "automatic insurer against any foolishness or mischance that occurs from portal to portal" without specifically saying so.

This bill, which for the first time lumps coal mining in with the other mining and quarry industries of the country, is a bill that ordinarily might be expected to be improved in the committee stage; it is in fact to go to standing committee. But the form in which it is laid out, setting broad principles rather than detailed implications, may make the framing of useful amendments particularly difficult. Moreover, such expert opinion as may be applied to it in committee may be rather lopsided. The miners have many members in Parliament; the colliery managers can probably find a friend or two; and mine and quarry owners outside coal may find a voice to put their points of view. But the largest mineowner in the country, the National Coal Board, has few friends in Parliament; neither its present masters nor its ideological allies are likely to put its point of view where it differs—legitimately—from Government or miners.

The Coal Board was of course consulted on the general principles of this bill, and will be consulted when detailed regulations are being drawn up. It has certainly given no public hints of its own reactions to the bill as published. No doubt it feels itself precluded from doing so, though the point of etiquette is a new one. Yet when expert opinion is brought to bear on so technical a bill, it is anomalous that the largest employer concerned—which will bear, or pass on to the consumer, most of the eventual cost—should be the only interested party unheard. Perhaps those members who as former coal-owners have so long been the most searching and expert Parliamentary critics of the National Coal Board, may once again represent the point of view of colliery ownership upon the safety code suited to British coal mining in the second half of the twentieth century. Nobody doubts the need for the utmost safety in mining; but the country needs to know how the search for greater safety should be combined with efficiency and innovation—and rather more than it has learned so far about the cost.

Business Notes

Blur from Sydney

THE agreed communique issued by the Commonwealth Finance Ministers at the close of the Sydney conference at the end of last week has done a little, but only a very little, to clear up the confusions caused in London by the cabled reports—reports varying apparently from the official but garbled to the semi-inspired and the merely guessed—while it was sitting. This unfortunate result is a sad commentary upon the arrangements made for releases of news or "background" information. In the circumstances, it is perhaps understandable that London officials are now reluctant to comment upon the earlier reports, and instead take their stand solely upon the one communique to which the Ministers formally subscribed. But this attitude simply makes the confusion the more tantalising. For the earlier reports, undependable though most of them undoubtedly were, had seemed to promise some reasonably clear-cut information and some quantitative assessments, whereas the actual communique is not noticeably less vague than such documents customarily are.

★

That, as the first article in this issue emphasises, is unfortunately especially true at most of the points at which the communique approaches the widest issues of sterling area policy—notably the attitude that the Commonwealth would hope to adopt in the event of any considerable intensification of pressure from an American recession. The communique emphasises that the Commonwealth's aim, if there is "some uncertainty about the future" (how masterly an understatement that is), would be to "inspire confidence" and "sustain production and trade and sound development"—but gives no hint at all of the steps it would take in pursuit of these objectives. On a few of the matters it does, however, provide some more intelligible pointers. The most notable of these suggests a shift in the priorities attached to dollar exports. Although the conference is said to have put "earliest main emphasis" on dollar earnings and although it stresses that there must be no relaxation of efforts to achieve a dollar surplus, it affirms that "it is just as important today that we should earn a substantial surplus in other non-dollar currencies." There must be "intensive efforts over the whole field of exports." In its consideration of this and all other efforts to strengthen the balance of payments of the Commonwealth, the conference virtuously puts emphasis upon the importance of realistic domestic policies. It acknowledges that in this context "more remains to be done"; but then says that "our Governments will continue to follow the policies which have served satisfactorily in the past year." Obviously no great change in policy is in contemplation anywhere, though there may be some "adjustments."

Finance for Development

THE one point at which the confusion caused by the earlier reports has been best dispelled is that of Britain's role in the finance of Commonwealth development. The concession that Britain has made in its attitude towards lending in the Commonwealth does not, as some had expected, promise a wide opening of the door to the London market. It is precisely of the limited kind surmised in these columns last week. Approaches by Commonwealth Governments for loans need not now be limited to specific projects but may relate to borrowings "in support of general programmes of development." But these programmes, to be eligible for finance from the London market, will still have to conform to the "general policy of concentrating on the improvement of the sterling area's balance of payments" and will have to be backed by an "adequate contribution" from local resources. In principle, the basic conditions for finance from London are maintained, but in practice the overseas governments will encounter some latitude.

The Chancellor himself, however, has apparently since made it plain that there is no intention to make new cuts within Britain in order to provide the export resources needed to give substance to this "special effort" in Commonwealth finance. That being so, the chances of any substantial expansion of British lending are in fact virtually identical with the chances of expansion of Britain's own production and of at least the maintenance of present competitiveness of British goods. Neither the would-be borrowers nor the British authorities should be under any illusions about the extent of those chances now.

The communique gives no estimates of the target surplus that Britain would like to reach to permit its full participation in Commonwealth development overseas. Nor does it venture upon any forecasts of the sterling area's balance of payments as a whole, so that the estimates that figured in last week's message are left without confirmation; but it has been indicated in London that the surplus for the twelve months to mid-1954 is expected to be about £200 million less than in the previous year. In the communique itself the only quantitative statements relate to the past—to the estimate that in 1952-53 the sterling area had a total surplus of "over £400 million" on its transactions with the rest of the world, compared with a deficit of nearly £1,000 million in 1951-52.

Realism from the Bankers

SEVEN of the annual surveys from the chairmen of the leading banks have appeared during the past week. They reveal, as usual, a wide area of common ground, as

well as some notable differences at particular points. But on one vital issue their unanimity stands out strikingly. Britain's evident progress during the past year, which all of them acknowledge, has not soothed any of them into complacency. On the contrary, in tones of varying urgency, they all utter warnings—necessarily, they are familiar ones—for the future. Perhaps the most austere analysis is that from Lord Balfour of Burleigh, chairman of Lloyds Bank, who in the course of a comparative survey of experience after the two world wars shows that since 1950 Britain's record of production and exports has compared unfavourably with that of other Western European countries. He attributes this lag, and many deep-seated maladies of Britain's economy, to over-taxation and "creeping" inflation—and obviously regards both conditions as still present. The prospect, he says, "must still occasion grave concern until productive investment at home has been greatly increased and until a substantial and enduring external surplus has been built up."

Mr A. W. Tuke, of Barclays, appears to deny the continuance of inflation, yet his warning is hardly less severe. He emphasises that if another series of claims for higher wages for the same work is conceded, "we may be thrown back into a state of crisis caused quite simply by the impossibility of selling our manufactured goods abroad." He also remarks that the progress of the past two years may all be wasted unless the government tackles the problem of its expenditure in a "sterner and more businesslike way." This question of retrenchment—which leads him on to a cogent plea for incentive reliefs in taxation, especially for the middle classes, by way of concessions in earned income allowance—is Mr Tuke's main theme; but, like the wages problem, it also figures in the statements from the other chairmen.

★

The distinctive feature in a vigorous maiden address from Mr D. J. Robarts, the recently elected chairman of the National Provincial, is an uninhibited plea for sterling convertibility "as soon as practicable." Mr Robarts does not regard the uncertainties about America's policies as any sufficient excuse for inaction by Britain—which he exhorts to be a "good debtor," notably by "rooting out the inflationary tendencies which still persist." To secure the vitally needed expansion of exports, he contends, it is above all necessary for British exporters to be able to quote firm prices, without "escalator" clauses; and argues that they cannot unless Britain has a stable system of prices and exchange. Lord Harlech, of the Midland Bank, takes the more general view that convertibility must wait upon America—and he then leaves it rather in doubt whether he would approve such a step even if the wider circumstances were propitious. Again, after surveying the several phases of British monetary policy since 1931, he contrasts the present phase of "partial" internal flexibility, combined with a fixed exchange parity, with the prewar phase of (more or less) fluctuating exchange rates combined with cheap money. Given the uncertainties of the balance of payments, the insufficiency of productive investment and the rising trend of consumption, he regards the recent efforts of the Government to liberalise the economy as "a striking act of faith"—which will not be justified unless Britain exerts "all the energy and resourcefulness that can be mustered" in support of exports and competitive power.

From Exports to Bids

THE problem of exports fittingly plays a particularly prominent part in the statements from two of the three northern banks—the District and Williams Deacon's—whilst Mr A. H. Bibby, of Martins, takes this same problem as the starting point of his reasoned plea for tax reforms to promote incentive. Like Mr Tuke, he asks for a withdrawal of the limit upon earned income allowance; and considers that there will be no "realistic" incentive until the effective top rate of taxation is not more than 25 per cent on incomes of up to £20 a week and not more than 75 per cent on incomes in the higher categories. In a rather disquieting survey of export prospects, Sir Eric Carpenter, of Williams Deacon's, makes the important point that the past year's relatively good showing arises from orders received some time ago; now orders are harder to get. He is convinced that an "era of intense competition" lies ahead. This feeling is plainly shared by Sir Thomas Barlow, of the District, who regards trading conditions as "exceedingly difficult." Sir Thomas's deduction from the experience since 1951 is that "no major group of our exports appears to be really strong enough to hold its own against external pressures"—a conclusion that enables him to reiterate, in slightly altered form, his earlier championship of the manufacturers of consumer goods, including a scrapping of purchase tax. He believes that these goods may be saleable abroad when capital goods are not. It is a tenuous argument; but it is understandable that the textile industries, which Sir Thomas obviously had in mind, should feel strongly both about purchase tax and about the priorities that have at times been given to exports of capital goods.

Amid the wealth of good counsel from the bankers two oddities stand out. In a reference to the vexed issue of "take-over" bids, Mr Bibby admits that some of these are "obviously economically sound propositions"; but he then goes on to affirm that too often the "victims" are companies that have virtuously responded to dividend restraint and have financed expansion by plough-backs instead of by competing for capital in the open market. But—to counter a dubious generalisation by a safer one—if these pre-empted resources are successfully employed to yield their best economic return, the companies never will be, or need not be, "victims" at all, for the bidder will be defeated. But if the assets are not yielding a proper return, then even the bidder who "merely" wishes to take possession of them will generally be performing an economic service to the community. The other oddity comes from Mr Tuke. He is alarmed that the financial pressures upon private businesses (with which almost everyone now sympathises) may give opportunities to a "mere financier" to buy a business and make a "handsome" profit by reselling it. This, he fantastically declares, "is the apotheosis of the spiv, and the damnation of honest business men." Can such ideas be made to flow beside closely-reasoned pleas for incentives, for the freer economy, and for productivity?

Terms of Trade Improve

AFTER four months of stability, the terms of trade bowed out 1953 with one more dip in Britain's favour. A decline of one point to 85 (1952=100) in the index of

import prices, coupled with the maintenance of the export price index at 96, reduced the terms of trade by one point to 89. The fall in import prices reflected mainly a drop of two points to 93 in the index of food imports, owing to seasonally lower prices of fruit and vegetables and lower prices for grain. The favourable movement in the terms of trade, which can take most of the credit for the improvement in Britain's balance of payments, was almost continuous between May, 1951, and May, 1953. During this time the index fell from a peak of 114 to 91. Since then the movement has been slight. It would be unwise to expect the decline to continue; and for the sake of Britain's exports a marked decline might even be undesirable. The fall in import prices has naturally been greatest in raw materials, thanks to the collapse of the Korean boom in commodity prices. The price index for imported raw materials—over one-third of Britain's total imports—fell from a peak of 125 in May, 1951, to 80 in June last year, and has since been almost stable. Between 1952 and 1953 the volume of Britain's imports of raw materials is estimated to have increased by one-tenth to a record high level, but the value, at £1,284 million c.i.f. in 1953, was £426 million lower than in 1951 (when the volume was greater than in any previous year), and £114 million lower than in 1952. Apart from textiles, prices of exports have not dropped far below their peaks. The index of metals and engineering exports, which together account for about half of Britain's export trade, has fallen by only four points from a peak of 103 in December, 1952. The index of "other manufacturers" has fallen by 12 points from a peak of 103 in June, 1952. The index of textiles, which soared to 121 in September, 1951, fell to 91 by November, 1952, but had recovered to 94 by September last year, and rose—perhaps ominously—by a further point in December.

Bigger Coal Exports

BRITISH selling achievements in the export field can be judged by quantities as well as by values. Unfortunately, quantities are not uniformly available over the full range of British exports, but it is possible to pick a number of trades where the upward trend in exports has not been broken. These include coal: exports reached their highest postwar figure in 1953 at just under 14 million tons and the rise of the last three years has been encouraging—from 7.8 million tons in 1951 and 11.8 million in 1952. In post-war trade negotiations coal exports have often been a bargaining counter to be offered where they would bring back the best return in the kind of imports Britain needed. The figures still show traces of that phase. Denmark remained the biggest customer for coal. But Italy has become the second largest and British coal exports to Western Germany have jumped by nearly 1 million tons. Steel has also enjoyed a strong export demand. Exports for 1953 were 2,639,357 tons, compared with 2,498,689 tons in 1952 and 2,602,634 tons in 1951. The modest setback of 1952 was thus more than made good. Exports of refined petroleum, too, pulled more than their weight, rising (in figures not very often used by oilmen) to 1,832 million gallons in 1953, compared with 1,305 million gallons in 1952 and 775 million in 1951, a product of the great expansion in the British refinery industry.

In a further big group of British exports consisting largely of consumer goods the 1953 recovery was sharp and welcome, but the whole of the 1952 setback was not recovered. The woollen group provides a useful example. These exports amounted to £139.8 million in 1953, compared with £123.9 million in 1952, but with £178.6 million in 1951. Quantities are not available throughout the group but in certain main classes, such as carpets, woven worsted fabrics and woven woollen fabrics, the recovery was only partial. The cotton figures were much more disappointing. They showed a further decline in value and, so far as the returns particularise, in quantity too. The group total was £133.4 million, compared with £148.0 million in 1952 and £209.4 million in 1951. The biggest item, woven piece goods, dropped from 864 million square yards in 1951 to 711 million in 1952 and 709 million in 1953.

The Comet under Scrutiny

THE statement that the Minister of Civil Aviation made in the House of Commons about last week's Comet disaster off Elba was intended to stop further speculation about the cause of the accident until the court of inquiry has made its report. It is not likely to have any such effect. Mr Lennox-Boyd confirmed reports that since the wrecked aircraft lies outside Italian territorial waters, the inquiry will be carried out by the British government, and when pressed, said that he agreed with the chairman of British Overseas Airways Corporation that sabotage could not be ruled out as a possible cause of the accident. No amount of pleading that "no more importance should be attached to this particular aspect than to many causes as much, but no more, important" can undo the effect caused by the open references that have been made to possible sabotage during the past week. It appears to be fairly firmly established that an explosion took place inside the aircraft, and the opportunities for such an explosion having been caused by any of the aircraft's accessories are few. Should it be possible to rule these out as the source of the explosion, it would not be the first time that evidence of deliberate sabotage has been found in a civil airliner.

It was with the same object of checking speculation about the soundness of the Comet's structure that the Royal Aircraft Establishment at Farnborough took the unusual step this week of giving an interim report on its examination of the Comet wreck recovered at Calcutta early last year. The wreckage consists of most of the Comet's tail, a number of crumpled pieces of metal that account for a substantial portion of both wings, and a few fragments of fuselage that escaped destruction by fire, including the sorry remains of one seat. These have been sufficient to establish that the two parts of the tailplane came off one after the other, floating down to escape serious damage. After that the wings broke and the fuselage crashed in flames. This confirms the general conclusions reached by the Indian court of inquiry, and goes beyond it by providing conclusive proof that there was no structural weakness in the tail or anywhere in the aircraft. The tail broke because it was subjected to an abnormally, or rather unexpectedly, heavy load that could only have been caused by "conditions in the atmosphere"—that is by the storm. A great deal of

work still remains to be done, but whether it will ever be possible to get to the bottom of the matter, and find out how heavy a load was applied to the tail and how abnormal it was, is doubtful when one critical piece of data, the forward speed of the aircraft, will never be known.

★

The importance attached by the RAE to these conclusions is not merely due to a desire to vindicate the Comet. The risk of structural failure from metal fatigue is the recurrent nightmare of all aerodynamicists concerned with high-speed, high-flying civil aircraft; military designers do not expect their aircraft to last long enough for fatigue to trouble them. Air gusts that apply sudden, intermittent loads to aircraft structures can, after a long period of time, cause this phenomenon of fatigue when the metal fails suddenly and without warning. Its onset cannot be detected by any method yet known. The RAE tests to destruction six complete sets of components of any new aircraft before a certificate of airworthiness is granted so that the life of the components can be predicted in advance, but this is a crude and unsatisfactory safeguard. An attempt has been made to build up a body of evidence by testing to destruction first 60 new Meteor tailplanes, using them as small-scale wing models and accelerating the normal loads experienced in flight, and later complete aircraft structures. The first Comet prototype is now undergoing the same process. The Comet is the first civil aircraft to be subjected to the severe air conditions of high altitude, still largely uncharted territory. On the results of the RAE's Comet tests, therefore, depends much of the future design of civil airliners.

Plans for Road Haulage

THE first sales of road haulage units back to private owners are not going very well, and the British Transport Commission is planning to develop the road services left to it under denationalisation with a proper commercial aggressiveness. Those are the implications of two separate statements on road haulage made this week; since the Transport Commission was concerned with both, the alarm of the private Road Haulage Association is understandable, though its public complaint was merely petulant.

In the first list of road haulage units offered for sale 217 of the 398 units on offer comprised vehicles only; they covered only 690 of the 3,154 vehicles in the whole list. The Commission and the Road Haulage Disposals Board stated this week that effective tenders had been received for 215 of the 217 "vehicles-only" units; the highest tenders had been accepted for 136 units totalling 350 vehicles, all tenders had been rejected for 65 units of some 300 vehicles, and decisions have still to be made about the remaining 14 units for which tenders were put in. So far, one further list of units for sale has been published and a third is expected shortly; but the three together will cover only about 10,000 of the 30,000 state lorries to be sold.

Last year's Act would leave the Commission with 3,500 of the haulage vehicles it now owns even if every other lorry is sold to private owners. The Transport Commission has now announced that it intends to act as a general clear-

ing-house for road services even after the resale is completed, booking orders and passing these to its own or private haulage operators. This is obviously a convenient arrangement during the possibly long-drawn-out period of disposal; whether it will be acceptable to customers and to private operators after that remains to be seen. The Commission plans to operate the vehicles it has left in three groups, as a general haulage fleet, as "Pickfords" for moving furniture and special indivisible loads, and as at present on exclusive hire contracts to particular traders. It has encountered a legal difficulty over the vehicles that it has out on contract: though the Act may require it to sell them, it has no power to compel a trader to give up the contract, or to transfer that contract to any new owner of the vehicles. The Commission's statement referred once again to the "Carter Paterson" network of railway feeder and delivery vehicles, which it cannot retain under the Act. It is discussing with the Disposals Board the possibility that the section of the Act allowing new companies to be set up "to avoid disruption" might be used here.

Green Light for VHF?

THE report of the Television Advisory Committee on the future of sound broadcasting in the very high frequencies will be read with approval by BBC engineers who have ambitions for 51 new sound broadcasting stations on VHF and who are known to favour the use of the frequency modulation system, as opposed to the existing amplitude modulation, for those services. The Committee's majority report is overwhelmingly in favour both of VHF transmissions and of the use of frequency modulation; it agrees with the BBC that while VHF is an "unwelcomed complication" it is necessary to supplement the now inadequate sound services provided on long and medium waves.

In a minority report, however, Mr C. O. Stanley, one of the two radio industry representatives on the Committee, dissents strongly and at some length from the views of his colleagues. He is not wholly convinced even of the necessity for VHF transmissions; as a radio manufacturer he no doubt has in mind the reaction to sets roughly one-third dearer than at present or to the adaptors costing £5 to £15 that would be needed to convert existing sets to VHF. If VHF services are inevitable, Mr Stanley pleads for caution in introducing them, and suggests that the television services should be the first candidate for attention. There are indications that he is far from happy at the decision to allocate the comparatively narrow Band 11 to VHF sound broadcasting, or with the Committee's plan to leave the police and fire services in undisturbed and undisputed tenancy of the most valuable wavelengths on that band. But his major difference with the Committee's report is on the question of FM as opposed to AM. All existing sound broadcasting, including that on present and future television sound channels, uses AM, and Mr Stanley sees no reason to introduce an alternative system. The Committee decided in favour of FM because it was technically more satisfactory, and is also considerably cheaper. The estimated investment involved in providing AM transmitters to give the same coverage as the proposed 51 FM stations would have been £9 million as opposed to £3.5 million for FM and running costs £2 million as against

WOULD YOU EXPECT EXTRA OUTPUT FROM THIS FACTORY?

We do not expect high production or low costs from a ramshackle factory equipped with antiquated machinery turned by animal power or by hand, lacking electricity and piped water, and with no housing available for half its workers.

Yet that is precisely the condition of fully half our farms. Two-thirds of our farms are without electricity. About half our regular farm-workers are without cottages, fewer than half our farm-houses and cottages are supplied with piped water. The standard of farm roads and access to fields is much lower than it should be.

It is not surprising that food production is lower than we want, that costs are high, that many farmers and farm-workers find life a hard struggle for bare existence and that there is a dangerous drift from the land. Yet what is done to help? Farmers farming good land are crippled by super-tax. Those needing capital for expansion are subjected to loans at interest as high as 5%! Is this really the sensible way to get that vital extra food?

The taxation system must be altered. Long-term loans at low interest must be offered. The land is our finest investment. Let us not forget it!

GROW MORE FOOD IN BRITAIN

£800,000 a year; these figures Mr Stanley challenges, but without producing estimates of his own.

Had Mr Stanley not been a member of the Committee, it is doubtful whether these objections would have obtained so full a hearing; even now it is uncertain how far his views are supported in the rest of the industry. His intervention may not prevent the Government from accepting the majority view of the Committee and allowing the BBC to go ahead, as it plans to do once permission is given, with its VHF programme; but it may mean that the programme will be scrutinised rather more closely and that may not be an unsatisfactory conclusion to the debate.

New Ideas for Gatt

A GALLANT attempt to rescue the General Agreement on Tariffs and Trade was launched by France in Geneva last October. The new plan for tariff reduction now has the support of Belgium, Denmark, Western Germany and the Netherlands also, and has now been made public with an explanatory pamphlet. It will need the adherence of all the main trading countries of Europe and North America. Any scheme which offers a hope of breaking the impasse into which the lower tariff plans fell after the unhappy session of Gatt at Torquay in 1950-51 deserves most sympathetic attention. And the French plan certainly offers a new approach.

Early postwar sessions of Gatt made progress by a long series of individual tariff bargains between pairs of countries. The reductions in tariffs at which they arrived were then extended to all through the operation of the most favoured nation principle. By the time the Torquay conference had ended it was clear that little, if any, further progress could be made along that road. The attempt was halted by a number of causes: British reluctance to cut further into the structure of Imperial Preference; America's failure to realise that a high tariff structure and a strong currency required correspondingly greater concessions; but probably the most potent cause was the fact that the low tariff group, of which Benelux is an example, found that they had nothing left to offer to the high tariff countries who would not accept the "binding" of existing low tariff duties as recompense for reductions in their own tariffs.

It is this third obstacle which the French plan tries to surmount. The proposal is for percentage tariff reductions all round in place of bi-lateral bargaining. Tariffs would be reduced by an average of 30 per cent (of their present incidences—not 30 per cent *ad valorem*) in three years by successive annual instalments. The participating countries would have discretion to make the reductions as they chose, but they would be obliged to spread them through the whole tariff and not concentrate them on a few items. To obtain this spread, the tariff of each country would be divided into main categories, such as primary foods, chemical products, etc., and the 30 per cent reduction would be applied to each sector. A ceiling, a floor, and a demarcation line are also proposed for each country. Where the existing tariff level is below the demarcation line a proportionately smaller reduction is required; where it is below the floor no reduction is required; where the duties are above the ceiling they have to be reduced to the

ceiling, but such reductions can be counted towards the 30 per cent cut.

The scheme has the merit of abolishing the bargaining advantage which the high tariff countries hold—a bonus on original sin which hampers negotiations. Under the French plan the highest tariffs suffer the greatest reductions. There are, however, the inevitable escape clauses which may weaken it—one to cover social and economic dangers, another for less advanced countries, and a third exempting purely fiscal duties. Like all previous schemes it will be difficult to adapt it either to the British Commonwealth preference system or the tariff reducing powers of the American Administration, but the chances should be explored.

Engineering Orders on the Decline?

"It is difficult to see from the shrinkage of order books that has occurred how the current rates of production can be maintained," said Mr Macarty, director of the Engineering and Allied Employers' Federation, at the court of inquiry into the engineering wages dispute last week. The federation had already produced figures covering periods of twelve months ending in May 1951, 1952, and 1953: these showed a decline of 8 per cent, in the total volume of orders placed, between 1950-51 and 1951-52, and a further decline of 25 per cent between 1951-52 and 1952-53. A similar comparison for export orders showed declines of 12½ per cent and 20 per cent for the two years preceding May last year. But no later statistics of orders in this form were produced when the inquiry was resumed this week, though the federation mentioned reports from some of its member companies that they had lost export business last year.

Some of the business lost, even last year, was lost on delivery dates; and the mirror-image of such a period of eating into order books as the federation has described is that an industry becomes progressively better able to offer fairly quick delivery. The year 1950-51, too, was one of somewhat hectic demand following the outbreak of war in Korea—and one during which customers were less prepared to rely on alternative sources of engineering products, other than America and Britain. Nevertheless, these somewhat shaded estimates of orders are disquieting, and emphasise the need for more regular statistics of the orders received in various major industries. The Ministry of Supply and the Board of Trade gather regular figures of orders for a number of industries, but very few are regularly published—the shipbuilding industry provides an outstanding exception, and indices of orders have occasionally been published, well out of date, for machine tools and for furniture.

It was argued in some quarters last year that the improvement in delivery dates that could be offered as order books shrink would act as "a kind of servo-mechanism" in enabling the less busy engineering industry to gain once more a better share of the business on offer. The large-scale flow of labour back into the engineering industries last autumn suggested that Britain might at last have been getting some such benefit, while Germany began to digest the orders it had obtained in 1951 and 1952 by offering

better deliveries. Certainly, there has seemed to be a genuine if not entirely general recovery, though the stimulation of home demand by the Budget for the consumer goods that the light engineering industries make may have been partly responsible. Mr Macarty's fears, however, reinforce the need for fuller and more up-to-date information about what business is really being obtained by the engineering industry.

The Atomic Industry

THE first full official account of the development and operation of Britain's atomic energy plants was published this week.* It is an absorbing, and occasionally an exciting record of a subject about which there has been a quite unnecessary amount of official reticence in the past. This book should go a long way towards sweeping away the fog of mystique and mistrust that impedes the layman's understanding of one of Britain's shining postwar industrial achievements.

The atomic industry is run by three men. Sir John Cockcroft, with his headquarters at Harwell, is responsible for the basic research. Sir William Penny, working at Aldermaston, has developed the military applications. The third atomic knight, Sir Christopher Hinton, is the man who has directed the designing and building of the atomic plants themselves, and who is responsible for their day-to-day running. It is this third aspect of the atomic industry that is covered in "Britain's Atomic Factories."

In 1946, Sir Christopher Hinton received what is described as "a brief instruction to produce annually a certain quantity of plutonium, to a given specification, in water-cooled piles," with no more guidance to work on than a handful of atomic formulae. He set up his headquarters at Risley, which has become the design centre for the new industry. The first step was to arrange for the production of the uranium charge to be used in these piles. A poison gas factory at Springfields in Lancashire (near Risley) was converted into a plant for producing pure uranium metal from crude ore. This is a fairly conventional operation,

* Britain's Atomic Factories. By K. E. B. Jay. HMSO. 5s.

The Atomic Factories

Harwell. The research centre for the whole atomic enterprise.

Risley. The design and planning centre for the atomic plants.

Springfields. An ore treatment factory converting crude uranium ore into cast rods of pure uranium metal for use by the Windscale and Capenhurst plants.

Windscale. Two atomic piles converting non-fissile uranium 238 into fissile plutonium 239 for use in weapons or future atomic plants.

Capenhurst. A gaseous diffusion plant converting uranium metal into the gas, uranium hexafluoride, in order to increase its content of fissile uranium 235 atoms above normal proportions. This "enriched" uranium, back in the form of a metal, will be used, like plutonium, either for weapons or atomic plants.

Aldermaston. Development centre for atomic weapons using either plutonium 239 from Windscale or enriched from Capenhurst.

distinguished only by the unpleasantness of uranium as a working material, and by the need for a quite exceptional degree of purity in the finished product. This plant was completed and in operation within 2½ years from the beginning of design work in 1946.

The Great Achievement

THE design and construction of two plutonium piles at Windscale in Cumberland presented the atomic engineers with their first major challenge. There was no time to spare for pilot-scale experiments; for better or worse they had to work out detailed blue-prints with nothing more substantial than laboratory experiments to guide them. Once the basic design of the piles had been settled in 1947 (there were several theoretical alternatives to choose from) it took roughly three years before the piles "became divergent." The total absence of any engineering data about the work that faced these engineers is possibly the most striking feature about the whole atomic enterprise. When the Windscale piles were being planned, the only two plants of their kind in the world were both in the United States, and since the British atomic scientists working in North America during the war had almost nothing to do with their design, there was little that they could contribute on their return home.

Windscale was essentially a construction job. Its main engineering features involved the actual handling of the intransigent materials out of which the pile is built; the design of control gear for inserting and withdrawing the uranium charges that form the raw material for plutonium production; the design of safety controls to shut down this silent furnace should there be signs of it becoming dangerously hot; and the problems concerned with blowing vast quantities of cooling air through the piles (the idea of water cooling had by then been dropped) and drawing it away through 4 15-foot stacks so that the radioactivity collected in the pile could be safely dispersed.

The third big installation, the gaseous diffusion plant at Capenhurst in Cheshire, was a different and far more difficult proposition. The purpose of the plant is to produce "enriched" uranium that contains a much higher proportion of the fissile atoms of uranium 235 than is normal. In order to alter these proportions, which are roughly 1:140, the uranium metal is turned into a particularly virulent gas, uranium hexafluoride, which is pumped through a fantastic system of chambers separated by membranes through which the gas is filtered. The fractionally lighter atoms of uranium 235 move through the membrane a little faster than the heavier uranium 238, so when roughly half the quantity of gas in any one chamber has passed through the membrane the balance is drawn off and re-circulated until what emerges at the end of the process is a highly concentrated form of uranium 235. These gaseous diffusion plants—there is one other in the United States—are among the engineering wonders of the age, operating over immense areas in a total vacuum (a major feat of chemical engineering), performing a process in which individual atoms are the standard unit of measurement, and using one of the most corrosive and formidable materials known to science.

CLEAN COAL

The growing use of mechanical coal cutters and the working of thinner and poorer seams inevitably increase the amount of dirt in the coal that reaches the pithead. Efficient coal cleaning is more than ever essential to prevent trouble at power stations, coke ovens, gasworks and other coal-consuming plants, and to avoid burdening transport systems with millions of tons of rubbish. Simon-Carves have been building coal washeries for half a century. Plants by Simon-Carves are today responsible for nearly half the coal mechanically cleaned in Britain, and post-war plants built abroad have earned handsome amounts of foreign currency.

TYRESOLES (OVERSEAS) LTD

With this achievement behind it, representing an investment of more than £100 million, the Risley engineers now face the task of designing atomic power plants and of planning the future capital investment of the atomic industry. The official account of their work is one of the most important (and but for the size of its type, the most readable) accounts of how an industry sprang, fully grown, from the dragon's teeth sown at Hiroshima.

Private Trading in Tungsten

PRIVATE trading in tungsten, the mineral that is used in the manufacture of high-speed steel and other cutting tools, may be restored in the next two or three months. The most suitable method of reversion is now being discussed between the Ministry of Materials and the trade. The main problem is to arrange for the Ministry to be relieved of its surplus of tungsten, and for private imports to begin again, without appreciably affecting the market. Supplies are still heavily in excess of demand and the Ministry's price, which is based on the European market, has fallen in the last two months by another 80s. to 165s. a unit (of 22.4 lb) for wolframite. But the sudden transfer to the open market of the whole of Britain's requirements, which are now met from official stocks, might conceivably stiffen prices.

It is therefore probable that both the trade and the Ministry will favour a gradual reversion to private buying. Consumers could be allowed to import, provided that they bought a proportion of their total requirements from the Ministry at the market price. Such an arrangement would smack of a "conditional sale," but it would be free of its usual objection, for consumers would be buying an identical article from the Ministry and not, as sometimes happened with plywood, a specification that they did not want. Initially, when consumers were arranging their forward contracts, the proportion of purchases from the Ministry could be high, and could later be progressively reduced as shipments against those contracts were made. The Ministry may, however, have to guard against its prices being talked down. The "market price" of tungsten tends to be somewhat conjectural—especially at present when the market is so thin—and consumers might show a very human inclination to understate the price at which their private purchases were made.

Apart from tungsten, raw jute and jute goods are now the only commodities still in the Ministry's hands, and it is unlikely that they will remain fettered for long. It is surely time for Lord Woolton to announce plans for the winding-up of his Ministry. The number of commodities that have been freed in the last year suggests that this department must be heavily under-employed.

Eastham Oil Dock

THE problem of providing berthing and dock accommodation for the large sizes of tanker that are now coming into service is exercising the minds of many oil

companies, port authorities and dry dock owners, particularly in the United Kingdom. The shape of things to come is outlined by the opening of the new wet dock for large tankers at Eastham, near the entrance to the Manchester Ship Canal. Built by the Port of Manchester at a cost of about £5,500,000, the dock has four berths, varying in length from 725 to 900 feet, with a depth of 40 feet alongside. The entrance lock is 807 feet long and 100 feet wide, which will take laden tankers of well over 30,000 tons deadweight, and the rectangular water area of nearly 19 acres gives plenty of room for turning. The new dock will handle a large volume of oil traffic, both imports of crude oil and exports of refined products, for the area is a huge concentration of oil refineries and installations.

There are several interesting technical features in the construction of the Eastham oil dock, work on which began in November, 1949. The entrance lock is controlled by three all-welded steel caissons, each weighing about 1,700 tons. These do not mitre, like normal lock gates, but slide sideways into recesses in the lock walls, operated by electro-hydraulic machinery; and the recess for the intermediate caisson has been made large enough to be able to be sealed off and used as a dry dock for the repair and maintenance of the other caissons. Culverts connect the dock with the Ship Canal, so that the level of water can be maintained without the need for pumping. An important innovation, so far as safety is concerned, is the provision of "oil weirs" in the dock. If oil should spill from a tanker in the dock a "reverse penstock" goes into action and sucks the surface mixture of oil and water into chambers in the dock walls, where the oil can be separated and reclaimed.

Rival Building Societies

FIGURES now arriving from the big building societies show that 1953 has been a year of most notable advance. Certainly that ought to be so, for there have been greater opportunities for housebuilding in the private sector, which is largely financed with building society money. Steadier interest rates and the steadier value of money may also have given investors a little more encouragement to provide the money that the societies lend on mortgage. But the general advance in building society assets conceals a thrusting race for third place in the movement. In the point of size the Woolwich Equitable has for many years come next after Halifax and Abbey National. Last year if the Woolwich society had been content to stand on its September 30th balance sheet it would have been overtaken by number four—the Co-operative Permanent—whose year ends on December 31st. But the Woolwich Equitable has announced its figures at December 31st too, showing that it was still leading by a short head, though the Co-operative Permanent was coming up strongly.

Both societies show record figures, the rate of expansion in the Co-operative being greater. The total assets of the Woolwich at December 31st were £89,156,102, an increase on the year of £10,382,865—in the three months since the balance sheet the society put on a spurt and increased its assets by £3,202,000. Co-operative Permanent shows total assets at the end of last year of £86,674,335, an increase of £11,928,141. Both societies can claim to have made their

full contribution to house buying by lending record sums on mortgage. The Woolwich advanced £17,516,326 in 1953 compared with £13,424,058 in 1952, while the Co-operative made advances of no less than £19,329,756 compared with £11,442,591.

These big new advances have been covered by net public investment plus the normal repayment of old mortgages in the Woolwich but not quite covered in the Co-operative. The Woolwich shows a rise of £9,456,707 in mortgage balances matched by a rise of £9,910,101 in shareholders' and depositors' funds. In the Co-operative a rise of £11,804,411 in mortgage assets is matched by a rise of £11,638,451 in shareholders' and depositors' balances. Therefore the cash and gilt-edged holdings which are the depositors' first-hand security have been more than maintained in the Woolwich but not quite maintained in the Co-operative which showed an abnormally strong position in the previous year. But the growth in the size of the two societies is affecting the proportion of liquid assets to shareholders' and depositors' money; in the absence of full balance sheets no exact calculation of liquid asset ratios can be made, but the figures so far available suggest that the Co-operative Permanent has reduced its liquidity ratio from the exceptional figure of 17.6 per cent a year ago to 14.9 per cent, and the Woolwich Equitable from 16.7 per cent to 15.9 per cent in the same period.

Declining Freight Rates

FOR the last three months of 1953 the tramp freight index compiled by the Chamber of Shipping has shown a steady decline, ending in December at 71.5 (1952 = 100), some way below the average of 77.5 for the whole year. The only commodity in the index for which freights did not decline compared with the previous month was esparto grass, which barely maintained its level at 70.3. The middle of the year is normally regarded as

the slackest season for voyage chartering, but the rates for all cargoes except esparto and timber were lower in December than in July. The decline from the peak of the Korean war continued throughout the year, although the rate of decline is diminishing. In some trades, however, the fall

in freight rates has been marked. In the first quarter Chinese charterers paid up to 102s. 6d. per ton for cereals to Europe, but lack of trade has since brought this down to 65s. Similarly, rice from China to Ceylon has fallen from 55s. to 46s., and coal from China to Chittagong from 55s. to 32s. 6d. Grain from Eastern Australia to Britain has fallen from 107s. 6d. to 80s., and sugar from Queensland from 137s. 6d. to 102s. 6d.

Activity in the time charter market was much lower than in 1952, and the Chamber of Shipping time charter index for December was 57.8 (1952 = 100) again lower than the average of 60.6 for the year. The ease with which the liner conference has been able to charter vessels for West African round voyages, to help with seasonal cocoa shipments, and the ease with which a spate of vessels has been fixed this week for grain from the Plate to Poland, both point to the continued weakness of the freight markets. But it would probably take a very heavy drop in the volume of trade to bring about any further general fall.

Another Uranium Boomlet

VIGOROUS but selective activity has again surged up in the gold share market. During the past week the London market has been steadily giving Johannesburg a lead and taking shares from Johannesburg. Probably also some of the mining finance houses have let a few shares go at rising prices. Big operators have been active but the imagination of the smaller investor has apparently not been excited. This may be as well for by Wednesday afternoon there were already signs that the market was moving irregularly. Still it has been an active week for South African mines; markings in the week ended last Wednesday amounted to 8,030 compared with 4,629 in the previous week and 1,692 in the corresponding week of last year.

This has not been one of the great shifts which move the Kaffir market as a whole. That kind of movement occurs only in response to a general change of view about the profitability of gold mining as a whole or about the price of gold. This time activity has been concentrated on the mines which are producing or about to produce uranium in conjunction with their gold and on the developing properties of the Orange Free State. It sprang up when the quarterly figures of the Anglo American group for December showed high OFS values and rising uranium profits. With a 7,518 inch-dwt crosscut of the basal reef Western Holdings has established the highest Orange Free State value yet shown from actual underground development. This was coupled with higher uranium earnings from Daggafontein and a first uranium profit of £228,000 from Western Reefs.

The market received its first check from West Rand's uranium profits announced on Wednesday and its second reverse from the colourless results shown by the Johannesburg Consolidated Investment group on Thursday. The "Johnnies" figures disclosed a fall in the payable reef development of Freddie's North. The West Rand statement brought to light a factor which the market had chosen to forget. Uranium profits rose to £204,176 in the

December quarter compared with £186,509 in the previous quarter. But gold profits fell, so that total profits declined from £438,014 to £419,084. The reason is that in order to boost uranium production the company is working gold and uranium ore which would not be payable on its gold values alone. The life of the mine naturally benefits, but some of the gilt comes off the uranium gingerbread.

SHORTER NOTES

The preliminary report of United Steel (for the 53 weeks to October 3rd) confirms all the forecasts made in the company's prospectus. A final dividend of 7½ per cent has been recommended on the £14 million equity capital, which with the interim dividend of 2½ per cent on a capital of £10,194,000 makes the full year's distribution approximately 9 per cent. The group's profits after depreciation have risen from £6,198,712 to £9,111,141. The directors warned investors in the prospectus that the 1952-53 profit was exceptionally high and that in the future a profit of about £6 million would be regarded as satisfactory.

Darwins recently bought from Iron and Steel Holding and Realisation Agency the Sheffield Forge and Rolling Mills company for £420,000. The statement of Mr Frank Thompson-Schwab to this week's extraordinary meeting of Darwins explained that the difference between the buying price and the figure of £275,982 for which Sheffield

Forge and Rolling Mills was nationalised was well covered by profits of over £150,000 retained in the business since 1949.

The price of copper, which seemed to bear a charmed life, has fallen sharply on the London market in the past two weeks. The decline was evidently set off by heavier offerings of lower-grade copper, and then accentuated by news of smaller sales in the United States, and by a not surprising official statement that Chile has been unable to sell all the new production of the American-owned mines in Chile. On Thursday, however, the market closed steady, with cash copper at £220 a ton, a fall of £11 10s. in two weeks, and three months' was £12 10s. lower at £209 10s.

Prices of cocoa, coffee and common teas have slipped sharply off their peaks in the last week. Accra cocoa for early shipment closed on Thursday at 390s. a cwt c.i.f., a fall of 60s. on the week. Brazilian "superior" grade coffee dropped by 88s. to 600s. a cwt, f.o.b. Santos, and then climbed back to about 630s. Clean common broken pekoe fell by 3½d. to 4s. a lb at the London auctions.

In the table of net changes in national savings since the war published on January 9th the figures were shown as being in thousands of pounds. They were in fact in millions of pounds.

Company Notes

F. W. WOOLWORTH. In the equity market it is the next dividend, and not the current one, that counts. This is certainly true when the equity commands a wide market and when there is such an obvious "bull point" as the demise of EPL. No better example of this habit of market behaviour can be found than in the fluctuations in Woolworth's 5s. ordinary stock which followed the company's preliminary report for the year to December 31st.

Having raised the interim equity dividend from 15 to 20 per cent last August, the directors decided to leave the final dividend unchanged at 40 per cent, making the full year's distribution 60 per cent, compared with 55 per cent in 1952. The decision not to increase the final payment confounded the optimists and the market's immediate reaction was to mark the 5s. ordinary stock units down from 66s. 6d. to 64s. But it was quickly realised that this was an unnecessarily churlish response to a preliminary statement that showed that profits before tax had risen by £2,676,498 to £18,976,954 and the 5s. stock units were marked up again to 65s. 7½d.

Over the week-end more consideration

was given to the company's preliminary statement. It was then realised that the bound in the company's profits suggested an increase in sales greater than the average increase in consumption last year. Purse strings were loosened all over the country but seldom with more readiness

	Years to Dec. 31, 1952	1953
Earnings :-		
Net profit, before tax ..	16,300,456	18,976,954
Taxation	10,530,384	12,189,831
Net profit	5,770,072	6,787,123
Tax credits	8,714	494,191
Available for distribution ..	5,778,786	7,281,314
Ordinary dividends	4,331,250	4,950,000
Ordinary dividends (per cent)	55	60
General reserve	750,000	1,250,000
Added to carry forward ..	190,036	516,314

than in the Woolworth stores. It was also realised that EPL took £2,180,000 (compared with £1,475,000) from profits and that, now that the levy is dead, this sum would be added to the current year's net earnings if there is no change in trading profits.

The directors, moreover, have shown

themselves by the dividends declared last year and in earlier years to be ready to distribute a high proportion of net profits to shareholders. Investors could therefore start thinking about the current year's dividends and the 5s. stock units were marked up again, so that they now stand at 67s. 3d., to offer the slender yield of under 4½ per cent. The obvious danger in this is that the financial year still has about eleven months to run. The market has jumped the gun. But has it jumped it too soon?

JUTE INDUSTRIES. There are no surprises in the preliminary statement issued by Jute Industries on the year's trading to September 30th. Trading profits have risen from £960,000 to £1,050,000; the participating preferred dividend has been raised from 14 to 16 per cent; and the ordinary dividend has been increased from 15 to 20 per cent. These dividends together absorb £148,500 from a net profit of £408,352, which compares with a net profit of £318,507 in 1951-52.

The tenor of the chairman's remarks last spring pointed to these increases in profits, though he carefully avoided any definite promise. In his statement, Mr W. G. N. Walker pointed out that in the summer of 1952 the group's trade

and profits were badly hit when its customers reduced their stocks of jute products after the fall in the controlled price of jute. By the beginning of the 1952-53 financial year, however, the "much more realistic level" of prices restored confidence and the group's order books were filling up once again. Throughout 1953, in fact, jute consumption in this country was running at a high level and prices were low enough to deter consumers from searching around for substitute materials.

The jute industry is still enjoying a spell of fair weather, protected from the full blast of Indian competition by governmental controls. And, however much the government tinkers with the machinery of control—as it may do shortly—it will probably still leave the industry

	Years to Sept. 30, 1952	1953
Consolidated earnings :-		
Trading profit	961,774	1,052,570

Preferred dividends (per cent)	14	16
General reserve	212,500	352,500
Added to carry forward ..	Dr. 16,050	4,704

with a measure of protection. It was, perhaps, with these considerations in mind that the market marked up the price of the 10s. preferred stocks to 16s. (to give a yield of 10 per cent) and the 2s. ordinary stock units to 4s. 1½d. (to offer a yield of 9½ per cent).

BRITISH TIN INVESTMENT.

Preliminary figures of British Tin Investment Corporation write the final chapter of one of the most glaring stories of bungled legislation of which Parliament and the Treasury draftsmen can have been guilty. This is an investment company

of £3,300,000 total assets invested mainly, but not wholly, in tin mining. Its portfolio contains one £117,000 company—Tin Industrial Finance and Underwriting—which is a finance company. The £100,000 tail wagged the £3 million dog to the extent that the group became liable to excess profits levy on the whole of its income notwithstanding that the bulk of the income came in dividends from companies which themselves had faced the EPL liability. After the 1952 Finance Act had been enacted nothing could be done; the awkward finance company could be neither liquidated nor sold for it was the status at the time of the passing of the Act which mattered. So in 1952 the group had to provide £106,000 for EPL which was not far short of the total assets of the finance company.

The 1953 Finance Act has now put that matter in order by allowing the company to establish its franked income status over the franked portion of its income with retrospective effect. There has still remained a small liability of £15,420 for EPL because some of the company's dividends come from Malayan registered companies and were not franked. But it has been possible to bring back £90,580 of the £106,000 provided in 1952. That explains why the total dividends for 1953 amount to 30½ per cent compared with 18½ per cent in 1952 although the group profit before tax was £58,492 lower. Taking a line through these peculiarities of the tax law it is fair to regard the 7 per cent second interim dividend declared last September at the time of the tax settlement as being applicable to the 1952 profits and not to the 1953 figures. On that basis the total dividends for 1953 would be 23½ per cent as compared with 25½ per cent for 1952. That gives a fair picture of the fact that the group began to feel the effects of the lower earnings of the tin companies in 1953, but that the full downward adjustment of dividends to the standard implied by a tin price of around £645 a ton has yet to come.

SECURITY PRICES AND MARKINGS

LONDON STOCK EXCHANGE

Next Account begins: January 27th.
Next Contango Day: January 27th.
Next Settlement Day: February 2nd.

ALTHOUGH the market was very active after the weekend, with more bargains being marked on Monday than on any day since May, 1951, prices, except in the Kaffir market, were generally easier. The gilt-edged market was not very active and a few selling orders were sufficient to depress prices a little; on Wednesday and Thursday, however, prices remained firm. But there was a noticeable increase in the demand for Dominion and Colonial issues on Wednesday and their prices began to move up again. Foreign bonds were active and some fresh support was given to Greek and Peruvian issues. Japanese loans, following the lead of Tokyo Electric, also improved but German issues, which had been firm earlier in the week, came on offer on Wednesday.

In the industrial market, apart from the flurry in the shares of the multiple stores on Monday, the tone was dull, and by Wednesday the *Financial Times* ordinary share index had slipped back to 132.5, after touching 133.8 on Monday. Store and textile shares were particularly badly hit; and, on Wednesday, the only group to resist the general drift in prices was the electrical equipment shares. Oil shares were dull at first but took a turn for the better in dealings on Wednesday and Thursday morning. Tea shares lost their recent buoyancy and were marked down when profits taken, following the fall in tea price at the auctions.

The busiest sector of the market was the Kaffir group, and on Monday, 2,536 bargains were marked, the highest number since October, 1949. On that day prices, especially of the OFS issues, closed with widespread gains in spite of a bout of profit making in the afternoon. Prices, however, weakened in early dealings on Tuesday and though a rally was staged later in the day losses were widespread throughout the list. Further losses were reported on Wednesday but on Thursday the OFS developers were in demand again.

* In consequence of official purchases of tender bills in connection with cash subscriptions to the Exchequer Stock Fund in October, it was impossible to calculate the division between tap and tender bills until all the bills purchased had passed their original maturity date.

THE MONEY MARKET

LOMBARD STREET has had a difficult week. Revenue transfers have been exceptionally large, and as apparent bill maturities were only just equal to the week's take-up of new Treasury bills the market had to lean heavily on help from the authorities. This was given through special purchases of bills from the banks on every day except Saturday (when market supplies of credit were just adequate). On Thursday of last week, however, even large indirect purchases were not sufficient to prevent a number of houses from being forced "into the Bank" whilst on Wednesday of this week, during the stringency caused by the banks' callings for their monthly make-up, several houses only just avoided renewed recourse to the Bank.

The rapid inflow of tax revenue was reflected in a £10 million under-allotment at last week's Treasury bill offer of £220 million. The market maintained its bid at £99 9s. 4d. per cent for the 91-day bills on offer, securing an allotment of 43 per cent; its bid of 1d. less for the 92-day bills (attributable to the incidence of Easter Monday) was fully allotted, so that its average allotment was 51 per cent (against 64 per cent). This fall was attributable partly to the under-allotment and partly to an increase of over £16 million in total applications. The offer yesterday was reduced to £210 million, or £30 million less than the corresponding maturities.

The Bank return shows a further reflux of notes of £20 million, bringing the total reflux since Christmas to £97.1 million—slightly more than in the corresponding weeks a year ago and, as then, slightly in excess of the outflow of notes in the five weeks of heavy pre-Christmas spending.

REPORT OF THE DIRECTORS

The Balance Sheet of The Lancashire Steel Corporation Limited and the Consolidated Balance Sheet of the Corporation and its Subsidiary Companies, both as at 3rd October, 1953, are presented herewith, together with the Consolidated Profit and Loss Account for the 53 weeks ended that date.

The Balance of Income after Taxation available to the Parent Company amounts to £1,018,443

	Paid or Provided	Recom- mended
Deduct:		
Dividends paid and recommended—less Income Tax:		
Cumulative Redeemable First Preference Stock 5% for the period	£38,354	
Non-Cumulative Redeemable Second Preference Stock Interim Dividends of 1½% paid 27th February 1953, and 3½% paid 3rd December, 1953, making 5½% for the period	23,787	
Ordinary Stock or Shares		
An Interim Dividend of 2½% paid 27th February, 1953, on £3,462,238 "A" and "B" Ordinary Stock	48,471	
A Final Dividend payable on 8th January 1954, of 9.84816d. gross on each of 4,500,000 Ordinary Shares of £1 each fully paid		£101,559
	£110,612	£101,559
Income retained by the Parent Company	806,272	
Deduct Allocation to General Reserve	800,000	
Unappropriated Surplus	6,272	
Surplus brought forward at 27th September, 1952	637,528	
Surplus carried forward at 3rd October, 1953	£643,800	

On 13th July, 1953, the issued Capital of the Corporation, in accordance with the provisions of the Iron and Steel Act, 1953, became the property of the Iron and Steel Holding and Realisation Agency.

With the agreement of the Agency the Capital of the Corporation was reorganised at an Extraordinary General Meeting held on 3rd December, 1953, as follows:

(a) The £1,400,000 5% Cumulative Redeemable First Preference Stock and the £798,438 5½% Non-Cumulative Redeemable Second Preference Stock were converted into 2,198,438 5½% Redeemable Cumulative Preference Shares of £1 each fully paid.

(b) The £2,992,238 "A" Ordinary Stock and the £500,000 "B" Ordinary Stock were converted into 3,492,238 Ordinary Shares of £1 each fully paid.

(c) The sum of £3,339,924 being part of the sum standing to the credit of the General Reserve of the Company was capitalised and distributed to the Agency by issuing as fully paid 2,301,692 5½% Redeemable Cumulative Preference Shares of £1 each and 1,037,702 Ordinary Shares of £1 each. As a result of this reorganisation the Issued and Fully Paid Capital of the Corporation held by the Agency now consists of:

4,500,000 5½% Redeemable Cumulative Preference Shares of £1 each.
4,500,000 Ordinary Shares of £1 each.

The Dividend of 9.84816d. gross on each of the 4,500,000 Ordinary Shares of £1 each now recommended as a final dividend for the period ended 3rd October, 1953, is the equivalent of 5½% on the £3,492,238 "A" and "B" Ordinary Stock previously issued, and, with the interim dividend of 2½% on that Stock paid on 27th February, 1953, makes a total dividend of 8% on that Stock for the period.

During the year The Wigan Coal Corporation Limited, in which this Corporation holds the whole of the "A" Ordinary Shares, was placed in voluntary liquidation, and a Receiver was appointed for the First Mortgage Debenture Stock of The Broughton and Plas Power Coal Company Limited, of which Stock this Corporation holds a substantial majority.

Capital expenditure for the year amounted to £1,082,330 which includes expenditure on the new Rod and Bar Mill at Warrington and on 18 new Coke Ovens at Irlam, both of which are now in operation, and also expenditure on the 1952/57 development programme now being undertaken for the purpose of increasing the Corporation's steel output. This programme includes an additional steel making plant, two new large capacity blast furnaces to provide the iron for the increased steel output, a blast-furnace gas plant, and ancillary equipment. Extensive rebuilding and the installation of new plant is also to be carried out in the wire drawing departments, particularly in those producing high stress wire.

In accordance with the Articles of Association the Earl of Crawford and Mr. P. E. Holloway retire from the Board by rotation and offer themselves for reappointment.

The Auditors, Messrs. Thomson McLintock & Co., Chartered Accountants, will continue in office under the provisions of Section 159(3) of the Companies Act, 1948.

By Order of the Board,
R. H. CLOSE,
Secretary.

THE LANCASHIRE STEEL CORPORATION LIMITED and Subsidiary Companies

CONSOLIDATED PROFIT AND LOSS ACCOUNT for the 53 weeks ended 3rd October, 1953

NOTES ON THE ACCOUNTS

1. Iron and Steel Holding and Realisation Agency. References to the Iron and Steel Holding and Realisation Agency ("the Agency") should, in relation to periods prior to 13th July, 1953, be read as applying to the Iron and Steel Corporation of Great Britain.
2. Commitments for Capital Expenditure. Outstanding commitments for Capital Expenditure amounted approximately to:

	3rd Oct., 1953	27th Sept., 1952
(a) The Lancashire Steel Corporation Limited	£1,400,000	£320,000
(b) Subsidiaries in the United Kingdom	150,000	235,000
	<u>£1,550,000</u>	<u>£555,000</u>
3. Development Expenditure and Construction Work in Progress. It is not proposed to provide Depreciation on Development Expenditure and Construction Work in Progress until the financial year in which the assets concerned come into operation.
4. Trade Investments. There is an uncalled liability of £20,000 on a Trade Investment of the Parent Company.

5. General Reserves.

	The Group
At 27th September, 1952	£ 4,000,000
Provisions no longer required: Relining, Maintenance and Deferred Repairs	310,000
Taxation	100,000
Amounts set aside for Equalisation of Taxation	90,000
	<u>500,000</u>
Excess of distributions received during year over cost (less distributions received to 27th September, 1952) of certain Trade Investments	303,952
Excess Profits Tax Post-War Refund, transferred from Capital Reserve	51,612
Transfer from Profit and Loss Account	800,000
	<u>£5,655,564</u>
At 3rd October, 1953	<u>£11,344,927</u>
6. Relining and Rebuilding. In arriving at the Manufacturing and Trading Profit the amounts charged for Relining and Rebuilding of Furnaces and Coke Ovens exceeded the actual expenditure thereon by £62,053. For the 52 weeks ended 27th September, 1952, the amounts charged fell short of the expenditure by £27,718.

REPORT BY THE AUDITORS

We report to the Members of The Lancashire Steel Corporation Limited that we have audited the Books and Accounts of the Corporation for the 53 weeks ended 3rd October, 1953, and have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our audit. In our opinion proper Books of Account have been kept by the Corporation so far as appears from our examination of those Books. The annexed Balance Sheet is in agreement with the Books of Account. In our opinion and to the best of our information and according to the explanations given to us the said Balance Sheet, with the above Notes on the Accounts, gives the information required by the Companies Act, 1948, in the manner so required and gives a true and fair view of the state of the Corporation's affairs as at 3rd October, 1953.

We have also examined the annexed Consolidated Balance Sheet as at 3rd October, 1953, and Consolidated Profit and Loss Account for the 53 weeks ended on that date of the Corporation and its Subsidiaries with the audited Accounts of those Companies, certain of which have not been audited by us. In our opinion the Consolidated Balance Sheet and Consolidated Profit and Loss Account, with the above Notes on the Accounts, have been properly prepared in accordance with the provisions of the Companies Act, 1948, so as to give in the case of the Balance Sheet a true and fair view of the state of affairs and in the case of the Profit and Loss Account a true and fair view of the profit of the Corporation and its Subsidiaries regarded as a single undertaking.

MANCHESTER.

LORD BALFOUR OF BURLEIGH ON NEED FOR SAVING

The annual general meeting of Lloyds Bank Limited will be held on February 12th at the Head Office of the Bank, 71 Lombard Street, London, E.C.

The following is the statement by the chairman, the Rt Hon Lord Balfour of Burleigh, DCL, DL, accompanying the report and accounts for the year ended December 31, 1953:

My lords, ladies and gentlemen,—

In March, 1953, the Rt Hon Sir Oliver Franks, GCMG, KCB, CBE, was elected to the board of the Bank. After rendering conspicuous service in the Ministry of Supply throughout the war Sir Oliver became its Permanent Secretary in 1945, but returned to Oxford as Provost of Queen's College in 1946, only to be recalled to Government service in 1948 as our Ambassador at Washington. In June, 1953, his appointment as deputy chairman of the Bank was announced. A great variety of public work in many different fields lay open to Sir Oliver after his return from his notably successful term of office in Washington, and we count ourselves extremely fortunate to have secured his services for our Bank.

I refer with special pleasure also to the appointment of Sir Jeremy Raisman, GCIE, KCSI, in June, 1953, as deputy chairman of the Bank. Sir Jeremy has rendered outstanding service as a director and since his appointment in 1947 as vice-chairman. The Bank is most fortunate in the prospect of Sir Jeremy's services as deputy chairman.

Sir Patrick Hamilton, Bt, has been appointed a director. He brings valuable industrial knowledge and experience to the service of the Bank.

With deep regret I have to record the resignation owing to impaired health of Lord Ramsden, who had been a director since 1942. I am very glad to be able to add that Lord Ramsden will retain his chairmanship of our Yorkshire District Committee.

I regret also having to record the resignation of Sir Henry Upcher from the Eastern Counties Committee, owing to failing health. Mr A. I. Baker, CBE, has been appointed a member of that committee.

I record with pleasure the conferment of the honour of GCVO on Lord Scarbrough and of a knighthood on Sir Reginald Verdon Smith.

Sir John Carew Pole, Bt, DSO, TD, has been appointed a member of our Devon and Cornwall Committee, which has suffered loss by the death of Mr D. M. Petherick.

AMERICAN VISIT

In the spring of 1953 I had the pleasure of visiting the United States and Canada accompanied by my wife. We met every-

where a most kindly and hospitable reception, not only at the hands of banking friends all over North America, to call upon whom was the primary purpose of my visit, but from business and other circles with whom we came into contact.

Wherever I went I was given the opportunity to talk about Britain's economic problems, and while questions put to me were sometimes critical, there was no mistaking the universal interest in and earnest hope for Britain's economic recovery.

PROFIT AND LOSS ACCOUNT AND BALANCE SHEET

Turning now to our profit and loss account and the balance sheet, our profit at £2,083,781 is £119,116 higher than last year, but should the steady decline in our loans and advances persist and the growth of our staff costs and running expenses continue, our future earnings may not be maintained at the present level.

With regard to the increase of 2 per cent in the dividend, making 14 per cent for the year, which members will be asked to approve, I emphasise what I have indicated on previous occasions, that it has been considerations of public policy which have been largely in your directors' minds in recent years in refraining from altering our rate of distribution. But—and especially in our own case, as our reduction was more drastic than that of others—it has become at last a matter of simple justice to the shareholder that we should permit some alleviation of the restraint which we have so long imposed on ourselves and on him.

It is considered desirable to strengthen our published reserves, and a sum of £500,000 has been added to general reserve, making the total of the reserve fund £16,500,000.

An amount of £300,000 has been allocated to reserve for future contingencies.

Referring to the balance sheet, our current deposit and other accounts at £1,204 million show an increase of £35 million.

The principal changes in our assets are increases of £50 million in our holding of Treasury Bills and £4 million in our investments.

In conformity with the general trend of bankers' advances, as a result of the restrictive lending policy our loans and advances show a reduction of £21 million, the largest falls being in the categories of public utilities and personal and professional borrowers.

INDIA, PAKISTAN AND BURMA

There was no pronounced improvement in trading conditions in India and Pakistan during the past year and import and export trade remained at a low level, with a con-

sequent reduction in the activities of the British Exchange Banks. There are, however, some encouraging signs, including an improvement in the prices of certain of the primary products which bulk so large in the economy of both countries.

Industrial development, too, both in India and Pakistan, is proceeding at an increasing pace which in the long run should increase the demand for British exports, which it is essential should be competitive both in price and delivery with those of other European countries; at the same time these developments should give rise to an increase in the demand for banking services.

Our branches in both countries have maintained their position and the high standard of service they have always shown in the past.

In Burma there has been relatively little change, our branch in Rangoon having maintained its business at about the same level; conditions generally, however, militated against any expansion.

My warm thanks go to the officials and staff of all our Eastern branches who continue to give of their best in very trying conditions.

STAFF MATTERS

In my statement last year I referred to the excellent relationship subsisting between the bank and the staff. An overwhelming proportion of our staff are members of our Staff Association which exists for the joint objects of safeguarding the welfare of the staff and of forwarding the interest of the bank.

During the last year we concluded an arbitration agreement with our Staff Association by the terms of which machinery is prescribed for setting up an independent arbitration tribunal in the event of failure to reach agreement upon any matter under discussion between us. Adequate conciliation machinery between employers and employed is an essential part of a proper relationship, and the negotiation of this agreement has been concluded in a most friendly atmosphere.

As shareholders will remember, our Staff College at Eyehurst was opened in the spring of 1948. After five years' experience it is a great pleasure to record its unqualified success. Fifteen senior courses and nine junior courses have been held in which respectively 552 and 323 men have participated, and it is our intention that in future the bulk of men nominated for a senior course will have had the benefit of a junior course beforehand. We are more than satisfied with the results achieved.

The establishment of our Training Centre at Hindhead was mentioned in my 1951

statement. Comprehensive schemes dealing with the preliminary training of new entrants, both young men and young women, are now in full operation and we have reached the interesting stage when some men who passed through the Centre in 1950 as new entrants are proceeding on a junior Staff College course at Eghurst during this spring. The work of the Training Centre is proving its value in the instruction of our new entrants.

Both our establishments are fully residential and have a high standard of training and accommodation. The existence of these centres is a factor in helping us to establish that high standard of performance which is essential if the quality of the Bank's service to the public is to be maintained.

PREMISES

One of our departments which has not previously figured in my annual survey is our premises department, and I think shareholders will be interested to have some details of the excellent work of new building and reconstruction which goes on continuously.

The arrears of maintenance and alterations which had accumulated during the war years were very large, and it was only during 1953 that we were able to overtake the major part and bring most of our premises into good order.

In addition to ordinary maintenance, 22 new offices have been provided either for new branches or for existing branches.

For 1953 the most notable event was the opening for business in October of our completely new building, replacing a war casualty, at Exeter. The building, besides accommodating our Exeter branch and the local branch of the executor and trustee department, also provides accommodation for the district manager of Devon and Cornwall and the area staff controller.

During 1954, apart from maintenance and alterations, we contemplate rebuilding five more branches which were destroyed by bombing and providing new buildings for seven other branches.

THE POSTWAR RECORD

Since it was at the beginning of 1946 that I had the honour of becoming chairman of this bank, my annual statements to shareholders form a series extending over the entire period since the war. On previous occasions my remarks have been devoted mainly to a review of economic developments during the preceding twelve months and of the problems which appeared most urgent at the particular moment. It is my intention this year to take a rather broader canvas and to look at the postwar period as a whole.

When problems of reconstruction were discussed during the war, it was common to place the so-called "transition period" at five years; this was, for example, the interval allowed in the constitution of the Bretton Woods institutions. Perhaps it was unduly optimistic to suppose that the world economy could return to something like normality within so short a space of time; we shall never know, for precisely five years after the end of the war came the invasion of Korea. The peaceful progress of rehabilitation was violently disrupted. The free nations were called upon to assume a vast new burden of defence and rearmament; and the sudden upsurge in commodity prices resulting from the scramble for strategic commodities meant a renewed outburst of inflation.

To a large extent, the economic impact of Korea has now in turn spent itself. The phase of the expansion of armaments has

largely been completed; most commodity prices have returned to something like their early 1950 levels. For a year or more the world economy has been spared any major new disturbances. In spite of the readjustments which are now taking place, North American production remains at a high level. Consequently, world trade also remains at a high level and is even in a state of approximate balance, however precarious. We are, in short, at a moment of slack water. Whether this means that the tide is on the turn, in the world as a whole, from a period of inflation to a period of deflation only the future will show; it is, in any event, a suitable point at which to examine our achievements and failures during the past eight years.

TWO BASES OF COMPARISON

In appraising our record over this period, two obvious measuring-rods present themselves: the record of the corresponding eight years after the first world war and the record of other countries after this war.

Nobody would deny that on this occasion we have in most respects done much better than after 1918. For the great mass of the industrial population the years after 1918 were a grim period of hardship and apprehension; for the ordinary man the past eight years have seemed by comparison uneventful and secure. It has not, of course, been all honey. For some time we all suffered much inconvenience from shortages of various kinds, and it is only now that we are being freed from rationing and other irksome restrictions. In the textile areas there was for a time quite severe unemployment. Nevertheless, taking the country as a whole and the period as a whole, the distinguishing feature has been the high level and stability of employment. The recurring violent crises in the balance of payments have not touched the man in the street, who still remains unaware of the dangers to our national livelihood that threaten a rude awakening.

There is no need to dwell on the horrors of the earlier period, which the older generation must remember only too well. After a short-lived inflationary boom, there came a world-wide slump of devastating suddenness and intensity. In September, 1920, the rate of unemployment among trade unionists was 2.2 per cent; eight months later it was 22.2 per cent. Owing largely to the loss of our former overseas markets and the resultant depression of the export trades—which presented this country with an exceptionally difficult problem—unemployment thereafter seldom dipped below 10 per cent even in relatively good years; over the whole period from 1921 to 1938 it averaged nearly 14 per cent. Worst of all, the upheavals of boom and slump were attended by embittered industrial strife. Indeed, it is symbolic of the contrast between the two periods that, whereas 1926 will be remembered as the year of the General Strike, 1953 will be remembered as the year of the Coronation.

The trend of production has also been more favourable this time. After the first war it was not until 1927—nine years after—that the real national income at last rose above the prewar level. On this occasion, money incomes were, as early as 1946, sufficient to buy as large a volume of goods and services as before the war, though the things people really wanted to buy were often not available and there had been a widespread deterioration in quality. By 1950, industrial production is estimated to have been about one-third higher, and agricultural output about one-half higher, than before the war. Between 1946 and 1952, the output of all goods and services—the real national income—is estimated to have risen

by about 15 per cent and consumption by 5 per cent.

That does not mean, of course, that everybody shared in a rising standard of living. After payment of taxes, the real purchasing power of wage incomes, taken as a group, has risen by about one-third. And that does not take account of social service benefits. On the same basis, the collective value of all other incomes has fallen by something like a fifth or even a quarter. For conditions of creeping inflation, as I have not failed to stress in previous statements, have meant great hardships for those whose incomes are fixed in money terms. Such people were far worse off in 1953 than in 1938.

SUCCESS OF EXPORT DRIVE

Another striking contrast with the post-1918 period is to be found in the success of the postwar export drive. During the war our export trade was virtually closed down in the interests of the war effort; many important markets had to be recaptured afresh; yet in spite of this handicap our exports at their peak have been raised some two-thirds above the 1938 volume. It is true that this result was achieved under exceptionally favourable conditions, with our overseas customers in the main highly prosperous, with the American boom creating an environment of expanding world trade and with German and Japanese competition absent or greatly reduced. Under such conditions we could almost certainly have done better still had our internal finances been handled differently; but the actual achievement is very substantial.

In the years after the 1914 war, exports never recovered to more than about three-quarters of their prewar level. Yet our external position, paradoxically, was more satisfactory after the first war than it has so far been after this one. If exports were depressed after 1918, the need for exports was also reduced, since the world-wide collapse in prices meant a considerable shift in our favour of the terms of trade. With exports well below the 1913 level, we nevertheless managed to achieve in most years a substantial balance of payments surplus. As prices fell the value of sterling rose, until in 1925 we were able to return to the gold standard at the prewar parity of \$4.86. In retrospect, that was no doubt a great mistake—a mistake, that is, of tactics (i.e., the exchange rate chosen) and not of strategy (i.e., the objective of stable rates of exchange). In any case, the unfortunate result of the 1925 decision does not alter the fact that this time we have staggered from crisis to crisis, that our external payments are only precariously in balance, even though the United States has been enjoying a tremendous boom, that our external reserves are quite inadequate and the convertibility of sterling—which is absolutely essential to our long-run salvation—is still a matter of argument and not of fact.

In short, the two postwar periods present a double contrast: after the first war, deflationary conditions at home accompanied by external solvency; after this war, inflationary conditions at home accompanied by serious balance of payments troubles. This is, of course, no coincidence. Every body now realises that an excessive level of home demand is bound to upset the balance of payments. We have not in fact managed to strike the proper balance between inflation and deflation. With just a little more restraint in the demands made upon our limited resources it should have been possible—in spite of the very real difficulties confronting us—to avoid the succession of crises which have left us vulnerable to any small recession in the outside world. As it is, our external reserves—and the value of sterling—have had to be sacrificed.

COMPARISONS WITH EUROPE

Let me now take up my second yardstick and compare our experience with that of other countries since 1945. In appraising our own postwar achievements we must, of course, leave North America out of account entirely when seeking a basis of comparison. By 1946, American production was already double the prewar level and is now about two and a half times the prewar level. The fairer comparison is with the other countries of Western Europe.

At first sight we seem, by this test also, to have done extremely well. According to the statistics compiled by the organisation for European Economic Co-operation, industrial production in the other countries of Western Europe, taken as a group, was as late as 1948 still well below prewar level, while our own was well above it. By 1950, the increase of about one-third in our industrial production compared with prewar was exactly twice as much as that achieved by the other members of OEEC. Unfortunately, these figures include Germany, and if that country is excluded as a special case a very different picture emerges. When that is done, it appears that even in the early post-war years we did very little better than our neighbours across the Channel, and on balance over the whole period to 1950 we just kept pace with them.

PROGRESS ON CONTINENT

What is disconcerting is that in the general progress of Western Europe since 1950 this country seems to have been left behind. Due mainly to the slump in textiles, a number of other countries also experienced some setback in 1952. But the United Kingdom was almost the only European country in which industrial production for 1952 showed no increase whatever on 1950. The Continental members of OEEC, as a group, registered an expansion of 11 per cent between the two years, even if one continues to exclude Germany, where the increase was 28 per cent. By 1952, production in France, for example, showed a substantially greater rise over the prewar level than our own.

In the last few months, it is true, British production has been moving ahead once again beyond the 1951 peak levels, but the rate of increase has been easily exceeded in some other European countries, and is almost certainly not above that for the OEEC group as a whole. Moreover, it is not in respect only of industrial production that we seem in recent years to have been lagging behind. More disquieting still, since 1950 our merchandise exports have declined while the export trade of the other members of the OEEC group has risen—and that is still leaving Germany out of account. The economic resurgence of Germany—assisted no doubt by comparative freedom from defence burdens but nevertheless based upon hard work—is clearly going to confront us with most formidable competition from now on.

Statistics always require careful interpretation and doubly so when used for international comparisons. It may be that the indices of production make insufficient allowance for the preparatory work which has gone into building up our defence effort. But that would not change the general picture. It seems beyond reasonable doubt that a comparison of our recent progress with that of our continental neighbours is discouraging. To what is this result to be attributed? In previous statements I have left no doubt of my view that the source of a great many of our troubles resides in the financial conditions in this country throughout the postwar period: to be precise, in the combination of over-taxation and creeping inflation.

EXCESSIVE MONEY SUPPLY

To a large extent, the economic history of the postwar period is already implicit in three simple figures for the year 1946. Taking the corresponding figure for 1938 as 100 in each case, we arrive at the following indices for 1946:

Money incomes	172
Public expenditure	345
Money stock (i.e., currency and bank deposits)	236

Even allowing for the rise in money incomes, in other words, the burden of public expenditure had doubled; hence the excessive weight of taxation which has been one of the outstanding features of Britain's postwar economy. Secondly, the stock of money had risen nearly half as much again as the level of incomes. The crude quantity theory of money is subject to many qualifications. Nevertheless, there was a reasonable presumption that, if this stock of money were to remain in existence, the real national income would have to increase by something like a third if prices were to be prevented from rising.

Far from being reduced, the stock of money was actually increased (mainly through Mr Dalton's cheap money drive) by a further 16 per cent between 1946 and 1952. Over the same period, the real national income is estimated to have risen by only 15 per cent—but the prices of all goods and services rose by 41 per cent. The potential inflation bottled up by physical controls in 1946 has gradually made its way into the open, as it was, of course, bound to do.

On previous occasions I have shown the manifold ways in which over-taxation and creeping inflation undermine our economy, so that there is no need for me to go over this ground in any detail. The important things are that over-taxation militates against all-out personal effort and extinguishes personal saving, while creeping inflation encourages excessive consumption and impedes the necessary expansion both of our capital goods industries and of exports. These are evils whose effects can only manifest themselves after a certain time but which in the long run will be cumulative. They would be quite sufficient to account for the waning impetus of recovery and for the precarious state of our balance of payments, which are our major national problems.

INADEQUATE SAVINGS

There is ample evidence that the supply of savings in postwar Britain has been quite inadequate to enable us to fulfil our national tasks. The clearest proof is, of course, our inability to achieve a sufficient surplus in the balance of payments to make our due contribution to the development of the Colonies and other parts of the Commonwealth. The latest balance of payments figures, for the first half of 1953, may not be so bad as they look, because in 1952 we were running down stocks and last year were probably building them up again. Nevertheless, it is disturbing to find our payments little more than in balance, with American purchases from the test of the world at boom levels and with the aid of discrimination on our part against dollar imports.

Quite apart from the external balance, however, it is clear that we have been consuming too much of our current production and making too little provision for the future. Over the five-year period 1948-1952 we devoted on the average just over one-eighth of our total output to the formation of capital in all forms. For a group of six Continental countries the lowest comparable figure is one-fifth of total output and the average over one-quarter. In other words, in many European countries the

proportion of resources devoted to building up the national capital has been double that in this country. Nor is it the case that the share of this capital investment going to productive industry (as distinct from housing and the Government sector) has been greater here than elsewhere. It may be argued that what matters is not gross capital expenditure, which includes expenditure needed to maintain existing capital intact, so much as net additions to capital, which alone help to raise the level of future production. This does not turn the comparison very much in our favour; in the six Continental countries mentioned, net capital formation has been on the average half as large again in relation to national income as in this country.

The unhealthy trends in the supply of savings are quite apparent if we examine the nation's capital account for the five-year period 1948 to 1952. We find that, after providing for the maintenance of physical capital, persons and "unincorporated business" (for example, professional people and traders other than limited companies) have been drawing heavily on past savings over the period as a whole. This is probably the most serious feature of the whole situation.

Similarly, the public corporations (which means essentially the nationalised industries) had on the same basis a sizeable current deficit for the period. This deficit, as well as the large net investment of over £1,000 million in these industries, fell to be financed by others. It is clear that the strain on an inadequate total supply of savings has been all the greater because the nationalised industries have fallen so far short of providing for their own capital requirements.

By the same criteria the local authorities had a small current surplus, but only after receiving more than £1,500 million in grants from the central government, which in addition financed most of the local authorities' net investment (mainly in housing) of well over £1,500 million. The combined effect of housing subsidies and rent restriction has been greatly to exaggerate the housing shortage. If rents, in real terms, had not been so sharply reduced, the burden imposed on the national exchequer by the finances of the local authorities might have been appreciably smaller.

Apart from the national exchequer, public and private limited companies alone, taken as a group, had a balance of savings left over after financing their own net investment. This resulted partly from the wide profit margins characteristic of a period of inflation but also from dividend limitation and from the restraints, at times severe, imposed on private investment.

TOO MUCH PLOUGHING BACK

With other sources of risk capital so constricted, it is obviously better that companies should have had ample undistributed profits to plough back than that they should have been impeded by lack of earnings. None the less, the excessive degree to which industry now has to depend on the ploughing back of profits has its drawbacks. There is no guarantee that expanding industries will get their proper share of the available savings, or that new enterprises will be able to find capital at all.

Once a business has made adequate reserve provisions it is much the best thing, under normal conditions, that profits surplus to the requirements of the business should find their way back, via a healthy investment market, to those enterprises that can make the most profitable use of additional capital, and whose growth—or even foundation—may well be frustrated under present conditions. It is clear that no sufficient substitute has been found for the private investor as the source of the risk capital which is the life blood of enterprise, and equally clear that the private

investor cannot provide risk capital on the necessary scale unless he has the income out of which to invest.

Maldistribution of company saving and a resultant slowing down of industrial progress is part of the concealed price that we pay for maintaining conditions in which dividend increases (or, for that matter, tax concessions to the saving and investing classes) are inhibited by fears of aggravating the wages spiral.

HEALTHIER ATMOSPHERE

Some people may feel that the evils we have been discussing are now things of the past, that in the last year or so we have turned over a new leaf. There has undoubtedly been some improvement in the financial climate since the return to more orthodox monetary techniques two years ago. The cost of living has been steady for many months past, though retail prices have yet to reflect to any marked extent the decline in wholesale prices. It has been possible to remove many important commodities from rationing or control without untoward effects; the complete abolition of food rationing is foreshadowed for the near future.

Externally, the balance of payments has been steadily on the credit side for eighteen months. Thanks to the improvement in the terms of trade we have got through 1953 without the usual odd-year crisis. Our sterling liabilities have been greatly reduced and are in fact slightly lower today than in 1945, which means that they represent now a very much smaller real burden than they did then. The reopening of some of the major commodity markets has enlarged the usefulness of sterling to overseas holders and the restoration of other markets is in prospect. Sterling holds firm in relation to the dollar and is no longer quoted in any market at more than a trifling discount.

All this makes a heartening catalogue of improvement. Can we, all the same, claim to have got rid of over-taxation or of creeping inflation? It is some consolation that in spite of the greatly increased burden of defence since 1950 it has been possible to prevent taxation absorbing a still larger proportion of private income; nevertheless, the level of public expenditure, and the dead weight of taxation which that carries with it, remains one of the chief obstacles to our future stability and progress.

RECORD BANK DEPOSITS

As to inflation, it is a matter for regret that the new monetary policies introduced in November, 1951, have not in fact meant a reduction in bank deposits. On the contrary, Lloyds Bank's seasonally adjusted index of deposits has for some months been standing at record levels. Indeed, although the advances of the clearing banks have been reduced by a further £67 million over the past twelve months, fresh governmental demands on the banking system have been responsible for a further rise of well over £200 million in net clearing bank deposits.

The major banking trends since the adoption of the new monetary policies in November, 1951, are summarised in the table below. It will be seen that in the first twelve months, taken as a whole, bank advances were sharply curtailed and at the same time we lost nearly £300 million of gold and dollar reserves. That these movements were not reflected in any contraction in bank deposits was due to very heavy government borrowing from the banking system. During the second twelve months, admittedly, the expansion in deposits can be explained almost wholly by the finance of the very welcome recovery in our gold and dollar

reserves. Nevertheless, I should be happier if we had been funding bank deposits over the past year instead of creating some £200 million of additional purchasing power,

CHANGES IN:

	Nov., 1951 to 1952	Nov., 1952 to 1953	Nov., 1951 to 1953
"Net" Clearing Bank Deposits	+ 1	+219	+220
Advances and Commercial Bills	-277	- 70	-347
Other Principal Assets of Clearing Banks*	+274	+292	+566
Gold & Dollar Reserves	-290	+238	- 52

* In the main, an increase in these assets reflects direct or indirect lending to the Govt. sector.

particularly as it is the official view that the general situation calls for the maintenance of the restrictions on bank lending.

WAGES SPIRAL CONTINUES

It is disquieting that the recent increase in output has gone so largely into personal consumption, that it has brought so little increase in exports to match the rising trend of imports. Moreover, though retail prices have been stable for many months past, the wages spiral continues. One of the basic questions is whether it will prove possible to resist wage demands which are not justified by higher productivity. We must continue to give thanks for the restraint and sense of responsibility shown by most of the leaders of the trade union movement, to which I have paid tribute in previous years; but until the wages spiral is arrested the value of money must continue to decline and we cannot claim really to have mastered inflation.

Finally, it is regrettable that in spite of the greater strength of sterling to which I have referred, yet another year has passed without bringing convertibility visibly nearer. The sterling area, like the world as a whole, has been nearer to dollar balance. Unfortunately, the dollar gap could reappear overnight if the slight downturn already perceptible in American production should develop into a real recession; and our gold and dollar reserves are in no shape to take the strain which that would impose.

The great impediment to convertibility—on which depends the survival of the sterling area and a great deal else—is thus the dangerously low level of our reserves. Experience over the past year has confirmed, what was already apparent, that we cannot hope out of current trading surpluses alone to raise these to a level that would justify the plunge into full convertibility. The only alternative would be some special measure designed to strengthen the liquidity of the sterling area, which implies the co-operation of the dollar countries and above all of the United States. Last year I expressed the hope that this problem would receive the priority it deserved in the programme of the newly elected President. It is the great disappointment of 1953 that those hopes have not been realised.

CONCLUSION

Summarising my analysis of the postwar period, I cannot escape the conclusion that our position must still occasion grave concern. It is true that the acute peril of two years ago has been surmounted. The immediate threat to the stability of the pound sterling has receded. We have a breathing space gained by our own efforts, with the help of some good fortune. But before we can face the future with confidence, two things are necessary, both of them

dependent upon an adequate supply of savings.

First, we need a great increase in the volume of productive investment at home, for we cannot hope to hold our position in world markets unless the rate of modernisation of our industrial equipment at least keeps pace with that of our competitors. Secondly, our overseas earnings must somehow be increased until these are sufficient not merely to pay for our food and raw materials in a good year but to leave a substantial surplus year in year out.

In this context, I recall Mr Butler's statement that an annual surplus of the order of £300 million is needed if we are to play our proper part in the development of the Commonwealth. In fact we are still barely paying our way, even though world trading conditions could scarcely be more favourable. Unless we can do much better than we are doing, even a minor recession in world trade—such as can hardly be avoided at some time during the next few years—would mean a fresh relapse into acute difficulties, while the long-term outlook would be bleak indeed.

INFLATION STILL EXISTS

Can we feel sure that our internal policies are directed above all else to the achievement of these supreme objectives? Notwithstanding the progress made in checking inflation during the past two years, the continuance of the wages spiral is sufficient evidence that inflation persists. We have to ask ourselves whether the last two budgets have after all been sufficiently realistic. Moreover, it is clear that monetary policy in the sense of higher rates of interest alone cannot do everything. If we wish to ensure that the pound maintains its value, that manpower finds its way to the right industries, that increased output goes into exports or capital formation and not into consumption, then an expansion in bank deposits is not the best way to promote those aims. It is the inescapable duty of the Government to put a stop to inflation at its source, which is the additional supply of money derived from Government spending. The question which still awaits an answer is whether any Government can today hope to survive the unpopularity which effective disinflation would provoke.

Without effective disinflation, maximum production of the right things is not within our reach, though in addition it requires the fullest co-operation of capital and labour. To secure this co-operation is more than ever the essential task of management. I take for granted that labour is entitled to a real status of partnership in industry, and I believe that more thought than ever before is being devoted to the best means of making that a reality for the rank and file. Nothing would do more to secure enthusiasm for productivity. But I wish it could be more generally understood by labour that abnormally high profits are a product of inflation just as is the wages spiral which steadily lowers the purchasing power of the pound. One cannot blame the workman for seeking higher wages to compensate for higher costs of living or the shareholder for a similar reaction about dividends. But what must not be overlooked is that profits are not merely the reward of the shareholder; they are also the ultimate source of the risk capital which alone can provide the basis of future industrial progress.

And I am sure the hard fact is not sufficiently realised that no one in the world owes us a living and that, utterly dependent as we are on the sale of exports in a buyers' market, nothing will get us through but tremendous efficiency and the fullest competitive power.

BARCLAYS BANK LIMITED

CAPITAL AND RESERVES ENLARGED BY REORGANISATION SCHEME

AN EVENTFUL YEAR

NEED FOR RUTHLESS CURTAILMENT OF GOVERNMENT'S CIVIL EXPENDITURE

EVILS OF OVERTAXATION

MR A. W. TUKE'S PLEA FOR THE MIDDLE CLASSES

The annual general meeting for the year 1954 of the stockholders of Barclays Bank Limited will be held at the head office, 54 Lombard Street, London, E.C., on February 10th.

The following is the statement of the chairman, Mr Anthony William Tuke, on the report and accounts for the year ended December 31, 1953, which has been circulated to stockholders:

During the past year we have suffered the loss by death of one of our colleagues, Mr Humphrey Brand. A landowner in Sussex, he started his career in the Royal Navy, but in 1925 he joined the bank, becoming a local director first at Lewes and subsequently at Brighton when our two local head offices in those areas were amalgamated. He was elected to the board in 1945, and his premature death has brought great sadness to us all.

We are also very sorry that Mr Lionel Buxton, one of the directors retiring by rotation, has decided owing to his age not to seek re-election. Mr Buxton's early executive appointments in the bank were successively at Fakenham, Yarmouth and Hull, but he is perhaps best known as having been our senior representative in Paris, where he spent the years from 1922 to 1937. With Mr Buxton's retirement from the board there will come to an end a connection with his family whereby a period of 88 years has been covered by only two generations, Mr Buxton's father, Mr Samuel Gurney Buxton, having become a partner in Gurney's Bank in Norwich in 1866 and an original director and vice-chairman of the limited company in 1896 until his death in 1909; his eldest son, Mr Edward Gurney Buxton, having been a director from 1909 until his death in 1929, and Mr Lionel Buxton a director from 1929 until 1954.

Two others of those retiring by rotation, Lord Dudley Gordon and Mr Quintin Gurney, have reached the age of 70, and, as stated in the notice of the meeting, resolutions will be proposed for their re-election or a further term.

We have appointed three new directors during the year: Sir Matthew Drysdale, who has recently completed a term of four years as chairman of Lloyd's, Mr A. D. Marris, who is a managing director of Lazard Brothers and Company Limited, and Mr T. C. Dundas, who is an executive local director of the bank in the Brighton and Lewes district. To all three we offer a sincere welcome as colleagues in our counsels.

I also wish to refer to the impending retirement on pension of our senior general manager, Mr G. F. Lewis, after a lifetime of most valued service to the bank, for many years in the Birmingham area and more recently at head office. Although Mr Lewis is giving up his executive post, I am glad to know that his dynamic energy and encyclopaedic knowledge of banking will not be lost to us, since there are plans whereby we shall retain the benefit of his services elsewhere within the group. On Mr Lewis's retirement there will be some rearrangement

of the duties of the general managers. Mr J. D. Cowen, who has recently been occupied mainly but not exclusively on staff matters, will in future concentrate his attention on general duties, and we are reverting to our former policy of designating one of our general managers as general manager (staff). To this post the board have appointed Mr Austin G. Boyd, who has served as a local director successively at four local head offices in the Home Counties, and Mr Boyd has already taken up his new appointment.

EFFECT OF RECONSTRUCTION SCHEME

Perhaps the most interesting feature of our balance sheet this year is the change in the form of our capital account and the increase in the total of our capital and reserves, reflecting the effects of the reorganisation scheme which has just been completed. In place of an issued capital of £15,858,217, with an approximately equal amount in the reserve fund, we now show an issued capital of £22,914,703, and a reserve fund which, after being augmented by a transfer from profit and loss to which I refer later, now stands at £12,750,000. Thus the two accounts together amount to £35,664,703, as compared with £31,608,217 a year ago.

With the development in banking which has taken place in the last two generations, resulting in a much wider distribution of risk and an increase in liquidity, the question of the proportion of a bank's capital and reserve fund to its liabilities to its depositors has lost some of its old importance. It is perhaps of more practical interest to look at the relationship between the capital and reserve fund of a bank and its premises and trade investments, which certainly ought to be provided out of stockholders' money. Be that as it may, the addition of £4 million which we have recently made is a step in the right direction, even though it bears a very small proportion to our total liabilities to the public. Our scheme has also had the welcome effect of simplifying our capital structure, there now being only one class of stock in the hands of the public, all fully paid and quoted in units of £1. The directors were much gratified by the response made by the stockholders as a whole to the somewhat complicated scheme which was put before them. As was natural, there were certain questions and criticisms, but the voting at the extraordinary general meeting and the proxies received were overwhelmingly in favour of our proposals. I think it would be true to say that the questions and criticisms which reached us were almost wholly founded on a misunderstanding of the respective rights of the old "A" and "B" stockholders. As I set out in the explanatory letter which I sent to stockholders on October 22nd last, the capital of the company was originally in one class. When it was split into "A" shares which were fully paid and "B" shares which were partly paid, the rights attaching to the two portions of the old share remained unaltered, except that the amount which the fully paid

"A" shares were to be entitled to receive for any one year out of the distribution of profits was limited to 10 per cent on the amount paid up on those shares. The criticisms, though relatively very few in number, revealed some variation in content, but in my view they all failed to give full weight to this fundamental point.

DEPOSITS FOLLOW NORMAL COURSE

Our deposits have, during the course of the year, followed a fairly normal course, falling from £1,318 million at the beginning of the year to £1,243 million in March, and then rising steadily to £1,389 million in December, thus showing an increase of £71 million on the year. In so far as banking figures and indeed the figures of one bank alone can be taken as a criterion, it would appear that, although an increase in banking deposits normally implies increased inflation, there has in fact been little or no deterioration in the country's internal finances, when allowance is made for the growth in industrial production and for the surplus in the balance of payments.

INVESTMENTS

On the assets side, there has been an increase in our holding of Treasury Bills, although our support of the Government's funding operation in October had the effect of transferring £30 million out of this category into that of investments. Mainly as a result of this transaction, the total of our British Government Securities has increased from £441 million to £481 million. In accordance with the practice which we established last year, these investments are valued at under cost and below redemption price. The aggregate market price on December 31st was in excess of their book value. Our advances show a slight increase at the end of the year, although during the course of the year there has been some further contraction in bank lendings as a whole which, if other things were equal, would produce a similar contraction in bank deposits. The comparison of these figures is made difficult, and deductions unreliable, by the wide fluctuations in the borrowings of the nationalised Public Utilities, which at the present time are at a fairly low ebb. I have little doubt also that the progressive release of commodities from Government control, even though we may hope that it will have a beneficial effect on prices, will tend to make those who trade in these commodities lean at times a little more heavily on their bankers, a prospect which does not cause us any alarm.

RESERVES STRENGTHENED

There has been a moderate increase in our net profit this year, to which the reduction in the standard rate of income tax has contributed. We have thus been able, not only to increase the total dividend on the old "B" and "C" stocks, but also to set aside £873,119 to bring the reserve fund up to

£12,750,000. Stockholders will remember that as part of the scheme for the reorganisation of our capital we have already paid second interim dividends of 9 per cent on the "B" and "C" stocks, as compared with final dividends of 7 per cent last year, together with a second 5 per cent on the "A" stock; and there is therefore no recommendation in regard to any final dividend on this occasion.

DIFFICULTIES AND ACHIEVEMENTS

The year 1953 has been an eventful one, perhaps the most eventful and in some ways the most hopeful since the war ended in 1945.

First and foremost, the Coronation of Her Majesty the Queen. On this subject many loyal and appropriate words have already been spoken from pulpit and platform and have been written in the daily and periodical press throughout the civilised world. Mere words soon pass into oblivion, but a vivid and happy memory remains, not only to those few who were present in Westminster Abbey on June 2nd, but also to millions who through the miracle of television felt themselves to be actual participants in the sacred and moving ceremonial.

By a happy coincidence there synchronised with this great event the announcement that at last the ascent of Mount Everest had been accomplished, and that one of Her Majesty's New Zealand subjects and his faithful Nepalese companion, members of a British expedition, had succeeded in bringing to a triumphant conclusion a long series of gallant attempts which had hitherto fallen short of the ultimate achievement.

It is unfortunate that not all the parts of the Empire have been able to reflect the happy and high spirit of the Coronation. To speak only of territories with which we are directly concerned through the operations of Barclays Bank (Dominion, Colonial and Overseas), it is very regrettable that in Kenya, where the situation was allowed to get out of hand, the Government have not yet succeeded in regaining full control. More recently, disturbances have been threatened in British Guiana, fostered without doubt by Communist influences, and action has also had to be taken in Uganda; but on these occasions the Colonial Office, perhaps remembering rather belatedly that the business of Government is to govern, have lost no time in asserting their authority to maintain law and order. All these troubles may be described as the growing pains of native peoples, struggling to emerge from their former state of complete dependence on their white governors and encouraged by false friends to adopt violent policies. This discontent is an inescapable result of the impact of education on virgin soil, and we must not be surprised if firm and patient cultivation is needed for several generations before the weeds are choked by healthy growths.

RELAXATION OF CONTROLS

At home there has been a progressive relaxation of food rationing and other controls. It is also an undoubted fact that one now sees men and women walking about the streets with cheerful faces, instead of the depressed and harassed expressions to which we had become so accustomed that we hardly noticed them except when returning to this country from a visit overseas. Can it be that there is some connection between these two phenomena: that it makes the housewife happy to have in the shops a wider choice of nice things even if she cannot afford to buy them all? This theory does not accord with certain political propaganda, but it is nevertheless true, in my belief. Even now we have to wait some months longer for the official release of certain agricultural products, and before we put the dark days of food controls behind us, let us remember that we have already been kept waiting

for eight years for a liberation which has long since been achieved by our defeated enemies.

I am conscious that, arising from the relaxation of controls, there has been some loss of confidence amongst farmers in the past year which I hope and believe is not entirely justified. In the recent past, when markets have been controlled and demand unlimited, farmers have been able to rely with some confidence on a profitable outcome of their operations, subject always to the vagaries of nature which no one can control. The outlook in this respect may be more uncertain in the future than it has been in the past, but in spite of the pressure of the urban vote, I cannot myself see the nation ever again neglecting its agriculture. That would be a suicidal thing to do. There are, of course, very great difficulties in marrying freedom in the agricultural markets with guaranteed minimum prices, and it would appear that this problem needs a great deal more thought. Our methods of marketing have in the past been much neglected, and there must be scope to develop new systems to the mutual benefit of the producers, the various middlemen and the consumers.

IMPROVEMENT IN FINANCIAL AND ECONOMIC SPHERE

To turn to the financial and economic sphere, I would note first of all that our reserve of gold and dollars continues to climb slowly towards the still distant goal of sufficiency: sufficiency, that is, to support sterling as a convertible international currency. Leaving aside the special payment of £63 million which was made on the American and Canadian debts at the end of the year, there was an addition to the reserves of the sterling area in every month of 1953; but the total net addition is no more than £240 million, and in the 1951-52 crisis no less than £133 million melted away in one month. Not that a sufficiency of reserves, when achieved, is clearly recognisable. If confidence were complete and permanent, no large reserve would be necessary. When confidence is lacking, no reserve, however large, can do more than put off the evil day of bankruptcy. In the latter half of 1951, our reserves seemed to be irretrievably launched on the downward path, like Gadarene swine rushing in demonic frenzy to their doom. The herdsmen chose this moment to ask their masters for a vote of confidence. They very nearly obtained it, but their masters decided, by a narrow majority, to dismiss them and engage others, remembering no doubt that a lot of good pigs had been lost in the same way before and concluding that they did not know their job. The new herdsmen could at first do nothing to stop the headlong flight. But after a time the rush was checked, and then stopped; the heads of the terrified animals were turned, and inch by inch, grunting and squealing, they began to climb the hill. By now they have gained quite a lot of ground, and although the top is still a long way off, the path is not quite so rough as it was; but if once their heads were turned again.

For this improvement in our external reserves the authorities deserve the greatest credit. The terms of trade have been helpful to this country beyond reasonable expectation, but, on the other hand, the improvement has been achieved apparently without the use of their most potent though drastic weapon, namely, the power to contract by open market operations the cash base on which the whole inverted pyramid of the country's credit structure is poised. Looked at in retrospect, it would seem that the Government's objective has been limited to preventing any further extension of inflation in the economy, and has not included any attempt to reduce the inflation by positive deflationary action. Some disinflation cer-

tainly took place at the start, but this seems to have been caused mainly by the widespread fall in the price of raw materials, which in its turn caused manufacturers and others who hold stocks in trade to adjust their views as to future market prospects. Apart from this, the position has been held more or less in equilibrium by the re-adoption of the old method of controlling credit, in place of the new heresy of perpetual cheap money combined with elastic physical controls: elastic at least in theory. That the change in policy was bearing fruit was signalled by the fact that the Chancellor felt justified in making a moderate reduction in taxation in his 1953 Budget. The Bank Rate, which had been running at 4 per cent since March, 1952, was in September last unexpectedly reduced to 3½ per cent. In olden days this would have implied that the danger of inflation was past, and even perhaps that trade needed a stimulant to help it to defend itself against a slump. While I can hardly subscribe to either of these propositions, it is at least clear that the reduction may be regarded as evidence that the immediate crisis is past, and that it is now possible to take a longer view of the country's needs. If, however, another series of claims for higher wages for the same work should be conceded, we may be thrown back into a state of crisis caused quite simply by the impossibility of selling our manufactured goods abroad at the resultant higher prices.

When thinking of financial problems and estimating the influence of monetary policy, those of us who work in the City of London must always be on our guard lest we think too much of the market for short term money. The country lives on the products of its industry, and all other interests must, if necessary, be subordinated to the maintenance and improvement of our productive capacity. For this purpose the manipulation of money is important only in so far as it provides the means of keeping the atmosphere healthy for the conduct of business. It is not an end in itself. It is even possible to pay too high a price for the maintenance of the purchasing power of the pound in the world's markets.

NEED FOR GOVERNMENT ECONOMY

The efforts of the Government to improve the atmosphere, in which it has received loyal support from all sections of the community, can however all be wasted unless the question of its own expenditure is tackled in a sterner and more businesslike way. It is true that there exist various statutory checks on expenditure; the Select Committee on Estimates, the Comptroller and Auditor General, the Committee of Public Accounts, and of course not least the Treasury itself, have each their important part to play in restraining extravagance. But it is also true to say that, with the exception of the Treasury, they work at too late a stage to exert more than an indirect or moral influence. The problem must be tackled at an earlier stage, when policy is being decided.

An aspect of this question which is fundamentally unsatisfactory is that there is no inescapable pressure on any Government to economise, in the sense that a board of directors or a private individual has to economise. If it is prepared to forget that there will be a day of reckoning, there is in the last resort no limit to the amount of money that a Government can raise internally by taxation, or, failing that, by inflation. And every item of economy which may be proposed involves inconvenience, or perhaps even hardship, to somebody; and that somebody has a vote and may make a fuss: he may write a letter to *The Times*, or he may get his Member to ask a question in Parliament, and the burden of daily administration

is already intolerable without adding to it. "No, for the sake of saving a few thousands (or even a few millions) it really is not worth it." A specious case can be made out for a reprieve in each separate instance, and there are always people with vested interests who will resist any divesting economy. No one likes, for example, to have the number of men under his command reduced. That applies even to bank managers, who have to find the salaries of their staff if not out of their own pockets at any rate out of their branch profits; how much more to Government servants, whose salaries fall like manna from heaven and who never have to sully their thoughts with base considerations of profit and loss.

We find the same tendency prevalent in the expenditure of Local Authorities. Mercifully, they have no power to create money for their own use, as the Central Government has, but there has been an appalling increase in their expenditure in recent years, and the increased assessments with which we are threatened are not likely to reduce the aggregate demand upon the ratepayers as a whole. At the end of the war the Central Government took away several of the duties of the Local Authorities, but they set them new tasks, making them responsible for quite an important part of the administration of the Welfare State. They were given objectives, particularly under the Education Act, which if they are ever reached, will send the rate burden very much higher even than it is today. Moreover, instead of using the restraining hand which might have been expected in our postwar impoverished condition, the Central Government set standards to the Local Authorities in the carrying out of their work that would never have been dreamed of in prewar days, and which the Local Authorities would probably not have aimed at themselves if their prewar measure of discretion had been left to them. The limiting factor has been not merely the money, but perhaps still more the labour and materials which could be made available. If the standards had not been set so high, a given amount of money spent, for example, on new schools, could have been made to provide more school places, and thus have enabled Local Education Authorities, who have inevitably fallen far short of their statutory obligations in this respect, to make better use of their resources. I believe it is a fact that there has recently been some disposition to permit slightly less elaborate standards of building, and this is a step, if a small one, in the right direction. The fact remains that, with Government encouragement and with the incentive of considerable treasury grants, there has been a tendency for the members of Local Authorities, even though they would exercise proper economy in their own personal or business affairs, to shrug their shoulders and accept a situation of which they cannot really approve but which it is beyond their power to alter.

STATISTICAL FACTS

Let us descend from generalities to the realms of statistical fact, and let us measure the extent of the increase in taxation since before the war. The growth in the burden was clearly set out in a letter, published in *The Times* on July 22, 1953, from Mr Douglas Jay, well known as a writer on economic subjects:

Total Government Revenue as a percentage of current gross National Product		
	1938	1951
United Kingdom	17	32
United States	18	26
Canada	20	24
Sweden and Norway	18	27
Holland	18	28

The United Kingdom, which in 1938 was

at the bottom of the list with 17 per cent, now heads it with 32 per cent, nearly double its own prewar figure and six points higher than the average percentage for the other countries. Mr Jay thinks that "there is not very much in it"; but the monetary value of 6 per cent of the 1952 national income is £820 million, and to me it is a horrifying thought that nearly one-third of the whole national product now falls into the maw of Government. £820 million represents just under half the revenue raised from income tax in 1952-53, or more than six times the yield from surtax, or more than three and a half times the full cost of the reliefs given on income and profits taxes in the last Budget. These figures are so astronomical that perhaps they are not very easy to comprehend. Measured in more mundane terms, and in round figures, an annual expenditure of £820 million would buy a pint of beer a day for every adult man and woman in the country, or alternatively five cigarettes a day with the children included; three-quarters of it would buy a large loaf of bread a day for every man, woman and child.

COUNTRY'S SAFETY OF PRIME IMPORTANCE

We may perhaps be inclined to excuse ourselves by pleading that, when we undertook somewhat hastily the vast new liabilities of the Welfare State after the war, we did not know that we should so soon be faced with heavy additional expenditure for military preparedness. But the safety of our country comes first, and our costly amenities, even welfare and education, must if necessary be curtailed. Let no one dare to say that, if we cannot afford both welfare and safety, then safety must go. Necessary defence expenditure, which properly includes our responsibilities in the Empire, to which I referred earlier, is in fact the most important element in social security, for without national security, social security would be a farce and a fraud. We must not, therefore, found our prospects of reduced taxation on our hopes of reduced international tension; nor when there is any relief from this source must it be used for financing further instalments of state benevolence. It will be needed to be held in reserve as additional taxable capacity in case we become involved in another major war. Difficult though it may be, it is the civil expenditure of the Government, including the Local Authorities, which must be ruthlessly curtailed. If there is to be any further increase in social services, it can only come out of increased production.

TAXATION AND THE MIDDLE CLASSES

There is hardly any limit to the evils which flow from excessive taxation, and if I pick out one for special emphasis it is because I feel that, despite his lip-service, it does not sufficiently interest the party politician. I refer to the plight of the men and women who provide the brains, the enterprise, the leadership, without which the manual workers, however skilled, would be as helpless as sheep without a shepherd. I am thinking first and foremost of those who occupy the executive and managerial posts in industry and commerce, but many others must be included, notably members of the professions, against whom the dice are specially loaded because they cannot possibly make adequate provision out of income for their dependants and for their own old age. There is also the man who, from small beginnings, has by his own skill, industry and thrift, built up a prosperous independent business of his own. Countless businesses of that kind flourish throughout the country today, though their names may be unknown outside their immediate circles. But it is increasingly difficult for new ones to come forward to fill the gaps, because present-day

taxation prevents the accumulation of capital by thrifty husbandry within the span of human working life. Today the only way in which a man who has built up a business can put aside any capital is by selling it, which is exactly what he ought not to do, in the country's interests, as long as he is capable of running it efficiently. This state of affairs also gives openings to an even more undesirable type of transaction, where a mere financier can seek out a business which has been prudently managed, dress it up so that it appears to be more prosperous, and then resell it, walking off with a handsome profit. This is the apotheosis of the spiv, and the damnation of honest businessmen.

BACKBONE OF THE NATION

Membership of the section of the community to which I have referred, who might be described as the middle classes, is not merely a question of breeding and environment, important though those factors are, for better or worse. There is a constant flow from one class of income group to another, and not all of it in the same direction. More especially is this true today when there are so many openings for the intelligent boy to move from primary to grammar school and from grammar school to University. When a man has lifted himself out of the rut, and has made his mark in the world, is he not entitled to enjoy the fruit of his labours? Fortunately for the country's welfare, the mere earning and spending of more money is not everything to him: almost certainly the satisfaction of a good job well done is his first consideration. But he would not be human if he did not ask for some tangible benefit for himself and his family. No self-respecting man likes to think that his wife is obliged to work outside the home to help to keep the home together. Everyone wants his children to have a better start in life than he had himself. Some would define this in terms of education at a public school; but who today can pay the fees of more than one child out of taxed income? Some would define it in terms of foreign travel, an experience particularly valuable to us Englishmen, who are possibly inclined to be a little insular in our outlook; but many parents today find it hard even to pay their children's expenses in the valuable holiday visits organised by the schools. These people are the backbone of the nation and, furthermore, with the passing of the great houses of England, they provide the only channel through which the arts of civilisation can be handed down to future generations. They do not ask for subsidies on their bread and butter, and they would scorn to live in utility cotton wool provided by the Welfare State; they want to be allowed to pay their own way out of what they earn.

From their point of view, which is the greater curse, direct or indirect taxation? Which is worse, to take so much of a man's salary as to leave him with barely enough for his daily needs, or to deduct a much smaller proportion and then say to him: When you spend money on non-essentials, you will have to pay some more taxes to the Government? The question has only to be asked in this form to provide its own answer. It is immaterial whether he buys cigarettes and pays customs duty, or buys petrol and pays petrol duty, or buys one of a host of other inessentials and pays purchase tax; they are all taxes on expenditure, and can be avoided in so far as he is willing to deny himself the pleasures that they represent. He may prefer to spend the extra money on school fees or on a holiday abroad on which there is no tax. He might even decide not to spend it at all, but to put it aside for a rainy day. And there we touch another of the great evils of overtaxation, namely its effect on savings. It is probably true to say

that the net aggregate saving of the salaried and professional workers as a whole today is a minus quantity (even when their life policy premiums are included), if regard is had to the endless stream of realisation of past savings to meet the expenses of illness, education and the like, together with the constant drain of death duties. Taking the economy as a whole, all of these have to be covered by new savings before it can be said that the net balance is a credit one.

FAIR SHARES

If it were decided to make taxation less intolerable for the middle classes, the best

means of giving effect to this decision would undoubtedly be through the earned income allowance, a concession which the Chancellor has already expressed a desire to make. Not only might the proportion be made more favourable, but even more important, the upper limit of this allowance should be removed, so that full benefits are no longer denied to those who most deserve them from the point of view of the services which they render to their employers and through them to the nation.

Some might perhaps feel that this offends against the modern doctrine of fair shares, which seems to have been quietly substituted for the older creed of equal shares. A

doctrine of equal shares is of course sheer nonsense, as the Russians discovered long ago. As far as fair shares are concerned, surely it is fair that he whose work is more valuable to the community should have the higher reward, and surely any other result is unfair.

Our present Government has no need, I think, to suffer from any inhibitions of this kind. It is true that until Government expenditure has been more seriously taken in hand the prospects of major reductions in taxation do not look very favourable; but when you have some money to spare, Mr Chancellor, please give a thought to the middle classes.

WILLIAMS DEACON'S BANK, LIMITED

SPECTRE OF INCREASED COMPETITION ASSUMING CONCRETE FORM

GREATER EXPORTS TO NORTH AMERICA A PLEASING FEATURE

TAXATION SYSTEM PROVIDING INSUFFICIENT INCENTIVE

SIR ERIC CARPENTER REVIEWS THE ECONOMIC SITUATION

The annual general meeting of Williams Deacon's Bank, Limited, will be held in Manchester on Thursday, February 11, 1954. The following are extracts from the statement by the chairman, Sir Eric A. Carpenter, OBE, on the report and accounts for the year ended December 31, 1953:

The proceedings at the annual general meeting will be restricted to the transaction of formal business and I propose to continue the practice of recent years in issuing a brief statement on the bank's affairs in advance of the meeting.

At the end of June Mr J. M. Thomson resigned his directorship and the good wishes of all his colleagues go with him in his retirement. We have elected to the board Sir Edwin Herbert, Mr Rudolf de Trafford, OBE, and Mr W. R. Ballantyne, and to all these gentlemen I offer in your name a cordial welcome.

I now turn to the accounts, from which you will see that deposits stand at £142,727,887, an increase of £2,113,966 on last year's record figure.

On the assets side, the liquid items, namely cash, money at call and discounts, amount in total to £47,894,550 or 33 per cent of our deposits.

British Government Securities have again increased slightly. The course of gilt-edged prices has been much steadier than last year and in general there has been a gradual rise in which, of course, the short dated securities, which form so large a proportion of the investments of clearing banks, have participated. We have again, as always, valued our British Government Securities at market price or less.

Advances at £37,824,129 show an increase of £1,277,325.

Our net profit, after making the usual provisions (which include contributions to staff pension and widows' and orphans' funds and appropriations to contingencies account) is £291,531, an increase of £24,332 on the year. With the balance brought forward of £156,789 this gives a total of £448,320 to be dealt with. After transferring £125,000 to reserve fund we propose to pay dividends of 7½ per cent on the "A" shares and 6½ per cent on the "B" shares and to carry forward £181,523. I feel sure you will agree that these results are very satisfactory.

The rate of dividend on the "B" shares is the maximum applicable to those shares but the rate on the "A" shares has remained unchanged for 24 years and in view of the great changes which have taken place since then we feel that a modest increase in the dividend is fully justified.

During the year new branches have been opened at Mossley and Great Ormond Street, London, and preparations are now in hand to open a branch at Bournemouth during 1954.

The year 1953 has been a memorable one in many ways. The Coronation during the summer and the celebrations which accompanied it were a signal for spontaneous rejoicings throughout the whole of the Queen's domains and the solemnity of the occasion was brought home vividly to multitudes of her subjects by the use of television. The announcement on Coronation morning that a British Commonwealth team had climbed Everest was widely taken as an augury presaging, we all trust, a second glorious Elizabethan age.

In the outside world, the fighting in Korea has died away, the troubles in Malaya have diminished but have been replaced by new troubles in Kenya, and it would appear that only prompt action has forestalled a similar grave possibility in British Guiana. It is to be regretted that the enlightened and disinterested steps taken by the British Government with the object of affording our colonial fellow subjects a greater say in their own affairs should be seized upon by some elements as an opportunity to cause confusion and unrest.

ECONOMIC MATTERS

As far as economic matters are concerned, I think it would be right to say that 1953 has been a distinctly reassuring year. There has been a steady, if not particularly impressive, rise in the gold and dollar reserves, the balance of payments is improving, the terms of trade have continued to go in our favour, the cost of imports has fallen a little but exports have produced the same amount. On the other hand, however, the spectre of increased competition from Germany, Japan and other countries is now assuming a concrete form. I should like to deal in detail with some of these broad tendencies.

The improvement in the gold and dollar reserves which set in towards the end of last year, following upon restrictions on imports here and in other parts of the sterling area, has continued and there has been a modest surplus each month until December when the annual payment due on the United States and Canadian loans caused a deficit. Over the year the surplus has been £240 million, but this includes £110 million of American aid so the margin is still a very narrow one, particularly when it is remembered that it is the surplus of the whole sterling area. It must also not be forgotten that in the last three months of 1951 no less than £333 million was lost and the total reserves even now amount only to £899 million.

At the same time, we have been able, during the year, to relax some of our restrictions on travel and on imports which particularly affect countries in Continental Europe, and Australia has relaxed many of her restrictions on imports which has been of particular interest to the textile industries here.

Our general position is, therefore, so much improved that in many quarters sterling is now a scarce currency, as is evidenced by the recent purchases of it by Brazil, Japan and Turkey from the International Monetary Fund.

Nevertheless, I repeat, the increase in reserves provides no grounds for complacency: three factors must be borne in mind. In the first place, although the most gratifying aspect of the improvement in our own dollar position is that it has been achieved, in part, by an increase in dollar exports whilst dollar imports have been kept at practically the same figure, it must be remembered that this position could be rapidly reversed if an American recession of any importance came about, thus causing a reduction in American imports. Secondly, it should not be forgotten that we have benefited largely by a big improvement in the terms of trade, of which I shall have more to say later. In the third place, we must not overlook the figure of the sterling balances. Whilst the total owing to non-sterling countries has been very satisfactorily reduced since the war and the amount due to the Dominions is perhaps no more than they need for exchange purposes, the total due to the colonies has risen each year and was at

June £1,133 million, or some two-and-a-half times what it was in 1945. Moreover, it is the colonial territories who have such a useful surplus of dollar earnings.

BALANCE OF PAYMENTS

To turn now to the broader question of the balance of payments, the provisional figures for the first half of 1953 make satisfactory reading—following as they do two previous half years in which there was also a surplus. Although the estimated surplus is lower at £81 million than the two previous half years and is, indeed, little enough, it includes a slightly smaller element of American aid at £55 million.

A most welcome feature is the higher level of exports to North America which nearly enabled us to have a surplus on current account with the dollar area exclusive of American aid. In every year since the war we have had a heavy deficit with the dollar area, except in 1950 and 1953.

The overall net surplus of £26 million is, however, a very small part of the total of trade and other payments during the half year of £1,861 million and is less proportionately than the surplus of £148 million out of £3,919 million in the whole of 1952. It is also less than we need and has been earned under favourable conditions which may not always persist, since the terms of trade have moved very much in our favour and there has been a very high level of activity in America. It has, however, come about in part because we have set our house in order, as also have the other countries in the sterling area following our example; indeed, they earned a net surplus with the non-sterling world and so helped to augment the reserves.

AMERICAN ECONOMIC SCENE

Because the surplus earned is not large enough and events in North America have so important a bearing on what happens in the rest of the world, anxious eyes have, of late, been turned towards the American economic scene. The question is being asked, can the high level of activity be kept up now that the Korean war has ended and Federal expenditure is being reduced? There has been a slight drop in activity in the last six months. If it continues to fall, a point could soon be reached at which a more rapid decline would be set in motion by cumulative factors. Fortunately such estimates as reach us indicate that whilst consumer credit may be high and orders in some industries have declined, building is expected to keep up, as will public works, but the doubtful quantity is expenditure on personal consumption.

day, follows, therefore, that economic 38.8. opments in the United States in the still few months of the present year will be depreciated with the keenest attention through- Government trading world. As far as the sterling 30 all the concerned, the United States market 30 the utmost importance for such com- 30 nities as wool, tin, rubber and cocoa, as 30 all, I may add, as for manufactured goods 30 rom this country.

The factor which has helped most to alter our external position for the better has been the improvement in the terms of trade, or the ratio of import prices to export prices. During the year the prices of the things we import have continued to fall, in the case of raw materials quite steeply, whereas the prices of the things we export have remained fairly stable, any fall being quite a small one. The result is that at the end of the year a given quantity of exports would buy 10 per cent more imports than in 1952. This steady improvement in the terms of trade has been going on now for over two years. It may go on even longer but it is well that we should realise that the good

showing of the balance of payments figures is due more to the terms of trade than to any other cause.

Many further steps towards the elimination of controls have been taken during the year. Zinc was decontrolled from the beginning of the year, softwood in November, the copper market was reopened in August and sulphur, sulphuric acid and magnesium have been freed from the end of the year. Cotton, now partially freed, will be completely in private hands by the end of next summer. In the domestic sphere, the abolition of egg rationing in March and of sugar rationing in September have been warmly welcomed and we are now looking forward to the complete abolition of all food rationing this year.

The figures of imports and exports appear, as I have indicated, to give cause for reasonable satisfaction when they are compared with those of the previous year. The total cost of imports has been some 4 per cent less than last year though their volume has been some 10 per cent greater whereas exports have produced the same amount though the volume of them has been slightly higher. Moreover, the trend has been distinctly favourable. Imports in 1952 were falling gradually as the year went on. In 1953, in spite of relaxations, their cost has been fairly steady, month by month, with the volume rising. The tendency was for exports to decline in 1952 as the months went by, whereas the reverse has been seen in 1953, which ended with some very satisfactory figures and a falling trade gap.

One very pleasing feature is the increase in exports to North America, particularly to Canada. North America is a difficult and exacting market and although it takes only an eighth of our exports no market is more important to us. Exporters who try to enter the dollar market deserve every encouragement and I hope that they will make full use of the many Government services which are available to help them and about which there has been some publicity lately. The banks, too, are always ready to play their part.

LOOKING TO THE FUTURE

It is, however, in looking to the future that the prospect is not as bright as appears on the surface. It is true that Australia is expected to remove all restrictions on imports in the New Year, and this will be especially welcome to the textile industries, but South Africa is to cease discrimination in our favour, which means that unless British exports are competitive in price, quality and delivery, dollars accruing to this country from the proceeds of South African gold may well be much less. Competition is becoming keener, particularly from Germany and Japan and the latter is again pressing for concessions in colonial markets. Perhaps the most important point is that the past year's good showing arises from orders received some time ago but orders are now harder to get. It was particularly regrettable to notice recently that a large contract for locomotives for India was lost, not on delivery dates or on credit terms but on price alone. A contract of this nature is inevitably followed by orders for spares, on which there is usually a higher rate of profit than on the original contract.

DISTURBING FACTORS

Even when we look at the details of the past year's figures there are one or two disturbing factors. Far too much of the increase in imports has been in food, drink, and tobacco, in other words in consumer goods, and too little in raw materials for our industries. We have made great strides since the war in exports of machinery, motor vehicles

and chemicals and it is therefore disappointing to see a fall in these during the year. Textiles and clothing have gone abroad in greater volume but produced roughly the same amount and this is made up of rather less cotton goods and rather more wool and rayon.

Productivity, as shown by the index of industrial production, has increased by nearly 5 per cent on last year, and towards the end of the year had exceeded the postwar peak in 1951. This most satisfactory result of the year's work was accomplished, it is true, by a slightly larger labour force and is, of course, in part the fruits of improved methods and of the installation of much machinery since the war.

This increase in productivity is most satisfactory from the general point of view in that it is only thus that the high standard of living of our people can be maintained.

It is when increases in earnings are not reflected in commensurate increases in production that there is need to pause and consider the effect, first on prices and then on the struggle for exports now getting so much keener. This aspect is of major importance today in viewing claims for increased wages generally whatever the merits of individual cases may be. All the reports of the teams who went to the United States testify to the overriding urge throughout industry there to improve and cheapen production so that the share of all parties may be the bigger. We would do well to ponder this.

ERA OF INTENSE COMPETITION

I have said enough, I think, to show that, in my opinion, we are entering an era of intense competition. The resurgence of Germany, Japan and other countries as exporters—taken in conjunction with the rigidity of our economic structure here, clogged and hampered as it is by excessive taxation—pose grave questions for us all. The Budget last April brought a small but welcome reduction of taxation but I should, I think, be failing in my duty if I did not voice the opinion that such reduction will not prove enough to enable this country to face up to the struggle in the export markets which is certainly coming. To us in this country this is, of course, a matter of life and death, and a taxation system which provides insufficient incentive at so many cardinal points is a poor ally for that struggle. I trust that the Chancellor next April will bear these considerations in mind.

That does not mean to say that we are not grateful for the reduction of income tax, the repeal of the excess profits levy from January 1, 1954, and the restoration of the initial allowances on industrial buildings, plant and machinery, and shipping. But, of course, the question of adequate depreciation should be thoroughly investigated, particularly in those heavy industries which require the expenditure of large sums on capital re-equipment. It is quite absurd in a community which must trade to live to have a state of affairs where, quite literally, year by year the tax-gatherer takes a portion of capital. For example, the problem of replacement of tonnage bedevils, under present conditions, the whole policy of the shipowning industry, and if there is an industry more vital to us than that I do not know it.

LESSENING OF ACTIVITY

As the year went on and both here and abroad, in Germany, Holland and Belgium and to some extent in the United States, a slight lessening of activity became apparent, there was a swing away from dear money and Bank Rates were reduced in most countries. Here, a reduction of one-half per cent was made in September, though to a large extent for technical money market reasons,

with the object of making rates more realistic. Although the reduction was treated in some quarters as a signal that all was well with the economy, it was soon made clear by official pronouncements that the object was greater flexibility and more effective control in either direction as the need arose and that no one could foresee in which way the influence of monetary policy would be required in the coming months.

With the disappearance of the sellers' market everywhere, the giving of long credit as a competitive factor has now assumed very considerable importance, in addition, of course, to the other factors of price and delivery. This is only natural in the case of large and expensive installations of a capital nature and following upon reports that Germany in particular was granting very long credit, efforts have been made here to form specialised institutions to give help in the same way to an extent that individual manufacturers could not undertake. This has been applied particularly to ships and aircraft and more recently to the export of capital goods in the engineering and electrical goods industries. In all these cases the Export Credits Guarantee Department has given invaluable help, but it may be that in some quarters there is a mistaken idea that the banks have not done as much as they might. I am sure that if all the facts were known it would be fully appreciated that the banks have played and are still willing to play a very full part right up to the limits which prudence and long experience have shown to be most necessary, and I notice that at the end of the year the German banks found it necessary to issue a warning, indeed a protest, on this subject to their own Government.

COTTON INDUSTRY

The cotton industry has had a year of steadily improving conditions and has shaken off the evil effects of the recession in the previous year. Buyers have been more ready to give orders, some labour has come back to the mills and at the end of the year lengthening delivery dates, particularly in the finishing section of the trade, were the order of the day. Production has gone up appreciably in all sections, though the high rate of output achieved towards the end of 1951 has not been reached, and a great many looms are idle for want of operatives.

Prices of the raw material have been remarkably steady and exports both of yarn and cloth have been higher than in 1952, helped in part by the relaxation of import restrictions in Australia. It remains a fact, however, that though the industry is much sounder financially than it was before the war, we are now exporting only half the quantity of cotton yarn and piece goods that we were in 1938, and competition from Japan and India becomes more severe as time goes on. Owing to the fact that some 75 per cent of the output of the industry is now used at home there is a danger that it will become a net user of foreign currency instead of one of our principal sources of strength in earning exchange through exports. Rayon exports, it is true, have greatly increased, but only by a fraction of the fall in cotton goods.

Much thought is being given to the reorganisation of the Liverpool Cotton Market and to the steps which will have to be taken when the Raw Cotton Commission comes to an end in 1954. This will undoubtedly involve individual mills and merchants in the necessity of holding larger stocks, a matter of no small moment at today's prices, if the mills are to have a steady flow of cotton of the right quality. In this connection we expect, inevitably, to be called upon to help with the finance of our customers' requirements so that they may obtain the raw cotton they require.

The coal position is satisfactory for the

moment, thanks largely to the mild autumn weather, and stocks are as good as a year ago. Production, however, instead of being 2 million tons more than last year, was a million and a quarter tons less, due to a fall in manpower, the second week's holiday and some fall in opencast output. In view of increased mechanisation and the fact that manpower at the face has not fallen, the result is disappointing, as it would be only reasonable to expect an increase, and in the meantime consumers have to pay more for their coal.

There has been a satisfactory increase in coal exports, though price competition is now a serious factor.

Coal is the principal raw material used in the generation of electricity and in the production of gas, both of which increased during the year. At some time in the future it is hoped that most of the electricity produced will come from atomic power stations and a start has already been made experimentally. Hitherto, little or no attempt has been made to obtain natural gas from deep borings, from which source most of the gas consumed in the United States and Canada is obtained. The announcement, therefore, that the Gas Council are to make extensive searches for natural gas is of considerable interest.

IRON AND STEEL

Iron and steel continue literally to forge ahead to ever higher production records. The target of 17,500,000 tons of steel has been exceeded, in other words, over a million tons more has been produced during the year. The output of pig iron, too, has again passed all previous records by about half a million tons and the supply of home produced iron ore has kept up. This is the first full year in which the industry has had the benefit of all the new blast furnaces, coke ovens and other plant, which have been installed since the war, and good use has been made of them.

As a result of the greater production it was possible to dispense with steel rationing in May and in looking to the future such difficulties as are likely to arise come, not from the production side, but from the selling angle. Iron and steel are the raw materials of the engineering and other industries which have begun to feel the effects of competition and light iron foundries in particular have been finding things difficult, particularly in goods for export.

A start has been made in the denationalisation of the steel industry and the first company, United Steel, was successfully sold back to the general public in November. It is, however, fairly obvious that the whole operation is going to take some time.

At the end of the year, reports of increasing activity continued to reach us from all the areas served by the bank and this was particularly so from those districts concerned with the steel and textile industries. This was, not unnaturally, reflected in the bank's own activities which have expanded satisfactorily.

Our trustee department has had a busy year, both at the head office and at the branches in London, Sheffield and Preston, as more and more of our customers are taking advantage of its services. We intend, in due course, to open a trustee branch in Bournemouth.

In conclusion, I should like to take the opportunity of expressing, on behalf of all my colleagues and myself, to Mr King, the general manager, the assistant general managers and to all members of the bank's staff in whatever position they may be serving, our best thanks for their devoted efforts throughout the year and our appreciation of their keenness and enthusiasm.

APEX (TRINIDAD) OILFIELDS

The thirty-fourth annual general meeting of Apex (Trinidad) Oilfields, Limited, was held on January 20th in London.

Mr Malcolm MacLachlan (chairman and joint managing director) said that the production for the year amounted to 2,986,000 barrels of crude oil and 4,058,000 gallons of casing head gasoline.

During the year 77,760 feet had been drilled in continuance of the programme to obtain production and to extend the tested areas of the property. Five wells were completed in the Main Field and six in the South Quarry area.

In the main Synclinal zone three wells were completed, one small and two satisfactory producers. The deep well which was being drilled last year in the eastern part of the Syncline, with the objective of testing whether the Herrera sands of the Penal oligocene structure extend under the company's field, was finally sunk to a depth of 14,889 feet, some 800 feet deeper than the previous record for the Island.

A further deep well was programmed to commence in the current year in the central section of the Syncline in addition to the deep well in the South Quarry area which was originally planned for last year.

The estimate given to members in 1944 of the total ultimate oil production from the then proven areas was proving conservative, and in addition the company had a welcome contribution from the developments in the Synclinal zone. The Trinidad management now estimated that, despite the production in the meantime of over twenty-seven million barrels, the further recoverable production should exceed the amount which was estimated to be available in 1944.

The report and accounts were adopted.

RAPHAEL TUCK & SONS, LIMITED

IMPROVED GENERAL TRADING

The fifty-second annual general meeting of Raphael Tuck & Sons, Limited, was held on January 21st in London, Mr Desmond Tuck, chairman and managing director, presiding.

The following is an extract from his circulated statement:

That we are late in presenting the report and accounts is due to the fact that I felt stockholders were entitled to up-to-date information as to the current trading position. To give this we have waited for the figures of the first six months of the present year. I am glad to state that these indicate a distinct improvement and that taking these into consideration with our prospects for the ensuing six months the board has declared an interim dividend of 2½ per cent for the year ending April 30, 1954, on the Ordinary Stock.

It has been quite a revelation to those who have visited our works to see for themselves what is involved in the production of Greeting Cards, Children's Books, Postcards, Calendars, Table Paperware, Viscose and Metal Foil Wrappings, and general colour printing, the work of which is carried out in freehold premises which are the property of the company and of its stockholders.

With these resources at our command and with such further up-to-date mechanised methods of production we hope to be able to instal, I cannot but look forward to the future with confidence.

The report and accounts were adopted.

MIDLAND BANK LIMITED

ORGANISATION'S WIDESPREAD RAMIFICATIONS

URGENT DEMAND FOR EXPORT EXPANSION

HEALTHY NATIONAL ECONOMY REQUIRES FLEXIBILITY IN MONETARY SYSTEM

LORD HARLECH ON EVENTS OF PAST YEAR

The one hundred and eighteenth annual general meeting of Midland Bank Limited, will be held on February 16th at the head office, Poultry, London, E.C.

The following are extracts from the statement by the chairman, the Rt Hon Lord Harlech, KG, PC, GCMG, on the report of directors and balance sheet for the year to December 31, 1953:

The annual report of directors and balance sheet appears this year in a new format. It contains, as is now usual, some additional material which it is hoped will interest shareholders and other readers.

Comparison of our latest balance sheet with that for December, 1952, shows much the same features, on a somewhat larger scale, as those to which I called attention a year ago. The total of deposits is £75 million higher—a rise of 5½ per cent as compared with 1½ in 1952. The expansion of purchasing power in the hands of the public, recorded by the collective returns of the clearing banks and by the official estimates of currency in circulation, has reflected a further growth of the national income and of the turnover of business as a whole. The authorities have continued to rely upon the exercise of restraint in non-governmental borrowing from the banks, and the enlargement of deposits has been accompanied by an increase in the banks' holdings of Government debt. As the policy of the Bank of England has been to provide an ample cash basis for this expansion, the banks themselves have become still more liquid, notwithstanding the Government's debt funding operations during the year.

In our own bank, as will be seen from the balance sheet, the holding of Treasury bills has gone up by £41 million, and of investments by £39 million, while advances to customers—representing non-governmental borrowing—have declined by £20 million. Our "liquidity ratio," that is the percentage of deposits which is covered by cash, short loans to the money market and bills maturing day by day, has risen by about 2 per cent to 38.8. At the same time we have strengthened still further the safeguards against capital depreciation of our investments in British Government securities. To-day more than half the total have final maturity dates within the next five years, and nine-tenths within 10 years.

The further decline in advances calls for explanation. In part it results from an accidental factor—the irregular rise and fall of short-term borrowings by the nationalised gas and electricity undertakings to finance their capital expenditure in anticipation of periodical issues of stock to the public. In part, too, it reflects the official policy of restraint in the provision of finance for personal and professional purposes. Even so, the fact is that accommodation to industry and trade has on balance diminished over the year—and this at a time when the Government has been reducing controls and turning back into private hands the trade in a number of commodities.

This is a process which might have been presumed to necessitate heavier borrowing from the banks for carrying on production

and distribution. On the other hand, the demand for finance has been eased by the continued downward movement in prices of most basic materials. Further, as the postwar phase of irregularity of supplies of raw materials and components has come to an end there has been less anxiety in industry to accumulate and carry stocks. Another factor contributing to the increased financial liquidity of business as a whole has been the considerable volume of new capital issues and other arrangements for augmenting the permanent resources of many undertakings. Doubtless any change towards an upward trend of primary prices would lead to a review of business policy in respect of stocks, which might well be reflected in a renewed demand for advances. Against that possibility there is at present an ample margin for future expansion of advances in response to needs that fall within the range of official policy.

REASONS FOR DIVIDEND DECISION

It will have been noted that the net profit of the bank for the year just ended is about the same, after allowing for the change in the standard rate of income-tax, as for the previous year. The full effect of the lowering of the Bank Rate, with associated changes, was not felt until near the end of the year, as bills already held in our portfolio ran off and had to be replaced at lower yields. Now, however, the downward movement is exerting heavier pressure on our earning power. The volume of work continues to grow, and the upward trend of banking costs has not yet come to an end. Further, the risks attendant upon the lending side of our activities must be expected to increase as business is carried on more and more in the circumstances of a free economy enjoying less of the protection afforded as one effect of Government controls and intervention.

In recommending an unchanged rate of dividend for the past year your directors have had in view all these and other factors. They are of one mind in believing that our first concern, now as always, must be the security and strength of the bank's financial position in the interests of all concerned, more particularly our depositors. Hence the substantial appropriations that are again being made to inner reserves. They recall that our own rate of dividend has for many years been higher than those paid by most other banks. They would remind shareholders, too, of the heavy burden of profits tax where profits are distributed as dividends. In our own case the dividend at the rate of 16 per cent works out at £2,425,000; but owing to the methods by which income tax and profits tax liabilities are calculated the dividend and the taxes related to it actually absorb £3,464,000.

During the past year we have again had opportunities of watching the progress of our two affiliated banks, the Belfast Banking Company and the Clydesdale and North of Scotland Bank, and I have been impressed by the efficiency and enterprise with which they strive, with success, to maintain their high standing in their respective spheres of activity. Our Executor and Trustee Com-

pany, too, is making further headway in its own specialised branch of business, which is closely ancillary to our regular banking operations. In all three organisations I have been glad to notice, as in our own bank, the outstanding quality of the staff and, in particular, the promise to be found among the younger members that the standard we have set ourselves will be fully upheld. I would like to record with pleasure the establishment of a new Midland-Bank Staff Association.

REQUIREMENTS OF BANKING PERSONNEL

In the light of what has just been said about the risks attendant upon our business, it is clear that, in banking no less than in industry and trade, there never was a time when higher standards of managerial ability and judgment were called for than to-day. Technically, banking is a highly skilled service; but much more is needed than technical knowledge and reliability if the work is to be well done. In banking, the proportion of posts calling for the exercise of personal responsibility is exceptionally, perhaps uniquely, high. Hence one of the major problems of administration is to secure throughout a widely scattered system the influence of the highest quality of managerial capacity at the centre, without frustrating the development of similar capacity throughout the organisation. We believe that the structure of our bank is well adapted to the development of this quality, for it assures to customers the application to their problems of the best judgment and managerial consideration available in the whole organisation, rather than restricting them to the attention of personnel available in the particular branch or region. Many business people and private customers are known, moreover, to appreciate the advantage of consideration of their needs under a system that combines the benefits of close individual understanding of their requirements with the widely experienced judgment that is available at the top levels of managerial responsibility.

INFORMATION SERVICES

Describing the services of the bank as a source of information, the statement continues:

The head office intelligence department provides general economic and financial data to meet requests from an ever-widening range of individuals, public departments, educational and other bodies in this country and abroad. The quarterly *Review*, the mailing list for which is constantly lengthening, has the distinctive quality of being written wholly within the bank.

Another section of the bank's organisation, with similar but rather more specialised functions, lies within the overseas branch at Old Broad Street, which, through its foreign trade information department, has developed since the end of the war its own particular range of services designed to help forward the efforts of industry to expand its activity in international trade. Apart from the routine handling of overseas status inquiries, much of the work in this field is concerned

with providing introductions, to be used by correspondence or on personal visits, for business men desirous of establishing representation in this or that country or making other forms of contact whereby overseas trade in their particular products can be enlarged. This is a two-way traffic, arising on the one hand from the initiative of British exporters and importers and on the other from traders in all parts of the world seeking, through their own banks, business introductions in this country. In the course of dealing with many thousands of these inquiries the department acquires and makes accessible a wide and detailed knowledge of channels of trade in every sort of product, as well as a fund of up-to-date information about regulations of all kinds, throughout the world, affecting British exports.

PROGRESS OF THE NATIONAL ECONOMY

I turn now to a review, which must needs be highly compressed, of the course of affairs in the national economy. During the past year industrial production has recovered the ground lost in 1952, and latterly it has been running well above the high level of 1951. Only in a very few sections is any difficulty experienced in maintaining a continuous inflow of raw materials. Against the encouraging rise in manufacturing output has to be set a further growth of personal consumption, so that it can still be argued that there is need of allocating larger proportions of the national resources to new capital investment, particularly in the improvement of industrial equipment, and—in present circumstances an even more urgent demand—to the expansion of exports.

This last requirement, indeed, is critical. Lower import prices have contributed to the maintenance of a surplus on the current balance of payments, but it is doubtful whether the net result for the year just ended will turn out to be as gratifying as for 1952. It seems that the rise in our gold and dollar reserves, limited as it is, is being achieved at the cost of an enlargement of Britain's short-term sterling liabilities and a change-over to recurrent deficits in trade with Western Europe as settled through the European Payments Union. There is no sign of the early establishment of a sufficient surplus on the balance of payments to finance new investment in British territories overseas and other parts of the world.

The facts being as they are, it is a striking act of faith that the Government has taken a number of steps towards liberalisation of trade, credit and investment. If this act of faith is to be justified by results the need is manifest for exerting all the energy and resourcefulness that can be mustered in support of export trade, and in particular for improving Britain's competitive position in the markets of the world.

In the past year or two we have witnessed a change, in favour of the buyer, in world markets and a rapid revival of the productive and selling power of countries which had until recently been only small participants in world trade. It was perhaps a natural consequence of the struggle for economic recovery that all sorts of special devices should have been brought into use, particularly in European countries, for promoting export trade by, in effect, indirect subsidies. The Federation of British Industries is to be congratulated on its preliminary success in its attempt to remove such unequal inducements, which tend to add uncertainties and instability to the basis of competitive trade. But the possibility of their modification or removal by international agreement should not blind us to the ever-present need of achieving and maintaining the highest standards of quality and adaptability of products, competitive pricing, and the fulfilment of the shortest possible delivery dates. On a national

plane, moreover, we need to make available, through the creation of a healthy surplus of production over consumption, the capital resources to back up the efforts of industry in technically proficient production and in active salesmanship in markets throughout the world.

The restoration of convertibility of the pound sterling stands as a central objective of official policy, though its attainment does not perhaps rank so high in unofficial estimates of near-at-hand achievement as it did a year ago. It seems that any further developments await the emergence of more definite lines of United States Government policy than have yet appeared. It would be a thousand pities if, when American trade and currency policy has become clearer, the then existing international position of this country should be found to hamper the exercise of United Kingdom leadership towards a fuller realisation of the world's capacity for orderly expansion of its manifold resources for the benefit of all nations.

Reverting to our domestic situation, the records of the past year have been characterised by greater steadiness of prices than in previous years. Prices of finished goods, however, have been steady rather by virtue of the further decline in prices of basic materials than of any cost economies within industry itself. Accordingly the apparent equilibrium must be regarded as precarious, and the needs of the balance of payments make it imperative that costs of production and distribution should be freed from any further pressure of internal inflation.

SIGNIFICANCE OF RECENT MONETARY CHANGES

Reference has been made to the immediate effects upon the banking position of the lowering of Bank Rate and the associated changes in other rates which took place last September. In a long-term context it might be argued that this was perhaps the most significant economic event of the year. I say this not because it seems to have been interpreted rather widely as indicating a change in current monetary policy. On the contrary, one of its unusual accompaniments was a clear official warning that there was no intention of making credit more readily available; and indeed there was little or nothing in the economic situation itself to warrant a stimulus to the demand for credit. It was not an "easy money" move, though it did mean, for both public and private borrowing as a whole, cheaper money. Its deeper significance arose from other considerations. One of them was the fact that the change was announced in the time-honoured manner after the weekly meeting of the Court of the Bank of England—a different procedure from that followed on the occasion of the two preceding upward movements. Another was the removal, in effect, of the special rate for Bank of England loans to the money market against Treasury bills, a new device introduced when the Bank Rate was first raised, in November, 1951. The abandonment of this device gave greater flexibility to the market, so that, although the Treasury is still by far the largest borrower, and to that extent "calls the tune," the preference it enjoys from its top credit standing is no longer augmented by special discrimination in its favour. The margin between discount rates for Treasury bills and prime bank bills is now just about the same as before the war. These facts point to the conclusion that, as in industry and trade generally, the policy of the Government is to move towards the rehabilitation of what is often called the "economics of the market place."

I would emphasise the setting of the facts just mentioned in the monetary history of

the past two decades. The period falls naturally into three parts: first, the years from 1931 to 1939 when active official intervention in monetary affairs was being progressively developed after the breakdown of the gold standard; next, the wartime regime, which extended to 1947, of still more active intervention supported by statutory controls; and, finally, the postwar phase of piecemeal relaxation of controls and a tentative approach towards internal monetary flexibility.

In terms of economic priorities, the feature of the prewar period was the preference accorded to domestic monetary policy as against any fixing of exchange rates and of the value of the currency in terms of gold—the overriding condition of an effective gold standard. The objects pursued in domestic monetary policy were, first in time, a diminution of the weight of debt charges on the national Exchequer, and secondly the provision of a stimulus to investment, through a "cheap money" policy, in the interests of business recovery and alleviation of the then intolerable burden of unemployment. To this end open market operations to expand the volume of money went hand in hand with low interest rates. Monetary measures were thus pressed forward to stimulate projects leading to a cumulative business revival and enlargement of the opportunities of employment. On the external side of monetary affairs, the pound sterling was left to find its own level of value in terms of other currencies and of gold, subject to more or less continuous intervention by the Exchange Equalisation Account with a view to smoothing out violent fluctuations and combating speculative movements. The "sterling bloc" came into being in recognition of the continued supremacy of sterling, notwithstanding the departure from its traditional relationship with gold, in the conduct of world trade and finance. The old system of fixity of exchange coupled with internal monetary flexibility had been replaced by flexibility of exchange in response to the outcome of calculated intervention in domestic monetary affairs. Along with this change went a shifting of prime responsibility for monetary management—now much more active and continuous than ever before—from Threadneedle Street to Whitehall.

The outbreak of war brought an immediate reinforcement of intervention by controls. On the side of external monetary relations, a fixed exchange rate with the dollar was re-established, exchange resources were mobilised and reserves concentrated in the Exchange Equalisation Account—the functions of which thus became passive rather than active. Rigid restrictions were imposed upon the use of foreign currencies, and the informal sterling bloc was contracted and transformed into a firm administrative unit which came to be known as the "sterling area" operating a joint "dollar pool." The whole system of maximising our gold and dollar resources and keeping the demands of the bare, controlled minimum was supported by the regulation of imports, exports and domestic consumption.

As to internal monetary arrangements, controls were less firm and all-embracing, yet scarcely less important. All borrowing other than by the British Government itself was made subject to official regulation. New issues of capital were almost entirely suspended during the war years, while bank advances diminished. The raising of new money by local government authorities also was controlled and concentrated upon a single source fed from the main stream of central Government borrowing. In this way there developed the concept of a comprehensive national budget, broadened from its classical notion of ordinary Exchequer receipts and expenditure to encompass emergency expenditure of the central

Government, the provision of cash for its trading operations in food and many other commodities, and all new capital outlays of local authorities. The major factor in determining the volume of money, the growth of which was more restrained than during the first world war, was the rising budgetary requirements of Government. Fiscal policy came to dominate monetary policy. Departmental funds, particularly the accumulating surplus on national insurance schemes and the growing resources of the savings banks, absorbed large quantities of newly issued Government securities while expanding bank deposits at a time of declining bank advances accompanied a marked increase in the volume of Government borrowing from the joint stock banks. "This monetisation of debt" along with the other factors noted, enabled the authorities to keep interest rates at a low level throughout the war.

The cheap money policy was pressed still further after the end of the war. The system of centralised governmental responsibility evolved for purposes of war finance was switched over to the promotion of physical and economic reconstruction, and to the furtherance of expansion designed to ward off the risk of business depression such as had been experienced after the first world war. Hence in the early postwar years the new constitutional arrangements were given permanent statutory form in the Bank of England Act, the Borrowing (Control and Guarantees) Act and the Exchange Control Act.

The events of this period of Government intervention coupled with controls derive their significance largely from the divergence which they marked from older economic theory. The expansive monetary policy, including low interest rates, had been pursued before the war with the object of promoting a fuller use of economic resources at a time when those resources were under-employed. The same procedure was continued throughout a period of sharply contrasted conditions—conditions of continuous strain upon all available resources. The inflationary effects of this policy, maintained in such circumstances, were largely offset for the time being by the rigid imposition of both financial and physical controls. As events turned out, the inflationary effects were to a large extent only deferred or deflected, and even in the subsequent period budgetary and monetary policy have had to be shaped in terms of a continuous resistance to inflationary pressure.

THE APPROACH TO INTERNAL FLEXIBILITY

The story of the past few years has been characterised by a tentative and somewhat halting approach towards greater internal flexibility. I say "internal" because by now the United Kingdom, along with many other countries, had become committed to the principle of fixed exchange rates subject only to marginal day-to-day fluctuations and to the possibility of occasional, controlled adjustments of the gold parity under the rules of the new International Monetary Fund. One such revision of the parity of the pound occurred in the autumn of 1949—striking evidence of the carry-over into the postwar years of inflationary pressure. In principle the United Kingdom was committed to convertibility of the pound sterling. The premature establishment, in effect, of that condition in 1947 was followed by a hasty retreat, and since then only a very gradual advance can be noted. The sterling area system remains, and exchange control is still enforced. But some degree of limited freedom of payments, of movement of funds and of market operations has been found practicable. The fixed dollar parity for the pound is sustained by official control over the supply of and demand for the "hard" currencies.

Domestically, a welcome advance towards elasticity can be noted. Up till 1951 the stress was still on fiscal policy, coupled with physical controls, as the chief instrument for arresting any decline in the purchasing power of the pound sterling; but from that time onward, especially as the physical controls were progressively abandoned, more reliance came to be placed on monetary policy. As regards the quantity of money, it was indicated that the authorities intended to work towards restoration of the system under which the volume of bank deposits was governed by the cash resources made available to the banks by the operations of the Central Bank. This appears to remain an objective, though operations thus far have been conducted without rigidity and the financial needs of Government are still a principal determinant of the volume of money outstanding.

INTEREST RATES

It is in respect of interest rates that the movement towards greater elasticity has become notably more marked. Ever since early in 1947 long-term interest rates had been allowed to take their course, subject to continuing control of non-Governmental borrowing but to no more than an occasional minimum of active official intervention. The first step towards similar elasticity in short-term rates was taken in the autumn of 1951 after 20 years of almost unbroken fixity, and various technical modifications have had the effect of restoring considerable freedom for short-term rates to settle themselves in relation to a bank rate which has recovered some at least of its old-time manoeuvrability.

To sum up, the course of events in the third phase can be described as a partial return towards an open, freely-moving money market. As yet the return is no more than partial, for several limitations remain, including selective regulation of borrowing from the banks, continued restrictions on new capital issues and close scrutiny of operations falling within the scope of exchange control. Even so, within the past year the control of capital issues has been relaxed in favour of investment and unit trusts, while exchange control has been modified to allow greater scope for financing foreign trade and to permit freer market dealings in various European currencies. Apart from the maintenance of controls, intervention is still practised. Thus the impact of Government receipts and expenditures and of the operations of publicly controlled funds upon monetary conditions is still one of the main factors to be taken into account in shaping the design of the Budget, while official influence upon conditions in the short-term money market is exercised from time to time as occasion requires.

The major contrast, however, between the system towards which we have been moving in recent years and that which was developed in the prewar period lies in the current adherence to a fixed exchange parity as against what may be called the regulated elasticity of exchange rates practised in 1932-39. It can hardly be disputed, as a basic dogma, that a healthy, adaptable, expanding national economy requires, as one of its basic conditions, an element of flexibility in its monetary system. If that flexibility is not provided in the relations of its national currency with those of other countries, then it must be provided in its own internal monetary arrangements; the choice may be deferred, but it cannot be indefinitely evaded. Thus interpreted, the steps taken can be described as yet another stage in the long experimental process of working out an effective monetary system for a "mixed" economy—neither wholly "free" nor wholly "planned."

TRINIDAD SUGAR ESTATES LIMITED

The thirty-first annual ordinary general meeting was held on January 21st in London, Mr E. Cassleton Elliott, FSAA (the chairman), presiding.

The following is an extract from his circulated statement:

Trinidad had more normal weather in 1953 compared with the very dry weather in 1952, and as a result the production of sugar increased substantially. The tonnage reaped was a record for the estate.

The profit for the year shows a substantial improvement on the poor results of the previous year, due to the better crop, and accordingly the directors recommend a dividend of 7½ per cent for the year, less income tax, compared with 5 per cent.

As regards the prospects for 1954 crop, subject to weather conditions during the grinding period, I think we should have a good yield from estate canes, and it is hoped that tonnage of farmers' canes will show some improvement.

For 1954 crop the price payable under the Commonwealth Sugar Agreement with the Ministry of Food for that part of the Commonwealth exports being bought at the negotiated price has been fixed at £41 per ton, a reduction of £1 6s. 8d. Any part of our export sugars which are not covered by the negotiated price allocation will have to be sold on the basis of world price plus Imperial Preference, and this is at present well below the negotiated price of £41. The term of the Commonwealth Sugar Agreement has been extended for a further year to 1961.

The report was adopted.

SMITH AND WALTON

(Manufacturers of and Dealers in Paints, Varnishes, Enamels, etc.)

The twenty-third annual general meeting of Smith and Walton, Limited, was held on January 19th at Haltwhistle, Northumberland, Mr Harrison S. Walton, joint managing director, presiding.

The following is an extract from the directors' report:

In their report to shareholders 12 months ago, the directors expressed confidence in the future and in their ability to maintain the company's profits. It is therefore all the more pleasing to be able to report a further record year's trading. The policy of increased representation in this country, coupled with the establishment of further distribution depots in the larger centres of population, has proved itself beyond doubt over the years since the war. The 24-hour service for standard products which is thus made available to customers has undoubtedly been the major factor contributing to the record sales of high-quality materials. The lead which the company gained in the establishment of Emulsion Paints some years ago has been fully maintained by Synflat, sales of which continue to increase. In other fields the directors have been equally active, particularly in connection with surface coatings for the industrial user. A team of industrial representatives has been at work for some time; their returns are satisfactory and leave no doubt that in this new sphere sound progress is assured.

For the future—nothing short of a major national crisis can upset the carefully prepared forward policy of the directors. The results of the current year to date are most encouraging.

The report was adopted.

NATIONAL PROVINCIAL BANK LIMITED

A YEAR OF PROGRESS

ESSENTIALS TO SUCCESS IN COMPETITIVE WORLD MARKETS

PRODUCTION COSTS THE CARDINAL PROBLEM

NEED FOR REDUCTION OF TAXATION

MR D. J. ROBARTS ON STERLING CONVERTIBILITY

The one hundred and twenty-first annual general meeting of National Provincial Bank Limited will be held on February 11th at the head office, 15 Bishopsgate, London, E.C.2.

The following is the statement by the chairman (David John Roberts, Esq.), which has been circulated with the report and accounts for the year ended December 31, 1953:

BOARD OF DIRECTORS.—We have to record with great regret that the Right Hon the Earl of Selborne, PC, CH, has found it necessary, owing to ill-health, to relinquish his office of chairman. Lord Selborne was appointed deputy chairman in 1950 and became chairman in October, 1951. We had hoped that we should enjoy the benefit of his leadership for many years and we offer him our sincere good wishes for a speedy restoration to full health and vigour. It is a consolation to us that he will retain his seat on the board and we look forward to having him with us as soon as his doctors are agreeable. At the invitation of the board I have assumed the office of chairman.

Since our last annual general meeting we have suffered grievous loss in the deaths, within a few days of each other, of two senior members of the board, the Right Hon Lord Aberconway, CBE, LLD, and the Right Hon the Earl of Cromer, PC, GCB, GCIE, GCVO. Lord Aberconway was appointed to the board in 1936 and his knowledge of the shipbuilding, coal, and iron and steel industries was of the greatest value to the bank. Lord Cromer had been a director since 1938 and we shall greatly miss his wise counsel and his insight into international affairs.

Earlier this year we had the pleasure of electing to a seat on the board Mr John Raymond Ropner who is distinguished in the shipping world. More recently the present Lord Aberconway, who has already made his mark as one of the leaders of the younger generation of industrialists, has accepted our invitation to become a director. I am sure that these appointments will meet with your warm approval.

We offer our congratulations to our colleague Mr Donald Anderson on the Knighthood which Her Majesty has been pleased to confer upon him.

We have to record with great regret the death of Mr A. Kingsford Wilson, who had been a member of our Sheffield local board since 1930.

MANAGEMENT AND STAFF

During the year Mr H. F. Willmot, a joint general manager, retired after more than forty-four years of distinguished service in the bank, including six years as a joint general manager. The directors have been pleased to appoint as a joint general manager Mr W. Lynn.

I wish to pay a special tribute, in this my first statement, to the high standard of the services rendered to our customers by the

management and staff. I have had many opportunities of appreciating the loyal co-operation which exists at all levels throughout our great institution and in my opinion this spirit must be counted as a most valuable intangible asset. I am also happy to record a marked improvement in both the numbers and the quality of applicants coming forward to join our service and it would seem that the attraction of banking as a career is becoming more widely appreciated.

THE BANK'S 120TH ANNIVERSARY

Last year we celebrated our 120th anniversary and to mark the occasion we published a short account of our origins and history, under the title of "Bold Adventure." This little booklet was well received by our friends throughout the world, as their many letters of appreciation have shown. It is interesting to record that the initial cost of the "experiment" of founding the Bank 120 years ago was estimated at the modest sum of £300: the statement of accounts, to which I shall shortly turn, affords sufficient commentary on the success of the experiment.

COUTTS AND COMPANY.—The balance sheet of Coutts and Company as at December 31st last accompanies our own report and accounts.

STATEMENT OF ACCOUNTS

The total of our liabilities on current, deposit and other accounts, which at the end of 1952 was £854,562,827, now stands at £869,423,762. The ratio of the more liquid assets, cash, money at call and short notice, and bills, to these deposit liabilities is 39.5 per cent. This compares with 38.8 per cent a year ago.

Investments in securities of, or guaranteed by, the British Government are shown at £247,615,167, giving a ratio to deposits of 28.5 per cent, compared with 28.0 per cent last year. In accordance with our unbroken custom, we continue to show these investments at a figure which understates their market value.

Our advances have again fallen during the year, from £252,102,387 to £244,187,325. Full provision has been made for all accounts carrying any risk of loss to the bank. We have continued to exercise the selective control over advances enjoined upon us by the Chancellor of the Exchequer and this has restricted our opportunities to expand this important side of our business. Moreover, raw material and wholesale prices have fallen from the high levels of recent years and stocks held are lower in volume: in consequence the demand from some industries and trades for bank finance has tended to decline.

PROFIT AND LOSS ACCOUNT

The net profit for the year as shown by this account is £1,765,768 compared with £1,525,013 for 1952. The amount brought forward from 1952 is £686,466 and this,

added to this year's profit of £1,765,768 gives a disposable figure of £2,452,234. An interim dividend of 8½ per cent has been paid and accounted for £443,162.

It is proposed to deal with the balance as follows: To pay a final dividend of 8½ per cent, £443,163; and to make an appropriation to reserve funds of £750,000. Thereafter will remain to be carried forward a balance amounting to £815,909.

A TURN FOR THE BETTER

The past year marks a definite turn for the better in our postwar readjustment. As the months passed, one could sense a gradual change in the mentality of the country. A burden seemed to be lifting; a more tranquil and cheerful tone began to prevail; there was a revival of hope and confidence. In part this was certainly inspired by the Coronation of our gracious Queen, which linked the whole nation together in a common celebration. In part, it reflected the relaxation that has taken place in international tensions. But in part it was due to more mundane causes. Accustomed as we have become to the recurrent exactions of successive Chancellors of the Exchequer, the alleviations in the last budget were a welcome surprise, even though they left us plenty more to hope for in the future. The gradual demobilisation of wartime controls and of rationing, and the better and more varied diet which became available have also helped. A love of freedom and a dislike of restrictions are in our blood and we look forward to the disappearance of the remaining controls. In every country where this policy has been tried it has been successful in providing incentives and stimulating enterprise. So it may be hoped that this year the nation will go forward in better heart to work together in the common task of rebuilding our prosperity by the only means by which it can be done—greater efficiency and higher productivity.

PROGRESS IN THE FINANCIAL FIELD

During the past year definite progress has been made in the financial field. The clearest evidence is the strength of sterling which has become more and more a hard currency. A number of factors have contributed to this, but the revival of the use of Bank rate as an instrument of financial management has certainly played an important part. In the prevailing conditions, it is difficult for Bank rate to be made fully effective. But, even so, the action taken has produced good results in tapering off some of the inflationary financing to which we have become accustomed and in enabling our economy to shed some superfluous fat. It has therefore helped to achieve a precarious balance. But the volume of domestic consumption is still too high and the volume of savings too low: the insurance companies and pension funds are still practically the only sources of personal savings. We have, it is true, achieved a gradual increase in our gold and dollar

reserves during the year; but, during the first six months at any rate, our sterling liabilities increased almost as much as our reserves. We are still indebted to the European Payments Union to the extent of some £200 million and our position there has not improved as much as might have been expected. We are also receiving substantial aid, both direct and indirect, from the USA. We are just paying our way and are very far from earning the surplus of £300-£350 million which we are aiming to secure. There is still much to be done before we can reach a position of financial security and independence and if a chill wind should blow from overseas we might find ourselves again in grave difficulties. We do not want to justify the wisecrack that we have turned the corner so often that we are now back again where we started.

STERLING CONVERTIBILITY

It is more than a year since the Commonwealth Finance Ministers agreed that sterling convertibility should be their common objective and that each part of the Commonwealth should take action to assure a balanced economy. Substantial progress has certainly been made in securing a balance with the dollar area. In the first six months of 1953 the Colonies, as usual, had a large surplus (£58 million) with the dollar area. The rest of the sterling area had a surplus of £21 million (instead of a deficit of £61 million in the first half of 1952); the United Kingdom had a surplus of £34 million. But the United Kingdom had received £55 million on account of US Defence Aid, and further—this is the important point—the sterling liabilities of the United Kingdom increased in this period by £173 million. To that extent we have been obtaining supplies on credit and, although this may be a temporary phase, at present the strength of sterling seems to be due not so much to our efforts as to the efforts made by our partners in the Commonwealth. The sterling area system is a tremendous source of strength to us but we must not become dependent on it, any more than we can afford to become dependent on the generosity of the USA.

One might have expected that the steadiness of the sterling exchange and the improvement in the general position of the sterling area would have enabled the authorities to carry out their declared aim of making sterling convertible—but little has been heard of this subject lately. One of the reasons which have led the authorities to go slow on their objective is apparently the disappointment of hopes that the United States would facilitate action by revising their tariffs so as to encourage imports into the USA. We can certainly urge on them as the world's greatest creditor the desirability of such action, and there has been a growing appreciation in American business circles of the economic arguments in its favour. A simplification of the procedure enforced by the US Customs should surely be practicable, and it may be hoped that the Randall Commission may succeed in inducing a more liberal policy towards imports generally. It will not, however, be easy for any American administration to make a radical change in their economic policy. A delay on the part of the US authorities was therefore to be expected and it must not be regarded as an excuse for inaction on our part. Our own status has changed from creditor to debtor, and if we want the USA to behave as a good creditor we must on our side show ourselves good debtors by eliminating those weaknesses in our economy for which we, and we only, are responsible. If we can root out the inflationary tendencies which still persist in our system and can make our industries and costs of production more fully competitive in open markets, we will be in a stronger position to appeal for more liberal trade

policies, not only in the USA but throughout the world.

PRODUCTION COSTS THE CARDINAL PROBLEM

The cardinal problem is to prevent our costs of production from pricing our exports out of the market. Production in recent months has shown a satisfactory increase but too much of the output has gone into the home trade instead of into exports. We have to face increasing competition from other manufacturing countries which are now claiming their share of world trade and we are tending to lose export orders, even in sterling area countries. It is often alleged that foreign exporters obtain orders because they can offer more favourable credit facilities than UK exporters can do. In some instances this may be true, but I am inclined to doubt whether this is the sole cause of many lost orders. In the case of credit-worthy customers I believe that appropriate credit facilities can and will be made available to exporters by British banks and accepting houses. Certainly this is true of National Provincial Bank. Normally, I am sure, delays in delivery and non-competitive prices are a much greater handicap than the alleged lack of credit facilities. The cost of credit in the Continental countries rules substantially higher than in this country and, if their exporters can quote better terms, it is because their people are prepared to work harder for less wages than we are.

NEED FOR SOUND CURRENCY AND STABLE EXCHANGE

In many of the sterling area countries our exports enjoy the benefit of preferential duties and the system of exchange control also favours sterling imports. Thus, we have a double advantage and we have a most valuable assured market in these countries. But the reverse of the medal is that these advantages make our export industries less careful to keep their costs and prices down. They can for the time being continue to export to the preferential markets despite rising prices, but they will be handicapped in their efforts to export to the open markets. And, even in the preferential markets, we are being increasingly criticised on the ground that we are not quoting reasonably competitive prices. The decision of the South African Government to abolish discrimination against dollar goods in the grant of import licences is a warning. We have been helped by the fall in international commodity prices which has swung the terms of trade in our favour: but this means nothing more or less than that the prices of our exports are rising more, or falling less, than those of the commodities we import. If our competitors cut down the price of their manufactures, and we fail to do so, the terms of trade may still be in our favour but the trade itself will be lost. Above all, our exporters must be able to quote firm prices, without an "escalator" clause allowing prices to be adjusted for increases of costs: and this will be practicable only if they can rely on stability of costs. For this purpose we need a stable system of prices and exchange.

Unfortunately, the measures required for this purpose do not command the unanimous support of all parties. The opponents have not ventured to produce any alternative policy but they appear to be afraid that convertibility will impede the realisation of the social policies connoted by the term "Welfare State." This is surely a short-sighted view. There is no social benefit of greater importance to the country than a sound currency and a stable exchange. Without the solid foundation of a stable currency, prices cannot be kept stable and without stable prices all the plans of the Welfare State will be illusory. And the attainment of stability depends not on what the USA or Europe may do—though

they can undoubtedly help—but on our own economic and industrial policy. If our workers insist on constant increases of money wages, without any equivalent increase of productivity, we cannot hope to keep our currency sound or our price level stable. In that case retail prices and the cost of living are bound to rise but it is no use blaming the Government for the increase of prices—the blame should be laid fairly and squarely on the shoulders of those who have insisted on inflating wages. Each year the statistics show that the price level has risen in close correspondence with the increase of the wage bill and the process is bound to continue until the workers realise that increasing wages all round can bring them no real advantage. It may be noted that in the Continental countries which have seen the full effects of currency inflation all classes are united in their opposition to such policies: and at present Germany, Belgium and Holland are giving the lead towards convertibility which ought to come from London.

RESTORATION OF A FREE EXCHANGE URGED

It is with this background that I stress my firm conviction that sterling must as soon as practicable be made convertible, at any rate for current transactions. So long as exchange control, buttressed by prohibitions or restrictions on imports, is practised you can have no assurance that the currency is sound. The system tends to promote the instability which it pretends to correct. Prohibitions and discriminations against dollar imports would not be needed if our exchange rate were sound and our goods competitive. A free exchange market would provide the acid test of how our economy is operating. It is a very delicate mechanism which registers the real value of a currency, with all the varying checks to which a currency is liable, without manipulation, for all to see. International conditions are at present favourable for the restoration of a free exchange and it may be hoped that the opportunity will not be lost to carry through the internal measures required for that purpose.

Meanwhile, the authorities here have taken such steps as were possible to improve the technical status of sterling as an international currency. The resumption of exchange dealings, within certain limits, has enabled the technique of exchange operations to be revived and brought up to date. The freeing of the commodity markets promises once more to restore London's supremacy in this field, with the trading profits that result. The reopening of free markets enables the holder of sterling to acquire almost any commodity here at the lowest world price. As a result there has been a satisfactory increase in the demand for sterling and a consequent improvement in the rate not only for free sterling but for the various categories of switch and securities sterling. All this is to the good and it may be hoped that we may soon see the abrogation of the remaining restrictions on sterling transferability, which only harm our credit and hamper our export trade. It should be borne in mind, however, that the freeing of the commodity markets entails most of the risks and strains on our exchange, without all of the advantages, that would follow the restoration of full convertibility; and accordingly, whichever course we adopt, it is necessary to set our domestic finances in good order.

REDUCTION OF TAXATION AND GOVERNMENT EXPENDITURE ESSENTIAL

The improvement in sterling has been aided by various measures to restrict the supply of sterling abroad. It would have been better, however, if a similar restriction

could have been enforced on the supply of sterling at home. It is true that, as I mentioned in connection with our accounts, bank credit has been tightened for individual customers and the increase in rates has discouraged some types of business. But the expenditure of the Government and of the industries owned or controlled by the State has continued unchecked and has largely neutralised the restriction of credit in other fields. The position of the public finances has been one of the main factors in the liquidity of the market. The Government has not felt able to raise money from the public on a long-term basis appropriate to

the expenditure that is being incurred and has had to rely on Treasury Bills or relatively short-term bonds. The difficulty facing the authorities is that the present level of taxation makes individual saving practically impossible and they have to raise funds from the money market. Moreover, a similar difficulty faces industry: the excessive taxation levied on the profits of companies makes it impossible for them to provide adequately for the re-equipment and replacement of plant out of their own resources and they have had increasingly to apply to the market for additional capital. Every year since 1945 my predecessors have drawn attention to the

threat to enterprise and initiative inherent in the present level of taxation and now more than ever such qualities are essential if we are to survive in an increasingly competitive world. A reduction of taxation is essential on many counts but there is small prospect of this being possible so long as Government expenditure is maintained at its present level. This, indeed, is the central problem, the solution of which would unravel our other difficulties, and until the Government is able to tackle this problem the optimism engendered by the present favourable trends must be qualified by anxiety as to the longer-term prospects.

DISTRICT BANK LIMITED

EFFORTS TO HELP CONTRIBUTIONS TO NATIONAL PROSPERITY

EXPANSION IN FOREIGN DEPARTMENT BUSINESS

PROGRESS EVIDENCED BY GRADUAL RE-ESTABLISHMENT OF FREER ECONOMY

RESURGENCE OF INITIATIVE AND ENTERPRISE FOLLOWS CONTROL SHEDDING

SIR THOMAS D. BARLOW REVIEWS COTTON AND RAYON TRADE PROBLEMS

The chairman, Sir Thomas D. Barlow, GBE, has circulated, with the report and accounts, the following statement to the shareholders of District Bank Limited, prior to the one hundred and twenty-fourth annual general meeting to be held on February 12th at the head office, Spring Gardens, Manchester:

Before turning to more formal business I wish to congratulate Sir Alan C. Tod on the knighthood that he received in the Coronation Honours as further recognition of his valuable public services. During the past year we have had pleasure in appointing to the board The Right-Honourable The Earl Peel and Mr Alfred Whittle, FCA, both of whom are well known in industrial circles.

There have been changes also among the principal executive officers. Mr D. F. Pollard, who has been a chief general manager since 1949, has retired on pension after forty-five years of loyal and devoted service, and we wish him every happiness in the future. Mr William Mitchell, manager of head office, has been appointed deputy chief general manager, Mr John L. Rife has become a joint general manager, and Mr A. W. Goodall, head office manager.

THE YEAR'S ACCOUNTS

From the balance sheet you will see that deposits, which have been running at a higher level throughout the year, now stand at £251 million and exceed last year's record figure by £3 million. Our liquid assets—cash, money at call and short notice, treasury bills and bills of exchange—at 35.5 per cent of our deposits, still show a high degree of liquidity. Investments are increased by £4 million: practically all our holdings of British Government securities continue to be repayable at fixed dates and appear in the balance sheet below their market value.

Although the figure for advances is larger than it was twelve months ago, the average level of lendings has not varied greatly from that of the previous year, and the higher figure recorded embraces certain advances of a very temporary nature. Our lendings continue to be well spread over the whole range of industry and it is pleasing to report that to a growing extent our funds are being used to further the export trade and to assist

other industries of major importance, including agriculture which has the heavy responsibility of providing so much of the country's food. From this it may be gathered that within the limits of the Chancellor's directives every effort is being made to help enterprises which contribute to the nation's prosperity.

The increase in the bank property item is accounted for by the purchase of properties and the rebuilding or extension of premises where the business has outgrown the existing accommodation. In accordance with our programmes of development we hope to open offices in two important centres, Newcastle-on-Tyne and Derby, within the next twelve months.

SPECIALIST ACTIVITIES

With the gradual easing of trading restrictions by many countries there has been an expansion in the business of our foreign department. The re-opening of the commodity markets and the larger imports have brought us a greater volume of foreign exchange transactions and more import credits have been established on behalf of customers. Especially welcome has been a recent addition to the total of export bills and a small though significant increase in the number of our export credits.

Realising the many difficulties which now face those who seek to maintain and increase the sale of their goods abroad, our export information service makes available to customers as much data as possible concerning market and financial conditions overseas. Much of this valuable information is gained by our officials, who continue to make frequent visits to other countries.

Each of our trustee offices is making good headway and the over-all activities of the department show a progressive increase year by year. The rapid growth of our trustee business over little short of half a century provides ample proof of the growing appreciation of this specialist service.

In these days of costly living and high, complex taxation, there is an obvious need to ensure that an estate is carefully and efficiently administered. A frequent difficulty encountered nowadays by executors, and one which makes their task increasingly

onerous, is that of valuing shares in a private company for Estate Duty purposes. The problem is not only to arrive at a fair value but also to mitigate the serious effect of the duty liability when a testator's main assets are shares in such a company. It is, therefore, reassuring that the Chancellor of the Exchequer is already giving the matter his consideration and the results of his investigation are awaited with much interest.

PROFIT AND DIVIDENDS

The year's results show a satisfactory improvement. After the usual provisions have been made, net profit at £559,744 is £44,072 higher than that of the previous year and, with the amount brought forward, the disposable balance is £854,105. As mentioned in the report we are appropriating £200,000 to our general reserve and, since we feel the time has arrived when there is justification for an increased payment on the "A" and "C" shares, we are recommending a final dividend of 10% per cent on these shares (making 20 per cent for the year). We are also recommending the maximum dividend of 5 per cent on the "B" shares (making 10 per cent for the year), all dividends being paid less income tax. Subject to satisfactory profits being earned, it is the intention of the board to recommend that this annual level of distribution be maintained, and that the dividend should be paid in equal half-yearly instalments. After the appropriation to general reserve and allowing for the dividends, which items together will absorb £510,027, there remains a sum of £344,078 to be carried forward to the next account.

Realising the importance of close co-operation between head office and the branches, we frequently hold managers' conferences and refresher courses for newly appointed officials. Our general managers also continue to visit offices under their control. These arrangements are proving well worth while and from another satisfactory annual report I am sure we can say we have evidence that the bank continues to meet the needs of its many customers. Once again, therefore, I should like to take this opportunity of expressing most sincere thanks to the management and staff for a year of loyal and efficient service.

A FREER ECONOMY

Much has been accomplished since the gold and dollar deficit inherited by the present Government threatened a financial crisis. Indeed another year's progress has proved the soundness of the corrective measures which were adopted. Our balance-of-payments position for the first half of 1953 showed that, even excluding Defence Aid, there was an over-all surplus and a balance was nearly reached with the dollar area. The upward surge in the cost of living has been checked, production has improved and we have added to the national income. But perhaps progress has been most clearly evidenced by the fact that we have gradually re-established a freer economy.

It must, however, be recognised that external conditions made progress easier for us. A high level of activity continued in the United States, the price of raw materials declined and, as they resolved their payments difficulties, Commonwealth and European countries were able to diminish the restrictions they had been compelled to impose upon imports. Nevertheless it must be recognised that neither our gold nor dollar reserves expanded as much as we had hoped, and our exports gained but little ground whereas those of the United States, Germany and Japan forged ahead. This is disquieting and, as we are likely to experience keener competition in overseas markets, the consequences may become more manifest during 1954.

EXPORT PROBLEMS

It must be admitted that trading conditions are in many ways exceedingly difficult and subject to incalculable changes. A year ago monetary and investment policy was framed to restrain home demand for capital goods and not to depress the internal trade for consumer goods for which overseas demand had declined. With tax concessions modifying that policy today, and with greater external demand for consumer goods, it may well be difficult for exporters to accommodate themselves to these changes to say nothing of numerous other complications.

Of recent months there has been some lack of sterling and, as at the same time more dollars have been available, there has been a growing tendency for certain countries to buy from the United States rather than from us. It is also inevitable that there should be some slackening of demand as we move into a buyers' market because customers tend to delay their orders in the expectation of lower prices. Furthermore, various incentive schemes by which some countries seek to increase their sales abroad hamper our exporters, whilst barter agreements and political influences impede the normal trend of international trade.

Allowing for these conflicting circumstances it is not surprising, though extremely disconcerting, that, judged by volume, no major group of our exports appears to be really strong enough to hold its own against external pressures. Textiles and certain other consumer goods, which were the first to wilt under the difficult trading conditions of 1952, have subsequently made some recovery. On the other hand metal and engineering products, which gave way more slowly, declined steadily and, despite a recent improvement, still fail to make satisfactory headway even with the notable support afforded by our newest export, aircraft. Such contrasting experience should, I think, serve to emphasise the wisdom of not depending too much on one group alone and this view seems to be borne out by the trend of miscellaneous manufactures which, apart from a set-back of short duration in 1952, have made reasonably good progress.

Mainly the lesson to be drawn from even this brief unsettled period of two years is

that the broad divisions of our exports—consumer and capital goods—do not experience the same vicissitudes at the same time and that, if we are to aim at over-all stability in good times and bad, the importance of both sections must be recognised. Moreover, the economies of many countries are still so artificially supported by rearmament, or by intensive nationalism fostered by prolonged inflation, that the ups and downs of trade are not likely to diminish in any foreseeable time. Admittedly the rising standards of living in recently developed countries should stimulate the demand for the more complex products which we, a highly industrialised nation, are equipped to supply. But, on the whole, postwar resettlement may well lead to changes in the international pattern of trade greater and more unpredictable than hitherto and, that being so, it seems to me that a diversity of exports ought to serve us even better in the future than it has done in the past.

THE JUSTIFICATION OF IMPORTS—

Meanwhile, although a wide range of manufactures has enabled us to increase the volume of our exports, the increase has been insufficient to justify our large intake of imports. Since this situation threatens the balance of payments, it is natural to question the need for these heavy imports, especially as, with a high level of domestic consumption, they may be deflected from exports on which our solvency depends. I would, however, venture to suggest that some needless apprehension can be removed by an examination of the facts.

In a manufacturing country such as ours, which possesses few raw materials, imports must precede processed exports. There is, therefore, reason to hope that larger imports will in due course be reflected in larger exports. Some increase in our consumption is explained by the welcome, though small, rise in capital investment with its promise of greater efficiency in production. The progressive freeing of our economy, with the dispersal of stocks consequent upon the substitution of private for state trading, is also bound in the transitional stages to absorb more imported commodities, whilst the gradual termination of rationing may well have brought about the purchase of more food from abroad.

—AND OF THE HOME MARKET

In so far as industrial stocks and the nation's larder have been replenished, the balance of payments position is better than it might seem and, because we have been importing whilst commodity prices have been falling, our purchases would at least appear to have been well timed. Satisfactory as this may be, it is reassuring to have it from the Chancellor himself that internal trade has not risen to such an extent as to overstrain productive capacity or starve the export industries. This is not to say that the home market can be indulged with every luxury, but let us at least recognise the desirability of maintaining activity here at the highest level practicable. After many years of restrictions and austerity this, I think, is something of which we may need to be reminded. When all is said and done, we produce in order that we may consume, and, just as a nation denied the opportunity to consume will become dissatisfied and lose its efficiency, so one given greater freedom to do this will increase its initiative and its production.

This is certainly borne out by our own experience. The shedding of numerous controls has at one and the same time freed production and helped to restore consumers' choice with the result that a much wider and more attractive range of goods in increasing volume is finding its way into the shops. We might welcome this flow and variety as

proof of the resurgence of initiative and enterprise, but I think we can also do so in the expectation that they will spur the community on to greater effort to earn more in order that they may buy. Over and above this, we should welcome a vigorous home market because it is indispensable to the development of an export trade in that it facilitates technical advancement, furthers enterprise in regard to style, design and new products, provides a backing for ventures into fresh markets, and reduces the overhead costs per unit of output.

For so highly industrialised a country as ours there should be no doubts about the need for expansion and development. The revitalised home market is but another step towards the desired end and a move which, with the re-created monetary and price mechanisms, should make our economy more flexible and therefore more efficient. The need for efficiency is a continuing one in industry and especially so just now when discovery and invention are proceeding rapidly in so many fields. Indeed it is impossible to over-estimate the importance of efficiency at the present juncture when, in the interests of the nation at large, production has to cope with an active domestic trade and make a bid for exports at one and the same time—a time moreover when no day passes without reports of mounting competition in world markets.

THE IMPORTANCE OF PRODUCTIVITY

But despite what has been done to increase efficiency, it seems to me scarcely possible that exports will not fall far short of what is urgently required if wages are allowed to raise costs when many other countries are effectively containing their inflation. Moreover we are considerably hampered—as responsible quarters recognise only too well—by a serious lack of capital for industrial development. This may seem a tedious repetition of the obvious, but so inadequate has been the flow of capital over recent years that for industry as a whole it has been practicable to do far too little beyond offsetting wear and tear of equipment and, although during 1953 the Budget and Bank Rate have facilitated industrial investment, the beneficial results from projects which have thus been made possible will not be felt for some time.

Cheaper exports in quantity cannot therefore be expected immediately by means of increased mechanical resources, and if they are to be produced—as indeed they must—this can only be by a much better use of existing capital equipment. The key to an increasing output of exports at the right price is then much greater productivity which can only be achieved by unflagging and co-ordinated effort of management and men. In this way we may hope to make good the existing shortage of capital and hasten the time when adequate re-equipment and modernisation can be undertaken so that these can play their full part.

This is not to overlook high taxation, a lightening of which would most effectively augment the supply of capital for industrial development and so increase production. But without forgetting that heavy taxation is an evil or without lessening the pressure to get the fiscal burden reduced, it is in my opinion more realistic to rely on increased productivity because this is within our own power to accomplish. What is more, increased productivity has much to recommend it since it is one of the surest ways to gain tax concessions and, I should add, a higher standard of living.

COTTON AND RAYON TRADE PROBLEMS

For the cotton and rayon trade increased productivity is of particular importance, seeing that over and above problems relating to capital and taxation it has to contend with

a serious shortage of labour, the aftermath of a falling off in business a year ago. With the industry now working at full pressure there is every need to make the best use of existing machinery and manpower and so prevent the loss, through long deliveries, of orders, particularly those from abroad. But a further reason why equipment and labour must be used to the best advantage is that profit margins have narrowed despite the steady improvement in trade. The fact that the present high level of demand with extended deliveries is reminiscent of the situation which preceded the earlier recession provides yet one more reason for this co-ordination—in order that competitive strength may be improved in readiness for another lean time should it come.

Nor can the trade be blamed for being apprehensive because the present activity owes far too little to expansion of business overseas. It is of course not right to assess the industry's foreign currency earnings without taking into account a wide range of exports which are not classified as either cotton yarns or manufactures but which have a cotton or rayon content. Indeed, allowing for these items, the industry's overseas trade balance is not only well on the right side but is improving. Nevertheless export orders fall far short of what is required and, although so much of the home trade relates to industrial materials, preoccupation with this market must not be allowed to disguise the fact that in the long run the trade's prosperity depends on an expanding export business. Meanwhile there is no comfort to be drawn from the knowledge that some competing countries with advantages of labour, wages, or productive methods, are also finding it difficult to increase, or even maintain, their cotton exports.

In spite of growing uncertainties, however, Lancashire's position has been greatly strengthened by the clearance of stocks and by the increasing demand for a very wide range of cloths. Moreover, the financial strength of many concerns now provides them with much greater resources with which to meet competition. But reassuring as this may be, there is the problem of new machinery: so prohibitive is its cost that only with the full co-operation of labour, whereby machines are employed to the very best advantage, will it be possible for the industry to undertake extensive re-equipment and modernisation.

Purchase tax not only continues to concentrate production on fabrics which are less suitable for export but also acts as a deterrent to experiment and enterprise which, given free expression, would be invaluable in the export field. Certainly mechanical and technical developments will be held in check so long as purchase tax hampers production of the medium and higher quality ranges. For high-class merchandise, in particular, intricate machinery is needed, but its installation could only be justified on the lower costing that would ensue if the lifting of purchase tax freed the home market and so permitted the trade the full advantage of manufacturing for unrestricted domestic needs as well as for exports.

The termination of the operations of the Raw Cotton Commission was sooner or later inevitable, and the Liverpool futures market for trading in American cotton is to be reopened in May. While there will be a universal wish for its successful operation, initial difficulties are bound to be experienced, especially in providing a spot market of sufficient size. Moreover, outside growths, the use of which has been steadily increasing in Lancashire of recent years, will not be tenderable against the American contract. These difficulties, which are serious, belong, it is to be hoped, to the transitional period, but until they are resolved they will exercise the minds of all closely connected with the

ANSELLS BREWERY, LIMITED

ALL OUTPUT RECORDS BROKEN

MR A. E. WILEY'S SURVEY

The fifty-third annual general meeting of Ansell's Brewery, Limited, was held on January 15th at Birmingham.

Mr A. E. Wiley, chairman and joint managing director, in the course of his speech, said: The trading results are very satisfactory, in spite of continued difficulties, through rising costs, particularly those concerned with managed houses, such as wages—which are controlled by the Catering Wages Board—local rates, and most of all the maintenance of your licensed properties.

In 1939 the cost of maintenance of licensed and other properties was approximately £72,000; this year the expenditure has risen to £345,000, and I can see no possibility of this figure being reduced unless there is a considerable drop in costs, and particularly some relief in taxation, for example, an allowance for depreciation of buildings similar to that which is given to manufacturing businesses.

LARGER PROFIT AND DIVIDEND

The present year's group trading profit amounts to £1,940,030, compared with £1,762,999 for the previous year, being an increase of £177,031. This increase is brought about by additional turnover and the extension of your company's operations through its newly acquired subsidiaries. It will be noticed, however, that there are increased charges for depreciation of £23,308 due to additional capital expenditure during the year, taxation £53,415 and debenture interest £15,811 owing to the change during the year of the 5 per cent second debenture stock.

The total charge for taxation of £928,503 is considerably in excess of the amount last year. This excessive and penal charge for taxation, in spite of the small reduction in the standard rate in April, 1953, still calls for further consideration by the Chancellor of the Exchequer to grant some further relief in order that your company's high standard of efficiency in plant and equipment can be fully maintained, particularly the company's licensed properties, as mentioned earlier.

The balance remaining for appropriation is £936,773, compared with £810,166 in 1952. This amount has been appropriated in accordance with details given in the report, including final dividend of 12 per cent, which, on the increased ordinary stock, is approximately 24 per cent more than that which was paid for 1952, and which I am sure you will agree is very satisfactory, leaving a balance of £297,131 to be carried forward to next year.

SUBSIDIARY COMPANIES

In previous years I have always referred to the results of your subsidiary companies, and I am pleased to say that the Victoria Hotel still continues to become more popular. We have most encouraging reports from people visiting the hotel. The sale of your products has considerably increased during the year.

The South Wales Company, Lloyds (Newport), Limited, has been instrumental in increasing considerably the profits of the parent company. I cannot help referring again, however, to the unfair competition we receive from the clubs in South Wales. We do not ask for any privileges over the

tenants and managers to see their customers drifting off to the clubs on Sunday evenings while our houses, which have the comfort and service to offer, have to remain closed. Some more equitable legislation concerning licensing laws in Wales is long overdue.

We have now had an opportunity of having almost a full year's trading of the Leicester Brewing and Malting Company, Limited, the results of which have been most satisfactory and have fully justified the acquisition. Trade is increasing month by month, and your directors are very satisfied with the results. During the year we also took over the wholesale bottling business of Messrs E. Brittain and Company, of Leicester, and the figures will show that the confidence of your board in the advisability of this action was not misplaced. Mr W. R. Brittain has joined the staff of your company, and I am sure that his extensive knowledge of our trade will prove to be of advantage to your company.

The policy of your board has always been to keep the brewery in full production as far as possible and, had it not been for the various acquisitions, the increased profits as shown in the year's accounts could not possibly have been achieved.

The Holt Brewery Company, Limited, have had another successful year.

MR WALTER SCOTT'S SPEECH

Mr Walter Scott, JP (deputy chairman and joint managing director), in the course of his speech, said:

There should be little doubt in your minds that the company has made considerable progress in the period under consideration.

We have had the advantage of barley at a more reasonable price, and that being our main raw material has proved very useful in helping to counteract the increased costs of most other commodities and essential requirements for production, such as wages, maintenance of plant and transport, etc., the expenses for which have all risen.

Also, as was anticipated when our subsidiaries in South Wales and Leicester were acquired, we have considerably added to our earning capacity; the possibilities of which are by no means exhausted, as our products become better known and our plans can be more extensively carried out. As a result we can boast that we have broken all records for output, both of draught and bottled beer, in the history of the company.

By far the larger proportion of our output is in draught beer, which is the best way of serving beer, as it contains its natural yeast and is generally preferred by our customers, especially the older and more discriminating ones, and it is also the cheapest way of enjoying beer.

A NEW STOUT "NEWCREST"

On the other hand, there is a decided tendency for bottled beer to increase, but not to the extent as in some other districts. In either case we always study the preferences of our customers, and in this connection last year we put on a new stout named "Newcrest," having a milder hop palate which does not mask its full flavour. This is of outstanding quality and has evidently appealed to the popular taste, as the demand has greatly exceeded our expectations.

The report was adopted.

THE HEROIC STORY OF No. 4 Commando

Their business was to kill and to destroy: quickly, efficiently, ruthlessly. They were Commandos, and their deeds will never die. Murdoch C. McDougall, himself one of their leaders, has now told the heroic story of the men of No. 4 Commando: he has set down his account with the eye of a soldier and the pen of a born writer, and JOHN BULL is proud to present it in serial form—before book publication—in the issue out Wednesday, Feb. 3rd. *Ramps Down!* is a story you should read.

JOHN BULL's literary programme for spring follows *Ramps Down!* with Vic Oliver's fascinating autobiography—*Gay Adventure*; then comes Hammond Innes' brilliant new novel of intrigue in Morocco—*The Strange Land*; and Paul Brickhill's superb life-story of Group Captain Douglas Bader, D.S.O., D.F.C.—*Reach for the Sky*, destined certainly to be the Book of the Year.

JOHN BULL represents a standard in reading matter, in illustrations, and in the quality of its production that is obtainable in no other comparable magazine; it is bought regularly by considerably more than a million readers. See for yourself how good it is: buy a copy today.

Craven

for

Civic

honours

SIR JAMES BARRIE considered that a tin of Craven Tobacco was a far greater award than the freedom of the city. In 'My Lady Nicotine' he said:

"It is a Tobacco that should only be smoked by our greatest men. Were we to present a tin of it to our national heroes, instead of the freedom of the city, they would probably thank us more."

Craven Tobacco is unstinting in its service—mellow, slow-burning, deeply satisfying. Try it—every pipeful will honour you with smoking riches.

Obtainable in three fine blends
Craven Mixture 4/7 oz.
Craven Empire de Luxe Mixture 4/3 oz.
Craven Empire Curly Cut 4/4 oz.

HAPPY MARRIAGES PORT & STILTON

Mature partners! . . . each of an age to contribute to good living and to bring out each other's qualities. Every Cheese has its day and every day calls for Port. Saccone & Speed Ltd. will gladly send you details of the fine range of Vintage Port held in their cellars, and the following Wood Ports are of specially fine quality.

Rex, Very Fine Tawny	Per bottle 19s.
Brigade, Very Superior Ruby	19s.
Old Vintage Character, Full-bodied	20s.

All orders delivered carriage paid to any address in U.K.
Our full price list will gladly be sent on request.

to all jobs

In a large
office—
switch all
machines
to one job

...That's Sensimatic Accounting

OUT WITH OFFICE DELAYS, posting "peaks," overtime—in with *Sensimatic* control over the production of accounts! A small firm may need only *one* Burroughs Sensimatic Accounting Machine to handle all its different routines. The large organization, which can switch every Sensimatic simultaneously to one type of work, will certainly reduce the size of its machine installation.

The Sensimatic's endless versatility originates in the Sensimatic control

unit—which directs this unique machine through any *four* different posting operations in any combination. There's no limit to the number of control units you can use on one machine.

Call Burroughs about the Sensimatic now. Five versions are obtainable (giving as many registers, or combinations of registers, as you need), and you'll be surprised at the low cost.

Burroughs Adding Machine Limited,

Avon House, 356-366 Oxford Street, London, W.1. Sales and Service Offices in principal cities.

•WHY "SENSIMATIC"?

This is the sense-plate of the Sensimatic which guides the machine automatically through every mathematical function and carriage-movement of any four posting operations. Turn the selector switch and you're on (say) Accounts Receivable; another quarter turn and the machine's set for Stock Records; and so on.

Burroughs

ask the typist

A typist worthy of the name knows the importance of every single part of the typewriter she uses. She takes into account lightness of touch, free running of the carriage, easy accessibility of working parts. She appreciates especially the interchangeability of major units which enables her to switch from one job to another at a moment's notice. After months and years of work—perhaps at several different machines—the typist's opinion carries a lot of weight. And when she says the new Imperial is good we know that it has passed her test. It's the test that really counts.

One and a Half Worlds

THE Randall Commission deserves all praise for the admirable expedition with which it has produced its report. If this is all that can be said without qualification, that does not mean that Mr Clarence Randall, Professor John Williams and other undoubted liberals on the commission are less convinced internationalists than Mr Bell, Mr Gray and the authors of more forthright American utterances of recent but fading memory; they, too, if left to their own devices, might have issued a statement fiery enough to light up both Europe's enthusiasm and Congress's irritation. But the freer traders on this commission had a different and more difficult task to perform. They had to dilute their liberalism into practical schemes that would be innocuous enough, on the one hand, to be acceptable to the Taftite wing of the Republican Party that is in control in Congress (personified in this instance by the chairman of the Senate Finance Committee, Senator Eugene Millikin); but strong enough, on the other hand, to provide some basis for advance by non-dollar countries to the ideal of a single trading world. Nobody should be surprised that, in striving to attain both objectives, they have failed to attain either.

The main features of the report are set out on page 321 of this issue. They do not make very stimulating reading. The commission started from the assumption that economic aid—open or disguised—should be terminated as soon as possible; this is going to happen in any case, and the commission was wise to recommend the inevitable. In its place the majority proposes a long list of minor improvements in American investment and trade policy. They recommend that special tax privileges and even experimental government guarantees should be accorded to Americans who invest abroad; that the "Buy American" Act should be modified; that the Trade Agreements Act should be continued for three years, with power to the President to make further tariff reductions, some of them without requiring reciprocal reductions by other countries; that the existing barriers against imports of food and raw materials should be lowered; and so forth. But from every one of the recommendations here specified—and from some of the others—Senator Millikin either dissents or demurs; and two of his colleagues from the House of Representatives have dissociated themselves from the report in its entirety.

Unfortunately, these Congressional dissents are of greater practical importance than the majority report. They make it cruelly plain that when (and if) the proposals of the majority report are put into the Congressional cauldron, they may boil down to very little—not that there is so very much there even before the boiling has started, so far have the majority gone in the effort to carry the politicians with them. Even if the proposals of the majority were carried through Congress in the teeth of Senator Millikin's present convictions—and it is difficult to see how they can be—they would be unlikely to increase American spending overseas by more than a few hundred million dollars in any normal year. The commission itself recognises that in 1953—a year of

exceptionally favourable trading—the outside world ran a dollar deficit of between \$2,000 and \$3,000 million, and was able to finance this only by economic and military aid. Much of that aid is now to terminate, but the gap—which would, of course, be very much larger but for discriminatory import restrictions against dollar imports—is plainly going to remain.

★

It is therefore no longer a subject for sophisticated argument whether the sterling area can make a speedy advance to non-discrimination in trade and to full convertibility. It is a lesson of simple arithmetic that it cannot. The question at issue now is the much more limited one of whether the sterling area can make what the commission calls “a gradual controlled approach” towards these objectives, or whether it should retreat further under its imperial umbrella. The Randall report holds out some inducement to the more liberal alternative, in the form of larger credit facilities for debtor countries from the International Monetary Fund, and perhaps also from the Federal Reserve Banks. It also confers a specific blessing on floating exchange rates. With these aids, it is argued that the non-dollar world could go forward to the removal of restrictions on trade and payments, gradually and hand in hand. Some of the recommended steps are greater freedom for trading in dollar commodities on the London markets, further liberalisation of trade among the countries of Europe and even (though here the Congressmen disagree) increased trade in non-strategic goods across the iron curtain.

The policy of a gradual approach to convertibility and non-discrimination is one that will command almost universal assent—though there will still be wide differences of opinion about how fast and how far the approach can go, and whether there need be any provision for retreat in bad times. Unfortunately the liberals on the Randall commission seem to have gone out of their way to strike one blow for the faint-hearts in this matter, and they have been jostled out of their way to strike another. The report's sin of commission is that it launches a sharp attack on inter-governmental commodity agreements which might serve to stabilise the prices of staple raw materials. This is the only passage in the report where old-fashioned liberalism rings out clearly, clear as a death rattle for the embryo tin and rubber schemes; it is unfortunate that this is also the only place where the sterling area finds old-fashioned liberalism on America's part unhelpful. The report's sin of omission in this field is that it makes no proposal that America's “escape clause” and “peril point” provisions—under which tariffs can be raised if domestic industries get into difficulties—should be removed; foreign exporters who shoulder the considerable initial expense needed to establish themselves in American markets will therefore still be advancing across a perpetual trap-door. Thus while it is clearly implied that the non-dollar countries' approach to full con-

vertibility and non-discrimination is to be a one-way street, with no question of return, America itself is to be allowed to beat a retreat at any time.

These two recommendations are disappointing (they will be more than that if—as is not wholly impossible—they turn out to be about the only advice in the report that Congress follows). But with these exceptions, the majority report comes up to the expected standard of moderate helpfulness. Unfortunately, all that the labours of the Randall Commission have proved is that helpful suggestions, even when so moderated, are not likely to be accepted. American action cannot be counted on to close more than a small part of the dollar gap. What conclusions should the rest of the world, and the sterling countries in particular, draw from this now almost established fact?

★

There will be plenty of people, of course, who will seize upon it as justification for still more discrimination and restriction, for shutting ourselves up even more completely in a hemisphere hermetically sealed against the dollar. But this would be quite illogical and very silly. Even if trade with the dollar area cannot be as free as trade with other currency areas, it is still to everybody's advantage that it should be as large and free as it can be. The fact that the Americans are less anxious to take us to their commercial bosom than we hoped provides no grounds for deciding that trade with them is still as true as ever it was that it is the only way to avoid being divided into two completely separate worlds for economic purposes would not only impoverish them all but would sooner or later hinder them from acting together in political matters, to their own ruination.

But if there is no excuse for a policy of Two Worlds, it is equally unrealistic to cling to the belief that the One World of postwar dreams—the One World without quotas, excessive tariffs, discriminations or exchange controls—can be attained within measurable time. It is not pleasant to say this, but it is a fact that should have been faced before now. Too much time has been wasted in elaborating rules for a world that cannot be recreated, instead of working out what can be done in the world that exists. What can be attained is, so to speak, One and a Half Worlds—a state of affairs in which countries are under an obligation to make their trade and payments as free as they can be made, but with the recognition that there must inevitably be grades of freedom. In practical terms, this means a large non-dollar area, practising a high degree of unrestricted multilateral trade within its own limits, and, though controlling its dollar trade more tightly, nevertheless spending in the dollar area every dollar it can earn. This is not an ideal picture, but it is a practical one, and one which would provide a large part of the benefits of the international division of labour. If the Randall Report and the Congressional commentary on it are read aright, it is to the ordering of the One and a Half Worlds that practical men will turn their minds.

Molotov's Horses

AT the very first session of the foreign ministers' conference, Mr Molotov amply justified the apprehensions that his diplomatic Notes had aroused as long ago as last September. He had then made it clear that the Soviet government was not interested in a conference on Germany and Austria alone. What it wanted was a kind of global ding-dong, in which it could block progress on any one issue by dragging in wholly irrelevant matters, if necessary from the other end of the earth. It was thus no surprise when the Soviet foreign minister, at the outset of a meeting on German soil between the four powers that defeated and occupied Germany, immediately introduced the question of China.

By instantly accepting his demand that this irrelevancy should rank first on the Berlin agenda, the three other ministers not only caught the rocklike Molotov momentarily off balance; they also advanced towards three useful objectives. First, they sought to eliminate the tedious argument about procedure that marks nearly all negotiation with Communist powers; these wrangles make public opinion in the free world impatient, and thus weaken the western negotiators' position. Second, they showed the peoples of Germany and Austria that the West is so sincerely anxious to discuss their problems that its statesmen will bear with irrelevance, and even absurdity, to that end. Third, the three ministers proclaimed themselves ready to restate their views on the question of China before beginning to discuss Germany and Austria—a procedure which should set limits to Soviet attempts to use Far Eastern levers to extract concessions in Europe, or vice versa.

Any Russian offers to trade Asian horses for European ones must, indeed, be treated with great caution, whatever their form, and they may take many forms, of which the attempt to bulldoze the Peking government into the inner councils of the Great Powers is only the most blatant. The serious consequences that would follow an acknowledgment of Peking as the great power of Asia before it had dropped its present bellicose attitude have already been discussed in *The Economist*; it would mean, in effect, that the free world had surrendered in advance the bargaining counters with which it may yet succeed in imposing a measure of restraint on Communist expansionism in the Far East. But there are other forms of horse-trading as between Asia and Europe which Mr Molotov may now propose in the Berlin market.

Since the Russians' basic objective in Berlin, as at other times and places, is to disintegrate the unity of the West, the first hints of any new offers are more likely to be dropped in the private ears of individual western delegates than made openly across the conference table. And something may be found to appeal to

the palate of each of the three western partners. In Britain, a strong and by no means wholly left-wing lobby might be mustered to welcome a suggestion that concessions in Europe could lead to better trading relations with China. For a good many Americans, a hint that a modest reduction of United States armed strength in Europe would facilitate a genuine settlement in Korea might have considerable attractions. France, however, is the most obvious customer for a horse-trade of this kind; how many people in Paris would refuse to look twice at an offer to call off the war in Indo-China in return for the abandonment or emasculation of the European Defence Community?

From the western point of view, it was therefore singularly apt that it should have been M. Bidault who, on Monday, took the first opportunity of declaring that the solution of European and Asian problems should not be made dependent on each other. (Equally felicitous was the choice of Mr Dulles as spokesman for the western decision to accept the Russian agenda.) Western statesmen are not without experience in these matters. They have seen the Russians make a German settlement dependent on an Austrian one, and that in turn on a solution of the Trieste problem; and more recently they have witnessed a determined Chinese attempt to sell peace to Korea at a price involving the satisfaction of a whole range of extraneous demands. But how far would public opinion in the free world endorse the three foreign ministers' understandable aversion from horse-trading?

To many people in the West, the general idea that concessions in Europe should be matched by concessions in Asia, with the object of reducing tension in both areas, must seem a quite reasonable one; and all the more so at a time when the line seems to be holding in Europe, while in the Far East the free nations are hard pressed. It is therefore all the more important that it should be clearly seen whether any Russian offers of mutual concessions are genuine or not. After six months spent in trying to delay and divide the West by diplomatic Notes, Mr Molotov has now come to Berlin to delay and divide it in person. There is not as yet the least evidence that the Russians and Chinese are honestly willing, or even able, to make substantial concessions in either Europe or Asia. Dare they withdraw the Red Army from Germany, or allow free elections in their zone? Could they call Ho Chi-minh to heel, or accept the continued existence of a non-Communist Formosa?

These are the questions that need to be asked and answered before any dark hints about horse-trading can

be taken seriously by the West. It is extremely doubtful whether any satisfactory answers will be forthcoming. On present form, the Russians are likely to parade a number of vaguely good-looking horses along the far side of the paddock, but without letting the western representatives get near enough to feel their fetlocks. Closer inspection would probably reveal any one of them to be a horse of a different colour, superficially

The Troubles of Buganda

ON his present visit to Africa Mr Lyttelton is not going to the little kingdom of Buganda. He will not be able to avoid it when he returns to Parliament. The colonial bear-baiters in the Labour party, in sharp contrast to their experience in the Guiana affair, have been gaining ammunition as the dispute has dragged on. It is all too probable that they will have another shy at their favourite Aunt Sally before public interest in the Kabaka's exile dies down.

The delegation sent to this country by the Lukiko (or parliament) of Buganda has made a good impression. Proud of their own traditions instead of preening themselves with foreign theorists' political traduccments, its members are just the sort of people on whom many liberals' hopes for African advancement now rest. They showed their good sense by trying to keep clear of the party quarrel in this country as long as possible. But when the Government finally decided that the Kabaka's exile was irrevocable, the delegation published its own account of the crisis, which introduced certain marked variations into the original theme. It is important, therefore, that any doubts about the Government's conduct of this affair should be cleared up.

What is the official case? Briefly, it presents the picture of a ruler who deliberately went out of his way to break the agreement of 1900 under which the British Government recognised him. The Kabaka made (though he has since retracted) two main demands: that Buganda should come under the Foreign Office and that it should be given self-government within a fixed period. By filing these he appeared to be demanding that his kingdom should be separated from the rest of Uganda, although he had specifically promised to assist in developing it as an integral part of the protectorate. When the British Government turned down his demands, he refused to pass on its decision to the Lukiko without adverse comment; although he was bound under the terms of the 1900 agreement to take the advice of his British officials. The Governor spent months trying to persuade him to act according to his responsibilities, and only when all else failed was the decision taken to depose him.

The Baganda delegation has made two important criticisms of this story. First, it claims that the demand for self-government was misunderstood. In the dele-

tinted and entered under a false name. The West should not altogether shut its eyes and ears to offers lest, by a miracle, they be genuine; but it must at all costs avoid being drawn into discursive debate about purely hypothetical possibilities of horse-trading. Mr Molotov is well equipped to continue on these lines at indefinite length, while nothing gets settled—but western opinion gets increasingly unsettled.

gates' view, the Kabaka (and the Lukiko) were entitled to speak only for Buganda; hence their narrow terms of reference. The Kabaka, they say, wanted to take the lead in achieving self-government for all four provinces of Uganda; admittedly, he wanted some sort of federation (which was a technical breach of his pledge to maintain an integral state), but he did not mean to ask for full-scale separation. They point by way of proof to a joint letter signed by the treaty rulers of the other three provinces as well as by the Kabaka. This letter certainly was written; but it is doubtful how far the other three rulers knew what they were about, since they were quickly persuaded by the Governor to retract. In any event, this explanation does not really hold water; the Governor had repeated and lengthy discussions with the Kabaka, and the dispute would not have gone as far as it did if the Kabaka had merely made himself look like a separatist by mistake.

The second criticism levelled by the delegation is more important. It is that the Kabaka was put in an impossible position—that he was penalised for acting in the spirit of the democratic reforms that the British themselves introduced in Buganda this spring. The Colonial Office maintains that the Kabaka put forward his proposals on his own initiative; but the delegates say that he was merely interpreting the wishes of his people. There is evidence to support this contention. There had already been agitation in the vernacular press for the views the Kabaka expressed; moreover, the Kabaka's ministers signed his original letter and he received wide support once his demands became known. Why, the critics ask, was the Kabaka first persuaded to fill the role of a constitutional monarch (which involved him in having to act as the spokesman of his people's wishes), and then held to the letter of an agreement that presupposed that he could act as an absolute ruler? The other three treaty rulers have taken up the same complaint—that it is impossible to act as constitutional monarchs and yet disregard their people's wishes—in a recent letter to the Governor.

The Colonial Office's answer to this argument is that the Kabaka and his fellow rulers are not meant to be constitutional monarchs; they are executives of the Government. The Kabaka certainly does not look or feel like a civil servant; but, since he has withdrawn the most intransigent of his demands, the Govern-

ment's refusal to allow him to return cannot solely be due to this difference of definition.

Instead Mr Lyttelton's case is based largely on an argument *ad hominem*: that on his previous record the Kabaka is not to be trusted. This is undoubtedly the key to many of the riddles in this unfortunate affair. The Government has so far been chary of bringing personal issues into the controversy, but if criticism persists it may feel bound to justify itself by doing so. Some of the personal issues involved are very delicate. Others are political and blunt. It seems, for example, that in the 1949 riots the Kabaka may have taken care to avoid too close an association with the Colonial Office, with the result that what had started as an attack on privilege in Buganda ended as an attack on the Protectorate government. Did he also prefer popularity to responsibility in other ways?

The Labour party has laid responsibility for the conflict at Mr Lyttelton's door, because he referred in a speech to the possibility—albeit extremely remote—of an East African federation (a suggestion loaded for the African with implications of white domination). This speech certainly set the cat among the pigeons; but the real causes are far more complex. A young African looks out from the shores of Lake Victoria on a world in ferment. In Central Africa the white settlers appear to be in control. But to the north, in the southern Sudan, Africans have won a form of self-government; and Somaliland is looking forward to independence after ten years of United Nations trusteeship. In Nigeria there are yet closer analogies; the concept of a unitary state has been successfully challenged and the more advanced peoples have won from the British acceptance of the principle of self-government by 1956 without incurring exile or suppression. The lessons of what has been happening in the rest of Africa have not been lost on the Baganda.

Yet no one looking at the tiny patch of Buganda on the map, with its population of little over a million, could seriously contemplate separating it from—or weakening its ties with—the rest of the protectorate. Unless the unit remains closely knit, its precarious prosperity is bound to suffer; and the reforms in agriculture, trade and education which the present Governor, Sir Andrew Cohen, has energetically put in hand are all dependent on the maintenance of national unity. The problem is to find a political framework within which they can be carried through to fruition. In accordance with normal colonial practice, the British Government envisages the development of self-government through a central legislative—and elective—assembly. Many Baganda, on the other hand, look instinctively, but perhaps muddleheadedly, for a solution that would leave their tribal structure intact—though no one really has any idea how a loose federation could be made to work. The resulting clash has been essentially a conflict between an administrator's logic and a tribe's emotions. Unfortunately it will now be harder than ever for moderate Baganda to take the lead

without appearing disloyal both to their tribe and to the exiled Kabaka, on whose head something like a halo of martyrdom has now descended.

For this reason, if for no other, any suggestion that there is still a chance of his returning is more cruel than kind. No constructive policy will be possible so long as any doubt on this score—and the accompanying fear of reprisals—remains. The moral of the affair is very different from that held by some people both in this country and in the colonies themselves. To paint a picture of an arbitrary and reactionary colonial power brutally suppressing the leader of a small nation whose only crime is a desire to be free is temptingly easy. It would be wrong in any part of the colonial empire, and doubly or trebly wrong in this case. If there is any territory in which British policy is unquestionably progressive and liberal, it is Uganda—where, one might add, the present Governor has (so far as a civil servant can) identified himself with the policy of rapid advance. It is not a conflict of reaction *versus* progress; it is a conflict between two conceptions of the path that progress should follow.

As popular institutions in the colonies take a firmer hold, it is becoming more and more obvious that the boundaries drawn across the face of Africa in the latter part of the last century were in nearly every case artificial. It is not that they divide African nations; there are no African nations, there are only tribes. Yet if the emancipation of Africa were to result in the creation of scores of independent units—a sort of super-Balkanisation—it would be a mockery. If the African peoples are to be able to stand on their own feet they will have to be welded into nations. It is

Retracing False Steps

It is not easy either for individuals or nations to retrace a false step, to turn over a new leaf, to begin a reformed career. But it is much easier for nations than for men. Such a change in individuals involves a rare wisdom and a rarer courage, much energy to break off old habits, much resolution to endure the reproaches of mortified vanity and the stings of wounded pride. It is painful to acknowledge error: it is humiliating to promise amendment. But that which in men presupposes a change of life, in nations implies merely a change of policy;—that which in men needs a change of character, can be effected in the case of nations by a simple change of Ministry. A State which has long carried on an obstinate and unprofitable war may suddenly conclude a moderate and honourable peace—the sole prerequisite and explanation being that the pacific opposition has come into power, and the belligerent administration has been displaced. A Government that has long been bigoted and retrogressive may embark in a career of generous improvement and of liberal institutions; and the inconsistency is veiled or removed by the simple fact that an old statesman has died, and a young one has stepped into his place:—the superannuated ideas of the past generation naturally giving way to the light and knowledge of the coming dawn.

The Economist

January 28, 1954

not, however, easy to find the right tempo for carrying this process out. Some tribes may fear that if it goes too quickly they will be swamped by their more advanced neighbours, who, for their part, may well find the pace too slow. Nation-building is perhaps particularly liable to be unpopular where, as in Buganda, a relatively advanced tribe has a well-developed set of tribal institutions. But to give way whenever there is opposition

would be to abandon the policy of nation-building for that of tribal fragmentation—and to do so, what is more, not because anybody in this country thinks that fragmentation is preferable, but simply out of weakness of will. When a trustee sincerely believes that he knows better than the beneficiary what will in the end be to the beneficiary's interest, he is not only entitled to insist on his own view; it is his duty to do so.

The New Rifle

THE Prime Minister's announcement last week that the British Army has adopted a new rifle was something that happens only once in a lifetime. Over fifty years have passed since as fundamental a change as this was made in the basic weapon of the individual British soldier. It is small wonder, therefore, that the final decision has been preceded by discussion and trials which have been continuous ever since the end of the war. It is even less surprising that the decision should have taken so long when the pros and cons of international standardisation have also had to be taken into account. Indeed, in the latter stages of the trials, the need to choose a weapon that all the Nato countries might eventually agree to use was one of the main difficulties.

Even now, Britain's adoption of the rifle known as the FN .30 is, it must be emphasised, still a purely national decision; there is no Nato agreement. The decision thus raises two important questions: Is this really the best rifle for modern war? And is it really the weapon that has the highest chance of being standardised throughout the Nato forces? Both questions are best answered by briefly examining the record.

FN stands for *Fabrique Nationale d'Armes de Guerre*, a Belgian firm from Liège, and .30 represents a calibre slightly smaller than the .303 with which Britain has fought the last two great wars; this calibre is also slightly larger than the .28 with which Britain's own new rifle, the now discarded EM-2, was first tried out in the initial trials after the war. At that time, it was recognised that the existing Lee Enfield rifle had become obsolete; Britain was, and still is, the only major power to rely on a hand-operated, breech-loading rifle as its basic infantry weapon. Experiments were therefore begun, on the one hand to develop a new self-loading rifle—one, that is to say, in which the spent gases of the expended cartridge automatically eject it from the barrel and force another in, so that the soldier has only to keep pressing the trigger—and, on the other hand, to determine the optimum calibre and velocity for modern war.

The decision about the size and type of bullet proved easier than the decision about the rifle. Nato took up the problem in 1951 and the verdict, when it came, was essentially a Nato recommendation. As a result, the

forces of all the Nato countries are now to standardise gradually on a rimless cartridge of .30 calibre firing a high velocity bullet which, wherever manufactured, will fit into any of their rifles or automatic weapons. This is no small achievement, though it will take years to put it fully into operation. The new cartridge and bullet are based on the existing American product, but are shorter and lighter; the factor of weight is important when dealing with ammunition supplies. This round was adopted after extensive trials last September, which were themselves the culmination of earlier tests following a standard laid down by Nato, setting out the desired characteristics of any new round. And although the process has been slow, it is hard to see how a better method could have been adopted, considering the number of countries involved and the conflicting interests of those which manufacture arms; right up to a late stage the British and Canadian experimental .28 round was still competing successfully with the American-backed new .30. Both the British EM-2 rifle and the Belgian FN .30 were originally designed for the smaller round, but both have since been adapted for the larger.

The fact that the great reserve of manufacturing capacity for small arms ammunition is in the United States and that the American Army has long used weapons of .30 calibre was certainly one of the main reasons why this size of round was eventually chosen as standard; though the Americans, like everyone else, will not be able to use the new cartridge in their present weapons without modification. But the question of the rifle itself is still open. And the one thing that the British decision to adopt the FN .30 makes certain is that standardisation of weapons, if it comes about, will not be done on the basis of any existing American pattern. As matters stand, several other Nato countries are keenly interested in the FN .30, but in the United States there is a division of opinion. Broadly speaking, the operational commands of the army tend to be for it, while the ordnance and the supply services are opposed to making any change from the existing M-1 Garand.

There is an American competitor to the FN .30, another recently developed, fully automatic lightweight rifle, the T-44. But like the British competitor of the

immediate postwar years, the EM-2, it is certainly not superior to the FN .30. On the whole, most technicians—and they are admittedly divided—regard both the American and British weapons as slightly inferior to the Belgian. All three have put up an excellent range performance, but the Belgian contains a simpler and, therefore, more rugged mechanism; soldiers who have used the FN .30 are almost unanimous in their enthusiasm for it. It uses 20-round magazines and enables the soldier to fire easily 30 or 40 well-aimed rounds a minute, compared with 10 or 15 from his present weapon. One decisive factor which ruled out the British EM-2 for the British army was a clear American view that the EM-2 would never prove acceptable to the forces of the United States; on the other hand, the Americans may yet adopt the FN .30. It is wrong, incidentally, to regard this weapon as purely Belgian. During the elaborate trials which have taken place in the past few years, many modifications have been made to it on British and Canadian suggestion, so that the result is to some extent due to a co-operative international effort.

There was a moment in 1951 when the War Office had almost decided to adopt its own new design of rifle. Now that the decision has gone in favour of the rival design, it would serve no purpose to procrastinate any longer; certainly the recent suggestion in the House of Commons that Sir Winston Churchill, under American

pressure, had accepted an inferior weapon firing an unnecessarily heavy round, was almost comically wide of the mark. Naturally it would be a great advantage to the North Atlantic alliance if its members could all use the same type of weapon, and it will be a great pity if the Americans, from whatever motive, end by rejecting the FN .30. But agreement on small arms ammunition already means a standardisation of chamber, barrel and ejector, and this means that by far the greater part of the problem is solved.

As to the FN .30, 5,000 are now to be supplied from the Belgian factory to British units in all parts of the world, including Malaya; later, they will, of course, be manufactured in this country. Experience in the field is still expected to suggest improvements; moreover, the FN .30, while already slightly cheaper to produce than its rivals, might become cheaper still if it could be made serviceable with a plastic rather than a wooden butt. Meanwhile, Britain, like America and other countries, will go on manufacturing ammunition for existing weapons, and these will continue in use until they can be replaced. But the best service that the British decision to adopt the FN .30 could render to the western cause would be to prove this new rifle in action, and so to hasten the day when it may be manufactured in bulk to meet the common demands of all the Nato forces. And that means receiving the blessing of the biggest arsenal of all, the United States.

Notes of the Week

Rumours of Retirement

THE speculation about Sir Winston Churchill's retirement is getting stuck in an emotional groove. Some Conservatives are not only exceedingly angry about recent discussion in the press of the merits or demerits of his remaining in office; they also regard it as an impertinence that anybody should ruminate in public about when he is likely to go, and about what would happen then. Some of their wrath has fallen on one of their own backbenchers, who suggested last weekend that Sir Winston (together with Lord Woolton and Sir Walter Monckton) was likely to retire soon after the Queen returns to this country. The unfortunate Mr Osborne was only guessing, and he seems to have been clumsy; but, by bringing his guess into the open, he was trying to perform for his constituents a service that the whole electorate needs. Sir Winston's retirement will be the most important political event in this country since the 1945 election and there is every need for full

discussion of what will follow. If Conservatives doubt this, they need think back no further than to the history of the Labour Government after Ernest Bevin left the Foreign Office. Some Labour MPs, like some Conservatives today, had thought it unseemly to discuss frankly the departure of an ailing man. They, too, had believed that when the time came everything would sort itself out. Now they know better.

Sir Winston, unlike his admirers, obviously does not feel hurt at the current speculation; on the contrary, he is enjoying it hugely. Unfortunately, he is not helping to direct discussion into the right channels by his preference for the oblique. He has made two contributions this week. The first was an ambiguous interjection—of the one word "delusion"—in the Commons when a Labour member said that the House will "no doubt now be receiving some authoritative enlightenment" about Mr Osborne's speech; in the context, this interjection could have meant several things. The second has been an announcement that he will address a Conservative women's rally on May 27. This has been taken as Sir Winston's hint that he still expects to be

Prime Minister on that day. But if he feels compelled to retire before then he is hardly likely to be deterred from fear of disappointing the Conservative women; in any case, the speech is scheduled for less than a fortnight after the Queen returns.

A Brisk Foursome

UP the sleeves of the four players round the Berlin table there may still be any number of cards. But the table itself is already carpeted with the knaves, kings, and lesser fry—no aces as yet—that were firmly planked down, face upwards, at the foreign ministers' first meetings. Frankness, and on the western side terseness, have been the order of the day. That is as it should be. The Berlin conference is not a cautious probing of the 'unknown contents of unfamiliar minds; it follows upon a marathon exchange of diplomatic Notes and other statements in which the basic attitudes of all parties have been made sufficiently clear.

The outspoken can, of course, verge on the naïve. It did so on Monday, when Mr Molotov declared that the creation of a European army would provoke the formation of a matching alliance in Eastern Europe. It is no secret that immediately after the war the Soviet government set about binding its satellites into a tight mesh of military alliances and centralised economic plans. These interlocking alliances—nearly a score of them in all—were concluded publicly and indeed with *panache*; and it is laughable to suggest at this late date that Eastern Europe is a military vacuum. There is a perfectly good East European Defence Community in existence with Marshal Rokossovsky sitting at its centre.

There was considerably more subtlety in Mr Molotov's statement on Wednesday, when he began to break down his broad concept of a five-power conference by citing specific questions, such as trade, that might be discussed at a meeting that included China. His press officer later extended this line of thought by pointing out that Indo-China could also be discussed at a five-power meeting. That was as far as the matter had got when *The Economist* went to press; but before the week is out, more will doubtless be heard of what seems at first sight a very ingenious attempt to get round the obvious objections to granting the Peking government a seat at the high table.

Divided Germans

THE comment of most West German newspapers on the opening moves in the Berlin conference has been disappointing. Mr Molotov was so anti-German in his speeches that Mr Dulles and Mr Eden stood out as the champions of German freedom and unity. For this relief German writers offer no thanks. To read their comment one would not think that only four months ago German voters voted in the great majority for Dr Adenauer's policy of working with the West to get German reunification on the best possible terms. Sceptical editors are writing for a bored public.

In the Federal Republic little is expected from the conference. To most of its people who are not refugees from the East, the uniting of Germany offers the prospect of yet another painful upheaval in their fortunes. The immense labour of constructing a new state out of the postwar chaos is not forgotten. To unite with an Eastern Germany which is as different from the West as Poland is different from Britain would need a comparable effort in reverse. In Berlin and the Soviet Zone feelings are different. Hopes and prayers are fixed on the foreign ministers. The disappointment will be bitter if they do not at least reunite Berlin.

High-Handedness at Suez

MR SELWYN LLOYD appeared to be under-rehearsed when he answered in the House on Monday questions about Egypt's interference with free use of the Suez Canal. For he failed to make it plain that the Egyptian government has been extending considerably what it unilaterally asserts to be its legal rights. On the grounds that it is still at war with Israel, it has hitherto acted on the basis that it is entitled in self defence to stop contraband of war destined for that country and to stop and search ships passing through the Canal for arms, fuels, and chemical substances usable for war purposes. By a new cabinet ruling that runs from November 30th last, the Neguib government now classes as contraband "foodstuffs and all other commodities which are likely to strengthen the war potential of the Zionists in Palestine in any way whatever." It has already victimised Greek, Italian and Norwegian vessels carrying meat and clothing, and seems to feel entitled to stop virtually any goods. Lawyers will find it difficult to distinguish between its new practice and the use of the Canal for blockade.

Owing to the loose wording of the Suez Canal Convention, they will have ample room for debate. This "perpetual" treaty, signed in 1888, says at one point that the Khedive may in time of war take such steps as are necessary for the defence of Egypt, at another that his steps shall place no obstacle in the way of free use (*usage*) of the Canal, and at a third that the Canal shall in no circumstances be used for purposes of blockade. The Israel government now points out that Egypt is violating not only this convention, but also a Security Council resolution of 1951 which ruled that the Israel-Egypt armistice was "of a permanent character" and that there were no justifiable grounds for claiming the right of search in self-defence.

Debate between these two countries is bound to be sterile; but what about the other states affected—the ship-owning nations of the world—which are being seriously inconvenienced? These, said Mr Selwyn Lloyd lamely, had perhaps better get together. But who does he think should take the initiative? If he himself is afraid of aggravating his troubles with Egypt over Canal defence or murdered soldiers, he might at least let other victims understand that if they start the ball rolling against Egypt they will get British backing. Norway, France, the United States, the Netherlands, Greece, Turkey and Italy are all affected. General Neguib cannot be allowed to get away with this defiance.

The Seven Shilling Standard

THE public corporations, which have the advantage of a sheltered home market, are doing their best to ensure that the size of this season's wage-award will be roughly seven shillings a week; or twopence an hour; or eighteen pounds a year. The pattern has been set by the Transport Commission, with a minimum offer of 7s. a week for the lowest-paid railwaymen, by the National Coal Board, with an offer of 7s. 6d. for the lowest-paid mineworkers, and by London Transport which is ready to pay London busmen an extra 7s. The effects of envy and example are already evident. Last week the Executive Committee of the National Union of Railwaymen was so impressed by the Coal Board's generosity that it sent Mr Campbell back to the Transport Commission with instructions to try to secure, for the lowest-paid railwaymen, the extra 6d. that the Board had given the miners. This week the representatives of the provincial busworkers let it be known, at the Ministry of Labour, that they would not accept less than the 7s. that London Transport was ready to give the busmen in London. Seven shillings, or thereabouts, is the price of industrial peace in the mines and on the railways—and only the worst-organised workers will accept much less, unless somebody is beaten in a strike.

The immediate test case for private industry is still the bizarre guerilla action conducted by the Electrical Trades Union. The union is asking for an increase of 3d. an hour in London and 2½d. elsewhere, but has said it would settle for 1½d. followed by the chance of more at the hands of an arbitration tribunal. There were signs this week—they may still be false signs—that the contractors may be preparing to make an offer that could be anywhere between 1½d. and 2d. an hour. If they do so, it will be surprising if the engineering employers, whose confidence has been shaken already by the Ford Company's decision to raise wages by more than 8s. a week, should fail to join the general upward movement. The effect that any such rise in costs would have on exports, and through them on employment, is dangerously uncertain. The Government can rightly claim that its successes in the past two years have been at least partly achieved by disinflation through public authorities' exertions; it is a sad commentary that some of the fruits of these may now be going to be lost by cost inflation through public industries' example.

Clean Sheet in Kenya

THE good name of the British army in Kenya has been cleared by the court of inquiry. The court was a military one and was sent out to Kenya because of the disquiet caused in this country by the unpleasant practices brought to light at the trial of Captain Griffiths. There will be general relief that so far as British units are concerned all fears of widespread Black-and-tannery have proved groundless; indeed the evidence brought before the court suggests that the British army is widely regarded by loyal Africans as their friend and protector.

The inquiry has revealed only two black spots, and both have to do with units of the King's African Rifles. Investigations are still in progress and comment would be

premature. But the fact that African units are concerned shows how unfortunate it was that the court's terms of reference did not allow it to investigate the conduct of security forces outside the strict army command. Emotions are always more likely to get out of hand among the emergency police and other units (such as the Kikuyu Home Guard), which are often hurriedly thrown together and officered by men without the traditions and discipline of the regular army.

Yet these units, simply because they have closer contact with the people, have it in their power to swing popular feeling away from the Mau Mau towards the forces of law and order. For this reason it is particularly desirable that there should be an investigation into the conduct of the para-military forces no less rigorous than that which has cleared the British army. There should also be some hard thinking about the present system of divided command, which allows the right hand—the regular army—no control over what the left hand may be doing.

How Not to Oppose

ON Wednesday, the Labour Party provided two more object lessons in how to make oneself look silly when presenting an arguable case. Perhaps its members were bored with the technicalities of bank notes, baking and boffins' rewards which had engaged the House's attention on the previous two days. Their first fit of exuberance was when they opposed the second reading of the Landlord and Tenant Bill, on the ground that it made no provision for leasehold enfranchisement; the principle of enfranchisement, as defined by Sir Frank Soskice, is that leaseholders "should be entitled, at a price to be fixed, to become the freehold owners of the houses in which they and their forebears have lived." The Government's reasonable compromise in this matter is that when a long lease comes to an end the leaseholder can stay on as a statutory tenant, protected by the Rent Restriction Acts. Like most compromises, especially those designed to clear up muddles arising from agreements that were entered into up to a century ago, this provides plenty of scope for intelligent argument about repair provisions, redevelopment, and the uncertainty caused by the presumed impermanence of statutory rent restriction; but Labour spokesmen submerged all this in fiery allegations of a "wicked ramp," of the landlords' submission of the "biggest wage claim in British history" and so forth. Why Socialists, of all people, should think it better to borrow capital than to pay rent, nobody explained. The Liberals, who are also attached to the principle of leasehold enfranchisement, voted with the opposition in the eventual division, which the Government won by 288 votes to 264; but they must have been made to feel that they were voting in queer company.

Immediately after this debate, Mr Hale moved for an address praying that the Aliens Order, 1953, should be annulled, in order to curb the Home Secretary's powers over aliens coming to or living in this country. This was backed up by a thesis, which was presumably meant to be funny, that "before long new Huguenots would be coming from the seaboard of America as refugees from McCarthyism"; but it was really based on quite genuine public doubts about the wisdom of the Home Secretary's recent refusal to allow foreign delegates to the conference

of "Teachers for Peace" to land in this country. When questioned about this last week, Sir David Maxwell Fyfe said that only seven Belgians, four Frenchmen and two Germans had been turned back; and he stated as an apparently immutable principle that he will not admit foreigners to attend meetings that are instruments of Communist propaganda, although individual Communists are (quite rightly) allowed to come here to talk private and unorganised nonsense. But was it really worth while to give so much publicity to an obscure conference and so much work to the unfortunate officers who had to shrimp for these people at the ports?

A Tweak from the Caudillo

GENERAL FRANCO'S protests against the forthcoming visit of the Queen to Gibraltar are a waste of time. On no question of foreign policy is it so easy for a British Government to get support from all sides as on this matter of the Rock. Not even Mr Bevan will be found expressing in the Madrid press his dislike for British imperialism.

It is not difficult to understand the General's motives. With large sums of dollars available for building bases, with American ministers speaking of all-out partnership, with the French worried in Morocco and the Arabs girding at the British—the time is felicitous for cutting a figure in the Mediterranean. He has watched carefully events in the Middle East and has doubtless judged that this is a good moment to take his turn at twisting the lion's tail. The lion, it is true, has doubts on some matters and his left and right legs sometimes show a lack of muscular co-ordination which enables a skilled lion-tamer to turn him over on his back. But there are no doubts on the issue of

Gibraltar and General Franco has achieved nothing more than a timid tweak.

He has already hurt himself in the process. The students of Madrid were ordered by one voice of authority to demonstrate in the streets in their thousands, only to find that another voice had told police and guards to break them up. Their patience, too, must be exhausted.

Soviet General—Retired

SOVIET generals who are bowler-hatted do not normally indulge in arm-chair strategy. Last week, however, the official daily newspaper *Izvestia* published a long article on the shape of a future war signed "a retired general." Since a bourgeois Blimp could not easily find favour with the editors of *Izvestia*, these anonymous views on future strategy must be regarded as an expression of Soviet ways of thinking.

The article starts with the familiar attack on "American apologists of a policy of strength" which, if followed consistently, must lead to war. The outcome of such a struggle, writes the general, is far from certain, for the war would be carried to the American continent. Postwar developments in "aviation, jet weapons, and submarines" have shown that the Atlantic Ocean would provide in future no more protection than the English Channel did in the war against Hitler. It is not, however, concluded that atomic developments will make it possible to dispense with land forces. The general does not believe in a push-button, long-distance struggle, and is scornful of all the "peripheral," "global," "transoceanic" or "intercontinental strategies." War, in his opinion, cannot be waged without mass land armies, and the "United States, despite their economic resources, cannot wage it alone." He therefore describes EDC and all other regional plans as American attempts to mobilise all the necessary cannon-fodder.

It is significant that Moscow should argue in these terms when the idea of withdrawing from overseas and covering allies by the threat of devastating atomic retaliation is gaining ground in the United States. Perhaps Soviet generals are battling as sturdily for large armies as American admirals for large battleships. Or perhaps Soviet and American strategic thinking—and imagining—are so far apart that neither government can really appreciate the military motives of the other. If American ideas develop further on present lines, the time may come when a United States government will be considering the very decision that the Russians have been clamouring for since 1948—the withdrawal of American troops from the mainland of Europe and Asia. It is to be hoped that it will exact some price from the Russians beforehand.

Malayan Wages Fall

MALAYA, like Britain, is having its wages troubles. This week's award by Mr Justice Taylor on the wages of rubber plantation workers, however, unlike anything that could happen in Britain, marks an official reduction in the

basic rates; the daily rate of field workers is to go down from \$2.10 (Malayan) to \$1.95, for checkroll tappers from \$2.50 to \$2.25, and for contract tappers from \$2.80 to \$2.25. These are large reductions and they come at a moment of recession rather than of prosperity. The reason for the award is that plantation wages are fixed by agreement between the employers and the trade unions, on a sliding scale which moves according to both the price of rubber and the cost of living index. And rubber had lately fallen below even the bottom of the previously agreed scale.

It is one thing to arrange that wages should fall in certain circumstances and another to see that they really do. In Malaya there has long been a tradition of variable wage rates; the price of rubber is notoriously volatile and boom can give way to slump very quickly. Moreover, in periods of depression it is financially impossible for the less efficient estates to maintain large numbers of workers on their pay-rolls. But the fact remains that big reductions in both wages and the volume of employment are extremely unpalatable, as much to the individuals affected as to the general economy of the country in which they live. It is not, therefore, surprising that the Malayan rubber workers' unions are to hold a poll of their members to decide whether they will accept the recent award. The result should be known about the middle of February.

Whichever way the verdict goes and whatever its consequences, this is a situation which should drive home once again—and this time in specific terms—the lesson that it is dangerous to divorce economics from politics. Tremendous efforts have been made to beat Communist terrorism in Malaya, and their relative success is compelling the Communists to adopt more subtle political tactics. The depression created by the fall in rubber and tin prices provides them with a situation which they may yet be able to exploit much more effectively than they have done so far. Is it still impossible for the Americans, in spite of their well-understood desire to retain a large synthetic rubber industry for reasons of defence, to give more weight to the political consequences in South East Asia of a reduced demand for natural rubber?

Butter Prepares for Battle

AFTER May 8th the battle of butter against margarine will begin in earnest, untrammelled by rations and restrictions. The new branded margarine, probably selling at about 1s. 10d., will be a formidable opponent; but that very fact will keep butter cheap. The butter price may rise fairly sharply at first as the subsidy comes off and everyone indulges the new freedom to buy. It will not be surprising, however, if it eventually settles down, even without the subsidy, at 3s. 3d. or 3s. 6d. per lb, compared with the present subsidised price of 3s. 4d. The producers are determined to scotch the idea now creeping about the world that butter is a luxury; they are alarmed at what has happened in the United States, Germany, and more recently, Belgium, where high-grade margarine has gone far towards displacing butter from many working-class and middle-class tables.

The derationing of butter, fats and cheese will leave only

meat on the ration, and that ration will be inoperative again in four or five weeks' time when mutton starts pouring in from New Zealand. It may be officially discontinued soon after. The summer months will therefore see the axe laid to the local offices of the Ministry of Food, but there will not be a reduction of staff in Whitehall, where much new work is bound to be created by the deficiency payments scheme.

The farmers are likely to urge that the work that remains should be brought under the umbrella of the Ministry of Agriculture. That, however, would be a great mistake. A Minister of Agriculture inevitably tends to see things from the producers' point of view; otherwise he does not remain a Minister for long. So long as the nation is paying £250 million or more in agricultural subsidies, it is essential that there should be a Minister of Food to speak for the consumer.

Farmers' Lament

THE resolutions passed by the National Farmers' Union at its annual general meeting this week strove hard to give the impression that agriculture is facing hard times and is in danger of being abandoned by an ungrateful Government. One resolution deplored the failure to hold a special price review after the recent wage award, and made the usual request for prices that will give farmers "a fair profit"—the implication being that present prices fail to do this. Another resolution singled out egg prices as "completely unrealistic" and demanded that they should be fixed at an "economic level." Since the Ministry of Food is at present losing over £1 million a week in subsidising the sale of home-grown eggs at a price which consumers will pay, this resolution seems very sensible—until it is realised that the farmers have a higher and not a lower price in mind. The Government was also rebuked for not providing more definite schemes for agricultural marketing, although it has in fact conceded the principle of producers' marketing boards for several important commodities.

The union's annual meeting is an opportunity for farmers to put forward their maximum demands in preparation for the price negotiations with the Government, which are about to begin and which this year will be especially crucial. Attitudes struck on this occasion must therefore be taken with more than a pinch of salt. A deeper significance, however, needs to be attached to the resolution that called for renewed restrictions upon imports of agricultural produce. This resolution reflects the farmers' genuine fear that Government guarantees to agriculture will not be continued on their present generous basis once their cost to the taxpayer has been made clear. If imports were to be closely regulated, retail prices would inevitably rise to a point where the cost to the Exchequer of subsidising each unit of home-grown food would be less than at present. But this would mean that British consumers would be denied most of the benefits of falling world prices and increasing world surpluses, in order to keep up the prices of home-grown food. Sir James Turner offered the nice slogan of "ordered abundance" as a euphemism for this policy of planned scarcity.

Calm at Lagos

THE meetings of the resumed Nigerian constitutional conference are being held in private. Nevertheless, if anything dramatic had occurred, it would soon have become widely known, and the absence of reports of a walk-out by any of the delegates gives ground for hope that so far the conference is making good progress. Two things only may foreshadow a future clash. First, Mr Awolowo, the leader of the Action Group, refused to take part in the welcome to Mr Lyttelton on the first day of the conference—presumably to mark his continued displeasure with the Lagos award; secondly, Dr Azikiwe, Nigeria's most prominent nationalist, this time attends the conference as leader of government in the eastern region (where his party recently won an overwhelming victory in the regional elections), and therefore as a delegate with the same status as Mr Awolowo.

Another feature of the recent elections in the east was that Dr Endeley's Kamerun National Congress won all of the thirteen seats allocated to the Cameroons. At the London conference in August, Dr Endeley put forward a claim for separate status for the Southern Cameroons, which at present form part of the eastern region. The delegates from the Northern Cameroons wished their territory to remain part of the northern region. Mr Lyttelton agreed in principle to both these requests, provided that Dr Endeley's demand for separate status was endorsed at the regional elections—as it has been. A new constitution for the Southern Cameroons has accordingly been put before the conference at Lagos.

Briefly, this constitution would give the territory its own legislature and executive council. But the territory would not rank as a separate region because it is too small to stand on its own financially. Instead, it would be "quasi-

federal territory," and would have to be given financial help by the federal government, which, for its part, could demand guarantees of sound administration. The territory would be represented in the federal House of Representatives by six members and, as at present, it would have one minister in the central Council of Ministers. The proposals should offer an acceptable scheme for keeping the Cameroons within the Nigerian Federation, while acceding to the wish of its people, who are Bantu, not to be dominated by another African people—the Ibos of the eastern region. The compromise is one more illustration of the difficulties, referred to in an article on page 302, of making nations out of a motley of tribes.

Foreign Office Nightcap

FOR twenty-eight minutes last Thursday the House of Commons, on a motion for the adjournment, discussed the idea of an Atlantic Assembly which would bring American, Canadian, European and British parliamentarians together to consider their common problems. That is to say, Mr de Freitas offered a warm and carefully arranged dish on which Mr Nutting, Joint Under-Secretary of State, poured cold water. The result in Hansard is a soggy mess.

The Foreign Office argument appears to be of a niggling, caught-you-out-there kind. The Council of Europe, said Mr Nutting, is better than most people admit; it could not live in the shadow of an Atlantic Council; therefore there should be no Atlantic Council. This enthusiasm for the Council of Europe is something new and appears to be a serious rival to the enthusiasm for a more fully developed Atlantic association that Mr Eden has recently expressed. If so, there seems to be some lack of realism among Mr Nutting's advisers. If the European Defence, Political and Coal-Steel Communities come to anything, they will produce a tight political association of six nations which will certainly leave little for the Council of Europe to do. Britain is then liable to find itself in the predicament of a solitary dancer who has got left out of a Paul Jones. Quite apart from that prospect, it is strange that British policy has no ideas for tightening the links between Europe and North America. The future of the North Atlantic Treaty Organisation needs far deeper and bolder thought than ministers have yet given it. Mr de Freitas should not be discouraged.

Substitute for Development Councils

THE development councils set up in many British industries as a result of the Industrial Organisation and Development Act of 1947 have neither fulfilled the hopes of Sir Stafford Cripps and his colleagues that they would serve as powerful engines of modernisation, nor justified the fears of business men that they would prove the thin end of the wedge of public control. The new Industrial Organisation and Development Bill, introduced this week, does not affect these councils in any way; it merely strengthens the powers of substitutes for them. The portion of the 1947 Act to which it is relevant is section 9, under which industries without a development council

Perpetual...service

In his attempt to attain the unattainable—perpetual motion—man found his way to the fundamental principle of the conservation of energy. In modern diesel engines and electrical plant the 'unattainable' has come very close to achievement. And today the engines and the plant are being applied to the services for mankind to which the search for perpetual motion was dedicated—the raising of water, the fertilising of deserts, the moving of ships across water, the grinding of corn.

THE BRUSH GROUP is the world's largest exporter of industrial diesel engines. Many of them go to parts of the world where civilisation is little more than a clearing in the jungle. Here, diesel engines and electrical plant mean more than just a new source of power, they signify hope and the chance of a life free from drudgery. Every year BRUSH GROUP equipment goes from Britain to help make the earth more fruitful, to bring light and power to undeveloped areas, to modernise locomotion. Every day, every hour, BRUSH GROUP plant is at work somewhere across the world, improving living conditions, giving perpetual service to mankind.

could be required by the Board of Trade, or other appropriate body, to pay a levy for three specified purposes: the promotion of scientific research, the promotion of export trade, and the improvement of design.

The present Bill extends that minimum by adding to the three purposes listed in section 9 the other functions assigned to the development councils themselves; these include consumer and managerial research, training, the improvement of costing and accounting practice, standardisation, statistical records and publicity. The Bill thus represents, from one aspect, a considerable and potentially beneficial strengthening of the original Act and a recognition by the Conservative Government of its usefulness. From another aspect it appears as a retreat from the idea of the development council; the greater the success of the alternative procedure, the less the need and the incentive for industry to reconsider its dislike of Sir Stafford Cripps's brainchild.

From a third point of view, however, there is some reason to distrust the new Bill. The 1947 Act allows development councils—and thus, under the Bill, makes a proper subject for a compulsory levy—the function of “promoting arrangements for . . . co-ordinating production, and for marketing and distributing products.” This could lend support to an outburst of cartelmongering in the worst Tory tradition. The development councils are statutorily provided with an independent chairman and a minority of independent members as well as an equal representation of workers in the industry. Under the alternative procedure there is no such safeguard for the public interest. Everything depends on the “authority named” (Board of Trade or other) and on the body to which that authority entrusts the funds raised by statutory levy. The matter may be cleared up in debate. It certainly needs watching.

Developing Guiana

COMMUNISM, it is often maintained, so far from being caused by poverty, only becomes a real menace in countries that are slowly lifting themselves out of the trough. British Guiana may be a case in point. Political unrest found expression at the very moment when most was being done to improve its economic lot. The International Bank's recently published report* on the colony shows that although the population has been increasing at the tremendous rate of 3 per cent a year (largely because the country has been cleared of malaria-carrying mosquitoes) prosperity has more than kept pace. Real national income has recently been increasing by just under 5 per cent a year, and income per head by 2 per cent a year.

If the five-year development programme outlined in the report goes through, there is every chance that material progress will continue, and even be speeded up. But this can only be done by a big expansion in the colony's production, and exports, of rice and sugar. The mission recommends that development should largely be concentrated on these two staple crops grown along the coastal strip. Drainage, communications and research into

* The Economic Development of British Guiana. Report of a mission organised by the International Bank for Reconstruction and Development. The Johns Hopkins Press (London: Geoffrey Cumberlege). Pages 385. 5s or 48s.

improved cropping methods are the first priorities; hopes of tapping the colony's inland wealth and of expanding light industries must wait. Relatively less should be spent on social welfare and more on productive investment.

This is not a popular programme, and it could easily be wrecked if the government in power was one that ignored the fundamentals on which the colony's prosperity depends—the protected market for West Indian sugar given by Britain and the fostering of a favourable climate for foreign investment. Presumably the problems raised by the report have been discussed by the Governor, Sir Alfred Savage, on his recent visit to London. The only way to keep the colony on the political highroad is for local non-Communist politicians to capture the popular imagination. At present the United Democratic Party has no field organisation to compare with that of the still entrenched People's Progressive Party, and seems to lack purpose and confidence. It will not succeed until it can show that it is both united and democratic and a party.

Coaches in Confusion

WHEN is a bus-load of people a “private party” going out for a “special occasion”? Lawyers have been asking this riddle for over twenty years, and it would seem from a parliamentary answer given by the Minister of Transport last week that it is still causing headaches in his Ministry.

The riddle arises from the provisions of the Road Traffic Act of 1930 about the licensing of road passenger services. Buses and coaches on regular services have to be licensed, and so, too, do coaches running excursions; but coaches that have been chartered (defined as “contract carriages”) do not need a licence, provided that they are carrying a private party on a special occasion. But there was soon a legal debate about what was a special occasion. Special to the trippers—their annual picnic? Or special to the destination—Blackpool Illuminations? Originally, most people thought it meant the former, but in 1933 the High Court declared for the latter interpretation. In the 1934 Act Parliament tried again to define what it wanted. This led to new absurdities, and meanwhile a black market in unlicensed public transport was appearing. In 1951 another High Court decision confirmed the narrow interpretation of a special occasion, by ruling that a bus which carried people from a holiday camp to the station was in need of a licence.

It was one of the main tasks of the Thesiger committee, whose report* was published early in December, to suggest ways of clearing up this legal confusion. It proposed to get out of the difficulty by doing away with the exemption. It would continue to exempt cars, seating eight people or less, but would introduce a simple licence for public service vehicles. The Minister of Transport, however, understandably does not want to impose a new control in a field where there are already far too many controls anyway. Mr Lennox Boyd's answer in Parliament last week suggests that the Government would prefer to seek agreement once again on what is a special occasion. This time it will need to get the definition right.

Letters to the Editor

Debate on Death Duties

SIR—Your article of January 9th fails to mention one point of great importance. In carrying out the provisions of the 1940 Finance Act, the Estate Duty Office treats as a single person persons who are related to one another, persons who are in partnership and persons interested in any shares which are the subject of a trust. And "relative" means husband, wife, ancestor, lineal descendant, brother or sister.

In one private limited company I own one-tenth of the ordinary shares, and the company is controlled by considerably more than five persons, but according to Sections 46 and 55 read together, these are in fact treated for estate duty purposes as one person. Many think, myself among them, that that is the most harsh application of all. It was clearly only intended to deal with family estates formed into a company to avoid death duties, yet it has been made to apply to all estates of partners in businesses of considerable size where a private limited company is formed. Because of this, former partners, related or unrelated, sometimes even antagonistic, are treated as one person for the purposes of the Act.—Yours faithfully,

ALPHA BETA

Crisis Over Port

SIR—Your correspondent finished his article of December 30th on an unnecessarily pessimistic note. On the subject of import duty, he says: "But it would take more than any reduction . . . to restore port-drinking to its former position in a Britain that has lost the habit."

Because of the import duty, Britain may have lost the habit of drinking port: it has certainly not lost the taste. In a survey on alcoholic drinks carried out in 1949, 56 per cent of those interviewed said they liked port, a figure second only to that given for beer. In the same survey, to the question: "If wine prices were reduced, which wines would people drink more?", the highest percentage, 52 per cent replied: "Port."

None of us in the trade hopes for a reduction of import duty from 50s. a gallon or 8s. 4d. per bottle to the prewar level of 1s. 4d. a bottle. We would, however, like to see the traditional balance of 1 to 2 restored between import duties on light and heavy wines. The duty on light wines was reduced by Sir Stafford Cripps during his term of office as Chancellor of the Exchequer to 13s. a gallon, or 2s. 2d. per bottle. The Exchequer has been more than compensated for this wise move.

It is not too much to hope, surely, that

in view of the figures I have quoted port would have at least a large proportion of the success that has been achieved by light table wines since the reduction of their import duty.

In "Notes of the Week" you point out that the port advertising campaign has borne some fruit. This was done on a very modest budget. If a stimulus of this nature can produce such results, how much more effective would be the direct appeal of a price-cut.—Yours faithfully,

R. W. GODSON

Port Wine Trade Association, E.C.3

Made in Sheffield

SIR—It is much to be regretted that your Special Correspondent, writing in your issue of January 16th, should have made a statement concerning Sheffield's civic pride which is so grossly inaccurate as to be quite inexcusable. He writes, "Its Corporation have not even managed to make a worthy collection of Old Sheffield Plate."

In fact, Sheffield Corporation possesses the largest and finest collection of Old Sheffield Plate in the world. This collection is housed and displayed in the City Museum, a modern building of considerable distinction, which, like its contents, seems to have escaped your correspondent's notice. In 1943 Sheffield Corporation purchased the world-famous collection of Old Sheffield Plate made over a period of some 50 years by Mr Frederick Bradbury, author of "History of Old Sheffield Plate" and the greatest authority on the subject. The collection now owned by the Corporation and displayed at the City Museum comprises about 1,200 specimens, and attracts collectors, dealers, designers and students from all parts of the globe.—Yours faithfully,

H. RAYMOND SINGLETON

Director

Sheffield City Museum

Services Not Servants

SIR—I was first amused and then somewhat disturbed by an article in *The Economist* of October 31st. It implied that services and goods available in New York City or one or two other of the larger cities are available generally throughout the country. There are places that not only do not have the heated towel rails in those shiny bathrooms, but do not even have the bathroom.

May I give you a few facts on some of the services described in the article as they pertain to our small community?

Lest anyone think we are in the backwoods, we are only 75 miles from New York City and 30 miles from Philadelphia. For heating, those people who do not use anthracite use oil. It is true that these oil burners do operate practically automatically. They also get out of order, usually on the coldest day in the winter. It is true that the various companies supplying the oil also have a service guarantee policy for an annual fee, but the idea that they will send a repairman night or day leaves me without words. We have such a policy, but to get a plumber over when we need him we just about have to throw a cocktail party in his honour, and then likely as not he will complain about the *hors d'œuvre* and run off without even looking at the heater.

It may shock your special correspondent, but in our community I know of no place where you can put a coin in the slot and have a large block of ice or a bag of ice cubes clatter out. I know of no one in our neighbourhood who provides television meals—ugh!—or offers home delivery of meals at any price. I know of no drug store where you can get a whiff of oxygen for 25 cents to cure a hangover, although if you or your correspondent can assure me that this gadget really works I am going to have one installed in our house. Finally, I know a number of people who should attend charm schools, but, unfortunately, I do not know of any schools that I might recommend to them. I am not sure what class I am in, but whatever it is I haven't the faintest idea where I could go to get a lecture on how to go up or down.

Seriously, I do think it is a great mistake to give the impression that everything is so easy over here that our bodies are atrophied completely, except for our fingers which get a great deal of experience pushing buttons.—Yours faithfully,

J. O. J. SHELLINGER

Ambler, Pa.

Wages Cauldron

SIR—In your survey of industrial relations in the issue of January 9th you state that the Electrical Power Engineers' Association has set up an Action Committee to improve the status and salaries of "technicians" in electricity supply. In the ordinary way one would not bother to quarrel with the loose use of the term "technician" to describe technical staff men, but it is as well to point out on this occasion that the ranks of the EPEA are, in fact, made up of professional engineers and technologists. It is because we believe that the position of the qualified technologist in electricity supply has worsened recently in relation to the clerical, accountancy and secretarial grades, and to some sections of the manual workers, that we have embarked on our present campaign for a readjustment.—Yours faithfully,

A. M. F. PALMER

Retreat to Dunkirk

THE WAR IN FRANCE AND FLANDERS, 1939-40.
By Major L. F. Ellis.
Her Majesty's Stationery Office. 425 pages.
7s. 6d.

WHAT is the lesson of this clear and judicious chronicle of six weeks' fighting? Was it the most dismal or the finest hour? How is the fact that it covers so many politicians with shame to be balanced against the fact that it is as full of gallant feats of arms as any volume of Fortescue? To glory in the magnificent stubbornness of the retreat during May, 1940, and in the audacious efficiency that brought nearly 600,000 men back to Britain is to obscure the lessons to which Major Ellis quietly points.

The lessons are relevant at this very moment: the dangers of holding a long thin line against concentrations of armour which have the initiative; the fault of sticking to so-called strategic bombing when the army needs every ounce of air force co-operation; the uselessness—in the long run—of throwing half-trained and under-equipped reserves into battle against seasoned troops; the risks of allowing to a national commander, who is under the orders of another national commander in an allied army, the right of appeal to his own government. Those who have to weigh these matters in Supreme Allied Headquarters and in Whitehall should read this volume's account of how two territorial divisions faced between Scarpe and Somme seven German armoured divisions on a thirty mile front. They had been on construction work, were half-trained, were not equipped as fighting divisions, had no artillery and lacked adequate transport, signals organisation and administrative units. Each division was at half strength, and the 23rd division fought with 13 guns from a Royal Artillery instruction school, of which 11 could be fired only over open sights. Such facts are more easily forgotten nowadays than the superb performance of the regular battalions. Likewise the futility and muddle that marked the heroic defence of Calais are less comfortable to ministerial memories than the brilliance and technical superiority of the British fighters over Dunkirk.

The indictment to be drawn is, of course, incomplete. There are two volumes in this series to come, on the "Grand Strategy" that created a last-minute commitment on the Continent and allowed a weak French army to provide the hinge on which the BEF

swung into Belgium. (The original plan of the Conservative cabinet was to have a token force of only two divisions in France and to fight the war mainly in the air and at sea.) And there are two volumes to come—they are bound to be controversial—on the war at sea and the strategic air offensive. But what is important to remember is the very narrow squeak of 1940, the jeopardising of an inadequately supported regular army and the way in which calculations about how the war would go were upset. After all, the Belgians, British and French had 134 divisions against the German 136; but Holland was overrun in five days, Belgium in 18, and France in 46.

The materials for a provisional judgment are well set out in this volume, which is much more readable and succinct than it looks. It is clearly and elaborately mapped; there is a thorough analysis of the British forces engaged; an appendix gives in German relevant quotations from enemy documents on the campaign; a supplement examines the German conduct of the operations; and the author passes, in a special chapter, modest but penetrating judgments on the British conduct of the campaign. Here he shows no recrimination and marked fairness. Perhaps he is too kind to Lord Gort and a little too unkind to Weygand; but he shows full understanding of the difficulties of the RAF in a role for which they had not been trained. He is generally satisfied with the equipment of the BEF, which is surprising, but criticises the lack of armour, the bad wireless equipment, the inadequate intelligence organisation and the lack of air reconnaissance. Here is his final verdict:

So small an army as the British Expeditionary Force could not, however, have done more than it did had it been perfectly equipped. Its front was never broken. It fulfilled the task laid on it by the French High Command. It stood in the path of Bock's advance (in the north). So long as it was fully engaged in doing this it could not also do something else; the closing of the breach in the French front to the south had to be done, if at all, by the French. It was only when it had become clear that the French could take no effective steps to close the breach and the Belgian defence was on the point of collapse that the British Government ordered withdrawal to the coast for evacuation.

In other words the Weygand counter-attack plan was never possible, and Lord Gort showed good judgment in foreseeing the need to withdraw to the coast—better judgment than was some-

times shown by those in London who sent him advice and orders, which now read a little like Hitler's orders in 1944-45.

Deeply interesting and quite decisive is Major Ellis's demolition of the notion that Hitler, for political reasons, deliberately spared the British forces around Dunkirk. On May 23rd Rundstedt had five armies dangerously spread; his ten armoured divisions were scattered and had suffered heavy losses. He wanted to turn south against the French in compact and orderly fashion so as to make sure of the Atlantic ports. He was not interested in being the anvil below Dunkirk while Bock brought the hammer blow from the north. It is clear from the German documents that Brauchitsch, the Commander-in-Chief, his Chief-of-Staff Halder, and the two Army Group Commanders disagreed about what should be done. Moreover, neither Guderian nor Kleist believed that tanks should attack in the difficult Dunkirk terrain. If the British Army was spared to fight again "it was a failure of the professional soldiers and the Army High Command." Hitler, be it noted, supported Rundstedt in his decision to pause and regroup. So much for a mischievous postwar German legend. Major Ellis, in this as in most other respects, has done a balanced and thorough job in lucid, sometimes graphic, English.

Historical Evidence

ENGLISH HISTORICAL DOCUMENTS. VOL. VIII, 1660-1714.
Edited by Andrew Browning.
Eyre and Spottiswoode. 966 pages. 80s.

THIS is the second massive volume to be published of an ambitious series designed by its general editor, Professor David Douglas, to make the basic material for English history "extensively available in bulk to a wide public." Twelve volumes are projected, each comprising about a thousand pages and costing £4. Editorial comment is concerned only with making the documents intelligible and not with drawing conclusions, for the aim of the series is to enable the public to check, by reference to the original evidence, "tendentious or partial" interpretations of the past. But it is arguable that the public is more likely to be protected against misinterpretation of the past by free discussion among historians than by the publication of selected sources on this scale. The volume of original evidence for the more recent periods is so great that it is difficult to see how any selection, even with half a million words at the disposal of each editor, can be as authoritative and comprehensive as is claimed. Any selection is necessarily partial and individual; and historians are always asking new questions and exploiting new sources.

Professor Browning's selection of documents for this volume is varied and lively, illustrating constitutional and ecclesiastical issues, methods of public finance, social life and foreign policy,

concluding pleasantly with contemporary character sketches of the leading personalities. Yet, wide as this selection is, it cannot do all that the general editor of the series has claimed. It is difficult, for example, to see how a reader could use this volume to check the sympathetic study of the Tory party by Professor Feiling, whose account depends largely on sources untapped by Professor Browning. The editor's special knowledge of the reign of Charles II has enabled him to include some highly interesting material illustrating parliamentary management by Arlington and Danby. But politics in the reigns of William III and Anne, when the use of influence was such a controversial issue, receive more cursory treatment.

During the latter part of this period England was engaged in the biggest continental campaigns since the Hundred Years' War; but this selection throws little light upon the political and social effects of financing the struggle. "The heavy burden of the late long and expensive war," ran an act of 13 Anne, "hath been chiefly borne by the owners of the land of this kingdom, by reason whereof they have been necessitated to contract very large debts." Writers such as Davenant and Swift betray very clearly the resulting political fissures, yet their comments are not included by Professor Browning. Mercantilist pamphlets, which helped to inflame public opinion against France, are omitted, while the European trades, important in themselves and for their influence upon Anglo-French rivalry, are neglected. Again, it

The Commonwealth and the Sterling Area

73rd STATISTICAL ABSTRACT 1949-1952

This Abstract has always held a unique position among contemporary statistical publications, in that it bridges the gap between national and international publications and enables the trade of the individual countries of the Commonwealth to be brought together and viewed as a whole. The expansion of summary information in the present volume adds considerably to its value to all interested in the economic development of the Commonwealth as revealed by trade statistics.

Price 15s. By post 15s. 6d.

HER MAJESTY'S

is surprising to find only twelve pages of desultory observations in the section on science, education, scepticism and superstition, and startling to discover virtually nothing from the writings of the Marquis of Halifax. Nevertheless Professor Browning has brought together a great deal of material for which any student of this period will be grateful. The bibliographies are admirably thorough and intelligently set out, though the index is inadequate.

An Atomic Steward

REPORT ON THE ATOM.

By Gordon Dean.

Eyre and Spottiswoode. 288 pages. 16s.

FOR three years, from 1950 to 1953, Mr Gordon Dean was chairman of the United States Atomic Energy Commission, during one of the less controversial periods in its history. He is a sensitive and compassionate man, as well as a competent administrator, and this book is, probably unconsciously, a record of the effect of close contact with this gargantuan and awe-inspiring enterprise upon a temperament such as his. So few non-scientific men have been in the privileged position of attending the inner councils of the atom that this half-personal, half-documentary report is the first accurate description of the growth, planning and running of such an organisation as seen through their eyes. Scientists take care of the technicalities; but the task of supervising the translation of their atomic formulae into steel and concrete, into teams of men and women, and expressing the whole in dollar notation, the task of keeping the correct balance between soaring scientific ambition and the country's other needs, rests on the scientists' colleagues and ultimately on the chairman. Throughout his description of this fantastic dream-world, certain major problems of policy recur, problems to which Mr Dean puts forward his own solutions, distilled from his experiences.

Mr Dean conveys much of his wonder at the monstrous size and speed with which the new industry developed. When present schemes are completed, a total of \$9,000 million will have been invested in less than a decade in the plants needed to transmute crude uranium ore into complete atomic weapons. This "well exceeds the combined capital investment of General Motors, US Steel, du Pont, Bethlehem Steel, Alcoa and Goodyear," the giants of American industry, but it represents the minimum investment compatible with the country's security. Mr Dean believes, as do many in this country, that a substantial stockpile of atomic weapons is the only possible insurance against the prospect of a war of extermination too horrible to contemplate. The deterrent powers of atomic retaliation are debatable, but, in a thoughtful chapter on atomic weapons, Mr Dean asks whether the United States has not been manoeuvred into an attitude of reasoning where

it becomes less of a crime wantonly to invade your neighbour, burn his cities

and murder his women and children than it does to use an atom bomb in your own defence... working ourselves into a position where the most important single ingredient in our defence arsenal was tucked away where it couldn't be taken out, except under the most extreme conditions, without a good deal of soul-searching at home and a loss in our reputation for morality abroad. No one appreciated this situation more than the Russians. By means of it, they were given a much greater freedom of action in the postwar world than they would otherwise have enjoyed.

A stricture like this, when it comes from so fundamentally reasonable a man, cannot be brushed aside as another manifestation of American atomic jingoism. Mr Dean, unlike most advocates of atomic sabre-rattling, knows what he is writing about.

For the same reason, his misgivings about the administration of the American atom enterprise deserve to be read with care. Mr Dean is far from happy at the creakings of the Atomic Energy Commission's administrative machine. Cost estimates go inexcusably wide of the mark. Terms offered to companies that undertake development, construction and operation of the plants as the commission's agents are unsatisfactory and are accepted only through mixed motives of patriotism and an urge to get in on the ground floor. Tussles with Congress over the commission's annual budget, when it has already had to commit itself to expenditure for several years in advance, is only another instance of how the lusty infant in Mr Dean's care kept bursting out of the swaddling clothes wrapped round it by a doting Administration and an awestruck Congress. He is convinced that the sooner private industry is allowed to take over responsibility for development, especially now that the world stands on the threshold of atomic power, the better both for the atom industry and the American taxpayer who foots its mammoth bills.

On the question of secrecy, Mr Dean has an admirable sense of perspective that enables him to see the atom in its correct proportions. He drives home with considerable force the argument that the atom is not "Made in USA" and its appearance in Russia is not due to treachery alone. Secrecy has not prevented atomic progress elsewhere. Other countries, using scientific knowledge open to all, are rapidly catching up on American developments, without any help from American know-how. There is a world of difference between a reasonable exchange of information between friendly rivals, and the barring of doors to all comers, and Mr Dean realises that both industry and science are certain to lose their vitality in an atmosphere of stifled secrecy.

Britain is now at the point reached by the United States in 1947 when the military authorities handed the atom over into the keeping of the civilian Atomic Energy Commission. Last week an official account of the building of a pilot industry was published by Her Majesty's Stationery Office ("Britain's

Atomic Factories," 5s.). Soon a corporation will be set up to take over responsibility for this venture from the Ministry of Supply and to pilot it through to adult status. Mr Dean writes with a deep sense of mission, and British administrators need not be too proud to learn from his experiences.

Solitary Poet

THE EGOTISTICAL SUBLIME: A

History of Wordsworth's Imagination.

By John Jones.

Chatto and Windus. 212 pages. 16s.

"WORDSWORTH'S originality is not easily approached," Mr Jones declares early in this important study. "He enclosed his finest performance in a husk so tough and commonplace as to mislead bad critics and distress good ones." Certainly much recent writing on the poetry is queerly inadequate. It has been viewed by Sir Herbert Read as a hastily erected screen before an unfortunate erotic experience; by Professor Beatty as a dressing up of the undistinguished philosophy of David Hartley; and by the late Irving Babbitt as exemplifying the doom of nonsense imposed upon Western thought by Rousseau. Yet Wordsworth took little interest in philosophy, and to its contemporary developments, at least, not even Coleridge could edge him beyond an attitude of ignorant defiance; he had "never read a word of German metaphysics, thank heaven!" Again, it is not easy to think of any personal relationship as definitive with him. His proper title Coleridge declared to be *spectator ab extra*; his was always the sympathy of "a contemplator rather than a fellow-sufferer," so that he felt "for, never with" his subject.

"I gazed and gazed," "I looked and looked," "I stared and listened": this constitutional detachment is the ground of all Wordsworth's thought. Solitude is the theme of his long life and the pre-occupation of his poetry; he celebrates

the individual Mind that keeps her own
Inviolate retirement.

On this cardinal fact Mr. Jones comments:

The solitude of which he is speaking issues from an attitude towards personality; from an eagerness to accept the fact that I am myself just because I am not anything else: to be me is to be always apart. The final barrier which is differentiated existence, dreadful to Coleridge, is embraced by Wordsworth as the source of enlightenment and strength. "Inviolate retirement" sounds a note of exultation because the poet believes that the way to wisdom lies through the individual's awareness of his individuality.

Here, then, Wordsworth starts, and the poetry of his great decade is a huge sustained argument from solitude to relationship, from the points "where all stand single" to their connections with each other. And this the context of literary history has tended to mask. "The large and lazy assumption that the Romantic poets were all striving to express unity has obscured the structure

of distinct but related things which is the world of Wordsworth."

Having made this preliminary diagnosis, Mr Jones embarks upon a dissection of the poet's imagination which he describes in a preface as "of some pretension." His boldness has been justified, and many will find here the most perceptive writing on Wordsworth since Matthew Arnold's essay.

Pioneering Inquiry

COLONIAL SOCIAL ACCOUNTING.

By Phyllis Deane.

Cambridge University Press. 360 pages. 50s.

THIS book is Miss Deane's final report on her inquiry into the measurement of the national incomes of Northern Rhodesia and Nyasaland. The social accounts of the two territories for 1945 are presented, together with some data for 1938 (already presented in an earlier publication) and 1948. Very full information is given about village economic surveys and other sources of information used in the preparation of the estimates.

Miss Deane discusses the difficulties of constructing the social accounts of territories in which subsistence activities form a major part of all economic activity. The problems of definition, valuation and measurement are immense; they are illustrated in some detail. The available statistics are patchy and meagre, and additional data are difficult to collect. The result is that the estimates are tentative. Thus the key estimates of the value of subsistence output are "purely token figures and it is important to remember that a revised scheme of evaluation would alter the results radically." "The concepts which are applicable to a money-exchange economy mean relatively little in the context of a subsistence economy." In view of the inherent difficulties, it is therefore somewhat surprising to be told that, in drawing up social accounts,

there is the need to maintain some kind of uniformity with international conceptual standards so that the village social accounts will have some meaning in an international framework.

Thus what Miss Deane describes as an experiment in national income measurement of colonial territories "has had a very limited success." This outcome could have been (and may well have been) predicted before the detailed investigations were started. Miss Deane claims that the framework of the necessarily incomplete social accounts "can be useful for general descriptive and analytical purposes." She refers to the discussions in the book of the economies and economic problems of Northern Rhodesia and Nyasaland, but these provide no surprises for the student of African colonial conditions. On several topics Miss Deane departs from the purely descriptive and statistical. Here her views are interesting: for instance, on Rhodesian agricultural price policy, the problems of migrant labour, and the efficiency of the distributive trades. But the discussion is far too brief to be

altogether satisfactory. Perhaps the eight pages of photographs, attractive as they are, might have been omitted to give Miss Deane more room within which to develop her sometimes provocative views on important and controversial questions.

The Voice of Marshall

ALFRED MARSHALL AND CURRENT THOUGHT.

By A. C. Pigou.

Macmillan. 85 pages. 7s. 6d.

IT was a happy idea of Professor Pigou to choose as his subject for the Marshall lectures in 1952 what Marshall would have to say about the current state of economic thought, what of the current state of fact and policy. In relation to each of six important topics—mathematical methods, statistics, elasticities, the rate of interest, utilities and socialism—the authentic voice of Marshall speaks through his distinguished pupil and first successor in the Chair of Political Economy in the University of Cambridge. The lectures bring us back the man who in his own words was "accustomed to think in Mathematics more readily than in English," also the man who "had come into economics out of ethics." The university student of today will find his best introduction to Marshall in this slim volume. He will be convinced of the weakness of ready reckoners for Utopias, and of the strength latent in the faith and works of—to him—an Ancient.

Professor Pigou makes a fresh contribution of his own. He suggests a neat test of significance of measures of elasticity of demand and also puts a fresh formal complexion upon Keynes's challenge to Marshall's views on the rate of interest, although it may be doubted if either protagonist would have accepted the position offered him. For the scrupulous reason that "there is not enough evidence," he forbears asking what Marshall would have thought "about what politicians call the policy of full employment." But, on this, may it not be a fair guess that Marshall would have felt deep disquiet lest the national paper-chase in recent years was undermining the ordinary man's standard of living; and would not the practice of making two jobs out of one person's work have roused him—as did Defoe's story of the Volga boatmen—"to slay the old fallacies again and yet again before their [the people's] eyes"?

Part II of the book consists of a paper on the trade balance, written by Professor Pigou at about the same time as the lectures. Let any who would begin to understand that "monstrous monument of statistical skill," the British Blue Book on Income and Expenditure, particularly in conjunction with the command papers on the balance of payments, turn first to Professor Pigou's basic skeleton schemes of the data; and, above all, let him learn the lesson that "statistical variations are not causes, but channels through which genuine causes exercise their influence."

Shorter Notices

ABADAN.

By Norman Kemp.
Allan Wingate. 18s.

Mr Norman Kemp is a young reporter whose taste for hot spots has won him work for several major newspapers and news agencies. It is therefore hard to conceive why he let the deadline for this book slip by. It is the human interest story of the ordeal suffered in the summer of 1951 by the Anglo-Iranian Oil Company's rearguard at Abadan. Produced in hot blood, his turgid style would have passed muster, outweighed by the topicality of his tale of the arrogance and pettiness of the young men in pin-stripe suits who arrived from Teheran to take over, of the nasty tests of character and forbearance to which the company's British staff were put, and of the despair of its senior Persian employees, torn between knowing what they were losing and saying that nationalism must come first. Told after the lapse of two years, his story cannot carry its overload of items in the vein of "Mrs Bonnie James paused only to snatch her baby before she ran for the plane."

Mr Kemp tries to justify the delay by transforming himself from reporter into historian, but the attempt is not satisfactory. He has never been over the mountains and into Persia proper; all its history is news to him and much of its nature escapes him, and pages of painstaking quotation from Foreign Office documents do not make up for many resultant omissions and mistakes. He is obviously

splendid at getting into the front row during a riot, and scarcely any Englishman outside the company saw what he saw. He would have done better, therefore, either to have stuck to the kind of reporting that he can do or to have found himself a collaborator to handle the history.

★

THE LONDON MAGAZINE. *A monthly review of literature.*

Edited by John Lehmann.

Chatto and Windus. 104 pages. 2s. 6d.

The appearance of a second new literary periodical in the space of five months must cause some surprise. *Encounter*, which broke surface in October, is of wider scope and is concerned with literature, arts and politics. *The London Magazine* is concerned only with literature and, if its first issue is a fair sample, is interested more in the publication of original work than with criticism. A high proportion of the contributors to its first issue are in their late twenties or early thirties, but it also includes a rather ragged canto by Louis Macneice in memory of Dylan Thomas and a highly polished chapter from the next book of Elizabeth Bowen. This brave venture is sponsored by the *Daily Mirror*.

★

A TEXTBOOK OF ECONOMIC THEORY.

By Alfred W. Stonier and Douglas C. Hague.

Longmans. 513 pages. 25s.

This is described as an introductory textbook, requiring of its readers no

previous knowledge of the subject. In a narrowly technical sense this claim is justified; nowhere is there assumed a prior familiarity with economic terms and analytical construction. There is assumed, however, a capacity for concentration, a facility in juggling with abstractions, and an ability to pursue a complex train of thought without ever losing sight of original assumptions, which is generally acquired only late in the course of study—whether of economics or of any other rigorous mental discipline. In fact, this "Textbook" is especially recommended by its authors (both experienced university teachers) to candidates for Part I of the London BSc(Econ) degree; to students, that is to say, who have survived the sifting of the first university year, who have decided that they are really interested in economic theory and who want to get their teeth solidly into it. The ordinary run-of-the-mill beginner should really be warned off.

For the intelligent budding specialist the "Textbook" is admirable. Nowhere else is he likely to find so clear, comprehensible and authoritative an exposition of the construction and use of economic models. Used as it deserves to be used, here is the means of carrying him smoothly from the solid beginner's ground of, say, the Cambridge Economic Textbooks to those altitudes where the learned journals have their being. It is concerned strictly with theoretical economics, not in the least with political economy; but the authors are scrupulous in reminding the student of the real-life limitations inherent in abstraction. The book deserves, from its necessarily limited but ever-renewed audience, a warm and lasting welcome.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Business Man's Budget

Washington, DC.

PRESIDENT EISENHOWER'S 1955 Budget, the first that has been superintended throughout the whole of its long gestation by the new Republican business men in government, rests on the assumption that, as he said to Congress last week, conditions will be "fairly stable . . . internally and externally, during the period" the Budget covers. In other words, it is assumed that there will not be an economic recession of sufficient size to make necessary any drastic overhaul of the pattern of American taxation and expenditure, and that the frontiers of the cold war will remain, for the next eighteen months at least, where Mr Dulles and his threat of massive retaliation have bidden them to remain.

Federal expenditure for the fiscal year 1955 (beginning July 1, 1954) is estimated at \$65.6 billion, a reduction of \$5.3 billion from that of the fiscal year 1954, ending on June 30th. Revenue is estimated at \$62.6 billion, leaving a deficit of \$2.9 billion, slightly less than that for the current year. The requests for authority to incur new obligations—that is for congressional authority to plan expenditure much of which will become due for payment after June 30, 1955—total \$56.3 billion, \$4.4 billion below the figure authorised for 1954. By the end of the 1955 year the unspent balance of appropriations voted in previous years will, it is estimated, be lower than at any time since the rearmament programme got into its stride in 1951.

From the economic standpoint the interest of the Budget lies not so much in the general figures but in the underlying calculations. In the first place both the President and the Secretary of the Treasury have made it clear that estimates of revenue are based on roughly the same level of economic activity as prevails at present: if the economic activity in the government have a different view it has not been permitted to distort the symmetry of official calculations. Secondly, while the reductions in taxation will clearly do something to stimulate consumer demand, they have not apparently been worked out with this as their primary object.

Two of these reductions occurred automatically on January 1st when a special increment to the personal income tax and the excess profits tax expired. The President has demanded the continuation, in the interests of revenue, of the general corporate income tax and of the special excise taxes, which would otherwise lapse on April 1st. Clearly, the Administration is not using the Budget to reinflate consumer demand. This is borne out by the nature of

the income tax revisions recommended in the Budget Message; though a number of sensible proposals for tidying up the chaotic structure of tax exemptions were included, these seemed aimed chiefly at helping the citizen as an investor rather than as a consumer. Furthermore, the demands of orthodox Republicans for a balanced Budget and the hangover of election invective against inflation seem to have inhibited the Administration from trying to encourage retail sales by a lowering of excise taxes.

Finally, despite all that has been said about the determination of the Eisenhower Administration to use the resources of the federal government to prevent "readjustment" from rolling into "recession," the President has not asked for any increase in authority to incur expenditures that would give him the necessary freedom of action in stimulating economic activity quickly, through public works or other channels. In the Administration's plan for countering recession, such pump priming clearly plays a subsidiary role to monetary adjustments and to improvements in the automatic economic stabilising forces, such as increasing social security payments.

★

Estimated spending on national security, which is still responsible for two-thirds of the national expenditure, is \$44.9 billion for 1954-55, \$3.8 billion less than is expected this year. This reflects a projected cut of \$4 billion in the spending of the United States armed forces themselves, and a slightly increased rate of expenditure on atomic energy and on foreign military aid, now rechristened "mutual military expenditure," in yet another attempt to make it more palatable to Congress.

As was to be expected from the "new look" of American strategy, recently unveiled by the President and Mr Dulles, and accepted with so much misgiving around the world, it is the Air Force which is to spend the largest proportion of the funds, \$16.2 billion, its highest figure since the end of the second world war. In part, however, the pre-eminence which has been given to the Air Force is only a return to the pattern of priorities which existed under the Democratic Administration, and which the new civilian heads of the Defence Department sought to change last spring, without the advice of the Joint Chiefs of Staff. While the Army, with \$4.1 billion less to spend, will shrink to 17 divisions from its present strength of 20 by the middle of 1955, and the Navy and Marine Corps will

Guide to the Moon

8 plates, folding map and 14 diagrams. 16s. net.

THE ECONOMIST: "He writes easily and well; his explanations, accompanied by clear sketches, can be easily understood . . . all potential lunatic voyagers should read it right away."

NEW STATESMAN: "It would be hard to imagine a more straightforward and attractive account of the origin, motions and features of the moon."

2nd IMPRESSION

READY TODAY

An exciting and completely authoritative account of progress made in atomic research throughout the world

Report on the Atom

by Gordon Dean,

Chairman, United States Atomic Energy Commission, 1950-1953

Demy 8vo 288 pages

16 pages of illustrations 16s. net.

SIR JOHN COCKCROFT writes:

"Mr. Gordon Dean has held for four years the most important position in the Atomic Energy world of today. His book can be commended as an objective and authoritative statement."

and Professor J. ROBERT OPPENHEIMER:

"A model of clarity and of interest . . . a balanced, informative and inspiring account of what other nations are doing in the same field."

"No important conclusion or argument or impression is based on error of fact, in this respect this book is unique and welcome."

EYRE & SPOTTISWOODE

The United States Budget

For the 1955 Fiscal Year Beginning July 1, 1954

All figures are for fiscal years ending on June 30th of year shown; those for 1954 and 1955 are estimates.

The 1955 estimates of receipts include proposed new taxes.

Income tax receipts include refunds for overpayments to be distributed during the year.

*The budget figures do not include transactions involving insurance and other funds which the Government holds in trust. At present most of these are taking in more money than they pay out.

THE ECONOMIST, JANUARY 30, 1954

remain virtually unchanged in size and strength, the Air Force, with 23,000 active aircraft, or 120 fully-equipped wings, will by then be well on the road to the goal of 137 wings by mid-1957.

The major economies that are being made result only partly from a conscious decision on the part of the Eisenhower Administration to base its defence policy on the strategy of the "long haul" rather than a rapid build-up of strength. In considerable measure they merely follow from the fact that the rearmament programme has now been running for four years, and that much of the capital expansion which it involved has been completed.

Thus while there will be a reduction in the coming year of some \$600 million in manpower costs (derived entirely from reductions in the strength of the Army), the largest single saving, of \$2.7 billion, is in procurement. Expenditure on aircraft and ships will remain roughly constant in the next eighteen months, and expenditure on electronics equipment and guided missiles will go up, but spending on soft goods, vehicles and ammunition will go down sharply, since the stocks of these goods are said to be now virtually complete. Again it is obvious that the Administration is not going to use defence expenditures to offset the reluctance of the public to support the durable goods industries. However, when it comes to new appropriations, the Administration's plans for the future emerge more clearly. The total request for new defence funds is \$30.9 billion, about the figure which the Administration believes to be the annual charge which the economy and Congress can bear for the "long haul."

★

Similarly, the high level of expenditure on the "mutual military" programme, \$4,275 million, or \$75 million higher than the current year, reflects chiefly the higher rate at which American equipment and offshore procurement contracts are now flowing toward the North Atlantic Treaty countries from funds previously authorised. However, only \$2,500 million is requested in new authority, a reduction of nearly 50 per cent from the amount authorised two years ago. For atomic energy both the estimate of expenditure for 1954-55 and the request for new funds are higher than last year, but no new appropriations have been given to the programme for stockpiling commodities since 1953.

No attempt has been made in the Budget to differentiate economic aid from technical assistance; the combined expenditure for these purposes, and for information activities abroad, is estimated at \$1,125 million. But in contrast to mutual military aid, the request for new authority is almost as large as last year \$1,025 million. This, it is clear, represents a recognition that, however healthy the European economy may look through Mr Stassen's eyes, it is impossible to consider terminating economic aid to the Far East.

So far the Budget has had a good reception in the press, and there is much praise for the President in becoming, as the *New York Times* puts it, "the master and not the creature of his Budget." It now goes before an election-minded Congress and there is no guarantee that it will come out looking as it did when it went in. Nevertheless, all but the most Victorian Republicans are grateful that the Administration has managed to exhibit its zeal for economy without undermining the gains in social welfare of the past twenty years.

Aid for Trade?

ANY expectation that the Randall Commission would find ways of enlarging international trade which had been overlooked by its numerous able predecessors was always wide of the mark. The special function of this body, as is shown by the inclusion of ten members of Congress as well as by the haste with which it has wound up its labours, was to devise a progressive foreign economic policy which protectionist Republicans could be induced to support and Congress to pass at this session.

If, in the words of the Republican *Herald Tribune*, the programme is "less of a clarion call for freer trade than had been hoped for by some," the real blow has been the failure of the majority, despite a number of concessions, to carry with it the chairmen of the committees of the House and Senate which deal with legislation on trade and tariffs. Virtually every section of the report is followed by dissents, either from Mr McDonald, head of the steelworkers and the only trade union member, who in all but one instance wanted more liberal trade policies, or from the conservatives who felt the commission had gone too far. But it is the complete and angry dissent of Mr Reed, chairman of the House Ways and Means Committee, and the milder but probably more damaging qualifications of Senator Millikin, which make it appear that Mr Randall's half-loaf may result in hardly any bread at all, even if the President is prepared to support the commission with all the resources at his command.

In view of all the circumstances that surrounded its preparation, the report does not lack courage. It begins by dispelling the argument, so favoured by Mr Reed and his ally Representative Simpson, that the dollar gap has virtually ceased to be a problem; it points out that the gap is concealed, not closed, by extraordinary restrictions on dollar purchases by other countries and by extraordinary American expenditures abroad of about \$5 billion a year. The economic aid included in this total should, in the view of the commission, cease as soon as possible and so should any attempt to disguise economic aid as, for example, "defence supporting aid." Where continued economic help is necessary and in the American interest, loans should take the place of grants.

The free world, the commission considers, must build its future upon its own efforts and attract the additional capital it needs by creating a hospitable climate for investors. Although the report believes that the United States government can play only a minor role in encouraging private American investment abroad, it concedes that this has been disappointing since the war, and recommends a number of changes in the tax laws to provide greater incentives, and also the extension of government guarantees, during a trial period, to cover the risks of war and revolution as well as of expropriation or inconvertibility of exchange. In his Budget Message, the President urged Congress to adopt four of the commission's proposals, including the reduction of the corporation tax rate on all foreign earnings from the present 52 per cent to 38 per cent, a benefit investments in the western hemisphere already enjoy. Government loans, aside from those appropriate for the Export-Import Bank, are reserved by the commission for truly extraordinary circumstances.

The realm in which the commission's strictures are likely to accomplish least, but on which the majority

clearly and understandably felt most strongly, was that of American farm policy, which is hardly ruled by the faith in vigorous competition, or the maintenance of a broad free market to which the commission has nailed its flag. Moreover, it would have been difficult to condemn international price fixing agreements for commodities, upon which some countries are almost totally dependent, without frankly recognising that in this respect the United States, with its high rigid supports of farm prices, is among the worst offenders.

The first specific recommendation which took courage concerns raw materials on which the United States is dependent; the commission suggests that if it is considered necessary, for military reasons, to maintain domestic production, this should be done, not through the tariff, but by other means—subsidies or contracts to purchase.

★

Although the commission deprecates the belief that the United States is any longer a high tariff country or that reductions in the American tariff, by themselves, are likely to solve the dollar problem, the heart of the report nevertheless lies in its section on tariff policy. It suggests that the President should be allowed to exempt other countries, on a reciprocal basis, from the Buy American Act, which at present requires the government in its purchases to favour domestic producers; that the Tariff Commission should undertake a study of means of simplifying commodity definitions and rate structures, and that the Senate should complete the work begun on customs simplification, particularly by adopting improved methods of valuation. The commission proposes that the General Agreement on Tariffs and Trade should be renegotiated to confine the functions of the parties to sponsoring multilateral trade negotiations and should then be submitted to Congress.

The key proposal is for a three-year extension of the Reciprocal Trade Agreements Act, and the granting to the President of power to reduce existing duties, on a reciprocal basis, by 5 per cent during each of those years (which, incidentally, cover the remaining life of this Administration). One-year extensions have become the recent practice. Even three years of assurance of freedom from tariff increases falls short of the hopes of foreign exporters, but the commission feels that there has been relatively little experience of trade concessions under normal trading conditions. It considers that after a three-year trial, in which the progress of other countries toward freer trade can be judged, a longer extension might be desirable.

During this period, the President would also be given authority to reduce tariffs, not necessarily on a reciprocal basis, by 50 per cent from levels prevailing in January, 1945, on articles the import of which is negligible, and to reduce to 50 per cent any rates still above this level. The commission did not, however, recommend abolition of the escape clause, which enables American industries to seek relief if they can show they have been damaged by tariff concessions, or of the "peril points" the Tariff Commission must set when negotiations are undertaken. But the report underlined the President's authority to disregard the Tariff Commission's view in the national interest. To all these constructive proposals, however, Mr Reed and Mr Simpson turned an obstinately deaf ear and even Senator Millikin found them of dubious validity.

It was widely believed that the commission might endorse a plan to compensate domestic industries and workers for the losses they might suffer if tariffs were cut, but it has not done so, although it reprints Mr McDonald's elaborate scheme for technical assistance to such industries and for economic aid to displaced employees. Mr McDonald was more successful in bringing the majority to his view that competition from lower-wage countries should be considered unfair only if the wages involved were lower than those generally paid in the commodity's country of origin—a suggestion which would be likely to cause friction abroad and overwork for statisticians at home.

An enlightened view—which is now becoming general in American official quarters—was taken by the commission on east-west trade, in which it believes the United States might acquiesce, subject to a continuing ban on the shipment of strategic materials and on American exports to China and North Korea. An even more controversial proposal is that foreign dollar earnings should be expanded by repealing the requirement that half of all aid cargoes be carried in American ships, and that the government, in deciding how large the American Merchant Marine should be, should take into account the availability of foreign vessels.

The final recommendations concern currency convertibility, which the commission regards as an indispensable condition of trade balance in a free market, although it does not recommend any "dash for convertibility" on the part of the countries concerned. In the belief that sterling is a key currency, and that Britain's reserves need strengthening to restore confidence, the commission, after much thought, recommended that these reserves might be found through better use of the \$3.3 billion resources of the International Monetary Fund and that a second line of defence might be provided by a line of credit with the Federal Reserve System. In the United States this is taken, according to the *New York Times*, as a polite, but firm, disappointment of British hopes for a government stabilisation loan.

American Notes

Senate and the Seaway

BEFORE this week's debate on Senator Bricker's isolationist attack on the presidential treaty-making powers is over, a way will, it is hoped, have been found to ensure the defeat of the Senator's constitutional amendment. Mr Eisenhower has staked his personal and official prestige on overcoming Mr Bricker's challenge. That prestige has already been pricked, since the new congressional session began, by the Senate Interior Committee's unexpected refusal, by one Republican vote, that of Mr Dworshak of Idaho, to separate the question of statehood for Hawaii from that of statehood for Alaska, as the President wished. The continued linking of the two strengthens the opposition and makes it improbable that even Hawaii will become a state during the present session.

The outlook would, however, be brighter if the President were to use his influence on behalf of Hawaii as he has just done so successfully on behalf of the St Lawrence Seaway, which has been approved by a substantial bipartisan majority in the Senate. A tête-à-tête breakfast at the White House might, for instance, change Mr Dworshak's mind as completely as it did that of Senator Dirksen of Illinois, a long-standing opponent of the seaway. The break came when Senator Kennedy of Massachusetts and Senator Smith of New Jersey, arguing that the defence and prosperity of the nation should come before local

considerations, shattered the hitherto almost solid east coast front against the seaway. Basically, however, the favourable Senate vote was merely a recognition of the fact that Canada, after waiting for half a century, and no longer in need of outside financial help, was now going to build the seaway on its own—and control it when built.

The Senate vote means that out of politeness Canada must now give the House of Representatives a decent interval to consider the Seaway Bill, and the lobbyists for the rail and shipping interests another opportunity, which they may use successfully, to kill the Bill. But the Republican withdrawal of the federal government from the hydro-electric part of the project has weakened the opposition to it. So has the reduction in the contribution which the United States is now to make to the navigational development. It is no longer a question of a completely co-operative American-Canadian project, but merely of a United States government corporation building a section of the new channel on the American side of the International Rapids, at a cost of \$105 million, with Canada taking responsibility for the other works, which will cost at least twice as much. Canadians may be excused for feeling that congressional approval of the seaway, even if it comes at last, will be too little to excuse its lateness.

McCarthy Goes for Harvard

INTERESTING questions are raised by the decision of Professor Furry, of Harvard University, to admit to Senator McCarthy that he was a member of the Communist Party from 1938 until after the war, but to refuse any information about other Communists he knew except to a grand jury and then only if he felt they were guilty of serious crime such as espionage. In his three previous brushes with congressional committees, Professor Furry has refused to answer any questions and has invoked the protection of the Fifth Amendment, which provides that no one can be forced to testify against himself. In the minds of many,

reliance on this constitutional privilege has become identical with a confession of guilt, and for his own sake and that of the University, Professor Furry quitted his legal hide-out.

Senator McCarthy has been gunning for Dr Pusey, the president of Harvard, whom he accuses of maintaining a "privileged sanctuary for Fifth Amendment Communists." Dr Pusey feels that subversives have no place in education and deplores the use of the amendment. His crime is partly that he does not feel that those who avail themselves of it should necessarily be dismissed. But Dr Pusey, who comes from Senator McCarthy's home town of Appleton, Wisconsin, made an enemy of the Senator long ago by his courageous criticism of his methods.

The question raised by the Furry case is one on which Senator McCarthy has sought guidance from the Attorney-General. It is whether, having answered questions about himself, a witness can refuse to testify about others without becoming guilty of contempt. The fear that they would be forced to turn informer explains why some witnesses refuse to speak at all. Another point on which the Senator is taking advice is whether the courts are likely to uphold the view put forward by men outside the government service that the Senator has no right to question them since his subcommittee's theoretical function is to investigate mismanagement in the government.

Some curb may be imposed on the Senator's activities by the conditions he has been forced to meet in order to secure the return of the Democratic members of his subcommittee who walked out last summer in protest against his one-man rule over staff appointments. In future appointments must secure the approval of the majority, and the minority will have their own counsel and clerk and the right to appeal to the parent committee if they object to hearings being held in public. The Republican leaders were anxious to have the Democrats back, to share any of the mud thrown at the subcommittee as well as to prevent it from continuing to be, as it has been during the last nine months, a one-man platform which has made the name of Senator McCarthy known to practically every American.

Good Homes in Good Neighbourhoods

ALTHOUGH some Republicans are taking the opposite view, the main doubt about the President's housing proposals, sent to Congress this week, is whether they go far enough to achieve either of his objectives: a good home in a good neighbourhood for every American, including especially Negroes and others belonging to minority groups, and a continuously high level of house building for the good of the national economy. Exactly how far the proposals go will become clearer as detailed legislation is put before Congress. The emphasis, as might have been expected, is on indirect federal encouragement to local authorities and private enterprises, to help them make up the admittedly serious deficiencies in American housing.

In one respect, however, the President reluctantly admits that direct federal action is necessary, temporarily at least. He recommends the continuation for four years of the public housing programme that provides homes for low-income families, especially those displaced by slum clearance and other rehabilitation projects. His proposal, for 35,000 units a year, compares poorly with the 135,000

authorised in the 1949 Housing Act, but better with the numbers that have actually been built under that Act, and well with the 20,000 public housing units which were all that Congress felt the country could afford during the current fiscal year. Before the four years are up, the President hopes that the needs of low-income families will have been met by a new experimental programme for government insurance of low-cost, long-term mortgages.

If Congress approves these two programmes, they will make it easier to reach the goal of one million new housing starts which builders are aiming at again this year. For the demand is now chiefly for cheaper homes and it was the fall in public housing starts that was mainly responsible for last year's decline in house building. Another building activity for which there is also still an unfilled demand is for the repair and modernisation of existing houses and here also the President's proposals should prove helpful. For not only does he ask for direct loans and grants to local authorities to enable them to clear or rehabilitate slums, and make plans to prevent their spread, but he also asks that the terms on which the federal government insures loans needed to buy or improve existing homes should be made as easy as those on borrowing for new houses.

In case deflationary pressure should make it necessary to stimulate building activity, the President asks for additions to the limited authority which Congress gave him at its last session to adjust the terms on which the government insures and guarantees mortgages. He also recognises that it may still on occasion be desirable for the government to purchase existing mortgages, in order to make more credit available for building loans. His plan for reorganising the Federal National Mortgage Association, through which the government operates in this secondary mortgage market, would leave it with power to continue such operations, although under strict controls. Otherwise the President proposes that the association should gradually become a private enterprise financed by the users of its facilities.

Horns of Plenty

As Mr Harold Stassen pointed out early this month, the United States now smiles on non-strategic trade with the Soviet bloc, though not with Communist China or North Korea. Restrictions are being relaxed not only in recognition of the fact that other countries must trade to live, but also in the belief that the balance of advantage may lie with the West and that trade may carry democratic ideas into eastern Europe. But when an American businessman recently approached the government for permission to buy 40 million pounds of government-owned surplus butter and 14 million pounds of cottonseed oil to sell to the Soviet Union he was turned down.

There was no question of the balance of advantage. Mr Benson, the Secretary of Agriculture, must have been sorely tempted by the possibility that eventual Russian purchases might reach 150 million pounds of butter. He is already the unhappy custodian of 262 million pounds accumulated under the price support system, some of which has begun to deteriorate. Now, with the opening of the new season, butter is once more pouring into the Commodity Credit Corporation's stores at the rate of nearly a million pounds a day. Moreover, it is conceivable that the Soviet Union might be willing to barter manganese,

which is in short supply in America, for the butter which is embarrassingly plentiful.

What the Cabinet could not stomach was the prospect of explaining to American taxpayers, as they spread margarine on their bread, why Russians should eat butter at American expense. Naturally no more than the world price of 46 cents a pound is being offered for butter which it cost the government 67 cents a pound to buy; American housewives are paying more than 70 cents. Surplus com-

"Bossy, What Sharp Horns You Have"

Herblock in the Washington Post

modities have been sold abroad at cut rates before now, but only to friendly countries.

The door is not quite shut. On April 1st Mr Benson must decide at what level he is going to support the price of butter next year. He might let it drop as much as 10 cents a pound, if he does not mind risking the defection of the dairy states in next November's election. This would almost be enough to enable East and West to meet.

SHORTER NOTES

The Republican Administration has been without a Solicitor-General for over a year, ever since it took office, but the President has at last nominated Judge Simon Sobeloff, of the Maryland Court of Appeals. He must still be confirmed by the Senate.

*

In 1953, for the second successive year, there were no lynchings in the United States, and the Tuskegee Institute, which keeps records of these crimes, has decided that a new index of race relations would be more suitable. Studies will in the future emphasise the economic and cultural progress of Negroes.

The World Overseas

Japan Faces the Overdraft

FROM OUR TOKYO CORRESPONDENT

UNDER the Zodiac calendar, this is the Year of the Horse in Japan; it is supposed to spur the confused, demoralised nation into headlong galloping progress. (The last Year of the Horse was 1942, when the Japanese steed ran wild in the south Pacific.) The Prime Minister, Mr Yoshida, hailed the New Year with a minor Cabinet reshuffle which brought the number of ministers who have served under him to the imposing score of 99. The unimportant reshuffle was intended to emphasise his implacable determination to "super-balance" the budget, tighten Nippon's belt and usher in a new era of reform, economy, austerity and true independence. He submitted heroic evidence of his Government's sincerity by sternly rejecting a salary increase for government officials which could technically have been extended to the Cabinet.

The redoubtable Mr Yoshida has cleared many hurdles during his unprecedented five terms of office, but he will need a sturdy mount to carry his colours through 1954. Japan's precarious economy is still sustained only by dollar transfusions which the Americans are now administering with flagging enthusiasm. Exasperated American representatives have indulged in sufficient "thinking aloud" at the interminable wrangles over Japanese rearmament to warn the Japanese that the wells of American generosity and aid can dry up.

During the past three years the United States has spent \$2,500 million in Japan for goods and services to maintain the Korean war, defend Japan and help other Far Eastern nations. This emergency sustenance enabled and encouraged the Japanese in 1953—the Year of the devious and sluggish Snake—to import a flood of luxury goods which has helped swell the trade deficit to \$240 million. The sick and ailing yen has lost another 10 per cent in value during the past eight months, so that the real exchange value should be nearer 600 instead of 360 to the dollar. Dumping—masked by a dual-price system (below-cost for exports, and inflated prices for the domestic market)—has held exports with a struggle to 1952's level of \$1,200 million, despite the 50 to 60 per cent leap in overall prices since the Korean war. But the reckoning has only been postponed: even with the heavy cutback of the "super-balanced" budget to 1,000,000,000,000 yen (£1,000 million) by slashing government estimates and funds for social welfare, disaster relief and public works, another staggering trade deficit of \$300 million is forecast for 1954, with growing unemployment and labour unrest. American spending must continue to fall off after the Korean ceasefire and such ugly problems as industrial inefficiency, obsolete equipment, self-defence

(under whatever name), reparations and the ever-mountaining population must be squarely faced.

To thrust the blame for this crisis on to Mr Yoshida, the only able, patriotic and courageous leader the Japanese have had since the war, would be grossly unfair. Japan has been a victim of American generosity. The people are only now dimly sensing a state of emergency. Their old Japanese discipline and fortitude have been sapped by the hot-house atmosphere in which they have been living since 1948. That they would still respond to a clear call to their patriotism and pride, no one who knew them before and during the war can doubt. But the brutal shock and universal sacrifices involved in such a harsh readjustment demand a new leader, divorced completely from the unreal, dream-like period of the surrender and the Occupation, possessing the qualities of Yoshida but lacking his American legacies and commitments, real and fancied, and radiating the illusion—which it must be—of national freedom from non-Japanese influences and interests. There is no such leader in sight.

An Alice-in-Wonderland Scene

Why the Chinese and Russians have neglected this lush field for mischief on the vital Far Eastern front is one of the great mysteries of the cold war. The Osaka industrialist and his sworn enemy the Socialist politician are alike panting with the same eagerness for some encouragement from the Asian mainland: the one to gain (he fondly hopes) trading advantages by playing off Peking against Washington; the other to achieve (he fondly hopes) the beatific state of pacifism and neutralism which General MacArthur, in a fit of aberration, once told Japan was eminently practicable and desirable. ("Japan can become the Switzerland of the Far East.")

This is only one of the rich paradoxes of the Alice-in-Wonderland scene in 1954 Japan; another was the recent formation of a Communist-inspired organisation, the "Guard-the-Constitution Association," sworn to defend the inviolability of MacArthur's Constitution against the feverish attempts of the Americans to induce Yoshida to change or bypass it for the sake of speedier rearmament. "If I am asked which I choose, butter or guns, I shall say both," Mr Yoshida has sturdily declared in a New Year message to the nation. "It is not possible to rearm at the sacrifice of the people's livelihood." His real problem, as he well knows, is to help the nation survive at some certain sacrifices of the people's livelihood. With or without American aid, Japan must find new export markets at lower

costs. Too many Japanese still believe that the old pattern of trade with the new China can be restored. If they are naïve, they believe impatiently that American aid with its explicit and implicit commitments is delaying that happy return to normalcy—and neutralism. If they are cynical, they believe that they will be able to extract counter-bids from the Americans for every bid by the Chinese, to have their rice and eat it too.

Traditionally, the Year of the Horse brings opportunity and good fortune to Japan from the east—not the west. Whatever hopes Mr Yoshida may build on his reluctant, belated and still inadequate austerity drive, many Japanese, right wing and left wing alike, would be far happier if opportunity came to them in 1954 from enigmatic but Asiatic Peking, to their west, rather than from intrusive and nagging Washington, in the east.

Writers in Soviet Russia—II.

In Search of a New Gogol

THE crude literary make-up laid thickly on the face of Soviet society has cracked rapidly in the post-Stalinist climate. With Malenkov, Khrushchev and others admitting that the lot of the Soviet consumer has not been a very happy one, or that everything is not for the best in the countryside, the touched up *Sovcolor* versions presented in plays or novels have been revealed as a grotesque camouflage. Once the political leaders themselves partly lifted the curtain veiling the seamy side of Soviet life, wholesale literary whitewashing became an anachronism.

Hence in the last few months there have been many signs of a new deal for the Soviet writer. The divorce between fact and fiction, the elimination of real conflict, the literary polishing, varnishing, prettyfying—all these virtues of yesterday have now been openly branded as vices. Critics, unaccustomed to express their real feelings openly, at first hardly dared to whisper thoughts which not so long ago had been judged heretical. Paradoxically, they had to be prodded from above to speak freely, and to aim their arrows at all offenders, however high their position. To emphasise the change, the second congress of the All-Soviet Union of Writers has been summoned to meet this summer after an interval of twenty years.

Hitherto the question "Why have we no Gogols and Tolstoy?" was purely rhetorical, but now it has acquired a genuine air and is echoed in all debates. The theatre was the first to come under fire. The chief accusation against Soviet plays was that they are set in an imaginary society where, to quote Konstantin Simonov, "the better competes with the good and the perfect with the best." Protagonists are mere puppets who are "set answers to be found at the end of an arithmetical primer." "Positive" heroes are given all the trump cards and there is never any doubt about their triumph in the final act. Soviet Romeos and Juliets discuss methods of potato sowing in their balcony scene. Nowhere in real life, exclaims an exasperated critic, will you find a mechanic who dreams with his beloved how they will compile the inventory on the tractor station, or a holidaying miner whose only wish is to go back to work. And yet such plays have been put on with official blessings. The Soviet public, however,

apparently knows how to indicate its "collective criticism" by means of "epidemics of coughing and yawning."

The state of the novel has been described in no less scathing terms. Here, too, the chief trouble is that writing proceeds according to the latest set formula. Cautious authors prefer to avoid the human being, that rich but dangerous subject. Psychology has abandoned the stage to technology. Two examples were quoted from recent prize-winning novels: in one, dealing with military life, one could see the army but not the soldiers; in another, with a factory as the background, one could learn everything about intricate production processes, but little about the Soviet worker.

Is it merely that all talent has been exhausted among the heirs of Tolstoy? Obviously not. How could a Soviet playwright follow his vision, write spontaneously, knowing full well that his play would have to struggle through the purgatory of six bureaucratic examinations before reaching the stage. The critic, that Party watchdog, however, is described as the writer's chief persecutor. *Novyi Mir* has published an imaginary dialogue between the two and the writer's *cri de cœur* is really moving. He had been bullied all along not to depart from the prescribed path and "now you are all sick with my straight line." At first all his visions were branded as false, all his judgments were blamed. So, in despair, he bid goodbye to his muse and climbed on a "literary tractor." The solution may not have been artistically satisfying, but nobody could find fault with him any longer.

No More Ventriloquism?

Such striking revelations were unthinkable under Stalin. This may well herald a new era, but a crop of masters will not spring up tomorrow. After years of ventriloquism the writers must be searching uneasily for their own voice. It is significant but not astonishing that they have to be encouraged by *Pravda* to speak up. The literary tractors may be scrapped and the crudest forms of propaganda abandoned, but a sufficient number of Stalinist taboos remain to preclude for the moment a real picture of Soviet society. Who would dare to mention the bloody collectivisation, the forced labour camps or the Moscow trials? The Beria affair has shown that the purging of Stalinism need not be an uninterrupted and easy process. Indeed, in today's disclosures there is clearly a false note. Critics have been chosen as scapegoats, though all know they were merely the instruments of Stalinism.

Soviet rulers may hesitate to grant their writers too much freedom too quickly because of the tremendous power it would give them. Critics and writers in Tsarist Russia had been the conscience of the nation; whether they willed it or not, through their writings they precipitated the downfall of the regime. And this they did in backward, illiterate Mother Russia. Now, when everybody can read, when books circulate in millions and reach the remotest parts of the country, a Soviet Gogol could wield dynamite. Was Malenkov urging and prophesying the doom of Stalinist society when he declared last year:

It would be wrong to think that our Soviet reality does not provide material for satire. We need Soviet Gogols and Shchedrins (a 19th Century satirist) who, with the fire of their satire, would eradicate all that is undesirable, decayed and moribund. . . .

(Concluded)

NOTES FROM INDIA

These Notes are contributed by our correspondents in India, or compiled in London on the basis of reports from them

The Troops in Korea

THE behaviour of India's troops in Korea has upheld all the best traditions of the Indian Army and their country is very proud of them. This, indeed, is the only strong emotion felt by most Indians about Korea. They have always had a distaste for Syngman Rhee and his methods; that distaste has been slightly, but only slightly, enhanced by his threats of military action and accusations of Communism against India. They have always felt that there are two sides to the question of the prisoners of war. Indians now have the authority of all their correspondents and of their representative on the Repatriation Commission that there have been intimidations, extending on occasion to murder, in the camps, and that there has been organisation from outside, especially by the South Koreans. On the other hand, they always suspected that most of the prisoners really did not want to go back to Communism.

On the duration of the explanations and on whether the prisoners should be released on January 23rd, opinions were more tepid still. Nobody in India objected when the explanations stopped, but nobody would have felt it was appeasement if they had continued. While few would have minded very much when the prisoners were released, equally few would have felt that freedom had been infringed if they had been kept until a political conference; it is generally felt the armistice agreement can be read both ways. Mr Nehru's own suggestions were the result of his desire to prevent any risk of the war breaking out again, not of any special belief in the Communist interpretations. Perhaps surprisingly, India's relations with neither China nor America have been affected by the part it has played in Korea. When Mr Nehru says that India is not eager to go to the political conference, but will, if asked, regard acceptance as a duty, he reflects the general public view; for the public's main reaction to India's role in Korea is that the way of the peacemaker is hard. Chinese intransigence, South Korean hysteria, and Mr Dulles's remark about the "so-called neutral commission" have all left their mark.

Liberalisation—with Protection

IN its import policy for the first half of 1954 the Government of India has made no startling changes. The exchange position has become stable after the large surplus of 1951-52 and the large deficit of 1952-53; over the last year, with the assistance of foreign aid, the sterling balances have remained almost steady, and it has not been necessary to draw on the releases. Delhi expects this position to continue; indeed, it anticipates a slight improvement in exports—tea is now strong and jute goods are not so weak as they were. Such changes as it has made represent on balance, therefore, a slight further liberalisation of the already more liberal policy of the second half of 1953.

Token imports of luxury consumer goods, much criticised by the Indian industrialists who were affected, are to continue. Quotas have been increased for a few more items—betel-nuts, for example, and razor blades. In certain cases licences are not to be confined quite so rigidly to a narrow definition of the items for which they were given; newcomers are to be given rather more scope. In general regular importers will automatically be given new licences to the same value as the old; the range of licences for actual users has been further extended. The machinery of import control has been enormously improved over the past three years, and the new measures, together with some further decentralisation, will improve it still further.

Nevertheless, there is a fly in the ointment. The policy of using import controls as a means of protection has once more been asserted. The Mulgaonkar Committee has just reported that from 25 to 50 per cent of some parts of the Indian engineering industry are idle; there has been a prompt response in the form of cuts in quotas on items ranging from ball bearings and table fans to steel screws and copper wire. The pronouncements of ministers show an increasing concern for the consumers, but policy does not yet extend to permitting imports in more than admonitory quantities where they could be manufactured at home.

Congress Meets

DURING the past few days the Indian National Congress Party has been holding its fifty-ninth annual session, at which a number of resolutions were passed affecting government policy, but mostly without much controversy. Mr Nehru's towering personality has lately given the Party an appearance of unity which so big an organisation does not naturally possess. Indeed it was Gandhi's view that after independence Congress should dissolve rather than turn itself from a national movement into a political party. Its importance in relation to the smaller parties in the House

of the People—particularly the Communists—may be gauged, however, from the accompanying chart.

★ ★ ★

Future of Travancore-Cochin

THE state of Travancore-Cochin in the extreme south of India goes to the polls on February 15th. This will be the first big test since the general election of both Congress and Communist popularity. At the beginning of the year, at their Madura Congress, the Communists

reaffirmed their line of moderation, parliamentary action and united front. The Communists are strong in Travancore-Cochin, which has at once more literacy and more landless labourers than anywhere else in India; it is thus an excellent testing ground.

By themselves, the Communists have no chance of winning. The government overthrown in September was a coalition of the Congress and the Travancore Tamil Nad Congress (TTNC)—a Congress bud which wants the Tamil parts of the state to join Madras—and its defeat was the result of the jealousy of the Trivandrum District Congress Committee, in whose bailiwick the TTNC had scored its successes. The election is not, therefore, being fought on any major political issue. The question is what tactics the Communists will adopt and whether they will fight by themselves. They have been negotiating madly to get as wide a united front as possible.

So far they have had a mixed success. Communists are not opposing the TTNC in eight seats, though they have got no commitment in return; and they are still quarrelling about who should contest two seats with their partners of the last united front—the Revolutionary Socialists and the Kerala Socialists. But they have landed one very big fish indeed. The local Praja Socialist party, India's main opposition party and normally bitterly anti-Communist, has decided to make an electoral pact with them.

The Communists have paid a high price; in a House of 117 they are contesting only 40 seats and leaving almost as many to the Praja Socialists. However successful they may be, therefore—and there is no reason to believe that the Communist hold on Travancore-Cochin has gone up since 1951—they would have to have a coalition with the Praja Socialists in order to form a government. The best guess, nevertheless, is that the Congress Party will come back again, even if to do so it has to be firm with the Trivandrum District Committee, and make it up with the TTNC.

* * *

Prospects for the Crops

THIS year the monsoon has been good everywhere in India, better even than in 1943-4, better than it has been for a generation. Mysore has had its best crop since 1883, and Madras, after six years of drought, is complaining that a good many village reservoirs (tanks) are overflowing. The rain has fallen at the right times, in the right places and in the right quantities; except in the Godavari even the floods have been less bad than usual. Of course, nothing is ever quite perfect. There were a few late showers which damaged the excellent groundnut crop; scarcity has been proclaimed in a few villages in Ahmednagar District; the Kosi has moved its bed even more violently than it does every year. But all this is nothing compared with the famines which affected 30 million people last year, or the terrible crop failures of 1952.

It is too early yet to say just how much better this year's crop will be than last year's; despite local famines, that was itself slightly better than average—102 on an index of 100 for 1936-7 to 1938-9. There are sound estimates only for the main commercial crops. Cotton, at 4 million bales, will be 500,000 bales up; groundnuts, at 2½ million tons of decorticated nuts, will also be perhaps 500,000 tons up; and jute, at 3 million bales, will be 1½ million bales down—jute prices were particularly low at sowing time. But more important than the commercial

crops are the food crops, and these are likely to be perhaps 10 per cent or some 5 million tons higher than last year, which in turn was probably about 10 per cent higher than the near disaster year of 1951-2.

These excellent yields have enabled the Indian Food Minister, Mr Kidwai, to speed up the policy of decontrol he began in 1952. The number of people under rationing is being rapidly reduced, and even in the rationed areas overseas wheat is free. Restrictions on inter-district movement have almost gone and those on interstate movement are being reduced. Government procurement of the crop has been abandoned in many states and many price controls have been abolished. The only really rigid controls which remain are those on rice in the big towns and the seriously deficit areas of Malabar and Travancore-Cochin.

Why Saragat Stayed Out

FROM OUR ROME CORRESPONDENT

IF ever the moderate Socialists in Italy, headed by Signor Saragat, had an opportunity of decisively influencing government policy it was during the recent political crisis. Signor Fanfani, the progressive Christian Democrat, who had been entrusted with the formation of a new Cabinet, seemed bound to look left for allies. Had he not forced the Pella government out of office by vetoing the appointment of a right-winger as Minister of Agriculture, and had not the whole crisis arisen through the insistence of Signor De Gasperi on a return to the old policy of collaboration with the other three moderate parties?

The stage seemed set, therefore, for a reconciliation between the Socialists, alienated by Signor Pella's flirtation with the Monarchists, and the Christian Democrats. Agreement was in fact reached on the broad outlines of measures of reform. But at the last moment, the negotiations broke down. Fanfani thereupon switched his batteries and succeeded in overcoming the reluctance of the right-wing members of his party to join his Cabinet.

Political circles in Rome have been severe in their condemnation of the Socialist Party's intransigence, and history is likely to underwrite their verdict. It is contended that it would have done better to put pressure on Fanfani to choose the most liberal elements among the Christian Democrats in forming his Cabinet, and only to have made a firm stand if those attempts failed. Moreover, not only were Saragat's tactics wooden and mistimed, the pretext on which he broke was ill-chosen. His party withheld its confidence on the grounds that Fanfani would not promise to introduce an extreme form of proportional representation. Under the present arrangement, the Socialists have 19 seats against 27 on a proportional basis. This system, though possibly short of perfection, hardly justifies torpedoing what may be Italy's last hope of a central government.

But, to be fair, there is another side to the story. The unfortunate fact is that the moderate lay parties in Italy are too weak to stand by themselves. But if they collaborate with the Christian Democrats, they risk being stamped as "tools of the clericals," and even being absorbed by them; and if at any stage they make common cause with the Communists, they run a similar risk with them. At the June elections the Socialists' poll dropped by 500,000 because they were regarded as satellites of their Christian-Democrat allies. It is hardly surprising that they should

then have veered sharply towards a policy of "the opening to the left." But the Christian-Democrat leaders, increasingly out of touch with "new ferment" in their own ranks, have shown few signs of modifying their policy to suit Saragat's book. On the contrary, they have brought the art of giving and shelving skilfully vague promises to a fine point. Saragat's attempt, therefore, to pin them down on the most concrete issue, the electoral law, was understandable.

Had he yielded on that issue and supported Fanfani, he would immediately have been denounced as a capitulator by the large fellow-travelling Socialist Party headed by Signor Nenni. This now has 75 deputies (to Saragat's 19) and, together with the Communists, they muster 37 per cent of the total seats. Secure in his Left-wing orthodoxy, Nenni can out-manoeuvre his rivals not only from the Left but from the Right. He was prepared, for example, to take a chauvinist line over Trieste. In the same way he dropped an opportunist bombshell, just before Saragat's refusal, by holding out prospects of adopting an attitude of benevolent neutrality towards Fanfani, thus possibly making the new government dependent on his neutrality.

There is known to be a strong current of hostility in Nenni's party to this line, and the official policy is to await Fanfani's statement to Parliament before jumping one way or the other. In any case Fanfani would resign at once rather than be at the mercy of the Left's whim. The aim of Nenni's elastic tactics is simple. It is to detach the left wing of the Christian Democrats and integrate it into a popular front, and to hold up ratification of the European Army. If Fanfani falls, the manoeuvre can be repeated with greater hopes of success with the left wing Christian Democrat Gronchi, who was strongly backed by the left parties in opposition to Fanfani. Alternatively, there will be new elections at which the Left will gain. Heads I win, tails you lose.

Nenni has always skilfully played up his "independence" from Moscow. If he were prepared to make even a gesture of unorthodoxy in the field of foreign politics, there are large numbers of voters who, dismayed by Saragat's ineffective fumbblings, would now back him and his policy of social reform. The mournful truth is that, in the contest between the rival leaders, the odds are heavily on Nenni.

Franco-German Press Meeting

FROM A CORRESPONDENT

A CONFERENCE unique in the history of Franco-German relations took place at Strasbourg on January 11th, when a group of French and German editors and their correspondents met for a two-day conference under the auspices of the International Press Institute to examine their performance in reporting on each other's country. It was a modest affair. It brought together 18 editors, foreign editors and correspondents—9 from each country. The French delegation was drawn from the five leading Paris newspapers and three provincial newspapers in the area of the German frontier. The Germans came from Cologne, Stuttgart, Munich, Frankfurt, Bonn, Oelde Westfalen and Bad Reichenhall. But if this limited gathering was a pointer to the Franco-German press in general, the frankness and cordiality which marked its meetings indicated that the newspapers of the two countries are ready to take advantage of any trend towards better relations.

The first question the conference had to settle was whether reporting across the Rhine was sufficiently defective and mischievous to demand action to improve it. Agreement was reached quickly enough that it was, though in fairness to the German daily press it was pointed out that some of the worst distortion of French news occurred in the powerful weekly illustrated press. German impatience with a France that refused to admit that it had fallen from the rank of a dominant European and imperial power, and French suspicion that the German leopard could never change its spots were frankly examined.

Once the mutual confessions of weakness had been made, the main question was what the press could do. The editor who has to calculate the finances of each column of his paper and the foreign editor who has to fight for space for his correspondents' despatches cannot take refuge in academic recommendations. A French editor spoke of the psychological problem of trying to be objective about a situation on which many readers felt very strongly. But he went on to say that in his region, Lorraine, there was so much interest in and admiration for the West German recovery that never since the war had there been such a favourable moment for promoting Franco-German friendship on the basis of objective reporting.

The Cost of Being Fair

The meeting considered how advantage could be taken of this rift in the clouds of national *ressentiment*. It was agreed that the problem facing both French and German editors was how to get better sources of information about each other at an economic cost. The problem was particularly acute for those newspapers without a correspondent which had to rely on the spot news coverage of agencies. It appears that the French provincial press has no correspondents in Germany and that, unlike the Germans, it has not been able to cooperate to maintain correspondents on a pooled basis. Several suggestions were put forward—for example, the pooling of the costs of a correspondent by a group of newspapers, on which the French sought German advice, and the provision of a digested service of comment and documentation prepared by the newspapers of one country for the press of the other.

Such propositions were shelved as too ambitious at the present stage, but several practical decisions, embodied in a "gentleman's agreement," were reached. First, it was agreed that "it would be useful to set up, in Paris and Bonn, two complementary committees consisting in each capital of two journalists—a Frenchman and a German" with the task of "intervening in a friendly way with the editorial direction" of any newspaper considered guilty of "a flagrant violation of the principles of objectivity and honesty" to which those present pledged themselves. Secondly, personal contact between editors should be encouraged, especially by opening their columns to each other for the discussion of burning issues as they arise. One German editor there and then offered his leader page every six weeks to his French colleagues and two present took him up. Thirdly, the number of special correspondents in the two countries should be increased and their working conditions improved—in particular by an effort to get transmission costs lowered and by providing them with better means of information by the newspapers of the country in which they were working (for example, by letting them have

copies of newspapers free and quickly). Fourthly, editors should seek closer contact across the Rhine by meetings and the exchange of their newspapers.

These decisions, taken by a comparative handful of editors at Strasbourg, can mean much or little, according to the extent to which they can be spread through the rest of the French and German press. But it was a brave and encouraging beginning. For most Germans and Frenchmen the press is the mirror in which they see each other. It is a gain that eighteen leading newspapermen agreed to hold the mirror straight and encourage their colleagues to do the same.

The Pandit, the Pentagon and Pakistan

FROM OUR KARACHI CORRESPONDENT

THE comment is frequently made by overseas visitors familiar with both Pakistan and India that the space in the Indian press devoted to Pakistan is considerably smaller than the corresponding coverage given to Indian affairs in Pakistan newspapers. The observation is shrewd and picks out a definite Delhi attitude. India has cause for complacency and its air of detachment; after all it is, as it were, the inheritor of the elder brother's portion of a great estate. Not only did it fall heir to vast possessions and industries but also it arrogated to itself the historic name of "India." However, at least twice the calm superiority and the indulgent tolerance of India towards the younger brother, Pakistan, has been sadly ruffled. Both occasions have arisen out of a suggestion that Pakistan should align itself with influences other than Asian, by which Mr Nehru really means Delhi, and each time the Pandit has indulged in his favourite pastime of "reacting sharply" by expressing his opinion and offering his unsolicited advice in unequivocal terms.

The first occasion was the proposal emanating from quarters outside Pakistan that the country should be attracted into the orbit of the proposed Middle East Defence Organisation. India immediately took it upon itself to launch a violent campaign of criticism, cajolery and threats in which the *Hindustan Times*, of Delhi, the *Amrita Bazar Patrika*, of Calcutta, and the *Times of India*, of Bombay, joined enthusiastically. In Pakistan the reaction to the proposals was neither favourable nor inimical and took the form of "let's wait and see what it is all about and what its implications are." There was a certain amount of opposition from the Lahore left-wing press which drew the comment that it was following the Indian communist party line; the Pir of Manki Sharif and Ali Kasuri Sahib, both of the Jinnah Awami League, which provides the only real opposition to the present Muslim League government, also expatiated on the dangers of Pakistan's participation in the security arrangements of either the eastern or western bloc.

All this happened a year ago. Now once more there has been an extraordinary exhibition of hysteria in Delhi, occasioned originally by the mere mention of the possibility that the United States might give military aid to Pakistan. As regards the proposed aid itself, the extent of which is only now gradually being revealed, public opinion in Pakistan was surprisingly unanimous in its acceptance. In

this country, whenever a subject hits the headlines, whether it be as remote from Pakistan as, say, the problem of birth control in Paraguay or the exploitation of the Esquimaux, every political office-holder of whatever standing considers it his bounden duty to issue a statement to the press. On this occasion nothing of the sort occurred. The one public figure of any consequence to make a statement was Mr H. S. Suhrawardy, President of the Jinnah Awami League. He was first of all reported as saying that the proposed aid would be a "blow to national independence, initiative and effort." He also went on to say, as his political colleague the Pir of Manki Sharif on the previous occasion had said, that Pakistan's interests would be best served by keeping neutrality between the two power blocs, and that moreover no alignments should be made which might arouse hostility or suspicion in India.

Twenty-four hours later, however, after he had had a talk with Mr Nixon, the American Vice-President, who was in Karachi at the time, Mr Suhrawardy executed a *volte face* and in a special interview with *Dawn* took great pains to contradict his previous statement. He claimed that he had been misreported and that, as wheat aid had been received on perfectly honourable terms, it was possible that military aid might be available in the same way to assist in strengthening Pakistan's defence. He further stated that it could not be denied that, because of the liberal education received under the British, the people of Pakistan had developed an outlook more akin to that of the western democracies than to the Communist states of the eastern bloc. It is interesting to compare this last statement with that made a week later by the Prime Minister, Mr Mohammad Ali, for whom Mr Suhrawardy has a great personal regard, when he said that Pakistan had its own ideology and valued the state of human freedom, and that if it was found that some other country also valued the same principles, obviously Pakistan would have more sympathy with that country. When asked by a correspondent to what country he alluded the Prime Minister said that they should make their own inferences.

A Feint that Failed

As far as the newspapers, both vernacular and English, were concerned, the only objections came, as might be expected, from Mian Iftikharuddin's *Pakistan Times* of Lahore and its Urdu satellite *Imrose*, and even they toned down their objections as a result of the Indian reaction. The *Pakistan Times*, it may be remembered, was edited by Faiaz Ahmad Faiaz who is now serving a four years' sentence for his participation in the Rawalpindi conspiracy.

The initial dismay at Mr Nehru's suggestion that the Kashmir negotiations might be imperilled (a rather maladroit diplomatic feint) and the apprehension over the possible incitement of anti-Muslim feeling in India as a result of Congress propaganda, has now largely been dissipated. Broadly speaking, Mr Mohammad Ali's position has been strengthened and consolidated and his intended course of action made smoother by Delhi's violent reaction. Some years ago Barindra Ghose, brother of Arabindo Ghose and a converted revolutionary who quitted the political arena for an *ashram* in Pondicherry, passed a penetrating judgment on Mr Nehru. "Jawaharlal," he wrote, "is a clever man but there he stops: he is too pedantic to be intuitive. He ignores the human factor." The Pandit was younger then but the appreciation still appears to have some point.

Riley A joy to own—
a dream to drive

With its long, low lines and elegant new styling, the Riley 1 1/2 litre Saloon proclaims its good breeding and your own good taste wherever it goes. Its special appeal is to the discriminating motorist who expects 'all round' excellence in a car. The Riley has one of the most successful engines ever designed, matched by incomparable steering, superb road-holding, suspension and braking. See and test the Riley 1 1/2 litre for yourself. For the sheer pleasure of driving there's nothing quite like a Riley—it's a car of rare character.

Yes indeed! Riley for Magnificent Motoring

Ask your Riley dealer for full information about the brilliant new Riley 'Pathfinder'.
Riley models are fitted with safety glass all round.

"What's past is prologue"

BRITAIN has more electrical generating plant than it has ever had before; there is more electricity for everyone.

Britain's demand for electricity is also greater than it has ever been before; the factories, the farms, the homes and the offices are using more electricity—and asking for still more.

To meet these needs, British Electricity has achieved new records of construction each year. The sum of these to date adds up to the grand fact that Britain has 32 more power stations and the power available has been increased by more than a third in the past five years.

But all this fine plant is giving full output only for short periods once or twice a day. Continuous full operation would reduce the cost of electricity production. The most effective way to obtain more economical electricity generation is to expand the use of electricity for all purposes—in the home as well as in the factories, in office buildings and on the farms, and for street lighting. Every extra unit of industrial production, every new technique in armament, every provision of new houses—or of new services in old houses—every development in rural and farm facilities . . . calls for more and more electricity; so that in addition to the six million horsepower installed in British Electricity's first five years, 10 to 11 million horsepower of new generating plant is needed in the second five years to keep pace with our national and personal requirements.

THE BUSINESS WORLD

Monetary Policy in Step?

BY far the most striking feature of the end-year balance sheets of the clearing banks, completed this week by the Westminster Bank's figures, is the growth they reveal in deposits since the end of 1952. This increase has been common to nearly all the banks, and it has raised the aggregate of net deposits (excluding cheques and other items in course of clearing) to the new high point of £6,370 million, compared with £6,154 million twelve months previously and £6,035 million at end-1951.

Such an expansion of credit is the very opposite of what most people expected when the "new" monetary policy was launched by the revival of Bank rate towards the end of 1951. The refurbishing of the orthodox weapons of credit restraint was expected actually to reduce the volume of money, or at least decisively to end the long phase of expansion. And for a short time in 1952 it did seem that these expectations might be justified. The rise in interest rates and the toughening of bank lending policies—working in conjunction with falling world prices and with retrenchment in Britain's export markets—reversed the upward trend of bank advances and severely curtailed commercial bills.

But this steep decline in the amount of bank credit used by the private sector of the economy, amounting to almost £300 million during 1952 as a whole, was soon offset by an even more striking rise in the credit demands of the public sector; as a result, the total volume of credit actually rose by a further £119 million in that year. The Government's big demands were mainly attributable to two broad influences emerging from the counter measures to the crisis of 1951. Disinflation tended to reduce the flow of tax revenues, and played a significant part in producing a large shortfall on the domestic budget. Simultaneously, the dramatic reversal from deficit to surplus in Britain's

external payments account during 1952 meant that the Government was no longer a net borrower of sterling from overseas sources, but had instead to provide sterling for net repayments overseas. And, since the climate of disinflation already seemed sufficiently chilly, the Government saw no need to finance its needs by forcing securities upon the market instead of selling Treasury bills to the banks.

★

These special explanations of the credit expansion of 1952 do not extend, however, to the still larger expansion of 1953; for this further shattering of the expectations of end-1951 reasons have to be sought elsewhere. During 1953 the Government did not have to face on balance any large unexpected demand for finance; thanks to a big reduction in its "below-line" expenditure, the Exchequer's overall deficit was much smaller than in 1952. And the net surplus on the external balance of payments must also have been smaller. The public sector was, indeed, a large net borrower from the banking system, but its borrowings were probably less than half those of 1952.

The financing of the Government was therefore responsible for the creation of a much smaller volume of credit in 1953 than in 1952; had other factors remained unchanged, bank deposits would actually have fallen in 1953. But in fact there has been a big reversal in the credit trends in the private sector. Bank advances, which in 1952 dropped by £182 million, have in this past year fallen by only £42 million; and the banks' portfolios of commercial bills, which in 1952 were drastically reduced (from £181 million to only £66 million), have since risen by £13 million. More-

over, the year's fall in advances seems to be more than explained by a dip—temporary, no doubt—in the borrowings of the nationalised public utility industries; the latest figures to November last show a fall in these borrowings of £55 million, compared with November, 1952. Private borrowers, therefore, may have made net new demands on the banks to the extent of some £25 million, whereas in 1952 they reduced their demands by almost £300 million.

Most of the year's increase of £127 million in bank investment portfolios does not represent a net new creation of credit: the greater part of it arises from the switch out of Treasury bills and call money that resulted from the Government's funding operations of last autumn. But a moderate portion may represent true net purchases by the banks from the public, as distinct from securities supplied directly or indirectly by the Government broker; to that extent the total creation of credit for the private sector will have been larger than the estimate above.

The rise in the demand for finance by private borrowers has developed more slowly, however, than many bankers expected; indeed, it appeared mainly in the closing months of the year. The year's net movement—equivalent to perhaps 1½ per cent in the credit granted by advances and bills—is certainly small when set beside the good recovery in industrial production. Moreover, the reopening of commodity markets does not yet seem to have resulted in any notable increase in demands for bank finance.

The total intake of new credit by the private sector cannot, in any case, have been responsible for more than a quarter of the year's rise in net deposits. The balance has been directly attributable to borrowings in the public sector; and if the assumed temporary fall in the direct borrowings of the public utilities is allowed for, this would mean that the central government's demands appreciably surpassed £200 million, in contrast with some £400-£450 million in 1952. This volume of borrowing is notably smaller than the Government's apparent need for finance for purely domestic purposes, when allowance is made for net

receipts from tax certificates, defence bonds, savings certificates and from the counterpart of the increased note circulation, but without including cash issues or sales of securities through the market. The Government filled this gap, and financed the surplus on the balance of payments by borrowings from the public, as distinct from the banks. The first of these factors was smaller, and the second presumably smaller, than in 1952; but when gold reserves are rising appreciably while the total surplus is shrinking, it is difficult to guess the impact upon the Treasury's need for cash. It may have been larger on external account than the total surplus alone might imply; if so, its borrowing policy may have been more conservative than the extent of its reliance on the banks superficially suggests.

In the last analysis, however, the clue to the year's monetary experience lies in the intentions of last April's budget. Partly in consequence of the stimulus it gave, the expected expansion of production has been approximately attained. This rise in output, and its associated rise in incomes, presupposed some expansion of the volume of money; it turns out that the borrowings of the private sector from the banking system have only moderately expanded, and that quite recently. The monetary authorities have obviously taken the view that there was scope for a moderate easing of the credit situation as a whole. They have therefore thought it right for a further volume of credit to be created against Governmental borrowings. That is to say, the Treasury once again has not seen any need to resort to aggressive borrowings on the market in order to stop the rise in its demands upon the banks. There is room for argument whether the resultant policy has been firm enough—for an important slice of the additional real resources available during the year has gone to consumption and wage pressures have revived. But, in the circumstances of this past year, any such criticisms should be addressed to the stimulus budget rather than to monetary management as such. Only in the event of a very sharp adverse turn would monetary influences have been deliberately used to change course from the budget.

The Gnat and Nato

THE Gnat is a small jet fighter aircraft that is expected to fly this autumn; it has also become the symbol of a controversy over defence policy, the temperature of which is rising as the aircraft nears completion. The Gnat is what is ironically known as a "light" fighter; it is about the same size and weight as a Spitfire, and a great deal smaller, lighter, cheaper—and faster—than the modern jet interceptor, though less elaborately instrumented, and more lightly armed. Many defence experts hold that a fighter of this type will have to go into production, not because it is technically superior to its heavier counterparts (although it is certainly not inferior), but because it is 'so much' cheaper, easier to build, and easier to operate. There is an argument of expediency against perfectionism.

The North Atlantic Treaty Organisation's experience of attempting to plan the defence of Western Europe has demonstrated two facts about the modern fighter that tend to be overlooked. One is that few countries can afford to buy such fighters in the numbers needed to give adequate defence. The Mystères and the Hunters on order for Nato will all be paid for with American dollars, not with local currency. The second is that these fighters make such heavy demands on a country's resources of machines and man-power that they cannot be turned out in quantity in peace time, no matter who foots the bill; further, their size, weight and landing speeds suggest that they are not suitable for operation on the kind of emergency airstrips that would have to be used if Europe became a battlefield. These arguments apply with even greater force to Commonwealth countries that have to get along without American aid.

The modern jet fighter costs about £70,000 and weighs at least 16,000 lb. The Gnat, it is estimated, should cost about £25,000, weigh about 6,000 lb fully laden, and take about one-fifth of the man-hours to produce that are needed for the bigger fighter. Had the Gnat been designed in France, Belgium, or Holland or even the United States, it might by now be going ahead with the maximum official backing. But for better or worse, it is a British design that has had the misfortune to be put forward at a time when the British defence budget is big enough to provide for substantial re-equipment of the RAF with Swifts and Hunters—the only Nato country able to afford this—but not big enough to provide a margin for the development of any additional fighter types such as the Gnat. In consequence, the Gnat is being built and financed out of private funds and has no official backing.

The Air Ministry's arguments for rejecting the light fighter in principle and the Gnat in particular are difficult to refute. In the Swift and the Hunter the RAF has on order and under construction as many day

fighter machines as it is likely to need, and by comparison with these fighters, the Gnat carries fewer guns, has a smaller number of radio channels, and is generally less fully instrumented. And because the Air Ministry has no immediate use for the Gnat, the Ministry of Supply, the department that would normally finance its development and handle the production orders, has steadily refused to give the project support. But this is far from being the end of the story. The air experts admit that the Gnat, while under-instrumented, has all the essentials of a modern high-speed fighter; radar ranging, VHF radio, armour, ejection seat, and 30-mm cannon. The Gnat has been designed by Mr W. E. Petter, who was responsible for the astonishingly manoeuvrable Canberra bomber, and its prospective performance has never been questioned. The RAF concede that unless a machine like the Gnat goes into production, other Nato countries will never afford an adequate number of supersonic fighters. A second attraction is that the Gnat could operate from emergency airfields in Europe. Pressure is therefore being brought to bear on the Ministry of Supply to order a small number of Gnats as "research" aircraft in order that their performance can be put through proper Service testing.

★

Meanwhile the company building the Gnat, Folland Aircraft Ltd., continues to finance the project out of its own funds. The company is a substantial contractor to the aircraft industry, and is not short of work. Its major difficulty has been to get a jet engine to meet the Gnat's exacting requirements—that is, an engine weighing around 800 pounds, but giving a thrust of between 4,000 and 6,000 pounds. (The Rolls-Royce Avon, originally built to give a thrust of 7,000 pounds and currently giving 10,000 pounds, weighs in the region of one ton.) With such an engine, the aircraft would be able to fly at speeds well in excess of Mach 1 (the speed of sound at any given altitude) in level flight and over a wide range of altitudes. No British fighter has yet attained this performance. Folland Aircraft succeeded in interesting the Bristol Aeroplane Company which is now developing a small engine, the Orpheus, to Folland's specifications. The extent of Bristol's commitment in this project is uncertain, but there are indications that the engine might eventually get the Government support at present withheld from the Gnat, since there are a number of applications to which the engine could be put. On this basis, Folland has calculated that the company could produce Gnats at the rate of 50 a month by 1956, at a price of £25,000 apiece, fully equipped.

A twist has been given to an already complicated

situation by the growing interest shown in the War Office and the Admiralty in the Gnat. The Navy needs light fighters on its smaller carriers, and while the Gnat in its present form has too high a landing speed for carrier operation, the possibility of using it as the basis for a Navy fighter is being studied. The Army's interest in the Gnat is for the ground support of troops. The armies in Europe need cover from 1,000 or more front-line ground attack fighters. In the past, day interceptor fighters have been specially modified for this rôle, and in the normal course of events, Swifts and Hunters would be similarly adapted when they had been superseded by improved interceptors. The Air Ministry finds this an economical way of getting two lives out of its fighters, but the catch, from the Army's point of view, is that there may never be enough Swifts and Hunters in service to provide, ultimately, the ground attack strength that the Army needs. Nor will those aircraft be

taken off interceptor duties for several years. Strongly supported by the British element, the Nato Supreme Headquarters at Fontainebleau has decided that the only way to get adequate fighter support is by drawing up and publishing its own requirement for a light fighter for ground attack duties. This was completed only a few weeks ago,

and it is a requirement that the Gnat could easily meet.

A new factor entered the scene with the arrival of a team of American experts from Washington. A clause slipped into last year's Mutual Security Act provided a sum of \$40 million to finance the development of "special weapons" in Europe, which would contribute to the efficiency of Nato. The money must be allocated, but not necessarily spent, before the end of the American financial year in June. The experts have been studying a good many projects including several proposed by the Ministry of Supply—and they have also studied the Gnat. If the aircraft seems promising, Washington would have a strong interest in seeing it developed as rapidly as possible. The smaller countries in Western Europe are looking to Washington to provide them with the military equipment that they need to meet their Nato commitments, and it would make a considerable difference to the American taxpayer if those commitments could be fulfilled with Gnats costing £25,000 in place of Hunters and Swifts costing £70,000 to £100,000.

Folland Aircraft is doing something which has become pretty rare in the aircraft industry. It is

developing, without any assistance from the Government, a combat aircraft in which it has faith—much as the de Havilland company years ago had unsupported faith in the Mosquito. If the company can secure an initial production order from either the British or American governments, then it can be certain of an almost inexhaustible market among the less prosperous European countries and in the Commonwealth where defence costs are a major concern. Developments in radar design in the United States have produced sets small and light enough for the Gnat (or the Swift or Hunter) to carry; the aircraft could also be adapted to carry guided missiles and the company will certainly attempt to establish it as an interceptor and not only a ground-support machine. Much depends, inevitably, on Bristol's progress with the Orpheus engine. And if, in the end, no orders can be secured, the company stands to lose the several million pounds that it costs to develop even a small aircraft.

These and other signs during recent months that the British aircraft industry is being more venturesome in development risks must be welcomed unreservedly. But as the story of the Gnat shows, enterprise of this kind can create awkward problems for Government departments that have already sanctioned

substantial capital investment in production lines for other projects with which the new ventures compete. But whether the Ministry of Supply's present policy towards the Gnat is correct in view of the machine's tactical, if not strategic importance, is a matter on which many experts in each of the services are prepared to express doubts. The Gnat's buzz is likely to become increasingly irritating as the time for its first flight approaches in the autumn.

INDEX

The Index to *The Economist* is now published quarterly. The subscription rate is 5/- a year; single copies are priced at 2/- each. The Index to Volume CLXIX (October to December 1953) is now available from:

Business Notes

A Bait for Bankers?

DOUBTS about what the Treasury would do to replace the £412 million of 2½ per cent National War Bonds (1952/54), due for repayment on March 1st, are now set at rest. Its decision—which fits nobody's guess—gives a glimpse of the plans that the authorities may have in mind for the gilt edged market this year. Holders of the maturing bonds are invited to signify before February 8th whether they will convert on March 1st into 3½ per cent Conversion stock 1969 plus a cash payment of £1 per cent making the effective issue price £99. No cash subscriptions are invited. Hence no investment potential is being withdrawn from the market; and, indeed, a large slice of the maturing stock is already in official hands. The authorities could therefore be bold in fixing the terms distinctly "above" the market—and the date fully as long as the banks are likely to accept. The new stock, with its appeal of a single date, is designed ultimately to become a bankers' stock, though at present it is probably too long for some of them.

The authorities were obviously confident that they could pull the medium-dated range of stocks up to their level; and this confidence has been justified. Medium-dated stocks did rise after the announcement, the sharpest advance being in Gas 3½ per cent 1969-71 which rose ½ to £98½. In the assented form the maturing War bonds are now quoted at around £99 which supports the idea that the new stock will start near the issue price. The market reaction indeed was favourable to everything except perhaps the name of the new stock which some people disliked because there is already a 3½ per cent Conversion stock (1961 or after) in the market. The big attraction is obviously the single date. A fifteen year 3½ per cent stock of this kind is an opportunity that the Treasury seldom offers. Its yield to redemption in March 1, 1969, is £3 11s. 9d. per cent. At the time of the announcement the yield on the slightly shorter 3 per cent Funding stock 1966-68 was £3 8s. 8d. to redemption in 1968 and on the 3½ per cent Gas stock 1969-71 £3 16s. 9d. to redemption in 1969.

The Treasury is certain of acceptances from well over half the outstanding £412 million of maturing War bonds for the Government departments are big holders and have been buying recently. The balance is held all over the country, mainly in small amounts, for the stock was originally a wartime "tap" issue. But holdings in the money market—for whom the replacement stock is much too long—are believed to be quite small. Any guess of the amount of new stock that will result from the operation is obviously dangerous, but the market is anticipating a total of over £300 million. Much if this will start life in the Government departments and gradually become available in the market. On that assumption the Treasury is com-

fortably in hand since the conversion operations of last October left a surplus of around £300 million. The market should therefore be clear for some time for the capital needs of the nationalised industries and for the resumed flow of Dominion and Colonial borrowing that the Sydney conference foreshadowed.

No Blast of the Trumpet

THE tariff walls that surround the United States will not crumble before the toot of the Randall Commission's trumpet. But in spite of an unpromising start there is some solid and sound advice in the majority report though it is vehemently countermanded by the protectionist spokesmen on the Commission. The suggestions fall under three main headings. The first proposal is an amendment of the Buy American Act to exempt from its provisions the tenderers from other nations "that treat our bidders on an equal basis with their own nationals." Some harsh things are said in the report about the persistence of this anti-depression measure of 1933 into an era where it has no logical place, but the proposed concessions are limited to those countries that can acquit themselves of any discrimination against the United States—and they are few. In the second place the Commission recommends a fundamental review of tariff schedules and customs formalities. It admits that the present complexities of customs administration are a significant deterrent to imports into the United States and that they create irritations which are detrimental to the foreign relations of the United States.

Thirdly, the Commission proposes a three-year extension of the Reciprocal Trade Agreements Act which embodied the President's powers to engage in tariff negotiations. The President should be authorised to reduce existing tariff rates by not more than 5 per cent of the present rates in each of the first three years of the new Act. That will overcome the serious obstacle to tariff negotiations with the United States which arises because on certain important items the United States have already yielded the maximum of present permissible concessions, namely 50 per cent of the rates in effect on January 1, 1945. The Commission also suggests that the President should be authorised to reduce tariffs by not more than half of the rates in effect at the beginning of 1945 on products which are not being imported, or imported in negligible volume, into the United States. This concession could be made "with or without receiving reciprocal concessions." For all other reductions of tariffs, however, the principle of reciprocity is to continue to apply. The Commission suggests that in an annual report to Congress on the trade agreements programme, the President should announce

what reciprocal concessions have been obtained in exchange for the reductions in the American tariffs. The Commission re-emphasises this point by declaring "we do not believe that unilateral action by the United States will solve the world's trade problems."

Apart from the implications of the complete dissent from these tariff recommendations from two members of the House of Representatives, who hold important positions on the Committee that will consider any relevant legislation, the main disappointment with this section of the report must lie in the emphasis given to this principle of reciprocity. Given the inordinately high level from which the reduction in American tariffs began and given also the structural surplus in the United States balance of payments to which the Report makes repeated reference, it seems strange that the Commission should so consistently refuse to face the logic of its own reasoning—the need for some unilateral tariff concessions on the part of the United States.

Caution on Convertibility

ONE of the most revealing and significant sections of the Randall Commission's Report is that dealing with progress towards currency convertibility and the part that the United States might play in helping that movement. It is, incidentally, the only section of the report unencumbered by notes of dissent—perhaps because the relevant passages are addressed not to the United States but to the outside world. The report defines the two views on inconvertibility; one regards it as a short-term problem requiring for its solution little more than the curbing of inflation; the other sees inconvertibility as a problem that emerges from structural and deeper-seated changes in international trade and payments already becoming apparent before the war.

The Commission leans to the second view. Although it agrees that general economic conditions required for currency convertibility are more nearly present today than at any previous time since the war, it still envisages progress towards this goal as a sedate movement in which each step should be consolidated before the next one is taken. The Commission would deplore a mere technical convertibility bolstered up by restrictions on trade; it believes that the removal of restrictions on payments and on trade should go hand in hand. It does not favour a "dash" for convertibility, or letting a currency "find its own level"—which might all too easily lead to unrestrained inflation. It is, however, sympathetic to the concept of a "floating rate" by which it presumably means a wider tolerance of exchange fluctuations on each side of the parity. Above all, it stresses that before any move into convertibility can be made by European currencies, and particularly by sterling, a considerable strengthening of reserves must be achieved. It points out that even now sterling finances about 40 per cent of the trade of the world and if it were made convertible it would be exposed to commercial and speculative pressures to a far greater extent than any other European currency.

The necessary strengthening of reserves, says the Commission, could be achieved by more active utilisation of the International Monetary Fund's holding of gold and

convertible currencies which now amount to \$3,300 million. A second means of strengthening foreign reserves would be provided by the extension of stand-by credits or line of credit arrangements to foreign central banks by the Federal Reserve system—a proposal that drew no reservation or dissent from any member of the Commission.

The Commission also warns Europe not to make any move towards convertibility that might wreck the European Payments Union before something better can be put in its place. Such comment on the convertibility problem is highly revealing as a reflection of official and well informed views gleaned from witnesses who were examined by the Commission during its visits to Europe. A careful reading of this section of the Report will provide the best available information on the character of such official convertibility plans as exist in Europe today. It will also reveal how much the United States have learned since 1945 when their highest authorities were instigating not so much a "dash" as an isolated "crash" into convertibility by sterling.

Against Commodity Agreements

THE Commission is opposed to international marketing agreements as a means of stabilising commodity prices. It believes that such agreements cannot solve the problem of instability, and that they "introduce rigidities and restraints that impair the elasticity of economic adjustment and the freedom of individual initiative, which are fundamental to economic progress." Another objection is that the types of agreement so far tried or proposed "involve commitments which could lead, if extensively employed, to very great outlays of American government funds in certain contingencies, of indeterminate amounts." The Commission is therefore also against proposals that the United States should itself operate buffer stocks to stabilise world prices. "Experience with the costs of efforts to stabilise certain commodity prices within America are an indication to the indeterminability of the costs of similar programmes on a world-wide scale."

The Commission doubtless had in mind the cost of subsidising exports of American wheat under the International Wheat Agreement. This agreement, it states, has contributed little to solving the wheat problems of America and the world at large. The criticism is surely confused. The only remedy for the massive surplus of wheat is for the exporting members to produce less or sell more. The cost of subsidising America's exports of wheat is simply a function of its high domestic support price, which—as the report complains elsewhere—has encouraged over-production in America and abroad. US government funds are not committed in the new International Sugar Agreement, nor would they be in the proposed tin agreement, both of which, incidentally, attempt to adjust production to demand by controlling exports and stocks in the producing countries.

The Commission would attempt to bring greater stability to commodity prices by: trade liberalisation; diversification of the economies of countries excessively dependent on a few commodities; avoidance of actions by America in its own commodity control and stockpile programmes that would have avoidably disruptive effects on prices; continued international co-operation to improve knowledge of

world supply and demand, and to explore possible means of lessening instability of prices; and policies that would temper the fluctuations in the American economy. These proposals are admirable, familiar and almost certainly inadequate. Two members of the Commission, Mr McDonald, president of the steel workers' union, and Mr Whitney, a New York financier, share these doubts, and state that commodity agreements that embody flexible price policies and take account of long-term trends of supply and demand may be worth while.

Second Thoughts for Steel Shares

BY all reasonable standards, the offer of Lancashire Steel shares to the public has been a failure, and much worse than most people foresaw. Clearly, the 4,500,000 £1 ordinary shares were over-priced at 22s. in face of the discount on United Steel ordinary shares. But the 4,500,000 5½ per cent preference shares at 21s. were expected to attract the institutions and some personal funds as well. In fact, apart from underwriters' applications, only 500,000 of the ordinary shares were applied for and only 2,700,000 of the preference shares. Of these, applications for 1,600,000 preference and 400,000 ordinary come from former shareholders. The offer was technically "oversubscribed"; since underwriters had to back their commitments with firm applications for the same number of shares, that follows automatically. But the fact, as distinct from the appearance, is that after small applicants and former shareholders had received full allotments, underwriters were required to take up 89 per cent of their quotas of ordinary shares and 42 per cent of the preference shares.

There must now be a decent interval free of steel offers, and some clear thinking before Sir John Morison and the City consortium attempt to sell back another company to the public. The period of market indigestion with Lancashire Steel may not last long, for there are so few "stags" wishing to sell. Already the preference shares, which touched 1s. discount on Monday, have rallied to around 1½d. discount. The ordinary shares have been down to 2s. 6d. discount and are now around 2s. 1½d. discount.

In the interval which must now elapse two points seem to call for thorough reconsideration. First, what is the proper yield for a steel share against the background of Labour's renationalisation threat? Lancashire Steel was resold to the public at a profit of roughly £14 million and the preference shares have been created with a right to redemption at 22s. No one can pretend to envisage how renationalisation would be contrived if it ever were enacted; but there is at least a possibility that the whole £14 million might fall on the 4½ million ordinary shares, involving a capital loss of over 5s. per share. That possibility, remote as it may be, costs something in terms of current yield. Secondly, is there any real merit in requiring underwriters to put in firm applications equal to the amount of their underwriting? It does not increase the funds that underwriters are prepared to earmark for investment in steel shares. And the method hardly achieves even good window dressing; for some part of what the institutions are now taking up as underwriters represents their genuine

requirement as investors. If these shares had been taken up on free applications along with those from the public, the result would have looked better.

"Commitments" and Coal

IN return for the wage increase of which it has recommended acceptance this week, the National Union of Mineworkers would promise nothing more specific than that its leaders will have one extra talk with the National Coal Board every three months. Even if its polite agreement as to the desirability of an extra 5 million tons of coal from the mines this year were the "commitment" that the board would like to suggest, the union would not be promising anything remarkable, nor is there any suggestion that anything would happen if its "commitment" should not be honoured. An increase of some 5 million tons in deep-mined output this year is roughly what might be expected from the recent trend of output, other things being as equal as they ever are in coal; last year, though extra holidays cost the industry about 5½ million tons of output, the miners' final total turned out to be only about a million tons lower than the year before.

The wage increases will cost just under £10 million a year, adding about 2½ per cent to the industry's wage-bill; so an increase of 5 million tons or rather more, if it occurs, should neatly bring the labour cost per ton back to its present figure. The Coal Board, therefore, was able to hope that no general increase in prices need result—though it covered itself by mentioning rises in other costs, such as likely increases in the cost of more elaborate safety measures under the bill now in Parliament. Once again the board emphasised that it did not intend to raise the price of coal to "industrial consumers" as a result of this wage increase; and once again it reserved its right to review the prices of its different coals "from time to time."

This increase in coal costs, therefore, is for the present broadly to be absorbed by the industry, and the miners' wage increase will not cost the coal consumer more immediately; though the railwaymen's will, since the impending increase in railway freight charges would add perhaps 2s. to 4s. a ton to the delivered price of coal. Any wage increase that can in some way, however tenuous, appear to be linked to productivity has perhaps some virtue today. But this one should not be allowed to set the precedent that the miners are entitled each year—in advance—to whatever benefits may accrue from all the resources that are ploughed into the coal industry; their own skill and effort are not the only contributions.

A Banker on Convertibility

THE last movement in this year's symphony from the bank chairmen has been heard this week; it carries to fitting crescendo the warning notes about exports that sounded through the earlier phases. Lord Aldenham, of

the Westminster Bank, points out that in 1953 Britain paid its way only by a narrow margin, yet it will require "our very best efforts" to better this margin in 1954. Increasing competition in export markets, he emphasises, is "now no distant menace." There is disturbing evidence of the energy of the "united" drive of employers and employed in Western Germany; there are "many instances" in which British goods have been priced out of even their traditional markets; and there still are difficulties over Britain's delivery dates.

Lord Aldenham's other main theme, the question of convertibility, may seem less fitting to some of his brother-chairmen. One of them had pleaded for convertibility "as soon as practicable" and others had expressed regret at the delay. But Lord Aldenham bluntly says that "it does not seem likely that full convertibility between the pound and the dollar would help us much at present." Unless Britain's shop-window was as attractive to the world as the American shop-window, it would imply either a depreciation of the pound or "an even more severe restriction of dollar imports than we suffer from now." He sees some favourable signs in the progress of Britain's exports, notably of cars, to North America; but is anxious that Britain should "not again risk the disastrous experiment in convertibility of 1947."

The Westminster Bank's decision not to raise its dividend is explained in approximately the terms indicated in these columns a fortnight ago. Lord Aldenham recalls that the Westminster has long paid (and still pays) a higher nominal rate than most of its competitors, and he then draws attention to the fact that the temporary depreciation shown on its investments at mid-1952 (when the book loss sustained during the half-year was not "minimised" by any writing-down) represented a high proportion of its published reserve at that date. This "so recent and so sharp reminder of the way in which the market value of even British Government securities may fluctuate" convinced the board that there was no justification for raising the dividend. The "best interests" of shareholders were served by strengthening inner and published reserves.

To Plough or Not to Plough?

IN the past few days investors have had the advantage of two contrasting views on how much of a company's earnings should be distributed and how much ploughed back into the business. Sir Harry Pilkington, president of the Federation of British Industries gives one view, Lord Balfour of Burleigh, chairman of Lloyds Bank, the other. The banker and the industrialist start from the same point: there is a big need for the investment of fresh savings in industry; there is no certainty that the right amounts will be forthcoming when and where they are needed. From that point, the two part company. It is the industrialist who pleads for low dividends and a compulsory holding back of shareholders' money, the banker who calls for liberality.

Says Sir Harry Pilkington: "We must persuade our own shareholders to take the long view." He believes that industry will continue to plough back as much of its profits as it can and that that is all to the good. "The perpetual demand for greater resources is most profitably met from

within by the retention of profits, even in some cases of all the profits." Lord Balfour takes exactly the opposite view. He says that the excessive degree to which industry now has to depend on the ploughing back of profits has drawbacks. "Once a business has made adequate reserve provisions it is much the best thing, under normal conditions, that profits surplus to requirements should find their way back, via a healthy investment market, to the enterprises that can make the most profitable use of additional capital, and whose growth—or even foundation—may well be frustrated under present conditions."

It must be admitted that the distortions of the tax system are at present working for Sir Harry Pilkington's view and against Lord Balfour's. Retained profits bear heavy taxation. But distributed profits bear also distributed profits tax and often surtax, and the potential sinews of new investment are thus diverted from private risk financing to the public sector of the economy. There also remains plenty of room for a difference of view about what constitutes adequate reserves. The capitalist in power is apt to use a different standard from the minority investor without intimate responsibility. Shareholders of J. Sears have just discovered that even a take-over and change of masters does not always release as much as had been hoped for. Still when all allowance has been made for those factors the average investor would prefer to take his dividend and do his own investing rather than submit to the course of education and compulsory investment which Sir Harry Pilkington outlined to his Scottish audience last week. And, as Lord Balfour pointed out, excessive ploughing back gives no guarantee that expanding industries will get their proper share of available savings or that new enterprises will be able to find capital at all.

FBI Meets World Bank

THIS is the season when the bankers express their views on industry and trade. No one will complain if for once the industrialists have found occasion to express their views on banking. Least of all will the bankers complain, when the result turns out to be a fine testimonial. In an atmosphere of doubts about the fair distribution of the orders that spring from the operations of the International Bank a four-man group from the Federation of British Industries including Sir Norman Kipping, the director-general, went to Washington, visited the headquarters of the bank, and presented their report on Wednesday. Introducing it Sir Norman Kipping frankly admitted that they had gone out in an atmosphere of "allegations of practices that were biased" and that they had been converted. The most vital conclusion reads: "We have no doubt about the bank's impartiality of outlook." In detail they apply that testimonial of impartiality specifically to the department of General Wheeler, the Engineering, production to demand by a powerful effect on the flow of the producing countries. schemes. On one item only—*to bring greater stability there still a suspicion of addiction to speculation and diversification.*

Though the visiting group has come back converted their report is certainly of value: it will receive a wide distribution through industry in this country, which is itself worth while. There remain important suggestions of detail, though many

ECONOMIST, JANUARY 30, 1954

of these have to be addressed to the British Government rather than to the International Bank. They include a plea to the Treasury for "as open a policy as possible" on the use of the British sterling subscription to the bank's funds. They also reveal the regrettable fact that the bank's able and internationally-recruited staff includes no British engineer; no British engineer of sufficient qualifications has been put forward—which presents a useful job for the FBI and the British authorities to tackle.

Purchase Tax Changes

CUSTOMS returns for 1952-53 show, for the first time, the effects of the "D" scheme on purchase tax revenue. At first sight, they appear to bear out the textile traders' argument that sales resistance to goods attracting tax is on the increase. While the yield of Customs rose by £12 million to £1,764 million, total purchase tax receipts dropped from a peak figure of £338 million in 1951-52 to £315 million for 1952-53, and the amount paid on clothing and textiles (including shoes) fell from nearly £80 million to £45.5 million of which only £26 million came from textiles. But a drop in receipts would have been inevitable, since the rate of tax on textiles was cut, shortly after the 1952 budget, from 33½ per cent on made-up clothing, and 66½ per cent on piece goods to 25 and 50 per cent respectively. Moreover, 1952-53 covered a period of depression in the textile industries during which retail sales were indeed recovering, but the movement of goods through the hands of the "registered traders" who collect the tax from retailers were decidedly slow and traders' stocks of taxed goods were kept down to levels barely adequate to support normal trading. A high proportion of the stocks being unloaded onto the market during that period also consisted of erstwhile "utility" merchandise that had attracted no tax at all. The drop in receipts from textiles, however, looks as if it has been substantially more than the £10 million that the Chancellor estimated that he would lose during 1952-53 (£17 million in a full year) when he introduced special tax concessions in May, 1952.

The effects of the minor recession in consumer trades can be seen in the purchase tax receipts for most other types of goods. In almost every group, they were lower than in 1951-52, the only noticeable exceptions being radio and television, up from £20.9 million to £24.6 million as

1951-52	Goods chargeable at	1952-53
£ mn.	Per cent	£ mn.
198	25	135
94	33½	5
46	50	112
	66½	42
	100	315
338		

television reached new areas, and road vehicles (including cycles). The yield here rose from £50.8 million to £71.3 million as more cars came onto the home market. The only other category to show an improvement was toilet goods and perfumery, where the tax receipts rose £2.4 million to £23.1 million.

Car and radio sales (both attracting tax during that period at 66½ per cent) made a big contribution to receipts

during 1952-53. Tax concessions made in the 1953 budget, when the rates on non-textiles were cut by one-quarter bringing them down to 25, 50 and 75 per cent, were expected to cost the exchequer no more than £60 million in a full year. The table suggests, however, that unless retail sales of taxed goods have risen considerably, the cost to the Exchequer may prove substantially higher.

Back Duty Squeeze

AMID the mass of statistics in the report (Cmd. 9030) of the Inland Revenue Commissioners for the year to March 31, 1953, the commissioners have revealed what blood their probe into savings and deposit accounts has drawn. From the statistics reproduced in the accompanying table it is clear that this investigation has had some success in clawing back tax payments from those who had failed to declare their full incomes. Nearly 10,000 cases were dealt with in 1952-53, compared with just under 5,000 in the previous year. Over £11 million, compared with nearly £9½ million, was collected in back duty; nearly £4 million of this total charge represented the penalties imposed on the culprits. In addition, the District Inspectors settled over 136,000 "small cases" in 1952-53, compared with just over 5,000, and collected nearly £5.4 million in back duty, compared with only £421,000 the year before.

BACK DUTY COLLECTION

Years ended March 31	Number of Cases	Total charge £'000	Penalties* £'000
1939.....	2,774	3,131	Not known
1948.....	1,411	4,190	967
1949.....	1,802	4,432	1,060
1950.....	1,886	5,054	1,291
1951.....	2,838	7,470	1,735
1952.....	4,962	9,430	2,446
1953.....	9,836	11,045	3,865

* Included in total charge.

Blood, then, has been squeezed from the smaller stones. This was made possible by the 1951 Finance Act, which gave the Inland Revenue the power to obtain from the banks and savings banks (including the Post Office Savings Bank) the names and addresses of those who received more than £15 of deposit interest not taxed at source. It was not until 1952-53 that the Inland Revenue could take full advantage of this investigation and then it had to employ more inspectors to tackle the job. But it would be premature to pat the commissioners on the back for this achievement. Counter measures against tax evasion started late and cannot yet be over. And the Inland Revenue could enter the fight only after it had been provided with new powers of inquisition.

A Blow to the Heart

IN their latest report the Inland Revenue Commissioners have revealed for the first time what proportion of the assets of estates caught in the death duty net represent

shares in private companies, as distinct from quoted securities. The appropriate statistics are reproduced in the accompanying table. They must be treated with caution, not least because they are in a sense part of the Inland Revenue's answer to the long list of memoranda recently submitted to the Chancellor on estate duties.

The estates have been grouped in the order of their net capital values. Hence, the distinction between the estate that consisted almost entirely of liquid assets or quoted securities and the estate made up of private company shares or property has been entirely lost. The statistics in their present form would suggest that the smaller estates (on which the duty is light) have substantial liquid balances and that, therefore, it was not necessary for the executors to sell, say, shares in a private company or some piece of property to meet the duty. As a superficial generalisation this cannot be far off the mark. But it cannot hide the fact that each individual estate may differ widely from the average pattern. Some even in the low-duty categories doubtless consist of little more than assets (or shares) in a family business, so that death may force a sale of shares perhaps jeopardising a family's control.

DISTRIBUTION OF ASSETS

Range of Net Capital Value of Estate	Private Co. Shares	Quoted Securities	Liquid Assets*	Trade Assets	Land and Property†	Rate of Duty
2,000-5,000	1.8	25.9	34.5	5.3	34.5	1.2
5,000-10,000	3.4	31.6	29.1	5.1	30.8	3.4
10,000-15,000	4.0	37.2	28.2	4.7	25.9	6.8
15,000-20,000	6.5	40.6	25.0	3.6	24.3	10-12
20,000-25,000	7.5	43.3	21.2	4.2	23.8	15
25,000-30,000	6.0	45.4	21.8	4.3	22.5	18
30,000-40,000	8.2	46.9	20.4	3.3	21.2	21-24
40,000-50,000	8.6	50.3	18.3	2.9	19.9	28-31
50,000-60,000	8.4	53.0	17.9	1.9	18.8	35
60,000-80,000	8.4	53.8	18.4	2.5	16.9	40-45
80,000-100,000	10.7	52.1	17.6	1.0	18.6	45
100,000-200,000	12.3	52.5	16.8	1.3	17.1	50-55
200,000-300,000	16.2	49.0	12.8	3.1	18.9	60
300,000-500,000	11.2	51.7	13.6	0.4	13.1	65
500,000-1,000,000	19.1	47.0	12.7	1.9	19.3	70-75
1,000,000-2,000,000	26.2	30.7	20.8	2.7	19.6	80
Over 2,000,000	30.3	39.5	8.1	0.2	21.9	80
All estates	7.0	40.1	24.1	3.7	25.1	...

* Including cash, insurance policies, building society shares and deposits, mortgages, bills, etc.

† Including land, household goods, house property, business premises, and other real and personal property.

Even with this grave shortcoming these statistics indicate the threat that death duties can impose on a private company, whose shares or assets do not command a ready market. As the estate grows larger, the more menacing does this threat become. The table shows that at the very best many of the estates worth more than £200,000 have to exhaust all their liquid assets to pay the duty, and few families would be willing to lose all the liquid assets before touching the business assets. Right at the top of the scale the greater part of assets of every kind must be realised to pay off the duty. Thus in the larger estates death duties can force a sale of business assets. And if this sale leads to a loss of control it has dealt a severe blow to the heart of the family business in this country. The blow will be even harder when the next generation of owners dies. With the high rate of tax on incomes this generation will be unable to build up large personal estates outside the business.

Discount Market Portfolios

THE accounts of the "Big Three" discount companies for 1953 reveal, as expected, a notable expansion of their bond portfolios and a contraction of bill portfolios. The aggregate of the former has risen by £55.2 million to £240.8 million, the highest figure ever shown, while the aggregate bill portfolio has dropped by £71.1 million to £327.7 million and thus is almost 25 per cent below the peak reached four years ago. Although these trends, as the accompanying table shows, are common to each of the houses, they should not be regarded as measuring the change in the pattern of portfolios during the year, since important movements are known to have taken place towards the year-end. It will be noted that by far the greater part of the aggregate fall in bill holdings, as well as a large part of the rise in bond holdings, is represented by the Union Discount. The investment holdings of this house have been virtually restored to the high level shown at end-1951; but in 1953, as in 1951, an important part of the rise resulted from market conditions late in the period. The bill holding, similarly, was affected by abnormally heavy purchases by the banks during December.

There is no doubt, therefore, that, despite the growth of "outside" competition, the discount market's turnover of Treasury bills during the year showed no such decline as the balance sheets might seem to suggest. Indeed, the chairman of the National Discount discloses that his company enjoyed a record turnover. At the level of rates ruling

for bond money before the reduction of Bank rate, bond business did not look attractive by comparison with business in bills, and portfolios probably tended to decline in the first half of the year; they have since been substantially built up. During the greater part of the year, turnover of commercial bills remained at a very low level, but towards

Advertising and Friday

Payday—full employment and a full pay packet for everyone. Public demand is keeping the works at full capacity.

But the economists have a spectre called "deficiency of effective demand". In plain terms people buy less than the works produce.

The machines slow down, profits fall, individual firms and trade as a whole descend into the trough of the trade cycle.

Against this, advertising keeps sales moving. Production flows. People hold their jobs. Firms retain their trained and valuable labour forces.

In modern economic theory advertising is not an uncompensated item in production costs. By creating mass demand it makes possible large scale production with lower prices. And at the same time helps to stabilise demand at the level needed to maintain employment.

Why do we do it?

IT MAY PUZZLE SOME READERS of these advertisements to know why—since mass circulation is not the aim of the Manchester Guardian—we advertise at all. Here are our reasons.

Truly, we do not seek the millions—not they us. The Manchester Guardian is for the relatively few, the influential 'thinking minority'. But not all of that minority is yet fully aware of the Manchester Guardian and of how much it offers them.

We believe that there is still a considerable number of men and women who would really appreciate the Manchester Guardian but who—because habit is so hard to break—continue with a newspaper which does not really satisfy them. These are the new readers whom we should like to enlist.

To gain such extra readers would be an obvious help to the Manchester Guardian. Equally the Manchester Guardian would be a help to these readers. Here then is a marriage of mutual interests which your newsagent will be happy to arrange.

If you have any difficulty in getting your Manchester Guardian regularly, please write to: The Manchester Guardian, Manchester.

the end of the year the flow of these bills began to respond to the sharp reduction of rates that followed the reduction of Bank rate—and perhaps also to freedom for commodity dealings.

Merchandise Marks with a New Look

THE revised version of the Merchandise Marks Act comes into operation on Monday, and with it a whole batch of new headaches for traders and their solicitors. It now becomes an offence to make claims that are "misleading," as well as those that are blatantly false, and the new Act embraces such aspects as the properties or quality of goods that the old one did not. But these admirable intentions may prove difficult to put into practice. It promises to be exceedingly difficult to define such a term as "misleading" to the satisfaction of the courts, and harder still to pin down so elusive a concept as "quality." And the new Act operates under the same handicap as its predecessor, namely that unless the offending claim is made on a trade mark, or a label attached to a specific piece of merchandise, it may be difficult to find adequate grounds for prosecution. Traders who make lavish promises in their advertising, but are more circumspect about what they print on the packet, are beyond the Act's reach.

At the same time, it is beginning to look as if large numbers of trade descriptions that industries have continued to use after changing production techniques deprived them of much of their original meaning, may now be offences under the new Act. (Furniture is a typical example.) Finally, the problem of policing the Act remains as big as ever. The Board of Trade and the Ministry of Agriculture, which share nominal responsibility for instituting proceedings when the offence seems sufficiently serious, are likely to do whatever they can to start prosecutions under the new Act during the next few months, in order to demonstrate that it has some meaning. But they are not likely to maintain this degree of interest for long, and few private organisations have the funds necessary to bring many cases to court unless the magistrates begin to award them higher costs.

Support for the Tin Scheme

THE Malayan tin-mining industry has decided by the large affirmative vote of 68 per cent to support the proposed International Tin Agreement, and the Federal Government will ask Britain to sign the agreement on its behalf. In Nigeria, the other British tin-producing colony, the industry is in favour of participation; the Nigerian government is not committed, but may well be favourable. In view of Malaya's financial difficulties the British government, subject to Parliamentary approval, will finance its contribution to the buffer stock. Malaya's maximum contribution, based on its production, is 36.6 per cent of 25,000 tons of metal or its cash equivalent, which at present would involve £5.8 million. The loan is to be recovered by a

levy, probably of 10 per cent, on the value of tin exports, but producers that can show need may receive further financial assistance. Mines that do not or cannot fulfil their production quota will be allowed to sell their quota to another mine at a mutually agreed price, but the arrangements for such sales have still to be worked out. The problem is to arrange for such transfers in a way that affords maximum flexibility in the industry without creating a vested class of absentee mine owners.

Nigeria, the smallest of the tin exporting countries, has a commitment of only 5.4 per cent to the buffer stock. The two major mining groups would finance their own contributions, and it is understood that the Colonial government would assist the smaller companies without calling on aid from the British government. The prospect of the agreement coming into effect is perhaps not materially worsened by the Randall Commission's objections to such agreements. It was never likely that Congress would ratify a tin agreement, but the Administration may still be sympathetic to it, at least in private. It is probable, however, that the British government will have to work even harder to collect sufficient support for the pact from the independent consuming countries. The Randall Commission's report has driven the last nail into the coffin of a rubber agreement, in which American participation would be vital.

Futures Trading in Sugar?

A MODIFIED form of futures market in raw sugar is being considered by the London trade. As the whole of Britain's domestic requirements of imported sugar, amounting to just under two million tons a year, are still handled by the Ministry of Food, the market may have to be confined to the raw sugar that is privately imported for refining and re-export. This amounts to some 650,000 tons a year, plus about 40,000 tons represented by manufacturers' exports of goods containing sugar. Refiners became wholly responsible for the export trade in refined sugar on

OUTPUT OF THE BRITISH COTTON INDUSTRY
WEEKLY AVERAGES

January 1st. The basis of such a market would be so narrow that the hedge it could offer might be of little value, and might thereby prejudice the eventual establishment of a much broader market in London. But the trade may consider this risk worth taking if it could be sure that the "pilot" market would simply be a stepping stone to a broader market within twelve months or so. A decision may therefore be postponed until the Ministry has indicated its plans for the future marketing of sugar imported for domestic use.

The main problem is to prevent the market from being used as a place where foreign holders of sterling could buy dollar sugar. As in other futures markets, delivery abroad of dollar goods could be prohibited, unless payment was made in dollars; but this would probably weaken foreign confidence in the contract. The foreign operator would have to decide what he would do if dollar sugar, which he could not export, were tendered to him in London, and might think that British refiners would call the tune. But if the Bank of England was prepared to take a fairly liberal view of the dollar risks involved, it might tolerate a limited delivery of dollar sugar to be swapped on the actual market for sterling sugar. It might then also be possible to broaden the market by extending its facilities to participants in Britain's large entrepôt trade of some two million tons a year—roughly half the sugar traded through the free world market. The difficulty is to design a contract that will both attract this trade and contain adequate safeguards against losses of dollars. If it could be done, the London market could go a useful part of the way towards regaining its prewar lead in futures trading, despite the lack of a large home trade.

Who Buys New Ships?

ONLY 169 new ships, totalling 520,000 tons gross, were ordered from British shipyards last year, and existing orders for about half as much tonnage were cancelled. New orders in 1953 were less than half the volume of 1952, and little more than an eighth of the huge tonnage for which

	Tons gross		
	1952	1953	Difference
United Kingdom:—			
Work begun.....	1,187,520	1,279,350	+ 91,830
Launched.....	1,300,612	1,316,688	+ 16,076
Completed.....	1,263,804	1,250,263	- 13,541
Total under construction at end of period:—			
United Kingdom.....	2,146,402	2,173,709	+ 27,307
Abroad.....	3,972,183	4,121,167	+ 148,934

orders were booked in 1951. Meanwhile the industry has been working into its arrears of orders: at the end of last year the industry had about 2.2 million tons of ships under construction, about the same tonnage in course of preparation, and little more than a million tons of untouched orders on its books. This is a situation more comfortable than that of many other industries, but the cycle of construction is far longer on shipbuilding; moreover, these outstanding

orders are not evenly distributed between the large shipyards and the builders of small vessels, many of whom are already short of business.

The decline in orders appears to be affecting shipbuilders throughout the world, but the statistics of construction suggest that Britain is markedly the heaviest sufferer, and its share of tonnage under construction is still shrinking. Although there is now slightly more tonnage under construction in the United Kingdom than a year ago, the shipbuilding work abroad has increased by nearly 150,000 tons, and this total conceals declines of over 185,000 tons in Japan and of nearly 125,000 tons in the United States. Britain's competitors delivered 740,000 tons more than in 1952, while Britain's output was lower. German yards began 1953 with 515,000 tons under construction and finished with 634,000 tons on the stocks, yet they succeeded in delivering a total of 712,000 tons during the year. Japan, similarly, which had only 567,000 tons under construction at the beginning of 1953, delivered 732,000 tons in the twelve months; and Sweden, which began with 350,000 tons, completed 470,000 tons. These countries, admittedly, were not building large passenger liners, which naturally take longer to build, but one German yard did complete a tanker of 45,000 tons dw in nine months from the laying of the keel. A longer working week, the extra shifts and the absence of restrictive labour practices all contribute to this speed of delivery, with which British yards at present can rarely compete.

Terms of Trade

It often happens that when the terms of trade for the United Kingdom are improving they are worsening in the rest of the sterling area and vice-versa. The United Kingdom gained a substantial advantage last year. Prices of the manufactured goods which make up the bulk of the export

trade fell much less than did prices of the agricultural and mining products which make up a large part of the imports. Therefore the terms of trade (the ratio between import prices and export prices) improved. In the rest of the sterling area, whose members are largely exporters of primary products and importers of manufactured goods the terms of

trade have been worsening since 1951, though not in the year to last April. Because the United Kingdom is banker for the whole sterling area and because any further cheapening of the exports of the agricultural members of the area might force a reduced consumption of British goods, it is clear that a further improvement in the United Kingdom terms of trade would not be an unmixed blessing.

The Board of Trade have made a useful attempt to show the comparative effect of the worsening in the United Kingdom terms of trade in 1951 and recovery in 1952 and 1953 against the opposite movement in the rest of the sterling area. The accompanying chart shows that for the whole sterling area there was a significant improvement from an index (1950 equals 100) of 117 in the April-June quarter of 1952 to 108 in the April-June quarter of last year, which is as far as the figures go. The figures make no claim to be more than broadly correct. They have been compiled under several difficulties, one of the most important limitations being the necessity of using figures of the trading partners of some of the sterling area countries instead of their own figures. That produces a dubious time factor—the difference between the time of shipment and the time of arrival.

SHORTER NOTES

During 1953 the average level of wage rates rose by about 3 per cent, and the index of retail prices by only one per cent. The index of wage rates stood at 138 at the end of

December, against 134 a year earlier; some 9 million workpeople had received increases in wages amounting by the end of the year to nearly £2½ million a week. This increase in wage rates (as distinct from actual earnings, on which the latest official data available relate to last spring) compares with an increase of 6 per cent during 1952 and of 11 per cent during 1951.

★

An indication of building society lending policy was given by the chairman of the Burnley Building Society, Sir John Grey, at Wednesday's meeting. He explained that the sum of £6,871,890 advanced on mortgage by the society last year was only 66 per cent of the purchase price of the properties concerned. The Burnley society's total assets last year advanced by £3,168,032 to £37,553,650.

★

The IMF has agreed to the devaluation of the Paraguayan guarani from 6 to 15 guaranies to the American dollar as from January 1st.

★

The height of the two stacks at the Windscale plutonium plant is 415 feet; four stacks of fifteen feet high, as a note last week misrendered the measurements, would not be adequate for the dispersal of radio active air.

Company Notes

J. SEARS (TRUE-FORM BOOT). Mr Clote, with his offer for the equity of J. Sears was the pioneer of the recent bout of take-over bids. A year after his successful bid comes the preliminary report of J. Sears (for the year to December 31st). It gives the impression that a take-over does not necessarily lead to quick profits for either the new proprietors or for the minority.

The group's trading profits have risen from £1,072,577 to £1,131,499, a smaller increase than those reported by some other boot and shoe companies. The ordinary dividend has been reduced from 62½ to 50 per cent. This must also be compared with the dividend of 22½ per cent paid for five years before Mr Clote threw his hat in the ring. The reduction follows Mr Clote's criticism last year that the rate of 62½ per cent (declared by the defeated board) was excessive. It seems that Mr Clote and his associates are not anxious to distribute much more than half the available earnings.

They seem anxious to prove that their object is not to take quick profits but to modernise and develop the business. A capital profit was made on the sale of the

freeholds on some of the shops of the subsidiary, Freeman, Hardy and Willis. Having sold the freeholds the group has, of course, taken out leases on these shops. The resulting cash is to be used first to pay off the outstanding debentures (at the maximum redemption price of 105) and then "to develop and extend the business and interests of the group." No capital return is believed to be at present under consideration.

The question to be asked apparently is: what is the future of J. Sears simply as a shoe company? The industry is vulnerable to sudden changes in consumers' demands and competition within the industry is strong. Plans to modernise the group's shops and to raise their business efficiency cannot be carried out without spending money. Moreover, amortisation and ground rents on leasehold properties (written up to their present values) are sure to take a bigger slice of profits than depreciation on freehold properties (entered in the books at their original cost). This extra cost will not affect the group's full accounts for the year ended December 31st, but ought to be disclosed there or in Mr Clote's statement.

Mr Clote will undoubtedly explain the "how" and "why" of his latest moves, though these moves may not be reflected in the accounts themselves. Then he may be able to destroy the lingering suspicion that he paid too much for the shares.

★

CARRERAS. The preliminary statement of the Carreras group prompted the question whether the stability in its profits disguised a rise in turnover matched by an increase in costs. The group's full accounts do not provide an answer and they raise yet another question. Why have its stocks risen so sharply?

Both in 1951 and 1952 the Carreras group operated with stocks of the order of £13 million. Last year this holding was increased by £4.2 million to £17.4 million. To a small extent this increase reflects a rise in the dollar price of tobacco and the acquisition of the stocks of newly purchased subsidiary companies. But it must arise principally from the bigger allocations of dollars last year for the import of tobacco. The tobacco manufacturers can hardly now describe stocks as uncomfortably low, as they did a year ago. Uncertainty about future dollar allocations encourages the tobacco companies to buy as much leaf tobacco as they can when they can, so that this increase in stocks

may be nothing more than an anticipatory and temporary move.

There are, however, some signs in the balance sheet that the group may adopt a policy of holding higher stocks. The success of the Dunhill cigarette argues the need for bigger stocks. The purchase of some of the assets (including its leaf tobacco stocks) of R. & J. Hill and of the issued capital of the Belfast company, Murray, Sons and Company, also suggests

an expansionist policy. These purchases, together with fresh capital investment within the group, are reflected in the rise of the net book value of fixed assets from £2.3 million to nearly £3.4 million.

So far the increase in fixed capital investment and in working capital commitments has been financed by bank loans. These loans have risen by £5½ million to £12.3 million, representing well over a third of total liabilities of £31.8 million. A policy of capital expansion and more particularly a permanent growth in stock commitments suggest that there may be a case for replacing temporary finance by permanent capital. It is a possibility that

the holders of the "B" ordinary shares, who have no votes and who again received a dividend of 17½ per cent, might bear in mind.

CABLE AND WIRELESS (HOLDING). The directors of Cable and Wireless (Holding), which now ranks as one of the giants of the investment trust movement, seem to have the habit of catching the stock market by surprise. The surprise this year came when they announced that the total equity dividend for the year to December 31st would be 9 per cent, compared with the rate of 8 per cent (including a 2 per cent bonus) paid in 1952. And if Sir Edward Wilshaw and his co-directors obtain the consent of the Capital Issues Committee they intend to increase the equity capital from £5 million to £5½ million by a 10 per cent free scrip issue. On this news the £100 ordinary stock units were marked up by 12 to 160 (to offer a yield of 5½ per cent).

Not the least surprising feature of this decision was that it was taken in the face of a slight drop in net profits—from £319,605 to £317,000. It has been accompanied by a reduction in the appropriation to general reserves from £100,000 to £30,000. In company with the other investment trusts, Cable and Wireless enjoyed an easy time last year. Equity prices were rising and so, too, were equity dividends, while fixed-interest securities remained practically unchanged in value. Hence, the group's profits before tax and loan interest went up from £916,805 to £942,000. Taxation fell from £320,507 to £266,000, but loan interest rose from £276,693 to £359,000, as a direct result of the conversion of the short-dated ventures into longer-dated stocks. The ease in equity payments suggests a measure of confidence in the future, but it must be remembered that any investment trust with a heavy weight of loan stock is particularly vulnerable when stock markets are falling.

LONDON STOCK EXCHANGE

Next Account begins February 10th.
Next Contango Day: February 10th.
Next Settlement Day: February 2nd.

HELPED by the strength of the gilt-edged market after the announcement of the conversion offer, industrial equities began the new account quite sturdily. Gilt-edged stocks, which had remained firm, advanced briskly after the news of the conversion offer had been made known on Monday evening. In dealings after the market had closed they put on between ¼ and ½ of a point and on Tuesday the long and medium dated stocks made further gains of ½ of a point while several of the "shorts" put on another ¼. On that day 3½ per cent Gas (1969-71) gained ¼ to 98½ and 4 per cent Gas (1969-72) ¼ to 101. Further gains of ¼ were recorded among the medium and long stocks on Wednesday, but the market was less buoyant when dealings began on Thursday. In the foreign market German, Greek and Japanese issues were marked down in the face of end-account selling, but on the first day of the new account the Greek loans rallied quite strongly (on a report that a committee was to be set up in Athens to study a debt settlement).

Industrial equities edged upwards at the end of the old account and then took a leap forward in dealings at the beginning of the new account. At first interest was concentrated upon radio and electrical equipment issues while engineering and paper issues fell out of favour. But at the beginning of the new account interest broadened to include almost every group. Dealings began in the Lancashire Steel equities at 2s. to 1s. 6d. discount and in the preference shares at 10½d. to 6d. discount; by Wednesday's close the discount on the preference shares had narrowed to 1½d. discount but the equity went to 2s. 1½d. discount, after touching 2s. 6d. discount.

Oil shares, under the lead of Shell and Anglo-Iranian, made further headway. Tea shares drooped and rubber shares were barely steady. Kaffirs were marked down at the end of the old account, but the OFS issues came back into demand when the market opened on Thursday.

Financial Statistics

EXCHEQUER RETURNS

For the week ended January 23rd, there was an "above-line" surplus (after allowing for Sinking Funds) of £137,440,000 compared with a surplus of £189,579,000 in the previous week and a surplus of £128,225,000 in the corresponding period last year, bringing the cumulative deficit to £120,513,000 (£129,176,000 in 1952-53). There was a net "below-line" receipt of £6,511,000 which brought the total cumulative deficit to £433,149,000 (£596,416,000 in 1952-53).

* In consequence of official purchases of tender bills in connection with cash subscriptions to the Exchequer Stock issued in October, it was impossible to calculate the division between tap and tender bills until all the bills purchased had reached their original maturity date.

THE MONEY MARKET

ALTHOUGH revenue transfers were still heavy in the week covered by the Bank return, credit conditions in Lombard Street eased considerably from the stringency experienced in the previous week. Market supplies of funds were adequate for demands on every day except Thursday of last week, and even then purchases of bills by the authorities (made indirectly through the banks) reached only small proportions. At the weekend credit conditions were markedly easy, and on Tuesday a surplus of funds actually emerged—though the authorities made no attempt to mop up the idle balances through sales of bills.

At last week's Treasury bill tender the market raised its bid by 2d. to £99 9s. 6d. per cent for the £210 million of bills on offer. Applications rose by only £8 million to £343.8 million, and the market's allotment rose from 51 to 58 per cent; the average rate of discount fell by nearly 8d. to £2 1s. 11.79d. per cent.

The Bank return shows a further reflux of notes of £8 million; despite the reduction of £25 million in the fiduciary issue, the reserve in the banking department still stands at over £40 million. The fiduciary issue has now been reduced three times this month, and is restored to £1,575 million—its pre-Christmas level and the basic level proposed in the new Bill. Government securities in the banking department rose by only £8.1 million despite the transfer of £25 million from the issue department and an increase of £5.3 million in the Treasury special account; but as "other securities" were up on balance and public and other accounts fell, bankers' deposits fell by only £5.4 million.

Private Treatment in illness

NO FINANCIAL WORRY

In the event of serious illness or operation many people want private advice and treatment for themselves and their families, but are afraid of the cost. B.U.P.A. offers an inexpensive solution. For a very reasonable annual subscription, the Association pays all or a major part of the cost of private nursing home, hospital and specialist treatment, members being entirely free to make their own arrangements.

The Association's sole aim is to assist its members; it is entirely non-profit-making.

Attractive special schemes are available for Staff Groups. Send postcard for brochure to:

THE BRITISH UNITED PROVIDENT ASSOCIATION

President: The Viscount Nuffield, G.B.E., F.R.S.

24, LOMBARD STREET (Dept. 1/43) LONDON E.C.3

1853

1953

The Chartered Bank of India, Australia and China, was incorporated in England by Royal Charter on 29th December, 1853, and during the ensuing century its system of Branches has been progressively extended to most centres of commercial importance throughout Southern and South Eastern Asia and the Far East. At all these Branches a complete banking service is available and, in particular, facilities are provided for the financing of international trade in co-operation with the Bank's offices in London, Manchester and Liverpool, its Agencies in New York and Hamburg, and a world-wide range of Banking correspondents.

EXPORT QUESTIONS NEED EXPERT ANSWERS

Will Latin America take Airliners?

WHETHER you are exporting airliners or T.V. equipment, dynamos or omnibuses, the markets of Latin America pose special questions about currency, import regulations and exchange control. As the only British Bank with branches throughout Latin America, we are particularly well equipped to answer these questions promptly and accurately, and to advise and assist you in many other ways.

Our *Fortnightly Review*, a digest of reports sent in from our 56 branches in South and Central America, is an invaluable summary of economic information for all who trade in these markets. We shall be glad to send you a specimen copy on application to:—

THE UNION DISCOUNT COMPANY OF LONDON, LIMITED

The Rt. Hon. LORD KENNET OF THE DENE, P.C., G.B.E., D.S.O.

(Chairman)

ERIC O. FAULKNER, M.P., D.E. (Deputy Chairman)

The Hon. GEOFFREY C. GIBBS, C.M.G. J. IVAN SPENS, O.B.E.

DAVID JOHN ROBERTS Sir ARCHIBALD JAMIESON, K.B.E.

STATEMENT OF ACCOUNTS AT 31st DECEMBER, 1953.

Liabilities	
CAPITAL (in £1 Units of Stock):	£
Authorised ...	7,500,000
Issued ...	5,544,000
Share Premiums (all applied to paying up part of issue of new shares)	2,456,000
RESERVE (after having applied £30,000 to paying up balance of issue of new shares)	8,000,000
PROFIT AND LOSS—Balance carried forward ...	761,603
	8,761,603
LOANS (Secured on Assets of the Company) ...	231,167,736
DEPOSITS, OTHER LIABILITIES AND RESERVE FOR CONTINGENCIES ...	13,690,133
DEPOSITS BY SUBSIDIARIES ...	100,107
PROPOSED FINAL DIVIDEND, less Income Tax ...	152,460
	245,110,436
	£253,872,039

CURRENT ASSETS:	
CASH AT BANKERS AND IN HAND ...	5,223,303
BILLS DISCOUNTED—less Rebate and Reserve ...	141,501,578
SECURITIES QUOTED: British Government, British Corporation, Public Board, Dominion and Colonial Government and Corporation ...	96,059,334
Unquoted: British Corporation and Public Board	992,446
Mortgages ...	9,895,271
LOANS on Securities and amounts receivable ...	253,471,932
	100,107

FIXED ASSETS:	
SHARES IN SUBSIDIARIES—At Cost ...	100,107
The net assets of Subsidiaries at 31st December, 1953 are represented by Deposits with the Company (per contra).	
FREEHOLD PREMISES, including Furniture and Fittings, at Cost, less amounts written off ...	100,000
	£253,872,039

39, CORNHILL, LONDON, E.C.3

WESTMINSTER BANK LIMITED

CONTINUED EXPANSION OF BUSINESS

THE NATION'S GREAT ACHIEVEMENT

LORD ALDENHAM ON IMPORTANCE OF SAVINGS

The annual general meeting of Westminster Bank Limited will be held on February 17th at the head office, Lothbury, London, E.C.

The following are extracts from the statement by the chairman, The Rt Hon Lord Aldenham, circulated with the report and accounts for the year to December 31, 1953:

I am glad to report that our business continues to expand; the number of our account holders has substantially increased and the volume of work passing through our books is correspondingly greater. Our policy of branch extension has made satisfactory progress during 1953, and we have opened 21 new offices, bringing the total to 1,104. We have been helped by some relaxation of Government controls affecting building and expect to benefit still more in this way during 1954.

In spite of this increase in work and in the number of branches, I am pleased to tell you that there has been a slight reduction in the total number of staff employed, whilst at the same time we believe that the high standard of service we have set ourselves is being well maintained.

During the past year senior officers of the bank have visited a large number of countries, including Canada, the United States, Pakistan, India and Latin America. These visits have enabled us to strengthen old links with our banking friends overseas and to establish new contacts. At a time when the fostering of Britain's foreign trade is of paramount importance, we may regard this side of our activities not only as important to the bank and its customers but also as a contribution to the wider national interests.

A reference to the bank's activities overseas would not be complete without an expression of our pleasure at the award of the CBE to our New York representative, Mr A. W. Beaman.

The accounts show a net profit for 1953 of £1,474,736, which is £28,190 more than last year, after provision for taxation and appropriations to inner reserves.

DIVIDEND DECISION

We have been able to maintain the dividend at 18 per cent per annum, a rate which has been rather surprisingly described in some quarters as "meagre." It must be admitted at once that the declaration of this dividend has come as a disappointment to some of our shareholders, since several of our competitors have been able to declare increased dividends. But it should not be forgotten that for many years now this bank has paid a higher rate of dividend than almost all its competitors, and that we are still in that proud position; nor should it be forgotten that, while any depreciation of investments suffered up to December 31, 1951, had always been set off against profits or reserves, we decided to show in our published statement of June 30, 1952, the depreciation on our holdings of British Government securities which had occurred in

the previous six months, without minimising that deficiency by any transfer from inner reserves or from current profits.

That temporary deficiency amounted to £7.9 million, compared with published reserves at that date of £9.3 million; it is true that this fall has been recovered since then, but after so recent and so sharp a reminder of the way in which the market value of even British Government securities may fluctuate we have decided with regret that it is in the best interests of our shareholders that the whole of the profits of 1953, after payment of taxation and of the usual dividend, should go to fortify the published and the inner reserves upon which we rely to take care, not only of such losses as these, but of any others we may sustain through the normal risks of business.

BALANCE SHEET FIGURES

The balance sheet shows that during 1953 the total of current, deposit and other accounts increased by nearly £27 million.

On the other side of the balance sheet the total of our advances, following the trend shown by bank advances as a whole, fell by £13 million, and the income from this item showed therefore a very substantial decrease compared with 1952. The contraction in this asset may be attributed in part to the lower level of the prices of raw materials and to the more liquid position of industry during the year. At the same time it may be mentioned that the terms of the request made by the Chancellor of the Exchequer to the banks to exercise restraint in their lending policy bears a little more hardly upon our bank than upon some of the others, because the proportion of our advances made to private and professional customers used normally to be larger than the average.

GROWTH OF DEPOSITS

The growth of our deposits, together with the lower level of advances, has necessitated an increasing use of our funds in the less remunerative outlets of bills discounted and investments, which increased by £31 million and £21.5 million respectively.

In spite of difficult trading conditions in France and Belgium throughout the year, Westminster Foreign Bank has been able to show a net profit for 1953 only slightly smaller than for the previous year.

Our affiliate in Ireland, the Ulster Bank, which this month holds its 118th ordinary general meeting, has had a satisfactory year and has declared a profit approximately equal to that for 1952.

TWO NATIONAL CONSIDERATIONS

As a nation our two main considerations at the end of each year must be to judge how far progress has been made towards a real and lasting peace, and how far we have been able to add to our scanty gold reserves by earning a little more than we have spent.

We may well be pleased that the Prime Minister has been able to tell us that the

danger of war is further away than it was in 1951; and pleased also that a four-Power conference of Foreign Ministers is to be held this month. But it is still difficult to believe that much progress has yet been made in the re-establishment of those really friendly relations with Russia that the world so sadly needs; though this is not for want of trying on our side.

It is a great achievement indeed that in spite of our very heavy and very necessary expenditure on defence, it seems certain that in 1953 we have paid our way. In the first half of the year this country showed a surplus of £26 million on its current international payments and receipts excluding defence aid; and it looks as if the surplus for the second half-year will not be less. It is not possible to judge accurately how we are faring by taking a single year's figures, and a diagram is given in the directors' report to show the trend of the United Kingdom's own balance of payments since the end of the war. Movements in the total volume of stocks of food and raw materials are not published, but the indications are that in 1953 the balance has been achieved without any lowering of these stocks. The diagram shows how narrow has been the margin of success; and it indicates that if the downward trend of 1953 is not arrested this year the balance will move against us.

The 1953 balance is likely to be some way short of the figure at which we must aim if, after paying the service of our debts to the United States and Canada, we are to add to our reserves and provide funds for the development of the countries within the Commonwealth. It will need our very best efforts if the figures of our exports in 1954 are to show an improvement on those of 1953. All the reports that come to us from Western Germany tell of employment and employed there united in an energetic drive for export markets. Increasing competition is now no menace.

EXPORTS

In considering how we are to increase exports, the price factor is of course of consideration, and it is most disturbing to find many instances of our having been ourselves out of traditional markets.

But almost as important as price is ability to promise quick delivery, and certainty of being able to keep it promises. It should be easily understood that when a buyer buys a foreign machine and gets it sooner than his competitor who has bought British, lasting harm has been done to our prospect of future exports. But this lesson is best learned on the spot, and it would be valuable indeed if not only our export sales managers but also some of the foremen at the producing end could get out to their foreign markets and see the harm which is done by delays.

Seven instances of ships turning away from Tyneside to foreign ports for their repairs have recently been reported in the Press, and our lack of ability to guarantee an

early completion date seems to have been one of the main causes; such cases do bring home to us all that the so-called two sides in industry must be united as one side if we are to survive foreign competition.

A stable cost of living would greatly help our ability to give good delivery dates by lessening the risk of industrial disputes; and much has been achieved in this direction, both towards stability and towards minimising loss of man-hours in industrial disputes, during 1953. There has been a comparatively small rise in the index of retail prices, in spite of the reduction in the food subsidies. It would be interesting to learn from our leading economists whether food subsidies may not to some extent have been "feather-bedding" foreign farmers, by keeping up the price of the commodities we import. Certainly the reduction in subsidies has not brought with it the corresponding rise in prices in our shops which many people feared.

EFFECT OF COMPETITION

Competition also brings in its train demands from overseas buyers for longer terms of payment. Such demands cannot unfortunately be compensated by easier terms of payment for our own purchases of imports, since these are in the main of raw materials and foodstuffs, unsuitable for long credit terms. Were a British manufacturer able to obtain the same length of credit in buying his raw materials as he has to accord to a foreign importer when selling the manufactured product, his financial problem would be much easier. But this bank, and other banks, can help, and are helping to overcome this difficulty, by providing finance to our exporters to enable them to grant easier payment terms to the overseas buyer. Our bank also maintains an intelligence service able and more than willing to help any manufacturer wishing to expand his exports to new markets.

It does not seem probable that our 1954 figures will be improved by what are called the terms of trade, that is, the relation between the prices we receive for our exports and the prices we pay for our imports; lower prices for our wheat and cotton imports, owing to abundant crops, may well be matched by lower prices for our exports, caused by competition.

DOLLAR MARKETS

The growth of our total exports to the dollar markets of North America during 1953 has been most useful; it is not always realised that Canada is almost as good a market for ours as the whole United States.

Moreover we may hope from the fact that Canada may prove a steadier market in bad times; the curtailment of our exports to the United States in the two years of 1929 and 1938 amounted to 75 per cent and 40 per cent respectively.

In recent months there has been a definite tightening in business in the United States. Although we may hope that better methods have been evolved to avoid such serious depressions as those of 1929 and 1938, yet we must consider the effect on our economy, which any marked recession in the United States would have.

This leads at once to the study of the sterling area gold and dollar reserve. This reserve increased during 1953 from £659 million to £899 million, after providing £63 million for service of the United States and Canadian loans, an obligation which should always be regarded as a first claim on any dollars we earn. The increase is most welcome, but the reserve is still at a dangerously low level and could not be allowed to be substantially diminished, even if there were

a serious fall in American purchases of sterling area exports. In such an eventuality, the only possible course for us would be to cut our imports from America to the barest essentials. The need for a substantial dollar reserve is shown by the fact that the sterling area spent the equivalent of £4,000 million in 1952 on imports from the non-sterling world.

CONVERTIBILITY

It does not seem likely that full convertibility between the pound and the dollar would help us much at present. Until our national shop window has become as attractive to the whole world as the shop window of the United States, convertibility would seem to imply either a lower price for the pound sterling measured in dollars, or an even more severe restriction of dollar imports than we suffer from now. The latter device would be highly unsatisfactory, since it would lessen the volume of our own trade, while any foreign holder or earner of sterling would be free to acquire with that sterling, dollar goods, unhampered by our own import restrictions.

There have been welcome signs, however, during the year that our shop window is becoming as attractive as the American: motor-car exports to North America were insignificant up till five years ago; but in 1953 good salesmanship had brought them into the first place in our list of exports to that area. British tenders for the supply of electric power installations have been successful even over the tariff wall; and if we fear that the Buy American Act may hinder these exports in future, these successes do at least advertise to the rest of the world how competitive some of our prices and delivery dates can become when we really try.

US TARIFFS

Most certainly convertibility would help our invisible exports, and it may well be that the time will become ripe during 1954 for another tentative step towards it; and it is encouraging to remember how quickly the urge to convert pounds into dollars, or vice versa, disappears when it is believed that the right to convert is likely to be maintained. But we must not again risk the disastrous experiment in convertibility of 1947 which resulted in our selling much too cheaply to foreigners the dollars which we so sadly needed, and still need, ourselves. It is clear how closely our problem of convertibility is linked with the problem of United States tariffs, and no lowering of these tariffs is likely even to be considered before the report of the Randall Commission has been debated in Congress.

The recent purchases of tobacco and lamb from the United States do not create an obstacle to convertibility since the proceeds will be spent here in sterling as defence aid; but this is not true of the agreement to buy American films with blocked sterling. That agreement accumulates sterling in the hands of those naturally anxious to buy dollars with it as soon as this is permissible, even though it may for the time being be usefully invested here. It would have been much better to have bought only as many films as we could afford to pay for in dollars at once. The agreement runs only until September next, so that at least it can then be reconsidered.

COAL EXPORTS

Coal exports have increased, but they are still disappointing; they could do so much to maintain our balance of payments, and thus ensure the maintenance of our present standard of living. The National Coal Board publishes figures of £29 million, £32 million and £45 million capital expenditure in the

mines during 1950, 1951 and 1952, and there has been in 1953 no corresponding rise in production which the outsider would expect from this vast outlay.

However, the figures of industrial production as a whole have shown a most welcome recovery from the fall recorded in 1952.

Considerable progress has been made during 1953 in the removal of wartime controls; but measured in man-power freed for more productive purposes, progress has been too slow. In September, 1951, there were 1,283,000 persons employed in National and Local Government services (excluding the Armed Forces and the Police), and in September, 1953, there were still 1,245,000 thus employed, out of a total working-age population of 23½ million.

NEED FOR MORE SAVINGS

The need for more savings both to permit increased exports by reducing home consumption and to keep our machinery up to date is very great. The point is most strongly stressed in a recent report of the Organisation for European Economic Co-operation; and it is not unhealthy for us all to read and ponder the opinions of this body of independent, but friendly and constructive critics on the present state of our nation.

Any feeling of complacency about our recovery during the last two years will receive a severe jolt when the figures in this report of the increase in industrial production of other European countries are compared with our own.

In America a very high wage structure is supported by a very high figure of modern capital equipment behind each factory worker; our own wage structure is endangered by the lack of sufficient company and private savings to provide something approaching the same amount of modern capital equipment behind each of our workers.

In spite of this urgent need of savings to support our wage structure many people seem to regard earnings of interest from savings as being morally less desirable than earnings by way of salary or wage; and in fact they are taxed even more severely. Pensions provide a striking example of how muddled our thinking is in this respect. Pensions are regarded as deferred pay, and are rightly treated as earned income; but where a professional man has to provide for his own old age the income from his savings is not regarded as earned.

NATION'S WAGE PACKET

Much of this review has been devoted to the supremely important problem of our future exports, and to the bearing which the cost factor, the delivery date, the encouragement of savings, and the provision of bank finance have on this problem. It is a pity that the figure of our monthly exports cannot be made as exciting as a football "league table"; since if we lose our place in the export "league table," it is our bread and butter that is at stake.

If it were widely understood that the monthly export figure is in effect the nation's wage packet, with which to go shopping abroad—and we must shop abroad for many things—we should have gone far to achieve that unity of purpose between employers and employed which is so essential to our export trade.

A fair summary of 1953 would be that we have improved our defences, and we have improved our gold and dollar reserves; but that in neither respect have we moved nearly fast enough. We have not yet won back to a position of real security—and already it is almost nine years since the war in Europe ended.

ARTHUR GUINNESS, SON AND COMPANY, LIMITED

EFFORTS TO COMBAT RISING COSTS

LORD IVEAGH ON SUCCESS OF REORGANISATION

The annual general meeting of Arthur Guinness, Son and Company, Limited, was held on January 21st, at Park Royal Brewery, London, N.W.10.

The Earl of Iveagh, CB, CMG, chairman of the company, presided, and in the course of his speech said: Ladies and Gentlemen,—You have seen the annual report and accounts for the year ended September 30, 1953, and you will be as glad as I am that we are again able to show an advance in profits on previous years. The net profit of the group attributable to your holding was £1,838,576, as compared with £1,663,178 in the previous year. This is arrived at after deducting from the gross profit, depreciation, provision for pension fund, taxation here and in Ireland and sundry other items amounting to well over £3½ million as have been set out in the consolidated profit and loss account.

Our sales in Great Britain showed an increase over the previous year. It was not a spectacular increase; but we are more interested in steady advance that we feel we can consolidate than a fortuitous burst to be followed possibly by subsequent recession. It would be rash to prophesy, but I can say that the results in this country since September, 1953, continue to indicate progress. In Ireland the position is still affected by the very heavy rise in excise duty in the Budget of 1952.

In regard to exports, we had a slightly lower total than in the previous year; but latterly exports have been, over a period of some months, actually running at a rate that has not been reached since the palmiest days of our export market before the first world war. I would like to pay a warm tribute to the management, and that means especially Mr Fawcett, the chairman of our subsidiary, Guinness Exports, Limited. Exports are a comparatively small item in our total production, but they are of considerable importance both to the company and nationally.

CONTINUED RISE IN COSTS

Costs, generally, I am afraid, have continued to rise. As I mentioned last year, the cost of materials had shown some reduction, and that has helped, but, unfortunately, rises in many other directions more than offset the saving in respect of materials. We are, therefore, still in the position to which I have drawn attention on previous occasions, namely, that only our intensive drive for economies, our very considerable mechanisation, and our success so far in expanding sales, have enabled us to maintain our total profits. The actual unit margin of profit has been eaten into, and in some directions is too low.

EXPENDITURE ON MODERNISATION

We have not yet finished our heavy programme of capital expenditure, but we are drawing to the close of this postwar period of modernisation, from which we are already reaping many benefits. The two new ships are at work, and bulk delivery from Dublin to the North of England, by means of large transportable tanks, has commenced with complete success. Our fleet of road and rail tankers at Park Royal is now nearly complete, and we are delivering from Park Royal more

than 70 per cent by tanker and slowly making our way towards the 80 per cent figure.

INCREASE IN DIVIDEND

There is, all round, good reason, in my opinion, for moderate optimism and confidence; and it is in this feeling that your board has recommended that there should be a small increase in the total dividend this year. The shareholders may justifiably feel that they have had a long wait; seeing that even with the present increased dividend you are only getting just above what you were in the years before the war. If one takes into consideration, as one must, the fact that the £1 of 20s. purchasing power in 1938 is now worth only some 8s. 9d., then there is a very long way to go before we shall be able to give shareholders in real value anything like what they were getting before the war. I am afraid that is inevitable. But I believe we have all shareholders with us in our policy that our first tasks are to see that staff and employees are adequately and indeed generously dealt with, and that your property and plant are brought to and kept at maximum efficiency and productivity. Otherwise your investment would not be worth, actually or potentially, what in fact it is worth today.

SUBSIDIARY ACTIVITIES

Before I leave the question of accounts and prospects I have to report that your board considered it necessary to make some reservation in regard to two of our subsidiary activities, namely, the New York Company, and the few small separate bottling companies which are grouped in our subsidiary company, T. B. Hall & Co. As I explained last year we are a minority shareholder in New York; apart from our equity interest we receive a royalty on Guinness brewed and sold in USA. I am bound to say that we have been disappointed at results so far and in the light of experience over the last five years and the inevitably heavy cost of operating in such a vast country and in such a competitive market we felt on our side that it was prudent and realistic for us to write down our original capital investment in the New York business. The position of the USA market is having our continued and critical attention. In regard to our bottling companies, they are functioning in most cases satisfactorily and are serving the specific purpose for which we acquired them, which was to study and improve the bottling of Guinness; but in one or two instances they are facing greatly increasing keenness of competition, and are not proving as profitable as they were when acquired. Your board's object in taking such action is to see, both in the company's and in your own interest as individual shareholders, that there is no dead wood anywhere in the tree.

SUCCESS OF REORGANISATION

The reorganisation of the company has proved entirely satisfactory and efficient, and will prove of increasing value. The remaining legal and administrative details have now been completed; and during the year the two breweries have functioned as separate self-contained subsidiaries with close interlocking relations. From January 1, 1954, the

Dublin brewery is brewing once again of its own birthright and without the formal necessity of a licence under the Irish Control of Manufactures Acts of 1932 and 1934. The logical ultimate position, we feel, is that the full control of the Irish subsidiary should be in Ireland, but that is a matter the decision in which rests with Her Majesty's Treasury.

At the end of another successful year, I know that you would wish to pay tribute to the staff and labour in both countries. They have done a good job; and I am glad to add that throughout the year at both breweries we have been a happy team.

The report and accounts were unanimously adopted and the recommendation of the directors approved for the payment of final dividends on January 22nd of 3 per cent on the preference stock and 11 per cent on the ordinary stock, both less income tax.

The retiring directors, Lady Patricia Lennox-Boyd and Mr Henry Channon were re-elected. It having been decided that the remuneration of the auditors, Messrs Turquand, Youngs & Company should be fixed by the directors, the proceedings terminated with a vote of thanks to the chairman, directors, staff and employees, proposed by Mr Bernard Binsted and seconded by Mr Beer.

THE SOUTH WEST AFRICA COMPANY

The annual general meeting of The South West Africa Company Limited was held on January 15th in London.

After reviewing in detail the year's results, which he described as disappointing and due mainly to the fall in metal prices, Sir Dougal Malcolm, KCMG (the chairman), said: "As regards the current financial year, I think I can say that our feeling is one of cautious optimism. Whilst on the one hand the prices of lead and zinc remain at a low level when compared with the prices ruling during our peak year of 1951-2, on the other hand the production of lead/vanadium concentrates at Abenab West has increased substantially in recent months, thus reducing the cost per ton of concentrates to a considerably lower figure. As regards vanadium, however, sales unfortunately do not show signs of immediate improvement.

Progress of our operations on the tin and wolfram ore bodies in the Brandberg area the west of the territory has been encouraging, and with the starting up of the plant at Brandberg West a substantial increase in production has been effected, resulting in a reduction in the cost of concentrates produced. On the other hand, although the price of tin has remained steady over the past few months, wolfram has continued to drop. Economic exploitation is considered possible on the present scale of operations and prices for these metals below those at which they now stand. Consideration is, however, being given to enlarging the scope of operations with a view to a reduction in production costs to meet such eventualities.

It has become clear that without the provision of further working capital the company will find it increasingly difficult not only to maintain its present scale of mining operations and to expand where such expansion would appear to be desirable, but also to carry out the extensive prospecting operations called for in that area where lead, zinc and vanadium occur, as well as on the tin/wolfram occurrences, and negotiations are in hand for the provision of further working capital with this object in view.

The report was adopted and the total dividend of 2s. per share was approved.

THE UNION DISCOUNT COMPANY OF LONDON

LORD KENNET'S STATEMENT

The annual general meeting of The Union Discount Company of London, Limited, will be held on February 18th, at 39, Cornhill, London, E.C.

The following is the statement by the chairman, The Rt Hon Lord Kennet of The Dene, PC, GBE, DSO, which has been circulated with the report and accounts for the year ended December 31, 1953:

In 1953 the company capitalised the balance of its share premium account, £380,667; and also capitalised from reserve account a balancing sum of £30,000, making £410,667. This amount was distributed proportionately to shareholders as fully paid stock. The purpose was to simplify the balance sheet.

During the past year the discount market was working out the consequences of the return to some measure of relaxation of control and to greater flexibility of rates which had been experienced in 1952, and which was confirmed by the reduction of bank rate to 3½ per cent in September. The success of the operation, by which £552 million 1½ per cent serial funding was converted, leaving only £25 million to be repaid at maturity, showed the efficiency of the market in short-term British Government securities under present conditions.

The reduction of bank rate was considered, and no doubt rightly, not to indicate any change in the general policy of the Government for checking inflation, but rather as a measure of realism, to maintain the efficiency of the rate by bringing it into relation with the actual state of the money market. Under present conditions, changes, when they come, should no doubt equally be considered as measures of adjustment to established conditions, not changes of policy.

GREATER MEASURE OF FREEDOM

Events of some interest as further relaxations of control were the return to local authorities of freedom to enter the public market; and the return to banks of freedom from Treasury control of the terms of loans made by them for approved capital uses.

The rates for both Treasury Bills and the ordinary Bills have been steady, at the lower level which followed the reduction of bank rate. There has been some increase in the supply of Commercial Bills, reflected in a slight increase in the discount rate. There has been greater activity in the Commercial Bill rate, with the result that it is now very little above that for Treasury Bills.

A year ago I wrote that the stream of capital at the turn of the wheels of industry was still inflating, that there was still inflation concealed in its fall, and that the only effective government measure to increase the stream was to reduce public expenditure and taxation. There is another effective measure, simultaneously to increase production, but that is not in the hands of the Government. These observations are not out of date.

BALANCE SHEET FEATURES

Compared with last year, there is a reduction of £21,892,565 in the balance sheet total. There was a sharp decrease of £62,224,552 in the total of bills discounted;

this decrease in our holding, in so far as it concerns Treasury Bills, may be partially explained by the increased interest in this form of investment from outside sources. The total of investments increased by £31,681,497. The other notable change in the assets side of the balance sheet was the sharp rise in loans on securities to £9,895,271. This increase merely reflects your company's ease in funds on its balancing date. Net profits show an increase of £45,895, making a carry forward of £1,061,603, and from this figure the directors have transferred £300,000 to reserve account, with the result that your company's capital and reserve will amount to £8 million.

Owing to the pressure of his engagements, Mr D. J. Roberts has resigned the deputy chairmanship of the company, but remains a director. The board has elected Mr E. O. Faulkner to be deputy chairman. We thank them both, Mr Roberts for his long and able discharge, of the responsibility and Mr Faulkner for being willing to undertake it.

We thank the banks and finance institutions which give us their goodwill and most helpful co-operation, and we thank, too, the management and staff for their services, conducted throughout the year with the utmost efficiency and diligence.

ALEXANDERS' DISCOUNT COMPANY

A SUCCESSFUL YEAR

SIR ERIC GORE BROWNE'S STATEMENT

The eighty-sixth annual general meeting of Alexanders Discount Company Limited will be held on February 17th at the registered offices of the company, 24 Lombard Street, London, E.C.3.

The following is the statement by the chairman, Sir Eric Gore Browne, DSO, OBE, TD, which has been circulated with the report and accounts:

Once again I have to express the sincere regret of all who are concerned with the fortunes of Alexanders Discount Company Limited in the resignation of a member of the board, to whom the success and continued progress of this company are in particular so largely due. Lord Colgrain was elected a director in 1912. He was chairman from 1916 to 1950. Thus for over forty years it fell to him to take an active part in framing our policy during some of the most difficult years in the development of the London Discount Market. The figures which we now present are a tribute to his leadership. We are very grateful to him. In his place your board has appointed Mr S. J. L. Egerton. He is chairman of Messrs Coutts and Company and a director of the National Provincial Bank, Limited. We count ourselves fortunate in having obtained the services of another experienced banker.

The chief event in the London Money Market in the year 1953 was the reduction in the Bank Rate on September 17th from 4 per cent to 3½ per cent. The rate at which the Bank of England remained unchanged at 3½ per cent while other money rates and bill rates were reduced by at least ½ per cent, and Bank Bills by ¾ per cent and more. In the words of the Chancellor of the Exchequer: "The Bank Rate has been doing good and useful work as an instrument of monetary policy," but it must not be forgotten that the use of the instrument of the Bank Rate cannot achieve complete success,

in our fight for recovery, unless it is accompanied both in the domestic and in the national sphere by every possible effort to live within our means.

THE ACCOUNTS

We have had a successful year. If you will turn to the balance sheet you will see that the deposits are £141 million compared with £129 million the previous year, while bills discounted are £75 million compared with £80 million, and British Government securities £68 million compared with £52 million. Our balance sheet total is £145 million compared with £134 million, while the outstanding position which Her Majesty's Government plays as a borrower in the London Market is again emphasised by our turnover for the year in Treasury Bills of about £2,000 million. Our turnover of Commercial Bills was less than £100 million. The profit and loss account shows a balance of profit of £281,600, an increase of £105,050. We propose to recommend the payment of the following final dividends for the year 1953:

6 per cent cumulative preference shares £2 each, fully paid.

3 per cent—making 6 per cent for the year.

Ordinary shares £2 each, £1 paid.

12½ per cent—making 20 per cent for the year; plus a bonus of 5 per cent.

Both dividends and bonus, less income tax at 9s. in the pound, to be paid, subject to approval, on February 25, 1954, to those shareholders whose names appear in the register at the close of business on February 5, 1954.

My colleagues and I are anxious that there should be no misapprehension by any of you in regard to this bonus which we are happy to be able to recommend to you in respect of the year 1953. I ask you to regard it merely as a tangible token of one very successful year, carrying no implications as to our chances of being able to repeat it in the future.

DUAL ROLE OF LONDON DISCOUNT MARKET

As I see the position of the London Discount Market today, it has a dual role to play in our national economy. The first is its traditional and primary role of buying and selling bills of exchange in their great variety. And the second, which through force of circumstances has of recent years fallen to its lot, is to provide a free market in short dated Government securities. In fulfilling these functions, especially the latter, there is a serious element of risk, and it behoves your board, with every consideration for you the shareholders, to maintain its policy of building up and maintaining our resources. It is by this policy, and this policy only, that we shall be able to face with confidence a future, which, not only in its domestic but also in its wider and international aspects, does not, for the British Commonwealth of Nations, yet rest on firm foundations.

A proposal will be put before you for an increase in directors' fees. At present these amount to £8,000 and they have remained at that rate since 1931. It is proposed to increase this figure to £12,000. In the days in which we live, and having regard to the progress of the company, we hope that you will regard the increase now proposed as not unreasonable.

Our gratitude is once more due to Mr Macnaghten, our manager, Mr Dawkins, his deputy, to their assistants and to the whole staff. One and all have given of their best to your interests, and deserve our most cordial thanks.

WEST RIDING WORSTED AND WOOLLEN MILLS

A MOST SATISFACTORY RESULT

SIR JOHN KEELING ON WOOL PRICES

The twenty-fifth annual general meeting of West Riding Worsted and Woollen Mills, Limited, was held on January 27th at the Midland Hotel, Bradford. Sir John Keeling (the chairman) presided.

Before the official business of the meeting commenced the chairman referred to the great loss which the company had sustained by the death of his colleague, Mr John William Shelton, on January 10th, and said that the passing of this grand old man would be mourned by countless friends. The chairman paid high tribute to Mr Shelton's outstanding character and ability, his life-long devotion to his business, and the invaluable services which he had rendered to the company up to the last days of his life.

The following is an extract from the chairman's circulated statement: The results for the year to August 31st last were most satisfactory and reflect great credit upon all those responsible for the operation of our operating subsidiaries. We must not, however, overlook the importance of the large sums of money expended over the past ten years in bringing our plant and machinery up to their present high state of efficiency.

The profit of the group before taxation amounted to £1,585,767, an increase of £780,894 over the previous year. Taxation has again absorbed more than half of the profit and there has been provided for this purpose £823,312; the net profit of the group, after making provision for taxation, was therefore £762,455, an increase of £418,398 over the previous year. No provision was required for excess profits levy, and, as this unfortunate tax terminated on December 31, 1953, we have, thanks to the good standard of the group, escaped its ill effects.

On April 28, 1953, the issued ordinary capital was increased from £809,944 to £1,214,916 by the capitalisation of reserves, shareholders receiving one new ordinary share for every two ordinary shares held.

Your board recommend that the dividend for the year on the increased ordinary capital should be 22 per cent. An interim dividend of 8 per cent has already been paid and the final dividend will accordingly be 14 per cent. The amount distributed by way of dividend on the ordinary capital is again somewhat larger than the amount distributed in respect of the previous year. It is conservative in relation to the profit earned, but it follows the policy which has been so successful in the past, of building up the group with retained profits.

There are only a few items in the consolidated balance sheet to which I need make reference.

I have already mentioned the increase in the issued ordinary capital as a result of which reserves to the extent of £404,972 were capitalised. As, however, the trading profits of the year amounted to £596,544, to which must be added £23,216, being the net effect of other non-trading adjustments, the reserves at the end of the year at £2,661,772 exceeded the commencing figure by £214,788.

The fixed assets at £1,450,678, an increase of £138,969 over the previous year, now include those of an additional operating subsidiary, E. Wadsworth and Sons, Limited, acquired during the year. Stock on hand

and work in progress amounted to £4,603,199, as compared with £3,325,853 for the previous year. This increase was accounted for by the somewhat higher value of wool, the larger turnover of the group, and the stock of our new operating subsidiary. The surplus of current assets over current liabilities at £3,793,590 showed an increase over the previous year of £851,331.

Since the opening of the wool-buying season in Australia towards the end of August there have so far been no very material fluctuations in the price of wool. The general feeling in this country, however, appears to be that a somewhat lower level of price would encourage business and be more realistic.

Personally, I am of the opinion that a moderate fall in the price of wool would be in the best ultimate interests of the industry, and I certainly do not exclude the wool growers, who, in fact, have more to lose than anyone if a high price for wool should encourage the use of man-made fibres. Provided the price is reasonable, the characteristic qualities of wool are such that there will always be a demand for its products.

An interesting development during the year under review has been the establishment of a futures market in wool tops. This is an innovation in this country—unlike cotton, in which there was an active futures market before the war. It has, however, I think, yet to be proved that a futures market in wool will be of the same value to the wool textile industry as the futures market for cotton has been to the cotton industry.

Trading conditions during the past 12 months have possibly been more normal than they have been at any time since the war. The wool trade, however, is one of many industries where it is unwise to forecast the future, so I shall confine my remarks to saying that the results since the close of the financial year have continued to be satisfactory. So far as the remainder of the year is concerned, although trading conditions are not easy and profit margins narrow, and while we may not have the benefit of certain favourable factors which added to our profits last year, I am hopeful that the results will not be disappointing.

The report and accounts were adopted and the final dividend of 14 per cent, making 22 per cent actual for the year, was approved.

J. W. GREEN LIMITED

INCREASING SALES OF BOTTLED BEER

MR BERNARD DIXON'S STATEMENT

The adjourned fifty-sixth annual general meeting of J. W. Green Limited was held at Luton on January 26, 1954.

Mr Bernard Dixon, chairman, presided. The following are points from his statement:

Whereas during the winter months of the year under review bad weather conditions hampered trade to some extent, I am pleased to report that this was largely rectified by improved sales during the second half of the year, which finished on a strong note.

NEW BRANDS LAUNCHED

Last year, in common with many other breweries, we found that the steady increase which had taken place in Bottled Beer sales was beginning to ease. During the year we have successfully launched a number of new brands of Bottled Beer which already have

achieved considerable popularity, and our Bottled Beer sales have regained impetus and are steadily increasing in volume.

Throughout the Group the expenditure on properties has been exceedingly heavy. This is inevitable in the early stages where new groups of properties have been brought in. There will, of course, be a gradual easing of this expenditure, and this should have a beneficial effect on future profits.

REHABILITATION OF PLANT

I am glad to report that we are now at the end of our programme for the rehabilitation of the plant at the Luton Brewery, where every department is thoroughly up-to-date and should give the company many years' service.

It is anticipated that the by-products plant will be in operation in the early part of the new year. Considerable delay has been experienced in obtaining the equipment for this department.

NEW BOTTLING STORE

At our Sunderland Brewery we have practically completed a large, well-equipped bottling store, which should be fully capable of handling our requirements in that area for some time to come.

During the year the company brought into operation a fleet of articulated vehicles for the purpose of supplying some of our better-known brands, such as "Brewmaster," "Dragon's Blood" and "Poacher," to wholesale customers and other breweries in the group. This move has been entirely successful, with the result that these brands are becoming popular over an ever-widening area of the country.

The report and accounts were adopted.

NATIONAL DISCOUNT COMPANY

The Annual General Meeting of the National Discount Company, Limited, will be held on February 17th, at 33 Cornhill London, E.C.

The following is an extract from the statement by the chairman, Commander The Hon Lovel W. Coke, RN:

The balance sheet total amounts to £11 million. Deposits have risen by £3 million £186 million. Bills discounted are reduced by £4 million to £111 million, and Government and Corporation Securities have increased by £7½ million. The liability at the year for bills re-discounted has increased from £10 million to £16 million.

The profit and loss account shows after making provision for rebate, deduction of premiums on securities (in special amortisation), and taxation, an making transfers to contingencies and deducting directors' fees, there is a profit of £369,648. It will be proposed for the forthcoming meeting to pay dividend 5 per cent, less tax, on the "A" and stock, making 10 per cent for the year both classes.

Your directors recommend the issue to the "B" stockholders of a further 758,885 "B" shares by way of capitalisation of part of share premium account in the proportion of one new "B" share for every £3 of existing "B" stock.

In order to have a margin of capital available if and when the directors should consider it desirable to issue the same, it is proposed to increase the authorised capital to £5 million by the creation of an additional 2,300,000 "B" shares of £1 each.

SCOTTISH AGRICULTURAL INDUSTRIES LIMITED

COMPANY'S RECORD TURNOVER

The twenty-sixth annual general meeting of Scottish Agricultural Industries Limited was held in the North British Station Hotel, Edinburgh, on January 21st, the chairman, Sir William Gavin, CBE, presiding. In the course of his remarks the chairman said:

The annual report includes for the first time a financial summary of results for the past seven years, i.e., from 1947. From this you will see that gross sales for the year under review amounted to £20,513,026, and group profit before providing for taxation to £976,147. Both these figures are the highest so far recorded in the history of the company. The increase in the value of sales is mostly due to more trade and not to higher prices.

Depreciation has been charged at £353,570 which is £46,309 higher than last year and represents some 20 per cent of the book value of fixed assets. This is, of course, in excess of the amount which will be allowed when computing liability for income tax. We have also set aside £50,000 against possible falls in the value of stocks.

Shareholders will agree, I am sure, with these prudent steps in view of uncertain markets and the ever-present need for keeping buildings, plant and equipment up-to-date, which can only be done today at very high cost. Expenditure on fixed assets for the year amounted to £450,000. Increased turnover and working costs have also called for nearly £170,000 more working capital, making an additional capital requirement for the year of £620,000. You will note that this has been provided from the company's own resources.

The balance of group profit, after paying preference dividends, was £362,881 compared with £281,605 for the previous year. As already announced your directors recommend an increase in the ordinary dividend from 7½ per cent to 9 per cent. This, if approved, will absorb £101,772, leaving an undistributed profit for the year of £261,109. After transferring £239,516 to general reserves, the balance carried forward on the consolidated profit and loss account was £271,846, compared with £250,253 the previous year.

The report and accounts were adopted and the ordinary dividend of 9 per cent was confirmed.

THE MIDLAND BRIGHT DRAWN STEEL AND ENGINEERING COMPANY

The seventh annual general meeting of The Midland Bright Drawn Steel and Engineering Company, Limited, was held on January 26th in Birmingham, Mr H. Hipkiss, MInstBE (chairman and managing director), presiding.

The following is an extract from his circulated statement: The trading profit earned, while showing some reduction on last year's exceptional result, is, in the opinion of the directors, satisfactory.

During the year under review we experienced the return of a keenly competitive market. The relief from material and labour shortages was quickly followed by the falling off in trade, due, among other causes, to the export restrictions. These conditions in-

fluenced customers to restrict their buying to cover immediate needs and resulted in a sharp fall in turnover at one period during the year. We have, however, shared in the improvement that has subsequently occurred and the outlook is generally brighter.

The trading profits of the year have decreased from £313,933 to £224,837. The main contributing factor, apart from the exceptional results of 1952, was the difficulty experienced in the non-ferrous side of the group's activities, where fluctuations in the price of raw material have, to a greater degree than elsewhere, affected the sales.

With regard to the current year, providing trading difficulties do not appreciably increase and industry is not further burdened by heavy increased costs, we can look forward with confidence to another satisfactory year.

The report was adopted.

RAMBUTAN, LIMITED

The forty-eighth ordinary general meeting of Rambutan, Limited, was held on January 20, 1954, at the Registered Office, Redruth.

Mr Donald W. Thomas (chairman) presided.

The report and accounts for the year ended June 30, 1953, having been circulated for the prescribed time, were taken as read, as was also the acting chairman's statement, circulated with the report and accounts, which was as follows:

Shareholders will observe from the directors' report that Mr Stanley Wickett retired from the position of chairman of the company on December 31, 1952, and that he was succeeded in office by Mr D. W. Thomas, who has been a director of the company for thirty years.

Mr Wickett, previous to his resignation, had been chairman of the company for ten years, and his decision to retain his seat on the board, which he has held since his appointment in 1912, gives his colleagues the greatest pleasure, and they hope they may long continue to have the benefit of his wise counsel and advice.

Mr D. W. Thomas is now in Malaya making an inspection of the various mines comprising the Gopeng Group, of which Rambutan, Limited, is one.

During the financial year ended June 30, 1953, 80.22 tons of tin ore were recovered from 301,500 cubic yards of ground treated. This compares with the 1951-52 production of 81.49 tons from 268,600 cubic yards.

The accounts for the financial year submitted herewith show a gross profit of £9,301 as compared with £7,855 in the previous year. A total of £7,902 was paid to the Malayan Government in respect of tin ore sold during the year, and £9,265 provided for United Kingdom and Malayan taxation.

Two interim dividends, a total of 8½ per cent, paid to shareholders on account of profits for the year absorbed, after taxation, £4,688. The sum of £1,853 has been written off capital expenditure and £2,000 transferred to general reserve, leaving a balance of £12,429 on profit and loss account, which the directors propose to carry forward to the current year.

Rehabilitation and War Damage Awards: The awards have now been agreed as follows:

Towards costs of rehabilitation	£10,190
Compensation for assets lost in 1941	582
	10,772

Before June 30, 1953, a distribution of 75 per cent was received—and this, as is shown in the balance sheet, amounted to £7,602 (on rehabilitation account), an initial repayment of £41 having previously been credited. Seventy-five per cent of the compensation for assets lost in 1941—£436—has also been received, and is shown in the profit and loss account. These together reconcile the figure of £8,039 shown in the balance sheet as the interim payment on account of the award. It is understood that repayments to be made will not exceed 90.4 per cent of the awards. The directors have accordingly deemed it prudent to write down the balance of the rehabilitation account to £1,569—the amount which the company has since received. A transfer from the general reserve account of £4,057 has provided for the excess of rehabilitation expenditure over 90.4 per cent of the awards.

The report of our general managers, Messrs Osborne and Chappel, appended hereto, gives particulars of work done at the mine during the period under review. It will be noted that in July, 1952, Malayan Government legislation provided for the establishment of a compulsory employees' provident fund to which both employer and employee contribute approximately 5 per cent of the employee's wages. Shareholders have been advised of the output for the first three months of the current financial year, a total of 21½ tons, and it is anticipated that satisfactory returns will continue. The price of tin was well maintained until April, 1953, when it fell by approximately £200 per ton metal and further declined to the uneconomic level of £568, equivalent to £409 per ton tin ore. Latterly there has been some improvement, but few Malayan producers can work at a profit and provide reserves to ensure the future with tin at its present price.

The reconvened International Commodity Conference on Tin recently completed its second session at Geneva. A draft International Agreement was prepared for detailed consideration by the Governments and members of the industry concerned and it is to remain open for acceptance from March 1 to June 30, 1954. In the meantime an International Tin Council has been set up in London.

There was a general improvement in the security position during the year and no incidents occurred on the company's property. Constant military patrol of the district continues as a precaution.

It is my privilege to record our thanks to the general managers, the resident manager and staff at the mine, for their loyal service under conditions which, although showing improvement, are nevertheless difficult.

Before moving the adoption of the accounts Mr Donald Thomas thanked Major W. E. Hosking for all that he had done during his term of acting chairman. He advised shareholders that he had recently visited the property on a number of occasions and that he had been very pleased to see the developments taking place at the mine.

The statement of accounts and balance sheet, together with the directors' report, were received and adopted.

At a later stage in the meeting the chairman proposed a vote of thanks to the general managers, the resident manager, and the staff at the mine. He added that as a consequence of his visit to Malaya he had been able to appreciate the difficulties under which the staff were living. In this connection he wished particularly to accord appreciation of the services of Mr F. Bede Cox (resident manager) who would be retiring shortly after service with this company and associated companies of over thirty-three years. Mr and Mrs Bede Cox would be very much missed by their friends in Malaya and he wished them a very long and happy retirement.

TOWN INVESTMENTS, LIMITED

A YEAR OF FURTHER PROGRESS

The thirty-first annual general meeting of Town Investments, Limited, was held on January 22nd in London.

The Viscount Buckmaster, the chairman, who presided, said:

The past year has been one of further progress. In it the consolidated revenue of the group has increased from £321,733 to £334,330.

The parent company, as you are aware, is, for taxation purposes, regarded as a "dealing" company. As a result, if any of the company's properties are sold at a profit, income tax and profits tax are payable on the difference between the purchase price and the price realised. While there are compensating advantages, this position, none the less, makes it difficult to take profits and reinvest.

As a property company we are faced also with the unfortunate situation that sums set aside for the amortisation of leaseholds are not allowed as a charge against profits for the purposes of income tax and profits tax.

The Government have at last made an attempt to solve the almost insoluble problem presented by the Rent Restrictions Acts. Whatever the final form of the Bill may be, the effect on the companies of the group is not likely to be considerable.

As far as fresh purchases are concerned, the board has a number of propositions in hand, and are also prepared to consider opportunities for investment overseas.

The report was adopted.

THE AVON INDIA RUBBER COMPANY

ENCOURAGING INFLOW OF ORDERS

The sixty-fourth general meeting of The Avon India Rubber Co., Ltd., was held on January 27th at Melksham, Wilts, Major R. F. Fuller, DL (the chairman), presiding.

The following are extracts from his circulated statement:

Throughout the year the price of rubber has continued to fall which has entailed a continuous writing down of stocks, which in total has been greater than the amount previously set aside as a raw materials reserve. It was therefore decided to make use of this provision, and the amount of £80,000 has been brought in. Including this, the net balance available amounts to £150,954, compared with £137,001 last year.

Our turnover in the past year, although greater in volume, did not reach the level of the previous year in value. Selling prices of our products have been reduced at an even greater rate than the fall in manufacturing costs. The current year has opened with an inflow of orders which is very encouraging.

Production at Bridgend has continued to progress and we are employing nearly double the number of workers as compared with the same time last year.

Our organisation in British East Africa has operated successfully in spite of the disturbed conditions. The factory of Avon Tyre Remoulding Services, Limited, is now in operation.

Our many and varied connections overseas have been maintained and attention is continually devoted to expansion of this sphere of operations.

The report was adopted.

THE POWER-GAS CORPORATION LIMITED

LARGER PROFIT

The fifty-fourth annual general meeting of The Power-Gas Corporation Limited was held on January 28th in London, Mr N. E. Rambush, DSc (Hon), MICHEM, FRSA (chairman and managing director), presiding.

The following are extracts from his circulated statement for the year ended September 30, 1953:

Your directors, having considered the profit available and the strength of the company's position, recommend a dividend at the rate of 10 per cent plus a special bonus of 2 per cent, both less tax. Profit on trading and other income for the group was £765,737 (£725,610 in 1952); current taxation £333,973 (£320,922); group profit after deduction of all charges, including taxation, £269,936 (£261,243).

Orders booked during the year amount to £6½ million, slightly less than the peak figure of last year. The value of orders from the iron and steel industry is the highest in our history.

Orders for the chemical industry have been maintained at a satisfactory level. We continue to contribute substantially to our country's export trade and orders have been received from almost every country in the world with which British trade is possible.

During the year our resources have been fully employed and production in the old works and the partly constructed new works at Stockton and also at erection sites has increased considerably. Orders on hand will keep us busy for some time to come. Overseas markets continue to engage our constant attention.

The report was adopted.

"He

LIFE EN ESPAÑOL—average net paid circulation 200,000-250,000 copies in Spanish, circulating in Central and South America.

LIFE INTERNATIONAL—average net paid circulation 250,000-300,000 copies in English, circulating in 120 countries outside North America.

These are the INTERNATIONAL EDITIONS of LIFE MAGAZINE, with a combined circulation of over 500,000 copies every fortnight.

TIME & LIFE BUILDING, NEW BOND STREET, LONDON, W1

"I have seen their advertisements in LIFE EN ESPAÑOL". This is a comparatively new phrase in the Spanish-speaking countries of Central and South America. But already it is influencing the sales and prestige of British and Continental companies in those areas.

LIFE EN ESPAÑOL—the Spanish-language edition of LIFE INTERNATIONAL—began circulating in Central and South America just over a year ago. Like LIFE INTERNATIONAL's English-language edition, it has a selective readership concentrated mainly among men and women in the higher income groups; yet, today, the circulation of LIFE EN ESPAÑOL exceeds 225,000 copies and distributors are still asking for more. If your company is seeking to enter the rich markets of Latin America, or increase the sales of products already established there, an advertisement campaign in LIFE EN ESPAÑOL offers these advantages: the consistent appeal of brilliant picture-journalism, fine printing and colour reproduction, and a growing circulation among those with the means to buy and the power to influence the buying of others. The Advertisement Manager will be pleased to supply full details of circulation and rates on request.

MANAGING DIRECTOR of a well-known public company requires a first-class secretary-shorthand typist. The successful applicant will preferably be aged 23-33 and of good appearance, education and background. University degree and knowledge of languages an advantage but not essential. Applicant must be a thoroughly proficient shorthand-typist with a sound understanding of modern filing systems and executive office procedure. Good salary, conditions and prospects for a girl with ability, initiative and personality and a willingness to work hard.—Box 439. This vacancy has been notified in accordance with the Notification of Vacancies Order, 1952.

THE METAL BOX COMPANY LIMITED have a vacancy for a General Research Assistant (male) in their Market Research Section. Candidates should be of good education (not necessarily University) and should have had about two years' market research experience. A good personality, commercial sense and an ability to write clear and accurate reports are essential. Experience of sampling survey techniques desirable.—Write, giving full details, salary required, etc., to Ref. No. MR/3, Staff Division, The Langham Portland Place, London, W.1. This vacancy has been notified in accordance with the Notification of Vacancies Order, 1952.

SOLICITOR required to take charge of Legal Department of large industrial concern in North West with head office in Manchester. Applicants must be experienced and energetic lawyers who will take a real interest in the activities of the concern, be able to run a busy office concerned with commercial and general work and a substantial amount of common law litigation. Salary will be according to qualifications, but not less than £2,000 per annum.—Applications should be submitted by February 12th to Box 433.

PRINCIPAL ASSISTANT-SECRETARY required by the Scottish Council (Development and Industry). The post will be a responsible one requiring adaptability and resource. Administrative and/or business experience essential. Salary according to qualifications. Applications, with not more than three relevant testimonials and specifying three persons to whom reference may be made, should be addressed to the Secretary, The Scottish Council (Development and Industry), 1 Castle Street, Edinburgh, 2.

THE BRITISH FEDERATION OF MASTER PRINTERS invites applications for appointment to headquarters Secretariat. Applicants should be in the age group 24 to 32, preferably with experience in the printing industry. Commencing salary in the range £500-£800 per annum according to age, experience and qualifications. Details of education, employment to date, age, etc., to be submitted by letter to the Secretary, British Federation of Master Printers, 11 Bedford Row, London, W.C.1. This vacancy has been notified in accordance with the Notification of Vacancies Order, 1952.

MILFORD-ASTOR Automatic Presentation Machine Model No. 7M2, complete with all accessories (founts of type, etc.) for producing showcards and displays of all kinds in plastic and board. Unused.—Apply Box 432.

PROGRESSIVE Member Firm with first-class connections North America and Britain, requires ambitious, experienced man to head their American/Canadian department.—Write in strictest confidence, qualifications, experience and salary required to Box 443.

NATIONAL FOUNDATION FOR EDUCATIONAL RESEARCH IN ENGLAND AND WALES

Applications are invited for the following appointment, to commence on September 1, 1954 (unless otherwise arranged).

STATISTICIAN to be responsible for the development and operation of a statistical unit in the service of the Foundation's research and test construction programmes. The appointment will be for five years in the first instance at a salary in the range of £700-£900 per annum according to qualifications and experience. Superannuation scheme. Candidates should have either an Honours degree in Statistics or in Mathematics with specialisation in statistics (experience in psychological or educational measurement would be an asset), or an Honours degree in Psychology or Education with specialisation in the application of statistics to psychological and educational problems. A sound knowledge of the theoretical basis of statistical methods and of the principles of experimental design, together with some experience of their practical applications, will be required.

Applications for the above post, on the special form provided, and giving names of three referees, should reach the undersigned not later than February 17, 1954. Forms and further details on request, BEN S. MORRIS, Director, 79 Wimpole Street, London, W.1.

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA invites applications from suitably qualified British subjects, not older than 32 years of age, for the post of ASSISTANT TRUST OFFICER at Singapore. A knowledge of taxation will be a recommendation.

Applications, or requests for further information concerning the appointment, may be addressed to the Secretary of the Bank at 38 Bishopsgate, London, E.C.2.

MANAGEMENT Consultants are required by the Wallace Attwood Company. Applicants between the ages of 30 and 45 must possess a University degree or technical equivalent in engineering and have held responsible executive positions. A thorough practical and current knowledge of the organisation and routines of industrial concerns is essential. Substantial salary and excellent prospects are available. Replies in confidence to Chantrey House, Eccleston Street, S.W.1.

EXECUTIVE, 40, at present Company Secretary (3,000 employees), owing to amalgamation seeks responsible management post. University degree, qualified lawyer, chartered secretary, experienced all company secretarial work, including modern accounting systems, pension funds, staff control and general administration. Highest references. Free within a reasonable period. Box 444.

PART-TIME WORK required by Economic Research Assistant.—Box 440.

Weapons to End War?

MILITARY power should be the servant and not the master of policy. If that has been a sound principle in the past, it is a vitally important one for the era of atomic strategy, when new weapons present old temptations as well as new possibilities. Atomic power offers to the fighting man what he has sought ever since warfare began—the possibility of achieving surprise with decisive concentration of destructive power. To the statesman who is told that attack is the best defence (no completely effective defence against atomic bombing yet exists) it offers weapons simpler and less costly in manpower, though hardly in money, than the complex array of what are now called conventional forces. From the moment the first atomic bomb was dropped on Japan in 1945 it was clear that no great power could or would dispense with this and similar weapons unless, by a miracle, all great powers could agree to dispense with them simultaneously. And now, as a climax to vast expenditure of resources, there has emerged the simple and dazzling idea of the master weapon and the overwhelming deterrent to aggression—the nostrum against total war. For obvious reasons of geography, industrial power and national psychology the idea has a special attraction for Americans; for the Russians, too, it may well seem to be the master weapon which will one day assure the safety of the Soviet Union and the permanence of the revolution that it has brought about in the land mass between Germany and the China Sea. And now the idea, in more modest and cautious form is beginning to form the basis of British strategy.

Simply to say that the idea of keeping peace by a threat of limitless horror is alarming and horrible gets no one anywhere. War itself is horrible and wicked, and if the choice is really between years of "conventional" war and a single night of atomic bombing, who can say which is the more horrible and the more immoral? Indeed, it can be argued that the only way to stop war is to create the certainty that he who starts it will himself suffer horribly and at once, and that the purpose of a great power's strategy should therefore be to pile up the most gruesome deterrents with a margin of superiority over the defences of likely aggressors. It is this argument that needs careful scrutiny. For what is involved is not only the distribution of the British resources allocated to defence, but also the whole planning of the Atlantic alliance in which the United States is a dominant partner. For the American reliance on atomic weapons may point clearly—in the long, if not the short, run—to "peripheral strategy" and to the reduction of American ground forces stationed abroad. And this possibility affects here and now the future security and political shape of the approaches to Britain across the Channel.

The American thesis was clearly stated by Mr Foster Dulles on January 12th before the Council of Foreign Relations. He attributed to the Republican Administration a new "basic" decision, "to depend primarily upon a great capacity to retaliate instantly by means and

at places of our own choosing." "Local defences," Mr Dulles insisted, "must be reinforced by the further deterrent of massive retaliatory power."

We need allies and collective security. Our purpose is to make these relations more effective and less costly. This can be done by placing more reliance on deterrent power and less dependence on local defensive power.

Similar statements, some of them less restrained, have been made by other American spokesmen; and it is to be hoped that British ministers will not again be entirely silent on the question of atomic strategy when the White Paper on Defence and the estimates themselves come up for discussion in the weeks ahead. Certainly the present emphasis on creating a British strategic bombing force can be justified only by similar lines of argument.

This idea of the master-deterrent has obvious attractions. It seems to offer a way to peace and security to which purely defensive measures offer at the moment no alternative. Perhaps guided missiles will offer the alternative—but not yet. It brings into play one of the few respects in which the western alliance can hope to maintain military superiority over the great Soviet-Chinese bloc—industrial potential and technical skill and scientific ingenuity. It is specially attractive to the United States and Britain, two powers which have to find in the age of aircraft and missiles the substitute for the old maritime strategy. But it is one thing to devise new weapons and train men in their use, and quite another thing to think and decide about their use. To be satisfied with the present high level of expenditure on research into, and production of, atomic weapons one must have an opinion about the assumptions underlying American thinking.

★

Clearly, three conditions must be fulfilled if a deterrent is to be effective. There must be known superiority over the defences of a potential enemy; the potential enemy has to be sure that the weapons would be used if aggression is committed; the government wielding the weapon must have the support of a public opinion convinced that it should, if necessary, be used without delay. To set out these conditions is sufficient to show that political—as well as military—decisions are required at every stage, to an extent greater than some military planners realise. The expense of stockpiling weapons that may never be used must be borne by the voter; statesmen must present to the electorate the arguments that have created the policy and seek support for them, lest potential enemies treat the deterrent as a gigantic bluff. If it can be said that this has been done in the United States, can the same be said of this country?

To illustrate the importance of this question it can be recalled that the United States enjoyed a decisive superiority in atomic weapons from 1945 until some time after the first atomic explosion in the Soviet Union in 1949. That superiority was not used to stop the

Korean war in 1950-52; indeed, most or all of America's allies would have opposed any such idea on the grounds that it would spread the war, not stop it. In a situation where war is not declared and aggression can be waged by proxy, the decision for or against using atomic weapons may be far less simple in fact than it appears to an air marshal in theory. It has to be remembered, too, that evidence of a thermonuclear explosion in the Soviet Union last year has brought a new factor into the problem: the probability that the Soviet Union can catch up on the United States faster than was calculated and may one day be able to make and deliver hydrogen bombs. More than ever before, those who think in terms of stopping or winning war by atomic bombing have to reckon with reprisals in kind, with the capacity of their own populations to withstand them, and with all that is implied in terms of costly and permanent civil defence measures.

★

Two further questions arise for the layman when he tries to plumb the consequences of atomic strategy. First, against what kind of aggression is "massive retaliatory power" to be used? The question is not academic, because any resumption of hostilities in Korea or any active Chinese intervention in Indo-China would invite—if public statements are to be believed—retaliation, as Mr Dulles would put it, "by means and at places of our own choosing." Is "we" the United Nations, Nato, the American President and the British and French Prime Ministers, or President Eisenhower alone? Is it now the intention to do exactly the opposite of what was done in 1950 in Korea—that is, to say, to extend a local conflict by striking at the source of the aggression? It is, perhaps, better that aggressive governments should be left in doubt on this point; it is certainly not a matter for a public pledge. But it is necessary that the British government—to say nothing of other allied governments—should know how the answer would be decided.

The second question is of special importance to this country. The essential feature of Western Europe's defence as it now exists is the presence in the front line of six American and four British divisions. They were placed there originally in order to stop a sudden thrust westwards by the Soviet striking forces in Eastern Germany. With the passing of time such an emergency has appeared less likely, and those forces have begun to play a semi-political role no less important for the maintenance of peace. Their presence is a guarantee of American and British willingness to watch over and assist in the political, military and economic integration of Western Europe. To the French they are the surety against being left in isolation with a rearmed Germany; to western-minded Germans they are the surety against a revival of aggressive nationalism; to Western Europe generally they provide a shield behind which it can argue about its future. To urge—as is being urged in some quarters in the United States—that their

numbers can be reduced because their original military role can be partly taken over by atomic weapons is to ignore political realities. Indeed, the weakness of the thinking behind the theory of "peripheral strategy" appears to lie in this kind of oversight, in the failure to realise that different weapons and forces are needed to perform different political tasks. There are situations in which a cruiser is more effective than a squadron of bombers, in which the presence on the spot of a handful of soldiers is more effective than the threat to bring up overwhelming force from a distance. Is it certain that the master weapon can or should be used for anything but the major mischief?

The prospect opened up by these questions is baffling, even heartrending. Clearly—barring a miracle—atomic weapons have come to stay and the process of increasing their range, power and numbers will continue. Until diplomacy can create an atmosphere of confidence in which hard sense can be talked about disarmament and international control of atomic power, the fact has to be accepted that atomic weapons will be

Political Pulse

THE Labour party fared very badly at the by-election at Ilford North last Wednesday, but this may have been because most of its supporters felt too cold to turn up. In a poll in which only 45 per cent of the electorate bothered to participate, and in a constituency that had been won by Labour in 1945, but has been safely Conservative ever since, the Conservatives' share of the total votes cast increased by 4.3 per cent above their share at the general election of 1951, the Liberals' share increased by 1.4 per cent, but Labour's share fell by 5.7 per cent. This was the fifth by-election since Parliament's re-assembly last November; in two of the previous four the Labour party had been able to claim a small swing to its side, but in the other two the Conservatives had been able to claim a slightly smaller swing to theirs. In each case there was one common factor: namely, that enthusiasm—and the total poll—ran low. The analyst who seeks to draw firm conclusions from these results is searching for a trend on a half-empty see-saw, which is a disingenuous thing to do.

There are, however, four by-elections now impending—three of them in constituencies that are safely Conservative and one that is safely Labour—and, even though the polls are likely to remain low, the Labour party is going to set great store by the swings they may portray. For Transport House is anxiously aware that if Labour is to face the prospect of the next general election with any confidence, it will have to start increasing its share of the poll at by-elections soon. So far it has fallen very badly behind bogey. It is a customary feature of British politics for oppositions to run ahead of

accumulated as actual deterrents and as potential war-winners. Nor is this merely a dumb acquiescence in hideous necessity. There is clearly something in the doctrine of deterrence. There are some wars that it can prevent. But there must remain uneasiness on three points. First, there seems to be a risk that the strict and literal application of the Dulles doctrine could turn minor and limited hostilities into major conflict—a risk that the launching of a bomber force might start a world war in the effort to stop a local one. Second, there is a risk that British defence policy may devote too many resources to atomic weapons and too few to the forces on which security would depend if, when the time came, the responsible political leaders decided for one reason or another—moral doubts, political uncertainty or simply fear of reprisal—that atomic weapons could not be used (just as poison gas was not used in Hitler's war). Thirdly, there is a risk that the decision for or against their use should be left entirely in the hands of one man. Free men may trust President Eisenhower to act with wisdom, courage and restraint. Can the same be said with certainty of all his possible successors?

Governments in polls in the mid-term between general elections, but for the Government to regain at least some of the lost ground on the final straight. There is probably no deeper explanation of this than that the minority of marginal and non-party voters who bother to turn out at by-elections is a peculiar sample. It is composed, almost by definition, of those who feel most strongly about current issues; and whenever anybody feels strongly in Britain, it is usually against the powers that be.

It is therefore something of a triumph for the Conservatives that they have avoided any clear net swing to Labour since October, 1951; or rather, as the record suggests, it is something of a feat on Labour's part that it has managed to avoid achieving one. The record is worth study; although the figures do not show what the British people can be induced to vote for, they do suggest what it can be induced to vote against. Within very broad limits, the twenty-five by-elections since the present Government took office can be divided into three main phases.

During the first phase, by-elections went as by-elections normally do, in trend against the Government. Three of the four contests during the Conservatives' first nine months of office showed a clear swing to the left, which reached its furthest point in July, 1952, at the now almost forgotten Tory débacle of Dundee East. At that by-election the Conservatives' share of the total vote fell by a full 10½ per cent below their share at the general election; admittedly three-quarters of this loss was picked up by a less-than-usually-queer-fish of a Scottish Nationalist, but the relatively high (71 per

cent) poll in a safe opposition seat registered a clear vote of protest against the Government. No doubt Dundee was exceptional—it felt it had been shabbily treated by the textile recession—but it seems probable that a general election at that time would have swept Labour a good part of the way back to its commanding majority of 1945-50. Along Labour's line of battle that summer there was a jaunty surge up with the bonnets of that shabby Dundee—up and then all the way up, and over the windmill at Morecambe.

★

For the second phase in the by-elections, the phase of Tory recovery, dates very clearly from Mr Bevan's apparent accession to a commanding position in his party at the Morecambe conference in early October, 1952. No doubt the success of Tory economic policy—in the tangible form of derationing and decontrols—helped in the process; but it can only have been a subsidiary factor, because at the time the swing began the dash for freedom had embraced only tea, ham and lead. Although Mr Bevan's accession heated the enthusiasm of the hard core of Socialist constituency workers, who always and automatically turn out to record Labour votes at by-elections in any event, it clearly also heated the apprehension of a wider segment of the population than that which always and automatically turns out to vote Tory; and by so doing, in ten separate by-elections between the middle of October, 1952, and early April, 1953, brought the political pendulum back very close to its position in October, 1951.

Indeed it did more than that. Towards the end of this phase, there were signs of a trend not merely back to the 1951 level but a few points further right. It reached its furthest point at the former marginal Labour seat of Sunderland South last May, when a Liberal candidate intervened and—contrary to previous postwar experience—proceeded to take over 4 per cent of the poll from Labour but only just over 1 per cent of it from the Tories. This was sufficient to carry the Conservative candidate home, making Sunderland the first constituency for 29 years in which a Government candidate had won a seat from the Opposition at a by-election. The trend towards the Tories continued at Abingdon last June, with a 75 per cent poll and a very similar swing in a seat with a 5,000 majority.

There has been no very obvious change in the living conditions of the people to account for the change since then—the change to the present phase, of exceptional apathy and even more dangling uncertainty. Indeed, it is a pleasing point for collectors of the absurd that the original swing towards the right started at a time when prices were still rising and industrial production was still flagging; since the cost of living has been stabilised and industrial production has recovered, enthusiasm for the Government has waned—although, admittedly, enthusiasm for its opponents does not seem to have increased.

The answer is probably again mainly to be found in Mr Attlee's return to his own pale version of prominence on the other side of the fence. The alternative to the present Government no longer appears to most people to be composed of frightening men with frightening ideas, but of rather flatulent men with kindly emotions. The policy of that alternative government is no longer regarded as potentially Bevanite, which means that it would be based on irritable sentiments that the British public sometimes like to vent in private but would find alien to vote for in practice—more anti-Americanism as a basis for foreign policy, more nationalisation for industrial policy, and more spite for fiscal policy. Instead the next Labour Government is envisaged as a continuation of the last Attleeite one—a poor thing perhaps but, in essentials, our own. This may not give the people very much to vote for; but, in an unimportant by-election on a cold winter's day, comparatively few people below a certain income level are going to bother to turn out to vote against it.

★

The stage has therefore been reached when the marginal voter finds that neither party is capturing his enthusiasm (which is not unusual) but also that neither party is unduly irritating him (which is very unusual indeed). If this phase lasted, it should be a recipe for a result at the next general election that would not be very different from the result at the last one. But to assume that the phase will last is to assume a lot away.

Apathy breeds on uninteresting events and moderate prosperity; and there should be some interesting events—and there may be less prosperity—in the months ahead. Among those interesting events, of course, is the possibility of Sir Winston Churchill's retirement. Normally the loss of a leader should redound to his party's disadvantage (especially if it came just before a general election); but this particular loss has been talked about for so long that marginal Conservatives may take the wrench of having to compare Mr Eden with Mr Attlee without intolerable party strain. Similarly any increase in industrial unrest should in normal circumstances benefit the opposition; but there is always the chance that Labour will manage, as it has in the field of colonial policy, to make public uneasiness on this score rebound in irritation on its own head. Finally, and most important, any American recession will certainly lead to a swing to the left in Britain, if it goes far enough to cause domestic unemployment; but there is always the chance that it may only go far enough to enable Mr Butler to appear again as a man who solves crises by tax cuts instead of by more austerity. In each field the unpledged elector who stays away from the polls at by-elections is waiting to see how statesmen will react to great events; even while Sir Winston is still there nobody now seriously considers that events might be made to react to great statesmen. And that, together with the weather, is perhaps the main explanation of last week's arctic apathy at Ilford.

Cheap Food or Dear Farming

THIS is a crucial year for British agriculture. It is the first year in which the Government guarantees to farmers will have to be operated in the entirely changed circumstances of free markets and unrationed food. The annual price negotiations between Government departments and the National Farmers' Union have just begun. In the farmers' view their outcome will be the vital test of the sincerity of Government policy towards agriculture. Unfortunately, they will be an equally vital test of whether that policy can be made to work in the long run.

The basic problem that the price negotiations must tackle is the mounting cost of implementing the guarantee to British agriculture. So long as the Government was responsible for the purchase and sale of all food, both home-grown and imported, this cost was effectively disguised as part of the general cost of the food subsidies. Since the main function of these subsidies was to keep down the cost of living, they could plausibly be regarded as aids to the consumer. Now that the Government is restoring a free market in foodstuffs, they can no longer be looked on in this light. There is doubtless a consumer element still in a few subsidies, such as that on milk, where production has been deliberately stimulated beyond market requirements because of its nutritional value. But, in general, the subsidies now represent the cost of paying to British farmers prices that are much higher than those prevailing on the world market. Decontrol and derationing generally add to the taxpayers' losses, because the Government is no longer able either to make consumers take an appropriate proportion of the home-grown produce, or to find part of the funds to subsidise home production of food by making a profit on competing imported products. It still does both these things in its manipulation of the bacon ration; but that is now an isolated example.

The total cost of supporting British agriculture in the financial year that is now nearing its end (including direct subsidies to producers as well as the Ministry of Food's trading losses) is not likely to be much under £300 million, and next year, unless firm corrective action is taken, it will be higher. Farmers are as aware as the general public soon will be that their prosperity cannot be floated for ever on such a mountainous load of taxation, equivalent at the moment to nearly 1s. 3d. on the income tax. They are casting around for other ways in which the burden of agricultural protection might be carried.

The first suggestion, which the farmers have already put forward, is that imports should be controlled more tightly, so as to facilitate the disposal of home-grown food. Widespread application of this principle would save the taxpayer money. But it would do so simply and solely by penalising the consumer in the most

objectionable way possible. Danish bacon would presumably be kept out in order that English bacon—50 per cent dearer but not nearly so popular with the housewife—could find a bigger market. Flour imports would be prohibited so as to overcome the unwillingness of British millers to use up the supplies of home-grown wheat which at present are a glut on the market. Except, perhaps, as a protection against dumping of subsidised foreign produce, strangling controls over imports of cheap foreign food are a device that should be ruled out of court.

An alternative proposal is to spread the cost of the agricultural subsidies more widely. For instance, the prewar wheat subsidy was financed by a levy on the milling of all flour, whatever the origin of the wheat. In cases where the proportion of imported to home supplies is high (as with wheat) this is a tolerable way of financing a particular subsidy. But it could not be applied generally, and at the best it is no more than another way of shifting the burden from taxpayer to consumer. It thus avoids the fundamental question, which is how to prevent the subsidisation of British agriculture from becoming too extravagant and wasteful.

★

There is in fact no answer to this question except a policy of making the guarantees to British agriculture somewhat less absolute than they are at present. This is a proposal that would be met with cries of betrayal by the farmers themselves. It would in reality be nothing of the sort. The guarantees that farmers at present enjoy go far beyond anything contained in the Agriculture Act itself. In five respects at least the present procedure gives farmers more protection than they can reasonably expect, with consequences that are bound to become increasingly wasteful and costly as a free market returns.

In the first place, the Government's price guarantees cover a broader range of products than is necessary to impart a general measure of stability. Is it really necessary to underwrite the price of duck eggs or to guarantee the market for a minor crop like rye (probably a market twice as large as normal British demand can fill)? Secondly, there is too little assurance that the subsidised products will be of satisfactory quality. For instance, the moisture content in some wheat is too high to justify the price that must be paid for it. Thirdly, there should be a limit to the quantity of production to which the price guarantee applies. The Government has power to impose such a limit, but it is naturally reluctant to take a course which savours of "restrictionism." Fourthly, the price guarantees operate for too long a period ahead. Crop prices fixed now will be in effect up to the summer of 1956, while the mini-

mum prices fixed for livestock products will cover the four years up to 1958. Fifthly, the prices themselves tend, as a result of convention, to be fixed too high. This is indeed the root of the whole problem. If guaranteed prices were regarded (as they should be) as minimum prices, sufficient to give farmers a reasonable measure of subsistence while leaving them to make profits by their own skill and efficiency, then the other rigidities in the price review would matter little. But if guaranteed prices are expected (as they have been) to be high enough to give the least efficient producer some sort of profit in bad times and good, then their conjunction with other watertight guarantees leads to a muddle that can be to nobody's long-run advantage—if only because it cannot endure.

The present state of the grain market illustrates this point. The British farmer is able to buy imported grain at a low price to feed to his animals, while selling his own grain at a high price to the Government. It would not have mattered that the guaranteed prices in this case were fixed years ago, had they been genuine minimum prices; but since they were not, some provision for varying them in line with world prices or with the quantities of grain produced would surely have been an elementary exercise of prudence. The return to the free market ought to be the occasion for firmly enshrining the principle that it is a minimum and not a maximum guarantee of price to which farmers are entitled. That is indeed the main object in switching over to deficiency payments, in place of fixed prices, for cereals and livestock. But the farmers are fiercely determined to prevent this change, and so far their opposition has been successful.

★

Only in the case of eggs has the correct principle been adopted, in the teeth of farmers' claims that the minimum price of 4s. a dozen would prove "uneconomic." In fact, the output of eggs has soared and it now seems that the price was set too high. Under the scheme for cereals, the "standard" prices (on which the deficiency payments will be calculated) are the same as, or higher than, the previous fixed prices, despite the fact that world prices are rapidly falling. Under the livestock scheme, each individual transaction will be underwritten with a price guarantee so that the farmers' incentive to study the market will be reduced or eliminated. In all these cases, the new price guarantees do not vary much from the old fixed prices, with the vital difference (from the Government's standpoint) that they must be implemented on a market in which prices are falling and supplies are uncontrolled.

The consequences of this policy are not hard to forecast. As the taxpayers' bill grows still bigger, pressure will increase to restrict supplies, both home-grown and imported (but primarily the latter). It will be said that only by the elimination of "disorderly surpluses"—in other words of a cheap and abundant supply of food—can the nation get proper value for its expenditure on

agriculture. The next step will be that a state-supported system of dear farming will produce its inevitable concomitant of dear food; and the inevitable consequence of that will be a wave of hostility to the farmers among the public that will make Mr Stanley Evans sound like their best friend.

If these things should occur, farmers themselves would not be much to blame. They have been scandalously misled by Governments which for years have neglected all questions of cost in their frequent exhortations to agriculture. The British wheat that is already a glut on the market is the result of an exhortation, only two years old, to grow as much wheat as possible. Thus shielded, farmers cannot be expected to adjust overnight to falling prices and accumulating surpluses. They will expect, and rightly, that the Government should not forget its promises to them in times of plenty. But the Government itself must explain, while the chance is there, that producers cannot expect an unlimited protection under the new conditions. They are entitled to a minimum of stability (no more) on the basis of which they must determine the size of their market according to their own efficiency, and not by reference to Government "targets" implemented as necessary by restrictions and controls. This should not and need not mean a return to the days of dog-and-stick farming. Given Government support and an expanding market for food, the permanent outlook for British agriculture is brighter than it has been for a century. But if it is the Government's duty to protect agriculture against instability or depression, it is the farmers' own task to make their prosperity. The present price review is perhaps the last chance to make this distinction clear before no alternatives are left but to abandon the consumer or to betray the producer. And in the end—it is a pity that British farmers should be misled by their false friends on this matter—it is a simple electoral fact that the consumers have many more votes.

Latin American Customers

THE bad-tempered atmosphere that seems to surround all discussion in Britain of trade with the Latin American republics is not difficult to explain; but, unless it is correctly explained, there is real danger that a national mood of bitter cynicism and defeatism will establish itself. Last year, British traders with Latin America had good cause for alarm. They, who once had supplied a quarter of the region's imports, who had already seen the United States assume a dominant position in the trade, now found both their percentage of the twenty republics' imports and the absolute scale of the trade sliding frighteningly downwards, while their German competitors thrust up past them. Moreover, in the two biggest republics, things were quite melodramatically bad for the British exporter; sales to Brazil were almost extinguished by the dead weight of Brazilian debts, while Germany's victory in the Argentine market was even more startling.

It is hardly surprising to find British businessmen, angry at being repeatedly told that their German competitors have more vigour and initiative, rounding on their own Government. They complain that it withholds the backing that the Germans get from Bonn, and simultaneously—with rather more justification—they lay a good part of the blame for Britain's troubles on the Latins themselves. In this welter of mutual recrimination, sizable successes and promising beginnings are lost to sight; and younger and more venturesome businessmen are discouraged by the complaints of the old hands from even investigating the market.

It is high time to restore perspective to the British outlook on this market, which includes a considerable segment of the dollar area. And the first need is to sweep away the lingering memory of the Golden Age, when Britain built the railways, ports, and civic utilities of the young republics, financed and carried their trade, and invested heavily in their farms and mines. The Golden Age is long dead. Britain has no prescriptive right to a special position in Latin America today; and—what is often forgotten—it did not have it even before the second world war. Indeed, it is quite ludicrous to hear German competition discussed as a novel threat, while the Germans themselves have still to restore their Latin American trade to its prewar position in the pattern of their economy.

At the root of the factors that have reduced British trade with the twenty republics to its present proportions is a largely understandable economic nationalism—stimulated, but not created, by wars and depressions which revealed to Latin Americans the dangerous degree of their dependence on overseas markets and supplies. Today, while the region still exports crops and minerals, its real face has changed dramatically. Since 1951, the output of its factories has exceeded in value that of its farms. It is increasingly a food

importer. Its demand for imported fuel—primarily petroleum—is rocketing upwards; and its industries require more and more raw materials. A population that has increased by some fifty millions in twenty years calls for food and for urban employment in light industry; and while food, raw materials and industrial fuel now come high on the republics' import lists, textiles and similar consumer goods come very low. The economy of Britain is, in fact, no longer naturally complementary to the Latin American economy.

★

The United States, on the other hand, can both supply the foods that several of the republics need, and offer an unrivalled market not only for their minerals and raw materials but also for coffee, which today represents a quarter of all Latin American exports. This natural partnership plays a greater part in maintaining the United States' dominance of the Latin American trade than the temporary advantages it gained over its European competitors during the war.

* All Germany.

† Federal Republic.

All this is, for British traders, the gloomy side of the picture. But it is also fair to say that, if British exporters are really less vigorous and more defeatist than their rivals in Latin America, this is partly due to psychological, rather than material, factors. The spectacle of British commercial hegemony declining in the region not only prevents the British from enthusing about new initiatives, but has led many Latin Americans to expect too much from Britain—an attitude that has now, inevitably, been transformed into a habit of assuming that British firms will meet a demand less quickly than their rivals. Again, the practice of discussing Latin America as an indivisible whole is unfortunate. The British businessman who hears of hostility in Argentina, or of payment log-jams in Brazil, needs to be reminded that there are eighteen other republics, not all of them minuscule, and some of them with a good record for prompt settlement of accounts.

The fact that fourteen of these are dollar-account areas is an obvious pointer to their attractiveness as

a market; less widely appreciated is the fact that most of their doors stand wide open to trade on straightforward, if highly competitive, lines. (Peru although not a dollar market, may be grouped with these in view of its present government's strenuous and impressive effort to liberalise trade.) In 1952 these republics imported some \$3 billion worth of goods; and this included a big proportion of capital equipment. The report of the Crosland trade mission, which visited five of the dollar republics a year ago, indicated the great possibilities of this market. Already some reorientation of British trading efforts to the north may be detected. Too many concerns, however, still concentrate on the traditional, but now queasy, markets of the south.

★

These latter may be considered under two heads. First there is the group of countries, in which Brazil is the most conspicuous, whose troubles are basically due to their own failure to export. By vainly holding out for unrealistic prices for some of their major exports—Brazilian cotton, Bolivian tin, Chilean copper—they have lost the means to pay for imports, and are now desperately trying to restore a balance, largely by slashing imports. One great difficulty here is Britain's limited ability to absorb these countries' products and thus increase their capacity to buy in sterling. With the second group, however, the problem is reversed. Argentina and Uruguay have lately been selling to Britain far more than they have bought from it; the complaint is that they have hoarded their sterling, or used it to make purchases elsewhere. A somewhat parallel situation is to be found in Cuba and the Dominican Republic. While insisting on payment in dollars for the sugar they sell to Britain, they prefer to buy from the United States goods that Britain is only too willing to supply.

The businessman who calls for governmental support is here on firmer ground. In the republics of which Britain is a good customer, he is entitled to ask that its obvious bargaining power should be used. In fact, it is used; and if the trader complains that he sees few results, he must in turn be asked to take into account three limiting factors. The first is obvious: one cannot brandish a big stick without inviting retaliation, as the history of meat negotiations with Argentina shows. Second, it is scarcely possible, nor would it be right, to insist that all sterling earned in Britain should be spent there; this country cannot expect to enjoy the advantages of its position in the sterling group and at the same time to prevent other countries from spending their sterling on, say, oil or raw materials from elsewhere in the sterling area. And third, it is wrong that Britain should help to enmesh the world in the kind of rigid bilateralism that restricts trade.

There is, then, no simple answer to the question whether British setbacks are the fault of successive governments or of the trading world itself. Circumstances alter cases, and in Latin America circumstances

vary a great deal. Moreover, to realise that the greater part of the loss of trade already sustained was caused by external factors is to take the first step away from defeatism.

A little despair, however, is useful if it will cause some sections of British industry to abandon the attempt to sell unsuitable goods to unwilling customers, and to concentrate on meeting genuine needs. Exports to Latin America must change their form and focus as the area itself changes. The shift is to capital goods, to the northern dollar markets, to modern designs acceptable to swiftly developing countries; above all, perhaps, to the combination of sales and technical service. Trade, in modern Latin America, follows the technician; that is the principle underlying the new attention to joint ventures in partnership with local capital, to the stationing of highly qualified engineers in the republics, and to the training of Latin Americans in Britain. On the successful application of these principles will depend the future fate of British trade with one of the most rapidly developing regions of the world.

The Prince Consort

Another important matter touched on in the debate in both Houses, and completely explained, was the conduct of Prince Albert. . . . With respect to his interference with foreign affairs, it was not for one moment concealed nor denied that his Royal Highness takes a great interest in them, as he necessarily must and ought in all that concerns the welfare and honour of the country, the dignity of the Crown, and the peace of Europe. Neither in constitutional law, nor in usage, nor in justice, is there a shadow of a reason why he should not interest himself, and deeply interest himself, in all these things. The objection, in fact, to his interference, is not to the mere fact, but that he had interfered in a sense unfavourable to the views of one party. . . . The objections to his conduct are founded, not on his having given advice or offered suggestions, but on giving wrong advice. These are met, however, by the simple statement that the Ministers are responsible for the conduct of affairs, and that if they are not allowed to conduct them as they think best, they must resign. . . . They have not resigned; they have always been, and seem more likely than ever to be, supported by the House of Commons; they are responsible to it and the nation; the only inference, therefore, is that Her Majesty follows their advice. . . . The surprise is not that Prince Albert should have interfered, but that the mere fact of his taking an interest in the most important public question that has been agitated in Europe for a quarter of a century should have required defence. Yet the accusation had taken such a strong hold of the public, that at least an explanation was indispensable. For weeks it has been the subject of conversation in club-houses and coffee-houses of all degrees; and from the lower ranks of the latter it has passed into street lyrics, and in the vilest ribaldry has been sung in every part of the metropolis. The fact is instructive. By no means now can the influence of the press be prevented—by no means can the influence of the multitude over the march of public affairs be extinguished. . . . it lends a bias to the whole national policy.

Notes of the Week

Where the Four Came In

It is hard to understand what led the Prime Minister in the House of Commons on Tuesday to express optimism about the proceedings in Berlin. Ten days of talking have made it clear, if there was doubt before, that the conference should not have taken place until thorough and secret preparation had revealed possibilities of real negotiation. The summary of events given on page 403 shows how little the Foreign Ministers have progressed.

Everything that Mr Molotov has said is to be found in Malenkov's big speech of August 10th. His intention to harass and manoeuvre the Americans out of Europe was plainly revealed in his Notes last autumn. Likewise, the main principles asserted by the three Western Ministers were known beforehand. Only M. Bidault's impressive candour and resolution could be regarded as in any way unpredictable. Indeed, an attempt by Mr Molotov to squeeze him out of his solidarity with Mr Eden and Mr Dulles may be the next development—for the Soviet representative has shown bouncing form.

What is there to be said on the credit side? There are to be meetings in restricted—not necessarily secret—sessions, thanks to Mr Dulles's agreeing to discuss further the question of how and when to get the views of China on problems which concern it. There has been some give and take by the West in accepting the Soviet agenda, by the Russians in agreeing to put off consideration of their own proposals for a new disarmament conference and for an invitation to West and East Germans to join in the talks. There have been "quips and cranks and wanton wiles" over dinner and tea, and a Mad Hatter's moment last weekend, when the Russians were said to be interested in the idea that the European Defence Community would offer security to them against a rearmed Germany.

The Base in Germany

MUCH of this had nothing to do with the German problem, about which three things are fairly clear. First, Mr Molotov is deeply embarrassed by the Western insistence on free elections throughout Germany, which strikes at the main weakness in his position—the obvious fact that Eastern Germany would vote overwhelmingly against its Communist rulers. He has tried to confuse the issue with his latest proposal for a referendum, in which

Germany would be asked to make a quite bogus choice between a peace treaty that the Russians would like and an association with the West that they would dislike. Secondly, it is probable that the Kremlin's military advisers are even more embarrassed by the idea of giving up the great forward base in Eastern Germany than British soldiers are by the idea of leaving the Canal Zone. It has to be reckoned that generals may have a stronger voice than before in Soviet policy towards Germany.

Lastly, it is likely that Mr Molotov will urge that the running of elections should be left to the Germans themselves, and that representatives of Bonn and Pankow should be brought together without delay. The objections are obvious: Dr Adenauer would be asked to recognise (as he could not) the Ulbricht regime as the legitimate Eastern government, and endless delays would be caused by committee work which would be claimed by all opponents of the EDC treaty as a reason for delaying ratification.

★

Two features of Mr Molotov's tactics are puzzling, as M. Bidault has acutely pointed out. The Russians are bitterly opposed to the Germans joining the EDC. By accepting Mr Eden's plan for forming an all-German government they could certainly delay, and probably cripple, the whole policy for Western Europe's integration. For Mr Eden and his colleagues have insisted that this government would be free to choose its own alliances—an assurance which the Russians refuse to accept. Again, Mr Molotov seems unable to grasp that one way of tempting the Americans to withdraw one day from Europe, or at any rate to reduce their strength there, is to let the Germans and their neighbours go ahead with their community plans. The advantages to Soviet policy of relaxing the West's suspicions by considering its plans for Germany are so obvious that Mr Molotov's inflexible attitude can be explained only by assuming that he is determined to stay in Eastern Germany.

Awakened Horse

OPPOSITION leaders are learning the price of political alliance with the trade union movement. They are being pressed by the recently reconstructed trade union group in the Parliamentary Labour Party to align themselves with current wage demands, and to attack the Government's economic policy on the grounds that it is responsible for what they are being asked to call justifiable unrest. Mr

Aitlee and Mr Morrison, together with some of their most experienced colleagues, are uneasily aware of the danger to the party of any suggestion that they are fomenting industrial unrest for political ends. But they have been forced to agree to demanding a debate later in the month, although it has not yet been decided whether they must attack the Government directly by a vote of censure, or obliquely in a debate on the adjournment.

The growing belligerence of trade union MPs is reflected in the list of new officers just elected as their spokesmen in the Parliamentary Party. To replace a collection of elderly nonentities they have chosen such men as Mr George Brown, one of the heartiest and most effective of the younger right wing leaders, and Mr Fred Lee, former Parliamentary Secretary to the Ministry of Labour and another "coming man." Significantly, two of the four new officers are engineers and one is a railway signalman. All of them are openly anti-Bevanite. So far as the domestic life of the Parliamentary Labour Party is concerned, this may indeed be the most important feature of the new leaven. Having roused the slumbering union forces in the constituencies and the party conferences, the Bevanites, coupled with the changing economic climate, now seem to have added to their own difficulties by stirring the union MPs to regain the dominance in the Parliamentary Party which numbers alone always partly gave to them.

So far as the industrial battle itself is concerned, it is by no means certain that militancy in parliamentary opposition will attract more support to the unions' side. That battle is still in a state of mainly suspended fire, while both sides await the all-important report of the court of inquiry into the engineering dispute, which is expected in a few days' time. The most important news from the one active sector of the front this week has been that the employers in the electrical contracting industry are still standing firm against the guerilla strikers. Reports that they were considering a peace-seeking offer—which were referred to in these columns last week with the warning that they might be false—have proved to be false indeed. The employers have issued such a shattering denial that it will be more difficult than ever for them to retreat, even if they should some day wish to do so.

The Rifle Backfires

SUSPICIONS that Labour regarded the Belgian rifle as an appropriate political weapon rather than an inappropriate military one were amply confirmed in Monday's short but brawling debate in the Commons. Mr Shinwell must have had some doubts about his accusation that the Prime Minister had "yielded to American pressure," but it cheered the faithful behind him. Nor will the country at large really believe that Sir Winston persuaded the War Office to reverse a decision against its own judgment; he may tend to talk about rifles in the idiom of G. A. Henty, but—in military, as distinct from economic, matters—he does not do things like that.

The argument for choosing the Belgian FN, as was argued in an article last week, is simply that, other things being equal, preference should be given to the rifle offering the

best prospects for Nato standardisation. Labour claimed that the weapons are not equal, but their implied disparagement of the FN collapsed when Mr Head brought another of their unsuspected skeletons clanking into the Commons. He revealed that while Labour was in office two tests provided a slight balance in favour of the FN and that at one stage (admittedly while the Americans were still toying with the .280 round) a member of the Army Council sent a signal to Washington, stating it to be War Office policy to standardise on the FN. Later, when the Americans reverted to the .300 round, a new situation was created; but the procedural wrangle which followed Mr Head's failure to arm himself with the signal when he disclosed its contents should not obscure the significance of this earlier decision.

It also should not obscure the oddest issue to arise from the debate. Although the tests in 1951 suggested that the Belgian rifle was slightly better, the experts advised the Labour Government to adopt the British EM2. The only explanation Mr Head could offer was that the then Director-General of Artillery did not agree with the results of the tests. This, coupled with Mr Strachey's disclaimer of all knowledge of the signal to Washington, throws a curious light on the relations, at least at that period, between ministers and their experts.

Japanese Dilemma

THE trade agreement with Japan, under which colonial peoples will be allowed to buy Japanese goods if they want to and even people in this country may be allowed to buy about 5d. worth of Japanese manufactures per head, has put some members of Parliament in an awkward dilemma. It is politically advantageous to rail against the agreement; the Opposition is therefore determined to rail, and Conservatives from the affected areas in Lancashire and the Potteries also feel bound to make deprecatory noises. But, as so often, it is impossible to translate these complaints into reasoned and convincing argument, because the basis for such argument simply does not exist.

The bare facts, as an article on page 407 points out, are that Japan is short of sterling, and that it would therefore have had to impose restrictions on imports from Britain if it could not sell more goods in sterling markets. Britain's alternative was either to accept a reduction in the market for its export industries, with no compensating advantages; or to risk an equivalent reduction in the sterling market for those of its industries that compete with Japan, with the compensating advantages of a slight decrease in the cost of living for restive Africans and Malaysians and of a thimbleful of bargains for the British housewife. Any responsible statesman would choose the latter, and both Mr Harold Wilson and Mr Ralph Assheton know it.

In Parliament, where Government spokesmen can answer back, as distinct from on platforms or in the press, where they cannot, the objectors are therefore searching for ways in which to earn favourable mention in their constituencies without offending too much against their own self-respect. On the right and in the centre the line chosen is that the Government should have undertaken fuller consultation with the interests affected before signing the agreement; it should, apparently, have poked at the

hornets' nest before sitting on it. On the left the objectors have chosen to flog the horse to which they always turn when in difficulties. The agreement, it seems, is all America's fault; Mr Dulles is forcing the Japanese to sell toys to British children as an alternative to selling them to the nurseries of Red China. It is for each MP who indulges in these elaborations to settle with his own conscience whether they are really fulfilling their purpose, which is to strike the politically advantageous note of protest without sounding both embarrassed and silly.

Post-Stalin Production

THE Soviet Central Statistical Office has now issued its report on the fulfilment of the current five-year plan in 1953, its third year. This was the year in which Stalin died and his successors announced sweeping changes for the benefit of the consumer. Just because it was a year of transition it is difficult to assess the extent of the shift. There is a clear departure from precedent in the very presentation of the report, with its greater emphasis on the development of light and food industries. But there is no evidence of any slowing down in the rate of growth of basic production, though coal and steel output fell slightly short of their annual targets.

SOVIET BASIC PRODUCTION
(Mn. tons)

	Coal	Petroleum	Electric Power*	Pig Iron	Crude Steel	Rolled Steel
1952...	300	47.5	117	25.2	34.4	26.8
1953...	318	53.0	132	27.5	37.8	29.5
1955 Plan	372	70.0	163	34.1	44.2	34.1

* 1,000 mill. kwh

Light industry, it is claimed, no longer lags behind the pace of heavy industry. Gross production in both was apparently 12 per cent higher than in 1952. Indeed, according to the report, output of consumer goods ran ahead in the second half of 1953, reaching a level 14 per cent higher than in the corresponding period of the previous year. Even so, the government must have run down its stocks to keep up the pledge to the consumers, since retail sales are alleged to have risen by no less than 21 per cent.

The picture of agricultural development is somewhat confusing. Malenkov's admission that the Soviet method of calculating the biological (as opposed to the barn) crop was resulting in exaggerated figures, rendered the planners' task difficult. They got away with the cryptic sentence that "the actual quantity of grain, despite bad weather conditions, equalled that of the previous year" (about 130 million tons in the inflated calculation). In accordance with the new plan to foster agricultural production, 100,000 agricultural specialists were sent into the countryside. Great progress is claimed in livestock breeding: the number of horned cattle rising by 15 per cent and that of pigs by as much as 70 per cent. Breeding outside the collective farms apparently accounts for a large part of this increase. One wonders how Khrushchev's policy of incentives could have produced such results in such a short time.

Prague Looks at the Future

AN interesting glimpse at the shape of things to come in the offices of the east European planners has recently been provided by Mr Pucik, the chairman of the Czechoslovak State Planning Office. He said that his new economic plan, the successor to the first five-year plan which ended in 1953, will be divided into two parts. The first will cover the years 1954 and 1955, and the second the five-year period, 1956-60. The object of this division, he says, is to obtain the greatest possible advantage from co-operation with the Soviet Union and the people's democracies; all these countries were due to begin new long-term economic plans in 1956, and Czechoslovakia would also then be concluding a new series of long-term economic agreements within the Soviet bloc.

Mr Pucik was not strictly accurate; Hungary concludes its current plan this year and presumably, like Czechoslovakia, will have to mark time until 1956; Bulgaria, which embarked on a new five-year plan in 1953, no doubt makes too small a contribution to the bloc's economic potential to be seriously considered. In any case, 1956 must be the key year, since that is when the sixth Soviet plan is due to begin.

Thus, whatever the exact significance of the Soviet bloc's new course in economic policy, it is certainly not going to mean less co-ordinated planning. On the contrary, it may mean a good deal more. At present each satellite's industrial production has to fit in with that of the Soviet Union. There is, however, little evidence that inter-satellite co-ordination of planning—as distinct from a number of joint industrial projects—has gone very far. Indeed, so long as each country, in accordance with the Stalinist precept, was striving to develop all branches of its heavy industry simultaneously, the scope for inter-satellite planning was bound to be limited. But if, under the new dispensation, each is really going to be able to base its industry on a more realistic estimate of its capabilities—in other words, to cut its coat according to its cloth—then the scope for co-ordinated planning will clearly be much greater. This might be pointed out to Mr Molotov next time he denounces the integration of Western Europe.

INDEX NUMBERS JUNE 1947=100

Liberals Face the Future

INCH by painful inch the Liberal party is moving to a more realistic understanding of its position in British politics. Its latest bout of self-analysis has been related to three ends—raising more money, concentrating its resources on the more hopeful constituencies and hammering out a policy more aligned to the issues of the day. Some progress has been made in each case, but the main lesson being forced on the party is that it must abandon any idea of a sudden Liberal revival and concentrate on a long, slow haul—with the immediate objective of trying to win one or two more seats. This will be hard enough, as witness another lost deposit at Ilford North.

The new Liberal electoral strategy calls for an annual income to central funds of £40,000, a trickle when compared with the sums available to the two main parties. In order to use these resources to best effect, all the constituencies in the country have been graded according to their prospects for a Liberal success. The list has not been published; but it is believed that preferential treatment might be given to about 100, and not necessarily the 109 rather arbitrarily selected for battle at the last election.

Within the House of Commons itself the Liberal party has been declining not only in numbers but in influence, largely because it has failed to keep up any sustained argument. With only a handful of MPs no party can cover all aspects of policy, and its one chance of making its small presence felt would be to concentrate on two or three lively topics of general interest on which it could claim distinctive views—say education, monopolies and worker-management relations. Some signs of a more contemporary approach to policy issues emerge from the agenda for the party's annual conference next April. There is a reasonable resolution on education; a comprehensive attempt to make the co-ownership dream a little more practical; and an official resolution from the Executive which effectively admits that at last year's conference the Liberals went slightly berserk on agriculture, when the Executive found itself committed to a dash for freedom. This heady policy is now to be subjected to the all-embracing rider that after thirteen years "the Government has an obligation to farmers to provide them with an outlet for their produce at remunerative prices until such time as adequate competitive marketing arrangements can be established."

Defencelessness Undefended

THE Home Secretary's reply last week to criticisms of civil defence administration was disappointingly evasive and vague. After regretting, with formal correctness, that the Select Committee on Estimates should have criticised his officials instead of the Government itself, Sir David Maxwell Fyfe said that the committee was under a misapprehension about the role of civil defence. He emphasised that in the preparations made to deter aggression civil defence plays a secondary role to military defence. Everyone understands this; account was taken of its secondary

nature in framing a programme that was to cost only a fraction of the cost of rearmament. What the committee complained of was not that the civil defence plan was secondary, but that it was not being carried out. Sir David seemed to imply that this was by design, but then recounted the Government's excuses for failure to get on with the job. Briefly, these were that the services are new, that defence production programmes are always slow to develop, that international and financial conditions were changing—and simply that correct estimating was difficult. He also drew a remarkable distinction when he said that the programme for fire appliances was not cut, but spread over a longer period.

This is far too serious a matter to be brushed aside with polite tributes to loyal officials and hard-working volunteers. The stark facts are that there is still no civil defence worthy of the name, that it cannot be produced out of a hat when it is needed, and that its absence might powerfully encourage the potential aggressor.

Uneconomic Nationalism

WHATEVER nationalists north of the border may have liked to think, the English welfare state is not being paid for out of Scottish taxes. That, at any rate, is the conclusion that is meant to emerge from the Treasury's vast—and unnecessary—labour in producing Cmd. 9051, which sets out details of revenue and expenditure in 1952-53 for England and Wales on the one hand and Scotland on the other. It estimates that Scotland contributed 9.69 per cent of United Kingdom revenue (excluding Northern Ireland), but benefited from 12.34 per cent of the expenditure that can be specifically allocated. These figures must be treated with caution. Over 60 per cent of expenditure (on such things as defence and administration) cannot be satisfactorily allocated; and the Treasury had to do some complicated juggling to arrive at its estimates for revenue. Allowance had to be made, for example, for the many firms with head offices in England which are taxed south of the border on profits made in Scotland. Obviously, the unfortunate statisticians did their juggling with scrupulous fairness and painstaking effort; but they, of all people, must have known that the effort was not worth while.

This makes it all the more surprising that in this week's rather drab debate in the House of Commons on Welsh affairs—in which all representatives of Welsh constituencies were eager to show what good Welshmen they are—it was suggested that the Welsh contribution to the national pool should be subjected to the same form of analysis. The results would probably be even more vague and less complimentary than those for Scotland. In any event this is the wrong yardstick to apply. The principle of derivation should have no more place in decisions about expenditure beyond the borders of Wales and Scotland than it does on the English side of them. The real case for the Scottish and Welsh nationalists is not based on economic considerations; those are merely silly abstractions introduced by the silliest people on either side. The case is based instead on principles of administrative convenience and innate *amour propre*; and about these—and their relevance to

'ENGLISH ELECTRIC'

To mining, as to so many industries, electricity brings power for productivity, power for cutting and carrying, and to convey miners to and from the surface. For nearly 50 years ENGLISH ELECTRIC has produced mining electrical equipment—hoist drives, hauling 24,000 miners a day in Britain alone; coal cutter motors; underground locomotives; and much else to increase mining's contribution to the prosperity of many nations.

bringing you

From coal, that ENGLISH ELECTRIC helps to produce, comes much of the world's mounting electrical power. ENGLISH ELECTRIC plays an ever increasing part in generating and distributing electricity and helps the world to put it to good use, not only for better work but also for better living—through ENGLISH ELECTRIC transport, for example, and ENGLISH ELECTRIC domestic appliances and television.

better

living

WOULD YOU EXPECT EXTRA OUTPUT FROM THIS FACTORY?

We do not expect high production or low costs from a ramshackle factory equipped with antiquated machinery turned by animal power or by hand, lacking electricity and piped water, and with no housing available for half its workers.

Yet that is precisely the condition of fully half our farms. Two-thirds of our farms are without electricity. About half our regular farm-workers are without cottages, fewer than half our farm-houses and cottages are supplied with piped water. The standard of farm roads and access to fields is much lower than it should be.

It is not surprising that food production is lower than we want, that costs are high, that many farmers and farm-workers find life a hard struggle for bare existence and that there is a dangerous drift from the land. Yet what is done to help? Farmers farming good land are crippled by super-tax. Those needing capital for expansion are subjected to loans at interest as high as 5%! Is this really the sensible way to get that vital extra food?

The taxation system must be altered. Long-term loans at low interest must be offered. The land is our finest investment. Let us not forget it!

GROW MORE FOOD IN BRITAIN

This announcement is issued in the interests of British agriculture by Massey-Harris-Ferguson

Ferguson tractors are manufactured for Massey-Harris-Ferguson, Coventry, by The Standard Motor Company

claims for an Ulster type of constitution, which would leave the essential economic unity of the kingdom intact—there is much more room for debate.

To the Power of Five

WHATEVER happens at Berlin, the international status of the Peking government must eventually be decided; and before the final moment of decision arrives, much more thought must be given to a question the full implications of which have been missed. Is Asia's sole representative in the inner council of five great powers to be a Communist government?

First, of course, it must be asked whether there should be an inner council at all. Current Communist doctrine on this matter strongly resembles the theory of the Holy Alliance as expounded by Metternich. The idea that an anointed band of five powers should take decisions affecting all the eighty-odd nations in the world is advanced by Mr Molotov and others on the strength of the special position allotted to these five in the UN Charter. In fact, however, the Charter made no such bow to legitimism. Admittedly, its Article 106 required America, Britain, China, France and Russia to consult together—and with other appropriate governments—if joint action to maintain peace proved necessary before the Security Council was ready to authorise such action. But the Council felt itself ready in June, 1950; and it can scarcely be argued in 1954 that Article 106, which bears the label "Transitional," remains valid. Nowhere else in the Charter is any authority, as distinct from privilege, granted to the five-power group as such.

If, however, an inner group is to be constituted, on realistic rather than legalistic grounds, it must surely be related to 1954, not 1945. Which are the great powers today—and which will be tomorrow? In 1945 India was a dependency, and Japan, Italy and Germany lay prostrate; but today each of these carries as much real weight as did China or France in 1945. How long can such countries be kept out of the inner council, if there is to be one?

A Reminder from Syria

SYRIA'S military dictatorship has been challenged. President Shishakly not only preaches but practises there a policy that is the pipe-dream of all Arabs: armed neutrality and no commitment to any western power. He has done without foreign aid, largely thanks to luck with harvests, to his success in maintaining security and in creating good conditions for industrialists. But in Syria politics run in the blood, and to maintain a balanced economy is no defence against incorrigible political adversaries. Last week, therefore, President Shishakly took a leaf out of President Neguib's book and smacked down the political leaders who had been tunneling against him.

The chief centres of disturbance seem to have been Homs—home town of the last civilian president, Hashim Atassi—and the feudal and recalcitrant Druse mountains of the

south-east. The outburst is a sad business, because Shishakly had done steadier work on the social and economic front than most of his civilian predecessors, and because, unlike Neguib, he had kept his word about holding parliamentary elections. He had even allowed banished politicians to return and run campaigns. In the elections last October his Arab Liberation Movement won 72 out of 82 seats; but a sinister mark of its unpopularity was the fact that in the big towns under 20 per cent of the electorate voted. Accused by the abstainers of many undemocratic practices, he may not be popular enough to be able to afford the risks he took in giving them elbow-room.

His drastic action has had a mixed reception in the Arab League states, divided as they are into dictatorships and parliamentary regimes. Iraq and Lebanon are highly critical; Jordan is silently hoping he will not expose weaknesses that will strengthen Israel. President Neguib and King Saud, by contrast, have sent him encouraging telegrams. Neguib's support springs from fellow-feeling and the hard fact that a success or failure in one dictatorship can set an infectious example in another. Shishakly, therefore, poses the West—indirectly—with the question whether a dictatorship by no means ideal is preferable to any alternative that can be discerned. To think about it is to illuminate the bigger question, now crucial for Britain in Egypt, whether to uphold such regimes by showing confidence in them, or by opposing them to weaken them.

Back to the Slaughterhouse

WHEN the Government ceases to trade in meat this summer, the wartime concentration of slaughterhouses will also be discontinued. At present only 482 slaughterhouses are in operation in England and Wales, although before the war there were no less than 11,500. The facilities now in use are not flexible or localised enough to meet the needs of private traders, who cannot (as the Ministry can) move livestock about at will. More slaughterhouses will therefore be needed, but to avoid the wasteful methods of prewar days the Government aims to promote a policy of "moderate concentration."

The committee that is examining the problem* has now recommended that the control of slaughterhouses should be returned to the local authorities. From the viewpoint of public health, this may seem the simplest solution; but it is a transparent economic mistake. Under the Food and Drugs Act, 1938, which will now become effective for the first time, the local authorities may close, without compensation, any slaughterhouse where conditions are insanitary or where avoidable cruelty takes place. To meet the economic problem, the committee suggests that local authorities should be encouraged during an "interim period" to buy out redundant slaughterhouses and provide new public facilities where needed.

These suggestions really amount to a restoration of the prewar system. One of its main defects was that offals and other by-products were generally wasted or inefficiently utilised. In rural areas, the individual butcher who both selects and slaughters his beasts may operate very cheaply.

* Interdepartmental Committee on Slaughterhouses. Interim report. Cmd. 9060. 6d.

if not very hygienically; but in big consuming centres modern abattoirs with a large throughput provide the most economic method of slaughtering. In an efficient abattoir, the profits earned from the many hundreds of by-products more than cover the cost of transporting and slaughtering the livestock. But it should be obvious that effective schemes for the concentration of slaughtering can only be worked out on a regional or national basis; the task cannot possibly be tackled by over 1,000 local authorities scattered across the country. Nor will many authorities be willing to pay (as the committee suggests) 50 per cent of the cost of compensating the owners of redundant slaughterhouses. If the Government is in earnest about reducing the costs of livestock marketing, then it must act quickly to produce a better scheme than this.

Tornado at the Tate

THE emotional storm now raging through the Tate Gallery shows artistic excitability at its not unusual extreme. The board of trustees of the Tate were already aware, even before the indefatigable Mr Douglas Cooper pointed it out in a letter to *The Times*, that some of their purchases had contravened the terms of their trusts, and corrective steps had already been taken. The trustees had bought a Henry Moore sculpture with funds that were earmarked for British paintings; and a picture by an artist who had been dead for 26½ years with funds that should have been devoted to the works of artists who had died not more than 25 years ago. But no one can complain that these careless errors have been in any way disastrous. The trustees, by publishing a long statement of self-accusation in the best communist manner, have given some people the false impression that some grave maladministration has been unearthed.

This impression has now been strengthened by a letter written to the *Evening Standard* by Mr Graham Sutherland, announcing that he has resigned from the board of trustees. His reasons, which the chairman of the board says were given more fully to that newspaper than they

had been to himself, were not only that there had been breaches of trust, but also that the buying policy of the Gallery had resulted in great waste of public money. In particular it had recently bought works that it could have bought at a much lower price some years ago; and it may have paid an unnecessarily large sum for a Degas statue of a dancing girl, of which there are several other casts. But for these decisions the board, including Mr Sutherland, were collectively responsible, and there seems no reason why he should thus publicly arraign his colleagues.

The affair would surely never have reached such a pitch if personal animosities were not involved. The Director of the Tate Gallery appears to have enemies in the world of art, a world in which an amenable man is always apt to be called a weakling and a firm man a pig-headed mule. But this unfortunate animosity provides no proof of maladministration, and it is worth noting that for one reason or another the Tate Gallery has never been so popular with the public as it is today.

Pools and Politics

NEARLY three years have passed since the Royal Commission's report on gambling was published. But both the Labour and Conservative governments have felt that where manners and morals are said to clash politicians should keep well away from the fracas; and the report's recommendations have been discreetly forgotten. Some of these, which concern betting on football pools, were dusted up and given a brief airing last week, when a Private Member's bill embodying them was brought up for second reading in the House of Commons. Unfortunately the measure was talked out, by a Labour member who said—probably quite rightly—that it was badly drafted; he did not meet the point that a bad bill can be amended in committee.

Under present regulations, the private companies that control the football pools are not obliged to publish any details of their transactions, and few of the eight million or so people who "invest" £65 million a year between them have any idea how their money is divided up. In fact, it seems, about 50 per cent of what the public pays out comes back in winnings. Most promoters restrict themselves to a maximum of 5 per cent clear profit and devote about 15 per cent of the takings to meet expenses; the Government takes an automatic tax cut of 30 per cent, over and above such other gleanings as postage and purchase tax on coupons.

Last week's bill would have compelled promoters to publish both the results of individual competitions and their annual accounts—and to return a predetermined proportion of the stakes in prizes to the competitors. Perhaps the publication of weekly accounts of the results of individual competitions would increase expenses exorbitantly; but the other requirements seem to have been unobjectionable devices to throw more light into an unnecessarily dark cupboard, even though the punter would have been left in his present happy unconsciousness of the heavy odds against his winning on any given occasion. It is a pity that potential Government spokesmen sat looking out on this debate in tactful and frightened silence.

A Beach for a Rock?

THE sleeping watchdog at the Straits of Gibraltar might well have been let lie. Now that it is awake, its barks are echoing far and wide. General Franco's claim that Spain never accepted Britain's possession of the Rock has met the scholarly retort that, on the contrary, it solemnly acknowledged British rights not only in 1713 and 1729 but also by the Treaty of Versailles in 1783. Moreover, in the latter treaty there was no question of the Spaniards bowing to superior force. They renounced their claims to Gibraltar in the course of a straightforward bargain, and Britain paid a high price; it handed Spain both Minorca and Florida. It would seem to follow that, if this exchange was invalid, Spain had no right to sell Florida to the United States in 1819. Is Florida, then, still British? If so, General Franco is going to incur a good deal of trouble and expense. He must either buy Florida back in order to present it to the British Crown, or—if, as is probable, the exchequer in Madrid could not finance the purchase of Miami Beach alone, at current prices—Spain must at least disgorge the proceeds of its sale of stolen property. The International Court might also accept a British claim to compensation for having been defrauded of a century of Florida sunshine; and that, as a hundred Florida mayors can assure General Franco, has a price beyond rubies.

Controlling Private Schools

THE recent conviction of the headmaster of a private school for offences against children has attracted a good deal of publicity to the fact that the Ministry of Education's jurisdiction does not extend over these schools, and that highly undesirable people may be teaching in some of them. As a result some Labour MPs pressed the Minister of Education last week to introduce Part III of the 1944 Education Act. Under this part of the Act the Ministry would be empowered, among other things, to take action against a school if it considered that the proprietor or a member of his staff was not a proper person to be in charge of children. After due notice, and subject to appeal, the offending person would have to leave or the school be closed.

But Part III—which aims to raise the standard of education in private schools as a whole—carries with it far more than an examination of the morals of schoolmasters. It is designed to provide the Minister with an elaborate machine for inspecting and registering private schools, and an even more elaborate system for dealing with objections and appeals. It covers not only the quality and qualifications of staff, but questions of accommodation, equipment and so on. To introduce Part III now, when the maintained primary schools are overflowing, classes are enormous, and standards of accommodation are often deplorable, would make it impossible to impose very high standards from the outset of the new order.

It would be a mistake to send this bulldozer off to a premature start in order to shift a tiny, though nasty, heap of muck. But it might strengthen the hand of the Minister now, without damaging the effectiveness of Part III in the

future, if it could be announced that the machinery will be set in motion in, say, 1957. If some such early date was set, the minority of very bad private schools might hasten to put their affairs in order before sanctions could apply.

Malanomania

ANOTHER acrimonious session of the South African parliament began last Friday. The government's programme, announced in the speech from the throne, ensures that the political temperature will be kept at boiling point, since it contains several new *apartheid* measures. Among other things Dr Malan's government proposes to force through a Bill giving effect to the compulsory transfer of Africans from their present humble residences in and around Johannesburg, to new locations on the far outskirts. Another Bill, not as yet disclosed in detail, proposes to separate the races in trade unions, and to amend the existing conciliation and arbitration laws.

Meanwhile the skeleton from the last parliament, the Coloured Voters Bill, is still not buried. The Select Committee appointed by parliament to examine the question will shortly be tendering its report; but, inevitably, a renewed fight is bound to take place, since the parties are past compromise. Dr Malan's chances of putting through the measure by constitutional processes seem brighter, for during the recess the United Party shed itself of seven of its members, who, for one reason or another, refused to accept the party whip. However, even on the doubtful assumption that all seven go into the government lobby, Dr Malan is still a few short of the numbers required to give him the necessary two-thirds majority of both Houses. Thus he must still go on with the slow, but fruitful, policy of disrupting the ranks of the opposition, even though this means deliberately prolonging the parliamentary crisis.

On his return from the Sydney Conference Mr Havenga, the Minister of Finance, had to face a crisis blown up overnight by a rumour—baseless, as it turned out—that the South African pound was to be devalued. It is estimated that something like £10 million was temporarily lost to the country as a result. This incident should prove to the Nationalists how sensitive foreign opinion is to events in South Africa.

Letters to the Editor

One and a Half Worlds

SIR—Surely some qualification is needed of the statement in your current issue that "it is a lesson of simple arithmetic" that the sterling area cannot make a "speedy advance" to non-discrimination and convertibility. Admittedly, it would require some readjustment of our internal credit policy; as you say in another context "there is room for argument whether recent policy has been firm enough." But the resulting figures are surely not to be regarded as immutable. The arithmetic of any balance of payments is simply the product of monetary and credit policy and again and again it has been shown what large and rapid changes in the figures can result from a comparatively small adjustment of policy. It is not easy to estimate the extent of the adjustment required to allow us a "speedy advance to convertibility" but to some observers, at any rate, it would seem that no great effort would be required. Surely we can do what Belgium, Germany and the Netherlands have achieved. If we can't, the reason must be found in our domestic political situation and, in that case, we ought to place the responsibility where it belongs and not complain that American politicians are unwilling to reverse their traditional Protectionism in order to make it possible for us to attain convertibility without any effort.

What is the alternative to making such an effort? It looks as if it would be the acceptance of more inflation (on the 7s. standard as a start), a weakening of the exchange, the adoption of wider points, if not of a "floating rate," and eventually another devaluation of the pound, which Mr Gaitskill openly proposes as his remedy in the event of an American recession. With this would come a steady rise in cost of living and more industrial unrest until we get into the grip of the vicious spiral which will slowly but surely strangle our economy.

Do people really want a constantly depreciating currency, with its threat to their standard of life? If not, would they not be prepared to accept the effort needed to attain stability? I wish that you would give your opinion as to the extent of the effort required to change "the arithmetic" instead of regarding it as conclusive.—Yours faithfully,

FREDERICK LEITH-ROSS

London, E.C.4

Grains and Nonsense

SIR—I have read your articles and comments on agriculture over a lengthy period and whilst I have found them consistently hostile they have at least been consistent in demanding over and over

again that the price of support by the taxpayer shall be the utmost efficiency on the part of the British farmer and the fullest use of his land. In your last issue, however, you change your ground and for the first time within my memory, you advocate the limitation of production by price differential. This is such a vital matter that I feel compelled to join issue with you on it.

The limitation of production would, in fact, remove from the average farmer his chief means of lowering production costs since, in farming, at any rate, the scope for intensifying production is usually much greater than the scope for reducing prime costs. By restricting production, you would, therefore, not only be helping to prevent farmers from becoming more efficient and making full use of their land but would also be denying them the opportunity to preserve farm incomes by increasing production in an attempt to offset lower prices.

This is not to say that I am in favour of British farmers being perpetually insured against long-term downward price trends. Given time to make the adjustments, I am sure that British farmers can compete on equal terms with the rest of the world. It is against fortuitous, short-term downward price trends that our farmers need to be insulated, and having regard to the importance of a stable and productive agriculture in our present-day economy, I do not think that that is an unreasonable requirement. Great wisdom was, in fact, shown, when the Agriculture Act was made to provide for the fixing of prices several years ahead. If the long-term price-mechanism is allowed to work freely as will have to be the case, then a long period of falling prices will, in itself, restrict production by eventually driving the inefficient farmers out of business. It is one thing, however, to let a process develop naturally but quite another to bring it about artificially.

It is true to say, I think, that the majority of informed people believe that the present fall in agricultural prices is unlikely to be permanent. It is, therefore, somewhat surprising that you should feel that the farmers' triple guarantee of price, quantity and long-term market (if the latter is anything of the sort) should make such nonsense. In any case, I cannot recall that when, for a long period, British farmers were being forced to sell their products well below world prices, you voiced a single protest.—Yours faithfully,

DOUGLAS SELIGMAN

Crawley, Hampshire

[Mr Seligman has mistaken our point. We did not advocate (and do not want) any artificial restrictions on production; but if

the price guarantees to farmers continue to be as absolute and costly as at present, then the Government may eventually be forced into restrictionist policies as the only way to keep the subsidy bill within limits.—EDITOR.]

The Troubles of Buganda

SIR—Admiration of the British way of colonial life should not blind one to the results of the "legalistic" or "parliamentarian" approach to colonial administration.

Uganda, Kenya, Northern Rhodesia and Nyasaland have all in recent years experienced trouble or unrest and the Sudan Government a vote of non-confidence. In all these the main questions at issue were colonial parliaments, the nomination or election of legislative or executive councils, federal assemblies or inter-colonial boards. Agricultural, economic or industrial progress were merely secondary issues.

In the Congo just across the frontier, a few hundred miles from the East African dependencies, those same years were years of perfect calm which brought new roads, new housing projects and a higher standard of living to the Africans—with no news about parliaments or councils, legislative or otherwise.

The only non-European countries where parliamentarism works, are, if I am not mistaken, Ceylon, India and the Philippines. Even in Europe and the Americas there are several countries where it does not work. The Bantu have not the slightest natural inclination to, or interest in, democracy. Colonial administration is a practical problem, unrelated, I am afraid, to the theory of politics.—Yours faithfully,

N. A. DE KUN

Belgian Congo

[Belgian policy in the Congo is discussed by a correspondent on page 40.—EDITOR.]

Eggs and the Taxpayer

SIR—I read your note in *The Economist* of January 9th with interest and curiosity. Where do you get your feeding stuffs which have "become so cheap"? You are clearly on to a good thing. The winter laying pellets which I bought for £39 5s. 11d. a ton a year ago, cost £40 14s. 4d. in October, 1953; £39 19s. 4d. in November. The tail corn that completes the hens' ration didn't cost any less to grow this year than last. The only things that have got cheaper are eggs for which the producer received about a shilling a dozen less this winter than a year ago. All this, you say, "has put still more profit into producers' pockets." Be a sport. Tell us how.—Yours faithfully,

FELICITY PALMER

Newbury, Berks

[The price of feedgrains has fallen sharply, and the price of compound poultry feed slightly, since feeding stuffs were de-controlled. The domestic poultry keeper may be paying more because he now buys the superior feed formerly reserved for commercial producers instead of the rationed balancer feed which is no longer produced.—EDITOR.]

Books & Publications

Rich Young Country

IRAQ 1900-1950. A Political, Social and Economic history.

By Stephen Longrigg.
Oxford University Press for the Royal Institute of International Affairs. 446 pages. 75s.

THERE are two ways of writing contemporary history. One—the Chatham House way—is to sit upon a cloud and dispassionately survey the puny world of men. The other is to infuse the story with a warm flow of personal observation. The one lament that must be uttered for this majestic book is how sad that one of the few living writers who could have chosen the second method has preferred the first. Off and on, Brigadier Longrigg has worked in Iraq for thirty-five of the fifty years that he describes; he must have seen tempers rise, laughter bubble and tears flow. Yet apart from a *risqué* adjective or so—"restless" for this statesman, "forceful and domineering" for that—he writes as if he prefers libraries to men. The three occasions on which he pauses in his careful cata-

logue to sit back and, in his near-Gibbonese, to describe the general scene in 1920, 1932 and 1950, give extra grounds for regret that he unbends so seldom. The Chatham House method is better suited to the general sweep of world affairs than to the story of one small country with, as yet, no chroniclers or biographers of its own. Once Gertrude Bell is dead the colours fade and—for the middle years between the wars—will remain dim unless someone now in his sixties has kept a diary.

Otherwise, there can be nothing but admiration for a book that will, for all time, serve as an indispensable mine of information for Iraqi and foreign historians. It is at its best on the subjects that lend themselves to chronological treatment. It gives, for instance, a full and understanding picture of the vicissitudes of poverty and—in its last pages—of the sudden transition to wealth, and the adequate arrangements for using it. It gives a candid one of the difficulties of evolving a good administration or—for that matter—a true democracy out

of a largely uneducated nation; the role that the pasha played and still plays in relation to an impatient bourgeoisie is well described.

So is the slow growth of central government authority over jealous rivals such as the Shi'i divines, mostly Iranian, who had for centuries been accustomed to direct the opinion of their flock upon every topic, and over Kurdish chieftains who were always able to take refuge with cousins on the far side of some frontier. An interesting tale that can be picked out from the record is that of the slow rise of the Shi'i community to posts that were once the prerogative of Sunni first families. Iraq comes creditably out of the story: it has survived some horrid moments; it is digesting some awkward minorities; and, even before the boon of wealth from oil came its way, it could give points to certain neighbours in the fields of management of its national finances, of provincial administration, and of knowing when to listen to advice.

Where the method of meticulous chronology falls off is in helping people who do not know Iraq to single out the main points of interest in its story. It is left to a reviewer to underline them, both small and great—to exclaim, for instance, at the virtues of the Portsmouth Treaty, which was so lightly discarded in 1948 but was so full of the arrangements Egyptians are asking for now; or at how early the British theory of devolution was practised in Iraq. This happened fifteen years before the much more famous gesture in India and

THE FUTURE OF STERLING

By A. C. L. DAY

12s. 6d. net

The international position of sterling, both within the Sterling Area and outside, is a matter of the greatest importance for the future of the British economy. This book considers the origins of the present position of sterling as an international currency and on this basis suggests possible lines for future development.

Pakistan. Is a new country the worse for this early weaning? Not if Iraq is anything to go by; but the book does not venture to guess whether salvation is mainly due to lessons retained from the unloved British era, or to strokes of fortune, or to that tough streak of commonsense in Iraqis that often stops them from being the bondslaves of their very genuine nationalist emotions.

The Old South

THE COTTON KINGDOM.

By Frederick Law Olmsted. Edited by Arthur M. Schlesinger. Routledge and Kegan Paul. 705 pages. 42s.

EVERYONE who has found Central Park a welcome clearing in the asphalt jungle of New York is, whether he knows it or not, a debtor to Frederick Law Olmsted. But the Olmsted that Messrs Routledge and Kegan Paul have reintroduced us to in this handsome and, one might almost say, park-like format is a younger man than the great landscape-gardener. Before he was appointed architect in chief of Central Park in 1858 Olmsted had completed three extensive journeys through the South and the South-West and had embodied his findings in articles and books which, between them, constitute the most vivid picture available of life and labour in the slave states. He is the Arthur Young of the ante-bellum South and in this capacity has put the historian as much in his debt as the New Yorker. As Allan Nevins puts it,

few books of economic and social observation ever written in any land possess the enduring interest of Olmsted's "A Journey in the Seaboard Slave States," "A Journey Through Texas" and "A Journey in the Back Country."

These volumes, based on material collected (and originally published in the *New York Times*) between 1852 and 1854, had all appeared in both Britain and America before the election of Lincoln and the outbreak of the Civil War. They were the work of a dispassionate observer who, though a Northerner with a frank aversion to slavery, made it his business to report the Southern scene as he saw it, honestly and with no axe to grind. But the war left him with no doubt that his cause was the North's and "The Cotton Kingdom" is in fact Olmsted's reply to Fort Sumter. It was designed primarily for the English market as a rebuttal of Southern claims that "cotton was king" and that slavery was the wave of the future, and it provided much of the ammunition that was fired, with even louder explosions, by J. E. Cairnes in "The Slave Power," a year later.

Nevertheless "The Cotton Kingdom" is not special pleading. It is, in fact, a skilful compression and consolidation of the three original travel books, with only a very small admixture of new and propagandist material. Read now, it impresses one by the restraint and objectivity with which it describes the fantastically anachronistic society of the Old South,

part late Roman Empire, part Wild West. Sociologists may praise the book as one of the pioneer classics of their science; readers to whom such a claim is but a dubious recommendation may prefer to regard it as a superb job of journalistic reporting, infused with an agricultural economist's understanding of soil and labour problems and a civilised sensitivity to all the nuances of breeding and degradation that characterised this remarkable society.

With an ear as keen as George Borrow's for the dialogue of wayside encounters, an eye trained by his profession to appraise landscape, man-made as well as natural, and a judgment based on experience gained in Europe as well as in the North, Olmsted had an equipment for his self-imposed task that no American investigator of his period possessed. Reissued in this spacious edition, with a helpful introduction from the pen of Professor Arthur Schlesinger (Senior), his findings will be welcomed by all students of the Old South and of many inquiring laymen besides.

The Role of Thrift

SAVINGS IN THE MODERN ECONOMY: A Symposium. Edited by Walter W. Heller, Francis M. Boddy, and Carl L. Nelson. Minnesota University Press (London: Geoffrey Cumberlege). 370 pages. 40s.

THIS volume is the result of a conference on Savings, Inflation and Economic Progress held at the University of Minnesota in May, 1952. The participants whose contributions are here reproduced included academic economists, statisticians, banking and insurance executives, and other business men, and experts from the International Monetary Fund and the International Bank for Reconstruction and Development. They also included two eminent parliamentarians with first-hand experience, current or recent, of a Chancellor's responsibilities—Mr Douglas Abbott and Mr Hugh Gaitskell. This wide range of expertise ensured that the papers produced should be professional but not esoteric, and, perhaps more important, that there should be an open confrontation of the two aspects of savings which it is of such huge practical importance to reconcile; the positive aspect, the classical thrift which is the limiting factor to all economic progress, and the negative aspect, the mere not-spending which menaces full employment. (Comparatively little was explicitly said about the ex-post, purely passive concept of saving as a magnitude settled, entirely without volition by the savers, by the interaction of investment and the supply of money. Indeed, this particular piece of economic determinism looks, in the light of the section on Savings Behaviour, too crude for serious consideration.)

The papers have been arranged under three main heads: Savings and Economic Policy; Savings Concepts, Data and Behaviour; The Savings

Problem in Under-developed Economies. A survey and summing-up of the symposium by Professor Harlan M. Smith prefaces the whole, and a comprehensive discussion of Savings and the Problem of Inflation in the United States, by Mr George Garvy, rounds it off. Necessarily there is a good deal of duplication, though, as often happens, the comparatively slight divergences between writers approaching the same topic from different angles are sometimes particularly instructive.

Necessarily too, in the proceedings of a short conference, there are topics left in the air and debates unresolved. A valuable hare is started in the Concepts and Data section—how far does the nature and purpose of saving determine the degree of its anti-inflationary effect; how far is it practicable to keep track of that nature and purpose?—and is not pursued by the contributors on Policy. Mr Hugh Gaitskell and Professor David McCord Wright ought to collide head on with an illuminating effusion of sparks, but do not; and one could mention plenty of other instances. Nevertheless this is a stimulating, solid and valuable collection, and the conference of which it is the record could usefully provide an example for British academics, administrators and business men.

Implacable Moloch

SOVIET EMPIRE. *The Turks of Central Asia and Stalinism.* By Sir Olaf Caroe. Macmillan. 300 pages. 25s.

THIS book presents with understanding and enthusiasm, and with excellent maps, the story of the Turanian peoples of Soviet Central Asia. It has to some extent been inspired by Professor Velidi Togan's "Turkistan To-day," first published in Turkish in 1929 and revised in 1940. The first part gives a historical and cultural background of this "crucible of empires" and the concluding chapters discuss the "heritage of chagatai" and the extent to which Turkic national traditions can call a halt to communism. These chapters are the best in the book and it is when writing of Babur—"warrior in single combat . . . man of letters . . . born a prince and in the end a founder of an empire"—or describing the interplay of Turks and Mongols as resembling "the raindrops on a moving windowpane . . . streaming together across the glass only when a storm of rain blows up and carries all before it," that Sir Olaf opens doors through which one must enter and look more closely at the peoples he portrays.

The central section of the book discusses the Czarist period, the dynamic but brief transition years (with a new assessment of Enver Pasha), and the period of Soviet domination. It is unpromisingly pro-Turkic and its very virtues at times threaten its value as an objective study. A defect is the equation of Czarist and of Soviet policy towards

Starch does surprising things

IN SUCH SURPRISING PLACES

Example:

GLUCOSE IN JAM PRESERVING

It is not always easy for jam manufacturers to make jams that contain enough soluble solids to be satisfactory in quality, yet are not too sweet for their customers' taste and will not crystallize during storage. Liquid glucose, which is made from starch, helps jam manufacturers to solve these problems. It provides abundant food energy but is not as sweet as cane or beet sugar (sucrose). When liquid glucose is used in jam making to replace some of the sucrose it reduces excessive sweetness without reducing food value; it brings out the natural flavour of the fruit; it helps the jam to set; and it prevents crystallization. Corn Products Company

Limited, the Industrial Division of Brown & Polson, manufacture considerable quantities of liquid glucose for this purpose. Brown & Polson Industrial Division produce 200,000 tons of starch products a year: more than 400 different products, which are helping more than 80 different industries to reduce production costs, to make better products, or even to make products that could not otherwise be made at all. We have spent more than 100 years in the building of this large and varied business. We have learnt a lot about the industrial uses of starch products, and our advice is freely at your disposal.

CAN STARCH HELP YOU?

When you read in these advertisements how starch products are helping other industries you may see new possibilities of turning them to account in your own business. We shall be glad to discuss them with you.

CORN PRODUCTS COMPANY LIMITED

THE INDUSTRIAL DIVISION OF

Brown & Polson

WELLINGTON HOUSE, 125/130 STRAND, LONDON, W.C.2

these particular peoples. In the nineteenth century juxtaposition of Kazakh and Russian, the tragedies and perplexities of nomads anywhere in contact with a colonising frontier of settlement should be assessed. Whatever they did elsewhere and however cruel their battles, the Czars in Central Asia left Koran schools, Muslim ecclesiastical endowments and customary law intact.

Dealing with the Soviet period Sir Olaf states unequivocally what is happening in the five republics and shows the scale and the ruthlessness of Communist ambition and the resulting trammelling of national aspirations. Yet here, too, some observations could be made. The view that the Cyrillic alphabet was put in because Kemal's Turkey went over to the Latin script could be compared with a philologist's suggestion that Soviet nationalities living in close contact with the Russians changed over because "it is easier to write one's mother tongue with traditional Russian letters than with a... medley of characters elaborated... by some 'compromising' alphabetic commission." On the nomads it should be added that seasonal pasturage has been reintroduced in some places. This belated measure will not indeed bring back to life the million Kazakhs who perished in the forced collectivisation, which Sir Olaf describes with great insight. His book is valuable for putting into the limelight the process of assimilation by an implacable Moloch of fifteen million people who both deserve and claim a better fate.

Europe's Geography

A GEOGRAPHY OF EUROPE.

Edited by George W. Hoffman.

Methuen. 775 pages. 52s. 6d.

A SOCIAL GEOGRAPHY OF EUROPE.

By J. M. Houston.

Duckworth. 271 pages. 21s.

TO write an advanced geographical textbook on the whole of Europe that will be at once comprehensive and within reach of the pockets of undergraduates and teachers is probably an impossible task. Most writers reduce the ground to be covered by concentrating, consciously or otherwise, on certain aspects of European geography. In the past it was generally physical geography, and the relation of human geography to its physical setting, that was in favour. More recently greater emphasis has been placed on the way that man himself has, throughout history, formed the geographical framework within which he lives. Professor Hoffman inclines to this second approach, which is a natural reaction against the crude physical determinism of earlier writers. A further but related difficulty is to decide what proportion of the book shall be devoted to the systematic study of Europe as a whole, and what to the large number of quite small regions, of the order of the French Pays, which are so characteristic of the European scene. Professor Hoffman's solution is to devote two chapters

to the necessary historical and physical introductions, and then to divide Europe into seven major regions (Western Europe, Northern Europe, etc.), to each of which one chapter is devoted.

Within these chapters the treatment of material is mainly systematic: geology and physiography are followed by historical geography, population, agricultural geography and so on. Such a systematic treatment may well be the only way of dealing with the mass of material available, but the lack of purely regional geography does rather smooth over the variety of texture that is so characteristic of the European landscape. It is possible also that the pendulum has swung too far from physical geography: there is continual and necessary insistence on the importance of the historical development underlying Europe's human geography, but the equally revealing story of the growth of Europe's physical frame has been comparatively ignored.

Professor Hoffman, as well as contributing the chapter on Central Europe, had the task of co-ordinating the efforts of no fewer than nine other American and European geographers, of whom Professor East of Great Britain contributed the long chapter on "The Historical Background." This work of co-ordination is managed extremely well: all the regional contributions are built to a standard pattern, and each, we are told, was read by all the other contributors. The resultant unity is enhanced by the excellent maps, the majority from the same hand, which make this generally well-produced volume a real pleasure to use.

★

SOCIAL geography, according to Dr Houston, is the study of "the distribution and limits of population, migration and change; the study of rural settlements and field systems; and urban geography." These are topics on which British geographers have produced comparatively little work; the lack of studies of types of rural settlement and field systems is particularly noticeable. The output of their continental colleagues has been more voluminous, but is largely inaccessible to those who have not both linguistic ability and the use of a major geographical library. The idea of summarising this mass of work upon European geography, of relating to it the more scattered work on our own country, and of including with it the results of the author's own researches was therefore a most valuable one. The material is presented in a clear and logical form, with interesting and well-drawn maps and some most striking air photographs of various types of towns, villages and field systems. If it does nothing else, this book will serve to remind British geographers of the tasks that still lie before them in writing the human geography of their own country.

This is not the usual textbook version of what is already familiar to everybody, but a serious book for which there was a very real demand. It is therefore un-

fortunate that when Dr Houston's work is examined more closely, certain deficiencies are noticeable. In the chapters on the various aspects of the rural landscape, the important German studies of the last twenty years are almost entirely neglected, while much of the information on the forms of Germanic rural settlement is misleading as it now stands. In addition, the book is marred, especially in its list of references, by a disproportionate number of errors in the spelling of names and foreign words, and by incorrect page references. Finally there is a more debatable point: the author restricts social geography to the study of the various visible features of the cultural landscape quoted at the beginning of this review, together with population. Such a study is interesting and valuable, but is it really impossible to advance no closer to a truly social geography than this?

Shorter Notices

INTERNATIONAL ECONOMIC PAPERS.

Edited by Alan T. Peacock, Ralph Turvey, and Elizabeth Henderson. Macmillan. 255 pages. 15s.

With the aid of Unesco funds, the International Economic Association is doing a useful job in translating and republishing the important economic papers of which this volume forms the third selection. The Swedish School is represented by a penetrating critique of Professor Myrdal's "Monetary Equilibrium" by Hr. Tord Palander (1941) and by Wickse's key essay, "The Enigma of Business Cycles" (1907). There is an interesting correspondence between Croce and Pareto "on the Economic Principle," from the *Giornale degli Economisti* of 1900 and 1901. More recent reprints are "Customs Unions and National Interests" (Maurice Byé, *Economie Appliquées* 1950); "Underemployment in Underdeveloped Economies" (Alfredo and Ifigenia de Navarrete, *El Tremestrio Económico*, 1951); and "A Comparison of Marxian and Keynesian Dynamics" (Hans Peter, *Jahrbücher für Nationalökonomie und Statistik*, 1950)—this last being the only mathematical contribution.

The principle of selection is not clear, and a paragraph or two of editorial comment, particularly on those older papers whose background both of theory and of current events is outside the personal recollection of most readers today, would make the collection more valuable, but the standard is high throughout.

★

LAW AND THE COUNTRYMAN.

By W. J. Weston.

Rupert Hart-Davies. 146 pages. 7s. 6d.

This is a collection of articles almost all of which have previously appeared in *Country Life*. It does not set out to be a complete textbook for the farmer (today, a farmer would need the whole of the "Laws of England" if he wanted any such thing); it succeeds in being pleasantly informative. It is, perhaps, best suited to the gentleman farmer (if he still exists), someone who likes to have some knowledge of his rights and duties in his head but who is wise enough to know that he may have to fall back upon professional advice if he runs into real difficulty.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Economic Balance Sheet

Washington, D.C.

THE annual Economic Report to Congress is a product of the Employment Act of 1946 which at the same time created the Council of Economic Advisers, one of whose duties is to "assist and advise" the President in preparing the report. Until last week, therefore, Mr Truman was the only President who had ever been required to report at the beginning of each session on the nation's economic health. For a time, indeed, in the spring of 1953, it seemed that he might be the last, as well as the first. Congress nearly destroyed the Council, and did succeed in disbanding its staff, by cutting off appropriations, and it was months before President Eisenhower was able to put the machine together again and appoint the three new members.

The change in the Administration and in the composition of the Council gave added interest to the report which went to Congress on January 28th. When Mr Leon Keyserling was chairman there were regular complaints that what had been intended as a severely objective document had become too political, and there was some curiosity about whether Dr Arthur Burns, who is much less of a political animal, would be able to avoid this particular pitfall. He tried valiantly but, as many people had suspected, a report to be made by the President to Congress cannot be drafted as if party politics did not exist and elections were never held.

Passages of self-congratulation, both for past achievements and triumphs still to come, were bound to appear—for example:

The success with which flexible monetary and debt management policies were used in 1953, first to prevent inflation and later to avert credit stringency, should inspire confidence among all citizens in the capacity and readiness of government to respond promptly to changes in economic circumstances.

And this is not the first Administration to take credit to itself at one and the same time for stopping inflation and for those by-products of inflation, such as the reduction of unemployment to the lowest level ever reached in peacetime, which have popular appeal.

Those who have been watching the "readjustment" or "descent from an overtime economy," which has lately been making economists wonder whether the United States was headed for an "orthodox recession" or, perhaps, something a little more unpleasant, had hoped that the Economic Report would shed some light on the views of the three men whose responsibility it is to keep a sharp eye on what is happening. But it shed very little because, apparently, the President's advisers on public relations

have passed down the word that those who talk about the possibility of recession are to be called "pedlars of gloom and doom." The first congressional comment came from Mr Halleck who, as Republican leader in the House of Representatives, presumably knows what is expected of him; he called the report a

devastating answer to the shameful whispering campaign of reckless partisans who are trying to stampede the country into a depression for their own political advantage.

Mr Halleck, unlike Senator Douglas, who takes a more pessimistic view of the immediate future, is not hampered by a knowledge of economics; he overlooked—as did all the writers of headlines in the American press—the significant fact that almost every expression of confidence by the Economic Advisers was followed by a warning. The warning generally took the form of a statement that a "minor readjustment" could develop into something serious unless the government was prepared to use the power at its disposal—power which, it is widely feared, many in Congress would be loth to allow it to use. Nevertheless, the expressions of confidence are based on something more than a desire to discourage the United States from talking itself into a depression.

★

There are three factors which seem to justify the Council's belief that the present "contraction" need not continue until the autumn. One is that the number of new houses started in 1954 is expected to be close to the number started last year and that there is nothing to suggest at the moment that the saturation point in housing has been reached. Indeed, the Council believes that "vacancies in our cities, with few exceptions, are below the level regarded as necessary for a healthy, competitive market," that the continued movement to the suburbs will ensure a high rate of residential construction for some time to come and that, thanks to the system of insuring and guaranteeing mortgages, "the housing industry has become less vulnerable to recessionary influences and is less likely to contribute to economic instability."

The report also points out that there is no speculative position on the Stock Exchange, as there was in 1929, to multiply the effects of a business contraction. There has been, however,—and this may prove equally unstabilising—an enormous increase in the amount of instalment credit outstanding. It was just over \$3 billion at the time of the crash in 1929, fell to as little as \$1.5 billion by the end of 1932, and has been rising rapidly ever since 1945, except

The American Economy

during the first year of the Korean war. It increased, indeed, in the twelve months between June, 1952, and June, 1953, by the record amount of \$4.6 billion—from \$16 to \$20.6 billion—and, despite the drop in employment since then, it has grown another \$1.2 billion. But there would not have to be any great further rise in unemployment before the potential danger of such a large draft on the future became a very present one. There was also, by the end of 1953, more than \$100 billion of mortgage debt outstanding, which would undoubtedly have, in the eyes of the debtor, a prior claim.

However, perhaps the single most hopeful factor the Council was able to report, and one that had not been previously revealed, was that, while inventories declined during November and December, the level of retail sales did not. Since what has happened so far has been an inventory recession, there is reason to hope that the Economic Advisers are right in their belief that "the inventory adjustments have been largely responses to current sales rather than protective movements geared to unfavourable forecasts of future sales." If this belief is true, then they are right in saying that the "moderate contraction now under way" should stop soon. But, with the caution they show throughout the report, they add the warning that "an inventory readjustment can affect other types of spending" and, indeed, the whole stream of business and consumer spending.

There is, therefore, nothing in the report to answer the question being asked by so many people—is there going to be a recession serious enough to have a disturbing effect on the rest of the world, if not on the United States as well? It would not be surprising to learn that Messrs Burns, Jacoby and Stewart are somewhat less optimistic as individuals than is the Council of Economic Advisers as a corporate body. And they can hardly be altogether confident that, should the moment come when they feel that the government must act, their advice will be taken in time. The chairmen of congressional committees, although nominally of the President's party, are likely to be obstructive, but there might also be opposition from nearer home. It is, after all, less than four months since the Deputy to the Secretary of the Treasury congratulated the country on moving back to American principles from the "alien philosophy partly borrowed from Karl Marx and partly from Maynard Keynes" which had, during the last twenty years, "crept into public thinking and into the councils of government." Yet should it become necessary to counter recession, it will be difficult for the Economic Advisers to find any expedients which are not tainted with one or other of these philosophies.

"Buy American" Shocks

New York.

THE Department of the Interior has just awarded a new contract for an electrical transformer for the Bonneville dam in Oregon to an American firm, the Maloney Electrical Company, even though its offer, a minimum of \$404,000 with an escalator clause that might push the price up to \$480,000, was at its lowest nearly \$140,000 above the amount bid by an Austrian firm, the American Elin Company, and nearly \$70,000 above an Italian tender. This

award came shortly after a similar case, in which another Bonneville contract went to the Westinghouse Electric Corporation, although both the American Elin and English Electric Companies had submitted bids that were substantially lower. On both these occasions, the Department of the Interior argued that the foreign firms had insufficient experience of building the particular type of transformer required, although the Austrian and British companies had previously been awarded contracts, not yet completed, for similar types of equipment for the Bonneville dam.

Foreign firms may therefore be excused for fearing that the tendency of the present Administration is to avoid arguments with the American electrical industry by interpreting specifications and engineering requirements in ways that keep competitors from abroad out of the American market. If this is so, then it will make little difference to foreign firms even if Congress does improve the Buy American Act, which requires that domestic concerns be given preference in the award of government contracts, as the Randall Commission recommended.

The Buy American Act is a vague Act, which has generally been interpreted by administrative regulation to mean that foreign bids may be accepted if they are 25 per cent lower than the lowest American bid. Although the government agencies since the Republicans came to power have at times seemed to be keeping to this criterion, at other times the factors on which they have based their awards have been difficult to appraise. This erratic behaviour has given nearly as much cause for complaint to the domestic industry as to overseas competitors. The recent Bonneville contracts are examples of awards that have gone to American firms when foreign bids have been lower by more than 25 per cent, but on other occasions a foreign firm has won a contract even when it underbid by less than 25 per cent. For instance, the English Electric Company was recently successful with a bid, for two generators for the McNary Dam, which was only 15 per cent below that of the General Electric Company.

This American firm has protested to the government against the award, adding to the domestic electrical industry's rising clamour for more effective and certain protection than has been provided by the Buy American Act. American manufacturers of heavy generating equipment have been faced with mounting competition, particularly for federal government contracts, ever since the European electrical industry began to re-enter the American market after the war.

★

The American electrical industry rests its case for preferential treatment on three broad bases. It contends, first, that foreign firms have insufficient experience of manufacturing for and installing equipment in the United States—although how such experience could ever be gained if imports were barred is not explained; that, while foreign firms may meet American engineering standards as set out in the specifications, normally they do not, as do American firms, provide for overloads well in excess of rated capacity; that, owing to the high cost of labour in the United States, American equipment is built with a view to minimising maintenance costs, while in Europe such considerations are less important; and that American suppliers can guarantee an immediate and continuous repair service, but that over-

seas suppliers are less dependable and may, in wartime, be unable to ship urgently needed replacement parts. Secondly, as the General Electric Company calculated in the McNary Dam case, the American bidder may argue, on the basis of a number of rigid assumptions, that the federal government loses more in tax receipts, from the domestic manufacturer and from his suppliers, his employees and his shareholders, than it gains by accepting a lower tender and collecting import duty from the overseas supplier. The electrical companies' third contention is that, since a prosperous domestic electrical equipment industry is essential for the security of the United States in time of war, that industry must be protected against foreign competition.

The greatest benefit to the federal government, and to national security, would obviously be obtained if American firms could win all the contracts by underbidding their foreign competitors. This raises the issue which is fundamental to the whole controversy—the question of comparative labour costs in the United States and Europe. Heavy power generating equipment is essentially "custom built," to exact specifications and tailored to meet the needs of the particular project. With few exceptions, therefore, the major components cannot be mass-produced. The cost of labour is thus a large part of the total cost: wages in the European electrical industry are so much lower than in the American that no conceivable advantage in productivity that the United States may have in this type of equipment is sufficient to offset the labour cost advantages enjoyed by its European competitors. Experts have recently estimated that wage costs in the electrical equipment industry in Britain were in 1952 only 28 per cent of the equivalent American labour cost and that, more significantly, the differential between the two had widened considerably since 1938. Although comparisons of this nature can never be exact, there is certainly a large wage differential, at existing exchange rates. But does this mean that a single American industry must be protected at the expense not only of the American taxpayer, but of the prosperity and industrial strength of America's allies?

American Notes

Constitutional Divisions

THROUGH the fog of party rivalry and parliamentary manoeuvre that at the time of writing surrounds the Senate debate on Mr Bricker's constitutional amendment, it is clear only that the amendment itself has now no chance of being approved by the necessary majority of two-thirds and that the President's opposition to any interference with the constitutional division of powers is as strong as ever. For the White House has turned down a bipartisan compromise, the best that could be worked out by Senator Knowland, the Republican leader, and Senator George, the Democrats' constitutional authority, and one that Mr Bricker too was prepared to accept. Its exact terms are not available, but it is understood to have included an earlier proposal of Mr George's, that congressional approval

should be required for executive agreements—the President can now conclude these with other countries without congressional approval, at least until the necessary funds have to be voted. This made the compromise unacceptable to Mr Eisenhower, even though it abandoned the notorious "which" clause, the centre of the objections to the Bricker amendment. This clause would, it is argued, enable a single State Legislature to block United States participation in an international treaty.

The effect of the controversy on the Bricker amendment, and of the Administration's efforts to rally public opinion against it, has been that this constitutional argument has become a lively, even if not a very well understood, political issue. This partly explains why the President is prepared to forgo the outright victory which he could certainly have over the rebellious members of his own party, and to consider a constitutional compromise in the Senate, provided it is innocuous, which would allay popular fears that the presidential treaty-making powers might be abused. Another even stronger reason for a compromise, at least for one acceptable to Mr Bricker, is that it would prevent the division between the two wings of the Republican party, Mr Bricker's isolationists and Mr Eisenhower's internationalists, from becoming publicly defined in a bitter fight and an open vote in the Senate. Finally, a compromise, would, or perhaps only might, mean the end of the argument, which will otherwise constantly come up, to divide the Republican party and perplex the voters, between now and the November elections.

But it seems unlikely that any compromise amendment can be found that is approved both by the President and two-thirds of the Senate, especially since a group of liberal Democrats is opposed to any tampering at all with the constitutional treaty-making provisions. It now appears probable that the whole question will be referred back to committee. There is always a danger that from there it may escape once more on to the floor of the Senate, but the President's supporters hope that this time they will be able to kill it off before it does.

Return of the Prodigal Son

THE President's counsel of sympathy and suspended judgment has been welcomed by many Americans who are unwilling to jump to conclusions about the former prisoners of war from Korea who are to be tried for collaborating with their captors. Mr Eisenhower even referred his listeners to the parable of the prodigal son, to excuse men who made a simple mistake under trying circumstances—that is, became sympathetic to Communist ideas—and then repented. There are other Americans, however, who feel that there is no excuse for those who "went progressive" and still more, particularly in the services, who feel that standards must be maintained, whatever extenuation the individual may plead.

Both the President and the Defence Secretary seemed surprised and displeased by the timing of the Army's announcement that it had arrested one of these returned prodigal sons, Corporal Dickenson, and that a court of inquiry would determine whether he should be court-martialled on charges of currying favour with the Communists, at the expense of his fellow prisoners, to secure

better treatment for himself. Corporal Dickenson was one of the original 23 Americans who refused repatriation; with one other, he later changed his mind. At the time of his arrest the Department of Defence evidently had not abandoned hope, as it did a little later when it issued dishonorable discharges for the remaining 21, that they might be won back. The Army's view is that in simple justice to other prisoners who suffered the full rigours of the camps, Corporal Dickenson could not be left to enjoy, undisturbed, the prodigal's welcome which Crackers' Neck, Virginia, had accorded him.

On the case of Colonel Schwable, which is rather different, the President said what is in many minds: that no one sitting in the comparative security and comfort of Washington could be sure how he would have acted under mental and physical torture. Colonel Schwable, of the Marines, was the highest ranking of the 36 American airmen who signed false confessions of having taken part in germ warfare. All renounced them when they were released. Forty others nobly refused to sign anything. The President's assurance that the Secretary of Defence will watch both trials carefully is, however, a guarantee that justice will be tempered with mercy and that if the Marine Corps' motto of *Semper Fidelis* must be upheld, it will not be done too ruthlessly.

Coffee Boils Over

WITH the price of green coffee boiling up from 57 cents to over 70 cents a pound in two months, and with the retail price of vacuum-packed ground coffee at over \$1 (7s.) a pound, and in danger of going to \$1.20 in a few weeks, there is fervid rivalry in Congress and government for the honour of finding the source of the heat. If the Republicans cannot shift the blame, high coffee prices will scald their chances of winning housewives' votes next November. But if they succeed in shifting it, as many of them are trying to do, on to the Latin American suppliers of coffee, then the relations of the United States with its neighbours will cease to be good.

There is in fact little doubt that coffee will remain on the boil for months, if not years. For this winter's rise in price is, in part at least, the result of a short crop in Brazil this season and of a severe frost last July which will affect next season's crop. Brazilian officials have invited American clubwomen and trade unionists to come and see for themselves that higher prices are justified by the present shortage. This disaster came at a time when the once plentiful stocks in Brazil, which supplies about half the coffee used in the United States—and the United States uses two-thirds of the coffee consumed in the world—were nearing exhaustion. For since the war's end brought Europe back into the market, a steadily rising demand for coffee has been regularly exceeding production. New bushes planted now will take several years to produce a crop, far longer than any American buyers' strike is likely to be sustained, against present prices, at least. Even now such strikes, much publicised as they are, seem far from general, although one restaurant is paying five cents to every customer who orders a substitute beverage with his meal and coffeeless Wednesdays are being suggested.

But in spite, or probably because, of this underlying

situation, the Federal Trade Commission has found enough evidence of speculation to justify it in starting, at the President's request, a full-scale investigation of the rise in future prices and of a possible corner in coffee. The Senate Banking Committee is conducting an inquiry of its own into the whole market position, and Senator Gillette is improving the occasion by urging that the Coffee and Sugar Exchange be brought under federal control. The other exchanges, for domestically produced commodities, already controlled and Senator Gillette has been recommending this type of regulation for coffee ever since it last boiled over four years ago.

Ashamed to be Solvent

MEMBERS of Congress who find it as difficult to balance their own budgets as it is to balance the federal government's are equally reluctant in both cases to apply the obvious remedy, especially in an election year. For they believe, and a recent Gallup poll confirmed that belief, that the voters would look as suspiciously at a Congressman who had voted for an increase in his own salary while preaching economy as they would at one who had voted for an increase in taxation. Thus, even though congressional salaries are among the few that have not gone up since 1946, members of Congress were alone in testifying to the President's Commission on Judicial and Congressional Salaries against higher pay for Senators and Representatives. One of these witnesses, Mr Burdick of North Dakota, has since relented to the extent of suggesting a bonus of \$2,500 a year every time a legislator is re-elected.

The commission evidently, and probably rightly, took such expressions of satisfaction as being for public consumption only and it has given members of Congress an opportunity of saving both their faces and their solvency. Its report, on which some action must be taken before the middle of March, recommends such a big increase in congressional salaries that legislators can vote themselves a substantial rise and still argue that they are exercising great self-denial. The commission proposed a doubling of the present pay of \$12,500 which, with the expense allowance of \$2,500, would bring congressional salaries up to nearly £10,000 a year before taxes, with free office space, secretarial help and other perquisites as well. At present, however, the expenses of only one trip home and back a year are paid; the commission suggests that six round trips should be allowed free.

The commission's argument is that congressional pay has not only not kept pace with the rise in the cost of living and the responsibilities of the position, but has also fallen below the salaries that members could earn in other employment notably in industry and legal practice, and even in the civil service. As a result members of Congress are taking outside work when legislation today should be a full-time job, some experienced legislators are retiring from Congress and able men without private means are refusing to run for election. This argument can also be applied to the judiciary, and salary increases, of much the same order as those advocated for Congressmen, are recommended for federal judges. The Speaker of the House of Representatives and the Vice President, who presides over the Senate, should, according

to the commission, get \$40,000 instead of \$30,000 a year and more adequate expense allowances. The Vice-President, whose duties are becoming more onerous, should also have an official residence. If all the recommendations were carried out, the net cost would be only \$7.5 million a year, allowing for the amount that would come back to the Treasury in tax payments.

Additives or Octanes?

New York

THE higher quality petrol containing new chemical "additives," which has now been introduced in Britain, has been available to American motorists since last summer. In the American race for better engine performance, a flying start was secured by the Shell Oil Company with an aggressive advertising campaign for its new TCP petrol, a premium grade fuel containing the additive tri-cresyl-phosphate, first developed for the Air Force. The company enjoyed an immediate and striking increase in sales beyond even its own expectations, and it was five months before competitors began to fight back seriously. They relied, however, in general on the appeal of higher octane fuels, rather than on additives, although if they could find better additives than Shell has done, there is no doubt that they would use them.

The basic problem, from which started the race for the quality stakes, is that of dealing with the unwanted metallic deposits that collect in motor-car engines. The deposits on the sparking plug form a conductor which short-circuits

the spark; those in the cylinder head become "hot spots," giving rise to pre-ignition, an undesirable condition recognisable by a noise described appropriately as "wild ping"; this is not to be confused with the conventional "knocking" normally associated with the burning of too low octane petrol in a high-compression engine. In both cases, the effect of the deposits is to reduce significantly the power of the engine.

Other oil companies dispute the Shell claims regarding both the frequency of pre-ignition and plug-fouling, and the effectiveness of TCP in overcoming them. Since the arguments are based on tests carried out by different companies, under different conditions, and notably with different brands of petrol and motor oil, refined by different methods, the disagreement is hardly surprising. But it is indeed remarkable that, while one company could find that only 3 per cent of late model cars experienced pre-ignition troubles, another company could claim that 95 per cent did.

More fundamental than this technical and statistical dispute, however, is the adoption by the oil companies of two separate, although not necessarily mutually incompatible, routes to better engine performance. The Shell way—the additive way—has given quick results, but its main purpose is to neutralise the adverse effects of the deposits, without preventing their occurrence. The other way is to tackle the problem at its source, by trying to eliminate those properties of petrol and motor oils which cause the deposits in the combustion chamber. The motorist may well be gratified by the new power thus put at his disposal. But perhaps the economist may be forgiven for wondering, as he watches the crawling city traffic, whether the value of the prize is worth the cost of the resources expended in winning it.

On the trail of trade

THE National City Bank of New York was the first American national bank to open a foreign branch. Since that day it has always been a leader on the trail of trade.

Wherever trade has been active, The National City Bank has opened a branch. Today the bank commands a world-wide network of 57 overseas branches, staffed by men with a first-hand knowledge of local business practices and regulations. In addition, The National City Bank has correspondents in every commercially important city in the world.

The London branches offer the facilities of this world-wide organization and are, as well, uniquely equipped to advise on trade with the dollar countries.

THE NATIONAL CITY BANK OF NEW YORK

(ESTABLISHED 1812)

Incorporated with limited liability under the National Bank Act of the U.S.A.

Head Office: 55 WALL STREET, NEW YORK. London Offices—City: 117 OLD BROAD STREET, E.C.2. West End: 11 WATERLOO PLACE, W.1.

Businessmen's Trust-Busting

THE group appointed to recommend changes in the anti-trust laws is not likely to report in time for Congress to act at this session. But already the Republican philosophy of "promoting competition rather than attacking industry" is bearing fruit. Somewhat fewer new cases are being brought by the Department of Justice—under thirty in the past year, compared with an average of fifty a year under the Democrats. This is not necessarily proof of relaxed vigilance, as some small traders fear; the Republicans claim that they are bringing only legally sound cases against clear-cut violations of the law, instead of pursuing ideological vendettas which will not hold up in court, such as that against the du Pont Company for an alleged monopoly in cellophane. The suit brought against Pan American World Airlines and the Grace Company for restricting competition in transport to South America through their control of Panagra Airways has shown that some big businesses which enjoyed immunity under the Democrats are in for rude shocks.

Particular emphasis, however, is being placed on weeding out the hoary perennials, cases begun as long ago as 1941, and saving both business and the government time and money by trying to reach agreement out of court in both old and new cases. Whether substance is being sacrificed to speed depends upon the terms in individual cases. In one important settlement, that with the great chain-grocers, the Atlantic and Pacific Tea Company, the general view is that the company got off lightly. The A and P, as it is generally known, has promised to mend its ways and dissolve one offending subsidiary, but despite the Department of Justice's insistence that it is going to spend more time on enforcement than the Democrats did, there is some doubt whether compliance will be easy to obtain. The original aim of the Democrats was to break up the chain into seven competing units.

At the Federal Trade Commission, which also investigates anti-trust violations, the new Republican majority has propounded a "rule of reason" in place of the twenty-year-old Democratic practice of making certain trade practices automatic (or *per se*) violations of the law. But the wider look which the commission is insisting on taking at the economic consequences of certain practices and the greater

CONSUMER PRICES in the UNITED STATES
INDEX NUMBERS 1947-49=100

discretion it intends to exercise may not always benefit business. One small concern, whose exclusive contracts the commission decided had not greatly injured competition, has profited. But the case against Pillsbury Mills, Inc., which a trial examiner dismissed, is to be reheard; the commission believes that when Pillsbury bought up the assets of two competing flour concerns, the company, on the face of things, did exactly what Congress forbade when it tightened the anti-merger provisions in 1950.

SHORTER NOTES

The Senate has ratified the mutual security treaty with the Republic of Korea, which was negotiated last August after the truce had been signed in Korea. Administration spokesmen assured Senators that the United States was not committed by the treaty should the South Koreans resume hostilities on their own responsibility.

Last week, after *The Economist* had gone to press, the Senate Interior Committee reversed its earlier refusal to separate the twin questions of statehood for Hawaii and Alaska. The Hawaiian Bill will be debated shortly by the full Senate, while the Alaskan Bill is still in committee.

The launching of the atomic submarine, *Nautilus*, last month marks the first major attempt to propel a vessel by atomic energy. Built in two and a half years at a cost of \$55 million, this giant of the submarine fleet will undergo sea tests in about six months to substantiate the belief that, with a top speed of 30 knots, it can circle the globe without surfacing, a wartime advantage that may offset its size and cost.

Through a special Bill that has been passed by Congress and sent to the President, the acreage that may be planted to cotton in 1954 has been raised from the 18 million acres set by the Secretary of Agriculture, in accordance with the law on price supports, to 21 million acres. The new figure still represents a 16 per cent. reduction from the 25 million acres planted last year, but various steps are also taken in the Bill to soften the blow to the western states which suffer most severely from these cuts.

In the first major Bill to come before it at this session, the House speedily gave its approval, and an initial fund of \$26 million, for the establishment of an Air Force Academy, with the same status as the Navy's Annapolis and the Army's West Point. The number of students will be limited to 300 cadets annually until the Academy is permanently established, at a site yet to be chosen and at a cost of between \$100 million and \$500 million. Senate approval is, however, still needed.

The World Overseas

Tibet Behind Curtains

NEGOTIATIONS between India and China about Tibet began in Peking on the last day of 1953. It has been officially stated by Mr Nehru that the talks will not deal with territorial questions—that is to say, with the undemarcated sections of the Indo-Tibetan border, which are presumably to be left as they are—but only with matters of trade and communications. Since the Chinese in 1951 reconquered Tibet after its long period of *de facto* independence they have had to deal with factors of Indian influence there which do not conform to their idea of sovereignty over the country, and which were not automatically eliminated even when India withdrew its original protest against the suppression of Tibetan independence. During the period of independence the Indian government had had a representative with quasi-diplomatic functions in Lhasa; with the restoration of Chinese rule, Delhi was willing to reduce this to a consulate-general; but that still left it with a means of contact with the Tibetan authorities in the capital, and with three other consulates at Yatung, Gyantse and Gartok. All these had Indian military guards for their protection and communication with India by an Indian-owned telegraph service.

These consular agencies have hitherto served the needs of a number of Indian merchants trading with Tibet across the Himalayan passes. There has also been a constant coming and going of Indians over the frontier in pilgrimage to the sacred lake of Manasarowar, which is within Tibet. All such contacts are naturally contrary to Communist ideas of secluding a people who have been "liberated" from contamination by the non-Communist world; and in any case, if Chinese sovereignty over Tibet is once recognised and made effective, it is for the Chinese government to decide whether it will allow foreign consulates to exist in Tibet or permit foreigners to enter the country. In Sinkiang, where there was formerly an Indian consulate-general at Kashgar and Indian merchants did a brisk trade

from Kashmir, conditions have been made impossible for Indian residence or travel since the Communists took over control; the province has been declared a "closed area" and the Kashgar consulate-general has had to be wound up. In Tibet the Chinese Communists have not yet proceeded to such extreme measures in order to isolate the territory from India, but Indian merchants and pilgrims have been subjected to vexatious and harassing treatment and it has been made plain that the new authorities are unwilling to allow the old relations with India to continue.

For Mr Nehru the situation is politically an awkward one, for if Indians are to be excluded from Tibet as they have already been excluded from Sinkiang, it cannot fail to produce adverse criticism at home of his policy of cultivating friendship with the Chinese People's Republic. To many Indians it seems that the barring of Indians from places to which they have long had access is hardly an appreciative response to the friendly gestures of their Prime Minister, and unless he can preserve something of the former Indian rights, he may find himself under pressure to get tough with Peking, which would involve modification of his whole foreign policy. The present negotiations are,

therefore, of considerable importance, and it seems that for bargaining purposes Delhi is relying on the minimum of trade with India that is indispensable to Tibet and its Chinese garrisons in the present state of Chinese communications.

Unlike Sinkiang, which can obtain from the neighbouring areas of the Soviet Union any supplies which cannot be brought across the desert from China proper, Tibet must depend on India for various commodities, including extra food for the army of occupation, which it is still virtually impossible to convey in bulk over the mountain ranges dividing Tibet from the Chinese "motherland." The Communists are, indeed, working hard to remedy this state of affairs; motor roads are being constructed into Tibet from

Sikang province to the east, from Chinghai to the north-east and from Sinkiang to the north-west, but the distances are enormous, and the conditions for road-building extremely adverse, so that for some time to come the easiest approach to Lhasa and Shigatse will continue to be from Sikkim. Last year the Chinese had purchases of rice for their troops sent up from Calcutta rather than routed directly from China, and even so the shortage of food in Tibet has been so severe that Peking is reported to have withdrawn a third of the occupation forces.

A Victory for the Dalai Lama

Meanwhile there is evidence that the attempt to absorb the strongly differentiated Tibetan nationality into the body politic of China has been meeting with serious difficulties. There have indeed been some spectacular publicity successes; the sister of the Dalai Lama has attended the Vienna Peace Congress, and a delegation representing both the Dalai and Panchen Lamas has visited Peking and praised the "free and happy life" of the peoples of China "under the correct leadership of Chairman Mao and the Chinese Communist party." What is more to the point, the Communists have been bringing young Tibetans to Peking to undergo courses in Marxism-Leninism and training as cadres for future administration. But in the meantime there appears to have been a consolidation of Tibetan sentiment round the Dalai Lama as the symbol of the national cause. He has emerged from his traditional seclusion and goes about freely among the people of Lhasa; he has refused to fly the flag of the Chinese People's Republic from his sacred palace, the Potala; and when the Panchen Lama (whom the Chinese have tried to build up as a rival to the Dalai Lama) recently visited Lhasa, the collective ruling of the religious dignitaries compelled him to prostrate himself before the Dalai Lama and thus admit his subordination, in spite of a Chinese demand that they should bow to each other as equals.

Even more disconcerting for the Chinese, a nationalist political party was formed and held demonstrations in Lhasa; it has now been banned and its leaders arrested, but it may well continue to exist underground. There is no sign that the Tibetans are strong enough by themselves to drive out the Chinese, but the latter are still too few on the ground to be able to take extreme measures without serious risk; they cannot count on being able to control this vast and mountainous land if, by a direct attack on the Lama hierarchy, they were to provoke the Tibetans to a guerrilla revolt.

The East Seeks New Markets

THERE has been an unusual buzz of activity on the east-west trade front in recent weeks. A party of British business men, 33 strong, having finally obtained their visas, are now in Moscow for trade talks from which they expect to reap rich harvests. Simultaneously reports from the satellite capitals speak of eagerness on the part of Hungary, Poland and Czechoslovakia for new trade and financial talks with the British Government. The Hungarian overtures are of particular interest because trade between the two

countries has been virtually at a standstill since Mr Sanders was imprisoned in 1949. On his release last August the British Government expressed willingness to discuss a debt settlement that might lead to a new trade agreement; but until now Budapest has not responded.

Since Malenkov last August proclaimed the policy of "extending economic relations with foreign countries" as part of the general drive to improve the lot of consumers behind the iron curtain, the Communist bloc has tended to concentrate on working out deals with the industrially undeveloped areas—India, Indonesia, Greece and some of the Latin American countries. The import policy of the Communists in regard to those areas has been consistent but there has been no similar homogeneity in their exports. From these sources they have sought unprocessed foodstuffs and raw materials for their own consumer industries. They have offered in return an extraordinary hotch-potch of goods, all of them in negligible quantities—manganese, engineering machinery, grain and other agricultural products, coal, optical instruments, oil, and so on.

Now, one by one, the western industrial nations are being approached, first France, then Italy. The most recent is Belgium, with which the Soviet Union has just signed a trade agreement. The composition of Soviet imports is familiar; the emphasis is on ships, machinery and technical fibres. Fats and vegetable oils appear for the first time, but there is no mention of the manufactured consumer goods that the Russian peasant has been led to expect. Perhaps the Russians' intention is to acquire from Britain the necessary machinery with which to turn out their own goods—a policy that would accord with their long-term goal of self-sufficiency as soon as possible.

Communist Exports Lag Behind

The Soviet Union proposes to send to Belgium some of its traditional exports—wheat and timber—along with a few strategic materials that have only recently begun to reappear on Soviet export schedules—manganese and chrome ore. In recent months, however, more than one trading partner has found that the East has fallen down heavily on its deliveries. Greece is a case in point. Not long ago a Greek official declared that the new trade agreements with members of the Communist bloc have "proved disappointing." The Soviet Union has lagged behind in exports of such goods as timber and machinery and "in most cases the Russians have made no deliveries at all."

The satellites appear to be even more hard put to it than the Russians to find exports with which to pay for increased deliveries from the outside world. Apart from Polish bacon and coal and Czech sugar and textiles the satellites seem to have little to offer of interest to the West. Many of their prewar agricultural surpluses have disappeared. And their medley of light industries competes directly but unsuccessfully with the output of West European light industry.

As a consequence of these developments some West European nations are becoming increasingly disillusioned with eastern markets. Sweden, for instance, which has long taken the lead in developing east-west trade, has recently refused to supply the Czechs with iron ore because of unsatisfactory payments. Czechoslovakia, rather than make good on this trade, is striving to develop its own iron resources; it has also turned for supplies to Brazil, a debtor country whose record as a trading partner more or less matches its own.

Fully equipped plant in Canada

available NOW under exceptional circumstances

**No investment in Fixed Assets Required—
Full Equity Participation to Those Able to
Utilise Capacity**

HERE IS AN UNUSUAL OPPORTUNITY for a product manufacturer to establish operations in the Canadian field and begin production immediately in a well-organised concern with a back-log of orders.

This plant has 200,000 square feet of fully equipped floor space. It is strategically located in the heart of the country's largest industrial centre, adjacent to both railway and waterway transportation. Nearby markets, supply centres and the availability of skilled labour are further major advantages making for successful operation.

The plant is presently engaged in both commercial and defence production, serving the railway, automotive and aircraft industries, armament projects, as well as the chemical and engineering trades. The equipment includes 500 modern machine units embracing every type of machine operation in heavy, medium and light shop work. Precision processing is a basic part of the plant's manufacturing advantages. A Tool Department with experienced design staff and complete facilities is an integral unit. Auxiliary operations cover heat treating, plating, pattern making, die sinking and welding. The shop is equipped with eight overhead cranes and other handling equipment. Adequate space exists for assembly operations. Excellent laboratory facilities are available including quality control supported by precision testing equipment.

Opportunity is offered here for straight product manufacture or for sub-contract work. Supervision of operations making for efficient, low cost production is a further advantage to the company taking over this modern, fully-equipped "ready to operate" Canadian plant. Further facts and details will be furnished upon request.

Squaring Strasbourg with GATT

FROM OUR SPECIAL CORRESPONDENT

TWO things were achieved by the conference of European and Commonwealth businessmen, financiers and economists which met last weekend, under the auspices of the European Movement, at Church House, Westminster. It publicly launched the idea, which has been hovering for some time in the economic air, of some closer form of trading collaboration between Europe and the Commonwealth and French Union; and it managed somehow to reconcile this idea with the spirit, if not entirely with the letter, of Gatt. The conference was fortunate in meeting so soon after the publication of the Randall report in the United States, since its underlying purpose was to produce preliminary talks between as many European and Commonwealth countries as could be induced to think alike about trade matters, with a view to a subsequent concerted approach to the United States. The conference appeared in fact to be the crystallisation of the feeling in Europe that something new and drastic must be done to try to make the currents of world trade and investment flow in Europe's favour.

The 218 delegates to the conference had taken as read the Council of Europe's "Strasbourg Plan." This is a proposal to tighten the trade and investment links between Europe and its overseas territories by means of a system of intermediary preferences, situated somewhere between imperial preference rates and the corresponding most favoured nation rates which would be enjoyed by members of the Council of Europe in their trade with the overseas territories. The *prima facie* attractiveness of this plan is heightened by the uncertainty surrounding the reception which even the fairly modest Randall recommendations are likely to get on the other side of the Atlantic, and by the real need for some means of solving Europe's balance of payments difficulties. The concept of an industrial western Europe, interlocked with African and Asian territories crammed with raw materials, in a single bloc independent of the dollar, is one which is certainly likely to commend itself to Europeans. As the great majority of the delegates were Europeans, and not representative of governments, the Strasbourg conception received their general blessing.

Icy Blasts of GATT

During the course of the discussions it became clear, however, that the Strasbourg plan meant different things to different people; and here lay the real divergence of opinion which split the conference. To the protectionists the plan was a means of restricting trade to an exclusive bloc; to the free traders it meant the establishment of a practical regime which would temper for a period the icy blasts of Gatt to the economically shorn lambs. Admittedly in the conference's final resolution on trade some relaxation of the most favoured nation clause was recommended, but only with the express proviso that preferential rights should be regarded as steps towards a universal system. The conference indeed roundly condemned trade restrictions of all kinds. A significant incident occurred in committee when a member of the United Kingdom delegation tried to insert

a clause in the resolution permitting the increase of tariffs to protect infant industries. He was howled down by the whole German delegation, most of the French delegation, and the Canadian representative. *The upshot of the conference was a clear victory for liberal economic principles.

Though this conference has done valuable work in stating a case and putting forward a plan, it is difficult to say what its effect will be. It may be that the somewhat limited funds at the disposal of the conference made it difficult, for transport reasons, to secure an adequate representation of the Commonwealth countries. Of the eight massive reports submitted for preliminary reading, none was written by a Commonwealth representative; and of the 218 delegates only 15 (excluding the United Kingdom) were from the Commonwealth. This was perhaps somewhat unfortunate in a conference which set out to provide a concerted view of the Commonwealth and West European nations on the practical possibilities of the Strasbourg plan. If it is becoming painfully evident that no drastic changes in American policy are to be expected in order to help Europe out of the mess, it is very natural that the nations that suffer most from present American policy should turn to new ideas. The notion of the Strasbourg Plan, being squared with Gatt, is a good one. But it would be interesting to know what the other members of the Commonwealth think.

Front Populaire?

THE executive committee of the French Socialist party has warned its followers against the "duplicity of Moscow agents" luring the innocent with the deceptive vision of a popular front. The communiqué sounds like a half-repentant afterthought, following the two presidential elections (for the Republic and the National Assembly) in which the Communists backed the Socialist candidate. Many saw then the first signs of a possible reappearance of the popular front and the warning is intended to prevent the idea from spreading among the rank and file.

That French Socialists should think it necessary to warn one another against a common front with the Communists shows how far the "untouchables" of the Chamber have travelled recently. Many deputies are no longer frightened of "contamination." Indeed, the Communists have made a breach in the wall of parliamentary isolation by a skilful attack on two fronts, with their appeal for social improvement and national independence. Other parties may still refuse to join the Communists on a common platform in support of a constructive programme; but against specific policies they find it increasingly difficult to decline their backing. A common "national" front against EDC finds much applause from the right, while a "popular" front against the right-wing Laniel government is not distasteful to many Socialists, and even Radicals.

The pendulum having swung to the right, there is naturally a search for a left-wing alternative, but the traditional solution of a coalition is precluded so long as the Communists remain beyond the parliamentary pale. When the tacit agreement to boycott them was made, the balance of power lay with the centre; but the return of the Gaullists to parliamentary activity has switched it to the right, so throwing Socialists into quasi-permanent opposition.

Unless a government with a progressive social policy palatable to the Socialists can be formed by the centre parties, there will be growing pressure to call in the Communists to restore the balance. With the arguments for and against M. Bidault's German policy dominating people's minds, there is little talk of "Soviet Trojan horses." The Communists are at the threshold of the "system" and it is no longer possible to dismiss with a shrug the idea of a French popular front.

Workers' discontent may impose a certain "unity of action" on deputies elected with working-class backing. The fire of discontent which burst into flames last summer is still smouldering below the surface. The pressure for higher wages is growing stronger. According to official sources real hourly wage-rates have remained almost unchanged since September, 1951, and the postwar tendency towards a quicker rise of lowest income groups had been reversed even earlier. It is estimated that at least 700,000 employees get less than the present minimum guaranteed wages, at a time when all the trade unions backed by the wage commission press for a substantial rise of this minimum. The government replies that the essential thing is to revive production. Last year industrial production fell by four per cent. But the workers have little faith in pledges of the government or the employers and think that they will not get a square deal without fighting for it. The Communists carefully avoid reckless ventures which would put them out of step with other trade unions, and as long as the causes of workers' discontent persist it will be increasingly difficult for left-wing parties to ignore Communist overtures.

A University for the Belgian Congo

BY A CORRESPONDENT

THE new university college at Louvanium near Kisantu in the Belgian Congo opens this month. It is closely associated with the University of Louvain in Belgium, and ultimately its courses and degrees will have the same status as the degrees of metropolitan universities. As there are so few fully developed secondary schools in the Congo, the first year's teaching will be preparatory; it will be general in nature, and will cover matter usually included in school syllabuses in Europe. The college is starting in a small way with some two dozen students and half a dozen lecturers, but is planned to grow much on the lines of the university colleges in Nigeria and the Gold Coast. The intention is to admit white as well as African students, and to have no social or educational colour bar.

This is a very important development in policy for the Belgian Congo. So far government has been "paternalistic"; health and social services have been provided for Africans, on a scale rarely seen in Africa, and the teaching of manual and technical skills has been admirable, but higher education has been retarded. Until recently no Congolese student at all went overseas for university education, and even now there are only a handful in Belgium, compared with the several thousand undergraduates from British West Africa in Europe today. Naturally this policy has been construed as a deliberate attempt to prevent political development. But the opening of the new university is a sign that Belgium realises political change is inevitable.

The home government has denied, and is still denying, political power to the 60,000 Europeans in the Belgian Congo (twice the number that has so much importance in Kenya) on the grounds that this group would only pursue a sectional policy designed to protect white interests. This is resented by the settlers and business men, but the highly successful economic results achieved in the Congo indicate that settler predominance in politics is not an essential condition for economic progress. The Belgians are hoping that this situation can be maintained until there are sufficient educated Africans to play their part in the move towards self government. It will be interesting to see how this experiment succeeds, so different, as it is, from British policy in either East or West Africa.

The Norwegian Economy 1953

BY comparison with the tranquil progress made by its Swedish neighbour, for the Norwegian economy, 1953 was a troubled year. Yet, internally, stable conditions prevailed; the level of prices remained virtually unchanged, and the gross national product advanced steadily, if unspectacularly, by 2.1 per cent. But it was a bad year for Norway's external trade.

At home, industrial production increased by 4 per cent over last year to a figure of 127 (1949=100). The sector of industry serving the home market increased its output but that producing for the export markets suffered a small decline. Most progress was made in the mining, clothing and paper industries. The agricultural sector enjoyed an excellent harvest with output in many instances making new records. The forestry industry, likewise, had an exceptional year, while the shipbuilding yards, in delivering over 112,000 gross tons, set up a new record.

Unemployment, except for a normal seasonal increase in the winter months, recovered from the abnormally high levels in the first quarter, to only .4 per cent of the insured population, in October. The new wage agreements made in the spring brought an average increase of .6 per cent.

According to figures of Norway's national budget recently released, the rate of investment is to be maintained at an extremely high level—nearly 35 per cent of the gross national product. In due course, when these investments bear fruit they will no doubt contribute strongly to Norway's foreign earnings, particularly in dollar markets. But at present in view of Norway's adverse balance of payments, and its inadequate foreign resources, this exceptional

rate of capital formation may prove more than the economy can bear. As it is, there will have to be a sharp increase in private saving, since the State proposes to reduce its own budgetary overall surplus of 113 million kroner in 1952-53, to a deficit of 250 million kroner in the financial year 1953-54. No provision has, however, been made for a reduction of taxation.

In its annual review, the Organisation for European Economic Co-operation (OEEC) suggested that some of the less essential investments might have to be trimmed, and part of the dollar saving investment schemes deferred. In this connection a possible source of retrenchment might be the housing programme which in 1953 achieved a new record of 34,000 houses completed. Foreign loans, if obtained in sufficient amount, would alleviate the difficulties.

Norway's balance of payments is its weak spot at present. During 1953 the overall deficit on goods and services account amounted to 1,025 million kroner, compared with only 36 million kroner in 1952. Exports increased in volume by 4 per cent, and imports by 8 per cent; but the main reason for the considerable change in Norway's foreign

balance was a weakening of 5 per cent in the terms of trade. Moreover, freight rates, which are important to Norway on account of its large merchant marine (now over six and a half million tons), are still nearly 50 per cent below the average of 1952. Shipping earnings were, as a result, less by 530 million kroner. On the import side the main increase was the item of ships purchased abroad, which increased by 230 million kroner.

Of the total deficit 631.8 million kroner was with countries belonging to the European Payments Union (EPU), as compared with 46.1 million kroner in 1952. The main changes were increased deficits with Western Germany, France and the Netherlands, and a reduced surplus with the United Kingdom. With an accumulated accounting deficit of 106.5 million EPU units of account, Norway is already in the second *tranche* of settlement, and thus must pay 30 per cent in gold. On the other hand, after taking into account dollar aid, it had a small balance on dollar account. Like many other Western European countries it is exploring the possibilities of east-west trade and has recently signed a £10 million deal with the Soviet Union.

The return of the Labour party to power in the election last October ensures the continuation of a policy of consolidating the welfare state; but the distressing condition

of Norway's foreign trade may make some modifications necessary. Like Sweden, the authorities are still trying to adapt fiscal and monetary controls to serve their broad social and economic policies. Should there be a recession in world trade it remains to be seen whether these would be adequate.

Berlin in Brief

JANUARY 25th. M. Bidault and Mr Eden opened by urging that the four foreign ministers should concentrate on the problems of Germany and Austria. M. Bidault said that the solution of Asian problems would not be helped by linking them artificially with European questions; he did not believe in "the system of reaching agreement by global exchanges." Both ministers insisted on free elections as the first step to German reunification. Mr Molotov then set forth Soviet policy and its familiar objections to western policy and proposed the following agenda for the conference:

- (1) Methods of reducing international tension and convening of a five-power meeting
- (2) Germany and the problem of ensuring European security
- (3) The Austrian treaty.

January 26th. In his opening speech Mr Dulles agreed to accept this agenda "for the sake of getting on with our work." But he insisted that the United States, although not refusing to deal with Peking "as occasion requires," would not join in a five-power conference with Communist China "for the purpose of dealing generally with the peace of the world." At the end of a long speech Mr Molotov proposed that a five-power meeting of foreign ministers should be convened in May-June, 1954, "to consider urgent measures for reducing tension in international relations." M. Bidault and Mr Eden also accepted the Soviet agenda.

January 27th. All three western foreign ministers opposed Mr Molotov's proposal for a five-power conference. Mr Dulles said that it was useless to talk about another Asian meeting so long as the Chinese held up the political conference on Korea. The proposal for a five-power conference, he said, was merely a device to get Communist China a position in world councils that it has not earned. He pointed out—as did Mr Eden—that there was no evidence that Peking was willing to collaborate on a Korean or Indo-Chinese settlement. Mr Molotov persisted in advocating a five-power conference to discuss three groups of questions: (1) Military questions, especially disarmament; (2) political questions, especially China; and (3) economic questions, including trade. The western ministers, he said, had dealt only with political questions and ignored the 800 millions in the "peace-loving" countries who formed a vast and important market.

January 28th. The western ministers again argued against the Soviet proposal for a five-power conference. M. Bidault reaffirmed France's willingness to make peace in Indo-China. He said the Chinese Communists must convince France of their peaceful intentions and did not need a five-power conference to do that. Mr Dulles argued

that the United Nations could carry out all the tasks proposed for this five-power conference, and that the latter would inevitably turn into a permanent body "with a vast network of sub-committees and experts" which would in effect replace the United Nations. Mr Dulles and Mr Eden suggested passing on to items 2 and 3 of the agenda. It was eventually conceded by the Western Ministers that they should take up with Mr Molotov the question of a five-power conference in restricted session the following week. When it looked as if the meeting was moving on to Germany, Mr Molotov caused surprise by suddenly producing a new proposal for a world disarmament conference to be convened.

January 29th. Mr Molotov insisted on a discussion of his proposal for a disarmament conference. M. Bidault suggested the four governments should together help the present UN Disarmament Commission to reach agreement. Then a general conference on disarmament could be summoned in accordance with the General Assembly resolution of January, 1952. To his suggestion that they should postpone consideration of his and the Soviet proposals until they met in restricted session, Mr Molotov agreed.

The ministers then turned to consideration of the German problem. Mr Molotov proposed the admission of representatives from western and eastern Germany. The western ministers refused, and no decision was reached. But Mr Eden was able to put forward a detailed plan to bring about the reunification of Germany in five stages:—

- (1) Free and secret elections throughout Germany according to an electoral law drawn up by the four powers, and under the supervision of a commission composed of representatives of the four occupying powers and perhaps of neutral representatives as well.
- (2) The convocation of a National Assembly.
- (3) The drafting of a constitution by the Assembly. At the same time the Assembly could set up some all-German authority which could assist in drafting the constitution, prepare the nucleus of an administrative machine, and open preliminary negotiations for a peace treaty.
- (4) The adoption of the constitution and the formation of an all-German Government, which would assume the functions of the existing governments in western and eastern Germany, and would proceed to negotiate a peace treaty.

EAST-WEST TRADE

A Practical Report

Our fourth quarterly report on Eastern Europe is now available. It brings you right up-to-date on economic developments in

Eastern Germany	Rumania
Poland	Hungary
Czechoslovakia	Bulgaria

The report contains a wealth of information for those interested in the prospects of trade with Eastern Europe.

Particulars from:

THE ECONOMIST INTELLIGENCE UNIT
22 Ryder Street, St James's, London S.W.1.
 Whitehall 1511 Ex. 129

(5) The signature and entry into force of the peace treaty.

Mr Eden emphasised that the new all-German Government must be free to assume or reject such of the international rights and obligations of the Federal Republic and the Soviet Zone as it considered necessary and to conclude other international agreements.

January 30th. Mr Molotov again proposed that German representatives should attend the conference; but finally agreed to give way to Western objections. The meeting then discussed Mr Eden's unification plan. Mr Dulles and M. Bidault warmly welcomed it, while indicating that modifications and improvements might be made. Mr Molotov made surprisingly mild preliminary comments. After the meeting Mr Dulles and Mr Molotov had a short private talk on the pooling of atomic resources. Comment from Berlin became optimistic.

After the Week-End

February 1st. After M. Bidault and Mr Eden had both spoken in support of the British plan Mr Molotov attacked the EDC and American bases, appealed for Franco-Soviet co-operation against German militarism, and proposed that representatives from east and west Germany should be invited to state their views on particular problems. Finally, he tabled proposals for a German peace treaty modelled on the Soviet draft treaty of March, 1952, with three amendments:—

- (1) No political or military obligations contained in treaties concluded by the Federal Government or the east German regime should be imposed on the government of a united Germany.
- (2) Germany should be obliged to pay only its commercial debts to the four powers.
- (3) Germany's armed forces should be limited to those needed for internal security, local frontier defence and anti-aircraft defence.

The treaty would also provide for withdrawal of all occupation forces within one year from the enforcement of the treaty, and stipulates that Germany shall not undertake "to enter into any coalition or military alliance directly against any country which took part in the war with Germany." Mr Molotov also proposed that deputies of the four foreign ministers should prepare a draft peace treaty within three months; that they should be assisted by representatives of both German governments; and that a peace conference should be convened within six months. He referred only briefly to Western insistence on all-German elections and made no reference to Mr Eden's proposals.

February 2nd. The three Western ministers in turn expressed their disappointment at Mr Molotov's polemic of the previous day, rebutted his charges against them, and urged him to consider seriously the British proposals for German unification.

February 3rd. The Western ministers made prolonged and fruitless efforts to persuade Mr Molotov that under the British plan, a united Germany would in fact be free to assume or reject the obligations of the EDC Treaty. Mr Molotov failed to discuss free German elections; instead he proposed that a referendum should be held throughout Germany to find out whether the people wanted a peace treaty or the Bonn and EDC Treaties.

Cylinder liner of the Deltic, the new Napier high-speed marine diesel engine which promises to improve radically the economics of seaborne freight. Far smaller than other diesels of equal power, the opposed-piston 18 cylinder 2,500 h.p. Deltic derives from the application of aero-engine materials and technology to the problem of ship propulsion.

Every new Napier design springs from 150 years of fine engineering experience.

NAPIER

Partners in Progress

with The ENGLISH ELECTRIC Company Ltd.

D. NAPIER AND SON LIMITED · LONDON · W.3

It means faster progress in the clearing of sites for new factories and housing estates, in the building of new roads, in the breaking of new ground for agriculture. It means greater economy for the contractor on every excavating and construction job.

Today, in Britain and in the many countries for which Britain is an international source of supply, contractors are taking delivery of the new

Doncaster-built International LTD-6. This is a 40.5 horsepower full-diesel crawler, incorporating the exclusive features and the traditional ruggedness of construction which have kept International in a class of their own.

With its remarkable versatility and its outstanding economy of fuel, and with matched allied equipment, the International LTD-6 certainly means business.

THE BUSINESS WORLD

Trade with Japan

WHEN trade with Japan is under discussion all kinds of emotions are bound to be unleashed. They are a compound of wartime hatreds and memories of prewar Japanese dumping, of fabulously low export prices quoted on the strength of allegedly sweated and underpaid labour. These emotions have certainly been stirred by the trade and payments agreement which was signed by the United Kingdom and Japan last week. They must not be allowed to get in the way of the substance of the agreement, of the facts contained in it, and of the reasonable consequences, as distinct from the hysteria, that may develop from it.

The background to the agreement is the fact that for a year and a half Japan has run a serious deficit in its trade with the sterling area. Trade between the two is conducted in sterling by virtue of payments agreements, the first of which was signed in August, 1951. Before that date, payments to and from Japan were made by sterling countries on the basis of agreements with the occupation authority and settled in dollars. Under the sterling payments agreements, all payments between Japan and the sterling area are made in sterling and the two sides confer if the account gets seriously out of balance. Japan, however, enjoys no automatic overdraft rights or permitted "swings" in its favour; the provision for consultation is a one-sided affair which comes into effect if and when Japan holds more sterling than it deems convenient or wise. If the pendulum swings in the other direction, Japan has to replenish its denuded working balances in London, by borrowing in the open London market and by forward exchange operations.

During the first full year of this sterling payments agreement, the tide was running strongly in favour of Japan. During the sterling area's spending spree which followed the post-Korean inflation of primary com-

modity prices, heavy sterling purchases were made in Japan. By the middle of 1952, twelve months after the new payments agreement had come into effect, Japan had built up the impressive balance of £130 million in London and was insistent on "consultation."

The remedies, however, had already been discussed at the Commonwealth economic conference in January, 1952, which heralded the austerity campaign and import cuts. Japan felt the impact of these decisions with exceptional severity. Japanese exports were considerably curtailed at a time when Japan's imports of primary commodities, and particularly of wool, were being stepped up as its industry recovered. Japan's sterling balances were soon crushed into insignificance. Early in 1953 the Japanese were complaining that their working balances in London had been reduced to an inadequate level, and during 1953 Japan ran a deficit of about £100 million in its current payments with the sterling area. This deficit was the combined result, first, of a continuing inflation of costs in Japan which made its goods difficult to sell abroad and, secondly, of restrictions on Japanese sales to sterling markets through quotas and discriminatory import licensing—a restrictive system no longer "justified" on the grounds that Japan enjoyed a large surplus with the sterling area.

Japan's gap in its trade with the sterling area was filled last year by stop-gap measures. The running down of working balances took part of the impact; in addition, Japan raised about £30 million by dollar swaps—that is, purchases of spot sterling against dollars balanced by forward sales of sterling; Japan also covered its shortage of sterling by buying £44 million of sterling from the International Monetary Fund. That was the unbalanced and precariously supported position that underlay the negotiations for the extension of the trade and payments agreement up to the end

of 1954. An attempt had to be made to achieve a better balance of trade and payments between the two areas. The broad alternatives were to achieve balance by cutting the longer side of the account down to that of the smaller (by curtailing Japanese imports of colonial raw materials and British manufactures), or by elongating the shorter side (by encouraging more Japanese exports to sterling countries). The expansionist solution was chosen and plans were laid for achieving over 1954 an approximately balanced flow of trade and payments of about £210 million each way.

The achievement of this objective implies approximately maintaining the level of sterling area exports to Japan, but increasing by nearly £100 million the imports which the sterling area will be prepared to take from Japan. The Japanese Government have undertaken to provide sterling sufficient to maintain United Kingdom exports to Japan in 1954 at the current level. They have, in particular agreed to provide sterling quotas to a value of £2 million for the import of wool and worsted yarns and manufactures for which no provision had been made over the past year. There will also be a small quota for British motor cycles, another new line of export. Furthermore, Japan has given guarantees of sterling payment for sales of sterling oil and earnings of British films in Japan.

★

On the other side of the account the changes are inevitably more dramatic. The most important of these is the notification by the United Kingdom to Colonial Governments that they may import from Japan in 1954 "up to their estimated requirements for their own consumption and for the entrepot trade." It is in these markets that the export industries in Britain, and the textile industry in particular, may feel the draught of competition for they have hitherto been preserved for British imports by the quantitative restrictions of import licensing. But this prospect hardly warrants the shouts of angry dismay that have come this week from Lancashire. Is it seriously contended—in the home of free trade—that the Malays and the Africans whose labour produces so many of the dollars with which the British people indulge their taste for both essentials and luxuries should be thanked and rewarded for their efforts by an indefinite continuance of the embargoes which compel them to buy their cloth in Lancashire whether they like to or not, and exclude the competition of, perhaps, cheaper manufactures from Japan? If so, it would be difficult to conceive of a shorter cut to losing the colonial empire.

The United Kingdom Government are also establishing import quotas for a number of traditional Japanese exports to this country, but the effect of these on the total volume of trade between Japan and the sterling area is likely to be small. An import quota of £3,000,000 has been established for Japanese cotton and rayon grey-cloth, all of which is to be re-exported after processing. This is no concession to Japan and

involves no hardship to the British textile industry. Many British dyers and makers-up have recently come to depend on Japanese grey-cloth for supplying the colonial markets and the quota which has been established for 1954 is, in fact, appreciably smaller than the amount of grey-cloth imported from Japan for processing and re-exporting during the past year. The quotas for imports from Japan destined for consumption in this country are considerably smaller than the pre-war imports of these particular goods, even without any allowance for higher prices. The most important (and those which have caused the most vocal resentment in the industries that consider themselves threatened) are: apparel—£300,000, as against imports of £778,000 in 1938; cotton and rayon piece goods—£300,000, as against £401,000 in 1938; pottery—£50,000, as against £151,000 in 1938. The other quotas established for 1954 are: toys £150,000, electric lamps and bulbs £50,000, buttons and studs £80,000, paper manufactures £50,000, brooms and brushes £50,000, lacquer ware and ivory fancy goods £40,000. "Made in Japan" will again be seen in British shops, but the quotas involve no risk of a flood.

Whether the agreement signed at the end of last week will, in fact, achieve the balance which it contemplates between Japan and the sterling area remains uncertain. The quotas which have been established for Japanese goods are permissible ceilings, not guarantees of imports. Japan's ability to sell up to the limits authorised in the agreement cannot be taken for granted, given the serious inflation of costs and prices from which it is at present suffering. The hoped-for bilateral balance in payments between Japan and the sterling area must also depend on the policy of dominions such as Australia and South Africa, whose intentions could not be anticipated or specified in negotiations taking place in London.

In any case, it would be unwise to expect an early restoration of equilibrium in a trade which has become so seriously unbalanced. In the early months of 1954, therefore, the United Kingdom Government have agreed that the Japanese government may seek temporary limited accommodation in London through normal commercial channels. This probably implies a prolongation of the dollar swaps through which Japan has been covering a part of its sterling deficit in recent months. It is, however, to be hoped that, after living with a steadily hardening pound for nearly two years, the Japanese authorities will abandon some of their earlier illusions about the relative desirability of the pound and the dollar. Japan's concern for maintaining a substantial dollar reserve can be understood, for the Japanese balance of payments is no longer receiving the full tide of support which came its way when hostilities in Korea were at their height. Nevertheless, the Japanese should now be prepared to disgorge some of their dollars, of which they have a reasonably adequate supply. It is not by seeking exact bilateral balance that they will maximise their trade with the sterling area. It is high time they called in the currency of the New World to restore their deficit with the old.

Next Phase in Rubber

THIS year the natural rubber industry must work its own passage. The American strategic purchases, which until now have taken the bulk of the surplus off the market, are nearly completed; the Randall Commission's objections to commodity agreements have killed any lingering hopes of stabilising the price by an international buffer stock scheme. Yet the outlook for rubber in 1954 is reasonably hopeful. Natural rubber has not entered this year under the weight of a gross surplus of nearly 200,000 tons as the Rubber Study Group last May feared that it might; that forecast was revised in October to 169,000 tons, and it was still too high. Preliminary estimates show that world production of natural rubber fell slightly by 68,000 tons to 1,717,000 tons in 1953, while consumption rose by 115,000 tons to 1,565,000 tons; hence the apparent surplus turned out to be little more than 150,000 tons. Of this, American strategic purchases absorbed about 70,000 tons, and British purchases about 20,000 tons. The small remainder of some 60,000 tons seems to be an over-estimate, because consumers' stocks rose by only about 42,000 tons in 1953.

This unexpectedly favourable outturn, with supply and demand virtually balanced, appeared too late to check last year's break in prices. The American government's decision at the end of 1952 to bring its high-cost synthetic plants back into use started a further collapse, and the threat of surplus did the rest. Between December, 1952, and October, 1953, the spot price steadily dropped from 28½d. for No. 1 sheet to 16d. a lb.; since then the price has hovered rather uncertainly between 16d. and 18d. a lb. But the drop in prices appears to have minimised the probable surplus, because the largest consumer, the United States, found it profitable to increase the proportion of natural rubber in its total consumption. In the first half of 1953, the proportion of natural rubber in the total consumption of the United States was 39.6 per cent; by December natural rubber had risen gradually to 46 per cent, although total consumption itself had been falling in the second half of the year. For 1953 as a whole, American consumption of natural rubber rose by 100,000 tons to 553,000 tons, and this accounted for almost the whole of the increase in world consumption.

A survey of the probable supply and demand for natural rubber in 1954, highly tentative though it must be, suggests that the balance may be more favourable than last year. American rubber manufacturers expect only a slight fall in their total consumption from the record of 1,334,000 tons in 1953 to some 1,300,000 tons; even the more cautious estimate of 1,260,000 tons does not herald a disaster. In the next few months their consumption of natural rubber is expected to rise to 50 per cent of

the total, and to stabilise at about that figure. This suggests that American consumption of natural rubber in 1954 may rise to about 600,000 tons. If consumption outside the United States shows little change from the total of 1,012,000 tons for last year, world consumption of natural rubber may rise by some 35,000 tons to 1,600,000 tons. Production is expected to shrink to about 1,680,000 tons, leaving a surplus of the order of 80,000 tons. Allowing for a seasonal fall in production in the next few months it is even possible that the surplus will not appear until the autumn.

★

This bold crystal-gazing rests on two main assumptions. The basic assumption is that the recession in the United States is no more than mild—which at least is not yet disproved. The second is that the price of natural rubber does not rise above the price of synthetic, and thereby discourage American consumption of natural rubber. Other uncertainties are the effect of Indonesia's recent export incentives on shipments of

smallholders' rubber, and how long the present lull in Russian demand will last. On the other hand, it is probable that the American stockpile will take a final 30,000 tons of natural rubber this year, and that Britain may take another 20,000 tons or so. And if confidence can return to the rubber market, an appreciable quantity could easily be absorbed into dealers' stocks.

A return of confidence—which is an essential prerequisite of stable conditions in the rubber market—seems justified. World consumption of rubber (of all types) has doubled every decade, and there seems no technical reason why such expansion should not continue. How much of this prospective future increase will go to natural, and how

much to synthetic, will depend mainly on price. Ultimately the price of synthetic rubber must set a ceiling for the price at which natural will move freely into consumption. But at the present cost of a synthetic plant—which is put at nearly £500 per ton of annual output—natural rubber should have nothing to fear from synthetic, provided that it remains competitive. This does not mean that the price of natural must stay at its current level. American GR-S synthetic now sells at 23 cents a lb., and the oil-extended rubbers, which involve the user in higher manufacturing costs, at 21 cents a lb. No. 3 sheet, which is considered equivalent to these synthetics, is now quoted at 19½ cents a lb., landed New York, and could therefore rise by a cent or two and still be competitive. And in 1955, when the American government's synthetic plants should have been sold to private operators, the price of synthetic will almost certainly have to be raised.

Whether a return of confidence to the rubber share

which command a premium over sheet rubber. The general public is therefore taking little interest in rubber shares either as buyers or sellers. Among the few larger investors who consider rubber suitable for their portfolios there is a little buying, but it represents only a fraction of the total funds that would find their way into rubber shares if the way seemed clear.

The problem is to distinguish those companies which seem likely to do well in a competitive market. Past profits and dividends help little for they are based on prices and costs wholly different from those now current. Again, accounts ending on different dates can reflect widely different rubber prices. For the year 1952 the London average price of No. 1 sheet was 2s. 4 11/32d. per lb. Reports are now coming from companies which ended their years in June and September last year, covering average prices of 1s. 11 3/32d. The current price is around 1s. 5d.

For that reason profits and dividends have been excluded from the accompanying analysis of a sample, taken for the purpose of illustration only, of Malayan companies in the good and medium ranges.

High yields per acre and low capitalisation per acre at the market price of the shares are important. Moreover, those companies that were mean to their shareholders in the immediate post-war years are now often strong in

market is equally justified is less clear. Investors have often found that they could do best in rubber shares by buying the rubbish at an early stage in the return of interest to this market. The 2s. share standing at a few pence in a company which is not making a profit but might do so if the price rose often yields the biggest proportionate gain. But this is not an occasion where the whole industry is likely to swing into a period of readily made profits, and therefore it is not an occasion for raking over the rubbish heap. No informed opinion would suggest that more than a third of the British-owned Malayan estates are yet making appreciable profits, and though there are welcome signs of falling production costs, there are also fears that the Federation Government may have to increase taxation.

The profitable sector of the Malayan industry may broaden, but the companies which comprise it seem likely still to be those with the high yields per acre or with speciality products, such as latex and sole crêpe

working capital and have achieved substantial replanting of high yielding trees.

Malayan export duty of 5 per cent is normally included in the estate cost. It is dangerous to press deduction from the figures too far. For example, the London price of No. 1 sheet has been used, but no company is fortunate enough to produce its whole output in that quality. Moreover, when the output of rubber is falling, the yield on the equity corresponding to a rise or fall of a penny per lb. will also shrink. Nevertheless, that calculation remains a useful guide for comparing one company with another—more useful, perhaps, if 1954 fulfils some part of its promise of greater stability than in the hectic boom and unchecked falls of the past four years. But it would still require a brave man to cling confidently to the belief that the upturn in rubber is going on. Rubber may be climbing the bottom of the cellar steps; it is not rushing up the ladder through the roof.

Business Notes

Productivity Regained

"LABOUR productivity" throughout British industry—as crudely measured by the relation between the official production index and an index of employment in industry—appears to have risen rather less than the volume of production in 1953, after falling, roughly in line with output, in 1952. Employment in 1952 averaged nearly the same as in 1951 (though it must have concealed some under-employment), and output and productivity both fell by 2-3 per cent; but last year employment in industry rose slightly, so that the 5-6 per cent increase in output was achieved with a rise of about 5 per cent in labour productivity. In the manufacturing industries the decline and recovery were rather more marked, both for productivity and production. In 1952, manufacturing output fell by 4 per cent and productivity by about 3½ per cent; in 1953, output rose by just under 6 per cent and productivity by about 5 per cent. The 1953 figures, in all these instances, are roughly back to the 1950-51 trend.

With this resumption of growth in industrial output and productivity—here measured against labour, but perhaps representing mainly, over the last two years, the degree to which a slowly increasing total industrial capacity was employed—comparisons over a longer period regain some

head of 3 per cent between 1935-38 and 1946, and another estimate suggests a fall of nearly 5 per cent.

Estimates based upon calculations of national income, on the other hand, suggest a rise in "real national product" of about 12 per cent between 1938 and 1946, while the working population rose by only about 4 per cent in the same period; and though this rise covers other sectors of the economy than industry, the divergence is not easy to explain away. The old index of production, based upon 1946 and upon a less complete coverage than the existing index, could be used to give two different answers, according to alternative weighting; according to one, industrial output in 1946 was more than 2 per cent higher than in 1938, and according to the other 1946 output was 4 per cent lower. These discrepancies may have their uses for opposing political propagandists—or indeed for the same politician on different occasions—but otherwise they offer a salutary reminder of the strictly limited significance of such global comparisons.

Indecision Over Rail Freights

THE 10 per cent increase in railway freight charges for which the Transport Commission applied some weeks ago did not come into effect last Monday, as had been proposed, because the Government had not made up its mind. The Transport Tribunal, acting as a consultative committee, had passed its report on the application to the Minister of Transport by the middle of last week. But by the time that *The Economist* went to press this week, there had still been no indication of what the Cabinet had decided—and the silence was encouraging speculation about that most dangerous expedient, a railway subsidy.

The railwaymen, meanwhile, had wrung the last penny out of the settlement that the Government forced upon the Transport Commission in December. With "extreme disappointment" at not being able to squeeze any more, the National Union of Railwaymen this week accepted the Commission's final offer of increases for a wide range of railway workers, which will cost in all some £12½ million a year—about £6½ million more than the rise in wages allowed for in the application for higher freight charges. The total of increased costs to the Commission, as set out in support of its application, would now be in the region of £30 million a year. The Commission and the union have still to begin their discussions upon the railway wages structure and the possibilities of increasing efficiency on the railways; it is probable that here, too, the union probably hopes to exact a price for any concessions it has to make.

significance. In 1953 total industrial output appears to have been about 38 per cent greater than in 1946 (the official index, based on 1948, gives an average of 120 for the year), and productivity may have been about 18 per cent higher. But the calculations by which postwar output might be linked with prewar output remain conflicting. The estimates of Dr Rostow would suggest a fall in industrial output per

Fuel for a Cold Spell

LATE last year, while the weather was saving the National Coal Board's face by remaining providentially mild, a comfortably ghoulish remark became fashionable in Hobart House. It was: "Remember 1946-47? This is just the way that winter began. . . ." A fortnight ago, only about a week late by the standards of that winter of fuel crisis, the cold spell arrived.

As the accompanying chart shows, the temperature pattern of the two winters does show some resemblance; but so far, 1953-54 seems to have had a slight margin of warmth—and a very substantial margin of coal. November was unseasonably warm in both winters; last December was much warmer than December, 1946; and January much the same in both years, with the break in temperature coming in the fourth week of 1947 and the fifth week of 1954. The Ministry of Fuel and Power has recently revised the reporting basis upon which it records mean weekly

temperatures, but the figures in the chart are on a comparable basis. The country began this winter with distributed coal stocks 70 per cent larger than in 1946, and has drawn on those stocks proportionately much less; the latest stock figure, 16,715,000 tons on January 23rd, represented about two and a half times as much coal as consumers held at the same time in 1947.

There is, of course, an irreducible minimum of distributed stocks—which was perhaps some 7 million tons in 1947 and may be not much less than 10 million tons today—below which these seem of little avail in preventing serious local coal shortages. Inland consumption, too, is probably 10 per cent higher than it was in winter 1946-47. But so far, at least, the fuel industries seem fairly healthily placed to withstand sharper weather than Britain has had this year. No electricity load-shedding has yet been necessary, and industry has no load-spreading arrangements in force. The power stations as a whole have six weeks' coal in hand, and the temporary hold-up of colliers on the North-East Coast is not expected to cause any particular difficulty for those stations that normally receive coastwise deliveries. The gas industry stocks amount to more than

four weeks' consumption, and other industrial consumers in general—except the coke ovens—have larger stocks than at this time last year. So far, weather has not significantly held up coal movement by rail, though there has been some anxiety over this in South Wales and Northumberland. Nor has tonnage been lost in the mines through lack of wagons to take the coal, or through the freezing up of the washeries. The Coal Board's anxieties, for the moment, continue to be directed towards next winter. It no longer possesses the cushion of opencast stocks that served it so usefully last autumn; and some of its most productive areas, such as Staffordshire, Warwickshire, and South Yorkshire are becoming seriously short of manpower.

Marketing Persian Oil

REPRESENTATIVES of eight international oil companies have been meeting in London this week to discuss the arrangements that would be needed if Persian oil is again to find its way into the world oil market. The participants include five American companies which last week were granted a waiver by the Department of Justice against the jeopardy of proceedings under the American Anti-Trust laws—an immunity which was a *sine qua non* of their joining in a marketing scheme, though it seems to have some strings to it. These companies are: Standard Oil of New Jersey; Standard Oil of California; Texas; Socony Vacuum; and Gulf Oil. The other participants are Anglo-Iranian, Compagnie Française des Pétroles and Royal Dutch-Shell.

Anglo-Iranian's statement on the conference is of interest, not least for its guarded terms:

In pursuance of the discussions with the Persian Government on the subject of oil, and in view of the international difficulties in the way of getting Persian oil back into world markets, the Anglo-Iranian Oil Company have resumed their talks with other oil companies able to make a contribution to the solution of this problem.

This statements stops well short of suggesting a marketing consortium to handle Persian oil, but it is difficult to see what other construction could be put on a "contribution to the solution of this problem" by the joint efforts of seven groups together with Anglo-Iranian. Indeed, it is clear from reports from Teheran that discussions with the Iranian authorities must be proceeding on the assumption of a consortium. The discussions in London, which may well continue for some days, are at what is called the "working level"—which means that they are concerned with the analysis of technical marketing problems and with suggesting a solution, if a solution is possible and if it is required.

In this complicated exercise, there has been a meeting of minds, but there is much work to do before it could be given definite and legal form. But a posture of technical readiness to meet these marketing problems is obviously a sensible act of preparation, in the hope that Iran may eventually agree on terms for the restarting of production. Two parallel sets of negotiations, in London and Teheran, are concerned with different things—marketing on the one hand and the restoration of plant and the start of production on the other hand. The second set of problems is no less important, and may be even more diffi-

cult, than the first. It involves, in particular, agreement on the proportion of Iranian output for which the Anglo-Iranian Oil Company is to make itself responsible. The company has seemed prepared to handle 50 per cent, though it would assert that it could handle more. But there are suggestions from Teheran that American companies should handle 50 per cent, Anglo-Iranian 45 per cent and Iran itself 5 per cent. Both in marketing and in production the compromise between what is tolerable to Anglo-Iranian (still uncompensated for the seizure of its properties) and what the Iranian authorities may be disposed to accept may be far from easy to reach.

A Sponge for Savings

SHARE markets remain strong. On Thursday the *Financial Times* ordinary share index rose by 1.0 to 138.2, a rise in a week of 2.9. The index of Gold Developers rose by 0.24 to the highest point yet reached of 106.29. But it has also recently become clear that a long queue of would-be borrowers is pressing forward to stake claims on the supply of funds becoming available for investment. The nationalised industries, the Dominions and the Colonies are waiting; should investors show signs of having large funds ready for industrial investment, Sir John Morison would no doubt be glad to step forward with a steel share offer, but the ordinary run of new industrial financing is substantial in its own right.

The Dunlop Rubber Company asks for £7 million; New Broken Hill Consolidated requires a mere £1 million to equip its lead-zinc mine for a substantial increase in production. It will raise the money by a public issue of that amount of 5½ per cent unsecured loan stock at par, half the issue bearing conversion rights into ordinary shares at 25s. per share (against the present price of 21s. 6d.). Rickmansworth and Uxbridge Valley Water Company and Newcastle and Gateshead Water Company are each opening tenders for £250,000 of new stock. Behind these issues already announced a substantial number of plans for both large and small issues are in active preparation. This prospective mopping up of fresh funds must set some limit to the continued capacity of the market to rise.

One operation is not in this class. By issuing £2,200,000 4½ per cent debenture stock (1970/85) at 99 10s. per cent W. H. Smith (Holdings) are engaging in a largely self-balancing operation which will call for no fresh money. Of the total, approximately £1,900,000 will be offered in exchange to holders of the 4½ per cent "A" and 4½ per cent "B" Debenture stocks of the subsidiary company Hambledon Estates. Those two stocks are to be paid off at £112 per cent as stage two of the liquidation of the estate company, and as it is also desired to repay about £300,000 of bank loans, holders will have the opportunity of applying for extra stock. Already holders of over 90 per cent of the 7 per cent Preference of Hambledon Estates have accepted conversion into 7 per cent Preference stock of W. H. Smith (Holdings) so the estate company can now go ahead with its arrangements to disappear. Its appearance in 1929 and present liquidation illustrate two phases in the pressure of death duties on the family business.

Slackening Gold Flow?

THE sterling area was still in dollar surplus in January; but the portents for the coming months are not good. The gold and dollar reserves rose by \$25 million in the month, including a further \$15 million from defence aid. If allowance is made for the \$4 million paid in gold to the European Payments Union (on account of the December deficit) it will be seen that the surplus on other dollar payments, including North America, was \$14 million. This is fully \$100 million less than the large surplus shown in December, and is, indeed, the smallest since last September. A considerable part—perhaps \$50 million—of the December surplus was attributable to the purchases of Soviet gold; but the surplus on commercial account then was surpris-

* After taking account of the payment of \$181 million on December 31st for the service of United States and Canadian lines of credit, the United States lend-lease loan and the ERP loan.
† EPU settlements in any month depend on the surplus or deficit with Europe in the previous month.

ingly good. For this reason it would perhaps be unwise to make too much of the sharp deterioration in January; the figures for any single month may be considerably distorted by special factors. Nevertheless, it is something of a disappointment that December's improvement should have been reversed so soon despite the continued firmness of prices of sterling commodities.

Meanwhile, the balance with Europe appears to be steadily deteriorating. The sterling area had a surplus of £4.7 million with EPU in January (which will fall to be paid 50-50 in gold and in reduction of debt in the middle of this month); but this does not reflect a credit balance on trading account. Over £12½ million was paid through EPU by the Netherlands in the middle of last month to cover the next six annual service instalments on loans totalling £45 million made by Britain to Holland in the war. These loans were to be paid off in twenty annual instalments, starting in 1948; but this year the Dutch Government has apparently decided to cover its commit-

ments until 1960 at one stroke. The payment thus masks a deficit with EPU on commercial account of over £8 million. This disturbing trend suggests that the further liberalisations of imports from the OEEC area by both Britain and Australia in the autumn of last year are now exerting their full effect—and that exports are not rising correspondingly (partly no doubt because France still lags so far behind in its liberalisation programme). If this trend were to continue into the summer—when tourist expenditure and imports of fruit and vegetables are seasonally high—the deficit with EPU might again prove the most embarrassing aspect of the sterling area's external accounts.

Dunlop's New Money

A WEEK ago, shareholders in the Dunlop Rubber Company rubber-stamped their directors' proposals to reconstruct the company's capital and to make a fresh issue of preference shares. Only one discordant voice was raised, and this was in criticism of the decision to issue preference rather than ordinary shares. No shareholder exercised his undoubted right to inquire on what exactly the new money was to be spent. That Mr Beharrell, who presided, had expected close cross-examination was obvious from his warning that he would disclose only what was in the "interests" of the company to divulge. Shareholders never tested his reticence and if they know less about the company's programme than they might, that is their own fault.

Dunlop's directors have decided not to come to the market with a public offer. Instead, the 7 million new 5½ per cent preference shares are being offered, though not as "rights," to ordinary and preference shareholders and debenture holders in the Dunlop Rubber company. At the issue price of 21s. these £1 preference shares (repayable in a liquidation at 22s.) offer a yield of £5 4s. 9d. per cent, which is well above the current yields of £4 5s. 4d. on Fisher and Ludlow 4½ per cent preference shares and £4 18s. 3d. on ICI 7 per cent preference stock. The underwriters would probably be well satisfied to take the stock into their portfolio if Dunlop's stockholders failed to fill the subscription lists. The underwriting commission of 5½d. gross is an added attraction. The price of the existing preference stock (into which the original stocks were converted) is pinned at the moment to the issue price of 21s. The dividend requirements of all the preference capital were covered more than six times by profits in 1952 and stockholders will not fail to note that the directors believe that trading profits in 1953 have been higher than in 1952, and there is a non-recurring tax refund also in prospect.

No prospectus would be complete without some indication of how the proceeds of an issue were to be invested. The Dunlop board are content with the broadest indication. One third of the new money is to be used to reduce the temporary borrowings of the group, and another third is to be used in modernising plant and in developing "new manufacturing methods" in this country. If the pilot plant for synthetic rubber forms part of these plans, it will clearly be neither expensive nor extensive. Dunlop will no doubt be careful not to tread on the toes of the natural rubber growers but will look to Canada for the small but growing

amount of synthetic rubber that it needs. The rest of the new money will be invested in subsidiary companies in Canada and the United States, where big developments are in progress, and in Malaya; and there is a margin for future developments.

Big Fall in Bank Deposits

THE figures of the clearing banks for their January make-up follow, as usual, hard on the heels of their end-year balance sheets. They show that in the first three weeks of January the seasonal contraction of credit has been sharper than usual. Aggregate net deposits have dropped by £138 million to £6,232 million, whereas in the corresponding period last year they fell by £110 million. This sharp contraction is, of course, mainly attributable to the heavy flow of taxes to the Exchequer, which enables the Government to repay floating indebtedness to the banking system. Hence the principal counterpart of the fall in deposits is to be found in the banks' liquid assets—their holdings of Treasury bills, call money and cash have fallen by £118 million—with the result that the liquidity ratio has dropped from 36.8 per cent to 36.2 per cent. But although Government repayments have been the predominant factor during the period, this influence accounts for only part of the steepening of the fall in deposits by comparison with last year. Whereas in the first three weeks of 1953 bank advances rose slightly, this time they have shown a contra-seasonal fall of £12 million. At the same time, the banks' portfolios of commercial bills, which had risen steeply in December, have declined by £2½ million—though at £76 million they are still £9 million up on the year.

† Ratio of Assets to published deposits.

It appears, therefore, that, despite the pressures of the tax-gathering season, the private sector of the economy has been leaning less heavily upon the banks. On the usual basis of estimation, repayments of indebtedness by the central Government have amounted to about £125 million, compared with £115 million in the similar period last year. This increased rate of repayment is, however, slightly less than might have been expected from the improvement in

its domestic finances as shown by the Exchequer Returns. It would be unwise, however, to try to draw from this disparity any conclusions about other demands upon the Treasury's finances; the difference between the dates of the Exchequer and banking returns can cause serious distortions at this season of the year. But it may be noted that in the most nearly comparable period—the first 23 days of January—the above-line surplus was £425 million, compared with £396 million in the slightly longer period last year, and there was a decline of roughly £11 million in net expenditure below the line. The credit effects of this improvement were, however, partly offset by a small increase in the rate of net repayments of tax reserve certificates and a steeper reflux of currency from circulation. At January 23rd the Exchequer still showed an appreciable above-line deficit, but in the week to Saturday last another strong inflow of revenue converted this into a small surplus, compared with a deficit of £20 million at end-January, 1953.

Home Power for Scotland

THE two area electricity boards that are to merge within a new South of Scotland Electricity Board together have about 1,100,000 consumers, out of the 13,900,000 customers of the area boards as a whole, and they sold in 1952-53 some 4,000 million units of electricity, out of the 51,500 million units sold by all boards. The two generation divisions that would also pass to the new board under the Electricity Reorganisation (Scotland) Bill that had its second reading in the Commons this week include power stations with an installed capacity of about 1,100,000 kW, plus some 230,000 kW under construction; this compares with the British Electricity Authority's total installed capacity at March 31, 1953, of 17,200,000 kW, with 9,400,000 kW under construction. But the new board would have about four times as many consumers and about four times the sales of the North of Scotland Hydro-Electric Board and twice as much installed capacity. It will incidentally inherit BEA's present obligation to buy surplus power produced by the hydro-electric stations.

Under the new Bill, BEA will lose all responsibility, and the Minister of Fuel and Power nearly all, for electricity supply in Scotland. The assets, powers and duties of BEA, north of some point on the border that has still to be defined, will pass to the new board. This will presumably involve shared ownership of the new super-grid line running north to Carlisle and up to Glasgow, as well as Scottish ownership of the northern section of the transmission network. The grid control centre in Glasgow will be operated by the new board; since coal costs in Scotland are slightly lower than in England, the new authority may have a chance to achieve lower bulk supply costs. But if questions of load shedding on one side of the border or the other should arise again, the question which areas shall undergo a power cut will be a matter of negotiation. Development planning, again, will require co-operation; for BEA will have no direct influence upon supply planning in the new area nor will it be able to vet development plans of the North of Scotland Board.

Nationalist Electricity

THE devolution of Scottish electricity is being carried out primarily as a gesture to Scottish national pride; Government spokesmen this week made little pretence of having studied any economic consequences that it may have upon the supply of electricity to Scots. References to the virtues of decentralisation in nationalised electricity were abundant if generally half-hearted; though Sir Arnold Gridley, as an expert, expressed the view that this unifying of responsibility for generation and distribution under a single regional body might be beneficial. Sir Arnold excepted from his approval the splitting of responsibility for transmission; the new measure, of course, sweeps away the centralised control of the grid system that has existed in Britain ever since the Central Electricity Board was set up.

Financial severance may prove a tangled business; broadly, all assets and liabilities that BEA has in Scotland will pass to the new board. The liabilities in respect of British Electricity Stock or money borrowed that are attributable to Scotland will be treated as a loan from BEA to the new board, on similar terms. The financial transfer, like various other provisions of the Bill, is left to agreement between the two electricity authorities, the two Ministers concerned, and in this instance the Treasury. Presumably the new board will be entitled to some Scottish share of the central reserve fund set up by the Authority; one item to be counted in the final balance will be the £1 million worth of gilt-edged investments originally belonging to the Edinburgh electricity authorities, a reserve fund that the South-East Scotland Area Board transferred to BEA but to which they have always asserted their claim.

Cotton's Brave Front

AMERICAN cotton farmers are swamping the Commodity Credit Corporation with cotton. Over 5 million bales of the massive new crop have already been put under loan, raising the Corporation's total holding to some 10 million bales, enough for a year's domestic consumption. Cotton prices, which were bumping the support level of 32.70 cents a lb. for most of last year, have recently risen by nearly 1½ cents as supplies have been taken off the market. Sentiment has also been helped by President Eisenhower's request to Congress to increase the borrowing powers of the CCC, and by a slightly better demand for cotton at home and abroad. The strengthening of American cotton prices has contributed to the firmness of "outside growths." Egyptian prices, which are linked to American prices, have risen by more than a corresponding amount owing to the reduction of about 40 per cent in the Egyptian crop, which has enabled the Egyptian Cotton Commission to increase its price differentials over the American market. In New York, however, the future delivery months are all at a discount on the spot price, now about 34.80 cents a lb. Traders are demonstrably sceptical of the American Administration's plans for dealing with the surplus of cotton.

The 1953-54 crop is now estimated at 16,437,000 bales,

compared with 15,136,000 bales in 1952-53. Domestic demand is expected to absorb about 9 million bales and exports about 3.3 million bales. The carry-over at the end of this season may therefore rise by about 4.1 million bales to 9.6 million bales. The International Cotton Advisory Committee expects that production in the rest of the world may fall by between 500,000 to 1 million bales this season, but that the total carry-over may be between two and three million bales larger than last season's 17 million bales. The American Congress is determined to add to the glut. It has raised the effective limit on this year's plantings from 17.9 million acres to 21.4 million, which compares with 25 million acres planted in 1953. As it is the marginal land that will go out of production, the drop in output may be negligible. The President's plans for dealing with the farm surpluses—even if passed by Congress—would not operate until 1955, and only touch on the problem. Surpluses are not removed by segregation, and "friendly" countries can probably look forward to obtaining an increasing proportion of American cotton in one form of "easy payments" plan or another.

Participants in Air Finance

ALLOTMENTS of the capital of Air Finance Ltd., the company launched last autumn by three leading merchant bankers in conjunction with the Finance Corporation for Industry, reveal for the first time the extent to which the aircraft industry has itself participated in the venture. The issued capital amounts approximately to

Cushion Trust Ltd.	...	50,000
Moorgate Nominees Ltd.	...	50,000
Morgan Nominees Ltd.	...	50,000
Finance Corporation for Industry Ltd.	...	50,000
	740,000	233,675

the £1 million originally mentioned, but the greater part proves to be in the form of partly-paid shares, so that the total paid-up capital is just under £308,000. In addition to these initial cash resources (and the right to call up a further £666,000) the company has special loan facilities up to £10 million at the FCI, as well as normal banking facilities.

The accompanying table shows the complete list of subscribers, from which it will be seen that nearly two-thirds of the initial cash has been put up by the four sponsoring financial institutions—Lazard Bros., Erlangers and Morgan Grenfell (subscribing through their nominee companies) and the FCI, each of which has contributed £50,000 wholly by way of the fully-paid "B" shares. Participation by the aircraft manufacturers and makers of components (which have together put up £108,000 in cash) is, appropriately, mainly by way of the partly-paid shares. By far the greater part of the industry's total contribution, it will be seen, has come from six companies—Blackburn, Bristol, de Havilland, English Electric, Rolls-Royce and Vickers, each of which has provided £16,250 in cash. An intriguing feature of the list is its omission of several large units in the industry—notably Hawker-Siddeley, Handley-Page and Fairey Aviation—as well as a number of smaller ones. The new company is, of course, concerned solely with finance in the export field; it is possible that other aircraft manufacturers may participate in it as pressure for credit facilities for overseas customers grows more intense, as it is generally expected to do.

Supersonic Handicap

THE Minister of Supply's statement in the House of Commons about British research on piloted supersonic aircraft was as vague as the question that prompted it. Mr Sandys said that a "considerable programme of research" was in hand and "a number of different types of supersonic service aircraft are in course of development." This goes without saying. A supersonic aircraft is one that can reach the speed of sound in level flight (760 mph at sea level) and represents the next stage in fighter development. While the only service aircraft now capable of this is the American Super-Sabre, it is axiomatic that any future fighters must be planned with at least this performance in mind. The point at issue, however, is whether Britain intends to institute a research programme on high-speed aircraft comparable to the American research that has produced two phenomenal aircraft, the Bell X-1A which reached 1,650 mph (Mach 2.5) in mid-December and the Douglas Skyrocket, which touched 1,327 mph (Mach 2.01) a few days earlier.

One project for a supersonic research aircraft was cancelled in 1946, and no steps were taken to order an alternative design. The idea of conducting high-speed research with piloted aircraft was dropped in favour of using unpiloted models and guided missiles, and it was decided to proceed gradually with the development of piloted aircraft, building up performance step by step with each successive design. Doubts are sometimes expressed whether this programme has produced results as satisfactory as those that the Americans have obtained with the co-operation of their test pilots, and whether something on American lines should not now be attempted. Some critics hold that the teething troubles of the new British fighters might have been avoided had British designers possessed the same knowledge about high-speed flying conditions as American designers.

Plunger to Plastic

Here is a "shooter" at work. His connection with the girl in the plastic mackintosh? He is seeking oil; and oil is one of the basic raw materials for many types of plastics.

The shooter's target lies several thousand feet below the earth in Nottinghamshire. As he presses the plunger he detonates a dynamite "shot." This creates shock waves which are reflected back to the surface from underground rock layers. Recorded and charted, these shock waves indicate where and at what depth likely oil-bearing formations may be found.

About three-quarters of a million tons of oil have so far been produced in Nottinghamshire; not much compared with Anglo-Iranian's yearly output of over 30,000,000 tons, but every ton produced at home saves valuable tanker space.

THE BP SHIELD IS THE SYMBOL OF THE WORLD-WIDE ORGANISATION OF

Anglo-Iranian Oil Company

It's good business TO TRAVEL BY FRENCH RAILWAYS

When in France, travel by the service that serves all France. French Railways have the most up-to-date rail system in Europe with fast services to all parts of the country and excellent connections with adjoining states. A whole variety of reduced-fare tickets are offered, so that extended travelling shows an appreciable drop in cost per kilometre. Aboard the train comfort and courtesy surround you: excellent meals may be had en route and wagon lits or couchettes (1st and 2nd class) ensure a good sleep for overnight passengers.

Better travel by SNCF FRENCH RAILWAYS

Information, tickets and reservations from any good Travel Agent or French Railways Limited, 179 Piccadilly, London W.1.

TOURIST TICKETS
offer a 20% or 30% reduction on ordinary fares, subject to a minimum return or circular journey of 1,500 or 2,000 Km and certain conditions of stay in France.

FREE BOOKLET "FRANCE"
A postcard NOW brings you a free copy of this exquisite colour printed travel book giving a delightful foretaste of the French scene; included also is a folder of practical information on rail travel.

Pint-Sized Atom Plant

REPORTS that the Radio Corporation of America has succeeded in generating electricity direct from materials made radio-active in an atomic pile have caused interest but hardly excitement among British scientists and industrialists. In itself, the RCA demonstration is a considerable feat. Taking a material known as strontium 90, a by-product of atomic fission, the Americans constructed a small battery. The highly radio-active strontium gives off vast quantities of electrons; if these electrons bombard a germanium transistor (a sophisticated version of the cat's whisker and crystal, which is replacing the familiar radio valve in certain uses) they displace a far greater number of slower-moving electrons from the transistor, and the result is an electric current. Even though the currents so far achieved are infinitesimal, this represents a completely new way of obtaining electricity, involving neither turbines, nor generators, nor boilers, nor any fuel other than the radio-active waste products of uranium fission. The principle seems to have been known to scientists for some time, but RCA is the first to build a gadget round the phenomenon.

A great deal of study is going on in Britain about ways of making use of the immensely powerful radiation from atomic wastes, the disposal of which raises peculiar and thorny problems. A paper on the effect of radiation on transistors is being prepared at Harwell, and may be published shortly. Information so far released about the new RCA "battery" is scanty, and suggests that the difficulties of further development may be immense.

Instead, they offer the rather breath-taking suggestion that quicker progress might be made, despite the additional complications, by attempting to negotiate simultaneously a number of agreements, which could be operated independently or together. Their report argues that countries might more readily make a concession in one commodity in return for a similar concession in another—much as they bargain over tariff reductions at GATT. Such agreements might also attract wider support and have a longer life than single-commodity agreements. The United States, for example, might have been willing to join the agreement on tin (which it imports) as the price of an agreement on wheat (which it exports); and Britain might have been more reluctant to leave the wheat agreement at the cost of losing the tin agreement.

The report considers that the buffer-stock type of agreement is generally preferable to the multilateral contract and opposes, except in special circumstances, an agreement which restricts production, because this tends to feather-bed the high cost producers. The theoretical virtue of the buffer stock is that it does not interfere with the pattern of production and trade, and simply moderates violent short-term fluctuations of the trend of prices. The practical difficulty, which is recognised in the report, is that without restrictions, the cost of financing the stock—at least in the short term—can rise to massive proportions.

Barriers to Scientific Liaison

THE British Commonwealth Scientific Office (North America) has been established in Washington, under various names, since 1940, with the responsibility for scientific liaison originally between the United States and Britain, and now extended, through separate missions, to other members of the Commonwealth. It was at first concerned mainly with liaison on military research and development, but has since the war broadened its collaboration to the economic and industrial field. Its latest review of "Science in USA" contains once again an informative review of development in many fields of American research. But the review also refers to one administrative decision of the United States Government that may make the missions' own work of liaison more difficult than before.

In March, 1953, the two "documentation centres" of the Department of Defence were amalgamated into a new body, the Armed Services Technical Information Agency. The regulations under which this new agency works make it the main channel of dissemination for technical reports produced in the Department. It is authorised to distribute unclassified material only "for use in connection with United States military projects and contracts and other Department of Defence work." Astia is forbidden to supply even unclassified material except for defence purposes, and even persons doing defence research are allowed only material for which they have established a "need-to-know." But in particular, Astia is not concerned to collect information from foreign sources, and is expressly precluded from supplying information to "foreign governments or nationals."

Much of the unclassified defence material is eventually published, though this introduces an extra time lag; and

* "Commodity Trade and Economic Development"; United Nations, 5a.

some reports are sold to the public through the Department of Commerce, which does issue partial lists of published technical reports. Direct exchanges of research reports between institutions or branches of the Department is still allowed; and it is still not too difficult to obtain unclassified research material from other Federal departments, usually after delay. Attitudes of American Government agencies towards dissemination of information differ widely—the Atomic Energy Commission, for example, passes out unclassified information about its multifarious activities on the widest and most useful scale. Even so, the new restrictions under which Astia works must reduce the effectiveness of such liaison organisations as the Commonwealth Scientific Missions, for the Department of Defence itself is financing more than a third of all the scientific research in America.

Ice-Cream and Cinema Profits

THE one figure that the cinema industry has always chosen to leave out of its elaborate estimates of profit and loss, when presenting its case for relief of Entertainment Duty to the Customs and Excise Department, or arguing over the "Eady" levy with the Board of Trade, has been the income that it derives from selling ice-cream and confectionery to its audiences. It has always been uncomfortably aware, however, that the Board of Trade has had a good idea of what these sales amounted to, having once obtained detailed figures in the course of collecting its quarterly statistics. Last week the Board, through Mr H. E. Browning and Mr A. A. Sorrell of its statistics department, revealed what it knew of this last missing piece in the jigsaw of film finance.

In a comprehensive and useful survey of statistics of film cinema exhibition, read before the Royal Statistical Society, Messrs Browning and Sorrell revealed that in the quarter for which details of these ancillary sales were obtained, April-June, 1951, cinemas sold £670,700 worth of tobacco, and £2,827,500 worth of ice-cream and confectionery. Practically every other person who went to the cinema, it seemed, bought some kind of refreshment—usually ice-cream. Since that time there has been a decline in admissions, which in 1952 was at the rate of about 4 per cent, and there may have been a greater falling-off in sales. Since sweets rationing was abolished, more confectionery has been sold in cinemas, partly replacing ice-cream, and the profit margin on sweets is much lower; though it may be added that the promotion of these sales has been enlivened by many managements, and sales of soft drinks appear to have expanded.

Messrs Browning and Sorrell offered no estimates of profit margins on these sales—which might in fact be about 9 per cent on tobacco, up to 50 per cent on ice-cream and 30 per cent on sweets—but they commented that the profit on a turnover of more than £3 million a quarter "must have made a substantial contribution towards the revenue of the trade." On their own showing, it needs one. They suggested that in 1951-52 the exhibitors as a group might have been just about able, from film revenues, to cover all costs "except the payment of rent." Even an annual profit of perhaps £5 million on ancillary sales, plus perhaps £1½ million from showing screen advertising,

would not seem to offer a particularly fat margin for rent and operating profit on cinemas worth in prewar values some £95 million.

Boom in Valves

ONE section of British engineering that has been unusually stimulated by the development of petroleum refining and chemical process industries—as well as from new techniques developed to serve the atomic energy projects—during the period of dollar scarcity since the war is the manufacture of valves to control the flow of liquids and gases. Output has grown considerably, while exports have recently shown a better record than any other engineering product. More manufacturers have turned to specialising on valves; and within this more concentrated industry individual companies have themselves been specialising to a greater extent upon particular types and ranges of industrial valves—which may vary, for example, from water valves 13 feet in diameter to half-inch stop valves.

A review of progress in this industry published this week by the British Productivity Council records that valve output has increased fourfold in value since 1946. Increases in prices must account for a considerable proportion of this growth; the review quotes incomplete prewar figures which suggest that the volume of output today is about two and a half times the volume in 1935. The slackening of demand for some types of capital equipment that developed late in 1952 has had little obvious effect upon the output of these

ANNUAL DELIVERIES AND EXPORT OF INDUSTRIAL VALVES

Year	Value of Total Deliveries £'000	Expressed as % of 1946 Value	Value of Deliveries for Export £'000
1945*	3,901	78	1,140

ubiquitous components, the value of which continued to increase during the first ten months of 1953. Nevertheless, orders have been slackening in recent months; delivery periods, which for certain types of valves lengthened to two or three years in the immediate postwar years, are now down to a few months, while some manufacturers are producing only to orders received.

About 85 per cent of valves are today made by specialist companies (against only about 50 per cent in 1935), and probably some 15,000 people are employed in valve manufacture. The Productivity Council thinks that in this industry the volume of output per man-year probably increased slightly more between 1948 and 1953 than it did in manufacturing industry as a whole (for which it puts

SHIP'S PLATE

"It'll sink," they said, when the first iron ship was launched. But it didn't.

Iron was eventually superseded by steel for ship construction and today in shipbuilding more steel plates are used than in any other industry. Usage of steel plate in other directions is, however, developing fast. Since the war, nearly all railway wagons have been largely built of steel plate. The movement and storage of oil calls for immense quantities for storage tanks, pipe lines, road and rail tankers and tanker ships. Tanker ships, which require proportionately more plates than other ships, now form about 50 per cent of our shipbuilding output.

These are some of the reasons for the great rise in the demand for plates and why production has been increased from 1,633,000 tons in 1946 to at least 2,400,000 tons in 1953.

STEEL is at your service

THE BRITISH IRON AND STEEL FEDERATION Ltd

SUPER FINE WIRE

Great developments in the modern fields of Telecommunication and Electronics have created an exacting demand for fine resistance wires. We have a large and up-to-date plant engaged in the production of Super Fine Wires, where manufacture from start to finish is closely controlled at every stage. We supply Super Fine Wires in all our resistance alloys, notably "Nichrome V", "Nichrome", "Karma" and "Advance", in sizes from .002 in. (0.05 m/m.) downwards.

the annual average increase at slightly over 2 per cent); in the valve industry "and others" this improvement in productivity is attributed largely to the amount of additional capital equipment installed.

SHORTER NOTES

Final results of the first sale of state-owned transport units by the Road Haulage Disposals Board, published this week, confirm the earlier indications that this was a failure. Out of 398 transport units comprising 2,323 vehicles with operating licences and 157 spare vehicles, bids were accepted for only 159 units of 602 vehicles with operating licences and 14 spares. The sales of transport units with premises as well as vehicles were even less successful than those of "vehicles-only" units. A number of the transport units for which all bids were unacceptable, or for which no bids were received, are to be put up for sale again in a "special list" to be advertised this month. Two further lists of vehicles for sale have already been advertised, and a fourth list, apart from those units being put up again, will probably be published next month. Even this fourth list will leave the Commission with about 20,000 vehicles that have not

been offered for sale, apart from those it is allowed to retain under the Act.

The second half of the wool-selling season has opened a few pence lower for merino and fine crossbred wools, but prices of medium crossbreds are almost unchanged. The New Zealand Wool Commission (London Agency) estimates that in January the average clean cost, delivered UK, of merino 70's and 64's fell by 4d. to 156d. and 135d. a lb respectively; crossbred 58's were 2d. cheaper at 111d. a lb, and 56's were unchanged at 90d. Medium crossbred 50's and 46's were 1d. cheaper at 72d. and 69d. a lb respectively.

The Council of Foreign Bondholders has now made known the weighting scheme which it has suggested to the Treasury for use in deciding the relative treatment of various Bulgarian, Hungarian and Rumanian loans in the distribution of ex-enemy property. Maximum weighting in respect of unpaid interest, principle and sinking fund is given to the Rumanian 4 per cent 1922 loan and to the Monopolies 7 per cent loans of 1929 and 1931. Maximum weighting is also given to the Bulgarian League of Nations loan and the Hungarian League of Nations loan.

Company Notes

TOOTAL. The bonus issue of ordinary shares and the bigger equity dividend from Tootal did not take the market by surprise. It had been anticipated for some weeks and the £1 ordinary shares, which stood at 84s. at the beginning of the year, were quoted at 105s. on the eve of the announcement. Intelligent and anticipatory speculation can go a long way. The actual increase in dividends, however, was larger than had been expected and after the announcement the shares jumped to 119s. 6d.

Speculation about speculation is not a rewarding study. And shareholders would do better to concentrate on the implications of the bonus issue itself. By capitalising £2,400,000 from reserves the company intends to make a 300 per cent bonus issue to ordinary shareholders, raising the equity capital to £3,200,000. On this new capital, the directors intend "having regard to current trading conditions and the present earnings of the business" to pay a dividend for the year to June 30, 1954, of 10 per cent. This new dividend represents a rate of 40 per cent on the existing capital, compared with 25 per cent (including a 12½ per cent Corporation bonus) paid in 1952-53 and of 15 per cent (including a 2½ per cent bonus) paid in 1951-52. All doubts about the next dividend and the present course of the group's trade have been set at rest by this announcement. Clearly the recovery in sales and earnings from the 1950-51 recession

recorded in the company's latest accounts (for the year to June 30th last) has been carried a stage further.

A 300 per cent bonus issue, however, implies something more than confidence in the immediate future. It suggests that at the very least the directors have a good deal of confidence in the longer term prospects as well. In commenting on the issue they point out that the company's postwar policy of retaining the greater part of earnings has enabled the group to develop, modernise and extend its plant. About £2½ million has been invested in fixed capital and further sums have been invested in working capital and in sales organisations overseas. Nor has a halt been called to this policy. The directors emphasise that "considerable sums will be needed in the near future for financing new projects already begun or planned, and additional sums will be required for working capital if the business is to continue to expand in the manner the directors anticipate."

In fact, they seem reasonably certain that the group will be able to plough back a good part of its profits to maintain a high degree of liquidity in the business as well as to pay a dividend of 10 per cent on the new and enlarged capital. If they are right, then the yield of 6½ per cent offered on the basis of the new dividend cannot be very far off the mark. It accepts the directors' assessment of the future but not without the important proviso that Lanca-

shire is the home of one of the most vulnerable of British industries.

HARRODS (BUENOS AIRES).

As a footnote to present indications from Argentina that fresh British capital investment would be welcomed and to the new law that capital entering Argentina after August 26th last year for approved investment would be allowed remittance at the rate of 8 per cent per annum, the experience of one of the older investments in Argentina may be enlightening. Harrods (Buenos Aires) has been adding substantially to its stake in Argentina, but recent

* Excluding peso profits earned in Argentina; profits of 75,325,248 pesos earned in the three years to August 31, 1953, are excluded as non-transferable.

additions have not been of a voluntary nature. Mr F. A. Stacpole, the new chairman, tells shareholders the worst. From profits earned after June 30, 1949, the company has so far been permitted to remit nothing except for a small amount of debenture interest of a subsidiary company. The law which allows the Argentine central bank to grant up to

a non-cumulative 5 per cent of profits earned on recognised capital after August 27, 1950, so far as foreign exchange is available, just has not been operated for the company. It and its subsidiary—South American Stores (Gath and Chaves)—have submitted applications without effect for about 41 million pesos. In addition there are accumulated profits amounting to about 64 million pesos which appear unremittable under present regulations.

This sorry treatment by the Argentina of the past profits of the group takes some of the edge off the fact that peso earnings, too, are now falling sharply. Mr Stacpole reports a drop in consumer buying with fiercer competition among retailers and expects profits for the year to August 31st at least to be small, this being the natural consequence of a slowing down of inflation. The 8 per cent preference dividend is being paid with the aid of a transfer from reserves and with a warning as to the uncertainty of future dividends. There is no ordinary dividend and has been none since 1951.

ASSOCIATED COMMERCIAL VEHICLES. The full accounts of Associated Commercial Vehicles, one of the giants of the commercial vehicles industry, tell much the same story as that unfolded in the accounts of the leading motor car manufacturers. Trading profits changed little in the year to September 30th; at £1,984,319 they were £141,462 higher than in 1951-52. This increase, however, was no mean achievement in a year that witnessed a decline in the production of commercial vehicles.

The increase in gross profits is reflected both in the rise in taxation and in net profits. Yet in spite of the advance in net earnings (from £633,946 to £774,399), the directors have been content—as their confrères elsewhere in the motor industry were—to leave the ordinary dividend un-

changed. It is again 22½ per cent. The directors have ploughed back more money into the business, a policy that they have pursued for a number of years, while adding to the interests of the group. To some shareholders the time must seem ripe when the rigours of this policy should be lightened by granting a bigger return on the equity.

As with most of the other motor manufacturers, the year to September 30th brought a substantial easing of ACV's working capital commitments. Its stocks were reduced by £2,179,679 to £6,084,417, accompanied by the inevitable rise in

	Years to September 30,	1952	1953

liquid balances. The group's cash balances rose from £502,511 to £2,126,863 and, in addition, the group was able to lend out £725,000 in short-term loans. The group was, no doubt, encouraged to reduce its investments in stocks and work in progress by the fuller and steadier flow of raw materials to its factories. The signs of prosperity are as much in evidence in ACV's accounts as they were in the other motor company reports but these signs should not be allowed to gloss over the fact that the commercial vehicle manufacturers are in for a competitive struggle as keen as that in the motor-car industry.

LONDON STOCK EXCHANGE

Next Account begins: February 10th.
Next Contango Day: February 10th.
Next Settlement Day: February 16th.

In spite of a slight reaction in gilt-edged prices, industrial equities made fresh progress this week. Gilt-edged stocks, which had remained firm before the week-end, tended to slip back. The market was very quiet and these losses were confined to about ½ of a point. By contrast, Dominion and Colonial securities remained firm. One of the most active sections of the market was that dealing in foreign bonds. Japanese issues rose sharply in response to the signing of the trade agreement and, though profits were taken later, they did not lose all the ground that they had gained. At first, German loans advanced, with the exception of the Potash bonds which were marked down on the announcement that the debtors had not made a fresh offer. Later, however, the Potash bonds rallied but the other German loans turned dull. Elsewhere in the market, some speculative interest was taken in Greek issues and in Balkan issues (in advance of the statement on the distribution of frozen assets).

The demand for industrial equities improved and as the market was none too well supplied with stock, prices responded with widespread gains. Engineering issues were in the van of this rally. Later on tobacco shares (led by "Bats") and confectionery shares joined in this rally. The biggest movements, however, were recorded in textile shares. These were marked down on Monday, following the news of the Anglo-Japanese trade agreement, but the announcement of the bonus issue and bigger dividend from Tootal led to a very strong recovery. Most of the leading cotton textile shares took part in this advance, with Linen Thread and J. and P. Coats in the lead. Oil shares were very active but prices moved rather irregularly; Shell remained firm but Anglo-Iranian, which had been marked up on Monday, lost some ground. Tea and rubber shares were very quiet and prices were hardly tested. Kaffirs were dull at the beginning of the week, but improved on Wednesday and in early dealings on Thursday when the Cape renewed its support for uranium issues.

allowed to have them out for twenty-eight days' holiday a year. The Air Council has also announced some special concessions (such as furniture allowances) for RAF men serving overseas. Such concessions, designed to soften the rigours of service life, are badly needed. They will probably do as much as, or more than, straight pay increases to help to keep the regulars in harness.

A grimmer note was struck in the House when Mr Sandys, the Minister of Supply, announced that bacteriological experiments are to be carried out in Bahaman waters this year. These are not in themselves a novelty; research on germ warfare has been going on in this country for many years, but the empty spaces in West Indian waters offer more scope for investigations which no responsible government should hesitate to undertake. A bigger question mark hangs over the announcement that next year's estimates for Civil Defence are to be cut by £2 million. The cuts fall chiefly on equipment and materials, which are the only heads under which the civil defence authorities have been spending much money; so much equipment was bought to help Lancashire out of its 1951 textile slump that stocks are now overflowing. These estimates were probably mainly prepared before the recent Select Committee criticised the inadequacy of civil defence; although the burden of that committee's complaint was not that estimates were too low, but that expenditure never came up to them, the virtual standstill in the most important forms of civil defence expenditure seems bound to leave the civilian population with a distressingly naked look.

Voting Without Choice

THE 1,347 hand-picked candidates for the Supreme Soviet have duly polled 99 per cent of the votes in the Soviet parliamentary "elections." After an electoral campaign which sounded as if everything was in earnest, this was a useful reminder that the whole election is a mere formality. The candidates of the "Communist and non-party bloc" are selected from above, and once they have received official blessing need fear no qualms at the polls, since they are unopposed. The electors have the right, indeed the duty, to vote—but not to choose. The Supreme Soviet is supreme only in name and theory, while the real power in the country is wielded by

(1) This covers mining, manufacturing, electricity and manufactured gas with the following exceptions: Denmark and Greece exclude mining; Ireland and Sweden, electricity and manufactured gas; and Austria, manufactured gas. (2) Special trade (excluding re-exports) with the exception of Ireland which covers general trade. Belgium includes Luxembourg.

Financial Statistics

EXCHEQUER RETURNS

For the week ended January 30th, there was an "above-line" surplus (after allowing for Sinking Funds) of £123,130,000 compared with a surplus of £137,440,000 in the previous week and a surplus of £108,947,000 in the corresponding period of last year, bringing the cumulative account to a surplus of £2,617,000 (compared with a deficit of £20,229,000 in 1952-53). Net expenditure "below-line" absorbed £10,708,000 which brought the total cumulative deficit to £320,727,000 (£497,674,000 in 1952-53).

* In consequence of official purchases of tender bills in connection with cash subscriptions to the Exchequer Stock Loan in October, it was impossible to calculate the dividend between tap and tender bills until all the bills purchased had passed their original maturity date.

THE MONEY MARKET

CONSIDERABLE revenue transfers made credit generally short in the week covered by the Bank return, but as the authorities stepped in with special purchases of bills no serious stringency developed. Such purchases were needed on a moderate scale on the Thursday of last week, and were made almost wholly through the banks; but on Saturday and Monday the amount required was relatively small. On Friday and Tuesday market supplies of credit were just adequate, whilst on Wednesday credit conditions turned very easy, with balances unlent at the close.

The market maintained its bid at £99 9s. 6d. for the £220 million of Treasury bills on offer at the tender, but as applications increased by over £38 million, to £382 million, its allotment fell from 58 per cent in the previous week to the unusually low level of 36 per cent. The offer at yesterday's tender remained at £220 million; if this is fully allotted there will be no excess of maturities next week.

The Bank return shows an increase in the active note circulation by £3.4 million, marking the first reversal of the post-Christmas reflux. Government securities in the banking department were down by £3.9 million; but this fall was wholly due to the fall of £12 million in the Treasury special account (which reflects the notional book-keeping connected with the receipt of defence aid). "Other" securities were up by £8.3 million and public accounts by £7.4 million, so that bankers' deposits rose by £5.8 million to £284.4 million.

BRANCHES THROUGHOUT THE COUNTRY

Perhaps you
didn't know that
LA CHAUX-DE-FONDS

has a beehive on its coat of arms, signifying
the diligence and industry of its famous
watchmaking citizens?

But everybody
knows

that La Chaux-de-Fonds annually exports
more than one-half of the whole Swiss produc-
tion of watches, and also millions of postage
stamps printed there for foreign Governments.
Naturally, like all other Branches, the La
Chaux-de-Fonds Branch of the Union Bank
of Switzerland, has great experience in all
matters concerning imports and exports.
This experience is available to you.

1853

1953

The Chartered Bank of India, Australia and China was incorporated in England by Royal Charter on 29th December, 1853, and during the ensuing century its system of Branches has been progressively extended to most centres of commercial importance throughout Southern and South Eastern Asia and the Far East. At all these Branches a complete banking service is available and, in particular, facilities are provided for the financing of international trade in co-operation with the Bank's offices in London, Manchester and Liverpool, its Agencies in New York and Hamburg, and a world-wide range of Banking correspondents.

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

Head Office: 38 Bishopsgate, London, E.C.2.

For One Hundred Years the Standard Bearer
of the British Financial Tradition in the East

BAY HALL TRUST LIMITED

Summary of Directors' Report for the year
ended 31st December, 1953, and of the
accompanying Statement by the Chairman,
Sir Charles Hambro, K.B.E., M.C.

DIRECTORS' REPORT

The gross revenue amounted to £284,222 compared with £219,911 in 1952. After charging Debenture Interest, Taxation, Directors' Fees, Management and General Expenses amounting to £104,770 the net profit is £99,452. Adding £145,205 brought forward, the total available for appropriation is £244,747. The Directors have placed £250,000 to General Reserve and recommend a dividend of 7½ per cent., free of tax, which will absorb £76,035, leaving £118,712 to be carried forward.

At market prices on 31st December, 1953 (or where no market price existed at the valuations by the Directors at that date amounting to £282,913), the Share and Debenture Holdings and Foreign Government Securities had an aggregate value of £2,742,797 as compared with their book value of £2,291,846.

CHAIRMAN'S STATEMENT

The net profit of £99,452 compares with £99,845 for 1952, an increase of £2,007. Full provision has been made in the Profit and Loss Account for United Kingdom taxation in respect of all income to 31st December, 1953. Double taxation relief allowable to the Company amounting to 2s. 6d. in the £, has been taken into account in arriving at this provision. At the end of 1953, the value of the investments showed an indicated appreciation of £450,848 over book cost. Over 22 per cent. of the investments, taken at the valuations at 31st December last, are situated in the United Kingdom, Union of South Africa and other parts of the British Commonwealth. About 25 per cent. of the investments are in ordinary stocks and shares and the balance in fixed-interest bearing securities.

COMPANY MEETINGS

RADIO RENTALS LIMITED

INCREASED VOLUME OF BUSINESS

DEMAND FOR TELEVISION STEADILY SUSTAINED

MR H. F. HUNT ON THE CONTINUED PROGRESS

The seventeenth annual general meeting of Radio Rentals Limited was held on February 2nd at Grosvenor House, Park Lane, London, W.1, Mr H. F. Hunt (the chairman) presiding.

The secretary (Mr J. L. Wilkie, CA) read the notice convening the meeting and the report of the auditors.

The following is the statement by the chairman which had been circulated with the report and accounts:

In presenting to you the directors' report and the accounts of the group to August 31, 1953, it gives me great pleasure to report an increased volume of business, and a considerable degree of development, resulting in an increased profit.

RECORD NUMBER OF NEW SUBSCRIBERS

The profit of the group for the year under review, after providing for all charges, other than taxation, amounted to £536,440, an increase of £172,262 over that for the previous year. This increase is attributable mainly to the growth in the number of the company's subscribers during the year, which was greater than ever previously achieved in the history of the company. Public interest in television was very considerably stimulated by the Coronation of Her Majesty Queen Elizabeth II, and as a result, business in the summer months was much heavier than could normally have been expected. I am happy to be able to tell you that, since the Coronation, the demand for television has been very steadily sustained.

Another factor contributing to the increased profit, is that in a very considerable number of areas in which we are making television services available, the number of subscribers per branch has reached a level at which television renting becomes profitable.

Having now had several years' experience in the renting of television sets, we have been able slightly to reduce the rate of depreciation on our instruments, so that it is now only a little higher than the rate allowed to us by the Inland Revenue authorities for taxation purposes. Even so, the amount charged for the year is no less than £689,313. In this connection you will note that the sum of £47,955 has been credited in respect of provisions for depreciation in prior years, now no longer required.

GRIEVOUS TOLL OF TAXATION

The net profit attributable to the members of your company, after charging all expenses including taxation, totalled £125,362, an increase of £25,469 over that for the previous year. In considering this net profit, the most relevant factor is, of course, the grievous toll of taxation levied on your company in this particular year. Excess profits levy, for which the group is liable at the maximum rate, calls for no less than £104,144, making the total taxation liability £403,421, which is over 75 per cent of the profits earned. As I pointed out last year, excess profits levy operates most unfairly on a developing business such as ours. The only consolation is that it has now

been recognised by the Government as a bad form of taxation. It ceased to operate, as you all probably know, on December 31st last.

During the year under review, as I have already told you, the attention of the public has been increasingly focused on television. It is also very satisfactory to note that during the year our growth in the number of our radio subscribers was greater than that achieved during any of the past few years.

SUBSIDIARIES' ACTIVITIES

All the subsidiary companies operated at a profit for the year under review, except Rentevision, Limited, which has not commenced to trade, and they all played their part in contributing to the earnings of the group. Tribute is especially due to our factory at Bradford, operated by Mains Radio Gramophones, Limited, which not only continued to supply the group with sets of the highest quality at economic prices, but also increased their scale of production to a most creditable level.

Burgot Rentals, Limited, the company renting burglar alarms, made continued progress during the year, and I am happy to tell you that its services are well regarded by those most concerned with crime prevention and detection in this country.

Turning now to the profit and loss account, the only item to which I shall call your attention is of staff bonus, pension scheme and staff welfare fund. We are very fortunate in having a co-operative team of employees, and I am certain that the main increase under this heading, which consisted of a Coronation bonus of a week's wages to every member of the staff, will meet with your full approval.

NEW BRANCHES

Apart from meeting the greatly increased demand for television in all areas already served by the group, our most pronounced progress has been in the opening of new branches, in an effort to obtain fuller national coverage. Since I last reported to you, we have opened branches in several towns including Hull, York, Grimsby, Merthyr Tydfil, Aberdeen and Wallasey, and have obtained better premises for some older branches.

I would now like to deal with the matter of appropriations. Your directors propose to increase the rate of ordinary dividend for the year to 40 per cent by recommending the payment of a final dividend of 30 per cent. Your directors also propose that £100,000 be transferred to general reserve, so bringing it up to £288,319.

Trading in the current financial year to date shows a reasonable improvement as compared with the year under review.

COMMERCIAL TELEVISION

I feel I should make some short reference to commercial television. Naturally, we shall endeavour to provide the necessary adaptors to enable our existing and future sets to

receive the alternative programmes, when they become available. This development will, I am sure, result in increased business for your company.

It now only remains for me to record the thanks of the board and the shareholders to the staff of the group for their efforts during the past year. For many years we have been fortunate in the group in having "a happy ship" and I am sure that it is your wish, as well as mine, that this will long so continue.

The report and accounts were adopted and Mr A. D. Smith, FCIS, was re-elected as a director.

Mr H. F. Hunt told the meeting of his intention to retire after having been chairman of the company for 21 years, including the years before it became a public company, but intimated that he was continuing in the service of the company as financial adviser. Mr Ferring-Thoms paid tribute to Mr Hunt's service to the company as chairman and the meeting closed with a vote of thanks to the chairman and the board, proposed by a shareholder.

KOLOK MANUFACTURING COMPANY LIMITED

(Manufacturers of Carbon Papers,
Typewriter Ribbons, Stamp Pads
and Inks)

REASSURING PROSPECT

The forty-fifth annual general meeting of Kolok Manufacturing Company Limited was held on January 29th at Tottenham, N.17. Mr E. S. Dumont (Chairman and Managing Director) presided and said:

The net profit of the company for the year ended August 31, 1953, is £111,677 and the net profit of the group is £122,760. Whilst this represents a reduction in the group profit of £18,956, it is a far smaller reduction than I anticipated at the commencement of the year when we were faced with very difficult conditions and a recession in trade.

During the latter half of the year under review there was an improvement in the demand for your company's products and the improvement has been maintained. The prospect for the current year is therefore reassuring, although profit margins are being affected in some cases, particularly in export markets.

The financial strength of the group has been well maintained, the surplus current assets over current liabilities amounting to £294,276 as compared with £287,104 for the preceding year.

The group value of the stock in trade has been reduced as compared with the preceding year by £59,648, which is reflected to some extent in the increase in cash including tax reserve certificates.

Taking all the circumstances into consideration, your directors feel able to recommend a higher dividend distribution for the year under review. The increase is represented by the proposed final dividend of 22 per cent on the present Ordinary share capital of £125,000, compared with the final dividend for the preceding financial year which was 20 per cent on the then issued Ordinary share capital of £100,000.

I express my cordial thanks and appreciation to all in our service for the loyal and excellent manner in which they have carried out their duties, and to my colleagues on the board for their encouragement and support.

The report and accounts were adopted.

GOLD & BASE METAL MINES OF NIGERIA

INCREASING COLUMBITE PRODUCTION

The nineteenth annual general meeting of Gold & Base Metal Mines of Nigeria, Limited, was held on January 28th in London.

Major General W. W. Richards, CB, CBE, MC (the chairman), in the course of his speech, said:

Members will no doubt be interested to have some guide as to the result of our operations for 1953.

As already published, production totalled 552 tons of tin concentrates and 93 short tons of columbite, both having an average grade of over 73 per cent.

As regards the financial results for the year, it is estimated that, provided the price of tin does not vary considerably from the present price for the next three or four months, our working profit, before depreciation, interest charge, etc., will be somewhat less than for the previous year, but this could only be expected in view of the heavy fall in the price of tin and the reorganisation in the company's operations previously referred to by me in Nigeria during the year.

An estimate of the position for 1954 is difficult to make, but our target is to increase columbite production by 50 per cent.

MINES DEVELOPMENT SYNDICATE (WEST AFRICA)

I would like to refer to Mines Development Syndicate (West Africa), Limited, who own the lead zinc deposits in Southern Nigeria. It is expected that a limited underground development programme will soon be undertaken from existing shafts commencing initially at the Ameri Lode. The object of the programme will be to prove part of the higher grade ore reserves already indicated by diamond drilling. It is confidently expected that the programme covering both Ameri and Nyeba will be completed by the end of 1955 and will place the Syndicate in

a position to raise the additional finance necessary for production.

INCREASE OF CAPITAL

Members will be asked today to pass a resolution to effect an increase in the authorised capital of the company. This has been done for one reason only—the flexibility which unissued capital gives to a company.

I would assure you, however, that there is no intention at present of issuing this additional capital.

The report was adopted and a resolution passed increasing the capital from £600,000 to £1 million by the creation of 3,200,000 shares of 2s. 6d. each.

TANGANYIKA CONCESSIONS, LIMITED

The annual general meeting of Tanganyika Concessions, Limited, was held on January 28, 1954, in Salisbury, Southern Rhodesia, the Right Honourable Sir Ulick Alexander, GCB, GCVO, CMG, OBE, the chairman, presiding.

Addressing the meeting, the chairman said that while the developments in which their associated company, the Union Minière du Haut-Katanga, had been engaged in the Belgian Congo since the war were well known to stockholders—and indeed the profitability of this enterprise was clearly reflected in the profit and loss account of their company—what was perhaps less well known was the development programme which their company had at the same time been carrying out in Angola with the Benguela Railway Company.

Few would doubt the importance today of the development of Central Africa, a development which had grown rapidly of recent years and showed every indication of increasing at an even greater tempo in the near future. The Benguela Railway was clearly destined if only by its geographical position, to play a major part in this development, and it was with this in mind, as well as the immediate tasks of serving the needs of Angola and the Belgian Congo, that their board had formulated their policy in regard to the railway. The programme had indeed

been impressive, and one of which they felt they were entitled to be proud.

The financing of this great development in Africa had not been easy, but their board believed that it would provide in the reasonably near future an adequate return to their company for the outstanding enterprise which it had shown.

The report and accounts were adopted.

MICHAEL NAIRN & GREENWICH, LIMITED

IMPROVED RESULTS

The thirty-second annual general meeting of this company was held on January 28th at Kirkcaldy, Sir Robert Spencer-Nairn, Bt, the chairman, presiding.

The following are extracts from his circulated statement:

The net profit attributable to our group for the year ended September 30, 1953, amounts to £327,155, which compares with £195,712 for the previous year and shows an increase of £131,443. The board recommend a final dividend of 12½ per cent, less tax, which makes a total of 15 per cent for the year. Stockholders will be gratified to see that the results are a material improvement on those of last year.

Trading in the early part of our financial year was disappointing, particularly in our export markets. Sales, however, in the latter part of our financial year have been sufficient to offset any diminution in the earlier part of the year. The future of our industry at home should benefit from the general increase in home building, which, encouraged by the present Government, is expected to follow the easing of restrictions on private building, while the freeing of soft timber from control and the anticipated early return to wood floors in houses should result in an increased demand for our products.

Problems, both economic and political, remain and dictate caution in assessing the possible extent of our activities in the coming months. The Nairn organisation continues well capable of making the most of whatever conditions may be encountered.

The report was adopted.

PROFIT by EUCLIDS

EUCLID Tractors & Scrapers handle a heaped load of 16 cu. yds. at a speed of 29 m.p.h.—the fastest earthmoving units of their kind.

BLACKWOOD HODGE

Subsidiary Companies Branches Works and Agencies throughout the World

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA invites applications from suitably qualified British subjects, not older than 32 years of age, for the post of ASSISTANT TRUST OFFICER at Singapore. A knowledge of taxation will be a recommendation.

Applications, or requests for further information concerning the appointment, may be addressed to the Secretary of the Bank at 38 Bishopsgate, London, E.C.2.

PRODUCE OFFICER required by the NIGERIAN GOVERNMENT MARKETING AND EXPORTS DEPARTMENT for 18-24 months in first instance. Salary, etc., according to experience in scale £807, rising to £1,631 a year. Gratuity of £100/£150 a year. Outfit allowance £60. Free passages for officer and wife. Assistance towards the cost of children's passages or grant up to £150 annually for maintenance in United Kingdom. Liberal leave on full salary. Candidates under 40, must have a University degree in Commerce, Economics or Agriculture, and should possess administrative ability. Experience of inspection and grading of agricultural products an advantage. Write to the Crown Agents, 1 Millbank, London, S.W.1. State age, name in block letters, full qualifications and experience, and quote M5C/39943/EN.

PRINCIPAL ASSISTANT-SECRETARY required by the Scottish Council (Development and Industry). The post will be a responsible one requiring adaptability and resource. Administrative and/or business experience essential. Salary according to qualifications. Applications with not more than three relevant testimonials and specifying three persons to whom reference may be made, should be addressed to the Secretary, The Scottish Council (Development and Industry), 1 Castle Street, Edinburgh, 2.

EXPORT MARKET ANALYSIS ASSISTANT required by Ford Motor Company Limited, of Dagenham, Essex. Must be young and possessed of initiative as well as enthusiasm for his subjects. Economics graduate preferred. Knowledge of agriculture or tractor usage a useful asset.—Reply to Salaried Personnel Department, quoting reference KMR.

AN Executive Director required to assist with the management of an old-established Public Company in the manufacturing field. The Company employs approximately 2,000 personnel. Applicants must have had experience of higher management and control.—Full particulars to Box 442.

14 NEW TOWNS. Latest facts, figures and comments in special issue of "Town and Country Planning" journal for planned as well as planners. 1s. 6d. from 28 King Street, W.C.2.

THE UNIVERSITY OF MANCHESTER

Applications are invited for the post of ASSISTANT LECTURER in GOVERNMENT. Salary on a scale £450-£550 per annum with membership of F.S.S.U. and Children's Allowance Scheme. Applications should be sent not later than March 31, 1954, to the Registrar, the University, Manchester, 13, from whom further particulars and forms of application may be obtained.

A LEADING WORLD AUTHORITY and brilliant speaker will give the Albert Howard Memorial Lecture—"The Under-Developed Lands of Britain." Dr. L. Dudley Stamp (Dir. of Land Utilization Survey, London Univ. Professor of Social Geography), at Kingsway Hall, W.C.2, 6.30 p.m., Wednesday, Feb. 24. Tickets 3s. from—Soil Association, 88 Hyde Park Mansions, N.W.1.

MANAGEMENT CONSULTANTS are required by the Wallace Attwood Company. Applicants between the ages of 30 and 45 must possess a University degree or technical equivalent in engineering and have held responsible executive positions. A thorough practical and current knowledge of the organisation and routines of industrial concerns is essential. Substantial salary and excellent prospects are available. Replies in confidence to Chantrey House, Eccleston Street, S.W.1.

ACCOUNTANT, about 35, married, knowledge of Motor Trade, required to take full responsibility for all accounting matters of Company in Baghdad. Remuneration equivalent to £1,500 per annum free of tax and with no exchange control restrictions. One month's holiday a year, which can be accumulated up to three months. Interview in London and final interview in Baghdad. Only first-class date to Box 445.

ATTWOOD STATISTICS LIMITED require 2 CLIENT SERVICE EXECUTIVES. Expansion in Great Britain and on the Continent creates need for two senior Client Service Executives. While not essentially trained statisticians, applicants must have had considerable experience in the use of research statistics as a marketing tool and the ability to interpret figures to Managing Directors and top level Sales and Advertising personnel.

Applications, in confidence, should be sent to Staff Controller, Attwood Statistics Limited, Chantrey House, Eccleston Street, London, S.W.1.

EXECUTIVE (38), Qualified Accountant, Secretary, Economist, good experience other fields, seeks change to post demanding creative ability. Present income £1,300.—Box 444.

What would grandfather say, Mr. Horsefall?

The development of plastics has given industry and the home many useful materials. Polyvinyl chloride is a case in point. Already familiar as curtains and garments and cable coverings, it now provides flexible belting for coal mines which is singularly unaffected by hard wear and tear. In an allied form it is a floor-covering material of exceptional durability. Organic Phosphorus Compounds (for which Albright & Wilson supply the intermediate) are often used as the plasticizers to maintain the flexibility and to make the finished plastic flame-resistant.

How superior technical skill can win new world markets

Biggest single shipment ever dispatched to Italy

Fifty-two David Brown Tractors—48-wheeled tractors and 4 track-layers—were in one consignment that recently left for Italy. It is David Brown's biggest Italian shipment to date, fulfilling a growing demand for David Brown Tractors from all over the world. The demand stems from good design and good engineering. David Brown build tractors which can get the best out of the worst of the world's land. Indeed, the whole vast range of David Brown products is made and sold in the conviction that Britain's future prosperity lies in the export of inventive genius and mechanical skill. This policy is today paying dividends—and paying them in foreign currencies.

Mr Butskell's Dilemma

THE Opposition is turning its principal guns to bear on the Government's domestic economic policy. With the Budget only two months ahead this is a perfectly proper thing to do. But it is important—both for it and for the country—that it should fire at the right sector of the line and use the right ammunition.

At the moment some of its backbenchers are urging it to fire in the 'wrong direction, with grave menace to its own life and limb. At last week's meeting of the Parliamentary Labour party a demand seems to have surged up from the powder monkeys that the party should exploit the unrest that is said to exist in industry at present; and it is reported that Mr Attlee gave the nod to this strategy. Probably it was not a very happy nod, and certainly his senior lieutenants are not eager to follow it. For the more responsible Labour leaders recognise that—quite apart from considerations of the national interest—an attack in this sector could only be supported by two types of ammunition; and one of these is blatantly dud, while the other is little less so.

The really dud argument, which is already being used by some of the rank and file (though not by their leaders), is that the workers are justly rising in wrath because they are worse off under the Tories than they were under Labour. This argument is bound to backfire. The Conservatives can gleefully respond that from 1946 to 1951, while Labour was in office, annual average wage rates rose by 24 per cent and retail prices by 32 per cent; in the first two years during which the Conservatives were in office wage rates rose by 13 per cent and retail prices by 10 per cent. Under both governments, earnings rose much more sharply than either wage rates or prices. Of course, the slightly greater rise in the workers' real income under the present government has not been at all due to Tory benevolence, and it has only been marginally due to the Tories' marginally wiser economic policy. The principal reason has been that the present Government has been fortunate in the turn of the terms of trade. But this is a difficult point for Labour to get across.

The second argument that Labour is being driven to deploy, however, is that the Tories have not adopted a policy of fair shares in distributing this benefit from better terms of trade. With a great deal of statistical juggling (and leaving the reduction of income tax out of account) it can be suggested that the rise in net dividends last year was of the order of 10 per cent, while the increase in wage rates (if calculated from December to December, and not from annual average to annual average) was of the order of 3 per cent. This argument may make a mild plop among those most ready to accept it. But figures given on page 445 of this issue (in an article which examines some of the other statistics behind wage claims) suggest that the Tories will be very weak debaters if they do not throw it back again before it explodes. Dividends have only risen by a quarter as much as earnings since 1938; and if the whole of the rise in net ordinary dividends last year had been distributed to the workers instead of to shareholders, it

could not have pushed basic wage rates up by more than about 5½d. a week.

If the Opposition does give this line of argument an impassioned airing on the floor of the House, it is therefore very likely to be made to look silly. Indeed it may help the Tories just when they need help most. For the Government must know that the wage increases granted in the past two months may have an adverse effect—quite possibly an obviously adverse effect—on Britain's economic position in the course of this year. The wage settlement that prevented the railway strike last Christmas, which was as wildly popular as the Munich settlement was on the immediate morrow of its signing, may in six months' time be as widely regarded as a mistake as Munich is now. If Labour does not tie itself too closely to the unions' demands, the blame for any such trouble can be laid wholly on the Government.

Does this mean that the Opposition cannot derive any electoral advantage from any economic policy at this time? Indeed it does not. Its hour of opportunity may now be striking. It is difficult to believe that external economic events will go so wonderfully well for the Government in 1954 as they did in 1952 and 1953. If so, and provided Labour's hotheads do not muff their party's chances, it is the Conservatives who may soon find themselves with an economic crisis to be blamed for. This technique of opposition, of lying low and waiting for a possible crisis, does not sound very coherent, and it may be said that it cannot possibly be constructive. But it can be made both. The right technique of economic opposition at the moment can be summed up in a slogan. The slogan is that the Opposition should keep itself on the constructive and sunny side of Mr Butskell's dilemma.

★

Mr Butskell is already a well-known figure in dinner table conversations in both Westminster and Whitehall, and the time has come to introduce him to a wider audience. He is a composite of the present Chancellor and the previous one (any resemblance to certain other historical characters, such as Sir Robert Peel—or Sir Robert Boothby—is purely imaginary). Whenever there is a tendency to excess Conservatism within the Conservative party—such as a clamour for too much imperial preference, for a wild dash to convertibility, or even for a little more unemployment to teach the workers a lesson—Mr Butskell speaks up for the cause of moderation from the Government side of the House; when there is a clamour for even graver irresponsibilities from the Labour benches, Mr Butskell has hitherto spoken up from the other.

This admonitory role in Parliament is only one facet of his composite personality. It is in his policy-making—as distinct from policy-moderating—role that he runs into his perennial dilemma. He is willing to bolster up demand when there is slack in the economy, or to trim down demand a little (a very little) when there is a danger of inflation. But—and this is the secret—he has

not yet shown himself to be a really strong character in the face of adversity; political pressures stand in his way. If ever external economic events make it necessary to cut down demand very ruthlessly, he is quite likely to run away; and the result is apt to be an economic crisis, which redounds to the disadvantage of the half of him that is in office and to the advantage of the half that is not.

★

The Mr Butskell who is in office at the moment has been extraordinarily lucky. He took up his duties at a time of grave economic crisis, used the one weapon that his other half had shunned for political reasons—the weapon of Bank rate—and found that it worked even more effectively than he, his civil servants or (let us admit it) even the previous Mr Butskell's critics had ever expected. Partly as a result of this, but partly also as a result of a fall in import prices, he was able to introduce a mild first budget and a very popular second one. During this period his other half across the floor complained that more resources should have been devoted to investment and less to consumption (which was very sensible), but also that the food subsidies should have been cut less abruptly and that commodity markets should have been opened more slowly (which was really rather silly).

Towards the end of 1953 a new danger appeared on the horizon: the danger of American slump. The Mr Butskell in office has reacted to this danger by a lowering of Bank rate and certain tentative measures to pave the way for more employment-creating trade within soft currency areas. These measures have been moderate and sensible, and the sterling area has ridden through the mild American recession that has already occurred with surprising *sang froid*. In the face of this danger, the other Mr Butskell across the floor has restricted himself to newspaper articles, advocating that if the recession turns into a real slump Britain should adopt a floating exchange rate for the pound, impose stricter controls over imports from the dollar area and attempt a further extension of soft currency trade. He has been unfairly criticised for this; if the slump really did come, the Mr Butskell who is at present Chancellor would almost certainly have to resort to these measures, although he would not find them very popular.

But there is now a third possibility. In the last few weeks the stock markets in America and Britain have decided that there is not going to be an American slump. They are not necessarily good judges; they have not always been in the past. But the mere fact that they are so confident means that business men may now be less ready to cut down real investment at the first sign of trouble. As a result, to make a rash generalisation, the world seems to be sitting on a blunter razor edge than it seemed to be only a few weeks ago. Moreover, the Council of Economic Advisers in America has put forward a quite arguable thesis that America's recession in the past few months has been

due to a drop in swollen inventories towards a level more appropriate to the current level of sales, and that this drop has now gone nearly as far as it had to go. Once again this thesis is of some importance in its own right; if only because some American business men may believe it and draw confidence from it.

On balance, therefore, the best guess—it is only a guess—at the prospect before the world economy for 1954 is that American production may continue to bump downwards a little for another few months, and then start slowly to bump up again. If so, the prices of the commodities that Britain imports, which are already adjusted to a graver level of recession than has in fact occurred, would be likely to rise against us; but the prices of the manufactures we sell, which have to face growing German and Japanese competition, would probably still be held down. In short, the terms of trade, which have been the Conservative Government's most powerful ally to date, may be about to turn traitor. If this happens, the wage inflation that has already taken place this winter—and which may price some British goods out of these very competitive

world markets—will be seen to have had very grave consequences indeed.

The one safe conclusion from all this is that the Mr Butskell now in office ought at the moment to be a more worried man than any effective Mr Butskell now in opposition. It is very easy to see what tactics the latter should adopt. First, he should be writing newspaper articles advocating that, if a slump comes, the Government should adopt all the measures that everybody knows it will have to adopt in that eventuality; and he is doing this, very eloquently. Secondly, and more important, however, he should be inveighing against any measures (such as rumours of a new cut in Bank rate) that might increase spending, and quite specifically saying nothing that will lead the public to suppose that he is in any way an abettor of the rise in wages and costs now creeping across the British economy. That stigma should be left with the Government, where it belongs. The next few weeks will show whether the Opposition will seize this chance of golden silence; or whether, in a Brown fury, it is going to throw the opportunity for constructive Butskellism away.

The Italian Danger

ALTHOUGH Russian efforts to gain control of Germany seem to have been fairly and squarely exposed in Berlin, the same cannot be said of Communist infiltration in Italy. Yet although the rich resources, the strategic position and the dynamic qualities of the German people render them a more important prize than their Latin neighbours, the loss of Italy to the western cause could compensate the Russians quite heavily for setbacks they may suffer in Berlin. If the four power conference represents one more phase of a carefully staged battle, fought from prepared positions on the main front, Italy may be likened to the scene of an outflanking movement; the object of a possible left hook which might one day shake and stun Western Europe. In political terms, a swing over of the Italians to the Communist side would convert their country into a symbol of defeat for the free world and so, ironically enough, give Italy a greater importance than any it now has as a member of the Nato team.

Is such an event possible? The news from Italy is far from good. A strong tide is unquestionably running in the Communists' favour and a new note of real alarm has lately been heard in both London and Washington. No one seriously argues that Italy may become Communist tomorrow. But it does no good to blink the fact that, whether Signor Scelba is now given a vote of confidence or not, the prestige of parliamentary government has suffered a sharp decline since the general election of last June. Inversely, Communist chances of winning power by fair means or foul within, say, the next two years, have lately

increased. The political trend, it is true, has been towards extremism of the Right as well as the Left, but it is the Left that is very much the stronger; it was the gain by the Left of 1½ million votes, giving it a total poll of 10 million, that was the main surprise at the last election. It would be wrong to jump to the conclusion from the parliamentary frustrations of the last few weeks in Rome that there is a serious and immediate possibility of Italian democracy collapsing; but it would also be wrong to ignore the possibility, and there are two broad questions which should be asked and answered. What chance remains that Italy may yet settle down under a stable democratic regime comparable with that of the De Gasperi era from 1945 to 1953? How in practice might the Communists achieve power?

The difficulties that have been experienced in forming a government since last year's elections—particularly under Signor Pella, who for a time succeeded, and under Signor Fanfani, who has just failed—make one thing clear. The only chance of organizing a lasting democratic majority, with the Chamber composed as it is at present, lies in a coalition of the four central parties: the Christian Democrats allied with the Republicans, the Liberals and the right-wing Democratic Socialists. These four parties, which broke with one another after the June elections although they had fought a joint campaign, could have together a majority of 16. And this is the only majority open to the centre parties. It has not so far been attainable because the Democratic Socialists, feeling their support in the country ebbing away through their association with an

unprogressive, predominantly Christian Democrat policy, have refused to join. To-day, if Signor Scelba can keep these Socialists with him, he may succeed in staying in power. If he does not, he will fail; and if he fails, the chances of anyone else like him succeeding will be smaller than ever.

★

The only two realistic alternatives to a central coalition seem to be either the formation of a coalition based on Monarchist—and perhaps neo-Fascist—support of the right wing of the Christian Democrat party, or the holding of fresh elections. A right-wing coalition of this kind would in the end do more harm than good to democracy in Italy. It would open the way to an extreme form of nationalism, which would become reactionary in home affairs and make Italy an increasingly awkward partner abroad. It would almost certainly provoke violent Communist opposition which would, at the least, undermine the Italian economy through industrial and agrarian unrest. Fresh elections, on the other hand, seem likely to strengthen the Left—the Communists and the fellow-travelling Socialists of Signor Nenni—rather than the centre.

If there is really a chance of the Communists coming to power in Italy during the next two years, how would they be likely to accomplish it? No country has so far simply voted itself Communist by a genuine majority in free elections. Even though the Italian Communist party is the largest anywhere outside the Sino-Soviet bloc, it could scarcely hope to win an election outright unless it could tap some entirely fresh source of strength, such as the solid vote of the impoverished South. This is still unlikely, since it is precisely from the South that the Right has always drawn much of its following.

The Communists are more likely to win power either through another big increase in the vote of the fellow-travelling Nenni Socialists; or by repeating some form of electoral manoeuvre like that by which Communist members of the scrutinising boards in the last elections managed to secure the technical invalidation of no less than 1,300,000 votes, most of them cast for the central coalition; it was, in fact, Signor De Gasperi who won the last election, though victory was allowed to slip from his grasp. While it is unlikely that the Italian Communists could batter their way to power like the parties of Eastern Europe, as there is no Red Army following on their heels, they might, on the other hand, be able to exploit any further decline of democratic prestige as Hitler did in Germany in 1932. Then it was the Communists who split the opposition to German Fascism; today it is the Fascists who split the effective opposition to Italian Communism.

★

The success or failure of the latest attempt to give Italy stable Government will be crucial. This is not France, where the situation is nearly

always serious but seldom desperate. In Italy a dangerous muddle has been going from bad to worse. Signor Scelba, for so long Signor De Gasperi's Minister of the Interior and famous as the architect of the new republican police force, is a democrat with few illusions. He comes from the centre of the Christian Democrat party and, in his view, social and economic programmes are not enough; he also believes that Communist—or Fascist—force must be met with force. It is hard to see what the little group of Democratic Socialists under Signor Saragat would hope to gain if they withheld their support from him; for, if middle-of-the-road government were to fail in Italy, they would in any case have no future. One reason, on the other hand, why they have been readier to serve under Signor Scelba than under the more leftish Signor Fanfani is that the effect of the prolonged political crisis has been to rally the Christian Democrats into making greater concessions to them, in terms both of seats in the cabinet and of measures of policy.

This, then, is the position which has brought the American Ambassador, Mrs. Luce, back to Rome at short notice from Washington, and which has caused some dismay in London. Nothing irretrievable has yet happened; but the fact that it may happen during the next few months, if nothing can be done to stop it, makes an intelligent and sympathetic attitude by other western nations an urgent necessity. It is difficult to point to specific things they can do; but two things should be constantly borne in mind when considering Italian affairs. One is that the intangible often has an effect on Italian public opinion out of all proportion to its apparent importance to the outside world. The other is that, if a democratic government in Rome is to be helped with a diplomatic success, Trieste has obvious priority.

In Italy itself, it is a curious twist of history which has given Signor Saragat, who lost heavily in the last elections, the power perhaps to alter the destiny of his country. After refusing three times to continue support of a Christian Democrat prime minister, he now appears to have taken the view that however right he may have been in calculating that his party's advantage lies in remaining outside the government, he must now put patriotism before party. If democrats are to fight extremists of right and left successfully, this is a lesson they must all sooner or later learn.

Outlook for West-East Trade

THE recent and fashionable upsurge of enthusiasm for trade with the Soviet bloc follows a year during which trade through the iron curtain reached the lowest level since the war. From all sides the pressure is insistent; even the Americans (if Mr Stassen's and the Randall Commission's views can be considered representative) seem now to be more favourably inclined. And a number of spokesmen in this country recently emphasised Britain's desire to expand trade with the Communist bloc in goods of no strategic value. By all accounts the Russians, and their Eastern European governments, are eagerly seeking more foreign trade. And Moscow has been dangling before the eyes of British business men—and the Berlin conference—the prospect of orders worth £400 million.

Why is there this optimism about East-West trade when the record during 1953 was so poor? There are two main reasons: First, the tailing off of dollar aid, coinciding with the fear of an American recession, has prompted many countries to explore new export outlets, among them the Communist countries. Secondly, there are hopes, as yet unproved, of a more liberal Soviet policy in foreign trade raised by Malenkov's speech last August. It would be rash, as yet, to assume that these signs necessarily point to a really substantial and permanent increase in East-West exchanges. But if there is now more good will on both sides, what is holding back trade?

Many like to put all the blame on the allied strategic controls; but it is a mistake to think that they are the only restraining factor. Last year, for example, the volume of East-West trade fell, at a time when the strategic controls were becoming, on balance, less rather than more restrictive. Moreover, the experience of such countries as Sweden and Switzerland, which do not formally subscribe to the restricted allied list, is exactly parallel to that of the other western countries. It is clear that the low level of East-West trade was mainly the result of the internal economic policies followed in the countries of the Communist bloc. They were reflected in the disappearance from western markets of the eastern grain surplus, which formerly was one of the main props of trade between East and West. For example, grain supplies from the Soviet Union to Britain fell from a total value of £35.7

million in 1952 to only £3.6 million in 1953. That there have been, and still are, serious shortcomings in the agriculture sector of the Soviet and satellite economies has been admitted by Khrushchev and other Communist spokesmen. Moreover, the new policy of giving more to the consumer is bound to cut still further into the former exportable surplus. And there is no indication as yet of any change in the Soviet bloc's policy of self-sufficiency, which already directs more than three-quarters of its members' trade into internal channels. All these factors contribute to the overriding fact of the vanishing surpluses.

Because 1953 was a bad year for the Communist bloc's foreign trade it does not of course necessarily follow that East-West trade is a dead letter. The low level of commodity exports may be only temporary; the new agricultural measures might be quickly effective.

Furthermore, though the old staples of the East's exports may permanently diminish, there are signs already of more diversified exports, including such things as oil, pig iron, motor cars and so on, becoming available. The Soviet Union has also substantial quantities of gold to finance its import requirements, and there have been clear signs in London and elsewhere of its readiness to use them. The fact remains, however, that solid evidence such as the trade figures for 1953 does not justify unbridled optimism for East-West

trade. At present there is too much hope fanned by judicious propaganda.

What East can do for West in trade is an almost bankrupt theme. Nearly everything that needs to be said about it has been said already. Seen from another viewpoint, however, western policy towards the East does offer some novel and important possibilities. If the West can do nothing to alter the fundamental conditions of the Communist countries' internal economy, and their ability or willingness to engage in foreign trade, it does retain a certain amount of control over what it can offer to them. It could strengthen, or weaken, or re-design the strategic embargo. Even if the cold war in its various forms were likely to come to an end—and the Berlin conference has so far provided no sign that it will—no one suggests that the Communist bloc should be supplied with guns, aircraft or tanks. And only a few people maintain that large tankers, radar

The West's Strategic Controls

Sixteen countries (14 Nato, western Germany and Japan) operate controls on the export of strategic goods to the Soviet bloc. A co-ordinating committee (COCOM) meets regularly in Paris to unify the embargo system. There are two main categories of restricted exports: *Absolute Embargo* on goods of high strategic importance such as war potential machines, munitions, vital materials; *Quantitative Restriction* in which limited supplies considered to have no strategic importance are allowed. Other items are kept under review in case they should become strategic. All decisions of the Paris committee are subject to the unanimity rule. The American Battle Act gives the Administration power to cut off economic aid to any allied country which contravenes the embargo; this ultimate sanction has never, in fact, been imposed. Exports to Communist China are embargoed under separate arrangements in terms of the United Nations resolution of June, 1951.

equipment and scarce raw materials do not increase Soviet and Chinese war potential. It is at the margin between what is not obviously strategic and what is obviously non-strategic that all the argument arises; and it is only at this margin that the existing allied controls can be seriously criticised. Thus it is against this margin that Communist propaganda is concentrated; it tries hard to divide the western countries with the suggestion that only American-inspired controls prevent the West from finding great new markets and important sources of non-dollar supplies in the East. And because the controls that are worked in Paris are both secret and intricate, much that is said against them goes unanswered.

A case, therefore, can be made out for offering some resistance to the present attack on the controls by refurbishing them. It should be not impossible to reduce the existing complicated structure to a short list of items of the highest strategic importance, the delivery of which beyond the iron curtain is under

EUROPE AND SOVIET BLOC

absolute embargo. The controls would then be simpler, less costly to operate, and easier to explain and justify. But to do this and no more would be simply to play the Communist game. Western governments—and, what is more difficult, western businessmen—have to learn the lesson taught by the Communist trading bloc; the lesson that trade and politics are inseparable. If the free world is to make important concessions in its eastward trading, then it must see to it that it gets something in return, whether in the form of economic or political concessions. What is obviously improvident is that the present successful policy of restriction should be gradually worn away by drip after drip of one-sided concession.

Even this would not be enough, however, for the Kremlin would still have a free hand to create all manner of mischief in the West with its economic weapon. Its monolithic trading organisations, taking direct political orders from the top, confront individual,

self-seeking, politically unaware businessmen in the West. To correct this disparity a suggestion has recently been made that a western consortium of business, financial, and government interests should be formed, under NATO auspices, which would act as a central clearing house and channel for trade with the Soviet bloc. This body would assume responsibility for co-ordinating the strategic list. Thus, by giving private business from all countries a hand in the controls, friction and distrust would be obviated. The smugglers might be driven out of business, and Moscow's clever tactic of window-shopping the same orders from country to country could be checked.

Whatever the West does to modify its controls is not likely to lead to any great increase of trade, desirable though that may be. But if it does not exercise the little power of initiative that it now possesses, the controls will inevitably lose their effectiveness. In the end the volume of the West's orders from the Soviet bloc will depend solely on the plans of the politicians sitting in the Kremlin; and it would be premature to assume that they have given up for more than a temporary period their policy of self-sufficiency for the bloc that extends from Eastern Germany to the China Sea.

Safety at Sea

Experience proves that large ships meet fewer disasters than small ones, and that steamers meet fewer disasters than sailing vessels. Will it not, therefore, be proper in the State to prescribe the use of large steamers and to proscribe the use of small sailing vessels? If the one principle of giving security to life, though at the expense of an invasion of the right of property and an invasion of freedom, be the proper guide for the Legislature, let it be carried out to its full extent, and never, for the sake of property and freedom, risk danger to a single life. . . . We dwell with some earnestness and reiteration on this topic, because ships and railways now occupy much attention, and from the same cause. Both now transport a large number of persons from place to place, and both occasionally lead to a sacrifice of life. Erewhile we looked with tranquillity, or it may be with exultation, at hundreds and thousands of lives sacrificed in battle; or heard with indifference of the wreck of mighty men-of-war, which consigned thousands of brave hearts to an untimely death; or invited its infliction as a punishment on misguided or misled fellow-creatures who had trespassed on some ill-considered penal statute; but now we take a deep interest in the loss of a single life by a railway accident or the wreck of a passenger vessel. Now the authorities, which before were as often set in motion to take away as to preserve life, are required to exert themselves for the safety and protection of passengers by sea and land. This is a very manifest improvement in the general humanity; but, like every new-born zeal, it may be carried too far. We think it is, and that it demands too much interference with business—too many regulations—which the Legislature is ever ready to grant, because every one seems to add to its utility, its importance, and its power.

The Economist

February 11, 1854

Blaming the Index

IN the past few months the content of trade unions' depositions in support of wage claims has suffered a sea change. Until the latest round of claims the argument for wage increases was generally based on a demand that wages should "keep in step" with increases in the Interim Index of Retail Prices. Now that the index has been stable for many months—it was 140 last December, the same as in the previous March—the argument for increases has taken the form of casting doubts on the validity of the index. Some of these doubts are due to a deliberate search for any old straw by people who want to throw bricks at economic stability; but some are due to genuine misunderstandings, which need to be cleared up.

For there is a world of difference between the function of the present index, as understood by those who drew it up, and the function that even the more moderate trade union leaders assume for it. The argument of the moderate union leaders can be summed up by a quotation from a speech by a delegate at the last Trades Union Congress:

The present Interim Index of Retail Prices . . . bears little or no relation to the real needs of the working population of this country. . . . The outstanding example is the value attached to rent and rates. Even our grandparents considered that a reasonable proportion of their income to allocate for this purpose was at least 10 per cent. Our dear great-aunts in the Ministry of Labour consider we can be adequately housed today by the expenditure of 7 per cent of our income. On this assessment, if your wage is £10 per week you cannot spend more than 14s. per week on living accommodation. I defy anyone in this hall to tell me that they can get adequate living accommodation for 14s. a week. If you are among the fortunate who are offered a Council house you probably have to pay rent of about 35s. a week and you would need to have, according to the Ministry of Labour, a weekly wage of £25 in order to take that house.

This is such a carefully reasoned misunderstanding that it is important to explain at some length the two fallacies on which it and other current criticism of the index seem to be based.

The first fallacy arises from the familiar misconception that most households have only one breadwinner. Although it is true that the weight accorded to rent and rates in the index is 7 per cent, this does not mean that the average worker is assumed to spend 7 per cent of his income in this way. It means that the average household is. And that average household is supported by more than one income. In fact, according to the Ministry's survey of household budgets in 1937-38 (on which the index is based), it is supported by 1½ incomes; that survey showed that the average industrial household consisted of 3.77 persons, of whom only 0.99 were children under 14 years of age, and as many as 1.75 were wage or salary earners. In consequence of this the average expenditure of a working-

class household at that time was 91s. 8½d. per week, although the average earnings of adult male manual workers were only 69s. per week. The difference, of course, was met out of the contributions of subsidiary earners in the household—including the pay-packets of wives and adolescent children and grandfather's pension.

Today these contributions must be playing an even greater part in supporting the average household. The Census of Population in 1951 showed that nearly half the households in Britain that were headed by somebody in work included two or more earners; that only about half of them had any children at all; and that what wage negotiators often call a "typical" family unit of one man supporting a wife and two children was in fact typical of only one household out of twelve. A much higher proportion of married women is in employment now than before the war; and the earnings of women and juveniles have risen more steeply than those of adult males. The last earnings census for April, 1953, showed that while men's earnings had risen by 169 per cent since 1938, youths' earnings had risen by 197 per cent, women's earnings by 209 per cent, and girls' earnings by 238 per cent. In addition, social benefits of all kinds have materially increased and family allowances have been introduced.

This varied composition of the average household's income makes it quite absurd to translate the weights in the index back into money terms for any particular weekly wage—in order to demonstrate, for example, that the index must be wrong because it "allows" such a worker an inadequate amount for food or rent. This line of criticism, pursued logically, would also give the same worker an "allowance" of a sixth of his earnings for alcohol and tobacco. The hard-pressed worker with a larger-than-average family to support, and without squatters' rights on cheap living accommodation does not—or should not—spend one-sixth of his income on these items. He uses his money to pay for such basic items as food and rent and rates instead.

The second fallacy behind current trade union criticism of the index is based, oddly enough, on a half-hearted recognition of the first. It is said that while the index might portray changes in the cost of living for the average household (with more than one earner and therefore some money to spend on inessentials), it does not accurately portray changes for poorer households. For example, food prices have gone up by 15 per cent since the general election in October, 1951 (although they have fallen by nearly 4 per cent since last June); wage rates have gone up by only 13 per cent (although earnings have risen by more). Therefore, despite the fact that the cost of living index as a whole has risen by only 6 per cent since the Tories came into power, the triumphant conclusion is reached that lower paid workers are now worse off.

The argument that an index based on the consump-

tion patterns of the worse-off families would show a much bleaker picture than that based on the consumption patterns of average families is a tempting one to propound; nobody can define what a worse-off family is, let alone assemble the figures to refute it. But the argument is almost certainly statistical nonsense. All the evidence suggests that quite substantial changes in weights do not materially affect the *trend* of the index over a short period of years, which is all that the index purports to measure. For example, the Technical Committee, which reported to the Cost of Living Advisory Committee, in September, 1951, found that up to that date "the use of prewar weights in computing the index has not . . . resulted in any tendency for the index figures to understate the rise in retail prices since June, 1947"; it did not think that it had resulted in any significant overstatement either. On its recommendation new weights, based on the estimated pattern of consumption in 1950 and allowing for the higher rents on new dwellings, were introduced in January, 1952. Another inquiry into household budgets, which will lead to another re-weighting of the index, is at present being undertaken by the Ministry of Labour.

Facts About the Index

The interim index of retail prices, as at present weighted, assumes that the average household spends 39.9 per cent of its income on food, 9.8 per cent on clothing, 7.2 per cent on rent and rates, 6.6 per cent on fuel and light, 6.2 per cent on household durables, 7.8 per cent on drink, 9.0 per cent on tobacco, and the remaining 13.5 per cent on miscellaneous goods and services.

In the year to mid-1948 the index rose by 10 per cent; but under the influence of the Crippsian policy of wage and dividend restraint it rose by only 1 per cent in the year to mid-1949 and by only 3 per cent in the year to mid-1950. At this stage the wage freeze thawed; and this, together with a rise in the price of imported raw materials, caused the price index to rise by 10 per cent in the year to mid-1951 and 10 per cent in the year to mid-1952. By this time import prices were falling again, although the rise in wages went on. In the year to mid-1953, the index rose by only 2 per cent; and in the six months since then it has actually fallen fractionally (by just under 1 per cent, with food prices alone down by 4 per cent).

But it will be very surprising if this leads to any material alteration in the trend of the index as at present constructed.

The conclusion remains that a comparison between the change in earnings and the change in the index of retail prices reasonably mirrors changes in the workers' real standard of living over a short period. This does not imply that there is not still some real hardship at the lower income levels. The household that has only one breadwinner and an army of dependants is badly off today—as it always has been. The pensioner, living alone or with his wife, is worse off still. This may well provide an argument for higher family allowances and higher pensions. But it is absurd to suppose that it also constitutes a case against the present index of retail prices, or a case against relating wage negotiations to the consumption habits of households of more or less average size. The average wage earner today supports about 1.1 dependants; wage negotiations based on the spending habits of the "typical worker" with a wife and two or three children leave that average earner in the odd position of putting in a claim that he has two or three phantoms to support.

Facts About Real Earnings

The chart below shows changes in the annual averages of weekly earnings, consumer prices, wage rates and gross dividends on the base 1938 = 100. The figures for weekly earnings and gross dividends for 1953 are estimated.

It will be seen that wage rates have kept in remarkably even step with consumer prices since 1938, although they fell very slightly behind them between 1948 and 1951. Since 1951 (primarily because of the rise in real income attendant upon the improvement in the terms of trade) wage rates have caught up again; in 1953 both consumer prices and wage rates were at 228-229 per cent of the 1938 average. Weekly earnings have consistently risen by more than wage rates; by 1952 they were officially estimated at 282 per cent of the 1938 average, and by 1953 they were probably about 300 per cent of it.

Gross dividends were held down below 109 per cent of the 1938 average until 1950; since then they have risen fairly steadily, but are still only between 140 and 150 per cent of the 1938 average.

Notes of the Week

Bidault versus Molotov

THE main question that was posed by the decision to hold the Berlin conference has now been answered with the greatest clarity. All four Ministers wanted to know, for various reasons of foreign or home policy, whether there was anything that could be said or done in public that would justify changes in their previously defined attitudes. Mr Molotov clearly hoped to be dealing with a faltering France; Mr Eden may have faintly shared Sir Winston Churchill's hope that he would meet a more malleable Molotov; Mr Dulles may have feared that his solid front with his colleagues might be pierced by some new approach to the problem of China; and M. Bidault probably feared that he would encounter a suggestion—very hard to reject—that the Russians might put the brake on aid to Ho Chi-minh in Indo-China if the French would disengage from the European Defence Community. So far as Germany and Europe's security is concerned, the hopes and doubts have all been removed. It remains to be seen whether anything said in the restricted sessions, or about Austria, revives them.

Mr Molotov cannot count his handling of the conference as a success. He has stiffened the western ranks, scattered many illusions, and convinced many who have tried to keep an open mind that he is a dishonest as well as a stubborn arguer. He laid himself open to exposure by the acute mind and sharp tongue of M. Bidault, who has fairly put French prestige back on the pedestal from which it was jostled at the Bermuda conference. Indeed, M. Bidault spoke like the representative of a great power and the minister of a strong government.

Seto Instead of Nato

THE security system proposed by Mr Molotov on Wednesday is a more precise elaboration of a kind of Monroe Doctrine for Europe which he put forward in his Note to the western powers last November. The chief difference is that it cannot now be said to have even the merit of bringing about the reunification of Germany. Mr Molotov has all along made it plain that he is intent above all on breaking up the North Atlantic Treaty Organisation, but for a time it seemed possible that he might be prepared to pay a price for it. Now it can be seen that he intends to have his cake and eat it. He means to retain the Soviet zone, unless his plan for un-free elections and an imposed peace treaty is accepted; and he also proposes to replace

Nato and the EDC by a Soviet-dominated European network of alliances, which may here and now be dubbed Seto. The Russian proposals are, in brief:

Germany will remain under the occupation powers until the Molotov plan for a peace treaty is carried out; the east and west German states will join the Soviet-European Treaty Organisation. The usual treaty obligations for joint prior consultation and resistance against armed attack will be undertaken. There will be a permanent political and military committee which will be only consultative, and on which the United States and China would sit, presumably balancing each other out.

Perhaps it might seem that these proposals offer a way of uniting East and West and that the European system might be added to the North Atlantic Treaty. But article seven shows that this is not the Soviet intention. It declares that the parties should "undertake not to enter any coalition or alliance or conclude any agreement the purposes of which would contradict the purposes of the treaty on collective security for Europe." Often enough Mr Molotov has made it clear that this description applies to Nato, the EDC and the coal-steel community.

His objections to the EDC are first and foremost levelled at its links with the United States through Nato, and there would be no point in his proposing an alternative European system if it were not to sever Europe's ties with America. It would be sheer illusion to think that, because Mr Molotov said "not to enter" instead of "must leave," he has in mind that the European states could remain in the western security system when the American and British had withdrawn from Europe. On the face of it, West Germany and the communist states would be the only ones which would be bound "not to enter" the North Atlantic alliance, because they are the only ones which are not already in it one way or another. But it is inconceivable that a system based on the free world's common defence against Soviet expansion could be combined, on Soviet terms, with a system intended to exclude America from Europe.

Europe without Britain

BRITAIN's place in Seto has not been explained by Mr Molotov. His treaty would be open to any "European state" that accepted its purposes and obligations. But his definition of a European seems to be someone who cuts himself off from America, while accepting the Soviet Union as a European state. The fact that he has not said so in his present draft resolution should not wipe out the memory of all his previous utterances. If Britain left Nato, it could no

doubt become a member of Seto. That should be enough to damn Mr Molotov's club in British eyes.

What will be the reaction of France, to whom the Russian suggestion is mainly directed? General de Gaulle and other anti-Americans have from time to time made suggestions that seem to run along somewhat the same lines as Mr Molotov's, but they may be shaken to find the Soviet foreign minister now showing so clearly where those lines lead. M. Bidault himself has once again probed straight to the heart of the matter. He said that Mr Molotov was proposing to neutralise not only western Germany but the whole of western Europe, and his proposals meant the organised division of Germany for a further fifty years. Mr Molotov was offering no loosening of the eastern bloc while demanding the disbanding of the western alliance. The French people, he told Mr Molotov, had no desire to sever the tried and trusted friendships they had formed, and the French concept of security included partnership with the United States and Britain.

Internal measures to neutralise Germany—the corollary to Seto—were also elaborated by Mr Molotov in a resolution last Wednesday. He added two points to his former proposal for the withdrawal of the main forces of the four powers. One was an improvement, in that it suggested that the powers should supervise the withdrawal, each presumably watching the other. But the second addition made the proposal even worse from the western standpoint, since it would allow the armies to return to Germany if there were a threat to security inside that country. Mr Molotov submitted that his resolution would create conditions favourable for the settlement of the German problem. With the Americans having retired, perhaps, to the far side of the Atlantic and the Russian army only a few miles away across the Oder, no one can deny that it would solve the question *à la Russe*.

Tory Troubles

FOR a change, it is the Conservative Party that has been in domestic trouble this week. It is not in the nature of the Tory animal to allow itself to be split from top to bottom, but it can sometimes grow soggy in the middle; and it is very plainly doing so now. There is no Tory equivalent to the Bevanite faction—largely because on the Tory back benches there are no Bevans, only a number of Lord George Bentincks. But these Bentincks have now built up a sizeable array of grouses, rooted in their ingrained distrust of the party's new internationalism and of its adherence to the full structure of the welfare state, with all that this entails in the field of fiscal and economic policy.

From time to time this distrust spurts to the surface. After the fuss about officers' pensions and Suez (which, it is to be hoped, is not to be followed by any silliness about Abadan), the malcontents have found no less than four economic issues to grumble about in the past two weeks. The first of these, in the middle of last week, was when they forced Mr Thorneycroft to reconsider his new Industrial Organisation and Development Bill. Finding that this would continue and extend the principle of compulsory levies for voluntary development councils, the back-benchers

branded it as "Socialism" and told Mr Thorneycroft that his job was to reduce the area of interference with industry, not extend it. The Bill was scheduled for debate on Thursday of last week, and to save itself from public humiliation the Government was forced to propose a debate on the uninspiring Sydney conference instead. The Opposition, whose intelligence service seems to have been at fault, fell into the trap of agreeing to this face-saving device.

In this debate on Sydney the second cause of unrest—in the familiar form of pressure for wider margins of imperial service—was ventilated down Mr Butler's neck. He stood up to this fairly easily; and even adopted *The Economist's* slogan that "if we cannot get one world immediately—which is, after all, a great ideal—we may have to work for one and a half worlds." But by Tuesday of this week he was in trouble again, meeting the back-benchers' annual pre-Budget campaign for tax concessions—in this case, for concessions on purchase tax. Mr Butler said that he had been impressed by arguments about the evils of uncertainty in this matter, and that he would make a very early statement; on Thursday he made this statement and declared firmly that there will be "no further changes in purchase tax schedules in or before the budget." As the leading article in this issue argues, the Government has gone as far as it should in limbering up to meet the possibility of American recession at this time; for the short term—it may be for the very short term—its policy should clearly be to discourage any further increase in consumers' demand.

Lancashire and Labour

THE fourth Conservative storm on which Ministers had to pour oil this week arose, of course, from the Japanese payments agreement and trade arrangements. The Government was helped in its efforts to smooth down this trouble by the fact that Labour's attack on the agreement proved to be fiery only in word and mild in deed. The motion on which the challenge was launched had been tabled only after much private discussion and it had to strike a half-hearted compromise. It conceded that no British Government should openly force poverty-stricken peasants in the colonies to buy dear British goods, but suggested that the Treasury should have consulted Lancashire capitalists—apparently in order to work out a less open way of such enforcement. This was a rather peculiar motion for Labour to adopt, and only a Mr Harold Wilson could have regarded it as an occasion for extravagant oratory. Mr Wilson accused the Government, among other things, of making cotton a "Cinderella" industry and of sacrificing Lancashire to world oil interests and the Australian wool growers. This might go down well in Lancashire, but the Government had no real difficulty in puncturing such exaggerations. It also had no difficulty in promising to comply with the innocuous proposal of Lancashire Tories, framed in an amendment presumably aimed at their constituents, that future trading arrangements with Japan should be based on the experience of the coming year.

Labour's shifting on the Japanese issue compared poorly with the forthright eruption from its front bench the previous day in defence of American air bases in Britain. These stations are under constant sniping from the Labour

left wing; but, without warning, when Sir Winston Churchill was answering questions about them, Mr Shinwell and Mr Arthur Henderson leapt forward with the very responsible reminder that it was the Attlee Government that decided to establish the bases, and that this is a decision "from which at the present time we are not prepared to run away." In view of the recrudescence of left wing activity, marked by a woolly new motion about Germany, such remarks are timely. If only similar responsibility can be shown in the economic field, the Labour Party may still take advantage of the Tories' party troubles to reassert its effectiveness. There is a pale pink hope.

Candid Friend for the Boards

LAST week's adjournment debate on the report of the Select Committee on Nationalised Industries should have dispelled a good many anxieties, which had been keenly felt not only on the Labour benches but a long way beyond them. The establishment of a new Select Committee to watch, on Parliament's behalf, over the doings of the public corporations, might *prima facie* mean a number of different things. It might—particularly in conjunction with the appointment of a high-powered Comptroller backed by a corps of auditors and accountants—be a serious threat to the autonomy of the boards, and thus to their capacity for efficient management and enterprise. It might be a permanent gadfly, nagging away at just those questions of day-to-day administration that have been deliberately removed from Parliament's scope. It might become an intervening tier in the structure of government, encroaching on the functions of the Minister. It might try to be either a permanent efficiency audit or an alternative to the admittedly unsatisfactory consumer councils. Last—though probably least serious—it might be misused, for political purposes, as a means of eliciting, distorting and broadcasting any facts which the opponents of nationalisation might find useful.

Fortunately, the select committee, as envisaged by Mr Crookshank in his opening speech, should avoid these mistakes. What is proposed is rather a two-way consultative link or channel of communication, which could no less easily act, when needful, as a Society for the Prevention of Cruelty to Nationalised Industries rather than as an instrument to publicise or assess their shortcomings. The detailed job of efficiency audit or organisation and method research is one best done within the nationalised industries themselves—individually or, perhaps better, jointly. The major questions of policy co-ordination, investment priorities and so on are in the last resort questions for the Cabinet (though postwar Cabinets have not handled them very well). The neglected consumer councils, were they properly used, would save a lot of parliamentary frustration. But the general scrutiny to be exercised by the proposed Select Committee ("watchdogs, not bloodhounds," as one member put it) is something which none of these devices can replace.

No constitutional device can, of course, entirely resolve the dilemma of accountability. Either Parliament has some power, direct or indirect, to call the boards to account, or it has not. The greater its power, the greater the risk of red tape, overcentralisation and timidity in nationalised

industry; the less its power, the greater the risk of irresponsibility, autocracy, and all the anomalies of an *imperium in imperio*. Whatever power Parliament has, however, will be the better exercised—and the less likely to be misused—for being well informed.

New Threat in Indo-China

BYPASSING the important French strongpoint of Dien Bien Phu, the rebel forces of the Communist Vietminh are closing in on Luang Prabang, the capital of Laos. When a similar situation arose at the end of the campaigning season in the early summer of last year, the Vietminh failed to take Luang Prabang; but their sudden thrust down into this entirely new area gave the French and their allies an unexpected jolt. When the rains came, the Vietminh withdrew. Today the situation differs in two ways. On the one hand, the Vietminh are in greater force and have plenty of time left in which to advance further south before this year's rainy season. On the other hand, although their prospects of real success are greater, their attack has long been expected. While there is dismay at the foreseeable

consequences of Vietminh victory in this area, the shock of surprise is lacking.

These events in Indo-China are being followed very closely in Washington, in Paris and in Berlin. The American interpretation is that the situation in Indo-China has lately taken a distinct turn for the worse. As a result, the Administration has chosen to apply for the first time its new policy of striking back at the Communist bloc by methods and in places of its own choosing;

it has made a significant break with precedent and has sent 400 American air force technicians to give direct help to the French and Vietnamese in their struggle.

In Paris the mood favouring negotiation over Indo-China continues to gain ground; in Berlin, on the other hand, M. Bidault has resolutely insisted on the stopping of Chinese Communist aid to the Vietminh and a cessation of hostilities in Indo-China as conditions for holding Mr Molotov's proposed Five Power Conference. Whether or not the Russians and Chinese hope to influence the Berlin meeting in any way by the present Vietminh offensive, it does make this a particularly bad time for the French to attempt to open negotiations with Ho Chi-minh—as M. Plevin, the Minister for Defence, must find during his present visit to Indo-China.

Missing Links in Iran

THE departure to Abadan of a team of oil experts representing seven companies and four nationalities has sent spirits soaring prematurely. No negotiations with Iran have started and the expedition is simply a fact-finding one, charged with establishing a figure without which they cannot begin. How much capital must be poured into the oil installations to put them back into running order? The answer, in dollars, runs at least into tens of millions.

The Iranian exchequer, living from hand to mouth on an American grant of \$43 million that may last till June, cannot possibly supply such a sum. Therefore the outlay must come from the visitors, who will not risk so large an investment unless they have guarantees: first, that it will set in motion well-managed and regular production; secondly, that it will not be a prey to capricious decisions by politicians who would rather curry favour with an ignorant public than explain to it what is in Iran's best interests. Such conclusions as the companies have reached will all of them be operative only if oil is being well and steadily produced. The arrangements for that kind of production have yet to be made with the National Iranian Oil Company. *Hamlet* still lacks the prince.

Another sobering thought for Iranians is that the motive of the western powers in urging the oil companies to pursue investigations is to secure revenue, and therefore stability, for the country. But there is still not much indication that the one will lead to the other. In its six months of office, the Zahedi government has some achievements to its credit; it has restored law and order, corrected a foreign policy that had brought the country no advantages whatsoever, and secured one American grant-in-aid. But it has given no sign that, if it recovers the lost oil revenues, it will spend them any more intelligently than they were spent between, say, 1948 and 1950. Such portions as were then devoted

HOUSING PROGRESS
Permanent Houses Completed in Great Britain
THOUSANDS

THE ECONOMIST, FEBRUARY 13, 1954

to development and welfare were chiefly spent in hiring advice; and the advice was not taken because to carry it out would have entailed unpleasant changes, such as taxation of the rich. The government has not shown that this attitude is a thing of the past, and in cities such as Teheran there are therefore large middle-income and lower-income groups who are lukewarm and sceptical.

It has just founded a "National Guidance Council" one of whose jobs is "to study ways and means of making the great Iranian people realise the prominent position it has held in world history." This is a redundant project, since all Iranians already know their great past by heart. What needs explaining is the price that must be paid to secure the foundations for greatness in the future.

Exhortation to Islam

THE state of Iran today gives special point to an exhortation just made by one of the world's Grand Old Men, the Aga Khan. Though he made it in Pakistan, where it appeared in the "Aga Khan Platinum Jubilee Supplement" of the newspaper *Dawn*, he is entitled to address a wider public. For he is the Imam of the small but far-flung Ismailiah sect of Islam, and he is a direct descendant of the Prophet. Unfortunately, the Ismailis form so small a proportion of the faithful that he may not get for his common sense the attention it deserves.

Under the heading "This I have learned from life," he gives his opinion that Islamic culture, once in the forefront of technical as well as intellectual progress, has in the last three centuries been totally outclassed by that of peoples who "have drawn their force from other intellectual sources." He upbraids his co-religionists for living with their heads turned backwards over their shoulders and for being content to "put a full stop to fresh inquiry." The creed of Islam, he says, does not preclude mastery over science; on the contrary, there is an element in it that calls for the harnessing of nature to man's needs:—

Today perhaps we are farthest away from control over nature, while the west from America to Russia increases its great and overwhelming power over natural forces. . . . It is for the public of Pakistan, and indeed of the Moslem world, to adjust its cultural foundations of knowledge to the study of and ultimate victory over the forces of nature ever at our disposal through science. . . .

Here is the problem that confronts all reformers in Islamic states. Is it possible to bring about this mental revolution without destroying the orthodoxy that is the citadel of the faith? Lord Cromer thought not: hence his famous dictum that no reform of Islam was possible, because a reformed Islam would be something different. The Aga Khan himself, in a message to Mustafa Kemal in 1923, adjured him not to weaken the moral hold of the Caliphate by divorcing it from politics. Kemal, while not repudiating Islam, held that it "distracts people from the paths of progress" and that it was "indispensable, in order to secure the revival of the Islamic faith, to disengage it from the condition of being a political instrument." The Turkish solution, which was to break the narrow bonds of orthodoxy, is thought too drastic by the present leaders of Pakistan,

THE ECONOMIST, FEBRUARY 13, 1954

PyE TV FOR INDUSTRY

A recent demonstration at the National College of Rubber Technology proved conclusively that television can be a most effective educational medium for technical instruction.

During the past four years intensive research has been carried out by Pye engineers at Cambridge and this has resulted in the development of a special television camera for industrial use. The new camera has many advantages; it is small, can be operated without special lighting, costs about a third of an ordinary television camera, and what is most important it can be operated by untrained personnel. This camera transmits an extremely bright picture of fine definition on closed circuit, up to a distance of 1,000 feet feeding any number of receivers up to 15.

In technical education, especially in the instruction of apprentices, it has always been difficult to get large numbers of trainees around a particular piece of machinery for direct instruction. Television overcomes this problem, enabling any number of students to study the detail of an experiment from the television screens in a lecture room away from the actual demonstration.

This is only one of the many ways in which Pye Industrial Television is helping British and American industry. For further information will you please write to Pye Limited, Industrial Television Division, Cambridge.

Say goodnight to that cold

IN Scotland—where cold, rain and mist are no strangers—they well know the best defence against chill: that long, slow wave of inner warmth that comes from a good Scotch Whisky.

These treacherous nights, when you're damp and tired, make yourself a White Horse toddy. Take it at bedtime, with hot water, lemon-juice and sugar—or in hot milk. Finding you sleeping soundly, wrapped in a gentle glow, the cold that was counting on no resistance will probably change its mind.

WHITE HORSE

Scotch Whisky

 MAXIMUM PRICES:— Bottles 25/-, ½-Bottles 14/3, ¼-Bottles 9/6, Miniature Bottles 3/3, as fixed by the Scotch Whisky Association. 

Egypt and Iran, as they cope with constitution-making and reactionary mullahs and Moslem Brotherhoods. But they have yet to find a middle road.

Garlands for Mr Lyttelton

OF all the Ministers who have recently had occasion to travel abroad, only Mr Lyttelton, so far, has come back to receive universal applause. Two months ago, he was being subjected to a virulent campaign of abuse by the extreme left wing of the Labour party and to sustained criticism from even its more moderate leaders. On Wednesday, after his statement on Nigeria, he even received congratulations from Mr Fenner Brockway.

The applause was a well-earned tribute to Mr Lyttelton's successful chairmanship of the Nigerian constitutional conference, whose results are described on page 476. Some criticism was, however, directed on Thursday against the proposed constitutional changes in Northern Rhodesia. At the end of his visit there, Mr Lyttelton declared that the sudden swamping of white voters by black voters could not be envisaged. This could be interpreted as meaning that the European dominance in the territory's government would be preserved indefinitely. But at the same time Mr Lyttelton said that the African must not get the impression that his road to advancement was barred; something "unusual and exotic" in the way of constitutional changes should be looked for in order to give the Africans a bigger share in government and yet preserve European leadership. To meet the intractable problems of a plural community this statement cannot be considered reactionary. The question is whether an unusual and exotic solution can be found before it is too late. One of the fruits of Mr Lyttelton's visit and his discussions with European and African leaders is that he will have seen for himself how urgent the need for a solution has become.

Perhaps the best comment on Mr Lyttelton's chairmanship of the Lagos conference came from the Sardauna of Sokoto, who expressed the hope that Mr Lyttelton would

be spared politically until 1956 when the revised constitution is to be reviewed. For all the success attending the recent conference, it had to be remembered that its decisions are not binding for more than two and a-half years. Whether the unity of Nigeria that has still been preserved under the present arrangements (published as a White Paper Cmd 9059) will then be retained is an open question. The 1956 conference will probably have to face demands for full self-government from one or more regional governments without prejudice to the continuance of British supervision in the others and in the federation. It will need gifts of chairmanship at least equal to those Mr Lyttelton showed in his fortnight at Lagos.

Kenyan Dilemmas

THE tentative discussions now taking place in Kenya on constitutional changes have already run into difficulties. In November of last year the European elected members, led by Mr Michael Blundell, came out in favour of a policy which, by Kenyan standards, could be called boldly liberal. On this foundation private discussions have been held between the different racial leaders, in a search for an agreed formula for representation of all the races in responsible posts in the government. And African leaders have lately done their best to help these along by showing a much bolder front against Mau Mau.

Unfortunately, however, it is now obvious that Mr Blundell has failed to carry the white electors all the way with him; and last week a clear division of settler opinion was brought to light, when a proposal to amalgamate the organisations of the elected members and the electors was indefinitely postponed, apparently because of differences of policy. The settlers feel strongly—and with some reason—that the present government (which contains no elected representatives) is not dealing firmly enough with the emergency. They claim that the division of responsibility between a military commander and a civilian governor leads only to muddles and frustration; and are asking for the formation of a war cabinet, with a war minister and an unofficial majority. But they instinctively draw back from taking the plunge of advocating that this cabinet should be multi-racial. They clearly have in mind a government that would be dominated by themselves.

The lives and property of these men depend on firm conduct of the fight against terrorism, and to that extent their attitude is understandable. But in the long run settler rule, without the co-operation of the other races, could only lead to disaster. There are only three ways of governing Kenya: through a government composed of representatives of all the races; through continued Colonial Office control; or a still greater devolution of power upon the military. The British Government should give clear warning to all concerned that if the present discussions break down through lack of trust, a choice will have to be made between the second and third methods—and it may even be that the military method would be the better of the two.

Housing and the Bill

THE Minister of Housing has exceeded his target by nearly 20,000. In 1953, 318,779 houses and flats were built, compared with 239,922 in 1952; this makes a total of over 1,500,000 built since the end of the war. The number of houses built to let increased in 1953 by 24 per cent and houses built for sale by 83 per cent. This was a good response to Mr Macmillan's instruction that houses for sale, of area less than 1,500 square feet, should be licensed automatically. Yet the number built for sale in 1953 was still less than one in five of all homes built—in other words, no greater than the proportion fixed (though never reached) under the Labour Government.

One measure of Mr Macmillan's success is that he must now look more closely at the bill. The subsidisation of local authority houses is now costing the country some £90 million a year in rates and taxes, and to this, at the present rate of building, each year's output adds about £10 million. It is obvious economically—if not politically—that what is needed now is that private individuals should take a larger share in the house-building programme; generally speaking each new house built for sale releases another house for somebody lower down the income scale to move into. Mr Macmillan might smooth the way for private housebuilders by removing every sort of control other than town planning control; and he intends to press forward to his other desirable objective of slum clearance by granting appropriate financial incentives. But the resources needed for building are being absorbed—and the cost of building is being pushed up—by the heavy local authority programme.

It will not be easy to choke off the spate of new local authority houses. At the end of the year 250,000 houses and flats for letting had already been started, as well as 60,000 for sale. This year's performance will therefore be even more impressive than last year's, besides absorbing even more resources and being more burdensome than ever to the taxpayer.

Canada Sees the World

LAST weekend Mr St Laurent, the Canadian Prime Minister, passed through London on the first stage of what his Foreign Minister, Mr Lester Pearson, has described as a "voyage of friendship, goodwill and exploration." He is visiting nearly a dozen countries in Europe and Asia, including France, Germany, Pakistan and India. No other Canadian Prime Minister has made a comparable tour; that Mr St Laurent should want to make it is a significant sign of Canada's growing status as a world power.

Canada's vast economy is expanding so rapidly that it would not be surprising if the country were to be completely absorbed in its own affairs. But over the last decade, its interest in the world around it, stimulated no doubt by the menace of aggressive Communism, has expanded almost as rapidly as its own economy. It has played more and more of a leading role at the United Nations; it has made

a valuable contribution towards preserving the delicate balance of Anglo-American relations; through Nato it has become closely linked with the countries of Western Europe; finally, in recent years it has taken an increasingly strong interest in Asian affairs.

Mr Lester Pearson told the Canadian House of Commons a short time ago that through its membership of the Commonwealth Canada has a special obligation towards the peoples of Asia and a special opportunity to help them. He pointed out that the disruptive social, national and economic forces at present at work in Asia would have erupted in any case, even without the aid of Moscow. Canadian policy in Asia, therefore, must be something more than negative opposition to Communism; it must be a constructive attempt to convince the Asian people that "free democracy can do more for the individual than Communist tyranny can ever hope to do." These are enlightened words from the Canadian Foreign Minister. Moreover, they are not merely words; since 1951 Canada has allocated \$75 million for capital investment under the Colombo plan, and an additional \$1.6 million for training technicians. Mr St Laurent's tour should do much to put Canada still more on the map as a power that counts in South East Asia. It will be all to the good if it does.

Aboriginals in Fleet Street

BEFORE the royal tour of Australia ends there may be time for the British press to put right one matter that went badly wrong in New Zealand. There the Queen's otherwise triumphal passage was marred by something for which neither royalty nor antipodean affection can be blamed. The fault lay with certain London daily newspapers—and, curiously enough, most of all with those that cry loudest their belief in the Commonwealth.

Distinguished New Zealand editors complain that some Fleet Street correspondents' comments on the tour were pervaded with that irritating condescension that has so often made the Englishman's path in the Commonwealth needlessly difficult. One—a woman—smugly revealed that she had always thought Maoris lived in trees; and she was not the only correspondent to parade such patronising and naïve ignorance. New Zealanders are accustomed, it is true, to solid local newspapers, and can hardly appreciate the fierce competitive urges that drive big national dailies to smother the facts with the sickly cream of "human interest." But many of them who know Britain well deny that their countrymen are noticeably more touchy than, say, Londoners, who, they believe, would react just as sharply if a visiting New Zealander publicly giped at their own sacred cows. They appreciate that the Fleet Street men were writing for readers at home; but they point out that the more controversial remarks were bound to be widely reprinted in the Dominion.

Underlying the controversy is the impression, now common in New Zealand, that the interest of several London newspapers in the Commonwealth is strictly limited to special "angles," and that they should not wait for royal tours before sending their star writers to explore the outer marches. Several correspondents covering the tour have expressed the hope that they could return at

leisure and really learn something about New Zealand. It might pay their employers to help them to do so.

To Understand Japan

IT is good news that Mr Yoshida, the Japanese Prime Minister, is to visit London. The British Government has been slow in deciding during eight years how much attention to give to postwar Japan, so encouraging the tendency in that country to judge its relationships with the West entirely in the light of its experience of American occupation and tutelage. Now that Japan is trying to stand on its own feet, it is increasingly conscious of the political and economic role for which it is cast in the Far East; and it may well feel surprise that the role is so little understood in this country and the Commonwealth. Indeed, much British criticism of the recent trade pact has almost entirely ignored the sheer political importance of giving the Japanese a fair chance of earning their living.
