The New Steel Project

THE New Year has begun well. As the year 1953 ends, the dominant feeling is one of pronounced optimism in respect of economic affairs. This feeling was strongly voiced by the Finance Minister in a Press Conference on December 29. It is visible in an exclusive interview given to the Editor of "The Eastern Economist" which appears in full on pages 18 and 19 of this issue. It is not, however, opinions alone which will convince doubtful minds. There has been in at least one respect a powerful display of decision. This is in regard to India's new steel plant. Between the first agreement signed at Bonn on August 15 last year and the agreement of December 21, the Government of India has operated at high pressure. There is a note of resolution in the public sector which can rightly be acclaimed as something new and heartening.

The longstanding plans for the establishment of a new unit for steel manufacture in India have at last taken practical shape with this agreement between the Government of India and the German Combine of Krupps and Demag. Thus there have ended five long years of doubts and indecision. It will be remembered that project reports of three American technical consultants in 1948 clearly established both the extent of the demand for steel and the availability of all the resources for its manufacture within the country. The difficulty over finance seemed insuperable in the initial stages; then came a period of suspense, caused apparent-

ly by indecision as to whether two steel units each with a capacity of half a million tons or one with a million-ton capacity should be established. The absence of any proposal for a steel unit in the Draft Five-Year Plan and the very vague provision made in the final version in December 1952 seemed to indicate a total lack of foresight in implementing a scheme which admitted of no two opinions on its desirability as well as urgency. The Ministry of Production has certainly to be commended therefore for having taken the initiative to break this chapter of empty talk and translating a scheme into firm action.

165109

The outstanding fact about the present arrangement is the choice of the partner for executing the task of construction of a steel plant. It has long been a settled fact that a new steel project would be established under State ownership. It was inevitable that foreign technical assistance should play the leading part in the building up and initial working of the plant. The international reputation of the German Combine in the field of steel manufacture provides sufficient guarantee that the responsibility for the technical side of the construction and operation will rest in proper hands. The Combine has taken up this assignment at a time when German and other European steel expansion plans have almost reached completion and both capital equipment and technical personnel will be available to undertake similar tasks elsewhere. With their assurance that the cost and efficiency of the Indian steel unit will not be less favourable than in the other units which Krupps and Demag have already helped to establish in Europe, the Indian steel project may be said to start under very good auspices.

There are many important details of the steel project which still remain to be settled. The first relates to location. The German partners have to decide from the technical point of view between the competing claims of the four sites now under consideration. Within the scope of any latitude which technical considerations may permit, there may also enter an element of political choice by the Government of India between Sindri (Bihar), Durgapur (West Bengal), Bilhai (Madhya Pradesh) and Rourkela (Orissa). This, however, is much less important than the question of the particular kind of process of steel manufacture which is to be adopted. This question is directly related to the outlay on the project as well as to the unit cost of production. One major decision has, however, been reached which will have a vital bearing on both. Both the Government and the German Combine have now made it quite clear that the most economical unit will be a million-ton plant and that it can be best established by starting with half-a-million-ton capacity and doubling its size in due course.

This decision sets at rest an old controversy as to the size of an economical unit. There is a written contractual undertaking that the steel works should be made ready to commence production within a period of four years from the decision on the location of the plant. There also appear to be informal assurances that as the steel unit is being erected, as much of productive activity as is possible will commence even earlier. In view of the European experience of the construction of such plants in less than three years in some cases, and the earnestness of the German firm in the present undertaking, it would not be over-optimistic to hope that the period of four years is only an outside limit. There would arise some subsidiary matters like the township for the plant. The German technical consultants will advise and settle the layout of the township but the work of constructing the houses and the financial outlay remain outside the scope of the present project agreement.

The purely financial provisions for the formation of the Company to be known as "Hindustan Steel, Limited" appear to be favourable enough. Though the Company will have an authorised capital of Rs. 100 crores, the estimate for the project, which would vary according to the process to be adopted, is expected to be just over Rs. 71 crores. There is an obligation to preserve the ratio of 4 : 1 in the shareholding between the Government and the Combine, and to regulate accordingly the issues of capital from time to time, with a ceiling on the Combine's investment in the share capital of the Company at Rs. 9.5 crores (in D Marks not exceeding the equivalent of $20 million). There is provision for applying for a loan to the International Bank of $40 million or to other sources to the extent of a shortfall. This figure of $60 million in foreign capital contemplated is still below the total foreign exchange requirements of the project which has been estimated at 60 per cent of the total cost of the project (or about Rs. 42 crores). There is thus opportunity to utilise in this project part of the other foreign aid available for financing the plan, the means of absorption of which is now causing problems.

The conditions of the Indo-German agreement require that orders must be placed in Germany at least to the extent of $67 million, if the entire subscription of the Combine to the share capital of $20 million is fully invested in proportion to orders. But there is an important safeguard in the stipulation that global tenders will be invited for plant, equipment and supplies and that quality, prices and delivery dates will be the sole determining factors for their acceptance, subject to the exclusion of government subsidized tenders. The transactions of the Company are subject to taxation and there are no other special concessions. The remuneration of Rs. 2.1 crores agreed upon with the German Combine for their technical advice as consultants has come in for some criticism; it would appear, however, to be counterbalanced by other advantages and would in any case appear too trivial in the context of the general progress made on the project.

A significant addition has now been made to India's Five-Year Plan by this agreement. It can lead to the growth of sufficient confidence to plan for more of such steel or other heavy industrial projects in the next five-year plan, on which a beginning has already been made. The German technical consultants have agreed to train Indian technicians not only in the operation of the plant for manufacture but also in the processes of construction, which will make sufficient personnel available for future tasks. These terms are, perhaps, more favourable than could have been expected in any agreement for technical assistance on commercial lines. The steel project is not to be judged merely in terms of the steel to be made available. It must be reviewed as a symbol of the type of economic development that is needed in the future and the willingness to go all out to achieve it.

As this first chapter ends, it will generate the belief that the Government of India is able to think spaciously in industrial, as well as in agricultural, terms. Whereas multi-purpose finance seemed plentiful, the most obstinate parsimony always existed on steel. Now that mood has ended: this is the time not only for the consideration of other large industrial schemes including another steel plant. It is a time to see how small units of the engineering industry can be dovetailed into our plans for the utilisation of the steel to be produced.

Economists in Conference

THE 36th All-India Economic Conference held in Jaipur on the 28th and 29th December was inaugurated by Mr. T. T. Krishnamachari in an address which was appropriately provocative in an age where the stimulus to new thinking in the economic sphere has become a most urgent need. It was apparent at this meeting that the economists themselves recognised this overwhelming need. It was not to be expected that this recognition would be translated immediately into action, but, for almost the first time, the major theoretical subject of discussion, the application of Keynesian economics to underdeveloped countries, gave place of priority to the practical subject, which was the making of Indian import policy. It is still unhappily true that even an intensely practical subject like import policy continues to be discussed by economists in an extremely tenuous and rarefied theoretical atmosphere in which practical administrators can scarcely breathe. But it is significant nevertheless that our economists are becoming more practical; on this occasion it was also significant that the Minister of Commerce and Industry went more than half way to meet them. This inaugural address showed an acquaintance with recent studies in theoretical economics which was slightly embarrassing to some of his listeners.

This meeting of the currents on an academic platform was, perhaps, unduly emphasised by the Presidential address of Prof. S. Kesava Iyengar, who submerged his theoretical economics in a crusade against new administrative weaknesses. What was right about this Presidential address was its outspoken criticism; every platform in this country is a democratic platform and can, and should, be used to direct attention fearlessly to weaknesses which can bear correction. Prof. Kesava Iyengar mentioned a few of these. But the total impression left by him on his listeners was that he had set out to tilt at many windmills and did not do much constructive work in the process of an address which lasted an hour and a half. There is everything to be said, for example, for demarcating survey numbers properly and incorporating the results in a correct map of villages of the Hyderabad State. But to place the emphasis on details such as these at a time when the broad lines of economic policy are in a state of violent flux was surely very mistaken.

The truth is that in a country as vast and varied as India, there will necessarily be some great inadequacies in respect of detailed administration. But it is even more true that there are, recognising the size of the country in this respect, some quite dashing successes. For example, while Hyderabad State and perhaps Rajasthan might show the defects in abundance which Prof. Kesava Iyengar analysed, there are some States like Madras, Mysore, and Bombay where the survey and settlement work and the village records constitute one of the most advanced administrative achievements to be found anywhere in the world. Again, even assuming that survey numbers are not adequately demarcated, and the pressure of duties on revenue officers appears to perpetuate this neglect, should we at this time place correction of these errors in the top priority class? Surely, the distraction of revenue officers from their routine duties is a measure of the importance which the country attaches to other things.

Mr. Krishnamachari was fortunately able to reflect in this Conference much more appropriately the true problems which face India's economists. This is essentially to "indicate in precise terms the direction in which India might proceed in order to reach the goals we in a Welfare State have set for ourselves". It is still true that, while much has been written on planning and subjects akin thereto, this fundamental challenge to India's economists to set out the pattern of India's economic progress in what Mr. Krishnamachari described as the Rostow approach has been left unanswered. Our economists have tended to work in a political vacuum. If they are professors trained in the old school, they tend often to treat Indian universities as though they were replicas of Oxford, Cambridge, and London, where so many of them were trained. In another school, of which Mr. Krishnamachari said that it had not yet attracted any economist of eminence, there is such preoccupation with the cottage industry concept that the fact that over large areas that concept has been expressly rejected seems to them only an obstinate but trivial detail. Between the classical or neo-classical or Keynesian economists of the Great British universities and the Gandhian economists of none, constructive Indian economic thinking today has fallen between two stools.

It is no solution for this basic defect in economic thinking to draw from statistical organizations a great wealth of descriptive material of the kind included in the National Sample Survey. Statistics is a respectable calling, and nothing is more childish than for economists to decry statisticians who are really the only people who can put the theories of economists to the test. The statistician provides the economist with a laboratory. The spectacular developments in Indian statistics in the last five years are developments of which India can well be proud. But this escape into statistics provides no solution to the basic economic problem which is the description of the economic links that matter in the Indian economic system.

If the National Income Unit of the Government of India, which was appropriately weighted two to one in favour of economists, had been able to inspire research into the elements most necessary for a comprehension of the Indian economic system, almost nothing more need have been said. But the fact that the National Income Unit after having been in session for four years has been able to produce only one report (for 1948-49), which has answered no fundamental question on the nature of the income-investment relation in India, shows that enlightenment must be sought elsewhere. Mr. Krishnamachari's address at the 36th Economic Conference suggests that where the Finance Ministry has not succeeded, the Ministry of Commerce and Industry is likely to have something more positive to contribute. Why should not the Ministry of Commerce and Industry supply the catalytic agent which will enable the reaction of new economic thinking to go rapidly to work?

This surely is the answer for current economic research in India. The universities do not have the resources. Our leading economists are not trusted in the counsels of the Government, because they are believed to be academic. The lack of resources and the lack of intellectual stimulus, because our economists are made to feel that they are not important, have kept our economists in their ivory towers. This is the country's misfortune. The Government must go out in a big way to woo its economists. It woos the people; why then are its economists neglected? Their influence on the new generation in colleges is enormous; if the Government of India intends capturing the intelligentsia, it is obviously elementary public relations to get the economists on its side. Will not Mr. Krishnamachari constitute in his Ministry a committee of non-official economists, who can both learn and interpret the practical problems with which India's commerce and industry are now faced? It is sincerely to be hoped that this 36th session of the Indian Economic Conference will be the instrument of a new approach to the economist as well as to economic science.

Magistracy Unlimited?

THE Bill to amend the Criminal Procedure Code now published for general information seeks to carry out the assurances given recently by the Home Minister about reform of the judicial administration. The system of criminal procedure has certainly been in need of amendments. There will be little regret over the abolition of the system of trial with the aid of assessors as that system has long outlived its usefulness. Many of its evils, however, have been common to the jury system, for which the Home Minister has developed a strong partiality. The verdicts of Indian juries have often been the despair of judges and considerations of caste and class and misguided sympathy for the accused had influenced too often the verdicts. The Home Minister has, however, wisely left it to the States to decide whether sessions trials should be held by a Judge sitting alone or with a Jury. That seems a wise compromise. The abolition of protracted proceedings before Magistrates for committing accused to Sessions Courts may also be a step in the right direction.

The extension of the scope of summons cases to offences punishable with imprisonment of less than a year may also be acceptable. The proposal for speeding up the procedure for warrant cases by restricting the opportunity for cross-examination to only one stage is more debatable. The vesting of discretion in the Magistrate to allow or not further cross-examination may not ensure complete confidence, especially when a Magistrate has to function under a mandate for speedy disposal. The restriction on adjournments, in order to compel examination of witnesses on their first appearance, seems unexceptionable in theory but difficult to enforce in practice. Under the new procedure, prisoners under trial will acquire the right to be released on bail if their trial is not concluded within six weeks from the institution of a complaint before a Magistrate. By enabling "formal" witnesses to give evidence by affidavit except when they are required to be cross-examined, time and trouble will be saved. These are almost exhaustive of the changes which may be regarded as prima facie justifiable and well worth trial.

The more controversial changes, however, are numerous. The provision for enabling trials of offences at or as near the place of occurrence of a crime at the discretion of Magistrates and Sessions Judges arises out of a misguided belief in the value of the so-called people's participation in court work. Trials nearer the scene of occurrence are possible even now in special cases with the permission of the State Government; the scope for abuse of this process is, therefore, restricted. A more frequent resort to this procedure would only dislocate the normal work of the Courts and of those attending them. The powers for summary punishment for alleged perjury places a power which is likely to lead to gross abuse. And still worse is the proposal to extend the powers of the Magistrates to trial of offences punishable up to seven years' imprisonment. The argument for this proposal is very strange; it rests on the fact that there now exists a provision, in Section 30 of the Criminal Procedure Code, by which first class Magistrates can be empowered by the Government in certain States to try all cases not punishable with death. That Section now applies to only three Part A States, and the bigger States like Bombay, Bihar, U.P., Madras and West Bengal are not among them. It should have been obvious that any proposal for reform should have attempted to introduce uniformity, if at all, only by raising the other States to the level of the excluded States rather than by pulling down the majority of the Part A States to the level of the rest. There can be no doubt that this proposal is misconceived and highly objectionable.

Not the least of the objections to this step is the fact that power will be given to the State Government under this Section to extend the jurisdiction of first class Magistrates, which would enable them to avoid the more independent Sessions Courts in all but the most serious cases. The question of extending magisterial powers beyond the maximum of two years' imprisonment now in force may be a relevant matter to consider where there has been a complete separation of the executive from the magistracy. So far only two States have made substantial progress in the direction of such separation; and in Madras, the separation still lacks a statutory basis. The expansion of the powers of the Magistrates in these circumstances is fraught with grave danger to the right of a citizen to get a fair trial in the more serious types of offences. It is a wholly retrograde provision which ought to be strongly resisted; in fact, Parliament should take this opportunity to repeal Section 30 of the Criminal Procedure Code, which has perpetuated an anomalous position so long.

Indeed, the major item of reform of the criminal courts, which is missing in the present Bill to amend the Criminal Procedure Code, is the complete absence of any amendments to enable the separation over the whole country of the executive from the judiciary, which is an objective enshrined in the Constitution. It is clear from the experience of Bombay that statutory amendments are needed; in Madras, a very intricate formula to separate the preventive and judicial powers of Magistrates has been worked out, but obviously uniformity in this matter is desirable and necessary. It can easily be achieved by enacting suitable amendments to the Criminal Procedure Code, by Central legislation, which can be merely applied by any State Government as soon as it can make the administrative arrangements for separation of the judicial Magistrates from the executive. Any question of extension of the powers of trial and sentence of the Magistrates can only arise after this vital safeguard has been provided. The circumstance that it is the Home Ministry which has sponsored these amendments raises the suspicion that it was not mere oversight that was responsible for Government turning the blind-eye to this important reform, while being very zealous about extending magisterial powers under a specious plea. Since only the State Governments were consulted it is not surprising that no objection was forthcoming against these proposals of the Home Ministry.

The tendency to strengthen the executive is also revealed in the proposed amendment to convert defamation against public servants, including Ministers, Governors and the President, into a cognizable offence. Public servants are thus sought to be placed in a privileged position, though a number of other men in public life or in business are equally at a great disadvantage in following the cumbersome procedure in filing complaints against grossly defamatory attacks. Once the privilege is granted, there can be no assurance that even a citizen who exercises his legitimate right of criticism of public servants will not be harassed since it can now be done at public expense. The executive has always been too sensitive and resentful of criticism in the past to provide a guarantee that it will not set in motion the machinery of the State to harass legitimate critics before the Courts. The prospect of facing the burden, financial and physical, of defending against such an action, could deter even genuine criticism sufficiently even if trials led to eventual acquittal by the Courts in each case. In the light of the failure to effect separation of the judiciary and in view of the enhancement of the powers of the magistracy, this new protection to public servants including politicians in office can become an instrument of executive tyranny which should be resisted.

THE WEEK'S NOTES

PROSPECTS FOR BERLIN MEETING

While the Western reply to the Russian note of December 26 for a Berlin meeting of the Foreign Ministers' may be made only after further diplomatic consultations, it seems unlikely that the Western Powers will now demur to the Russian proposals. Both British and American reactions have generally been in favour of acceptance. There is nothing particularly objectionable about the change of date to January 25, sought by the Soviet Union. As to the venue of the meeting, there is unlikely to be any Western objection to the Russian proposal that representatives of the High Commissioners of the Four Powers should together decide the place. The object would certainly be to cut the exchange of notes and go ahead with the meeting, so long as there can be no serious disagreement over the agenda. The Russian note has omitted all reference to the two questions on which the Western Powers are keenly interested, namely German unity and the Austrian treaty. The Soviet note suggests that the Soviet Government would only be interested in the discussion of the question of "assuring European security and eliminating the threat of the rebirth of German militarism" and secondly, the convening of a Five-Power Conference, including China, to lessen international tension.

There is probably sufficient meeting ground even in these apparently divergent proposals. Both Austria and Germany can be discussed, if not specifically as such as the Western note has demanded, at least as part of the problem of European security and German rearmament. The only question is whether the United States, which has so far made Germany and Austria test cases for proof of Soviet intentions, would agree to the discussion of a Five-Power Conference. There can be no objection to listening to the Soviet Government's suggestions on this subject. The British point of view might be to accept the Russian suggestion at face value and proceed to discuss what safeguards are needed to assure the Soviet Union of security against any military threat. It is, of course, unwise to expect that a Foreign Ministers' meeting would immediately lessen tension. Either party cannot remain indifferent to the propaganda value which the other can derive out of the failure to progress towards understanding. Whether the meeting will prove another episode in the cold war or a real prelude to understanding will, however, be decided.

N.N.R.C.'S APPEAL FOR INSTRUCTIONS

The report of the Neutral Nations Repatriation Commission does not contain much that was not already known about the manner in which the explanations to prisoners have proceeded in the last three months. Though there has been a minority report, which will be grist to the anti-Indian prejudices in South Korea and in certain American circles, much of the ground is common. The minority report emphasises that the prisoners on the other side were equally well organised in their attitudes. The difference in numbers has, however, made a substantial difference to the effect, if not the principle, of such organisation. Moreover, the organised violence against individual prisoners, who were wavering in their attitude to explanations, has resulted in murders and disappearance of men apart from the failure of the explanations. The actual issue, however, is what the Custodian Force has to do now with the prisoners on its hands. The N.N.R.C. is not quite clear as to the modus operandi of the reversion to civilian status on January 22. The implications of this condition were not sufficiently clarified in advance, as it was assumed that a Political Conference would meet before that date as a matter of course.

The N.N.R.C. has to meet a situation in which the prospects for such a conference have fast receded. The Commission is therefore making another bid to clarify matters. It is, of course, possible to say that there was no need, since the N.N.R.C. could well have invoked the specific clause which grants civilian status to the prisoners. There is always the fear that that step might wreck the chances of agreement in Korea but it is a risk which is inevitable. On the same logic, the earlier action of Dr. Rhee in releasing prisoners could have prevented an agreement, though it did not. It is unlikely that the Commission will now receive agreed instructions from both Commands but the present reference makes their moral responsibility clear. Whether the principle of voluntary repatriation of prisoners has been fully vindicated in Korea is for history to record.

PREVENTIVE DETENTION

The debate in Parliament on the policy of Preventive Detention has once again proceeded on the usual lines to justify the official attitude. The Home Minister cited the unanimous opinion of the State Governments that the power of preventive detention should continue and gave examples of the grosser instances of disturbances of law and order. The real issue was whether the Act, if necessary only for such extreme instances of lawless conduct, was actually being enforced in that spirit. The numbers of those detained have progressively declined from 1865 at the end of 1951 to 338 at the end of 1952 and to 117 at the end of 1953. Whether lawlessness was so considerably higher in 1951 than in 1953 seems debatable, but it is certainly arguable that the Governments have been more careful in resorting to Preventive Detention. But it cannot be denied that there have been more cases of improper detention on insupportable grounds than legitimate cases. The Home Minister cited the fact that Advisory Boards under the Act had recommended release of detenus in 224 cases out the 700 cases reviewed as evidence of the safeguards provided against arbitrary enforcement. But that was sufficient proof also of the improper exercise of the powers to harass citizens against whom no prima facie case could be made out.

There is confirmation of this conclusion in the figures of the cases decided by the Supreme Court. There were 335 cases under the Preventive Detention Act before the Supreme Court between October 1952 and November 15, 1953, and detentions were upheld in 74 cases and set aside in 83 cases. More significant is the fact that in 158 cases detention orders were revoked by the State Governments before the petitions came up for hearing, showing their inability to justify their action before the highest judicial tribunal. There is thus conclusive evidence of abuse of executive authority under the Act, the continuance of which can only be justified in the very few extreme cases of attempt to undermine law and order. The Opposition amendments to the resolution on the subject had at least this justification for their introduction that there was no bona fide application of the special powers. The fall in numbers of detenus during the last year has been the direct result of the Supreme Court's intervention and the work of the Advisory Boards. It is to be hoped that in the remaining one year of the Act's life, there will be a more responsible exercise of authority.

REORGANISATION OF THE STATES

The appointment of a Commission to examine de novo the question of reorganising the States of India has long been expected, since the establishment of Andhra State. The terms of reference are wide enough to enable the Commission to survey the problem in all its aspects and the choice of the members has been made with a view to lending prestige to its recommendations. But it is doubtful whether the Government or

the Commission would be wise in throwing the whole question again into the melting pot in the manner in which the Prime Minister's statement in the House of the People suggests. "The language and culture of an area have an undoubted importance " Mr. Nehru said, "as they represent a pattern of living which is common in that area. In considering a reorganisation of States, however, there are other important factors which have also to be borne in mind. The first essential consideration is the preservation and strengthening of the unity and security of India. Financial, economic and administrative considerations are equally important."

All this is familiar. The point that arises is whether a Commission, however objective and dispassionate, can now control or dispel the sentiments and emotions that are evoked among the people of the area in which the demands for reorganisation have been raised. The integration of the States, for example, showed that administrative and financial considerations will be readjusted to the new patterns in due course. In any case, the present pattern of division of the territory of the Union does not reveal much of method. The Part "C" States have an anomalous status and the tendency has been to make them semi-autonomous units, thereby creating new political pressures to maintain that status in future. It would be wise for the Government to accept the sentiment in favour of linguistic provinces and to investigate the conditions under which they can be established and the arrangements, administrative and political, that should precede the establishment of each linguistic unit. It may even be considered whether the existing distribution of powers between the States and the Centre should be revised to fit in the administrative and cultural autonomy of the States with a larger measure of Central control, to evolve and implement common policies. That might be a better premise than attempts to minimise the linguistic and cultural movements.

I.F.C. VINDICATED

The report of the Enquiry Committee on the working of the Industrial Finance Corporation and the decisions of the Government on the Committee's recommendations have served a useful purpose. They have shown the kind of unwarranted suspicions that are likely to be raised even in clear cases because of rumours and insinuations that are easily spread. The Committee is satisfied that the Chairman and Directors of the I.F.C. had disclosed their interest in the concerns which applied for loans and with which they were associated. There has been no regional bias in the rejection of applications for loans. The Committee has recognised the Corporation's limitations in the matter of promoting industries in backward regions or in favouring smaller industries against the bigger units. Loans granted on too strict banking considerations often tend to indicate a bias in favour of the established industrialists instead of those struggling to start new ones. The Committee's suggestion that the Board of Directors should be more closely associated with the work of the Executive Committee, to take responsibility for dealing with the more difficult cases deserves to be implemented. The Government has refused to accept the unfavourable interpretation by the Committee on certain cases of expeditious grant of loans, which did not warrant that interpretation.

The Government has accepted the suggestion for a wholetime Chairman for the I.F.C. and to amend the Act accordingly, but it is doubtful whether the present scale of operations would justify the step and secure the services of a person of suitable standing. The Government's decision to have panels of advisers, on a functional rather than a regional basis, was a right one. The Government has also rightly refused to accept the suggestion that all companies having Directors on the Board of the I.F.C. should be ineligible for loans; the proper course would be to have a report of each such case sent to Government for scrutiny and in all such cases the Government's nominees on the Board must take an active interest. It has also been provided that the I.F.C. should send up a report of every loan in excess of Rs. 50 lakhs, though it will not be necessary to take Government's sanction for it. The Committee's final recommendation that direct interference by Parliament in the day-to-day administration of the Corporation should be avoided but that Parliament should be able to look more systematically into the affairs of the I.F.C., raises the general issue of the status of all such Corporations vis-a-vis Parliament, on which different opinions have prevailed. Not the least of the difficulties of the Corporation is that its attempts to clear itself in the eyes of the public by publishing reasons for its decisions may embarrass the companies whose reputations may be affected by disclosures of confidential information.

THE DELHI SCHOOL OF ECONOMICS

UNIVERSITY OF DELHI

DELHI-9. December 15, 1953.

The Delhi School of Economics is an All-India Postgraduate Institution of advanced studies, research, and training in Economics, which functions as a constituent unit of the University of Delhi. The School is administered by a registered society, and has as its Founder Members more than 140 persons drawn from all parts of India and from all ranks of life, who have made or are making a contribution of Rs. 1,000/- each to the permanent funds of the School.

The School proposes shortly to construct its own main building. Attached to this main building will be the School's Hall, which the students and staff of the School have unanimously decided to name SWAMI VIVEKANANDA HALL. The students and staff of the School have taken this decision, because they draw inspiration from the life and teachings of Swami Vivekananda and are anxious permanently to associate this inspiration with the future of their institution. It has also been decided by them that as much as possible of the cost of the construction of this Hall should be raised by small donations from as many persons and from as many parts of India as possible. With a view to facilitating this object, it has been decided that no single contribution should exceed Rs. 5/-, while none should be below Re. 1/-. In fact, receipt books have been prepared for the purpose, indicating that the donation should be of Re. 1/- or Rs. 2/- or Rs. 3/- or Rs. 4/- or Rs. 5/-, as the case may be.

As President of the Fraternity of the School which is the joint organisation of the staff and students and as Director of the School, I am venturing to appeal to people all over the country to make their contribution towards the building cost of the Swami Vivekananda Hall of the School. Donations, which should not exceed Rs. 5/- each, may be sent either by money order or by postal order and addressed to the Director, Delhi School of Economics, Delhi-9. Donations will be acknowledged and receipts furnished for the same.

WORLDGRAM

TRADE

Britain's Balance of Payments: Total exports in November 1953 were £248.8 million as compared with £236.9 million in October. Imports were estimated at £272.4 million for November, and the visible adverse balance was put at £23.6 million, the lowest for three years. U.K. exports to North America in November amounted to £25.1 million compared with £27 million in October. Shortage of sterling has hindered trade with South American countries and with certain Middle Eastern countries. The following are some interesting figures:

	November 1953	October 1953	First 11 months 1953	First 11 months 1952
	£ mn.	£ mn.	£ mn.	£ mn.
Exports f.o.b.* ..	248.8	236.9	2,455.6	2,482.5
Imports c.i.f. ..	272.4	279.8	3,067.4	3,216.5
Visible adverse balance	23.6	42.9	611.8	734

* Including re-exports.

* * * * * * *

India's Balance of Payments in November: For the third month in succession India's foreign sea and airborne trade has revealed a favourable balance. Figures show that in November 1953, the value of India's exports and re-exports of merchandise exceeded that of imports by Rs. 9.85 crores. The following table shows the comparative figures:

India's Balance of Payments
(Rs. in crores)

	Nov. (1953)	Oct. (1953)	Sept. (1952)
Exports and re-exports ..	47.07	45.85	47.81
Imports	37.22	43.47	43.12
Balance	+9.85	+2.38	+4.69

INDUSTRY

U.K. Industrial Production: First estimates show that the U.K. industrial production probably reached a new peak level in October. The index figure for output by all industries in October is put at 127-128 (base 1948=100). The estimate so far received is formed from sections of industry representing about 20 per cent of the whole index. The breakdown of the September figure for all industries is as follows:

Index of Industrial Production
1948=100

	September 1953	September 1952	August 1953	August 1952
All Industries	125	116	106	98
Mining and Quarrying ..	112	114	92	94
Manufacturing	128	116	106	97
Gas, Electricity and Water	122	120	108	103

Analysis of Press Advertising in the U.K.: The boom in press advertising continues in the U.K. The total value of expenditure on press advertising for the third quarter of 1953 was 22 per cent higher than in the same period last year. Amongst the major causes for this boom are: the greater supplies of newsprint; the end of Government control and rationing on certain types of products; and a shift to a buyers' market in general. Advertising on household soaps and detergents increased by 70 per cent in the first nine months of this year; most of this increase was due to the war between Surf and Tide. Also, advertising on chocolate confectionary has risen by 250 per cent. The following two tables show the exact situation:

Total Value of Press Advertising

	1953 (£ million)	1952 (£ million)
July-September	13.36	10.98
April-June	15.21	11.65
January-March	13.63	10.83

Expenditure on Press Advertising by Chief Product Groups

Classification	1953 (% of total Jan.-June expenditure)	1952 (% of total Jan.-June expenditure)
Food and Drink	23.4	22.4
Household Equipment	12.1	13.0
Household Stores	13.4	12.1
Motors and Cycles	13.7	10.2
Toiletries and Cosmetics	11.3	12.2
Wearing Apparel	11.8	14.3
Others	14.3	15.8
TOTAL	100.0	100.0

* * * * * * *

Tea and Coffee Consumption in the U.K.: Nearly half of the world's tea is consumed in the U.K. and the present annual consumption is put at 9.8 lbs. per head compared to 10.8 lbs. per head before the war. On the other hand, the U.K. consumes only 1.6 lbs. of coffee per head a year compared to America's consumption of 16.7 lbs. and Sweden's 12.9 lbs. The average retail price of good quality coffee has risen since decontrol to 7sh. 6d. per pound compared with the former control price of 5sh. 4d. per pound. The average retail price of tea, however, which was 3sh. 8d. per pound before the subsidies were removed in June 1952 has risen to about 4sh. 8d. per pound. A recent survey carried by the Tea Bureau in the U.K., with a sample size of 2,000, showed that there has been a slight increase in tea drinking. The soluble coffee extracts such as those made by Nestle's and Lyons, however, have increased enormously since 1939. The following figures present the true picture:

Net Imports of Tea and Coffee into the U.K.

	Tea (Mn. lbs.)	Coffee ('000 cwt.)
1953 (annual rate)	447	490
1952	473	731
1951	451	747
1938	517	280

* * * * * * *

Silk Cocoon Production in Jammu: The production of silk cocoons in Jammu province has been brought up to pre-1947 level. A report of the Mulberry Culture Department says that the Pakistan invasion in 1947 reduced production from 7,000 maunds to 1,700 maunds. The increase now permits all the silk factories to work continuously and even to lay up stocks of raw materials. The department has prepared a five year development plan and hopes to raise the production of cocoons to 12,000 maunds by 1958.

* * * * * * *

U.S. Tin Stockpile: The U.S. delegation to the U.N. International Tin Conference has recently dis-

closed that by next March the U.S. Government would have 38,000 to 40,000 long tons of tin in excess of present requirements for its strategic stockpile. The U.S. is the world's largest single consumer of tin, and at present no decision has been reached as to how the U.S. intends to dispose of its surplus stock.

* * * * * * *

New Steel Plant for India: After prolonged negotiations in Bonn and Delhi the Government of India signed an agreement recetly with a German combine for the installation of a new steel plant in India. The plant will be designed to produce 500,000 tons of steel in the first phase and will be expanded later into a one million ton unit. The first phase is estimated to cost not more than Rs. 70 crores. It has been provided in the agreement with the German combine of Krupps and Demag A.G., that the technical management of the plant would be provided by the German firms but Indians would be trained to operate it.

FINANCE

A £12.5 Million Transatlantic Cable Plan: It was announced in the House of Lords recently that a contract had been signed for the construction of the first transatlantic telephone cable system. The project will cost £12.5 million. The agreement was signed between the U.K., Post Office, the American Telegraph and Telephone Company, the Canadian Overseas Telecommunication Corporation and the Eastern Telephone and Telegraph Company of Canada. The U.S. will contribute 50 per cent of the cost while the U.K.'s share is 41 per cent and that of Canada 9 per cent. The first cable will be laid in the summer of 1955 and the second in the summer of 1956. The task is expected to be completed by December 1956. The reason for laying the telephone cable lies in the fact that the existing transatlantic radio telephone service is exposed to fadeouts.

* * * * * * *

U.S. Gross National Product: It has been estimated that the U.S. gross national product would total about $368,000 million in the calendar year 1953. This would be 5 per cent higher than the 1952 figure of $350,000 million. Personal income in 1953 is expected to total about $285,000 million or 6 per cent larger than last year's record level. Farm income, however, is expected to sink to about $16,500 million, the post-war low reached in 1949. Other features of the report include a moderate reduction of Federal expenditures for national security programmes and some declines in output and employment.

* * * * * * *

U.S. Aid to Britain: Allotments totalling $400 million were made to the U.K. during the year ended March 31, 1953, under the Mutual Security Act, 1952, including $41.9 million in respect of the American Aid (Agreed Schemes) Deposit Account. Receipts in respect of this and earlier allotments brought the total to $486.5 million.

* * * * * * *

German Export Credits: German export credits abroad are in the neighbourhood of $1,000 million mark now. At the present rate, German export credits are rising steadily at a daily rate of about $1½ million. Germany's credit with the E.P.U. now stands at $749 million, just $51 million short of the limit. A number of measures are being considered to prevent further swelling of German foreign credit which include: a reduction of credit margins of bilaterally accounting countries; adjusting of credit margins by the end of each trading year and an annual amount of 800 marks to be freely transferable by any German citizen every year to pay for his private commitments abroad.

* * * * * * *

The World Bank and the New York Money Market: The World Bank expects to offer a $100 million issue of U.S. dollar bonds on or about January 12, 1954. Maturity of the new issue is expected to be about 15 years. The bonds will be offered through an underwriting syndicate managed by the First Boston Corporation and Morgan Stanley and Co.

* * * * * * *

National Health Service and the Price Mechanism: In the U.K., under the National Health Service, spectacles, dentures, surgical footwear, artificial limbs and abdominal appliances are supplied to the patients. Since June 1, 1952, charges have been imposed on the purchase of all these, except for deaf aids and artificial limbs which are still supplied to the public free of charge. The demand for spectacles and dentures has been stabilised after the charges were imposed. The number of spectacles supplied under the National Health Service fell from 4.7 million in 1951 to 3.35 million in 1952 after the charges were imposed in April 1951. With regard to dentures, applications approved in 1951 numbered 2.3 million while in 1952 they amounted to 1.35 million.

* * * * * * *

Remodelling New Delhi Railway Station: The remodelling of the New Delhi railway station now in progress, was estimated to cost Rs. 19.95 lakhs out of which Rs. 1.39 lakhs have so far been spent. The new building will provide facilities like waiting rooms, refreshment rooms and retiring rooms for upper class passengers and will include spacious waiting halls and retiring rooms for third class passengers.

* * * * * * *

Indian Aid for Nepal's Development Projects: While helping to reorganise Nepal's army, India is also financing some of its development projects. In the two years 1951-53, Nepal spent Rs. 49 lakhs on development out of an aggragate expenditure of Rs. 2.17 crores. The balance was met through external assistance. An aerial survey of Eastern Nepal has been completed with the assistance of the Government of India and a further aerial survey of 30,000 square miles of Nepal will be finished in 1954. India is meeting the entire cost of surveying the country.

* * * * * * *

Indian Tariff Commission Review: Production costs of Indian industries, particularly labour costs, are rising. This is one of the conclusions drawn by the Indian Tariff Commission in a review covering the period October 1952 to September 1953. Several protected industries have made representations to the Commission that the liberalization of import policy has reduced or nullified the protection provided. Production increased in the metallurgical industries and in the engineering industry.

MISCELLANEOUS

A Beggar Survey in Trivandrum City: A beggar survey was conducted in Trivandrum City under the auspices of the Social Service League, University College, Trivandrum, on 12th December, 1953. A batch of two students was put in charge of the 22 Municipal wards of the city. The survey was conducted in the morning between 8 and 9 o'clock. The findings are reported as:

	Number of beggars
(A) Nature	
Male	633
Female	766
Children	675
TOTAL	2074
(B) Local (belonging to T.C. State) ..	1724
Outsiders (Tamils & North Indians)	350
TOTAL	2074

NEWS IN BRIEF

INDIAN

The Part 'B' States (Special Assistance) Inquiry Committee has recommended that special assistance should be given to Saurashtra, Madhya Bharat, P.E.P.S.U. and Rajasthan. The assistance would take the form of an outright grant of Rs. 4 crores and an ad hoc grant of Rs. 4 crores during the next two years to be spent on administrative buildings and public health service in rural areas.

* * * * * * *

A Central Conservation Board with headquarters at New Delhi has been set up by the Government of India. The Board will organise, co-ordinate and initiate research in soil conservation and assist States and river projects in drawing up schemes for soil conservation. The Central Government has provided Rs. 2 crores for soil conservation work in the First Five-Year Plan. This allocation has been subsequently reduced to Rs. 1 crore.

The International Bank for Reconstruction and Development made two loans to Brazil in December 1953, totalling $22.5 million. The first is a loan of $12.5 million to the Government of Brazil and the second is a loan of $10 million to the Usinas Electricas do Paranapanema S.A. This hydro-electric plant will serve the growing agricultural and urban centres and will help to electrify the Sorocabana Railroad.

Since 1947, suburban population in the United States has increased by some 9 million or 43 per cent. Today it numbers 30 million persons and by 1960 it is expected to reach 40 million. This 19 per cent of the nation's population earns about 29 per cent of the national income and hence influences shopping technique considerably. As a result of this shift in population, department stores have established branches in the suburbs at an increasing rate.

Business and Service

The Bank receives deposits, gives advances against approved securities, purchases bills, sells drafts and telegraphic transfers and transacts all types of Foreign Exchange business. Through its internal and external net-work of branches and world-wide arrangements it provides every kind of banking service.

A Window On The World

YOUR QUARREL AND MINE

By

ODYSSEUS

THE QUARRELS BETWEEN "DAWN" OF KARACHI and the Pakistan government, and between the Sydney "Morning Herald" and the government of New South Wales, Australia, have, in the past few weeks, been front page news throughout the Commonwealth, and indeed throughout the free world. Why?

The average reader of the responsible type of newspaper in all democratic countries usually takes seriously what he reads in the press, with one exception: quarrels between newspapers and governments. In such cases, he is apt to suspect that the press is not treating the quarrel on its news merits but is taking advantage of its own columns to boost its own interests. The public is therefore apt to regard such press versus government quarrels as a species of private warfare which it can afford to watch with disinterested amusement. In India, this neutral attitude is often qualified by sympathy for the government because, although a vast number of middle class Indians have spent a large part of their lives in anti-government agitations, fundamentally, the average Indian inclines to respect governmental authority, and the attitude towards government of loyal suspicion that is traditional in older democracies is not as widespread as every true democrat must hope that it will become.

Now what I want to urge here is that while there may on occasions very well be quarrels between press and government in which the public can afford to take up a benevolent neutrality, yet the normal type of such quarrels is one in which every democrat must be not merely interested, but keenly, fiercely, interested.

For the most frequent cause of press-government quarrels arises from ministerial or bureaucratic sensitiveness to criticism. And the right to criticise, to expose, to argue, and to expound alternative or unorthodox views or methods is the foundation stone on which the whole democratic structure rests.

The quarrel between "Dawn" and the Pakistan government, and between the Sydney "Morning Herald" and the New South Wales government has rightly created a stir that has spread from Pakistan and Australia to every country in the whole democratic world because it is not merely the freedom of journalists that is at stake but the freedom of every individual citizen—your freedom, my freedom.

If for a moment we examine the facts of the two cases, and glance at a third nearer home, we may see why this is so.

The Sydney "Morning Herald" published an editorial on November 17, demanding a Royal Commission to investigate allegations of corruption in the City Council. Within a fortnight, the New South Wales government had rushed through an Act making it compulsory (under pain of fines up to Rs. 13,000 and imprisonment up to one year) for a journalist to disclose to the police the source of his information about bribery and corruption of aldermen and employees of the Sydney City Council, and by December 3, the Public Prosecutor had launched an action against the editor of the newspaper. There can be few parallels of such swift retribution for those who venture to criticise Authority. Everyone familiar with public affairs, particularly affairs in which the police are concerned, knows that to say (as the New South Wales government says) that the informants of the Sydney newspapers have nothing to fear by giving their information to the police is mere sophistry. Many witnesses are ready (like those in New South Wales) to give evidence to a newspaper or to a Royal Commission or to a court of law that they would shrink from giving to the police, with all the unpleasant possibilities that might follow and from which there is usually no redress. No one wants to start a police dossier on himself.

WHAT WAS "DAWN'S" OFFENCE?

The facts of the Karachi case recall the quarrel between the "Times of India" and the Bombay government. For reasons which, up to the time when these words were written, had not been specified, the Pakistan government withdrew its advertisements from "Dawn" and from its associated paper, the "Evening Star", and forbade the representatives of these two papers to enter any government office. (How, incidentally, they are to obtain accurate information about government activities without such access is not explained). The newspapers believe that the government was angered by their defence of the sovereignty of the Constituent Assembly and by their demand that Scotland Yard detectives be employed to trace the murderers of Liaquat Ali Khan. On the other hand, the Karachi correspondent of "The Times" of London understands that the government alleges that the newspapers had thrice contravened the Official Secrets Act by publishing reports of a Cabinet meeting calculated to damage relations between East and West Pakistan.

Now, in both these cases, the governments concerned have the law of their lands to use against the newspapers if the newspapers have broken it. If the Sydney "Morning Herald" is wrong in alleging corruption against the City Council, it has libelled all the Councillors, and they can sue the paper for heavy damages; and if the action proves that the newspaper has acted mala fide, maliciously, an average jury, which is usually prejudiced against newspapers in libel cases, might well award damages on a scale which would bankrupt the "Herald" and lead to its permanent closure. Few people realise that these are the risks that a newspaper runs when it makes an exposure or a serious allegation.

In the Karachi case, the newspapers do not even know what their offence is! They suspect that it is criticism of the government, but a foreign correspondent (who, it appears, has privileges over the home press in such matters!) has been given to understand that it is a contravention of the law. Very well, then let the government prosecute the papers. Let the matter be settled by due process of law in open court where the whole world may hear and judge of the facts.

By their refusal to have recourse to the law of their lands, these two professedly democratic governments create the impression that they are in fact unable to find any law that has been broken.

And here we come to the rock bottom of the matter: for, in the Pakistan case, although no law seems to have been broken, the newspapers have been penalised by executive action against which they have no legal redress, and in the Australian case, the government has rushed through ad hoc legislation (of the most blatantly ad hoc kind that has surely ever been heard of!) to create an offence retrospectively where none existed before. From these facts it should be clear that these two quarrels (as that of the "Times of India" with the Bombay government, where execu-

tive action was taken without possibility of legal redress) are not mere private vendettas between governments and newspapers over which the average citizen can afford to indulge in a neutral chuckle. These quarrels affect your rights and mine as citizens. For, if today the government can take executive action against one citizen, or can create a new offence in order to punish another, then tomorrow the government is equally capable of depriving any other citizen of any other profession of any other right.

The fundamental position which every true democrat must defend is that no action should be punished unless it is proved to be contrary to the existing law by open discussion in a court, and that where a loophole is seen to exist in the law and some action is considered to be prejudicial to the public interest, a new law cannot be made retrospective, for the effect of a retrospective law is to make innocent people guilty, not by verdict of a jury of their peers but by verdict of a minister or a civil servant or a police officer.

A SUGGESTION TO MORARJI DESAI

When, some months ago, I expostulated in this column with the Bombay government against its withdrawal of advertising from the "Times of India," representations were made to me by persons friendly to the Bombay government to the effect that the "Times of India" deserved no sympathy because it had conducted irresponsible campaigns against the government. I regret that neither then nor since have I seen the "Times of India" regularly so that I am unable to assess these charges, but in any case they strike me as irrelevant to the principle at issue. If the "Times of India" behaved in a way that was legal but is thought to be contrary to the public interest, let a bill be framed and introduced on its merits as a non-controversial measure to take its chances in the Bombay Legislature without pressure from party whips, so that, if the elected representatives of the people approve, such behaviour in future (I repeat, in future) shall be illegal. But punishment by executive action is unjust and undemocratic.

It is for these reasons that the "Times of India" case, and now those of "Dawn" and of the Sydney "Morning Herald" have attracted world-wide attention in democratic countries. There has been a spate of editorials in Commonwealth, European continental, American, and other countries. There has been an exchange of shots between the Pakistan High Commissioner's Press Attache and "Dawn's" London correspondent in the correspondence columns of "The Times" of London (after which "The Times" gave its editorial verdict in favour of "Dawn"). Among the many editorials that I have read, one by the "Daily Herald", mouthpiece of the British Labour Party, struck me as summing up the whole problem most admirably. The "Daily Herald" said:

"Once more war has broken out between the newspapers and the State—this time in New South Wales, Australia.....

"Labour in Australia has suffered endless provocation from the press. Not a single newspaper of any size in the whole country puts Labour's case.

"Some newspapers use their monopoly of political power without scruple and often against the individuals who carry Labour's standard. They have a giant's strength and they use it like a giant.

"Even so, this does not justify the new law in New South Wales.

"If journalists were always compelled to reveal their sources, a whole multitude of facts which the public interest requires to be printed would never see the light of day. Every information would be liable to victimisation.

"The well of news—especially of any news reflecting against the government in power—would be dried up.

"So we urge Labour in New South Wales to repeal this totalitarian measure. They cannot serve Labour's cause if they reject the freedom which nourishes our democratic ideal."

The principle at issue cannot be better put.

PRESS NOTE

NORTHERN RAILWAY

Notice regarding changes in the Time Table

The important features of the changes in the Time Table that will take effect from 1-1-1954 are notified below for the information of the public:

1. **NEW TRAINS INTRODUCED:**

Nos. 419 Up and 420 Dn. Jodhpur Mails between Jodhpur and Ratangarh to the following abstract timings:

420 Dn.			**419 Up.**	
14-50	Dep:	Jodhpur	Arr:	13-0
18-7	Arr:	Degana	Dep:	9-43
18-19	Dep:		Arr:	9-31
21-55	Arr:	Ratangarh	Dep:	6-0

II. **EXISTING TRAINS CANCELLED:**

(i) Nos. 419 Up and 420 Dn. Passenger trains between Ratangarh and Degana.

(ii) Nos. 1SD and 2SD between Delhi and Shakurbasti.

(iii) Nos. 2TF and 5TF between Tundla and Shikohabad.

(iv) Nos. 3AJH and 4AJH between Allahabad and Janghai.

(v) Nos. 7BQ and 8BQ between Batala and Qadian.

(vi) Nos. 9AP and 12AP between Amritsar and Patti.

(vii) Nos. 49 Up and 50 Dn. Expresses appearing on pages 11 and 12 of January, 1954 Time Table will also not run during January and February, 1954.

III. **NEW STATIONS OPENED:**

(i) Bazida Jattan between Gharaunda and Karnal.

(ii) Kohar Singhwala between Guru Har Sahai and Jhok Tahal Singh.

(iii) Sewapuri (Name changed from Uparwar).

IV. **EXISTING STATIONS/HALTS CLOSED:**

(i) Aikar Halt between Jawalapur and Pathri.
(ii) Suaheri Halt between Basi Kiratpur and Bijnor.

V. **ADDITIONAL TRAIN CONNECTIONS PROVIDED:**

1. 420 Dn. with 402 Dn. at Ratangarh.
2. 401 Up and 419 Up at Ratangarh.
3. 309 Up with 61 Up at Ghaziabad.
4. 1SH with 9SU at Saharanpur.
5. 2SM with 4SRM at Moradabad.
6. 2BDS with 1DSU at Delhi.

VI. **THROUGH CARRIAGES EXTENDED:**

Bogie third class running between Delhi and Ghaziabad by 335 Up/310 Dn. extended to and from Meerut City.

VII. **THROUGH CARRIAGES PROVIDED:**

Bogie composite II, INT, III and bogie III Class between Delhi and Jodhpur via Ratangarh and Degana by No. 401 Up/419 Up and 420 Dn./402 Dn. trains.

VIII. **EXISTING THROUGH CARRIAGES CANCELLED:**

1. Bogie composite II, INT, Class between Saharanpur and Lucknow by 75 Up/317 Up and 2SH/76 Dn. trains.

2. Bogie composite II, INT, and III Class between Delhi and Jodhpur via Phulera by 302 Up/205 Up/403 Up and 404 Dn./206 Dn./204 Dn. trains and bogie III Class between Delhi and Jodhpur via Ratangarh and Degana by 401 Up/419 Up/241 Up and 242 Dn./420 Dn./402 Dn. trains.

IX. Apart from the above important factors, as many as 36 additional train halts will be provided while only 13 existing halts will be cancelled.

There will be slight changes in classification and numbering of certain trains also.

Numerous changes in train timings will also be effected for which reference should be made to the new Time Table to have effect from 1-1-1954, already available for sale at Railway Bookstalls.

Chief Operating Superintendent

NEW DELHI

LETTERS TO THE EDITOR

UNEMPLOYMENT AND MECHANISED PRODUCTION

Sir,

"The Eastern Economist" of November 27 carries a 'contributed' review article on Shri Chandulal Parikh's recent booklet on 'Unemployment'. The review seeks to refute his contentions and conclusions. I hold no brief for Shri Parikh, but the article in question contains certain assumptions which should not go unchallenged.

The assumptions are:

1. That the problem of unemployment in India cannot be solved by developing cottage and small-scale industries.
2. That the plea for the revival of cottage crafts at the expense of large-scale industries in untenable.
3. That the measures adopted to give relief to the handloom and Khadi industries have not improved the plight of the handloom weaver.
4. That the handloom industry is incapable of providing the means of livelihood to a larger number of people than the capital-intensive mill industry.
5. That, but for the mechanised capital-intensive mill industry, transport and other auxiliary industries would not have developed in the country.
6. That but for this mechanised textile industry, Government revenues to the tune of over Rs. 40 crores would not be available to the State in taxes.
7. That the sum of Rs. 6 crores allotted for the development of Khadi and for giving relief to the handloom industry is a considerable amount of money.

On the basis of these assumptions the writer of the article in "The Eastern Economist" builds up his central thesis of the "snowball effects" of mechanised industrial development on employment and so concludes that "large-scale industries are the products of the modern age of science and technology and any attempt to arrest their progress is as futile as King Canute's absurd effort to control the waves". He seeks sustenance for his assumptions in what Shri T. T. Krishnamachari, the Union Minister for Industry and Commerce, is reported to have said, and quotes him thus:

> "Even so-called capital-intensive industries provide ultimately for a large measure of employment. The fact that a factory with a high capital-labour ratio employs 5,000 people does not mean that it employs only 5,000. I have recently had an opportunity of visiting the Bhadravati Iron and Steel Works, Cement Works and Paper Mills, all of which employ round about 5,000 people. But in the township live 60,000 people and the activity of most people within a radius of fifty miles has some link with the Bhadravati township. If, for any unforeseen reason, work is stopped in Bhadravati, the area that would be affected would be not merely the township, but the whole range of the area fifty miles around Bhadravati. Therefore, when we speak of capital-intensive industrial units, we should not forget that they themselves provide employment ultimately to about fifteen to twenty times the labour directly employed by them. The snowball character of such industrial units should not be forgotten."

But unfortunately economic history shows that this snowball effect of mechanised industry does not always obtain. If planned on the model and scale of the American Automobile Industry of Detroit where secondary occupations in the preparation and manufacture of component parts are widely distributed among individuals and small groups, the "snowball character" can work out to sizable proportions. But where every process from A to Z is done in one and the same factory with the aid of machines, the snowball effect melts into insignificant dimensions.

On the other hand, in the short run, it may well be that such industrialisation may actually lead to contraction of employment, as recent studies of the I.L.O. have underlined. "The problem of the effects of higher productivity," says the annual report of the International Labour Organisation, "on job security is especially difficult in countries with a large amount of unemployment and underemployment. Where there is a surplus of labour, displaced workers are most difficult to absorb, and it might seem that policy in such countries should aim rather at increasing production and employment than at higher productivity. It would be inappropriate in such countries where labour is abundant and cheap and capital scarce and dear to adopt the capital-intensive and labour saving methods of production which are appropriate in such countries as the United States and Canada."

In India capital is scarce and the general poverty of a large and increasing population leaves little room for rapid capital formation. On the other hand there is plentiful labour, unemployed and under-employed. Our plan of development has, therefore, to be capital-saving rather than capital-intensive. The first important step of public policy, as the I.L.O. report pertinently says, is "to ensure that in current economic development plans an important and distinct sector is set apart for small-scale industries and assigned specific resources and its own machinery for development". The selection of specific industries will naturally depend upon local conditions and population pressures. In doing so, certain measures of protection to the cottage sector, as against the mature organised mechanised sector, will be called for so that employment opportunities are maximised.

Says the I.L.O. report: "The need for Government action is raised by the condition of certain of these industries, e.g., the handloom industry which plays an important part in maintaining rural incomes, but which are steadily losing ground to the large-scale mechanised industry. In these circumstances, an approach to tackling the problem may be made by reserving, as a transitional measure, certain sectors of production to the handloom industry". In the case of the handloom, it may be a question of reservation of production. In other cases, it may be a ceiling on production and so on. All that is contended is that once it is granted that the goal of full employment is sought to be achieved in this way, the right to control automatically follows.

However fond the dream of creating replicas of Bhadravati may be, we simply cannot do it. We do not have the capital resources for it. The Planning Commission has placed our national income at Rs. 9,000 crores. Allowing for a saving rate of 5 per cent, the capital available for investment purposes will be of the order of Rs. 450 crores. But never will the whole of it be available for investment in machine industry. Even the total capital invested in the last hundred years of industrial development in the country comes only to about Rs. 1,500 crores; and this huge investment has provided employment only to 1.8 per cent of the total working population. Future increments to investment in organised industry cannot be expected to do much better.

A hundred years ago India had an equilibrium between the agricultural sector and the non-agricultural sector. The population engaged in agricultural occupations and non-agricultural occupations was equally divided. Today the population dependent on land is computed at about 70 per cent. The rate of our population growth increases the pressure on the land and the consequent increase in the number of the unemployed further diminishes the per capita national income and the rate of saving.

In the circumstances, to reach even a semblance of equilibrium in our economy, the capital required will be of immence proportions if, that is, we are to have more copies of the Bhadravati township. Where is this capital to come from? External aid? We know what consequences follow. Even if it is forthcoming, to what extent can it meet our capital needs?

The writer makes much of the 40 crores of rupees derived as taxation from the textile industry. But who pays the taxes? The consumer. Actually, the industry should be paying much more if there was not so much tax evasion. But such huge taxes also signify huge profits and extreme concentration of wealth in fewer and fewer hands. In the meantime, what happens to the crores of displaced handloom weavers?

"Unemployment", "The Eastern Economist" article admits, "is doubtless a serious national problem, but its solution must be attempted not by turning our backs on industrialisation, but by galvanising our national economy through approved methods".

What these methods are the writer does not state. If he means creation of employment by starting public works by the State, why then does he object to a policy of cottage industrial development or to a paltry expenditure of Rs. 6 crores towards that end? If he thinks Rs. 6 crores is a lavish figure, we would like to remind him that it is hardly one per cent of the Central revenues, or roughly .007 per cent of the national income. If he is still having an uneasy conscience over this "prodigal" allotment, we would like to point out to the hundreds of crores silently paid by the people to the organised industry during the last two to three decades by way of protection that seems to have no end, by way of import restrictions, of low prices to peasants raising the raw material, by way of financial assistance through State-aided large corporations, and in a hundred other subtle ways known only to a complicated modern economic organisation.

Modern States make provision against unemployment by means of extensive and comprehensive social security measures and social services such as those adumbrated by the Labour Government in Great Britain—its "cradle to grave" social service and health programmes. We have not the resources for such an ambitious undertaking. We have, therefore, to evolve an economic system and social pattern of our own according to our resources—a pattern which will produce a sense of social security and stability. After an examination of the conditions obtaining in the country, competent authorities have come to the conclusion that the best results could be obtained by providing extensive employment opportunities to the large unemployed and under-employed population. In the development of village industries alone such opportunities exist.

The reviewer talks of the futility of ordering the tides back. Yes; while the organised industry soars to higher and higher heights, there gathers a tide of seething humanity, unemployed and uprooted from their homes and crafts. What Canute can push back this tide?

Yours faithfully,

C. K. NARAYANSWAMI,
Publicity Department,
All-India Khadi and Village Industries Board,
BOMBAY.

"DISEASE AND REMEDY"—A KEYNESIAN REJOINDER

Sir,

Even a latter-day Solomon, knowing economics too, would find it difficult to pronounce the maternity of this baby. Punctilious Keynesians would pick a hundred holes in the Plan while superior non-Keynesians have demonstrated their innocence as in the article under reference. One point that would pop up in favour of the former is the attitude of the planners themselves. It is extremely doubtful whether they would like to be identified with even respectably unorthodox economists like the Keynesians. So strong is the hold of orthodox economics in India.

But, the article under reference sees the Plan as the creation of "Keynesian Pundits" and also sees their hidden hand shaping the policy of the Finance Minister. And it is noted that at last he has decided to abandon this unwholesome influence and join the great pragmatist, Mr. Rafi Ahmed Kidwai. It will be pertinent to examine how far the contentions of the author have damaged the Keynesian doctrines.

The great Keynesian equation, as it is gratuitously labelled, viz., Income being equal to the sum of Investment and Consumption, has not proved wrong. It is merely a theoretical concept and requires considerable modification before being applied to quantitative analysis. The point about the food subsidy has nothing to do with the validity or otherwise of this form of Income analysis. It might be that the Finance Minister hoped that the withdrawal of the food subsidy of Rs. 80 crores will not affect the revenues or that compensatory factors will set in and counteract to produce the desired effects. Such faulty expectations of the Finance Minister have nothing to do with the equation which is used in static equilibrium analysis.

It is not the fault of Keynesian Economics if the Planning Commission and the Finance Minister insist on basing their plans and expectations on extremely static conceptions. Calculations have been made about revenue surplus, savings, investment and possible increase in national income on the tacit assumption that prices will not change or rather that any change in the price-level will be all along the line. It is in this spirit that we are treated to the obiter dictum that the national income will increase from Rs. 9,000 crores to Rs. 10,000 crores at the end of the five years, at constant prices. It is considered that the phrase "at constant prices" is all that is required to cover any possible effects due to a change in the price-levels of the various commodities. The largest single effect is ignored. Even if only the figures envisaged by the Plan for the primary sector come out to be realised, equilibrium will be upset. On the other hand, if the present trend persists, there will be a violent shake-up in the terms of trade between the primary sector and the rest of the economy. The former's share of 67 to 68 per cent of the national income will begin to contract. It is worth while to note that it was as low as 50 per cent in 1931 and the changes in productivity are negligible. The secondary effects of such a contraction in purchasing power, on the manufacturing and tertiary sectors with their rigid wage-price structure must be taken into account before making any guess about future income, revenue surplus or savings and employment.

Viewed against this background, the tilt at the ceterus paribus proviso is, to say the least, uncharitable. And it becomes even more so when the explanation attempted to account for the loss in revenues is wrong. It is said that the price of food articles rose consequent on the abolition of food subsidies. Assuming for argument's sake that the price of cereals rose and more was spent on food it does not immediately follow that less was available for non-food articles. It might be so for those employed in the manufacturing and tertiary trades. But their loss in purchasing power is more than compensated by the gain of the agriculturists. And being widely dispersed, it was definitely available for consumption expenditure. But the increased income of the primary producers was beyond the reach of the tax-gatherer. Further, it did not have any effect on Savings and Investment in the accepted sense of the terms. The steady worsening of the terms of trade could be said to be the principal source of disturbance in the economy. The accumulation of stocks in recent times is intelligible if we accept this explanation. As the price of foodstuffs increased there was the corresponding increase in wages, dearness allowance etc. So long as the shortage of cereals persisted the difficulty was not felt. But once the price of food grains began to fall with the first effects being visible in the open market or black market, call it what you will, purchasing power began to fall with snowball effect. Unfortunately, the wages, dearness allowance and production costs were adjusted to the peak prices and could not move down sympathetically. It is this factor of comparative rigidity in the wage-price structure that has led to the accumulation of stocks and decrease in sales.

The twin effects discernible, viz., a loss in revenue and a slump in the manufacturing trades, could be explained only this way.

Morality is a strange interloper in the field of economics. And if governments are to be pinned down to promises needless confusion is bound to prevail. A specific example will make my point clear. In the days of Sri R. K. S. Chetti and Dr. John Matthai, and to some extent in the first flush of office of the present Finance Minister, it was considered that the prevailing prices were too high and some deflation was called for. No doubt it was morally the best to be expected. And if the same zeal for moral obligations persisted there is nothing to justify the present eagerness to stabilise. If on the other hand, by a piece of artful dodging, it is explained that the Government have still not abandoned their hope of a "remedial recession", the public is being hoaxed.

The Keynesians are seldom found advocating an absolute cut in the consumption expenditure. And one of the few sins of which they are absolved is the attempt at a "remedial recession" on which hinges any significant reduction in the price-level. The proper way to secure investment is to stimulate not only consumption but also savings and enterprise. When industrial production increases the remedy is to see whether institutional action could increase off-take. The assertion that "the additional incomes dispersed are attracted more by increased expenditure on food than by increased expenditure on the products of industry" is based on the irrational feeling that the present boom in primary produce will persist. It is to be remembered that the present weighting of the terms of trade is only a flash in the pan and the long-term trend is distinctly against it.

All the same, it would be better if it is realised that the halcyon days when the cost of living is pegged and the general index is climbing are very far off. The unpractical Keynesian is at a loss to understand how it could be managed when the principal factor in the economy is the primary sector, vulnerable to the extreme. The imbalance will be even more severe where cereals are the mainstay. Burmese rice is now selling at 6 times the price in 1939 and was 3 times of the 1934 price in 1928. This is merely to emphasize the formidable job that a closed economy (all planned economies are closed economies) faces when trying to adjust with so large a primary sector. The expansion or contraction in the purchasing power caused by a gradual increase or a sudden sag in the price of food grains could never be compensated by tinkering with food subsidies or like measures. It is to be hoped that there will be an even worsening of the terms of trade in favour of the manufacturing trades with increased employment and cheaper techniques.

In conclusion, it is but fair that the exact position taken up by the Keynesians in general should be stated. They do not claim that all unemployment could be cured by adopting their remedies. The principal contribution they wish to make is to make the analysis easier and make quantitative calculations possible. To recognise the existence of under-employment equilibrium and measure the incidence of involuntary unemployment is much easier if the new Income analysis is tried.

Discussions about the remedies resulting from such an analysis have been largely confined to the cure of aggregate unemployment in highly industrialised countries. The conditions prevalent are; (1) There is the ability to save and invest. (2) The existence of skilled labour and idle productive capacity renders inflation bearable. (3) The factor of primary producers is negligible or could be controlled. (4) Wage-price rigidity is not very acute since the institutional disturbance is not much.

Sufficient attention has not yet been bestowed on clarifying the course of action for countries like India where conditions are different and far more formidable. Here we have, (1) Structural unemployment on a large scale, (2) Sectional unemployment due to faulty and insufficient allocation of resources, (3) Violent variations in purchasing power due to the predominant primary sector, (4) Lack of skilled labour and necessary capital goods, which alone can hold inflation from getting out of control, (5) Frequent problems in the wage-price structure partially due to the instability of the primary sector and, (6) Very uncertain savings and investment conditions.

The problems raised by these are extremely refractory. The crude and static conceptions underlying the present Five-Year Plan must be revised. Unless realistic adjustments are made and dynamic models visualised ad hoc tinkerings will always be necessary, even if only practical economists are put in sole charge.

The pragmatist qua pragmatist is, no doubt, the superior economic practitioner. But the detailed planner, when compelled as a creature of circumstance to become a pragmatist, does not cut a dignified figure even though the change may earn the weighty plaudits of informed journals like "The Eastern Economist." And to hunt and drag out a scapegoat in the Keynesian economics contributes neither merit nor conviction.

Yours Faithfully,

M. VENKATRAMAN.

Dated December 26, 1953.

A DELHI DIARY

A HAPPY NEW YEAR

THIS is, I believe, the first occasion on which an issue of "The Eastern Economist" has appeared (or should I say was due to appear?) on January 1. I am unable to discover if seven years ago or seven years from now this concatenation of events occurred or is likely to occur, but I have a feeling that a leap year (coming once in four!) has something to do with a jumping of Fridays. I must, therefore, take my chance as I find it. In the midst of much merriment going on all around me, I have suddenly decided to take time off to wish all my readers the best luck possible in this year of grace 1954. I dare to say it is going to be an exceptional year. Mr. Malenkov (the radio has just told me!) is optimistic, and the Foreign Ministers are meeting at Berlin on January 25. And thus in the very first month of the year there are two bull points for peace. That is a good beginning; tensions are now due to relax!

THE BATTLE OF THE BULGE

As if to add a dash of domestic optimism to the international picture, the Finance Minister spoke confidently at his Press Conference on December 29. He discerned a general improvement in the economic situation and observed that advance in the field of production had been "uniformly good". He expected prices to remain steady during the remaining period of the Plan. There was only one qualification. On one front represented by foreign exchange, he said, we were not investing sufficiently. But he refused to be depressed, and felt the "bulge" was a temporary mishap. He gave warning, however, that the Battle of the Bulge was on. If the present situation continued, nations willing to help would become diffident; a situation would then arise when the Planning Commission would have to sit down and re-examine the situation. But is the Planning Commission not sitting up (or down) already? Surely, one does not need to wait for further accumulation. The Finance Minister has indeed (see his interview with the Editor of "The Eastern Economist" in this issue!) got more than one string to his bow. But the trouble about the two distabilizers, he suggests, is that neither effects any new investment. It is not running down the balances that is important; it is running them down with additional investment in India.

I discern in the presence of this problem an absence of any bright new ideas in both official and non-official discussions. Everyone tells me that these balances will be run down, but unless it be through large new defence imports, nobody is at all precise as to how the trick is to be done. I have a (secret!) feeling that the more intelligent people have really recognised that, (with all Mr. Kidwai's success!) the only sensible thing we can now do is greatly to augment our defence expenditure. Far from considering this a misfortune, I consider it an excellent way of killing two birds with one stone. It is no use our crying out that this will hurt the Plan. I prophesy that the mobilisation of our defence resources is to be the largest element of new thinking in the next revised Plan which is (only!) some few months away.

This is not (to my simple way of thinking!) our most serious problem. Indeed it is a problem which is solving itself by gentle assistance from Pakistan and the United States. What is a most searching problem is finding the men of high managerial ability who will see these measures through. As our plans expand (every six months!), the gap they really expose is the shortage of managerial capacity of the highest order. It is reasonable to expect some diminution of the rate of rise of good managers in the private sector which is not expanding according to pre-war (or even early post-war) standards. But why is the public sector not bringing forth much outstanding capacity—at least proportionate to the massing of funds and powers in this sector? The answer was, I believe, given by implication in Sir Raghavan Pillai's most interesting Convocation address at Travancore University on December 19.

Management, I take it, is essentially the task of choosing the right men and setting them to work as a team. Who are the right men? Neither, said Sir Raghavan, the 'Yes-Man' or the 'No-Man'; essentially the man required was one who was not unduly influenced by the urge to be popular or powerful. And what about team-work? On this Sir Raghavan was outspoken. He said "We, Indians, are highly individualistic by nature and fall easy prey to forces of disunion. For many of our past misfortunes our aggressive individualism has been largely responsible. Yet, even today, in every department of life, our accepted motto seems 'every man for himself' ". This was strong criticism, but it came from so sober a source that it cannot easily be discredited. And it is permissible to draw the conclusion that Sir Raghavan was referring as much to the Civil Service as to anything else.

Men who have not learned to work in a team are naturally not the best men to obtain team-work from others. May it be that this increasing concentration on self-help (rendered individualistically!) is one of the main reasons why public management has not made greater progress than that displayed in the last few years? I have no chapter and verse to present; but I believe this to be the case. The remedy? I doubt if the proposed Institute of Public Administration is the answer. That institute may develop knowledge; but team-work is an attitude of mind. Its essence is trust; its method is consideration. And (greatly daring!) I suggest that where the trust is most required is between the politician and the civil servant, and where the method could be best employed is by a steadfast refusal of Ministers to dabble in details of implementation. I wonder whether Sir Raghavan can be thus freely translated for the general reader, and at least for one special one!

FAREWELL TO BIJAY

I should not omit, because of the deep feeling that it has caused, a tragedy which occurred in New Delhi on December 29. Lt.-Gen. Bijay Shamsher Jung Bahadur Rana, Nepal's Ambassador in New Delhi, was only 38. He was one of the most popular members of the Diplomatic Corps. He seemed to have all the diplomatic gifts; an aristocratic upbringing, great personal charm, a talent for friendliness and a genius for hospitality. When the news that he had been electrocuted in his bath by the failure to switch off an immersion heater first spread in New Delhi, it caused a profound shock. I can remember no occasion when such great feeling has been shown for a member of the Diplomatic Corps who are naturally somewhat removed from the popular mind. Many of the Gurkha soldiers lining the route to the cremation ghat were in tears and not a few people burst into sobbing as one of the longest funeral processions seen in Delhi wound its way to the Jumna Ghat. There has been a quick and quite understandable reaction against—immersion heaters!

ARGUS.

An Interview with Shri Chintaman D. Deshmukh

In this exclusive interview with Shri C. D. Deshmukh, Finance Minister of India, the Editor of "The Eastern Economist" records the second of the series of "The Eastern Economist's" exclusive interviews, the first being published in our issue of September 11, 1953, with Shri T. T. Krishnamachari, Minister of Commerce and Industry. In the present interview, the Finance Minister frankly explains his approach to various aspects of the Plan and deals in particular with the level of investment and its consequences on prices, utilisation of foreign exchange resources, import of capital goods, and the general tone of the economy on which authoritative opinion has been sought. In view of the central place that the Finance Minister occupies in the whole making of economic policy in the country, these pronouncements of policy will arouse widespread interest both in India and abroad.

1. Could you let us know in employment and per capita income terms what would be the benefits of the revised Five-Year Plan?

Shri C. D. Deshmukh: You are asking a quantitative question so to speak; indeed you are referring to per capita income. But are you referring to the increase in per capita income as a result of the entire investment in the Plan period or are you only referring to the addition to the per capita income attributable to the recent expansion of the Plan?

That's right Sir; the latter.

Shri C. D. Deshmukh: Now this recent expansion has been undertaken really to make up for the slack that has appeared in the economy. The additional investment is intended to arrest and counteract the fall in employment and incomes that would otherwise have taken place. Therefore, it is not a case of increasing the size of the Plan, other things remaining constant. In other words, we are trying to recalculate the investment necessary for attaining our targets in terms of employment and incomes in view of a new situation that has arisen. **Also, I am not sure that I can segregate the effect of what we are doing in the public sector. We have no ready formula which would enable us to reckon what the effect of this spending in the public sector on the total economy would be. What you have to consider is the aggregate level of investment and of economic activity in general in the system as a whole. The object, of course, is to step up total expenditure. By increasing the investment in the public sector, we would be enlarging money incomes in the community and then these incomes will create additional demand for consumer goods.** Therefore, business expectations may be improved and investment in the private sector may be stimulated. Then, in addition to the additional expenditure for public investment, I have also given assurances that the private sector will be assisted with loans from time to time and the effect of these also will have to be taken into account. All this, I expect, will have the effect of correcting the present slack in the economy. I am not in a position to tell you in quantitative terms what the net addition to the employment or per capita income will be.

THE THREAT OF INFLATION

2. If, as you suggest, the order of magnitude of investment in the public sector rises from about Rs. 420 to something like Rs. 600 crores per year, do you not consider that while this will secure a substantial improvement in employment and per capita income, it will increase the threat of inflation?

Shri C. D. Deshmukh: That is a matter of judgment as to whether the upward push that is given is just sufficient to tighten the slack or whether reflation will turn into inflation. That will have to be tested from time to time as you go along. There are various indices to watch. There is no means of judging in advance, except in broad terms. One has to keep an eye on price trends and one has to adjust policies in the light of available foreign exchange resources.

FOREIGN EXCHANGE RESOURCES

3. In respect of our foreign exchange resources, do you think that over the next two years we can utilise them more effectively than we have been able to do in the last 12 months?

Shri C. D. Deshmukh: Well, we have not drawn upon our foreign exchange resources at all during the last 12 months, which is another way of saying that our investment expenditure has not been wholly what it should be and that we can afford to raise the level of development expenditure. This is what we shall now attempt to do by the phasing of the Plan that we have already in mind as well as by the specific enlargement of the Plan about which figures have been given out—Rs. 175 crores. These together should, I anticipate, enable us to establish a reasonable import surplus. It may not necessarily be equivalent to what we failed to establish in the past so far as the supply of goods or services from outside is concerned because I have to keep a little cushion for commitments.

4. What are these commitments for which this cushion in foreign exchange resources has to be held?

Shri C. D. Deshmukh: I am thinking of any possible settlement with Pakistan in regard to the transfer of the remaining assets due to the State Bank of Pakistan in respect of India notes returned by them as one of the aspects of the financial settlement to be made with them. The other aspect which I have in mind in regard to this financial settlement is the repayment due to us from Pakistan of the portion of the loan—the public debt—which they have taken over, that is to say, in the Partition settlement. They were responsible for payment of instalments from August 1952. In other words, what I have in mind is that as against any cash payments that we may have to make via the Reserve Bank in respect of the assets held against notes, there would be a payment due to us by Pakistan in respect of the instalments of the public debt. I cannot say what the position on balance would be, but I should like to keep a cushion against any liability we may have to meet on this account. **The other commitment that I have in view is the urgency now of buying back our rupees from the International Monetary Fund which will cost dollars to the Central Dollar Pool, but will cost sterling to us.** It may be recalled that we had purchased in 1948—towards the middle of 1948—a round sum of about $100 million from the I.M.F. and it is high time that we thought of purchasing our rupees back as the interest charges are mounting up. For this purpose, this is a favourable opportunity because the sterling area's dollar resources are now better and we ourselves have for the moment an adequacy of sterling resources. Now, after allowing for these—and for the normal currency reserve—I do not expect that the balance that will be available will be so large as not to be absorbable or usable as a result of the increased tempo of development expenditure in the country both in the public and the private sectors. **In fact, we may soon have to face a strain on our foreign exchange resources.**

5. In other words, with the projects already included in the Plan and these commitments for which provision has necessarily to be made, you do not anticipate that our foreign exchange resources will be left unutilised over the next two years?

Shri C. D. Deshmukh: That's what I expect. A great deal depends upon our harvests. If these are as good as they have been this year, the quantity of food grains that we may have to import would be small and the same might happen in regard to cotton. That would leave a significant amount of foreign exchange resources available for use in other directions.

6. In that event, have you projects available which can be put into operation at short notice so as to utilise the resources thus made available?

Shri C. D. Deshmukh: So far as the public sector is concerned, there are a great many projects in the state of readiness for being undertaken at short notice. As you know, there was a news item recently that a team is going round surveying the power projects that are available. **Similarly, there is a great deal of information available, and investigation and other work complete, in regard to other projects like the irrigation projects, and both these types of projects could be undertaken at relatively short notice.** The direct foreign exchange content of these projects is not very large, but foreign exchange resources will be needed to meet the import needs both for consumption as well as for capital goods which arise consequentially. In other words, the improvement in the economy in consequence of the larger outlay proposed ought to give rise to requirements of consumer goods and capital goods. This year, for instance, because of the transition from the sellers' market to the buyers' market and the resulting psychology of the private sector, **the total value of the capital goods imported was, I should say, 20 per cent lower than in the previous years. The opposite might easily take place.**

THE CLIMATE FOR PRIVATE INVESTMENT

7. Do you see at the present time any signs of this revival of optimism in the private sector so far as import of capital goods is concerned?

Shri C. D. Deshmukh: I should have thought the answer to that can be given by the private sector itself. The Plan does not deal comprehensively with the private sector. We have never put any embargo on starting of new ventures or on expansions in the directions in which they are needed. **I think it is premature to form any judgment from past trends in regard to the demand for investment in the coming years because under our hypothesis this investment climate itself will have changed. My first postulate is that with our own expenditure stepped up, a great many things will happen which by themselves will bring about a change in the climate for private investment.** Therefore, apart from any resources that we might find, I should imagine other resources will also be forthcoming. I myself think that the opinion that has been expressed to you does not take notice of the change in climate that is occurring even before our eyes. **As far as I can see, the state of stock exchanges in the country is healthier than it was for some time. The rising trend in the prices of equities will, I expect, get stabilised, and will not witness a reversal. The investors share my views that with the additional investment expenditure, the general tone of the economy of the country must improve.**

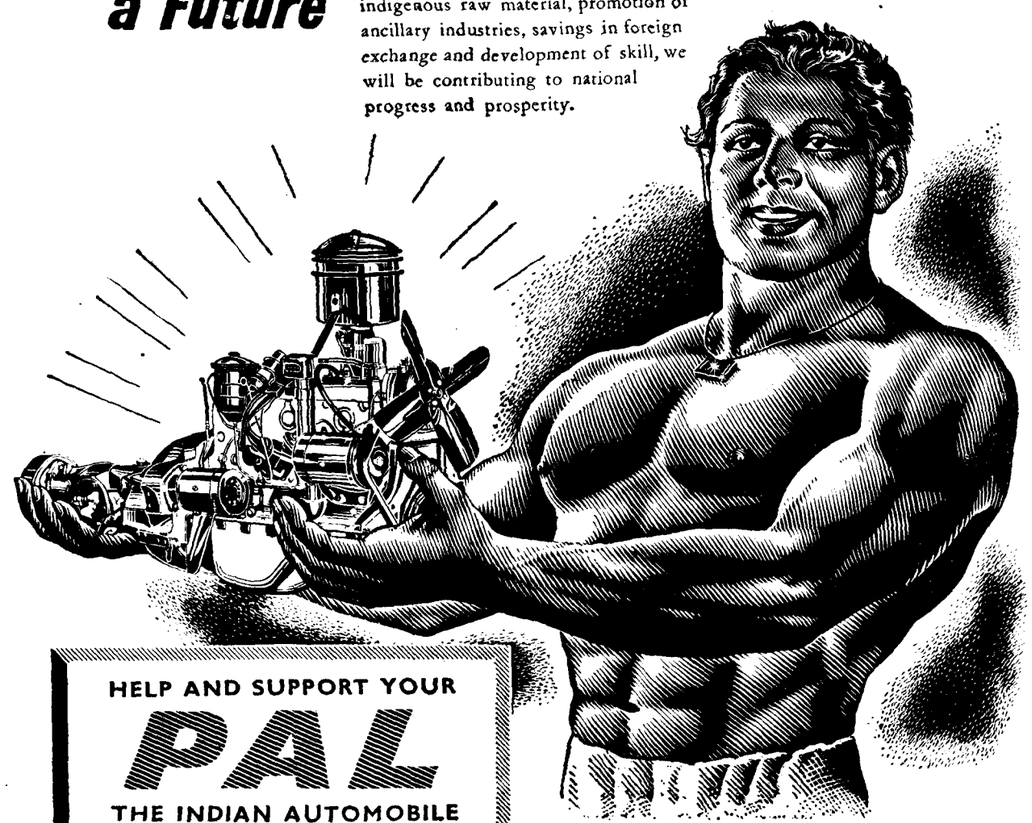
A POSSIBLE RECESSION AND THE PLAN

8. All this assumes that there will be no major international recession. In the event of a serious set-back in the United States, can these Plans go through without substantial alteration?

Shri C. D. Deshmukh: In the first place, whether there will be a recession in the United States or not and how serious that recession will be must be regarded as matters of speculation. Prognostications have been made in the past and have often proved wrong. **Nevertheless, should a serious recession develop actually and should primary prices fall to uneconomic levels, then I concede that corrective measures would undoubtedly be necessary on our side as they would equally undoubtedly be taken by the country concerned. I should imagine that the fact that we have a Plan and that expenditure in the public sector is already to be stepped up substantially should maintain domestic incomes and domestic demands.** We are already moving in that direction of preparation against a possible recession. You must have observed that this is one of the subjects which is going to come up for discussion in the forthcoming Sydney Conference. We shall have the advantage of concerted thinking on this matter. In spite of all this, if a serious prolonged recession does develop against all possible expectations and a large number of countries find their export income drastically reduced, this would affect the volume of world trade and incomes. **But if one may venture on a forecast, it is hardly likely that things will be allowed to go that far.** As I say, if they do, well, then we shall have to think out the problem afresh. I do not know that thinking can at this stage go so far as to indicate how the **Plan** would then have to be modified. I suppose in that case what we would have to attend to would be our own cost structure in order to be able to sell in the world markets.

9. Would you care to say a word in conclusion about the deliberations of the Sydney Conference with special relation to India?

Shri C. D. Deshmukh: I really cannot say very much because the agenda includes various complex subjects although the main subject will be the progress made towards establishing convertibility of sterling. As you are aware, this involves consideration of a great many cognate subjects. So far as India is concerned, we would have to give an account of the state of our own economy and the contribution that our handling of our economy is likely to make towards the solution of that problem which is of common interest to all countries of the sterling area.

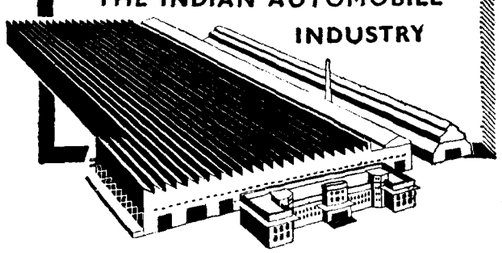


A Planned Programme with a Future

From the start of our modern, fully equipped plant in 1947, we drew up a planned programme of manufacture by progressive stages of complete trucks and cars in India.

First, side by side with assembling of automobiles, came the manufacture of component parts such as radiator, muffler, propeller shaft, leaf springs both rear and front, all steel cab, etc. This involved considerable research in designing, skill and experience in tooling and making of dies, jigs and fixtures.

The next step is the manufacture of all vital components such as **ENGINE, TRANSMISSION, REAR AND FRONT AXLES AND CHASSIS FRAME.** To manufacture all these components, indeed in the making of the entire truck and car, as much indigenous material as possible is being used. What is more, highly technical operations such as designing, tooling, casting and machining are being done by skilled Indian craftsmen sent by us for specialised training to America and the U.K.



By the end of 1955, according to this planned programme, Indian made vehicles will come out of our factory to meet the ever-growing demand from road transport, bus operators, national projects and defence. Thus, through direct employment, utilisation of indigenous raw material, promotion of ancillary industries, savings in foreign exchange and development of skill, we will be contributing to national progress and prosperity.

REVIEW OF RAILWAY RATES

On the 30th September, 1953, five years were completed since the new simplified telescopic continuous mileage rates for the carriage of goods were introduced on the Indian Railways. The basic new class rates, divided into fifteen categories, were arrived at without giving to industry an opportunity of criticising them and this is an important consideration to bear in mind, for although the commercial community was in agreement with the broad principles of the memorandum on the goods rating structure, prepared with the help and advice of the Secretary of the Standing Advisory Committee (Post-war Rating) it did not follow that they approved the details in full—particularly the upgrading of all the rates. Since then, integration of the former Indian State railways has resulted in an increase of rates. The rebate on the consumption of coal which was allowed to selected industries has been withdrawn. The coal freight was increased by about thirty per cent since April 1, 1952 and the freight on iron and steel from the same date. The industries protested at that time against the withdrawal of the concession in these two cases, but apparently even at the present level, the coal freight is not regarded as sufficiently reasonable, for there is some idea of increasing the freight still further in order to compensate for the increase in cost resulting from the increase in the provident fund contributions and the fall in railway earnings. Besides, there is some chance that the special treatment of coal for the purposes of fixing the standardised terminal and the short distance rates will be challenged before the Railway Rates Tribunal. The time is thus ripe for an exhaustive review of the present rating structure in the light of the needs of the Indian industries.

It is not necessary to exaggerate the case against the new system. Certainly, on the other hand, the basic principle of telescopic reductions in rates on long distances represents a great advance on the previous flat or horizontal rates. The disappearance of multitudinous railway systems has also helped incidentally to produce simplicity and uniformity. But it seems to be necessary to examine afresh at the present stage two points, namely,

(i) whether in the course of discriminating in favour of long distance carriage by means of telescopic reductions in rates, the Railways have not overlooked the need to make small distance charges also reasonable and equitable; and

(ii) whether in the interests of streamlining the rate-structure with the two objectives of simplicity and revenue in view, the need for special concessional freights in order to provide for or to encourage development has not been overlooked.

The cement and chemicals industries have recently complained to the Federation of Indian Chambers of Commerce and Industry regarding the effect of the increase in small distance rates on their costs. The demands for relief are in brief the following.

(i) the standardised terminals, and minimum short distance rates, which are already different for coal and the other commodities must be reconsidered with reference to particular commodities, where there are any hard cases,

(ii) where loading and unloading is done by the owners themselves, some concession should be granted, and

(iii) even small distance charges should be levied so as to help development, for example, the journey to a washery in the case of coal and that of washed coal onward to consumers should be treated as continuous.

As regrads (ii) namely, the need for special concessional freights in order to help in development, the basic raw materials should be moved at concessional rates and these rates should further be available where it will enable a particular industry to extend its market. For example, the Indian Foundry Association has recently asked for the restoration of the concession on long distance consignments to Bombay and Madras.

The Federation has suggested that a small committee should be set up in order to go into these matters. Two questions naturally arise. First, is the simplicity of the new rating structure of such great importance that it should override the need to provide for development? Secondly, what about the loss of revenue? The 1947 monograph put the Railways' point of view in the following words:

"The Railways could not survive for long if compelled to make adjustments that were of advantage only to their constituents, and it is in the process of carrying out adjustments that are mutually beneficial and declining to make adjustments that are not that Railways have often been accused of considering only their own interests and disregarding the wider interests of the country."

In the twelve months ended the 31st March, 1952, the cost of carriage of goods has been estimated at a little over eight pies per ton, and in at least eight categories the basic mileage rate for the first three hundred miles was less than this cost. It may be argued with justice that the first duty of the Railways is to maintain and improve capital and, therefore, to maintain revenue.

The answer to this defence is partly that there is already some traffic waiting to be carried (wagon bookings and bookings of smalls have been notoriously unsatisfactory) and this would bring in some revenue and make up the loss; partly that a rating policy suited to development would be its own justification because it is bound to lead to the expansion of traffic; partly that there is scope for economy (it has been estimated by the Indian Coal Consumers' Association, for example, that the lack of inspection before the despatch of coal for the Railways itself involves a loss of about a crore of rupees per annum); and partly that to the extent that the revenue does disappear and the operating surplus shrinks, it is inevitable that Railway capital expenditure, financed by general revenues, should play a more and more important part until such time as the country becomes fully developed and the Railway revenue is automatically adequate, reflecting the increased industrial and business activity.

The rating structure of the Indian Railways has to be fair both to the Railways and their customers and it should, therefore, be decided independently. Where rating involves fundamental development policies, the Rates Tribunal cannot be expected to decide matters and the Federation of Indian Chambers of Commerce and Industry has, therefore, done well to suggest that an ad hoc review of these matters should now be undertaken.

REFLECTIONS ON TENDENCIES IN TEA

(CONTRIBUTED)

Using a summary of observations of what has been happening to the tea industry in North-East India in the past decade, a number of tendencies emerge which have been used to establish the direction of trends and probable course of social, technological and economic developments a decade from now. The data available is neither comprehensive enough nor long enough to permit quantitative measurements. The conclusions reached, therefore, must not be taken as forecasts but as indications of possible future tendencies.

It is also necessary to make it clear that the figures wherever given are for the industry as a whole. Each district, sub-district, circle, company or individual garden will show a different experience depending upon the geographic, geological and climatic conditions, management policies, employment position and the like.

To say that garden population in North-East India during the next decade will be increasing at the average annual compound rate of 1¼ per cent is to oversimplify the matter because of tendencies in the other direction are bound to develop, such as migration and decline in recruitment.

The proportion of females to males on tea gardens will increase from 908 to 920 per thousand. Since 1881 and until the last census the sex ratio of the population in India has been declining due to too early and too many child births.

The proportion of women to men employed in the tea industry is 810 per thousand. This rate has been static for many years but labour saving changes are bound to reduce it somewhat in the next ten years.

Both the average size of families and the birth rate will show a slight decline. Life expectancy at birth will be increased from 32 years to 35 years if not more.

The average age of tea garden population is 22½. It is expected to increase to 24 by 1963.

The percentage of unproductive population (dependents) will increase from 40 to 45.

Outside recruitment has been on the decline. By 1963 it will be reduced considerably. Regions surrounding tea districts will continue to grow at the expense of tea garden population.

Judging by the course of events in the past five years one must conclude that wages will be high and will tend to go higher. Reductions in wages are not likely to occur even during periods of recession.

Diets have improved. Garden population is expected to eat more food, and have better balanced diets. Malnutrition will disappear from the morbidity lists of garden hospitals.

There will be an increase in the utilization of hospital facilities. Expenditure for medical care will be rising not because of poor health but as a result of continued appreciation of the need to improve and maintain health. At one time, malaria or "Assam Rot" accounted for about 60 per cent of the total sickness in the tea districts. The record of malaria sickness and admission rates to garden hospitals today is the lowest in India.

Medical facilities and services will remain to be of the highest standard in the country.

There will be better school attendance.

Absenteeism has been steadily increasing; today it costs the industry no less than five hundred lakhs of rupees per year. On an average a garden labourer works 235 days in a year.

Construction of houses will continue to be a problem for many years owing to lack of adequate finance and shortages of building materials. In 1950 new housing standards were introduced. At that time, 8 per cent of the houses were of the approved type. In 1953, 22 per cent of the houses conformed to specifications. By 1963, 90 per cent will be of the approved type. Similarly, in 1950 labour houses were classified into 5 per cent pucca, 22 per cent semi-pucca and 73 per cent kutcha. Today, the corresponding percentages are 8, 22, 70 and in 1963 they are expected to be 50, 20 and 30. With mechanical plucking and other labour saving schemes in mind gardens will carefully review their building programmes to see that they are not left with a large number of unoccupied houses in 1963.

There will be a certain amount of abandonment of areas under tea, particularly in Cachar, Darjeeling and Terai. There will be more concentration and the arrow points in the direction of Assam Valley and the Dooars. Acreage under tea in 1963 will show a slight decline when compared to 1953. At the same time, additional areas will be turned over to food growing.

By 1963 there will be fewer but bigger registered gardens in North-East India—probably 1,200 instead of today's 1,300.

Production of tea will be higher at the rate of ten to twelve million pounds per year. To maintain exports, and create new demand, export shipments will recede in value. Internal consumption will increase at the rate of nine million pounds per year. There will be a change in merchandising. More and more gardens will embark on distribution of tea in retail packages. This tendency will gain momentum when internal consumption is placed in its true perspective. There has been quite a change in the consumption pattern. In 1930, roughly 10 per cent of India's out-turn was consumed internally and 90 per cent exported. Today, the corresponding percentages are 33 and 67. In 1963 they will be approximately 50 and 50.

There will be many changes in labour philosophy. Relationship between unions and management will be more mature. The legalistic approach will be substituted by the problem-solving approach. Government and unions will accept the importance and necessity for the gardens to operate at a profit. All thought of the workers benefiting at the expense of the garden solvency will be eliminated. Managements will continue to devote careful consideration to human relations. The result of all this will not be a perpetual peace but a "working harmony".

Electrification will increase rapidly and hydro-electric and multi-purpose schemes will be in operation. Mechanisation will follow electrification. Natural gas will be used near the oilfields.

In the past, the major portion of the benefits from the numerous and extensive improvements in the methods of cultivation and manufacture and more skilful techniques have been dissipated in output restriction by labour and by high rates of taxes. Output restriction by labour has emerged from the pressure of population prompted by fear of working themselves out of a job and is understood in many quarters. There is less understanding of the effect of taxes and duties on the labourers' standard of living. Looking at it in its true relationship, taxes and duties are the greatest of all reducers of purchasing power. As a matter of fact, taxes and duties are largely the reason for much of the misunderstanding on wages between the garden labour and their employers. The soundness of the tea economy has been undermined by the tax structure which is stifling the spirit of the industry.

The average age of the tea bush will be lower. Higher average yields per bush and even higher yields per acre will be universal. More ingenuity will be demonstrated in cultivation, plucking, production, handling and planning. Probably no one in India has applied as much wealth, effort and technical know-how to its development and improvement as has the tea industry. Yet, today, this industry stands at the cross-roads, uncertain which way to turn. Vital and important decisions lie ahead. How they are decided will have far-reaching results.

Work and Time Study is being forced onto tea gardens by high labour cost and high rates of duties and taxes. The tea industry is now forced to use cost saving and product improving developments to improve its economic position. As soon as work studies are completed, Incentive system of wages will be introduced and applied throughout the industry. Better cost systems will be developed. New ideas and policies will provide the foundation for many changes and adjustments to meet changing conditions. The outstanding change will be the acceptance that increased productivity must lead to higher incomes for the workers and lower prices for the consumers if it is to be profitable.

Better communication and transportation facilities will be in evidence. More airports, double-track railways and better roads will be found in the tea growing districts.

The next crest in the price of tea shares is due in 1955 to be followed by a decline until a trough is reached in 1960, completing a cycle of approximately 9½ years. On an average the predominating tendency of the tea share prices is to slope upwards at the rate of 4.46 per cent per year. The ideal wave runs 132 per cent of the trend at crest to 74.75 per cent of trend at trough. In the move from trough to crest, it amounts to an average gain of 6.74 per cent per year and similarly in the move from crest to trough to a loss of 5.32 per cent per year.

As the result of the high proportion of profit paid out in taxes and duties during the past few years and the shrinking proportion saved and invested, the outlook for additional capital investment in the near future is poor indeed. There has been a dangerous "withering of capital" and the function of profits has been totally disregarded in all considerations. Unless this tendency is reversed, we will be due, sooner or later, for a rude and, perhaps, terrible awakening.

Basically, tea problems cannot be listed as new problems but rather as new expressions of old problems; nevertheless, quick and easy solutions are not to be expected. Understanding of the role of the tea industry in India's economy and appreciation of the benefits which have flowed from its efficient operation in the past will provide the best guarantees of economic soundness for the future.

THE FORT WILLIAM JUTE CO., LTD.

NOTICE

The half-yearly Ordinary General Meeting of the Company will be held at the Registered Office, No. 14. Netaji Subhas Road, Calcutta, on Monday, the 25th January, 1954, at 3-20 P.M. for the purpose of receiving the Directors' Report and Auditors' Report, passing the Accounts for the half-year ended 30th September, 1953, and transacting such other business as may be brought forward before the meeting.

The Share Transfer Register of the Company will be closed from 18th January to 25th January, 1954, both days inclusive.

By Order of Board.

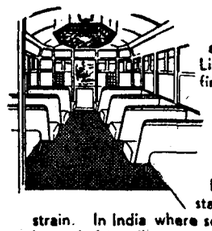
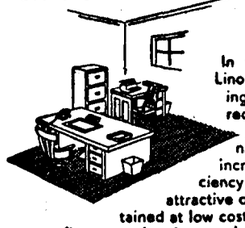
LINOLEUM—
The Versatile Floor Covering...

HOMES :



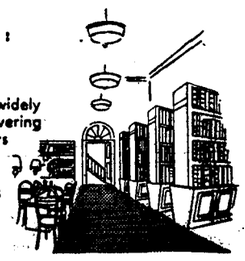
Linoleum can be laid on a simple cement or wooden floor in place of expensive marbles or mosaic floors. It is extremely comfortable to walk on, easy to clean ..hygienic...no jarring noises, no serious injury to children even if they fall. Linoleum adds colour and brightness to the home, safeguards health, promotes quiet.

HOSPITALS :



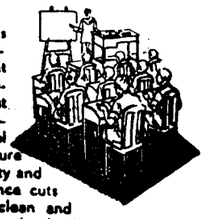
Being an hygienic, synthetic material, Linoleum is obviously an ideal floor-covering for hospitals and clinics. For nurses and doctors constantly on their feet, its "cushioning action" is a great boon; for the patients, no more disturbing noises from clattering feet.

PUBLIC TRANSPORT :



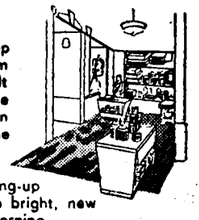
Tough, durable and easy to clean, Linoleum is the first choice for installation in public conveyances. Railway carriages, tram cars, buses.. Linoleum stands up to the strain. In India where so much luggage is carried in railway compartments, Linoleum seldom scratches or gets torn.

OFFICES :



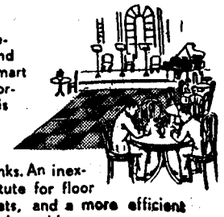
In the office Linoleum flooring effectively reduces noise and personnel fatigue, increases efficiency. For an attractive office maintained at low cost, Linoleum as a floor-covering is a real, long-term investment bringing everyday returns.

LIBRARIES :



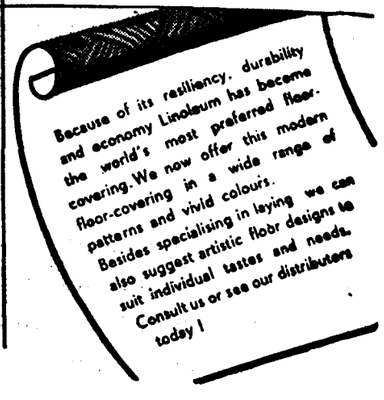
Linoleum is widely used for covering library floors because it minimises noise, makes for that quiet atmosphere so essential for concentration. No more screeching chairs or clattering feet.

SCHOOLS :



Because it reduces noise and contributes to a bright atmosphere Linoleum is a most effective floor-covering for school rooms and lecture halls. Its durability and ease of maintenance cuts costs. Easy to clean and hygienic it safeguards the health of the youngsters. Particularly suitable for gymnasiums and recreation rooms.

SHOPS :



For effective decoration of shop interiors Linoleum is unrivalled. It stands up to the heavy traffic on shop floors and the constant use of counters. Wash it clean at shutting-up time, and have a bright, new floor the next morning.

HOTELS AND RESTAURANTS :

Hotel managements have found in Linoleum a smart and durable floor-covering that is easy to clean and does not soil from spilled food or drinks. An inexpensive substitute for floor rugs and carpets, and a more efficient floor-covering than either.

INDIA LINOLEUMS LIMITED

8, ROYAL EXCHANGE PLACE, CALCUTTA-1

BUSINESS NOTES

A.C.C.

The Associated Cement Companies' balance sheet for the year ended the 31st July, 1953, shows an increase of about Rs. 35 lakhs in the net revenue from the sales of cement, but the profit nevertheless declined during the year by a little over Rs. 15 lakhs as compared with the previous year. The company has expansion programmes as follows:

(i) expansion of the Shahabad Cement Works, which is already in progress,

(ii) construction of the A.C.C.'s new factory at Sindri in order to make use of the fertiliser factory's waste product,

(iii) expansion at Kistna and Surajpur,

(iv) installation of modern plants at Khalari and Sevalia, and

(v) erection of a modern firebricks factory at Katni which will be completed by 1955.

The bonus issue of one share for each of five existing shares now held in the company, to be financed from out of the premium on shares and the reserves, takes into account the need to extend capital in order to increase it to a level which will be appropriate to the present size of the company, but from the point of view of funds in use, there cannot be any substantial change, at any rate immediately, unless cement prices are increased as a result of the recent review by the Tariff Commission. The withdrawal of the concessions previously offered by the Railways on coal freight and the increase of thirty per cent in the freight charge is the most substantial item in the increase in costs, but labour costs have also gone up and this year's experience of a decline in profits, in spite of an increase in sales, would hardly provide much inducement for the industry to expand, unless selling prices could be raised and the margin of profit could be thereby widened.

INDIA STEAMSHIP CO.

Sir A. Ramaswami Mudaliar's speech at the annual general meeting of the India Steamship Co., Ltd., shows that the freight earnings, at a little less than Rs. 4 crores in the year ended the 31st March, 1953, were a record. The company has already added 'Indian Commerce' to its fleet and is contemplating the addition of three more ships. The contemplated liberalisation of the amounts as well as the period of repayment under the Government of India's scheme for assistance to shipping companies will help in this addition to the fleet, but meantime, Sir A. Ramaswami Mudaliar has referred to the restrictions which have been imposed by the Conference lines on Indian shipping engaged in international trade on being allowed to load or unload cargo as the case may be at intermediate ports. This is a wholly inexplicable restraint on the freedom of operation of Indian companies, which wastes valuable shipping capacity and results in the loss of revenue to Indian companies, thus reducing their profits at a time when they have to finance their expansion principally by means of retained earnings. It is not clear how the Government of India can help the Indian companies in overcoming the opposition of the established shippers in the Conference lines, but bilateral pacts and Government intervention intended to extend the area of restrictive business practices seem to be inevitable, as Sir A. Ramaswami Mudaliar has pointed out, if equitable rights are denied. The Conference lines must re-examine this matter in the light of the complaints which have been made, so that it may be settled within the industry itself in a spirit of goodwill.

THE TAXATION OF BONUS SHARES

In view of the number of cases in which it is proposed, subject to the approval of the Controller of Capital Issues, to capitalise reserves and to distribute them as bonus shares, the ambiguity of the reply in the course of a recent question in the House of the People will be widely regretted. The legal position at present is that bonus shares escape taxation as income in the hands of those in whose names they are issued, because they entail no release of assets by the companies issuing them. Nevertheless, in spite of this position under the Indian law and in spite of judgments unholding this legal position under British law, there is some degree of basic hostility to the capitalisation of reserves as bonus shares, as was evident in the imposition of a special stamp duty on such shares in the British budget of April 1947. Whatever justification this attempt to tax bonus issues might have had in British conditions, the conditions in India are, however, different. Here, industry is comparatively undercapitalised. The extension of the capital base by formally designating as capital reserves which are actually used as capital whether they are so designated or not is the most important means of extending investment in industry, apart from the fact that in the conditions of the equity markets in this country at the present time, tax-free bonus issues, which are exempted by law in the terms of Section 2 (6A) of the Income Tax Act, have to be accepted as very common in company finance. It would be a pity if this position were to be changed for the sake of some extra revenue or because evasion of income tax is suspected by the authorities, although there is nothing to support the suspicion.

U.S. AID FOR ROLLING STOCK

The signing of an agreement between the Governments of the United States and India on December 24 last for specific appropriation of a sum of $21 million or Rs. 9.5 crores for the purchase of locomotives and wagons for Indian railways has an important bearing on accelerating the rate of the rehabilitation of this country's railway system. Authorisation for this appropriation comes out of the amount of $89.1 million of economic and technical aid by way of outright grant made by the United States Congress in August last.

The new source for expenditure has enabled the Railway Ministry to purchase from any country on the basis of competitive prices and suitable dates of delivery a total of 100 W.G. locomotives and 5,000 goods wagons divided in equal proportions between broad gauge and metre gauge requirements. Repeated reviews of the rolling stock position made on behalf of the Railway Ministry in the last two months disclose its concern over the state of the stock. At the beginning of the Five-Year Plan the holdings of goods wagons were estimated to be 199,094, of which 73,371 were expected to be overaged during the five-year period. Wagons ordered in the first three-year programme were 32,293 to which the programme of the next two years will add 29,000, leaving a balance of 12,078 still due for replacement. How long this process of clearing the accumulations of replacement will continue is left to anybody's guess and the Ministry's communique passes to the complacent conclusion about meeting the normal annual replacement demand of 6,000 wagons from home production. As regards locomotives, the first three years' programme has made a provision for the purchase of 769 locomotives which together with the next two years' procurement of about 500 locomotives will still leave 1,500 in an overaged condition at the end of the Plan. The present average age of locomotives in service is 30 years, and once it is reduced to 20 years (when

it will be so reduced is not estimated), the normal yearly replacements of 200 locomotives will be met from domestic manufactures.

The most significant admission made in this behalf is that after arrears of replacement are cleared and the position is improved to a locomotive stock of 78,000 with an average age of 20 years, railways will be sufficiently equipped to lift the present level of traffic offering. If this estimate of capacity is correct, it only means that the higher volume of traffic that will be created will have to look to other forms of transport for clearance.

TEA EXPORTS

The continuous and progressive bullish trend in the tea export market is obviously a reflection not only of the firm demand in the auctions at London but of the sustained levels of the entrepot trade there. How rapidly the spurt in exports shot up is indicated by the quotations between early November and the end of the third week of December. While business in the export quota was transacted at 18 pies per lb. early in November, the level shot up to 40 pies per lb. towards the end of the third week of December. The implications of the demand from London were clear and the Government of India took the appropriate action in announcing a higher rate for exports from 122 per cent of the standard exports to 125½ per cent, raising the exportable volume from 424.86 million lbs. to 437.05 million lbs. This liberalisation will have the effect of reducing the export price of tea to healthier levels, but the net gain from a higher volume of export is obvious. Transport facilities for tea in this season have been much better than last year and the season's output is expected to be disposed of practically by the end of February.

Demand from Ireland and Egypt has continued to go up. But what is of direct significance is that market studies in North America have disclosed that exports to the United States and also to Canada can be pushed up, given an energetic and vigilant drive. The overseas prospect for tea has been made still brighter by the Indo-Russian trade agreement which includes tea among the exports to the U.S.S.R. The size of the probable demand from that country will be revealed after some time, but this new market has strengthened the outlook for tea overseas. This rising demand must inevitably produce its repercussions on the volume, quality and prices of the supplies for the home market. The case for regulation of output, arranged on a voluntary basis by North Indian planters with sufficient justification before, will now lose ground and in any event in the interest of stimulating a higher volume of exports as well as safeguarding domestic supplies this limitation will have to be abandoned. Of equal importance is the need of vigilance on the price levels for the home consumer.

SUGAR POLICY

Sugar still continues to be in search of a stable policy and if the short debate in the Council of States is a sufficient indication, a stable policy will not be possible for some time more. Mr. Rafi Ahmed Kidwai explained the position as regards imports. In the first instance, one lakh tons of sugar were imported, to be followed by a second instalment of import of an equal quantity. In the meanwhile, as overseas prices of sugar declined, and since the first two purchases were made at prices much above the home prices, an additional quantity of half a lakh tons was ordered. The total imports, in this way, added up to 2.5 lakh tons.

The imported quantity was earmarked for distribution at the port towns and the adjoining coastal region. This was not solely because provision of transport facilities had created shortages and disturbed the distribution plan but because sale of imported sugar in the interior areas would have increased their cost and in turn necessitated further burden to eliminate the disparity between prices of home supplies and imports. The alternative to imports was reimposition of controls, which, apart from the difficulties involved in securing a balance between supply and requirements at reasonable prices, would have served no immediate purpose except sending stocks underground. The plain truth is that consumption habits have brought about an increase in the normal demand and so long as it is necessary, the shortfall will have to be made good by imports. This is as far as the prospect in the near future is concerned. For a permanent solution two things seem necessary. More intensive methods will have to be found out by cane research to augment in the sucrose content and to rectify the defects of overconcentration of the industry in the North. The second objective cannot be achieved easily, but the trend for transfer of sugar factories to the South should be given all needed encouragement. Mr. Kidwai revealed that a beginning in this desirable change seems within sight and some factory owners in the North have already applied their mind to it.

AUTOMOBILES AND TRANSPORT

It was inevitable that two spokesmen of the automobile manufacturing industry should feel constrained to re-emphasize the urgency of modification of Government's policy on automobile manufacture and what is intimately connected with it—motor transport. Government's decision of allowing five firms to assemble vehicles and to permit import of automobile components for assembly shows lack of a realistic appraisal of the problem. In the light of the hard fact that the capacity of the two manufacturing units is 60,000 vehicles, as against the present requirements of not more than 12,000 vehicles, both the spokesmen have rightly questioned the justification of the policy of granting latitude to assemblers.

Mr. B. M. Birla, as the President of the Automotive Manufacturers' Association of India, has rightly chosen to touch the broader and long-range aspects of the manufacturing industry and has reiterated the urgency of making readjustment in motor transport policy without any further hesitation. Since the inclusion of road transport in the official 11-point plan to counter unemployment, no positive action has been taken to stimulate the motor transport component of road development. The size of the direct and indirect employment created by the industry has been estimated by Mr. Birla at 160 persons per 100 vehicles. If this source of employment is not being fully tapped it is largely because of the neglect of motor transport. At the present time 30 per cent of capacity of buses and vehicles with private owners is said to be lying idle. The question remains unanswered why the Planning Commission's exhortation to halt nationalisation of motor transport is being conveniently ignored. Elsewhere in this column reference has been made to the purchase of railway rolling stock from the United States economic aid fund where official estimate admits the lag between railway transport capacity and the traffic demand on it even after acquisition of stock by the end of the period of the Plan. The need for removing the present handicaps to motor transport could not be underlined more clearly than by this bare truth.

GOVERNMENT OF IRAQ

DEVELOPMENT BOARD AND MINISTRY OF DEVELOPMENT BAGHDAD, IRAQ.

TENDER NOTICE

ESTABLISHMENT OF A COTTON TEXTILE FACTORY AT MOSUL, IRAQ.

The Development Board, Baghdad, Iraq, invites tenders for the establishment of a Cotton Textile Factory at Mosul, Iraq.

The work is sub-divided into the following sections. Tenders may be submitted for one or more sections. Each section will be considered separately:

SECTION A: Design and construction of a building, water supply and distribution, sewage disposal, roads and fencing and other civil engineering works.

SECTION B: Supply, erection and putting into operation of plant and machinery for spinning, weaving and finishing and fire-fighting equipment.

SECTION C: Alternative I — Supply, erection and putting into operation of plant and machinery for (i) Air-conditioning; (ii) Electric power house, sub-station, power and steam distribution and lighting; (iii) Workshop.

SECTION C: Alternative II — Same as above, but excluding power house and including process steam boilers.

Tender documents consisting of Instructions to Tenderers, General Conditions of Contract, Form of Tender, Technical Specifications and Drawings can be inspected and purchased (I.D. 5) from 1st of December, 1953, to 31st of January, 1954 at:

The Ministry of Development, Baghdad.

The Embassies and Legations of Iraq or of Countries representing Iraqi interest in London, Washington, New Delhi, Paris, Rome, Bruxelles, Bonn, Bern, Amsterdam, Copenhagen, Stockholm and Tokyo.

Messrs. Ibcon Limited, 3, Queen's Road, Bombay, India.

O.D.M. Lingeman Esq., Ibcon Representative, Yateley, Surrey, England.

Albert Ramond and Associates, Chrysler Building, New York 17, U.S.A.

Tenders must be submitted in sealed envelopes marked "ESTABLISHMENT OF A COTTON TEXTILE FACTORY AT MOSUL, IRAQ" tothe Ministry of Development, Contracts Section, Baghdad, Iraq, and will be received up to noon on the 1st of March, 1954. The tenders for section A should be submitted together with a deposit of 10,000 Iraqi Dinars either in cash or by a letter of guarantee from an approved bank established in Iraq.

Particular attention is drawn to the fact that tenders will only be accepted from firms of contractors who have previously executed works of a similar nature and magnitude.

The Development Board does not bind itself to accept the lowest or any tender.

The Minister of Development

BAGHDAD, IRAQ.

COMMODITY NEWS AND NOTES

FINAL ESTIMATE OF JUTE

According to the Directorate of Economics and Statistics, Ministry of Food and Agriculture, Government of India, the all-India final estimate of jute for 1953-54 puts the area and production at 1,196,000 acres and 3,128,000 bales (of 400 lbs. each) respectively as against the partially revised estimate for last year of 1,817,000 acres and 4,605,000 bales, thereby showing a decrease of 621,000 acres or 34.2 per cent in area and 1,477,000 bales or 32.1 per cent in production.

The decline in acreage and production of jute has been reported by all the jute-growing States; it is, however, more marked in West Bengal and Bihar and is due mainly to unfavourable weather conditions and low prices of jute at the time of sowing. In parts of West Bengal and U.P., the crop also suffered to some extent from floods and attack of Semilooper pest.

WOOL EXPORTS

It was announced recently that shippers of raw wool who may not have made any shipments during January-June 1953, but have exported during January-June 1951 or January-June 1952, would be considered for export allotments. It has now been decided that such shippers should also be granted export allotments up to 60 per cent of the shipments effected by them during the period January-June of 1951 or 1952. Another announcement stated that exports of wool waste would be licensed freely for shipment up to December 31, 1953. As a result of a further review, the Government of India has decided to extend the free licensing of wool waste for shipment up to June 30, 1954.

SECOND ESTIMATE OF MESTA

The all-India second estimate of mesta, 1953-54, puts the area and production at 349,000 acres and 539,000 bales of (of 400 lbs. each) respectively as against the corresponding estimates of 369,000 acres and 560,000 bales, thereby showing a decrease of 20,000 acres or 5.4 per cent in area and 21,000 bales or 3.7 per cent in production. The decline in acreage and production of mesta during the current year has occurred mainly in Bihar, Orissa and West Bengal and is due to unfavourable weather conditions at the sowing time. The decline in production has, however, been offset to some extent by increases reported by Andhra and Hyderabad. This estimate covers the period generally up to the end of October or beginning of November 1953. Till then, the condition of the crop was reported to be generally satisfactory. This estimate does not cover the entire area under mesta during 1953-54. Some late varieties of this crop are also grown in certain States. Complete data regarding the estimates of acreage and production will, therefore, become available in the final estimate due in March, 1954.

ADDITIONAL EXPORT QUOTA IN BENGAL DESHI COTTON RUMOURED

Reports are current that the Union Government will allow further export of 50,000 bales of Bengal Deshi. A decision in this connection is expected soon. It is stated that mills have taken practically the entire quantity of this variety of cotton which they are in a position to consume and that, therefore, the permission to export the additional quantity would not lead to a sharp rise in prices. Moreover, the authorities are stated to be feeling that no more time should be lost in disposing of the surplus of Bengal Deshi in foreign markets.

SECOND ESTIMATE OF SUGARCANE

According to the Directorate of Economics and Statistics, Ministry of Food and Agriculture, Government of India, the all-India second estimate of sugarcane for 1953-54 puts the current year's acreage and production at 4,101,000 acres and 5,100,000 tons (in terms of raw-sugar or gur) as against the adjusted second estimate of 4,228,000 acres and 4,990,000 tons respectively for 1952-53. The current year's estimate, therefore, shows an increase of 2.2 per cent or 110,000 tons in production over last year in spite of a decrease of 3.0 per cent or 127,000 acres in area.

The standing crop has been reported to be good in Uttar Pradesh, Madras and Andhra, and these States have mainly contributed to the increase in production. Bihar has reported a decline both in area and production, mostly due to adverse weather conditions. This estimate covers the period generally up to the middle of October 1953 and does not cover the entire area sown to sugarcane crop during 1953-54.

DYESTUFFS INDUSTRY

Mr. M.D. Bhat, Chairman, Indian Tariff Commission, while opening the Public Inquiry into the dyestuffs industry observed that the establishment and gradual building, up of a key industry like the dyestuffs industry in India is a very big enterprise and if it is to succeed, those engaged in it will have to lay the foundations securely and also make sure that in due course it finds its roots in the country and derives its sustenance from the organic and inorganic chemical industries developed within the country.

EXPORT OF CHROME ORE

The Government of India have decided to allow export of a quantity of 15,000 tons of Chrome Ore, irrespective of the grade, during the period January-June 1954. Exports will be permitted by established shippers and mine-owners with ready stocks. Allotments will be made to established shippers on the basis of 100 per cent of half of their best year's exports during any one of the four financial years ending March, 1953.

COMPANY MEETING

INDIA STEAMSHIP COMPANY, LIMITED

Freight Earnings Rise: Cash Resources Satisfactory

SIR A. RAMASWAMI MUDALIAR SURVEYS SHIPPING PROBLEMS

Addressing the Shareholders of the India Steamship Company Limited at its Annual General Meeting held on December 10, 1953, Sir A Ramaswami Mudaliar, K.C.S.I., D.C.L. (Oxon.), chairman of the Company, said:

Gentlemen,

The Audited Accounts and Directors' Report for the period ending March 31st, 1953, has been in your possession for some time. With your permission I shall taken them as read.

TRADING EXPERIENCE

It will be noticed from the Directors' Report that the freight earned during the year is Rs. 3,93,00,000, the highest freight earned so far. Conditions during the year were not, however, uniform, the rates of freight as well as charges for bunkering having varied during the course of the year. The turn-round of the ships took a longer time owing to delays and detentions at some of the ports resulting in the time taken for a round voyage by a ship being longer than estimated. This in its turn presented a serious problem to the Operation Department in its attempts to keep a regular schedule of service at both ends of the voyage. The expenditure under salaries and wages and under bunkering charges shows an increase over the former year and is due to rates of pay being revised in some cases and to the normal increase due to the earning of increments. Insurance premium also was higher as owing to the prevailing cost of ships the amount for which the fleet was insured had to be raised. It is gratifying to note that in spite of all these factors the Company has made a gross profit of Rs. 59,00,000.

FINANCIAL POSITION

In accordance with the decision of the Board of Directors which was announced at the last Annual General Meeting, the Debentures amounting to Rs. 25,00,000 have been fully redeemed. The Directors have provided the normal Depreciation of Rs. 23,00,000 and have transferred a sum of Rs. 18,00,000 to the General Reserve, bringing up that Reserve to Rs. 50,00,000. The cash resources of your Company are, therefore, in a satisfactory position.

COASTAL TRADING

In my last Address I referred to the part which your Company desired to play in the Coastal trade of the country. We had put one of the ocean going vessels—the 'INDIAN IMPORTER'—on the Coastal trade but your Directors felt that there was need for putting a smaller vessel also on the Coast and the nearby trades and, therefore, taking advantage of the Government's policy of offering loans for the purchase of vessels both Coastal and ocean going, your Directors have purchased a vessel built in 1952 and christened it the 'INDIAN COMMERCE'. This vessel is now regularly plying on the Coast of India and may also be utilised for trade between India/Burma or Ceylon.

DELAYS AT PORTS

The delay caused at some ports in getting berths and in discharging or loading freight has been referred to in previous Addresses. The 'go-slow' tactics adopted by dock labour has been causing serious concern to all Shipping companies. An additional factor, which has recently emerged and which is equally disturbing owing to its effect in delaying ships, is the dispute about the number of gangs that must be employed for a particular load. I do not wish to go into the details of this question as I understand the subject has been referred to Government. I can only say that your Company along with others desire to co-operate in providing all reasonable salaries and amenities to labour but wish also to emphasize that the labourer must be worthy of his hire and that he should do that amount of work which may reasonably be expected of him.

SHIPPING INDUSTRY

I referred to the sympathetic attitude of the Minister of Transport and of all the officers concerned with Shipping in my last Address. I am glad to report as a redeeming feature in the situation that this sympathy continues to be extended and that the Minister of Transport, the Secretary of the Ministry, the Director General of Shipping and other officers connected with the Ministry have shown a deep and abiding interest in the progress and welfare of Indian Shipping and in its expansion.

LOAN FOR DEVELOPMENT OF SHIPPING

The Five-Year Plan has stated that there should be at least 600,000 tons of Indian Shipping owned and operated by Indian Shipping companies by the end of the period of the Plan, i.e., by the end of 1955-56. The present tonnage of Indian Shipping is about 400,000 tons and it is obvious that if this has to be increased by another 200,000 tons within the next two years, both Shipowners and Government have to play their part in obtaining this result. At a recent meeting of the Consultative Committee on Shipping held at Bombay, the Minister of Transport exhorted the Indian Shipping companies to make progress in adding to their fleet and increasing the Indian tonnage, and stated that the Government would consider the grant of liberal loans for the purpose. Your Company had taken advantage of this policy of the Government at an earlier stage and had bought the vessel the 'INDIAN COMMERCE'. It is now negotiating for the construction of one vessel at least and perhaps two vessels of 10,000 tons d/w, equipped in the most modern way, at one of the Continental Shipbuilding Yards and is in communication with the Government of India for the grant of an appropriate loan on suitable terms. We hope to have the Government of India's approval for the loan very shortly, in which case the vessel or vessels will, it is expected, be delivered by the end of

1954 or very early in 1955. It would be clear from what I have stated already about the operation difficulties with the fleet which we now possess that it has become an acute necessity to add to our fleet and to maintain a regularity of service, if we have to fulfil the requirements of the shippers at either end.

HINDUSTHAN SHIPBUILDING YARD

As you are aware, the Government of India has taken over the Shipbuilding Yard at Vizagapatam and with expert foreign advice and assistance is engaged in expanding and improving the Yard. It is expected that the Yard will be in a position to build shortly not only coastal vessels but ocean going vessels of the requisite tonnage. The need for supporting the shipbuilding industry in the country hardly requires emphasizing. Indian Shipping companies are naturally expected to place orders for ships at Vizagapatam Shipbuilding Yard. Your Company desires to play its part in promoting this industry and has, therefore, agreed to place orders for further ships at this Yard. It is expected that such orders as are placed will be completed by the Yard in 1956 or 1957.

COMPETITION

The boom period which prevailed in 1951 and in the early part of 1952, as much in Shipping as in other industries, has practically ended and Shipping companies are facing severe competition. This competition is not always fair, notwithstanding the rules of the Conference and in addition where newcomers are concerned with their small fleet and the consequent infrequency of service, advantage is inevitably taken by owners of some large fleets. There is all the more reason why your fleet should be strengthened and the number of vessels on the India-U.K.-Continent trade increased. The Board of Directors are well aware of this fact and are taking all possible steps to meet the situation and I trust I shall be in a position at the next meeting to place before you concrete facts about substantial additions to your fleet.

CONFERENCE MEMBERSHIP

I referred on the last occasion to the applications that your Company has made for the privilege of becoming a member of certain other Conferences. These were the Colombo-U.K. Conference, the U.K.-Colombo Conference, the Colombo-Continent Conference, the U.K.-Port Sudan Conference and the U.K.-Aden Conference. It will be noticed that all these Conferences relate to ports which are on the route from India to the U.K. or Continent, ports at which normally the Indian Shipping Lines have to call on their way to or from the U.K. or the Continent. I deeply regret to state that we have made no progress in the matter of admission as members to any of these Conferences. I feel that the time has come when a plain statement of facts should be placed before the public in this country and before our Shipping colleagues in the U.K. in particular. The facts are these. The Indian Shipping companies have been allowed into Conferences which regulate the trade only between Indian ports and ports in the U.K. or on the Continent. They are not allowed into any Conference which regulates the trade between a wayside port on the normal route of Indian Shipping companies and any port in the U.K. It will be crystal clear that where trade emanates in India and is destined for any port in the U.K. or emanates from the U.K. with India as its destination, it would hardly have been possible even for the powerful U.K. Shipping Lines to have refused membership to the Indian Shipping companies. Indeed, even here membership was not allowed to the Indian Shipping companies till a guarantee was given that a certain number of ships would be regularly plying on this trade. But, notwithstanding the fact that India is a member of the British Commonwealth, the U.K. Lines have consistently refused to allow the Indian Lines membership of any Conference where the trade regulated does not emanate from an Indian port but emanating from a wayside port ends in a U.K. port or emanates from the U.K. and ends in a wayside port. The practical picture which arises out of this situation is as follows. Indian Shipping Lines can carry freight from an Indian port to Colombo, Aden, etc., but after discharging that freight they cannot carry further freight from such ports to any of the ports in the U.K. and, therefore, will have to go in ballast to that extent. Conversely, from the U.K. Indian Shipping can only carry freight to India and Pakistan and cannot carry any freight to the wayside ports including Port Sudan, Aden and Colombo. I can only hope that Shipping companies particularly those of the U.K. will review this situation and abandon an absolutely untenable and almost an unfriendly attitude, and trust that it will not be the painful duty of Indian Shipping companies to break into a Conference arrangement by which certain interests are safely entrenched.

I.M.C.O.

I have on more than one occasion referred to the Organisation which is contemplated for regulating maritime affairs and to the suggestion that the Government of India should seriously consider the desirability of becoming a member of the International Maritime Consultative Organisation. At long last it looks as if this Organisation will come into existence during the course of the next year, as the main difficulty of securing membership of seven countries with more than one million tonnage seems to have been resolved. Whether India should become a member and the practical steps it should take before accepting such membership are matters which are under consideration of Government. It is my firm conviction that India will stand to lose much even if she does not gain anything by not becoming a member of this Organisation at the appropriate time.

STATE INTERVENTION

It has become the fashion at annual conferences of the International Chambers of Commerce and of the International Shipping Federation for certain members who are safely entrenched in trade and in shipping particularly, to raise the question of 'flag discrimination' and to suggest that certain Governments have resorted to them by certain practices. The members who raise these questions overlook the fact that the practices complained of and many other practices far more serious and restrictive were resorted to by their own Governments in the not distant past and that these practices really enabled the shipping industries of such countries to attain their present position. Far more important and inexplicable is the fact that no reference is made to the restrictive business practices which are resorted to by some of the Shipping companies which have established themselves in the past. Having attended some of these Conferences and having followed closely the attitude of the Government of India in the bureaucratic past as well as in the present Republican Democracy, the representatives of Indian Shipping companies can certainly state that the Indian Government has been so scrupulously fair, so concerned about allegations of 'flag discrimination' that it has ignored rather than furthered the primary claims of Indian Shipping, claims which are recognised directly or indirectly by almost every Government in the world interested in its National Shipping. The loan that the Government of India has promised for developing

the Indian fleet will not I believe be called a case of 'flag discrimination' by any Shipping company of any nation, as in the recent past practically every Government has given liberal loans to its Shipping companies. Indeed it is an open secret that some Governments at least have no intention of requiring these loans to be repaid. In the International Conferences referred to above, the bilateral treaties of commerce which the Government of India has sometimes entered into with different countries have sometimes come in for criticism. A clause in such treaties speaks of each Government undertaking to help the National Shipping of the other Government as far as possible. That this clause has practically remained a dead letter and that no way has yet been found whereby the promises held out in the signed treaties can be translated in practice, does not disturb the critics. It is only further proof of the fact that vested interests will go to any length while maintaining their past position and in fact trying to improve on it by various methods of indirect discrimination, to cry out before they are hurt and to condemn Governments and Shipping companies without the slightest justification. I have always held the view that the mercantile fleets of various countries should be allowed to develop in their own way without restrictions or interventions by Government but I have also held the view that the phrase 'freedom of the seas' should not be a pious expression but should have a purpose and a meaning which no one can cavil at. The more I see of 'restrictive business practices' by well established shipping concerns, the longer I follow the proceedings of Conference Lines and the manner in which applications for membership are dealt with, the more I am convinced that it is only the strength of a powerful fleet backed up by its Government, which seems to influence some at least of the members of a Conference to accept proposals made by such, a fleet. It is a sad reflection that strength only pays and justice or fair play are sometimes secondary considerations in arriving at decisions. I trust that the lessons that Indian Shipping companies have learned during the past few years will be taken note of by the Government of India and I trust even more that Conferences will even now adopt attitudes which will make it unnecessary for National Shipping concerns to invoke directly or indirectly the intervention of their respective Governments.

INDUSTRIAL DEVELOPMENT AND SHIPPING

India is now in the process of vast industrial development both in the public and private sector. So far as the public sector is concerned Government have undertaken the starting and development of certain essential industries. The huge steel factory that is intended to be set up at a cost of nearly Rs. 80 crores, the integrated coach building factory near Madras, the explosives factory shortly to come into existence, the three oil refineries which will refine crude oil and other Central and State concerns which are under execution or are being planned will involve the import of plant, machinery and other materials in vast quantities. I trust that Government have paid some attention to the means of transport to be employed for the carriage of the vast amount of materials, plant and machinery which will have to be imported into this country in connection with these many schemes. Here is an opportunity for the Government of India without any reference to trade clauses, to provide that Indian Shipping gets a fair share and not a monopoly of the freight which has to be imported in connection with schemes which the Government of India is finding the money for.

TRIBUTE

I have already referred to the special interest that the Minister of Transport has shown in the progress of Indian Shipping and in additions to the Indian fleet. The Director General of Shipping and his assistants have been always co-operative and I should like to thank them all for the advice and assistance that they have given to your Company from time to time. I should also like to refer to the co-operation that has been extended to your Company as indeed to other companies, by the Port Trust authorities at various ports and in particular at the port of Calcutta. To the shippers who have patronised us both here and overseas and who have been loyal to us throughout, we are extremely grateful. But for their consistent support which I hope will be copied by other shippers we could not have made the progress shown in this Report.

It is no conventional language that I am indulging in when I state that I should like on your behalf and on behalf of the Directors to convey our thanks to the Executive and Supervisory staff and to all employees of the Company both ashore and afloat for their good and enthusiastic work throughout the year.

I shall now be pleased to answer any questions that the Shareholders may wish to ask regarding the Accounts.

The Eastern Economist Gift Subscriptions

An Ideal Gift for the New Year

"The Eastern Economist" is continuing this year its gift subscription scheme which it commends to its permanent subscribers who may be seeking suitable gifts for their friends for the New Year.

According to this scheme any subscriber of "The Eastern Economist" may take out one or more gift subscriptions for friends at a reduced rate of Rs. 30|- for annual subscriptions and Rs. 15|- for half-yearly subscriptions against the current rates of Rs. 50|- and Rs. 25|- respectively. For foreign subscribers the gift rates will be Rs. 40|- and Rs. 20|- respectively in place of Rs. 66|- and Rs. 33|-.

The gift subscriptions will be in force for only the period of the original gift; they will not be open to renewal at the same rate in respect of the same recipient of the gift.

The Manager,
'The Eastern Economist'
52, Queensway,
NEW DELHI (India).

Asia, Europe and the United States

FROM three different sources this week the spotlight has been thrown on trade between Asia, Europe and the United States. On January 4, there was released by the United Nations a publication described moderately as "A Study of Trade Between Asia and Europe" which is one of the most penetrating studies ever released on Asian affairs. In just 146 pages it contains a wealth of new information or rather old information brilliantly classified to make it new. The Secretariats of the Economic Commission for Asia and the Far East, the Economic Commission for Europe and the Food and Agricultural Organization of the United Nations are warmly to be congratulated on this production, the fruit of some fine teamwork of international groups. Yesterday, January 7, there was President Eisenhower's State of the Union message containing a powerful plea for "the creation of a healthier and freer system of trade and payments within the Free World—a system in which our allies can earn their own way and our economy can continue to flourish. Finally at the Sydney Conference there are known to be under examination some proposals relating to sterling area-dollar trade which will assist in time in an advance towards convertibility. With this powerful concentration of interest on trade in the Free World, it would be not unreasonable to expect some substantial changes in policy to emerge.

[illegible] comprehensive [illegible] generally, happily, this increased focussing of attention upon international trade is by no means the preamble to [illegible] and specific action either at Sydney or elsewhere. The President's message does more than all the other instruments combined; but his detailed proposals have not yet reached Congress and anyone conversant with tariff history in the United States knows at once that even fairly mild proposals which will make a difference will run there into heavy weather. It is good that the intentions of

the President are now more vocal, but Asia and Europe will not expect their deficiencies of dollars to be made good by sudden acts of generosity on the part of the United States. The major problem of raising the level of Asian-European-American trade remains, therefore, unsolved. And yet surely here is the essence of the problems of Asian development and European currency convertibility, on which in both Asia and Europe large hopes are being entertained.

There should be no undue optimism in respect of the Asian side of the picture. Figures available in the Annual Number of "The Eastern Economist" 'India in Asia' will show that Asia's international trade has now settled down at a level at which it will be impossible to finance significant development by a payments surplus. It is true that in India over the last twelve months there has been a surplus in payments of about Rs. 100 crores; but even this surplus cannot be adequately digested in view of the absence of a specific demand for capital goods on which it should be expended. It is foolish to underestimate the dilemma in which Asian countries as a whole now find themselves. Some of them have no foreign exchange resources; others apparently have resources which temporarily at least they are unable to translate into goods. Everyone (including the United Nations Secretariats) concludes that Asia's problem is obtaining capital goods and not consumer goods, but almost every Asian country today is importing consumer goods much more heavily than capital goods. And, almost worse is the fact that over the last two years the percentage of capital goods in value terms has tended to fall instead of to rise.

Whether this fall in the value of capital goods imported is significant of a fall in the tempo of Asian development or not may be debated. In the case of India it is almost certainly not a fact that the tempo of development is falling in spite of a drop of between Rs. 15 to 20 crores in imports in the last year compared to the average of the previous four. Mr. T. T. Krishnamachari, in his inaugural address to the 36th Economic Conference in Jaipur, advanced the opinion that in real terms there must have been significant rise in capital equipment. He pointed out in India how in respect of a wide range of machinery—spinning frames, looms and ball bearings were specifically mentioned—the restriction of imports was the consequence of a significant development of internal production. But even in respect of the imports themselves he held that, when a suitable correction was made for a fall in prices, it was obvious that imports had not fallen in real terms.

Mr. Krishnamachari did not estimate precisely at what rate capital equipment in the country was increasing. That is a study which the Planning Commission should set in hand at once. Again, on the problem of utilisation, it seems Mr. Krishnamachari's Ministry in a widespread probe into unutilised engineering capacity has discovered vast opportunities of better utilisation, implying on one rough estimate that about 40 per cent increased production could be obtained from some engineering units without any additional equipment whatsoever. It is, therefore, a great mistake to see (as do the International Secretariats) international Asian development so much in terms of capital goods imports. A stable level of capital goods imports at round about existing levels may be consistent with a rise in capital-intensive production by something like 50 per cent if full use is made of indigenous production and capacity.

This is true of India but it is probably not true of any other country in Asia, except Japan which does not need capital goods imports. But to say that it is probably true that most Asian countries need a great stepping-up of capital goods imports does not mean that they can sustain any significant reduction in their consumer goods imports. Here the balance of perspective needs radically to be changed. In the short period, consumer goods should not be cut off, as they represent for most Asian countries almost all that stands between primitive living and their hopes of economic advance. There is everything to be said for pressing on with the manufacture of consumer goods in Asia; but it is no use our risking additional political discontent by putting the cart before the horse.

Where then can the vicious circle be broken? Obviously, for most Asian countries by reasonable price-stabilisation policies for their exports, particularly tea, rubber, and tin. The United Nations study also seems to consider that there could be worked in with such a policy a triangular trading arrangement by which America buys from Asia, and Asia from Europe, thus killing two birds—Asian development and European convertibility—with one stone. But why, if these solutions are theoretically so simple, do they refuse to go to work.

Firstly, because both Asia and the United States interests are not identical with those of Europe. What the European recommendation implies—one British paper has been naive enough to state this bluntly—is that both Asia and the United States should go to the rescue of Europe. If Asia can accumulate dollars, why should she not buy directly from the dollar area, instead of being forced by triangular trade to give her dollars to Europe and accept the limitations of choice which predominantly European trade provides? Again, the United States naturally has no interest in buying from Asia, only to find additional difficulties of exporting to Asia by reason of European preferences which, as the Asian study reveals, still heavily dominate Asian imports. The proper course for Asia is to resist this pressure to restrict her freedom to purchase where she likes. The dollars that Asia earns must be used without any currency preferences for Asia's own interests; since dollars are convertible, this does not preclude purchases from Europe where Asian interests justify that course.

What this does mean is that if Europe wishes to benefit from American interest in Asian stability, she can only do so on the basis of the competitive character of her prices for goods that both Asia and America need. Now that American economic aid to Europe is tapering off, one would have thought that this—and not any triangular arrangement—is what Europe herself would desire. There is no permanent solution of Europe's dollar problem except her selling more to the United States and to Asia in such a manner that she attracts by her economic efficiency Asian orders to herself. Asia today will resent any tie-up which suggests that its trading choice is being limited in order to provide dollar-solvency for European countries.

Asia has a direct interest in multilateral trade. But it should be multilateral trade without strings. This does not exclude preferences where, as with Imperial Preference and India, they seem to be of mutual benefit and not one-sided. Partly because Asian trade has tended to follow traditional patterns, it seems that some considerable dividends could be obtained for Asia by a searching investigation where changes in its exports and imports could increase the real value that Asia receives out of her international trade. It is not enough to analyse the pattern of present trade between Asia, Europe and the United States. That task has been splendidly done. Cannot the same team be set to work to show Asia how she can realign her trade in order to secure the highest advantages from existing circumstances? If the United Nations will not undertake this study, Asian countries must arrange to do this for themselves.

The New Look of Indian Communists

THE Communist Party of India has been as earnest as most others celebrating the New Year, to ring out the old and ring in the new. With the Indian Communists, it was not the peal of bells but a long political resolution, adopted exactly at midnight on December 31, 1953, at the third Communist Congress at Madurai, that ushered in the New Year and their new policy. It is not easy to believe that Communist objectives can change even when their methods do, but if what the spokesmen for the Indian Communists have claimed can be true, there would be a large element of novelty in their latest definition of the Communist programme in India. Mr. E. M. S. Namboodripad, who as a top-ranking member of the Politburo, may be regarded as an authorised exponent, has described this change as a conscious attempt to adapt Marxism "to suit the circumstances of Gandhian India". He hastened to point out that this was only following the example of Mao Tse-tung, who had adapted Marxism to the China of Confucius. He even went on to elaborate the point that his party did not subscribe "to every sentence and every word" uttered by Marx, Engels and Stalin. To many, all this might almost seem open apostasy in the Communist ranks, but as Mr. Namboodripad pointed out, two of these prophets had lived in the mid-nineteenth century; and the Indian Communist Party's intrepidity in including the third has come only after Stalin has been sufficiently played down by his successors. The most significant omission in this context was the name of Lenin, which has now been restored to its primacy by the present archpriests of Moscow.

The suggestion that Marxism and Gandhism can thus be reconciled is sought to be supported not only by the Communist Party's abandonment of the methods of violence which were practised before 1951, but by the Chinese precedent. The abandonment of violent methods has been understood hitherto only as a change of strategy, to meet the firm measures adopted by the Government and the general public indignation against lawlessness. The attempt to make a virtue of this necessity by presenting it as a conscious compromise with the Gandhian influence may, not unlikely, mislead those who have indulged in the wishful thinking that Communism can evolve its own national patterns according to the traditions of each country. But the fate of the precepts of Confucius, which have been replaced in China by the formulae of Marxism might be a truer indication of what in time can happen to the Gandhian part of the Communist professions.

The main aspects of the Communist policy put forward in the resolution in explanation thereof may now be summarised. There has been wholehearted support for the Prime Minister's foreign policy as one of "strengthening the forces of peace", qualified only by a disapproval of the extent of the alleged influence of British imperialism. There has also been support for the general attitude of the Government of India towards the United Nations, and towards the proposals for American military aid to Pakistan. But all these virtues almost cease when internal policies are concerned, which impels the Communists to seek an early replacement of the Nehru regime by a "government of democratic unity". The Five-Year Plan is rejected as a failure, with the qualification that the community project schemes contain nothing objectionable as they ultimately benefited the people. The Communist Party, it has been stated, is not even against foreign economic aid and would indeed welcome it, if it were not of the character of American aid. The emancipation of the peasantry from "feudal oppression", the confiscation of all British interests in the country and relief from exorbitant taxation are the more lurid aspects of this new Communist manifesto.

There is, doubtless, in this change an anxiety for a reconciliation. It is possible to interpret this new mood as an attempt of the Communists to identify themselves with public opinion which is in favour of India's foreign policy, but is beset with anxieties on the problem of unemployment. It may also be a device to meet half-way the other political parties now in opposition to the Congress, which may be prepared to form electoral alliances with the Communists to defeat the Congress Party. There may be a combination of both reasons and there is ample precedent for Communist parties to take on a nationalistic role whenever Communist extra-territorial loyalty conflicted with intense nationalistic fervour. The role of Togliatti in Italy before the general elections last year is an instance of such change. The French Communists have been equally resilient when occasion demanded. The stoppage of violent activities by the Indian Communists since the general elections, which have earned for them release from detention and withdrawal of cases pending against them in many States, can be similarly explained. The specific changes now claimed therefore point to a desire for a different strategy in making the maximum use of this ostensibly parliamentary role to more effective purpose. The criticisms of Indian policy can give the appearance of being constructive when it assails economic stagnation, while warmly approving foreign policies. The possibility of its great appeal to the opposition vote cannot be overlooked. Secondly, the stress on adapting Communism to Gandhian India may hold out a bait to the other opposition political parties, particularly the Praja-Socialists, who have not concealed their readiness to form alliances even with the Communists against the Congress.

Whether or not the Communists have now rehabilitated their prestige by these policies will be known best in the elections to be held in Travancore-Cochin and P.E.P.S.U. and those likely in Andhra later in the year. The choice of Madurai as the venue of their meeting was apparently designed to establish that what seemed a Communist rout, after the Rajaji Ministry had been in office for a year, was not really so. The Party has also had the benefit of the British Communist leader who attended as a fraternal delegate. There should be nothing that is more sinister in all this than what has been usually associated with the Communists. These would, however, seem to be good reasons why other democratic political groups which have an aversion for Communist motives and tactics, should not rise to the baits offered to them, merely because of their mutual wrangles.

The most grave development has been the readiness of the Praja-Socialists, in their present mood of frustration, to lend themselves as instruments for the realisation of Communist objectives in the elections, and possibly also in any post-electoral political alignments. Whatever the imperfections and charges against the Congress Governments, it would be hardly honest for any political party to accept the main Communist claim that "democratic unity" can arise only when the Congress Party is replaced. On the other hand, these Communist tactics may be construed also as indicating apprehensions about their own weakness, in the light of the general support for Indian foreign policy and the better economic conditions which have relieved the food and cloth shortages, which they had exploited earlier at the general elections in 1951. If so, it would certainly be a disservice to Indian democracy if at this stage the Praja-Socialists and other political parties help to strengthen Communist hands for electoral advantages which will not ultimately fail to prove illusory when the political gains have to be shared with them.

Control Over Corporations

THE recent discussion in Parliament of the non-official resolution seeking to establish greater control over government corporations was necessarily inconclusive. The Government was not prepared with a complete scheme for the administration of these corporations. Neither was Parliament, which suggested instead that all the procedure that applies normally to issues from the Consolidated Fund should be applicable without distinction to the expenditure of these bodies—at any rate for the present. In the result, status quo has been maintained, which means in substance that these corporations will continue to be more or less independent.

Notwithstanding that the latest of the ad hoc reports, namely, that of the Rau Committee on the Damodar Valley Corporation, has commended the U.K. practice of non-interference in detail or in day-to-day administration, there is undoubtedly growing uneasiness, however, about the Indian practice of creating private limited companies to manage industrial and public undertakings owned by the Government. It is not merely that Parliament has resented the fact that considerable sums of money, once voted out of the Consolidated Fund, can be spent thereafter in a manner over which it can have no say. Nor can this resentment be wholly explained by the fact that the corporations exhibited initially a tendency, as for that matter some of the Government departments themselves have recently done, to sidetrack the Comptroller and Auditor General's authority. The nominated members of the directorates, being government servants, untrained in business, have not also been able to lend to the higher management of these corporations the weight or authority which may be commensurate with the size of these undertakings. Parliament tends naturally in these circumstances to take the view that the advantages of the new corporate form of organisation are not demonstrably such that established procedure should be sidetracked.

Precedents abroad are unfortunately not quite helpful. The Government Corporations Control Act of the United States, now more than eight years old, has restricted the authority of the General Accounting Office in that country to a broad audit (erroneous or illegal items cannot, for example, be disallowed) and to a report to the Congress. The Canadian Crown companies have likewise managed over a period of years to retain substantial immunity from detailed and paralysing control from outside. In Sweden, Parliament controls some corporations broadly in the sense of providing capital, controlling investment decisions, appointing the top-ranking officials, and the like; but there are also other bodies in which the State holds shares and which are not subject to even this degree of control. In the Netherlands, regulations prescribe the degree of control which the General Auditing Court can exercise over commercial undertakings. A Public Undertakings Audit Board was established in France about seven years ago, in order to provide for an appropriate investigation, without powers of decision, on the basis of which the concerned Ministries could act, if necessary. But all this legislation, except that it underlines the fact that detailed control is impracticable, has not really helped to establish any one pattern of administration as being suitable.

Recent experience in the United Kingdom particularly illustrates the difficulties. A committee of the House of Commons has suggested that the practice regarding the admission of questions regarding corporations should be widened to permit, in the discretion of the Speaker, information which might have been once refused; and more recently the constitution of a separate select committee, with an officer of the status of the Comptroller and Auditor General and one professional accountant attached to it, has been recommended. There has been nothing like unanimity, however, about these suggestions. The Comptroller and Auditor General in the United Kingdom has not been very enthusiastic. Others have opposed any suggestion of close and detailed supervision in vehement terms, on the ground that this will merely introduce into the management of commercial and industrial undertakings those tendencies towards centralisation, excessive caution and avoidance of risk-taking, which characterise all government departments. Mr. Herbert Morrison has suggested instead a periodical investigation once every few years as the maximum extent to which Parliament or the executive could go, while maintaining the freedom of action of the corporations unimpaired. Opinion, in other words, is confused and divided.

Actually, the position in India is not as bad as may appear at first sight. Statutory legislation setting up the corporations either includes, or the memorandum and articles of association of private limited companies can be made to include, a provision permitting the issue of directives by the Minister concerned. This would maintain the executive's overall authority; and Parliament, in so far as the executive is answerable to it for the sins of omission and commission in the exercise of these powers, can also exercise adequate control, even if it is remotely operated.

It was argued by Dr. Krishnaswami in the recent debate that this would not go far enough. For most purposes, including price fixation, the importance of which was stressed both by the House of Commons committee as well as the recent debate in the Indian Parliament, a section permitting the issue of directions would, however, be quite adequate. At the same time, the reports by the corporations can also be expanded, as suggested in the United Kingdom. They can be discussed by Parliament. The Comptroller and Auditor General can also carry out a statutory audit in his discretion, independently of the professional accountants' audit; and the Public Accounts Committee, on the facts disclosed by such audit, can hold the executive answerable for anything which it had done or not done, in the exercise of its powers to issue directives.

In due course, as and when this position has become settled, the Comptroller and Auditor General's vigorous objection to the effect that the so-called private limited companies are a fraud on the law can be met by ad hoc legislation governing the case of these government companies. There is no reason why Parliament's supervision, confined and restricted in this manner, should not work out very well in practice. One reason for the insistence on greater control seems in fact to be the lack of appreciation of the opportunities already provided by existing statutes or practices.

Parliament in any case can do no more, without promoting bureaucratisation, red-tape, and other attendant evils. After all, the mere substitution of one system for another is not going to be any remedy for evils like corruption, indecision, and incompetence, which are as likely to exist under departmental as under corporate management. It must be realised on the other hand that in India as elsewhere, we are still in the process of learning from experience. Only one thing can be said with absolute certainty and that is that in the interests of efficient and decentralised administration, the corporations should not be harassed by a paralysing control. It would be short-sighted if we were to reverse existing arrangements merely out of consideration for what seems to be constitutional propriety, or in the hope that centralisation and the forms of parliamentary control will automatically solve all problems.

THE WEEK'S NOTES

AGENDA FOR SYDNEY

Whatever the agenda of the forthcoming Commonwealth Finance Ministers' Conference, its proceedings cannot fail to be deeply influenced by the general concern over the possible decline in United States business activity in 1954. Mr. Butler recently stated in London: "If we are going to move into difficult times, we want to expand our strength and our resources." It is natural that all alarmist suggestions, such as that the Sydney Conference will meet under the shadow of the threat of an American recession, should be deprecated. But the level of U.S. economy during this year has been the subject of close study in Washington and there should be nothing out of the way for countries which are closely dependent on the American market thinking of their economic supports. The sterling area countries have already felt the effects of a fall in the levels of world commodity prices which has turned the terms of trade so strongly against them. They have been sustained, however, by the hope that there is only a process of readjustment which would in course lead to stability; the economic policies now under consideration in Washington show that a readjustment would be possible without creating the maladjustments associated with a recession.

The old disinflationary policies to which the Commonwealth Finance Ministers had adhered with different degrees of faith have largely become inappropriate. The cost of living and the structure of industrial costs still present some problems but they require special attention. The old principle of countries balancing their payments has been felt to have been overdone in view of the drastic import cuts enforced by Australia, and the current difficulties felt by India in absorbing even the available foreign exchange resources for development planning. It is now stressed that there is no lack of financial resources to undertake the right type of projects in the Commonwealth countries which would contribute to the strength of the sterling area. There would be sufficient opportunity to extend on the results assessed at New Delhi last October of the working of the Colombo Plan.

UNSTABLE COALITION IN ANDHRA

The Andhra Cabinet is facing a crisis once again on the question of the choice of the capital and the uneasy coalition with the Krishikar Lok Party has again been responsible for this development. Faced once again with an ultimatum either to resign or to vote with the Government on all the budget demands relating to expenditure on buildings in the present State Capital, Mr. Latchanna has tendered his resignation. It is, of course, quite inconsistent with all notions of parliamentary Government that a member of the Cabinet should be conceded the right to vote with the Opposition on a cut motion. The K.L.P. representative had been earlier requested not to do anything which would disrupt the unity of the Cabinet or offend constitutional proprieties but the appeal has fallen on deaf ears. Mr. N. G. Ranga has accused the Congress party of having backed out of their earlier assurance that an opportunity would be given to decide the location of the permanent Capital. There is now no prospect of a rapprochement; there is the possibility of a Government defeat when the K.L.P. adds its own votes to those of the Opposition in the Assembly.

The Congress Legislature party in the State is now said to be ready to face elections, if the Government is defeated. This confidence may spring from the fact that Mr. Prakasam, who was formerly in Opposition, is now on the side of the Congress. Even the former members of the Praja Socialist party who have now seceded may be admitted to strengthen the party to secure an electoral victory over the Communists, the K.L.P. and some of the independents. The Communist party which has a strong organisation in Andhra may not be worried by the prospect of elections and the party has a major electoral issue, in the question of the Capital, on which to challenge the Congress. The outcome of an election may be to bring the Congress and the Communists into sharper opposition by reducing the strength of the smaller parties and the independents. A general election in the State seems to be the only method through which the perpetual wrangle over the conditions of a coalition in Andhra can be ended. The advantage derived from the coalition Ministry during the last four months may, from the Congress point of view, be the decline of the strength of the P.S.P. and possibly also of the K.L.P., as a result of recent developments.

PUNISHMENT FOR "UNTOUCHABILITY"

Four years have elapsed since the Indian Constitution came into force and enacted in Article 17 that untouchability was abolished and that its practice in any form was forbidden. The enforcement of any disability arising out of untouchability was declared to be an offence punishable in accordance with law. Any such law had to be enacted by the Indian Parliament since the jurisdiction of the States to make laws in respect of offences against Fundamental Rights was taken away by Article 35(a) (ii). The Bill now published to govern the punishments for such offences was, therefore, overdue since an offence was created without defining how it should be dealt with. There have, however, been several State laws enacted before the Constitution came into force which had sought to remove civil disabilities. The earliest among them had been enacted in Madras in 1938 and in Bombay in 1946. About 20 of these State laws will be repealed under the Central legislation now proposed.

The Bill will not be confined to Hindus. It seeks to penalise not only persons directly enforcing disabilities connected with untouchability, but also those indirectly exerting social pressures on others who refuse to practise untouchability. The penalty in either case may extend to six months' imprisonment or a fine of Rs. 500 or both. In the case of offences committed in the course of the practise of any profession, trade or calling to supply goods or services there is an additional liability for the forfeiture of licence for such practice.

The importance of the step now taken to enforce the Constitutional injunction against untouchability cannot be exaggerated. The law provides for the complete repudiation of all customs and usages which have formed the basis all along for perpetuating the various kinds of segregation, untouchability and unapproachability. It is not easy to root out an evil in a short time when people are still custom-ridden. But the enforcement of the penalties must be viewed as an aid to the constructive work of Harijan uplift in which obstacles may be created by fanatical adherents to customary practices. Considering the unequivocal attitude taken by the Constitution towards the removal of untouchability, it was not inappropriate that the punishable offences should have been declared to be cognisable.

CONFERENCE ON INTERNATIONAL LAW

In the absence of direct reporting by the Press on the proceedings of the International Legal Conference, it is not easy to make a detailed assessment of its contribution. The general feeling among those who participated has been one of considerable satisfaction that the first gathering of its kind in Asia has been organised with success. The subjects discussed ranged

from World Government, Human Rights and the revision of the U.N. Charter to the organisation of the judiciary and the legal profession. The Conference provided an opportunity for exchange of information about the attitudes towards law and judiciary in the various countries and an opportunity for the visiting judges and jurists to discover the present role of the judiciary in this country. When an official report of the proceedings is published, it will be time to examine in detail the contribution of the Conference to current legal problems. The proposal for the establishment of a Consultative Committee of Asian countries proved of immediate interest and found favour in the Conference.

As befitting an assembly of jurists, opinion has been strongly in favour of making unhesitating suggestions for reform of the United Nations Charter, but not for their enactment against the opposition of a substantial group of Powers. The system of Permanent Membership of the Security Council and the veto may yet prove the minimum conditions required by the Big Powers. But if there is a steady increase in the area of international authority such as through the steady extension of the compulsory jurisdiction of the International Court of Justice, it would be sufficient achievement in the progress towards the ideals of World Government. A paper on private rights acquired by foreign nationals elicited the general opinion that rights acquired by foreign nationals should be respected in cases of State succession, but where those rights affected the exercise of sovereign powers by the new State, they could be abolished on payment of compensation, and that an aggrieved foreign national should be able to approach an international judicial agency after exhausting the remedies available in the municipal courts. These are principles which are of importance to the outstanding case for which they were presumably intended to apply.

REFORM OF CRIMINAL PROCEDURE

Among the large number of amendments to the Criminal Procedure Code proposed in the Bill now published for general information, there is one which seeks to define the scope of the High Courts' authority in the exercise of their revisionary jurisdiction. Under Section 435 of the Code, the High Court may send for the record of any proceeding for the purpose of satisfying itself as to the correctness, legality or propriety of any finding sentence or order. This power of revision had been deliberately left wide, but in actual practice, several High Courts had themselves imposed restrictions on the exercise of this power and had invoked it only to set right gross irregularities in procedure or of interpretation, in cases in which there was no right of regular appeal to the High Court. The practice has not, however, been uniform and some High Courts have often interpreted Section 435 too literally. The proposed amendment in the Bill seeks to restrict the power of revision only in the manner in which certain High Courts have already accepted limitations. It may, however, be pointed out that this could have been considered and adopted as a convention by the Chief Justices who recently met in Delhi, instead of being forced on them by legislation.

There has been an unwelcome addition to the number of offences which can be compounded. The inclusion of theft in this category is questionable. Whether in the present context of enthusiasm for social reform it is appropriate to make bigamy compoundable should also be seriously considered. The Bill seeks to end the anomalous system of punishment called "transportation for life," which has continued even after the cessation of transportation out of India. This will be substituted by "imprisonment for life," which will mean imprisonment for a maximum period of 25 years without remissions. Two other matters which seem similarly unobjectionable relate to the restriction of magisterial powers in the decision of disputes relating to immovable property, whenever there is a likelihood of a breach of the peace, and the provision for appeals to High Courts against acquittals in cases instituted on private complaints. It is right that magistrates should only prevent breach of the peace and refer the actual disputes relating to property to the Civil Courts. The proposed right of private parties to appeal against acquittals has been coupled with the safeguard which imposes liability on appellants for compensation in the case of frivolous proceedings.

NATIONAL RESEARCH DEVELOPMENT CORPORATION

The National Research Development Corporation of India established by the Government of India for exploiting in the public interest the inventions of the Council of Scientific and Industrial Research and other research organisations was registered in New Delhi on December 31, 1953. Replies from 14 out of 18 research institutions which were requested to furnish information about projects awaiting development have already been received. One hundred and three processes have been reported which are now under examination. Further information required is being obtained to decide the order of priority for their development.

The Corporation will exploit inventions of the network of National Laboratories and Research Institutes, patents and inventions of different Departments of the Government of India, the State Governments, Commodity Research Committees and other statutory research organisations. All these inventions will be assigned in the first instance to the Corporation who will negotiate with industries for their exploitation. Where any industrial concern agrees to bear the cost of setting up a pilot plant, to afford facilities for the conduct of pilot plant trials and to provide facilities at the firm's own cost to a research institution, it will be permitted to use the results of research free of any royalties for a fixed period. The results, however, would be the property of the research institutions and the Corporation will be at liberty to make them available to other parties and the firm will have no claim to royalties or other income accruing from the exploitation of research results.

The Corporation has been set up by the Government as it was felt that the gap between research and its industrial utilisation was a wide one and to bridge it effectively, a specialised organisation devoting itself exclusively to this work was necessary. The authorised capital of the Corporation is Rs. 1 crore divided into 10,000 shares of Rs. 1,000 each. Government has agreed that the Corporation should have a subscribed capital of Rs. 10 lakhs (1,000 shares of Rs. 1,000 each) of which Rs. 5 lakhs will be paid during 1953-54 and Rs. 5 lakhs in 1954-55 when the shares will become fully paid up. Any further finances required by the Corporation will be made available in the form of a loan.

CANADIAN LOCOMOTIVES UNDER COLOMBO PLAN

The Government of Canada have, at the request of the Government of India, agreed to give to India 120 steam (WP Type) locomotives as Canadian assistance to India under the Colombo Plan. The tentative schedule for the delivery of these locomotives to India is that deliveries would commence ten months from the date of the order and would be at the rate of six locomotives per month. The Canadian Company with which the contract for the locomotives is being negotiated is the Canadian Locomotive Co., Ltd. of Kingston, Ontario..

As in the case of Canadian raw materials which are supplied to India under the Colombo Plan, the amount to be charged by the Government of India to the railways for these steam locomotives will be paid into a Special Development Fund to be used for other economic development projects. The exact amount of the counterpart funds to be established, the administrative arrangements for its establishment and the projects for which it may be used will be agreed to later between the two Governments.

WORLDGRAM

TRADE

World Materials Conference: The Central Group of the International Materials Conference set up in 1951 to deal with raw material shortages after the outbreak of the Korean war, has agreed to dissolve itself, it was officially announced recently. The Group which allocates scarce materials among non-Communist countries said its last commodity committee was dissolved last September and there was no new development calling for action by the Conference. The decision was taken at a meeting on December 15, 1953. Twenty-seven countries and two international organizations belonged to the Conference. They have agreed to consult among themselves in the event of concern about future shortages.

* * * * * * *

Over 65 Tons of Russian Gold Received by U.K.: Between 65 and 70 tons of Russian gold has been sent to Britain in the last 5 weeks, according to usually reliable sources. The first of these shipments was handled by a city firm of merchant bankers on account of a foreign client. Deliveries in December were all consigned directly to the Bank of England which has declined to make any statement on them.

* * * * * * *

Fertilisers from America: India is expected to receive 18,000 tons of fertiliser, other than ammonium sulphate, under a technical co-operation agreement, expected to be signed with the U.S. Government. The American contribution will be 1,150,000 dollars and the Indian Government will spend Rs. 500,000. The varieties of fertiliser which will be imported under this agreement are those that are not yet being manufactured by the Sindri Fertiliser Factory, and will include 5,000 tons of urea and 5,000 tons of ammonium sulphate-nitrate. Half of the imported fertilisers will be sold, while the other half will be distributed free for demonstration purposes.

* * * * * * *

Hungarian-Swedish Goods Exchange Agreement: Representatives of the Hungarian and Swedish Governments have been conducting commercial negotiations in Budapest. On November 17, 1953, they signed an agreement regulating the exchange of goods between the two countries for 1953 and 1954. Hungary will export textiles, pharmaceutical goods, iron and electrical goods and various agricultural produce to Sweden in return for cellulose, wool, rags, staple fibre, ball bearings, steel, various machines and instruments.

* * * * * * *

The Salt Cess Act: The Salt Cess Act, passed by the Indian Parliament during its last session, comes into force from January 2, 1954. The Act provides for the levy and collection of cess at the rate of two annas per standard maund on salt manufactured in a salt factory solely owned or solely worked by the Central Government. Two clauses provide: (1) The cess on salt levied under the Act shall be collected at the time of the removal of the salt from the place of manufacture. (2) All salt falling under the following categories shall be wholly exempt from the cess leviable under the Act: (a) Salt exported by sea to Japan; and (b) salt manufactured without licences by any individual or group of individuals in cases where the total area of the land from which salt is so manufactured does not exceed ten acres.

INDUSTRY

Sindri Factory to be Expanded: A scheme for the expansion of the Sindri Fertiliser Factory for manufacturing urea and ammonium nitrate is under the consideration of the Government of India. It is understood that the scheme might cost between Rs. 6 crores and Rs. 8 crores, though the actual figure would be known only after tenders were received by February this year. The Government expected assistance under the terms of the Technical Co-operation Agreement with the United States in this connection. The Sindri Factory is expected to manufacture its own coke this year, and the resultant coke oven-gas could be utilised for the manufacture of urea and ammonium nitrate.

Oil Discovered in Australia: At "Rough Range No. 1", West Australia Petroleum ("WAPET") has been testing oil showings on a sand at 3,605 to 3,620 feet. Perforation tests showed a very waxy crude oil which flowed for 25 hours at the rate of 23 barrels per hour through a ¼ inch bottomhole choke. The well is located just inland from Exmount Gulf in an isolated section of Australia's west coast, some 700 miles north of Perth. Tests at this depth have now been completed and drilling resumed in accordance with original plans for deep testing. After more than two years of mapping and geological and geophysical exploration, analysis and planning, the West Australian Petroleum Pty. Limited selected the Rough Range site for this first petroleum venture in the surrounding near-desert area.

* * * * * * *

Self-Sufficiency in Transparent Paper: India has reached self-sufficiency in Non-Moisture-Proof Transparent Paper. By the middle of 1954, India is expected to attain self-sufficiency in the Heating-Sealing and Moisture-Proof varieties of Transparent Paper as well. The Travancore Rayons Limited will double their existing capacity of Non-Moisture-Proof Transparent Paper of 80,000 reams a year when their new plant goes into operation in February this year. On account of its transparency, strength, and lack of odour, Transparent Paper made from cellulose is superior to ordinary packaging paper.

* * * * * * *

Woodpulp Production in Finland: Finnish production of woodpulp for sale was 530,000 tons in the first nine months of 1953, or 114,000 tons less than in the corresponding period in 1952 and 235,000 tons less than in 1951. Total production in 1953 is estimated at some 710,000 tons, 156,000 tons less than in 1952 and 322,000 tons less than in 1951. The total market capacity of the Finnish woodpulp industry is 1.15 million tons.

AGRICULTURE

Land Donations for Bhoodan: Land donations totalling 23,56,521 acres had been collected through the Bhoodan movement in different States up to December 5, 1953. According to the report, Bihar with land collections of 12,97,888 acres leads other States in the movement. Land distribution of 39,739 acres to 6,882 landless peasant families has so far been effected in Uttar Pradesh, Tamilnad, Madhya Pradesh, Rajasthan and Hyderabad. The State-wise land collection in acres reported as on December 5, 1953, is as follows: Assam 1,349; Andhra 10,299; Uttar Pradesh 5,00,642; Orissa 47,499; Karnatak 1,634; Kerala 10,000; Gujerat 20,845; Tamiland 14,252; Delhi 7,659; Punjab 3,183; Bengal 3,951; Bihar 12,97,868; Madhya Pradesh 53,628; Madhya Bharat 55,730; Maharashtra 9,564; Vindhya Pradesh 3,963; Saurashtra 8,000; Himachal Pradesh 1,350; Hyderabad 71,695.

POPULATION

India's Livelihood Pattern: According to the 1951 Census Report's third chapter entitled "Livelihood Pattern—1951", out of 1044 lakhs, 710 lakhs or 68.1 per cent are agriculturists and 334 lakhs or 31.9 per cent non-agriculturists. Among agriculturists 64.4 per cent are cultivators of land wholly or mainly owned; cultivating labourers form only 21 per cent. Among in-

come-earners, earners of profit are more than twice as numerous as earners of wages and salaries. 324 lakhs of self-supporting persons are engaged in industries and services other than cultivation. Plantation industries account for 10.6 lakh workers; coal mining 3.1 lakhs; processing and manufacture 92 lakhs; cotton textiles 21 lakhs; metals and chemicals 12.4 lakhs; other manufacturing industries 24.3 lakhs. 59 lakhs are engaged in commerce, 51 lakhs in retail trade and 4.6 lakhs in wholesale trade. 16 lakhs are engaged in construction and utilities, and 19 lakhs in transport, storage and communications. 33 lakhs are engaged in services, of whom 21 lakhs are engaged in public administration—of these 5 lakhs are Central Government employees (including Armed Forces). 14 lakh persons are engaged in domestic services.

MISCELLANEOUS

International Advisory Committee on Scientific Research: The Executive Board of U.N.E.S.C.O. has approved the establishment of an International Advisory Committee on Scientific Research. The task of the Committee will be to assist U.N.E.S.C.O. in carrying out and developing its scientific programme and in promoting international co-operation between national councils and centres of research. The Committee will be composed of 15 members, of whom 12, of different nationalities, will represent national research organisations. The other three members will be representatives of the International Council of Scientific Unions, the Council for International Organisation of Medical Sciences, and the Union of International Engineering Organisations.

* * * * * * *

More than a Million Refugees: There are 15,000 European refugees in northern China, known as the "Shanghai" refugees, according to the U.N. High Commissioner for refugees. In Europe, refugees number 100,000 in camps under the mandate of the U.N. Commissioner (45,000 of them in Germany) and 300,000 in camps not under the Commissioner's mandate. In the Near East, there are 872,000 refugees registered with the U.N. Relief and Works Agency for Palestine Refugees, and another 37,000 who were looking after themselves, but whose means are now exhausted.

* * * * * * *

Bolivia Receives Industrial, Agricultural, Technical Aid: Bolivia has, with the aid of various U.N. agencies succeeded in freeing 2.5 million 'peons' (enslaved debtors) from a primitive and vicious life of exploitation at the hands of the landowners, who till recently controlled the economy and Government of the country. Another reform has extended the right of franchise from 100,000 to 3,500,000 persons. Bolivia has received valuable assistance from the International Bank. Eight U.N. advisers are helping the Government of Bolivia in the spheres of mining, power, industry and administration. Seven additional experts are expected to take assignments in the near future. Experts from the I.L.O., F.A.O., and U.N.E.S.C.O. are also providing advice to various Government departments.

* * * * * * *

Lebanon Ratifies Anti-Crime Convention: In a brief ceremony at U.N. Headquarters, Lebanon became the 43rd country to ratify the U.N. Convention on the Prevention and Punishment of the Crime of Genocide. The Convention, which came into force on January 12, 1951, makes genocide—destruction of national, religious, ethnic or racial groups—a crime under international law.

* * * * * * *

Grant for Social Welfare Work: The Indian Social Welfare Board has approved grants to 239 institutions from all over the country to the tune of Rs. 8.6 lakhs. This is the first instalment of the assistance the Board proposes to provide to Voluntary Welfare Organisations in India. Rs. 2,08,000 go to 60 institutions looking after handicapped and delinquent children; Rs. 2,00,000 to women's institutions; Rs. 1,58,000 to child welfare work through 47 institutions and the balance to 74 organisations doing general welfare work.

* * * * * * *

U.N. Technical Expert for India: The U.N. Technical Assistance Administration is sending an expert to India to advise the Government on the latest mapping techniques by use of photogrammetry. The expert, Mr. Holland K. Hagen (Norway), will advise Indian Officials in the use of the photogrammetric equipment which the T.A.A. is providing and on the training of Indian personnel for this type of work. Photogrammetry is the technique of making measurements of scale drawings from photographs. The T.A.A. is also sending another expert to India to advise on the latest techniques for improving map printing and photographic methods.

* * * * * * *

Japan to Spend £24 Million on Arms Production: A total of 14,000,000,000 yen (24,000,000 sterling) will be spent during the next fiscal year on the production of arms and on equipment needed by Japanese industry. The emphasis in this programme to expand Japan's arms production capacity will be on the aviation industry, fuel refinery equipment for defence purposes, underwater weapons manufacturing and on gunpowder. About half of the needed capital will be raised by the industrialists themselves, while the rest is expected to be provided through loans from the Japan Development Bank and the projected American M.S.A. wheat grant counterpart fund.

* * * * * * *

Scholarships in Public Schools: When the Public Schools of India open for the next year, students drawn from families of the lower income professions like clerks, mechanics, vaids, hotel servants, parcel clerks in railways, workers in the press and peons, will enter their portals. This has been made possible by the Government of India Public School Merit Scholarships Scheme. The Government of India have provided Rs. 1 lakh for the scheme during 1953-54, but as the scholarships will continue till the students leave school, the Government contribution will go on increasing every year till saturation is reached with scholars studying in all the grades.

* * * * * * *

U.K. Disturbed at U.S. Aid to Egypt: The U.S.A. is considering aid to Egypt. Reports from London indicate that Britain was disturbed that the U.S.A. might soon announce a programme of military and/or economic aid to Egypt and upset a settlement of the Suez problem. Egypt is receiving some $16 million during this fiscal year which ends next June.

* * * * * * *

U.N.I.C.E.F. Gift: The Punjab Red Cross Society has received one lakh pounds of dried milk powder and 20 sewing machines from U.N.I.C.E.F. for free distribution in the State. The milk will be distributed among expectant and nursing mothers and undernourished children. The sewing machines will be given to maternity and child welfare centres. The Society has also received medicines and tonics worth Rs. 21,000 from U.N.I.C.E.F. for distribution among nursing and expectant mothers, and children.

* * * * * * *

U.S. Equipment for Allies: The U.S. Defence Secretary, Mr. Charles E. Wilson, said recently that in the four years ended last June the United States had shipped its Allies 7,800,000 tons of military equipment and weapons valued at 7,000,000,000 dollars. These figures do not include aircraft and ships delivered under their own power. He listed their deliveries to overseas Allies: Tanks and combat vehicles: 27,000; artillery pieces: 2,580; small arms and machine-guns: 1,500,000, motor transport vehicles: 147,000; naval vessels: 546; aircraft 4,340. More than half of the military aid shipments—4,000,000 tons, worth 3,800,000,000 dollars—were delivered in the fiscal year 1952-53.

NEWS IN BRIEF

INDIAN

The Government of India has completely decontrolled coarse grains—jowar, bajra, maize, barley and other minor millets—with effect from January 1, 1954, according to a Food and Agriculture Ministry Press note issued recently. It has also been decided completely to decontrol gram. There will now be no restriction on its movement from one place to another.

* * * * * * * *

A three-and-a-half-mile long drain has been executed through the collective efforts of about 6,000 villagers at Antari in the Partapgar district of U.P. It will irrigate 10,000 acres of land and eradicate malaria from 36 villages around it. It is estimated that about one lakh maunds of additional food grains will be produced as a result of the irrigation facilities provided by this drain.

* * * * * * * *

The first project report of the Siemmens for the establishment of a heavy electrical equipment factory in the country would be available in the first week of January, it was learnt from authoritative sources in New Delhi. If the project is finalised and approved, it is estimated that it would involve an investment of about Rs. 40 to Rs. 50 crores. The factory will be designed to meet almost all requirements of the country in the matter of heavy electrical equipment for executing and maintaining various hydro-electric projects.

* * * * * * *

The following members have been renominated by the Government of India to serve on the Central Advisory Board of Education for a period of three years: Dr. Zakir Hussain; Prof. N. K. Sidhanta; Mrs. Hansa Mehta; Mrs. Hannah Sen and Mrs. Zarina Currimbhoy. Dr. K. L. Shrimali, Dr. J. C. Ghosh and Dr. S. S. Bhatnagar have been nominated by the Government of India as members of the Central Advisory Board of Education.

* * * * * * *

Ninety thousand lbs. of skimmed milk powder and 100,000 multi-vitamin tablets have been allotted to the Rajasthan State branch of Indian Red Cross Society, out of the gift received from the American Red Cross for under-nourished children, and expectant and nursing mothers.

* * * * * * *

India produced about 250 feature films during 1953, as against 233 in 1952. Western India contributed 119 feature films to this all-India production, according to Mr. Jaimani Dewan, president of the Indian Motion Picture Producers' Association (IMPPA). Box office collections had recorded an overall fall of over 25 per cent, while the fall in collections per average picture was anything between 40 and 60 per cent. Production of pictures in Hindi had received a set-back since 1947 and about 60 per cent of the annual output is in regional languages.

* * * * * * *

The next session of the House of the People will commence on Monday, February 15, 1954, it was officially stated in New Delhi.

* * * * * * *

Mr. Shri Ram, Chairman of the Board of Directors of the Industrial Finance Corporation, it is gathered, has submitted his resignation from chairmanship of the Corporation to the Government of India. It is presumed that he has taken this step in view of the recommendation made by the Industrial Corporation Inquiry Committee that the Corporation should have a whole-time paid chairman to be appointed by Government.

* * * * * * *

The total deposits in post office savings banks for 1952-53 amounted to Rs. 120.54 crores. The corresponding figure for 1951-52 was 117.78 crores.

FOREIGN

The U.S. Census Bureau estimates that—as the new year begins—the United States population, including armed forces overseas, is about 161,200,000. This is an increase of about 2,700,000 during 1953 and an increase of about 10,000,000 since the April 1950 Census.

* * * * * * *

A spokesman for Fairchild Aircraft Company, of Hagerstown, Maryland, said two Fairchild C-119 'flying boxcars' would be delivered to the Indian Air Force during January. He said deliveries of 24 additional C-119s ordered by India would start in September, 1954. In recent weeks, he added, Indian air officials had visited the factory to familiarise themselves with the planes.

* * * * * * *

Japan's rice harvest last year was estimated by the Agriculture and Forestry Ministry at 274,619,000 bushels, smaller by 56 million bushels than 1952's actual harvest of 330,760,400 bushels. The Ministry said that this made last year's crop the worst harvest in 19 years.

* * * * * * *

China will concentrate its main efforts in 1954 on building up heavy industries and railways, according to a Government newspaper quoted by the New China News Agency. The review of the old year and a stock-taking for the new said the tasks for 1954 were "tremendous," while 1953 had been marked by "adverse natural conditions in certain areas."

* * * * * * *

India, Ceylon and Canada have agreed to launch a joint tea propaganda campaign in Canada from the middle of this year, it is reliably understood. Negotiations between the two producer countries, India and Ceylon, and trade circles in Canada during last few months have resulted in this decision.

* * * * * * *

A further 900 former German war prisoners released from the Soviet Union—the eleventh batch since September, 1953,—arrived recently at Fuerstenwalde, near the Polish-East German border, Red Cross officials have announced.

* * * * * * *

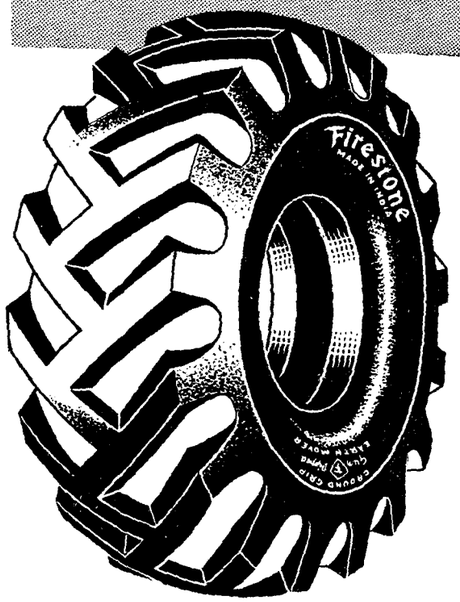
The Swiss Alpine Club will make a new bid to scale the world's highest peak, Mount Everest, conquered by Tensing and Hillary. Before the successful British expedition to the Everest in 1953, the Swiss had reached the highest point on the mountain—Lambert and Tensing having gone up to 27,750 feet. The team is expected here in March, 1954. Three other expeditions are also visiting the Himalayas this spring. They are sponsored by the California Himalayan Committee (attempt on Makalu, 27,790 feet, east of Everest), the Japanese Himalayan Club (attempt on Manaslu, 26,658 feet) and an Argentine attempt on Dhaulagiri (26,795 feet).

* * * * * * *

More than one death every nine minutes was the toll on the U.S. highways over the three-day Christmas week-end. The number of 523 deaths in automobile accidents was only slightly less than the 545 record in 1950. A total of 717 deaths in accidents of all types took place.

* * * * * * *

The Public Health Service, an adjunct of the U.S. Federal Security Agency, announced recently that 155 construction projects, at a cost of $38 million, for river and stream purification plants were approved in the third quarter of 1953. Of these 87 were new plants and 68 were additions.



Firestone

Proudly Presents

THE FIRST

"earthmover"

MADE IN INDIA

India has now entered a phase of development and construction of huge dams, irrigation projects and hydro-electric generation which is an integral part of its Five-Year Plan to raise the living standards of the people within the shortest possible time. To accomplish this, large quantities of earth-moving equipment are required and, to match this equipment, a correspondingly large number of special tyres are needed. Firestone immediately responded to this demand and now present with pride the *first* earthmover Tyre to be built in India.

ANOTHER Firestone FIRST !

TO SPEED THE PROGRESS OF THE FIVE-YEAR PLAN

A Window On The World

CHOOSE YOUR FAVOURITE IMPERIALISM

By

ODYSSEUS

[Owing to the vagaries of the mails, one of the series of five articles by Odysseus on India's foreign policy and Western and Communist imperialism was lost. The missing article appears below.—ED.]

IT IS 200 PER CENT UNDERSTANDABLE that India, having been conquered by a Western power and having gained her independence, should be distrustful of Western imperialism. Shortly after independence, observes Dr. Werner Levi in his new book "Free India in Asia", if Western policy could be interpreted in more than one way, the imperialist interpretation was that most likely to be chosen, and he adds "it was a one-track approach, understandable, but not necessarily excusable."

Let us consider Western imperialism. The first fact to grasp is that no situation in any country of the world stands still to be gazed at as in a crystal; it is in a constant state of change, like the coloured pieces in a kaleidoscope that is being slowly but remorsely revolved by the unseen hand of Destiny. The trouble about the history books that we read at school is that they inevitably create the impression that history came to a full stop a few years before we were born, and that it can be conveniently picked up and studied at leisure like a curio in a glass case. But history books begin going out of date on the day that they are published. History never pauses for breath any more than we do. And one of the major developments that has not yet got into the history text books is that the Western imperialism of which India experienced the full blast for a century received its death blow on August 15, 1947.

Dr. Levi observes that when India began her existence as an independent State, she was the uncompromising champion of all peoples still under colonial rule and Pandit Nehru bluntly asserted: "No foreign power should have any colonial territories in Asia," a sentiment which I, for one, heartily endorse. Of course, France should yield control of her colonial islets in India; of course, the British should concede independence to Malaya at the earliest possible moment; of course, the Indo-Chinese should be allowed to manage their own affairs. But what about Sakhalin, the Kuriles, Armenia, Azerbaidzhan, Georgia, Turkmenistan, Uzbekistan, Kazakhstan, and Kirghistan? I'll have a small bet that many people have never heard of some of these places. Yet:

A FORGOTTEN ASIAN EMPIRE

(1) They cover an area the size of undivided India.

(2) All were conquered or absorbed by Russia in the nineteenth or twentieth centuries.

(3) Their peoples are just about as closely related by racial and cultural ties to the Russians as Indians are to the British!

(4) All of them have honourable traditions of struggles for their independence, and their stories fall into the same pattern as those of colonial peoples everywhere.

What is the difference between Russia's colonies in Asia and those colonies which used to be, or still are, under Western control? Only one : the struggle for independence could be observed and reported with comparative ease in British, French, or American territories, but the non-Russian territories of the U.S.S.R. are cut off from all contact with the non-Communist world. Foreign correspondents could visit India and report Gandhiji's salt march. The Amritsar tragedy could shock the civilised world and play its part in arousing the British conscience to action. But how many people have heard of the anti-Soviet insurrection in Georgia that broke out on August 27, 1924, in which some 3,000 Georgians perished? Only the student who is able to read Russian and who has the time to track down and puzzle out the interpretation of obscure declarations in the Soviet press, such as the following made by M. D. Bagirov, for ten years the leading Ogpu official in Azerbaidzhan and the first secretary of the local Communist party since 1937: "From the very first days of the existence of the Communist party in Azerbaidzhan, national deviationists tried to counteract by every means the formation of a firmly united monolithic Bolshevik party...."

Indian nationalists used to make great play of the circumstances in which Clive won the battle of Plassey in 1757, when with only 3,000 men he defeated Surajah Dowlah's army of 60,000 and secured Bengal for Britain. Have they ever heard of General Chernayev's great victory on June 15, 1865, when with only 1,500 men he captured Tashkent held by 30,000 men with fifty guns? Only two persons were killed in the final "assault" on the city. Russian historians describe this as "the most triumphant day of the whole central Asian campaign". Is there any reason why Tashkent children, who read such self-congratulatory remarks in the text books written by the Russians which they have to use in their schools, should feel any less humiliated than Indian children did in the bad old days? The only difference is that for Indians the bad old days have ended happily. In central Asia they continue. This area east of the Caspian Sea and south of the lakes of Aral and Balkash is, in terms of power, of far greater importance than the whole vast area of Siberia (with whose name and features most people are much more familiar), for central Asia gives Russia a vantage point from which she can elbow Afghanistan, keep an eye on India, and feel the pulse of western China. It was the possession of this area which turned the Europeans whom we call Russians into a great Asiatic power. If the peoples of central Asia were to throw off the foreign yoke, Russia would cease to menace India and China and would sink to the status of France in Asian affairs.

THE BENEFITS OF IMPERIALIST RULE

But, say those who are always ready to give the U.S.S.R. the benefit of the doubt, Soviet colonial methods are unlike those of other Europeans; they are humane, and have substantially raised the colonial standard of living. But was this not precisely the argument used by apologists of British rule in India? British assertions of the benefits conferred on India did not cut much ice in nationalist circles. And do Soviet sympathisers know anything about the "good work" that the Soviets achieved, for example, when settling the nomads in conquered Kirghistan? This is a typical example of the sort of thing that used to evoke official complacency in India when British authorities drew attention to the land settlement and other administrative achievements. The settlement of the nomads in Kirghistan was accompanied according to official U.S.S.R. statistics by a decline in the number of sheep and goats from 3,665,000 in 1914 to 1,886,000 in 1937. The Communist party alleged that Kirghistan "nationalists" were responsible for this economic disaster. The opposition to the settlement of the nomads

was officially referred to as Sydkovism, after Abdurkerim Sydkov, accused of leading a nationalist counter-revolution. Another prominent Kirghiz expelled from the party was Prime Minister Yusup Abdurkhumanov, denounced as a traitor because he asked that no Kirghiz India to those used by the apologists of Soviet colonial that recalls old controversies in India about the export of wheat while there were famine shortages inside the country.

The resemblances between the arguments that used to be employed by the apologists of British rule in India to those used by the apologists of Soviet colonial rule are striking enough to suggest the essential similarity of colonialism in all countries. For example, Soviet writers state that the union of Kazakhstan with Russia prevented the enslavement of the Kazakhs by the "barbarian States of the Orient" (sic!) and brought them into close contact with a country "incomparably more civilised than all its Asiatic neighbours" (sic!). The Soviets state that the annexation of Kazakhstan ended the division of the country between China, Russia and Kokand, and opened the door to modern economic progress.

The Soviets state that Kazakhstan has never been a distinct and organised State but only a group of loosely associated "hordes," whereas the Soviet regime has enabled the Kazakhs to have a real State of their own at last—the Kazakhs S.S.R. Rabrindranath Tagore, Gokhale, and other exponents of India's cause and culture, would have understood at once why even Kazakh Communist party members, whose loyalty to the regime was beyond suspicion, rejected these claims, which they regarded as insulting and belittling. These Kazakh nationalist deviationists dared to assert their views in a "History of Kazakh S.S.R.", published in 1943. They were at once charged with "grave errors" (a) in considering Czarist Russia as being their country's worst enemy; (b) in regretting the liquidation of the traditional horde organisation; (c) in making national heroes out of those who defied Russian rule. Their "History" was speedily withdrawn. A revised edition issued in 1949 was also criticised for its nationalism and it was not until 1951 that a satisfactory edition was forced out of the Kazakh writers: this edition proves that Kazakhstan is a Russian dependency not only politically but culturally.

ODYSSEUS IS ENCOURAGED

I have received the following letter which refers to the final article of a series of four with the general title "Is Philosophy of Practical Value?":

"Dear Sir, May I send you a line of congratulation for your extremely penetrating article in the number for November 6, 1953. You have put your finger on what is undoubtedly the greatest problem of our age.

"I hope that from time to time you will refer to this problem as it is impossible to remind intelligent people too often and too often of its existence. Yours faithfully,

W. R. Crocker,

High Commissioner for Australia in India."

I am touched by Mr. Crocker's generous words. One who writes a weekly column shoots at an unseen target. Rarely can he know whether he has hit the mark, i.e., whether he has succeeded in communicating to his readers his own interest in the matter under discussion. All that he can do is to explain why something is important to himself and hope that others will find it important too.

Mr. Crocker's letter encourages me to believe that the research and reflection that lie behind this weekly page and a half, (which does not, alas, write itself) are worth the trouble. Thank you, Mr. Crocker.

[The previous articles on the closely related topics of India's foreign policy and Western and Communist imperialism were: "Asian Solidarity—Fact or Fiction?" (November 13); "Some Books on Foreign Policy" (November 20); "Communist Imperialism" (November 27); "Who Will Pick Up the Apples?" (December 11).

Those who wish to pursue the subject more deeply may find the following books helpful: "Free India in Asia" by Dr. Werner Levi (Minnesota University Press, 1952); "Twentieth Century Empire" by H. V. Hodson (Faber and Faber, 1948); "Twenty Years Crisis" (Macmillan, 1939) and "Conditions of Peace" (Macmillan, 1942) both by Professor E. H. Carr; "The Balance of Tomorrow" by R. Strausz-Hupe (Putnam, New York, 1945); "Inquest on an Ally", a study of Soviet foreign policy by Paul Winterton (Cresset Press, 1948); "Russia and Her Colonies" by Walter Kolarz (G. Philips and Sons, 1952); "What is Communism?" by J. Plamenatz (National News Letter, London, 1949)].

A good book and . . .

a good cup of **TEA**
are ideal companions

AND A GOOD CUP OF TEA IS MADE THIS WAY

• Boil fresh water • Rinse out teapot with boiled water • Put in one teaspoonful of tea for every person and one extra teaspoonful for the pot • Stand tea for four to six minutes before serving • Add milk and sugar after tea has been poured into cup

* *1,250,000 workers are employed in the Indian tea industry.*

BOOK REVIEWS

PUBLIC OPINION RESEARCH

International Social Science Bulletin of U.N.E.S.C.O.: Vol. V. No. 3, 1953: $1.00; 6sh; 300 fr.

This special issue of U.N.E.S.C.O.'s "International Social Science Bulletin" is devoted completely to the subject of Public Opinion Research. There is an introduction by Dr. George Gallup which describes the beginnings of the Gallup Polls and talks optimistically about the next twenty years. It is a most stimulating piece, indicating the tremendous advance that has been made in the scientific study of public opinion. Dr. Gallup, perhaps surprisingly, expresses the view that there is no real social value in forecasting elections. But he argues these forecasts have brought important improvements in research technique and have added greatly to our knowledge of human behaviour. He illustrates this in the Public Health field by reference to applications in poliomyletis and the common cold. Apparently what people think of various forms of treatment is an important scientific fact in formulating public health campaigns.

A very interesting account of a survey conducted by the W.A.P.O.R. (The World Association for Public Opinion Research) on behalf of the U.N.E.S.C.O. appears in this bulletin. Surveys were conducted in one town each of the United Kingdom, Sweden and France. The towns selected were Cambridge, Uppsala and Grenoble, towns with high levels of education, being University centres and towns of tourist attraction. The object of the surveys was to find out the public's information about the Universal Declaration of Human Rights, and their attitude towards it. The survey was conducted covering a sample of 500 subjects in each of the three towns. This was followed by an intensive publicity campaign lasting from three weeks to a month. Immediately following on the campaign, a second survey was conducted covering a new sample of subjects equal in number and exactly comparable with the sample questioned in the first survey. The result of one of the smaller surveys is given below:

Opinion on the Work of the United Nations Before and After a Publicity Campaign

	Cambridge		Uppsala		Grenoble	
	1	2	1	2	1	2
	%	%	%	%	%	%
Satisfaction ..	45	50	53	61	49	49
Dissatisfaction ..	32	27	16	13	29	22
No views ..	23	23	31	26	22	29

The results in respect of the work of the United Nations given above seem to show that satisfaction with the United Nations is a commodity which (within limits) can be sold at least in Cambridge and Uppsala!

CLOTH FOR THE PEOPLE

Clothing India's Millions: Published by the Millowners' Association, Bombay.

Whether one agrees with the view that man took the most significant step towards civilisation when he learned the use of wool and cotton and turned them into cloth to cover his nakedness, one must agree with the view that the story of cloth is a most fascinating one. It is not only fascinating but is the basis of the livelihood of millions of people in this country—those who grow and market the cotton, those who convert it into yarn and cloth and who, in their turn, market the finished products.

Whatever may be the place of handlooms or powerlooms in the economy of the country, the cotton mill industry also has come to stay. And at a time when the whole country is convulsed with passionate pleadings for the survival of this sector or that of the textile industry, it is a happy idea of the Millowners' Association, Bombay, to take upon itself the task of acquainting the public with all aspects of the mill industry. The illustrated booklet brought out by it, which is the first of its kind to be published on the cotton mill industry in India, is an excellent piece of work and should undoubtedly succeed in its aim of creating a wider interest among the public in this premier industry of India.

The total amount of money invested in the cotton industry is Rs. 104 crores. There are 453 cotton mills in the country of which as many as 200 mills are located in the State of Bombay, Bombay City and Island alone having 65 mills. There are 1,14,27,034 spindles and 2,03,786 looms. The mills consume about 30 lakh bales of Indian cotton, if not more, every year and thereby give to the cotton growing sector of agriculture alone as much as Rs. 121 crores. The latest five-year (1948-52) annual average production of yarn and cloth by the mills in India was 134 crore lbs. and 413 crore yds., respectively, but the production for 1953 exceeded even these high figures. It might interest one to know that, with the yarn turned out by the mills in India in one year, it is possible to girdle the globe 6 lakh times! The industry engages 7,43,000 operatives, besides providing employment to a large number of people engaged in the manufacture of textile auxiliaries.

On an average, the industry has been contributing every year to the Government more than Rs. 10 crores by way of taxes. In addition, the Government collects about Rs. 20 crores from excise duties on mill cloth and, although regarded as a powerful competitor to the handloom and khadi industry, it is out of these Rs. 20 crores that a sum of nearly Rs. 6 crores is being spent on the development of the handloom and khadi industry. In short, the cotton mill industry in the country plays a very important part and has been contributing to the economic prosperity of the country in a number of ways. This year, by the way, marks the hundredth year of the beginning of the cotton mill industry in India.

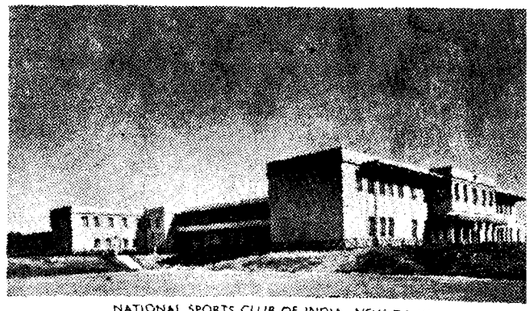
TWO ANNUAL REVIEW NUMBERS

Capital's Annual Review of Trade, Commerce and Industry: December 1953: Rs. 5.

'Capital's' Annual Review of Trade, Commerce and Industry has come to occupy a special position in respect of Annual Numbers. For one thing, it comes out earlier than all the others, the present issue having been a supplement to 'Capital' of December 17. It is also a specialised study containing articles on trade, commerce and industry only with a powerful selective influence at work.

The current issue contains a brilliant article on 'Industrial and Agricultural Development in India' by Colin Clark, perhaps the most stimulating of modern econometricians. There is also a fine piece on 'Foreign Investment and Underdevelopment' by Geoffrey Tyson, a former Editor of 'Capital'. Mr. W. H. J. Christie of the British India Corporation writes on 'Recruitment for Business in India' with special reference to the pace of Indianisation. Dr. N. Das, Secretary of Industry and

Commerce of the West Bengal Government does an interesting piece on the 'Economic Position of the Average Indian'. This piece just fails to establish whether the total standard of living has gone up. It is a pity that the figure for food grain consumption stops short at 1951-52 which shows a supply per head of 279.8 lbs. against 310.7 for 1949-50. Surely the position was much better in 1952-53 and is no worse in the current year. Even as it is, the improvement in salt, sugar, and tea consumption shown in this article is heartening. Mr. D. C. Driver, who has made himself a leading authority on Indian coal looked at from the consumer's angle, writes on this theme and 'Capital's' Legal Correspondent deals in a most interesting article 'Summary Dismissal and Discharge' with some Indian decisions affecting the right of a master to dismiss an employee without notice. There are special reviews of the Tea and Jute industries and the Calcutta Stock Exchange which will be read with great interest. This is remarkably a good review for which congratulations are due to 'Capital's' enterprising Editor, Mr. Neil McInnes.



Commerce, 1953. Annual Review Number:
Price Rs. 7-8.

'Commerce', 1953 annual review number is if anything even more elaborate than those that have gone before. It runs into 182 pages with material and writers drawn from almost every range of economic activity in India and some from abroad. Mr. Eugene R. Black writes on 'India and the World Bank'; Mr. A. D. Gorwala on 'The Unemployment Problem'; Mr. Ivar Rooth on 'Task Before International Monetary Fund'; Mr. S. T. Sadasivan on 'The Role of Commercial Banks in Industrial Finance'; Dr. S. S. Bhatnagar on 'Scientific Research in India'; Mr. K. K. Birla on 'Sidelights on Sugar Industry'; Mr. K. D. Jalan on 'Outlook for the Jute Industry'; Mr. K. G. Milne on 'Electric Supply Industry'; Mr. Ivor Bull, the leading exponent of coffee problems in India, on 'Coffee—The Key to the Malnad' and Mr. V. I. Chacko on 'Planning in Independent India'. There is also the standard review of particular industries and the trends of markets of 1953 with some vital economic statistics added. This is a remarkable production worth much more than seven and a half rupees at which it is priced.

A DELHI DIARY

THE BRIDGE OF SIGHS?

A NICE debate arose yesterday in New Delhi if the serious railway accident which occurred at Bhatinda on Monday was the effect of the collapse of the bridge or was due to neglect on the part of the train staff. On Wednesday, Mr. Karnail Singh, Manager of the Northern Railway (who, incidentally, has done a very remarkable job on this Railway), felt impelled to correct some errors of "information". The bridge, it seems, is intact. The trouble was that "a breach in the canal just below the downstream of the bridge (sic!) had occurred and had eroded a portion of the railway embankment removing the support from under the track." This, I agree, clears the bridge and, I suppose, those responsible for the maintenance of the bridge. But since those responsible for the maintenance of the bridge are also responsible for the track (or can there really be intense division of labour here?) it seems to me that the responsibility lies exactly where it did before. Nor, to my mind, is the seriousness of this accident, the seventh on the Indian Railways in seven days, greatly abated by the reduced toll of the dead and injured. There were 17 killed and 41 injured; it is just fortunate that in 24 of these 41 cases injuries were not serious.

A RAILWAY HERO

I do not think that it was Mr. Karnail Singh's intention to produce complacency or deprecate public criticism of the failure of the track maintenance staff to set right the breach before the train came over. There is urgent need for exemplary punishment in case of failures of duty which reflect themselves in railway accidents. Likewise, I hope there will be tremendous rewards available to the members of the family of men like engine-driver Daulatram of this same ill-fated train. It has been placed on record that Daulatram's body "had to be torn from the vacuum brake which he was clutching at the moment of his death". He bore extensive burns on the head and chest but seems to have thrown himself on the vacuum brake in a desperate attempt to stop the train. It is believed that this action saved three bogies and about five hundred persons. I like to think that it is of men such as these that the new India is made.

AND DECORATIONS

Have we no decorations fit for acts of heroism such as these? It was announced this week that the President has instituted two types of awards known as Bharat Ratna and Padma Vibhushan for exceptional service to the country. The former is "for exceptional services towards the advancement of art, literature and science and in recognition of public service of the highest order." The Padma Vibhushan (in three classes!) will be awarded for distinguished public service including service rendered by Government servants. I am not quite clear on the precise difference between the two, but I welcome the addition (in a country which in its Constitution has frowned on titles) to these new forms of recognition for public service.

I consider that we were too hasty to abandon titles when we framed our Constitution. The spirit of this section was also to abandon civil decorations. Now that we have come back (rightly in my opinion) to civil decorations, why should we continue to jib at titles? The Order of Lenin and the Order of Stalin are greatly prized honours in a country which is supposed to have abolished all privilege. Would not an institution of Heroes of the Indian Union enable new production records to be set in special fields? Now that it is almost certain that the Constitution is to be revised, surely it would be a good thing to allow both decorations and titles. Who can doubt that the institution of the present decorations is against the spirit of India's Constitution?

SARTORIAL DIRECTIVES

Meanwhile, may I, finding myself in a critical mood, speak frankly on the Prime Minister's three-page circular on dress for Government officials. It is true that this note is "not an order but a recommendation for the present" implying that compulsion is only some distance away. As I see it, Government officials will tend to comply, because this is hardly a matter on which most officials will choose to incur the displeasure of the Prime Minister. There may even be some (gentle!) competition to get in first.

It is not the order in itself which is a serious matter. It is the direction about which I am concerned. India is moving in acts such as these towards a kind of regimentation which is bad for the national spirit. For formal occasions the Government has every right to prescribe dress and insist (not merely recommend!) on compliance. But when people have in the heat of summer to wear "buttoned-up short coats and trousers" surely there is an unduly heavy demand placed upon officials only. I think in a matter like this, the direction will be resented; people like at least when working to be clad as suits them best. And both because of this mental resistance and the unsuitability of the prescribed attire for some seasons, I prophesy there will be a further (small!) decline in efficiency.

There is another matter which troubles me. Can it be that the Prime Minister's order of priority of important things is so mistaken as to allow him to devote so much time and thought to this particular matter as he seems to have done? I have not yet (failing in curiosity!) seen this note which runs into two closely-typed pages. I am told, however, that the note surveys "the sartorial changes in India and the world from pre-historic to Moghul and British times" and arrives at the conclusion that since habits and climatic conditions are different in different parts of India, no attempt need be made to bring about uniformity in dress. Recognising that habits are different, the Prime Minister then promptly proceeds to prescribe uniformity. Was the historical preamble really necessary in order to make the Madrasi, the Bengali, the Gujerati and so on wear the same attire merely because they work in the Central Secretariat in New Delhi?

AND POSTAL RATES

There was another disturbing announcement which fortunately has been quickly laid to rest. It was reported after Mr. Jagjivan Ram had spoken at Silchar this week that postal rates were going up all over again. Fortunately, Mr. Jagjivan Ram quickly heard the groan which emanated from many (misinformed!) sources and his Ministry was quick with an assurance. The notification said: "The Minister was replying to suggestions demanding reduction in some postal rates. The gist of what the Minister had stated was that there were losses on many items of the Postal Department and, therefore, it was not at all possible to reduce the existing postal rates. On the other hand, there was every justification for increasing some of the postal rates. But no increase in postal rates is under contemplation."

All's well that ends well!

ARGUS.

SPECIAL ARTICLES

THE CASE FOR COFFEE

THE response at the local auctions in Coimbatore, Tiruchirapalli, and Madurai, even in the month of December (after the minimum release prices and the revised sale prices at Coffee Houses had gone into effect) having been poorer than was anticipated, the Indian Coffee Board is now carrying into the year 1954 an estimated quantity of 8,500 tons from the old coffee crop. Together with the anticipated 1953-54 crop, which is now placed at about 24,500 tons, this means that the embarrassing situation in the coffee trade still continues to persist.

The poor response at the auctions cannot be explained except on the assumption that the trade is bearish and uncertain in its outlook. There is an exportable surplus. But even the Coffee Board, meeting last month, could not make up its mind regarding export allocations, but postponed consideration of the question till February 1954. Exports moreover are likely to be delayed, even if prompt action is taken. The old crop has deteriorated during the time that it had to be stored and did not move; and exports will, therefore, have to be arranged primarily from the new crop. Meantime, even though pool payments by the Board for the 1954 crop have now been reduced, the Board is still faced with the problem of financing itself from sales in order to reduce its seasonal overdraft—it has asked on the other hand that its borrowing powers should again be raised. All this is so unusual that the time has clearly arrived when the problems of the coffee planters should be examined at some length.

The disagreements between the Board and the Government of India are now too well advertised to be politely overlooked and, perhaps, the immediate prospect is also not encouraging from this point of view, because the Bill to amend the Coffee Market Expansion Act and the decision, if any, on exports may continue to divide those responsible for regulating the marketing of coffee. Some issues in the present controversy must, however, be highlighted in the interests of Indian coffee generally.

The trade has recently protested against the reduction in the estimated cost of production of coffee (from Rs. 2-7-1 per point, this is believed to have been reduced to Rs. 2-1-0 per point as a result of the cost-accounting enquiry recently conducted by the Government). It has urged that the official attitude which is that this cost is not so much the minimum return to be secured to the grower as a fixed return, and the still later decision to subsidise internal prices from export prices, which means of necessity that internal release prices cannot be certain, will together affect production, and at the least arrest the recovery of the coffee plantations. This recovery has so far been very steady since the depression of 1940, thanks to the incentives which the marketing policies of the Board have provided, and it would be a retrograde step if the attraction of a good price were now to be withdrawn.

It may seem at first that the coming year's crop at 24,500 tons is a refutation of this argument. But the economic life of the coffee plant is about fifty years; and it matures after six or eight years of growth—with the result that no one can now say how far the uncertainty and the bearish outlook, which have prevailed in the recent past, have really affected production. At the least, however, the tendency to plant robusta rather than the more delicate arabica, which has been in evidence in recent times, will be confirmed as a result of present developments. Cultural and manurial practices may also be affected, with results which can be apparent only after a few years.

The first cost-accounting enquiry which was undertaken by the Government of India in 1945 emphasized the insecurity of investment in the coffee plantations, and pointed out that the return should be adequate, the good years taken with the bad, to ensure steady progress. During the last decade or so, whatever the Indian Coffee Board has done or failed to do, it has extended cultivation and production, and has provided employment; and in view of the work which still remains to be done, the absence of a certain and reasonable policy is bound, therefore, to lead to anything but the desirable consequences.

The area under coffee was once about 300,000 acres. Future possibilities, if the present rate of extension and improvement is kept up or improved upon, have not been studied. But the Coffee Board thinks that production can be stepped up to at least 40,000 tons; and individual planters have put a reasonable target at about 35,000 tons in fifteen years. The Coffee Board estimates that there are about 100,000 acres in South India which can be planted now with coffee; and its cautious estimate has apparently been based on a rough appraisal of the possibilities of extensive rather than intensive cultivation. Experience on the area belonging to the Consolidated Coffee Estates justifies, however, estimates of future production, which are much more optimistic and which might indeed be described as wild, but for the fact that modernisation has taken place on a large scale in this area, and intensive cultivation has been fully justified by the results.

The Chairman of the Consolidated Coffee Estates looks forward to export possibilities of the order of 24,000 tons in fifteen years and 80,000 tons ultimately. This latter estimate, if realised, will bring valuable foreign exchange, much of it in the shape of dollars, perhaps. It would also make India one of the world's four most important exporters of coffee. The stakes are thus high; and the experience of the Consolidated Coffee Estates is so valuable and dependable that there is every reason, contrary to what may appear at first sight, to review the policy in relation to coffee so that the future of this crop in this country is not prejudiced.

The industry has not been too prosperous. Also, the planters' and growers' views have changed a great deal during the last year; and it will not be realistic to exaggerate the importance of the differences which still persist. Speaking for itself and the trade, the Board now wants a realistic and independent enquiry, not only into costs, but also into all the other aspects of coffee-growing. The Board would undoubtedly want also to ensure that the return to the grower is fair. Whether a pool basic price of Rs. 2-4 per point, which works out to a return of Rs. 180 per cwt. for Plantation A, is fair is to be judged, in the opinion of the growers, both in relation to the future of the industry and in relation to the fact that the consumer need not necessarily be benefited only at the expense of the grower. The price received by the grower, it has been estimated, is only about 75 per cent of that which is paid by the consumer.

One of the growers' arguments at the present time is that if only production can be extended, it should be possible, as the results of intensive cultivation over a period of years become available, to subsidise the internal consumer from the proceeds of export coffee. The pooling system, which is now firmly established, makes it easy for the Coffee Board to show this consideration to the Indian consumer, and it may, therefore, be well advised to work for realising the production and export possibilities, about which planters have been more optimistic than they have ever been, rather than to create a bearish psychology in the immediate present, as a means of reducing prices. The contemplated amendment of the Coffee Market Expansion Board, apart from the fact that it seems to be a reflection on the present elected Board, is not welcome to the industry, mainly because it is not sure how the industry would fare in the new set-up, when pricing and marketing policies are destined to be of so much importance to it.

The gist of the industry's demand is that an independent enquiry into coffee prices and marketing should be undertaken, so that the industry's point of view may get a hearing. The decisions taken for the long-term period should be such that the estates and the trade may not be left any longer in any state of uncertainty as to the future prospects of investment in the industry. The Board has for some time been asking for an enquiry by the Tariff Commission. There is little reason, if any, why this request should not be granted.

ACCIDENTS ON RAILWAYS

DURING the week ended January 4 last accidents to trains on Indian railways averaged one per day. This is certainly disconcerting news. The safety record of the railways has not received such a black mark in the course of the last three years. Its severity becomes apparent if these accidents are viewed in relation to the toll of casualties involved. This series of accidents is reminiscent of the first three and a half months of 1950 when the number of accidents rose as high as 18, involving no less than 110 fatal casualties in the first three quarters of 1949-50. The accidents which occurred in quick succession in the week ended last Monday have also marred the fair record achieved so far in the current financial year.

The public mind has every reason to view these rapid occurrences with a feeling of concern. The first accident in this unfortunate series took place in circumstances in which it could be least expected. The Deccan Queen which had almost reached its destination (Victoria Terminus) collided against a suburban local train at a peak traffic hour when great vigilance in traffic control was clearly indicated. The incidence of casualties was kept at 60 injured only because this fast moving train had slowed down. The second collision occurred on New Year's Day very close to Howrah. On the next day, however, the accident to the Raxual-bound train of the North-East Railway proved to be tragic exacting a toll of ten killed. The next day again, two accidents took place—one to a mixed parcel-cum-passenger train near Baroda and the other to a goods train near Kalyan (Bombay). This latter derailment of a goods train can be conveniently excluded from the present discussion since no passenger train was involved in it and no human casualties were entailed. The derailment of a passenger train that took place in the Saran district of Bihar was a minor accident on the last day of this ill-fated week. But the most tragic event, which eclipsed all the other accidents, was the deep plunge that the bogies of the passenger train of the Northern Railway took into a canal near Bhatinda. So severe was the crash that the capsized bogies were interlocked smashing a number of passengers in the debris. The toll of casualties was high with 17 killed and 41 injured. From the safety angle, the earlier accidents and particularly the one near Raxual, were certainly enough to cause concern. But the magnitude of the last disaster was of a nature that demands a searching enquiry.

Accidents by the fact of human nature may recur at intervals, but when they tend to be concentrated in a brief period and occur in situations in which there is no great apprehension of their occurrence, it is desirable and necessary to try to analyse their probable causes. Preventive and precautionary measures may suggest themselves if their source is ascertained accurately on investigation. While the railways have embarked on a five-year programme of rehabilitation and reports indicate an earnest effort to improve their operational performance, set-backs like the present one are indicative of some slackness in vigilance. The recent series of accidents needs to be analysed in relation to accidents in the past few years. They are set out in the table at the end of this page.

Only broad conclusions may be attempted from the figures in the table inasmuch as no fixed trends can be expected in a phenomenon like a railway accident. Whether and to what extent they could be prevented or the damage caused by them minimised is, of course, a matter depending entirely on the facts of each case and individual official investigations may prove of greater help to control their causes to the extent that they are amenable to human control. The year 1947-48 had the worst experience of accidents judged from the major criterion of loss of or injury to human life. Fatal casualties as well as the number of injured persons were the highest in this year and their ratio to the number of passengers carried also was the highest, though the number of accidents—derailments and collisions—was lower than in some other years. In this specific year, the human factor, as represented by the immediate post-partition dislocation of railway operating staff, was a major cause of this high record. Accidents are not necessarily related to the volume and pressure of traffic since 1947-48 did not experience their maximum impact. The year 1950-51, on the other hand, which represents traffic at its peak, had very low incidence of casualties. Broadly speaking, the deterioration which commenced in the first post-war year 1945-46, continued for four years, but it was arrested in 1950-51.

The impact and toll of accidents in 1944-45, when railways were operating under the severe strain of war

ACCIDENTS INVOLVING PASSENGER TRAINS AND THE INCIDENCE OF CASUALTIES

Year	Derailments	Collisions	No. of passengers carried (million)	Killed		Injured	
				Number	Per million passengers carried	Number	Per million passengers carried
1944-45	329	91	971	34	0.04	132	0.14
1945-46	268	73	1,093	89	0.08	253	0.23
1946-47	396	51	1,139	93	0.08	340	0.20
1947-48	308	48	1,044	298	0.29	721	0.69
1948-49	265	34	1,185	55	0.05	260	0.22
1949-50	277	38	1,255	111	0.09	365	0.29
1950-51	239	30	1,308	21	0.02	284	0.22
1951-52	252	32	1,232	38	0.03	294	0.24
Week-ended January 4, 1954	3	3	..	27	..	119	..

with unsatisfactory equipment and rolling stock, was lighter than what is experienced in the recent past. One week's casualties between December 29, 1953 and January 4, 1954 have practically approached the level of the whole of 1944-45.

This is a development which surely warrants a searching investigation. It needs to be interpreted against a changed background. Since the programme of revitalisation of the rolling stock, track and other physical assets was launched three years back, the condition of the railways from the viewpoint of transport capacity has improved considerably in relation to the earlier years chosen for comparison here. The recrudescence of accidents in the recent past tends to show that their causes may not be found to be primarily and necessarily connected with factors other than the human factor. It is not in the least the intention of this article to pre-judge the findings that will emerge after the investigations in individual cases of accidents are completed. Its purpose, on the other hand, is to indicate certain trends in traffic operations which are prima facie warranted by published reports about the accidents. The most tragic accident among these—the accident near Bhatinda—must claim grave attention and so far evidence of sabotage does not seem to be available. At the time of the accident, according to one source, the water in the canal was overflowing the banks. This is a serious allegation which needs thorough investigation. But in any event, full and satisfactory enquiry must be made to ascertain how far those charged with the upkeep and supervision of the railway track were responsible for the occurrence of this tragic derailment.

A majority of the remaining accidents have occurred near important stations or in their yards which is a circumstance of significance. The accidents which took place within one mile of Victoria Terminus and Howrah stations, as also the accident in Saran district while the train was about to enter the station, belong to this category. The collision of the Deccan Queen with a suburban train raises strong queries about the control of the mechanism of automatic signalling. The head-on collision of the Raxual-bound passenger train with a goods train took place within half a mile of the terminus and likewise the derailment of the mixed train 20 miles from Baroda is also stated to have taken place near a road-side station. All these accidents which occurred in the vicinity of railway stations suggest certain strong inferences about the degree of vigilance and alertness shown by the traffic staff. It is also essential to assess in detail how far the inspection and maintenance of the permanent way was carried out on the lines laid down. No hole-and-corner enquiry will do. The public must be informed about the disciplinary action taken against the officers responsible.

Busy men all over the world have come to rely for guidance on weekly journals; they find the kaleidoscopic changes in national and international affairs too rapid and too deep for daily newspapers. Those of discriminating taste choose periodicals which deal with the countries and subjects in which they are interested.

THOUGHT

has earned distinction among Indian journals for its foresight and sober judgment in the nation's political, social and cultural affairs. It has built up a pool of original writers and critics who comment on events with a rare insight and balanced judgment.

THOUGHT's opinion on national and international affairs always claims the ear of responsible persons and organs of public opinion.

THE BUSINESS WORLD

THE INTERNATIONAL TIN AGREEMENT

The International Tin Agreement, which emerged from the discussions at Geneva last month will be welcomed unreservedly by the producing countries. The details of the agreement are simple. Producing and consuming countries (seven and eighteen in number respectively) have one thousand votes each. Ratification by consuming countries with 333 votes and producing countries with 900 votes will bring the agreement into force, and it is to endure for five years from the date of such entry into force. The floor price has been fixed at £640 per ton and the ceiling at £880 per ton. At the floor and the ceiling, it is obligatory for the Council to buy or sell as the case may be. While the price ranges from £640 to £720 per ton, buying is optional. Likewise, while the price ranges from £800 to £880, selling is optional. The size of the buffer stock has been fixed at 25,000 tons, and it is anticipated that if the agreement can be worked on these lines, it will help to stabilise tin prices and to promote orderly mining throughout the Belgian Congo, Ruanda, Urundi, Bolivia, Malaya, Nigeria, Indonesia, and Thailand.

The price range, namely, £720 to £800 which the agreement regards as fair, may appear prima facie to be high. Did not the price of tin go down below £600 per ton in London in July last year? But from the point of view of the consumers generally, the agreement has nevertheless three attractive features.

In the first place, Article XVI, as was inevitable, permits any country on national security considerations to take action which it considers to be appropriate and in that event, a country which considers that its interests are affected can complain, provided there is no war in existence which justifies the action taken under the national security provisions. The complaint will be investigated, and if it is established, the complaining government may be permitted to withdraw.

In the second place, the existing quotas for the producing countries can be altered to the extent of five per cent every year, this degree of flexibility being introduced in order to shift production and export allocations, in case the latter prove to be necessary, from the less efficient to the more efficient countries.

In the third place, the Buffer Stock Account is to be kept separate from the Administrative Account and the producing countries are to bear the gains or losses as the case may be of buffer stock operations. This exempts the consumers from paying for price stabilisation losses. The only grievance which they can have, perhaps, is that from their point of view, the price range selected for stabilisation could have been lower.

Whether this is a substantial grievance is, however, doubtful. The peak of tin prices was reached in February 1951 at £1,620 per ton, and in 1952, not even Mr. Stuart Symington's consumer resistance could pull down prices appreciably. In the contracts negotiated before the private import of tin was permitted into the U.S.A. (from the 1st August, 1952) a price of $1.18 per lb. was regarded as the norm, this being the price negotiated in succession for the British deliveries, for the purchase under the long-term agreement with Indonesia and for the sale to the Reconstruction Finance Corporation of Bolivian tin. These contract prices of 1952 correspond to a sterling price of £944 per long ton and though tin has gone below £600 in the London Metal Exchange since then, a floor of £640 with an option to support the market as long as the price ranges from £640 to £720 is not after all so unreasonable in the light of recent history.

The arguments in favour of a reasonable price are that it will incidentally provide incentives and promote stability in South-East Asia. The wider economic implications of a support price, which are bound to be reflected in the prosperity of the sterling area are undoubtedly important, but to the tin-producing countries themselves price stabilisation is even more directly relevant although obviously tin is not as important as rubber and the stabilisation of tin prices cannot go a very long way, while the future of rubber prices and of the plan recently produced by the Rubber Study Group is uncertain. This broad economic argument is not, however, the only one in favour of price ranges more or less of the order mentioned in the new international tin agreement. The Paley report projected an increase of 49,000 tons in the free world's consumption of newly-mined tin by 1975. If this demand is to be met, the long-term price must be attractive. Only an attractive price will make it possible to prospect for tin in Malaya and to overcome water and labour shortages in Nigeria and the Belgian Congo and to mine for tin in the peculiarly difficult conditions in Bolivia, where deposits at an altitude of 12,000 feet have to be won and tailings left from the earlier treatment of higher grade ores have to be utilised.

At the moment, the agreement depends in substance, though not formally, on ratification by the United States. The United States has from time to time been thinking of minimising the use of tin and of finding substitutes for it. The use of welding, of aluminised steel, and of printed, instead of soldered circuits are examples in point. The time has now arrived, at least in so far as the tin agreement is concerned, when the United States should be thinking of arguments such as those which were used in the Paley report, rather than of the immediately apparent loss or gain. The Geneva discussions have produced a good agreement which deserves to be tried and, therefore, at this stage ratified.

THE GERMAN ACHIEVEMENT

(From Our Own Correspondent)

By Airmail Francfort-on-Main, Dec. 29, 1953.

A question often asked outside the German frontiers runs: "Will the German economic miracle continue to exist?" It is not too easy to answer it; the economic development of the last year, however, offers some hints.

During the first ten months of 1953, the Federal Republic, including West Berlin, had an export surplus of approximately 1,800 m.D Mark, which means that this year's foreign trade will close with a balance of 2,000 m. DM in favour of the German economy. This is three times the surplus of the previous year. In addition, there is a favourable balance from so-called services amounting to approximately 500 m. DM. It is obvious that this implies important problems for the Federal Republic. The German currency is already being referred to as "hard" currency, and countries which have trade relations with Germany are already worrying as to how they may close the "DM-gap". On

the other side, voices are being raised in the German export industries circles asking how far the world markets will be able to buy German goods. The question is whether it will be possible of achieving a balance by increasing imports in the Federal Republic, whether the German markets are capable of receiving more imported goods, and whether a further increase of imports will not involve a reduction of domestic production.

The directive issued just before Christmas concerning the 100 per cent liberalization of the automobile trade shows the sincere endeavour to do the very utmost by way of liberalization. One is quite aware that a comparison with pre-war times cannot be made, an entirely new situation having arisen due to the splitting up of Germany in a bigger Western and a smaller Eastern zone. In addition, it must be recognized that each of these zones is part of another bigger economic system. In the Western zone approximately 50 million people are herded together. The splitting off of the main agrarian areas in the East and the sharp increase of demand of the West German population during the last five years, together with the general reconstruction interests, have made for a continuous increase of imports.

Besides, the fear of foreign countries that they might be eliminated from the world markets due to German exports needs to be removed. No doubt, the German economy during the last years—due to various favourable conditions—has been able to gain considerable ground in foreign markets, but the progress achieved has not yet reached the levels of other industrial States. As compared with 1936, exports from the Federal Republic during the last year were about one-third higher than those of the pre-war times. England, however, had—within the same period—increased her exports by more than 60 per cent, France almost doubled them and U.S.A.—as compared with 1938—had multiplied them by nearly three.

The development is also characterized by pressure on the prices of export goods, this being a consequence of sharper competition in the world markets as well as of the bigger supply of goods which were wanted for armaments and other essential supplies for the Korean theatre of war. Consequently, official and private economic circles are tackling the problem of correcting the terms of trade. During the third quarter of 1953 the import side, however, a fall in prices occurred which as against 5.6 per cent during the first six months. On the import side, however, a fall in prices occured which in the period from January to June 1953 amounted to 16.1 per cent, and in the third quarter to 10 per cent. At the moment when the price pressure in the markets of raw materials and semi-manufactured goods will be effective also in the markets of manufactured goods, the balance of trade and the balance of payments may possibly undergo considerable changes.

The Indian request for more capital investments in the interest of building up the domestic economy has evoked remarkable interest in business circles of the Federal Republic. The West German capital market has, however, not yet reached a liquidity which would allow of big long-term overseas investments without affecting the economy and life of fifty million people. It must not be forgotten that the Federal Republic in the interest of restoring full political and economic confidence of foreign countries, has acknowledged the debts of the Hitler Regime and of former Governments. Nearly 30,000 m.DM are involved in the obligations thus acknowledged. The difficulties thus posed for the balance of payments problem are considered to be great. In fact, the interest payments and amortizations have actually begun on a small scale. In case the agreement on the European Defence Community is signed or the Federal Republic joins the Atlantic Pact or some other settlement for the German defence contribution is agreed upon, additional large outlay will be required at home, and also, of course, a large share of the industrial capacity and of the labour available. It need not be assumed that this demand will be so big as to make it impossible for the Federal Republic to give technical assistance to other countries by placing at their disposal experts and skilled personnel and, to a certain degree, by the supply of goods and the grant of credits.

THE TRIANGULAR CONFLICT

By

CROESUS

The more public inquiries into the protection of industries that one attends, the more one becomes convinced of the inescapability of a sort of triangular conflict of interests, I mean the indigenous producers, the importing interests and traders, and the representatives of foreign manufacturers catering to this market. An interesting feature which I noticed at the Public Inquiry into the Protection of the Dyestuffs Industry, which began towards the close of last year—December 29, 1953—was the practically passive participation of the foreign manufacturing interests. They seemed merely content to watch the proceedings, but the arguments for and against any protection, or the degree of protection, were mainly advanced by the indigenous manufacturing interests and the import and trade interests. Although the position of any impartial tribunal in such circumstances is none too enviable, it is perhaps worth emphasising that the overall attitude of both the Commission and the Government of India—as reflected in the utterances of the Industrial Advisor to the Commerce and Industry Ministry who was present on the occasion—is one of positive encouragement to an industry which is of importance to the national economy and to the technical progress of other established industries in the country. The dyestuffs industry clearly falls under this category, as witness these words of Mr. M. D. Bhat, Chairman of the Tariff Commission: "Since the products of the organic chemical industry not only contribute to the strength of the national economy, but are also required for the promotion of national security, and since technical progress in the dyestuffs industry is linked up with the technical progress in the organic chemical industry as a whole, the establishment of the dyestuffs industry in India which would indirectly help the development of many other industries is of more than ordinary significance."

Probably it seems to have been taken for granted, whether it is protection of an industry or anything else, that you should pitch your claims a little higher than what you actually want in order to be assured of getting the latter. It is all very well to ask for protection to the extent that it is called for by reason of the preparations made and the plant installed. But to expect protection even in respect of plans in the offing, which have yet to be scrutinised and sanctioned by the authorities, is to ask for too much. Indeed, Mr. B. N. Adarkar, Member of the Commission, had to pull up a representative of the manufacturing interests for doing so.

On the other hand, it is difficult to understand the rather obstructive attitude of some of the importing and trade interests even towards the legitimate demands of the indigenous manufacturers. As and when Indian interests start and develop, it necessarily follows that

imports of goods manufactured by the new industry have to be restricted, even though, in the process, those wholly dependent upon the import trade in these articles may be adversely affected. For the sake of a relatively few who make a living in this way, the larger interests of the country, which lie in the full-scale development of these industries, cannot be put off or sacrificed. At the same time, when some constructive suggestions come from this quarter, they should not be scouted.

As Mr. Bhat rightly observed, one great difficulty in respect of the dyestuffs industry is the problem of reconciling the short-term and the long-term considerations in its development. Whether the industry should be built up from base upwards, that is, beginning as near the stage of basic materials as possible, or from the stage of penultimate intermediates, is a matter of opinion. It may be that assistance in respect of penultimate intermediates, which form the basis of the dyestuffs industry, as it is today, may delay or postpone the manufacture of the intermediates themselves in the country. But, as against this point of view, the manufacturers contend that the process of building from the base upward will not only be a long-drawn affair but that it will also require a very huge investment. According to them, a more practicable approach would be to hasten slowly and proceed step by step, that is, from penultimate intermediates to primary intermediates and then on to the basic materials. There is a school of opinion which strongly holds that, although it may take time, this is a better way of establishing the dyestuffs industry in the country and they even go so far as to say that the industry, as has been established so far, is no more than just a chemicals-mixing industry or a mere assembling plant. While this school is right to some extent, its argument loses all the force when, from this premise, it proceeds to demand continuation of the present scale of imports—not token imports—of even the final products from the intermediates that are being manufactured in the country.

In considering the question of protecting the dyestuffs industry, it is necessary to stress the fact that even the gradual building up from the stage of penultimate intermediates constitutes a very big enterprise which means that those who have taken to it have done so deliberately being fully conscious of their responsibilities. Even so, they have to realise that an important key industry like this must be based on secure foundations and also make sure, as the Chairman of the Tariff Commission remarked, that "in due course, it finds its roots in the country and derives its sustenance and strength from the organic and inorganic chemical industry developed within the country".

Now for a brief outline of the position of the dyestuffs industry. Judged by the size of the market for dyestuffs in India, as Mr. Bhat said in opening the inquiry, there would appear to exist sufficient scope for the dyestuffs industry to grow. For a long time India's requirements for dyestuffs have been met entirely by imports and it is only in recent years that a small proportion of the requirements has begun to be met by indigenous production of a few types of dyestuffs.

The following figures of imports obtained from the seaborne trade figures tell a tale of their own:

Year	Quantity (Million lbs.)	Value (Rs. in crores
1947-48	19.5	15.4
1948-49	13.7	12.3
1949-50	7.5	7.9
1950-51	14.0	11.9
1951-52	15.3	14.3
1952-53	7.2	7.5
Average for six years	12.9	11.55

The first enterprise in this line, namely the Associated Research Laboratories, Bhatgar, started production of rapid fast dyes on a very small scale in 1940. It has since expanded and undertaken the manufacture of almost the whole range of these rapid fast dyes, Rapidogen dyes, developing salts, and solubilized vat dyes of green and blue colours. The Atul Products, Ltd. came into the field seven years later, that is in 1947, with the object of undertaking the production of a series of Azo dyes, including Congo Red, Sulphur Black and Alizarine, in collaboration with the Calco division of the American Cyanamid and Chemical Corporation. This company started production only in 1952. In addition to these two, there are a number of small factories producing one or more of the rapid fast dyes. Thus, the industry as established today covers only a small portion of the entire field of dyestuffs production and the total output of the industry is confined to a limited number of dyes produced from imported intermediate products.

According to information received by the Tariff Commission from the different manufacturers, the total annual installed capacity and the actual production in January-June, 1953, for different types are as follows:

	Installed Capacity Lbs.	Production Jan.-June, 1953 Lbs.
Azo Dyes	2,117,672	267,359
Sulphur Black	1,000,000	204,475
Rapid Fast Dyes	400,000	28,689
Rapidogen Dyes	152,000	21,065
Fast Colour Salts	996,800	98,511
Solubilised Vats	150,000	38,594
Others	79,000	4,300
TOTAL	4,895,472	662,993

In other words, the total installed capacity itself is only slightly more than a third of the average imports of dyestuffs for the past six years, while the actual outturn for the first half-year of 1953 was only slightly more than one-eighth of the installed capacity! This shows the considerable leeway yet to be covered by the indigenous industry and, by the same token, the still large field for those engaged in imports of dyestuffs. But then importers would have to restrict their imports to those dyestuffs that are not at all manufactured by Indian producers and to those that the latter cannot yet supply to the fullest requirements of the country. This is not difficult. For a prominent importer of dyestuffs suggested that it would greatly facilitate matters if Indian producers invited all importers and clearly told them of their plans of manufacture well in advance, so that the importers could arrange their imports programme accordingly. This, however, presupposes not only perfect understanding between the two interests, but also an implied undertaking by those engaged in the import line to take to dealing in their own country's products. Here, it is of the utmost importance that the Indian manufacturers should realise that they also owe a duty to these importers whose living is hit by the products they manufacture and, as far as possible, enlist their services only, instead of trying to give distribution rights to rank outsiders and newcomers whom they may wish to patronise for some reason or other.

A SESSION WITHOUT OFFICE-BEARERS

By

CROESUS

On the last day of last year, the Indian National Trade Union Congress held its last annual session at Jalgaon, which has since come to be termed as Shahstrinagar, in memory of the late Mr. Hariharnath Shastri, the General Secretary of the I.N.T.U.C., who died in the recent Nagpur air crash. Indicative of his genuine interest in this field of work, the late Mr. Shastri had prepared a voluminous report of 250 pages covering a wide range of labour matters, both national and international. But, unfortunately, he was snatched away and the proceedings of the annual session of the I.N.T.U.C. were marred to some extent because of this tragedy. Unfortunately, even the President of the I.N.T.U.C., Mr. Michael John, could not be present because of illness, and the session had thus to proceed without either the President or the General Secretary.

However, Mr. John's absence was not felt so much because he had sent his address, which was read out for him. In this address, the I.N.T.U.C. President made some very interesting observations which must go on record. It is particularly noteworthy that Mr. John condemned the growing wave of violence in some ranks of labour lately in no uncertain terms. He said: "The cult of violence as it is expressing itself in the methods of intimidation and the acid bulbs cannot be allowed to take root. What has been going on in Calcutta and some other places in the name of Trade Unionism is both a matter of shame and a challenge to the genuine Trade Unionists". Prime Minister Nehru, who inaugurated the annual session, also thought it fit to refer to this, and asked trade union leaders to settle labour disputes by peaceful means without resorting to any sort of violence, which might unnerve the employers.

Another important observation of the I.N.T.U.C. President that should be very gratifying to all is that the trade union movement should be kept aloof from party politics if it is to grow. In this connection, he referred to the headway made in achieving trade union unity amongst railwaymen, seamen, and ordinance workers, and looked forward with hope to the coming closer of the Hind Mazdoor Sabha and the I.N.T.U.C., so that a strong and united democratic trade union movement could be built up. At the same time, he told the Conference how the I.N.T.U.C. had been resisting the attempts of the Communists and other political parties to utilise the working class as a pawn in their political game. "If the Congress tries to do so, we shall resist any such attempts by Congressmen also," he added.

There were one or two controversial points that Mr. John raised on the occasion. For instance, he blamed the Government for the inordinate delay in bringing about legislation to abolish the Labour Appellate Tribunal. Whatever may be the labour point of view, one cannot expect the Government to ignore the points of view of other interests, including the employers, on this vital question. It may be recalled that, presiding over the 21st annual general meeting of the Employers' Federation of India earlier in the same month, Sir Homi Mody, President, vehemently deprecated this move to get rid of the Appellate Tribunal. He rightly emphasised the necessity to maintain a judicial machinery which would act as a corrective to individual judgments and ensure some sort of uniformity in the application of the principles that should govern the determination of claims in respect of wages, bonuses and the like. The country has had experience of industrial courts without an Appellate Tribunal such as the one that the country has today. So long at least as settlement of disputes continues to be through the medium of adjudication by law, it seems that an Appellate Tribunal cannot be done away with. It might be a different story if these disputes were settled by direct negotiations or voluntary arbitration as some labour ministers and labour leaders have been visualising for some time past.

Finally, attention must be called, I feel, to one of the resolutions by the Conference which requests the I.N.T.U.C. Working Committee to work out a scheme of norms with regard to the payment of minimum wages and other fields of industrial relations in which lack of uniformity is creating difficulties. This is a very wise move on the part of labour, and if this should lead to wages having some kind of a definite relation to production, the one issue which gives rise to the largest number of labour disputes would have been eliminated.

BUSINESS NOTES

THE STERLING AREA'S SURPLUS

The sterling area's gold and dollar reserves were $2,518 millions at the end of 1952. They have risen in recent months as follows:

	E.P.U. Settlement	Residual gold and dollar balance	Change in reserves
January, 1953 ..	+58	+ 30	+132
February, 1953 ..	+18	+ 74	+125
March, 1953 ..	+19	+ 15	+ 63
April, 1953 ..	+11	+ 76	+107
May, 1953 ..	+21	+ 14	+ 48
June, 1953 ..	+10	+ 8	+ 46
July, 1953 ..	+ 2	+ 51	+ 89
August, 1953 ..	— 6	Nil	+ 13
September, 1953	—15	+ 4	+ 17
October, 1953 ..	+ 6	+ 15	+ 34
November, 1953 ..	—15	+ 32	+ 41
December, 1953 ..	+ 4	+114	— 43*

* After taking into account the payment of $181 millions on account of the American, Canadian and E.R.P. loans.

The year-end reserves cannot still be regarded as satisfactory, because of three reasons.

(i) the recent liberalisation of imports from Europe will not be fully reflected in these reserves,

(ii) the present level of $2,518 millions compares with $3,867 millions at the end of the second quarter of 1951.

(iii) the present accretions are partly due to the sale of Russian gold, which may well prove to be temporary.

The surplus with the E.P.U. and the moderate deficits in the months in which there were no surpluses as well as the dollar balance have been encouraging throughout 1953, but the reserves must obviously be brought up to a much higher level, in view of the uncertain prospects for American business and American aid in the coming year.

AIR AGREEMENT WITH THE U.S.

The year-and-a-half old stalemate in the negotiations between India and the United States for a revision of the Air Transport Agreement entered into by them in February, 1946, remains unresolved. A crucial stage seems to have been reached now for, if due credence is to be given to Press reports, the Government of India has decided to give one year's notice of its intention to terminate the agreement.

It will be recalled that the Indo-U.S. Air Transport Agreement was the first inter-government agreement concluded by India and at that time this country had no direct interest of its own in international commercial aviation. India's operations were confined to her national frontiers and in this sphere her rights were fully safeguarded by the guarantee of the principle of cabotage—reservation of domestic air routes exclusively for national airlines. The Indo-U.S. Air Agreement, however, envisaged the future possibility of India entering international air transport and with this possibility in mind a clause was inserted in the agreement ensuring equality of opportunity to future Indian international operators. When India actually entered the international sphere of aviation, experience demonstrated that a theoretical equality of opportunity did not offer safeguards to her interests in view of the disparity between her and operators of other nationalities armed with the benefits of longer standing. In the air transport agreements which are currently in force between India and the U.K. and the Netherlands, a scheme of possible distribution of operating capacity has been ensured by the insertion of a clause offering equal rights. India's claim in the negotiations with the U.S. was that the agreement with that country should be brought on a par with the agreements in force with the U.K. and the Netherlands by a provision for allocation of capacity. The choice of termination of the agreement which this country has to adopt does not by any means constitute the last word and twelve months is an adequate time in which the notice after it is given can be rescinded. But this course is possible only if India's modest demand for some effective share in the traffic is conceded.

IMPORT POLICY FOR JANUARY-JUNE 1954

The scheme of token imports evolved mainly to set a standard for indigenous production has been continued. Provision for increased imports of essential consumer goods and also of the goods the import duty on which was stepped up at the commencement of the financial year has been maintained. In addition, steps have been taken to facilitate larger imports of industrial equipment and raw materials and also of a few items required by the consumers. The import quotas of only 22 items have been enhanced. These include betel nuts, safety razor blades, flashlight cases, essential oils, moulding powders and unset pearls. Provision has also been made for the grant of additional licences to established importers for increased imports of machinery, cation active finishing agents and scientific and optical instruments. The list of items open to new-comers and actual users has been enlarged.

Import quotas of 34 items have been stepped down. These include such diverse items as table fans and card cans and jams and jellies, lead pencils and hand knitting wools, cod liver oil and duplicators and also a large variety of engineering stores as for example, iron and steel screws, other than machine screws, brass, lead and copper wrought and copper wire.

A number of stores, as for example, electric motor starters, some drugs, medicines and chemicals, and a few kinds of surveying and mathematical instruments have been detached from the main serial number and importers will be required to establish separate quotas for these items. Other devices, as for example, limiting the extent to which licences can be used for import of specified stores or fixing the minimum value below which imports of certain items will not be allowed, have been adopted to secure a reduction in the import of 24 items.

Importers will now be able to obtain their licences even for multiple items on production of quota certificates if they are unable to present the licence for the previous licensing period. Those who have been unable to establish their basic imports in the past will have a fresh opportunity to do so. The established importers for some of items, as for example, machinery, cation active finishing agents, scientific and optical instruments, will be able to apply for additional licences. The system of grouping has been extended and importers will find it possible to import a number of allied items against their import licences. The import licences for most kinds of fabrics, some kinds of papers, most kinds of arms and ammunition, and almost all kinds of moulding powders have been made interchangeable.

The issue of Capital Goods licences for jute and hemp machinery has been decentralised. Rules relating to the grant of minimum value licences have been liberalised and small importers will be given licences for reasonable values to enable them to effect imports in convenient units.

Provision has been made for the first time to grant facilities to persons engaged in some lines, as for example, tailoring establishments, hair dressing saloons, dentists and opticians, to import directly their specialised requirements.

MILLETS DECONTROLLED

The final and complete decontrol of jowar, bajra, maize, barley and other millets from New Year's Day was a logical corollary to the earlier decision taken on decontrol on a restricted scale. It will be recalled in this context that only about a couple of months back, on 5th November, 1953, control on millets was lifted as within individual States, but the ban on inter-State movement continued. This ban now goes, and import and export of millets as between the various States is permitted unhampered except in Saurashtra, Madhya Bharat and eleven districts of Uttar Pradesh. These scarcity areas need the continuance of control and its desirability is underlined by the wide price fluctuations which took place recently in Saurashtra.

Production of millets has reached reassuring higher levels in the current year, the estimated increase in bajra being the highest at 14.5 per cent above 1952-53. Other millets have recorded satisfactory increases below this level. Last year's imports of millets too showed a healthy trend towards decrease and amounted to 1.3 lakh tons for 1953. In the current calendar year imports can be reduced to a much smaller quantity to strengthen the reserves, if necessary. The essential point about home production is the marked upward trend from 15.7 million tons in 1951-52 to 17.4 million tons in 1952-53, while the position for the current year will show a higher improvement. The increase in the availability of millets and the free trade channels through which it can be procured in the consuming areas will facilitate large numbers to revert to the consumption of cheap millets to which they have been normally accustomed and to that extent the pressure on rice will be eased. Apprehensions expressed in East Punjab and surplus areas of U.P. about the adverse effects of export on internal prices are probably not well warranted. The immediate repercussion of full decontrol is to push up prices by a moderate margin. In judging the nature of this trend the pent-up demand in deficit areas must not be overlooked. But over a sufficient period, prices will be stabilised at reasonable levels which will be in the interest of surplus as well as deficit States.

PROTECTION FOR SERICULTURE

Government's partial rejection of the recommendations of the Tariff Commission on the issue of protection to the sericulture industry has provoked unfavourable reaction. The industry as well as the trade question the correctness of the decision not to make any change in the present rate of import duty on a variety of raw and semi-raw materials. The Commission had made a specific and pressing recommendation suggesting a drastic reduction in the duty levied on raw silk and cocoons, silk yarn including thrown silk warps, silk yarns spun from silk waste and silk fabrics as a direct remedy to help bring down the production cost of indigenous silk manufactures. The effect of continuing the import duty at the present rate in pursuance of the Government decision will be to perpetuate the existing low purchase of overseas materials, which indigenous supply is not expected to supplement in a full measure. The official reason for refusal to reduce the duty rests on the belief that the wide margin of difference between the landed cost of raw silk and its market price prevents any possibility of carrying the benefit of the lower duty to the consumer as well as the weaver. Consumer preference for fabrics made out of imported raw silk, it is asserted, would be sufficient to sustain the higher market price. In receding markets and inadequate purchasing power, it is reasonable to expect that the internal market prices of the raw materials cannot but tend to find adjustment to lower levels. This issue will need reconsideration at the next periodical review.

The continuance of protection to the industry for five years ending 31st December, 1958, was only expected in view of the urgency of lending support to this cottage-cum-small-scale industry. Its failure to make any advance either in quality or quantity during the last about two decades of protection further emphasizes the necessity to tackle the problem on an organized basis. The Tariff Commission's recommendations about research, cultivation, methods of production, marketing, and so forth, confirm this approach. That will now be the major responsibility of the Silk Board.

STANDARD BATTERIES

Standard Batteries have registered another year of progress in their march. The system of distribution to different market centres and guarantee of product has been carried a stage further. In respect of guarantee, in particular, fuller benefit is being taken of the laboratory for testing facilities and claims against failures have now been reduced to a negligible proportion. It is the claim of Standard Batteries that they are seeking developments in different directions with the purpose of establishing indigenous production capacity to meet varied uses, with the requirements of any emergency in view if it should arise. Manufacture of aircraft batteries is being expanded and the firm has obtained exclusive authorisation to produce special types of batteries for the new trainer aircraft designed by Hindustan Aircraft. The demands of the defence services for a variety of specific kinds of batteries are also being met on an expanding scale and this patronage has been of direct assistance in diversifying the types of production. The indents of railways for cells have kept an upward trend, but more orders are deemed essential if production costs are to be reduced by fuller use of capacity. In the sphere of industrial use, sales are increasing and the limitation of manufacture of motor cars to a few chosen types pursuant to the Tariff Commission's recommendation has been welcomed as a desirable step in the direction of standardisation of ancillary equipment including batteries.

But financial results have shown a receding tendency and in spite of an increase of 15 per cent in the sale of units of batteries the net profit has shrunk. Mr. R. D. Char has stressed in his presidential address at the company's last annual meeting the need to cry a halt to the burden of labour costs which has clearly taken a rigid form. He has referred to the dominant need to pay greater attention to efficiency and labour productivity and has pleaded for a change in labour legislation to revive the confidence of managements to undertake schemes of expansion unhampered by restrictions such as those on rationalisation.

STATE FINANCE CORPORATION FOR BOMBAY

The Bombay Government is lining up with some other State Governments rather late in starting its State Finance Corporation, when the need for accommodation there is more pressing than in most other States because of the advances made by industry. The chief beneficiaries of the corporation's credit facilities will be the medium and small industries whose demands for funds to acquire plant, machinery and other categories of fixed assets will now be met on a larger scale and more favourable terms than before. The period of repayment may be allowed up to a maximum limit of twenty years.

Acceptance of applications for shares earmarked for non-official parties commenced this Monday and there need be no doubt that full subscription will be registered earlier than the final day of acceptance fixed on January 11th. The terms of the share issue are attractive enough in the context of the investment market. Out of an authorized capital of Rs. 2 crores divided into two lakh shares of the value of Rs. 100 each, the issued capital will be Rs. 1 crore consisting of one lakh shares. The allocation of the issued capital has been determined in the following proportions: 31,000 shares to be purchased by the Bombay Government and 20,000 shares by the Reserve Bank of India, giving them a majority holding. The remaining shares of 49,000 are to be divided between the institutional investors and other parties in the ratio of 44,000 and 5,000. The shares have been classified as trustee securities and approved securities under existing laws and they are given the cover of the State Government's guarantee as to return of the principal and payment of dividend. The rate of dividend has been fixed, tax-free, at a minimum of 3½ per cent per annum and the ceiling is 5 per cent per annum. Dividend is to accrue from January 1, 1954.

PETROLEUM EXPLORATION IN WEST BENGAL

An agreement between the Government of India and Standard-Vacuum Oil Company for the joint exploration for petroleum and production of petroleum if it is discovered in commercial quantities in West Bengal was signed in New Delhi recently. The agreement is the result of negotiations between Government and Standard-Vacuum which have been current for the last 18 months.

Government and Standard-Vacuum have agreed to contribute jointly the funds required for the operations. The Government will provide one-quarter of the expenditure and Standard-Vacuum will contribute the balance. The aggregate contribution of the Government will not, however, exceed Rs. 2½ crores unless the Government wishes to provide further contributions towards the continued expenditure for the project.

Standard-Vaccum has given the assurance that if commercial production of oil in sufficient quantities is established, it will consider the erection and operation of a refinery of a capacity of at least ten thousand barrels per day.

Standard-Vacuum will manage the joint operations. The Government and Standard-Vacuum will each nominate an official who will discuss from time to time the programme of the joint operation.

Standard-Vacuum has supplied petroleum products in India for the past sixty years and expects its business to grow with the further development of trade and industry in India. Two years ago, by agreement with the Government of India, an agreement was made for the construction and operation of a large refinery near Bombay. Today construction is well advanced. Several years ago, Standard-Vacuum indicated its interest in the possibility of prospecting for petroleum in this country. By subsequent arrangement, preliminary work including an aerial magnetometer survey, has been carried out. The Agreement signed now provides a basis for continuing and expanding the exploration work by means of a joint operation with the Government of India.

COASTAL SHIPPING

More than usual interest seems to have been aroused in the last few weeks in taking active steps to acquire additional shipping tonnage for the coastal trade. The Transport Minister's appeal made in Bombay about two months back to shipowners to give a concrete shape to their plans for expansion of their fleets is reported to have been received with encouraging response and it now remains for the Government to take a quick decision on liberalizing its terms of purchase loans. Improvised arrangements of chartering ships to pay the coastal trade are estimated to cost one crore rupees per year by way of hire charges and in view of the reservation of coastal shipping for Indian companies it has become all the more incumbent to eliminate the share of charter ships in this trade. The wide gap between coastal ships which have not run out their normal life and the Five-Year Plan target of 315,000 gross tons by March 1956 indicates that procurement will have to lay emphasis on the purchase of second-hand ships to anything up to three-fourths of the additional tonnage. This was also anticipated in the Plan.

Apart from additional tonnage, coastal shipping has pressing problems which need early relief. On the West Coast, in particular, dry dock facilities are quite inadequate and as progress continues to be made in increasing the fleets of the coastal companies this difficulty will be felt with greater hardship. The only facilities available on this coast are the two dry docks at Bombay and pressure on their capacity is too heavy. Long detention and delays involved in procuring repair or renovation facilities in these two docks inevitably cut into earnings and the contracting margin of profit. Mr. Pratapsinh Shoorji Vallabhdas, Chairman of the Malabar Steamship Company, pleads for reservation of one of the two dry docks at Bombay for coastal ships. Such exclusive reservation may not be feasible at an international port like Bombay and alternatively a system of priority for this trade will have to be devised. Its case becomes stronger in view of the difficulties about meeting the trade's demand for a third dry dock in the immediate future.

INQUIRY INTO DYESTUFFS

The Tariff Commission's inquiry into the manufacture of dyestuffs for its case for protection and assistance is currently under way. Although it may be assumed reasonably that assistance will be recommended directly on a generous scale, the investigation will have to be as thorough as possible in view of the basic importance of this industry. The need to lay its foundations securely in view of its fundamental importance to the chemical industries will also direct attention to chalk out a policy of protection that will be most conducive to its growth in the long term. An element of complexity is introduced in the inquiry owing to the multiplicity of the products of this industry which at once affect a number of manufactures.

For years this country's requirements of dyestuffs were satisfied exclusively by imports and the small beginning which has been made recently covers only a fraction of the various types of dyestuffs. The problems posed in expanding its coverage and growth in terms of output present genuine difficulties which will need careful tackling. The Chairman of the Tariff Commission has referred to the initial issue about the alternatives of building up the industry from the base with the production of the basic raw materials and starting with the use of final or penultimate intermediaries in the development of dyestuff manufacture. The arduous course involved in the first choice—from slow and costly growth of production of raw materials —and the element of initial risk that it carries have turned attention to the advisability of adopting the second choice in the first instance. The emphasis is on working from intermediaries downwards to the basic raw materials as a practical method of approach. Assistance to the industry is, therefore, indicated primarily in direct relief in import duty on intermediaries and on raw materials to the extent they are consumed by it. As for the protective duty on the types indigenously produced, the highly developed competitive strength of long established manufacturers abroad will be a weighty consideration.

COMPANY AFFAIRS

KESORAM COTTON MILLS LTD.

The working results of Kesoram Cotton Mills Ltd. (Managing Agents: Messrs Birla Brothers, Limited) for the year ended 31st March, 1953, disclose a drop in net profit, before providing for depreciation and taxation, from Rs. 101.04 lakhs in 1951 and Rs. 95.13 lakhs in 1952 to Rs. 48.35 lakhs in 1953. The position with regard to stocks at Rs. 135.76 lakhs is slightly better than the preceding year when they were as high as Rs. 170.67 lakhs. There is a sizable improvement in sales from Rs. 499.61 lakhs in 1951 and Rs. 575.06 lakhs in 1952 to Rs. 604.28 lakhs in the year under report.

Fall in profits has necessitated reduced allocations for depreciation and taxation. Rs. 25 lakhs have been transferred to the taxation fund as against Rs. 34 lakhs in 1952 and Rs. 37.17 lakhs in 1951. Provision for depreciation has declined from Rs. 8.92 lakhs in 1951 and Rs. 10.74 lakhs in 1952 to Rs. 7.62 lakhs in the year under review. Dividends on both preference and ordinary shares have remained unaltered at 7 per cent and 11-2|3 per cent per annum respectively.

Balance sheet as on 31-3-1953:

Capital and Liabilities:

	Rs.
Capital	1,40,00,000
Reserve Fund	75,00,000
Capital Reserve	1,45,87,000
Dividend Equalisation Fund	15,00,000
Sundry Liabilities	1,19,93,297
Profit and Loss Account	1,02,434
TOTAL	4,96,82,731

Property and Assets:

Gross Block	3,25,40,151
Depreciation	98,53,151
Net Block	2,26,87,000
Liquid Assets	2,69,95,731
TOTAL	4,96,82,731

FORT WILLIAM JUTE CO., LTD.

The working results of the Fort William Jute Co., Ltd., for the half-year ended 30th September, 1953, make an impressive reading. Unlike many other jute companies whose balance sheets have been received by us, sales have been maintained at the preceding half-year's level of Rs. 75.31 lakhs. Net profit, after providing Rs. 1,83,925 for depreciation, has advanced from Rs. 2.77 lakhs to Rs. 8.12 lakhs. The previous loss of Rs. 4.99 lakhs has been entirely wiped out. The directors have proposed transfer of Rs. 1,00,000 to the general reserve account which had been reduced to nil during the last two years. Favourable working results have also helped the directors to clear off the outstanding dividends on the cumulative preference shares for the preceding three accounting periods and the half year under review. Also, for the first time since March 1951, the directors have proposed a dividend of Rs. 5 per share on the 14,000 ordinary shares.

The balance sheet shows an increase of Rs. 49,025 in the gross block from Rs. 72,62,198 to Rs. 73,11,223 but depreciation having gone up by nearly two lakhs, net block stands reduced from Rs. 29.35 lakhs to Rs. 28.00 lakhs.

Balance sheet as on 30th September, 1953:

Capital and Liabilities:

	Rs.
Capital	24,00,000
Loans Secured	45,69,620
Reserve	1,00,000
Sundry Liabilities	7,90,915
Profit and Loss Account	2,915
TOTAL	78,63,447

Property and Assets:

Gross Block	73,11,223
Depreciation	45,11,118
Net Block	28,00,105
Liquid Assets	50,63,342
TOTAL	78,63,447

THE MOHINI MILLS LTD.

The Directors' report of the Mohini Mills Ltd. (Managing Agents: Chakravarti, Sons & Co.) for the year ended 31st December, 1952, discloses a steep rise in the figure for sales from Rs. 161.42 lakhs in 1950 and Rs. 200.20 lakhs in 1951 to Rs. 242.95 lakhs in the year under report. Stocks at Rs. 13.98 lakhs are lower by Rs. 5.48 lakhs as compared with the year 1951. Net profit, before providing for depreciation and taxation, has registered a sharp decline from Rs. 30.93 lakhs to Rs. 17.25 lakhs (including Rs. 1,00,000 transferred from the dividend equalisation fund). Fall in profits, state the directors, was due to Mill No. 2 because for a major part of the year Government-allotted foreign cotton had to be purchased at prices much higher than the current market rates. Manufactured cloth had to be sold at very unremunerative prices because of heavy slump in the market. Reduced profits have brought down the dividend from 7½ per cent to 5 per cent per annum. Allocations to both depreciation fund and taxation fund are dropped from Rs. 14 lakhs to Rs. 8 lakhs and Rs. 9.28 lakhs to Rs. 6.71 lakhs respectively.

It has not been possible for the directors to get the profits of Mill No. 1 of Kushtia transferred to the registered office. The directors applied to the State Bank of Pakistan for permission to transfer Rs. 15 lakhs out of profits of Mill No. 1. Despite the fact that they have complied with all the formalities and the requirements of the State Bank of Pakistan, the decision of the Bank is still awaited. The directors have been forced, in these circumstances, to declare that the dividend on the ordinary shares would be paid immediately after the profits are transferred from Pakistan to India.

Balance sheet as on 31st December, 1952:

Capital and Liabilities

	Rs.
Capital	59,88,257
General Reserve Account	5,00,000
Dividend Equalisation Fund	2,00,000
Machinery Renewal Fund	1,50,000
Reserve for Bad Debts	1,25,000
Sundry Liabilities	1,15,69,546
Profit and Loss Account	11,04,571
TOTAL	1,96,37,374

Property and Assets

Gross Block	84,54,400
Depreciation	67,06,257
Net Block	17,48,143
Liquid Assets	1,78,89,231
TOTAL	1,96,37,374

HEIGLERS GROUP OF COAL COMPANIES

The Directors' reports and the audited accounts of seven coal companies, managed by F. W. Heiglers & Co., Ltd., for the half-year ended 30th June, 1953, have been received for review. The names of the companies are Bhulanbararee, Borrea, Churulia, Ondal, Standard, Burrakur and Sendra. Borrea is the only company in this group which has been able to step up the ordinary dividend from 25 per cent to 30 per cent per annum. Churulia, Ondal and Standard have succeeded in maintaining the preceding half-year's level. Burrakur had to cut down dividend from 5 per cent to 2½ per cent while Sendra and Bhulanbararee failed, just like the preceding accounting period, to declare any ordinary dividend. The table below summarises the ordinary dividend record of all the seven companies during the last three half-years.

Ordinary dividend per cent per annum:

	30-6-1953	31-12-1952	30-6-1952
Bhulanbararee	Nil	Nil	5
Borrea	30(a)	25	30
Churulia	25|16	25|16	25|16
Ondal	20	20	20
Standard	20	20	20
Burrakur	2½	5	7½
Sendra	Nil	Nil	Nil

(a) Dividend 20 per cent + 10 per cent bonus.

Except for Burrakur and Sendra, all the other companies show sizable improvements in net profit (before providing for depreciation and taxation). Net profit of Borrea has advanced from Rs. 3.10 lakhs to Rs. 4.58 lakhs, of Ondal from Rs. 1.63 lakhs to Rs. 3.23 lakhs and of Standard from Rs. 2.13 lakhs to Rs. 2.64 lakhs. The table below outlines the movements in the size of net profit during the last three accounting periods:

Net Profit
(Before Providing for Depreciation and Taxation)

	30-6-1953 Rs.	31-12-1952 Rs.	30-6-1952 Rs.
Bhulanbararee	23,920	—24,706	70,545
Borrea	4,58,447	3,09,646a	3,97,522
Churulia	10,582	—10,257	9,391
Ondal	3,23,016	1,63,262	1,05,189
Standard	2,63,892	2,13,429	1,86,673
Burrakur	9,78,885	12,48,404	14,75,502b
Sendra	—69,988	—59,114	22,813

a—Refund of E.P.T. amounting to Rs. 63,743 included.

b—Refund of E.P.T. amounting to Rs. 1,55,568 included.

The directors do not subscribe to the view that there is a large unsatisfied demand. They are of the opinion that a majority of consumers have substantial stocks of coal and shortages, wherever they occur, are due to transport bottlenecks and restrictions. "In our view" they say, "there is a surplus production of coal above the country's needs, and this has led to the offering by some colliery owners of illegal rebates below the Government controlled selling prices."

COMMODITY NEWS AND NOTES

COARSE GRAINS AND GRAM DECONTROLLED

The Government of India have completely decontrolled coarse grains—jowar, bajra, maize, barley and other minor millets—with effect from January 1, 1954. When the decision to decontrol was first announced, it was emphasised that inter-State barriers would continue as before. These barriers against the movement of coarse grains will now be removed except in the case of Saurashtra, Madhya Bharat and 11 districts of U.P., namely, Gorakhpur, Gonda, Bahraida, Basti, Mirzapur, Jaunpur, Ghazipur, Ballia, Deoria, Azamgarh and Banaras. Export from these areas will not be permitted, but there will be no restriction on the import of coarse grains from outside. Coarse grains can now move freely through trade channels without the necessity of import or export permits. The decision to decontrol has been taken because of a marked improvement in the production of coarse grains in the country. In 1952-53, production amounted to 17.4 million tons as against 15.7 million tons in the previous year. This improvement has not only been maintained but enhanced during 1953-54, as the following figures of acreage under cultivation show:

Crops	1953-54 (1st estimate)	1952-53 (adjusted 1st estimate)	Average of preceding five years' corresponding estimates (1948-49 to 1952-53)
Jowar ..	26,192	24,606	22,588
Bajra ..	26,514	23,154	20,769
Maize ..	3,464	7,764	8,184
Ragi ..	4,771	4,598	4,667
TOTAL ..	65,941	60,122	56,208

The improvement in production has also been reflected in a rapid fall in prices of coarse grains in all parts of the country, especially in surplus areas. The majority of even those States which used to be deficit in coarse grains are now self-sufficient.

It has also been decided completely to decontrol gram with effect from January 1, 1954. There will now be no restriction on its movement from one place to another. Gram production in 1952-53 was 3.77 million tons as against the previous year's figure of 3.29 million tons. Reports on sowings in 1953-54 indicate that the next crop will be at least as good as the 1952-53 crop. There has also been a fall in gram prices, particularly in surplus States.

JUTE PRODUCTION IN U.P.

The quality of jute grown in U.P. is constantly improving. Keeping in view the Government's policy to encourage the raising of only quality fibre, the target of jute production has been fixed at five lakh maunds for the next two years, which should meet the entire requirements of the jute mills in the State. The evidence that better quality jute is being grown in U.P. is furnished by the fact that more jute mills are buying the commodity as it was in no way inferior to that grown in Assam or West Bengal. The Jute Development Department, which also makes marketing arrangements for cultivators, is encouraging the growth of co-operative credit sales societies in the jute growing belt. The disposal of raw jute will eventually be taken up by these societies in order to eliminate the middle man.

FREE EXPORT OF MUSTARD AND RAPESEED OILS

The Government of India has, it is learnt, decided that the export of mustard oil and rapeseed oil should be licensed freely up to the end of June, 1954. This means continuation of the present export policy in regard to these two oils for six months more.

PETROLEUM EXPLORATION IN WEST BENGAL

An agreement between the Government of India and the Standard-Vacuum Oil Company for the joint exploration for petroleum and production of petroleum if it is discovered in commercial quantities in West Bengal was signed in New Delhi recently. The agreement is the result of negotiations between Government and Standard-Vacuum which have been current for the last 18 months. Government and Standard-Vacuum have agreed to contribute jointly the funds required for the operations. The Government will provide one-quarter of the expenditure and Standard-Vacuum will contribute the balance. The aggregate contribution of the Government will not, however, exceed Rs. 2½ crores unless the Government wishes to provide further contributions towards the continued expenditure for the project. Standard-Vacuum has given the assurance that if commercial production of oil in sufficient quantities is established, it will consider the erection and operation of a refinery of a minimum capacity of ten thousand barrels per day.

U.S. NATURAL RUBBER CONSUMPTION GOES UP

As at the end of October, with the results of two more months still to be reported, consumption of natural rubber in the United States this year has already exceeded annual consumption totals for the entire years 1952 and 1951. The U.S. Department of Commerce reported recently that American consumption of natural rubber in October totalled 46,480 long tons. This brought consumption during the first 10 months of 1953 to 467,558 long tons—a gain of more than 100,000 tons over the 367,307 long tons consumed in the comparable period of 1952. Total consumption came to 453,846 long tons for the entire year 1952, and to 454,015 long tons for the entire year 1951.

JAPAN'S COTTON CLOTH EXPORTS IN 1953

Japan's 1953 cotton cloth exports are expected to reach 890 million square yards, an increase of 130 million square yards over last year, to top the list of the world's cotton cloth exporting nations, according to a survey of the Japan Cotton Spinners' Association. During the January-November period, she actually exported 804,872,000 square yards (Yen 56,350 million in value) of cotton cloths and 18,665,000 lbs. (Yen 5,071 million in value) of cotton yarns, which indicate a marked increase of 98,070,000 square yards in the volume of cloth, as compared with the corresponding period last year, but a drop of 4,555 million yens in value owing to the lowering of the export prices.

TOBACCO STOCKS ACCUMULATING

Mr. G. Latchanna, Andhra Agriculture and Forest Minister, told Pressmen recently that he had represented to the Union Food Minister, Mr. Rafi Ahmed Kidwai, the urgent need to explore foreign markets for tobacco. He added that over 40 million pounds of tobacco of last year remained unsold with the producers in Andhra State. The prices of tobacco, he said, had fallen from six annas a pound to about 1½ annas. He suggested to the Union Food Minister that the tobacco export trade should be done by the Governments of States producing it instead of by merchants as at present, to secure a minimum guaranteed price to the producer. China, Russia, and Japan, he said were the chief customers for Indian tobacco and in all the three countries the tobacco import trade was conducted by their Governments.

FOOD GRAIN IMPORTS IN 1953

The total quantity of food grains imported by India from abroad during the calendar year 1953 amounted to 2,017,850 tons. In 1952, 3.85 million tons were imported, and in 1951, 4.72 million tons.

COMPANY MEETING

THE CONSOLIDATED COFFEE ESTATES (1943) LTD.

Chairman's Speech at the Tenth Annual General Meeting of the Company, held on December 31, 1953.

Gentlemen,

On behalf of my fellow Directors I present to you the Balance Sheet and Profit and Loss Account for the same period.

As it is the tenth anniversary of the founding of our Company and as it is the last time that I shall have the pleasure of presenting these accounts to you personally, I am including additional particulars of our work and progress in my address which I trust you will find of interest.

I am glad to inform you that as a result of a very heavy coffee crop and a useful pepper crop, the year has again been a successful one.

The dividend which your Directors have been able to recommend is 15 per cent against 18 per cent last year. There are so many uncertainties related to the marketing of coffee in India today, and so many commitments have still to be met that it would have been imprudent to recommend a higher rate; also the 1953-54 coffee crop, though it is expected to be our second highest crop, will be some 300 tons lighter than the record crop covered by this report.

Ten lakhs have been transferred to General Reserve for the reasons which I have given above. One lakh has been transferred to the Debenture Redemption Fund and in July we were able to purchase Madras and Mysore State Loans against this Reserve, whilst the Balance carried forward to next year is much the same figure as the Balance brought in from last year.

In the Profit and Loss Account we have valued our coffee at Rs. 2-2 a point, against a valuation of Rs. 2-9 a point last year. Coffee prices ran up to undesirable levels in 1952, and a fall in prices was therefore necessary, but in my opinion the pendulum has now swung too far the other way, and I shall refer to this later. We have always left what we believed was a reasonable reserve in our valuations against eventualities and we have followed the same course again this year, otherwise our accounts would have been distorted.

Apart from the dividend, the main things which interest shareholders must be the crop, the condition of the estates, our expenditure both Revenue and Capital, our financial position and the market for our products. I propose to deal with each of these in turn.

The crop at 1938 tons was our highest by no less than 480 tons. This reflects the greatest credit to all on the estates. I must confess that I had always hoped to harvest a two-thousand-ton crop whilst I was still in charge of the Company, but someone else must now have this pleasure. The pepper crop was useful, the cardamom crop fair and the paddy and orange crops on the whole poor.

In the coming season we expect a more than useful coffee crop. We had at one time hoped for the same sort of crop as we have just harvested, but the prolonged drought scorched up much of our robusta (as well as spoiling our paddy and oranges) and the showers when they did come were late, and in many cases backing up rains were lacking. Taking all in all, therefore, we are not faring badly. Pepper should be about an average crop. Oranges will be a useful though late crop on some of our estates, cardamoms fair, but the paddy harvest this year will be a bountiful one, and nearly double that of last season.

The estates I am glad to report are in excellent condition; prospects for next year are correspondingly good, and it is possible that I may have missed the two-thousand-ton crop by only one year. The potential for an even larger crop than that is there if only our blossom showers and the following up showers, which can be equally important, do not let us down.

We are beginning to reap the reward for the patient work of replacing old coffee which was commenced by our predecessors, the Consolidated Coffee Estates, Ltd., a sterling company, and has been continued by ourselves.

When we purchased these estates in 1943, they included 246 acres of arabica and 700 acres of robusta, all seven years of age or younger, representing a replanting of old coffee, most of it during the depression. In the past ten years we ourselves have replanted or opened up 660 acres of arabica, 645 acres of robusta, and have purchased 125 acres of good young robusta, thus over one-third of our acreage is made up of young coffee. I believe that the clearings and replantings of today are definitely better than those of ten years ago. New techniques of planting, raising cover crops, raising shade, manuring, pest control and soil preservation have been adopted, and better seed material is now available. It is a heartening thought that much of this young area has still to come into profit.

The older coffee also has responded well to the more generous treatment we have been able to give it in recent years.

The references to plantation crops are brief in the Five-Year Plan; but there is a comment about the tea industry which is completely apposite to coffee today:

> "A remarkable fact about tea plantations is that while the area under tea has remained unchanged for over a decade under International Agreement, production has increased by about 43 per cent over this period. This incidentally brings out that where sufficient capital is invested, yields can be increased appreciably."

Unless the coffee industry is permitted to accumulate and reinvest sufficient capital to bring its estates into an economic condition, the yields of Indian coffee will remain the lowest in the world.

Our pepper has helped us splendidly. Here we are reaping a reward for a policy of planting pepper, and maintaining our vines, during a period when the pepper market was very depressed. The average crop for the first five years since 1943 was 45 tons, and for the second five years 79 tons. Our crop increased at a time when pepper prices also increased, and has been of such value during the last five years that it has more than paid our ordinary dividend during this period. The value of our pepper during these five years was Rs. 32,61,300 while the cost of our Ordinary Dividend for the same period was Rs. 29,89,200. I do not pretend that your Directors have related these two items together when considering their dividend policy. On the other hand they have realised that these very high pepper receipts are in the nature of a windfall, much of which should be ploughed back into the Company. They have given us courage to accelerate our labour and staff housing

and welfare schemes, and to commence introducing amenities such as piped supplies of water and electric light, which are taken for granted in cities, but which were completely lacking on our estates, and indeed are still lacking on most coffee estates.

Pepper prices are now well over the peak, but this is a commodity we can produce relatively cheaply and we shall endeavour to make up for the fall in prices through an increase in our crops. Newer methods of propagation and maintenance show promising results.

Oranges to which we had attached great hopes have disappointed us. The five years' drought from which the whole of South India suffered injured the trees wherever these were being grown without a cover crop of coffee, and even in the more favoured places many trees have "frenched" and must be uprooted. We have installed machinery to supply overhead irrigation to one block of oranges, and have hopes that this may provide an answer to the short life of the loose-skinned Coorg orange in rainfall districts like ours. Lemons, limes, grape-fruit and tight-skinned oranges are all much hardier, and we have planted a fairly large acreage of all these fruits in our young robusta coffee, so that various types of juices may be available for our Fruit Juice Factory.

The dry years which have upset our Coorg oranges have also checked any real development of our cardamoms.

Our paddy crop this year as mentioned earlier, and in spite of late rains, will prove an excellent one. Much work has been put into the improving of our fields, their water supplies, the methods of cultivation and the selection of types of paddy to grow particularly on our more difficult high fields, and all these must in due course be reflected in our crops.

When we come to our expenditure, I regret to say that our overall estate expenditure again shows a considerable rise. Part of this is due to the cultivation of a larger acreage, but most of it is due to a policy of doing more intensive work on our estates in the belief that this will enable us to harvest larger crops, for the only logical way of meeting our ever rising costs is through increasing our yields, and all our thoughts and endeavours go to this end, and appear to be accompanied by a measure of success. In calculating average crops it is desirable to work on a six years' average, so that the hazards of the weather may be cancelled out and allowance made for the two or three-year cycles in which coffee bears its high and low crops. When we purchased these estates the average arabica yield was 2.01 cwt. an acre and robusta 4.27 cwt. For the last six years, these averages are 4.08 and 5.46 respectively.

It is obvious that there is scope for great improvement in both these figures, particularly when our large area of young coffee comes into bearing.

The expenditure per acre on our coffee has risen from Rs. 220-6 in our first season to Rs. 667 in the season just concluded.

Our Capital Expenditure has gone largely to rehousing our uncovenanted staff and labour, and last year Rs. 3,34,835 were spent under this heading.

Increasing crops necessarily involve the spending of more money on enlarging our drying grounds and coffee stores and improving our pulphouses. The application of additional fertilisers after the monsoon has called attention to our shortage of manure stores. It is not possible to run lorries into many of our estates after the monsoon, and fertiliser must therefore be transported as an upload during the crop season and stored on the estate till required from August onwards.

In the last few years our estates have been largely mechanised as regards transport, spraying and the supply of water. Mechanisation should lead to economies, but its great advantage is the assistance it gives us in carrying out our work at the proper time, and correct timing is the key of most agricultural operations. What is not always realised is that once mechanisation is decided on, many other things automatically follow; the metalling of the main roads through our estates, otherwise our tractors cannot run, the provision of extra accommodation not only for the tractors and implements, but als for the driver and where there is much machinery for a mechanic. We have found tractors to be definitely preferable to lorries on our estates, and we are using them to an increasing extent for cultivating our paddy fields.

Ten years ago the value of the stores and spare parts on the estates as at 30th June was only Rs. 2,67,772. Today it has increased to Rs. 12,64,945, all of which has had to come from our Reserves. The largest item is grains, which shows an increase of over four lakhs, for in 1943 it was unnecessary to lay in a year's supply of food for our labour as we have to do today. In addition due both to the delays in the making of payments from the Pool, and to the cut in size of these payments we have to try and maintain higher fluid cash resources to enable us to meet our day-to-day expenditure.

A policy of restraint in declaring dividends has assisted us to carry out these and other improvements. The total profits we have earned since 1943 are Rs. 1,37,10,232 of which 37 per cent only has been distributed by way of dividends, 10.6 per cent paid or reserved for taxation, 16.58 per cent has been spent on the rehabilitation and rehousing of our staff and labour, and the remainder has been ploughed back into our business.

The marketing of coffee in the past year has, as in the previous four years, been governed by factors, many of which are irrelevant to the marketing of an agricultural commodity. In the earlier years the insistence directives from Government were to maximise exports even at the expense of the consumers, for coffee was judged to be a luxury and the country was said to be in dire need of foreign exchange. In spite of advice that this would seriously affect internal prices, this policy was persisted with, and matters came to a head in 1952 when coffee prices soared to unprecedented heights. Now, in a most curious way, growers are being blamed for the result of a policy that they have always opposed. Then for a period the rightful needs of the consumer were at last recognised. Now the pendulum has swung to the other extreme; a low return has been arbitrarily fixed for the producers, and as prices are now presumably low enough for the consumer, most of the considerable profits on exporting coffee are being piped off to the Central Exchequer by means of an export duty of Rs. 62-8 a cwt., neither the producer nor the consumer benefiting in any way from this arrangement.

Incorrect policies bring their own nemesis with devastating swiftness. With coffee, there have been three such instances within the last two years.

(a) The export policy of Government in 1952 as mentioned above resulted in a rise in internal prices which was unprecedented.

(b) The halving of the quantity of coffee exposed in Pool Auctions in December 1952 followed by the failure to hold Pool Auctions in January resulted in coffee prices rising again, whilst the Board was left with no finance to meet even the initial payments to growers when they delivered their coffee to the Pool.

(c) The lack of any internal or export sales policy in 1953 has resulted in the accumulation of vast and deteriorating stocks of coffee, mostly robusta, which could have been exported, but must now be consumed in India, and once again the Board are unable to meet their commitments to the growers.

Now a fourth instance has arisen regarding what constitutes a fair return to the grower for his produce. An arbitrary and incorrect decision has been taken and this is already causing distress to growers in all districts. This distress is increased today, as the Board's borrowing powers are quite inadequate to finance the holding of their huge stocks and at the same time enable them to meet even the normal first payments made to growers when they deliver their coffee to the Pool. Any grower without good credit is puzzled how to find the finance for the maintenance of his estate, to pay for his fertilisers which should be delivered by crop lorry within the next few months and to pay for his grain stocks. In Coorg these are normally purchased direct from the threshing yards. Such decisions must in the end be corrected, but in the meantime much unnecessary hardship is caused. This matter is most urgent, and it would afford relief all round if, as the Coffee Board has already requested, it could be settled by some independent Tribunal at as early a date as possible. As the Central Government will receive over a crore of rupees from the Industry this year the request is eminently reasonable.

The statement of Dr. Punjab Rao Deshmukh in October is pertinent:

> "I fear that our attempts at the marketing of agricultural produce have all an atmosphere of isolation from the rural community, as it often appears to be an attempt to impose things from above. No structure which is not based on the co-operation of the parties concerned can be durable or expected to stand by itself".

There are no marketing difficulties concerning coffee which cannot easily be resolved if the advice of those who grow and market coffee is sought in a spirit of co-operation, goodwill and understanding.

The decision to impose an export duty was passed by Parliament in November, and in the course of the debate in the two Houses the unwished for honour of being singled out for discussion fell on our Company, and the novel suggestion is reported as having been put forward by the Minister that "the Consolidated Coffee Estates will get only Rs. 250 (an acre) and nothing more and a small man may also get Rs. 250."

Some small men are most efficient growers, whilst some of the larger estates are poorly cultivated. It is not clear whether what the Minister proposes is assistance to the small grower or to the inefficient.

We welcome any proposals which will increase the welfare of the small planters, but if it is desired to devise production disincentives for our own Company, we trust we will be permitted to devise them ourselves.

The increase in our coffee area is due to two things, the ploughing back of a substantial part of our savings and our having obtained Rs. 23,33,000 of additional Capital from the public, most of which came from our own shareholders.

So far our policy has been to go in for more and still more intensive cultivation of our land. As a result of this the employment **per acre** over ten years has increased as follows:

Managers	17%
Staff	108%
Artisans	768%
Labour	100%

Our use of fertiliser per acre has increased by over 400 per cent.

Our use of chemicals per acre by over 250 per cent.

We could reduce our expenditure under any of these main headings, and our crops and profits would then fall till we reached the figure permitted by Government, but I hope that such a policy will never be forced on us.

I am reminded of a famous cartoon of the time of the Franco-Prussian war. The French had just introduced the newly invented mitrailleuse or machine-gun to their army, and a French soldier is shown looking up from his gun over a field strewn with corpses. Underneath is the caption:

"Hullo! The battle is over, I must have turned the handle too quickly."

This appears to be the difficulty which has arisen not only with our Company, but with other growers who by efficient methods have succeeded in obtaining even higher yields. We have gone ahead too quickly and achieved too great success in our battle for the economic production of coffee.

We had never viewed our policy from this light before. The urge throughout the Five-Year Plan is to increase production, to increase employment, to save capital and to reinvest it. All these things we have done. These views are summarised in a nutshell in the Peoples Edition of the Five-Year Plan:

> "An increase in the stock of capital—accompanied by knowledge of how to use it to best advantage—will lead to an increase in the community's output of goods and services and so to a rise in its material well-being. This may be put shortly in the phrase 'the key to economic progress is capital formation'".

I trust that a more balanced and dispassionate view of the whole coffee industry may yet prevail.

I may be excused if I quote again a remark of Sir Russell Kettle's, extracted from "Capital" which I quoted three years ago to you.

> "We are not concerned with the political aspects of company profits, but in view of the controversy which rages round this subject there should be a proper appreciation of facts. Profits are a material factor in creating and maintaining employment; they encourage new ventures and the expansion of trade; they enable fresh capital to be raised and national wealth to be augmented; they provide a material proportion of taxes to defray Government expenditure, including expenditure on social services, and they are the source of the income on the invested savings of numberless individuals of moderate means. The myth that companies are owned by a comparatively few wealthy and avaricious shareholders dies hard. Those who regard the earning of profits as a social evil or even as a crime might reflect upon the consequences which would follow their suppression or dissipation."

Surely there is much wisdom in this quotation.

I do not know whether or not coffee is India's most heavily taxed agricultural commodity but it must come close to it. Our own estates will have directly met or provided no less a sum than Rs. 14,41,371 to the Central and State Governments as a result of last year's working.

Such contribution from our 6,767 acres of coffee comes to Rs. 213 an acre made up as under:

		Per acre
1.	Land Tax	Rs. 2|-
2.	Agricultural Income Tax	„ 59|-
3.	Excise Duty (on 1,686 tons sold internally)	„ 105|-
4.	Export Duty (on 252 tons, our proportion of the 3,000 tons exported) ..	„ 47|-
	Contribution per acre	Rs. 213|-

This omits the Income Tax payable on our Dividends and the Income Tax payable by our Staff.

All this from land which would otherwise yield no revenue, and if untended, would hardly provide grazing, and of which at least another three lakh acres still lie neglected and fallow in our hills.

It is difficult to understand why there should be such controversy about one relatively small Company, when there is enough abandoned waste land in the Malnad to support another forty companies our size Surely instead of this sort of unprofitable unpleasantness, goodwill should be created to develop this vast neglected asset.

It is appreciated that when this development does take place, as some day it must, though conditions can never be more favourable than they are today, Governments will draw up their own plans of action Nevertheless, although there are many skilled planters whose estates yield better crops than ours, it simplifies the arithmetic if we calculate the direct benefit the country would receive if this area were cultivated by companies similar to our own and providing similar taxation. Then the Central and State Governments would reap a taxation reward of Rs. 5¾ crores annually, and coffee exports of 80,000 tons worth Rs. 55 crores and more would make coffee India's fourth most important export. Consumers could then be subsidised to a degree which has not been conceived today, and at the same time very adequate encouragement could be given to producers. This is an ultimate object, but even on a comparatively slower rate of development we should be able to export at least 24,000 tons of coffee worth Rs. 17 crores, within a period of 15 years if the encouragement to do so was given.

As far as we are concerned, I do not believe that it is fully appreciated that we are a Rupee Company, that 86 per cent of our share capital is owned by Indians, that although we employed no Indian covenanted staff in 1943, today we employ seven against eleven Europeans, and a further three Indians are employed in non-officer grade posts on salaries alone exceeding Rs. 300 a month. An inaccurate statement even on this matter was furnished to Parliament which is why I mention it now.

More important is the fact that we have no fewer than 1,400 shareholders. In other words, each of our shareholders owns on an average something less than five acres of coffee. If the habit of investment is to be encouraged, should not these people be encouraged also, provided that no anti-social policy is involved? Many of them depend on their dividends for their living, and in good faith, we have to do our best for those who have supported and relied on us.

No place for coffee was found in the Government of India's First Five-Year Plan. One reason might very well be the oddity of an Agricultural subject being placed in the Commerce Portfolio, but this means that an additional responsibility was placed on growers to ensure that all aspects of developing their industry were carefully studied. We can make many excuses for failing to put forward our case, but the blame lies with us, and planters must see that it is not repeated.

To return to our Company, at Kushalnagar there was an increase in the quantity of coffee cured from 1,092 tons the previous season to 2,054 tons in 1952-53. This was a splendid achievement.

Our Fruit Juice Factory is still in the Pilot stage, and we have had to wait for certain machinery to enable us to proceed with our production. The quality of the products manufactured is excellent.

In March of next year I shall be leaving India on my final furlough, for my employment by the Company will cease finally next September. Your Directors have given very careful consideration to the arrangements which will have to be made after my departure. Mr. R. C. Paterson who is at present both our Secretary and one of our Directors will take my place as head of the Company. Mr. D. H. Dasappa, a Director and one of the most knowledgeable coffee planters in Coorg, has kindly agreed to act as Visiting Agent for our estates. Two of our senior managers one in North Coorg and one in South Coorg will see that his instructions are properly carried out. We hope to strengthen the planting side of the Directorate by persuading a well-known planter to join the Board. The Directors of the Company have requested me to pay one more visit to India in two and a half years' time, and to report on the estates, which I hope I shall be able to do though in a private capacity.

We have succeded in building up a splendid coffee team in our Company, and I have no doubt at all, that whatever our achievements have been in the past, those of the future will put them in the shade.

And now it only remains for me to thank my fellow Directors for the help and guidance they have given me throughout the year.

I must congratulate our managers and all those employed on the estates, in the Curing Works and at our Head Office for the splendid results achieved by their labours during these years, and also thank them for the loyal and unfailing support they have at all times given to me.

POLLIBETTA, IVOR BULL,
31st December, 1953. Chairman.

Your "next day" neighbour...

Over 30,000 passengers have already flown by B.O.A.C. Comet Jetliner since the world's first service was inaugurated in May 1952. Ask any one of them about this miracle of effortless flight... about the comfort and quiet as you cruise eight miles a minute... the lack of vibration and absence of travel fatigue. Then you will understand why B.O.A.C. is miles ahead in air travel. And why your next flight to Japan, Singapore or Bangkok must be by B.O.A.C. Comet Jetliner.
No other airline flies so far so fast...

Consult your local B.O.A.C. Appointed Agent, or B.O.A.C. Offices in Bombay, Delhi, Calcutta or Madras

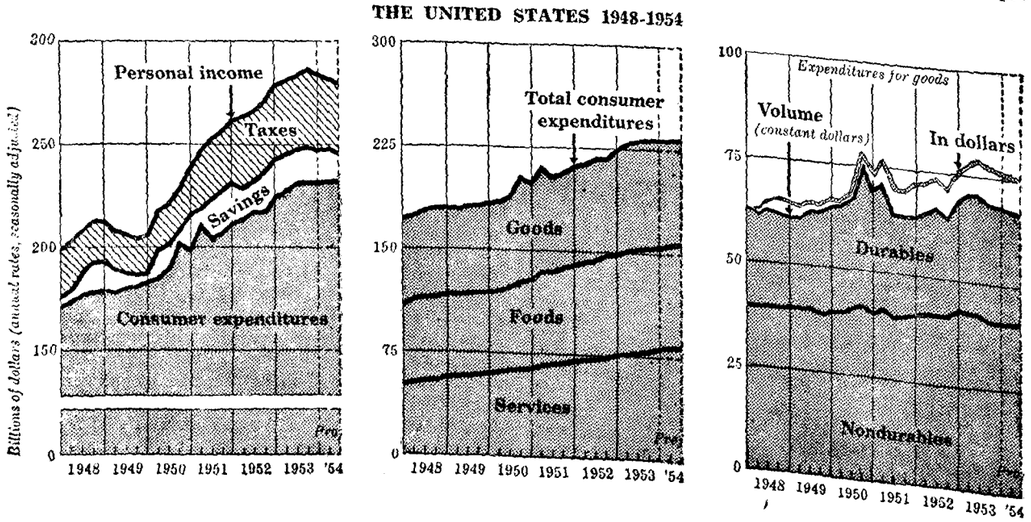
1954: Recession or Readjustment?

THE grand debate has gathered force this week. Is 1954 to be a year of recession, or merely a year of readjustment or downturn? In India, the differences between these words are scarcely understood. They are American symbols in ascending order of magnitude to describe the range of drops in business activity short of depressions. A 'downturn' is merely a levelling off of previous rises. A 'readjustment' implies a fall in activity such as that which occurred in 1949; this was a fall of about four per cent in industrial production in the United States from the 1948 level. A 'recession' is something of the order of a drop in business activity of over ten per cent. A 'downturn' can be taken by the United States in its stride and the Free World with some little difficulty. A readjustment can be absorbed readily in the United States, but will cause severe repercussions abroad, as a four per cent fall in American production has tended to be reflected by a twenty per cent reduction in imports from the sterling area. Anything like a recession of ten per cent in real terms of American business would shake almost every trading partner of the United States.

Which of these declines is portended in available data at the beginning of 1954? The economists are fairly divided. Colin Clark in Britain and Paul Douglas in the United States prophesy a recession, the latter being a little more pessimistic than the former in proclaiming that the recession is already on. Senator Douglas argues on very inadequate data. The production of automobiles is 12 per cent below last year; mail order sales, chiefly to farmers, are down 16 per cent; carloadings are down 12 per cent as compared with the comparable period last year. Business failures are 50 per cent higher, and steel production in the last two weeks of December was just about seventy per cent of capacity. This is a gloomy picture. But it only shows how erroneous particular figures can be. There is no indication that total consumption expenditure in the United States has fallen.

Given below are the most trustworthy figures set in graphical form. They have been abstracted from Department of Commerce figures and set out by 'Fortune'. They show a levelling off; a downturn and no more. Mr. A. S. Goldberger and Mr. L. R. Klein, notable econometricians of the Department of Economics, University of Michigan, describe forecasts from their mathematical model as revealing a "mild downturn". In this forecast gross national product (at 1939 prices) moves down from about 180.1 million dollars to 174.8 million dollars for 1954. This latter figure is 2.8 million dollars above the 1952 figure of 172 million dollars. Even more comforting is the figure given for consumption in 1939 prices which is 117.3 million dollars for 1954 against 116.1 in 1953 and 111.4 in 1952; in other words, there is to be no net decline in consumption expenditure. The fall is almost entirely in gross private capital formation which is scheduled to drop (at 1939 prices) from 26.0 million dollars in 1952 to 22.7 million dollars. There would appear, therefore, to be a slowing down of new investment; no significant slowing down on consumer demand.



There is no doubt there is some producer hesitation already, and almost all the facts presented by Senator Douglas are the sensitive points in the American economy which reflect this change. But the insensitive points of the American economy greatly exceed the sensitive points. Senator Douglas's picture is certainly unjustified in its gloom.

The safest bet in this conflict between the experts is that 1954 will see a readjustment of the same order as that which took place in the United States in 1949. This is a sufficiently gloomy prospect. And we in India cannot afford to ignore the impact of such a readjustment on our economy. It is almost certain that we will benefit by a drop in the prices of machinery; but equally it is almost certain that there will be a decline in our market for hessian, where Pakistan competition is now beginning seriously to tell. Pakistan has only three large mills but they are reported to be working triple-shift while India's mills by the working agreement are limited to a 42½-hour working week with 12½ per cent of the looms sealed. The future of the jute industry should be causing serious concern. A downturn of any kind in the United States is bound to affect hessian sales. The wisdom of retaining any export duty on hessian at the present time can certainly be questioned.

It is obvious, however, that it is not only our hessian exports which will come under pressure. Any downward movement of prices in the United States will certainly affect almost all our exports, and, with a rigid cost structure like the present, India is in no favourable position to enter into a price-cutting race. The possibility of an American recession thus tends to underline the need of a price policy which will enable adjustments to take place in India before they are forced upon us by the readjustments in the United States. We have, indeed, some capacity to manoeuvre in the fact that we still have a small range of export duties which can be removed. If the readjustment is of the order of two or three per cent as forecast by Messrs Goldberger and Klein, the removal of the export duties might be sufficient to keep our exports at their current levels. If the readjustment is larger than five per cent (which seems prima facie unlikely), a serious reconsideration of labour policy will be inevitable.

To the extent that an international factor operates to reduce our prices, there will be additional scope for deficit financing to increase to cope with a fall in internal prices. This is not, however, in all circumstances a consummation devoutly to be wished. While the acceptance of deficit financing has now won widespread support, the greatest caution will need to be exercised that deficit financing does not price us out of our export markets, even after the export duties have been removed. It is vital that the Indian system should be carefully studied with the same techniques which are being used in the United States to determine the result on prices of varying changes in certain coordinates of the system. Has India any econometricians? This is the time for a search to be made for those who can prophesy with a good mathematical model as a guide. If India has no econometricians, here at least is one field where a foreign technical expert can profitably be set to work.

THE UNITED STATES 1948-1954

The Praja Socialist Dilemma

WHEN the Praja Socialist Party held its first National conference in Allahabad last month to take stock of its position and plan for its future, there seemed to have been a distinct loss of the confidence which it had developed earlier. Six months earlier, at the Betul convention in the middle of June, the Party could look back to a satisfactory record of bye-election successes which appeared to indicate growing preference for the P.S.P. as a constitutional opposition. The talks on coalition earlier in the year, between Mr. Nehru and Mr. Jayaprakash Narayan, had also conferred more political importance on the Praja Socialists than what would ordinarily have been possible on the basis of the votes or seats secured by them in the general elections. Apparently, it was that confidence which inspired the unanimity of opinion at the Betul Convention against opposition for the sake of opposition and favouring a constructive approach vis-a-vis Congress Governments and their policies. The complaint against the Congress organisation and the Government then was mainly that they were unwilling to translate into action the ideas which they professed; and the task of the P.S.P. was felt to be to step in only where the Congress had failed.

All these ideas suffered modification later in the year and had raised anxiety over the organisational aspect of the party. The starting-point of the change was the negotiations over a coalition government in Andhra and the Congress Party's stand over the status of Mr. Prakasam. It is not possible to hide the fact that whatever the merits of the stand of the P.S.P. leadership, there has been a serious tactical defeat for the P.S.P. in Andhra when Mr. Prakasam was forced to leave the party. It was made worse when the bulk of the rest of the party was also alienated. The position in Andhra today is, if the expectations about a general election in June materialise, that there would be a polarisation of the two parties, Congress and Communist, the prevention of which has hitherto been regarded as the raison d'etre of the P.S.P. That role was particularly appropriate in Andhra because of the vantage held by the Communists, partly on the basis of the opposition vote, which the K.M.P.P. and K.L.P. had earlier shared. The leadership of the P.S.P. may have reasons to feel self-righteous about its stand in relation to its Andhra wing, but, in the event, it has been proved a serious political miscalculation.

It has exposed the lack of restraint and cohesion in leadership which are vital at least in the formative stages of a political party. The reaction to the Andhra reverse has not been to bring in a chastened mood but a persistence in courses which could only cause further confusion. The decision to have an electoral arrangement with the Communists in Travancore-Cochin, in opposition first and subsequently in office if that should be possible, fits in precisely with the Communist policy disclosed at Madurai. It was a far cry from the coalition with the Congress, discussed in March, to the working electoral partnership with the Communists later in the year. A narrow conception of political expediency might well have dictated such a course; but then if expediency had been the criterion there should have been no difficulty in finding a modus vivendi with the Andhra P.S.P., which would have saved the party from premature collapse in that area. A political party is certainly more than the sum of its membership; it would not, however, follow that the membership is, therefore, easily expendable.

The existence of the "present malaise" in the P.S.P. is not denied. At Allahabad, the General Secretary of the party, Mr. N. G. Goray, presented a report which has analysed the reasons for it. Unfortunately, the report seems to have concentrated attention more on organisational discipline than the achievement of cohesion on the basis of firm programmes and policies. It is difficult to detect the presence of such cohesion even in the highest levels of leadership of the party; the consequent uncertainty in the ranks is only natural. The lack of a close touch with the people of various ranks, which the Goray report has deplored, cannot come merely through organisational discipline of the kind which is transmitted from above. There has been lack of sufficient emphasis on constructive work at the primary levels because such work can only be practicable through co-operation with administrative agencies. Such co-operation need not necessarily affect the identity of the Praja Socialist creed or its organisation. So long as a mood of petulant anger prevents such co-operation, which any political opposition in a democracy can offer in its own, and in country's, long-term interests, the feeling of frustration cannot obviously be avoided.

The Congress Party has two major accomplishments to present before the country—its foreign policy and the economic programme comprised in the Plan. The Praja Socialists have hardly been able to work out alternatives to either on which they could take a stand in an unrelenting manner, regardless of consequences, if they are actually so irrevocably opposed to Congress rule. "Whatever mistakes of omission or commission our Government may have done in details in its foreign policy", Acharya Kripalani declared at Allahabad, "its position of non-alignment by whatever name called, as between the two Power-blocs, the Anglo-American and the Russian, is the only correct position that a peace-loving nation like ours can adopt at the present juncture". The criticism of the 'details' of this policy has never seemed at any time to have been strikingly appropriate. With a mixture of hindsight and extreme irresponsibility, leading P.S.P. spokesmen have freely indulged in talk of what could have been done several years ago, to avoid facing the question of what specific changes of day-to-day policies they would advocate now and why. Such vague charges like the failure to build up a third force can never carry any conviction; they may sound clever, but they do not ring true.

The general hostility to the Five-Year Plan is more pronounced and less hesitant. There will be few to disagree with the general criticism, made from any quarter, that what is being done in not enough. Such dissatisfaction is the mainspring of initiative. But has the P.S.P. a concrete alternative? Would the P.S.P. oppose the Government's irrigation programme or power schemes as now conceived? Does it dislike the community projects, or the rate of railway rehabilitation? Obviously it cannot be dissatisfied, because of its political doctrine, with the fact that the private sector has not been fully assisted so far to play a larger role. The policy of land redistribution, on which alone the P.S.P. seems to have something of a missionary zeal, is not a complete economic policy. The old slogans of nationalisation, decentralisation of industry, swadeshi or equality are there; are they enough at least to give the party rank and file the impression of a distinctive policy, which justified the extent of opposition and non-co-operation which is advocated in the political sphere with the Congress administration? The latest feat of the policy commission of the Praja Socialist Party at Allahabad has been to think up the giant sum of Rs. 60,000 crores as the capital outlay needed on economic development and to contrast it with the pigmy of Rs. 2,000 crores offered by the Government of India in the first Plan. No one, wishing the growth of the P.S.P. for the role of a constitutional democratic opposition, can view with equanimity these extremely unhealthy political tactics. Whether the ensuing electoral experiences in Travancore-Cochin, P.E.P.S.U. and possibly Andhra, will bring more wisdom, cohesion and sense of responsibility remains to be watched.

Streamlining the Service

THE news that Dean Appleby will be visiting India again and that the Institute of Public Administration, which he recommended, will soon be established illustrates the persistence of attempts to improve the public service. Unfortunately, however, the services themselves have not, at any rate recently, been excessively enthusiastic about these attempts.

The evils to be treated are recognisable. Civil servants holding offices which are impressively described, have been less and less able in recent years to take decisions or to accept responsibility. Integration of the services has been a major unsolved problem in the former Indian States, and it has destroyed morale on a very big scale. Even at the Centre, post-war reforms seem to have had two broad effects. They have created frustration in the middle ranks, and strengthened the feeling of casteism within the public service the cadres functioning as castes in effect—as the Prime Minister himself has not been slow to recognise; and the difficulties of the initial constitution of the cadres being what they are—inevitably, for example, the I.A.S. is staffed by comparatively inexperienced men—it has been all to easy for politicians to get out of the habit of relying heavily on the services. An Institute is hardly the answer to these problems.

It is already to be feared that the public service is not drawing the best talent that there is in the country. Ministers, who have been in the rough and tumble of politics, naturally get the feeling of being more closely in touch with their constituents than the civil service. At the same time, in the rush of paperwork, the increasing remoteness of the Secretariat, which even in the old days, contrary to the general impression, was quite evident to non-official Englishmen, is becoming more and more apparent. Junior civil servants are naturally overwhelmed in these circumstances by the multitude and complexity of modern administration. Their preponderance in the services, inevitable in the conditions which prevailed after independence, has led recently in the south to the creation of Commissioners' divisions, in defiance of a hitherto-established tradition.

The seniors, however, for their part, are no longer competent to decide matters. Taking orders from those who do not any longer belong to their own class, they have even to some extent lost confidence in themselves. And, not unimportantly, in quite a few positions, the salaries in the public service are no longer adequate. The difficulties of attracting talent to the higher judiciary have, for instance, been so conspicuous recently that the question of liberalising conditions for resuming private practice, in the case of retiring judges, has had to be re-examined. Some old-established rules are also being waived at the present time in the case of scientific personnel. This increasing awareness of the need to make public service more attractive may help. Nevertheless, general administration has become, perhaps, slightly less attractive on balance than it used to be.

It is no secret that the Prime Minister has been interested for some time in putting matters straight. He has preached to and even at the services, whenever, in recent times, there was an occasion. He has openly favoured some more flexible system of recruitment, outside the Public Service Commissions perhaps, for the technical posts. A system of titles for distinguished service has also been revived; and while Dean Appleby's services are again being requisitioned, the Prime Minister has quite recently been busy laying down standards of dress in the public service, and has tried to force monogamy on civil servants—to the extent, that is, that this is an imposition.

These are laudable attempts. The anxiety to reform the public services, by nagging if necessary, and to use them as the spearhead of reform is the counterpart of the Prime Minister's impatience of intolerable or bad working conditions and of his quite well-known desire that Government should set an example to all other employers in the matter of emoluments and amenities. But all the same, it does no good to be impatient and to undermine the feeling of confidence and security which was built up after independence, especially by Sardar Vallabhbhai Patel. It is possible to carry the idea of converting the public service, by artificial means if necessary, into an enlightened and reformist class a little too far—just as the idea of providing ideal conditions of service in respect of employment under the State can degenerate easily into pampering.

Whether civil servants are or are not able to conform in practice to standards, which are from time to time laid down for them (and much more can obviously be said on the matter of dress which has been the subject of the Prime Minister's recent circular), it is unfair both to the services, and to society outside of them, to lay down the law for a class. It is hardly appropriate to seek to introduce desirable reforms, provided they are desirable at all, by forcing them on a serving class by means of executive fiats—instead of legislating for the entire nation.

If the public service in India is in need of improvement (as which growing bureaucracy is not?) the proper and appropriate remedy is not to restrict the freedom of its members, or to provide set and academic courses of instruction for their benefit. The real decisions may be hard for a ruling party to make. But nevertheless, they must be made. Madras has set an example in this matter—even at the cost of personal unpopularity for the Chief Minister.

Interference by non-officials in the day-to-day administration has been severely restrained in that State. Madras was also the first State to insist that senior officers must be posted back to it, so that they could be available for training the others. After all, there is no substitute, even today, for district experience; and if prolonged stay in the districts is apt to make one conservative, and to induce disbelief in the virtues of mere paper plans and programmes, this is not an attitude which need be entirely regretted in the civil service. On the contrary, this may be just the tradition to promote in the permanent service, as a counterblast to the Ministers' tendency to change everything and to introduce ill-digested reforms. Even Madras, however, does not go far enough.

District experience is valuable. But it is no longer adequate in many appointments. The difficulties which the Government of India has experienced, in succession, in finding legal draftsmen, managing directors of companies, and persons qualified for higher office in the Reserve Bank, are the consequence of the almost complete neglect so far of training within the civil service, in the sense of providing a succession of jobs intended to enlarge the experience of individuals and to qualify them for particularly difficult offices. The time has arrived when the key positions, calling for special knowledge, can no longer be filled, as they have recently been, as a result of a mere chance. Dean Appleby's idea that there must be greater mobility and selection by merit must obviously be explored more fully than it has been.

It must be recognised above all that the public service cannot be improved in isolation from the rest of the community, or be expected to conform to standards which are not common to the entire society. To seek to improve the administration, but to pay utterly inadequate attention to the quality of education in the universities, is most assuredly not to put first things first. In this sense, there can be no divorce at all between improving general standards and the standards of the civil service. One may wonder sometimes whether this is appreciated quite as much it should be.

THE WEEK'S NOTES

THE STATE OF THE AMERICAN UNION

President Eisenhower's State-of-the-Union message covers a very wide range of subjects. The President has emphasised the great "strategic change" in the world during the past year which has given the initiative to make the United States policy "not limited to mere reaction against crisis provoked by others." The theme of U.S. foreign policy, he declared, was "to hold this new initiative and to use it." In the field of foreign assistance and trade, which the President called was the practical application of U.S. foreign policy, the main principles were stated as follows: "Military assistance must be continued. Technical assistance must be maintained. Economic assistance can be reduced." This reduction of economic assistance, however, was mainly in relation to Western Europe and the other areas in which objectives are being achieved. The President also declared his intention to propose in his Budget message that the Secretary of Defence should have "primary responsibility for the administration of foreign military assistance in accordance with the policy guidance of the Secretary of State."

Defence policy took a prominent place in the President's message and contained the suggestion to Congress that American defence would be stronger if the U.S.A., under appropriate safeguards, shared with her allies certain knowledge of the tactical use of nuclear weapons. This has been one of the red rags to Congress all along. A second subject which has made Congress allergic for more than a decade is the question of participation in the St. Lawrence Seaway Project sponsored by Canada and the President has in this case also earnestly sought Congress approval in the name of security and economic advantage. The domestic programme was prefaced with assurances on the elimination of subversives in Government and readiness to propose other measures to combat subversion, including forfeiture of citizenship rights. The indications given of the Budget proposals revealed a lower level of revenue and expenditure. Individual income-taxes have been reduced and the Excess Profits Tax has expired and more tax reductions have been promised along with reduction in expenditure. The current fiscal year has shown tangible evidence of saving of $7,000 millions and a further $5,000 millions of saving is promised in the next fiscal year. There is a promise of revision of the tax system by removal of restraints on the growth of small business and the burdens on small tax-payers; for business that wants to expand or modernize its plant there is promise of "liberalised tax-treatment of depreciation, research and development expenses, and retained earnings." Whether all this would fulfil the fears of recession caused by the prospect of a lower government spending or release new forces of expansion may be debated. The President's message has certainly given the first impression of a bold, new programme.

INDO-CEYLON UNDERSTANDING

Prime Minister Sir John Kotelawala, who will arrive in Delhi shortly, has already built up an atmosphere of friendliness in this country of which he will see sufficient evidence during his brief sojourn. His statements have from time to time raised expectations about a satisfactory outcome of the long-standing problem of the citizenship of Ceylon Indians, which is now the only source of differences between India and Ceylon. The immediate internal political reactions of a fair settlement of the question of citizenship have probably figured more prominently in Ceylon hitherto than the long-term benefits of close co-operation between the two countries. This does not mean that the two countries are not co-operating sufficiently already but that a better understanding may be reached when this vexed question is put away and ceases to affect Indo-Ceylon relations. Recent reports have indicated the possibility of voting rights being conferred on Indian residents without citizenship. This status of "denizens" will probably be explored more fully at Delhi and it is unnecessary at this stage, when its implications are not clear, to pronounce on its adequacy as a substitute for citizenship for any section of the Indians. As this point is said to have been raised at an earlier stage with the Indian Prime Minister the Government of India must by now have been able to decide its attitude.

Sir John Kotelawala's other desire to bring the South Asian Governments into closer contact to exchange views on common problems has secured a very favourable response not only from India but also from the other countries concerned. The initiative came at a time when Indo-Pakistan differences on the question of U.S. military aid were at their sharpest. The Pakistan Prime Minister has indicated that he would refrain from attending the entire meeting of South Asian Prime Ministers or those sessions in which military aid to Pakistan is discussed, if at all. Such a boycott would make the meeting a farce. If the plea of domestic jurisdiction is raised on any vital issue which affects the relations between any two countries, even such informal discussions as those now contemplated will become useless and get wrecked on legalistic detail. Obviously national sovereignty can clothe any act with sanctity and prevent any problem from being regarded as common. The test must be whether there are reasonable grounds to consider that the policy of any one or more country creates sufficient reactions among the others to make it a common problem for purposes of informal discussion. No meeting of Asian Prime Ministers would be necessary to exchange friendly greetings or discuss commonplace matters. Sir John Kotelawala's prior visit to Karachi was, therefore, appropriate, and should have made him wiser on the question whether the time for a meeting is now suitable.

U.S. ECONOMIC AID TO INDIA

The two operational agreements between India and the United States signed during the last two weeks show a different type of utilisation of U.S. foreign assistance to India. For 1953-54, the United States has authorised a sum of $77.1 million to India under her foreign aid programme, which, with the $88.35 million authorised in the earlier year (under the technical assistance programme) brings the total U.S. aid to $165.35 million, besides the wheat loan of 1951. However, of the $77.1 million now authorised only $16.6 million is technical aid of the kind already received and the balance of $60.5 million is economic aid. This change in designation is of some significance because the technical aid granted could only be absorbed at the rate at which the various aid projects made progress with the result that the unutilised balance of foreign aid has been high. Together with the recent favourable payments position, which has prevented the utilisation of other foreign assistance and of the sterling releases available, the impression has been created that there are limits to the capacity of the Indian economy to absorb foreign aid. This impression has to be corrected and the two operational agreements show the directions in which economic aid is needed and still can be utilised effectively for development purposes.

The first operational agreement allocates $20 million for the purchase of 100 W.G. broadgauge locomotives and 5,000 freight wagons (of both gauges), which will accelerate the pace of Indian railway rehabilitation. The existing arrangements for rehabilitation under the Five-Year Plan would still leave 1,500 locomotives and 12,000 wagons overaged and in need of urgent replacement, while the rate of internal production will

hardly be able to supply these requirements. The second operational agreement provides for the purchase by India of 200,000 tons of steel which is about half the shortage in the current year in respect of plates, rails, sleeper bars and sheets. The cost of the steel is $25.5 million and a special feature of the agreement is that purchase is permitted on a global tender basis.

EMERGENCY—THE LEGISLATIVE FICTION

Some disquiet has at last been manifested in parliamentary circles over the tendency of the executive to resort to ordinances as a convenient instrument of enacting legislation under the plea of emergency. The Constitution has rightly provided a method by which the executive can act quickly in a real emergency when Parliament or the State Legislatures are not in session. There are stringent conditions prescribed in Articles 123 and 213 for the ratification of an ordinance by the Legislature. That should be sufficient indication of the spirit in which the emergency powers should be exercised. Further proof, if required, of the exceptional character of the emergency powers can be gathered from the fact that so long as Parliament is in session, no law can be enacted, whatever the nature of the emergency, except under the due parliamentary procedure. There is now sufficient ground for the feeling that the spirit of the Constitution has been flouted on a number of occasions by the Government of India on various pretexts. The ordinances enacted at the end of October last related mostly to Bills which had been pending for some time and could well have waited till the session of Parliament was convened early in November last. In none of them could it be proved that any serious crisis could have arisen if Parliament had been asked to give priority as soon as it met, or if approval was sougnt in the earlier session if there had been sufficient forethought.

It is another of such spurious emergencies that will be created when the Press (Objectionable Matter) Act expires at the end of this month. The Ministry of Home Affairs had only the diligence to prepare a draft Bill and introduce it in Parliament but not to get parliamentary approval, obviously because the power of ordinance is handy in such cases. The executive may even choose to quibble over the language of the Constitution and say that the word "emergency" has been excluded and that on each occasion the President must only be satisfied that "circumstances exist which render it necessary for him to take immediate action". The impropriety of stretching this language to cover every ostensible necessity of the executive is obvious. It would at the same time be inappropriate for Parliament to devise fetters on the exercise of this authority because of frequent abuses of it. The President is already placed in the embarrassing position of having to declare that he is "satisfied" whenever the Council of Ministers decides on immediate action. It is for the Cabinet to exercise this special power in a more responsible manner in order to set up healthy conventions for the future.

PACE OF AGRARIAN REFORM IN MADRAS

The Malabar Tenancy Bill passed by the Madras Legislative Assembly last week has marked another step forward in the policy of agrarian reform in Madras State which commenced with the Tanjore Tenants' Protection Act of 1952. It is difficult to simplify the very complicated pattern of tenure-holding that has developed in Malabar. But the existence of a large number of tenants and landless workers in Malabar has given an impression of the existence of landlordism in the sense of concentration of ownership, which is contrary to facts. The Madras Chief Minister pointed out during the debate that out of 450,000 pattas (holdings with proprietary rights) 430,000 were covered by assessments of less than Rs. 50 per annum. About 120,000 of these "landlords" owned less than 10 cents. There were 9,000 pattas assessed between Rs. 50 and Rs. 100 and only 6,000 assessed at above Rs. 100. The agrarian discontent is mainly the result of an increasing pressure on land of a growing population. In this situation, while the Government can intervene to protect tenants by prescribing lower shares of the crop as rent, the welfare of the community as a whole did not warrant any directly discriminating policy in favour of tenants alone to the disadvantage of the small landowner, in such matters like the resumption of direct cultivation of land.

Even so, the Bill now passed restricts the landlord's right of bona fide resumption of cultivation by declaring that no tenant should be liable for eviction if he or his family has been in occupation for 6 years. There has been an increase of allowances for expenses of cultivation. Safeguards have been provided for other kinds of evictions. The rent paid by tenants, equal to half the assessment, in addition to a share of the crop, has now been abolished. A limit has been prescribed to any future increase that may be awarded in the process of fixing fair rents to be paid by tenants.

This measure has synchronised with another measure for protecting the tenants of South Kanara from eviction. It has been provided that, subject to the payment of the current rent, no cultivating tenant in South Kanara district can be evicted from his holding for a period of one year. This measure can only be a prelude to other steps for dealing with the problem in a more comprehensive manner later on. These agrarian reform measures have come in a piecemeal fashion, mainly because the problems in the various areas are dissimilar. But the progress has been steady, even if it appears slow to those who are zealous for land reform in the abstract.

BOMBAY BAN ON ENGLISH TEACHING

The dogmatic and self-righteous attitudes of the Bombay Government on public policies, which are of a highly controversial nature, are matters of common knowledge, though the danger of intolerant and highly opinionated governments riding roughshod over public opinion has been increasing in other areas also. The latest directive of the Bombay Education Minister to prevent English teaching schools from admitting pupils other than pupils belonging to the Anglo-Indian Community or of other citizens of non-Asian descent has far-reaching implications. Ostensibly it is in pursuance of a policy adopted in 1948 that English should be gradually replaced by Hindi and that instruction should be restricted to Hindi and the mother tongue, except for the Anglo-Indian community. The wisdom of that general objective need not be questioned. But whether it should be implemented in the intolerant manner in which it is now being attempted is the issue that is raised by this new directive.

Obviously the existing schools will be affected. There are about 31 Anglo-Indian schools which, when deprived of the Indian students who form perhaps more than half the total strength, will be left financially weak. This will affect their capacity to work well even for the benefit of the Anglo-Indian students but there is no technical breach of the assurances given to this community. The other English teaching schools have to adapt or perish gradually. That is still a lesser loss than the deprivation of the right of an Indian citizen to choose for his children the type of education which he regards as most suitable among the systems available. English is still the best common medium for all the regions in this country and it remains the most acceptable to persons belonging to other States who live in Bombay State and for whom both the Bombay regional languages as well as Hindi would be equally foreign. Others may see in an early English education and rightly, a stronger foundation for a sound technical or specialist education. There remains the question of the nature of the right which Article 29 of the Constitution guarantees; if it cannot extend to cases like this, it is time to question its value.

WORLDGRAM

TRADE

Export of Iron and Manganese Ores: The Government of India had announced the licensing procedure for the export of iron and manganese ores from the port of Calcutta up to December 31, 1953. The Government of India have reviewed the position in the light of available transport capacity and have decided to license the export of these ores to both established shippers and mine-owners from the port of Calcutta during the quarter January-March, 1954, on the same basis as for the quarter ending December 31, 1953. Intending exporters are required to apply to the Joint Chief Controller of Imports and Exports, Calcutta for their export allotments.

INDUSTRY

New Heavy-Duty Tyre: The new Firestone Earthmover tyre contains more than 100 pounds of Rayon Cord with a total length of over 64 miles. The weight of rubber in this tyre is approximately 400 pounds (compared to 11 pounds in an ordinary passenger tyre) and each tyre contains more than 200 pounds of various chemicals. The 21.00-24 contains more than a mile and a quarter of beadwire weighing 24 pounds (compared to half a pound in an ordinary passenger tyre). The load capacity of this tyre is 15,490 lbs. at 25 m.p.h., 17,350 lbs. at 10 m.p.h. The prescribed rim is 15" and the maximum section width is 23". The height of the tyre is 69". The total weight of 748 pounds compares to a normal passenger tyre's weight of 24 pounds. Thus the Firestone Earthmover tyre weighs more than 30 normal passenger tyres.

* * * * * * *

Steel for Indian Development Projects: The Government of India and the U.S. Technical Co-operation Mission have recently signed a $25.5 million project for augmenting India's steel supplies. The agreement, which makes 200,000 tons available for industrial and economic development, is the second in a fortnight covering economic aid in the fulfilment of the First Five-Year Plan. It is anticipated that 43 per cent of the new steel will be devoted to railway rehabilitation, wagon building, etc. 23.5 per cent will go to the steel processing industry for ship-building, hospital equipment, tubewells, etc; 20 per cent for agriculture and rural development; 8.5 per cent for river valley development; and 5 per cent for small-scale industry and cottage industries.

* * * * * * *

India Signs Agreement on Oil Exploration in West Bengal: Intensive exploration of the Ganges-Brahmaputra basin in West Bengal for petroleum will be undertaken jointly by the Government of India and an American oil firm under an agreement signed recently. The agreement increases the possibility that India will be able to meet its own requirements for petrol, kerosene, lubricating oils, and other petroleum products.

* * * * * * *

World's Most Self-Sufficient Loco Factory: Fifty-four locomotives were rolled off the Chittaranjan assembly lines during 1953, an average of more than a locomotive a week. The Chittaranjan "W. G." locomotive weighs about 120 tons, and takes some 5,300 parts and components to manufacture each engine. These works are now producing over 80 per cent of these parts for which early 1,000 different items of machinery and plant are maintained and operated. The workshop has separate foundries for iron and brass, a forge, a smithy, a light machine shop, a heavy machine and wheel shop, a tool room, an erecting shop, a boiler shop, etc. There are in operation nearly 1,440 electrical motors with a total cumulative horse-power of 13,500. The works and offices occupy a total area of one million square feet, and the Chittaranjan township houses about 30,000 persons.

* * * * * * *

Protection to Sericulture Industry to Continue: The Government of India Resolution on the Tariff Commission's report on the continuance of protection to the sericulture industry has recently been published. The recommendation that the protection granted to the industry should be continued, has been accepted. Government are, however, unable to accept the recommendations of the Commission which involve drastic reductions in the duty levied on raw silk and cocoons, silk yarn including thrown silk warps, silk yarn spun from silk waste and silk fabrics. Existing rates of duty in respect of these items will, therefore, continue.

* * * * * * *

National Research Development Corporation: The National Research Development Corporation will exploit inventions of the network of National Laboratories and Research Institutes, patents and inventions of different departments of the Government of India, the State Governments, commodity research committees and other statutory research organisations. If any industrial concern agrees to bear the cost of setting up a pilot plant or afford facilities for the conduct of pilot plant trials, it will be permitted to use the results of research free of any royalties for a fixed period. The results, however, would be the property of the research institutions and the Corporation will be at liberty to make them available to other parties and the firm will have no claim to royalties or other income accruing from the exploitation of research results. The authorised capital of the Corporation is Rs. 1 crore divided into 100,000 shares of Rs. 1,000 each. Government has agreed that the Corporation should have a subscribed capital of Rs. 10 lakhs of which Rs. 5 lakhs will be paid during 1953-54 and Rs. 5 lakhs in 1954-55 when the shares will become fully paid-up.

* * * * * * *

Development of Indian Handloom Industry: Further loans and grants for the development of the handloom industry in different States have been sanctioned by the Central Government out of the Rs. 4 crores earmarked for the development of the industry during the financial year 1953-54. The total of grant and loans sanctioned up-to-date during the current financial year is Rs. 2,55,85,331. This includes Rs. 1,31,47,231 by way of grants and Rs. 1,24,38,100 by way of loans. The Government of India have sanctioned the payment of a further grant of Rs. 16,880 to the Orissa State Government for the development of the handloom industry in the State. The amount includes Rs. 10,880 to be spent on improvement of designs and Rs. 6,000 to be spent on standardisation of handloom cloth. Government have also sanctioned a grant of Rs. 2,338 to be Hyderabad State.

FINANCE

More Sterling Releases to Egypt: The British Treasury is considering an Egyptian request to release £10 million sterling under the 1951 Anglo-Egyptian Sterling Agreement. It is learnt that the British Treasury have already released £5 million at the request of the National Bank of Egypt.

* * * * * * *

Five-Year Plan for British Guiana: A £14 million five-year development Plan for British Guiana is proposed on behalf of the World Bank. The Plan has been prepared by the survey mission of the World Bank, which spent six weeks in British Guiana studying the Colony's economy. The mission suggests improvement of techniques in the cultivation of sugar-

cane and rice, and better communication facilities in the interior.

* * * * * * *

Capital Issue in Australia: The Defence Reparations Act, which was passed soon after the Menzies Government assumed office, to empower the Government to gear the national economy for war and to sustain controls against influences expired recently. The sweeping powers contained in the Act renewed annually, were never invoked except to maintain the control of capital issues begun during war-time. Control of of Capital issues was maintained rigidly till the end of 1949, then temporarily suspended in 1950, and reapplied in 1951 in an effort to divert public savings from the booming stock market to Government loans. In the last 18 months, this control had become less rigid, and its disappearance will have no noticeable effect on Australian economy. The Government will surrender all the drastic wartime controls over materials, power, transport, productions and investment, not otherwise contained in the Constitution.

* * * * * * *

U.S. Economic Aid to Europe to End on June 30, 1954: Mr. Harold E Stassen, Director of the U.S. Foreign Operations Administration stated recently that U.S. economic aid to Europe would virtually end during the present fiscal year (by June 30, 1954). Mr. Stassen mentioned Turkey, Greece and Spain as "exceptional situations" that would require continued economic aid, and stated that the amount of economic aid required in the fiscal year beginning July 1, 1954, would be less than at any time during the past five years. Generally, there would be less money needed for military and economic assistance, while a greater amount will be required for technical assistance.

* * * * * * *

World Bank Suspends Czechoslovakia: The World Bank announced recently that Czechoslovakia had been suspended for failure to pay 625,000 dollars owed by her on subscription account to the Bank's pool of lending money. Czechoslovakia is the only Communist country among the Bank's 55 members. Czechoslovakia's total subscription is 125,000,000 dollars of which she has already paid the 18 per cent—22,500,000 dollars —in her own currency. She has owed 625,000 dollars on the 2 per cent account to be paid in gold or U.S. dollars for two and a half years.

* * * * * * *

Allocation of U.S. Military Aid Funds to Middle East Countries not yet Finalized: The U.S. Congress, in the Mutual Security Act, authorised $50 million for allocation of military aid to countries of the Middle East of which $30 million has been appropriated for the current fiscal year. None of these funds has as yet been allocated; the matter is still, under actice consideration.

* * * * * * *

Temporary Terminal Tax on Mela Passengers Ordinance Issued: The Uttar Pradesh Tax on Railway Passengers Ordinance, 1954, providing for the levy of a terminal tax from January 7 to March 15, stations 1954, on passengers travelling by Railway to certain in the Kumbh Mela region, was promulgated by the Union President. The proceeds of thus special tax will be passed on to the U.P. Government to meet heavy expenditure incurred by the State Government in this period and the Railways will act merely as collecting agencies.

AGRICULTURE

Forest Utilisation Board Reconstituted: The Government of India have decided to reconstitute the Central Avisory Board on Forest Utilisation to give further weightage to industrial, agricultural and consumer interests. The Board was set up in 1939 to stimulate and to ensure active liaison between forest research and industry. The functions of the Board will be: (a) to assign priority to various items of research, (b) to co-ordinate research with the needs of industry, agriculture and the general public, and (c) to forge links between producer, consumer and research.

MISCELLANEOUS

Indian Co-operation with the U.N.E.S.S.O.: The Indian National Commission for Co-operation with U.N.E.S.C.O., the first conference of which took place in Delhi recently, will promote better understanding of the objects of the U.N.E.S.C.O. by the people in India, and will serve as a liaison agency between the U.N.E.S.C.O. and the institutions working for the progress of education, science and culture, and for acting in an advisory capacity to the Government of India in matters concerning the U.N.E.S.C.O.

* * * * * * *

French Armaments in 1954: M. Pleven, Minister for Defence, explaining the Defence Budget before the Defence Committee of the National Assembly, stated that the French Army in 1954 would have an additional 1,600 officers, 5,000 N.C.O.'s and 9,400 regular soldiers, which represents an increase of 8 per cent in officers, 10 per cent in N.C.O.'s and more than 17 per cent in long-service men.

* * * * * * *

Kumbh Mela and the Indian Railways: Indian Railways expect to be called up to carry between 3.2 million and 3.6 million passengers at the annual Kumbh Mela. For peak periods, the Railways have made arrangements for 270 trains operating daily through nine stations every five minutes, day and night, for several days on end. Third Class passengers will receive special consideration. The total cost to the Railways in connection with the Mela may be about Rs. 75 lakhs. Over 10,000 Railway staff will be concentrated in the Mela area.

* * * * * * *

Pakistan Finance Minister Inaugurates Fourth Economic Conference: The Pakistan Minister for Finance and Economic Affairs, inaugurated the Fourth All-Pakistan Economic Conference recently in Karachi. The Conference was attended by delegates and observers from Japan, Russia and Czechoslovakia and a large number of economists and business men from all over Pakistan. The Minister called upon the Conference to analyse the factors which had kept countries like Pakistan under-developed and give guidance for making the country strong and prosperous. He said the fiscal policy of the Pakistan Government was directed to promote agriculture and industry and a considerable lee-way had been made in this respect.

* * * * * * *

Polio Vaccine Heads List of Top U.S. Medical Achievements of 1953: The development of a promising vaccine against infantile paralysis, which succeeded last year's discovery that the blood derivative gamma globulin is capable of providing temporary protection against polio, was rated by experts as the top U.S. medical achievement of 1953. Mass field trails of the new vaccine, developed by Dr. Jonas E. Salk, are planned for next year. Preliminary tests indicate that it may protect inoculated children, for three years, or longer, against the three known types of polio virus.

* * * * * * *

World Health Organization Executive Meeting: The Thirteenth Session of the W.H.O. Executive Board and a meeting of all W.H.O. Regional Directors, will take place in Geneva, where several problems of vital importance to economically underdeveloped countries will be discussed. These include proposals for an increase of W.H.O.'s regular budget in order to offset the irregularity of funds made available, by governments through the U.N. technical assistance programme to facilitate effective planning in international health work. The Organisation plans assistance to over 100 countries, on projects of health improvement.

NEWS IN BRIEF

INDIAN

The Government of India have reviewed the export policy for linseed oil and have decided to continue to license its export freely on shipping bills up to the end of June 1954.

* * * * * * *

A 'Handloom Week' will be observed shortly throughout India to emphasise the importance of the handloom industry and its capacity to clothe India's millions. The All-India Handloom Board has decided the week should be an annual feature, to popularise the use of handloom fabrics. State Governments will be subsidised.

* * * * * * *

The Government of India have reviewed the export policy of kardi seed, niger seed and their oils and have decided to continue to license export of these commodities freely on shipping bills up to the end of June, 1954.

* * * * * * *

Three training centres for officers in charge of Development Blocks and the National Extension Service are proposed to be opened with effect from April 1, 1954, with financial assistance from the Ford Foundation. The total cost of the three training centres for a period of three years is estimated at Rs. 8.47 lakhs or roughly about Rs. 2.82 lakhs per centre.

* * * * * * *

Passport administration in India, which has so far been carried on through the States, is to be centralised under the Government of India through the Ministry of External Affairs.

* * * * * * *

The Government of India have, it is learnt, decided that the export of mustard oil and rapeseed oil should be licensed freely up to the end of June 1954. This means continuation of the present export policy in regard to these two oils for another six months.

* * * * * * *

A target of five lakh maunds of quality jute for the next two years to meet the requirements of jute mills of Uttar Pradesh has been fixed by the State Government. Co-operative credit sales societies in the jute growing belt are being encouraged by the Jute Development Department for the purpose of marketing arrangements for cultivators.

* * * * * * *

The Finance Minister of Madhya Pradesh presented to the State Assembly a second supplementary estimate of Rs. 61,61,476, for the year 1953-54. The estimates include a grant of Rs. 6,50,000 for purchase of general tools and plant for major and minor irrigation projects, Rs. 7,70,000 for establishment of basic-cum-extension training centres for village level workers, Rs. 12,00,000 for welfare of backward classes and removal of untouchability and Rs. 10,00,000 for famine relief work. An expenditure of Rs. 14,90,000 has also been provided for local development works.

* * * * * * *

The Union Ministry of Rehabilitation has sanctioned Rs. 75,000 to the Government of Uttar Pradesh for advancing loans for educational purposes to displaced persons in the State.

* * * * * * *

For relief work in flood-affected areas of the country, the Indian Red Cross Society has received Rs. 1,500 and Rs. 1,000 from New Zealand and the Greek Red Cross Societies, respectively. The National Christian Council Relief Committee in India has donated 137,500 lb. of skimmed milk powder.

* * * * * * *

The development committee on the Automobile Industry is due to meet in New Delhi, to review the progress made so far, and to discuss proposals for the manfacture of heavy and medium trucks.

FOREIGN

The Government of Portugal, a member of the North Atlantic Treaty Organisation, has announced a record budget of $246,000,000 for 1954, with 30 per cent allocated for defence.

* * * * * * *

National Savings in Britain in 1953 were £1,142,000,000 ($3,197,600,000), while drawings from savings amounted to £1,147,000,000 ($3,211,160,000). The "dissaving" in 1953 was £5,000,000 ($14,000,000), as against £26,000,000 ($72,800,000) in 1952.

The United States has more than three-quarters of the world passenger cars, and almost half of its trucks and buses, according to registration figures.

* * * * * * *

Italy has distributed 637,000 acres of farm land to 52,000 peasant families in three years of its land reform programme. Italy has also spent 38,000,000,000 lire ($60,000,000) for construction of farm houses, land improvement, irrigation and farm equipment.

* * * * * * *

The world supply of newsprint in 1953 was estimated at 10,880,000 tons—an increase of 290,000 tons over 1952.

* * * * * * *

Ceylon's Rubber Commissioner recently stated that the Government of Ceylon was offering China first option of buying the surplus of sheet rubber, estimated at 15,000 tons this year.

* * * * * * *

Under the Technical Co-operation Scheme of the Colombo Plan, Mr. P. H. Mainprize, former lecturer at Gravesend Technical College, Kent, will take over a three-year appointment as Principal, Bhavnagar Technical Institute, Saurashtra. The Institute provides a five-year course for 150 students in all aspects of motor vehicle engineering and technology.

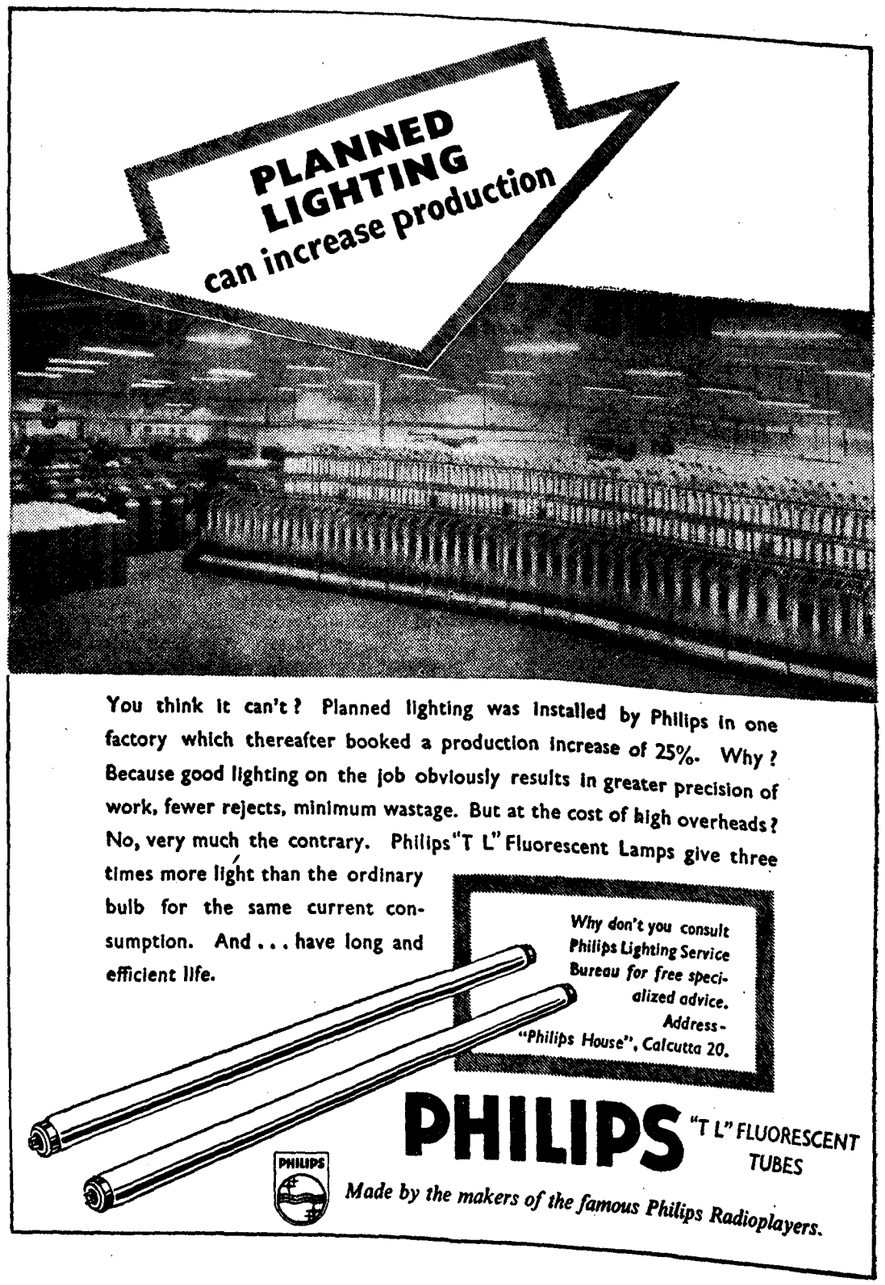
* * * * * * *

It is reported that nearly 100 oil wells were drilled in North-West and South-West China by geological prospecting teams during 1953. Twice as many teams were operating in 1953, as in 1952.

* * * * * * *

According to the Food Production Directorate, Ceylon expects a record rice harvest of nearly 20 million bushels of paddy this year.

* * * * * * *



The Prime Minister of Ceylon, Sir John Kotelawala, will open the plenary session of the 10th meeting of the Economic Commission for Asia and the Far East on February 8 at Kandy. The session of the E.C.A.F.E. which will comprise a series of three meetings, will begin earlier on January 20. Over 200 delegates and some others as observers will participate in this conference.

* * * * * * *

The Government of Canada have, at the request of the Government of India, agreed to give to India 120 steam (WP Type) locomotives as Canadian assistance to India under the Colombo Plan. The amount to be charged by the Government of India to the railways for these steam locomotives will be paid into a special Development Fund to be used for other economic development projects.

* * * * * * *

World crude oil production rose last year by over 30 million tons—about the same increase as in 1952—to a record of 654 million metric tons. Main production increases were in the Middle East (about 16 million tons), the U.S.A. (8 million tons), Canada (3 million tons), and U.S.S.R. and Rumania (5½ million tons). A widespread search for new oil supplies is taking place and in all major oil producing centres productive capacity is higher than the present level of output.

A Window On The World

A RURAL INDIAN IDYLL

By

ODYSSEUS

TWO RECURRENT THEMES stressed in this column are:

(1) India is a democracy in name but the practice of democracy is little understood outside the narrow circle of the educated classes. In this lies the opportunity, (a) of those who would like to perpetuate a bureaucratic despotism, and (b) of those who are working to promote Communism, and

(2) the biggest impediment to co-operation for national prosperity (a) between employers and workers, and (b) between what with rough approximation may be called the ruling classes (educated people in positions of greater or lesser power ranging from District Officers to local constables), is that lawgivers, administrators, economists, and social workers, are all drawn from the middle classes whose outlook on, and experience of, life differs from those of the industrial and rural masses as chalk from cheese. The broad result of this abyss between educated rulers and inarticulate masses is that misunderstandings and injustice arise which create antagonism to the rulers and to the democratic regime with which they are identified.

These two themes are apt to be unpopular with some people because they disturb the complacent view that independence has automatically turned India into an idyllic garden of poetic justice. Yet there is plenty of evidence to support my submissions if you are ready to look for it in the right places. What is more it is only by public ventilation of abuses that we may gradually realise our ideals. This week I am going to initiate a little more ventilation of some abuses brought to public attention by a disinterested authority who has no axe to grind and no reason to invent or to exaggerate.

Some weeks ago, I saw a brief report in that admirable newspaper, the "Mail" of Madras, of a lecture entitled "The Government and the Village" given at Mysore University by an American anthropologist, Mr. Allen Beales. The few lines quoted seemed so full of first-hand observation by someone who had not read up the subject in books but had spent patient days away from offices living among villagers, that I made it my business to secure the complete text. This is a document that every Home Ministry, every District Officer, every person in a position of power, and every sincere democrat in India should study. Here is a summary:

Mr. Beales distinguishes two representative types of villages: Kadduhalli, an isolated forest village, barely touched by official development plans, and Hattarahalli, a plains village near a town, which has experienced the full blast of development and of cultural changes caused by the impact of administration and "progress".

WHY VILLAGERS ARE ANTI-GOVERNMENT

Mr. Beales found the relations between the people of Kadduhalli and the government "strained and hostile beyond belief," and he supports his assertion by citing (a) his own personal observations recorded on the spot and (b) the villagers' evidence in their own words:

January 20, 1953: Today a bamboo weaver was caught removing bamboo by a guard. The guard demanded a Rs. 15 bribe. The weaver said he had no money; the guard threatened to hit him. "Seeing that the guard was about to hit me," the weaver told Mr. Beales, "a man named Shiva asked him not to hit me. The guard got mad with Shiva. He accused him of breaking forest regulations. Finally, the guard took Rs. 10 from me.... He ordered the watchman to remove all wooden articles from Shiva's house. The guard said: 'I'm going to burn all these things'. Shiva asked him not to, and promised to give him as much money as he asked for. The guard agreed to take Rs. 50 after threatening to prosecute Shiva in court. No villager should talk when the forest officer is punishing people."

January 23, 1953: Basava and two others were spreading grain for threshing. I watched their work and Basava talked of his troubles: "We want four bamboo sticks about 1½ inches thick. If we're caught taking them, we'll be fined Rs. 5. To build a small house I must pay in advance the amount asked by the foresters. Yesterday they came here and took one kolaga of ragi from each house (this is enough grain to feed a man for a week) together with beans and ghee. If we don't give it, they go into our houses, remove our fire-wood and put up a case against us. We can't read. We don't know how to cope with them. We don't know the government regulations. If the whole village gets together to oppose them, they make a case saying that the people assaulted them.... We must give 8 annas for each animal grazing in the forest. If we pay one or two rupees to the forester, he allows them to graze.... Once a year we must take licenses for our cattle, paying the full amount. The ranger takes an anna extra for each animal.

"Once a year, the forest produce is auctioned. We are not supposed to take anything without the written permission of those to whom the forest is auctioned. Usually only business men buy produce from the auctions. We must use our own trees. Even honey is auctioned but we have the right to use the small combs."

January 24, 1953: Statement by Rajappa: "We are afraid of government officers because they have done more harm than good in our village. Therefore, we will never say anything against government.... By chance if government does any good, we will accept it as God-send."

February 2, 1953: Statement by Krishnappa: "At harvest time we give the accountant one kolaga of ragi, the forest guard one kolaga, and the village menial four headloads. My land taxes are Rs. 11 for five acres and Rs. 1-8 for three tamarind trees. If we don't bribe them, they report that we have broken some rule. Today the accountant and headman asked us not to tell you anything.... Eight days before your visit, the revenue inspector took Rs. 70. That was the old inspector. Now the elders have agreed to give Rs. 35 to the new man who wanted Rs. 50."

A CHARMING VILLAGE CHARACTER

February 3, 1953: Statement by Motappa: "The teacher's son is on the taluk food committee. He made my brother spend Rs. 70 for a license. When my brother realised that the teacher's son could not get him a license, he approached an educated farmer of Berehalli who sent my brother's application to the proper officer and got the license without any cost.

"Two years ago, this teacher's son asked all the people of our village to get loans from the government. He asked us to pay Rs. 7-8 each. He collected from all the villages around probably more than Rs. 300, but he did nothing.

"We pay Rs. 16 to the Shambog whenever we want a tarmarind in the reserved forest listed under our names. The accountant takes a yearly tax from us on such trees and we take the fruits. Usually this teacher's son will take all the tamarind trees in the reserved forest at auction every year. He orders us not to touch any trees he has taken in auction. Though we have bought a particular tree from government and are paying the tax on it, he will say we own some other small young tree elsewhere. He asks us to pay Rs. 50, otherwise he will take our harvests. If we oppose him, he fetches the revenue inspector, tells something against us, and makes us pay a bribe. We don't know who made him a member of the food committee. He is one more Yama (god of death) to us besides the forest people, the revenue people, the headmen, the accountant, the police, and the vaccinator, to all of whom we must give bribes whenever they visit our village. In addition, we give them food free of charge."

March 4, 1953: Mr. Beales and his assistant were eyewitnesses of a visit of forest guards and recorded the facts on the spot: "About 15 ragged individuals without uniforms came. One was wearing part of a forester's uniform. The gang had two guns. Two of them went to Thimappa's house and asked for a jackfruit. Thimappa said 'I haven't any'. This irritated the guards and they seized his cattle which were grazing in the field. These cattle, they said, had been grazing illegally in the reserved forest. The guards brought the cattle to the village and threatened to impound them if the villagers did not pay a bribe. As the guards were leaving the village, they caught sight of me and left in considerable haste without the cattle."

That, then, is what goes on in a forest village in democratic India where every citizen's rights are protected by the Constitution. The villagers are poor; many must collect roots from the forest in order to subsist and most cannot afford decent clothes or housing, Mr. Beales reports. They are completely uneducated; they know nothing of their constitutional rights. They are at the mercy of any petty jack-in-office. The village is in what should be a richly productive forest area, yet the forest has been almost completely destroyed by the forest guards (!!), timber merchants, and villagers.

In Mr. Beales' view, what renders village improvement well-nigh impossible is this war between the villagers and minor officials, and the war of extermination which villagers and officials jointly wage against the forests. Mr. Beales urges, first, that the villagers should be given a much greater degree of self-government. If they were allowed control over the minor government officials, corruption could be eliminated. Secondly, he urges that the villagers be given a definite share of the forest products. If they were part-owners of the forest, they would not allow it to be destroyed. There is, he suggests, no reason why an area where sandalwood, teak, bamboo, citrous fruit, mangoes, and jack-fruit grow wild, should be allowed to become a desert.

Next week I will summarise and comment upon Mr. Beales' first-hand observations on Hattarahalli, a representative village near a town.

Meanwhile, I invite you to reflect over what the villagers of Kadduhalli are likely to feel about independence, democracy, and the existing order in India, and above all to ask yourselves with what arguments they are likely to refute Communist suggestions that all their woes will vanish under a Communist regime.

BOOK REVIEWS

THE ASCENT OF EVEREST

The Ascent of Everest: By Sir John Hunt; Chapter 16 By Sir Edmund Hillary: Hodder and Stoughton, London: Price 25sh. net.

The writing of this book, like the climbing of Everest, seems to have been a race against time. Sir John Hunt says in his first piece in this book that "the demand to tell the story quickly has been urgent and it was written within a month." For a rush job this surely must be one of the most remarkably finished books that has ever come forth. It is well conceived and well written; its small drawings are a delight, while the coloured photographs are unforgettable. The contents of the book are best described in Sir John Hunt's own words which are reproduced on the fly leaf of the dust cover.

"This is the story of how, on 29th May, 1953, two men, both endowed with outstanding stamina and skill, inspired by an unflinching resolve, reached the top of Everest and came back unscathed to rejoin their comrades.

"Yet this will not be the whole story, for the ascent of Everest was not the work of one day, nor even of those few anxious unforgettable weeks in which we prepared and climbed this summer. It is, in fact, a tale of sustained and tenacious endeavour by many, over a long period of time....We of the 1953 Everest Expedition are proud to share the glory with our predecessors.

"And this will not be the story of those two men alone. In this or any other mountain venture, sound and successful climbing is fundamentally a matter of teamwork....The ascent of Everest, perhaps more than most human ventures, demanded a very high degree of selfless co-operation. It would be difficult to find a more close-knit team than ours. In this and in the work of our Sherpas lies the immediate secret of our success."

No description of this book in a review is possible. One must go to the original for all the fascinating details in the initial planning, in the solution of the problem of the "closed-circuit" oxygen apparatus and all the many details which made the supreme triumph of the ascent of Everest possible. This is one of the grandest stories of human endeavour and it is greatly told.

THE SIKHS

The Sikhs: Kushwant Singh: George Allen and Unwin, London: 16s. net.

"The chief reason for my writing an account of my people," says the author in the Prefare, "is the melancholy thought that contemporary with my labours are being written the last chapters of the Story of the Sikhs. By the end of the century, the Sikhs themselves will have passed into oblivion". There is curiously little in this book which justifies this attitude of total pessimism in regard to the Sikh community. It has shown down the years, and particularly in the great period of its trial when the Sikh kingdom was broken up, a vitality which has always defeated its gloomy prophets. The influence of Sikh business men both in the Punjab and the Delhi area shows no sign of disappearance and, unless Kushwant Singh is referring only to the lack of Sikh ascendancy in the Congress Party, it is difficult to find in his book any justification for his initial sentence.

This is the first large study of the Sikhs by a Sikh. Kushwant Singh is also (no offence meant!) an exceptional Sikh. He carries the gift of writing well with a fine balance of historical judgment; and his legal training and his term as lecturer in Hindu Law and Jurisprudence of the University of the Punjab from 1942 to 1947 have enabled him to take a judicial view in respect of matters which are very close to his heart and to his mind. This is without question the most interesting and the most objective account of Sikh affairs that has yet been written. It can be deservedly regarded as one of the few outstanding publications on Indian history in the years after Independence.

It has been a happy thought to include in the Appendix to this book a full, and apparently new, translation of many Sikh prayers and poems beginning with "JUPJI—THE MORNING PRAYER" which deserves to be much better known than it is, both in India and abroad. The first lines of the Mool Mantra, or basic belief, which are not in verse are set in lines which make grand poetry of what was originally prose. This is how it reads:

"There is one God.
He is the supreme truth.
He, The Creator,
Is without fear and without hate.
He, The Omnipresent,
Pervades the universe.
He is not born,
Nor does He die to be born again.
By His grace shall thou worship Him.

Before time itself
There was truth.
When time began to run its course,
He was the truth.
Even now, He is the truth,
And
Evermore shall truth prevail."

RUSSIA AND THE FAR EAST

Soviet Policy in the Far East 1944-1951: Max Beloff: Oxford University Press: Price 21s. net.

Mr. Beloff is an acknowledged authority on his subject, being Reader in the Comparative Study of Institutions in the University of Oxford, and has already written "The Foreign Policy of Soviet Russia, 1929-1941". The present book deals with one aspect of Russian foreign policy in the post-war years. The chief value of this study lies in the fact that it is well documented, especially from Soviet sources, though it also includes American and English sources, and is a factual account of the events which have taken place in the Far East between 1944 and 1951. One could have wished that the author had given his own interpretation of some of the major events and tendencies which have been at work in this area, as a purely factual account runs the risk of being at times rather dry. Though Mr. Beloff (at least in Marxist eyes!) looks at events through Western aids to vision, he will be credited with being as objective as possible in presenting the case from both the Russian as well as the American points of view.

The major portion of the book is devoted to the events in China after 1945. The author lays stress on the fact that Soviet policy at the end of the war was based on the assumption that the Communists in China would not be strong enough to overcome the Chiang Kai-shek regime for some considerable time and that the best they could hope for was to form a coalition with the Kuomintang. Hence, Stalin's earlier efforts

were directed towards maintaining good relations with Chiang. Nevertheless because of the presence of the Red Army in Manchuria, the Communists were able to secure most of the supplies and weapons which had been captured from the Japanese, and in addition were able to secure important strategic points due to the connivance of the Red Army when it finally withdrew. If the author's interpretation is correct, the final rapid victory of the Communists in 1949 came as a surprise to the Russians. Mr. Beloff's conclusion is that although Chinese policy cannot be completely independent of Soviet policy, China certainly does not appear to be a mere satellite, but is more likely to be a junior partner.

The chapter on Japan begins the story from the Soviet Union's denunciation of the neutrality pact of 1941 with Japan, deals with the various steps leading to the Soviet entry into the Japanese War, the final surrender of Japan and the subsequent relations of the Allied Powers as shown in the working of the Occupation authorities between 1945 and 1951. The activities of the Japanese Communist Party are dealt with at some length and the difference in the Soviet and American approach to the general problem of Japan is emphasized. The chapter concludes with the negotiations for the Japanese Peace Treaty and the San Francisco Conference at which it was signed.

There is a very useful chapter on Korea. The author gives a detailed account of how the original division of Korea at the 38th Parallel came about, of the subsequent events which took place in both North and South Korea, and finally of the origins of the Korean War. Mr. Beloff, however, takes it for granted that the war started with the invasion of South Korea by the North Koreans and does not examine the evidence on which that assumption is based. Since this question has never been satisfactorily cleared up so far and since there is considerable evidence for holding that it was the South Koreans who probably began the war, as is shown in I. F. Stone's "The Hidden History of the War in Korea", it would have been interesting to see the results of Mr. Beloff's research on this point. The value of any study on Korea would be considerably enhanced for the student of history by the data which it contains on this important question.

Finally, there is a chapter on "Soviet Policy in South-East Asia", by J. Frankel which deals with Indonesia, Viet-Nam, Malaya, Burma, Thailand and the Philippines. The account is somewhat brief, but covers the main happenings and Soviet policy in relation to these countries. The Appendix contains the full texts of the Treaties and Agreements between the U.S.S.R. and China in 1950, the U.S.S.R. and the Mongolian People's Republic in 1946, and the U.S.S.R. and the Korean People's Republic in 1949.

THE BRITISH COUNCIL

Report of the British Council, 1952-53: 2s. 6d. Available from the British Council, Indra Palace Lodge, Block H, Connaught Place, New Delhi.

By a Royal Charter, the British Council was founded in 1940 with the express purpose of "..promoting a wider knowledge of our United Kingdom.....the English language abroad and developing closer cultural relations..." Since its inception, the British Council has spread its activities in all corners of the globe. Its growth has been continuous except for an abrupt closure in Iran and a reluctant departure from the People's Republic of China. The report for 1952-53 shows the wide scope of the Council's activities.

It brought, for example, 394 distinguished research scholars, university teachers and officers, and post-graduate students to the United Kingdom by means of scholarships, and bursaries for short periods of study or training. And many (the figure is not mentioned) British scholars and professors were enabled by Council grants to go abroad. From India a Professor of Bacteriology and some mining engineers went to the United Kingdom.

There is a powerful slant on purely cultural pursuits. Thus the British Council sponsored the famous Boyd Neel Orchestra for a tour of Canadian and Australian cities, and enabled the Halle Orchestra to go to Vienna; the Sadler's Wells Ballet on a much welcomed trip to Portugal, Germany, Poland, Canada and the United States. The Council also sponsored an exhibition of English Printing from Hazarth to Turner at the Hamburg Kunsthalle and a collection of the works of the British sculptor Henry Moore at the Musee National d'Art moderne in Paris; to India the British Council sent the British Universities Debating Team, and organised a Town Planning Exhibition.

The record is one of which the British Council can be proud. Of course, its achievements have only been possible because of total grants from the U.K. Exchequer which amounted in 1952-53 to £2,862,035.

INTERNATIONAL ECONOMIC PAPERS

International Economic Papers No. 3: MacMillan and Company, Limited, New York and London: 15sh. net.

Volume 3 of International Economic Papers consists of a series of translations, for the International Economic Association, in the main of old papers and is not a new collection of research documents. The volume has been prepared with the help of a grant of U.N.E.S.C.O. and it would appear that this means of financing unprofitable publications is capable of greater development.

The selection of papers in the present work is designed to foster theoretical research in terms of some concepts which have not hitherto received the attention they have deserved. For example, there is a paper "On the Concepts and Methods of the Stockholm School" of whom incidentally Dag Hammerskjold, the present Secretary-General of the United Nations, is a member. This paper, however, is devoted particularly to a study of Gunnar Myrdal's "Monetary Equilibrium", a book which has appeared in the English language and is, therefore, to that extent, more widely known than other publications of this school. There are also studies of business cycles with papers by Knut Wicksell and Arthur Spiethoff. There is a series of papers "On the Economic Principle" by Benedetto Croce, and Vilfredo Pareto. There is an interesting paper by Alfredo Navarrete Jr. and Ifigenia M. De Navarrete on "Underemployment in " Underdeveloped Economies". But the most searching paper from the point of view of current research is the last paper by Hans Peter on "A Comparison of Marxian and Keynesian Dynamics". This is a brief affair being a matter of fifteen pages. But it is full of brilliant suggestions and for the advanced mathematician, who can deal happily with matrices and differential equations, there is probably a rich mine to be explored. It would appear that the conditions of stability of the economic system and the rate of growth can be formulated on the assumption of both Keynes and Marx. Of these, it is the translation of Marxist theoretical assumptions into mathematics which needs greater attention. It would be interesting to see how the Marxian theoretical models compare with facts.

A DELHI DIARY

THE Indian National Commission for UNESCO was inaugurated on Saturday, January 9, with an appropriate fanfare of trumpets. The setting was derived not a little from that of the Gandhian Seminar which was such a dashing (publicity?) success that it could justifiably serve as a model which the Ministry of Education could copy. Thus the Central Hall of Parliament was duly chosen; invitations were issued (if I might use a Press metaphor!) with the same wide range of coverage; the attendance was as good as on the occasion of the Gandhian Seminar. Maulana Abul Kalam Azad, Minister of Education and President of the Indian National Commission for UNESCO, was unhappily absent because of the accident he has sustained which will keep him in bed for six weeks. But his able speech was read by Humayun Kabir which gave it the additional advantage of being delivered in English instead of its (original?) Urdu which would not have been understood by half those present. The Prime Minister delivered a provocative inaugural address, though a little too reminiscent of the theme of his speech at the opening of the Colombo Plan Conference last year. The total effect should have been something as impressive as that of the inaugural meeting of the Gandhian Seminar. It was not. Why?

I have been asking myself since last Saturday why this inauguration of the Indian National Commission for UNESCO which enjoyed all the trappings of the Gandhian Seminar has fallen so far behind in public interest. The answer is not in the absence of celebrities. Dr. Luther Evans, Director-General of UNESCO, was here; so was Sir Ronald Adam, Chairman of the Executive Board; so again was Julian Huxley, the first Director-General of UNESCO and a great figure on his own account. On the dais, there was also the President of the U.N. General Assembly who conferred an honour on this meeting which the Gandhian Seminar was without. There was interest enough in all the speeches, fraternal and otherwise. But somehow the spell of interest was not the same.

I hazard an opinion. The Indian National Commission in the public mind is a branch of a foreign business which has been established here. It is a fine business; there were appropriate tributes paid to it from all quarters. But it is essentially a business conceived in foreign terms with only an Indian replica. It was the other way round with the Gandhian Seminar. There it was the foreign countries which had come seeking an Indian replica. Apart from this change in that in one case we were importing and in the other exporting, there was a tremendous difference in the commodity which was being traded. Everyone in India knows Gandhiji; there are (unhappily!) so few people in India who know about the activities of UNESCO. This is an additional argument for a National Commission; but it does not make the task of the inaugural session any easier by comparison!

I should not be taken to imply any criticism of the Ministry of Education. On the contrary, the arrangements made must have involved a tremendous amount of correspondence and organization in the widest sense. All this has been done with great efficiency. Of course, even the most minute organization cannot prevent the proverbial hitch. Dr. Luther Evans and Sir Ronald Adam were held up by a fog of Jaipur and arrived for the meeting (after the maddest of rushes!) five minutes late. "Little did I think," said Sir Ronald, "that I would leave London in bright sunshine and arrive in Delhi in the midst of a fog!" Short of controlling the weather, the Ministry of Education, under the direction of Humayun Kabir, has done everything that is possible to sell the Indian National Commission at once.

BHUTAN IN THE NEWS

The Maharaja and Maharani of Bhutan have conquered the headlines on every day since Tuesday this week. The Maharaja and the Maharani arrived by an I.A.F. Dakota at Palam where they were warmly received by the Prime Minister, Mrs. Pandit, some Ministers of the Central Government and three Service Chiefs and officials of the External Affairs Ministry and the President's Military Secretary. There was also a fifteen gun salute (which is seldom heard nowadays!) and an imposing guard of honour provided by the three Services. On the next day the President called on the Maharaja (thereby reviving the picturesque exchange of visits of Princely India). There was also a State Banquet with mutually appreciative speeches. Finally, on Thursday there was a ceremonial parade of a thousand picked soldiers. It is legitimate to draw the conclusion from all that has happened that the Maharaja of Bhutan has acquired a special place in the counsels of the Government of India.

People have been asking why this sudden appreciation of Royalty has descended on Republican India. The answer seems to be that the Maharaja of Bhutan has occupied a place which is (happily!) different from the Indian Princes who accepted paramountcy in unalloyed form, and have (therefore!) been duly relegated to relative obscurity in the Age of the People. In Bhutan the Maharaja is still the government, and there is justification enough for according to him the trappings it has been so readily dispensed with in respect of rulers who have already lost power to their people. This is certainly an anachronism in the new India, but it is important to recognise a difference based on fact and not on philosophy. There is no conflict in India's approach. We (as in the recognition of Communist China!) are realists where power is concerned. We do not like the Communist philosophy nor do we like the philosophy of Absolute Kings. But we recognise them when we find them and accord to them the honour which their existing power requires. I think we are right; we do not demand that other people should think exactly as we do; but we consider that if there is a moon in the heavens, it should not be treated as if it were merely green cheese!

INS AND OUTS

Of more interest in New Delhi (amongst our policy-makers!) has been the coldly indifferent statement made yesterday by Lord Swinton, the British Commonwealth Secretary, on American aid to Pakistan. On evidence which now seems very shaky, there were many newspapermen in Delhi who believed that the United Kingdom did not favour the proposed Pakistan-American alliance and that diplomatic channels at least were conveying India's view on these matters rather than those of Pakistan. Lord Swinton's observations would not have attracted the interest they have but for this feeling that the Anglo-American alliance would somehow diverge upon the pact, it being believed that the United Kingdom at least was anxious to prevent American ascendancy in a traditionally British sphere of influence. At the present time I am busy counting India's friends; am I to count the U.K. in or out?

ARGUS.

SPECIAL ARTICLES

CHITTARANJAN'S CENTURY

THE delivery of the hundredth locomotive ex-Chittaranjan provided the Transport Minister recently with the opportunity of announcing the immediate plans of the Railways for the expansion of locomotive-manufacturing capacity within the country. The capacity at Chittaranjan, it is now announced, will be stepped up by 30, so that 150 locomotives per annum can be produced. The latest production targets are as follows:

1954, 70;

1955, 90.

As a short-term measure, it is intended to raise production, as soon as possible, to 150 locomotives per annum, on the basis of reasoning which is more or less as follows.

As a result of implementing the Five-Year Plan for replacement, the Indian Railways now expect to be left in 1956, with about 1,500 engines will be overaged. This problem of overage is to be tackled, therefore, by means of a programme which aims at spending Rs. 100 crores in the next ten years. It is anticipated that very soon, if not in 1956, we may have about 7,800 locomotives with an average age of twenty years. At this stage, Telco's and Chittaranjan's production is expected to be adequate for normal needs.

With about 8,000 locomotives in service, the rate of depreciation being one-fortieth per annum, the requirements for replacement, if they can be evenly spaced out, will be about 200 locomotives every year—which can be distributed between Telco and Chittaranjan in the ratio of 50 and 150. Towards attaining this target, Telco is to overcome its difficulties in attaining the stipulated minimum rate of monthly rate of production; and Chittaranjan will pay special attention to the establishment of a foundry intended to produce 5,000 tons of heavy and intricate loco castings.

The Railway Board is obviously of the view that with an internal production of 200 B.G. and M.G. locomotives per annum, self-sufficiency will be either attained, or will not be very far off. It is doubtful, however, whether this target of 200 per annum can be regarded at this stage as anything other than a tentative short-term target. The Minister himself indicated at the ceremony that he will be glad to see Chittaranjan's capacity even further. In what follows, some of the pros and cons regarding this increase in capacity will be examined.

The somewhat cautious planning of the Railway Board is apparently due to a number of reasons. In recent years, standardisation has proceeded very far in the designing of engines. About 500 different classes of locomotives were in use in 1925. The reduction in this number has not been as rapid as it might have been. Three hundred and seventyseven types were in use in 1952. The standardised post-war types will, however, soon be so numerous that this number may well be reduced to about 50. Even so, it must be recognised that obsolescence will have to be provided for; it is doubtful whether it is wise policy to go in for extension of capacity very rapidly, when the future is technologically uncertain.

Chittaranjan's production is not diversified, and this is another limitation. Diesel locomotives have to be used even at the present time, in areas where water is unsuitable. Moreover, the abandonment since about 1930 of the import of high grade coals, and the reduction in the power/weight ratio of Indian locomotives consequent on the use of indigenous coals, have led to some difficulties which cannot be ignored in the long-term. Thus the Railways are naturally interested in using the best grades of coal possible, within the limits of what is now available within the country. Others have, however, argued the case for conservation, or the claims of inferior coals. Beyond a point, the problem of obtaining thermal efficiency and, therefore, power, to the extent needed, consistently with the use and conservation of Indian coals, may be insoluble.

It is possible that electrification will become in these circumstances more desirable as an alternative to steam locomotives. Both the projected electrification of the Howrah-Moghulserai section and the Railway Board's evident desire to link up the manufacture of electrical multiple-unit stock with the proposal to set up a heavy electrical plant are significant in this context. The normal demand for steam locomotives cannot be determined while these plans have not taken shape.

These considerations have obviously influenced the plans of the Railway Board. They cannot, it is true, be entirely ignored. Nevertheless, in a developing economy, in which transport so far has proved to be more often than not inadequate, it will be quite unwise to be afraid of the future and to be timid, rather than ambitious in building and planning. Export possibilities, as the Minister indicated, are always there. But even independently of them, our needs are bound to grow. Obsolescence and the possible growth of electrical traction are not more important than the growth of traffic and the needs for development. In the immediate future, the facts which are or should be relevant are firstly, that the Railways are expanding, and secondly, that the cost of manufacture at Chittaranjan should be reduced.

Chittaranjan costs include fairly heavy overheads. This inevitably follows from the fact that about one-half of the capital costs has been incurred on account of the township and staff amenities. Accurate costing has apparently been impossible so far, and it has seemed to be equitable to charge to the Railways the imported average costs for locomotives, plus overheads (which have to be determined ad hoc). It is obvious, therefore, that as production increases and as these overhead costs diminish, Chittaranjan's cost of production will go down. It is desirable to secure this result; and this is not unimportant, as a visiting Japanese team has advised that production at Chittaranjan can easily be doubled with the existing facilities.

This is one reason for increasing capacity. The Railways' needs, however, are also constantly expanding. It has been calculated that a two per cent increase in traffic levels every year will mean the addition of about 160 locomotives per annum. Over a period of years, this will mean a substantial addition to the engine stock; and additions at this rate are bound to leave present ideas of the normal level of equipment far behind. As line capacity expands, and more wagons are acquired, the need for locomotives will increase rapidly—if transport is not to be a bottleneck.

The projected internal production of about 200 locomotives on the ground that this will be adequate to meet the country's 'normal' requirements cannot, for these reasons, be regarded as anything more than a tentative target. For reasons which have been stated earlier, the optimum capacity cannot at the moment be established. But on the whole, our needs are likely to grow, in spite of all that can be said against extending too greatly the production of standardised steam engines.

Whether 'normal' state will ever arrive—deliveries being irregular and financial resources being difficult to obtain—may, moreover, be doubted. Even if such a number of locomotives can be added that the average age is brought down to twenty years, this will only mean, however, that replacement will be concentrated later on within a period of a few years—reflecting the heavy additions of new locomotives at present. In other words, 'normalcy' seems to be a mirage.

There is in short need for a definite bias, for a long time to come, in favour of increasing internal production. The progress that has been achieved so far at Chittaranjan has been remarkable. But now that a production performance of six locomotives per month has been established, the Railways should tackle the problem of extending capacity and reducing costs. Periodically, say, once in three years, our needs must be reviewed with a view to extending indigenous capacity till optimum size has been attained. Diversification, in the sense of the production of both B.G. and the other types, will at the same time be necessary; and accurate costing must be established, so that costs can, in due course, be brought down to the lowest possible levels. Chittaranjan can produce locomotives cheaply as well as efficiently. It must be expanded, therefore, to the extent which is proved to be necessary and needed, which means it must have very much more than the capacity contemplated at present.

INDIA'S FOREIGN TRADE: CHANGES IN DIRECTIONS

AN assessment of India's foreign trade in relation to the changing trends in its direction as well as composition seems appropriate at this stage. Speculation is rife for a few weeks now about the probabilities of a business recession in the United States in the current year and its likely repercussions on the rest of the free world which has developed very intimate trade ties with her. It would be useful to attempt a probe in the probable developments in the trade of this country with the rest of the world.

India's total trade surplus in the two pre-war years ranged between $45 million and $50 million. In the post-war period there was a complete reversal of this State and the total deficit rose steeply in the neighbourhood of $660 million in the two immediate post-partition years. This was the direct consequence of the partition of the sub-continent which upset the equilibrium in the economy. India not only ceased to be an exporter of primary products but became a net importer of large quantities of food grains, the two staple industrial raw materials—raw jute and raw cotton—and had no commensurate exports to pay for this spectacular increase in imports. The marginal trade surplus in 1950 of $35 million was the result of an austere import restriction policy and an energetic drive for exports adopted with the avowed object of correcting the payments position. Its size and duration give it no more than passing importance. During 1951 and 1952 food and fibre imports, which were made imperative by natural calamities, swelled the size of the trade deficit. But imports on account of developmental requirements were also an element responsible for this deficit. A comparative picture of the pre-war and post-partition external trade of India is given in Table B on the next page.

A deficit of a moderate magnitude has come to be accepted as a corollary to the policy of planned development of the country's economy. This factor, however, does not explain its aggregate value. But a part of the deficit calls for elimination in the long range perspective of the balance of payments settlement. The emphasis in achieving this result must primarily be on increasing the volume of exports. After the partition the composition of India's exports underwent a marked change. The position of the percentage share of the traditional staple exports in the total exports is indicated below:

TABLE A

Percentage Shares of India's Total Exports

Cotton and cotton manufactures ..	20	27
Jute and jute manufactures	24	20
Tea	14	14
Hides and skins	5	5
Pepper		3
TOTAL	63	69

India's status as a major exporter of cotton textiles has come to stay, but since 1952 the problem posed is the growing impact of Japanese competition in the South Asian and Middle East and African markets where medium and coarse varieties have a sustained demand. The share of jute—the exports computed in terms of value—has been kept at 20 per cent in 1950 due to price inflation. Agricultural and industrial development which is under way everywhere is bound to increase the demand for jute manufactures for packing requirements. But large availability of Pakistani jute to manufacturers in Europe has slowed down the progress of Indian jute manufactures in volume. Tea and hides and skins have proved to be stable sources of export. Restrictions on the intake of the U.K., the principal world consumer of tea, till October 1952 would certainly have depressed exports from India, but the absence of Indonesia from the market averted this result. Now with the return of freedom for tea in that country the larger volume of imports should assist maintenance of a high level of shipments from this country. Pepper entered into the composition of this country's exports as an important commodity on account of non-availability of supplies from Indonesia. Oilseeds, oils and fats, which were among the principal foreign exchange earners before the war have suffered a decline both because of a fall in output and higher internal demand for domestic and industrial consumption. The emphasis in exports in the post-partition years is shifting towards processed and manufactured goods. Tanned leather, footwear, oils, tobacco and a number of products of the engineering industries illustrate the importance of this shift.

Regional analysis of trade trends would help assessment of the developments in the direction of trade in the near future. The sudden emergence of the dollar area as a vital partner in India's post-war foreign trade is explained primarily by a few factors. The slow recovery of European countries and the absence of Japan from the export markets changed their direction to North America and in particular to the United States in 1948 and 1949. This factor now constitutes a less weighty reason. The high level of imports from North America in 1951 and 1952 of the order of $472 million and $635 million was largely necessitated by urgent requirements of food grains and raw cotton. With the difficulties of dollar exchange increasing again, trade equilibrium will have to be achieved by diverting the sources of imports to other areas, nevertheless exports to that country will have to be sustained and pushed up if possible. Burlap, manganese ore, tea and mica are the main items which will demand concentrated attention in this country's exports. But by and large, it will be difficult to maintain the level of present trade and a small dimunition in its volume seems inevitable.

North-Western Europe, which includes U.K. as the vital partner in India's trade, has developed a surplus with this country in recent years. The total volume of trade with this area has been smaller than the pre-war

only because of its preoccupation with repairing the ravages of war. India's deficit here in contrast with the pre-war surplus arises from her inability to export primary products. The bilateral trade agreements which have been concluded by her with several of the European countries have been helpful in bringing a flow of machinery and industrial equipment as well as a range of consumer manufactured goods. Availability of many of the European currencies as soft currencies coupled with the sterling area's membership of the E.P.U. have been solid factors in restoring the trade with the countries of this area. In the immediate context, however, the United Kingdom's action in raising the liberalisation percentage of imports from E.P.U. to the obligatory limit of 75 per cent will necessitate a levelling up of exports from the sterling area. Jute manufactures, manganese ore (for which demand will be up for increased steel production), tea, tobacco (whose imports from the U.S. had to be curtailed for reasons of dollar shortage), cotton waste, and hides and skins will be the principal commodities that should find an increasing market in the Western European countries. The return of Western Germany is now an important factor in augmenting the trade with this area.

India's trade with the U.S.S.R. and Eastern Europe has consistently been only marginal. The chief fillip was given when during the food scarcity period India entered into a barter agreement with the U.S.S.R. to secure wheat supplies. The new bilateral trade agreement between India and that country seeks to develop the size of the normal trade, but it is yet too early to say how far the two-way traffic in capital goods, jute manufactures, tea and other principal commodities included there will expand.

In Oceania, Australia has developed stronger trade relations with this country. Australian wheat, machinery, and dairy products have constituted the major imports of India, and the trade surplus which this country secured in 1951 and 1952 was due to Australia's sizable imports of Indian coal and cotton textiles. The scope for coal exports has now diminished as a result of large domestic output there.

In the Middle East, India has found a continuous and adequate source of mineral oils which have normally built up a trade surplus for this area. Cotton textiles are India's strong point with these countries, along with jute manufactures. But other consumer goods are finding a widening market which will keep the trade at above the present level.

The pre-war trade surplus of South Asia with India has shown a definite trend to rise. The major import has always been rice and its great shortage in this country in the post-war years has served to widen the trade gap. In return, cotton textiles and a new range of goods, chief among which are engineering products, have found an outlet for India's exports. The ability of this country to reduce the volume of rice imports and the practical difficulty of procuring alternative imports appear to indicate a shrinkage in the size of the trade with these countries. The picture is blurred by the scope for Indian cotton textiles in the light of Japan's concentration of her trade in this area. Japan, however, will continue to be our adjacent source primarily of industrial equipment and consumer requirements; and is not likely to affect India's cotton exports except in respect of superfines.

TABLE B

INDIA'S FOREIGN TRADE

(Value in Million U.S. Dollars)

THE BUSINESS WORLD

STERLING'S RESERVES

The discussions at Sydney during the last few days have served, perhaps, one unintended purpose. They have apparently highlighted the emerging differences of opinion between Britain on the one hand and the Asian countries whose spokesman on this occasion was Sir Oliver Goonetilleke from Ceylon. At the end of December 1953, the sterling area's gold and dollar reserves stood at $2,518 millions. While there is still talk of an American depression, it is natural for the Asian countries to worry about its possible repercussions on the undeveloped economies. Countries which are wedded to sound money, convertibility, internal balance, and (under the influence of American suggestions and traditions) non-discrimination are bound to approach some problems differently from countries which regard the maintenance of investment expenditures, in order to fulfil their plan targets as of overriding importance. Differences of opinion are in particular likely to persist on the following matters:

(i) in the event that the American recession develops into a depression, are the reserves of the sterling area to be used in order to finance purchases from the United States, in spite of an adverse balance of payments position, such purchases being intended as a prop to the United States economy, so that a depression may, if necessary, be incipiently arrested? The United Kingdom may regard this use of the reserves as legitimate from a wider point of view. In practice, the difficulties which have been experienced regarding the use of discrimination against the United States (difficulties arising from the Scarce Currency Clause or Article XVII of the Final Act of the I.M.F. and Article IX of the Anglo-American Financial Agreement) may make it impossible to insulate the non-dollar trading area from the results which will follow immediately from a failure of the United States' demand.

On the other hand, the developed areas have an interest in the use of the reserves to fight an American depression; but they may regard the conservation of these reserves for the purposes of financing development as even more important,

(ii) in passing individual schemes for economic development in the Commonwealth, the criterion which is obviously in use, namely, whether the project will help the balance of payments of the Commonwealth and its progress towards convertibility, is bound to conflict with the need for development. The financing of projects intended to step up rice production in Ceylon is a case in point.

(iii) at a later stage, perhaps, if the Commonwealth intends to move in step with the United States, rather than to accord first priority at all costs to development, differences are bound to develop regarding the extent of the deflation which may be permitted within countries which are wedded to the maintenance of high levels of government expenditure.

There is no reason at the present time to exaggerate these differences. The discussions at Sydney were informal. No conflict of interests has emerged, because the situation in which this is possible has not arisen and may not arise. But in judging the adequacy of the present level of the central reserves, namely, $2,518 millions (compared with $3,867 millions in mid-1951) these possible pressures and strains must be borne in mind.

This is all the more necessary, because at the moment sterling seems to be vulnerable in many different ways. Commodity-shunting is now more difficult, but danger from the following sources cannot be overlooked:

(i) if a non-European member of the transferable accounts area has an adverse balance of payments with a European member of this area, and finances this deficit by the payment of sterling, the European country to which this sterling accrues will sweep it into the holdings of sterling which will be eligible for compensation within the European Payments Union,

(ii) the increase in the percentage of British private imports from the O.E.E.C. areas from 58 to 75 per cent, this latter being the minimum standard set for countries which are not in serious balance-of-payments difficulties may prove to be a source of strain. The sterling area's cumulative position vis-a-vis the European Payments Union is that surpluses for the greater part of 1953 have reduced the net debt of the area very considerably. Whether latter-day deficits will persist and grow is not clear, but this is a possibility to be considered,

(iii) the Russian sales of gold against sterling, which sterling is used for the purchase of goods for supporting the Russian standard of living, is a development which is favourable to the sterling area, but it may well be temporary.

It is not necessary to exaggerate the importance of these potential strains either. But the steady growth in the reserves ($667 millions in 1953) may induce some degree of complacency which will not be justified.

From the point of view of the undeveloped countries, a programme for the future which is based on the recognition of the need for investment expenditures in the backward areas and on measures to transmit the influence of this investment demand to the dollar or E.P.U. area, as a cure in part for a depression, if necessary, and ultimately on discrimination, to the extent necessary, will be needed in the present circumstances. The alternative of insisting on internal balance may seem to be negative in comparison. This was obviously a point of view which was put forward at Sydney and in so far as it influences the Randall Commission in the United States as also the British Treasury itself it is bound to change the views so far accepted regarding the future of sterling.

THE PUZZLE OF CLOTH STOCKS

By

CROESUS

Probably due to the late harvesting of crops and the beginning of the customary busy season later than usual, the position of cloth stocks in the country during the past two years seems to present a puzzling pattern. Normally, the trend is for stocks to mount up and reach the peak by October and thereafter start declining. November figures generally are lower than the peak figures of October. This was so in 1948, 1949, 1951 and even in 1953. Only in 1952 and also in 1950, November figures were higher than in October; the position, however, was reversed in both these latter years (1950 and 1952), when the November figures were lower than October figures. Except in 1948 and 1951, December-end figures were not higher than in November.

But the trend in the early months of the year except in 1952 was invariably downward. Even in 1953 the downward trend, which began in December, persisted till the end of February and the position after two months improved further still, so that at the end of May the stocks were no more than 190,000 bales, as against 231,000 bales in 1952 and 223,000 bales in 1951. Only in 1950 and in 1948 were stocks at the end of May lower than at the end of May 1953. The trend since November 1953 has continued to be downward and on January 2, 1954, stocks were no more than 327,400 bales as against 424,200 bales on October 24, 1953, the highest stocks for the past five years. It was only at the end of October 1948, when the year's total mill production was 4,433 million yards, that the unsold stocks with mills were higher at 466,000 bales, as the following table will reveal:

CLOTH

(In million yards)

A study of the economics of the cotton mill industry shows that the trend of stocks is closely linked to the production and exports during a given period. Thus, when in 1948 the total production was 4,423 million yards and imports amounted to 34 million yards, while exports aggregated 344 million yards, the total quantity available for domestic consumption was 4,113 million yards, giving a per capita availability of consumption of about 15 yards. In 1949 and 1950 when production declined steadily to 3,806 million yards and 3,645 million yards respectively and exports continued to increase, there was a steady decline in the total quantity available for domestic consumption to 2,519 million yards, which explains the lowest per capita availability in 1950-51 to 9.70 yards. In the following two years, production steadily increased, while exports steadily declined, so that the total quantity available for domestic consumption also increased appreciably, the figure for 1952 being as much as 4,013 million yards. This is still less than the corresponding total for 1948 or for any of the three years 1943, 1944 and 1945. This figure will be raised further for 1953 to over 4,150 million yards, making allowance for the total exports of the year at 703 million yards. This is, of course, in addition to the handloom production which also has increased appreciably during the last few months. In short, the total quantity of cloth that would be available for domestic consumption in 1953-1954 would be about the same as in 1944-45, when the per capita availability of consumption and also offtake was over 15 yards. The question now is whether the per capita consumption will be at least at this level, if not at the pre-war level of nearly 18 yards according to private estimates and 17 yards according to Government estimates. If, in a year, production is high and there are also sizable imports, cloth stocks generally tend to be on the high side, unless there is a corresponding increase in exports and also in internal consumption. Since we have no reliable data for internal consumption, we must go on the basis of "guestimates" which, in the nature of things, are more anybody's guess-work than thoroughly dependable estimates. So, confining ourselves to available data, namely total available for domestic consumption, and comparing these with the stock figures for the corresponding years, we find that, invariably, when the former figure is high, as witness the position of monthly stocks in the years 1948, 1952 and 1953. The early 1954 figures may be gratifying, but we must watch for the trend over some more months.

In any case, it is too early yet to hazard any judgment on the basis of the past few weeks' encouraging progress in the movement of cloth stocks from various centres of production, both deficit and surplus areas. In nearly all the important centres, cloth stocks which had reached peak levels towards the end of October have registered marked declines. Reports from Ahmedabad indicate that everyday 3,500 bales or roughly twice the daily production of the mills in that centre are moving out. India's exports in the first nine days of the new year have been very encouraging, being of the order of 25 million yards. If this state of affairs should continue it is not improbable that there would again be a scarcity of certain categories of cloth and a further increase in cloth prices. Already, some categories of goods are quoting higher than a couple of months ago and this aspect of the matter is being closely watched by the authorities, it would appear.

It is possible, however, that some of the cloth movements upcountry are by way of a hedge against the stoppage of all wagon movements to Uttar Pradesh and other places in that State during the Kumbh Mela period, when there would practically be no goods traffic over that area. It remains to be seen whether this would be compensated by movements in other directions and this is an aspect to which the authorities should give some attention. Fortunately, the movement control in regard to textiles has not been scrapped yet, although at one time there was an attempt to do so and advantage should be taken of this to divert cloth to other parts of India, so that immediately after the Kumbh Mela cloth movements to Uttar Pradesh might be resumed, if need be on a larger scale than heretofore to make up for the interruption in supply.

CLOTHING THE MILLIONS

By

CROESUS

I do not know whether it is to mark the completion of a 100 years or to dispel the ignorance and prejudice about the cotton mill industry in India that the Millowners' Association, Bombay, has lately launched on a sort of an informative propaganda campaign. In either case, it is, I must say, being carried on in a really effective manner and is, therefore, doubly welcome.

In "Clothing India's Millions", the Association sought to reach the lay public and, for this purpose, it employed the graph or picture technique by including a number of photographs of the different processes of the industry and making the publication colourful, if I may say so.

In the second booklet entitled "Facts About the Cotton Mill Industry of India", on the other hand, the Association has concerned itself solely and simply with detailing facts—facts about capital invested in the industry, labour force employed, quantity of cotton consumed, yarn produced for its own consumption and that for feeding the handloom industry, volume of cloth produced, contribution to the exchequer, Central and State and local bodies, etc. Look at it from any angle, be it saving foreign exchange or providing employment, or assuring a lucrative market to the cultivator for his cotton crop or assisting the handloom and powerloom weavers by supplying yarn, you cannot but admit that the industry has made impressive showing over the past 100 years.

"The mills are fleecing us" is a complaint that people often make facilely, but few among them have apparently cared to ascertain "facts". The break-up of the cost structure given in the second booklet that has been brought out by the Association, for instance, makes illuminating and instructive reading. After a study of this and the percentage rise since 1939 in the elements of cost, not to speak of the tax on the raw materials and also on the finished commodity, there will undoubtedly be a better appreciation of the cotton mill industry's position.

How many know, for instance, that taxes on production and consumption of cotton cloth alone account for at least Rs. 40 crores! Or take, again, the incidence of sales tax which has been precisely worked out even to two decimal points. Do not these clearly prove that there are several factors far beyond the control of the industry that shape and influence the final price which the consumer pays?

Another aspect of the cotton mill industry's problem that has not received proper attention is that of the rehabilitation of the industry, many of the units of which have witnessed two wars and their baneful effect on the machinery. Pointed attention has, of course, been drawn to this by the Industrial Finance Corporation in its Second Annual Report and also by the Planning Commission in the Five-Year Plan, but these have to be dished out to us, the most apathetic nation that we are in these matters. And the M.O.A. booklet has done it.

Now that the industry has emerged from a decade of controlled existence, is it in a position boldly to face the era of free markets which may even mean unbridled competition? The M.O.A. booklet has this to say in answer:

"Relief and exhilaration are natural reactions to freedom from duress, but this joy is tempered by the knowledge that the industry faces the future with many unsolved problems. While production has already exceeded the Five-Year Plan target, there has unfortunately been no corresponding increase in the volume of consumption. Reduction of cloth prices, as a means of stimulating a higher rate of consumption, has thus acquired a good deal of importance, and, in this task, rendered extremely difficult by the existence of cost inflation, the industry seeks the co-operation of the Government through a suitable revision of the various levies and imposts which contribute in no small measure to making cloth expensive to the consumer".

The appeal of the publishers is that the public should have a more realistic appreciation of its position and problems than it seems to have. Granted this, the industry has this assurance to offer, namely that "it will play its role even more effectively than before in promoting the country's prosperity". It is for the public and the powers-that-be to decide whether the country requires the cotton mill industry in India to play this role.

Managing Agents:

Birla Brothers Limited.

BUSINESS NOTES

CLOTH EXPORTS UP

Provisional estimates of cloth exports as well as production for the year 1953, disclose a reassuring trend. Output is expected to reach a new peak at 5,000 million yards which will surpass the target of production fixed in the Five-Year Plan for 1955-56 by a margin of about 300 million yards. The unbroken upward trend in production had given cause for considerable concern in the third quarter of the last year as accumulations of cloth stocks raised apprehensions of a glut and closure of mills. A continuous process of price reduction could not help liquidation of stocks and finally towards the end of October last the Government announced certain measures of relief including abolition of the export duty on medium varieties which constitute the staple exports. The correctness of this policy was reflected in the quantity of medium cloth passed for shipment in November and December—25 per cent of the total in two months. Exports in December last at 77.6 million yards were the highest in any single month over a period of the last seventeen months. Total exports of the year were 701.3 million yards. The breakdown according to varieties in the last two years would be as follows:

	(Million yards) 1953	1952
Coarse	260.7	168.1
Medium	273.9	138.7
Fine	152.5	264.4
Superfine	14.2	22.6
TOTAL ..	701.3	593.8

While it is a fact that the 1953 quantity of exports is below the target of 1,000 million yards announced at the Buxton conference and later endorsed by the Government, it is also true that exports from Japan and the U.K. are relatively much below their respective targets declared in that conference. It is problematical whether exports of coarse cloth would have been pushed still higher if the export duty on it had been removed. But the satisfactory level of their exports appears to lend justification to the Government's reasoning about the duty not operating as a depressing factor. The loss of preferential import duty enjoyed by Indian cloth in Burma till October last was offset by stimulated demand from other countries including Indonesia, East and West Africa and also Pakistan. The decline in the two superior varieties was probably the result of Japanese competitive supplies. In the immediate future, however, enquiries indicate that the overseas buyer would prefer placing orders in India in view of comparatively late delivery dates from Japan.

TRADE DEFICIT WITH THE U.K.

A deficit in India's trade with the U.K. during 1953, excluding the month of December for which data are obviously not available, has been disclosed by the figures of account released by the U.K. Board of Trade. The amount of the deficit in the first eleven months of 1953 has been estimated by the Board at £3,394,000 which stands in contrast with this country's trade surplus of £1,053,000 during the first eleven months of 1952. The value of India's imports from the U.K. in January-November, 1953, was £104,894,000. The corresponding import and export values during 1952 were £102,911,000 and £103,964,000. There was thus a decline of £2,464,000 in India's exports and an increase of £1,983,000 in imports during January-November, 1953, as compared to the identical period of 1952.

India's imports from the U.K. show a drop in the staple items. For the sake of comparison the figures for the first eleven months of 1952 are indicated in brackets close to the figures for the same period in 1953. Imports of machinery from the U.K. in 1953 were of the order of £30,839,000 (£32,631,000). Vehicles also recorded a fall in value at £14,109,000 (£15,522,00). Other items whose import value shrunk last year included chemicals, drugs, dyes, electrical goods, and so forth. On the export side, the position of this country was held at the level reached by two important groups of commodities. Exports of tea in 1953 amounted to £44,747,000 (£43,573,000). This upward trend in tea was only to be expected following the complete withdrawal of restrictions on the domestic trade and consumption of tea in the U.K. from October 1952. Since the last quarter of 1953 the intake of tea there has been rising and this trend has not been offset by an increase in prices. Leather and leather manufactures registered a substantial increase of about 63 per cent in export value at £13,000,000 (£7,786,000). Oilseeds and oils were on the decline. But the most significant drop in India's exports was shown in jute manufactures.

OUTLOOK FOR OILS

Last week on January 6 the Government announced the decision to liberalise the export policy in regard to linseed, kardi seed, and niger seed as also their oils. The actual form which this liberalisation has taken is to allow the exports of these three varieties of seeds together with their oils freely on shipping bills during the first half of the current year. The immediate reaction to the announcement was to cause a spurt in prices. Soon after the decision became known linseed prices shot up from Rs. 15-8 per quarter to Rs. 16 per quarter, niger seed from Rs. 28-8 to Rs. 29 and kardi-seed from Rs. 24-8 to Rs. 25.

This purely short-period reaction in the seeds market, however, need not be taken as indicating a trend of an improved outlook for the export of oilseeds or their oils. It is an indication of some relief to a dull market. The real issue for consideration is whether a real fillip will be given to exports. On this score the initial enthusiasm is clearly no pointer of a positive trend. Lack of overseas enquiry stressed the need to make the prices of Indian seeds and their oils competitive. One factor which retards their competitive ability is the continuance of the export duty. About seven months back substantial reductions of 75 per cent were granted in the export duties, bringing the duty on linseed oil to Rs. 50 per ton and that on linseed to Rs. 25 per ton. This reduction, however, failed to push up exports because of the wide disparity in Indian and other prices in the overseas market. On the Continent, for instance, linseed oil from India was offered at prices 50 per cent above the offer for American oil. The trade has pressed for further relief in the form of total removal of duty as it is repugnant to the basic principle of trade policy to levy export duty in a competitive market. The so-called liberalisation, permitting free exports on shipping bills, is nominal and it would be too much to look upon it as an incentive to greater export. The price factor is decisive and on this score imports on payment of dollar exchange will not constitute a disadvantage. This directive does not alter the position of groundnut and its oil.

COASTAL SHIPPING TRADE

That the state of the coastal shipping trade is anything but satisfactory for some time past is becoming increasingly obvious. After the boom in the freight market which continued throughout 1952 and the earlier part of 1953 had worn out and the return to normal conditions re-introduced competition in the trade, adjustment to the new situation brought to the surface varying attitudes on the part of the shipping company managements. In the rush that ensued for business

there was a desire on the part of many of them to adhere to healthy trade practices, but the persistence on the part of some in resorting to the short-sighted policy of cut-throat competition and launching a general scramble for freight had the inevitable effect of undermining the morale of the trade. Rebates and rate-cutting threatened to jeopardise its immediate prospect. The attempts to straighten out the state of affairs, however, have so far failed to bear fruit. The Indian Coastal Conference was pressed to use its good offices in the matter, but its helplessness became apparent in no time. The inability of the Conference to take a firm initiative in this question arises from its curious constitution which invests a member company to veto any proposal by its solitary vote. In utter despair to seek restoration of healthy practices in the trade with the help of the Conference, the Scindia Steam Navigation Company resigned its membership. It seems that up to now neither has this premier company been persuaded to withdraw its resignation nor has the constitution of the Conference been amended by the abolition of the veto. There is force in Mr. Bhiwandiwala's plea in his presidential address at the last annual meeting of the Great Eastern Shipping Company urging the Scindias to stay in the Conference to secure the much-needed reform.

The chairman of this young shipping company has put forward a new theory of treating the coastal trade as a nursery to acquire proficiency in the skill and practice of shipping. He has urged that this reserved field should be left to new companies and the older and senior units should make room for them by switching over to the overseas trade. This plea presumes that there is real immediate scope for Indian shipping companies in the sphere of international trade. Facts are quite the other way. The instance which Mr. Bhiwandiwala has cited in his speech about the stubborn resistance of an established British line to admit Indian companies to the trade between India and the Persian Gulf (and the chairman of the India Steam Navigation Company has quoted more instances of this kind) is enough to demonstrate the invalidity of this presumption. The road to the development of Indian shipping does not promise to be smooth.

A.-I.M.O.'S PLEA

The All-India Manufacturers' Organization at its third quarterly meeting has come out with a fresh plea for direct aid and stimulation to industry. Sir M. Visvesvaraya's presidential speech set out with an altered emphasis the scheme for giving a push to industrialisation in the private as also the public sectors. If there is nothing new in the remedies suggested by the A.-I.M.O. for furnishing incentive and financial aids for the expansion of industry, the repeated stress on tax relief, with conditions attached for ploughing the savings back in investment, and provision of credit facilities signifies that delay in modifying Government policy on these lines is likely to retard the growth of industry. Two other planks in policy which have a direct bearing on the investor's psychology have been reiterated by the Organization as little heed seems to have been paid to them. They are modification of labour policy to remove the deterrents to new investment and a ban on further nationalisation. The precedent of the hasty method adopted for the nationalisation of air transport industry underlines the need of this warning and if nationalisation is deemed to be imperative in any individual case, the equally imperative need to maintain a rational policy on compensation ought not to be ignored.

What has been urged by the Organization in respect of the State Governments' freedom to go ahead with execution of plans of heavy industry is of dubious validity. The Five-Year Plan in action and the State Governments' share of responsibility in it should serve to re-emphasize the indispensability of full consultation and co-ordination with the Union Government to safeguard the objects of balanced allocation of funds and development on the pattern fixed for the achievement of the targets for expansion. The progress report on the Plan for the first two years has already demonstrated how the scope for deviation by State Governments in special cases is limited. It is doubtful how full freedom for the States in expanding industries without restraint is compatible with the achievement of planned development on a modest scale for which the financial resources are not all internally available.

EXTERNAL MARKET FOR TOBACCO

In the post-partition years tobacco emerged as one of the important and stable exports of the Indian Union. Exports of tobacco increased in value by more than 100 per cent from Rs. 7.18 crores in 1946-47 to Rs. 16.75 crores in 1951-52. Only graded and marked tobacco is allowed for shipments and the total quantity of such tobacco rose from 16.9 million lbs. in 1945-46 on a progressive scale. Part of this retained at home went into the production of superior types of products. The principal importer of Indian tobacco is the United Kingdom and its intake is of basic importance to the export trade. Egypt is the next important buyer. But latterly direct trade relations in the commodity have been established with the Continental countries, chief among which are Belgium, Germany, Italy the Netherlands, Sweden and Yugoslavia. The European countries, including the largest consumer the U.K., switched over to Indian tobacco owing to the urgency of eliminating expenditure on dollar tobacco. Next to the United States, China is a major supplier of tobacco, but her absence from the international market operated as an added factor in the stimulation of exports of Indian tobacco.

These immediate causes of a fillip to the external tobacco trade cannot, however, be regarded as the sole factors contributing to the overseas sales of tobacco. Far from being a temporary source of foreign exchange earnings, Indian tobacco has now established its reputation abroad and secured a stable footing. This is due to the energetic and sustained efforts of the Agricultural Ministry's Directorate of Marketing and Inspection acting in close collaboration with the trade. This collaboration has demonstrated the practicability of strict quality control of exports. The elaborate machinery that has been set up for grading and Agmarking of tobacco has been enabled to function smoothly and efficiently with active co-operation of the trade. The grades have been evolved after consultation with representative organizations of importers, particularly in the U.K. Export of tobacco not graded and marked has been prohibited under the Sea Customs Act. But it is vital to remember that strict adherence to authorised specifications has been primarily responsible for faith in the quality of consignments. Doubts which were raised earlier about the injurious effects on trade of constant intervention have been completely dispelled and it is now agreed that what was apprehended as an intervention has proved to be a valuable aid. The detailed technique of quality control in tobacco which has been lucidly explained in a recent official brochure should be of use to other trades as an indication of possible lines of quality promotion with necessary individual adaptations.

AIR TRAVEL INSURANCE

The initiative which is reported to have been taken by Mr. Jagjivan Ram in preparing a scheme for compulsory insurance of travellers on the scheduled domestic air transport services, close on the heels of the tragic air-crash near Nagpur, is clearly intended to provide automatic cover to the dependants of the insured in case the tragedy of accident overtakes travellers. Hitherto such insurance was entirely optional and it appears that its operation was curtailed.

Under the new compulsory scheme, the risk, it is said, would continue to extend for a period of 24 hours or so from the time the traveller books his ticket. It is to be presumed that the contract of insurance will provide for situations in which the actual continuance of the risk extends beyond 24 hours due to delays either on account of the carrier's responsibility or for reasons beyond his control. Compulsory insurance would entail a surcharge on every ticket and though the tariffs will have to be drawn up on an actuarial assessment, the ceiling on the amount of insurance intended to be fixed at one lakh rupees would require a premium-cum-surcharge of Rs. 10 according to reported indications. This is the premium actually prevalent at present. The Indian Airlines Corporation proposes to secure the agency of an insurance firm of international reputation for this purpose. The Commissioner of Insurance is said to have been approached in this behalf to issue the requisite authority for the agency agreement. This report has received Press publicity so recently that in the course of the few days since its curreney general reaction or reaction of Indian insurers to it has not been available. The scheme as published in broad outline is unexceptionable and as such its introduction is just a matter of time.

EXPORT OF IRON AND MANGANESE ORES

The Government of India have reviewed the procedure for licensing the export of iron and manganese ores. In the case of exports from Calcutta, it has already been announced that exports during the quarter ending March 31, 1954, will be granted up to 20 per cent basis as during the previous quarter ending December 31, 1953. Exports from all other ports except the port of Madras will continue to be licensed as hitherto. In regard to exports from Madras, the present system of licensing freely on the basis of ready stocks will continue to be in force up to January 15, 1954. But with effect from January 16, 1954, in view of the limited capacity for rail movements to Madras via Guntakal and Bangalore, it has been decided to regulate exports of iron ore and manganese ore originating from the Bellary-Hospet and Bangalore areas, on a quota basis. Exports of these ores originating from other sources will continue to be licensed freely even from the port of Madras as heretofore.

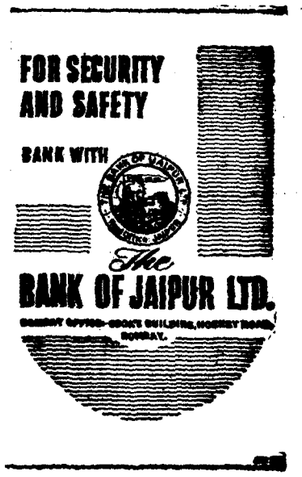
Established shippers of iron ore and manganese ore are advised to apply to the Deputy Chief Controller of Exports, Madras, with evidence of past exports duly supported by bills of lading in any one of the three calendar years 1951, 1952, or 1953. Allotments for the export of iron and manganese ores during the quarter ending Mafch 31, 1954 will be granted upto 20 per cent of shipments of each ore effected in the best year. Licences will be issued on shipping bills up to the export allotments granted by the Deputy Chief Controller of Exports, Madras.

It has been decided to give the necessary facilities to the mine-owners of iron ore and manganese ore, who are not eligible to receive allotments as established shippers, to participate directly in the export trade of the country. The mine-owners should submit applications for export allotments for the export of iron and manganese ore during the quarter ending March 31, 1954 to the Deputy Chief Controller of Exports, Madras, by January 25, together with details of production during the calendar years 1951, 1952 and 1953 supported by a certificate from the Director of Industries or the Officer-in-Charge of mines, as also an affidavit to the effect that neither the mine-owner applicant nor any of his associates has any interest in the export allotments that may be received by any established shipper. Export allotments will be granted to mine-owners by the Deputy Chief Controller of Exports, Madras, in consultation with the Chief Controller of Exports.

ION EXCHANGERS FROM INDIAN COALS

A new method for the preparation of ion-exchange material from coal has recently been developed at the Fuel Research Institute, Digwadih.

Ion-exchange material prepared from coal finds extensive use in water-softening. The technique provides a cheap and readily available supply of soft water for various industrial purposes. The water so softened is used in boilers, laundries, textile mills, dyeing houses, breweries, etc. When regenerated with acid, these materials form part of the equipment used for the production of de-mineralised water for pharmaceutical purposes, aerated water and other beverage industries. Ion-exchange materials from coal in various forms can also find use in other industries such as metal-concentration, sugar-refining, preparation and purification of solutions, refining of hydro-carbons, etc. In certain chemical processes, ion-exchangers are used as catalysts.

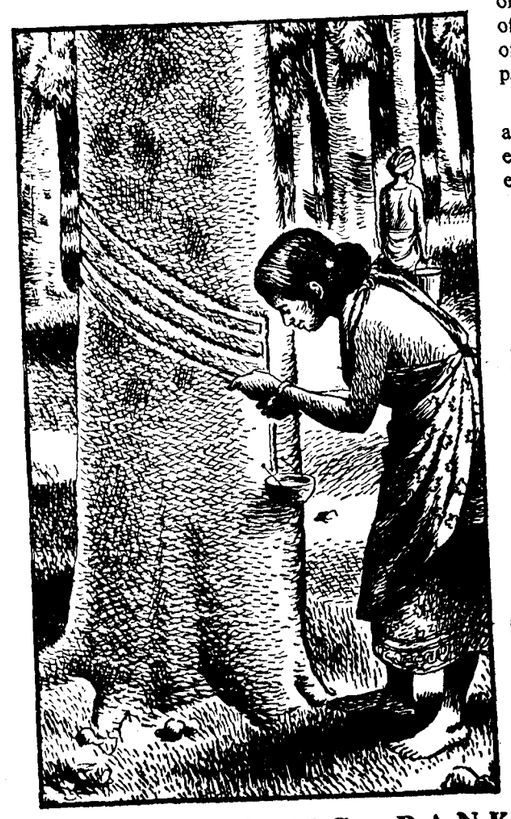


The ion-exchanger has been produced at the Fuel Research Institute on a pilot plant scale, and its water softening capacity has been tested experimentally in a large-scale softening plant in which water with a total dissolved solids equal to 440-480 parts per million was softened to zero hardness at an operating cost of As. 8 per 1,000 gallons.

All the materials for the manufacture of the exchanger are easily available in India. The equipment required is simple and can be easily fabricated. The method is covered by patent, but the C.S.I.R. is offering it for commercial production.

TRAINING IN CO-OPERATION

A Central Committee for Co-operative Training jointly set up by the Reserve Bank and the Government of India under the Chairmanship of Shri V. L. Mehta met recently to consider a co-ordinated scheme of training for the personnel of co-operative departments, co-operative banks and other co-operative institutions throughout the country. A proposal before the Committee was that the All-India Co-operative Training Centre at Poona, established by the Reserve Bank about a year and a half ago, should be further expanded so as to meet the needs of all States in respect of their "higher" personnel; that three or four regional training institutes should be set up for intermediate personnel in different parts of the country; and that local or State-wise arrangements should be made for the training of all other personnel, including members, directors, and secretaries of societies, and all village-level and other workers, official as well as non-official.



For the last mentioned part of the scheme, subsidies to State Governments are contemplated out of the provision of Rs. 10 lakhs made in the Five-Year Plan. Training schemes for higher and intermediate personnel will be administered by the Committee with funds provided by the Reserve Bank of India.

How banking serves the RUBBER INDUSTRY

RUBBER was first planted commercially in India in 1902. Today Indian rubber plantations, concentrated in Travancore-Cochin and Malabar, produce 20,000 tons of rubber every year, valued at four and a half crores of rupees. More than 250 Indian factories depend on this output for their production of finished goods.

Without banking, this growth could never have taken place. The facilities and guidance offered by a good bank, such as the availability of ready funds when needed and the collection of dues in any part of the country, have become part of the structure of the rubber industry.

We at Palai are proud that so many important rubber producers, and indeed leading firms in every field of business and industry in South India, employ the *complete* banking service we offer.

Current Accounts—Demand Drafts—Telegraphic Transfers—Bill Collection—Letters of Credit—Deposits—Investments—Loans & Overdrafts—Confidential Credit Reports, etc.

* * * *

If you have business interests in the South, it will pay you to open an account with us. Our 24 branches are strategically located, 22 in important South Indian business centres and two in Delhi and New Delhi; and we have correspondents in all important Indian cities. We offer a fully comprehensive banking service at each office.

Our clients can make deposits at any of our correspondent banks, situated in all important Indian towns and have the amounts credited to their accounts at any of our branches.

PALAI CENTRAL BANK LTD.
(Incorporated in Travancore-Cochin with Limited Liability)

Head Office: PALAI, TRAVANCORE
Branches at: Madras, Cochin, Quilon, Trivandrum, Alleppey, Mangalore, Bangalore, etc.
Also at: Delhi & New Delhi.

A LEADING BANK IN SOUTH INDIA

PC. 8427

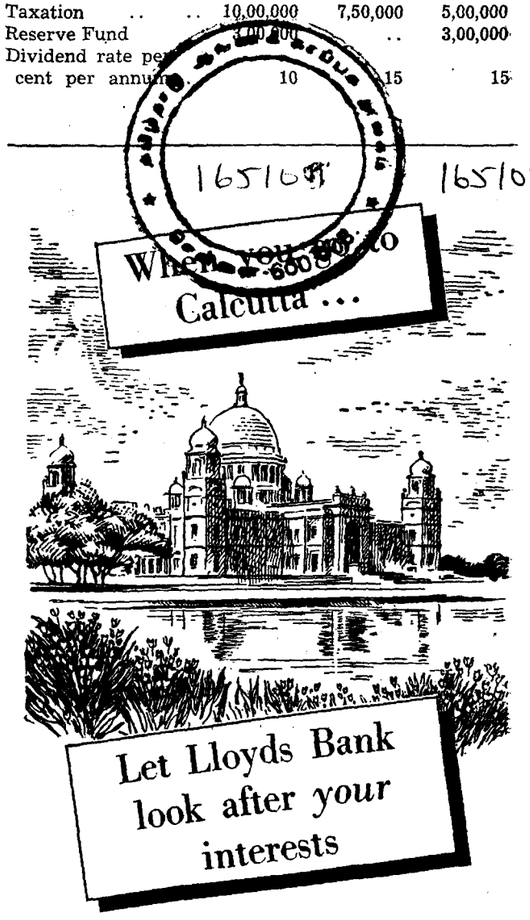
COMPANY AFFAIRS

ORIENT PAPER MILLS LTD.

The report of the Directors of the Orient Paper Mills Ltd. (Managing Agents: Birla Brothers Ltd.), for the half-year ended 31st March, 1953, discloses an impressive improvement, as compared with the preceding half-year, both in sales and net profit. Net sales have advanced from Rs. 153.75 lakhs to Rs. 177.56 lakhs while net profit (before providing for depreciation and taxation) has improved by about Rs. 21 lakhs from Rs. 41.19 lakhs to Rs. 62.32 lakhs. The allocation for depreciation has remained unchanged at Rs. 5 lakhs but the provision for taxation at Rs. 31 lakhs, as against Rs. 10 lakhs in the previous half-year, has absorbed almost the whole of the increase in net profit. The dividend equalization account has appeared for the first time in the balance sheet and the Directors have transferred Rs. 20 lakhs to this account. No additions have been made to the general reserve which stands at Rs. 56.50 lakhs and the repairs and renewals account which stands at Rs. 45 lakhs. Dividend on the ordinary shares has been proposed at the rate of Re. 1 per share—a rate which has remained unchanged since March 1951. The fluctuations in the fortune of the company during the last three accounting periods are outlined in the table below:

Half-year ended	31st March, 1953 Rs.	30th Sept., 1952 Rs.	31st March, 1952 Rs.
Sales ..	1,77,56,416	1,53,75,015	1,87,79,491
Net Profit (before providing for depreciation and taxation) ..	62,31,621	41,19,489	33,11,888
Depreciation ..	5,00,000	5,00,000	5,00,000
Taxation ..	31,00,000	10,00,000	7,00,000
Salaries and Wages	20,92,456	17,42,218	19,36,301
Manufacturing Expenses ..	7,22,604	6,71,269	7,87,925
General Reserve ..	..	5,00,000	9,00,000
Dividend Equalisation Account	20,00,000	..	..
Reserve for Repairs and Renewals ..	..	15,00,000	6,00,000
Ordinary Dividend (rate per cent per annum) ..	20	20	20

Balance sheet as on 31st March, 1953.

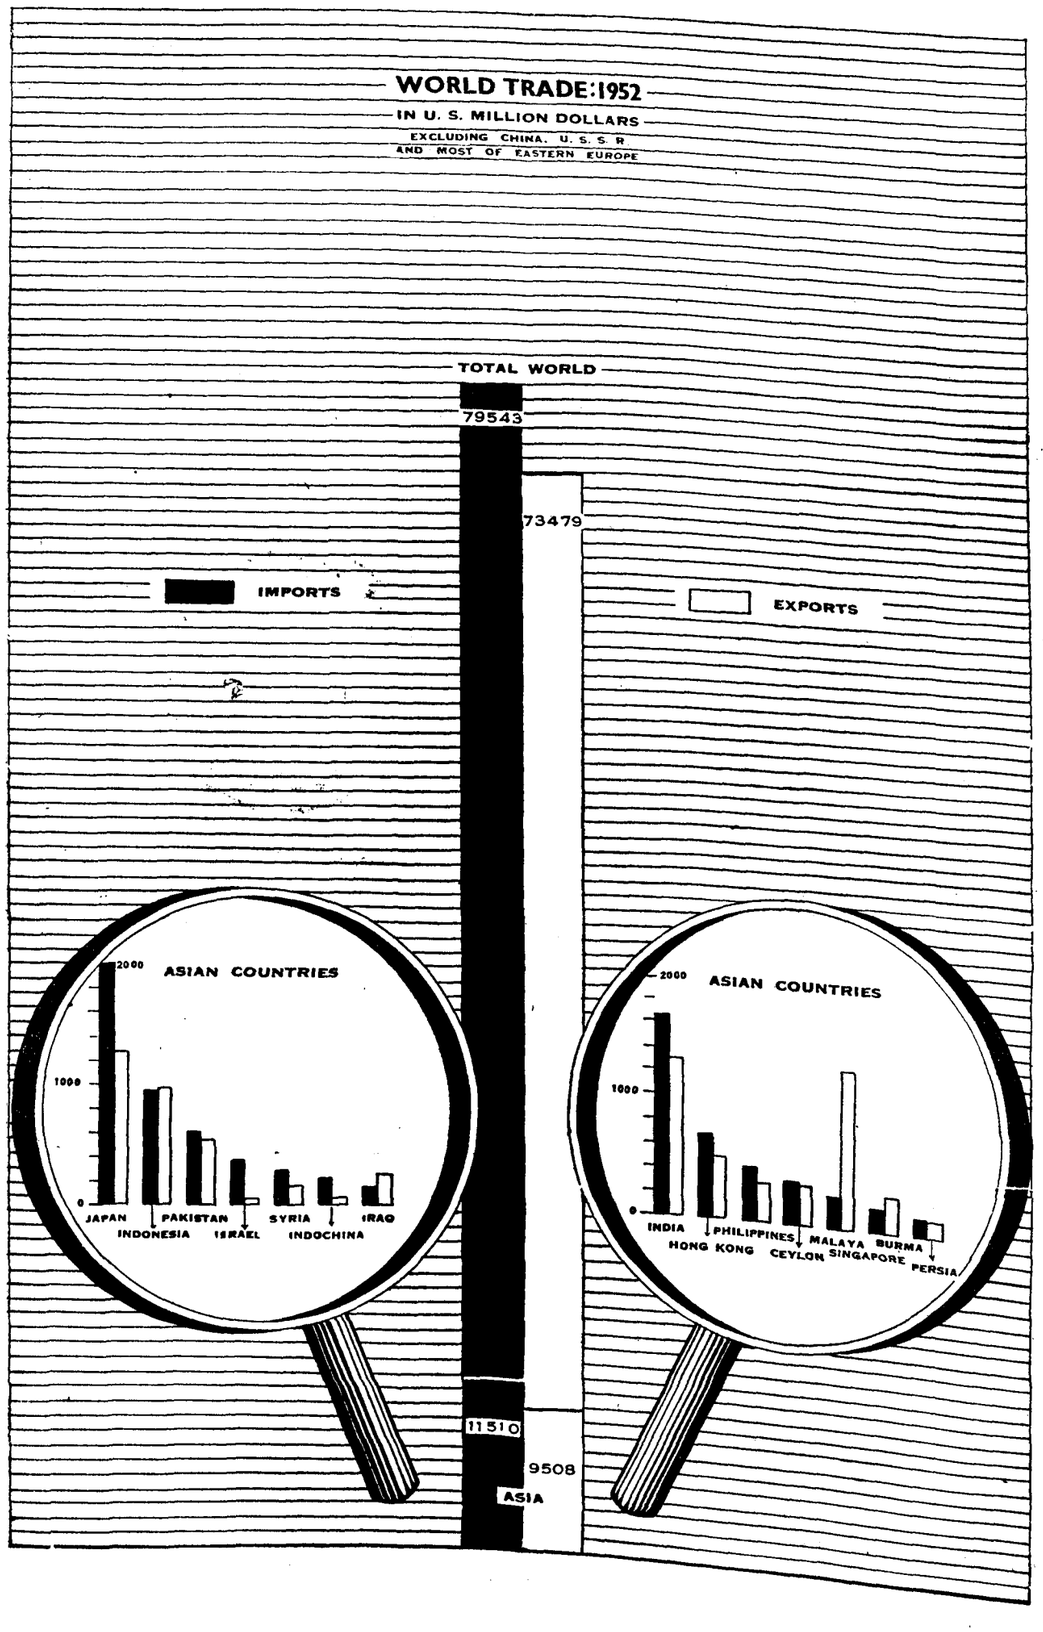


Capital and Liabilities	**Rupees**
Capital	1,21,95,000
General Reserve	56,50,000
Capital Reserve	1,00,70,000
Repairs and Renewals	45,00,000
Dividend Equalisation Fund ..	20,00,000
Sundry Liabilities	2,29,74,165
Profit and Loss Account ..	2,26,754
TOTAL	5,76,15,919
Property and Assets	
Gross Block	3,32,58,294
Less Depreciation	75,01,000
Net Block	2,57,57,294
Liquid Assets	3,18,58,625
TOTAL	5,76,15,919

THE ELGIN MILLS CO., LTD.

The working results of the Elgin Mills Co., Ltd. (Managing Agents: Begg Sutherland & Co., Ltd.), for the year ended 30th September, 1953, reflect the difficult trading conditions which the Indian Cotton Textile Industry experienced during the year 1953. The profit and loss account reveals a drop of about Rs. 6 lakhs in net profits (before providing for depreciation, taxation and reserves) from Rs. 33.30 lakhs to Rs. 27.39 lakhs. Provision for depreciation has been increased from Rs. 5.50 lakhs to Rs. 7.50 lakhs and that for taxation has gone up from Rs. 7.50 lakhs to Rs. 10 lakhs. A sum of Rs. 3 lakhs has also been transferred to the rehabilitation reserve. The ordinary dividend rate has consequently been recommended at the reduced rate of 10 per cent per annum as against 15 per cent in the year 1950-51.

The table below summarises the working of the mills during the last three years:



Year ended	30th Sept. 1953 Rs.	30th Sept. 1952 Rs.	30th Sept. 1951 Rs.
Profit (before providing for depreciation, taxation and reserves)	27,39,071	33,30,262	31,55,001
Depreciation	7,50,000	5,50,000	7,00,000
Taxation	10,00,000	7,50,000	5,00,000
Reserve Fund	3,00,000	..	3,00,000
Dividend rate per cent per annum	10	15	15

COMMODITY NEWS AND NOTES

LOWER SUGAR OUTPUT

Preliminary reports about sugar production this season have already started late. The normal tempo of production has not yet been attained in the U.P. and Bihar on account of irregular cane supplies. There are apprehensions that the 1953-54 season might witness a fall in the sugar output compared to the last two seasons. The problem of cane supply in the U.P. and Bihar is due to the tendency among the growers to turn to gur output which is comparatively more remunerative at present. The reports of falling cane production in the U.P. have induced some of the growers to demand higher rates than fixed by the Centre. The industry is reluctant to go in for costly cane, since the imports of foreign sugar have limited the chances of higher profits.

FREE EXPORT OF LINSEED OIL

The Government of India has decided to continue to license export of linseed oil freely on shipping bills up to the end of June 1954, says a Press note issued by the Chief Controller of Imports and Exports. The Government of India have reviewed the export policy of kardi seed, niger seed and their oils and have decided to continue to license export of those commodities freely on shipping bills up to the end of June 1954.

WORLD NICKEL PRODUCTION

World output of nickel will reach 335 million pounds this year or 45 million pounds more than the last year's production according to Dr. J. F. Thompson, chairman of the International Nickel Company of Canada. He forecasts that by 1960 world output of nickel will be almost 75 per cent more than that in 1949. Despite the expansion in output prices have been firm. This is because next to steel, nickel is the most important armament material and almost half of the free world's production last year has been allocated from military, Atomic and stockpile requirements.

The overall demand has been strong, but civil requirements may not be met on account of strategic needs.

FORWARD TRADING IN GUR ALLOWED

The Government of India has cancelled the ban on forward trading in gur, it is officially announced. The question of bringing this commodity within the purview of the Forward Contracts (Regulation) Act, 1952, is under the consideration of the Forward Contracts Commission, the announcement added. The ban on forward trading in sugar in the existing form will continue.

STANDARD OF SALT FOR HUMAN CONSUMPTION

The Government of India fixed the minimum standard for salt for human consumption in 1953 at 94 per cent sodium chloride content. In practice, however, the percentage enforced was 93.5, as fractions of .5 and above over 93.5 were treated as equivalent to one and the total as 94. It was intended that the percentage to be enforced for 1954 should be 95 per cent. After a very careful consideration of the representations that have been made by the salt manufacturers and their Associations, the Government of India have decided to maintain the minimum standard for salt for human consumption in 1954 at 94 per cent sodium chloride content without any allowance for fractions between 93.5 and 94.

WORLD TOBACCO OUTPUT UP

The world production of leaf tobacco last year was estimated by the United States Agricultural Department to be 7,323,894,000 pounds, for sale weight. This was 94,080,000 lbs. more than 1952's total and 90 million lbs. more than the average for 1947-51 (Farm sales weight is about 10 per cent more than average dry weight normally used). In 1953, in Asia the output was 2,923,386,000 pounds compared with 2,800,329,000 pounds the previous year. This was about 4.4 per cent above 1952, but still radically below the annual average during 1947-51.

BIGGEST EVER RICE CROP EXPECTED IN CEYLON

The Director of Food Production, Mr. Manikka Idakaddar, told the Press recently that rainfall in the past few months had favoured paddy crops greatly as a result of which next year's crop should exceed the 1952 crop, the biggest so far, by nearly three million bushels. The 1954 Maha crop is expected to bring nearly twenty million bushels of paddy.

EXPORT OF MANGANESE AND IRON ORES PERMITTED

The Government of India has decided to license the export of iron and manganese ores to both established shippers and mineowners from the Port of Calcutta during the quarter January-March 1954 on the same basis as for the quarter ending December 31, 1953.

TOBACCO STOCK ACCUMULATING

Mr. G. Latchanna, Agricultural and Forest Minister for Andhra State, told Pressmen recently that he had represented to the Union Food Minister, Mr. Rafi Ahmed Kidwai, the urgent need to explore foreign markets for tobacco. He added that over 40 million pounds of tobacco of last year remained unsold with the producers in Andhra State. The prices of tobacco, he said, had fallen from six annas a pound to about 1½ annas now. He said that he suggested to the Union Food Minister that the tobacco export trade should be done by the Governments of States producing it instead of by merchants, as at present, to secure a minimum guaranteed price to the producer. China, Russia and Japan, he said, were the chief customers for Indian tobacco and in all the three countries the tobacco import trade was conducted by their Governments.

PETROLEUM EXPLORATION IN WEST BENGAL

An agreement between the Government of India and the Standard-Vacuum Oil Company for the joint exploration of petroleum and production of petroleum if it is discovered in commercial quantities in West Bengal was signed in New Delhi recently. The agreement is the result of negotiations between Government and Standard-Vacuum which have been current for the last 18 months. Government and Standard-Vacuum have agreed to contribute jointly the funds required for the operations. The Government will provide one-quarter of the expenditure and Standard-Vacuum will contribute the balance. The aggregate contribution of the Government will not, however, exceed Rs. 2½ crores unless the Government wishes to provide further contributions towards the continued expenditure for the project. Standard-Vacuum has given the assurance that if commercial production of oil in sufficient quantities is established, it will consider the erection and operation of a refinery of a capacity of at least ten thousand barrels per day.

COMPANY MEETING

SPEECH DELIVERED BY IVOR BULL, ESQ., O.B.E. CHAIRMAN

COFFEE LANDS AND INDUSTRIES (MYSORE) LTD.

AT THE SEVENTH ANNUAL GENERAL MEETING OF THE COMPANY Held On 31st December, 1953.

Gentlemen,

As the Directors' Report and the Accounts have been with you for the statutory period, I propose with your permission to take them as read.

Although the crop we have gathered is the highest in the Company's history, the profit unfortunately is the second lowest, and we have been able to recommend a dividend of 3 per cent only. This is a disappointing result when the steady increase in the yield of our estates is remembered.

Last year, in addition to transferring Rs. 52,030 to our Dividend Equalisation Reserve, we were able to transfer Rs. 1,50,000 to General Reserves. This year we have been unable to transfer any sum to General Reserve.

Estate expenditure at Rs. 12,48,804 shows an increase of over two lakhs compared with 1951-52. Part of this increase is due to higher wages but with a heavier crop on the trees to be harvested this year, it was also essential to meet the cost of supporting the bushes with the additional fertiliser and spraying necessary to maintain their condition. The historic error in coffee growing in the past has been to use the proceeds of a heavy crop, after realisation, for additional expenditure on fertilisers. Meantime, the damage has been done. The only way to prevent the bushes from becoming exhausted is to support them before and during the period of crop strain. For obvious reasons we have had to cry a halt to our rehabilitation programme this year, but we have given our coffee proper backing, and there is every sign that the estimate of 500 tons will be realised.

For those who are only technically interested in coffee production, the result of the year's working is of considerable interest, although for the shareholders it is so disappointing.

Our estates in Mysore are better than the average, our yield at 3 cwt. is higher than the average. We believe them to be carefully, economically and intelligently worked, yet the total profit per acre is only Rs. 12-9. From this minute profit, not only have dividends to be paid, but it is the only source from which money can be found for improving our labour quarters and introducing the many benefits devised under the Plantation Labour Act for labour. Actually, even if we could borrow the money and if we paid no dividend at all, the profit would be insufficient to meet even half the interest of the cost of rehabilitation. Where we have just succeeded in paying our way, there are many other Mysore and Madras estates which have suffered a severe loss.

Our estates represent not merely a sample of a better than average Mysore estate, but also a better than verage Madras estate, and unless a price for coffee hich is fair to the producer is speedily fixed, there is tle doubt that the famous Arabica coffees of Mysore, the Nilgiris and the Shevaroys will go the same way as the Indigo industries of Bengal, Bihar and Orissa.

The arabica crop in both Mysore and Madras is declining, for in neither State has the coffee fully recovered from the depression of the thirties. No separate figures are available for the arabica and robusta crops before 1941, but the six yearly averages since then are given below:

Average Arabica Crop in Tons

Six seasons ending	Mysore	Madras	Total
1946-47	5,999	4,142	10,141
1952-53	5,122	3,788	8,910

This decline has taken place during a period of relatively stable prices. Now that prices have been forced down to a figure which is well below the average cost of production, the decline in the arabica crop will be greatly accelerated.

Again for the observer, though not for our shareholders, this position regarding coffee on the average estate is curious.

On our own estates, the actual profit was only Rs. 33,723 last year, and yet we shall have directly met or provided no less a sum than Rs. 2,12,352 to the Central Government and Rs. 4,032 to the State Government, a total of Rs. 2,16,384 on 2,688 acres, or Rs. 80-8 an acre made up as follows:

	Per Acre
Land tax	Rs. 1 8
Excise duty on 351 tons of coffee at Rs. 21 a cwt.	,, 55 0
Export duty on 53 tons (proportionate share of export)	,, 24 0
TOTAL	Rs. 80 8

The additional Revenue which the Central Government is taking out of coffee is quite obviously strangling an industry which should be benefiting the whole of the Malnad areas of the States in the South.

Although the effect of too low a return to the grower will upset the whole economy of large regions in the States, the fall in the Central Revenues will be relatively so little that it may well escape notice. It is only the States which will really suffer, not the Centre.

The reason why the good crop we have harvested has given such a poor return is a simple one. The return to the grower has been fixed arbitrarily at far too low a figure. In 1952, following an insistent directive from Government to export a large quantity of coffee which inevitably left an insufficient supply for the internal market, prices shot up to unprecedented

heights in August-October, though in December of last year, as I then reported to you, they had begun to reach more healthy levels. Now we are suffering from the rebound. An agreement was reached with Government last April to reduce prices internally, and to subsidise the growers for such reductions by means of the export of 2,000 tons of Robusta, for the price of coffee abroad is Rs. 140 to Rs. 250 a cwt. higher than in India. This agreement has not been observed, and now the benefit from exports which was to have compensated growers for releasing their coffee in India at a price well below the cost of production is being diverted, not even to the further assistance of the consumer but directly to Central Revenues. There is a lack both of good faith and of logic in the new arrangements. From excise duty alone the Central Government will receive one crore of rupees from the coffee industry this season. The diversion of additional large sums to the Central Revenues can only result in the death from starvation of the goose which has been laying these golden eggs for them.

Delivery of all coffee to the Board is compulsory. The low price fixed by Government is arbitrary and involves a loss to most growers. It is a nice matter for Constitutional lawyers to work out whether an individual can be forced to part with his produce at a loss, when there is a profitable market on his doorstep.

The finding of finance to work the estates has been troublesome throughout the year, mainly because of the low prices fixed, but largely because of the delay by the Board in making payments for the coffee delivered to them, the result of the attempt made by the Board, at the direction of Government, to hold stocks for which it had no finance.

The most disturbing result of recent Government policies is the complete cleavage which has arisen between the Government and the Indian Coffee Board. The advice of the Board on important and even unimportant matters is continually rejected and overridden. Yet the real knowledge of the coffee industry lies in Bangalore, not in Delhi. For years it was the Board that approached Government again and again to moderate their export programme, the effects of which would be disastrous for the consumer. All this is fully documented. It was only when disaster actually arose that Government's views altered and in a strange and illogical way, the Board is now blamed for the inevitable result of Government's own policies. A frustrated countryside is now represented by a frustrated Board which can only watch, whilst mistake is piled on mistake. The failure to evolve any consistent marketing policy in 1953 is the main reason for internal sales shrinking from an anticipated 18,500 tons to only 15,000 tons.

In 1952, although prices were completely out of hand for a long period, and although the releases for the December Pool auctions were halved, internal sales reached 17,867 tons.

The failure to implement the promise to export at least 2,000 tons of coffee as a preliminary step in May has aggravated the present stock position, so that no less than 8,500 tons of coffee which is urgently wanted abroad lies deteriorating and at heavy cost in the Board's godowns, even though the current crop which is being harvested is expected to be a bumper one. In spite of this a decision regarding exports is being delayed till February.

The result of the marketing errors prevents the Board from paying the growers for their coffee at the proper time. This adds to the cost of production for the grower has now to find the finance and pay interest for it elsewhere.

The harmful effects of the price errors will be numerous. Employment and production will be reduced, and the value of all estates will shrink. India could materially increase both her production and exports of coffee, but is prevented from doing so. The opportunity of earning additional foreign exchange is thrown away, and an opportunity to engage numbers of unemployed in the development of the large areas of land lying waste in our Southern Hills is lost.

The Indian Coffee Board as long ago as last August passed a resolution requesting Government to arrange for an enquiry into the Coffee industry through the Tariff Board, such enquiry to cover not only what would be a fair return to the grower, but also the possibilities of developing the industry for which there is obviously such scope. This resolution received the support of Planting Associations in all districts. The request was refused, but it is more than ever evident today that such an enquiry should be carried out speedily and in a judicial, calm and dispassionate atmosphere. Growers are accused of stubbornness and many other things for persisting in this request, but the nature of the debate in Delhi, in which the export duty of Rs. 62-8 was passed through both Houses shows clearly how essential it is that this problem, which affects so critically the fortunes not only of growers but also of districts, should be solved by an impartial body, and one free from all preconceived ideas and prejudices. Never was there a clearer need for the separation of the "Judiciary" from the "Executive."

Coffee presents a strange picture indeed today. World prices are high. Our rivals abroad are increasing their production, modernising their properties and building up their reserves against the day of stern competition which lies ahead. In India on the other hand the producer, and in particular the arabica producer, is being squeezed out of business through erroneous policies and penal legislation, and in what is designed to be a welfare State, the sale proceeds of coffee are being diverted to the Central Exchequer to such a degree that no funds will be left with most estates to finance the welfare of their labourers. This diversion of the growers' funds to the Centre seems also to imply that the recent expressions of Governmental sympathy for the consumer is on the wane.

The interests of the consumer and the producer can be combined, in fact have to be combined if both are to benefit, through an encouragement of production in India, an increase in exports from India and a sharing of the benefits arising from these exports. No plan for the development of our industry which could bring these benefits has ever been put forward by our Ministry, yet today India as never before has to produce or perish. The problem deserves attention which it should have received long before this.

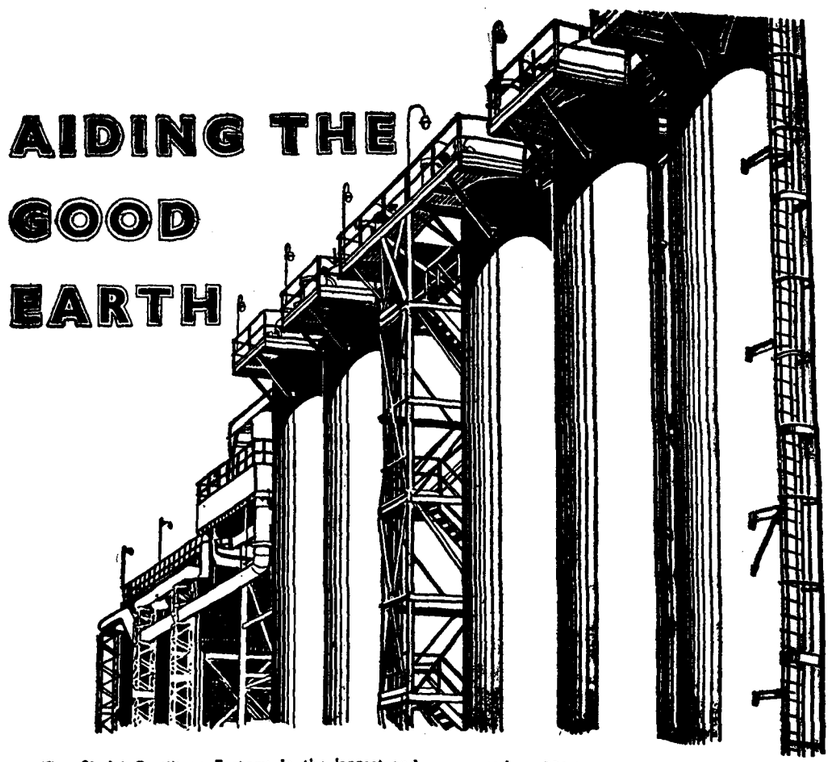
The main reason for the difficulties which have arisen so constantly between the producers and the Ministry must be put down to the mischance by which an agricultural subject is being dealt with by a Commerce Secretariat whose views have naturally always been related to the commercial exploitation of the fruits of our industry, never to the development of the industry itself. The trained agricultural approach which is so essential to solving our problems and which we would have received under different circumstances is inevitably lacking whilst we remain as peculiarly placed as we are at present.

The differences between Government and growers represent the fulfilment of a warning given by Dr. Punjab Rao Deshmukh in October and quoted below:

> "I fear that our attempts at marketing of agricultural produce have all an atmosphere of isolation from the rural community, as it often appears to be an attempt to impose things from above. No structure which is not based on the co-operation of the parties concerned can be durable or expected to stand by itself."

As regards our estates, the result of our additional expenditure and the intensive work which has been done on them is really encouraging, and everywhere there is a real improvement to report. When reasonable and fair Government policies are again the order of the day I am quite certain that our shareholders will have good reason to be satisfied with their investment.

At Hunsur they have had a very busy year. The crop cured was easily a record, and they expect to do better still in the coming season. The results of trading there also show an improvement.



This is the last year I shall be presenting the Accounts and the Reports to you and I am sorry that the former make such poor reading.

As explained the cause for this lies completely beyond our control, but as the interests of all the States in the South are so deeply involved, I refuse to believe that our very real difficulties will remain for long unremedied.

I must thank my fellow Directors for the thoughtful assistance they have always given to me, and our Managers and Staff for their excellent work in a year which has proved financially so disappointing to them.

HUNSUR,
31st December, 1953.

IVOR BULL,
Chairman.

The Sindri Fertilizer Factory is the largest and most modern of its kind in Asia. Built at a cost of Rs. 23 crores this giant scheme includes gas ammonia and sulphate plants, a 90,000 storage silo, a power house and 12 miles of railway track. Apart from large quantities of other materials, no less than 12,000 tons of STEEL went towards the construction of this project which is designed to produce 350,000 tons of ammonium sulphate annually for India's agriculture. The enriched soil will yield 875,000 tons of extra food for the country each year—a valuable contribution from a new enterprise.

* Undivided India §Average of weeks from November 1951

INDIA'S TRADE WITH THE U. K.

I. PRINCIPAL EXPORTS

(Thousand £)

	Full year 1952	November		11 Months Jan-Nov.	
		1952	1953	1952	1953
Total All Exports	114,554	8,067	11,603	103,964	101,500
Of which :-					
Tea	48,732	4,920	6,444	43,573	44,747
Tobacco	6,956	237	301	6,565	5,327
Non-metalliferous mining and quarry products other than coal	2,761	122	103	2,547	1,485
Non-ferrous metalliferous ores and scrap*	3,199	98	301	2,772	2,993
Raw cotton and cotton waste	2,301	217	2-1	1,992	2,817
Wool, raw and waste and woollen rags	3,449	282	370	2,920	3,871
Seeds and nuts for oil, oils, fats, resins and gums	6,144	224	240	5,766	4,037
Hides and skins, undressed	538	43	50	460	891
Woollen and worsted yarns and manufactures@	1,231	52	131	1,056	1,796
Coir mats and matting	1,216	172	154	1,025	1,668
Jute manufactures	13,256	25	1,038	13,148	6,593
Oils, fats and resins, manufactured	1,230	76	57	1,195	588
Leather and manufactures	9,284	797	837	7,786	13,000

* Mainly *manganese ore.* @ Mainly *carpets, floor rugs, etc.*

II. PRINCIPAL IMPORTS

(Thousand £)

	Full year 1952	November		11 Months Jan-Nov.	
		1952	1953	1952	1953
Total All Imports	112,149	7,890	10,624	102,911	104,894
Of which :					
Machinery	35,626	2,779	2,899	32,631	30,839
Vehicles (including ships & locomotives)	16,823	1,072	1,407	15,522	14,019
Iron & steel & manufactures	7,799	719	620	7,061	6,764
Pottery, glass, abrasives, etc.	1,885	128	161	1,752	1,586
Non-ferrous metals & manufactures	2,351	192	310	2,167	3,274
Cutlery, hardware, implements & instruments	3,572	201	383	3,260	3,433
Electrical goods & apparatus	11,391	928	637	10,192	10,037
Cotton yarns & manufactures	3,481	211	269	3,100	2,097
Woollen & worsted yarns & manufactures	4,840	280	315	4,619	5,404
Silk & artificial silk yarns & manufactures	691	40	223	653	744
Chemicals, drugs, dyes & colours	9,967	383	1,149	9,480	9,242
Paper, cardboard, etc.	2,128	112	84	2,006	1,224

III. INDIA'S IMPORTS OF MACHINERY FROM THE U. K.

(Thousand £)

	Full year 1952	November		11 Months Jan-Nov	
		1952	1953	1952	1953
Total Machinery	35,626	2,779	2,899	32,631	30,839
Of which :					
Agricultural machinery	460	5	2	449	116
Boilers & boiler-house plant—					
Boilers, water tube	598	54	60	549	410
Other	865	41	86	733	1,120
Electrical machinery—					
Generators	1,243	69	69	1,151	1,356
Motors & parts	622	65	64	578	714
Other descriptions	3,651	259	487	3,532	4,515
Excavating & earth-moving machinery	790	59	63	776	426
Mechanical handling equipment	1,004	113	132	856	1,272
Machine tools (metal working)	1,334	96	182	1,147	1,822
Mining machinery, other than portable power tools	418	29	34	385	287
Internal combustion engines—					
Marine	58	5	5	53	56
Other	3,429	126	41	3,325	364
Printing, bookbinding, etc., machines	697	46	40	666	766
Pumps	980	75	79	901	798
Refrigerating machinery	228	22	19	216	246
Sugar making & refining machinery	216	9	42	198	266
Textile machinery	8,670	884	613	7,940	6,407

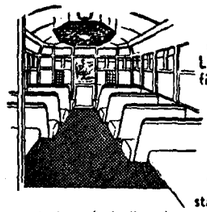
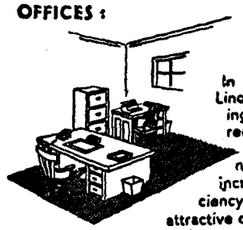
LINOLEUM—
The Versatile Floor Covering...

HOMES :



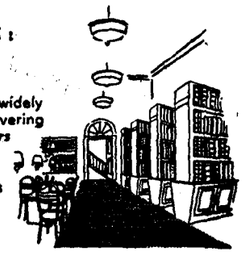
Linoleum can be laid on a simple cement or wooden floor in place of expensive marbles or mosaic floors. It is extremely comfortable to walk on easy to clean ..hygienic...no jarring noises, no serious injury to children even if they fall. Linoleum adds colour and brightness to the home, safeguards health, promotes quiet.

HOSPITALS :



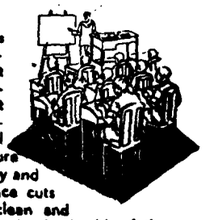
Being an hygienic, synthetic material, Linoleum is obviously an ideal floor-covering for hospitals and clinics. For nurses and doctors constantly on their feet, its "cushioning action" is a great boon ; for the patients, no more disturbing noises from clattering feet.

PUBLIC TRANSPORT :



Tough, durable and easy to clean, Linoleum is the first choice for installation in public conveyances. Railway carriages, tram cars, buses.. Linoleum stands up to the strain. In India where so much luggage is carried in railway compartments, Linoleum seldom scratches or gets torn.

OFFICES :

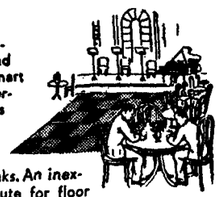


In the office Linoleum flooring effectively reduces noise and personnel fatigue, increases efficiency. For an attractive office maintained at low cost, Linoleum as a floor-covering is a real, long-term investment bringing everyday returns.

LIBRARIES :

Linoleum is widely used for covering *library floors* because it minimises noise, makes for that quiet atmosphere so essential for concentration. No more screeching chairs or clattering feet.

SCHOOLS :

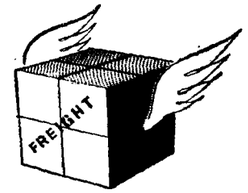


Because it reduces noise and contributes to a bright atmosphere Linoleum is a most effective floor-covering for school rooms and lecture halls. Its durability and ease of maintenance cuts costs. Easy to clean and hygienic it safeguards the health of the youngsters. Particularly suitable for gymnasiums and recreation rooms.

SHOPS :

For effective decoration of shop interiors Linoleum *is unrivalled*. It stands up to the heavy traffic on shop floors and the constant use of counters. Wash it clean at shutting-up time, and have a bright, new floor the next morning.

HOTELS AND RESTAURANTS :



Hotel managements have found in Linoleum a smart and durable floor-covering that is easy to clean and does not soil from spilled food or drinks. An inexpensive substitute for floor rugs and carpets, and a more efficient floor-covering than either.

Because of its resiliency, durability and economy Linoleum has become the world's most preferred floor-covering. We now offer this modern floor-covering in a wide range of patterns and vivid colours. Besides specialising in laying we can also suggest artistic flobr designs to suit individual tastes and needs. Consult us or see our distributers today !

Zero Hour at Pan Mun Jon

MIDNIGHT on January 22 is zero hour at Pan Mun Jon. It can be taken as certain that at that time the United Nations Command will release the 22,000 prisoners which they received from the Custodian Force on January 20. The Chinese and Northern Commands have not yet indicated what they will do; but there is enough in their letter of protest to show that General Thimayya has been read by the Communists to have yielded to United States pressure. There is no doubt that while India's prestige with the United Nations Command has not been significantly injured by the failure to release the prisoners while in neutral custody; it has been quite otherwise with the Communists. Zero hour at Pan Mun Jon thus brings with it a definite deterioration in Indo-Communist relations. By the Communists, India will be read as having acted

against their interests and in favour of the United Nations. And so, indeed, India has. In this arduous role in the Neutral Nations Commission and the Custodian Force, India has acted in a manner which has enabled the United Nations view, by and large, to prevail.

Because there will be charges and countercharges now, it is necessary to emphasise that this is the result of the merits of this particular case, and not any ideological leanings in the Cold War. What are the facts? Article 11 of the terms of reference of the Neutral Nations Repatriation Commission, contained in the annexe to the Korean armistice agreement, explicitly lays down that the NNRC must restore all prisoners in its custody to civilian status and let them free as from January 22. The Article reads: "The NNRC shall declare the relief from prisoners-of-war status to civilian status of any prisoners-of-war, who have not exercised their right to be repatriated and for whom no other disposition has been agreed to by the Political Conference within 120 days after the NNRC has assumed their custody."

The United States and the United Kingdom are insistent that release was not dependent on the allocation of full time for explanations or on the holding of a Political Conference. The Communists, on the other hand, maintain that the provisions for release were conditional on both explanations and a political conference. The Article quoted certainly does not justify the Communist interpretation on explanations; but there exists, by the inclusion of the Political Conference in the latter part of this Article, some doubt as to whether the holding of a Political Conference was a condition precedent to release by the Neutral Nations Commission. Different readers—possibly because of nationality—will read this Article differently. In India, the reading of this Article entirely supports the interpretation placed upon the clause by General Thimayya, Chairman of the Neutral Nations Commission.

According to General Thimayya, the Neutral Nations Commission has no competence either to release prisoners-of-war, or to declare relief from prisoners-of-war to civilian status, or to continue custody beyond January 23. Since the Neutral Nations Commission has, under Article 24 of the armistice agreement, the right of interpretation of the terms of reference of the Custodian Force, the ruling of the Commission must be considered as final. Neither the United Nations nor the Communist Commands have authority to interpret the terms of reference. And thus, while a nice debate can certainly be raised as to the extent to which General Thimayya's interpretation reflects the spirit of the agreement, no debate is necessary or desirable. Where in a legal document a specific provision exists in respect of the agent responsible for interpretation, no dispute can arise. General Thimayya's interpretation must be accepted as final, however much it may be resented. This is no more than saying that the decision of a supreme court shall prevail and be acceptable, no matter whether it is technically right or wrong.

The absence of this agreement to the exercise of a final ruling by the Neutral Nations Commission shows the extent to which the ideological war is still at work. Neither side has been willing to surrender its right of interpretation to the Neutral Nations Commission, in spite of the fact that there is a written undertaking to allow the Commission to interpret its own terms of reference. The salutary rule that where a judge has been appointed, neither litigant should attempt to influence the course of judgment by unwarranted pressure has been studiously ignored. The Neutral Nations Commission has operated under a shower of brickbats which has greatly increased its difficulties which were at all times large.

There should now at least be some bouquets. There is no decision of the Chairman of the Neutral Nations Commission which has not flown from an attitude of strict impartiality, such as could be clearly seen by unbiassed minds. The high regard that General Thimayya and his men have won all the world over reflects this fact that they have been able to create the impression that they were in fact impartial. There should not now be any suggestion in India that the Custodian Force has failed in any of its arduous duties. There are, of course, both sides of the Cold War reflected in India. It is hoped that these loyalties will not blind Indian nationals to their obvious duty which is, having satisfied themselves of the impartiality of their representatives, to accept without querulousness the decisions these representatives have made in exercise of their due discretion on the spot.

What then are the conclusions to be drawn from this unhappy piece? In the first place, that with the best will in the world and with one of the finest and most impartial agencies used in an international dispute, we have not succeeded in fulfilling expectations. Secondly, our neutral role has not been of any advantage to ourselves. The complicated decisions which had to be made have tended to displease both sides and now, as the unhappy chapter ends, our relations with Communist China have been somewhat strained. Thirdly, we are now more heavily involved in the Cold War by reason of the fact that decisions unpalatable to either or both sides have been made and enforced by us; we were acting this time, not merely voting. For a country seeking non-involvement, it is obviously unwise for us to go on seeking additional commitments such as this.

Has peace been assisted? Is not India losing by a process of involvement more and more her capacity to function as a bridge in the Cold War? And is not her increasing international isolation depriving her of valuable alliances at a time when pressure on her frontiers is certainly increasing?

One of the great disadvantages of the pre-eminence of the Prime Minister in the political life of India today happens to be the uncritical acceptance of so much that he does in the field of India's foreign policy. Is anything significant being done today to prevent a further deterioration in Indo-Pakistan and Indo-American relations? It is certainly true that both Pakistan and the United States have erred seriously in moving precipitously towards a military alliance; but it is the essence of foreign policy that it has the power to influence and to restrain. Why have we today so little capacity to influence Pakistan or the United States to refrain from action which is obviously unpalatable to us. Part of the answer has certainly been an undue deference to possible enemies at the expense of possible friends.

As our men come home from Korea, armed with the new experience they have gained, the country should pay a tribute to them not in empty words but in a real determination to study the facts of international life with a new understanding of the risks to our security which our foreign policy has tended to enlarge. Mere independence in foreign affairs is of no value in itself. Peace at any price is also not a policy for the world any more than it is for Kashmir; policy must be related to principle and national interest. In the last six months there has been a considerable loss to Indian prestige in the Free World. Worse, there has been some weakening in all our alliances; meanwhile, the strength of at least one unfriendly neighbour has increased. What moves in foreign policy are designed to arrest the deterioration which has occurred? The country has a right to know if any positive action is now contemplated.

The Sydney Conference

THE sterling area's periodical conference has just broken up, but it is far from being clear exactly how much it achieved. On the other hand, the official communique, which was issued last week on the conclusion of the Commonwealth finance ministers' meeting in Sydney, is somewhat confusing, although it reflects very correctly, perhaps, the trend of the discussions which preceded it. The communique can be made literally to mean almost anything.

It attempts to set out the greatest common measure of agreement within a conference, at which the undeveloped countries seem to have been very vocal for the first time, being represented by Ceylon. Since the countries which were represented could have reached an agreement only as a result of a compromise, the independent members of the sterling area naturally giving first priority to development, while the United Kingdom itself was equally naturally interested in convertibility, the communique reflects the desire to do the best that is possible in the interests of all the countries, in what may after all be uncertain times—with everyone having to counter an American recession or worse.

To be fair to the Finance Ministers, the exceeding complexity of the problems which they had to consider must be admitted. There is, for example, the question of the American recession. Sir Leslie Rowan's suggestion that the sterling area's reserves should be used to fight it proved to be controversial, for the underdeveloped areas have looked upon these reserves as the base on which their development plans are to be built. But the whole discussion was slightly meaningless, when even within the United States itself, not even Senator Douglas admits more than the possibility of a recession, and has reserved judgment on what it may lead to. The efficacy of the United States Administration's policy in the event of a recession will have to be tested, and the sterling area's action or efforts, if any, can, therefore, be only residual.

The American recession could thus be dismissed, with the promise of co-operation with other countries and international institutions. The conference, however, had two other important matters to consider, namely, internal balance and discrimination. British official policy on the first of these two important questions is quite clear, although some non-official economists do not quite endorse it. It is now intended that progress towards convertibility should be made by freeing the markets, deflating excess demand, and by the use of orthodox monetary policy. The comparative disappearance of commodity shunting and the consequent firming up of the free rates for sterling all over the world recently have been held to prove this policy. If everything is normal, therefore, if no slump materialises, and if the Randall Commission in the United States makes the appropriate recommendations, it will soon be time to bring the convertibility plan drawn up at the Chateau Muette up-to-date.

The United Kingdom is in a mood, therefore, to commend this policy of internal balance to the others. But the objective of internal balance, if it conflicts with the needs of development as it may, will not be welcome to the undeveloped areas. Interests, therefore, are likely to clash.

The other thorny point is discrimination. Article 9 of the Anglo-American financial agreement laid down the principle. Since then, quite a few Americans have been worried even about the regionalism that has been promoted by the O.E.E.C. and the E.P.U., and discrimination is, and remains, a lost cause. The declaration of adherence to non-discrimination in the communique issued by the Sydney conference is not, therefore, accidental. But on the other hand, in England now, there is growing academic opinion in favour of discrimination, led by influential economists; and after all, the test of the finance ministers' declaration will be the reaction of the Commonwealth in the event of either of two developments, namely, either an American depression, or the experience of convertibility, if the later should prove the case for discrimination against the United States.

The case for discrimination is pressed by two influential groups in the United Kingdom at the present time. There are the revivalists of empire, who believe in the integration of the Commonwealth as a principle; and there are those who believe that convertibility, together with the right to discriminate, is much better than an inconvertible pound, the sellers of which outnumber the buyers, because Britain cannot export and pay its way round, discriminating against the dollar, if necessary. There can be little doubt, whatever official policy today may be, that convertibility plans will begin to seem much more attractive to Britain, if only discrimination can be allowed. But, at the same time, some Commonwealth countries, like India, have been against the extension of the British preferential system, partly because of prejudice, but partly also because the economies of countries, which have still to develop, have little to gain, from arrangements which restrain free trade and promote high-cost regional groupings.

The differences of opinion on these matters may seem at first sight to have been irreconcilable. If convertibility is the prior aim, then obviously the British official prescription, namely, a certain measure of healthy deflation, and development promoted with the sterling area's balance of payments primarily in view, would seem to be unquestionably right. Even this official view may not go far enough. In addition, those who are claiming the right to discriminate may also be right. How is this British view to be rebutted? The answer seems to have been provided at Sydney.

It is possible to progress towards convertibility, while the development of the independent countries of the sterling area is not sacrified, if certain conditions are fulfilled, namely, if the United Kingdom enlarges its net exportable capacity, if a rehabilitation fund can be provided to underwrite sterling convertibility, if the developing economies pursue sound monetary policies consistent with their objectives and the United States liberalises its trade policy, and if, on top of all this, world investment is promoted. This string of conditions contains too many ifs. But it is a policy on which the whole Commonwealth can agree. More pertinently than even that, some progress has actually been possible recently on these lines.

The United Kingdom is now opening its capital markets for loans intended to finance the sterling area's development; and it has arranged with the World Bank to lend to these areas a substantial portion of its paid-in capital. The Fund has also just liberalised the conditions for its stand-by credit. Inflation has now been controlled throughout the sterling area; and, of course, the condition precedent for sterling convertibility, as the British see it, is the flow of investment from the dollar area and this condition still stands. The Sydney conference's communique may be just a reiteration of these wider objectives, which incidentally have convertibility as the ultimate goal, rather than of the more limited objective of a dash for freedom and convertibility first and anyhow.

India and Ceylon

THE Indo-Ceylon negotiations in New Delhi on the question of the citizenship rights of the Indian residents in Ceylon appear to have greatly disappointed hopes in India. Much of this disappointment has arisen plainly and simply because public opinion in India was unaware of the extremely limited range within which, because of public opinion in Ceylon, any Prime Minister of Ceylon can manoeuvre. To those who know the tremendous resistance in Ceylon to any generous settlement of the Indian citizenship issue, it is the spirit of the present agreement and not its letter which will be heartening. The presumption now is (for the first time) that the Ceylon Citizenship Act will be administered in a liberal spirit in the next two years in which registrations will be completed, although neither side is committed to accept any specific figure for such registration. The status of those not so registered as citizens has, it is true, been left undecided. There is, however, no insistence on their repatriation and presumably that question will not arise until those denied Ceylon citizenship actually choose to register themselves as Indian citizens. On the one hand, the Government of Ceylon propose to offer inducements to encourage persons to seek Indian citizenship; on the other, the Government of India will not only offer no objection but also actually provide some special facilities.

The position is a little less uncertain than it was before; it will, however, remain uncertain for the next two years until the completion of the process of registration and the response to the inducements to be offered. The actual status of those granted citizenship rights by the next general elections in 1957 need not worry us seriously. Where the Indians in any constituency are less than 250, they have to vote with the rest; where they are in larger numbers they will be placed in a separate register but be entitled to separate representation in the Lower House for ten years, their quota being determined in consultation with the Indian Prime Minister. The assurance of close consultations between the two Prime Ministers—whether there is any significance in avoiding mention of the two Governments as such is not clear—is the chief guarantee now available that due regard will be paid to the Indian point of view on the developments from time to time. Indirectly, it implies that India will have to demonstrate the satisfactory working of the assurances on the checking of illicit immigration, which has been incorporated as the first and more prominent half of the Prime Ministers' agreement.

So far as the attitude towards the illicit immigrant is concerned there can be no difference of opinion between the two countries. The Ceylon Government has been permitted to go ahead with its legislation which throws the onus of proof on the accused to prove that he is not an illicit immigrant. The concurrence of the Indian High Commissioner that a prima facie case exists for such prosecution should provide the required opportunity to safeguard against undue or indiscriminate harassment. Only actual experience will prove whether the test of illicit immigration now accepted provides a workable basis for dealing with this problem.

The proof of the working of the agreement would thus lie only in the manner of its actual implementation. If a substantial class of Stateless citizens is created the agreement would be devoid of any merit. There can be no answer yet to the question whether, with the facilities for registration as Ceylon citizens on the one hand and as Indian citizens on the other, the assumption is that anyone who fails to qualify either way deserves to remain Stateless. The hints thrown out recently in Ceylon by Sir John Kotelawala, that a class of 'denizens' with franchise rights may be created, apparently show the directions in which solutions may be attempted for the intermediate class of persons. These should require clarification. It should also be definitely understood that the inducements proposed to be offered by the Ceylon Government would in no event apply to those eligible to Ceylon citizenship under the present scheme of registration. Mr. Nehru has not failed to underline the point that "we have not finally solved these problems" because it was felt that "we would be on safe and sounder grounds to go a few steps now and a few steps later on". The only guarantee of a fair solution eventually now lies in the expression of Mr. Nehru's belief that the foundations have now been laid for a friendly settlement "which will involve as little trouble to other human beings as possible."

Only a mood of complete trust in the sincerity of the Ceylon Government to achieve a just solution could have helped such an agreement. Perhaps more than one cause contributed to the development of that trust. The Prime Minister of Ceylon refrained from taking the chauvinistic approach of his predecessors of regarding the Indians as an alien and unassimilable minority, inimical to the growth of Ceylonese nationhood. But the conclusion cannot be resisted that a far more decisive factor which contributed to the present outcome was Mr. Nehru's discovery that in Sir John Kotelawala, there was an echo of his own sentiments on the character of the awakening in Asia and of the need for solidarity and unity in dealing with the problems of the region.

The time was psychologically propitious because the Ceylon Prime Minister's approach stood in strong contrast to the determination of Pakistan to seek solutions independently of the feelings aroused by her policies in the countries of this region. Sir John Kotelawala's method of approach was equally appropriate as the talks were preceded by the suggestion for constant consultations among South Asian Prime Ministers on common problems. This initiative seemed to give the lie direct to those who, like Senator Knowland, would question the existence of a particularly common approach in Asia to the international questions of the day. There is, of course, the fact that Pakistan is as much an integral part of the Ceylon Prime Minister's scheme as any other country, and there is no evidence yet that Pakistan can just now fully subscribe to the sentiment expressed by Sir John Kotelawala in his broadcast from Delhi on Monday to the following effect:

> "We all recognise that to strengthen our lands, not weapons of destruction but arms and hands of construction, encouragement of increased yields of crops, better housing and a better standard of education and living are needed; these are the cannons which will win for us our true liberty".

And thus the understanding that has come between India and Ceylon rests on a much wider basis than the issue of citizenship. It has its virtues and demerits. The virtue would lie in the fact that two countries which can merge their identity in a larger purpose cannot seriously disagree on their minor problems. The drawbacks can become apparent when such a wider purpose fails to enthuse sufficiently. But in such a context there is perhaps no hope for the smaller problem either, as past experience has taught us. That makes it imperative that the two countries should make the utmost use of the honeymoon phase of the present alliance to solve their outstanding differences.

THE WEEK'S NOTES

RECONVENING THE U.N. GENERAL ASSEMBLY

The prospects of a meeting of the U.N. General Assembly in February are still uncertain. So far only a few States have concurred with the Indian request for reconvening the session on the 9th February. Mrs. Pandit indicated at a Press conference in New Delhi this week, that the extension of the time for reply until the 29th is likely to secure the concurrence of a majority of the members. There has been some misunderstanding over the statement in the letter to the member-nations that the absence of any reply from them before the 22nd would be presumed to be concurrence. Apparently this clause was without precedent, as it can be argued that the positive acceptance of a majority of the member-nations would be necessary to complete the formality for reconvening the Assembly. It might, therefore, be impracticable now to proceed on the basis that the absence of a reply before the 29th could be construed as consent. But, meanwhile, the developments in Korea may persuade a sufficient number to vote in favour of a meeting by the 9th February.

If the N.N.R.C. should play any further part in Korea, obviously a meeting would be desirable before it is dissolved before the 23rd February. At the moment, however, the main question that is facing the Commission is the disposition of the prisoners of war who have not opted for either side and of the prisoners of the North Camp, if no arrangements are made by the Northern Command to take charge of them from the C.F.I. In any case, the actual problems involved in relation to the question of the prisoners of war will not be known for about a week more. Those that remain by the date proposed for the meeting of the General Assembly may prove of less importance than the general settlement of the Korean question through a Political Conference. If the two Commands meanwhile attempt to thrash out this matter once again, the Assembly may have to meet later than proposed.

PARLIAMENTARY PRACTICE

Each parliamentary recess has, of late, been bringing forth many significant additions to the rules of procedure of the House of the People. They have gradually enlarged the scope of the members' rights of discussion and participation in the determination of policy. The latest of such amendments of the rules seeks to provide scope for the public also to petition Parliament and seek redress. Such petitions may now be presented to the House, either through a member or direct, on a Bill introduced in the House or published or on any other matter connected with the business pending before the House or any matter of general public interest. The last provision is, however, subject to the exclusion of matters directly within the cognizance of courts and tribunals or of State legislatures or for which other avenues of redress are provided. A Committee on Petitions to be set up by the Speaker will examine each petition and present a report to the House after taking evidence. There is of course the possibility that this procedure may be misused to create a large volume of work for the Secretariat and the Committee, especially by political organizations which have made a fine art of collecting signatures by the million. The restriction that such petitions should only be in Hindi or English, or if otherwise, should be accompanied by a translation may also facilitate abuse, apart from violating Article 350 of the Constitution.

Opportunity will also be given, under other rules now added, to members to call attention to a matter of urgent public importance to elicit a statement from the Minister concerned, immediately or later, without being followed by a debate. This is different from the opportunity already available, under Chapter VIII A added last October, to any member to raise discussions on matters of urgent public importance. A new chapter has now been added to regulate resolutions under Article 94 of the Constitution for the removal of a Speaker or a Deputy Speaker from office. On a motion for taking the Finance Bill into consideration, discussion may be permitted on matters of general importance besides monetary and financial policy. A fresh Committee has been set up to consider the absence of members from the sittings of the House and their applications for leave of absence with a view to seeing whether absence should be condoned or a member's seat should be declared vacant.

The new rules also enable secret sittings of the House of the People on the motion of the Leader of the House, with access only for the members of the Council of States to the galleries or for such other persons as authorised by the Speaker. Persons present at such sessions are prohibited from taking down or issuing any report of the proceedings, any such disclosures being treated as breach of privilege. These provisions are of much less immediate interest than the rules framed for the discussion of regulations, rules, by-laws, etc., made under the constitutional or statutory delegated authority and laid before the House for concurrence, corresponding to the prayer motions in the House of Commons.

HOUSING FOR THE MILLION

The President's speech at the opening of the International Exhibition on Low-Cost Housing contained the appropriate quotation from Bacon: "Houses are built to live in, more than to look at: therefore let use be preferred before uniformity, except where both may be had". The outstanding feature of the exhibition is the low cost of the houses exhibited, which ranges from Rs. 1,700 to Rs. 5,000, the latter being the ceiling prescribed for an exhibit. There is the further assurance that the model houses cater to all kinds of climatic conditions as well as rural and urban environments. Such an exhibition can only be the starting point of a much wider and broad-based effort to demonstrate the possibility of construction of such cheap houses all over this country and in the other countries of this region with similar housing needs. Thereafter must begin the task of making available, at the prices now assumed for the various components, all the necessary materials, whether locally available or capable of being fabricated and distributed through large-scale manufacture. If there is to be a long interval between this demonstration and the assimilation of the new techniques by those who are anxious to build and can afford the modest outlay, the Delhi Exhibition would not have served its purpose.

While the incentive to build and the willingness to adopt new techniques will depend largely on the individual anxious to have a house, the methods of encouraging him must be studied as a social technique. The U.N. seminar—which will be holding its sessions concurrently with the Exhibition—has here a fit subject to investigate and must devote as much importance to it as to the engineering aspects. The output of literature on the Exhibition which has already been published or broadcast shows the volume of enthusiasm which can be harnessed to the consideration of the more detailed questions of dissemination of new techniques. If certain standardized patterns can be evolved, and the manufacture of components can be undertaken by private small-scale industry, the planners can, by grant

of assistance for the establishment of such undertakings, ensure that the problems of marketing and sales are delegated to these manufacturers.

NEW SCHEMES FOR THE FIVE-YEAR PLAN

The details now available of the broad categories of schemes which will be taken up under the recent expansion of the Five-Year Plan do not indicate any substantial change in the proposals indicated by the Minister for Planning in Parliament last month. They are intended primarily to increase the employment potential of the Plan. The schemes on which this additional expenditure would be incurred will fall under four broad categories:

(1) additions in the programmes of the Central Ministries, Rs. 70 crores;

(2) programmes of permanent improvement in scarcity areas, Rs. 40 crores;

(3) additions in the programmes of the State Governments, Rs. 25 crores; and

(4) new programmes for increasing employment especially in the urban areas, the outlay ranging from Rs. 15 to Rs. 40 crores.

The additions to the Central schemes cover projects for the rehabilitation of displaced persons (Rs. 45 crores), road development (Rs. 10 crores), construction of office and residential buildings (Rs. 2.5 crores), health schemes (Rs. 2 crores), agricultural schemes (Rs. 2.16 crores) and the miscellaneous (Rs. 8.24 crores).

The rehabilitation programme for which an allotment of Rs. 35 crores had been made in the Plan for the first three years will thus be increased to Rs. 130 crores and cover the whole period of the Plan. In addition to housing schemes, it is proposed to devote special attention to the development of refugee townships, a number of which have become centres of chronic unemployment. Under the road construction programme certain roads which are either important for inter-State communications or are likely to promote rapid development will be taken up.

It is hoped that with the completion of the works in scarcity areas, local purchasing power will expand and the areas will develop greater capacity to start future development programmes. The programmes extend to twelve States and will be financed by loans from the Central Government repayable over a period of 30 years. These loans will be interest free for the first five years.

The main fields of development to which funds have been allotted to States for their plans are: Power Development (Rs. 9.1 crores); Roads and Road Transport (Rs. 8.1 crores); Irrigation (Rs. 3.5 crores); Housing (Rs. 1.5 crores); Social Services (Rs. 1.8 crores); and Industry and Technical Training (Rs. 1.1 crores).

The last category will include the following schemes:

(1) Assistance in setting up State Financial Corporations for small-scale and cottage industries (over and above the provision in the Plan).

(2) Provision of additional thermal plants in urban areas.

(3) Loans for housing programmes for low income municipal and government employees and for co-operative housing.

(4) Financial assistance for the development of road transport services.

(5) Work and training camps, apprenticeship and reorientation courses.

(6) Implementation of the recommendations of the Standing Education Commission relating to the diversification of courses, introduction of crafts, improvement of teaching of science, etc.

SITE FOR STEEL

Keen inter-State rivalry has been created over the choice of a site for the new steel project. The Government of West Bengal has presented a strong case for the choice of Durgapur in the Lower Damodar Valley. Though a spokesman of the Government of India indicated last month that the choice lay between four sites—Sindri, Bilhai, Rourkela and Durgapur—it is widely assumed that only the last two will deadheat in the race for the prize. The result has been to create a good deal of bitterness, added to disappointment in Madhya Pradesh. The matter was discussed at length in the M.P. Legislative Assembly and an indignant memorandum to the Central Government appears to have been submitted by the State Government. It is not known whether apart from the charges of neglect of the case for Madhya Pradesh, any argument on merits has been drawn up. But the difficulty about any such case by a State Government is that it is bound to present a one-sided picture. The various assumptions on costs and facilities cannot be either proved or disproved except by the technical experts. This applies as well to the case made out by West Bengal. There is no reason to believe that the Government of India will not insist on the experts explaining the various considerations for and against each of the four sites proposed so that the decision taken ultimately may be defended on the right grounds.

It would be hardly proper for State Governments to work up political feelings in a matter which is at present in the technical stages and in which public opinion cannot judge properly. One set of pressures creates another to breed unhealthy rivalry and suspicion. This is not the last of the steel projects to be started; a second steel project has already been indicated in the next Plan. The technical experts are hard-headed business men who may be trusted to fulfil their contract for the selection of the most suitable site, just as they have to select the most suitable process, in a responsible manner. If there are equally strong technical advantages in favour of more than one site, so as to create room for political decision by the Government of India, it would be necessary to view the question in the larger context of the balanced economic development of the country. The chief need is to avoid the self-righteousness which comes most easily to the spokesmen on behalf of any one State.

WORLDGRAM

TRADE

U.K. Trade Gap Reduced in 1953: United Kingdom exports in 1953 were the same as in the previous year, but sales to North America were 14 per cent higher. The monthly average of United Kingdom exports in the fourth quarter, provisionally estimated at £230,600,000, was higher than in any quarter since the first quarter of 1952. Imports in the fourth quarter of 1953 at a monthly average of £276,800,000 were slightly above the third quarter level and two per cent less than the rate in the first half of the year. The provisional total of United Kingdom exports for 1953 was £2,582 million, the same as the total for 1952. Imports in 1952 totalled £3,347 million—four per cent less than in 1952 and 14 per cent below the 1951 total, but 28 per cent more than in 1950 when they totalled £2,608 million. Re-exports in 1953, at £195,000,000, were 27 per cent less than in 1952. The excess of imports over exports and re-exports at £660,000,000 was 12 per cent less.

* * * * * * *

Record Price for Indian Tea in London: Indian common tea was quoted at 4sh. 4d. a pound at London tea auctions on January 11—a rise of 4d. on the previous sale and a new record level. Better quality teas advanced by 2d. to 3d. a pound at the opening of the market. As the auction progressed prices improved for poorer grades and values were finally raised by 3d. to 4d. all round, compared with last week's prices. Signs of increased consumption both in Britain and the U.S.A. accounted for the strong market, says "The Financial Times". Blenders were understood to be buying against a possible shortage next April or May when the final supplies from the 1953 crop will be coming to the market.

* * * * * * *

Cultivation of Cotton in U.P.: Nearly one lakh acres of land may be brought under an improved variety cotton cultivation in U.P. in the course of the next three years, under a plan of the State Government. The improved variety will replace land under 'desi' variety of cotton and arrest the decline in yields, which has been discouraging the cultivation of cotton. The new variety, called 35/1 showed good results during the year 1953-54 when the target of 15,000 acres was exceeded by over 2,000 acres, dispelling the belief in growers that some changes in the soil and climatic conditions had occurred, which would not permit cotton yields to improve. With the introduction of the new variety, growers are again taking to cotton as an alternate cash crop, wherever it fits in rotation. In 1954-55, it is planned to raise the new variety of cotton over 30,000 acres in selected villages of various districts.

* * * * * * *

Marked Rise in Tobacco Export: Cultivation and processing of the 'golden leaf', tobacco, which earns Rs. 12 to 17 crores in foreign exchange annually, have made rapid strides during the last eight years. The Indian Union is the third largest tobacco-producing country in the world, taking its place next only to the United States of America and China. The total area under tobacco in the Union is estimated to be about 700,000 to 800,000 acres, with a total yield of 50 to 70 crore lbs. Exports which were of the value of Rs. 7,18,45,358 in 1946-47 increased to Rs. 16,75,25,378 in 1951-52. The significant trend in the increase of exports is to be traced largely to the successful working of the export quality control measures under the tobacco grading scheme. The knowledge of 'Agmark' grades in tobacco has now spread to several continental countries.

INDUSTRY

Soviet Fuel Oil for Israel: The Economic Counsellor to the Israeli Foreign Office, Mr. Zey Argamon, stated recently that he had signed an agreement to buy 100,000 tons of Soviet fuel oil for Israel, with the option of purchasing a further 100,000 tons. The value of 100,000 tons of fuel oil was more than 1,000,000 dollars, and it was to be paid for with the proceeds of the 2,500,000 dollars contract signed last December, whereby Israel will supply the Soviet Union with 20,000 tons of oranges and 800 tons of bananas.

* * * * * * *

Search for Oil in Assam: Drilling operations have begun in the Assam Oil Company's probe for oil deposits first noticed at Naharkatiya in the Brahmaputra Valley last year. The well known as Naharkatiya II, is 20 inches in diameter. Provision has been made for drilling to a depth of 10,000 feet. Naharkatiya, I, which oil-prospectors considered unusual due to the occurrence of oil at less than 1,700 feet, has raised high hopes in respect of the commercial potentialities of the Brahmaputra Valley, which is now being subjected to seismic, gravitional and aero-magnetic surveys.

* * * * * * *

Oil Refinery in Aden: A new Anglo-Iranian Oil Company refinery with 5 million tons a year capacity is expected to start operating here before the end of this year. It is estimated to cost £45 million. Some 2 million tons of the refinery's output will be in fuel oil for use in Aden. More refined products will go to East Africa, India, Pakistan and Ceylon. A new harbour is being made for the tankers that will bring crude oil. Engineers are working on a jetty capable of berthing two large tankers. The sand dredged out of the harbour is used to build up the foreshore making more room for the oil town.

FINANCE

British Dollar Reserves Show Decline: The British Treasury announced recently that the sterling area had a gold and dollar deficit of $43 million during December 1953, and that nevertheless the area's gold and dollar reserves of 1953 amounted to $2,518 million as compared with $1,846 million at the end of 1952. Taken into account were receipts of $20 million in defence aid from the U.S.A. and $4 million from the E.P.U. The chief reasons for the deficit were payments by U.K. of $181 million due on U.S.A. and Canadian loans.

* * * * * * *

Bonn Government Plans to Ease Curbs on Dollar Imports: The West German Economics Ministry intends to relax restrictions on dollar imports during 1954, in keeping with its freer trade policy. It is hoped that a more liberal policy will stimulate two-way trade between Germany and the dollar area, and that German importers will benefit by being able to buy in the cheapest market, whether dollar market or otherwise.

* * * * * * *

World Bank Loan to India: The Government of India have accepted the British offer of £5,000,000 recently released from Britain's contribution of £60 millions to the International Bank. The amount, though it will be treated as a loan from the International Bank, will enable India to save dollar expenditure in its repayment as also on its interest charges. Out of this amount £4,500,000 will be earmarked for financing the new steel project and the remainder will be available for other projects.

* * * * * * *

Cut in Commonwealth Development Investment Plan: Britain had originally planned to invest 100 million sterling in development schemes in Common-

wealth countries this year but it is expected that this amount will be cut to half. The overriding necessity is to avoid a slide back into the inflationary conditions which existed throughout the Commonwealth group two years ago. The inflation problem could have a very damaging effect on the British trade drive, the officials believe, and could nullify the progress made since the last Commonwealth Economic Conference in London. The danger of high production costs forcing British goods out of world markets is recognised by most Commonwealth countries. They also realise that British industry must be kept on the top competitive level if any money at all is to be available from London for their own development projects. This will necessitate increased capital expenditure for modernising British manufacturing techniques this year—and less money for Commonwealth development.

* * * * * * *

Monetary Fund Eases Credit Policy: The International Monetary Fund has eased its credit policy to encourage the convertibility of sterling and other currencies. The new policy will make it easier for member-nations seeking free exchange of their own currencies with others to draw on the $3,500 million fund in convertible assets. Until now a country could withdraw a portion of its gold and dollar contribution to the International Monetary Fund. Any further credit granted was subject to review after a period of up to six months. The new policy eliminates the six-month requirements, and it is understood countries seeking convertibility can now ask the Fund to set apart part of its assets for a period of two years or longer. The Fund has also placed no limit on the amount members can borrow as a reserve to meet obligations arising from a decision to make their currencies convertible. Although the Fund is not expected to commit all or even a major portion of its assets to a convertibility move by one country, some quarters believe it might be willing to advance $2,000 million to Britain. Officials believe they cannot undertake the risk of convertibility without: (1) A much greater reserve, or stabilization, fund—possibly as much as $5,000 million. (2) Assurances that U.S. trade policies will be revised to give Britain long-term increased dollar earnings.

* * * * * * *

British Exchequer Loans for Colonial Development: Medium-term loans from the British Exchequer to the Colonial Development Corporation outstanding at March 31, 1953, amounted to £3,975,000, of which £1,400,000 was advanced in the year 1952-53, according to the Comptroller and Auditor General, in a White Paper published in London. The remaining £2,575,000 represented conversions into medium-term loans and advances made previously on a long-term basis. Until May 8, 1952, borrowings of the Corporation by way of advances from the Exchequer under the Overseas Resources Development Act had been for a fixed period of 40 years. On that date authority was given to borrow, in appropriate cases, for a period of 10 years at a lower rate of interest. The arrangement could also be applied retrospectively to certain advances. A Colonial Office statement shows long-term advances to the Corporation totalling £25,829,000 at March 31, 1953, an increase of £5,546,000 compared with £20,283,000 advanced up to March 31, 1952. Short-term advances totalled £610,000 of which payments during the year amounted to £260,000. Of the total of £30,414,000 advanced to the Corporation £30,164,000 is outstanding.

LABOUR

Taft-Hartley Labour Law: President Eisenhower has asked Congress to vote fourteen amendments to the Taft-Hartley Labour Laws. These include one which would compel members of a given trade union to vote on whether they wished to strike. Under another amendment all workers would be required to sign a document stating they were not affiliated to the Communist Party. President Eisenhower also proposed thorough examination of the pension system in private industry. As regards agricultural legislation the President asked in a separate message that Congress should "freeze" the present surplus of agricultural goods totalling some 2,500 million dollars, and that Congress should adopt a more flexible programme of maintaining agricultural prices than that at present followed.

* * * * * * *

Industrial Disputes Bill Assented: The Industrial Disputes (Amendment) Act, 1953, which provides for payment of compensation to workmen in the event of their lay-off or retrenchment has received the assent of the President of India. The provisions relating to lay-offs are based on an agreement entered into between the representatives of employers and workers who attended the 13th session of the Standing Labour Committee. As regards retrenchment, the Act provides that a workman who has been in continuous employment for not less than one year under an employer shall not be retrenched until he has been given one month's notice in writing or one month's wages in lieu of such notice and also a gratuity calculated at fifteen days' average pay for every completed year of service or any part thereof in excess of six months. A similar provision was included in the Labour Relations Bill of 1950 which has since lapsed. Though compensation on the lines provided for in the Bill is given by a number of employers, it is felt that a common standard should be set for all employers.

TRANSPORT

Airlines Carried 50,000,000 Passengers in 1953 for the First Time in History: For the first time in history more than 50 million passengers were carried by air in 1953, according to figures recently released by the International Civil Aviation Organisation. Passengers carried on international and domestic airlines in 1953 totalled 52 million, compared with 25 million in 1937. In 1937 the average number of passengers per aircraft was 5.3; in 1953 it was 24.5. The average distance flown per passenger has increased by 57 per cent in 16 years, from 350 miles in 1937 to 550 miles in 1953. Passengers carried and passenger miles flown were 10 per cent higher than last year, I.C.A.O. reported. The general rate of increase of 1953 figures over the 1952 figures was slightly greater than the increase between 1952 and 1951.

MISCELLANEOUS

Increase in Illegal Drug Traffic: Illegal drug trafficking seems to have increased during the last three years, according to the annual report of the permanent Central Opium Board published recently. The Board repeated its recommendations that the use of herion for medicinal purposes should be curtailed or ended. Legal production of this drug, the one most favoured by addicts, shrank from 3,620 kilos (7,982 lb.) per year in 1929 to 100 kilos (264 lb.) in 1952. Turkey was the biggest opium producer listed in the report for 1952 with 463.6 tons, followed by India with 349.7 tons, Iran with 134.6 tons and the Soviet Union with 104.3 tons.

* * * * * * *

Japan to Extend Technical Aid: Japan will shortly conclude teachnical aid agreements with India and other Asian countries. It is reported that the Foreign Office was planning to inaugurate the proposed Asian Society by the end of January, which will be charged with promoting friendly ties with Asian countries. Reports indicate that the agreement with India would be concluded first. At present there are 200 Japanese technicians in Asia and the number will increase considerably after the conclusion of the pacts. The only Foreign Office comment available was that the matter was under consideration.

NEWS IN BRIEF

INDIAN

India has placed orders with Japan, Germany and Austria for 480 locomotives at an estimated cost of $36 million. These orders have been placed outside the U.K. for the first time.

In India out of a total of 837 hosiery factories, Punjab alone has 303 factories. Eighty per cent of the woollen goods manufactured in the country are from the Punjab. Over 5,000 looms are in operation to produce artificial silk and mixed fabrics. At Sonepat, over 185 bicycles are produced daily, apart from accessories.

* * * * * * *

A Rs. 3.36-lakh scheme launched by the U.P. Government provides for an army of medical officers, inoculators, vaccinators, sanitary inspectors etc. for the Kumbh Mela. A general hospital and eight infectious diseases hospitals (total bed strength of 300), have been set up in the Mela area. 7,000 sweepers and trench diggers will keep the whole area clean. The public health arrangements at Kumbh fair are expected to cost the State exchequer about Rs. 17.75 lakhs.

* * * * * * *

There are 3,000 Gaushalas and Pinjrapoles in India, maintaing six lakh head of cattle at an annual cost of about Rs. 7 crores. The key-village scheme under the Five-Year Plan period at an estimated total cost of key-villages and 150 artificial insemination centres at an estimated total cost of Rs. 6 crores. Three hundred and forty key-villages and 109 artificial insemination centres have already been established in the country. One hundred and sixty Gosadans for the care of unproductive cattle are proposed to be set up during the Five-Year Plan period at an estimated total cost of Rs. 194.30 lakhs. The Government of India run three Central Institutes for maintaining high pedigree bulls for genetic and other purposes. Nearly 750 farm-bred bulls of known pedigree are distributed annually by the Central Government in different States for developing draft as well as milch breeds. There are at present 2,000 veterinary dispensaries in the country where treatment is provided for diseased cattle.

* * * * * * *

The All-India Manufacturers' Organisation has recently registered under the Societies Act an industrial foundation, in order to set up an Institute of Industrial Research and Industrial Economic Research. The A.-I.M.O. is shortly expected to publish an export guide, with a view to introducing Indian manufactures to foreign purchasers.

FOREIGN

Production in U.K. of passenger cars is expected to total 600,000 in 1953 (448,000 in 1952). Combined output of cars and commercial vehicles is likely to reach 830,000 as compared to 690,000 in 1952 and 785,000 in 1951.

* * * * * * *

The U.S. aircraft industry, which gets 95 per cent of its business from military orders, is the second largest factory employer in the U.S.A., the car industry coming first. The actual gross turnover for the aircraft industry was $9,000 million; the annual rate of sales reached $10,800 million at the end of 1953.

* * * * * * *

An American Oil Company has signed an agreement with the Philippine Government for building a 13,000 B/D refinery in Bauan, Batangas. The plant which will cost $30 million is expected to be completed and in operation sometime next year.

Trainees form India, Burma, Jordan and Turkey are among eight successful candidates out of 100 applicants for study grants under the World Bank's sixth annual general training programme. The purpose of the programme is to give an opportunity to students from nations affiliated to the World Bank to study aspects of its operations. The training programme, lasting from mid-January to mid-December 1954 will include studies into the organisation and administration of the International Bank for Reconstruction and Development, its loans, bond marketing and analyses of long-range development projects.

The production of electric power for public use increased by 4.4 per cent in the year ended September 30, 1953. The increase in the previous year was 4.3 per cent. Seventeen hydro-electric power plants in Switzerland have been enlarged or built, and on completion are expected to raise productive capacity by 25 per cent. It is estimated by the Swiss Bank Corporation that 1,000 million francs will be needed for investment during the next 10 years to develop electric power.

The Pakistan Industrial Development Corporation has decided to purchase two British-owned cement factories of the Associated Cement Companies of India at a cost of Rs. 50 million. The Corporation, it is learnt, propose to spend another Rs. 20 million on repairs and expansion of these factories, situated at Wah in Pakistan Punjab and Rohri in Sind.

* * * * * * *

According to the Textile Export Association of the U.S.A., Japan headed the world's textile exports with 900 million sq. yards. India was second with 750 million sq. yards, U.K. third with 700 million sq. yds. and U.S.A. fourth with 600 million sq. yds. Tighter import restrictions more than offset the increase in dollar holdings in foreign markets. Cuts in imports by Peru, Venezuela and Cuba hit U.S.A. exports. Indian and Japanese competition in the Far East also adversely affected U.S.A. market.

A Window On The World

IN AN INDIAN VILLAGE TODAY

By

ODYSSEUS

WE ARE CONSIDERING some differences between democratic theory and practice in India, between constitutional rights on paper at show level in New Delhi and at ground level in an Indian village. Last week, I summarised the first part of a lecture entitled "The Government and the Village" given to Mysore University by Mr. Allen Beales, an American anthropologist. We saw how the relations between the villagers of Kadduhalli, a representative forest village, and the government were, in Mr. Beales' words, "strained and hostile almost beyond belief". Today, I summarise Mr. Beales' first-hand observations on what constitutional rights look like in Hattarahalli, a representative village near a town, which has felt the full impact of modern administration and education.

Hattarahalli, only 15 miles away from a big town, is very different from Kadduhalli. Not only has a great deal of change occurred but a large proportion of the changes have been brought about by government action. Prior to British rule, Hattarahalli did not differ much from Kadduhalli. The social order was a hierarchy and the village was ruled by a small group of rich old men. The government in pre-British days was not democratic. Mr. Beales calls it "feudal", and if by this he means that it was based on status and not on contract, we need not quarrel with him, although this is not strictly the meaning of the term "feudal", which involves the idea of land held in return for military service. These "feudal" governments left the villagers a large share of the actual work of government. In fact, although Mr. Beales does not say so, the indigenous governments of India were essentially tax-gathering machines and did not touch the day-to-day lives of the villagers, except in so far as there were periodical descents of tax-gatherers. The panchayat was not, as some enthusiasts are apt to claim, a democratic institution, but it was at least an indigenous expression of the cultural and social organisation of the village. It enjoyed full authority and the villagers understood its working. Until 1880, in the particular group of Hattarahallis which Mr. Beales studied, the influence of the central government was little felt. The government was essentially the panchayat.

Around 1880, when British administration began to make itself felt in Hattarahalli, striking changes in the social organisation of the village began to occur. The loosely organised "feudal" system was replaced by a highly organised, paternal bureaucracy which originated in an industrialised nation some thousands of miles away. Even today, in 1954, the State capital, and still more New Delhi, the federal capital, remain thousands of miles away in spirit.

Both the British and British-trained administrators who formed the new government of the Province were in many ways foreign to the people whom they administered. These administrators knew little about the social organisation of the villagers and had little interest in maintaining it intact. Many of the changes that they inaugurated were destructive of the existing order; nor did they replace what they destroyed with anything save a bigger and better bureaucracy.

In 1886, for example, every acre and every tree was surveyed, labelled, and taxed. Instead of taking taxes in grain as previous rulers had, the new administration insisted that the villager should sell his grain in the nearest market and pay his taxes in cash. As Hattarahalli and India in general, in those days, produced an agricultural surplus, the prices realised by the agriculturists were low. Although the villagers had plenty of food and could afford to use butter as lighting fuel, they found it difficult to raise cash for taxes. When they failed to pay, the government auctioned their land to the highest bidder. Sometimes the government gave the land away to any man who was willing to pay taxes for it. In addition, the government claimed all the communally owned village lands and tried to ensure that every square inch was cultivated. Where previously a few rich families had owned all the village land, cultivating it or not as they wished, the government soon acquired control of most of the land and gave it whomsoever would cultivate it.

REVOLUTIONARY CHANGES

The results of this policy on the social structure of the village were revolutionary. Persons who had formerly been tenant farmers, and even serfs, acquired lands, while families which had been wealthy could find no one to cultivate their lands and were forced to sell them to the government. Hattarahalli became a village of small farmers. The social mobility introduced by the new administration led naturally to a weakening of the caste system and of the village social organisation.

The government's unconscious attack on the social organisation of the village did not, however, end with land reforms. Public schools, courts of law, and a police force were set up. Formerly education had been monopolised by members of what Mr. Beales calls the vegetarian castes, by which I suppose that he means the highest castes. At any rate the Brahmins used to have a near-monopoly of traditional education. The new education, says Mr. Beales, aimed largely at producing more and more civil servants, clerks, and school teachers. Mr. Beales is right in thus describing the results of the new education but, in fairness to the British, it is worth recalling that Western education was inaugurated on the insistence of, and with the full support of, Indian leaders, such as Ram Mohan Roy.

By the 1930's, says Mr. Beales, agriculture had become a discredited occupation in Hattarahalli and the aim of every ambitious boy was to become a government officer. By 1953, more than 30 out of 100 families in Hattarahalli were receiving income from relatives employed in government service or in industry. As neither the schools nor the urban employment exchanges paid much attention to the caste system of the village, education added to social mobility and helped to undermine the village's social organisation.

The law courts and the police, like the tax system and the schools, were foreign to the traditional village structure. Previously the law in Hattarahalli had been traditional and informal, based upon the authority and prestige of the village elders. The introduction of police and of law courts which enforced a different code of law, and were independent of the village, profoundly modified the power and prestige of the elders. In weakening their power, the law courts removed most of the customary sanctions which had previously controlled morality and social mobility. This is an example of the negative nature of these changes: for while the power of the elders was destroyed, the police and the law, situated at centres far removed from the village, were almost equally powerless. Philip Woodruff's ex-

cellent "crime" story of village life, "Call the Next Witness", illustrates this point.

A NEW ANGLE ON OVER-POPULATION

By 1953, the old social order had, in Mr. Beales' judgment, been almost entirely destroyed. On the other hand, little had been done to replace the panchayat and the caste system, and many of the changes were for the worse rather than for the better.

The acreage of cultivated village land was greatly increased; the number of cattle had decreased as there was no grazing land; the amount of fertiliser had decreased in proportion to the decrease in the cattle, and although the much larger cultivated area gives a bigger total yield than before, the proportionate yield is less.

Mr. Beales has a new angle of approach to the problem of India's over-population. He points out that when the elders lost their power, the younger generation began insisting that their large joint families be broken up. He states that previously few men were married before they were thirty, while at present most men are married and separated from their families by the age of twenty. This, he says, has led to an increase in the population. He goes on to assert that previously marriages were very expensive and many poor men could not afford marriage until late in life. When land became readily available to almost anyone, the poor of the village became socially mobile and were able to acquire money for marriage. And with the loss of social supervision by the elders, Mr. Beales says that marriages became cheaper and even poor folks were able to marry when young—another factor of increased population.

Mr. Beales' "Hattarahalli" is, of course, a village of Southern India and his facts may be true in the area that he investigated, but the hitherto accepted view has been that teen-age marriages are, and always have been, universal throughout India and that the main cause of the tremendous rise in the population during the last century has not been due to any change in the marriage age but to the elimination of internal wars and (as Mr. Beales goes on to add) to the reduction of plague and the control of famine. Mr. Beales' interesting theory of younger marriages caused by administrative changes should be further tested in other parts of India.

Since neither the village elders nor the police exercised any particular control over the village, and since the economically depressed classes demanded their rights, crimes became increasingly common. As often as not, these crimes went unpunished. The village elders had no power to punish the culprits and the villagers were afraid to complain to the police who knew nothing of village conditions and were as likely to punish the innocent as the guilty.

In the 1930's, for instance, Hattarahalli was dominated by a gang of thieves, who one day entered the garden of a rich man in order to murder him. A bodyguard employed by the rich man killed one of the thieves, who then complained to the police; the bodyguard was arrested. The rich man was able to rescue his bodyguard only by a large bribe.

In 1953, an old man tied a rope round his neck and jumped into a well. The police were called in and announced that murder had been done. Later when they found that no one had any motive and that the villagers were unanimous in thinking that it was a case of suicide, the police changed their minds. The danger of trying to co-operate with the police is obvious.

Few villagers want, however, to return to the "good old days", because whatever evils the new system of government has produced, it has emancipated the young, the middle aged, and some of the poorer people. Hattarahalli has changed from a village dominated by a few old men to one dominated by many middle class farmers, each the head of a small family. The overall change therefore seems for the better.

This and last week's articles have, I hope, given, with Mr. Allen Beales' aid, some insight into the difficulties of making democracy work in the villages. In a final article next week, I shall summarise Mr. Beales' constructive suggestions.

BOOK REVIEWS

THE PRINCIPLES OF MANAGEMENT

The Principles and Practice of Management: Edited by E. F. L. Brech: Longmans Green and Company. In India, Orient Longmans, 17, Chittaranjan Avenue, Calcutta: 50sh. net.

It is claimed that "this book is the first comprehensive British text-book of management in the present generation." Certainly nothing equally elaborate has appeared in India where a book of just this kind is badly needed. This has been a splendid example of integration. If anything, the weakness resides in the fact that the authors have attempted to cover everything from the principles of management to the setting up of production, personnel training, labour problems and the whole problem of accounts and budgetary control all in a single piece. It is not unlikely that the whole work might have been improved if it were set in two or three different books.

The six parts of this book might even have yielded six different books. The first of these might have dealt with the analytical framework within which principles of management could have been set out. There each of the four parts on major divisions of management, distribution, production, management and control, might have been expanded into a book. So also with the section on management in practice in which the story of management and the changes in management in the last fifty years have been described with special reference to British experience.

Not all the conclusions reached for Britain can be translated freely into India. For example, there is a general suggestion on page 732 that a Managing Director should not be Chairman of a Company, on the argument that "all too often a Managing Director serving as Chairman of a committee has to turn down a 'decision' reached by the members, because of aspects of policy which he knows but is not free to disclose." It is argued that "if the very same point were reached by the committee as a 'recommendation' to be transmitted to the chief executive outside of the meeting, the same emotional repercussions do not ensue". But surely this is an argument in favour of placing the authority of the Chairman and Managing Director together and not separating them at all. There is no point in making recommendations which are likely to be viewed unfavourably simply to save "emotional repercussions". There also seems to be an additional argument in India in favour of making a Managing Director a Chairman. There is a real shortage of administrative capacity at the topmost level; and there is no point in a problem's requiring for its solution two executives instead of one.

While, therefore, there is a great deal in this book which is of immediate application to India and while this book should certainly be studied carefully by all senior executives in the country, its strong British setting will need to be kept firmly in mind.

INDIAN FINANCE SILVER JUBILEE NUMBER

The Silver Jubilee Number of 'Indian Finance' serves to provide a landmark in the life of this journal as well as to provide the usual elaborate production expected of an Annual Number. Of these two purposes the first will attract greater attention. 'Indian Finance' has struggled against obstacles which have not weighed heavily against India's other financial journals. In his introduction headed "In Grateful Appreciation", Mr. Rangaswami describes his difficulties by saying that there is an "epigram as old as this journal that 'Indian Finance' has no finance". It is a great tribute to its Managing Director that over 25 years his wonderful enthusiasm and his persistent independence have enabled him to gather the support to enable his paper to grow and to influence policy on some important matters. There is no record of any equal achievement by a single person in financial or, indeed, in any other journalism in this country.

And thus the Silver Jubilee Number should record first a tribute to Mr. C. S. Rangaswami whose proud achievement it is to have carried this journal for 25 years almost entirely on his own shoulders. In the messages which have appropriately been obtained to mark this occasion, this personal tribute is freely bestowed on him by (amongst others) Sir Sarvapalli Radhakrishnan, Vice-President of India; Sir Chintaman D. Deshmukh, the Finance Minister; Mr. V. V. Giri, the Labour Minister; Mr. K. C. Reddy, Minister of Production; Mr. R. G. Saraiya, President of the Federation of Commerce and Industry; Mr. M. Ct. M. Chidambaram Chettiar, Mr. J. R. D. Tata, Sir Purshotamdas Thakurdas, Sir Shri Ram, Sir Vithal N. Chandavarkar, Sir Biren Mookerjee, Sir Homi Mody, Mr. C. H. Bhabha, Sir Chunilal B. Mehta and Mr. K. D. Jalan, and Mr. B. T. Thakur amongst business leaders, and Sir C. P. Ramaswami Aiyar and Mr. C. Rajagopalachari amongst important public men in the country. There is obviously widespread interest in this Jubilee and the occasion has appropriately been taken by people of eminence in many fields to pay tribute to one man's remarkable foresight and persistence. 'The Eastern Economist' joins with many readers of 'Indian Finance' in offering its tribute to Mr. Rangaswami on this happy occasion.

The contents of the Silver Jubilee Number present a varied collection appropriately reflecting the tremendously wide range of interest, which 'Indian Finance' has covered over the last 25 years. Dr. N. Das writes on "Unemployment: An Historical Resume"; Mr. G. L. Bansal on the "Growth of Commercial Organisations in India"; Mr. L. S. Vaidyanathan on "Life Assurance in India"; Dr. A. V. Sukhatme on "Quality Control in the Steel Industry"; Dr. B. V. Narayanaswami Naidu on "The Sericulture Industry" and there are a series of articles apparently by staff writers on the Automobile Industry, Paint Industry, Tea and Coffee Industries, Rubber Manufactures, Sugar Industry and so on. As with all special numbers, there is an abundance of information not all of which can be easily digested. Nevertheless here is a notable production which should find its due place as a reference work on the state of Indian economy today.

EDUCATION IN INDIA

Progress of Education in India: 1947-1952: A Quinquennial Review: Ministry of Education, Government of India: Price Rs. 2-10.

This quinquennial review of education in India fulfils a real need. There is a widespread belief that Education and Public Health have been badly neglected in the period of Independence, and certainly the allocation to welfare activities under these heads in the Central Budget has tended to be small. On the other hand, it is known that the State Governments have

made substantial increases in their allocations. But almost no one will be prepared for the remarkable progress shown in the tables contained in this publication. For example, Table 22 on page 112 shows that the number of students receiving education at university stage has moved up from 183,238 to 283,882 or an advance of something like 75 per cent in five years. The number of universities has increased from 21 to 23 and Arts and Science Colleges from 459 to 488. What these figures imply, therefore, is that overcrowding in colleges continues sharply to increase. The direct expenditure on Universities has also made a spectacular increase from about Rs. 1.95 crores in 1947-48 to Rs. 6.48 crores in 1951-52. Even when a correction is made for prices, this shows a real per capita increase in expenditure. This is difficult to explain; overcrowding should have meant a fall.

There has also been a substantial increase in primary and secondary schools in the country. In respect of primary schools for girls there would appear to be some decline, the figure for 1946-47 being 14,666 and the figure for 1951-52, 12,127. On the other hand, schools for boys have moved up from 120,600 to 141,996. The direct expenditure on primary schools in 1951-52 is reckoned at Rs. 34.34 crores against Rs. 15.26 crores in 1946-47. In respect of secondary education, direct expenditure has also moved up from Rs. 13.91 crores in 1947-48 to Rs. 29.56 crores in 1951-52. It is significant that secondary school education is now financed in its largest source by fees. Of the figure of Rs. 29.56 crores, Rs. 14.02 crores come from fees which are greater than Government funds (Rs. 10.4 crores) and local board funds (Rs. 2 crores) put together.

The picture presented by this quinquennial report suggests that in quantity very substantial progress has been achieved. Has quality remained unimpaired? The answer seems decidedly in the negative. Our enthusiasm for these results cannot be great. The deterioration in quality must receive treatment before further mass production is launched.

INDO-AMERICAN RELATIONS

American Foreign Policy Towards India: Satish K. Arora: Suneja Book Centre, New Delhi: Price Rs 3.

This little study of Indo-American relations, although it carries 1954 as its date, was obviously written some months ago. How otherwise could the existing differences on American aid to Pakistan be totally omitted? It is a serious limitation on this book that it ignores totally the most pressing problem in Indo-American relations at the present time, possibly the first severe test of the capacity of both the countries to understand the approach of the other.

In spite of this large limitation, this little book has some merit in that it brings together somewhat ingeniously many threads of Indo-American foreign policy and places them so that they look as if they form one connected string. One may well disagree from the conclusions. One wonders whether a sentence like the following does not show undue optimism. "In the last two years, United States Foreign Policy has achieved some success in India mostly due to the new type of diplomacy as represented by Mr. Chester Bowles". Was the improvement in relations in the Bowles period the result of any new diplomacy or just the absence of issues in dispute? It is likely the personal factor has been exaggerated both in India and the United States. Mr. Bowles and Mr. Nehru certainly hit off. But too much can easily be read into the personal side of Indo-American relations. Surely the trouble is elsewhere. The differences in the Indian and U.S. approach towards Communism are fundamental. There is little in this book which indicates the wide range of this gap. Magnificent salesman that he was, Mr. Chester Bowles was unable to sell to India America's containment philosophy. The unreal appearance of agreement could not last.

GOLD AND SILVER THREAD INDUSTRY

Gold and Silver Thread Industry in Surat: By Prof. D. R. Gadgil and Prof. R. K. Patil: Publishers: Chunilal Gandhi Institute of Learning and Research, Surat: Price Rs. 1-8-0.

The book is a brief study of the fortunes of the Gold and Silver Thread Industry. It includes details of two surveys conducted by the two authors, one in 1930 when Prof. Gadgil was the Principal of the M.T.B. College, Surat, and the other in 1951, which was conducted by Prof. Patil. The latest survey reveals, curiously enough, that the industry is still suffering from more or less the same maladies today as it did when the first survey was made.

The main problem of the "jari" industry, which is one of the most ancient industries of India, are those of organised marketing and good labour-management relations. After analysing these problems fully, Prof. Patil has made a fervent appeal for a proper marketing organisation for the survival of the industry, which is now passing through a very lean period even in the internal market, while, in the external markets, it is facing the threat of cheaper Japanese varieties made of rice-paper. The author also pleads for Government help in organising an export market, which would incidentally be helpful in bringing in valuable foreign exchange.

The book under review, published by the Gandhi Research Institute, which was recently formed to encourage research in economic and industrial problems, is only an introduction to the subject, as it were. Prof. Patil proposes to conduct another and a more detailed survey of the industry in the near future.

Indian Builder Annual: Edited by Sardar Patwant Singh: Janmabhoomi Chambers, Fort Street, Bombay 1.

Opening with an impressive article on "Hydro and Thermal Power Resources in the Andhra State", the 'Indian Builder Annual', which contains several articles spotlighting the importance of constructional projects in the development of a country, may be said to answer the long-felt need for an organised and efficient medium to publicise the "problems, achievements, requirements, and aims" of the building industry in India.

Sponsored by the Builders' Association of India, this handsomely got-up publication, which incidentally is the first annual, deals with a number of important technical subjects allied to the building industry such as, for instance, structural waterproofing and its problems. Another feature of the special number is the inclusion of several photographic plates pertaining to constructional projects and depicting the latest architectural trends in the country.

A DELHI DIARY

MEN VERSUS HOUSES

MEN have been jostling this week with houses for interest and from a brief survey of the last round (which took place on Wednesday evening!) I should have said that the houses have won. The accent was not, indeed, on houses only; it was on their cost, or more accurately, their low cost. This Exhibition opened by the President and attended by the (select!) multitude has got off to a splendid start. As the Exhibition was arranged on the spacious grounds occupied by the Railway Exhibition last year, it was feared that it might be overwhelmed by the comparison. It was known that stall-holders this time were not so keen, having spent much unfruitful advertising money on the Railway Exhibition. Mere spectators were also at first not very enthusiastic; after all what can be more exciting than a toy train running at full speed on (and off!) the rails? We set our teeth, and were prepared for much academic instruction with no real entertainment.

We were gloriously surprised. We seem to have eluded the seminar altogether (or was its opening wisely delayed?). Here were no abstract theories on low-cost houses projected in the minds of brilliant architects, and reduced to unconvincing paper. There were several real houses built in a row. Their materials were all available for inspection; the good arithmeticians could multiply square feet by price and see if the totals tallied. I am told (by one such!) that the totals do tally. But (being sceptical!) I consider that this is not enough. How do we know that the prices are correct and the labour costs correctly calculated. I entertain the greatest doubts in respect of a little house whose cost was given at Rs. 2,800. In Delhi that house will not (I assert!) be that price.

The only real way to carry conviction is the way it was done by the American Women's Club, which took over the furnishing and decoration of one of the little houses. It was beautifully done. Every item was not merely priced; it was measured and tagged. Thus if you had to have three yards of handwoven cloth for table mats, the price of the cloth and the work (many marked self, meaning no cost!) were all there on a neatly pinned paper slip. The three little rooms, a sitting room, a bed room and a dining room (in an open court) were splendidly done. The total cost of all furnishing was Rs. 449-12. As if to carry additional conviction, it has been arranged with the Oriental Furnishing Company, New Delhi, that they should supply on order immediately any of the pieces of furniture at exactly the price marked. Now, why was it left to the American Women's Club to provide the best businesslike demonstration in the show? Why were not the other cottages (furnished by the Irwin College and others) similarly practical in their demonstrations that this was no artistic or academic exercise, but a definite demonstration that tasteful decoration can be done within four hundred and fifty rupees? I pause for a reply.

SIR JOHN KOTELAWALA

I leave houses and even the Indo-Ceylon agreement, which has happily been dealt with elsewhere in this issue, to talk about New Delhi's most interesting visitor this week. Sir John Kotelawala, Ceylon's Prime Minister, on his first visit as Prime Minister of Ceylon to India, produced a most happy impression. In three brief days, he managed to radiate his smile on hundreds of interested people; his programme helped greatly to permit of this personal cordiality. The Ceylon High Commissioner, Mr. C. Coomaraswamy, gave a splendid party on Saturday the 16th. As time sped on, his guests showed a singular reluctance to depart; it transpired that a "friendship" cake was making its rounds. And many people were anxious to partake of it before departure. The cake tasted specially sweet; I am told that so did the first announcement of the Indo-Ceylon agreement. Second looks at the agreement have been more critical; but I venture the opinion that friendship has come to stay.

My first (and last!) reason for this profound prophecy is the belief that I entertain that Sir John Kotelawala is anxious that we should be fast friends. This was particularly noticeable in his address to the Indian Council of World Affairs on Monday. It was, in the main, a moderate speech, but it had at least two strong notes which were unexpected. The first of these was the broad indication that the "common" interests of Asian countries would tend now to put a brake on a "nationalistic" approach; this has been read as a gentle assurance that the spirit of settlement of the Indo-Ceylon question will take account of the larger interests of the area, and the elimination of sources of disagreement will be pursued with some vigour. We have no direct quid pro quo to offer Ceylon on the citizenship issue, and thus it was satisfying to note that an "overall" consideration is weighing on our side. I recalled a great saying of Canning about the calling in of a New World to redress the balance of the Old. I hope sincerely that all South-East Asian countries will call in the balance of the new regional approach of South-East Asia to redress the balance which has been lost by the nationalisms of this area. I believe I heard in the spirit of Sir John's speech an indication that this welcome development is under way.

The second point in his address which attracted me was its forthright condemnation of Communism. There is a general feeling in India that Ceylon is neutralist like India in declarations of this kind. It is quite clear that the present Prime Minister of Ceylon does not belong to the Indian School. On the other hand, he does not belong to the Pakistan School. He does not see the necessity of alliances in military terms with other blocs and appropriately (as a South-East Asian!) he considers that any matter which adds to the internal disagreements of this area cannot be in the interests of all, or any, of the countries involved. But to oppose the Americans in Pakistan is not necessarily to be gentle with the Communists, or to show special consideration to the Chinese or the U.S.S.R. I gather the cultural delegations from China and the U.S.S.R. are not visiting Ceylon! And I heard something about some visas of returning Communists being withheld; unhappily what is Ceylon's gain is India's loss!

Now, Ceylon which has no significant defence of its own is not fearful of attack because of its anti-Communist policy. This is because India protects her in the North and the seas controlled by her allies protect her in the South. It is quite true that Ceylon enjoys this privileged position so far as extraneous defence is concerned. But that does not alter the fact that here is the only country in South-East Asia which has no defence problems. Sir John implied in his address at the Indian Council of World Affairs that Buddhism had much to do with Ceylon's peace-mindedness. We hope it will find adequate expression in the one (peaceful!) dispute they have with the Indian Union!

THE KALYANI SESSION

I have just time to refer to the Kalyani Session of the Congress. Only the draft resolutions are available at the time of writing. But it does appear at once that there is a difference in tone on the U.S.-Pakistan pact. The present resolution has been drafted with wisdom and much greater moderation than the previous outbursts. The question will be asked: Would not the Congress have been wiser to have adopted its present approach rather than the belligerent kind? Again, I pause for a reply!

ARGUS.

SPECIAL ARTICLES

THE FREE MARKET IN GOLD

THE gold market in Bombay has steadied after the nervousness which followed the announcement at a Press conference about two weeks ago that contraband gold would be released by the Government of India. Nevertheless, prices in India, though insulated in theory from the trend in free gold markets all over the world, have necessarily reflected (because smuggling establishes a link) the bearish influences which have consistently prevailed in the other capitals in recent months. Within India itself, whether the Reserve Bank will invite bids for gold, and, if it does, whether it will, like the Banque de France, try to lead prices downwards, are not yet by any means certain. The long-term trend of prices being easy, and the immediate future a little uncertain, it will, however, be useful at this stage to assess the recent trend in the principal gold markets of the world, namely, Macao, Zurich, Paris, Beirut, Kuwait, Bangkok, Hongkong, Geneva and Amsterdam, and also to take stock of the present position.

The structure of demand in these markets has now undergone a change, which at the moment seems to be permanent. Demand has declined everywhere. The reasons vary from centre to centre. Payment in rupee notes for gold smuggled from the Middle East is for example now difficult. Indian exchange control is liberal; and it can also be evaded to some extent. But the restrictions in Kuwait on dealings in rupee notes, in the context of a falling market, seem to have restricted also dealings in Middle East gold. Macao in China has at the same time declined considerably in importance as a market; and the restrictions on the re-export of gold from Hongkong to Macao are only partly the reason for this decline. Macao itself can no longer pass on the gold which it used to obtain to the mainland of China.

The Paris free market now suffers from a lack of demand from private sources—this recent trend reflecting the cost of living and increased taxation in France. Also, the policy of the Banque de France has something to do with the bearish outlook on the Paris market. Black-market demand now having declined, the official regulations are of much more importance in France than they could have been, say, in 1951, when free gold fetched a price of $44 per fine ounce. In the result, the gold which is imported into the country has either to be sold to the Banque de France, or has to be exported out of the country—a situation of which the French monetary authorities have taken advantage. The Banque de France now buys the gold and mints it into louis d'ors, and either markets these louis d'ors internally at a profit, or exports the gold abroad for dollars, thus strengthening the official monetary reserves, against the day, if it should arrive, when the franc may have to float on the foreign exchanges, and when confidence in the frac may have to be sustained.

The Banque de France has thus been a monopolistic buyer in France recently. If it had not been buying in such large quantities, it is possible that the price of gold in the Paris free market might have slumped even further. But if the Banque de France has bought the gold, it has also guided the price of gold downwards, being in the position of a monopolistic buyer; and it has been helped in this policy by the preponderance of sellers in the other European gold markets.

In continental Europe, this preponderance is now explained by the fact that Russian gold, not easily recognisable as such because it is no longer marked, is being passed on through the free market centres. The Russian sales are themselves explained by the fact that Russia has great need of European currencies, particularly of sterling. In Far East Asia, gold is not perhaps on offer from the Communist countries, at any rate on the same scale. But the offtake from these countries has declined, which has the same bearish influence.

These market trends have a natural cumulative effect. For one thing, the luxury of processing South Africa's 40 per cent of production into nominally industrial forms, in order to honour the letter of the I.M.F.'s gold sales policy, can no longer be paid for in the present conditions, when the official price of gold has turned out to be almost a support price. South African gold is, therefore, now released to the markets as pure gold. This accounts marginally for the decline in the free market prices, in so far as the processing and reconversion charges are hereafter unnecessary.

Apart from this marginal influence, however, the tendency to refrain from purchasing or to unload in a falling market is also bound to be pronounced. This influence is apparent from the fact that the free market's absorption of gold in 1953 has been recently estimated at about $200 millions, as compared with $490 millions in 1951, when the free market prices diverged so markedly from the official parity price. Both price rises and falling prices are, in the nature of the circumstances, cumulative. While recent experience in the free gold markets confirms this, for those French hoarders of louis d'ors, who have purchased them as a hedge against inflation have suffered heavy capital losses, the fact that no rise in free market prices in the immediate future can now be foreseen naturally also means that the demand for gold may level off or even fall. It cannot in any case be expected to rise.

The decline in the value of gold as a hedge against inflation is pronounced, because of the potential losses in holding gold in a falling market. But this, like the disappearance of demand in the free market capitals, and the disappearance of processing for South African gold, is only a symptom of the major changes in the structure of demand which have taken place. In the last resort, Communist policies influence gold prices everywhere, either by reducing tensions and the scare of a shooting war, or by leading the market down by offers of gold which are intended to sustain or improve the Communist standards of living. The knowledge that the changes which have taken place in the free gold markets recently are to be explained in terms of these fundamental causes, and are not merely technical, is now becoming more and more widespread. This knowledge itself cannot but have a bearish influence, and, therefore, at least for as long as there is no basic change in Communist policies, there is no reason to anticipate that free market prices of gold will deviate materially from the present levels, which are near about official parity price.

The implications of this from the point of view of the Bombay market are interesting. Summarised briefly, these implications are that the Bombay price cannot rise very much above, say, Rs. 82, as long as the present trends in the world's free markets last, which is as long as one may now see into the future. Bombay prices cannot also fall appreciably, because as long as the United States Treasury continues to purchase gold at the official parity price, the prices in the free markets are bound to be stable, except for minor local variations. In other words, for the first time in the post-war period, free market prices of gold are now likely to be more or less stable; and since Bombay, although theoretically insulated, is still influenced by world market trends, the basic long-term stability of gold prices in Bombay seems also to be assured. For a country which is interested in gold as a traditional investment, this is undoubtedly a healthy development.

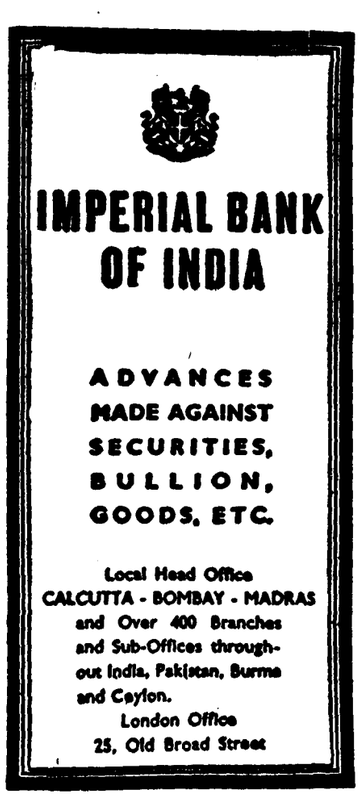
SAFETY IN THE AIR

THE findings of the Court of Enquiry on the crash of the Dakota aircraft on the night of December 12 last at Nagpur are now available. Since the fatal accident occurred, public attention has once again been directed to the issue of safety in air transport. The findings of the Court, which were awaited not without a feeling of concern, establish that on a judicious assessment of all the evidence placed before it the reasonable conclusion emerges that the human factor was the most probable cause of this tragic accident. In this enquiry the Court was not left exclusively to an evaluation of circumstantial evidence. Circumstantial evidence undoubtedly constituted a vital basis of the investigation, but there was also the direct evidence, up to a stage, of the pilot who was happily spared. The findings and the recommendations of the Court have been accepted by the Government. Interest will now shift to the precautionary measures which the Government has undertaken to adopt.

Civil aviation and particularly the operations of the private scheduled air services in this country have a reassuring record on the specific factor of safety. One airline before nationalisation had an absolutely spotless, accident-free record, and most others had satisfactory accounts of their performance to render on this score. But the dangers which are inherent in air transport and the understandable sensitiveness of travellers to the safety factor make it, in every sense, obligatory that searching investigations ought to be conducted in each case of accident. The suspension of the Comet from its operations by the B.O.A.C., after the recent tragic crash in the Mediterranean, for a thorough mechanical inspection, betrays no lack of faith in its undoubted role in future commercial aviation and intermittent enquiries into the accidents in which the Dakota aircraft is usually involved in this country do not by any means indicate that faith in its reliability has been assailed. A searching enquiry in each case of aircraft accident is essential precisely because no quarter must be left for any misconceptions and confidence in air travel must be maintained unimpaired.

A brief indication of the situation in which this last accident took place is necessary for an appreciation of the circumstances which led to it. It has been claimed that the various elements in the situation (excluding the technique adopted by the pilot and his judgment) attending the crash were far from being conducive to its occurrence. The evidence before the Court establishes that the obligatory inspection of the aircraft prior to its flight that night from Bombay coupled with the ground-testing operation conducted by the pilot himself before take-off at Nagpur, leaves no room whatsoever for any inference about mechanical defects having been left undetected. On this aspect of the accident, there is the weight of the testimony of an array of technical witnesses and, in a highly technical issue like this, it must prevail. There is little that a layman can suggest by way of its evaluation.

But there is one circumstance in this case on which convincing explanation, so a layman might reasonably think, appears not to have been provided. It is not clear to his comprehension how immediately after the aircraft got airborne and, while it was still running parallel to the runway, the port engine should suddenly cut dead and cause that fateful swing. The swing was, no doubt, corrected and the port engine picked up again, but it was this swing which influenced the decision of the pilot to return to the airport at once for an inspection of the port engine. After the commencement of the turn which the aircraft was given in its effort to land on a nearby runway, the port engine is said to have gone off again. The short-lived trouble developed by the port engine on two occasions might be compatible with absence of any inherent mechanical risk, but it figures as an element in the situation which has not been adequately discussed in the report of the Court of Enquiry and to the non-technical reader it would appear to have been left obscure. The failure of an engine on take-off is a risk always run; but here the engine, so to speak, came and went. Prima facie, there will be a doubt as to what really happened.



A major inference which arises from the combination of circumstances is that the tragedy could possibly have been averted, if two precautions, which were entirely within the control of the pilot, had been taken. The landing gear was not retracted soon after getting airborne as it ought to have been retracted, but on the contrary, it was left in a fully extended position throughout. Its consequence was that the climb performance was retarded and the aircraft did not gain high altitude. It is significant that this lack of adequate altitude, coupled with the time lost in taking the turn, precipitated the landing of the aircraft on a field and its impact particularly on the bund of the field. In the second place, what is of greater importance, the pilot failed to adhere to the procedure recommended in the operations manual laid down for his airline and did not throttle back the live engine and land straight ahead. The Court's finding is that in this case there was sufficient length of the runway in front of the aircraft for a straight landing. The extenuating circumstance from the pilot's viewpoint, however, appears to be the revival of the port engine. An unfortunate circumstance intervened in the course of the pilot's effort at landing on the airport. No sooner had he realised, on taking the steep turn, that the plane had lost considerable height than there came a fire warning relating to the starboard engine, which probably influenced his decision at precipitating the process of forced landing. The fire alarm turned out to be false.

The Court's verdict on the probable cause of the accident is the loss of critical height in the course of the steep left-hand turn executed by the pilot at an unsafe altitude. All other possibilities have been excluded by a process of elimination.

The recommendations of the Court for preventive measures which have been fully approved and accepted by the Government are vitally important for the future of safety in air travel and it is to the implementation of these recommendations that attention must be directed. This accident is one in the series which involved the failure of the human factor as the cause of air accidents. In fact, in this country, this factor has been responsible for about 80 per cent of the accidents. The Court has given first priority to its suggestion to make specific proficiency tests obligatory for renewal of pilots' licences. Its unequivocally emphatic attitude on the question of regular checks for proficiency in instrument flying and emergency pro-

cedures as a pre-condition of renewal of licences, apart from giving practical exercises to pilots, will ensure the chances of reasonable certainty in the adoption of measures calculated to avoid accidents in a larger number of cases than now. Mere acceptance of the recommendations pressed with a feeling of urgency by an enquiry court or committee is of little avail. It is a sad reflection on Government's sense of vigilance and duty that a similar suggestion for rigorous proficiency checks of pilots and an increase in their strength which was made quite recently after the investigation into the aircraft crash at Palam on May 9, 1953, has been conveniently forgotten. In any event, reports on enquiries dealing with human lives are the last documents that can be consigned to the pigeon-hole.

On the mechanical aspect of flying, the recurrence of false fire alarms deserves elimination and even if it may not be possible to invent an err-proof mechanism, as the Court would have it, the maximum elimination of false warnings can surely be attained. The major factor which weighed with the pilot in his decision to return to the airport was the uncertainty of the aircraft's maintaining or gaining the requisite height on one engine with the load it was actually carrying. Technically, the load was 403 lbs. below the maximum permissible all-up weight of 26,200 lbs. but, since one expert witness raises a doubt on the suitability of the load, all load factors should be recalculated to provide an adequate safety factor particularly on aircraft whose engines, near to the time of overhaul, may not be able to take their maximum acceleration. The public is intensely unhappy about these accidents. It does not relieve its anxiety to know that accidents are due to the human factor. It needs specific assurances that everything possible has been done to reduce the risks attendant on the human factor to an absolute minimum.

THE BUSINESS WORLD

THE PRICE OF CEMENT

The cement industry in India, which incidentally has been one of the most progressive, faces an uncertain future. Shri Dharamsey Khatau's address at the seventeenth annual general meeting of the Associated Cement Companies, if anything, underplays the importance of the crisis (for it may amount to that) which may be in store for this industry.

Rising costs of production have recently been a constant source of headache to those responsible for extending cement production. The Government of India has contributed directly to this increase in cost by reason of the withdrawal of the rebates on coal freights and the increase in such freights. While this is a disability which is common to all industries, it is particularly serious in the case of cement, because for every ton of cement produced, 0.25 to 0.50 ton of coal will ordinarily be required—while the location of quite a few units in the south of India makes the burden of railway freights particularly onerous. Because of this difficulty and the increase in establishment and operation expenses, a claim was made for an increase in prices, which in due course was investigated by the Tariff Commission, but after some delay which may or may not have been inevitable, the industry is now faced by the prospect of a reduction in prices, instead of the increase which it asked for.

This matter particularly concerns the old and established units, for the new units may still get a differential price, when Government's decisions on the Tariff Commission's report are announced. Only a hint of the problems which these Government decisions may create is contained in Shri Dharamsey Khatau's speech, but broadly they would appear to be as follows:

(i) the Tariff Commission's recommendation of 10 per cent return on the gross block or 4½ per cent return on the working capital employed has been made without treating bonuses to employees and managing agents' commission as items of cost,

(ii) even this 10 per cent return, moreover, is likely to be denied to the A.C.C.,

(iii) the new cement prices, when announced, seem likely to include an element on account of rehabilitation which is to be paid into a Rehabilitation Fund, which is to be jointly administered.

Naturally, these proposals cannot be acceptable to the cement industry or to the premier unit in it, namely, the A.C.C.

The industry has been progressive, but it is still far from realising the targets of the Five-Year Plan, and steady progress will be necessary, if the installed capacity of a little over 5 million tons is to be attained by 1956. Apart from this consideration, however, equity itself would demand that the trend of rising costs and falling profits, in spite of the expansion in productive capacity and increase in sales, which have already taken place, should be recognised.

The A.C.C.'s own experience is summarised in the table below:

Table Summarising the Principal Items in A.C.C.'s Balance Sheet, 1947-1953.

In lakhs of rupees

	1952-53	1951-52	1950-51	1949-50	1948-49	1947-48
Cement sales	1515.61	1480.02	1209.95	1085.43	962.50	759.30
Salaries and wages	239.32	221.42	192.51	179.52	160.21	139.97
Operation expenses	817.80	797.63	570.66	542.14	448.47	355.04
Establishment expenses	10.66	10.59	9.28	7.03	6.50	6.02
Provident funds	9.49	4.68	4.29	3.72	3.09	2.75
Managing agency commission	28.51	30.05	30.20	23.15	21.91	21.72
Net profit	181.23	196.46	192.93	162.46	90.59	75.61

These figures call for little comment. They prove the industry's case so completely that it is something of a puzzle to explain the Government of India's attitude in this matter at present—to understand why the concessions, if any, which are to be granted to the industry are being whittled down or tied. The major explanation seems to be Government's anxiety to reduce the cost of an essential raw material like cement which will have to be used so extensively in building. Perhaps, a belief that the industry will explore the scope for economies, if any, only under pressure may also be responsible. In either case, however, a policy of reducing the revenue from sales which accrues to the industry may defeat itself. The arrested progress of the industry may do more harm than the reduction in prices may do good. And the scope for economies will be limited because operating and establishment expenses are largely outside the industry's control.

The cement industry has now reached a stage in its post-war development at which a long-term rather than a short-period view of its problems is called for. Thanks in large part to the steady expansion in demand and sales, post-war development so far has been very satisfactory. At Sindri and near Robertsganj and elsewhere, new factories are coming up. It would be a pity if this progress were to be arrested because of hasty and unfavourable decisions regarding the price of cement in future.

PRIVATE ENTERPRISE: AN AWAKENING

By

CROESUS

At long last, the industrialists are awake. They have evidently been shaken out of their complacency by the overall policy of Government towards development in the private sector. The surprise is that it has taken them so long to realise that mixed economy, to which concept they have subscribed, need not necessarily mean 90 per cent free enterprise and 10 per cent State enterprise, but that it may as well be the other way about, if the Government of the day is so inclined. They took their first hint only when some Government

spokesmen began complaining that the private sector had not done as much as was expected of it under the Five-Year Plan. However, being shrewd people, they were not slow to see the writing on the wall that this presaged. Giving a dog a bad name, whether the dog is or is not at fault, is the familiar preliminary to hanging it in all democratic countries. The talk of setting up a Central Development Corporation to start industries which neither the private enterprise nor the Government would take up, for whatever reason, so as not to allow any stalling of development, meant taking it a stage further.

Sensing danger, albeit belatedly, free enterprise began to rub its eyes and decided to tell the Government plainly, but firmly, what it felt. At the twenty-first annual general meeting of the Employers' Federation of India last month, Sir H. P. Mody observed; "While free enterprise has been assigned a definite role and reassuring statements of Government's intentions are made from time to time, the blunt truth is that the actions of Government lack cohesion and consistency and create a state of uncertainty in which it has become very difficult for the private sector of industry to make any substantial contribution to the development of the country. The representations made by industrial interests from time to time seem to receive little attention. The flow of labour legislation, the irksome controls over profits, production and distribution, the refusal to provide adequate incentives for either old or new enterprises and the irresponsible opinions indulged in by some of those who hold positions of influence, continue; they are not only sapping the morale of the industrialist, but are destroying the confidence of the investor. Such a state of things cannot indefinitely go on. If costs keep continually going up through levies of one sort or another, if even ordinary discipline is not allowed to be maintained in factories, if surplus labour cannot be retrenched except at heavy cost and through protracted proceedings, and if installation, even where the necessity is established, of new or additional machinery is hampered for one reason or another, the situation becomes intolerable and free enterprise becomes only free in name. I am not arguing against the concept of a controlled economy; we have all accepted it; but controls have to be reasonable and must pay sufficient regard to the problems and difficulties of the enterprises which are sought to be regulated in the public interest."

At this meeting, more than one spokesman of industry not only supported Sir Homi's proposal to make the Federation a more effective body than it has been, but urged him to take immediate steps in this behalf. I do not know whether it was in pursuance of this that the E.F.I. President convened a conference last week of some of the leading industrialists in the country in order to consider the steps to be taken to bring about a more effective representation of industrial interests and to enlighten public opinion about the vital importance of the part that free enterprise can play in the economic development of India and in the attainment of the social objectives which are commonly accepted. After reading a reference to this meeting in a feature dealing with big business in a Bombay journal, I paused and wondered for a while whether this meeting, if it is intended—as I am sure it is—to take up a common and united front on behalf of all industrialists, could not have been more representative than it was alleged to have been. However, a chance discussion with one of the spokesmen of the meeting convinced me that the invitations were sent out on a basis designed to leave out no section of industry whatsoever.

Be that as it may, the outcome of the long and frank discussions at the meeting has been that steps are already being taken to present a more sustained and vigorous presentation of the view-point of industry alike to the Government and the public, more or less on the lines on which the Millowners' Association, Bombay, has started doing of late. For this purpose, the meeting felt a special machinery which could function continuously and expeditiously had to be devised and appointed a small committee, authorising, at the same time, Sir Homi to go further into this question and carry out the scheme.

Meanwhile, so as to keep up the tempo as it were, Mr. Dharamsey M. Khatau, Chairman of the Associated Cement Companies, Ltd., reverted to this theme in the course of his address to the shareholders at their seventeenth annual general meeting and said:

"Today, the morale of the industrialist is at a low ebb. He constitutes a ready target, and is often the subject of abuse in public speeches. He is painted as an anti-social evil thriving as a parasite on the exploitation of other's efforts; as a person to be tolerated only for as long as is necessary to bring about his replacement. If private enterprise is to achieve that which the nation expects of it, then this attitude should change. We do not expect either molly-coddling or fulsome praise, but is it too much to hope that when we have been able to contribute very substantially to the advancement of national interest, at least some gesture of appreciation, or some word of encouragement should be forthcoming from the responsible leaders of our country? Whatever social and political form Indian economy might eventually take, it is clear that, during the foreseeable future at any rate, private enterprise is not only necessary but is essential. No one can doubt that the industrialist will be encouraged to undertake his task with infinitely greater resolution when he knows that his initiative and endeavours are appreciated and accepted as an honourable contribution towards the betterment of the nation".

At this stage, it is necessary to stress the point that neither Sir Homi nor Mr. Dharamsey were trying to shield any industrialist found or alleged to be indulging in malpractices. Both of them made the position clear. Sir Homi thus said: "The malpractices which have come to light in the working of some industrial establishments call for our unqualified condemnation. We can have no truck with those who are out to exploit, by whatever means they can, the undertakings of which they have acquired control. Where the guilt has been brought home, it is the clear duty of the organisations to which the offenders may belong to expel them. Their actions are apt to bring discredit upon private enterprise and the least that can be done is to show that they are not, in any sense, representative of the general body of employers in the country".

Mr. Dharamsey also reiterated this, when he said: "We make no plea for condoning of malpractices in the field of industry. Whenever these occur, either in the public or private sectors, (mark the studied inclusion here of the public sector also) they must be rooted out and given no quarter. What we do ask is that Government and the enlightened public learn to differentiate between the good and the bad, that all are not painted with the same brush and that the good element is given the support and encouragement which it deserves and is entitled to".

It may be difficult for any Government to have two different attitudes, one towards the good and another towards the bad, but this need not mean that the Government should, with a view to penalising someone who, it may apprehend, will not play the game, enforce a general rule that will prove irksome to all. Take, for instance, the Industry and Commerce Ministry's latest proposal to assume control over the rehabilitation fund, although it is stated to be jointly with the industry or the unit of the industry concerned. From what Mr. Dharamsey explained to the A.C.C. shareholders the other day, it looks as though the Government is willing to sanction a certain increase in cement prices—not as much as the Tariff Commission has recommended—only if the industry is prepared to accept the condition of joint control over the rehabilitation fund. For this specific purpose, the Government is stated to be willing to sanction an increase of Rs. 2 per ton. This can only be interpreted to mean that, because the Government is probably not quite sure that all units of the industry will use this increase for the specific purpose for which it is intended, it wants to exercise a sort of an overall control on the whole industry. Surely there are other ways of making sure specific purpose, and it should not be difficult for the many new wings of the Government that have been created to ensure this by keeping a close and constant watch. Moreover, being a protected industry, all the accounts are necessarily open for inspection by the Cost Accountants of the Tariff Commission—and there is now a Chartered Accountant member also—who can be depended upon to discover lapses, if any. But, no, someone in the Ministry perhaps thinks this is the only sure and effective way and he must needs have it. That is all.

Whatever the supposed justification for it, the introduction of this principle is clearly an encroachment on the freedom of private enterprise. There is not even the saving grace that it is to be limited to the period of the First Five-Year Plan, which one could understand. Nor is there any assurance that whatever the appropriations the industry may have committed itself to already will not be excluded from being a charge on this fund. Yet the amiable A.C.C. Chairman has been sporting enough to explain the implications of the proposal to the Government and leave it to its good sense to arrive at a workable compromise. It remains to be seen what that compromise is going to be, but, however satisfying it may turn out to be, it is, in the opinion of many seasoned industrialists, a thin end of the wedge of further Government control which must be resisted on principle.

THE ASSOCIATED CEMENT ANNUAL MEETING

By

CROESUS

This year's annual general meeting of the Associated Cement Companies, Ltd. did not last as long as last year's, but it was more significant than the one held in 1953. Practically the whole interest of the entire body of shareholders seemed to be centred on one subject, namely the question of cement prices. The Tariff Commission, which was asked to go into this question, has submitted its report to the Government, and the Government's orders on the Commission's recommendations are expected anytime. Egged on by one shareholder after another, the A.C.C. Chairman, Mr. Dharamsey M. Khatau, could not but take the shareholders into confidence and explain the latest position. But, before going into that, it is necessary to refer to paras 15 and 16 of the Chairman's address on the occasion.

Briefly, these paras suggest that the Tariff Commission has recommended that the profits of the Company should be limited to a 10 per cent return on the gross block and a 4½ per cent return on the working capital employed. Bad enough as this is, the Company is also not allowed, it would appear, to treat bonus to employees and managing agents' commission as items of cost; only taxation and dividends are permitted to be met out of the profit element as defined. In the name of social justice perhaps, this is yet another instance of the sedulous encroachment of the authorities on company profits. If every company is asked to limit its profits thus and not permitted to treat even such items as bonus to employees and commission to managing agents as items of cost, we can once and for all forget all about ploughing back of profits and capital formation which, time and again, the Government itself has been mouthing and the Planning Commission also has been exhorting private enterprise to do. Apart from it, it is strange logic on the part of the Government to fix bonuses to workers at any level it pleases, regardless of the ability of the industry to afford it, and insist on the companies paying these bonuses, but, at the same time, refuse to accept it as an item of cost! Even in the case of commission to managing agents, the amount is no longer governed by the age-old and allegedly one-sided contracts but by revised contracts subject to the relevant provision in the Indian Companies Act, so that there is no chance of the managing agents mulcting the company.

Mr. Dharamsey has apparently worked out what the proposal actually means in the case of A.C.C. For he said: "The result is that, after paying agency commission, taxation and bonus to employees, the return of 10 per cent on gross block is reduced to about 4 per cent!" He was, therefore, more than mild when he added: "I submit that in any country, much more so in an underdeveloped one like ours, where the immediate need is for the production of greater wealth through rapid and efficient industrialisation, such a poor return is grossly inadequate to provide the incentive for people to save, and to risk their savings in the promotion of industrial expansion".

While expressing the hope that the Government would take a more realistic view of the profits which the industry should be permitted to earn in order to consolidate and speed up the progress of its development, the A.C.C. Chairman also sounded a note of apprehension that the Government might not accept even the Tariff Commission's modest recommendations. It is feared that the A.C.C. may not only not get the increase of Rs. 8 per ton proposed by the Commission in respect of new units but may also be asked to accept the new and novel principle of joint control of the Company's rehabilitation fund if it is to be entitled to an increase of Rs. 2 per ton specifically for the purpose of rehabilitation. It was not clear from what Mr. Dharamsey said whether or not this condition is to be binding only for the remaining period of the first Five-Year Plan and also whether the Company is prepared to accept it provided that the allocations from the fund already made by the Company are not objected to by the Government. It is a compromise in either case, and a compromise at the cost of a valued and vital principle, namely freedom of private enterprise, even within the limited sphere in which it is now allowed to operate, to guide its own affairs as best as it can and according to its own convictions. Probably the Government is afraid that private enterprise or some sections of it might abuse this freedom, but there is no need for any such fear, at any rate after Mr. Dharamsey's categorical assertion that "the A.C.C. can, with every justification, claim to have achieved all that is best in robust private enterprise" and that "it has justified the confidence reposed in it not only by its workers and shareholders but also by its consumers, namely the public and Government". Moreover, any abuse of the freedom or malpractices on the part of the management is not likely to be tolerated by the public in its present frame of mind. In view of this, it would appear that the Government will be taking no risk whatever

in allowing the A.C.C. in particular and private enterprise generally a fair selling price" in the secure knowledge", to quote Mr. Dharamsey, again, "that the incentive so provided will be utilised to the fullest effect in furthering the interests of the industry and those of the country".

CAPITAL REQUIREMENTS OF THE ELECTRICITY INDUSTRY

After exhausting perhaps all arguments to delay sanctioning an enhancement in the standard rate permissible to electricity undertakings, it will be remembered, the Government of India asked the Federation of Electricity Undertakings of India to provide specific instances State-wise where electricity undertakings have tried to raise funds but have not succeeded. These instances have now been collected and compiled by the Federation and a representation has again been made to the Ministry of Irrigation and Power earnestly imploring the Government that "they consider introducing during the Budget session of Parliament a Bill upgrading the standard rate and, if possible, at the same time, dealing with the other major points, such as deferred taxation reserve, rehabilitation reserve, and other forms of internal finance and of comparable importance known to the Government". The Federation has further offered to meet the Minister to place all these facts before him.

Meanwhile, the results of the enquiry made by the Federation, which has brought forth replies from 79 undertakings out of the Federation's total constituent membership of 226, show that most electric supply undertakings are unable to raise any significant finance under the present statutory restrictions. Since the 79 undertakings from which replies have been received also include the most representative units, it is clear that, even if replies are received from all the units of the industry, the conclusion cannot be anything different. As Mr. K. G. Milne, President of the Federation, observed at the last annual general meeting of that body in November, where any success has been achieved in raising capital, it is more due to the persistence of confidence of habits amongst the investing public, coupled with an element of anticipation that Government would soon accept the industry's legitimate demand for raising the rate of return. If this anticipation should prove wrong for any reason, it is not improbable that even the most favourably placed undertakings would find it difficult to tap further capital. Hence the need and urgency for prompt compliance with the request of the Federation.

Summary

Undertakings Statewise		Unsatisfied balance of capital requirements over last two years	Additional capital requirements over next three years	Total capital requirements yet to be raised
Bengal	(13)	25,00,000	4,85,80,850	4,61,80,850
Madras	(9)	18,24,490	95,00,000	1,13,24,490
Bihar & Orissa	(9)	27,54,280	59,50,000	87,04,280

BUSINESS NOTES

IMPORTS OF WOOLLEN FABRICS

If being vociferous in putting forward a case is any indication of the strength of the case, the wool traders and importers of woollen fabrics may be said to have a very strong case, indeed. But discerning sections of the public will not be taken in that way. They would want facts to convince them. It is a pity that so much of propaganda by interested parties is not countered by the authorities—and they can do so effectively with all the facts and figures of woollen manufactures, imports, etc. at their disposal.

The woollen importing and trade interests contend that the reduction for the current licensing period in imports of woollen fabrics from 25 per cent to 12½ per cent and of shady woollen goods from 40 per cent to 25 per cent has led to a sudden scarcity of woollen goods and consequently to a rise in prices. These interests further allege that the prices of Indian woollen goods have risen sharply by 15 to 25 per cent. Enquiries, however, reveal that since the announcement of the import policy for the current half-year there has not been even one per cent increase in the prices of Indian woollen goods, these being the same which prevailed in November-December last. Actually, some woollen manufacturers complain that they are finding it difficult to dispose of their stocks. Many mills have, therefore, been obliged to work only one shift, if not less than that. If this is the position in the midst of the busy season, what the position will be during the off season can well be imagined. It is accordingly a studied misrepresentation of facts to state that there is "a great scarcity of cheap qualities of woollen fabrics in the country."

As for the argument that past imports have not had any adverse effect on the indigenous industry, the truth of the matter is that they did not probably have an adverse effect because the gap between the requirements of woollen goods in the country and the total volume of indigenous production was still wide, unlike what it is today.

The statistical position may be indicated in brief. In 1950-51 there were 116,800 spindles, but since then a further 10,000 spindles have been installed and licences issued to instal another 21,000 spindles. The addition of these 31,200 spindles is more than the addition of 30,000 spindles to the existing installed capacity envisaged under the Five-Year Plan. It is estimated that the resulting addition to the manufacturing capacity will be about 5 million lbs. (both yarn and cloth) compared to the last three years' average annual imports of only two million lbs. of woollen yarn and cloth. This is an approach to the stage of self-sufficiency.

DIRECTIVE ON COTTON CONSUMPTION

The Textile Commissioner's recent circular impressing upon cotton mills the need to confine their consumption of Indian raw cotton to the quotas already allotted does not disclose Government's policy on supply in a full measure. While there is a positive statement on allotment of Indian raw cotton, the total silence on supplies of imported cotton is bound to cause suspense and uncertainty. Allotment of Indian cotton has no doubt been made for the current season on a liberal scale—20 per cent in excess of the quotas allowed in the 1952-53 season. This higher allotment stands unchanged, but mills have been asked not to bank on anticipations of supplies in excess of it. This instruction is explained by the fact that the first estimate of the cotton crop fixed at 42 lakh bales for the 1953-54 season has now been scaled down. Any tendency to rush in for purchase of more indigenous cotton is bound to push up cotton prices and also give an impetus to speculation, both likely factors being sure to push up production costs and cloth prices. Such a contingency needs to be avoided from the view-point of the domestic as well as overseas markets.

So far, the directive is sound. Mills have been advised to make good any gap between their total requirements and indigenous quotas by purchase of staple fibre or foreign cotton. It is precisely in this respect that omission to clarify policy has been disquieting. A positive statement assuring assistance to procure both at reasonable prices is quite essential. Staple fibre does not present any difficulty since quotas equivalent to previous season's purchases have been allowed. But an unequivocal statement about Government's intention to assist mills to import cotton by offer of necessary facilities is essential. If consumption of cotton by mills at the monthly rate of about 4 lakh bales as assumed by official estimate is to proceed unhampered, it is reasonable to place requirements of foreign cotton in the neighbourhood of 7 lakh bales. So far Government has given no indication of its reaction to the trade's suggestion to take advantage of the United States offer to accept rupee payment for cotton exports nor is it clear whether Egyptian cotton will be allowed to be purchased with liberal currency terms. Any third source is not so far within the knowledge of the trade. In any event, explicit information on imported supplies is necessary.

ENGINEERING INDUSTRIES

The first report of the Mulgaokar Committee appointed by the Ministry of Commerce and Industry to conduct a preliminary survey into the idle capacity of the units in the engineering industries, it seems from the summary version as it has appeared in the Press, has come to the conclusion that the extent of production capacity lying idle varies between 25 per cent and 50 per cent. The Committee is said to have made tentative recommendations to put back this capacity into active use. Domestic demand for the products of these industries, coupled with a potential market in the neighbouring countries, which constitute the long-term outlook for these industries, has obviously been accepted as the basis of the Committee's findings.

It was expected that a consideration of this problem would directly involve a reconsideration of the import policy. This is what the Committee is stated to have done. Its approach to the problem unequivocally suggests that demand should be carefully assessed by estimating Government requirements as also private requirements and provision made in the bilateral trade agreements. Further, the establishment of special committees for different classes of these industries has been suggested for the purpose of screening import applications in cases where real controversy is raised about the necessity of imports. On the assumption of one-fourth capacity lying idle, the additional need of steel and pig-iron imports is put at 1 lakh tons and 70,000 tons respectively to restore it to production. A reduction in the import duty on raw materials and semi-manufactures is also emphasized as an essential aid to the manufacturing units. Factories manufacturing railway stock and equipment seem to have pressed a demand for facilities to work three shifts to reduce the flow of orders on foreign producers. It is not at all clear from the published version what is precisely meant by the demand for supply of imported steel at all consuming centres at a uniform price. The steel equalisation and freight equalisation funds are already performing the function of ironing out price differentials. All in all, the tentative recommendations appear to assess the long-term requirements of these industries, but the issue of actual assistance in the immediate future may require a different approach and assessment.

INDO-U.S. STEEL AGREEMENT—IMPORT AND UTILISATION PROGRAMME

In pursuance of the agreement entered into between the Governments of India and the United States for the import of steel, a quantity of 200,000 tons is to be purchased from the free market with grant of $25.5 million (Rs. 12.14 crores) made by the Government of the U.S. to this country as part of its total economic and technical aid authorisation of the order of $89.1 million (Rs. 42.43 crores). Out of the total imports 200,000 tons are to be procured with the funds provided in the steel import agreement between the U.S. and India. The breakdown of this quantity according to types of steel is estimated as below:

Sheets—black plain, galvanised plain and galvanised corrugated ..	80,000 tons
Plates	50,000 „
Rails	50,000 „
Sleeper Bars	20,000 „
TOTAL	200,000 tons

The programme of the utilisation of these 200,000 tons of imported steel has been fixed by broad allocation. The shares of different types of demand are approximately as follows:

Railway wagon building and other railway requirements	43.0 per cent
Steel processing industries, industrial machinery making, pipes, tubes, oil drums and containers and similar requirements	23.5 „ „
Agricultural requirements and rural development schemes	20.0 „ „
River valley projects	8.5 „ „
Small-scale industry, tanks for petroleum industry, and so forth ..	5.0 „ „
TOTAL	100.0 per cent

ADVERTISING AND THE PRESS

Among the media through which advertisements seek publicity newspapers are certainly the most important. It was inevitable, therefore, that Mr. A. D. Shroff should make the relation between the two the central theme of his presidential address before the first annual general meeting of the Indian Society of Advertisers. His approach to the subject may present a difficult choice to the Press, but in the interest of a realistic approach he has made a fervent appeal for a readjustment of the rate structure adopted by newspapers. He has put the issue squarely with reference to relative costs obtaining in other countries and has urged that a full investigation into this question should no longer be postponed. As business activity is stabilising to more normal levels, while production costs tend to be inflexible in relation to prices, he argues, the problem of advertising costs must receive anxious attention. Newspaper rates may need a downward modification and this vital fact indicates that the emphasis of newspaper revenue will require a larger shift towards circulation.

The interests of advertisers are as much linked with wider newspaper circulation as those of newspapers themselves and Mr. Shroff proposes that the latter should now undertake organized readership surveys on a co-operative and not isolated basis. He estimates the current newspaper circulation at about 3.5 million or about 4 per cent of the potential circulation. Multiple readership at present puts restrictions on actual circulation and Mr. Shroff states that ways and means should be devised to encourage the reverse trend. How this objective is to be achieved will certainly pose a big problem before the Press, but a change in the advertising rates seems indicated in due course of time. The reference to combined rates does not raise a very vital problem and the emergence of special supplements for business publicity is not a phenomenon of newspapers' own making.

The present small membership of the Indian Society of Advertisers shows that quality and status are valued in organization more than numerical strength. The objective of the Society to bring a new and enlightened outlook to bear upon advertising as an integral part of production and sales activities and as an agency to reduce costs by promoting distribution promises to find increasing acceptance. There is also the assurance to give a healthy tone to advertising.

POLICY ON FOREIGN CAPITAL

The following authorised statement on the Government of India's policy on investment of foreign capital in this country has been issued officially:

It is the policy of the Government to welcome foreign capital in India in desired fields and there is no barrier to such capital coming to the country for investment in industries which are considered in the national interest. Cases of foreign investments are scrutinised by the Government of India with reference to their general usefulness to the national economy. Generally, permission is not granted for investment of foreign capital in purely financial, commercial or trading concerns except in such cases where technical know-how is an essential aspect of the trading activities. It is also the policy of the Government that in cases where foreign capital is allowed, the majority interest in ownership and effective control of that undertaking should remain in Indian hands. Relaxation is made only in exceptional cases where Indian capital is not forthcoming or the schemes are in the national interest. Whenever in such cases expansion is contemplated, greater association of Indian capital may be insisted upon. Government also expects that adequate provision is made for the training of Indian personnel for technical and administrative posts in the enterprises in which foreign capital is involved. Frequently such a provision is made a condition on which foreign investment is permitted.

Dividends are allowed to be remitted in full to the country of residence of the foreign investor.

Repatriation of Capital: The transfer of capital from India requires the approval of Exchange Control. Permission is freely given for repatriation of foreign capital invested after the 1st January, 1950, in new projects approved by Government after that date. This facility is available even in respect of appreciation in the value of the original investment made after 1st January, 1950. In the case of any foreign concern being compulsorily acquired by Government, reasonable facilities are given for remittance of compensation paid to such concerns.

Royalty Agreements: Prior approval of the Exchange Control is necessary for entering into agreements for payments to non-residents of royalties, technical charges etc. Approval is usually given if the rate is reasonable in relation to the benefits that are expected to accrue.

TRENDS IN TEA

The turn which the trends in tea in the London auctions are taking place give some cause for apprehension about the outlook in the immediate future. The reactions of trends in London on the home market will need to be watched and the feeling of concern about the price factor in India cannot be brushed aside until there is proof that anticipations of shortage are baseless. The essential point to be considered in the situation about the supplies of tea is that the demand of blenders in U.K. happens to be for the varieties

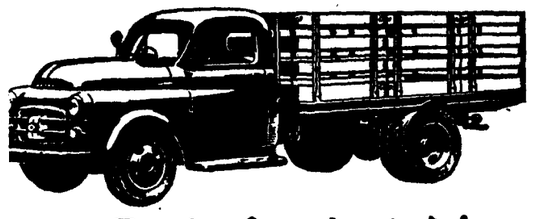
which hold the Indian market. North Indian teas are primarily subject to the impact of the demand.

For some time now wholesale dealers in London have entertained fears about possible shortage of North Indian teas in the second quarter of this year and they feel that these fears will not be dispelled until the outlook improves with the arrival of supplies from the 1954 season's crop. The overall position of tea supplies is that there is an excess of over 10 million lbs. in the 1953 season above 1952. But this excess is predominantly due to Ceylon's quality tea—24 million lbs. in 1953 more than in 1952. The North Indian crop is placed at least 17 million lbs. below 1952 and this is the largest shortfall region-wise. South India's excess of 8 million lbs. is not directly relevant to the pressure of demand from Mincing Lane. Of the remaining exporters, Pakistan has a small surplus and Indonesia has recorded a sizable deficit. London's estimates of the supply situation in the second quarter of this year and even a few weeks earlier take into account the higher demand for Indian tea from the United States. Last week's substantial increase of 4d. in the opening price of Indian common tea, pushing it to a new peak of 4s. 4d. per lb., was inspired by this uncertainty about supplies in the months to come. The weather factor in North India was responsible for the shortfall in the current crop. But it is difficult to see how the North Indian scheme of crop regulation can be considered to be completely unconnected with it. Price movements at home will require careful attention.

THE NEXT STEP IN TRANSPORT

The next step in the preparation of a plan for the development of transport has taken shape. It consists of the appointment of a transport adviser to the Planning Commission and also of the appointment of a study group. In the study group are included the representatives of the Ministries of Transport, Commerce and Industry, Food and Agriculture, Production, Labour and Irrigation and Power. The adviser and the study group have been enjoined to act in close liaison with each other.

This step follows the submission by the State Governments to the Planning Commission of their specific requirements of development in transport to sustain their approved schemes in the public sector as well as probable schemes of expansion in the private sector. It will be recalled that following the inclusion of road transport in the official eleven-point programme to solve the unemployment problem, the State Governments were called upon to present their expansion schemes in respect of road transport. If sufficient thought had been given to the preparation of these schemes when the Five-Year Plan was finalised, this new presentation of schemes can have no greater value than that of a revised and enlarged version. The truth, however, seems to be that no such attention was bestowed and transport expansion was planned on a haphazard basis. From published reports about the prescribed scope of the immediate task of the study group it transpires that there is no idea of drawing up comprehensive plans for the development of all the different forms of transport right now. Immediate preference has been given to schemes of expanding facilities for road transport. This is unobjectionable. Railway development is a long-term affair and in the immediate context, assuming that adequate arrangements would be made for provision of finance, increase of capacity to eliminate any probable bottlenecks in rail traffic appears to be impracticable. Road transport schemes on a regional basis will be given priority, firstly, to relieve congestion in the railways, and secondly, to raise the supply of transport services for medium hauls. Simultaneously with it a potential avenue will be created to absorb job-seekers. The study group acting in collaboration with the adviser is not expected to tackle the problems of railways, shipping and inland navigation except incidentally. Its main assignment will be roads.



WORLD BANK LOAN

The International Bank for Reconstruction and Development recently announced a new issue of $100,000,000 Fifteen-Year 3½ per cent dollar bonds, to be placed on the market on January 12 by a nation-wide underwriting group of 167 investment firms and banks, jointly headed by The First Boston Corporation and Morgan Stanley and Co. Of the total, $98,000,000 of the bonds have been offered in the United States at a price of 100 to yield 3.50 per cent to maturity date of January 1, 1969. The remaining $2,000,000 are underwritten by the Credit Suisse, Zurich, Switzerland, and will not be offered in the United States market.

The offering represents the fourth and largest issue of World Bank bonds to be brought out in the United States on a negotiated underwriting basis. Earlier negotiated issues included a $75,000,000 Three-Year 3 per cent loan sold in September, 1953; a $50,000,000 issue of Twenty-three-Year 3⅜ per cent bonds offered in May, 1952 and $60,000,000 of Nineteen-Year 3½ per cent bonds marketed in October, 1952. The three issues were successfully distributed by syndicates headed by The First Boston Corporation and Morgan Stanley and Co.

Total outstanding funded debt of the Bank, giving effect to issuance of the new bonds, will consist of $753,479,877 expressed in U.S. currency. Of this total, $675,000,000 constitute U.S. dollar bonds, $13,636,364 Canadian dollar bonds, $14,000,000 pound sterling bonds and $50,843,513 Swiss franc bonds.

DE SOTO
TRUCKS

Right for the job!

There is a new De Soto Truck that is best for your hauling job—on any road ... with any load ... at the speed you need.
Now ... more than ever before ... De Soto brings you lasting value.
You get greater horsepower, easier handling, more braking safety, plus a host of new advantages.
See for yourself how new De Soto Trucks can help our business. Come in today.

FLY BY B·O·A·C AND QANTAS

BRITISH OVERSEAS AIRWAYS CORPORATION IN ASSOCIATION WITH QANTAS EMPIRE AIRWAYS LIMITED

COMPANY AFFAIRS

THE BLUE MOUNTAIN ESTATES LTD.

The directors' report of the Blue Mountain Estates Ltd. (*Managing Agents: Messrs. Kothari and Sons. Ltd.*) for the year ended 30th June, 1953, shows that the estates harvested a record crop of 11,66,119 lbs. of coffee at a reasonably low cost. Accordingly, the net profit for the year shows an improvement of Rs. 46,910 from Rs. 4,91,018 to Rs. 5,37,928. The directors have, therefore, proposed a higher rate of dividend on ordinary shares at 12½ per cent as compared with 10 per cent in the previous two years.

Mr. C. M. Kothari, Chairman of the estates, struck an optimistic note in his speech at the tenth annual meeting held on the 7th December, 1953. He said, "Judging from the statistics available regarding the production, consumption and demand for tea and coffee in several countries, I personally feel that both these plantation crops have a bright future. Regarding tea, though America is the second largest importer of tea today being next only to Great Britain, it is surprising that the level of consumption per head in America is only 0.6 pounds as against 9.3 pounds in the U.K., 5.9 pounds in Australia and 3.6 pounds in Canada in 1952. Hence there is great scope for increased consumption in the United States which can be brought about by intensive propaganda."

It may be remarked here that Mr. Kothari recently toured both Canada and the United States on behalf of the Government of India. Mr. Kothari is confident that all the steps which the Government of India have taken and are taking in popularising Indian teas in both these countries must grow effective over a period of years.

THE BISRA STONE LIME CO., LTD.

The working results of the Bisra Stone Lime Co., Ltd. (*Managing Agents:* Bird and Co., Ltd.) for the half-year ended 31st March, 1953, disclose improvement in output and sales of limestone, dolomite and lime. Raisings of limestone at 4,65,456 tons increased by 19,881 tons over the previous half-year. Dolomite raisings increased from 11,271 to 16,648 tons while lime output showed a satisfactory increase of 1,50,486 maunds over the preceding accounting period. The figures for sales also show a similar upward trend.

The profit and loss account shows a credit balance of Rs. 92,485 after making the necessary provisions for depreciation, taxation, etc. and including the amount of Rs. 15,680 brought forward from the previous half-year. The directors have recommended a dividend of fourteen annas per share (without any deduction for income-tax paid by the Company) absorbing Rs. 87,500. The balance of Rs. 4,985 is proposed to be carried forward.

The Company was comparatively free from labour trouble during the half-year under-review.

"THE COTTON AGENTS GROUP" OF SUGAR COMPANIES

The audited accounts of the New India, Upper Ganges and Bharat Sugar Mills (*Managing Agents:* The Cotton Agents Ltd.) for the year ended 30th June, 1953, are now available for review. Upper Ganges seems to have done extremely well as compared with the other two mills. The figure for its net sales at Rs. 281.52 lakhs shows an improvement of 57 per cent over the previous year whereas the corresponding figures for New India and Bharat show sizable declines. Sales of New India have dropped from Rs. 131.99 to Rs. 102.36 lakhs and that of Bharat from Rs. 71.24 to Rs. 61.23 lakhs.

Because of favourable working results, the allocations for taxation and depreciation have been stepped up in the case of Upper Ganges. Provision for depreciation has been increased from Rs. 8.50 to Rs. 10.00 lakhs while that for taxation has been enhanced from Rs. 2.75 to Rs. 4.00 lakhs. Bharat has maintained the provision for depreciation at Rs. 60,000 but has enhanced that for taxation from Rs. 2.68 to Rs. 4.40 lakhs. New India's total allocation for depreciation and taxation is slightly less than that of the preceding year.

Upper Ganges has made no allocations to reserves or renovations but Bharat has provided Rs. 1.50 lakhs for "renovation and renewals" while New India has transferred Rs. 2.00 lakhs to the "general reserve". Of all the three, Upper Ganges alone has been able to step up its ordinary dividend rate from 20 per cent to 25 per cent per annum. Bharat maintained its ordinary dividend at 15 per cent and New India at 25 per cent.

The salient statistics regarding the working of the three mills during the last three years are outlined below:

	New India			Upper Ganges			Bharat		
	1951	1952	1953	1951	1952	1953	1951	1952	1953
(1) Sales (Rs. lakhs)	101.53	131.99	102.36	132.82	179.54	281.52	72.50	71.24	61.23
(2) Manufacturing expenses (Rs. lakhs)	107.74	81.17	76.45	139.68	208.84	152.68	58.39	49.27	43.68
(3) Net profit (Rs. lakhs)	9.88	9.15	4.63	2.64	3.24	2.64	5.37	3.66	2.11
(4) Provision for taxation (Rs. lakhs) ..	8.90	6.40	5.10	4.00	2.75	4.00	4.55	2.68	4.40
(5) Provision for depreciation (Rs. lakhs)	1.30	1.20	1.40	9.00	8.50	10.00	0.40	0.60	0.60
(6) Provision for renovation and renewals (Rs. lakhs)	4.00	..	..	..	..	..	4.00	..	1.50
(7) Transfer to general reserve (Rs. lakhs)	3.00	7.50	2.00	..	..	..	..	1.50	..
(8) Ordinary dividend rate per cent per annum	25	25	25	20	20	25	15	15	15

THE BOMBAY SAFE DEPOSIT CO., LTD.

The audited accounts of the Bombay Safe Deposit Co., Ltd., (Managing Agents: Forbes Campbell & Co., Ltd.) for the year ended 30th September, 1953, show a slight decline in profit from Rs. 79,340 to Rs. 76,959. After making the necessary allocations, the balance available for distribution amounts to Rs. 43,661 as against Rs. 46,202 in the preceding year. The directors have, therefore, scaled down the dividend from Rs. 35 per share, free of income-tax, to Rs. 32 per share.

CONSOLIDATED COFEE ESTATES (1943) LTD.

The net profit of the Consolidated Coffee Estates Ltd. for the year ended 30th June, 1953, at Rs. 19,29,700 is slightly lower than the preceding year's net profit of Rs. 19,32,315. Provisions for taxation and depreciation have also been slightly scaled down but the directors took the prudent decision of transferring Rs. 10 lakhs to "General Reserve" and Rs. 1 lakh to the "Reserve for Debenture Redemption Fund" in view of the may uncertainties related to the marketing of coffee in India today. The ordinary dividend has also been proposed at a lower rate of 15 per cent per annum as against 18 per cent in the preceding year.

Mr. Ivor Bull, the Chairman of the Estates, outlined in his address to the shareholders the following three instances of incorrect policies of the Government in regard to the coffee industry during the last two years:

(a) The export policy of Government in 1952 resulted in a rise in internal prices which was unprecedented.

(b) The halving of the quantity of coffee, exposed in Pool auctions in December, 1952, followed by the failure to hold Pool auctions in January, resulted in coffee prices rising again, whilst the Coffee Board was left with no finance to meet even the initial payments to growers when they delivered their coffee to the Pool.

(c) The lack of any internal or export sales policy in 1953 has resulted in the accumulation of vast and deteriorating stocks of coffee, mostly robusta, which could have been exported, but must now be consumed in India, and, once again, the Board are unable to meet their commitments to the growers.

A fourth instance of incorrect policy has arisen recently regarding "a fair return to the grower for his produce". According to Mr. Ivor Bull, an arbitrary and incorrect decision has been taken in fixing the price of coffee at a lower rate and this is already causing distress to the growers.

COFFEE LANDS AND INDUSTRIES (MYSORE) LTD.

The seventh annual report of the above company for the year ended 30th June, 1953, shows a substantial drop in net profit from Rs. 4,22,557 in 1952 to Rs. 92,955 in the year under report. Provision for depreciation has absorbed Rs. 1,10,677 and taxation Rs. 35,350. No allocations have been made for general reserve or the dividend equalization fund. The ordinary dividend has also been scaled down from 9 per cent to 3 per cent per annum. The directors stated: "Were it not for the fact that there was a carry forward of profit on the previous years' stocks the working of our estates for 1952-53 would have resulted in a loss owing to the lower prices which have been fixed for coffee, this in spite of the fact that the crop for the year was the highest harvested to date".

	Coffee Land and Industries (Mysore) Limited.			The Consolidated Coffee Estates Limited.		
	1951	1952	1953	1951	1952	1953
Net profit (Rs.)	4,04,896	4,22,557	92,955	17,17,598	19,32,315	19,29,700
Depreciation	92,420	1,01,513	1,10,677	2,04,698	2,67,319	3,43,282

HOWRAH MILLS CO., LTD. & THE RELIANCE JUTE MILLS CO., LTD.

The working results of both Howrah and Reliance Jute Mills for the half-year ended 30th September, 1953, are not very encouraging. While sales are up in the case of both the mills, gross profits have declined with the result that the ordinary dividend of Howrah has been scaled down and that of Reliance has been maintained at the preceding period's level.

The figure for sales of the Howrah Jute Mills shows a sizable improvement from Rs. 151.43 lakhs to Rs. 171.71 lakhs. The net profit at Rs. 4.59 lakhs compares unfavourably with a net profit of Rs. 5.54 lakhs in the previous half-year. Provision for taxation has naturally been cut from Rs. 7.26 lakhs to Rs. 5.00 lakhs while that for depreciation has been maintained at Rs. 2 lakhs. The ordinary dividend has been cut from As. 14 to As. 10 per ordinary share i.e. from 17½ per cent to 12½ per cent per annum.

The sales of Reliance, like that of Howrah, are up from Rs. 81.57 lakhs to Rs. 101.24 lakhs. Net profit is down by 50 per cent from Rs. 4.56 lakhs to Rs. 2.15 lakhs. Depreciation has dropped from Rs. 1.50 lakhs to Rs. 1 lakh. The ordinary dividend has been maintained at As 4 per share.

The directors report that the trading conditions during the period under review have not been easy. Hessian prices advanced during the half-year due to a multiplicity of causes but sacking prices lagged behind and at no time during the period was it possible to manufacture heavy goods at a profit.

COMMODITY NEWS AND NOTES

SAMPLE SURVEYS TO ESTIMATE RICE PRODUCTION

Shri Rafi Ahmed Kidwai, Food Minister, said recently in the House of the People that sample surveys for estimating production of rice were being carried out in the main rice-producing States (except Orissa), but the results of such surveys would not be available before February or March 1954. The present indications, however, were that the rice crop this year would be much better than last year. He added that there had been a fall in the prices of rice in West Bengal, Madhya Pradesh, Madras and Andhra during the last three months and it was anticipated that this falling tendency in the prices would persist during the next few months of the harvest season. Government, he added, were watching the situation very carefully. In case it was found that the prices in any area fell below the economic level, suitable measures would be taken to give necessary support to the price-level so as to ensure reasonable prices for the producers. The internal surplus of rice this year, he said, was expected to be sufficient to meet the requirements of the deficit States, but it might not be possible to purchase any substantial quantity of rice internally to build up a central reserve.

EXPORT OF BLACK PEPPER IN 1953

Export of Black Pepper in 1953 is estimated at around 11,000 tons. This is a bit lower as compared with 12,600 tons in 1952. Although the fall in quantity is not much, the decline in terms of value is expected to be bigger in view of the comparatively lower prices fetched in 1953. During December 1953 our pepper exports have amounted to 940 tons as compared with 722 tons in the previous months, which is a healthy sign. U.S.A. remains the main buyer, while U.K., Canada and Italy have increased their purchases. It is expected that the new crop will be at about 22,000 tons, comprising 13,000 tons from Travancore-Cochin State and 9,000 tons from Malabar. It is larger than the previous year by 2,000 tons.

JUTE OUTPUT MAY FALL IN ASSAM

Assam is expected to produce over five lakh maunds of jute less this year than last year. According to the preliminary forecast available, the State will produce 40,34,535 maunds of jute in 1953-54, as against 45,61,435 maunds in 1952-53. The total area under jute this year is estimated to be 2,56,000 acres, as against 3,13,273 acres last year. The decrease in area under jute this year was stated to be due to a slump in the jute market in the beginning of the season and unfavourable weather conditions such as drought and floods in certain districts at the sowing period. The insect pests also accounted for a considerable loss in the standing crops in the middle of the season.

BRIGHT PROSPECTS FOR COAL EXPORTS

Prospects for India's coal export this year seem to be bright according to a spokesman of the principal missioner's office. While Japan, one of the principal buyers of Indian coal, is expected to renew her contract for about 7,00,000 tons, Ceylon has already agreed to import 2,50,000 tons of Indian coal. In the current year Burma, another prominent buyer, will take 3,00,000 tons. India is stated to have the best chance of getting the contract for supplying 2,00,000 tons to South Korea, negotiations for which are in progress.

SPAIN'S OLIVE OIL OUTPUT RISES

Olive oil production was estimated in 1953 at 2,80,000 metric tons, compared with 2,00,000 tons in 1952. It was expected that the crop, added to estimated reserve of 80,000 tons from the unusually high 1951 yields, would be sufficient to meet national needs, which average 2,70,000 tons a year, and leave a small margin for export.

RECORD COTTON SURPLUS PREDICTED IN U.S.A.

The Department of Agriculture reported recently that domestic cotton use was showing a 5 per cent decline from last year and predicted a post-war record of about 96,00,000 surplus bales would be left over at the end of the season. The Agricultural Marketing Service noted that domestic consumption in the first quarter of the 1953-54 year was 30,00,000 bales, about 5 per cent below last year.

KATKI LAC CROP ESTIMATE

According to the preliminary estimates of the Indian Lac Cess Committee, the Katki lac crop in India for the year 1953 is expected to be 1,71,000 maunds as against a normal crop of 2,98,000 maunds. The estimate for the same crop for the previous year was 1,36,000 maunds. The poor crop throughout the country is due mainly to brood shortage caused by a poor Bysakhi crop and a very hot summer. The crop is poor even in areas where the Katki is usually good.

PEAK WORLD PRODUCTION IN SUGAR

Total world output of sugar in the 1953-54 season is expected to be 38.2 million tons—easily the highest figure ever reached. The estimate is some 2½ million tons over last season's figure. Most of it is accounted for by the sharp rise in output indicated in Europe, the remaining increase being fairly evenly divided among other producers.

WORLD COFFEE PRODUCTION

The Foreign Agriculture Service of the U.S. Department of Agriculture estimates the 1953-54 world coffee production at 40.6 million bags (132.276 lbs. each) compared with 40.3 million last season. This will allow 32.1 million bags of the current crop available for export, a post-war record. Brazil continues to be the largest contributor to world coffee supply, with a total output possible of 19.6 million bags and export availability of about 15.6 million bags against 15.2 million in the 1952-53 crop.

SALE OF IMPORTED WHEAT IN ORISSA

In pursuance of their decision of decontrolling wheat, the Government of India will be undertaking from January the sale of overseas wheat from Central storage depots to licensed dealers, including such licensed millers as produce atta up to the wholesale stage in the State of Orissa. Stocks will be issued from Central Government storage depots, and wheat atta will be available for retail sale through the normal channels in the free market without any quantitative limit. In the districts, wheat will be similarly available through the normal trade channels.

GRADING OF TOBACCO UNDER AGMARK

India earned nearly Rs. 16.7 crores of foreign exchange through tobacco exports during the year 1951-52. Of this amount, nearly Rs. 14 crores were through the ports of unmanufactured tobacco. While the U.K. has continued to be the principal buyer, Indian tobacco is gaining steady popularity in many countries and has already established itself, among others, in Pakistan, the Netherlands, Belgium, Egypt, Japan and Ceylon. The reason why Indian tobacco has come to occupy a place on the competitive world markets is, in a large measure, due to the enforcement of quality control on exports on the basis of Agmark grades.

THE ASSOCIATED CEMENT COS., LTD.

Speech of the Chairman, Shri Dharamsey M. Khatau.

The Seventeenth Annual General Meeting of the Associated Cement Cos., Ltd., was held in Bombay on Friday, 15th January 1954. The Chairman, Shri Dharamsey M. Khatau, referring to the concepts of a Welfare State and a Mixed Economy said: "A Welfare State must rely for its fulfilment on the efforts of its people. It is, therefore, vital at this stage of the nation's development that stress be laid on the responsibility for hard work and all-out effort, which both industrialists and workers must face up to in order to achieve the national goal."

"So far as 'Mixed Economy' is concerned," the Chairman continued, "it is important that both the public and private sectors understand clearly the principles on which its operation is based. As I see it, these principles envisage the development of two distinct and clearly defined spheres of industrial activity, each complementary to the other, each fortifying the other, and both knowing that they can count upon operating within the security of a nationally accepted long-term plan of economic development."

Speaking of the attitude of Government and the public towards private enterprise, the Chairman observed: "Today, the morale of the industrialist is at a low ebb. He constitutes a ready target, and is often the subject of abuse in public speeches. He is painted as an anti-social evil thriving as a parasite on the exploitation of other's efforts; as a person to be tolerated only for as long as is necessary to bring about his replacement. If private enterprise is to achieve that which the nation expects of it, then this attitude should change. We do not expect either molly-coddling or fulsome praise, but is it too much to hope that when we have been able to contribute very substantially to the advancement of national interest, at least some gesture of appreciation, or some word of encouragement should be forthcoming from the responsible leaders of our country? Whatever social and political form Indian economy might eventually take, it is clear that during the foreseeable future at any rate, private enterprise is not only necessary but is essential. No one can doubt that the industrialist will be encouraged to undertake his task with infinitely greater resolution when he knows that his initiative and endeavours are appreciated and accepted as an honourable contribution towards the betterment of the nation. We make no plea for the condoning of malpractices in the field of industry. Whenever these occur, either in the public or private sectors, they must be rooted out and given no quarter. What we do ask is that Government and the enlightened public learn to differentiate between the good and the bad, that all are not painted with the same brush, and that the good element is given the support and encouragement which it deserves and is entitled to."

UNEMPLOYMENT

The Chairman then referred to the crucial problem of unemployment in the country, the major cause of which was the terrifying rate at which the population was increasing, and hoped that the work being done to rationalise population would be further intensified, so that the rate of increase might be brought within manageable bounds in a reasonable period of time.

Referring to the role of industry in solving this problem, the Chairman continued: "I would like to take this opportunity of sounding a note of warning to those who advocate that one solution of the unemployment problem lies in industry being compelled to employ a larger number of workers than is necessary for the manufacture of its products. Such action would not only fail to ease the situation, but would inevitably further provoke it. This problem cannot be tackled by frustrating efforts at increasing the efficiency and output of labour. The best contribution which industry can make towards the provision of better jobs for more people is by the creation of greater wealth through higher efficiency, and the utilisation of this wealth to develop more industries. Thus alone will it be capable of providing expanding opportunities for employment.

PRODUCTION AND SALES

Reviewing the progress of the Company during the year, the Chairman said: "We have produced and sold a substantially larger quantity of cement than was the case last year. When it is remembered that the production and sales for the year 1951-52 were also considerably higher than the previous year, shareholders will appreciate the very strenuous and sustained efforts which the Company has made to increase production. Unfortunately, even though production and despatches have been very much higher this year than they were during the year 1950-51, the profits of the Company are less now than they were then. This unhappy position is due to an increase in production costs beyond our control, which has not been compensated for in the selling price allowed by Government."

TARIFF COMMISSION

Referring to the Tariff Commission enquiry, the Chairman stressed that the Company had pointed out the necessity of its being enabled to earn enough to provide for the modernisation and rehabilitation of its older plants, as well as to allow for the expansion programme laid down in the Five-Year Plan. Continuing he said: "It is understood that arising out of this enquiry the Tariff Commission had recommended to Government that the profits of the Company should be limited to a 10 per cent return on the gross block and a 4½ per cent return on the working capital employed. Out of this profit element the Company is expected to meet not only taxation and dividends, but also bonus to employees and Managing Agents' commission. The latter two items have not been accepted as items of cost. When it is so transparently clear that management is an integral part of the Company's organisation, and indeed is responsible for providing its very direction, and that bonus to labour results from adjudications ordered by Government itself, then it is difficult to understand the reasoning which excludes expenditure under these heads as being part and parcel of the cost structure. The result is that after paying agency commission, taxation and bonus to employees, the return of 10 per cent on gross block is reduced to about 4 per cent. I submit that in any country, much more so in an underdeveloped one like ours, where the immediate need is for the production of greater wealth through rapid and efficient industrialisation, such a poor return is grossly inadequate to provide the incentive for people to save, and to risk their savings in the promotion of industrial expansion."

The Chairman went on to say that though he had hoped that the Government would take a more realistic view of the profits which the Company should be permitted to earn, the present indications were to the

contrary, and that even the meagre increase in selling price recommended by the Tariff Commission was not likely to be sanctioned.

He then added: "The Cement Industry as a whole, and the A.C.C. in particular, can show a record of achievement which I submit will bear favourable comparison with other industries in the country. Your Company has always adopted a policy of producing and marketing the maximum quantity of cement at the lowest price possible, consistent with the aims of maintaining its plant efficiently; providing a reasonable return to its shareholders; anticipating and providing for the growing needs of the nation; and ensuring the well-being and welfare of its work people. Further, it has consistently followed the practice of ploughing back every surplus rupee into the strengthening of the business, so as to create greater national wealth and increasing employment. In fact I believe that the A.C.C. can with every justification claim to have achieved all that is best in robust private enterprise. It has justified the confidence reposed in it not only by its workers and shareholders, but also by its consumers, namely, the public and Government. In view of this record it is my earnest hope that Government will allow this Company a fair selling price in the secure knowledge that the incentive so provided will be utilised to the fullest effect in furthering the interests of the industry and those of the country."

PLANT REHABILITATION AND EXPANSION

The Chairman next reviewed the progress maintained by the Company under its Plant Rehabilitation and Expansion programme and stated that since the Company embarked upon its post-war expansion programme, it had already increased its annual capacity by 11 lakhs of tons. Plans had been translated to continue this expansion further, and to carry out a systematic programme for the modernisation and rehabilitation of several of the older factories. Under these schemes, it was intended to modernise the factories at Shahabad, Kymore, Dwarka, Kistna and Patiala.

Referring to the Sindri factory now under construction, the Chairman observed that the first unit of this plant with an annual capacity of 100,000 tons of cement would come into production in the latter half of 1955, and that a second unit with a similar capacity would begin operation a few months later. These expansion and rehabilitation projects had been designed and were being carried out entirely by A.C.C. engineers and technicians and a great majority of the machinery for these projects were manufactured in the Company's Workshops.

The Chairman continued: "As and when this programme is completed, your Company will have added a further annual capacity of 1,000,000 tons of cement over and above the 1,100,000 tons which I have already reported. The ability of the Company to achieve this programme must of course depend on its earning capacity and this in its turn must necessarily be regulated by the selling price permitted to us by Government."

PAKISTAN

Referring to the Company's factories in Pakistan, the Chairman remarked that negotiations were still going on with the Pakistan Industrial Corporation for the formation of a new Company in that country, and when negotiations were concluded, the matter would be placed before the shareholders for their consideration.

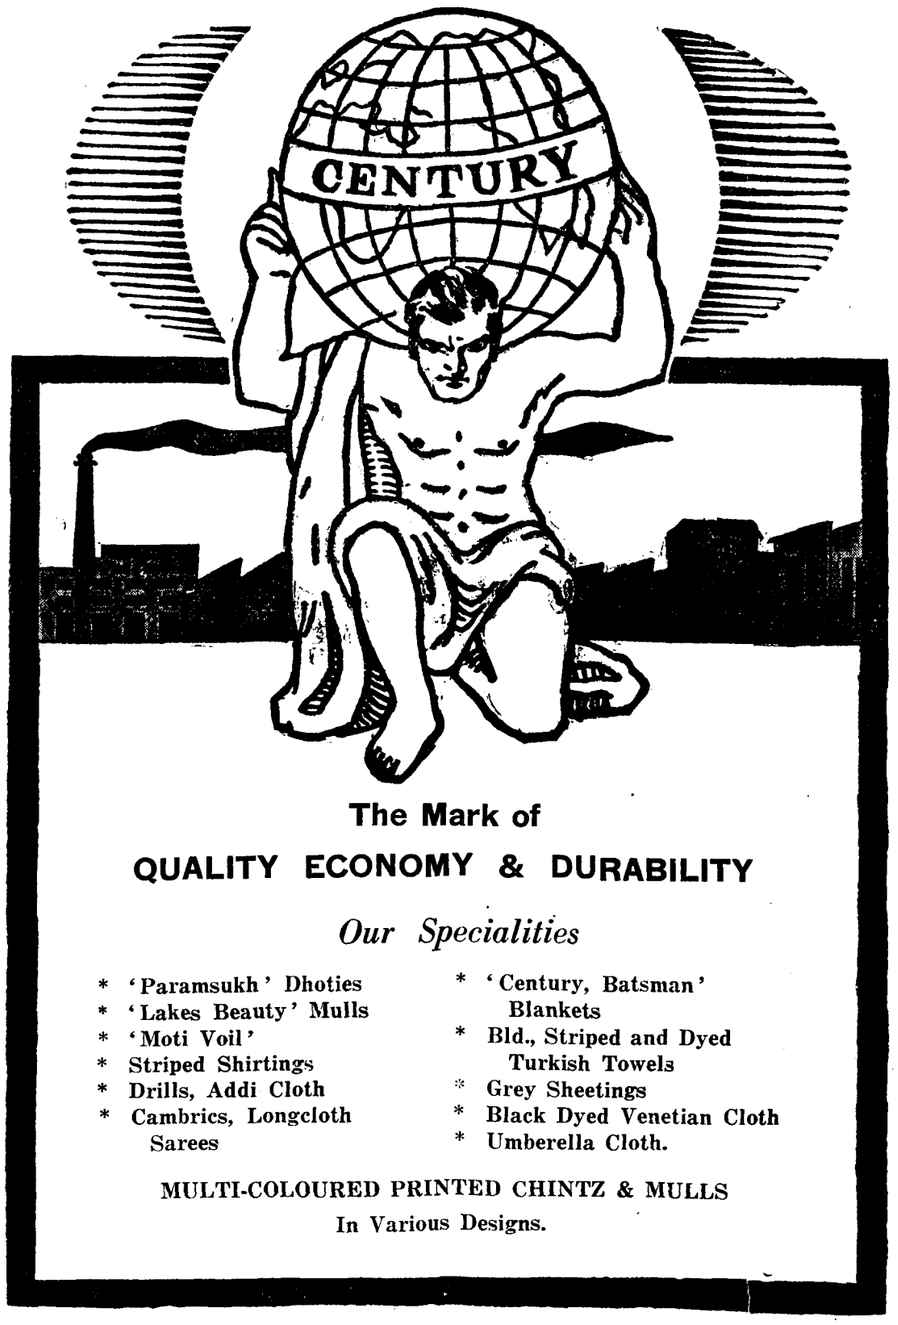
LABOUR MANAGEMENT RELATIONS

Turning to labour relations, the Chairman observed: "It is with some sorrow that I must again report to you this year that even though there has been an appreciable increase in the wage bill resulting from voluntary increments given by the Company, adjudication awards, labour legislation, etc., this has not been reciprocated by a corresponding increase in production effort on the part of labour.

"So far as the management of your Company is concerned, we believe that in the human will to work lies the greatest single source of productivity. We accept also that it is an inescapable function of management to ensure that our work people are given such material benefits as lie within the earning capacity of the Company. Further that they are provided with security and the opportunity to advance; and are treated as useful and essential members of society, whose day-to-day work is conducted in an atmosphere of personal dignity. It is to the attainment of these ends that we have dedicated our labour policies. And it is towards their achievement that we shall continue to strive.

"The attitude, however, of labour leadership, as I see it, is still most discouraging. It continues to emphasise increasingly the privileges which are due to labour, and to make on its behalf exorbitant and impossible demands. Little effort is made to enunciate the responsibilities that are labour's in the promotion of industrial progress, which alone can create the wealth required to provide a betterment in the standard of living. Government policy also takes the form of producing a bewildering succession of labour legislation without proper consideration of the impact which this must have on the industrial structure. The attitude is still abroad in Government that they must protect labour against the wiles of unscrupulous employers. These approaches to this essentially human problem on the part of Government and Trades Union leadership frustrate all attempts at increasing efficiency and the per capita output. Ultimately this will retard economic progress, and imperil the competitive position of Indian products in world markets.

"The crying need of the hour is for an immediate cessation of the studiously fostered propaganda by labour leadership that Indian capital is based on the exploitation of its work people. This attitude should be substituted by an approach which advocates joint endeavour by honourable men, imbued with a determination to make the country industrially prosperous, and in doing so to provide material well-being and social welfare."



BONUS SHARES

The Chairman then announced that sanction of the Central Government to the issue of fully-paid bonus shares in the ratio of one such share for every five shares held had now been obtained, and steps were being taken to call an Extraordinary General Meeting of the Shareholders for this purpose.

BONUS TO STAFF

The Chairman then stated that the Board had recommended this year the payment of a bonus equivalent to three months' basic earnings to the employees at the Head Office, the Works, and other places, and concluded by referring to the Company's appreciation of the loyalty and efficiency of the staff and operatives.

The report and the audited statement of accounts for the year ended 31st July, 1953, were then adopted.

NOTE: The index numbers in these tables are derived from official or semi-official publications, and wherever possible are shown on the base, 1948=100. Where per capita figures are not shown in these publications, mid-year population figures have been used to compute per capita incomes. The methods used for measuring national income in constant prices differ widely; it is therefore only with some reservations that the series shown in this table may be used for comparison between countries of inter-temporal changes in real income.

ECONOMIC DEVELOPMENT OF MAINLAND CHINA, 1949-53

TABLE I

Volume of traffic carried by state owned Rail, Road and Water Transport in 1952

	Million t/km	Percentage increase over 1951	Million Tons	Percentage increase over 1951
Rail Transport ..	59,461	15.4	131.0	18.5
Road Transport ..	255	89.5	4.0	140.4
Water Transport ..	3,961	45.6	5.3	49.6

TABLE II

AGRICULTURAL PRODUCTION, 1949-52

(Pre-1949 peak=100)

	1949	1950	1951	1952
Food Crops (a) ..	78.5	91.8	100.5	109.9
Rice (b) ..	75	97	99	110
Wheat (b) ..	72	80	89	101
Raw Cotton (c) ..	52	83	131	156

(a) The term "food" includes: rice, wheat, barley, oats, kaoliang (sorghum), millet, proso-millet, corn, soyabeans, peas, broad beans, pea nuts, sesamum and potato. For these crops, the Ministry of Agriculture placed the 1949 production at 110 million tons or 78.5 per cent of the pre-1949 peak. Taking 1949 as 100, the indices for subsequent years were 117 for 1950, 128 for 1951 and 140 for 1952. However, in the Minister of Finance's **Report on the 1953 State Budget** released on February 12, 1953, it was stated that food production for 1952 had reached the record high of 164 million tons, as compared with the Ministry of Agriculture's estimate of 154 million tons. (b) 1949 and 1950 estimates as given in an article on "Two years' significant Achievements in Agriculture" by Liang and Chin-chih, in **Popular Agriculture** (in Chinese), Peking, February, 1952 and quoted in **People's Handbook** 1952, Ta Kung Pao, Shanghai, Pp. 332-333. These estimates, like those for 1951 and 1952, are from the Central Committee on Financial and Economic Affairs as noted in **People's China** (Peking), **People's Daily** (Peking) and **Ta Kung Pao** (Shanghai). (c) World Economic Report, 1951-52, p. 52, quoting figures from the Central Committee on Financial and Economic Affairs.

TABLE III

FOOD AND COTTON PRODUCTION 1949-53

	Cotton (a) (000 tons)	Food (b) (million tons)
Pre-1949 peak	825	140 (d)
1949	430	110
1950	685	129
1951	1,080	141
1952	1,290 (c)	154

(a) The pre-1949 peak of 825,000 tons was given in **People's Daily,** Peking, October 7, 1949 from which are derived the figures for 1949-52 according to the rates of increase given in Table 2 for these years.

(b) Calculated on the basis of 1949 figure and indices given in footnote (a) under Table II. (c) The target for cotton yarn production in 1953 is 53 per cent above the pre-1949 peak which occurred in 1931. On the other hand raw cotton availability for 1953, if estimated to include the domestic production of 1,290,000 tons in 1952, would be 84 per cent above the1931 availability of raw cotton (516,000 tons from 1930 production and net imports of 185,000 tons in 1931). Making allowances for inadequate reporting of the 1930 production of raw cotton and for possible increase in 1953 consumption of raw cotton for non-mill consumption purposes such as padding etc., the raw cotton production in 1952 appears to have been more than sufficient for 1953 consumption. The reported imports from Pakistan and other countries are difficult to reconcile with these figures unless part of the 1952 raw cotton production was exported to the U.S.S.R. and Eastern Europe. (d) This peak is close to the sum of 1931-37 average of 126 million tons for the 22 provinces and 1935-38 average of 17 million tons for Manchuria.

TABLE IV

INDUSTRIAL PRODUCTION, 1950-52

(Pre-1949 peak=100)

	1950	1951	1952
Electricity	78	117	143
Coal	59	77	95

TABLE VII

INDICES OF RETAIL PRICES(a) IN FOUR CITIES, 1951 AND 1952

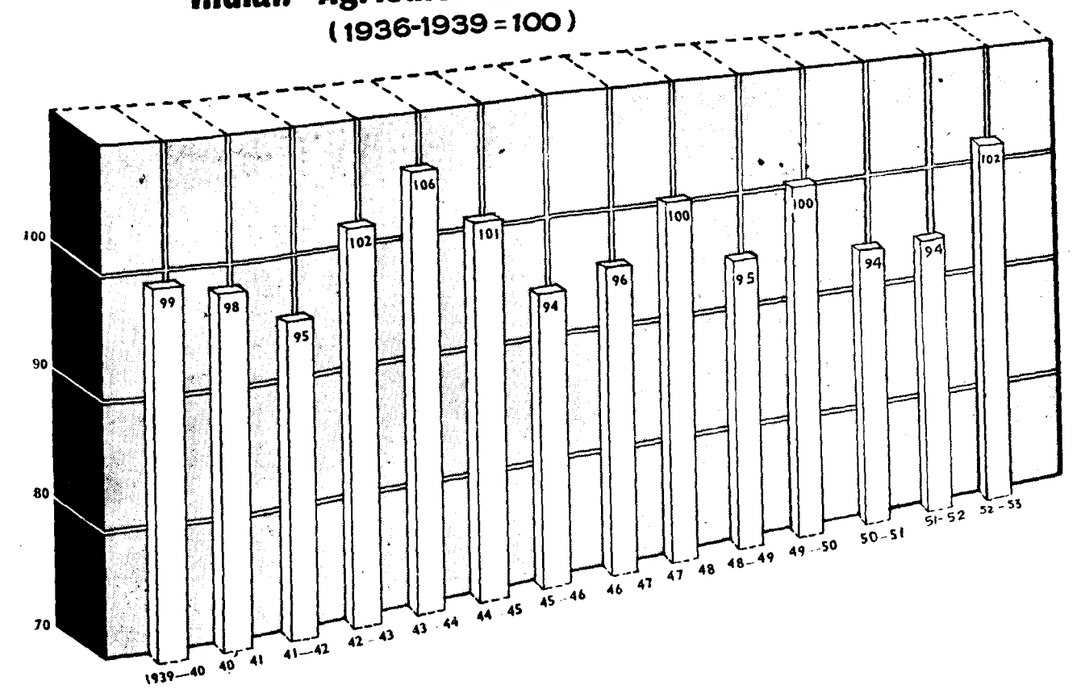
(1950=100)

Period	Shanghai	Tientsin	Peking	Wuhan	Average(b)
1951 First half	99	108	106	103	102
Second half	104	115	112	103	107
1952 First half	105	118	112	101	108
Second half(c)	104	111	113	98	107

Source: People's Daily, Ta Kung Pao.

(a) Retail prices indices refer here to price indices based upon "parity savings units" or "parity wage units." The latter cover commodities which vary in the different cities to reflect local consumption habits; for instance, in Shanghai: rice, coal briquettes, vegetable oil and cotton fabrics; in Peking: millet, wheat flour and cotton fabrics: Data for 1952, are not available for the north-eastern, western and southern provinces.

(b) Weighted average; weights as follows: Shanghai 45; Tientsin 15; Peking 15 and Wuhan 10.



(c) Preliminary.

Regd. No. D-314.

In 1896, just a year after Roentgen discovered X-ray radiation, General Electric introduced to the public the X-ray tube with automatic vacuum attachments. In 1913, when G. E. Research Scientist, Dr. W. D. Coolidge, devised the hot cathode tube, X-ray technique metamorphosed from an uncertain art into an exact science. Since then hundreds of developments have enabled General Electric to produce today various types of X-ray equipment for radiography, therapy and physical research.

A midget 60-KV Coolidge tube for dental radiography ... a 70-mev synchrotron for cancer therapy ... a 100-mev betatron or a 300-mev synchrotron for physical research ... following these typical products of General Electric research the latest is the Imperial Table rightly described as the radiologist's dream.

Over 3,000 G. E. X-ray equipments are functioning throughout India today, offering the results of G. E. research to the relief of the sick and infirm.

Fifth Republic Day

THE fifth Republic Day of the Indian Union has come and gone. There was no sign in the celebrations of this day all over the country that there was any serious break in confidence, or that there was any great need to question the broad outlines of present leadership in foreign or domestic policy. Perhaps that is as it should be. A day of rejoicing of this kind is not an occasion for a searching examination of conscience. There are three hundred and sixty four other days much more suitable for the purpose. But, now that India's fifth Republic Day has sped past, it would not be inappropriate to give expression to some more critical thoughts. The essence of India's constitution which came to us on our first Republic Day was that it was a constitution for the people. This means, if it means anything, that the issues raised by government policy should constantly be called in question by the people. Any display of confidence which implies that the people of India have given a blank cheque to the Executive is a negation of this constitution. It would be a bad day for the Indian Republic if the critical appreciation of the work of our leaders were suspended in an orgy of hero-worship or self-complacency.

Unhappily there is noticeable after four years of the working of the new constitution, and six and a half years of Independence, a notable lack of constructive criticism of the acts of the Executive. This is partly because the issues of policy, foreign or domestic, are so involved that the capacity to criticise constructively is in practice in India limited to some few thousands of people. To the millions of India, this failure to apply democratic criticism to the tasks of government is no censure. The power to vote does not carry with it the capacity to criticise, even destructively. In that respect, the masses of India must inevitably be mere onlookers so far as the making of policy is concerned. This is, for the present at least, again as it should be. Nobody has any right to demand that the masses should

formulate their own policies. They must find their spokesmen, and not only on the government side. It is in the striking failure to present an opposition of representatives, who can help constructively to change policy where it is mistaken, that Indian democracy has got off to a bad start. Those who have the capacity to criticise constructively are too often unwilling or afraid to speak out.

A superficial observer might deduce from the absence of opposition thus freely expressed either that there were physical restraints on freedom of expression or that there were in fact no serious disagreements with the policy of the Central Government. In both deductions he would be wrong. There are no significant restraints in India on the freedom of speech or written expression. The freedom of the Press is, by and large, a real and triumphantly living thing. Therefore, it is not a fact that people are prevented either by the law, or by the method of implementation of the law, from giving vent to powerful criticism of the government. Again, it is not a fact there is nothing serious to criticise. There is a deep undercurrent of discontent with things as they are. Part of this, it is true, is not connected with acts of government. But much the greater part of it is. There is no supreme veneration for the administrative capacity of the Central or State Governments amongst the people of India.

The situation is certainly anomalous. There is much that needs to be put right; there is to be found in private conversations much dissatisfaction with both foreign and domestic policy. There is in these conversations often knowledge and capacity which might well impinge on the making of government policy. But so little is expressed publicly, and so little is invited to mix with the making of policy, that the democratic process by which policy is made with a powerful ingredient from outside the government has failed obstinately to go to work. It is necessary, even before assessing the major weaknesses in present policy, that an answer should be attempted to the question why constructive thinking in opposition to the government is so weak and disorganised.

Unquestionably, the largest single cause has been the identification of policy, particularly foreign policy, with the mind of the Prime Minister. Because of the special place that Jawaharlal Nehru occupies in the affections of the people, even the few thousand non-officials who are able to supply criticism refrain from doing so; again, the executive instruments of the administration have tended more and more to accept without questioning the views that come down even on mere minutes from the Prime Minister. So far as foreign policy is concerned, the opportunities for critical judgment to affect policy have tended to be negligible. In the field of economic policy, the compulsion of events—such, for example, as the demand for employment in the latter half of 1953—has been effective in changing a government course. This shows a salutary response to pressure but, by and large, the processes of change in economic policy do not reflect the processes of argument and discussion which are essentials of democratic government.

The surprising thing in the overall result is that the unfavourable effects of this dependence on the mind of one man have not been larger. This in itself is a tribute to the Prime Minister, whose central aims in domestic policy have been imaginatively conceived. Equal tribute cannot be paid, so far as results are concerned, to foreign policy. On this Republic Day, it must be admitted that, while within the country the Prime Minister still enjoys the overwhelming support of the Indian people, our prestige abroad is lower than it has ever been since Independence, and there is cause enough for concern within. The probable conclusion of a military alliance between Pakistan and the United States implies that Indo-Pakistan and Indo-American relations are now poorer than they have ever been. And there is obviously growing indifference to Indian opinion in the counsels of the Commonwealth. There have been no corresponding gains elsewhere. The first impression of the working of our foreign policy in the last twelve months is certainly one which indicates a widespread loss of influence.

The major setback in India's foreign policy has arisen from a failure to establish Indo-Pakistan relations on a basis which would have prevented Indo-Pakistan affairs from becoming opportunities for the exercise of power-politics, both in and out of the Cold War. A settlement on Kashmir was the condition, and the necessary price, for this exclusion of foreign interference in the affairs of the sub-continent. At present, Indo-Pakistan differences stem from Kashmir; and Pakistan, in a mood of frustrated anger, has been able to exploit India's neutralism to acquire the military support of the United States. The Prime Minister contended at Kalyani that other countries have no business to interfere in the affairs of the sub-continent. In the practical world, however, there is only one way of preventing such interference. This is by assuring Pakistan by deeds that India, and not any other country, is her most trustworthy friend.

As it is, the resentment which has been raised against the United States-Pakistan military alliance in India has only made Pakistan more determined to proceed with it, and the Pakistan Prime Minister has been allowed to secure an excellent debating point that, if India objected to any dictation in Pakistan's affairs, she should not seek to impose her own advice. It is true this is only a debating point, because it is unlikely that a deterioration of Indo-Pakistan relations is in Pakistan's interest any more than it is in our own. But in the diplomatic manoeuvring which has resulted from our policy towards Pakistan and the United States, Pakistan has certainly won the first round.

To argue at this stage that the people of India should exercise no concern when there is universal alarm that military help to Pakistan may be significant is merely to add a domestic error to the error in foreign policy. Solidarity is at all times essential, but to talk about national solidarity as the only answer to the new threat to our security is surely a very misstaken approach to India's present defence problems. The country rightly demands that due action to mobilise our defence resources against every contingency should be taken. We cannot evade the hard logic of this demand. Either the military alliance of Pakistan with the United States has a significant bearing on our security or it has not. If it has a significant bearing on our security, corrective defensive action must be taken. If it has not, why has so much time and frenzied thought been devoted to stirring up public awareness of the danger of this alliance?

This is certainly a time for national solidarity. While Indian foreign policy is subjected to criticism, there should be no questioning of the personal position of the Prime Minister. Again, while economic policy should be constantly reassessed, particularly in terms of employment, there should be no questioning of the capacity of the three important figures—Sir Chintaman Deshmukh, Mr. T. T. Krishnamachari and Mr. R. A. Kidwai—round whom economic policy revolves. Errors have been made, but, in economic policy at least, they have been far outweighed by successes, particularly in respect of food and cloth. There should on this fifth Republic Day be no counsels of confusion. Here and there a change of policy is urgently needed; this does not imply any change of government. This fifth year of the Indian Republic is a time of testing; and it is not the Republic only that is being tested. Each of us has his place in this ordeal. India today expects every man to do his duty.

The Congress Session at Kalyani

ALL the usual features associated with the plenary sessions of the Indian National Congress were seen in the proceedings of the 59th Session held at Kalyani last week. The meetings of the Working Committee, the Subjects Committee and the open session revealed no significant change in the character of the Congress organisation. There has appeared to be near-unanimity on most issues of policy, judged by the response to the ten resolutions placed before the session. All these may pass for the coherence and vitality that is expected in the Congress because of its tradition and leading role in Indian politics. Actually, however, the repetition of these old formalities in the new milieu has appeared to be inappropriate. Those assembled at Kalyani and the wider audience in the country, already familiar with the details of the subjects discussed, have sought something more than an exposition of the issues discussed in Parliament and elsewhere. The Congress organisation has itself changed with the thinning out of its ranks by the secession of the Socialists and the Praja Party. The Congress, as the party in charge of the Government, has other forums to expound on and seek support for its general policies and actions. There has been no evidence that the working of the Indian National Congress has been adapted to these changed conditions.

No great importance can be attached to the various incidents relating to the Kalyani Congress. The vast crowds that thronged the precincts of Congressnagar were not unusual. There was, perhaps, some significance in that it should have been possible to create such enthusiasm in West Bengal where the prestige of the Congress is regarded as having declined steeply. The Kalyani session probably sought to repair the omission to pay sufficient attention to an area which has felt, justifiably or otherwise, greatly neglected. There was opportunity at Kalyani for the Congress to pay its homage to the great son of Bengal, Netaji Subhas Chandra Bose. But this is almost exhaustive of the special virtues of the Kalyani session. The searchlight was not turned on the other deeper issues involving the future of the Congress Party in relation to the problems coming up for attention and in regard to its function vis-a-vis other political organisations whose role will have a vital bearing on the manner in which the country will demand attention to its affairs in the future.

What the Congress has needed all along was a searching examination of the methods by which it will organise itself as a political party to implement the ideals which are enshrined in the country's Constitution and meet the challenge from rival groups and ideologies. The structural weaknesses of the Congress seem invisible on the surface only so long as the discussions relate to matters of foreign policy or such broad issues as the Plan and the reorganisation of the States. But again and again there have been dissensions and local intrigues in the Congress ranks in the States which have contributed to damage its prestige and enabled its opponents successfully to question the capacity of the Congress Party to play its role for the building up of India. A detailed examination of the party's problems at all levels could have suggested the lines on which solutions could be found otherwise than by temporarily patching up troubles whenever they arise.

Both as Prime Minister and as Congress President, Mr. Nehru has been well aware of these structural defects which greatly hamper the work of consolidation and development. There were references in his speeches to the lack of cohesion but he traced the causes to the habit of living in geographical and caste divisions. That, as all can see, was too superficial. The history of the Congress under its great leaders was an illustration of how these divisions were continuously submerged in the past in larger conceptions of unity and homogeneity. Something more plausible must be discovered to explain why that tradition has been interrupted in spite of the achievement of freedom and of the political integration that followed it.

The explanation may more correctly be traced to the quality of the leadership that the Congress Party has thrown up after Independence. At the Centre the strength of that leadership is centralised in the person of the Prime Minister, and it has been effective enough not only to ensure the selection of ministers from the regular party members but also to seek talent from outside and provide a composite and competent team. Most State Governments are, however, without this advantage and it would be extremely unwise to ignore it on the ground that the States' problems are so low in order of importance that it should not seriously matter. The problem of the future is essentially one of building up the prestige and capacity of the Governments at all levels for the internal task of nation building. Added to the want of new talent in the tasks of reform and administration has been the singularly fanatical or intolerant attitudes of State Ministers which appear to spring more from personal weaknesses than from the exigencies of the policies they have to execute. If the general Congress organisation had concerned itself more closely with the internal problems of the various States and their policies it would not have failed to draw useful morals for the future.

A great deal may depend on the possibilities of drawing in fresh talent. The Congress Governments can rise in public prestige, in the same way in which the Central Cabinet is unquestionably credited with competence, at least in economic affairs. The services can feel more assured in executing their daily tasks. The local party organisations may also be in a position gradually to release front rank leaders and the abler second rank politicians for higher tasks. As things exist, most of the leaders are permanently harnessed to their respective States on the ground that they are indispensable for the cohesion and solidarity of the party. Even at the Centre, the Defence Ministry has been lacking in exclusive attention from a sufficiently senior and experienced Minister. The Congress Party itself has suffered visibly by the want of a wholetime President at its head who could deal in greater detail with various organisational matters and rehabilitate its stature through both official and extra-official channels of activity.

In essence, therefore, the Congress has been facing a problem of leadership at the secondary and tertiary levels for which no solution seems yet in sight. This question is being generally posed as one of finding a successor to Mr. Nehru. But it is not merely one of succession, which will inevitably depend on the men available and circumstances at the time the question arises. It is ultimately a question of whether the Congress can build up a corps of leaders at all stages of the hierarchy from which the party can make its choice from time to time. The lack of cohesion has been manifested more because of the survival within its ranks of the less fit, than to any new trend of separatism; the latter has been the effect not the cause. The supreme task that faced the Congress at Kalyani, as it has faced it at all the earlier sessions in the last few years, was to probe further into this malady. That unfortunately has not been attempted; the verdict on the session will only be that it was one of the many opportunities that have been missed, the consequences of which will be felt in the future.

Low-Cost Housing

THE building industry in India has experienced a steady and lasting boom in recent years. In almost every urban area, there is now visible evidence of this fact, and the estimate of the value of new building, which an official committee placed at about Rs. 175 crores some time ago, is already, perhaps, out of date, for it is now relatively much easier to acquire materials, and the tempo of official and industrial construction has, if anything, increased since then. The housing situation has now become very much less acute in almost every city in recent months. Nevertheless, as those responsible for organising the low-cost housing exhibition have made it clear, housing policy in India still leaves much to be desired; and there are serious gaps, to which quite inadequate attention has been paid so far.

This is hardly the fault of the ministries concerned. On the other hand, the Works, Housing and Supply and the Rehabilitation Ministries, and the Ministry of Railways between them have been directly responsible for keeping much of the building boom alive. Every type of construction—Army-type huts, asbestos-cement structures, buildings using reinforced concrete now so widely in vogue, buildings in Chandigarh providing the best living two bed-room quarters for peons in India—has been promoted by the Government of India. The rehabilitation programme has also recently been extended, and about 29,000 industrial low-cost houses have already been sanctioned to date. The more recent Madras Slum Improvement (Acquisition of Land) Bill provides fresh evidence, if this is at all necessary, of the governments' anxiety to provide more adequate housing.

The lack of a housing policy, therefore, cannot well be blamed on the present governments. It is a 'damnosa hereditas' from previous regimes, and is explained by the fact that in view of the complexity and multitude of war and post-war difficulties, housing necessarily enjoyed low priority. A recent recommendation of the Industrial Finance Corporation Enquiry Committee which sought to discourage the Corporation from lending for "unproductive" purposes, like housing, illustrates, perhaps, how low this priority can occasionally be. This tradition is now being changed. But it can be changed only with difficulty.

Other difficulties in India must also be taken into account. The building society, which plays such a large part in mortgage finance in England, has yet to be organised on any scale in this country. Finance has, therefore, been difficult, in spite of the fact that individual banks of standing have been interested in housing, and, what is more significant, co-operative housing societies have been formed with loan assistance from governments. The recent growth of building activity, explained by ad hoc schemes such as subsidised industrial housing, the housing programme of the Coal Mines Labour Welfare Fund, and the building of townships by both government industrial undertakings and the rehabilitation ministries, has prevented more attention being paid to this question of finance for private building than the subject deserves. The latter-day increase in building on vacant plots (which has been aided by threats of resumption of the unused sites and by the general trend of the Government of India's policy) may also be responsible in part for this difficulty being ignored.

If finance has continued to be a bottleneck, the building trade itself has not yet been organised. One illustration of the prevailing state of affairs is the fact that the Central Government's training classes in building have admittedly not been too popular. Building contractors have recently been very active, no doubt. But there is still obviously room for the amalgamation of firms and for reductions in the rate of profit. Standardisation, in so far as that is compatible with the diversification which is necessary in such a vast country as India, is also still to be examined; and there is need for promoting elsewhere in the country co-operative schemes as in Madras, or private housing colonies such as those which have been organised by private enterprise in Delhi. How soon private builders can grasp and retain the initiative in promoting the construction of houses is not by any means clear.

The ultimate aim is not to recommend particular designs or building materials. In this sense, therefore, the housing exhibition is educative rather than utilitarian. The ultimate aim is to bring down housing costs in general, and this cannot merely be a matter of technology. Fortunately, for the future of housing in this country, the Government of India seems to be fully alive to this wider implication of the present attempts to educate the public regarding the importance of cheap and efficient housing.

Government research stations at Roorkee, Dehra Dun, and Karnal are already engaged in research and the spread of useful knowledge. A simple formula for water-proofing of mud-walls in rural houses, through the mixture of bitumen, illustrates the possibilities of research, but official policy is rapidly becoming more and more positive. Slum clearance is claiming attention; and though the progress here cannot be rapid, the Madras Bill at least indicates that the difficulties might have been exaggerated.

It has been suggested in addition that about twenty planned industrial townships all over the country should be built up, in order to reduce the chances of congested ribbon development in the future. The mere holding of land, in the hope of realising unearned increments, is to be penalised more and more. Contractors, it has been suggested, should be encouraged to amalgamate, so that they may undertake large-scale operations and cheapen their services. Building bye-laws in the municipal areas are out of date. They will everywhere need to be revised, so that they may be brought up-to-date and in conformity with the reduced standards of the present day.

Building materials can be made much cheaper than they are today. Mechanised large-scale units can reduce the costs of brick-making; and the grant of facilities, like the movement of coal, for brick-burning, and standardisation and reduction of costs in respect of timber supplied by the forest departments, together with the review of freight rates on building materials and increased transport in general, will also go a long way towards reducing the ultimate cost of materials. It may be too much to hope that all these suggestions will be accepted and implemented at once. Official policy recognises, however, the special case of building to some extent. Initial depreciation allowances have now been in force for about eight years—in order that an incentive may be provided for the building industry. All of the suggestions may, therefore, be destined to become more and more popular and important.

It is only when housing costs have been further reduced as a result of a rationalised policy on these lines, while personal incomes and standards of living have been improved at the same time, that the building industry can really come into its own. The responsibility for housing has been acquired by the Government of India only recently. Towards understanding what exactly this responsibility means, the exhibition, the seminar, and the conference of the International Federation for Housing and Town-planning can make an important contribution.

THE WEEK'S NOTES

EGYPT AND THE WEST

While Anglo-Egyptian tension has increased because of the murder of three British soldiers in two days, General Neguib has flatly stated that he has definitely made his last concession and that the British authorities must either accept it or leave it. He is also reported to have revealed for the first time his desire to enter into a military alliance with Britain and America but only on equal terms. These statements are obviously designed to conciliate the U.S.A. as against Britain, since with such avowed Egyptian intentions of a pro-Western policy, Britain cannot justify to her allies her insistence in the matter of uniforms of the British technicians who stay in the Canal Zone. General Neguib has been quite categorical in declaring that "if they wear uniforms, they still represent an army of occupation." In any discussions of the Anglo-Egyptian tension, therefore, this point about uniforms is likely to appear too trivial upon which to risk disagreement, when the larger issue has ceased to be a matter for speculation.

General Neguib's declarations in favour of Britain and the U.S.A. have been more forthright than usual, apparently because there is a tendency in British political circles to believe that the rest of the Arab League is more friendly to the West than Egypt but is compelled to support Egyptian xenophobia so long as a legitimate grievance over the Suez exists and Israel continues to create problems in the Jordan. General Neguib has declared his readiness to recognise a threat to Turkey or Iran as a threat to Egypt sufficient to justify British and American troops re-entering the Suez. But he has resisted any attempt to get a blank cheque for permanent British occupation on any of these grounds. Thus the Suez problem has been defined in a manner which thrusts responsibility for continuing tension on British prevarication. The mounting British anger at the increasing number of incidents cannot, in this situation, provoke stern retaliatory measures of the kind demanded by the Tory rebel group. It can only force the Government to yield to an early solution which protects British troops and satisfies Britain's allies. Mr. Aneurin Bevan has added his testimony to the fact that getting rid of the British is the one slogan which unites all sections of Egyptian opinion.

SPANISH ADVENTURE ON TWO FRONTS

Spain has chosen to create trouble for herself and others on two fronts almost at the same time. There has been a recurrence of the attack against the British occupation of Gibralter, which died down after two emphatic declarations of General Franco over two years ago. Simultaneously, tension has now developed in Morocco between France and Spain over the recognition of the French-sponsored Sultan by the Moors of Spanish Morocco. The latter looks more explosive than the former, though in both cases the strengthening of relations between Spain and the United States through military aid must be reviewed as an opportunity for exerting American good offices to counsel moderation. These recent developments in Spain have been viewed as an attempt of Franco's military dictatorship to make Spain appear as adventurous as possible, within the scope available to her. Calling it "adventure without tears", the "Daily Telegraph" has characterised the agitation for Gibralter as "a synthetic substitute for aggression" to provide occupation to hotheads who might otherwise be discontented. The paper adds: "Franco's real intentions may be gauged from the fact that he did not attack Gibralter during the war when he had powerful allies and we were 'in extremis'. He is about as likely to act now as to attack Portugal or attempt a reconquest of Spanish America."

In Spanish Morocco, however, the position is different because the local population, once stirred into a state of resentment, may not be capable of restraint. Spanish officers have been accused by the French Government of having fomented the demonstrations in Tetuan, though the French are apt to overlook the long-term reactions of their own action in deposing the Sultan, Ben Youssef, last August. Even if France had informed Spain of her actions, there will be substance in the Spanish charge that they were unilateral so long as those actions did not have the prior concurrence of, or the subsequent recognition by, Spain. Spain has always been on good terms with the Arab countries and has now stated that she would offer self-government to Spanish Morocco. The Arab League, now meeting in Cairo, has, therefore, supported Spain against France in the dispute over the succession to the Sultanate. Any Spanish gesture of self-government in Morocco would also stand in sharp contrast to the French policy of repression and high-handed deposition of the Sultan. The Moors have already demanded that the Caliph of Tetuan be given full sovereignty, independently of the new Sultan.

MR. LYTTELTON AT LAGOS

When a Conference was held in London last August to discuss the future constitution for Nigeria, many of the controversial details of the scheme were left untouched. There was, therefore, an impression of unanimity, because there was almost complete agreement on the desirability of a federal constitution for Nigeria. Considering the general aversion to a federal solution in the rest of Africa, this in itself seemed substantial progress in constitutional reform. Other questions which could have affected this achievement were left over for future discussion. The Conference was resumed at Lagos on January 18, marking the second stage, and Mr. Lyttelton has been taking part in these discussions. The allocation of Nigeria's revenue under a federal system and the future of the Cameroons are regarded as the two major problems facing the Conference. The test of the exercise of any federal type of authority will lie in the ability to collect taxes centrally. The Fiscal Commissioner's report on the financial provisions suggests federal collection of revenue (except personal taxes) and allocation to the regions. A total Federal revenue of £25 million is envisaged—£9 million in the North, £5.5 million in the East and £10.5 million in the West. The Eastern region is expected to show a deficit, which is to be met by grants in the first two years during which a balance will be attempted. The regionalisation of Nigeria's Marketing Boards—with their control over 90 per cent of exports and their reserves of £75 million—is a second financial problem which will be equally complex.

As regards the Southern Cameroons, Mr. Lyttelton had earlier conceded the claim for separate regional status if the elections disclosed popular support for the claim and if the region could be regarded as financially viable. While the people have been overwhelmingly in favour of separate status, the Fiscal Commissioner has reported that the Southern Cameroons would not survive on its present revenue. Nigeria is not willing to subsidise a separate Cameroons and hence a very difficult situation has presented itself. It may, however,

prove less intractable than the agitation over Lagos. The Action Group has repudiated the British award, given by common consent, that Lagos should become federal territory. This is an issue which may split the Conference evenly. There is also the possibility of the revival of the long-standing fears of the North against the political alliances between the Eastern and Western regions. But in any case, no federation can be imposed on Nigeria without reconciling these differences and providing safeguards against the various fears.

REVISION OF U.S. FARM POLICY

President Eisenhower's new farm policy has to be set against the background of Republican politics before the Presidential elections of 1952. The farm price-supports of the Democratic Administration were generally criticised by many Republicans as the relics of the New Deal era, but there was also a restraining influence among the Republicans who recognised the importance of the farm vote. The political importance of the farm bloc has been responsible for opinion outside the U.S.A. discounting the possibilities of farm price-supports ever being changed substantially to reduce world food prices. It was due to this feeling that the International Wheat Agreement was also renewed last year with a higher maximum price for wheat, even though there were indications of increasing wheat and corn surpluses. The position has now changed substantially with the accumulation of stocks of farm products with the U.S. Commodity Credit Corporation, very nearly up to the maximum borrowing authority of the Corporation of $6,750 million. The prospective stocks of wheat are 840 million bushels and of cotton 9.6 million bales. Though there will be a reduction in the current year of nearly 25 million acres in the area sown to wheat, corn and cotton, there is no danger of a substantial reduction of supplies, because of the possibilities of securing higher yields on the smaller area and the likelihood of diversion of the acreage to other crops like soyabeans, sugar and vegetables which also enjoy price-supports.

President Eisenhower's Administration has been thus compelled to face the problem of making price-supports more rational to suit the changing market conditions. The transition, however, is to be made gradual in order to avoid the effects of abrupt change in farm incomes. Modernized parity is to become effective for all commodities on January 1, 1956, and the changeover will be achieved in steps of five percentage points. Price support is thus accepted as a long-term programme and lest there should be any doubt about Republican policy, the President's message has endorsed the Agriculture Acts of the Democratic Administration (of 1948 and 1949) as "soundly conceived" and having received bipartisanship support. The Commodity Credit Corporation's borrowing authority will be actually increased to $8,500 million, which means that its stocks will immediately be allowed to increase.

There are two chief features of the new farm policy which the world outside will note with approval. The first is the declaration that however large the surpluses may be, food once produced must not be destroyed. Secondly, the excessive stocks will be removed from commercial channels for constructive purposes; Congress has now been asked to order the freezing of stocks of $2,500 million. (It is proposed to substitute food and fibre surpluses in foreign economic assistance and disaster relief to foreign countries). The Randall Commission has, in its report published this week, concurred in the view that farm price-supports should be discouraged and has also added that the International Wheat Agreement should be ended. Thus a policy which was hitherto regarded as politically impracticable has been attempted. The clue to its present feasibility perhaps lies in the new concessions promised to the 3.5 million small farmers, who hitherto derived very little benefit from price-supports because they accounted only for 15 per cent of the total agricultural output. Their number is larger and will be sufficient counter-weight against unpopularity among the bigger farmers.

BRITISH ADVANCE IN ATOMIC ENERGY

Great importance is attached to a report, recently published, on "Britain's Atomic Factories" which contains an account of the progress in British production of atomic energy. The secrecy about atomic plants will naturally restrict the amount of information that can be published about post-war progress in atomic factories which are owned and managed by the State. The report suggests that a reactor system, producing by atomic energy enough electricity to save annually 20 million tons of coal might be built in 20 years. But the progress in the techniques of harnessing atomic energy may well be faster than this in the next two decades. In Britain, where coal resources have been depleted at a rapid rate, the incentive to seek alternative sources of energy and power may be stronger to encourage a faster rate of increase in the production of atomic energy. The desire to economise manpower is not less urgent and the feeling is that Britain is on the eve of another revolutionary change which may have as much significance as the Industrial Revolution.

A Bill on atomic energy sponsored by the Government is expected to take precedence in the legislative programme before the next session of Parliament. It is expected to take priority even over the measure to legalise commercial television which has been hotly discussed in Britain in the last few months. Under the Atomic Energy Bill, the Ministry of Supply is to hand over responsibility for the governmental supervision of research and development of atomic energy to the Lord President of the Council, while a new semi-independent Corporation takes over the day-to-day responsibility. Sir Edwin Plowden is expected to become the Chairman of the Corporation when set up; he has already established the nucleus of a department within the Lord President's office, to work on the nature of the Government's relations with the new Corporation. A beginning will thus be made in "a new industry, which, as it grows, will increasingly revolutionise the conditions of human life".

WORLDGRAM

IN ADE

Soviet Trade Bid with U.S.A.: The U.S. Commerce Department recently received two applications for licences to export large quantities of surplus butter and cottonseed oil to the Soviet Union. It is reported that 150 million pounds of butter and 150 million pounds of cottonseed oil at an estimated value of $100 to $150 million are involved.

FINANCE

Record Deficit Trade Balance for Japan in 1953: Japan's excess of imports over exports witnessed a post-war record in 1953 with the figure reaching $1,135,892,000, it was announced by the Finance Minister of Japan recently. Exports for the year amounted to $1,273,611,000 as against imports of $2,409,503,000. Thus, the excess of imports over exports almost equalled the total export amount for the year. As compared with the previous year (1952) exports increased by 0.1 per cent and imports by 18.8 per cent. In volume, exports increased by 5 per cent and imports by 30 per cent due to a decline in prices.

* * * * * * *

U.N. Eleventh International Bank Mission: A Mission from the International Bank for Rsconstruction and Development left Washington on January 16 for the Federation of Malaya and the Crown Colony of Singapore where they will make a general survey of economic conditions. The surveys are being made at the request of the Government of the Federation, Singapore and the U.K. This is the eleventh general economic survey mission to be organised by the Bank, others having been completed in British Guiana, Ceylon, Colombia, Cuba, Guatemala, Iraq, Jamaica, Nigeria, Surinam and Turkey.

* * * * * * *

Union Government Sanctions Rs. 25 Lakhs for Taccavi Loans for Rajasthan Government: The Rajasthan Government have secured a sum of Rs. 25 lakhs from the Government of India for the grant of taccavi loans to the cultivators for construction of new wells and repairs to old ones. The District Collectors have, under this scheme, been empowered to sanction loans up to Rs. 1,000 in each case. The cultivators are advised to avail of the loan facilities from the Collector concerned as the sum is only available up to March, 1954.

* * * * * * *

Western Economic Aid to Yugoslavia: Tripartite (Anglo-French-American) economic aid to Yugoslavia for the period July 1, 1953 to June 30, 1954 was announced recently. The British share amounts to £3,000,000. The money is being spent mainly on materials for agricultural improvement. In 1951 following Yugoslavia's withdrawal from the Cominform the U.K., French and U.S. Governments started granting Yugoslavia free direct aid for the purchase of goods essential for economic development. British credits to Yugoslavia in the year 1951 to 1952 totalled just under £10,000,000 and in the following year £4,500,000. The tripartite aid is designed to put Yugoslavia economically on her feet, and not as a permanent arrangement. It is hoped that the present allocation of direct aid would be the last of the series.

POPULATION

Fast-Growing Population in Japan: Japan's fast-growing population exceeded 87 million as on October 1, 1953, according to a survey conducted by the Statistics Bureau of the Prime Minister's Office. The survey gave the exact figure on that date as 87,030,000 indicating an increase of 3,830,000 over the population recorded by the national census of 1950. During the last year alone the increase was about 1,180,000. The survey also showed that since the 1950 census, the density of population had risen from 223 persons per square kilometre to 236. The ratio of population increase, however, which was 5 to 3 per cent immediately after the war in decreasing by 1,000,000, has now come to normal at 1.4 per cent as the total annual increase. The survey also showed that during the period from October 30, 1950 to September 1953, a total of 200,000 persons migrated to Japan from abroad (mostly former prisoners of war) while 150,000 left Japan for other lands.

INDUSTRY

Two U.S. Motor Companies Combine: The directors of Nash-Kelvinator Corporation and the Hudson Motor Car Company recently approved the consolidation of the two companies into the American Motor Corporation, to form the fourth largest company in the automobile industry. Combined assets of the two companies total $355 million. As on September 30, 1953, they had a working capital in excess of $100 million, and combined sales for the year ended September 30, 1953 were in excess of $680 million. Total production in the same period was 244,507 cars. The new Corporation will have an authorised capitalization of 10 million shares of $5 par value stock. The two companies employ a total of 40,000 persons.

* * * * * * *

West German Steel Outlook Disturbed: According to West German statistics, Polish steel production exceeded 4 million tons and Czechoslovak production 4.2 million tons in 1953. The combined production of 8.2 million tons in 1953 is being regarded as highly disturbing due to unfavourable trends in world markets. Already Czechoslovak steel pipes and plates are offering competition to German products. The expansion of the State-owned Polish and Czeck plant capacities are alarming West German steel leaders due to their competitive possibilities.

* * * * * * *

Britain's Steel Record in 1953: The British Iron and Steel Federation announced that in 1953, output of steel at 17,609,000 long tons was 1.5 million tons higher than in 1952. Output of pig-iron was 11,175,000 tons compared to 10,728,000 tons in 1952. Steel-making capacity will be increased and new plants added during 1954.

* * * * * * *

U.S. Mineral Production in 1953: According to the U.S. Bureau of Mines, mineral production in 1953 was valued at $14,346 million—seven per cent higher than the 1952 production value. Production of iron ore was 20 per cent higher on shipments of 117.00 million long tons against 97.24 million tons in 1952. The greatest increase was in fuels. Volume and value of petroleum and natural gas far outweighed the continued decline in coal. Production of oven coke and coal chemicals, other non-metallic minerals and metals rose appreciably.

* * * * * * *

Supersonic Washing Machine in Production Soon: An electric sonic washing machine is about to go into serial production at the Elekthermax factory in Papa, Hungary, according to an announcement in the Hungarian Press. Invention of this machine was announced only last August. Clothing is washed as in other machines in a tub of detergent, but instead of using the conventional rotary apparatus to do so the machine employs high speed sound vibrations to "shake" the dirt out. It is stated to be more efficient and kinder to clothes than the ordinary electric washer. It does a wash in 15 minutes and it is claimed that it uses no more power than a 40 watt light.

Sheep Farming in Rajasthan: The total sheep population of the State of Rajasthan was 52 lakhs which was about one-fifth of the total Indian sheep population producing about 3 lakh maunds of wool, approximately a third of the total Indian produce, and as such organising such exhibition in areas like Shekhawati with a view to training the sheep-breeders in the latest methods of scientific working was of great importance. Rajasthan apart from exporting over 2 lakh maunds of wool was exporting 4 lakh sheep every year. This industry alone is employing about one million persons.

* * * * * * *

Coal Industry to be Public Utility Service: The Government of India have declared the coal industry so far as it is concerned with the production and supply of coal and coke to be a public utility service for the purpose of the Industrial Disputes Act 1947 (XIV of 1947) for a further period of six months from January 14, 1954.

MISCELLANEOUS

U.N.I.C.E.F. Buys U.S. Surplus Milk: The U.N. Children's Fund (U.N.I.C.E.F.) has purchased—at the nominal price of cent a pound (approximately As. 1½ per seer) some 30,000,000 pounds of U.S. Government surplus dried milk. In announcing the sale, the U.S. Department of Agriculture said the milk was purchased originally from American farms for 16 cents a pound (approximately Rs. 1-8 per seer) as part of the Government's price support programme. The milk will be used by U.N.I.C.E.F. to nourish children of member countries throughout the world.

* * * * * * *

N.A.T.O. to Develop Communications: The North Atlantic Alliance is expected to spend $100 million during 1954 to develop communications in Europe. The sum represents mostly allocations from previous years because of a two-to-three year lag between approval of projects by the North Atlantic Council and their realisation. It is expected to link the Adriatic Sea from the heel of Italy to Greece, and a similar link across the Aegean Sea from Greece to Turkey, thus allowing a telephone link extending from Northern Norway to East Turkey.

* * * * * * *

New Basis of Relations Between Britain and Siam: The relations between Britain and Siam have been placed on a new basis from January 14. Hitherto they were governed by the U.K.-Siam Agreement of January 1, 1946, for the termination of the state of war. In the changed circumstances of 1954, a new agreement providing: 1. That the relations of peace and friendship established between the two countries by the 1946 Agreement shall be maintained indefinitely; 2. That such other provisions of the 1946 Agreement as are still applicable shall remain in force (these include provisions relating to the upkeep of war graves); and 3. That the two Governments shall proceed to negotiate a consular convention.

* * * * * * *

I.L.O. Conference of Salaried Workers: The third session of the Advisory Committee on salaried employees and professional workers of the I.L.O. will open at Geneva on March 29, 1954, and will last until April 1954. The agenda includes:

(1) General Report, dealing with: (a) action taken in the various committees in the light of the conclusions of the previous sessions of the committees; (b) steps taken by the office to follow up the studies and enquiries proposed by the committee; (c) recent events and developments affecting salaried employees professional workers.

(2) Unemployment among salaried employees salaried professional workers.

(3) Conditions of employment of teaching staff.

India as a member of the Committee has to nom nate a tripartite delegation which may consist of tw Government representatives of employers' organisation and two representatives of workers' organisations hav ing a substantial number of members amongst salarie and professional workers.

* * * * * * *

Delhi Public Library Offers Training Facilities: The Delhi Public Library, a U.N.E.S.C.O.-Government of India public library pilot project, in operation for the last two years, now offers training facilities in public library service to Indian and foreign librarians. Advice on library matters like Urban Library Service and designing and operation of the Mobile Library Service, etc., are also to be given.

* * * * * * *

Progress of Scottish Hydro-Electric Scheme: Britain's greatest hydro-electric development—in the valley of the River Conon in Ross-shire—will be a showpiece of British craftsmanship and engineering ability when completed. Already under way, it has attracted visitors from various parts of the world. It is estimated that its output will be 442 million units of electricity per year. Building cost to the North of Scotland Hydro-Electric Board will be £16 million. Engineers from all over the world are visiting the Scottish Highlands to survey the huge scheme which will incorporate six generating stations, six main tunnels an six dams stretching throughout the Conon valley. Th project will bring prosperity to the Highlands—bett farming, more employment, improved household amen ties, and new beauty spots.

* * * * * * *

Appleby's Return: The arrival of Dean Paul H. Appleby of Syracuse University, for a second visit in India, was announced recently by Dr. Douglas Ensminger, Representative in India for the Ford Foundation. Dean Appleby completed a year ago a general survey of governmental administration here, his conclusions having been incorporated in a report made public by the Government of India. He has returned now at the request of Government. He will make no additional study and will prepare no new report, however. His visit is for the purpose of facilitating communication of matters earlier presented. To this end, he will have extensive conversations with Ministers and key officials here and in a number of States.

* * * * * * *

Indian Shipping Line to Japan: The first regular shipping between India and Japan by an Indian line will be inaugurated this month when the 8,000-ton "State of Andhra" arrives in Yokohama, it is learnt. The service is being started by the Eastern Shipping Corporation of Bombay. The "State of Andhra" is scheduled to arrive in Yokohama on January 21. It is carrying 3,000 tons of scrap iron in addition to general cargo from India, Singapore and Hong Kong. The "State of Andhra", it is stated, will be followed by two other newly-built vessels in February and March. The Eastern Shipping Corporation has joined the Hong Kong-Japan Freight Conference, the Japan-Straits Freight Conference and the Bay of Bengal Freight Conference.

NEWS IN BRIEF

INDIAN

Land collections under the Bhoodan Campaign total over 2 million acres. Up to January 5, 1954, 2,407,023 acres had been collected. Bihar tops the list with 1,323,796 acres, Uttar Pradesh with 500,891 acres and Rajasthan with 234,376 acres come next. Out of this 40,545 acres have been distributed in six States to 7,559 families.

A Window On The World

TOWNSMEN AMONG THE VILLAGERS

By

ODYSSEUS

ALL HONOUR TO THE MIDDLE CLASSES—the politicians, civil servants, social workers, economists, school teachers, and others—who, concerned over the obvious ills of the rural masses, are trying to promote rural uplift. When I was in Delhi this last hot weather, my delightful and charming friend, Dr. Sushila Nayyar, Health Minister of Delhi State, took me round the rural improvement work in the State. It struck me as admirably practical: I saw tanks being widened and deepened, drains being dug to lead flood waters away, roads being built, and several other useful undertakings.

All this is excellent and, in Delhi at any rate, I believe that a stride forward has been taken, but it is, nevertheless, important that the middle classes who are responsible for these uplift plans should remember with humility that they are city dwellers, chairborne, office-bound, and, too often, book-inspired. If their well-intended efforts are to bear the intended fruit (as opposed to unexpected fruit), our middle class reformers need constantly to check their paper plans by direct observation of village ways and customs.

That is why I have summarised at length in two previous articles a splendid lecture entitled "The Government and the Village" recently given at Mysore University by Mr. Allen Beales, an American anthropologist. For Mr. Beales' lecture was the result of an on-the-spot investigation. My first article, "A Rural Indian Idyll", published on January 15, revealed the tragic exploitation inflicted on an isolated South Indian forest village, not in some distant bad old colonial past, but today, at this moment as you read, in free, independent India. And don't forget that you no longer live under an imperialist regime that you cannot influence, but that, as a citizen and elector, you cannot divest yourself of a share of the responsibility for these injustices.

I trust that some public spirited members of Parliament will verify the allegations in my article by some searching questions to the Federal and State Ministers of Agriculture in charge of the forests in their respective areas. If Mr. Beales' facts are incorrect, they should be refuted. If they are correct, they are a national disgrace.

Last week's article, "In An Indian Village Today", revealed the hardships imposed on a village near a big South Indian town by an administration carried on from physically and spiritually remote centres. Today I conclude with Mr. Beales' reflections on the future.

VILLAGERS RIPE FOR COMMUNISM

Mr. Beales reports that the people of his representative village of Hattarahalli are profoundly dissatisfied with the existing regime. Their old culture and social organisation is disappearing, but nothing satisfactory is taking its place. Standing on the ruins of their former culture and faced with an overwhelming problem of overpopulation, the the villagers of Hattarahalli feel frustrated. Some think that a Communist regime could be no worse than the existing one, that it might be better, and that it is therefore worth a try. Some hope that the Congress Party will overcome its inertia (sic) and its corruption (sic), and come to their aid. The brutal fact is that every villager wants a change of some kind—now, and not a hundred years from now.

One of the basic aims of the Five-Year Plan is to increase the production of foodstuffs. If successful, this may well mean that the price of food would fall and that the farmer would have plenty of food but no money. That was all right in 1900, but now the people of Hattarahalli want cycles and wrist watches; they want to see a film once a month; and they want houses like those that they see in the big town nearbly. Why should pleasant bungalows be for the rich" and not for them? If the price of food continues to decline as it was at the time of Mr. Beales' investigation, this will produce grave discontent in rural areas. Here again, the effects of government programmes may not always be what the planners, who sit in remote air-conditioned offices, expect.

Agricultural reforms aim at greater working efficiency, especially by mechanisation. But greater efficiency and mechanisation in any industry mean that more is produced with less effort, that is by fewer people. What our office-bound planners sometimes overlook is that this raises a new problem which demands simultaneous solution—the creation of numbers of unemployed. Even a simple device like the iron plough reduces the labour required for ploughing by one-half. If an efficient weed killer, like 2-4-D, were introduced into Indian agriculture, it would, besides improving output, cause unemployment. A by-product of increasing agricultural production may thus be the unemployment of millions. Mr. Beales reminds us that the agricultural reforms programme of President Roosevelt's New Deal, and the simultaneous industrialisation of agriculture, resulted in one of the greatest migrations of human history, when millions of unemployed farm labourers left their homes in search of a livelihood elsewhere.

Because they live in the midst of these problems of technological unemployment, and of overpopulation, the people of Hattarahalli are well aware that there are too many people employed in agriculture. Many of them are trying to leave their village to find employment in industry. Most of the educated villagers, that is more than half the male population, understand the importance of education and see in it the door to urban employment. At present, however, certain reforms are contemplated in the educational system of the State which reduce the villagers' chance of finding employment in jobs other than agriculture. This year, the nearby High School has changed its medium of instruction from English to Kannada. This, Mr. Beales reports, is greatly resented by the villagers as they feel that it will now become more difficult than ever for them to get jobs in the State capital. Some of the wealthier villagers now send their sons to the big town where there are private schools that teach in English.

RURAL EDUCATION PLANS' FALLACIES

Nor, in village eyes, is this the worst threatened by the State's new educational program. The government plans to reduce drastically the amount of academic instruction made available to the villagers and to increase the amount of training given in agriculture and

related cottage industries. Thus, although the villagers consider it essential that one or two sons from every family should seek employment in industry, the education provided by the State directly opposes the only solution to their hardships that the villagers see.

The new educational system will, of course, benefit those who make agriculture their career, but the other 25 to 50 per cent of the youth of Hattarahalli, those for whom there are no jobs inside the village, will suffer terribly from an education that denies them any opportunity of competing with those educated in urban areas.

Mr. Beales considers it impossible at this stage to foresee what the effect of the government's plans will be upon such a village as Hattarahalli, but those cited above are some of the unforeseen results that Mr. Beales fears may emerge.

When planning for villages is discussed and it is asked whether any given plan will be accepted by the villagers or not, a number of fresh problems arise. Although the inhabitants of such villages as Hattarahalli are willing to respond to well-conceived planning programmes and village conservatism is greatly exaggerated, there are still a number of obstacles which prevent full utilisation by the villagers of existing plans. Corruption is one. For example, in getting loans from the government for building wells or improving the land, the villagers themselves are allowed little or no say in determining who should and who should not get loans. Decisions are taken by officials for reasons that bring intrinsically good plans into hatred and ridicule. Loans are intended for the poor, but relative poverty is often judged by the ability to give the largest bribe! Further, since all government officials with whom the villager deals are appointed civil servants, it is difficult for him to secure the removal of corrupt officials. Mr. Beales considers that there can be no end to corruption until the villagers are given effective representation in their own local government. The administrative and judicial branches of government must be brought down to the village level and the officials must become dependent on the villagers. European and American villages appoint their own local officials who are not responsible to some distant authority but to the village.

A man engaged in the administration of village development work told Mr. Beales that the greatest problem that he encountered was that of disunity in the village. Anyone who has lived in an Indian village is impressed by the number of faction fights, offences, and murders that take place. This sort of behaviour is, says Mr. Beales, characteristic everywhere in the world of people who are treated as second class citizens. Rapid social changes, feelings of inferiority, and absence of local self-government, inevitably produce social disorganisation. As long as the villagers are ruled by outsiders appointed by a distant government over whom the villagers have no control, social disorganisation, with its faction fights, general irresponsibility, and lack of neighbourly co-operation, will continue to frustrate development plans.

Mr. Beales concludes with the observation that there are two human groups involved in development planning: on the one side are the government officials who must ultimately administer the programme. If these officials are corrupt, the programme cannot be successful. On the other side are the innocent victims of development plans, the villagers. As plans are conceived and applied without consideration of their possible effects upon the human beings in the village, they may have tragic consequences which greatly exceed the beneficial effects intended. Good intentions do not always make good plans.

BOOK REVIEWS

A GERMAN IN TIBET

Seven Years in Tibet: By Heinrich Harrer: Translated from the German by Richard Graves: Rupert Hart-Davis, Soho Square, London: 16s. net.

This fascinating book describing the experiences of a German who escaped from a detention camp in Dehra Dun in 1943 and made his way to Tibet after almost incredible hardships is one which is as rich in adventure as it is in historical material about Tibet. The story of how this unhappy German detenu found his way into the counsels of the Dalai Lama and received asylum at Lhasa is one of remarkable interest throughout.

The picture of life in Lhasa which is the most interesting portion of the book recalls THE LOST HORIZON of Shangri-La, a kind of spiritual island in the middle of a world rent to distraction with strife.

After November, 1950, what? The tale unhappily abruptly halts. The author left Lhasa in the middle of November 1950, and the reader's hope that he would get from this unbiassed German source the story of Communist occupation in Tibet is thus bitterly disappointed. There is just enough in the last chapter to indicate how unhappy the change was. The Dalai Lama's flight to Gyangtse is briefly described. There is a passage of touching feeling in the description to be found on page 281:

"The monks of the Monastery of Jang swarmed in thousands to meet the Dalai Lama. They flung themselves before his horse's hoofs and begged him not to leave them, crying that if he went away they would be left without a leader, at the mercy of the Chinese. The officials feared that the monks would try to prevent the Dalai Lama from going any further, but at this critical moment he showed the strength of his personality and explained to the monks that he could do more for his country if he did not fall into the hands of the enemy, and that he would return as soon as he had concluded a suitable agreement with them. After demonstrations of affection and loyalty the monks cleared the way for the caravan to proceed".

The rest of this story is not told but we in India know it. The Dalai Lama who had sought asylum in India was 12 miles from our borders, when the Ministry of External Affairs, under advice from Sardar K. M. Panikkar, advised him to withdraw and return to his own country. In this manner India showed her acquiescence in the occupation of Tibet. There will be many in the wide world who will consider that in thus accepting the Communist occupation we betrayed this helpless leader of the most peaceful country in the world.

JAPAN'S FOOD IN THE WAR

Japanese Food Management in World War II: By Bruce F. Johnston: The Food Research Institute of Stanford University, Stanford, California: $7.50.

This, an interesting study of the measures taken in Japan during the war to protect the food situation, will be of historical rather than administrative value. The circumstances in Japan at the end of the war were exceptional and are not likely to be reproduced in any country or even in Japan again.

It is the opinion of the author that "deterioration in the quality and quantity of the Japanese diet and the precarious outlook for the maintenance of food rationing appear to have weighed heavily in the decision of the government to surrender in August 1945." This is certainly a likely conclusion. Japan has been at all times dependent on food imports; at the present time imports run up to 20 per cent of her food requirements. The virtual blockade and the tremendous shipping losses which Japan incurred near the end of the war reduced her capacity to import very significantly. On page 141, there is a statement to show that from December 1941 to July 1945, Japan lost 2,180 ships and the tonnage sunk or seriously damaged was 7,590,000. The effect of these shipping losses was bound to be reflected in the imports of food. The food controls became unmanageable at the middle of 1945 because of shortage of supplies and a drastic change had to be made in the order of priorities in imports. The priority given to food is shown by the rise in imports of staple foods and salt in the months of April, May, June and July 1945. Whereas in April the quantities of staple foods and salt imported were 269,000 tons, they had to move up in June to 446,000 tons and in July 407,000 tons or from 23 to 53 per cent of the total shipments. This was at the cost of coal, iron, steel and other non-ferrous metals which went down from 64 per cent in April 1945 to 37 per cent in June and 42 per cent in July. It is, therefore, quite clear that Japan's war potential in these last months was suffering on both sides. Food was inadequate because of the absence of shipping, and the diversion of greatly reduced shipping towards food imports seriously affected industrial raw materials. Even if the atom bomb had not been used, it seems the surrender of Japan was implicitly in these facts.

This is a very competent survey of a most interesting historical phase in Japan's life by a recognised authority. It will be remembered that Mr. Bruce Johnston served from 1946 to 1948 as chief of the Food Branch, Price Control and Rationing Division of the Economic and Scientific Section of General Headquarters of the Supreme Commander for the Allied Powers (SCAP). He has been assisted in this work by Mr. Mosaburo Hosoda, chief of the Archives section of the Japanese Ministry of Agriculture and Forestry, and Mr. Yoshio Kusumi, former Vice-Minister of Agriculture and Forestry and now a member of the Committee of the House of Councillors.

A SILVER JUBILEE

Silver Jubilee Souvenir: 1928-1953: Andhra Chamber of Commerce, Madras, Kurnool.

This is a good storehouse of information on all matters relative to the economic life of the newly fromed Andhra State. Articles accompanied by numerous charts and maps by a number of contributors "on the subjects in which they are specialised" cover every aspect of Agriculture, Irrigation and Power, Minerals, Industries, Commerce, Banking, Insurance, Transport, Finance and other allied topics. In the Foreword, Mr. P. Suryanarayana, President of the Chamber, says: "The completion of a quarter century of useful existence is a matter for congratulation for any institution". The Andhra Chamber of Commerce is also to be congratulated on this excellent souvenir.

Andhra is mainly an agricultural state having a surplus of about 3 lakh tons of food grains. But it has mineral resources too, which, though not very great, can be the basis for a number of important industries. Dr. C. Mahadevan has discussed in this souvenir the future of the mineral industries in Andhra state. Andhra, he contends, has sufficient quantities of mica, manganese and asbestos, the full utilisation of which will go some way towards the industrial development of the state. The possibilities for industrial development in the state and the industrial potentialities of the state have been dealt with in articles by Mr. R. C. Malhotra, Mr. V. Ramakrishna and others.

With a shipbuilding yard at Visakhapatnam and the proposed oil refinery also at the same place, Andhra starts well. It is for the Andhra Chamber of Commerce now to guide and advise the new state in the proper utilisation of the resources and development of her agriculture and industries. On this occasion of its Silver Jubilee, the Andhra Chamber seems well fitted to discharge these larger responsibilities. It carries with it the good wishes of the whole country.

TABLOID HISTORY

The History of Europe (1750-1950): By W. R. McAuliffe: Orient Longmans, Calcutta, Bombay and Madras: Rs. 6|-.

Volumes have been written on the causes of the French Revolution and even today it is a subject for debate. World Wars I and II are still live subjects for contemporary historians who have spread themselves in many books. Against this background, one's first impression of the present book must necessarily be that it has attempted the impossible. It seeks to cover in some 350 pages all that has happened from the beginning of the Agricultural and Industrial Revolution to the succession of Queen Elizabeth II. Is there a place for tabloid history of this cryptic kind? There is. But this is only for students of history to whom a skeleton of Europe is required. Many Indian students need just this skeleton in order to have an outer frame into which their reading of Indian history may be adjusted.

What were in brief the historical events which were changing Europe at the time when the East India Company was taking over the administration of India? What were the changes in Europe when the Indian national movement was growing to manhood and achievement? This book, specially conceived for a skeleton outline, tells this outline (and only the roughest of outlines) fairly well. It would be a terrible thing, however, if a history of Europe such as this caught on to the neglect of the classical manner such as belongs to H. A. L. Fischer's "History of Europe".

A DELHI DIARY

REPUBLIC DAY

A STRANGE question was going its rounds after the parade last Tuesday. Was this parade better than that of previous years, or was it not? I recalled (facetiously!) the crushing sentence which Hillaire Belloc once used in the Oxford Union when debating on the motion "This House is of the opinion that women students of Oxford University should be admitted to degrees". "Where all are perfect", said Belloc, "there can be no question of degree." The motion was then lost, though happily women (possibly not all being perfect!) have since been admitted to degrees. My feeling about the Republic Day parade is that it was as good as it has always been; no better and no worse. I think its end is far less impressive than its beginning and the school boys and school girls marching with enthusiasm deprive the display of finish which is clear in the military sections. But why do people keep asking this question? Some answer should be attempted.

I consider it is a case of bad conscience. We are becoming increasingly conscious of certain elements of deterioration elsewhere. We know that routine administration is sliding (gently!) down; the multiplication of civil jobs does not lead to promptness in many government offices. It is, perhaps, concluded that the military services cannot have missed the impact of the same forces which have affected the civil services. These are essentially political forces; the loss of confidence and authority in the services following on the transfer of power to politicians and the transfer of influence by adult suffrage to the people. It is plausible to argue that military efficiency has been affected; but as far as I can determine, this is not significantly the case. And the reason is that in the armed services the politician and the people are both a little outside the pale. It is because the army has been kept (in cantonments!) free from infection by the two leading currents of the Indian Revolution that it continues to function as an integrated whole. I got this impression from the parade. Our military services are much less concerned about pleasing the Prime Minister and the people than are our civil services. They work to a plan in which (happily!) political considerations in terms of pleasing the populace are out.

I count this as a source of strength and not of weakness. To my mind, in principle the transfer of power to the politician and of influence to the people was good. In practice, however, any principle can be overdone if it conflicts with equally good principles elsewhere. The transfer of power and influence must not lead to a loss of confidence in the minds of executive elements in the administration. If the politicians and the people had solutions for our problems and the skill of implementation, the undermining of the authority of the administrative services would not matter. When I say at present it matters enormously, no undue reflection on our politicians and the people is implied! But now that Dean Paul Appleby is back, I hope sincerely he will consider not merely the theoretical organization within which executive instruments should work, but the practical limits of power and authority which they should exercise independently of the politician or the people.

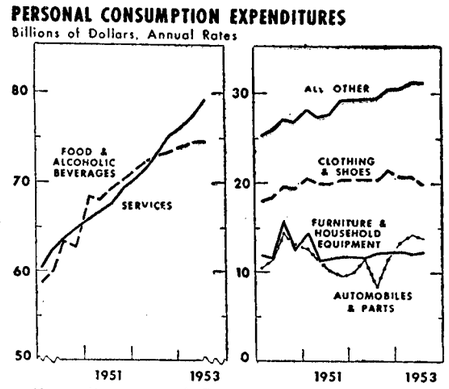
I count this administrative problem the largest of the problems which India has to face in this fifth year of the Republic. Unhappily, it is treated as subsidiary to foreign policy, the Plan, Linguistic States and so on and so forth, and nobody recognises that the success of everything depends on the men who have to do the job. I am constantly told that, since the Plan is being achieved, things cannot need so much rectification as I assert. But the First Five-Year Plan merely translated into figures an existing tempo (and almost all existing projects); it only made an easy matter look difficult by raising the great big bogey of resources. The Second Five-Year Plan will be a very different matter, and not because of the great big bogey of financial resources; it will be different because of the intense concentration of power in a few politicians (I had nearly said one!) and the absence of that wide dispersion of authority which is the hall-mark of a true democracy, and even more of a democratic executive agency doing new and difficult things.

I am convinced the job can be done. And (being an optimist!) I believe it will be done. But on this Republic Day (or rather three days later!) I must confess that I cannot see this being done without some considerable change in the outlook which the Prime Minister brings to bear on his treatment of the services or of the executive instruments in the private sector. I see from what is happening in Bombay that private industrialists are now awakening to the point that their public relations have not been good enough to convince the country of the important contribution they can make to the solution of many problems. It is not, however, the people who need to be convinced; it is not they who are stopping private enterprise from doing the job. An advertisement in a famous American paper says "Sell to the man at the top". In India, at least, this is the only policy. Will not Sir Homi Mody sell his ideas to the man at the top?

ALL OR NOTHING?

I have just time to deal with the Cultural Pageant and a picturesque figure. The Cultural Pageant which trailed after the parade was conspicuous for much enthusiasm and for some prolification! Why, for example, on the latter point, was Delhi allowed to present four items, three of which had nothing to do with Delhi? Was it Delhi's business to act for Travancore-Cochin, Bombay (in the form of a Maharashtrian wedding!) and West Bengal which (incidentally!) was speaking for itself? Why were Bombay and Madras conspicuous by their absence? Can it be that Mr. Morarji Desai refuses to participate in entertainments of this fickle kind? And has Rajaji nothing even philosophical to show from Madras? Surely, a cultural pageant of this kind should contain one (and only one!) representative from each of India's States. I am for all—or nothing!

MR. R. A. BUTLER



The picturesque figure was the British Chancellor of the Exchequer. He made a very powerful impression at his Press conference on Wednesday, answering questions on the sterling area, the U.S.-Pakistan pact, and the colonial question with almost equal ease. There was a gentle rebuke on Indo-Pakistan relations; he pleaded for a sense of proportion. There was gentle indignation on the colonial administration of the United Kingdom on which the Chancellor (in nearly the last answer of the session!) said he could speak for half-an-hour. Happily we did not spend that half-hour with the colonies; I wonder, however, whether the Prime Minister who was entertaining Mr. Butler at lunch shortly afterwards got that talk!

ARGUS.

SPECIAL ARTICLES

CONSUMER EXPENDITURE IN THE UNITED STATES

THE subject of consumer expenditure in the United States has assumed great importance because it is believed that a strong break here will have worldwide repercussions. It is important to analyse and explain the structure of consumer expenditure in the United States from many different angles, depending on the industries in which one is interested or in the exports and imports which are likely to be affected by a particular drop of expenditure. But for the purposes of the limited analysis which is here attempted the only three heads chosen are those included under durable goods, non-durable goods, and services.

NOTE.—Department of Commerce quarterly estimates, adjusted for seasonal variation.

The table below gives the structure of consumer expenditure in the United States from 1949 to the third quarter of 1953 under these three particular heads. It is, of course, true that the experience of 1949 to 1953 may not be repeated in 1954. The Korean boom has ended, and the peak of rearmament has been almost passed. Nevertheless, on the basis that consumer habits have tended to develop certain strong resistances to change, a study of these figures will indicate at least some points at which a recession is not likely to apply.

The most important factor in the structure of American consumer expenditure is in respect of services. The demand for services in the United States covers the widest variety of items. This includes air and rail transport, the demand for residential accommodation, and a wide variety of tourist and other undertakings. The figures for services have shown no single fall in any quarter of the years from 1949 to 1953. Consumer spending has maintained its uninterrupted post-war growth and in the third quarter of 1953 was 8 per cent greater than a year earlier, though probably half the rise was the result of higher prices. In this respect it is different from the demand of durable goods which has admitted setbacks, particularly in the last quarter of 1950, and in the second and third quarters of 1951, and the third quarter of 1953. The demand for durable goods is liable in the United States, even under boom conditions, to some considerable fluctuations, measurable in billions of dollars. On the other hand, the demand for services shows no fluctuations at all but a steady and unrelieved upward trend of a rate which over these years has been about 7 per cent. There is no indication today that the demand for services in the United States will alter significantly in the short period. In other words, the services expenditure in the United States provides a stabilizer for falling demand for durable goods.

The position of non-durable goods is more uncertain. In the year 1949 to 1953 the movement has been more or less steadily upwards, there being only three setbacks all relatively minor, one in the last quarter of 1950, another in the second quarter of 1951, and the third in the third quarter of 1953. Here the rate of rise, however, is lower than in services. The rise has been of the order of 20 per cent in five years or about 4 per cent per year. It would appear that non-durable goods can only act as a partial stabilizer against a recession in the demand for durable goods.

The total effect, therefore, of consumer expenditure is compounded of a highly fluctuating item under durable goods with a powerful elevating item under services, and a much less, but still effective, upward trend in non-durable goods.

CONSUMER EXPENDITURE IN THE UNITED STATES, 1949—1953

			Seasonally Adjusted at Annual Rates Gross National Product	Total Personal Consumption Expenditures	Durable Goods	(Billions of dollars) Non-durable Goods	Services
1949		I	258.8	177.4	22.4	99.4	55.6
	Quarters	II	255.2	178.4	23.0	99.2	56.2
		III	254.4	179.0	24.7	97.6	56.6
		IV	253.8	180.6	25.3	97.9	57.4
1950		I	264.4	184.7	26.3	98.4	60.1
	Quarters	II	275.0	188.7	26.6	100.4	61.6
		III	287.4	202.5	34.3	105.5	62.7
		IV	303.7	198.4	29.4	104.9	64.0
1951		I	319.6	210.5	31.3	113.3	65.9
	Quarters	II	329.3	204.5	26.3	111.3	66.9
		III	330.9	206.4	25.5	113.2	67.6
		IV	337.1	210.5	25.3	116.2	69.0
1952		I	340.4	213.7	26.0	117.2	70.5
	Quarters	II	345.1	217.2	27.4	118.0	71.8
		III	345.3	217.2	25.1	118.7	73.3
		IV	361.1	224.4	28.2	121.1	75.1
1953		I	362.0	227.7	30.2	121.2	76.3
	Quarters	II	372.4	230.4	30.7	122.1	77.6
		III	369.0	231.0	30.4	121.3	79.2

Messrs A. S. Goldberger and L. R. Klein's forecast for 1954, discussed in the leading article "1954: Recession or Readjustment?" in "The Eastern Economist" issue of January 15, argued that the total consumer expenditure in 1954 would rise rather than fall. This is in effect to state that the demand for non-durable and service items will offset a fall in durable goods. In this forecast the fall is in gross private capital formation from 26 billion dollars in 1952 (at 1939 prices) to 22.7 billion dollars in 1954. While investment in their model will run down by about 3.3 billion dollars, consumer expenditure which moves up from 116.1 billion dollars in 1951 to 117.3 billion dollars for 1954 shows no decline. In effect, this implies that the demand for services and non-durable goods is likely to be considerably greater than the fall for durable goods.

There is thus in their view in the American economy at the present time some prima facie evidence that the system, so far as consumption expenditure is concerned, contains a stabilizer which has been omitted from classical trade cycle theory. In the classical statement of industrial fluctuations, the fall in the demand for investment goods leads almost immediately to a decline in the demand for consumer goods. This pattern seems to have established itself in the United States in the years of the great depression. Consumer expenditure in these years showed itself quickly responsive to drops in investment expenditure. The position, however, at the present time seems in this respect to be markedly different. The consuming habits of people in the United States have tended to get stabilized, possibly because of the large element of personal saving now available, at a point which permits investment expenditure to decline considerably without affecting consumption expenditure. It may well be that this new element in the situation is likely to be the most significant factor in preventing a readjustment from running into a recession.

THE INDIAN STANDARDS INSTITUTION—1947-1954

STANDARDIZATION in India can be said to have commenced in 1909, when the Railway Board appointed an Inspectorate of Local Manufactures. The setting up of the Metallurgical Inspectorate later constituted the next important step in this direction. The function of the Metallurgical Inspectorate was the inspection of the 20,000-ton yearly supply of rails and fishplates contracted for five years by the Tata Iron and Steel Company which had been recently started. This inspection and testing organization can be taken to have laid the foundation of standardization in this country. Other organizations like the Central Standards Office of the Railway Board; Directorate of Technical Development, Army Headquarters; Directorate General of Supplies and Disposals; Central Board of Irrigation and similar others have grown since then which deal with standardization in their respective spheres.

As industrial development progressed in the country, industry as well as the Government felt the need for setting up a national standards body. The demand was first put forward by the Industries Conference held at Lucknow in 1940. The Industrial Research Planning Committee, in its report in 1945, also recommended the setting up of a Board of Standards for framing Indian Standard Specifications which were "essential preliminary to the maximum use of her (India's) resources for the industrial development of the country".

It was, however, only in 1946 that the creation of the Indian Standards Institution (I.S.I.) was proposed under a resolution of the Government of India, and in 1947, the Institution was formally set up. The activities of the Institution were actually initiated with the appointment in June 1947 of its present Director, Dr. Lal C. Verman.

The main objects of the I.S.I. include the preparation and promotion of standards, on national and international levels, relating to structures, materials, practices, operations, etc; co-ordination of the efforts of consumers and producers for improving products, appliances and processes; quality control and simplification in industry, and registration of Standards Marks applicable to products and commodities produced in conformity with the Indian Standards issued.

The Institution is under the overall control of a General Council (G.C.), with the Minister for Commerce and Industry, Government of India, as its ex-officio President. The Central and State Governments, the industry, scientific institutions and the Subscribing Members of the I.S.I. are represented on the G.C. The Executive Committee (E.C.), which is appointed by the G.C., is responsible for directing the affairs of the Institution. As for its finances, the Institution derives income from Central and State Government grants, subscriptions from members, sale of Indian Standards and similar other sources.

The technical work of the Institution is conducted by various Division Councils which have grown from the humble beginning of one Division Council in 1947 to four fully constituted Division Councils at the present time, namely the Engineering Division Council, the Textile Division Council, the Chemical Division Council and the Building Division Council, and an Agricultural and Food Products Section which is the precursor of a new Division Council. In addition, two more sections, one of Statistics intended to assist in surveys of industries, improvement of sampling procedures and study of methods of quality control, and another of Steel Economy for the purpose of devising ways and means for economy in the use of steel in structures without detriment to their efficient service or strength, have been instituted.

PROCEDURE FOR PREPARING STANDARDS

To formulate a standard, the concerned Division Council appoints a Sectional Committee, and that in turn appoints Sub-committees and Panels, which undertake the preparation of a preliminary draft. There are at present over 380 such Sectional Committees, Sub-committees and Panels, with a membership of about 4,000 experts drawn from all walks of life, working together on the formulation of standards on various subjects. On these Committees all interests concerned, such as the producer, the consumer and the technologist, are fully represented, with the consumer interest predominating. The draft standard is then issued in wide circulation for an adequate period to elicit comment from interested parties in India and abroad. The comments are then collected and considered and a final draft is evolved after reconciling the different viewpoints. The final draft is issued as a firm or tentative standard, as the case may be, after endorsement and adoption by the Division Council and the Executive Committee respectively. Thus, the preparation of a national standard involves continuous consultation, compromise and adaptation with a view to arriving at a general consensus of opinion of all interests concerned.

Notwithstanding this rather lengthy and complicated process, the Institution has, in its brief period of existence, issued about 450 Indian Standards, covering a wide range of subjects which can be broadly classified under the heads: Quality Control and Industrial Statistics; Documentation; Iron, Steel and their Products; Hand Tools; Non-Ferrous Metals and Alloys; Electrical

Equipment and Accessories; Refractories; Cement, Concrete and Allied Materials; Timber and Timber Products; Builders' Hardware; Sports Goods; Raw Minerals; Lac and Lac Products; Bitumen, Tar and Tar Products; Soaps; Essential Oils; Chemicals—Heavy and Fine; and Textiles and Textile Engineering. Special mention may, however, be made of the standards on Plywood Tea-chests, Cement, Mica, Lac, Electrical Appliances, Refractories, Salt, Cotton Fabrics and Jute, items some of which figure in our export trade. Standards on sports goods constitute a pioneering work conducted by the I.S.I., as these are the first ever published by any standards body of the world. While the standard for Plywood Tea-chests, which is now under revision, was hailed as one of the best standards that ever appeared on the subject, the standards for Mica form the main basis of international standards on the material. The progress of standards at various stages of formulation during the last four years is summarised in the table below:

Summary of Standards in Various Stages of Formulation

	Ending March			
	1950	1951	1952	1953
Subjects approved by E.C. ..	664	788	907	1109
Drafts under preparation or circulated	370	339	402	496
Drafts finalized	31	58	92	94
Standards published	79	217	300	391

IMPLEMENTATION OF STANDARDS

As has been seen, the process involved in evolving a standard is complex and lengthy, but that makes it eminently suited to adoption by industry and trade. The adoption is, however, voluntary; the I.S.I. being a democratic body, any compulsion in the enforcement of Indian Standards, by making them mandatory by law, can hardly be envisaged. However, of the 450 standards issued by the I.S.I. so far, over 200 have already been adopted by various Government departments for use as their purchase specifications, and many more are under consideration for such action.

CERTIFICATION MARKING

The I.S.I. (Certification Marks) Act was passed by Parliament in 1952. The Act confers statutory authority on the Institution to establish Certification Marks which could be applied to products and commodities conforming to the Indian Standards set by the Institution, and issue licences to manufacturers for affixing the Marks on their goods. Such schemes are in use in some progressive countries like the U.K. and France, and will come into operation in this country after further necessary rules in this connection are framed by the Government. The value of this system is that in the external trade, it will serve as a guarantee to the foreign buyer, who has had occasion for complaint in the past, because of the uncertainties caused by insufficient appreciation of his requirements and a measure of negligence on the part of some exporters. The coming into force of the Certification Marking Scheme should have a stabilizing effect in export trade and should encourage foreign buyers to purchase Indian goods with an amount of confidence. In the internal trade, while the scheme will provide protection to the manufacturer of quality against unfair competition by the producer of cheap and undependable goods, the inexperienced consumer will also be facilitated in making his purchases.

INTERNATIONAL CO-OPERATION

In the international field, the standardization activity is carried on by the International Organization for Standardization (I.S.O.). The I.S.I. is a member of the I.S.O., participating in the work of 48 of its Technical Committees. It holds the Secretariats for two International Technical Committees on Mica and Shellac. The Director of the I.S.I. has, since 1949, been the elected Vice-President of the I.S.O., the highest elective office in that organization to which the head of a national standards body is eligible. This is a special mark of recognition of the work done by a comparatively young organization as the I.S.I.

To co-ordinate the national work on electrical standardization with that of the International Electrotechnical Commission (I.E.C.), the Institution has set up the Indian National Committee for the I.E.C. (I.N.C.-I.E.C.) which is working under the Engineering Division Council. This association between the I.S.I. and the I.E.C. has resulted in increased consciousness on the part of Indian electrical manufacturing industry and trade for an increased participation in the international work.

THE BUSINESS WORLD

THE RANDALL REPORT

The full text of the Randall Commission's report on the foreign economic policy of the United States not being available, an assessment of its implications from the point of view of the undeveloped countries is somewhat risky. Nevertheless, enough is now known regarding the general tenor of the report to permit some tentative conclusions on the outlook in relation to two matters which are of interest to these countries, namely, the convertibility of the pound sterling and the compatibility of development with internal balance in general, which is the condition precedent for sterling convertibility. On the whole, the judgment can be hazarded that the Randall Commission's recommendations are realistic rather than starry-eyed (inviting a comparison which is natural with the Gray and Rockefeller reports) and in line with the Sydney conference's general conclusions in the sense that convertibility is a goal to which there can be only a "gradual and controlled" approach.

The inarticulate major premise of the report seems to be that non-discrimination stays as the general background of policy for the sterling area. In view of academic opinion in Britain—Sir Dennis Robertson being the latest convert to the need for a little discrimination, including tariff discrimination, rather than the dash for convertibility together with import restrictions, which necessarily have to be drastically applied —this assumption of the report is interesting and important.

This general background of American economic polidy being thus unchanged, the Randall report makes one important concession to the British point of view. It reiterates in effect the conclusions of the Bell report to the effect that American import policy should be liberalised. The detailed recommendations in order to give effect to this finding go about as far as Republican policy can be expected to approve, and if the recommendations are implemented there will no longer be such complaints as those over the rejection of the British tender for the Chief Joseph dam or as those of the Japanese regarding the cost of carriage of their aided imports in American ships. The issue as between the Bell report, which recommended tariff simplification, and the Piquet report, which belittled the consequences, cannot be settled except in the light of experience of what actually happens as the tariff and customs policies in the United States have been simplified. But the recommendation to liberalise is of undoubted advantage to the sterling area—whether this advantage is immense or not so great is not so very material.

This finding in favour of liberalisation is in general line with:

(i) the advance towards free markets within the United Kingdom and,

(ii) the efforts to withdraw controls and to rehabilitate a free enterprise economy generally.

But while this is welcome from the point of view of sterling convertibility, the realistic nature of the report means that the sterling area cannot entertain any hopes regarding some other matters.

In the first place, the recommendation to the effect that foreign economic aid should taper off—private investment being promoted instead—removes an important prop from under the plans for sterling convertibility. There is pointed absence of any mention of a fund to support sterling.

In the second place, the recommendations to the effect that commodity agreements and stockpiling should not be the means of supporting the prices of raw materials is apt to leave the sterling area wondering what these means should be. This mean that another prop is taken away.

The combined effect of these recommendations, which can be regarded as the elaboration of the British slogan of 'trade, not aid' and as an attempt to bring the foreign economic policy of the United States into line with the domestic policy of the Republican Party, is unlikely to be very substantial from the point of view of progress towards convertibility. Presumably, the Randall Commission intends that its recommendations should constitute only one more step in this progress —and that it is not for the United States to underwrite residually the convertibility of the pound sterling by proposing any extraordinary steps. Other steps in the progress towards convertibility will possibly be:

(i) expansion of the European payments union,

(ii) strengthening of sterling's reserves by adding Russian gold among other means which are open to the sterling area,

(iii) reducing the liabilities in the shape of sterling balances held by those countries which are likely to rush for the conversion of sterling into dollars as soon as convertibility is announced, and

(iv) a further improvement in the exportable capacity of the sterling area.

The words "gradual and controlled" used by the Commission in connection with sterling convertibility may well be significant. The Randall Commission does not recommend, as the Sydney conference apparently did not recommend, a wild dash for freedom. This should suit the backward members of the sterling area as a whole, for they cannot, in the nature of the circumstances, put convertibility rather than development first.

THE IMPORTANCE OF PRODUCTION RESEARCH IN TEA

IN dealing with the introduction of new techniques and methods for a well established industry such as tea, one is confronted with three uncomfortable problems. The first is whether it is wise to risk comment which might be biased and may be misunderstood. Secondly, there are many who would disagree with the approach, treatment and effects of the application. The third is that of reducing a complicated situation to a simple account.

Tea planters in India, it appears, are applying to today's problems, techniques designed to solve the problems of yesterday. To solve the problems of tomorrow the industry would be well advised to study productivity of production labourer as well as non-production worker on the garden.

Judging by the course of events in the past few years, one must conclude that wages will be high and will tend to go higher. Reductions are not likely to occur even during periods of recession. With 60 per cent labour content in the production cost of tea, the question of Work-and-Time Studies towers in importance over everything else. This may perhaps sound like

the quarrel about who should treat the patient. There is, of course, no single "best" solution. Nor is there an easy solution. However, huge progress has been made in scientific research of growing and manufacturing tea in the past fifty years. For that reason alone, it is a problem of diminishing size, while the greater and growing problem of production research has been neglected. The question of finding the best way, the standard of a fair day's work, workers' selection and training and establishing incentives still remain to be developed. Important as is the scientific research of growing and manufacturing tea, it is secondary, under the existing circumstances, to the importance of saving time or working efficiently.

The history of industrial progress in the world reveals that new techniques and innovations have usually been started without help from the leaders of the industry and often in defiance of their collective opinion. The tea industry in India is extremely conservative and selective and Agency Houses have felt perfectly justified in avoiding labour-saving changes as they had no heart for the introduction of labour-displacing techniques in times of buyers' market. In times of sellers' market their attention has been devoted to the expansion of out-turn rather than to an increase in efficiency.

From the early beginning, the planters' important characteristics were their ingenuity, shrewdness and inventiveness. These valuable characteristics seem to have been submerged by the existence of a large and constantly growing labour force, low wage level and perhaps too much reliance on scientific research to counter all adverse factors. As a result, they have been showing greater interest in the preservation of the status quo and security. Recently, however, partly in response to local conditions and the competition of other tea growing countries, there are signs of a rebirth of alert leadership.

After minimum wage legislation, India's tea gardens have to depend entirely on selling prices of tea. Until adjustments are made, they are bound to suffer. What is needed, therefore, is the realisation of their urgency and their utmost importance, a clear and objective study of the situation and unsentimental and sincere application of the results. The answer is Work-and-Time Study Engineers. They are trained to develop a sense of proportion for weighing the cost to effect gains, and a commercial instinct to draw the right conclusions and guide decisions towards profitable measures. They are the men to bring out the facts as they are, not as they are thought or believed to be.

No doubt many planters will regard advice on tea garden operation from Work Study men as just a piece of impertinence. On the other hand, the concept that the regular garden management can effect all necessary work in this direction is simply naive. No matter how experienced they may be in their knowledge of the work to be performed, no matter how well intentioned they may be, they cannot overcome the inherent complexities and variables that are part of production with anything other than measured facts. Determination and application must be factual and impartial, in so far as possible, it must be free from outside pressures, personal interests and prejudices.

It would seem to follow that with realistic and experimental approach a great deal of progress and development can be achieved in the tea industry by recognising the supplementary nature of Work-and-Time Studies for more efficient production and to improve labour and management relations.

One cannot over-emphasize the fact that in industries where productivity is higher than in tea, people do not work harder, but more effectively.

Wherever manual work is performed, there is always the problem of finding the most economical way of doing the job, i.e. "taking the work out of work" and then of determining the amount of work that should be done in a given period of time. Armed with accurate data, it would facilitate decisions such as application of uniform worker earnings as opposed to district-wide uniform piece rate to operations like plucking.

Work-and-Time Studies have been introduced into industry over seventy years ago and Systematic Time Studies, or Standard Data, or Predetermined Time techniques are being increasingly used throughout industry all over the world for the setting of standards, assignments and rates. Measurement of labour is now a recognised science in industry.

As already mentioned, labour cost is the largest element of expense on the gardens. It is also the greatest variable. It varies for many reasons. Chief of these are absence of measurement and lack of control.

It is necessary, then, to measure labour in order to know what part of cost it is and to properly reward extra efforts. These measurements provide the foundation for an efficient incentive plan. Everything one does has some kind of incentive behind it.

Experience reveals that regardless of time and effort spent to improve costs with better methods of cultivation and manufacture, the industry has never been able to realise the full benefits owing to lack of interest displayed by labour. "Payments by Results" is the way to overcome this failing, i.e., paying full value for extra effort in a fair way. It has been found that a good wage incentive plan is more efficient than the raising of wages, because extra money has to be earned by an extra effort. It is obvious that a good incentive scheme benefits the labour force through improvement in their standard of living.

Psychological factors play a very important role. As a matter of fact, the main obstacles seem to be neither technical nor financial but psychological. Due to climatic conditions in the tea growing districts, it appears that workers' happiness lies in remaining absent from work. Higher wages, therefore, are usually accompanied by an increase in absenteeism. In addition, low education and discipline are said to be the cause of less dependable sense of duty and efficiency. The figures can only measure what has happened—but past performances are no proof of what can be done under different conditions. Proper wage incentive schemes help to transform lost time into useful production resulting in a lower cost per pound. From these savings, the industry can pay higher wages and sell at lower prices, thus bringing about a doubly beneficial effect on real wages. It is not out of place to mention that nowadays, over two hundred million pounds of tea is consumed internally.

Naturally, it would be wrong to assume that Work-and-Time Studies and wage incentives are a cure-all, or that they are simple. It is like any other human effort —one gets no more out of it than one puts into it. This factor alone partially explains the different degrees of success attained by various companies. Everyone realises that every advantage has some disadvantage in it. The main difficulty is "standards" and to overcome it, it is expedient to reduce their number and use procedures that reduce errors. This form of solution points directly towards the use of good time-study methods. Time-study is much more reliable for setting production standards than any of the compromise or guess methods. Time-study is the best method that has been evolved for determining a fair day's work. Coupled with job evaluation, it can help to iron out inequalities and avoid inconsistencies.

To meet future competition is yet another important reason for measuring and rewarding all forms of labour effort. It seems that India's staying ahead in the race and sustaining a high degree of employment depends upon steadily increasing productivity. Otherwise, continued employment will depend largely upon reducing costs by lowering wages. Such an alternative is not to anyone's liking.

In maintaining India's position among tea exporting countries it is advisable to "remember that no war, no strikes, no depression can so completely and irrevocably destroy an established business as new and better methods in the hands of an enlightened competitor."

VOICE OF FREE ENTERPRISE

By

CROESUS

I am happy to find that more and more people are coming forward to press the view-point that, in the mixed economy, which is what our Government is wedded to, free enterprise has not only a significant role to play but that it has also to ensure that its voice does not fall on deaf ears. Indeed, Mr. M. R. Masani, who has been a staunch supporter of the mixed economy concept for India for as many years as I can recall, went a step further and exhorted the "accredited spokesmen of enlightened free enterprise" to come forward with a Charter or Declaration of Faith based on a policy of "clean hands" and "nation first" and express their readiness to live by it, when he addressed the Hyderabad Rotary Club recently. In a sense, leaders of private enterprise have done it and been doing it all along, although they have not given it, as Mr, Masani has done, an imposing name such as a "Charter" or a "Declaration of Faith". The Federation of Indian Chambers of Commerce, the Employers' Federation of India, and the Associated Chamber of Commerce, and perhaps almost every Chairman of important industrial undertakings lately have all been telling the Government that they are ready to make their contribution to the country's economic development, that they have ceased to regard the war-time and post-war returns on their outlay as normal any more, and that all that they need in return are good words of encouragement where these are called for and a reasonable degree of freedom in the sphere in which they are still allowed to function. But, for the first time, perhaps, industry is being made to realise that, if it is to be protected from further encroachments on the part of an all-devouring bureaucracy, this is not enough but something more is needed, namely, co-operation of those employed in industry and, even more than that, co-operation of the sovereign people. Industry has yet to enlist in full this twin co-operation. If it wants to do so, it has to educate the workers and the general public alike. It is only recently that sincere and earnest attempts are being thought of, if not made in this behalf.

Everyone says that labour is discontented, but why is it discontented? It is not always, nor in all cases, because it is not getting its due share in the existing circumstances. It is rather because it does not understand the inequalities it sees around it and is only made to demand the removal of these inequalities without actually working for it in a positive way. If labour wants a larger size of the industrial cake, it can do so only by enlarging the size of the cake in the first instance. Let it not be forgotten that if the existing cake is divided by any impartial person on any reasonable basis amongst all those that are entitled to a share —these are not merely the industrialists and the workers, but also include the public at large, the State (both Centre and States) and the local bodies—the share of each is bound to be little or negligible. Labour has to be convinced that its interests do not lie in merely putting forward more and more demands but in realising its own obligations not merely to its employer but to society at large. We have now a paternalistic Government which can be depended upon to protect everybody's interests.

The public's co-operation is also necessary if private enterprise is to flourish even in a so-called mixed economy. If all the time private enterprise as a whole is being branded—"painted with the same brush"—as unsocial or anti-social by the highest in the country, it is no wonder that the people are deluded into believing that it may be really so. Unfortunately there are some among those who are in power today who, having formed some impressions wrongly or rightly years ago, refuse to believe that conditions and the climate have radically changed since. Probably it is politics to take up such a stand when the wave of public indignation against a few unsocial elements is sweeping the country, making no allowance whatsoever for the terrible aftermath of every war. Following any cataclysmic happening such as a great war, the world throws up some frothy effervescence in the form of such unsocial elements, but, being unwanted and disliked, these elements cannot and do not last very long. And to follow any policy directed against these transient elements indefinitely is as unwise as it is harmful.

However, if the administrators follow a policy like this, enlightened private enterprise can only turn to the public and educate it. If public opinion is educated along right lines, it is bound to exercise its pressure on the administration. No Government, however powerful, can afford to ignore public opinion. The recent meeting of all sections of industry held in Bombay has set up a Committee with Sir Homi Mody as Chairman to chalk out and guide its work. Will this Committee give the suggestion to educate the workers and the masses about the useful role of private enterprise, its early and serious attention?

AN INDUSTRIAL AWARD

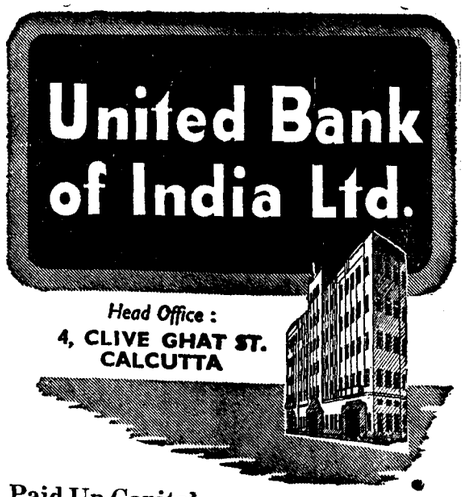
By

CROESUS

The Award of the Industrial Court, Bombay, in the matter of compensation for the loss of wages by the employees of the textile mills in Bombay due to short working or closure of textile mills during the period extending from November 1, 1951 to July 13, 1952, in compliance with an order of the Government of Bombay, owing to power shortage, may not mean, in terms of rupees, annas and pies, very much to the industry as a whole—a rough estimate puts the total compensation at about a crore of rupees. But it raises a number of important issues. It creates, for instance, an unfortunate precedent, which lays down that it is not so much

legal liability as the ability to bear the burden and the modern trend of social justice that ought to govern the demands of labour.

In the course of its judgment, the Court refers to the recent Industrial Disputes (Amendment) Act, 1953, in particular to the lay-off definition therein, and instances that as reflecting the modern trend. Although it concedes that this Act has no retrospective effect, it relies on the tripartite agreement which preceded the Act to indicate what the present-day concept of social justice on this point is. From a study of the judgment, one cannot help concluding that the Court had probably made up its mind to award compensation. For instance, the argument that Standing Order 16 would not apply to the facts of the case and that, even if it did, the Court still had jurisdiction to award compensation, having regard to the facts and circumstances of the case, if it so felt it could do so, and has, in the event, actually awarded compensation, and the rather involved arguments to justify a direct reference by the Government to the Court, instead of the reference being made by the representative union of the industry to the Labour Court, as prescribed under the law ordinarily, reflect more the sympathy of the Court for the workers than the strictly legal interpretation of the provisions of the law. Maybe, under the latest lay-off legislation of the Union Government, compensation is obligatory. But the question is: was it so when the cause of the dispute in question existed, namely, between November 1, 1951 and July 13, 1952?



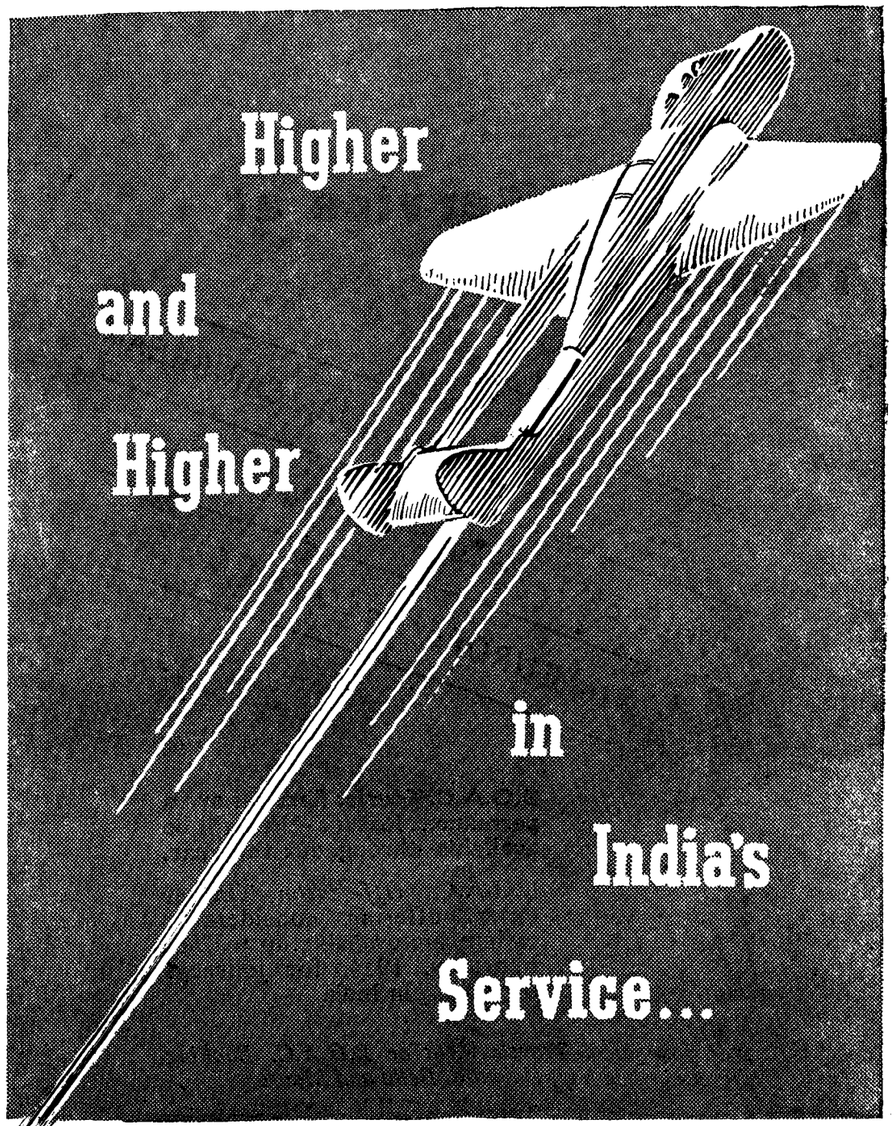
Under the law as then existed, the closure or short working was occasioned by reason of 'force majeure' and, as the spokesman of the mills rightly contended, it was covered by Standing Order 16 and as such no compensation was legally payable. A point to be remembered here is that the closure or short working was decided upon following a number of conferences held by the Government not only with the millowners and the management of the hydro-electric system but also with the representative union of the industry, namely, the Rashtriya Mill Mazdoor Sangh. Moreover, even after it was known that there was to be a reduction in the consumption of electricity, the mills, or at least some of them, did make every honest effort to prevent the closure or short working by installing power generating plants at considerable cost. This is a clear proof of the earnestness of the mills to leave no stone unturned to minimise the loss of work and the consequent inconvenience to their employees. One would have expected the Government of Bombay not only to take note of this gesture but also to appreciate it by prevailing upon the workers not to insist on their demand. However, after having been responsible for the power-cut and also referring the matter to the Industrial Court, it condescended to refrain from taking sides! Was any more evidence than this interest of the Government in securing compensation for the workers necessary?

There is one more aspect of the judgment that industrialists would have to take note of. The Court has stated, after pointing out that the closure does not appear to have affected, to any substantial extent, the profits or losses of the mills concerned, that, in the annual reports of the loss-making mills exhibited in the bonus case, "we find in only one or two of such reports any reference to losses due to curtailment of production on account of closures." In future, the managements of companies would have to take note of this and specifically include a reference indicating the extent of loss incurred by them due to causes beyond their control, if any, although, under the latest labour legislation, even this will not prove very helpful.

Then, again, one cannot resist questioning the statement of the Court that, "in consequence of the short working extending, in many cases, to 8½ months, more sacrifice was made by the employees than the employers". If, by this, the Court intends to convey that, because the mills can afford the loss, it is not a greater sacrifice on their part than it is to the employees, it may perhaps be unexceptionable as a statement. But, even so, a loss will not cease to be a loss whether it is one who can afford the loss that loses or one who cannot afford the loss does so.

Finally, attempts are made in certain quarters to justify the Award, on the ground that, in any case, the industry has, in effect, to lose very much less than what it is called upon to pay, because, to this extent, it would save the tax payable on the amounts involved. There is no gainsaying the fact that the compensation payable will be allowed as a permissible expenditure for purposes of income-tax. But there is no reason why the whole country and not merely the Bombay Government should be made to pay for the unimaginative power policy of the State Government.

Now that the Award has been made, and will probably be upheld even if the mills were to go in appeal, it is to be hoped that the Bombay Government would use its good offices to take an assurance from the workers that they will not question the setting off of the compensation out of the profits for the current year. This is the least that the Government can do for the industry.



Paid Up Capital & Reserve Over Rs. 3,68,00,000/-

Working Funds Over Rs. 34,14,00,000/-

BUSINESS NOTES

SUGAR-CANE PRICE

The action of the Uttar Pradesh Cane Unions' Federation in demanding an increase in the price to be paid for sugarcane has caused much concern about the impact of the demand on the sugar industry in the near future. The Federation's demand is for an increase of As. 5 per maund to Rs. 1-12 per maund and it has been accompanied by threat of direct action to stop supplies of cane to sugar mills from February. The Federation's large membership in this premier sugar producing State gives more than ordinary interest to its drastic demand of an increase of approximately 25 per cent in cane prices. Since cane price forms the most vital ingredient of sugar production costs the effect of the increase on the structure of the industry cannot be ignored. The Federation's plea for asking for the increase is, that the price level actually realised by the mills in the recent past was high and what it is claiming is only a share of this excess price along with the mills and labour, and nothing more. In effect it means that cane-growers want, in addition to a fixed minimum price, a scheme of profit-sharing. The U.P. Sugar Mills' Association which met this week to consider the demand has come to a decision not to concede it, and the current position is that the two sides are in complete disagreement. Present indications are that final settlement will involve careful negotiations as an acceptable formula will carry certain significant implications.

The Central Government has reacted promptly to the demand. It has set its face firmly against any increase in the minimum price of cane fixed at Rs. 1-7 per maund. But it has announced its intention to devise a suitable formula to enable cane-growers to secure a share in the excess profits earned by the mills. This scheme of profit-sharing with a guarantee for floor prices is inconsistent with free market operations, and the only reasonable and realistic course is to remove the guarantee and let cane prices find a proper level.

This demand for a higher cane price comes at a time when the official reports in this State disclose a deterioration in cane production. In the reserved areas the yield of sugarcane per acre declined for the year ended June 1952 by 18 maunds to 278 maunds below the yield for the previous year. The percentage of recovery also deteriorated in the same period to 9.3 from 9.8. The State Government which is reported to sympathise with the growers in their demand needs to pay priority attention not only to arresting this deterioration but bringing about a positive improvement in the output and quality of cane as a direct measure for the production of cheaper sugar.

COMPENSATION BONDS IN U.P.

Payment of compensation for the abolition of zamindari in U.P. is now taking final shape. Compensation to the former intermediaries through the medium of bonds has already been settled and in view of the convenience which this mode of payment confers on the State exchequer there is to be no going back on it. The scheme for issue of bonds has been drawn up in elaborate detail explaining the value of bonds, recovery of arrears, failure to cash vouchers within the fixed time-limit of three months, provision for the contingency of loss of the original bond, and so forth. The bonds are to be issued without fractions in whole figures of Rs. 50, Rs. 100, Rs. 200, Rs. 500, Rs. 1,000, Rs. 5,000 and Rs. 10,000. The amount of compensation covered by the bonds is made payable in a period of 40 years with interest at the rate of 2.5 per cent per annum.

It is some consolation to the title-holders of the bonds that the original scheme is being modified and although the modification is coming at the last minute, it seeks to introduce a welcome feature in the bonds. These bonds, which according to the original scheme that has been adhered to up to now were to be non-transferable and non-negotiable, are now proposed to be made negotiable. There need be no doubt that public views which have been elicited on the proposed change will endorse it. The rigidity of the claim to the value of the bond would certainly have operated as a serious handicap to the great hardship of the bond-holders. The State Government's intention to impart liquidity to the bonds is, therefore, a step in the right direction. The only other change proposed to be introduced is annual payment, in place of the original half-yearly payment, of the instalments due under the bonds.

TARGETS FOR COAL

The targets for the output of coal during the current year, fixed by the Government of India in terms of the policy of pegging the production for conservation of high grade coal, prescribe the level for selected A and B grades of coking coal at 7.4 million tons and for coking coals of Grade I and Grade II at the figure for 1952, when coal exports were maintained on a satisfactory scale. It is now for the Coal Board to fix targets for individual collieries with discretionary authority to entertain appeals from collieries to enhance their limits above 1953. Conventional precautions are to be enforced against downgrading of coals.

Targets for coking coal in the case of individual collieries, while they are to be related to the same quantity as in 1953, are to be governed by certain specified conditions which would show that a guarantee against recurrence of seasonal transport bottlenecks need not be assumed from the mere fact of the elaborate manner in which the conditions have been laid down. Ceilings of output for each colliery are to be regulated by the supply of wagons, which in turn are to be fixed on the basis of output targets together with stocks awaiting clearance for dispatch on December 31 last. No wagons are to be supplied in excess of the stipulated limit which would require the collieries to keep to a schedule of despatch of wagon-loads. This inflexible condition has been imposed obviously owing to the inability of the railways to make variations in wagon supply to suit the demands of reasonable adjustment. Individual targets are to be related to the working of the collieries on an economic basis. Precaution against excessive retrenchment is one vital consideration applicable to the output targets. Some latitude of interchange is allowed in respect of groups of collieries coming within the ambit of the same ownership or managing agency. In their case, targets for individual collieries may be transferred to others in the same group subject to the cumulative ceiling fixed for the group and subject to the further condition that no colliery will be closed down in the process. Government-owned collieries also have been brought under the scope of this scheme of targets and related obligations.

FALL IN VOLUME OF INDO-AUSTRALIAN TRADE

An outstanding fact about the Indo-Australian trade for the year ended March, 1953, is the great fall in the volume of trade. The major cause for the reduction of volume of trade between the two countries was the decline in Indian exports to Australia. Exports to

Australia in 1952-53 were valued at £A 14,646,000 as against £A 47,825,000 in 1951-52. Imports from Australia too have declined from £A 17,148,000 in 1951-52 to £A 16,911,000 in 1952-53. This meant that while Australia had an unfavourable balance of trade to the value of £A 30,914,000 in 1951-52, it had in 1952-53 a favourable balance of trade to the value of £A 2,502,000.

Some of the items of export from India which showed decline were the following: Gunny bags, cotton piece-goods, linseed oil, myrobalans, cotton waste, shellac and coir manufactures. Australian import of Indian coal which comprises 7 per cent of India's total exports has shown no decline while linseed exports to Australia had risen by 75 per cent.

On the import side, although Australia continues to supply a considerable proportion of India's imports of foodstuffs, non-ferrous metals and wool, there has been a decline over 1951-52 imports.

Australian import licencing regulations which came into force on the 8th March, 1952, and the steps which India is taking towards self-sufficiency particularly in respect of food are the main causes for this fall in volume of trade between the two countries.

THE BOMBAY TEXTILE AWARD

The extent to which uncalled-for liability can be foisted on industry in the name of compensation for lay-off is exemplified by the recent award of the full bench of the Bombay Industrial Court in the case referred to it by the Bombay Government on a motion by the Rashtriya Mill Mazdoor Sangh. The claim related to the period of about 8½ months between 1st November, 1951 and 13th July, 1952, when the textile mills were closed for an extra day per week. It will be recalled that this extra closure of mills was enforced on them by the cut imposed in the supply of electricity to the city owing to the acute shortage of power.

The Court's award directs that the mills concerned in the proceedings (in which about 2.40 lakh workers are interested) should pay their labourers compensation for the period of lay-off at the rate of 50 per cent of the basic wages and dearness allowance. No estimate of the extra payment which the award will involve is available at present, but it must be quite substantial. The involuntary unemployment enforced on the workers was none of the managements' own making and on the other hand the State Government's indifferent attitude in the matter of planning for electricity supply has now been established as a major cause of the power shortage whose magnitude could surely have been mitigated to a considerable extent by prudential planning and for which the failure of the monsoons cannot be blamed in toto. But whatever the cause of the partial closure, mills which were in no way responsible for it have been saddled with the cost of compensation. Further course in the proceedings in appeal, if any, will be watched with interest.

PLANTATIONS LABOUR ACT

The Industrial Committee on Plantations is scheduled to meet for its fifth session in Calcutta this week-end. The agenda before it requires a decision on the manner in which the Plantations Labour Act, placed on the statute book in November 1951, should be implemented. At a previous meeting held in Calcutta towards the end of 1952, the Committee, when called upon to fix a definite postponement of the introduction of the Act in view of the crisis in the tea industry, failed to come to an agreed decision on the ground that the data contained in the official enquiry team's report on the tea industry were inadequate. The team had made a firm recommendation for postponement of the enforcement of the Act for two years with a proviso to consider the question after tea prices staged recovery. In view of the fact that this contingency has been fulfilled the Labour Minister was asked in Parliament about Government's intention in this matter. It is in pursuance of Mr. Giri's assurance about early implementation that the Committee has to give its decision on the issue.

The State Governments which are responsible for the execution of the Act have already indicated their own views on the draft model rules circulated by the Union Government for eliciting comment from them as well as from workers' and employers' organizations. The final form of the rules in individual States is not a matter of importance now. Similarly, many of the benefits and amenities suggested by the Act are already being extended in the plantations and what needs to be done in respect of them is to bring them in conformity with the statutory provisions. The principal classes of benefits include medical facilities on the scale stipulated, housing and educational facilities, leave with wages, and so forth. But most important of all is the applicability of provisions for lay-off compensation in different States which is of vital significance in view of the prolonged periods of work stoppage in plantations due to adverse weather. The prevailing practice varies from absence of compensation in Madras, West Bengal, and Coorg to payment on certain scales in Assam, Bihar and Travancore-Cochin. The I.L.O. Plantation Committee's recommendation of 1950 to provide minimum wages on an average of 24 days in the month throughout the year has pitched the scale too high and the imposition of a burden of this magnitude on the plantation estates in a recessionary phase will be a heavy strain which cannot be pressed. The tripartite Committee will have to come to an agreement on a practical formula for the progressive enforcement of the provisions of the Act.

AN UNEMPLOYMENT PROBE

Despite marginal changes in the placements reported by the Employment Exchanges, unemployment has lost none of its magnitude. Measures to be devised for an attack on this grave problem necessitate a clear analysis of the situation which has given rise to it and from this angle fact-finding enquiries and investigations of a similar nature will surely conduce to a solution on the right lines. The report issued by the Indian Chamber of Commerce, Bombay, on the enquiry undertaken by it makes a constructive contribution to the issue. The findings contained in the report have for their main basis the replies and information supplied by 30 industrial associations and over 200 industrial and business associations which together represent the informed view of those who have to deal directly with employment. It derives its utility from the nature of its source of basic information.

Some of the conclusions which can be drawn from the report bear attention. As for Bombay City, the indifferent attention paid by the State Government to the planning of electricity supply and its adamantine opposition to the power expansion scheme advocated by Tatas were directly responsible for aggravating the magnitude of power shortage which resulted in great loss of production and employment. The Municipal Corporation's rigid policy of prohibiting the establishment of industries in certain specified zones has not only made erection of new factories difficult for lack of equally suitable sites but has brought pressure on existing industrial units to shift their location. Among

the measures which the Chamber has commended for greater productive activity are positive incentives like a realistic labour legislation policy, stores purchase on government account from indigenous production, easier availability of raw materials, a practical and less irksome administration of sales tax, and so forth. The emphasis placed on a bold and large programme of road construction suggests the urgency of labour-intensive projects which have their utility in the short-term as well as long-term contexts.

AID TO BONE-MEAL MANUFACTURE

Supply of bone-meal as a high quality agricultural manure has been an important plank in the grow more food campaign for quite a number of years. But it was only recently that a handy, cheap and indigenously manufactured mechanical digester was evolved for its production from readily available local sources of animal bones. Production of two important by-products —glue and tallow—is also an incidental benefit resulting from the newly devised digester. Bone meal in the form of fine powder capable of use as phosphatic fertiliser can be produced on a large scale from the total available supply of animal bones estimated at five lakh tons.

The requisite mechanical designer for softening treatment of bones and their manufacture into fine powder has been evolved after the Japanese prototype. The modifications introduced in the Indian machine are designed to adjust it for simple operation at an economical cost for small-scale industry. The idea is to stimulate its dispersal in villages possibly on a co-operative basis. The remodelled designer, experimented upon at the National Physical Laboratory and also in a series of trials, has been finally tested and now put for commercial use. Reduction of cost of production of bone meal was made imperative as without it the bone powder as a fertiliser would inevitably have proved too costly on the Indian farm. But this modification has necessitated a big-sized digester. Further modifications for local types will be necessary in the fire-box and grate to suit the kind of fuels—firewoods, wood-shavings, saw-dust, waste tann and bark, paddy or groundnut husk, coal etc.,—as they will be locally available in large quantities at cheap prices. But fabrication of the whole machine together with the modifications is so simple as to present no particular problem. A concessional fee of 3 per cent has been specially fixed by the Boiler Board as the inspection fee to be charged by the Chief Inspector of Boilers in individual States whose certificate for the manufacture of digesters is obligatory. More mechanical aids like these capable of easy operation in agriculture would help larger production and lowering of costs.

OIL DISCOVERY IN WESTERN AUSTRALIA

After more than 20 years of prospecting, which cost many millions of pounds and covered immense areas of the Australian continent, came the dramatic announcement early in December, 1953, of an oil strike in Western Australia. Oil had been found at Exmouth Gulf, about 680 miles north of Perth, capital of Western Australia.

Interest in this area as a possible source of oil commenced as far back as 1932. A company was formed to conduct surveys but drilling was not undertaken for lack of finances. Again, in 1945 another survey was begun to assess the oil possibility of the area. The very favourable report of the survey induced Ampol Petroleum Ltd. to make further investigations and Caltex soon joined them to form West Australian Petroleum Ltd. Drilling operations first commenced on 5th September, 1953, and within three months oil had been struck at a depth of 3,600 feet. Tests of the oil recovered show that the sample was a very high grade of crude oil.

It is believed that this discovery makes certain that a big field has been found, though much work remains to be done to assess the potential of the strike. There is great optimism and the shares of the companies concerned rose spectacularly.

The announcement of the oil find in Australia coincided with news of possibilities of finding petroleum in West Bengal and the signing of an agreement between the Indian Government and Standard Vacuum Oil Company for joint prospecting for oil in West Bengal and setting up of a refinery if and when sufficient quantity of oil is found. Geologists are optimistic about finding oil in this area because they believe this area lies in an oil-bearing belt stretching from the shores of the Mediterranean Sea to Burma.

DISTRIBUTION OF FERTILISERS

A meeting of the Secretaries of the State Departments of Agriculture held at New Delhi on January 19 last, discussed the measures that should be taken to increase the consumption of chemical fertilisers in different States during 1954. The State Governments agreed to distribute increased quantities of fertilisers, the total quantity decided upon for distribution during the year exceeding 4,00,000 tons.

The question of reducing the incidental charges and equalising the railway freight, with a view to making the fertilisers available to the cultivators all over the country at a uniform price, was also considered. It was agreed that immediate steps should be taken to get this expenditure reduced and to fix a uniform price at which the fertilisers could be made available to the cultivators in all the States. In cases, however, where there were some special difficulties, necessary adjustments could be made to enable the State Governments to sell it at a uniform price. The meeting also agreed to have a large number of demonstration centres throughout the country to popularise the use of ammonium sulphate, super-phosphate and other fertilisers.

COMMITTEE ON ORDNANCE FACTORIES

The Government of India have decided to appoint an Ordnance Factories Reorganisation Committee which will examine the working of Ordnance Factories in India and suggest methods for improving their efficiency of production, with Sardar Baldev Singh as chairman. It will examine the present organisation, procedure and methods of production in the Ordnance and Clothing Factories with reference to the probable demands of the Defence Services with a view to suggesting proposals for improvement and for ensuring maximum efficiency in production, and also with a view to increasing the ability of the Factories to produce a larger variety of specialised Defence stores for meeting the requirements of the Defence Services in the shortest possible time. It will also suggest measures for the maximum utilisation for civil production of surplus capacity in Ordnance Factories which may exist from time to time. The Committee will also consider other problems relating to Ordnance Factories such as distribution of load between various factories, inspection, cost accounting and methods of provisioning for materials and machines followed at present.

THE BIRLA COTTON SPG. & WVG. MILLS LTD.,

(P. O. BIRLA LINES)

DELHI.

We manufacture cloth from the highest class of Indian cotton and in a large number of varieties of attractive designs and charming colours. Our cloth is specially suitable for Delhi, Punjab, Rajasthan, U. P. & Bihar markets. Prompt delivery is guaranteed. Our manufactures are of medium counts and consist of Sarees from 5 yds. to 12 yds. in varieties of Borders, Prints, Striped Shirtings, Patta Shirtings, Coatings, Check Shirtings, Dyed Latha of Poplin type, Narma, Dhoties 6 to 10 yards, etc., etc.

Birla Brothers Limited.

COMPANY AFFAIRS

THE FORT WILLIAM JUTE CO., LTD.

The working results of the Fort William Jute Co. Ltd. (Managing Agents: Bangur Bros. Ltd.,) for the half-year ended 30th September, 1953, make a very impressive reading. The net profit, after providing Rs. 1,83,925 for depreciation, comes to Rs. 8,11,513 as against a profit of Rs. 2,77,092 in the previous half-year, when no provision for depreciation was made. The loss carried forward from the preceding accounting period has been totally wiped out and the total surplus available for distribution is as high as Rs. 3,12,912. For the first time since March 1951, the directors have declared dividend on the 14,000 ordinary shares at the rate of Rs. 5 per share. Rs. 1,40,000 have been utilised in paying dividend on the cumulative preference shares for the preceding three half-years and the half-year under report. Rs. 1,00,000 have been transferred to the general reserve fund.

A notable feature of the working of the Company during the half-year under review is a sizable drop in the manufacturing expenses, while the figure for sales has remained unchanged. This fact is very well brought out in the table below:

	30-9-1952	31-3-1953	30-9-1953
Sales (Rs.) ..	87,53,623	75,31,160	75,31,197
Manufacturing Expenses (Rs.) ..	68,47,577	50,28,239	44,77,577
Net Profit (Rs.) ..	—4,41,218	+2,77,092	+8,11,513
Depreciation (Rs.)	Nil	Nil	1,83,925
Taxation ..	Nil	Nil	Nil
Dividend Rate per cent per annum	Nil	Nil	10

TEEKOY RUBBERS (INDIA) LTD.

The ninth annual report of the Teekoy Rubbers (India) Ltd. (Managing Agents: East India Agencies Ltd.) for the year ended 31st March, 1953, shows a slight decline in the total crop realised from 5,10,018 lbs. in 1952 to 4,73,909 lbs. during the year under review. On the other hand, both the cost of production and the average price realised have improved. Average selling price has advanced from Rs. 126.5 to Rs. 130 per 100 lbs. Due to the increase in wages and other emoluments to labour fixed by the Government, the estate expenditure has increased from Rs. 57.5 to Rs. 69.0 per 100 lbs.

The net earnings of the Company amount to Rs. 2,03,551 after providing for all charges including depreciation and interest on debentures. The directors have recommended maintenance of the ordinary dividend at 9 per cent per annum, absorbing Rs. 90,000. Provision for taxation has been proposed at Rs. 70,150 as against Rs. 87,750 in the previous year.

The table below summarises the fluctuations in the fortune of the Company during the last three years:

	1951	1952	1953
Rubber Acreage ..	1,454	1,454	1,454
Total Crop (lbs.) ..	4,45,801	5,10,018	4,73,909
Yield per acre ..	337.5	358.0	326.0
Cost of Production (Rs. per 100 lbs.) ..	57.0	57.5	69.0
Average Selling Price (Rs. per 100 lbs.) ..	122.2	126.5	130.0
Dividend per cent per annum	7½	9	9

BALLY JUTE CO., LTD.

The Bally Jute Co., Ltd. (Managing Agents: Jardine Henderson Ltd.) has not done well during the half-year under review. The directors have listed the following two reasons for the poor results:

(a) Trading conditions during the period have not been easy. At no time during the half-year has it been possible to manufacture heavy goods at a profit.

(b) A deliberate go-slow policy adopted by members of the "Mechanical Staff" has seriously affected the productive capacity of the mill.

Net profit, after providing Rs. 55,000 for taxation and Rs. 75,000 for depreciation, comes to Rs. 61,454 as against Rs. 1,66,667 in the preceding accounting period. Dividend has been proposed for the preference shareholders at the usual rate of Rs. 3-8 per share, while no dividend has been proposed for the ordinary shareholders.

The figure for sales stands slightly reduced from Rs. 73,34,123 to Rs. 72,12,013; the manufacturing expenses also show a sizable drop from Rs. 46,33,048 to Rs. 43,58,300. The table below summarises the movements of the chief variables:

	31-3-1953	30-9-1953
Sales (Rs.)	73,34,123	72,12,011
Manufacturing Expenses (Rs.)	46,33,048	43,58,300
Net Profit (Rs.)	1,66,667	61,454
Depreciation (Rs.)	75,000	75,000
Taxation (Rs.)	Nil	55,000
Ordinary Dividend Rate per cent per annum ..	8	Nil

NEW SAVAN SUGAR AND GUR REFINING COMPANY, LTD.

The audited accounts of the above Company (Managing Agents: Messrs Karam Chand Thapar & Bros. Ltd.) for the year ended 31st May, 1953, show a profit of Rs. 1,43,260 out of which Rs. 85,885 have been provided for depreciation and Rs. 25,000 for taxation. The dividend has been reduced from As. 8 in the previous year to As. 4 per share in the year under report.

The lessees of the Company crushed 19,09,741 maunds of cane with a recovery of 10.3 per cent in 1952-53, as against 15,91,823 maunds with 10.03 per cent recovery in the previous year. The production of sugar also showed an appreciable increase from 1,59,447 maunds to 1,96,713 maunds.

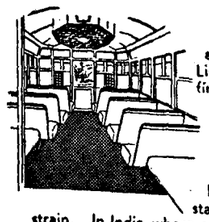
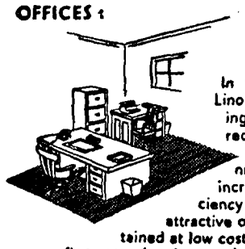
LINOLEUM—
The Versatile Floor Covering...

HOMES :



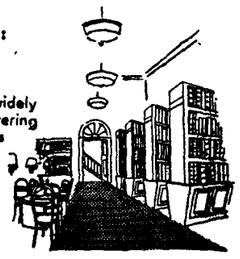
Linoleum can be laid on a simple cement or wooden floor in place of expensive marbles or mosaic floors. It is extremely comfortable to walk on, easy to clean ..hygienic...no jarring noises, no serious injury to children even if they fall. Linoleum adds colour and brightness to the home, safeguards health, promotes quiet.

HOSPITALS :



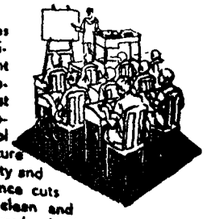
Being an hygienic, synthetic material, Linoleum is obviously an ideal floor-covering for hospitals and clinics. For nurses and doctors constantly on their feet, its "cushioning action" is a great boon; for the patients, no more disturbing noises from clattering feet.

PUBLIC TRANSPORT :



Tough, durable and easy to clean, Linoleum is the first choice for installation in public conveyances. Railway carriages, tram cars, buses.. Linoleum stands up to the strain. In India where so much luggage is carried in railway compartments, Linoleum seldom scratches or gets torn.

OFFICES :

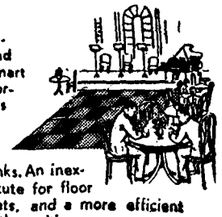


In the office Linoleum flooring effectively reduces noise and personnel fatigue, increases efficiency. For an attractive office maintained at low cost, Linoleum as a floor-covering is a real, long-term investment bringing everyday returns.

LIBRARIES :

Linoleum is widely used for covering library floors because it minimises noise, makes for that quiet atmosphere so essential for concentration. No more screeching chairs or clattering feet.

SCHOOLS :



Because it reduces noise and contributes to a bright atmosphere Linoleum is a most effective floor-covering for school rooms and lecture halls. Its durability and ease of maintenance cuts costs. Easy to clean and hygienic it safeguards the health of the youngsters. Particularly suitable for gymnasiums and recreation rooms.

SHOPS :

For effective decoration of shop interiors Linoleum is unrivalled. It stands up to the heavy traffic on shop floors and the constant use of counters. Wash it clean at shutting-up time, and have a bright, new floor the next morning.

HOTELS AND RESTAURANTS :

Hotel managements have found in Linoleum a smart and durable floor-covering that is easy to clean and does not soil from spilled food or drinks. An inexpensive substitute for floor rugs and carpets, and a more efficient floor-covering than either.

Because of its resiliency, durability and economy Linoleum has become the world's most preferred floor-covering. We now offer this modern floor-covering in a wide range of patterns and vivid colours. Besides specialising in laying we can also suggest artistic floor designs to suit individual tastes and needs. Consult us or see our distributers today !

INDIA LINOLEUMS LIMITED

8, ROYAL EXCHANGE PLACE, CALCUTTA-1

COMMODITY NEWS AND NOTES

NATURAL RUBBER

World output of natural rubber in November was 140,000 tons as against 142,500 tons each in September and October, according to the Rubber Study Group. This raises the total for the first 11 months of 1953 to 1.55 million tons. The production for 1953 can easily be estimated to be a little less than that for 1952, which was 1.8 million tons. Consumption for 11 months of 1953 was 1.43 million tons, leaving a surplus of about 120,000 tons. Although this surplus is not very large, yet over the past few years production substantially exceeded consumption leading to an accumulation of stocks. This accumulation resulted in spite of the strategic stockpiling, which too is now close to realization.

The price of natural rubber in relation to synthetic rubber has been falling continuously. During 1952, prices of top quality natural rubber averaged about 60 per cent higher than those of United States synthetic rubber, but now the two prices are almost at par with each other. The accumulation of stocks of natural rubber, in spite of steep downslide of prices, has created a serious problem if not a crisis for natural rubber industry.

Whether U.S.A. will take any positive steps to assist the rubber-producing areas is problematic. While United States is the major consumer of the commodity, she is also the producer of 90 per cent of synthetic rubber. In view of the growing stocks, America planned reduced production in several of her synthetic rubber plants.

The solution to the present impasse is the removal of the threat of synthetic to natural rubber industry and creation of fairer conditions of competition between the two. If a further fall in the prices of natural rubber is permitted, South-East Asia will be faced with a serious economic crisis which in turn may accentuate the already existing threat of Communism in that region.

INDIA'S JUTE EXPORTS IMPROVE

With larger jute exports between July and December, the year 1953 ended with a total export figure of 745,000 tons as against 735,000 tons in the previous year. Jute stocks which rose to 139,000 tons in May declined to 98,000 tons in November. India's share in the total of U.S. imports of hessian improved last year. Dollar exports amounted to 138,000 bales during January-October 1953 as against 191,000 bales for the 12 months of 1952. The production of jute goods, however, fell during 1953 owing to the reduction in the weekly working hours from 48 to 42.5. The production figure was 950,000 tons in 1952 and about 870,000 tons last year. In respect of raw jute although a minimum of 18 lakh bales are licensable annually from East Pakistan, the Indian mills have only taken 7.5 lakh bales since last July. The total annual requirements of the industry are about 57 lakh bales. The carry-over into 1952, however, was 16 lakh bales and the domestic crop was of the order of 30 lakh bales.

RAW JUTE EXPORTS FROM EAST BENGAL

The export of raw jute from East Bengal in the current season's first four months from July to October 1953 totalled 17,08,196 bales, valued at Rs. 17.47 crores. This was against 12,35,911 bales, valued at Rs. 12.54 crores during the corresponding period of the last season. Of these 17,08,196 bales worth Rs. 14.97 crores went to overseas countries, and the balance valuing Rs. 2.5 crores to India.

There has been a spurt of buying in the East Bengal jute market by Poland and Russia during the past few weeks. Poland has so far bought 40,000 bales and proposes to buy another 20,000 bales, while Russia has bought a little over 30,000 bales and is negotiating for a further quantity ranging anything between 60,000 and 100,000 bales, according to competent trade associations.

COKING COAL OUTPUT CEILING FOR 1954

The Government of India have decided to peg the production of selected A and B grade coking coals in 1954 to 7.4 million tons and grade one and two coals at the level of 1952. The production of selected grades of coking coals during the first 10 months of 1953 was 6.4 million tons as against 6.41 million tons during the corresponding period in 1952. The total production in 1953 is estimated to be about 7.3 million tons. Production of grade one and two coking coals respectively was 3.02 and 2.43 million tons during the first 10 months of 1953.

IRON SCRAP EXPORT QUOTA FOR 1954

The Iron and Steel Controller, Calcutta, has informed the Madras Tamil Chamber of Commerce that the Government of India have decided to allow the export of iron and steel scrap up to a total of 65,000 tons in 1954. These include turnings and borrowings, auto-scrap, condemned old and broken machinery parts (not more than 5 per cent of which will be cast iron), sheet cuttings and punchings. Ceilings for the first four categories have been fixed at 50,000 tons and the remaining 15,000 tons for the last category. Licences will be granted to individual exporters on the basis of total exports in the two previous years, except in the case of sheet cuttings, for which licences will be issued to organized associations and owners of baling presses. The ceilings are likely to be reviewed after June 1954.

CASTOR OIL EXPORT DUTY CUT RUMOURED

The oilseeds market in Bombay has been witnessing a spate of rumours that the Government will announce a cut in the export duty on castor oil at the end of the current month. The need for a reduction in the export duty has been repeatedly brought to the attention of the Government and even the Indian Central Oilseeds Committee has pleaded for it. Although there has been no clear indication of the Government's mind, a section of the trade feels that the duty will be reduced to Rs. 100 per ton. These hopes have assisted the recent upward trend in the prices.

GROWING IMPROVED VARIETIES OF COTTON

The 69th session of the Indian Central Cotton Committee, which will be held in Bombay on February 3 and 4, will discuss questions relating to improved methods of cultivation and development of better varieties of cotton, and cotton research. Mr. R. K. Damle, Secretary of the Union Ministry of Agriculture, will preside over the session.

EXPORT OF SILK WASTE

In a Press note dated March 12, 1953, the Government of India had announced that export of silk waste of West Bengal, Bihar and Assam origin would be licensed freely for shipment up to December 31, 1953. Pending finalisation of the export policy to be adopted during 1954, the Government of India have decided to extend the free licensing of silk waste of West Bengal, Bihar, Assam and Madhya Pradesh origin for shipment up to March 31, 1954. Shipment will be allowed only from the port of Calcutta as hithertofore.

"Five wonderful years! Time to build, time to create. For my child it will bring health, free schooling. For my family, security . . . may be, with hard work, a home to call our own!"

Nearly a quarter of the funds of the Five Year Plan will be used in increasing, improving and widening the scope of our Social Services. Rs. 425 crores will go to raising the standard of living of the people, training 13,000 new doctors, 20,000 new nurses and midwives. By 1956, more than 60% of all children over six years of age will be in our 2,02,142 primary schools. This long-range planning makes manifest our faith in the future. Here, indeed, is . . .

a pledge to posterity

Lakhs of tons of Steel will be used to implement the many diverse projects of the Plan. And so, in numerous significant ways Steel will provide the foundations for a richer, more rewarding future for our nation and our people.

NOTES: (a) Industrial schemes and projects under the Defence Ministry, including the Hindustan Aircraft Ltd., Machine Tool Prototype Factory and Radar and Wireless Equipment Project, are not considered here. (b) Projects Nos. 4, 5, 9, 13, 17, 19 and 21 went into production during 1951-52.

(1) Recoveries by sale of ships built at Vizag were of the order of Rs. 88.00 lakhs in 1951-52, Rs. 2,96.56 lakhs in 1952-53; they are not deducted from the total investments.

(2) This includes a loan of Rs. 28.0 lakhs for the purchase of Vizag built ships and a subsidy of Rs. 1,10.6 lakhs.

(3) This includes a loan of Rs. 52.0 lakhs for the purchase of Vizag built ships and a subsidy of Rs. 80.0 lakhs.

(4) Investment up to 1950-51 was of the order of Rs. 11,18.0 lakhs.

(5) Including Rs. 57.0 lakhs from W.H.O. and U.N.I.C.E.F.

(6) Excluding an investment of Rs. 50.0 lakhs in 1950-51.

(7) Including 350,000 dollars from W.H.O. and U.N.I.C.E.F.

(8) Excluding the "Charges in England (Stores)" amounting to Rs. 11.33 lakhs in 1952-53, Rs. 30.21 lakhs in 1953-54.

(9) Of which, investment of Rs. 40.0 lakhs has not been finally decided upon.

(10) The projects are to be associated with the private enterprise (Birla Brothers) shortly.

(11) Including the Travancore-Cochin's Ceramic and Porcelain Factory and the Mysore State's Projects, including Porcelain Factory, Soap Factory, Silk Weaving Factory, Implements Factory, Electric Factory, Electric Meters Projects, Fruit Canning and Kankanhali Silk Filature Project.

Republican Recipe

THE new year has begun in the United States with a spate of Presidential messages intended to clarify Republican policy. Normally speaking, these Presidential pronouncements on local issues in American politics, on the Benson plan for farm-support, the revision of Taft-Hartley, and the recommendations on housing and health for example, and even the budget message itself should be of little interest outside the American orbit. But the world, or rather the free world, is rapidly becoming integrated. As every year passes, the state of the American economy becomes more and more important to the rest of the world. Indeed, it can fairly be said that to some countries, American issues, as affecting the United States national income, are even more important than their own domestic economic policies.

The economic situation at the present time is however not simple. Every financier in a modern State has faced the problem of deciding whether he is going to budget for a recession or an inflation. The condition of the United States economy at the present time conspicuously illustrates this fact; and budget makers, planning well in advance of events, have to make up their minds and to take a stand regarding the future trend of events—always a task of some difficulty. Moreover, Republicans have had to make their decision in the knowledge that dire forecasts of the cumulated effects of a downturn have been made.

It is true that the major prophecy now seems to have been retracted—Mr. Colin Clark now thinks that this year's American recession will be of the order of that which the sterling area survived about five years ago, and that it will not be like the 1929 depression. This widely-advertised prophecy thus merely confirms now the general expectation that the downturn, if any, will be within the limits of five and ten per cent.

The forecasts have been confusing, nevertheless. Goldberger and Klein, it is to be remembered, put the order of the recession at only 3 to 4 per cent. Woytinsky has been even optimistic. Although employment will fall, the national income, according to him, is expected to reach a level of $385 to 390 billions, which would be well in line with the long-term trend of the American national income which has been predicted by the late Democratic Chairman of the Council of Economic Advisers.

The estimates are distinctly less discouraging now than they seemed to be some time ago. But nevertheless, as guides for action they cancel out; and the diffi-

cult question of what momentum, if any, is to be given to the American economy has had to be solved within the Treasury itself, with such advice as it can get from the now-liberated Federal Reserve System.

It is against this general background that the recent farm policy message, which proposes to go back to the 1948 and 1949 legislation, and to modernise parity, to reduce supports, and to make the support flexible, depending on the crops, must be understood. The Randall Commission's report, which would end economic aid, liberalise imports into the United States, and remove the unnecessary restraints on East-West trade in other than strategic materials, is also in line with this policy of withdrawal from a planned control of the economic system—with its concomitant of big government. Monetary policy is also now in line. Within the limits of practicability, the Treasury is now to suit its borrowing to the market and adjust it to the judgment of the federal system, rather than to seek the initiative and direction. The encouragement of private foreign investment abroad, recommended in the Randall report, and the attitude to sterling convertibility, which briefly is that the United States can help the process, but not hold itself responsible for bringing it about, are likewise merely the result of applying, in the sphere of foreign economic policy, the philosophy in which the Republicans believe.

This is not clearly a policy for a depression. Indeed, the administration has not pressed for the repeal of the automatic increase in the social security tax, which took effect from the beginning of the year; and although the lapse of the increases in individual income taxes and of the excess profits tax are now faits accompli, the tax laws, which expire at the end of March, are intended to be re-enacted—which is not quite what some of the gloomier forecasters would have recommended. The Republican proposals do not envisage a serious recession or a depression. On the other hand, they look much more like a policy for the chronic American problem of big government.

In case there is a mild downturn, which is quite different from a depression, (and in this context it might be relevant to remember that the present Chairman of the Council of Economic Advisers thinks that but for the advertisement which it had, the 1949 recession might not have been noticed) there are proposals, however, in the President's economic message which are intended to halt this recession before it becomes dangerous by cumulation. There is reiteration of the role of monetary policy, and of the determination to effect such reductions in taxation and to promote such public works as may be needed in order to arrest decline in the national income. How far these remedies may be adequate in the event of a serious downturn may be debatable. But if the prospect in store is not a depression, but only a mild downturn, the situation will be entirely within control; in that case, a depression psychology, against which any remedies which government might propose are useless, would be no longer at work. Only minor corrections will be needed; and appropriate changes in the short-term in such policies, consistent with the long-term pursuit of the traditional Republican objectives, might be quite adequate.

Some of the more specific proposals of the economic message are intended to make this assurance regarding the future even more certain. The extension of insurance against unemployment to an additional 6.5 million men, extension of social security to 10 million additional persons, and the increases in the social security benefits, which have been proposed, can all be defended on their own merits. But obviously, these proposals have anti-depression implications also—to make them all the more welcome. The reinsurance arrangements in connection with public health, the proposed insurance of long-term mortgage loans, slum clearance, and the development and maintenance or even an increase of the expenditure on highways have also been recommended in recent messages. They will be further props to the economy in the coming year.

There is thus a programme. Residually, however, the Republicans rely on private enterprise to take care of the economy; and as an earnest of their faith, the budget message has proposed tax reliefs, like the liberalisation of the conditions for carrying back losses or for depreciating investment. In the conditions which the Council of Economic Advisers anticipates in 1954, there will be no need for panicky action, and private enterprise is to be trusted to maintain the level of the national income.

As an economic policy at home and abroad these proposals have obviously been conceived as one whole. Whether they are as adequate for the times (from the point of view of the rest of the world) as the administration obviously regards them to be for the United States might be debatable, perhaps, in the opinion of some persons and countries. Even a five per cent recession, as has been pointed out, might, for example, go a very long way; and this may well impair the position of the sterling area. Prima facie, therefore, the British Treasury has still need to worry—the more especially because the doctrine of non-discrimination as a general line of policy stays put.

Here, the remedies which the Republican proposals apparently offer are a renewal of faith in a multi-lateral free-enterprise system. After all, if a major economic depression in the United States is not anticipated, the worst that the sterling area will have to face will be a small-scale crisis, like any one of those which the sterling area has managed to survive in the post-war period at intervals of every two years or so. There is no reason, however, to anticipate that the crisis will be prolonged or that it will be disastrous, just as there is no reason to anticipate that the American depression will prove to be embarrassing at home.

There are built-in stabilisers in the English economy, as there are in the United States. Moreover, in the event of a sterling crisis at any time in the future, the wider use of the temporary facilities offered by the International Monetary Fund is not only possible, but, as far as one may read between the lines of various recent pronouncements, may positively be encouraged. Increased trade within the sterling area and Western Europe as a crisis measure, or ad hoc remedies to the situation which actually confronts sterling, may also be considered as residual measures—to be examined later, if necessary at all.

The recent declarations of policy on both sides of the Atlantic, taken together, certainly imply that the sterling area's problems in the event of an American downturn may be more complex than those of the United States itself. But there is no reason at all why they should be intractable. There are off-shore purchases, Russian gold-sales, and the promise of help from established institutions, to help out in the event of a crisis. All the prophets of gloom may well be discredited.

On the whole, therefore, there is every reason to be confident and cheerful. After all, the forecast of a national income of $390 billions in the United States in 1954 may still turn out to be right. In that case, what the Republican party now seeks actually to achieve with its proposals, namely, the freer flow of trade, and the rehabilitation of the spirit of enterprise, may be just the things which the world as a whole now needs. The cheerful and optimistic undertone of the many messages which have announced or re-shaped the policy of the United States in recent weeks should not, in short, be missed.

The Randall Report

WITH the release of the main body of the Randall commission's report, the initiative in foreign economic policy has now been passed back from the legislative to the executive branch of the United States Government. The decisions which will be taken on the basis of this report rather than this report itself are, therefore, of interest at this stage. The latest message from White House to the Congress, transmitting the report of the Council of Economic Advisers, contains, no doubt, reassuring statements intended, perhaps, for the rest of the world. The trade policy of the United States, it has been realised, has been debated from year to year; and other nations have entertained doubts regarding its continuity. It is intended that trade policy and customs administration should provide instead "a sense of continuity, stability, and forward movement to the rest of the world". If this aspiration is at all to be realised, the political background of the report must, however, be appreciated; and the hard realities of the existing situation must be assessed.

The reaction to the report, barring polite comment, has not been favourable. It has reflected the disappointments of many who hoped that with just a few more steps left in order to reach the goal of convertibility, American policy would be much more positively helpful than in fact it has been. There has been little justification, however, for this latter hope. The conflict of opinion in a democracy which is as vital as is that of the United States, and the difficulties of the American constitution, which have been underlined by such writers as Edward Corwin, have not disappeared; and the fact that reports such as that former ambassador Douglas do not influence very much the course of events should by now be clear. It must be recognised much more widely than it apparently is that policy has to be framed in the United States against the background of local issues and programmes. Some effort should, therefore, be made to assess the worth of the Randall report in correct perspective.

Once this effort is made, some of the compulsions of the situation can be appreciated. The present administration in the United States is not only committed to a long-term reduction in the size of the federal budget, but is also under the necessity of making its practice conform immediately to its theory. An increase in taxation is not favoured by the administration itself, while an increase in the debt will be illegal, in view of the existing limits for the federal debt, which Congress has so far been quite unwilling to change. A trade policy for the United States which is based on the continuance of foreign aid 'a outrance' would, therefore, hardly fit into the general scheme of Republican policy. If the Randall commission had recommended this aid, as other commissions before it have done, its report might have become, already within the period which has elapsed since it was submitted, one of those well-meant, but academic documents, setting out the ideal to be attained, rather than the reality to be worked for, and, if necessary, to be fought for. It is a virtue rather than a defect of the Randall commission's report that it is severely and even disappointingly practical.

The remedies which it offers to the rest of the world in order to overcome the dollar shortage are mainly three. One is that the trade and customs policy of the United States should be liberalised as much as is at all practicable in the circumstances of today, and that the meaningless restraint on East-West trade should disappear. Another remedy is to ease the conditions on which stand-by credit can be made available from existing institutions. A third recommendation, which is offered for what it is worth, is that American private foreign investment in the rest of the world must be encouraged, by means of such action as it is possible for the United States to take. It is possible to think, even if one is disappointed that the Randall commission has not taken convertibility a stage further, or proposed a sure-cure for a possible American depression, that these recommendations which it has in fact made are of some value.

It has been fashionable recently to belittle the effects of trade liberalisation in the United States. The peril point and escape clauses are, for example, very much there. They are to continue according to the Randall report; and the Piquet report has demonstrated on an earlier occasion that the quantitative effects, by way of larger imports into the United States from the rest of the world, will not be appreciable in the event of trade liberalisation in the United States.

To these arguments, however, there are, at the moment at any rate, some adequate answers. The action actually taken on the applications made under the escape clause shows that the practice of the United States may be much more liberal than its theory. The annual growth of the United States economy also shows that it is possible to look forward to the future for the really appreciable gains from trade liberalisation. Even otherwise, the economic growth of the rest of the world, and the demonstrated rate of growth in the United States national income must, together, enlarge the gains to the rest of the world from a liberalisation and simplification of United States trade policy. The pessimistic estimates of the Piquet report cannot, therefore, be valid through time, if indeed they are valid now.

On a little reflection, it is possible also to see that the other two recommendations are likely to be more helpful than seems possible at first sight. In its statement to the Randall commission, the Fund had referred to the size of its resources, largely unutilised; it had also entered the caveat at the same time that in the event of a serious recession or convertibility, a temporary increase in its resources would be necessary. The Randall commission's recommendation that aid should be given from the Federal Reserve System must be considered in this context; and so considered, it can be regarded as fairly satisfactory. The tax concessions in order to help American foreign investment abroad, which have been announced in the recent budget, are at the same time evidence of the desire to help, in ways in which Republicans believe; after all, in spite of so much that has been said for official rather than private investment, an increase in the latter type of investment, if it materialises, will hardly be unwelcome.

The important question at the moment is thus not how adequate the report is, but how far it will be implemented. All in all, the Randall report, on second thoughts, is not really so unimportant, or vague, or inconsistent as it may at first appear to be. It is a hard-headed document, intended unlike some other recent reports to shape immediate policy. That it goes pretty far, though not as far as was hoped, must be obvious from the opposition, both within and without the commission, which is now becoming increasingly evident. If the Republican administration withstands opposition and is successful in resisting attempts to whittle down the present recommendations, it may yet be able to make a contribution towards increasing trade and prosperity throughout the world.

Colleges After Independence

THE expansion of higher education in this country has proceeded since independence at a pace which has certainly surpassed expectations and precisely because of such a rate of development attempts to cope with the dimensions of the problem have proved utterly inadequate. The process of expansion could not have pursued the course it did without prior expansion at the secondary stage. In fact, education at all levels, and higher education in particular, has been spreading on a substantial scale for some years past, but the awakening of a new consciousness and the impact of new aspirations aroused by independence have given a powerful impetus to the growth for which the resources provided in money as well as the teaching staff are certainly not equal.

This phenomenon could not allow a sense of complacency to be created and quite reasonably it has proved to be a source of considerable concern. Expressions of views freely ventilated by leading educationists do not conceal the disappointment at the drift which the course of the development of higher education is allowed to take. The emphasis which liberal, non-professional education at the higher levels has always received in the past continues to be the primary preoccupation even now. Attempts to give a practical and technical bias to the system have a long way to go. Even in the sphere of general education disproportion persists. What is deprecated in this sphere is the decline of humanities which must be recouped in reasonable proportion. There have been repeated pronouncements of a new policy to rectify the imbalance to adjust the educational system to a new order of life. Their sincerity need not be questioned. But what surely needs to be questioned seriously is whether there has been enough and real planning to put that policy into action.

One striking feature of the development of higher education in the post-independence period is an increase of about 50 per cent in the total number of universities to 30. The trend of development has predominantly followed a regional bias of which four new universities in Bombay State and one each in Bihar and Jammu and Kashmir States are typical representations. Regionalism is not essentially a trend to be regretted and there is much to be argued in its behalf on merit. It has made for compact universities committed to specialisation in certain selected faculties and in any event the unwieldy jurisdiction of the former Bombay and Calcutta universities was overdue for readjustment for a number of years past. The criticism against easy multiplication of universities relates in fact even to the earlier period since inadequate attention was paid to the basic factors of finance and teaching staff. This disregard has brought its penalty in the form of a positive deterioration in the standards of the universities. Future expansion must pay proper heed to the University Education Commission's dictum against the grant of a final charter to a new university unless rigid tests of financial soundness and quality of teaching staff are fully satisfied.

Information on the statistical growth of arts and science colleges as also of the number of students on their roll is far from complete. But on the basis of such information as is released by official sources, an utterly gross disparity between the increase in the number of colleges and the number of students is disclosed in the five years between 1947-48 and 1951-52. The increase of over six per cent in the number of colleges in the latter year to 488 has been tremendously outpaced by an increase of 76 per cent in the number of students to 323,682. No estimate of the increase in the teaching staff is available, but it is undeniably very low. The resulting evils of excessive crowding of students in the higher educational institutions have been nominally mitigated by the technique of the shift system and they are exhibited at their worst in the standards of education. Invariably in each university the same saddening story of falling standards has been repeated. The legacy of the lure of college education predominantly for clerical and higher jobs needs to be destroyed, but the way to its destruction cannot be sought through artificial and arbitrary restraints on admission. Such restraints are definitely repugnant to the democratic principle of equality of opportunity as also to the sound growth of a healthy system of education. Aspirations of young men for careers need to be diverted to other gainful channels and this is essentially the function of a diversification of the avenues of employment in industry, business, agriculture and the social services—in effect, of economic development in every direction.

Still another cause of the decline of university education is to be found in a tragic source—the financial plight of teachers. The quinquennial report on education for 1947-48 to 1951-52 brought out by the Union Ministry of Education comes to some very startling conclusions about the salaries of university and college teachers. Estimates for 1951-52 reveal that 30 per cent of the teachers came within the salary group of Rs. 100 to 150 per month, 22 per cent within the group of Rs. 151 to Rs. 250, 24 per cent within the group of Rs. 251 to Rs. 450, 6 per cent within the group of Rs. 451 to Rs. 650, 17 per cent in the group immediately above up to Rs. 1,000, while merely 1 per cent were privileged to receive salaries in excess of Rs. 1,000 per month. The University Grants Commission's latest directive for a minimum salary of Rs. 250 to teachers at the lowest rung is unlikely to alter this situation since a majority of them employed in the affiliated colleges are outside the Commission's jurisdiction. With at least 52 per cent of the teachers doomed to utterly inadequate salaries, the chances of attracting talent to this nation-building profession are bleak and it is hardly surprising if frustration elsewhere determines the choice of some for it.

The total expenditure on education at all levels from all sources has doubled in the five years following independence and this trend has been reflected also in the growth of direct expenditure on universities and colleges from Rs. 6 crores to Rs. 13.25 crores. But since the base year represents a situation of financial starvation the whole comparison becomes meaningless. Most of the universities are struggling on the margin and some had their solvency thrown into jeopardy.

The picture of the growth of higher education in statistical terms inevitably tends to divert attention from its genuine aspect. The goal and policy of education still remain to be remodelled to suit the needs of a free country. There is general consensus that the content of education must be changed to draw it closer to the culture of the country, while the process of transmitting the cultural and scientific advances of the West is proceeding. But it has not been translated in a new policy. This synthesis cannot be deferred long. Meanwhile, obsession with the change of medium of instruction at the university level threatens to clog the wheels of progress. Medium is subordinate to instruction and the impatience for the substitution of English by Indian languages must be restrained.

THE WEEK'S NOTES

RECESSION—THE GREAT DEBATE

The political debates in the United States, which were revived with vigour after the Brownell episode have for the moment been overshadowed by the greater debate on the nature of the American recession. Mr. Colin Clark, whose articles in the "Manchester Guardian" provoked a controversy, was present in person last week in the crowded Astor Hotel ballrooms to debate with Dr. W. S. Woytinsky, Director of Research of the Twentieth Century Fund. The outcome has been regarded as a satisfactory one. Mr. Clark's predictions two months ago looked dismal and it was not surprising that, in the eyes of American business men and economists, he should have appeared only less objectionable than the Soviet prophet of capitalist doom—Prof. Varga. At the meeting of the National Industrial Conference Board in New York, Mr. Colin Clark has modified his earlier assessment by stating that he expected a fairly serious decline with unemployment of the order of 1949 recession, not a major economic slump.

Mr. Clark now expects the U.S. downturn to last longer than in 1949 and believes that unless Government takes early action, the contraction in activity may be sharper. He has recommended large budget deficits in the next eighteen months, by deliberate reduction in taxes to create consumer spending power, at the rate of two billion dollars a month during the worst months that lie ahead. The possibility exists, according to him, of a big housing boom which would break the deflationary chain reaction. But that could only follow the decline in the relatively high construction costs which will not occur until the recession has proceeded some extent. The necessity, meanwhile, to bolster up business morale should compel budget deficits. But American economists, who do not share these fears fully, are reported to be of the view that doing too much and too early can prove as bad as doing too little and too late.

The issue has not been discussed decisively at this battle of econometricians armed with their equations. There has been uneven armour; Mr. Colin Clark's set of six equations were fewer than those of others. (Dr. Lawrence Klein uses 21 basic equations and Dr. Tinbergen 45.) Dr. Woytinsky employed a system of measuring by economic indicators. But remembering that when a pistol misses fire the butt end can be good enough, Mr. Arthur Summerfield, Post-master General of the U.S.A., denounced, at the dinner session of the same conference, the "economic jeremiads and professional demagogues who are trying to talk this country into a depression so as to further their own poiltical ends". Its moral is that recession talk can itself initiate a deflationary chain and should be avoided.

AGREEMENT ON KASHMIR ACCESSION

The talks in New Delhi on the implementation of the terms of the Delhi Agreement by Kashmir have been carried on in an atmosphere free from the constant insistence on autonomy in which the former Kashmir Prime Minister had indulged. The outcome has been full agreement on the specific steps to be taken now, which will not in any way impair or abridge the autonomy conceded to Kashmir under the old Delhi Agreement. The two major issues relate to the removal of the customs barrier in Kashmir and the extension of the jurisdiction of the Supreme Court of India to Kashmir. The customs barrier is expected to be lifted in the middle of April next, making all imported goods sold in Kashmir cheaper than hitherto. The State Government will be compensated for the loss of its customs revenue and of the right to levy income and excise taxes. Till now it was not the compensation but the maintenance of the right to tax as a feature of Kashmir autonomy that had stood in the way of agreement being reached on the questions of financial integration raised at the time of the Delhi Agreement.

The extension of the Supreme Court's jurisdiction necessarily involves the State's accession to the Fundamental Rights. Previously, the refusal of the Kashmir Government to countenance any judicial interference in the land reforms was urged as the reason for not acceding on Fundamental Rights. The agreement now reached is reported to have found a satisfactory formula for saving land reforms and certain special powers exercised in the State for security reasons. With the abolition of the board of judicial advisers in Kashmir, the Supreme Court will become the final court of appeal in civil and criminal cases. The President's prerogative powers of reprieve will also extend to Kashmir; his emergency powers, however, have to be exercised only on the advice of the State Government as provided in the Delhi Agreement. The actual terms of this earlier agreement have not been altered. The actual constitutional changes can be effected only through an order of the President under Article 370 but this requires the prior approval of the Kashmir Constituent Assembly, which is expected to meet soon to signify its approval. The position has not changed fundamentally since Sheikh Abdullah negotiated the Delhi Agreement; it has taken more than a year to get over the ex-Premier's subsequent attempts to resile from his undertaking.

OBJECTIONABLE MATTERS IN THE PRESS ACT

An Ordinance has been issued, as expected all along, to extend the life of the Press (Objectionable Matter) Act by two years from February 1, 1954, the date on which it was due to expire. The major objection to this step is the frequency with which the Executive has resorted to the issue of Ordinance as instrument of legislation. There is no excuse for the Home Ministry's failure to get the Bill introduced in Parliament in sufficient time to have it enacted well before the date of the expiry of the Act. The circumstances in which the Press Act was passed in 1951, should particularly have enjoined greater caution in this matter. The Act was then carried through in the face of severe opposition and ultimately it was the clause which limited its life to two years that reconciled many of its critics to agree to the measure. A routine extension of that life through an Ordinance is, therefore, doubly objectionable.

The two main changes which have now been made in the Press Act are retrograde. In this respect, it is in contrast to the progressive liberalisation of the provisions of the Preventive Detention Act on each occasion on which its life has been extended. The wide powers of the special jury in deciding questions under the Act—about the objectionable character of writings, the necessity for demanding or ordering forfeiture of security and the quantum of security—were cited as safeguards at the time of the original Act. All these powers will disappear. The position will now be that the jury can only decide whether a particular type of matter is objectionable or not, leaving the rest to the Sessions Judge. Moreover, if the Judge and jury in a Sessions Court gave their verdict against the State and in favour of the respondent, there was an end of the matter. The amendments now made would enable the Government to pursue the matter in appeal, adding to

the difficulties of the Press in defending its freedom of expression.

ADULT FRANCHISE FOR MALAYA

The report of the committee appointed by the High Commissioner for the Federation of Malaya to examine the question of elections to the Federal Legislative Council and the constitutional changes in the Federal Government arising therefrom has just been published in Malaya. The committee was a widely representative body and the following are the main points in the committee's report:

The present Legislative Council of the Federation should not be replaced immediately by an entirely elected council. The committee thinks that, as in similar circumstances elsewhere, the transition should be more gradual; and though it has not been possible to reach complete agreement as to the precise number of nominated members who should remain during the period of transition towards an entirely elected council, a considerable area of common ground has emerged and the committee as a whole recommends the retention of a substantial nominated element during this period. While recognising that the ultimate object must be a fully elected legislature, the committee considers that development and experience in the country has not yet reached the stage when all aspects of the political and economic life of the community would be adequately represented through the electoral process.

It is recommended that the council should have a maximum life of four years but that the High Commissioner should be entitled to dissolve it at any time whereupon all seats would become vacant. It is felt that this power of dissolution is necessary if an effective parliamentary system is to be developed. The committee unanimously agrees that all Federal citizens, provided they comply with the necessary residential requirements, should be eligible to vote at the national elections and recommends that voters should be aged 21 years or over, reckoned in accordance with the Gregorian calendar, and that women should enjoy the vote equally with men.

No claim is made that the pace of constitutional advance envisaged in the report is not too modest. It is not wholly undesirable that the progress in the conditions existing in Malaya should be gradual. The committee has rightly rejected communal electorates as they may tend to accentuate the separatist tendencies among the non-Malay racial groups.

ADMINISTRATIVE EFFICIENCY—THE ENDLESS QUEST

The search for a talisman for administrative efficiency is still on. The latest step taken in this connection is the deputation another senior official to study and report on the scope for the overhauling of existing rules and procedure. One more report will thus be added to the *many others already* on the shelves. Perhaps, these reports do not overlap as much as is generally imagined. The Gopalaswami Ayyangar report was concerned with the organisation of the Secretariat and the demarcation of responsibility. The Gorwala report dealt with the general principles to be observed in toning up the administration and the Appleby report approached the same questions from a different angle. The object now is more down-to-earth. The changes required in the procedural rules of business are to be examined and once specific suggestions are made, the bureaucratic passion for amendment of rules may be trusted to do the rest of the work of implementing them. Whether they will actually simplify the rules and the work is more than can be predicted.

It is stated that once the Centre has reformed itself, the States may be expected to follow suit. That belief proceeds on the assumption that the Centre is always ahead of the States in administrative efficiency. Actually, the administrators in many States are less constricted by coils of red tape than the Central Departments, if only for the reason that they have to deal more directly with the people and cannot always afford the leisurely ways of the Central Departments. If there had been a constant interchange of officers with the States and a freer circulation of personnel from the district levels to the Centre, the present arteriosclerosis of the Central Departments could have been cured. The required amendments to the rules would have come in the natural course. It is *hardly possible* that any single officer, however experienced, will be able to foresee the needs of every department in all its transactions to determine what is best for each in a short period. The present step is significant only as the manifestation of the discontent over the existing state of affairs.

There is sufficient reason for dissatisfaction with the nature of recruitment of personnel for Central services and with the system of promotion. The Public Service Commission has the final voice, but it has not earned public confidence in the manner in which the judiciary has earned a reputation for competence and impartiality. Especially in the matter of promotions, the Commission's tests are apt to prove less reliable than the assessment of merit by departmental committees. Moreover, the time of the services is wasted too much in the interpretation of rules relating to conditions of service in each department instead of being fixed on the regular work.

PROGRESS OF ANTHROPOLOGICAL WORK

The work done by the Anthropology Department of the Government of India in various fields is to be reviewed by the Central Advisory Board of Education at its next session commencing at New Delhi on February 7. Anthropology is closely related to several practical sociological problems facing the Administration. Various problems on which the Department has been working recently can help the formulation of policy. On the question of the primitive tribes, the Department is reported to have submitted to the Government a comprehensive report on their cultural and racial affinities and problems affecting their administration in the light of the experience of tribal populations in different parts of the world. A sub-station has been working at Port Blair in the Andaman Islands for establishing friendly contacts with the Jarawas, the Onges and the Sentinelese, tribes which could not be won over during the period of over 100 years of the British rule. Similarly, a survey is being carried out among the Abor tribes of the North-Eastern Frontiers of Assam, and a Field Party has visited the Tibetan border regions which have not been visited earlier by Indian Officers. The record is not unimpressive.

Records of tribal speech, music, and dances have been taken by means of cinematographic films and sound recording apparatus. Progress has been made in the restoration of pre-historical skulls in the remains of the Indus Valley and other ancient sites. Eight post-graduate students are now under training with the Department, each for a period of two years. To ensure collaboration with foreign anthropologists eager to work in India, a Visiting Fellowship tenable for two years is offered to a foreign scholar, once in two years, for research in India. But this is a field in which outside experience has to be applied in a more systematic manner and it would be desirable to explore the scope for securing technical assistance under the auspices of one or other of the various programmes.

WORLDGRAM

TRADE

Japanese Trade: Export contracts validated in 1953, amounted to $1,226,994,000 or $27,025,000 less than 1952 the Ministry of International Trade and Industry announced. In 1953 the pound area bought $341,750,000 worth of goods from Japan or 41 per cent less than the previous year. There was a marked decline in Japan's exports, ranging from 30 to 69 per cent, or such products as cotton, iron-steel and chemical fibre-goods with the exception of wool pieces. To the open account area, Japan sold $395,495,000 or 34 per cent more than 1952, with woollen products jumping nine times, cotton products doubling and chemical fibre 30 per cent up. The dollar area purchased $489,749,000 or 30 per cent more than the previous year involving cotton goods, machinery, iron-steel, chemical fibre and food-beverages in the order mentioned. Shipments to various areas in the first and second half of 1953 were: the dollar area—$250,292,000 and $239,457,000; the pound area—$108,620,000 and $233,127,000; the open account area—$52,195,000 and $243,300,000. The exports were: cotton textiles; cotton yarn, rayon textiles: rayon yarn; staple fiber textiles, 187,700,000 yds.; staple fiber yarn, 27,100,000 lbs.; silk textiles, iron-steel, lime nitrogen, ammonium sulphate, urea, superphosphate of lime, ammonium nitrate and synthesized fertilizer.

INDUSTRY

The Australian Wildcat Well: The Australian Wildcat Well, known as "Rough Range No. 1", reached the depth of 5,417 feet on last January 5th. This represents nearly 2,000 feet of progress below the discovery level of 3,605 to 3,620 feet where oil flowed in a 25-hour planned test early in December for the first time on the continent of Australia. At that time, Caltex announced a test-flow rate of some 550 barrels per day through a ¼" bottom-hole choke. Deep drilling is continuing in accordance with original plans toward the objective of 12,000 feet or somewhat lower with thorough tests to be made of all strata penetrated.

* * * * * * *

A "Flexible" Laboratory for Plastics Research: The first "Flexible" Laboratory in Britain was recently opened at Welwyn Garden City, and is now the home of I.C.I.'s Plastics Research, the largest of its kind in the country. A three-storey building, costing about £3,00,000 (Rs. 40,00,000), has been termed "flexible" to describe its architectural style. To suit the work of the Research Centre the structure is one whose interior arrangements can be quickly and cheaply altered as new processes are evolved in the plastics industry and new arrangements must be created to cope with them. The panels for walls and ceilings are devised on what is called a four-foot module, i.e., they are four feet in width and multiples of four in length. They clip into place, and are held by only two, or at most four, threaded bolts. This means that panels can be dismantled easily and replaced, and the walls of a room can be picked up and moved to new locations.

* * * * * * *

Developing Pencil-Making as a Cottage Industry: The Forest Research Institute, Dehra Dun, has succeeded in finding a substitute for imported 'Juniper' salts for the manufacture of pencils in India. Effort is also being made to develop the industry on a cottage-scale basis, in view of the demand created by the rapid expansion in primary education all over the country and as a much needed supplementary occupation to the rural population, especially during slack periods in agricultural operations. The Forest Institute has devised a set of simple pencil-making tools costing approximately Rs. 75, operatable by unskilled people with little training.

FINANCE

Japanese Purchases From I.M.F.: The Government of Japan purchased £4,300,000 ($12,040,000) recently from the International Monetary Fund. Japan had previously purchased £18 million sterling ($50,400,000) from the Fund during September and November of the year 1953.

* * * * * * *

Rockefeller Foundation's New Grant to India: The Rockefeller Foundation, a U.S. private philanthropic organization, made grants totalling $5,367,964 (approximately Rs. 2½ crores) during the fourth quarter of 1953. Included in the grants were funds totalling $68,450 (approximately Rs. 3,27,191) to aid a long-term investigation of population dynamics in India. Three co-operating institutions will conduct the study over a ten-year period in villages in the Punjab State. The co-operating groups are the School of Public Health of Harvard University, the Christian Medical College of Ludhiana, and the Government of India.

* * * * * * *

U.S. Aid to Nepal: The U.S. has helped Nepal to start a programme to train village-improvement workers. This programme will provide more than 4,000 trained Nepalese workers within the next five years. The joint U.S.-Nepal technical co-operation campaign is also conducting projects in plant disease and insect control, livestock improvement, improved farm tools, irrigation and adult education. The U.S. has earmarked $600,000 this year for the Nepal programme. Last year, the U.S. contribution was $497,000. The Government of Nepal is contributing about $500,000 in rupees.

* * * * * * *

Deficit Envisaged in New Bonn Budget: The West German Government recently presented the Federal Budget for the fiscal year 1954 to their Parliament. The 27,100 million Deutsche marks ($6,452 million) budget shows a deficit of 2,000 million Deutsche marks, and provides 9,000 Deutsche marks for Allied occupation and defence. Social expenditures are set at 8,075 million Deutsche marks. Although apparently less than the 1953 budget, the decline is illusory as receipts from U.S.A. and the International Bank of Reconstruction and Development Loans have been removed, and are being handled separately.

TRANSPORT

New Records for T.W.A.: In 1953, Trans World Airlines topped all previous cargo-carrying records. New records were set for ton-miles flown all along the airlines' 33,000 miles of domestic and international routes. Last year on routes within the U.S.A. the T.W.A. flew 18 million ton-miles of cargo, a 21 per cent increase over 1952. The airline had a 10 per cent gain on its overseas routes when the cargo ton-mileage almost reached 8 million.

AGRICULTURE

Irrigation Projects in Rajasthan: The Rajasthan Government have sanctioned the construction of a bund on river Kotheri in Udaipur Division at Meja at an estimated cost of Rs. 59 lakhs. This bund will irrigate 37,000 acres of fertile land in Udaipur Division. This is one of 19 medium irrigation projects included in First Five-Year Plan for which a sum of Rs. 388 lakhs was provided. Subsequently the Planning Commission sanctioned a further sum of Rs. 2½ crores for the medium

projects. These schemes in all will irrigate 6 lakh acres of land.

LABOUR

I.L.O. Experts to Consider Problem of Co-operatives: A report on the problems of the world co-operative movement will be put before the Governing Body of the International Labour Organization when it opens its next meeting in Geneva at the end of February. The report was prepared by twelve experts appointed by the I.L.O., who met in Geneva at the beginning of December. During their six-day session, the experts considered such questions as co-operative legislation, inter-co-operative relations, the organisations and functions of Government services, and I.L.O. action in the field of co-operatives, particularly through technical assistance to underdeveloped countries. The experts were selected from a dozen countries in Asia, Europe, Latin America and the Near and Middle East. They laid special emphasis on the need for technical aid in the training of co-operative leaders, and in the establishment of co-operative societies of different types.

* * * * * * *

Labour Welfare in Mica Mines: Over 41,000 mica mine-workers in Bihar and 87,654 in Madras received medical aid under Mica Mines Labour Welfare Fund schemes during 1952-53. In Bihar, at the Kodarma hospital, 2,732 mica miners were given treatment as compared with 2,931 during the previous year. Mobile medical units at Kodarma and Dhorakola rendered treatment to nearly 11,500 cases as compared with 6,369 during the previous year. The dispensaries at Dhab, Dhorakola and Ganpatbaghi attended to 26,875 old and new cases as against 24,357 in 1951-52. In Madras, the total attendance at three dispensaries at Sydapuram, Katichedu and Talupur was 137,654. At four maternity centres, 466 cases were handled during the year. In Bihar, over 1,42,000 Paludrine tablets were distributed to mine workers as a preventive measure against malaria, while in Madras, about 20 million square feet in the mining area were sprayed with D.D.T.

POPULATION

Seventy Per Cent of World's Population Undernourished: The United Nations Food and Agriculture Organization reports that in the 1952-53 season, for the first time since before World War II, the world's total food production caught up with the growth in population. The F.A.O. report points out that this favourable trend is not by any means true of all regions. People in many areas, especially in the Far East, still have less food than before the war. According to the F.A.O., 70 per cent of the world's people do not eat enough to maintain their health and strength. The report stresses the immediate need for greater agricultural production in the underdeveloped areas.

MISCELLANEOUS

Sickness Expenditure in the U.S.A.: In one year illness costs the families of the U.S.A. $10,200 million, and puts 8 million people (16 per cent of total population) into debt. Voluntary health in finance extends over 89.5 million people (58 per cent of population). The total private medical bill of the nation exceeds $9,000 million a year—an average of nearly $200 per family.

* * * * * * *

U.N. Convention on Refugees: Australia has removed the last legal obstacle from the Convention on the Status of Refugees. As a result of this ratification, the Convention comes into force from April 22. The Convention establishes minimum rights for the 2 million refugees under the protection of the Office of the U.N. High Commissioner for Refugees.

* * * * * * *

N.A.T.O. Bases Under Way: The North Atlantic Alliance has started construction of $44.8 million worth of new military training bases in six European countries. The programme designed to increase and ensure the readiness of the N.A.T.O. troops for combat, coincides with the growing concentration by N.A.T.O. planners on reserve forces and a long-term "depth" of defence. Air training bases will be built in the Mediterranean countries—chiefly Italy and Greece. They will be attached to N.A.T.O. airfields, 160 of which have been built or are nearing completion.

* * * * * * *

Encouragement of Popular Literature: The Government of India, anxious to encourage the growth of wholesome literature in all Indian languages, and specially in Hindi, have instituted the following measures for the purpose: (1) Authors and publishers are being invited to submit books for approval. Any book which is adjudged of sufficient value will be approved, and at least 1,000 copies of each approved book will be purchased by the Government of India for the Community Projects. Books may be submitted in manuscript by authors or in printed form by publishers. (2) Out of the approved books, the Government of India will give prizes to a number of authors. Twenty of these prizes will be given in the first year, out of which five will be worth Rs. 1,000 each and the rest of Rs. 500 each. (3) The Government of India will also encourage the translation of good books from regional languages into Hindi and from one regional language into another. It will, in particular, help in the publication in all Indian languages of the books for which prizes are awarded.

* * * * * * *

National Malaria Control Programme: Over 43 million people all over India have been protected as a result of the National Malaria Control Programme, during the period from April to November, 1953. During the same period over 8½ million houses have been spread with insecticides and about 345,000 malaria cases have been treated. About 75 million people suffer from malaria in India annually, and about 800,000 deaths are directly attributed to malaria and a similar number of deaths occur annually due to its indirect effects. The Planning Commission had agreed to set apart a sum of Rs. 10 crores, as the total contribution of the Centre including foreign aid, towards the cost of the programme over a three-year period. This amount was estimated to cover the formation of 90 units in 1953-54, to be increased to 125 in the following year, the units to be continued through 1955-56. Each unit is scheduled to afford protection to a population of one million. The total population to be protected over the three-year period was estimated at 125 million out of the 200 million exposed to the malaria risk in the entire country.

* * * * * * *

International Avalanche Control: The first international conference ever to discuss avalanche control will be held in Switzerland this summer under the sponsorship of the Food and Agriculture Organization of the United Nations. The conference will be held by members of the working party on torrent and avalanche control set up by F.A.O.'s European Forestry Commission in 1951. The working party studied engineering projects and reafforestation measures in the French Alps in the summer of 1952 and this year, in Switzerland, will exchange information on an international basis on the problems of snow and avalanches. The F.A.O. will issue a report summarising European experience in avalanche control. Research stations were set up in a number of European countries, including Switzerland, Austria and France, to study the behaviour of snow under varying conditions and on varying terrains. The research carried out at these stations has proved that a high proportion of avalanches can be prevented and where prevention is occasionally not possible the time they will occur can usually be foretold with considerable precision.

NEWS IN BRIEF

INDIAN

The 13th session of the Indian Roads Congress will open at Bhubaneswar on February 5. Mr. Nabakrushna Chaudhry, Chief Minister of Orissa, will inaugurate the session. About 250 delegates from all over India are expected to attend the Congress which will last till February 11.

* * * * * * *

The Government of India have sanctioned a loan of Rs. 36 lakhs to the P.E.P.S.U. Government during 1953-54 for the land reclamation and tube-well sinking schemes. This amount is to be adjusted against the total loan of Rs. 1 crore approved for the schemes during the Five-Year Plan period. The loan is repayable, together with interest, at the rate of 4¼ per cent, in 15 equated annual instalments of principal and interest.

* * * * * * *

A World Bank Mission, headed by Mr. George Woods, arrived here recently. It will discuss, inter alia, India's proposal for a loan to finance the State steel project. The question of financing a development bank may also be discussed with the mission.

* * * * * * *

It is proposed to set up export committees for various commodities entering the export trade of India. Some of these commodities are tobacco, spices and cashew-nuts. A beginning is being made with a committee for tobacco. An export committee for textiles has already been set up.

* * * * * * *

Mr. C. F. Cobbold, Governor of the Bank of England, will arrive in Bombay on February 5, at the invitation of the Governor of the Reserve Bank of India. Mr. Cobbold is expected to visit New Delhi, Calcutta and Colombo.

* * * * * * *

The Hon. Lionel Brett, British architect and town planner, arrived in Delhi recently to attend the Regional Conference of the International Federation of Housing and Town Planning being held in conjunction with the International Low-Cost Housing Exhibition. Mr. Brett is visiting India under the auspices of the British Council, and is expected to visit Lucknow, Calcutta, Bangalore, Hyderabad, and Bombay, where he will lecture on various aspects of housing and town planning in Britain.

* * * * * * *

The annual conference of Governors and Rajpramukhs will be held in the first week of March, 1954, at Rashtrapati Bhawan. The Sadar-i-Riyasat of Jammu and Kashmir and Lieut.-Governors have also been invited to attend. The Union President will preside over the conference and the Prime Minister, the Vice-President and some of the Ministers will be present.

* * * * * * *

The Government of India have reviewed the policy with regard to the export of onions and chillies. It has been decided not to release any quotas for the export of these commodities.

* * * * * * *

The Textile Commissioner to the Government of India has warned mills and dealers of cotton that no Indian cotton might be purchased or sold or offered to be purchased or sold at a price higher than the basic ceiling prescribed for the variety, unless its staple and class were certified by the East India cotton Association.

* * * * * * *

The Government of India have now decided in consultation with the Central Board of Trustees to grant interest to the subscribers of the Employees' Provident Fund at the rate of 3 per cent during the years 1952-53 and 1953-54.

FOREIGN

Mr. Paul W. Rose of Covington, Virginia, has been appointed Director of the U.S. Operations Mission to Nepal. Mr. Rose, who was first assigned to Nepal in November, 1951 as Chief Agriculturalist under the Point-Four Programme, has been serving as Acting Director in Nepal since May 1952.

* * * * * * *

The Brush Aboe Group, England, have offered one scholarship tenable for two years consisting of a free return passage (tourist class) from the place of residence to the place of training in the United Kingdom and weekly wages amounting to about £300 per annum. The scholarship is in Mechanical and Electrical Engineering.

* * * * * * *

The 'Borgwardwerke' Automobile Factory of Bremen has concluded an agreement with the Udatin Company, Ltd. of Surabaya, Indonesia, for the establishment of a joint venture for the assembly of Borgward cars to be set up in Indonesia. Financed jointly by both the parties, finalisation of details is now being worked out in Germany.

* * * * * * *

The U.S. Public Health Service says the nation's death rate in 1953 was 9.6 per 1,000 population. It is estimated that 1,523,000 persons died during 1953. The death rate was the lowest on record, and the same as in 1952 and 1950.

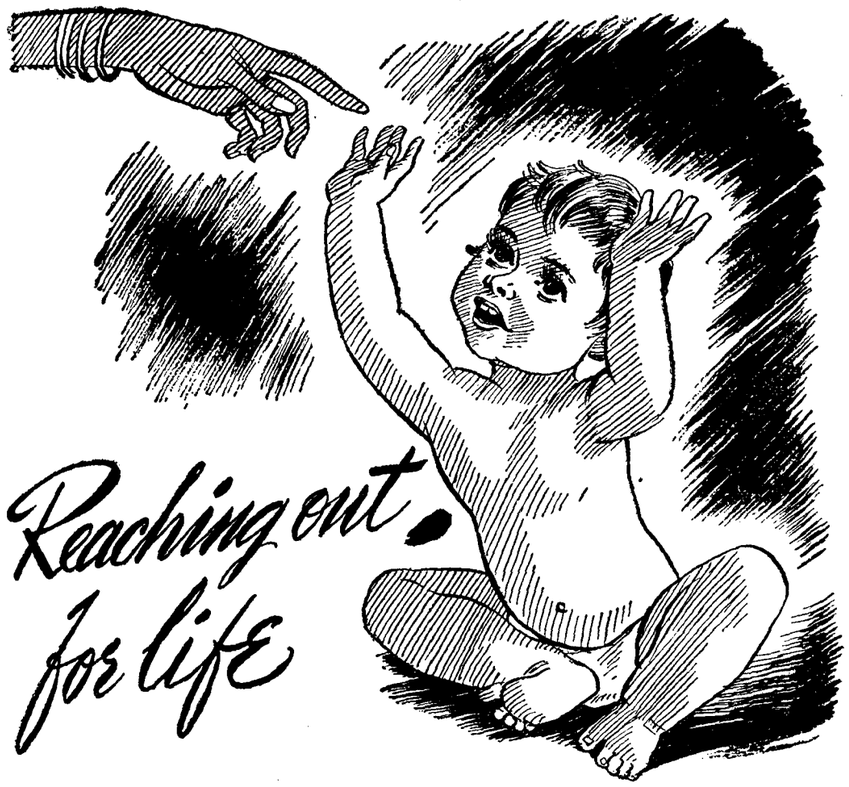
* * * * * * *

To help the Government of India obtain increased production from industry, two British experts—one in foundry operation and one in the machine-tool industry—have been made available by the British Government. Mr. A. B. Lloyd, member of the Institute of British Foundrymen, and Mr. J. D. Scaife, consultant production engineer, will spend three months visiting foundries and machine-tool factories in all parts of India. The experts' services have been made available by Britain under the Technical Co-operation Scheme of the Colombo Plan.

* * * * * * *

Mr. Harold Stassen, Director of U.S. Foreign Operations Administration, told the House of Representatives recently that the U.S.A. was paying 55 per cent of the cost of French operations against the Viet-Minh in Indo-China.

* * * * * * *



India, Germany, Austria, Yugoslavia, Pakistan, and the Near East will be major areas for relief and reconstruction programme toward which American Protestant and Eastern Orthodox Churches will be asked to contribute $8,000,000 (Rs. 3,82,40,000) this year. Last year more than $7 million (Rs. 3,34,60,000) were raised for overseas relief and rehabilitation.

* * * * * * *

France has asked for more American technical personnel to train Indo-Chinese to handle equipment supplied under the mutual assistance project. There have been several hundred American civilian technicians in Indo-China for a number of years.

A Window On The World

MAGIC FOR MODERN TIMES

BY

ODYSSEUS

I RECENTLY TOOK PART IN a pagan ritual ceremony of purification by fire against evil spirits, black magic, and witches. The procession of the whole village in which I joined, with my wife and my three children, did not take place in darkest Africa, or in some remote Bhuta-haunted swamp of Malabar, but at the village of Burghead two miles away from where I am now living in the country of Moray in north-east Scotland. Burghead is too small to be marked on an ordinary atlas but it is between Nairn and Lossiemouth, which are marked on any respectable map.

Few parts of the world can claim more history, ancient customs, and folk-lore to the square mile than the country of Moray, and I doubt whether any corner of Moray can claim to be stiffer with history and ghosts than the fishing village of Burghead, numbering around 2,000 inhabitants. The remnants of the ramparts discernible on the headland are those of the Pictish fort erected centuries Before Christ. Later, the Vikings found Burghead's sheltered bay a natural harbour and used it as a strong point from which to harry the Picts and Scots. Later again, it was at Burghead that, on August 14, 1041, Duncan, King of Scotland, was defeated in battle by the Norsemen. After this battle, his trusted general, Macbeth, murdered Duncan and made himself king, as Shakespeare relates. Macbeth's castle is a few miles away at Forres, and the blasted heath whereon the three witches—those "secret, black, and midnight hags"—uttered the weird prophecy which was to send Macbeth to his ruin, is within cycling distance of my home.

Moray was once thicker with witches than any other part of Scotland. The Church archives are full of records of prosecutions for witchcraft launched in the attempt to stamp out the black magic that was rivalling the Church's white magic. The ritual of the Clavie which has kept the witches away from Burghead for some two or three thousand years can be traced to Druidic purification ceremonies lost in the mists of time. The Druids were the priests of the old Celtic races of Gaul and Britain. Much of our information about them comes from the Romans who conquered these parts at various B.C. dates.

THE FIERCELY FLAMING "CLAVIE"

At nightfall on January 11 (that is, on the last day of the year in the old unreformed calendar), the King of the Clavie (a Gaelic word meaning "torch") filled a barrel with staves and tar, as his predecessors have done for centuries, fixed the barrel into a wooden receptacle on the end of a pole, set the wood ablaze, and lifting the structure onto his head amidst the cheers of the assembled villagers, bore the flaming barrel in triumph through the streets.

The Clavie's lurid light blazed forth, undimmed by rival beams from the moon or stars shuttered behind clouds, and the Celtic gods having primed the wind to blow half a gale, the flames leaped fiercely and cast a ruddy glare over the upturned, happy, excited faces of the cheering men, women, and children, who swirled after the high-held Clavie along the narrow streets. And the stone houses, by day a mournful weather-beaten grey, were bathed in exultant rosy hues.

We halted at certain ritually prescribed places, when burning brands, snatched from the Clavie, were handed to householders (their hands protected by thick leather gloves) who, after lighting their home fire, extinguish the brand and keep it carefully until the next Burning in a year's time. Their hearth thus purified, the Celtic gods are pleased, and the evil spirits sent, frustrated, on their way.

The barrel was carried to the top of a hill, where after fresh staves and tar had been thrown in to send up roaring flames that spread the light of the Clavie's luck far and wide over the shrouded village below, and out to sea for the safety of all sea-farers fortunate enough to spot the blaze, the barrel was cast upon the ground and scattered over the hillside. The burning tar, racing before the wind, set the hillside aflame (the grass in Scotland being damp, the fire died out when the tar had burnt up) and the villagers rushed among the driving smoke and leaping flames to pluck out brands to take the luck of Burghead back into their homes.

This is the sort of ritual that reformers in Europe tried for centuries, with considerable success, to stamp out, as representing the forces of darkness, and on which the city educated Failed B.A. in India pours contempt when he visits his village and comes across local fertility or other rites. "Superstition!" he scoffs.

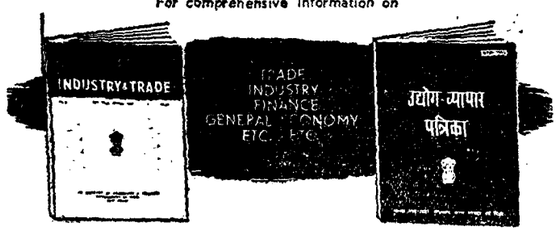
Now, nobody who has studied the injustices, the crimes, and the sufferings, wrought in the countrysides of all nations by a belief in evil spirits could uphold such beliefs. The stoning, maiming, and even killing of innocent men, women, and children, condemned as witches by ignorant neighbours are grievous to think of.

But too often in the past, reformers have seen only the evil of ancient customs. Usually lacking anthropological knowledge and themselves failing to apply the scientific outlook that they preach to the villagers, they do not realise that all human institutions originate in response to some human need. So that when eradicating abuse of an institution, it is vital to discern what need it fulfils and to ensure that that need continues to be provided for. I pointed out in this column in three articles on village life in India (in three consecutive issues of January 15, 22, and 29), the disruption of social life that follows uninformed interference and reforms in the mofussil. The old institutions, ways, and ideas, are uprooted, and the villagers must go through the tragic process (which may take two, three, or more generations) of filling the blank in their lives by the development of new institutions and ideas, adapted to their present needs. Unfortunately in many cases the disruption of their familiar ways and hierarchy, and of familiar sanctions for their system of morality, is so complete that either they cannot re-integrate themselves into a new community, or they achieve re-integration on a low level. This is one of the most frequent causes of anti-social behaviour in villages: dacoities, gang murders, faction fights, quarrels, litigation, and general lack of social co-operation.

THE SECRET OF SUPERSTITION

It is often difficult for an outsider to grasp the value of some ancient custom which, to him, seems

mere superstition, and which the villagers (who can hardly be expected to be well-versed in anthropology) can rarely explain, least of all to a stranger from a city from whom they have learnt to except scorn of their ways. The clue to understanding is to know that one of the most important functions of a custom such as the Burning of the Clavie is to create an opportunity for everyone in the community to share an experience. Any experience shared, especially if it is religious or mystic, is socially binding. It helps to prevent potential enmities from forming; it cements existing links between friends.



A second point for the townsman of good will when faced with queer village customs is to remember that it is an established fact that phenomena for which primitive peoples can find a rational explanation are outside the field of superstition. Magic is only called upon to explain incomprehensible phenomena. Consequently, the wider that you can spread the field of reason by education, the narrower you render the field of superstition. But there is no reason why in spreading reason you should abolish ancient customs that make cheerful occasions in which the whole community has a grand tamasha, which stimulates their instinct for social co-operation.

The survival of the Burning of the Clavie illustrates my argument. Everybody in Burghead has gone through the twentieth century mill of compulsory education. They are impregnated with the spirit of this scientific age of trial and error. The villagers would laugh at anyone who suggested that a neighbour had the evil eye or was a witch; they would be horrified if you hinted that a witch should be stoned out of the village and would hasten to hand you over to Jimmy McPherson, the local policeman. But the ancient Clavie tamasha, purged of its black magic associations, serves to promote neighbourly feelings among the Burgheadians. Everyone joins in the Clavie procession; everyone has laughed and cheered together; everyone has his own incredible story of miraculous escapes with smouldering trouser seats or blazing skirts. They are drawn together by these happy memories; they feel sorry if they leave Burghead to live in a town or a village unblessed by a Clavie.

If that is so, some city dweller may ask, why can't every village add to its social co-operation by inaugurating a Burning of the Clavie of its own? Because such a custom has to grow up naturally out of contemporary social beliefs and practices. If it is invented or imposed it is self-conscious and finds no echo in neighbourly hearts.

We who dwell in cities lose much training in social co-operation. We have few friends in the multitudes who surround us and little sense of obligation towards them. Still, we do have our tamashas when we climb into motor lorries and drive around the city striking gongs, and singing and shouting together, at the Saraswati or other puja. And let no half-baked intellectual sneer at us when we join in such fun, for it is one of the few opportunities for social co-operation left in the cities. And when you come across such customs in the villages, do not scorn. Envy them!

ENTERPRISE AND PROFIT

An Essay in the Theory of Profits and Income Distribution: By B. S. Keirstead, Professor of Economics, McGill University: Basil Blackwell: Pp. 110: 10sh. 6d. net.

This brief essay written under the auspices of the Nuffield Foundation in what was apparently a Sabbatical year illustrates the many great advantages of combining theoretical exposition and practical study and illustration. The starting point is the inadequacy of Classical theory to explain distribution—in particular its failure to show why or how the sum of the determinate shares of the factors exhausted the total product, to explain the reward for non-competing groups, and to determine the principles on which rent and profits as residuals could be arrived at. The conditions on which Euler's theorem can be said to hold in distribution are such as to exclude the entrepreneur, and, therefore, a classification of surpluses is needed. Naturally, surpluses are classifiable into four classes, namely, Ricardian rents, monopolistic profits, innovators' profits and a windfall element.

From here on, the discussion follows the now familiar lines, Knight and Shackle being very much in evidence. Entrepreneurial expectations are extensively discussed, and the role of profits regarded as the reward for uncertainty enables the reconciliation of such statements as that 40 or 50 per cent is the order of magnitude needed to attract venture capital, while progressive changes, with reference to which the horizon is not remote, need yield only 5 to 10 per cent.

The theory of this essay is not novel. The practical illustrations and observations, however, are quite interesting. Thus, the history of British industry between 1919 and 1939, says Professor Keirstead, is a history of the search for security by a rather tired and frightened business community. Monopoly groups have to be met, however, by other groups—and it cannot be assumed that the countervailing power, as it has been called, can reconcile us to regarding the result as approximating to a free enterprise system.

The practical conclusions which Professor Keirstead derives stand to commonsense. Incentives, he believes, are not necessarily and easily destroyed by high taxation—trade union ca'canny and the control muddle may be as relevant or even more relevant. The destruction of private capital may be made good by public saving and investment. Equality is also a good thing within limits. "Healthy, handsome, vigorous and well-educated, they (the British children of this generation) may yet prove that capital invested in public health, slum clearance and schools is not less productive in the long run than new machinery and new plant". But there is some point beyond which taxation discourages innovation, and at which the capital structure can be transformed too far in the direction of non-income-producing durable goods. Redistribution, moreover, may be relatively unimportant, compared to economic growth and productivity, for increasing the share of labour. What the point is at which innovation disappears, while the overgrown public sector and monopolistics groups on the other hand remain and dominate the picture, can be judged only by a process of trial and error—a rather tame conclusion this, but, perhaps, the only one which steers clear on the one hand of the assertion that 25 per cent is the critical limit (Colin Clark) and the denial that any statement on these lines can be made (Professor Dan Throop Smith, for example).

Professor Keirstead's essay contains much sound commonsense and should repay study. The hangover from a belief in the Classical system, according to which competition does all that is needed, or from the naive faith that countervailing power will be adequate, or from the belief that planning can take care of everything (state-endowed research, for example, taking the place of innovation) is still very great; and a book which explores the function of profits in relation to economic growth in the economies of today as we know them and not as they exist in models has some part to play in educating opinion.

FINANCIAL PROCEDURE ....

Parliamentary Financial Control in India: By P. K. Wattal: The Minerva Book Shop, The Mall, Simla: Pp. 192: Rs. 6.

Mr. Wattal is eminently qualified to write on this subject both by reason of his experience and because his earlier work on a similar subject, produced several years ago, became and remained for a long time a standard work. In this book, which has grown out of the lectures delivered by him as Principal of the Indian Audit and Accounts Service Training School, Simla, he explains financial procedure in India under the new Constitution in simple language and with great lucidity, with the result that all those who have to be concerned with executive or parliamentary procedure in financial matters will find this a good introductory study.

The changes which have been introduced in financial procedure in India after Independence have been many and far-reaching. Not all the changes, moreover, have taken place yet. The question of separating the balances of the Consolidated Fund and the Public Account is, for example, still under consideration. It is also possible that the date on which the budget is presented every year or the Provisional Collection of Taxes Act may be reconsidered—so that the estimates may be considered at more leisure. Control over the actual progress of expenditure, separation of accounts and audit, and the present practice of creating private limited companies in order to run government-owned industrial undertakings are all matters which are now under examination, and it is obvious, therefore, that financial procedure cannot be static. Essentially, these developments reflect the change in the position, namely, that Parliament is now sovereign and considers the arrangements which are best adapted to the exercise of its control.

Mr. Wattal explains some of these recent changes and will no doubt bring his lectures periodically up-to-date. One instance of the fact that procedure is still in the process of being settled may, perhaps, be quoted. It has been said that the Public Accounts Committee in England has power to send for persons, papers, and records, but that the Indian Committee has no such power. A recent amendment to the Rules of Procedure and Conduct of Business in the House of the People, issued in October, 1953, reads:

"A Parliamentary Committee shall have power to pass resolutions on matters of procedure relating to that Committee for the consideration of the Speaker, who may make such variations in procedure as he may consider necessary."

The Public Accounts Committee has published codified rules which are considered as additions to the rules of procedure of the House of the People and these rules would permit the Committee to make special reports or to regulate its procedure in any manner that may be found convenient.

The procedure in financial matters in India already is fairly satisfactory for purposes of enforcing accountability control, and as Parliament, which in this country has exhibited a bias in favour of economy, looks more and more into the accounts and estimates, efficiency is bound to improve. Merely controlling expenditure, which is what Parliament can do (as Lowell has said, a legislative body can say yes or no, but cannot itself initiate proposals) is, however, not all that is needed—although an enlightened control can go very far. Much, almost everything, still depends on the initiative and enterprise which is displayed by the executive, for financial policy, as is now realised, is positive and not negative.

RICE

Rice: By D. H. Grist: Longmans Green and Co.: Pp. 331: 35sh. net.

This volume has been produced in a series edited by Sir Harold Tempany for the Colonial Advisory Council of Agriculture, Animal Health and Forestry, and has been written by a former agricultural economist of the Colonial Agricultural Service. It is a technical study, and in this country in which modern methods of cultivation are now coming so much into vogue, with intensive cultivation according to the Japanese method being adopted on some three million acres, it should prove to be very useful.

Mr. Grist estimates that the annual increase in the world's rice production, which is necessary in order to meet the growing needs of the population, is about 1.3 million tons. The outlook, however, is not so very gloomy. 'Rice', according to Pendleton, 'is doubtless the most adaptable food crop a man grows, and if enough water remains on the soil until the maturing of the crop, it can produce at least a little grain on soils that are unbelievably poor in plant nutrients'. Mr. Grist estimates that improved methods might lead in the aggregate to the production from existing paddy areas of a total world crop of 200 million tons of rice, or roughly double the present out-turn. The Baguio meeting in 1948 estimated also that about 10 million tons were going to waste every year, because of insect and rodent infestation, wasteful methods of storage and milling and the like. There is comparatively little that can be done in the short period to improve trading arrangements, but empirical experience in India recently proves that production methods are not so slow to respond as is often supposed.

The information contained in this book will, therefore, prove to be particularly valuable. Mr. Grist's account is based on extensive knowledge and practical experience. About short-term crops (like the famed Japonica) he notes, for example, that during the Japanese occupation of Malaya, a variety of paddy from Formosa capable of producing two crops a year was introduced, but he doubts whether the two crops produced in the aggregate more than one long-term crop. He notes again that green manure, particularly farm-yard manure, lowers the water requirement; and from the point of view of this country, where minor irrigation works are now being undertaken in such large numbers, the Dutch policy in relation to irrigation undertakings is particularly instructive. Since this is comparatively very little known, the description may, perhaps, be extracted in full.

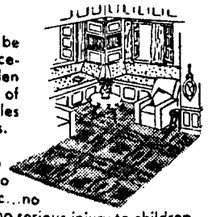
"Governments are frequently concerned with the high cost of irrigation systems for paddy cultivation and the small return that may be expected on capital investment. This is inevitable, for one is dealing with a crop which has a low market value in comparison with most other crops. In their development of the rice industry in Java the Dutch took a most realistic view of this problem. To judge as to whether a system of irrigation would be justified, data was first gathered on the agricultural and economic conditions of the region and also on the probable profit from the project, the quality of the water, and on other agricultural aspects. A financial estimate was based on these data. Irrigation works were usually only undertaken when they were at least 50 per cent 'fiscal remunerative'; in other words, the interest on the invested capital had to be at least 50 per cent of the rate determined before-hand. Thus, if the project yielded an interest of 3.6 per cent, and the determined normal rate of interest was 6 per cent, the scheme was considered 60 per cent 'fiscal remunerative'. Consideration was given in this way to the indirect advantages of a scheme of a social nature."

Mr. Grist's book will not make it unnecessary for the Indian farmer to consult the local agricultural department, and it cannot overrule Indian literature. Nevertheless, as a global survey, it provides a valuable background of knowledge and will rank as an authoritative work.

BANKER'S ANNUAL

The Indian Bankers' Annual, 1954: The Indian Press Publications, 585, Pycrofts Road, Madras-5, and 69, Fleet Street, London, E.C. 4: Pp. 288: Rs. 10.

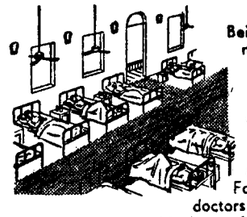
The new issue of this annual has been expanded in order to enhance its usefulness as a handy work of reference. Neatly printed and providing all the basic information which a banker needs from day to day in India, this book is now widely recognised to be authoritative. The classified information regarding bank directorates and branches and the full re-production of the Reserve Bank's Remittance Facilities Scheme will, for example, be particularly useful in banking offices, because the information is not as easily available as it should be. There are introductory articles surveying banking developments in the U.K. and the U.S.A. among other usual features.



SALES TAX LAW

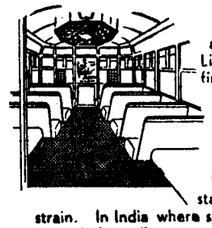
Law and Practice of Sales Tax in India: By Champat Rai, M.A., LL.B., Advocate: K. Rai and Co., Chandni Chowk, Delhi: Pp. 233: Rs. 15.

The basic constitutional provisions authorising the levy of sales taxes are now being re-examined, but a considerable body of case-law has already grown up, nevertheless, and it seems unlikely that there will be a wholesale change-over to a new basis, as for example, the purchase tax, or an amendment of the constitution. This book which reprints the various Acts with introductory and explanatory notes will be found useful by all those who have to be concerned with the existing law.



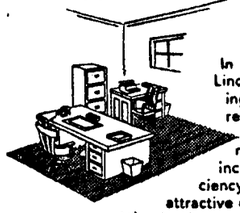
LINOLEUM—
The Versatile Floor Covering...

HOMES :



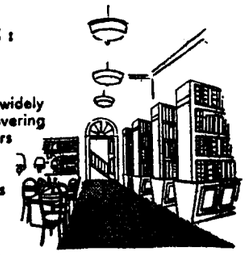
Linoleum can be laid on a simple cement or wooden floor in place of expensive marbles or mosaic floors. It is extremely comfortable to walk on, easy to clean ..hygienic...no jarring noises, no serious injury to children even if they fall. Linoleum adds colour and brightness to the home, safeguards health, promotes quiet.

HOSPITALS :



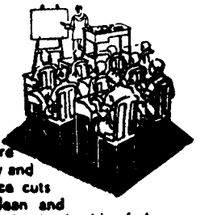
Being an hygienic, synthetic material, Linoleum is obviously an ideal floor-covering for hospitals and clinics. For nurses and doctors constantly on their feet, its "cushioning action" is a great boon; for the patients, no more disturbing noises from clattering feet.

PUBLIC TRANSPORT :



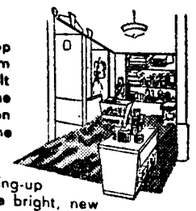
Tough, durable and easy to clean, Linoleum is the first choice for installation in public conveyances. Railway carriages, tram cars, buses.. Linoleum stands up to the strain. In India where so much luggage is carried in railway compartments, Linoleum seldom scratches or gets torn.

OFFICES :



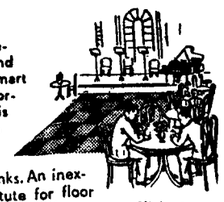
In the office Linoleum flooring effectively reduces noise and personnel fatigue, increases efficiency. For an attractive office maintained at low cost, Linoleum as a floor-covering is a real, long-term investment bringing everyday returns.

LIBRARIES :



Linoleum is widely used for covering library floors because it minimises noise, makes for that quiet atmosphere so essential for concentration. No more screeching chairs or clattering feet.

SCHOOLS :



Because it reduces noise and contributes to a bright atmosphere Linoleum is a most effective floor-covering for school rooms and lecture halls. Its durability and ease of maintenance cuts costs. Easy to clean and hygienic it safeguards the health of the youngsters. Particularly suitable for gymnasiums and recreation rooms.

SHOPS :

For effective decoration of shop interiors Linoleum is unrivalled. It stands up to the heavy traffic on shop floors and the constant use of counters. Wash it clean at shutting-up time, and have a bright, new floor the next morning.

HOTELS AND RESTAURANTS :

Hotel managements have found in Linoleum a smart and durable floor-covering that is easy to clean and does not soil from spilled food or drinks. An inexpensive substitute for floor rugs and carpets, and a more efficient floor-covering than either.

Because of its resiliency, durability and economy Linoleum has become the world's most preferred floor-covering. We now offer this modern floor-covering in a wide range of patterns and vivid colours. Besides specialising in laying we can also suggest artistic floor designs to suit individual tastes and needs. Consult us or see our distributors today !

THE WELFARE OF INDIGENOUS PEOPLES

THE problem of backward indigenous peoples is one of the questions of social and economic policy which has faced countries in widely differing stages of political and economic development. Historically, the problem had its beginnings in the era of colonisation by highly advanced communities of the New World and of the other regions which were uninhabited except by people with primitive cultures and ways of life. The problems of the 'Indians' in the American continent and of the aborigines in Australia belong to this category. The extreme divergence in race and culture would in any case have created problems of co-existence but the desire of the colonists to secure the best share of the land and the services of the indigenous peoples and the resentment of the uprooted indigenous peoples complicated relations. These complications have been absent in other areas like India where backward tribes have existed in isolation from other advanced cultural groups, but living not too far away from them without creating a state of mutual hostility or intolerance. But considering that even in India the problem of dealing with the North-East Frontier tribes raises special questions even when there are no racial disparities or inequalities in political status, it is not difficult to understand the reasons for the complexity of the problem in the other areas colonised or administered by European races.

In all these areas, however, the establishment of the supremacy of the colonists and the increase in their numbers to the extent of reducing indigenous peoples to small minorities have generally led to a policy of benevolent protection. The exception, however, is the African continent, where the settlers are in a minority and have yet to devise a proper relationship with the indigenous peoples. In Australia, the place of the aborigines has been long debated. The attempts to bring about a forced integration of the indigenous people with the Western ways of life made the indigenous people live a rootless existence and hastened their extermination. The aboriginals are now only a fourth of their size at the time of colonisation in Australia. There is, therefore, need to avoid a rude interference with the ways of life of the peoples in the process of assimilating them into the community. At the same time, the policy of establishing anthropological museums in the natural surroundings of such peoples—which has been attempted in some colonies, trusteeship and mandated areas and even in India—cannot be continued for ever; nor can such policy be feasible when large groups of backward people are concerned.

The responsibility towards indigenous backward peoples can be discussed in a constructive manner only where there is no serious conflict between them and the advanced communities under whom they have to live. The International Labour Office has now undertaken a study* of the conditions of life and work and measures for the uplift of indigenous people in independent countries. By definition this would exclude the colonies, mandates and trusteeship areas. The study, therefore, is not exhaustive of all indigenous peoples nor does it include the indigenous people of the Union of South Africa, which is obviously an explosive subject. There is a comprehensive survey of the nature of the problem and of the action taken to improve the lot of the backward peoples in the American continent, South Asian countries and Australia. The problems are not common. Racial factors will be of much less importance in Asia than in the other two regions. In Asian countries there are various levels of culture and economic backwardness among the local population that makes it easier to avoid many of the difficulties of assimilation. But many of the techniques employed may be studied with advantage both to avoid errors as well as to suggest new ways of dealing with the problems of integration.

The objective in most cases is to compress the development of primitive communities, which has ordinarily taken several millennia, into a few decades, without serious violence or disturbance to the people. The first requirement is a study of the behaviour and responses to new stimuli of the remoter tribes and of the long-term effects of new influences on their health and living. It has to be followed by appropriate measures to train the peoples in new ways of work through which they can make themselves useful to themselves and to the larger societies of which they form a part. A good deal of work has been already accomplished by anthropologists, missionaries and social workers, assisted by official teams and grants of financial aid. International specialised agencies are now engaged in active field work which will add to this knowledge and its dissemination. The present I.L.O. survey has provided fairly exhaustive factual basis for the knowledge of the dimensions of the problem in the particular areas chosen.

It is hardly necessary to enter into the finer points of the discussions about the identity of the backward indigenous peoples in these areas. There is no 'a priori' validity about any of the various criteria suggested for distinguishing the cultural groups. In some cases the existence of legal disabilities may help to distinguish these groups but ultimately even where these disabilities disappear, group consciousness, social and linguistic barriers and economic practices prevent the full participation of indigenous peoples in the national economy and culture. In India, for example, the number of all the people legally scheduled as backward is larger than that of the special groups who keep up distinct ways of life like the Assam Hill Tribes, the Todas and so on. In the American continent the total population classified as Indians is estimated at 16.2 millions (besides persons of mixed descent of 34.4 millions). Though this is double the estimated population of 'Indians' in 1825 of 8.6 millions, it is only slightly in excess of the estimated 'Indian' population at the end of the fifteenth century, when the Age of Discovery commenced, which was about 13.4 millions. These estimates at various periods illustrate the vicissitudes of the American Indians. Today these Indians almost entirely live in Central and South America; there are only 362,000 in the U.S.A. and 128,000 in Canada. Similarly, in a relatively well-developed country like Australia, about 72,000 people are classified as aboriginals and half castes; their numbers have declined from the estimated population of 251,000 at the time of colonisation. In New Zealand the Maoris number about 115,000.

The bulk of these indigenous people, therefore, live in the underdeveloped economies of South and Central America (15.7 millions) and in Asia. In Burma, there are about 3 millions. In India, of a total of 25 million backward groups, at least 5 million people belong to the groups for whom a beginning in the process of assimilation has to be made. The size of the primitive population in Indonesia is estimated at 16 millions; in the Philippines it is about a million and in Thailand a million and a half.

* Indigenous Peoples: International Labour Office (Studies and Reports. New Series No. 35) Geneva 1953. Price Rs. 16.

The conditions in which these people live vary widely and the problems are diverse as they spring from various tribal customs and the climatic and soil conditions of the areas into which they have been driven into seclusion. Some are of outstanding importance like the excessive indulgence in alcohol and cocaism in South America. The backwardness in health, nutrition and illiteracy is perhaps not far worse among these peoples than it is in relation to the rest of the population of the countries. But new ways can be fostered through better attention to food supplies, housing and living conditions and to the provision of new occupations. Indeed, the change in occupational habits may well prove the instrument of the general uplift that is to be attempted among these peoples. Agriculture and stockraising are the most important occupations; there are predatory systems of agriculture like the 'Caingin' cultivation in the Philippines and the 'jhuming' in Assam which have to be regulated. Subsidiary occupations like weaving, woodwork, fishing and leather work—for all of which there is sufficient knowledge of basic skills among the tribes and which are now utilised only for subsistence purposes—can be extended.

The I.L.O. Survey has made a compendium of the social and economic policies of the various governments based on official information. However, it does not provide a critical appraisal of the implementation of these policies. At best, most of them express benevolent intentions rather than concrete achievement. On the other hand, there is growing interest in the work of international agencies. The United Nations Technical Assistance scheme for the indigenous people of the Andean High Plateau (involving Bolivia, Ecuador and Peru) constitutes a beginning in more realistic activity which in time will have to be extended to make indigenous populations "find their rightful place beside their fellow citizens in the economic and social life of the nation". But all these activities require a constant stream of objective and critical scrutiny, for which one must look to non-official sources.

CRISIS TIME FOR SUGAR

THE sugar industry, which has been India's most crisis-ridden industry, is now facing another of its periodical trials in the decision of the sugarcane producers of U.P. to withhold supplies of cane to factories unless the price of cane is raised to Rs. 1-12 per maund. The logic of this demand is not difficult to understand. The price of cane, which was regulated by the minimum prices fixed by the Central Government for deliveries to factories, was reduced in 1952-53 in order to enable a gradual reduction in the selling prices of sugar, which have ruled very high since 1947-48 because of high cane prices. At the beginning of the 1952-53 season there was a sales problem for the additional sugar produced in the earlier season, which compelled this rather belated attention to the consumer's angle on sugar prices, and even extended to proposals for export of certain quantities of sugar, if necessary at subsidized prices. There was, however, no immediate relief to the consumer because of a special excise duty levied to tide over the financial losses of the change to a lower price. By the end of the season it had become evident that the fears of a glut were unwarranted and that the internal market could absorb the additional production at prices even above the official controlled price of Rs. 27 per maund.

In this background, the sugar policy for 1953-54 had to contend with the fact that a much larger sugar production can be maintained in future without difficulties of absorption at prevailing prices. The larger supplies of cane required for the purpose required the stimulus of high prices. Such prices had to be competitive with gur prices on the one hand, and, on the other, maintain their relationship with the final price of manufactured sugar, in the manner customary hitherto. A higher price for cane was, therefore, deemed necessary and was accordingly accepted. The minimum price for sugarcane payable by vacuum pan factories was fixed at Rs. 1-7 per maund for gate deliveries and Rs. 1-5 per maund for deliveries at rail centres, against Rs. 1-5 and Rs. 1-3 respectively, prescribed for 1952-53. In order to assure continuity in policy, it was also announced that these prices would be maintained not only in the current season (1953-54) but also in 1954-55. There was no consequent change in the nominal official controlled price of sugar of Rs. 27 per maund. The Government agreed to forego the special excise duty of one rupee, which should in any case have been abolished. The sugar mills agreed to forego As. 4 from their profits to keep this price unchanged, apparently assured of the unlikelihood of this sacrifice being actually imposed. Actually, the ruling prices of sugar have been very much higher than the official price in relation to which cane prices have been fixed. The reaction of the cane-growers to this situation is to assert their claims, if the primary assumption in lowering cane prices (on the basis of the ex-factory price of Rs. 27 per maund) is not to be honoured in practice.

The actual effect of their demand for fixing the cane price at Rs. 1-12 per maund would be that the Government and the consumer should reconcile themselves to a permanent increase of over Rs. 3 per maund in sugar price, thereby freezing it at the present high levels. This would, however, be opposed to the ostensible goal of Government policy which is to explore the scope for reducing sugar prices even below Rs. 27 per maund, to the extent possible. The Government cannot, therefore, accept that an upward trend in sugar prices, which provides fortuitous profits to industry, should be stabilised so as to make these gains permanent and enable the cane-growers also to secure larger shares. An alternative, therefore, which is being contemplated is to compel industry to share its booty with the cane-grower so that it can hush the present clamour, while the Government procrastinates in initiating those solutions for the sugar industry's problems which were suggested as early as 1950 by the Tariff Board in its very exhaustive report.

The role of imports, the function of which is to prevent prices from rising to unduly high levels, has so far been marginal. The total imports of about 245,000 tons for this season can, at the present rate of internal production, only supplement the deficiency in the total supply needed, judged by the level of consumption in the last season. Moreover, the price of imported sugar has been maintained higher than the actual landed cost in order to equalise it with the price of Indian sugar (thereby yielding a surplus of about Rs. 3 crores to the exchequer in the transaction). The sale price of imported sugar has been fixed at Rs. 31 per maund for Saurashtra, Bombay, Madras and Cochin ports and Rs. 29-4 per maund for Calcutta port, in parity with the landed cost of U.P. and Bihar sugar on the basis of a fair ex-factory price of Rs. 27 per maund. Thus, so far as current production and marketing operations are concerned the sugar industry has been protected by the lower cane prices on the one hand and higher prices of imported sugar on the other with the natural result that the sugar industry has been made the target of attack both from the consumer's and the cane-growers' points of view. But while the consumer waits for the relief for which hopes have been held out since the Tariff Board Report of 1950, the cane-growers' interests have become the playground of party politics.

The solution to the present impasse which will presumably be discussed at the meeting of the Sugar Cane Research Conference at Jullundur on February 7, may only relate to the question of fixing a share in the profits of the industry acceptable to the industry and cane-growers. The Union Food Minister and the Chief Minister of U.P. have been thinking only in these terms. As a temporary solution it may have some value but temporary solutions very often have the quality of creating precedents which have permanent influences. Whether the benefit to the cane-grower is given in the shape of a higher price or through profit-sharing, permanent interests will be created in the maintenance of the high prices of sugar which will go contrary to the long-term policy for the sugar industry. The resistance all along to cheaper sugar has been built into the structure of the sugar industry only through the cane policy of the State Governments and the minimum prices which have determined nearly 60 per cent of the final price of sugar. That process will only be accentuated. One more unfortunate precedent will be created because of a temporary situation, which will further complicate the situation, whatever be the basis of the system of profit-sharing to be introduced. There is no assurance that this principle of recognising a claim on profits, now based on one-sided regulation of price, will not, in time, be extended to other situations when profits may be higher in certain years due to other economies or development of by-products such as are under contemplation. Pending the revision of the Srivastava formula for price-fixing which is under consideration, there seems no reason to change the status quo in this matter.

The logical course would, therefore, be to end this one-sided regulation of prices which is at the bottom of all the trouble, and decontrol sugarcane prices also so that cane-growers can take the best with the bad. The policy of feather-bedding the cane-grower has gone on long enough now to make him sufficiently strong to hold his own in the market. The situation has always been such that gur-making and supply to factories have provided two equally good markets for his produce and the former has more often proved more attractive than the latter. The danger of sugar factories forcing lower prices on growers without minimum prices does not exist; the real minimum price is the profitability of gur manufacture and occasionally it is also the maximum. Moreover, all the benefits so far derived by the growers and the additional income to the State Governments by the levy of a host of imposts on cane supplies have not led to the development of cane-growing in quality or quantity so that little justification exists for the demands of cane-growers. On the contrary, the only danger of decontrol is the possibility of cane prices increasing higher and keeping up sugar prices also at a high level to the detriment of the consumer.

At this point, the general interest in the price level and the interests of the consumer can dictate a bolder course of maintaining prices through imports. Sugar production in the world is now higher and the trend of prices is downward. With the present foreign exchange position of the country, there can be no difficulty in procuring adequate supplies at reasonable prices. Free imports must be the new weapon for regulation of sugar prices. Though protection has been withdrawn from the sugar industry, an indirect advantage to Indian industry can be maintained so long as an import duty can be levied for revenue purposes. The best course would, therefore, be to abolish the artificial price regulation of imports by the Government and let ordinary commercial channels determine prices, after licences are issued freely, subject only to the levy of a fixed import duty. It is for the sugar industry, and for the cane-growers to adjust themselves to this situation. When all the incentives provided for improvement of quality and quantity in cane output have failed and all persuasion wasted on State Governments to avoid misappropriation of cane development funds, one may hope that exposure to the winds of competition may bring about a sense of realism.

The long-term policy towards the industry still remains unfulfilled. If there are windfall profits at the present time because of one-sided regulation, it is a proper occasion for enforcing on the industry the responsibility to provide the funds it has been seeking for its own rehabilitation, including the programme for the shifting of factories to areas with better cane supplies. It is the consumer who has borne the burden, and the cane-growers cannot deny it. Since the Government has accepted some share of responsibility for finding the outlay needed by the industry, there is reason why it should intervene to allocate the additional earnings for purposes of development on the lines now accepted all round as being in the national interest. To allocate it to any particular group will mean favouring further a sectional interest which has at no time in recent history been neglected or jeopardised. This stands to reason. But the queer brand of State politics in U.P. has always bedevilled the question and may still continue to do so.

THE CENTRAL BANK OF INDIA, LIMITED

(*Established December*, 1911)

Head Office: Mahatma Gandhi Road, Fort, Bombay-1.

The Guaranty Trust Co., of New York.
The Chase National Bank of the City of New York.

Banking business of every description transacted on terms which may be ascertained on application.

H. C. CAPTAIN,
Managing Director.

THE BUSINESS WORLD

OUTLOOK FOR DOLLAR PRICES

The reaction in the Bombay Cotton Market to the Government of India's announcement that United States cotton stapling 1-1/6 or more will be licensed freely against prior sales to the mills has been quite noticeable recently. The February contract moved about twenty rupees down and although the decisions which are still to be announced—whether payment can be made in rupees and the new import policy itself—may subsequently affect the prices of cotton, the instance of this commodity raises some important issues regarding the future of dollar prices generally.

The position of some individual commodities in which India is interested is analysed in the paragraphs which follow, in the light of the latest decisions on farm policy in the United States.

Cotton. After the 1954 crop, price support is to be adjusted to supply, modernised parity is to come into force in about two years from now (Jan. 1, 1956) and there is to be no requirement that the maximum use be made of production restrictions before support is used. On the assumption that acreage and production restriction in the new conditions will respond inversely to prices, production being maintained or even increased as prices fall, the outlook can, therefore, be bearish, in spite of the promise that a substantial part of the crop can go into the emergency reserve. Stocks at the end of August this year are expected to approximate to about one year's requirements.

Wheat. The position is more or less the same as for cotton, except that the transition to modernised parity after the 1st January, 1956, will be in easier stages.

Rice. Mandatory price supports are to expire after this year's crop.

Corn. The position is to be the same as for wheat, except for two changes, namely, first, that within the limits of the parity minimum and maximum points, adjustment of changes in the support price to the supply are to be greater, and secondly, that the carry-over allowance is to be increased.

Oilseeds. Little change.

Groundnut. Support is to become flexible from the 1st January, 1955, and parity is to be modernised from the 1st January, 1956, the transition to the new parity being in easy changes to be introduced from this date.

Tobacco. No change.

Wool. Domestic prices in the United States are to find their level and flat direct payments within the ceiling of the tariff earnings from wool are to be made.

This summarises the new farm-support plan in so far as India is interested. It will be unrealistic to think that the policy as proposed by the executive will just go through. The C.I.O. has already come out against it and so has the National Farmers' Union. In considering the long-term outlook for dollar agricultural prices, however, a few facts which have a generally bearish significance should be borne in mind.

Firstly, financial limitations which make the changes in support prices and parities necessary will prove to be no less compelling than politics. The new programme can, therefore, be trimmed or marginally altered. But it cannot be radically changed—which means that both parities and supports are bound to move down.

Secondly, the theory of the new policy is that flexible support, as compared with the present rigid requirements, will lead to changes in supply so as to adjust supply to demand—thus relieving the burden which is thrown on the State. If this theory is proved, there will not be a movement generally to lower levels of prices. But an important question is whether it will be proved. It is now widely held that the changes which do take place in supply may be to increase production and availabilities so as to keep up farm incomes. In the light of historical experience this is very definitely one of the possibilities.

Thirdly, the general trend of world agricultural prices is also not irrelevant. On a base of 1935-39, world production has been estimated outside the Russian orbit at an index figure of 110.4 in 1953-54, compared with 109.4 and 105.8 in the preceding two years. This increase in world production, if maintained, can hardly fail to affect agricultural prices in the dollar area.

In the result, the general trend of farm prices in the dollar area must definitely be expected to be bearish in the relatively short-term future, in so far as it can be foreseen at this stage. The prices and availabilities will be easy. But because of farm support on the reduced scale, prices cannot break. This is a natural result which will be well in line with other developments elsewhere in the world, for if the United States objects to stock-piles and international agreements as a means of propping up prices artificially, it is only just and proper that it should take at home the first steps towards applying the same principles. It should be able to demonstrate its faith in a free market—before or while free markets are being established abroad.

THE STATE OF ROAD TRANSPORT

By

CROESUS

Transport interests in Bombay are happy to find that, in the midst of the bustle of the Kalyani session of the Indian National Congress, Mr. Jawaharlal Nehru could find time to preside over an informal conference to discuss the all-important problem of transport. While no reports have been made in the daily Press about what transpired at this conference, it is reliably understood that Mr. Nehru agreed that the transport question was a very urgent one and, further, that he undertook to have the question carefully examined without any delay. This is, indeed, very heartening.

It is wisdom, as the adage goes, to strike the iron while it is hot. Mr. E. A. Nadirshah, President of the Indian Roads and Transport Development Association, has lost no time, therefore, to seize the occasion to issue a statement on the main causes that are handicapping the development of road transport in this country.

According to Mr. Nadirshah, there are three main obstacles that have been hampering road transport during the past few years. These are: (i) the restrictions under the Motor Vehicles Act, which take the shape of the use, by Regional Transport Authorities, of their discretionary powers not only for refusing permits for new vehicles but also for curtailing inter-regional and inter-State operation of goods lorries; (ii) the crippling taxes on road transport, especially on goods transport; and (iii) the sense of insecurity engendered by loose and frequent talks of nationalisation.

Pointing out that the whole basis underlying the regulation of motor transport has changed radically since the enactment of the Indian Motor Vehicles Act of 1939, Mr. Nadirshah observes that the powers given to the Regional Transport Authorities to restrict road transport so as to prevent competition with the railways have become obsolete, now that the conditions which influenced the recommendations of the Wedgwood Committee in 1937 no longer operate. Gone are the days when the railways used to languish through idle capacity and lack of traffic, as the Committee found them. However, the Regional Transport Authorities do not appear to have taken note of the changes since, judging from the excessive control and the undue restrictions they have been imposing on road transport. These twin evils of control and restrictions have brought about the present transport bottleneck. Today, as everyone knows, the traffic that is offering exceeds by a very large margin the total physical capacity of the railways and yet, thanks to the Motor Vehicles Act and the Regional Transport Authorities, road transport is prevented from supplementing the capacity of the railways and taking care of the surplus traffic.

The I.R.T.D.A. President has also alluded to the very heavy incidence of taxation on road transport. He points out that the cumulative incidence of the Central, State and local taxation on vehicles, on petrol and on goods in transit, amounts today to 24 pies per ton-mile, which is more than double the cost to the railways of carrying their commodities. Prior to the Second World War, it may be noted here, the tax incidence was less than 6 pies per ton-mile, and even this rate, be it noted, was regarded by an expert committee on transport, namely the Technical Sub-Committee of Policy Committee on Transport, as being far heavier than that required for the provision of roads and as smacking of discrimination, maybe unwittingly, against road transport. It is noteworthy that this committee further emphasised that the authorities should hold the scales even as between different forms of transport and that they should not single out one form of transport for any sort of discrimination or disability. The case, thus, for freeing road transport from its load of crippling taxes, if only to enable it to serve the country and to ensure the success of the Five-Year Plan, is very clear.

At this point, it would perhaps be interesting to see what attitude the Government will take in view of the peculiar position that obtains now, namely, the existence of State Government Transport in more than one State alongside of private carriers. Since, in a number of cases, the State Transport is under the authority of statutory corporations, it remains to be seen whether these corporations will also join with road transport interests in pressing the case for a relief from the excessive burden on taxation that obtains today.

Although it is well known that enough traffic is offering on the roads these days, ironically enough, few people are prepared to put new vehicles on the roads. This can only be explained by the apprehensions about the extent of nationalisation of goods transport by road. Hundreds of private operators, states Mr. Nadirshah, will come forward to put new vehicles on the roads, if only they can be assured that goods transport will not be nationalised and that their capital will not be turned into dead assets. On the other hand, whether for want of resources or for some other reason, even those State Governments which have taken over passenger transport, are now known to be not very eager to extend nationalisation to freight transport. If this is the case, there is no reason why the authorities should not give an unequivocal assurance that, for another ten years to come, there will be no nationalisation of goods transport.

In this connection, while the resolution placed before the meeting of Congress Legislators at Kalyani should be helpful, one feels that it does not go far enough. For the resolution does not specifically demand such an assurance but it contents itself with urging all State Governments, as an emergency measure, to liberalise the road transport policy, to issue permits freely to trucks for transport of goods and to remove restrictions on inter-regional and inter-State operations, notwithstanding their nationalisation programme. A mere emergency measure on these lines may not have the desired effect. It is imperative, therefore, to have a categorical statement of assurance by the authorities that the private sector in road transport will not be displaced for a period of at least ten years.

Before I conclude, I feel that I ought to draw attention to an interesting suggestion that has been made by Mr. N. Salivateeswaran, the Bombay M.L.A., to the meeting of the Congress Legislators in question in order to reduce the tax burden on road transport. The suggestion, which does not need further comment, is as follows:

"The Central Government, which today collects 40 and odd crores of rupees as its share of taxes, should guarantee or grant a subvention to the State Governments to the tune of Rs. 9 to 10 crores, that is 50 per cent of the amounts collected by the State Governments, so that the State Governments might reduce the State taxes by 50 per cent and the local bodies might abolish octroi and terminal taxes. The reduction of the State and local body taxes will lead to the expansion of motor transport by greatly increasing the number of vehicles on the roads. (According to one transport authority, the number of vehicles on the roads would have automatically doubled by this time but for the Motor Vehicles Act.) A reduction in the taxation would lead to more trucks. It would also go a long way towards covering any fall in the taxation revenue. A guarantee of Rs. 9 and odd crores, so far as the Centre is concerned, is not a big effort. With the expansion of road transport, the increased revenue due to increased consumption would work out to more than this amount. Actually, therefore, the Centre does not stand to lose anything in the long run. The State Governments and local bodies too would not lose anything, in view of the proposed subvention or guarantee from the Centre. And the cumulative effect of it all would be that motor transport trade would flourish and the present bottleneck in transport would be removed. At the same time, there would be more employment, and more trade, leading to the all round prosperity of the country."

BUSINESS NOTES

EXPORT OF RAW WOOL

The third instalment in the declaration of policy for export of wool was announced last week. It seeks to liberalise the quota allowed for export by a quantity equal to one-tenth of the quantity for which licences for export up to February have been granted already in November and December. Since these licensees constitute the established shippers, provision has been made in the new allotment of January 28, to accommodate other shippers or traders. These latter include shippers who effected exports during specified periods of the last three years and traders who had direct transactions of sales with exporters. The quantity released for this category not coming under the description of established shippers has not been disclosed so far, but it is limited. Liberalisation has thus been extended in respect of quota as well as the types of quota-holders.

The exception taken to this procedure by the All-India Wool Trade Federation relates to the allocation of quantity as well as to the procedure of licensing. The Federation desires to have the entire exportable quantity for the wool year being licenced at one time to eliminate uncertainty, complications and fluctuations in the trade and similarly it wants licensing on the basis of first come first served formula. The ad hoc machinery which was set up last December by the Central Commerce and Industry Ministry (representing the Central and concerned State Governments as well as the trade) has realised the unsatisfactory nature of statistics regarding wool output, home requirements and available exportable surplus. The surplus for the current wool year has been reckoned at 25 million or roughly 1.5 million lbs. below the last year. Ad hoc quota allocation was inevitable in this situation. The procedure of licensing appears to be meant to accommodate a wide class of claimants in view of the necessity of adopting an ad hoc basis for the year's exports.

CEMENT PRICES

Government's decision on the Tariff Commission's recommendations on cement prices which is now announced shows that the levels suggested by the Commission have been subjected to some reduction. While this decision has proved somewhat depressing to different units in varying degrees, the prices now fixed have not evoked adverse reaction in other quarters. The Tariff Commission's scheme in brief was to fix the basic price of cement for all manufacturers in relation to the production costs of A.C.C. and peg it for unpacked cement at Rs. 72 per ton f.o.r. destination. To this was to be added an extra price of Rs. 8 per ton for Digvijay, India Cement, and Travancore Cement, and in the case of Mysore Iron and Steel Works the extra charge was to be lower at Rs. 5 per ton. These price differentials were intended to meet the claims of varying costs of production. The prices actually fixed by Government reveal that Rs. 71 per ton are conceded to the older units and different prices ranging between Rs. 72 and Rs. 79 per ton for other units. Sone Valley which has chosen to stand aloof from the scheme of the rehabilitation fund has to sustain a decrease of Rs. 4 per ton.

The ceiling prices for destination for unpacked cement chargeable by different producers will be as follows: Rs. 75-8 per ton for Digvijay Cement Company, Jamnagar; Rs. 75 per ton for India Cements Ltd. and Orissa Cements Ltd., Rajganpur; Rs. 72 per ton for Mysore Iron and Steel Works; Rs. 79 per ton for Travancore Cements Ltd.; Rs. 67 per ton for Sone Valley Portland Cement Company which has not agreed to the condition regarding earmarking of Rs. 2 per ton for rehabilitation and expansion purposes; Rs. 71 per ton for the following companies, namely, Associated Cement Companies Ltd., Dalmianagar, Kalyanpur Lime and Cement Company Ltd., Banjari (Bihar), Dalmia Dadri Cement Ltd., Dalmia Dadri and Dalmia Cement Bharat Ltd., Dalmiapuram and Rs. 74-8 per ton for Jaipur Udyog Ltd., Sawaimadhopur, pending further examination of their costs. These prices will take effect from February 8, 1954. Packing charges for the current quarter, according to the recommendation of the Tariff Commission, work out to a flat rate of Rs. 11-9 per ton of cement. These packing charges are applicable for cement packed in new bags only. Charges for packing in old bags are subject to settlement between the buyer and the seller.

DEVELOPMENT COUNCIL FOR BICYCLES

The Development Council for the Bicycle Industry, which was inaugurated on January 29th, has come into existence at an appropriate time when the condition of this industry requires intelligent guidance through a difficult phase of growth. Though considerable progress has been registered on the score of quality, considerations of competitive strength make the policy of protective duty and import restriction imperative for some time more. There is enough evidence that the industry is anxious to bring protection to an early termination and precisely for the realisation of this object improvement in price and quality needs to be achieved as early as practicable.

The present production capacity of the six units, on the basis of single-shift working, of 4,17,500 bicycles, coupled with the capacity of the two projected new units of 80,000 bicycles, falls short of the estimated demand of 5 lakh bicycles. But the gap between actual capacity and production in 1953 was of the order of 1,53,300 bicycles, the last year being particularly good for production performance. The potential demand for this poor man's vehicle is considerably high and it is bound to go up as standards of living improve, but its exploitation by the home industry will be conditioned principally by its capacity to achieve lower production costs. It will be the primary task of the Development Council to co-ordinate production programmes of the different units and induce them to rationalise production methods by introducing adequate facilities for testing, inspection on strict standards and continuous research. Progressive improvement will need prescription of norms of efficiency. Large units and units functioning in collaboration with foreign producers may find compliance with such directions relatively easy, but the real problem will be for the smaller units which cannot bear the expenditure of maintaining testing equipment to ensure sustenance of quality. They will constitute the special charge of the Council. The small units (numbering over 24) engaged in the manufacture of parts and accessories are waging an arduous struggle for existence and expansion. They will need careful nursing. While prejudice against indigenous product is a strong factor that retards the progress of domestic manufacture of components, the prevalence of defects in them need not be denied. Lack of adequate standardisation is prominent among them. Besides, a wide range of components and raw materials which are now being imported will have to be manufactured at home. They include tubing, steel strips, bright bars, free cutting steel, free-wheels, and so forth. The Council will have to satisfy these and similar tests of its efficiency and utility.

PRIVATE REQUIREMENTS OF CAPITAL

It is open to serious question whether the requirements of the private sector for investment have been properly assessed in the first Five-Year Plan, but even apart from this doubt, it is obvious that this question of equity capital, which is under investigation by the Shroff Committee, should be given the most careful thought in view of the emphasis which the second Five-Year Plan will place on industrialisation. The depreciation funds, which are found to be grossly inadequate in relation to the high costs of replacement, and the available cash resources of industry including E.P.T. deposits have been severely depleted to fulfil the needs of renovation and expansion.

Since this basic aspect of the problem of augmenting the resources of capital for private investment has arrested attention now, Lala Karamchand Thapar has offered certain constructive proposals to help in its solution. In his presidential speech at the last quarterly general meeting of the Indian Chamber of Commerce, Calcutta, he emphasised how the role of the Industrial Finance Corporation as a source of supply of industrial capital in the long-term can be made more effective than at present. His suggestions in this behalf include raising the lending capacity of the Corporation to Rs. 200 crores with a simultaneous increase in the ceiling for individual loans by 200 per cent above the current limit. He also urges that some flexibility should be imparted to the terms on which the loans are advanced and suggests that the rigid and uniform rate of interest at 6½ per cent should be tempered in accordance with the nature of the security offered. The terms of repayment, he suggests, should be modified in relation to the nature and profit-earning capacity of the industry as well as the reputation of the party concerned. The inroads which the public sector makes upon the capital resources of institutional investors, he states, need to be restrained. About 75 per cent of the investments of insurance companies are channelled into Government and semi-Government securities. The small share of investment in private enterprise which is left for insurance companies raises a strong query whether the rigid restriction put on their discretion should not be relaxed.

The development of the bill market needs greater conscious direction and in addition to it Lala Karamchand Thapar makes other suggestions to increase the resources of short-term capital. This is basically the function of the commercial banks. He emphasises that in addition to the exploration of rural resources for bank deposits by a spread of bank branches in the small towns, Government should help to strengthen confidence in banks by depositing its own funds as well as those of public undertakings in banks. The expansion of lendable funds should be matched by a liberal policy of advances.

PROTECTION FOR SHEET GLASS

The review of the progress of the indigenous sheet glass industry, since the grant of protection for the first time in 1950 made by the Chairman of the Tariff Commission, Mr. M. D. Bhat, at the opening of the enquiry into the industry's claim for continuance of protection, suggests doubts in his mind, how far protection has been put to good use by it. The request for continuance of protection will very possibly be conceded, but the Chairman's frank remark that the industry would be on trial implies that weak spots will need earnest efforts for prompt and tangible improvement. The really weak spot, according to importers as well as consumers, is the quality of the product. This view has been corroborated by the enumeration of a number of defects in the finished products. To add to these, the state of grading is hardly satisfactory and packing which is important in view of the risk of breakage leaves much to be desired. Improvement must in the first instance be directed to the elimination of grievances on these counts.

In other respects, it would appear that the industry is pursuing a course of continuous progress. The present installed capacity of the three units of 64.6 million sq. ft. will be raised to 85.6 million sq. ft. when Hindustan-Pilkinton Glass Works go into production. Actual production has registered an increase from 9.4 million sq. ft. in 1950 to output at an annual rate of 17 million sq. ft. in 1953. Imports were high at 31.19 million sq. ft. in 1951, but since then they have been brought under control and the quantity purchased from abroad in the first eight months of 1953 was 4.31 million sq. ft. As against this total available supply, the demand is estimated to rise to 39 million sq. miles in the course of the next four years. If this estimate proves correct, considerable scope would be offered to narrow down the gap between indigenous installed capacity and actual output. The price factor seems to indicate consideration on the merits of cases of individual units. Location which has invited special problems of transport is one major ingredient in this complex factor.

It should be seriously considered whether the status quo was really altered when protection was first granted in 1950. What was then done was to convert the revenue duty of 45 per cent into a protective duty. But the rebate of import duty on soda ash was withdrawn to the positive disadvantage of the industry. The increase of 2½ per cent in the rate of the protective duty next year was a consequential change following the levy of a surcharge of 5 per cent on all import duties and its benefit was offset by the higher duty on imported raw materials. Continuance of protection from January 1955, therefore, would amount to continuance of the state of affairs prevailing over the past several years. The industry's claim for assistance in other directions merits careful but sympathetic consideration. The aids requested are restoration of rebate of duty on imported soda ash, concessional station-to-station railway freight rates on raw materials and finished glass sheets and upgrading of the priority for movements of coal and finished products by rail.

MANUFACTURE OF RAILWAY COACHES

The tardy preliminaries in setting up the long-advertised integral coach-building factory at Perambur, it seems, will be brought to an end by December this year. Tenders for the supply of plant and machinery which are already advertised will be settled in the next few weeks. Their total value is placed at Rs. 1.5 crores. The deputation of an official of the Railway Board to Europe to finalise this question in consultation with the participating Swiss firm next week promises that the preparatory plans will be executed without much delay. Action to procure part of the machinery has already been taken and it includes orders for steel placed on Tatas. With the end of the current financial year, three years will have elapsed since the Perambur project was taken in hand. The tempo of implementation took long to gather momentum and it cannot be blamed on provision of finance. It is, however, somewhat reassuring that energy is being exhibited now in the execution of the scheme. In the course probably of the next month, according to current plan, a school is to be established for the training of Indians in coach construction under the personal direction of two technicians of the Swiss firm. If all these arrangements go through according to schedule, the indications are that the factory will start production sometime towards the middle of 1955 and the shortage of passenger coaches will be mitigated on a larger scale than hitherto. The target for the factory has been placed initially at 300 integral coaches and 600 underframes.

FREIGHT MARKET

Shipping circles find initial reassuring evidence for the freight market in the current year which would be a relief after the conditions prevailing in the last few months. In the month of January freight rates evinced a steady tone, while chartering operations

maintained a satisfactory tempo and gave indications of a hopeful prospect for the current year. The prospect is bright particularly with reference to the Eastern and Far Eastern waters. Two factors which are primarily responsible for the improved outlook in this area are enquiries of Japanese importers for shipments of food grains and the total lifting of the remaining controls on the import trade by the Australian Government to be effective from April, 1954. During the last month, shortage was experienced in the Eastern waters in respect of vessels for early bookings. Some of the fixtures during January are indicative of the better situation anticipated in the following months. Two February carriers were closed for ore shipment from Calcutta to Japan at sh. 60 per ton f.i.o., which marks a steady rate. Three vessels were contracted for Japan for the transport of ore from Marmugoa at varying rates of $8, $7.98 and $7.70. Some more vessels were fixed for Marmugoa to Antwarp, Bremen and from a neighbouring port of New York. Transport for Indian coal to Japan was fixed at the steady rate of sh. 55 per ton for loading up to the current months. Chartering markets for grain in the U.S. Pacific region witnessed the active role of Japanese shipping.

INDUSTRIAL DISPUTES IN NOVEMBER

Provisional statistics of industrial disputes for the country excepting Andhra and Bihar during November, 1953, show a decrease in the number of disputes, workers involved and man-days lost as compared with the previous month. The total number of disputes during the month was 77 involving 36,485 workers and accounting for a time-loss of 315,305 man-days. The average duration of disputes rose from 5.0 days in October to 8.6 days in November. Nine of the disputes resulted in lockouts which affected 7,576 workers and accounted for a time-loss of 82,939 man-days. Four of these were in Bombay and the rest in West Bengal. Apart from strikes and lockouts resulting from industrial disputes, during the month, there were nine work-stoppages not connected with industrial disputes. Of these, six were in Bombay and the rest in Madras. These disputes involved 12,238 workers and accounted for a time-loss of 15,313 man-days.

Among the States, West Bengal showed considerable improvement as compared with the previous month. Improvement was also noticed in the States of Madhya Pradesh and Uttar Pradesh. Among the industries, the largest time-loss, viz., 70,000 man-days was accounted for by Paper and Printing, mainly due to a continued work-stoppage in the Titaghur Paper Mill in West Bengal. Increased time-losses were noticed in textiles other than cotton and jute; food, drink and tobacco; collieries, transport, plantations, municipalities and miscellaneous industries. The jute mill industry recorded no dispute during the month under review and this is a significant improvement as compared with the previous month. Compared with the previous month, the time-loss in minerals and metals; wood, stone and grass; mines other than coal and ports also was appreciably less.

MOVABLE PROPERTIES OF DISPLACED PERSONS

The Governments of India and Pakistan have decided that personal and household properties of evacuees lying with Custodians or friends and relations should be restored to them and facilities allowed for their removal to the other country.

Restrictions on through booking of such properties of evacuees from one country to the other are being removed and necessary fresh instructions in this connection have already been issued simultaneously in India and Pakistan. There will be no export or import restrictions and no customs duties will be payable.

Facilities will not, however, be provided for the removal of movable property falling under the following categories, and these must be disposed of within the country where the property is restored: (a) Machinery and machine parts other than bonafide personal and house-hold machinery like typewriters, sewing machines, bicycles, refrigerators, radios, motor cars, gramophones, electrical goods, musical instrument, professional instruments, apparatus and equipment; (b) Merchandise and trade goods; (c) Unsewn cloth in excess of what a family may reasonably be deemed to have acquired for normal personal and household use; (d) Cattle; (e) Cloth in excess of normally permitted quantities, and (f) Bullion.

Evacuee owners will be given a period of six months from March 1, 1954, within which to claim restoration or disposal of their movable property. Where evacuee owners are not in a position to arrange for disposal of their properties, such properties may be brought to the headquarters of the diplomatic representative of the evacuee's country, if the latter considers this necessary for further action. All other movable property belonging to evacuee owners will be disposed of by auction by the local custodians in the presence of the diplomatic representative of the other country or his nominee. After deduction of the custodian's fee, sale proceeds of the auction will be passed on to the diplomatic representative or his nominee for disbursement to the evacuee owners concerned.

In respect of movable property other than trade goods and merchandise which are physically taken over by evacuee owners or by the diplomatic representative, neither the custodian's fee nor any storage charges will be recovered.

With regard to the personal and household property left with friends and relations, evacuees will be allowed to remove their property by June 30, 1954 for disposal within India or removal to Pakistan.

Third party claims are admissible only against trade goods and merchandise, and such claims already lodged will be entertained. New claims will be entertained only in respect of charges for storage, those created by courts and from banks in respect of goods pledged or hypothecated with them. The banks should file such claims with the local custodians of evacuee property by March 30, 1954. It must be noted that third party claims are admissible only against the particular business transactions from which they arise and not against other dealings. However, payments already made by the custodian will not be reopened.

With regard to movable property covered by the recent agreement such as seized property including fire-arms, buried treasures, postal parcels and postal savings bank accounts, a separate announcement will be made. The Agreement does not apply to bulk transfer of lockers and safe deposits, the release of shares, securities, debentures and insurance policies held in banks.

COMPANY AFFAIRS

CAWNPORE SUGAR WORKS LTD.

The working results of the Cawnpore Sugar Works Ltd. (Managing Agents: Begg Sutherland & Co., Ltd.) for the half-year ended 31st October, 1953, show a satisfactory improvement over the previous year. Total cane crushed improved from 47,11,121 maunds to 59,23,536 maunds because the duration of the season increased from 150 days to 169 days in the case of the Marhowrah factory and from 98 to 132 days in the case of the Gauri factory. In recovery, however, there was a slight deterioration.

The net profit, after providing for both taxation and depreciation, shows an impressive rise from Rs. 5,35,655 for the year 1951-52 to Rs. 11,67,948 during the year under report. The directors have taken the wise decision of transferring Rs. 5,66,203 to the rehabilitation reserve in view of the fact that the cost of replacement of plant and machinery has been steadily going up. Rs. 2,00,000 have been transferred to the "quarters building reserve" in order to extend and modernise the present quarters of the supervisory staff and labour.

The fluctuations in the fortune of the company during the last three years are summarised below:

	1950-51	1951-52	1952-53
Duration of season days (for both the factories)	275	248	301
Total cane crushed (Md.)	50,59,751	41,11,121	59,23,536
Total sugar manufactured (Md.)	5,18,642	4,98,760	6,27,130
Net profit (Rs.)	18,10,464	5,35,655	11,67,948
Provision for depreciation (Rs.)	5,00,000	3,00,000	2,75,000
Provision for taxation (Rs.)	17,50,000	3,50,000	10,50,000

The balance sheet as at 31st October, 1953, shows that the total reserves of the company at Rs. 62,99,665 are more than two and a half times the issued and subscribed capital of Rs. 25,00,000. Total block account stands at Rs. 96,64,753. The accumulated depreciation is as high as Rs. 78,07,451.

SHREE GOPAL PAPER MILLS LTD.

The report of the directors of Shree Gopal Paper Mills Ltd. (Managing Agents: Messrs Karam Chand Thapar & Bros. Ltd.) for the half-year ended 30th June, 1953, discloses a sizable improvement in total output of paper as compared with the corresponding six months of the year 1952. With the completion of the long-term expansion scheme, sanction for which has already been received from the Government of India, the paper production of the mills is expected to increase by more than a hundred per cent.

The audited accounts for the period under reference show a slight gain in gross profits as compared with the , preceding half-year from Rs. 27,13,200 to Rs. 28,50,859. The directors have stepped up the provision for depreciation from Rs. 3,71,123 to Rs. 5,10,779. The provision for taxation at Rs. 8,10,000 is slightly less than that of the preceding accounting period. The ordinary dividend has been maintained at 15 per cent per annum.

The progress of the mills during the last three half-years is tabulated below:

Period ended	June 1952	Dec. 1952	June 1953
Paper output (tons) ..	5,188	6,004	5,721
Net profit (Rs.) ..	10,46,321	11,80,214	11,52,642
Depreciation (Rs.) ..	2,81,063	3,71,123	5,10,799
Taxation (Rs.) ..	7,50,000	8,35,000	8,10,000
Dividend (Ordinary) per cent per annum	15	15	15

The balance sheet shows the gross block at Rs. 108.50 lakhs. Total depreciations provided so far amount to Rs. 61.39 lakhs, with the result that the net block comes to Rs. 47.24 lakhs only. As against the total subscribed capital of Rs. 57.56 lakhs the reserves stand at Rs. 71.17 lakhs.

THE PUNJAB NATIONAL BANK LTD.

The working of the Punjab National Bank Ltd. for 1953 reveals, subject to audit, all round progress during the year. The total assets of the Bank exceed Rs. 79 crores. The deposits of the Bank at over Rs. 65 crores have increased by more than Rs. 6 crores during the year and by Rs. 3 crores over the figure as at 30th June, 1953.

The profits of the Bank have also shown an increase of Rs. 5.74 lakhs over its profits for 1952. The amount at disposal together with a sum of Rs. 1.92 lakhs brought forward from the previous year totals Rs. 41.79 lakhs.

The results of the working of the Bank for the year 1953 are really commendable.

BENARES ELECTRIC LIGHT AND POWER CO., LTD.

The directors' report of the Benares Electric Light and Power Co., Ltd., (Managing Agents: Messrs. Martin Burn Ltd.) for the half-year ended 30th June, 1953, shows an appreciable increase in the number of units sold from 9,926,818 for the half-year ended 31st December, 1952 to 10,983,183 during the half-year under report. The revenue realised from light and power loads shows only a nominal decrease from Rs. 14,50,157 to Rs. 14,38,649. In order to assist in providing funds for the cost of additional mains and services to meet the obligations, the directors have set aside a sum of Rs. 55,000.

The profit and loss account shows a profit of Rs. 1,44,729 after providing for taxation, depreciation, etc. The directors have recommended a dividend of 10 per cent per annum and an additional payment of two annas per share absorbing Rs. 1,06,244. The balance of Rs. 38,035 is proposed to be carried forward.

THE BANK OF BARODA LTD.

The profit of the Bank of Baroda Ltd. for the year 1953, subject to audit, including the sum of Rs. 2,38,382 brought forward amounts to Rs. 24,83,389. The ad-interim dividend paid earlier at the rate of 10 per cent per annum, free of income-tax, absorbed Rs. 5,00,000. The directors have provided Rs. 3,00,000 for taxation; Rs. 1,50,000 for the investment account and Rs. 6,00,000 for bonus to the staff. It has been proposed to pay a final dividend at the rate of 10 per cent per annum, free of income-tax, amounting to Rs. 5,00,000 and a bonus of one rupee per share free of income-tax amounting to Rs. 2,00,000. The balance of Rs. 2,33,389 is proposed to be carried forward.

COMMODITY NEWS AND NOTES

SECOND COTTON ESTIMATE

The all-India second estimate of cotton, 1953-54 puts the area at 12,956,000 acres as against 12,174,000 acres of the adjusted corresponding estimate of last year, thereby showing an increase of 782,000 acres or 6.4 per cent. Details according to trade description for the current and last years' estimates, are given below:

Variety	Area (thousand acres) 1952-53	1953-54
Long staple	2,948	3,303
Medium staple	5,411	5,619
Short staple	3,815	4,034
TOTAL	12,174	12,956

This estimate covers the period up to the end of September 1953. Till then, the condition of the crop was reported to be generally satisfactory.

FIRST MAIZE ESTIMATE

The all-India first estimate of maize, 1953-54 puts the current year's area at 8,464,000 acres as against 7,764,000 acres in the adjusted first estimate for 1952-53. This shows an increase of 700,000 acres or 9 per cent in area over 1952-53. This estimate covers the period up to the middle of October 1953. Till then, the condition of the crop was reported to be generally satisfactory. In North Bihar and parts of Bombay, however, the crop was slightly damaged due to floods or excessive rainfall. This estimate does not cover the total area sown to maize during 1953-54. Past experience has shown that the area at the first estimate stage forms roughly 90 per cent of the area under the crop finally reported.

SECOND GROUNDNUT ESTIMATE

The all-India second estimate of groundnut 1953-54 puts the area at 9,655,000 acres as against 9,501,000 acres in the corresponding adjusted estimate of last year. This shows an increase of 154,000 acres or 1.6 per cent in area. This estimate covers the period generally up to the end of September 1953. Till then, the condition of the crop was reported to be generally satisfactory.

LOWER BRAZILIAN COFFEE CROP

Brazil coffee crop for 1953-54 is now estimated at about 14 million bags as compared with earlier forecasts of 16.6 million bags. Recent frosts have damaged the crop considerably. 8.1 million bags had been harvested up to October 15, 1953. Brazilian coffee now available for export was no more than 10.6 million bags which is 19 per cent less than it was last year at this time.

EGYPTIAN COTTON CROP ESTIMATE

In its second forecast of the season the Egyptian Ministry of Agriculture has revised its estimate of this season's ginned cotton crop upward by 44,000 cantars to a total of 5,971,000 cantars (of 99.05 lbs.). Last season's ginned crop totalled some 9,715,000 cantars.

RECORD SUGAR OUTPUT IN AUSTRALIA

Australia's output of raw sugar for 1953 is expected to establish a record, according to an interim report. Australian mills were about three-quarter of the way through the present harvest of 8.5 million tons of cane and an output of 1,230,000 tons of raw sugar should be obtained. This quantity was over 30 per cent better than the previous years' record of 916,000 tons.

CEYLON RICE FOR INDIA

Ceylon and India recently signed a contract whereby 30,000 tons of full-boiled Burmese rice will be loaned to India for a period of three months. Two shipments totalling 13,000 tons of rice now on their way to Colombo from Rangoon have since been diverted to Cochin. Further shipments will be made before February 15 in fulfilment of the contract. The loan, meant for Travancore-Cochin where there is a shortage of full-boiled rice, will be paid back with Madhya Pradesh rice.

USE OF OIL CAKES AS MANURE

The Planning Commission has, it is learnt, recommended to the State Governments that the practice of diverting edible oil cakes for use as manure is undesirable especially when there is a shortage of cattle feed in the country. The Commission has suggested that non-edible oil cakes alone should be used directly as manure. Better results can be obtained if chemical fertilizers are used in combination with these oil cakes. The Government of Bihar is understood to have decided to publicize these suggestions in the rural areas of the State through leaflets.

EXPORT OF INDIAN RAW WOOL

The policy for regulating exports of raw wool for shipment by the end of February, 1954, and the basis on which licences would be issued to established shippers was announced in Press notes dated November 16 and December 24, 1953. It has now been decided to release a further quantity for export by March 31, 1954 and established shippers who have been given allotments in terms of the policy contained in the above Press notes will be given additional allotments equal to one-tenth of the allotments held by them.

MINING OF IRON ORE IN MADHYA BHARAT

Good quality iron ore, located at several places in Madhya Bharat, is attracting a number of financiers for its exploration. One mining lease for about 80 acres was granted by the State Government early last year. The party had already started work under the supervision of a German technician and about 1,000 tons of iron ore have been exported. Over 3,000 tons of ore are now ready for export. The ore is said to contain about 60 per cent of ferric oxide. A second mining lease for about 130 acres has also been granted by the Government and the mining work is expected to start soon. The Government have received more applications for prospecting licences.

INDIAN FOOD POSITION BRIGHT

Indian food position in 1953-54 appears to be brighter than in 1952-53. Production of coarse grains in 1951-52 was only 15.7 million tons, whereas in 1952-53 it rose to 17.4 million tons. The production in 1953-54 is expected to be even better than the production in the previous year. The stock in respect to wheat is estimated at 8 lakh tons, which would meet the country's requirements through several months to come. Imports would be decided upon only to build up reserves, provided prices are not unfavourable. Shortage of rice requirements is also not much. As against an import of 7 lakh tons of rice in 1951-52, the imports in 1952-53 were only 1.9 lakh tons, while in the current year the requirements of the country were expected to be fully met by internal surpluses, except some small imports. At the beginning of the year coarse grains have been completely decontrolled both in regard to price and movements except in three small regions of Saurashtra, Madhya Pradesh and eleven districts of U.P.

EXPORT OF ONIONS AND CHILLIES

The Government of India have reviewed the policy with regard to the export of onions and chillies. As the internal prices of these commodities are still ruling high, it has been decided not to release for the present any quotas for the export of these commodities.

THE COLOMBO PLAN IN ACTION

How the money was spent

Chart shows details for Ceylon, India, Pakistan, Indonesia, Malaya and British Dependencies in South-East Asia.

Each symbol = £10,000,000 Sterling.

[1] Ceylon's allocation for these groups not included.

[2] Burma's allocation by groups not available. Total expenditure is shown in Chart 1.

The Steel Site Controversy

THE unseemly controversy which has been raging for the last two months on the choice of a site for India's new steel plant promises in the last few days before a decision is reached to arrive at new limits of absurdity. Quite suddenly politicians, who have no conception of the technical complications involved, declaim in favour of their respective States and (in at least one case) threaten dire consequences if their rhetoric goes unheeded. Pandit R. V. Shukla, Chief Minister of Madhya Pradesh, has more than once proclaimed his intention "to expose the Centre" if the claims of Bilhai in Madhya Pradesh are overriden. The West Bengal Government has already produced three reports on the location of the steel plant at Durgapur; since the last two have been boldly marked January 1954 and February 1954 it may be presumed that there will be a monthly publication devoted to the polemical subject of the location of this steel plant until the Central Government announces its final decision. Only Orissa seems to be restrained. And unhappily there is no virtue even in this act of abstinence. For Orissa is restrained only because it is already well known that it stands in high favour; the German technicians have been known to have recommended Rourkela.

Thus the decision has been made more than difficult. And but for the fact that a solution exists in the

possibility of the commissioning of three plants instead of one, the prospects would be bleak. There would certainly be a serious set-back to Congress prestige in Madhya Pradesh if the Chief Minister, after all his declamations, and a personal visit to New Delhi with a suitable retinue, returned to Nagpur without success in his mission. Again, Dr. B. C. Roy, the Chief Minister of West Bengal, who continues to shoulder the heaviest burden in respect of unemployment in the whole country, could well complain if his political chances were impaired by the location of the new plant outside West Bengal. The political pressures to which the Chief Ministers and the local Congress parties are subject are all too real. It is impossible for a Congress Central Government, whose head by a happy accident is also President of the Congress, to ignore them.

It may, therefore, be taken for granted that political pressures will find some place in the decision to be taken, it is rumoured, next week. These pressures have been conveniently described as strategic, but unless there is a question of enemy occupation of the area of location, there is really no sense in the term. It has been ascertained in New Delhi that the possibility of enemy occupation has been specifically excluded, so that Durgapur, believed to be the most vulnerable site in the event of an attack from the East (which can only come from China) is not ruled out on this account. So far as bombing is concerned, there cannot really be much to choose; if Durgapur is uncomfortably close to Kulti where the Indian Iron and Steel Works are, Rourkela is uncomfortably close to Jamshedpur so that in both cases one squadron of bombers if it got through could accomplish damage at both sites. It might conceivably be argued in this case that if anti-aircraft protection is to be designed in any case to protect Kulti and Jamshedpur, location of the new steel plant within the ambit of these air defences would provide economy in defence expenditure. Contrary to the usual belief, provided defence is adequate, concentration without proximity is an advantage and not the other way about.

There is another strategic possibility, however, which needs deeper consideration. This is rarely mentioned except in a whisper; it should, however, be squarely faced. This is the possibility that, at some distant future date, a Communist majority might arrive in the State Assembly of West Bengal. That a consideration of this kind should stand against Durgapur is absurd for two reasons. In the first place, the refusal to assist West Bengal may bring about the very contingency which is feared; if West Bengal is strengthened here and now by a fierce industrial drive in the Damodar Valley area, the Communist victory can be put off to the Greek Kalends. Secondly, the provisions of the Constitution are clear enough that, in a strategic issue of misuse of power, the Central Government would be bound to act as in an emergency. The Indian Army has no foreseeable obstacle in its path; the protection of industrial enterprises anywhere in West Bengal can be easily accomplished. And, therefore, again there is no strategic obstacle here which cannot be overcome.

To say that Durgapur is not barred by strategic considerations is by no means to imply that it is the best site of the three. The West Bengal case has been argued cogently in three reports, all of which are competent and conclusive if their premises are accepted. Their premises cannot, however, be accepted as final. The location of a steel plant, like any other State economic activity, must be determined in the national interest; in economic terms, this means in terms of the total national dividend. The whole of the West Bengal case is based on a different criterion; it is argued constantly that only that site should be chosen which will produce steel at the cheapest price and be closest to the current market. This is certainly the test for a private undertaking, designed to produce the maximum profits for the investing agency on that project considered in isolation. It is not a final test for a national undertaking which has other considerations such as suitable expenditure on developments elsewhere which are to be integrated into a total pattern from which the dividend is to accrue.

Some simple illustrations will show, viewed from the national net product, as distinguished from what Pigou has described as the private net product, that the West Bengal argument is defective. For example, it is pointed out that capital cost will be Rs. 8 crores more in Rourkela than in Durgapur. What are the constituents of this saving? They are on transport of materials for building the plant; on the new township which will need to be built at Rourkela against one partly available at Durgapur; special tools and construction facilities in Durgapur where a barrage is being erected by the D.V.C., and the "time-period" of construction. All these are relevant for an assessment of the private net product; none, except the last, is a factor in computing national net product. So long as there are unemployed resources, the national interest is not injured by additional transport, the fruit of which incidentally accrues to State revenues; the new township is an additional national asset which fully offsets its cost, and so on. Against the additional expenditure to be incurred in Rourkela as against Durgapur there are thus additional assets somewhere else. No national balance sheet can be struck by omitting the assets when computing the liabilities.

Again, the issue of time-period in construction needs to be conceived against the larger purposes which industrial development must serve. If the argument that industry should only be located where existing facilities already are, this would be a conclusive argument against the dispersion of industries on any ground whatsoever. Moreover, the time-period of construction in any of the three cases under consideration will not in any case differ widely. It is part of the technical agreement signed with the Krupp-Demag combine that the works "along with appurtenant facilities shall be ready to commence production within four years from the decision on the location of the works" and there is general admission that in any case these works will not be ready before three and a half years because of bottlenecks on specific parts. The time factor in construction can, therefore, only be of the order of six months. It surely is unwise to make this a deciding factor.

When this has been said, this unprofitable controversy should be finally closed. And it should be closed with a proclamation which should satisfy West Bengal and Madhya Pradesh at least as much as it satisfies Orissa. The target for steel should be immediately raised by another million tons making the target for the Second Five-Year Plan 3.7 million tons, of which Rourkela should produce one million tons, and Durgapur and Bilhai half a million tons each in plants capable, like Rourkela, of rising to a million tons. While there is controversy which in its nature will be endless as to which site is best in the national interest, all sites are good enough to be worked together on strictly economic considerations. India is fortunate in having three additional sites of this fine quality; in any of these sites, as in Jamshedpur, it should be possible to produce steel which is cheaper than anywhere else in the world.

Because of our abundance of foreign exchange, because of the need of building up our heavy defence industries, notably tanks and armoured cars, because of the vital place which engineering industries must have in the Second Five-Year Plan, this is obviously the only right decision which can be made at the present time. The whole country should be united in the demand that it shall be made, and then pursued with unrelenting, and even passionate, haste.

The Kumbh Tragedy

THE Kumbh Mela at the historic Sangam, or meeting place of the Ganges and the Jumna with the subterranean Saraswati, has been invested this year with a grand, as well as tragic, significance. Never in all the history of the human race have so many human beings been collected in one place. The lowest estimate on the fateful day of February 3 has run above four million; but most observers consider the figure nearer five million than four. This figure alone should be the sternest rebuke to those superficial observers who have said so lightly that religion in India is losing its hold. To those who saw this tremendous concourse of people, interspersed with Sadhus and holy men of every imaginable description, there came on that same February 3 a sudden insight into India's one, and perhaps only, ruling passion. There was something on the faces of men and women which showed that this was not a concourse drawn together by the fun of this fair, which, assembling every twelve years down thousands of years, has acquired the historical reputation of being the world's oldest and most picturesque assembly. There was so much of exactly the opposite; men and women in millions came here, quite literally, out of a deep spiritual hunger. To unbelievers, the incredible thing was that for millions of people, by a simple act of prayer and bathing at this sacred time and place, complete spiritual satisfaction was found.

Above the terrible tragedy on February 3, when about five hundred people were crushed to death in a single stampede, there should be held this amazing fact. There are many severe failings in the conduct of this mela. Its planning was obviously defective, because the estimate of the probable concourse at between two and three million was grossly in error. The withdrawal of police at a critical time from a route on which the holy men, always unpredictable, had chosen to march was a stupid mistake. It is hoped that the Inquiry Commission will not fail to place the blame for this folly where it justly belongs. The failure to insist on the most complete health precautions has taken its toll in many cases of serious illness, and, it may be, of deaths. The breakdown of the administration immediately after the tragedy so that no news was carried to Government House at Allahabad for eight hours—thus permitting an official reception to be held on that very day—has been the most severe breakdown of local administration after the terrible trials of partition. There is much in these events which can, and should, shake confidence in the highest authorities of the Uttar Pradesh Government. A terrible price has been paid for their mistakes. These mistakes must on no account be repeated. But it is obviously foolish to lose sight of the almost impossible problem with which the authorities were confronted.

When the Prime Minister of India pleads for a sense of proportion in assessing the tragedy, although this may look callous and detached, he is only pleading for sanity. The fiercest and most unbridled criticism will not bring the dead back to life; it can only foster anger and hate, poisoning the great fount of religious passion which this tremendous display of Hindu faith engendered. It is outrageous to suggest that any of the actors in this great drama were conscious of the risks that were being run by this action or by that. To keep on arguing, therefore, that the tragedy was the result of the presence of V.I.P.'s—the President and the Prime Minister in particular—is a mean, and even despicable, attempt to discredit men whose devotion to the poor and lowly cannot be excelled. A sense of proportion means inevitably that deaths of our fellow-citizens, under circumstances as tragic as these, should never be made the occasion to extract political capital or to inflict private slander and display personal wrath.

There have been other comments which are almost equally out of place. The suggestion that, because India is a secular State, no official benediction should have been given to this mela is a curious confusion of the restraints which secularism imposes. It is true that the mela was widely advertised by the Uttar Pradesh Government and by the Railway authorities. The latter had a pecuniary interest in encouraging travel which has been displayed equally keenly on occasions which have related to non-Hindu festivals as well as to occasions without any religious significance. The Railways would have failed in their duty as a commercial undertaking if they did not take advantage of the urge to reach the Sangam in order to sell the services which alone justify their existence. The Uttar Pradesh Government would have been accused of being violently anti-religious if it had not taken the action that it did. Even as it is, the Uttar Pradesh Government—and perhaps even the Railways—did not do enough. To say that they should have done less would have been a deliberate interference with the exercise of free choice by a sovereign people.

The Indian intellectual is still confused about the place that religion occupies in a secular State. The intention of the makers of the Indian Constitution was to prevent discrimination between persons on the ground of religion; secularism is a negative, and not a positive, thing. To equate secularism with irreligion or indifference to religion or even the withdrawal of interest in spiritual matters is totally to misread the spirit, as well as the letter, of the Indian Constitution. To argue that the President of the Indian Union should be denied the opportunity of displaying interest in Hindu ceremonies in which he is a devout believer is to deny the Head of the State the fundamental freedoms which belong to every citizen. It is the critics of the President and the Prime Minister who need to be arrayed before the bar of public opinion.

Events at this mela must have shown for all time the trends of Indian public opinion.. Tolerant and unquarrelling even unto death, these people showed where they find their values. It is not for the Indian intellectual to decree on their behaviour; the Constitution requires that it is their political choice, not his, which shall prevail. And now, even after the tragedy, there can be none of these four million people who will find a solution of the problems of the mela in the refusal to hold religious melas. Religion may be the opiate of the people. But what has the dissatisfied intellectual to give to the people in its place? The Kumbh Mela showed, in any case, that the Indian people were not looking in any other direction.

In that sense, this was a supremely important political event. In the passionate faces at the Sangam, there was written the failure of Communist propaganda in the Indian sub-continent. Even on that February 3, when panic broke loose and the most peaceful of human beings, in a passion for survival, trampled on women and children, the choice was for religion against irreligion. It was, for the intellectual progressives, an unhappy day. To them the Goddess of Reason was dethroned. But on the issue of fact there can be no doubt. For the masses of the Indian people, materialism is a barren creed.

Communists and the Constitution

IS the Communist Party of India, now fighting the elections and planning for a "Government of Democratic Unity", a primarily constitutional parliamentary party or is it still extra-constitutional in its outlook in the sense of believing in violent and subversive activity as part of its doctrine of revolution? Public interest in this question, which was keen last month after the Communist Congress at Madurai, has been revived with the recent publication of the full texts of the resolutions and other secret documents by the Democratic Research Service at Bombay. The main conclusion that has emerged from the analysis by the Democratic Research Service is not very different from the worst suspicions of those already familiar with the nature of the Communist organisation, and the ways in which its tactics can change from time to time without prejudice to its real objective of bringing about a violent revolution. There is, and can be, no Indian orientation for the Communists. Their attempts to make use of the constitutional processes of electioneering and legislative methods have only one single objective, of expanding their organisation and influence, while they strengthen themselves for achieving their major purpose of capturing power through violent means. Any other interpretation of Communist strategy is only wishful and wasteful thinking.

There is sufficient authority cited from the documents now available for accepting this interpretation. The texts of these resolutions and the discussions at Madurai on the party line and policy are not by any means clear or coherent. Amidst the verbose and confused Communist jargon, which has, it seems, confounded the ranks of the party as much as the uninitiated, there stands out boldly the proclamation of the faith in the necessity for armed insurrection. It pervades the long discourse on the Tactical Line, the main point of which was to emphasise that Communist policy was not a peaceful but a revolutionary path. The belief in the necessity for revolution was more explicitly stated in response to the challenge from the doubting comrades of the P.D.F. of Hyderabad. "Unfortunately for us", says the most authentic exponent of the Communist creed to the P.D.F., "though the revolution is a crying necessity today, we are not in a position to carry it through as soon as we desire or as the crying necessity demands." The revolution is thus delayed not for want of intention.

There is abundant evidence that all the doctrines about the nature of the Indian situation are being distorted towards that end. The main basis of the doctrine is the assumption that India is now a colonial country and that its present "colonial set-up" and the absence of "genuine democratic liberties" (of the kind that are apparently available under Communism!) make an armed revolution almost inevitable. If any camp follower had doubts about the expediency or necessity for violence, he is directed to convince himself that it is the machinery of the State which is driving "the masses to the different methods of struggle and for self-defence." The Communist objectives can be realised, therefore, only "through a revolution, through the overthrow of the present Indian State and its replacement by a Peoples' Democratic State". There is, however, one exception to this doctrine of violence. That is the discouragement of individual terrorism which "undermines the possibility of unleashing partisan struggle"; this partisan warfare holds the key to the final culmination in a mass revolution.

These cardinal principles of the Communist faith have an importance to this country at this juncture which has been inadequately realised because the capacity of the Communists to bring about a revolution is discounted. There is certainly a legitimate confidence not only in the ability of the Indian army and the police to deal with any serious threat of civil commotion or war, but also in the unlikelihood of armed groups growing up unnoticed in any part of the country on such a scale as to challenge the unity or integrity of the country. The political integration of the country has left no vacuum of power which Communists can exploit for their major objective, and the transport and communications system is such as to deprive any insurrection of the advantages which were open to the Communists in China. All these the Communists realise as well as others and they are also aware of the numerous differences in their own ranks which now split them from top to bottom. The elections at Madurai to the Politburo have revealed these rival contesting groups and the fact that there is little cohesion in the present leadership of the Communist Party.

What is relevant in this situation is not undue apprehensions about the nature of the Communist menace but a clear definition of the attitude which the country has to adopt in dealing with the Communists. There is added importance to this question because of the elections in Travancore-Cochin, where the Communists have shown sufficient strength, and in other areas —like Andhra or West Bengal where they can be expected in future to create difficult situations in the formation and working of democratic Governments. The question is whether the Communists, who obviously avow no faith in the Constitution or in the civil liberties or in parliamentary methods, are entitled to the privileges which these confer, if they were to be returned by the electorate in sufficient strength. In other words, it is the old question whether the democratic liberties are unconditionally available, even when the intention is undisguised that they will be used to overthrow them at the earliest opportunity. The answer, implied in such policies as the Preventive Detention Act, is in the negative.

The Prime Minister's splendid speech in Trivandrum this week showed an awareness of both the extra-territorial and extra-constitutional character of the Communist opposition, though the condemnation was couched in somewhat mild and euphemistic terms. But neither the electorate there nor the rest of the country has received any assurance yet as to the consequences of a Communist ascendancy to power through the electoral process in order to defeat and subvert the Constitution itself. That possibility seemed near in Madras and Hyderabad after the last general elections and was overcome only because some special favourable factors existed. If the situation were to recur, there can and should be no hesitation about what the next step should be.

The present constitutional position of the States is happily such that they are only parts of a unitary and united Indian State, with no special right to the functioning of separate political systems under all conditions. That makes it inevitable that the President's emergency power to take over the administration of a State, when its Government cannot function in the normal constitutional manner, should be directly attracted when an avowedly subversive group acquires power. The question now facing is whether such a group should be allowed to operate until it has conclusively demonstrated its subversive character or whether a presumption can be drawn even in the first instance to prevent, even temporarily, the dangers of constitutional deadlock and dislocation. The 'preventive' character of detention in cases where danger to the State is apprehended is a direct precedent for taking action to prevent the larger danger to the State and the Constitution; and the Indian Communists' Manifesto is proof enough of the danger. Action must, therefore, be preventive, not merely punitive, and the country has a right to the assurance that there will be no compromise or hesitation in enforcing the principle if and when occasion arises.

THE WEEK'S NOTES

ASIA'S YEAR OF ADJUSTMENTS

The E.C.A.F.E. survey of economic conditions in 1953, in the region within its jurisdiction, shows a laudable concern for the economic progress of the area under the changed and still changing conditions of trade and earnings. It may be optimistic yet to hope that the export earnings of the area have "settled down" since the second half of 1953 at a level slightly higher than that registered in the immediate pre-Korean war period. These earnings are dependent on the nature of the American recession and its impact on the exports of the Asian raw material producers. The pace of decline has, however, been less rapid than in the initial phase of the post-Korean decline in commodity prices. Japanese exports are much larger today than before the Korean war. For the rest of the E.C.A.F.E. region, export earnings in the first half of 1953, were $2,700 million against $2,300 million in the first half of 1950 but supplies and prices are much easier now than in the pre-Korean period—jute, tin and rubber being the most obvious examples.

The major development in the Asian economy in the last year has been the improvement in the supply and prices of rice but the countries which depended on rice exports have also to participate in the general decline of prosperity. In the current year the fall in Japanese production has helped to accentuate the decline in rice but seasonal conditions are unlikely to be so completely normal in the area as to lead to a slump. The rice exporting countries, especially Burma, must make the readjustment necessary by growing and exporting more rice at current world prices; they have the assurance that the per capita standard of cereal consumption is still very much below the pre-war levels. The surplus expected in 1954 is one million tons, over effective demand at current prices. This is equal to the quantity of rice which India can import even now for her deficit areas, provided it is available at reasonable prices.

Except in the Philippines and Malaya, the E.C.A.F.E. survey has observed an upward trend in domestic wholesale prices and in the cost of living. This factor is disquieting because the higher costs make the process of adjustment to the decline of commodity prices very difficult and social tensions are likely to be generated in that process. The decline in the revenues of governments may create problems of finance for expenditure on economic development. The E.C.A.F.E. has registered these uncomfortable symptoms.

ANGLO-JAPANESE TRADE PACT

The storm of controversy aroused in the U.K. over the Anglo-Japanese trade pact, signed on the 29th January, is significant for its non-party character. The opposition has come mainly from the political sections, Labour and Conservative, representative of Lancashire's interests. It is an irony of history that these sections, which once were the citadels of free trade, should now feel the need for protection on very narrow lines. The Government of the U.K. deserves tribute for its boldness in sticking to the course dictated by wise considerations of national and international interests. Japan's trade with the sterling area showed a deficit of over £110 million by the end of last year and the choice was between allowing Japan to reduce her imports to that extent or enabling her to sell more to the sterling area even at the risk of competition to British goods. The latter course has been chosen and the effect of the new agreement would be to balance the trade at about £400 million, with the balance still in favour of Britain. British export trade in woollen and engineering products and oil are expected to benefit while Japan would be helped by the readmission of goods, banned since the war. Japan will be allowed to send £3 million worth of cotton and rayon goods (mainly grey cloth which will be processed and re-exported) and paper and board. This trade would help Japan to import, among other things, cotton from Uganda and Pakistan, Malayan tin and rubber and Australian wool.

The leading British Left Wing papers have supported this liberalisation of trade as a step in the right direction, and the official view is that Japan is an important trading area for the sterling group of countries and should be encouraged to trade more with all the members. But while there is great caution in British business circles about the prices at which Japanese goods will compete with British products, the feeling in Japan is strong that rising costs have priced Japanese goods out of many markets and further rationalisation was necessary. Lancashire exporters fear the loss of their colonial markets but it is pointed out that they have not nursed these markets too well so long as they were sheltered from competition. The stimulus of competition, the development of cloth consumption through cheaper cloth and the maintenance of purchasing power of the people through larger exports can create much better opportunities for higher levels of trade all round. Lastly, Japan, cut off from her trade with mainland China, has to be offered other opportunities for her economic well-being.

CANE CESS—AN IMPROPER LEVY

The cane-growers' strike in U.P. which is spreading to Bihar provides opportunity for drawing attention to the manner in which the internal politics of these two States is being allowed to influence the fate and fortunes of the Indian consumer and an industry of national importance. The cane cess of three annas a maund levied by these States is an undisguised tax on a raw material. The yield of the tax is devoted almost exclusively for revenue purposes, though in origin, the cess was a special levy, the proceeds of which were to be earmarked for cane development as it is being done in Bombay. The pretence about cane development has long been abandoned in these two North Indian States when the cess was increased from one anna per maund to three annas in 1947-48. Thereafter, it has proved a rich milch cow and nothing has been done despite the remarks of the Tariff Board that the levy of tax was "as a rule wrong in principle and it is particularly objectionable when imposed on the raw material of an industry which has been nursed by the consumers all over the country for a period of 18 years and for which they have made a heavy sacrifice during all these years". It is, however, time to awaken people concerned to the impropriety of the whole arrangement.

The Constitution does not confer any such specific taxing power on the States. Article 277 of the Constitution has permitted the continuance of the taxes, duties, cesses and fees lawfully levied by States and municipalities, immediately before the commencement of the Constitution, and the application of the yield to the "same purposes", until provision to the contrary is made by Parliament by law. Therefore, the power now lies in the Government of India to resort to legislation to abolish a State tax which is highly improper, or to prescribe the cess limits; six pies per maund should be the maximum necessary for cane development as such. That legislation will not apparently be forthcoming because of the politics of the two States involved in such legislation. There is no clear alternative remedy in sight but it is conceivable that an intrepid factory owner would take it into his head to challenge the validity of this improper tax before the courts. One ground for contention would be the interpretation of the term "same purposes". Are these purposes to be inferred from the original objects underlying the U.P. Control Act as it was operated until

1946-47, or from the subsidiary purposes developed later of exploiting the tax for revenue purposes? Or, does the mere act of appropriation—or of misappropriation—to State revenues before 1950 constitute a final definition of the purpose? The U.P. Act itself does not contain a statement of the object of the cess to make matters simpler.

LAND CENSUS

At last, there is hope that the census of landholdings, which was envisaged as part of the land policy of the Five-Year Plan, will soon commence. The Ministry of Food and Agriculture has entrusted the work to the State Governments, which have *not taken* much initiative *in this* matter despite their political interest in land reform and their direct and immediate responsibility for agriculture and its development. According to the Population Census of 1951, village papers were not available for one-fourth of the total land area but not much is known about even the other three-fourths for which some data are available. In most cases reform has preceded the collection of details about the impact of new measures. In Bihar, for example, the implementation of Zamindari abolition has been delayed by the absence of village revenue records and the necessity to create new machinery along with fresh collection of data, to cope with the work of direct collection of revenue, which the intermediaries managed formerly. The proposed census of landholdings is by no means a clear-cut task; the first attempt would probably yield only imperfect results. It is desirable, therefore, that the technique should be carefully perfected by preliminary sample surveys in selected divisions in each general zone with a distinct tenure.

It is easy to lay too much emphasis on the size of holdings owned or taken on lease. The opportunity must be taken to investigate the extent of *fragmentation* in the areas in which that process has been carried too far. The proposed tests for classifying the productivity of the soil on the basis of revenue settlement records and crop-cutting surveys have an important bearing in determining our knowledge of the size of economic holdings in particular areas. But such productivity data cannot reveal the extent to which low productivity is due to the soil and where it is due to lack of irrigational facilities. Grading of land according to irrigational facilities (*including* normal average rainfall) should also be undertaken.

The proposal to treat occupancy rights as ownership is not inappropriate; the Population Census which classified agriculturists as owner-cultivators and tenants proceeded practically on that basis. In any case, it is imperative that there should be uniformity in all major matters about the standards to be adopted so that the data may be comparable *region-wise*.

THE FUTURE OF EDUCATION

The recommendations of the Central Advisory Board of Education on secondary, elementary and girls' education have been conceived in satisfactory terms but there is bound to be a great gap between precept and practice. Eight years of elementary basic education is to be the general future educational pattern. If, as now contemplated, the period of secondary education should be sufficiently diversified to provide training in humanities, sciences, technical subjects like agriculture and commerce, fine arts and home science, the course of elementary education should be made adequate as a preparatory course. For a considerable time to come, the end of elementary education will also be school-leaving stage for a substantial proportion of pupils. Most of the schools dealing with these age-groups will be government schools, which is an advantage in the sense that it would help uniform insistence on a system of training of the teacher. The emphasis at this stage has to be more on the qualities of the teacher and the teacher's teacher. The real objects of educational policy must percolate through these media, not through official resolutions, or merely through the proposed financial assistance for opening libraries and training in practical subjects, though they are good as far as they go.

The Board has recommended a triple benefit scheme for teachers (pension and provident fund and insurance) and the abolition of tuition fees in training colleges. The suggestion that the wives of school teachers should be appointed as school-mothers and care-takers may augment the teachers' incomes but will not help to resurrect the virtues of the ancient "gurukula'. Rent-free accommodation for teachers will long remain an unrealised objective, especially in the towns and cities. It was, however, quite proper to have emphasised the need to foster contentment among the teachers so that more persons, especially women, may be attracted to the profession.

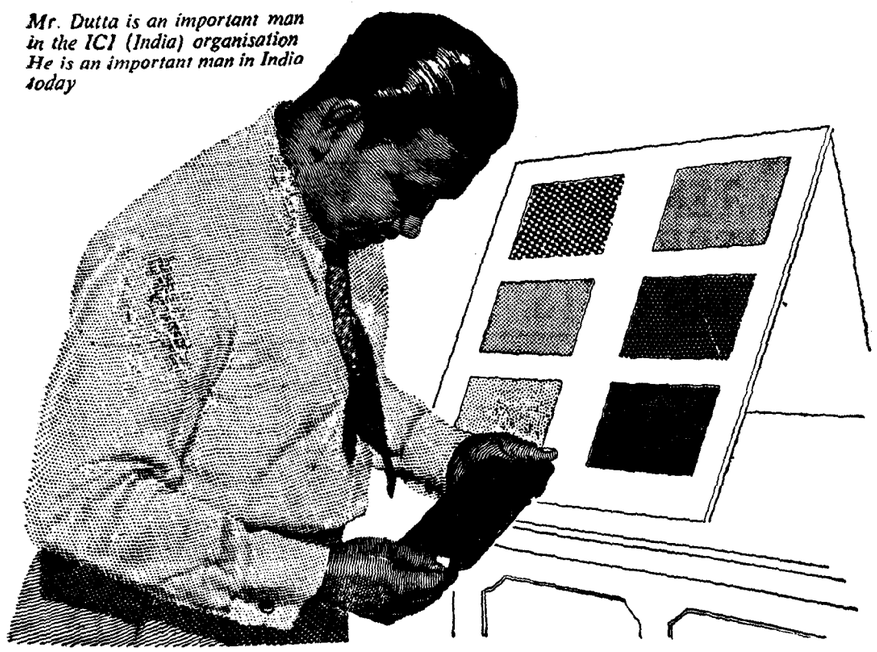
The diversification of the curricula in the secondary school stage has to be achieved without sacrifice of depth in some of the subjects, especially when it is proposed to make the completion of the secondary school course the minimum qualification for the public services as recommended by the Secondary Education Commission. On the Madras experiment on the shift system in primary schools, the Board has expressed approval, qualified with an emphasis on controlling out-of-school activities which is hardly practicable under present conditions. Having found that instruction for over 3 hours was not necessary, the children are being left to live in contact with their families or community as best as they can. It may be desirable, however, that in urban areas it should not be repeated because the spare hours may be spent in undesirable ways and surroundings.

AID FOR PAKISTAN'S NATURAL GAS

The Commonwealth Development Finance Corporation has announced in London that it has agreed to make an investment of the rupee equivalent of about £1,000,000 in the equity of a natural gas transmission undertaking in Pakistan called the Sui Gas Transmission Company Ltd. This is the first commitment of this private enterprise corporation, which has the backing of the Bank of England, since its formation was announced at the end of the Commonwealth Economic Conference in 1952. The total capital cost of the project —developed by the Pakistan Industrial Development Corporation in association with the Burmah Oil Company, which discovered the gas field last year, and with the approval of the Pakistan Government—is estimated to be about £9,000,000. In addition to the Commonwealth Finance Corporation loan, an application has been made by the Sui Gas Company to the International Bank for £5,000,000. The remainder of the equity capital will be provided equally by Burmah Oil, the Pakistan Industrial Development Corporation, and private investors in Pakistan.

Burmah Oil, through one of its subsidiaries, will be responsible for the management of the Sui Gas Company under a long-term agreement. The gas company intends to transmit natural gas from a large field in Sui, in south-eastern Baluchistan, by a pipeline over some 350 miles to Karachi through the lower valley of the Indus. The natural gas transmitted by the pipeline will be available for use over a wide area to help the development of the agricultural and industrial capacity of Western Pakistan and supplement the indigenous fuel and power resources of the country. One of the special purposes of the Commonwealth Finance Corporation was that it should encourage those projects which would increase the resources or strengthen the balance of payments of the sterling area and this project is said to have satisfied the test.

Paints are his Province



Mr. J. Dutta, whom you see here, is a specialist on paints.

Paints, for both decorative and protective use, are essential to many industries today. Their wide and varied application in many new directions gives rise to a number of allied problems. Which paint would suit a specific purpose? How can a paint be made to do a better job? Why is a particular paint behaving in an unsatisfactory manner?

These are the types of queries, vital to industrial efficiency, that demand the attention of our Technical Experts. Mr Dutta, as Plant Superintendent of the modern paint factory at the Alkali & Chemical Corporation of India, Rishra, near Calcutta – a subsidiary of ICI (India) – plays an important part in solving these problems

His work results in many benefits to our industries . . in indicating more effective paint-defence against rust and corrosion . . . in giving a better finish to the wide range of products now made in India.

Mr. Dutta is an important man in the ICI (India) organisation He is an important man in India today

. . . contributing to India's progress and prosperity

TRADE

Customs Barrier Between India and Kashmir Lifted: The removal of the customs barrier and the financial integration between India and Kashmir follows the agreement signed between the Union and Kashmir Governments. Elimination of barriers is expected considerably to bring down prices of goods, and dispel the psychological two-nation feeling; and will consequently aid the promotion of better relations between India and Kashmir.

TRANSPORT

World Shipping Tonnage: According to Lloyd's Register of Shipping, the total world shipping tonnage increased from 90.18 million G.R.T. in June, 1952, to 93.35 million G.R.T. in June, 1953. The U.S.A. with the largest mercantile tonnage in the world accounted for 27.23 million G.R.T. showing a decrease of 8,000 G.R.T. as compared to June, 1952, total. The Commonwealth had a total tonnage of 22.23 million G.R.T. showing an increase of 29,000 G.R.T. The U.K. and Northern Ireland with 18.58 million G.R.T. showed a decrease of 40,000 G.R.T. The largest increases were shown by Liberia and Japan recording an increase of 5.36 lakh G.R.T. and 4.63 lakh G.R.T. respectively over 1952 figures. The world total of oil tankers increased by 1.97 million G.R.T. to 21.96 million G.R.T. representing 24 per cent of all steamships and motorships as compared with 22 per cent at the end of June, 1952. The U.K. and Northern Ireland had the largest fleet of oil tankers in the world with 4.65 million G.R.T.

AGRICULTURE

Central Cotton Committee Meeting: The Indian Central Cotton Committee meeting in Bombay is expected to review the progress made in cotton extension work during 1953-54 and draw up plans for 1954-55. Increased production of long-staple cotton of 1-3/16" staple, of great importance to the national economy is to be considered. Schemes for an all-India cotton marketing survey, preliminary to the implementation of the recommendations of the Cotton Marketing Committee, will also come up before the Committee. Agenda includes the extension of several schemes which complete their sanctioned period, and the reorganisation of cotton research in respect of the Committee's schemes in the new State of Andhra.

* * * * * * *

U.P. Tarai Farm Yields Rs. 16 Lakh Profit: The 16,500-acre U.P. State farm in the Tarai colonisation area has made a profit of Rs. 16 lakhs since its inception. The total expenditure incurred by the U.P. Government on the Tarai colonisation area is Rs. 1.64 crores, while the total receipts amounted to Rs. 1.80 crores. The State Government has reclaimed 100,000 acres of land in this area, and 180,000 acres in other adjoining areas. About 7,500 families have been settled in the area, and a sum of Rs. 50 lakhs advanced so far as loans to them. About 100,000 acres have been brought under sugar-cane and other cultivation.

* * * * * * *

Plantations Conference Concludes: The Tripartite Industrial Committee, which recently met in Calcutta, concluded its fifth session. The Committee recommended that the Industrial Disputes (Amendment) Act of 1953, relating to the payment of compensation during lay-off, should be extended to the Plantations Industry with effect from April, 1954. The Committee also recommended that the Plantations Labour Act, 1951, the enforcement of which was delayed owing to 1952 slump in the tea industry, should be enforced with effect from April, 1954.

INDUSTRY

Industrial Production in U.S.: U.S. Industrial Production in 1953 was estimated at more than 36 per cent above the 1947--949 annual averages. Steel production touched a record of 112 million tons. New construction reached a record value of nearly $35,000 million—of which $23,500 was for private purposes. Aluminium, Rubber and Chemicals were among the many other industries that set new records in 1953. About 6.1 million passenger automobiles were made—the previous record in 1950 was 6.7 million.

* * * * * * *

U.S.A. Plans Atomic Power in Industries: The 15th semi-annual report of the Atomic Energy Commission recently revealed plans to utilise atomic heat in heating buildings at one of its big plants, first large-scale atomic power reactor in the quest for economical industrial power, which is expected to be fully developed within the next five years. In the medical field promising research has been made towards using radio-active thulium in a portable apparatus which might replace the X-ray apparatus in field equipment.

* * * * * * *

Burmese Textile Printing Industry: In January 1952, as part of the United Nations Programme of Technical Assistance to Cottage Industries in Burma, Mr. Suresh Sharma, of Imperial Chemical Industries (India) Ltd., was asked to take up a United Nations appointment as a textile printing and finishing expert and assigned the task of developing the Textile Printing Industry in Burma. The Textile Printing Centre in Rangoon has a variety of students, the responsibility for training them resting mainly on its own graduates who have shown promise as teachers. The 19 students with varied backgrounds who receive training range in age from 17 to 45 years. Commercial production on individual orders with a distinctive Burmese style of designing is in process. The sales rose from K. 310.13 in August to K. 2,334.86 by December, 1953, which makes the training programme self-supporting. Mr. V. K. Newalkar, a colleague of Mr. Sharma's from I.C.I. and also on a T.A.A. assignment, assisted Mr. Sharma at the Rangoon Centre and attended to the teaching of screen-making technique as also making of screen for demonstration. Working on cloth purchased from the market they make a profit of 6½ per cent in the case of regular prints where the foreign competition is severe and up to 110 per cent profit on fancy prints on house linen etc. The tools they need involve a small expenditure on a screen which is recovered from every yard of cloth printed and works out to a very small fraction.

Thirty-eighth Swiss Industries Fair: The Thirty-eighth Swiss Industries Fair will be held in Basle from the 8th to 18th May, 1954. It offers an excellent display of the extremely varied production of Swiss industry, the goods of which have won for Switzerland a sound reputation throughout the world. On a total area of 1,300,000 sq. ft. some 2,500 factories will present their combined display which is considered to be one of the finest of its kind in Europe. Prominent amongst the Exhibition will be the traditional Swiss exports, such as watches, textiles, textile machinery, electrical equipment, machinery, instruments, apparatus, chemicals etc.

* * * * * * *

Thomas to Manage West Australian Operations of Caltex Affiliate: The appointment of Mr. J. W. Thomas as Manager, Australian Exploration, was announced recently by West Australian Petroleum Proprietary, Ltd., an affiliate of the Caltex Group. Mr. Thomas replaces Mr. C. T. Newcomb, retiring General Manager.

Mr. Thomas born in Portland, Oregon, on October 5, 1914, graduated from the University of Washington in 1938 with a B.S. in Geology, he joined Socal in October of the same year. Prior to his transfer to Caltex he worked as a field geologist in Arabia and California, and was geologist on drilling wells and drilling foreman at various fields in California and Washington. Mr. Thomas has had considerable experience as an employee of the California Texas Oil Co. Ltd., the Standard Oil Company of California and in the New York Office of Caltex.

FINANCE

Funds for Agricultural and Animal Husbandry Schemes: Allotment of funds for new agricultural and animal husbandry schemes recommended for sanction by the Advisory Board of the Indian Council of Agricultural Research is the main item on the agenda for the meeting of the Council's Governing Body scheduled to meet in the Central Hall of Parliament House on February 10, 1954. The schemes approved by the Board in December last related, among others, to (1) a programme for conducting model agronomic experiments in co-operation with the cultivators during 1954-55 and 1955-56, (2) investigations into the farming methods and practices, (3) pasture-land development, (4) a national index of field experiments, (5) all-India survey of indigenous implements in common use, (6) utilisation of foreign breeds for the development of poor non-descript cattle in certain selected hilly tracts and heavy rainfall areas, (7) establishment of an artificial insemination centre, (8) survey of cattle sterility, (9) value of urea in the rations of cattle for growth and milk production, (10) effects of castration of buffalow bulls, and (11) setting up of a research-cum-extension centre on bee-keeping in Delhi State. Other schemes to be considered by the Governing Body for financial sanction include (a) establishment of research stations for pepper and cardamom in Mysore, Travancore-Cochin and Assam, (b) research in turmeric and ginger in Andhra and Assam respectively, (c) construction of a building for the Statistical Wing of the I.C.A.R., (d) award of fellowships to diploma-course students in agricultural statistics, and (e) assignment of Dr. F. Yates, F.A.O. Statistical Expert, to the I.C.A.R. Proposals for the continuance of current research scheme will also be taken up.

* * * * * * *

World Bank Mission to Malaya: A World Bank Mission is in the Federation of Malaya, conducting a general survey of economic conditions. The Mission is expected to submit recommendations designed to assist the Government of Malaya and Singapore in preparing long-term development programmes. These recommendations will relate to priorities for public capital expenditures, the rate at which these expenditures can be undertaken, measures for increasing production, and economic and fiscal administrative policies necessary for the success of the programme.

* * * * * * *

Soviet Technical Aid to Kabul: Soviet technicians in Afghanistan will build two big grain silos, a flour mill and a huge bakery, by the end of 1954 under an agreement signed recently between the Governments of the U.S.S.R. and Afghanistan. This is the first agreement for technical assistance signed between the two countries. These projects are expected to cost three and a half million dollars out of loans bearing three per cent interest. Repayment of the loans in kind will commence at the end of 1956, when Afghanistan will export wool, cotton and oilseeds to the U.S.S.R.

* * * * * * *

U.S. Institution's Grant: The Carnegie Corporation of New York announced the award of two grants totalling 49,000 dollars to the Royal Institute of International Affairs, London, to further Commonwealth relations. A sum of 24,000 dollars has been donated towards a Commonwealth conference in Pakistan next March, and a fund of 25,000 dollars administered by the Institute has been established to enable Dominion students to attend academic institutions in Britain. The Corporation was founded by the late Andrew Carnegie, the Scottish-born steel magnate, for "the advancement and diffusion of knowledge and understanding among the people of the United States and of the British dominions and colonies.

MISCELLANEOUS

Central Advisory Board of Education to Meet: The 21st Annual Meeting of the Central Advisory Board of Education is to meet shortly in New Delhi. The Board will discuss the report of the Secondary Education Commission along with the report of the Committee on the implementation of its recommendations. Other items on the agenda are the recommendations of the University Education Commission, and reports on the progress in technical education, rehabilitation of refugee students and teachers, the working of the Scheduled Castes Scholarship Scheme and the working of the Department of Anthropology.

* * * * * * *

Development of Maternity and Child Welfare Training Facilities: In India nearly a quarter of a million women die annually from causes arising out of child birth and for every women who dies as a result of pregnancy or child birth, 20 suffer from impaired health. Nearly half the total annual deaths at all ages in India takes place among children under 10 years and, of this, about half the number is among those under one year of age. Under a joint project of the Government of India and the U.N.I.C.E.F., each contributing approximately Rs. 45 lakhs, the existing Maternity and Child Welfare Section of the All-India Institute of Hygiene and Public Health, Calcutta, is being expanded to meet the needs of trained personnel in the countries comprising the South-East Asia region. The first course for Public Health Nursing, with 20 seats, has been inaugurated during the current academic session.

* * * * * * *

Malaria Control: U.N.I.C.E.F. Target for Mass Health Work 1954: At the end of 1954 the number of persons protected malaria will probably reach 125 million. Malaria will be under control in Asia within ten years. A large portion of U.N.I.C.E.F.'s aid is going into three mass health compaigns, directed at specific diseases affecting children, namely: malaria control, T.B. control and yaws control. Three mass health compaigns in Asia for 1954 are revealed in the report of U.N.I.C.E.F.'s targets. (a) To protect 7 million people with U.N.I.C.E.F., D.D.T., (b) To have the D.D.T. plants in Pakistan and India in production and (c) To test 26 million children against tuberculosis by B.C.G. vaccination.

* * * * * * *

F.A.O. Membership Increases: The Seventh Session of the F.A.O. Conference saw the Organization's membership rise from 68 to 71. Early in the Session Libya's application for membership was approved and Iran, a member of the Interim Commission which formed F.A.O., elected to take up membership. One of the final Plenary Sessions approved the application of Yemen for membership. At the close of the Seventh Session, Conference delegates voted to raise the Organization's budget to $6,000,000 for 1954 and for 1955. The highest previous budget level was $5,250,000 in 1953.

NEWS IN BRIEF

INDIAN

India and Haiti took their places on the twelve-nation United Nations Trusteeship Council for the first time recently. The Council, which is expected to be in session at United Nations Headquarters until March 12, will consider reports from the Administering Authorities of Trust Territories in Africa.

The posts and telegraphs department has decided to issue souvenirs to mark the India Postage Stamp Centenary celebrations in October this year. "The History of the Post Office" is to have two sections, one devoted to a historical survey of India's postal service while the other will deal with Indian postage stamps issued during the last hundred years.

* * * * * * * *

According to reliable information in New Delhi, Rourkela in Orissa has been selected as the site for the Government of India's new steel plant. It is stated the German experts who visited Rourkela and the iron-ore areas in Orissa in November last have recommended Rourkela as the most suitable site for the steel plant, mainly on account of its proximity to raw material centres and cheap electric power from Hirakud.

* * * * * * *

The Government of India have recently made available further funds towards their scheme for scholarships for Backward Groups amounting to Rs. 10 lakhs, thus raising the total grant for the scheme to Rs. 60 lakhs for 1953-54. The total number of scholarships awarded under the scheme is 11,624; 6,099 being for Scheduled Castes, 1,644 for Scheduled Tribes and 3,881 for other Backward Classes. Six scholarships are to be awarded during 1953-54 for overseas studies to candidates from these three groups.

FOREIGN

The Prime Ministers of India, Ceylon, Pakistan, Burma and Indonesia are expected to meet sometime in April to discuss common problems. Sir John Kotelawala, Ceylon Prime Minister, who last month proposed the meeting, has said the idea is to make the world realise the existence of 600 million Asians.

* * * * * * * *

The United States Air Force announced recently that it was sending a unit of B-47 jet bombers capable of atomic warfare to French Morocco. About 45 planes would fly non-stop to the new base in French Morocco sometime this month. It was announced that three Moroccan air bases were operating and a fourth base was still under construction.

A Window On The World

HARSH VOICES

By

ODYSSEUS

THAT SPARKLING CREATURE, Rebecca West, published a book of short stories between the wars called "The Harsh Voice", which included one of the most brilliant tours de force in the English language, a tale entitled "There Is No Conversation", which illustrates the difficulties that impede real understanding between a man and his wife, or indeed between any other two or more human beings each of whom is convinced that his own outlook on the world is wholly obvious and wholly reasonable.

I was reminded of Rebecca West's story by reading the reports published in the British press of Pandit Nehru's recent presidential speech at the Kalyani Congress Party meeting in which he uttered warnings about U.S. aid to Pakistan and about India's attitude towards the two power blocs and the Commonwealth, and by listening to the comments made upon this speech by a group of members in a club to which I belong.

As I listened I had a sinking feeling that Pandit Nehru's speech had created an effect on Western hearers exactly opposite to what he had intended and exactly opposite to its effect at home in India. What was evidently intended to promote reflection in the West, leading to a modification of Western policy, and what sounded obvious and reasonable in India, struck the West as so doctrinaire and so out of touch with reality that no advice that it contained could possibly be taken seriously. What was the height of reason in India presented itself as the height of unreason in the West. The task of trying to help you to see yourselves as you are seen over here in London is thankless, because, as you read, your indignation and resentment are likely to fall on me who am, as the French say, for nothing in all this: I am merely reporting. The importance of what I have to report lies not in its truth, justice, wisdom, or lack of them, but in the fact that it is a distillation of views expressed by a group that included diplomats, civil servants, editors, and a couple of politicians—a cross-section of people whose opinions make policy not only in Britain but in the Western world, for my club includes a substantial proportion of foreign diplomats.

WANTED: AN ASIAN AREA OF PEACE

Pandit Nehru said that India would not take part in any war, and he hoped that other Asian countries, by doing likewise, would thus build up an area of peace; the larger this area, the more danger of war would recede.

My friends said that, of course, if Pandit Nehru could persuade the U.S.S.R. and China into his area of peace, all the world would rejoice; but it was precisely because Soviet, Chinese, Indian, Pakistani, Iranian, Afghan, Turkish, and half a dozen other Asian interests were at variance over a varying number of points that the need for mutual consultation arose among those nations whose interests were identical.

If an area of peace, said my friends, were defined as an area that would attack no one but would defend itself if attacked, this definition covered a majority of the earth's surface in 1914 and 1939—the weakness of the definition lay precisely in the fact that it covered only a majority and not the whole. In both 1914 and 1939, neither the U.S.A. nor any country of the Commonwealth wanted anything but peace—the proof being that none of these countries were prepared for war and spent the first years of both wars on the defensive while they painfully accumulated sufficient force to go over to the attack.

In both wars, the U.S.A.'s position bore close resemblances to that proclaimed as India's by Pandit Nehru: the U.S.A. was strongly neutralist. In 1937, U.S. public opinion polls indicated that most Americans thought that U.S. participation in World War I had been a mistake. As the U.S. historians, Langer and Gleason, say in their monumental work "The Challenge to Isolation", American aversion to foreign entanglements, and their determined opposition to any political or military commitment, found their most eloquent expression in the effort to ensure by means of the Neutrality Legislation of 1935-37 that the U.S. would not be drawn into another war. A Congressional Investigating Committee had just demonstrated to the satisfaction of most Americans that World War I had arisen from the mad imperialist ambitions of the European antagonists, and that the U.S. had been sucked in by insidious propaganda and the machinations of powerful munitions-making interests. The Neutrality law, intended to forestall the repetition of this calamity, prohibited the export of arms to belligerent nations, forbade private loans to nations at war, and authorised the President to forbid Americans to travel in the ships of warring states. No loophole was left which would enable any foreign nation to argue that American intervention necessitated a declaration of war against her. Public opinion was wholly behind these Acts. According to Pandit Nehru's arguments at Kalyani, the U.S. Neutrality Act, which gave legal force to the policy which he is now advocating for India, should have ensured America's immunity from foreign attack. But what (said my friends) it did ensure was to make the Japanese (an Asian nation, by the way) feel confident that they could safely set up a new imperialism in Asia without fear of America; they reckoned that even if the American worm turned they could make sure that its turn was innocuous by destroying in advance the (neutral) American fleet at Pearl Harbour. If, after that, the Americans and their allies had any mind to dislodge the Japanese from Asia, it would be too late: the Japanese position would have been made impregnable long before.

The fact is that no nation, not even the rich and powerful Americans, who by their Neutrality Acts showed themselves more in earnest about neutrality than the Indians (who have passed no such Acts as yet), can stay neutral if its geographical position and its political, economic, or strategic, interests touch those of other nations to any appreciable extent. My friends conceded that the picturesque isle of Tristan da Cunha might, at a pinch, be able to pursue a successful policy of neutralism because it lies off the world's traffic routes and is of no interest to anyone. But India lies mightily athwart one of the world's key strategic areas. Her interests and those of several Asian nations touch and clash. She hasn't a chance of neutrality.

SOVIET SUBMARINES IN THE PERSIAN GULF?

Instead of preaching to us, my friends said, India would be better occupied in asking herself where her interests lie and in clarifying her obviously muddled thinking (sic). For example, India today sees U.S. and British warships and submarines moving freely about the Bay of Bengal, the Arabian Sea, and up to the

Persian Gulf, without a qualm. Such movements are thought to be of so little interest that they are scarcely reported in the Indian press. But would India, could India, be as indifferent if the present regime in Iran collapsed and were followed by a Communist regime which allowed Soviet submarines a base in the Gulf?

"That has not yet happened," I said. "If it does, Indian policy would, I am sure, be revised".

Such an attitude of wait and see, my friends retorted, was suicidal. If, however, the Kremlin were to receive simultaneous intimations from India and Pakistan that any intervention in Iran's affairs would be regarded as an unfriendly act and the presence of Soviet warships in the Gulf an act of war, the Soviets would hesitate to precipitate a crisis there, for the same reason that they obviously hesitate to precipitate a crisis in Europe, for—being better realists than India's foreign policy-makers make themselves out to be—the Soviets would know that war could not be localised in the Gulf but that the Anglo-American bloc would range itself on the Indo-Pakistani side before the Soviets had time to fire a shot.

"Why do you harp especially on Iran?" I asked. Because, they said, Iran is at the moment a terribly weak spot—economically and politically—in Asia's defences. They recalled how Hitler was left free to absorb Austria and Czechoslovakia, and Stalin permitted to erase from the map half a dozen states on his borders, because in those days everyone was busy appeasing the poor dictators who hadn't had a square deal and would soon join the satisfied nations if only they were allowed to help themselves liberally enough to other people's belongings. Hitler before the war and Stalin in the first post-war years knew this and acted on their knowledge.

My friends suggested that India ought to take warning from the fact that the only fighting that has gone on in the world in the past few years has not been in embattled Europe, ceaselessly vigilant behind its ramparts, but in peaceful Asia. In spite of all its distractions, Europe has built up such a united front that the U.S.S.R. knows that any funny stuff there would mean a world war, at once, at the drop of a hat, without argument. So the Soviets have turned their attention to Asia, where, except for Turkey, nobody is talking turkey to them in the words of one syllable that they understand, but where, on the contrary, everyone is professing friendship. The Soviets have been contained in Europe. They have been contained in Korea. But elsewhere in Asia, divided counsels, such as those of India and Pakistan, and wishful thinking such as that by the Congress President at Kalyani session, look good to the Kremlin.

My duty is done. I have reported what I have heard from people whose views, however erroneous, must be taken seriously. Harsh voices, maybe. But far from unfriendly.

A HINDUSTAN TIMES PUBLICATION

INTERNATIONAL SHORT STORIES

A collection of 41 selected stories from among those entered for the recent World Short Story Competition and the national competition held in India.

This book contains those five stories which shared the world prize of $5,000, including the now famous Indian story "Cyclone" which won $800.

TWENTY-THREE countries of the world and all the major regional languages of India are represented.

* Full Cloth Binding 420 Pages

Attractive Jacket * Price Rs. 8|-

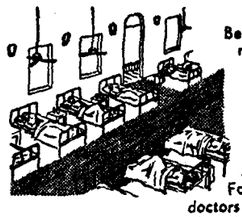
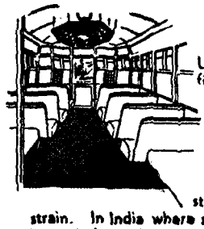
NEW DELHI



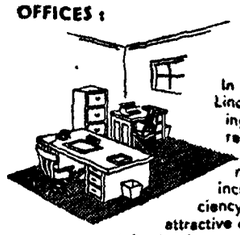
LINOLEUM—
The Versatile Floor Covering...

HOMES :



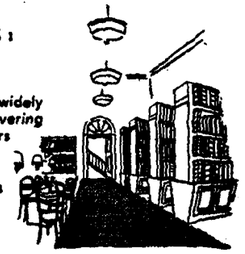
Linoleum can be laid on a simple cement or wooden floor in place of expensive marbles or mosaic floors. It is extremely comfortable to walk on easy to clean ..hygienic..no jarring noises, no serious injury to children even if they fall. Linoleum adds colour and brightness to the home, safeguards health, promotes quiet.

HOSPITALS :



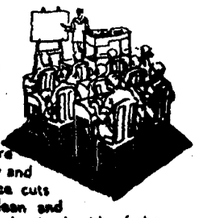
Being an hygienic, synthetic material, Linoleum is obviously an ideal floor-covering for hospitals and clinics. For nurses and doctors constantly on their feet, its "cushioning action" is a great boon; for the patients, no more disturbing noises from clattering feet.

PUBLIC TRANSPORT :



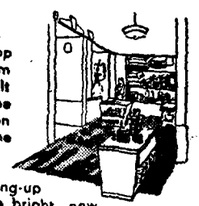
Tough, durable and easy to clean, Linoleum is the first choice for installation in public conveyances. Railway carriages, tram cars, buses.. Linoleum stands up to the strain. In India where so much luggage is carried in railway compartments, Linoleum seldom scratches or gets torn.

OFFICES :



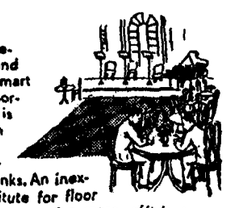
In the office Linoleum flooring effectively reduces noise and personnel fatigue, increases efficiency. For an attractive office maintained at low cost, Linoleum as a floor-covering is a real, long-term investment bringing everyday returns.

LIBRARIES :



Linoleum is widely used for covering library floors because it minimises noise, makes for that quiet atmosphere so essential for concentration. No more screeching chairs or clattering feet.

SCHOOLS :



Because it reduces noise and contributes to a bright atmosphere Linoleum is a most effective floor-covering for school rooms and lecture halls. Its durability and ease of maintenance cuts costs. Easy to clean and hygienic it safeguards the health of the youngsters. Particularly suitable for gymnasiums and recreation rooms.

SHOPS :

For effective decoration of shop interiors Linoleum is unrivalled. It stands up to the heavy traffic on shop floors and the constant use of counters. Wash it clean at shutting-up time, and have a bright, new floor the next morning.

HOTELS AND RESTAURANTS :

Hotel managements have found in Linoleum a smart and durable floor-covering that is easy to clean and does not soil from spilled food or drinks. An inexpensive substitute for floor rugs and carpets, and a more efficient floor-covering than either.

Because of its resiliency, durability and economy Linoleum has become the world's most preferred floor-covering. We now offer this modern floor-covering in a wide range of patterns and vivid colours. Besides specialising in laying we can also suggest artistic floor designs to suit individual tastes and needs. Consult us or see our distributors today!

A DELHI DIARY

I PLAYED truant last week. And my only excuse is that I have something to show for it. A visit to the Damodar Valley is (like the Damodar River!) liable to miscarry; and my programme for two days spread steadily into seven. At this time one can spend a month in the Damodar Valley and never have a dull moment. One catches the spirit of activity in a vast number of works, any one of which could occupy one for a whole day. I have spoken about the Tilaiya dam and the Bokaro Thermal Station before. On this occasion I shall have some brief words to say about Durgapur and Maithon and some longer things to say about Chittaranjan and Sindri, which are the great industrial searchlights of the new industrialisation in this area. I use the word "searchlights" deliberately. They seem to be two great beacons showing the direction in which massive industrialisation in the new India can take place. For me they certainly lit up the countryside. But let me begin at the beginning!

ON THE ROAD

I have tried to find out by various visual aids where the Damodar Valley starts or (if you like!) where it ends. I have reached no precise conclusion, but consider much the best way is to set out from Calcutta across the great Bally Bridge, joining the Great North Road about ten miles outside Calcutta. One's first sight of the valley (or rather of the Damodar Valley Corporation!) is an enormous earth bund which seems to spring out of nowhere and comes out on both sides of the road long before one reaches Burdwan. This turns out to be the sides of a great canal which is to make of the District of Burdwan a new land flowing with water and power, which are (I suppose!) the modern equivalents of the ancient milk and honey. Then one arrives at the 114th mile to the deviation for Durgapur and (if one is with a D.V.C. enthusiast!) one makes the turn, weak and unresisting. One will hear on the way as much about the tremendous advantages of a new steel plant there as about the barrage whose virtues do not need to be proclaimed!

Being totally innocent of steel polemics, I must confess I still cannot see why Durgapur is better than Maithon or any other place where both coal and water are available. But there are mysteries in location which are clearly not intended for the common man, which (happily!) I can still claim to be. One site looks to me very much like another at least until it is transformed (as are both Durgapur and Maithon!) with bulldozers, earth-moving equipment of every kind, cement-churning plants and so on and so forth. Even the great and turbulent Damodar and Burrakur rivers look like prostrate patients before the operating engineers who keep hacking with all these terrible instruments at their sides! The grand conception of the dam at Maithon (which is being built at a cost of Rs. 13 crores!) is a good excuse for pause and wonder. One notices with a feeling of intense relief (after one has done the rounds) that it is time for tea!

And so the pace increases; fortunately Chittaranjan, which is just fifteen miles away, is another day! For the uninitiated Chittaranjan, now a place, was once a person and it was of this great person that Rabindranath Tagore wrote: "Man truly reveals himself through his gift, and the best gift that Chittaranjan has left for his countrymen is not any particular political or social programme, but the creative force of a great aspiration that has taken a deathless form in the sacrifice which his life represented". I like to think of this great factory which is designed to produce 120 locomotives a year (and may be worked up to 200!) as enshrining something of the spirit which Tagore found in Chittaranjan Das—"the creative force of a great aspiration". For as long as I can remember, we in India have wanted to make locomotives; now that the task has been accomplished, one wonders whether it really was such a great aspiration. Still no one can deny the creative force which stands in and all around Chittaranjan. And thus Tagore's words have come to fulfilment in a great, even if in a material, way.

NO ENGINE TROUBLE!

At Chittaranjan, India's Railwaymen who have been in absolute charge from the beginning have justified themselves. Differently from members of the Indian Civil Service, one does not turn naturally to engineers as managers; and yet here they have done as well as almost any managers within the country. There has been no significant labour trouble in this factory at any time; it has dared to use (and make useful!) East Bengal refugees as skilled craftsmen; it has already worked itself up to half peak capacity. A production bonus system (which has taken three full years to prepare!) has emerged from its period of incubation, and perhaps in (one?) great leap the target of 120 engines per year will be attained. As an example of great team-work, this has been a dashing success. Should one reserve judgment on efficiency; is not the proof of the pudding only in the eating? So it is; but I shall be rash. Chittaranjan, I assert, in the name of all the doubters, has already done the job!

And so one passes even in the factory area from West Bengal into Bihar. It is about fifty miles to Sindri, and I believe this time one is as much off as on the Great North Road. One can spend many hours on the way. There is the Indian Iron and Steel plant at Kulti on the way, collieries (of various kinds!) and the new Fuel Research Institute beyond Dhanbhad where there are great extensions under way. The country here is (alas!) not very beautiful; which black country ever was? When one arrives at Sindri one is even in a mood to be on friendly terms with the new coke ovens which are determined to darken another patch of green in a darkening countryside!

CONTINUOUS SINDRI

The grand fertiliser plant at Sindri devours great masses of all kinds of materials, particularly coke, water, and gypsum and in some mysterious way (which I am still unable precisely to describe!) eventually comes out with sheets of crystals of ammonium sulphate moving happily up a tireless conveyor. This is one of the most modern fertiliser factories in the world and (more important?) has become the cynosure of all the world's eyes. Colombo Plan delegates, World Bank Missions, Imperial Chemical Chairmen (or is there only one?) all arrive here by a process which has now become as nearly set as the ammonia process itself. They arrive from both ends. I conclude, therefore, that the public sector in New Delhi and the private sector in Calcutta have found at least one issue on which they are in complete agreement!

The great public interest in Sindri (and Chittaranjan) must be a little embarrassing to its hard-worked officers. Almost the most significant virtue of both institutions is that the officers concerned (no doubt gnashing their teeth soundlessly within!) present the most cordial of countenances. I have seldom seen Public Relations better performed than at Chittaranjan and Sindri. But may Production never fall to tell the tale!

ARGUS.

SPECIAL ARTICLES

THE STATE OF THE TREASURY

THE idea of forecasting the Central budget is likely to seem strange almost to the point of being ridiculous, because not only is the extent of non-official knowledge greatly limited, but the personal approach to the problem on the part of the Finance Minister will, in any country and at any time, be slightly unpredictable. These two limitations can make all the estimates go awry. No sanctity can, therefore, be claimed for the estimates and trends which are summarised at the end of this article. One justification for the attempt to describe the background of the budget will, however, remain, in spite of these shortcomings. This justification is that an attempt to describe the position, in so far as it can be described in the light of the known developments of the year, will clarify matters and will enable the public at least to ask the right sort of questions; and, perhaps, since the facts themselves cannot change, the attempt may not be irrelevant after all.

The main trends as disclosed by the nine-monthly estimates for the current year are now known. As far as the principal heads of revenue are concerned, they are that the liberalisation of imports-cum-increase in import duties in last year's budget has proved to be inadequate, to offset the decline in imports and the readjustments in the hessian and cloth duties, which were subsequently made. The re-opened treasury bill market has not led to anything like the net increase under floating debt, for which credit was taken in the budget, or the increase in treasury bill sales which the Fund's mission has more recently recommended. Both the negotiation of as well as the drawal of the amounts committed on account of World Bank loans have also proved in fact to be long-drawn-out processes. Similar remarks apply in respect of the now sizable grants to India under the auspices of the Foreign Operation Administration. At the same time the credits which are due under the terms of the partition settlement with Pakistan are now dislocating the revenue budget in appreciable measure.

Last year's budget was drawn up, as every budget inevitably is, partly in the hope that something good would turn up, which, having regard to the now depleted level of the Government of India's cash balances, will enable the Government to carry, all at once, the burdens of a heavy debt maturity, a huge loan account, increased defence expenditure, and sizable expenditure from special development funds. Treasury bill borrowing to the extent of Rs. 110 crores or thereabouts (net), to take place in the normal course, or to be forced on the Reserve Bank of India, if necessary, was one way out of the situation created by the necessity to undertake all these commitments, and it was this way out which ultimately proved to be easy. The International Monetary Fund's mission has since blessed this sort of borrowing within limits.

As far as the current year is concerned, the tables at the end of this article take these factors into account. For the rest, the entries are self-explanatory, except that allowances have been made for the lag in expenditure in respect of projects financed from the Centre's loan account, and that similar lags in respect of expenditure financed from the special development funds, as also a further credit to the public account on account of the Indo-U.S. technical co-operation fund, have also been allowed for.

There is no basic change in the position in the coming financial year. The arrears under the partition settlement will, however, be carried forward, and the rupee debt falling due in the next financial year, at Rs. 47.96 crores, will reduce the strain on the capital budget. The effect in the one case is to relieve the strain on the revenue budget, just as in the current year it has been to increase this strain. This reduced strain in the revenue budget as in the capital budget will, however, be more than offset by the carry forward of expenditure into the fourth year of the Plan, when, irrespective of considerations of what is practicable or equitable, it will be natural for the Central Government to make an attempt to overtake the arrears of spending. Refugee expenditure, for example, will hardly taper off.

The budgetary situation in India today is anomalous in more ways than one. For one thing, the states, which believe less ardently in planning than does the Central Government itself, are making attempts on a proportionately less enthusiastic scale to increase their resources for spending. The difficulties of federation and of politics are there. The Central Government on the other hand, having underwritten the Plan, is, in the position of having to push it forward, irrespective of what the states actually do, although, after so many budgets in which taxation has been levied, the Centre can now, in the year in which the Plan enters the critical phase, realise much more easily than can the Fund's mission, the difficulty of pushing the level of taxation upward. A radical review of the taxation structure, if it had taken place in time, might have been helpful. But at this stage, this is one of those might-have-beens which can offer little consolation either to the Finance Minister or the public on budget day.

In these circumstances, the crucial questions in the current year's budget, as in that of the coming year, are mainly three. They are: to what extent will deficit financing in the sense of borrowing which may have to be taken up initially by the Reserve Bank, be undertaken (in view of the current economic situation and the present level of holdings of rupee securities and investments of the Reserve Bank, the important question is not so much whether this process is possible, but how far it can proceed). When will the payment under partition settlements with Pakistan and Burma be undertaken or resumed? And how soon will the foreign loans, which are in prospect, like, for example, the loans which are being negotiated for the Industrial Finance Corporation, the Trombay Thermal plant, and the Koyna project, be negotiated and drawn upon?

It is hard to answer these questions; even the Bernstein mission, which attempted to answer the first question, has not been wholly successful. The position is, indeed, difficult. That it is not impossible must, perhaps, be put down to the fact that the accounts of the previous years can be expected, on the basis of experience, to build up the cash balance beyond the level of about Rs. 80 crores, which has been carried forward as the current year's opening balance in the Central budget. Any estimate in lieu of this figure, which is likely to be out of date, can only be tentative. But tentatively, a guess that the opening balance on the 1st April, 1953, was Rs. 115 to Rs. 120 crores or about Rs. 40 crores more would seem prima facie to be not unreasonable. If this guess turns out to be correct, and if the estimates of expenditure and of borrowing on floating debt account are further broadly in line, the Finance Minister may still be able to manage the situation in the coming financial year, in spite of this being a critical year for the Plan. To one change, however, he may have to reconcile himself. The minimum level for the closing balance which he has indicated, namely, Rs. 50 crores, cannot easily be sustained; but this would hardly matter.

From the market's point of view, as also from the point of view of the much-harassed middle class, the important question which has still to be answered is whether the Finance Minister will feel called upon, as in earlier years, to do something about this. An atmosphere in favour of a little further effort by way of taxation has now been created by the Bernstein report. sional opinion is against the possibility of a major In the context of the fact that the balance of profes- recession in the United States, a tax programme may also not be a very great hazard. The Indian Plan will at the same time be entering into its critical period, when an effort will naturally have to be made to ensure that the investment is not greatly in arrears. The possibility of some marginal adjustments upward in taxation cannot, therefore, altogether be dismissed. There are some alternatives, which a hard-pressed Finance Minister can still consider; postal rates, the individual income-tax rate or an increase in the surcharge, a surcharge on the estate duty, a reconsideration of the tea or tyre or vanaspati excise, and a liberalisation of a wide line of imports with increases in customs duty as in the last year's budget, are examples.

The times are certainly hard, in the sense that this generation seems sentenced to permanent hardships. There are two arguments, or rather three, however, to urge against any immediate further taxation. First, it will be equitable and necessary to await the report of the Taxation Enquiry Commission, now that taxation of those classes which are being taxed has proceeded so far. Secondly, the scope for foreign aid must be more fully explored, even within the existing limitations. Thirdly, the taxation, if any, must be equitably spread, and cannot all take place, year after year, in the Central budget. For these reasons, expediency and equity alike would dictate that it will be wise to attempt to do little, or nothing, rather than to do too much. There is no reason, unless the estimates disclose a prima facie impossible situation which cannot be dealt with otherwise, why status quo cannot be maintained, as a compromise between the needs of the situation on the one hand and considerations of equity on the other.

REVENUE BUDGET

	Budget 1953-54	Revised 1953-54	Nine months' actuals 1953-54	Budget estimate 1954-55

THE FUND'S FINDING.

CONTRARY to the general impression, the report of the International Monetary Fund on the problems of Indian economic development has proved to be an extremely tame and unexciting document. Its practical value for purposes of guidance will, it is to be feared, prove to be little. This is because the limits which it has set for deficit finance are provisional and tentative, to be revised in the light of experience, so that the only practical targets which can be set up are two, namely,

(i) that the reduction in foreign reserves, which actually takes place from time to time, should be offset by equivalent borrowing in India from the Central Bank, against ad hoc securities of the Government of India, or against securities pledged by the scheduled banks, and

(ii) that over and above this, approximately Rs. 100 crores of deficits can be incurred in, say, a three-year period.

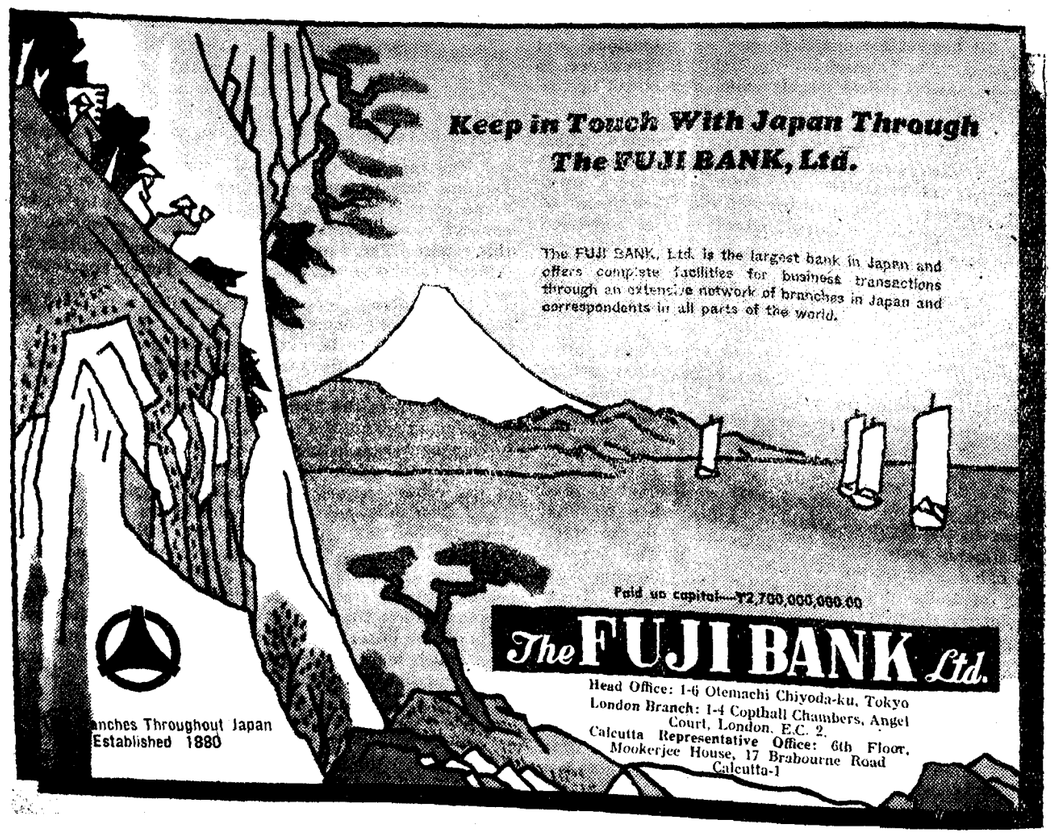
The qualifications subject to which this latter figure is to be regarded as valid are many and such as to destroy much of the value of the report itself. It is important, however, to assess these recommendations in correct perspective.

The first target, as will be seen, is more or less nominal. Ad hoc treasury bills were created and issued to the Reserve Bank of India, when terminal adjustments were made in connection with the sterling balances, enabling the acquisition by the Government of India of military stores and relieving it of pensionary liabilities in the United Kingdom. These adjustments led to a reduction in foreign exchange reserves, the effect of which was offset by the borrowing. In respect of the bulk of the three-hundred-crore deficit-financing, which the Fund's mission has now recommended over a three-year period, the proposal which is now made is thus far from being novel. The reduction in foreign exchange reserves, resulting from the use of the sterling balances, will lead, other things being equal, to a deflation. Deficit financing, in the sense of inflationary borrowing from the Central Bank, will, however, offset this deflation—so that in the net result, there are no price effects and the position remains stable.

The gist of the mission's recommendations thus turns out to be that about one hundred crores of genuine deficit-financing, which may have price effects, can be contemplated. But even this is subject to the qualification that it is really impossible to say, and that the Government of India can, therefore, proceed in this direction only by slow degrees.

The bias of the report is, on the whole, against genuine deficit-financing rather than in favour of it. Some of the considerations which are relevant in this context have, however, obviously been overlooked in this report. These must now be mentioned, so that the difficulties of the situation can be better appreciated.

First, there is one major difficulty which has become important since the report was first written. It is now proving to be difficult to run down the foreign balances. One of the main ideas in the present report is that if the sterling balances are spent, equivalent borrowing from the Central Bank can then take place, in order to offset the deflationary effects. But if foreign exchange cannot be spent, there does not then eventuate the chain of events which is contemplated in the report, namely, that money supply is first reduced, that inflationary borrowing by the Central Government then takes place, and that, with the proceeds of this inflationary borrowing, pre-emptive bids for resources are made by those to whom these proceeds accrue. In the conditions which actually prevail, genuine deficit-financing, which will have initial price effects to be offset later on by new production, will become much more important than it was in the scheme of the mission's report.



The mission has recognised the need for money supply keeping pace with the growth of the economy. What is apparently intended is that a little increase in money supply should first lubricate the economic

system, that development and new production should then take place, and that there should, thereafter, be a substantial adjustment in money supply, to suit the growth in the economic system which has taken place. This programme for development overlooks, however, the basic difficulties, which are mainly non-financial. To the extent that basic investment, such as the extension and improvement of the railway system, or expenditure on multi-purpose projects, has not taken place, but is necessary, and to the extent also that the problem is one of balanced development or of simultaneous advance on a number of fronts, the deficits will necessarily have to be heavy. Initial deficits of the order of, say, Rs. 100 crores in a three-year period, will hardly be adequate; at the same time, the question of adjusting the money supply to the actual growth of the economy which has taken place will be academic. The real problem of development is not so much to adjust money supply to this growth as to bring about this growth itself, incurring for this purpose deficits, to the extent to which they may be necessary.

The main trend of the recommendations in the mission's report regarding taxation is equally unhelpful at this stage. Here, the problem is hardly one of such simplicity as it has apparently appeared to be to the mission. Comparison of the ratio of taxation to the national income in various countries being admittedly invalid, it is just misleading to assume that the Indian tax system prima facie leaves much scope for an increase in the tax burdens. The mission seems to have overlooked some very relevant considerations in framing these recommendations. There is, first of all, the fact that even the existing taxation imposes very real hardship; the entire taxation system will have to be rearranged, and a growth in national income, forced, if necessary, by deficit-financed investment, will have to take place, before much more taxation can be levied. There are also the imponderable political factors, moreover; land taxes cannot be increased as easily as the mission apparently assumes they can be.

The limits of taxation will soon be reached in other cases. For example, the economic cost of an extension of social security (in the shape of industrial costs, or employees' contributions, which affect real incomes and may, therefore, destroy incentives) can hardly be overlooked. The impossibility or unwisdom of increasing railway freights or postal charges, when the absence of cheap and adequate transport is already proving to be a bottleneck which holds up economic development, or of increasing water rates, when what is important is not the revenue, but the rapidity with which irrigation can be extended, must also be taken into account in a country which has a development programme to implement.

The fact that the mission's report has not been able to arrive at any satisfactory principles, in the light of which the targets for deficit finance can be fixed on a more than provisional basis, is not after all surprising. It is, however, significant. There are really no principles, which can serve as a guide in this matter, except, perhaps, three very broad generalisations, and these are first that the investments which are financed by means of deficit must be productive and economical, second that the ratio of income to investment must be stepped up as much as possible, and third that foreign aid can be used, if available, to offset an inflation, if it develops. Subject to these observations, deficit-financing is a matter of necessity, depending on the level of expenditure, and, therefore, on that size of the plan which seems on wider grounds to be reasonable. Since it is a matter of necessity, and an expedient which is only to be residually relied upon, practical necessity, rather than 'a priori' principles, will, in the last resort, dictate how much deficit-financing and when this country will undertake for implementing its plan.

THE BUSINESS WORLD

DECISION ON CEMENT

Barring the Sone Valley Portland Cement Co., Ltd., every established cement company has agreed to the proposal for joint administration of the rehabilitation fund. The announcement last week of prices for all the units did not, therefore, come to the industry altogether as a surprise. There are, however, one or two matters arising out of the Government of India's Resolution on this subject, which seem to deserve some publicity. These relate to the rate of return on the gross block, the question of a uniform all-Inida selling price, and the period for which the prices are to be effective. The Government of India, it is to be noted, has differed from the Tariff Commission on all the three points.

The reduction of the gross block from the ten per cent proposed by the Tariff Commission to the eight per cent which is allowed in the Resolution is apparently to be explained by three reasons. First, the cement industry cannot be treated differently from the iron and steel industry. Secondly, the Government of India probably regards the level of dividends of the established companies as quite satisfactory. Thirdly, cement is an item which goes to inflate most costs of construction and the Government has a natural interest in keeping the cost low.

The validity of all these arguments is, however, limited. The iron and steel industry had itself protested against the return on gross block which was fixed, and in the light of the recommendation of even the I.M.F. report (as a recent example) that the return on investments should be satisfactory, the present decision cannot be defended. The matter, however, raises an issue of principle. What is the ceiling of the percentage return on the gross block which the Tariff Commission should regard as a maximum for purposes of guidance? Should this ceiling be eight rather than ten per cent? On any long-term view, there is no reason why the higher rather than the lower figure should not be adopted.

The question of fixing a uniform all-India selling price, which is the second point on which the Government of India has chosen to depart from the recommendations of the Tariff Commission, is presumed to involve administrative difficulties. Apparently, the intention is that the creation of a common marketing organisation within the industry itself, which will equalise costs for the consumer against the day, if that arrives, when cement prices are decontrolled, should not be prejudiced. This question, however, has been hanging fire for quite a long time now, and the divergence of interests between northern and southern producers is so great that there is no prospect, in the near future at any rate, of the common marketing organisation being brought into being. In these circumstances, the case for establishing an equalisation fund and a single price continues prima facie to be valid, and the administrative difficulties of operating the fund, if any, are bound to be negligible.

The period for which prices have been fixed has been left uncertain in the Government Resolution. The new prices came into effect from Monday and are to continue until further orders. This may well be a longish period, but the Tariff Commission recommended three years, and as the Government of India has changed the recommendation, the industry, and particularly the new units established in it which are now struggling to reduce their high costs, have no guarantee that the protection of a certain price will be available to them over a reasonably long period of time. The new decision on cement recognises the claim for special consideration of these new units which are situated at places which are far removed from the coal-bearing areas. The prices actually fixed are as follows:

(i) basic price of cement, applicable to the Sone Valley Portland Cement Co., Ltd., Rs. 67 per ton,

(ii) basic price plus rehabilitation charge, applicable to A.C.C., Rohtas, Kalyanpur Lime and Cement, Banjari and the two Dalmia companies, Rs. 71 per ton,

(iii) the Mysore Iron and Steel Works, Rs. 72 per ton,

(iv) the Digvijay Cement Co., Rs. 75-8 per ton,

(v) India Cements and Orissa Cements, Rs. 75 per ton,

(vi) Travancore Cements, Rs. 79 per ton.

In fixing these prices, the interests of the consumer have at the same time been taken into account. It would be a pity if the new cement prices, which are basically fair, were to turn out to be inadequate, because the Government of India has not accepted the recommendations of the Tariff Commission which has conducted a detailed investigation of the costs of production in the industry.

THE WORLD BANK MISSION

By

CROESUS

Considerable interest prevails here in the proposal of the World Bank-cum-American Investment Houses Mission—the members were in Bombay last week—for establishing an Industrial Development Bank for financing new industries in the private sector in India. Evidently, this has stemmed out of a correct appreciation of the difficulties of the private sector in this country, against which there have been complaints—without caring to inquire into the reasons—that it has not come forward with the quantum of investment expected of it under the Five-Year Plan. The appointment by the Reserve Bank of India of the Shroff Committee to explore means of finding more finance to industry through the agency of commercial banks—the Committee, I understand, has concluded its labours and finalised its report—also was a similar gesture. But it is obvious that more can be expected through the proposed U.S.-sponsored institution than the agency of commercial banks. At best, as a result of the findings of the Shroff Committee, commercial banks may be asked to relax the terms on which credits are being extended by these institutions, and conceivably to a greater extent than that to which they were tightened during the past two years or more under the advice of the Reserve Bank itself, as an anti-inflationary measure. Even this, it occurs to me, can be but a brief experimental measure in the context of large outlays —over Rs. 1,200 crores—under the Plan in the next two years and the consequent risk of inflation.

There were naturally apprehensions that the proposed Industrial Development Bank might conflict with the Industrial Development Corporation so sedulously sponsored by the Union Commerce and Industry Min-

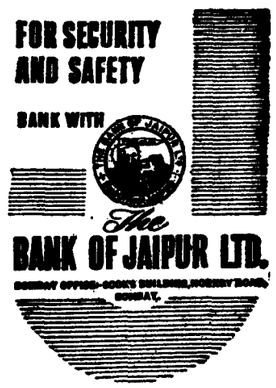
ister, Mr. T. T. Krishnamachari. So soon after this indefatigable Minister had succeeded in converting those that opposed the idea of such a corporation—it is well known that there was opposition to the idea both in the Planning Commission and in the Cabinet itself, for understandable prestige reasons—one would have thought that he would be loath to allow the World Bank-U.S. Investment Houses team to steal the thunder. But, due perhaps to the tact of the Union Finance Minister and more than that—to give credit where it is due—to the burning desire of Mr. Krishnamachari himself to prevent a stalling of economic development in the country on any account, either because of the reluctance of private enterprise or because of the lack of adequate resources with the Government, it would seem that the latter (the Union Minister for Commerce and Industry) also favours the latest proposal. This means that the line is now clear for the proposal to go through.

At least after the publication of the report of the I.M.F. Mission to India last year headed by Mr. Bernstein, I suppose there will be very few (who are really intent on the country's economic development) that would still oppose foreign aid. Does it really matter whether the Industrial Finance Corporation takes a loan from the World Bank to accommodate more industries in this country, or the World Bank itself establishes an Industrial Development Bank in co-operation with leading investment houses in America, and perhaps in Britain also, if feasible, to do the same thing? With the severe limits to capital formation and savings in India as things stand, as outlined by the I.M.F. Mission, even Mr. Krishnamachari must now be feeling that he might not get all the finance needed for his Industrial Development Corporation through the agencies he had in view. Moreover, as far as one can make out from what has been reported in the daily Press so far, the establishment of an organisation like the one proposed by the World Bank-U.S. Investment Houses Mission amounts, in effect, only to giving a new name to a procedure that is even now in vogue, namely the use of the counterpart funds arising from the U.S. aid in one form or another. For, where is any difference whether this is directly handled through the T.C.A. or through a new organisation which also is to get its initial working capital out of the identical source, except, of course, that the separate organisation now proposed is more ambitious and may be expected to relieve our anxiety about foreign aid at least to industrial undertakings in the private sector?

After reading the Randall Report in conjuction with the U.S. President's Budget Speech and the Report of the Council of Economic Advisers to Mr. Eisenhower, it should be clear to one that, under the Republican regime, there is bound to be a larger degree of shift in the emphasis on private enterprise and private investment both in America and outside. In America, one may also expect the gradual elimination of Government activity in the private sphere. Outside, according to the remedies suggested by the Randall Commission to overcome the world's dollar shortage, it is sought to ease the conditions on which stand-by credit can be made available from existing institutions—meaning undoubtedly the World Bank, the I.M.F. and the Export-Import Bank, among others—and to encourage American private investment abroad by means of such action as the U.S. can possibly take. If one bears in mind one important consideration, namely, that, whether it is an infant democracy such as India or it is an adult democracy that America is, an element of politics is bound to enter into, and influence, all vital decisions of this nature, one will not fail to appreciate the form of the proposal in question of the World Bank and U.S. Investment Corporations Mission to India. It is perhaps a better solution to our external resources problem than any that has come our way, and the consensus of opinion in informed circles in Bombay, therefore, is that it should be readily accepted.

BACK TO STATE BUDGETS

By



CROESUS

When, in the statements he made in India last year, Mr. Bernstein favoured deficit financing within limits, there were many who raised their brows. It would be interesting to know the reactions of these critics to the report to the Government of India made by Mr. Bernstein and his other colleagues of the International Monetary Fund. The report, as is only to be expected, elaborates Mr. Bernstein's views on the question. But, presently, it is not on that question that the public will concentrate.

Although the Ministry of Finance has made it clear, in a foreword to the report, that "while the views expressed in the report are entirely those of the Mission and the Government of India are not committed to them", it has also added that the Government "will take them into consideration in the framing of their future policies, within the framework of the social and economic objectives set forth in the Five-Year Plan". While the Mission approves of deficit financing in the prevailing circumstances and under certain given conditions, it emphasises the point that, in the long run, the resources for development must come from taxes or savings out of the current income of the people, or they must come from resources provided from abroad. It has accordingly dismissed the argument that recourse to foreign resources thus would increase India's public debt, especially to other countries, and create problems of servicing the debt as lacking in substance, and has favoured foreign aid to accelerate the tempo of economic development to the requisite extent. At the same time, referring to mobilisation of internal resources, the report speaks of stepping up small savings and re-examining of taxes on corporate profits to facilitate internal financing, by business, of capital outlays for replacement and expansion. These measures are already being taken and may perhaps be intensified further in the light of the Mission's report. But all these are taken for granted and will not have much effect. The business community accordingly feels all the more reassured now that the forthcoming budget will not have any additions to direct taxation. It is, however, concerned about the State budgets.

Now, both the Centre and the Planning Commission can feel flattered that their proposals regarding raising tax resources in the States have found favour even with the I.M.F. experts and they may, therefore, press the State Governments to increase land revenue by means of temporary surcharges, if need be, until assessments are completed, to impose agricultural income-tax, where the levy is still not in force, and to collect betterment levies and irrigation and power charges. One cannot say, in the light of the public resistance to moves in these directions last year—and things have worsened for the agriculturists since—how far the State Governments will respond to the call. Similarly, while private enterprise may welcome the Mission's proposal that services offered by public enterprises should be at full cost (operating costs plus capital costs), inasmuch as this would provide the correct basis of comparison between private and public enterprises offering similar services such as, say, gas or power

supply, the actual consuming public will strongly resist any move in this direction. The rather embarrassing problem before the State Governments is whether to please the Union Government and the Planning Commission, which have ere now rightly complained that State Governments have not raised all the resources required of them under the Plan, or to appease their subjects. If economic considerations alone should prevail, the States have no choice but to do what the Planning Commission and the Centre have been urging, but political considerations enter into the picture and, in the final analysis, it is undoubtedly these that will determine the action of all Governments, let alone our State Governments. To the extent that this is so, the hands of the State Governments are really tied. In the result, one fears these Governments may choose the line of least resistance and impose fresh and further burdens on a section of the population that is already labouring under a heavy load in all conscience. Spokesmen of most State Governments, it must be remembered, are not handicapped by any such assurances as those of the Union Finance Minister not to alter the tax structure pending the report of the Taxation Inquiry Committee. So it is the State budgets that need watching now rather than the Central budget.

BUSINESS NOTES

A SHORT-TERM PROGRAMME FOR ROADS

It is now obvious that planning for road development has not been conceived in the long-range perspective, but on the other hand it has proceeded on an ad hoc basis. Neither in respect of renovation and improvement, new construction, road transport services, motor vehicles taxation, administration of the Motor Vehicles Act, nor communications in the countryside has a clear and positive policy been accepted and announced. Only some of these aspects of road policy are being tackled and tackled piecemeal. Three years of the First Five-Year Plan have already run out. It is certainly a matter for some satisfaction to know that this problem is now being given the attention it has always deserved.

In this situation, the best thing to attempt would be to concentrate energy and resources on the execution of a short-term programme for the remaining two years of the Plan. Mr. R. K. Batra's presidential address at the eighteenth session of the Indian Roads Congress on February 5 last has the virtue of emphasizing concrete proposals for action in the immediate context. Finance is now certainly not the bottleneck because, in addition to the allocation of Rs. 118 crores made in the Plan and the appropriation of Rs. 25 crores during the five-year period from the Central Road Fund, an amount of Rs. 10 crores has been allotted for roads in the supplementary schemes to fight unemployment. A clear factual statement should be demanded from the State Governments (who have failed to supply it as disclosed by the progress reports on the Plan) about the various aspects of their road programmes—mileage awaiting improvement, mileage to be taken up for new construction under different classes of roads—state highways, district and local roads and village roads, and bridges to be repaired or newly constructed. Final commitments on these projects should be made. The Plan envisaged improvement or construction of 24,000 miles of arterial roads comprising national highways, state highways and minor roads, exclusive of 20,000 miles of village roads under the community projects and national extension services. One hundred bridges find priority in the Plan. Mr. Batra has done the right thing in drawing attention to the fact that priority for restoration of missing links in important roads and for several bridges at vital points of communications has not lost its urgency. His speech explains at some length the lines on which this first job of missing road links, bridges, a large number of culverts and new roads to link the countryside with the major roads and urban markets ought to be planned. The state of maintenance is another very weak spot and the magnitude of arrears can be gathered from an informed estimate which places the annual loss to motor transport on account of bad roads at about Rs. 38 crores. Maintenance and repairs are no less an important problem.

These are short-term concrete proposals from the chairman of the organisation of the country's road engineers and they demand earnest consideration from the new agency of the transport adviser and the study group set up recently by the Planning Commission.

IMPORT OF U.S. COTTON

The Government of India's announcement of last week declaring free imports of U.S. cotton of staple 1-1/16" or more has been received as a welcome decision. The condition imposed on the import of this cotton is that it must be strictly on mill account. Two points, it appears from the trend of reaction, need explanation before clearer indications can be obtained of the readiness of the trade to import. The clarification sought relates, first, to the currency in which payment is to be made—whether it is to be made in rupees, which, according to earlier reports, were acceptable in payment for U.S. cotton. It is also not clear whether any ceiling is intended on the total quantity to be imported under this decision.

Already, it is estimated that 80,000 bales of U.S. cotton from the 1951-52 crop still remain to be imported and the original validation of licences for the total quantity of this crop, which were limited up to June 1952, have been extended since then, taking the current extension to June 30, 1954. At present, evidence of enthusiasm to take advantage of the latest permission to import American cotton of 1-1/16" staple or longer is lacking and estimates are that the quantity to be imported will be in the neighbourhood of 200,000 bales on a reasonable reckoning. U.S. cotton of 1-1/16" staple is not directly competitive with Indian cotton of similar length so that it is unlikely to affect the consumption of Indian raw cotton. However, in relation to Egyptian and East African cotton of identical staple the U.S. cotton is about Rs. 100 cheaper, but this competitive advantage is offset by the major consideration of quality. In view of the superior quality of Egyptian and East African cotton of 1-1/16" staple, among others, it pays to import it for manufacture of fine varieties of cloth. Prices of these two are hardening at present, but the point has not yet been reached at which the balance of benefit will lie in purchasing U.S. cotton.

TEXTILE MACHINERY MANUFACTURE IN CHINA

In a short span of three years mainland China achieved a commendable degree of success in laying the foundations of a sound and developing textile machinery manufacturing industry. China's textile industry is now at least six decades old, but every single component of the different types of textile machinery required was imported before 1950. However, side by side with a scheduled programme of increasing allocation of funds for the rehabilitation of the textile units and establishment of new ones, the Communist Government made provision for the expansion of a new capital goods industry for the production of textile machinery. The strides made in this new venture are surprising. In its three-year life this nascent industry manufactured 600,000 spindles and 18,500 automatic looms which went to satisfy the requirements of several old mills and nine newly set up units. The next line of production which is to be taken in hand immediately is manufacture of complete sets of spinning frames. Further development of the industry is to proceed in the direction of other machinery required by cotton textile plants as well as machinery for dyeing and printing, and for woollen and silk mills. This is no wishful thinking and definite provision with production targets has been made for it in the current five-year plan. On the score of quality, if the certificate of accomplishment obtained at the various exhibitions in the Soviet Union is to be regarded as not free from bias, the testimony of appreciation won at the Leipzig fair needs to be accepted at face value.

Six newly set up plants have gone into production for varying periods in the last three years and they have been located in Tientsin, Tsingtao, Chengchow and Shanghai. Their manufacturing programmes and methods are planned on a basis of co-ordination in order to ensure that different parts of machinery manufactured separately in these units fit in with the final complete machinery. This implies a high degree of standardisation and precision. A new plant, bigger than any among the earlier six, was set up last year in Shansi Province. It has doubled the installed capacity of the industry. Its special function will be manufacture of complete sets of spinning frames. Five of these seven plants are State-owned and two are owned jointly by the State and private investors.

The lesson of this achievement must not be lost on this country and particularly on the Government. The degree of success attained in a short period in China is almost wholly due to the determination of the Government to build up this industry which is indispensable for a major textile manufacturing country. In India, while private initiative and venture are struggling to hold their own against the fierce competition of long established overseas manufacturers, the Government is unable to make up its mind firmly to abandon the attitude of vacillation and extend vigorous support to this key industry.

AUTOMOBILE LEAF SPRINGS

The automobile leaf spring industry in this country can establish itself on a developing basis only if it first pays attention to occupy the position of a regular supplier of leaf springs for use as original equipment to the manufacturers and assemblers. Its market for replacements is secondary in the order of priority. The claim of this industry for protection, which has been taken up for investigation by the Tariff Commission, marks the second stage into the inquiry of automobile protection. The industry comprises essentially three organized manufacturers—Metropolitan Springs Ltd., Bombay, Premier Automobiles Ltd., Bombay and Canara Workshops Ltd., Mangalore. In addition, Simpson and Co., Ltd., Madras, has obtained the licence to set up the manufacture of automobile springs with a production capacity of 45,000 springs or 562.5 tons. The total capacity of the three units in actual production is 142,000 leaf springs or about 1,775 tons on a single shift basis, but actual production in 1952, according to the manufacturers, was 52,000 springs or 660.9 tons. Estimates of the demand for these springs vary. However, the estimate of one producer to the effect that 60,000 springs are required for original equipment and 127,000 springs for replacements (which is the lowest among the estimates submitted to the Commission) seems to find acquiescence from manufacturers of automobiles. Total demand may go as high as 290,000 springs in 1956. At present one manufacturer uses indigenous spring steel and the preference of the other two for the imported variety is explained by the fact that the indigenous material lacks production according to correct specifications, but they have expressed their willingness to switch over to domestic supply if this defect is removed. It is apparent that the question of laying down standards for ensuring quality will have to be taken up without delay, since the fact of some consumer resistance is obvious. In view of the basic necessity of developing these industries as ancillary to automobile manufacture, initial barriers of this nature will need to be overcome by sustained effort.

The anomaly of lower import duties on components and parts, which has been consciously introduced in the belief that lower prices will stimulate higher consumption of automobiles, will require reconsideration as a matter of policy in this enquiry. Imports of leaf springs have been restricted for the current half year, but the industry's more basic demand relates to the quantum of duty. It has claimed an increase in the standard rate from 50 per cent ad valorem to 66-2/3 per cent and from 47 per cent to 60 per cent in the preferential rates. Rebate of import duty on raw materials, freight concessions and similar subsidiary claims rank among the demands of the producers.

NITROGENOUS FERTILIZERS FROM THE UNITED STATES

The supplementary technical aid agreement in respect of fertilizers signed between the Governments of the United States and India on February 6 last is interesting in some ways. It does not amount to a mere addition to the stock of chemical fertilizers domestically produced here. Two new varieties of fertilizers are to be supplied to this country by the United States Government under this agreement. They are: 5,000 long tons of urea, fertilizer grade, prilled or shotted, not less than 44 per cent nitrogen, and an equal quantity of ammonium sulphate-nitrate, crystalline, containing not less than 26 per cent nitrogen, of which 6.5 per cent to be in nitrate form and 19.5 per cent to be in ammoniacal form.

These nitrogenous fertilizers are new to Indian soil. This quantity of 10,000 long tons of the two stipulated types is to be brought to this country mainly for the purpose of testing and demonstration. The demonstration programmes will be confined primarily to the community projects, national extension blocks and training centres for village-level workers. But experiments of cultivation with these two fertilizers are also to be extended to other suitable areas. How far they will be popular will depend on the efficiency of the demonstration programmes and propaganda enough to carry conviction with farmers. But there seems no reason why the Indian farmer, who is shrewd to judge his own interest, should not take kindly to these new fertilizers, which have proved their utility in the United States. Not all the quantity of 10,000 long tons is to be distributed free in demonstration experiments. The sale-proceeds of part of the quantity are to be applied to the purchase of indigenously manufactured fertilizers—ammonium sulphate, superphosphate and mixed fertilizers—which, in turn, are to be distributed for demonstration free of cost to cultivators. The cost of imported fertilizers and their distribution, estimated to be $1.15 million (about Rs. 54.8 lakhs) is to be borne by the United States Government. The sale-proceeds of the quantity left over after stocks are earmarked for demonstration are expected to be enough to purchase 8,000 tons of indigenous fertilizers for popularisation. If the idea of nitrogenous fertilizers catches up, these two new varieties, which are cheaper than the fertilizers now produced in this country, will also be manufactured here.

I.C.C.C. MEETS

The meeting of the Indian Central Cotton Committee convened at Bombay last week has come to decisions on certain points which imply a policy of further bold programme of raw cotton expansion. The easier international cotton supply situation need not cause any doubts about the advisability of such a policy, since Indian medium and short staple growths must continue to command the major demand of the textile mills in this country. It is against this background that the decision of the Committee on the production target is to be appreciated. Actual output of 36 lakh bales in the 1952-53 season, which is explained on the ground of weather conditions, is hardly a proper criterion to judge the output target for 1953-54. Seasonal conditions having registered a positive favourable trend, the target fixed at 42 lakh tons for 1953-54 seems feasible. This amounts to advancing the achievement of the Five-Year Plan target for 1955-56 by two years. The Committee's reasoning is that the probable trends in cloth consumption at home and exports emphasize the necessity of raising the target at the end of the Plan period by 3 lakh bales to 45 lakh bales. This upward revision does not conflict with the Committee's suggestion to speed up the production of long staple cotton 1⅛".

The levy of the sales tax on raw cotton in some States has again invited the attention of the Committee. The arguments for its withdrawal, if old, have lost none of their urgency. The imposition of this tax at the final stage on cloth and yarn impart to the levy on raw cotton the indisputable character of double taxation. Part of it must affect the grower. Research has received the continuous emphasis it deserves. Modernisation of the equipment at the Cotton Technological Laboratory at Matunga, Bombay, has been urged as research cannot be allowed to lag behind. Finance is the crux of this problem and a transitional arrange-

ment for sharing its burden has been recommended before the responsibility devolves entirely on the State Governments on whom it should rest. For the first ten years the Committee has declared its readiness to provide the whole expenditure on research, but in the next five years it is to be shared half and half by the Committee and the State Governments after which the Committee is to withdraw its financial support.

BURMA-JAPAN TRADE AGREEMENT

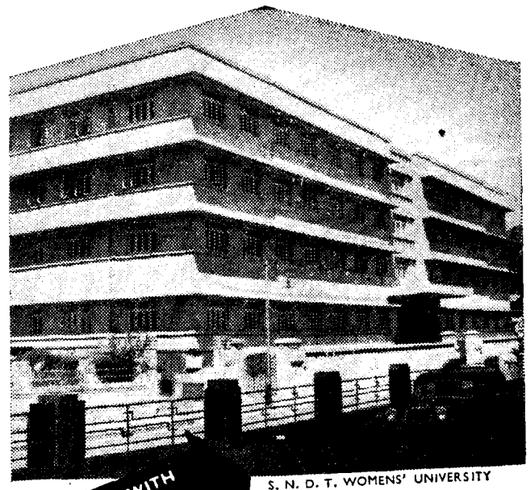
The particulars of the 4-year bilateral trade agreement between Burma and Japan signed on December 8 last show that Burma has struck a satisfactory deal ensuring a steady market for her staple export of rice in a recessionary phase, while Japan has secured an expanding and reliable outlet for her exports, whose position is made stronger by the introduction of standard tariffs following the abolition of preferential rates. The principal terms of the agreement may be set out in brief: In the calendar year 1954 Japan will import from Burma 300,000 long tons of rice and a minimum of 200,000 long tons with a ceiling of 300,000 long tons of rice in each of the remaining three years. The price for 1954 imports has been fixed at £50 per long ton f.o.b. Burmese port for the standard grade and during the rest of the period it will be negotiated every year at a level not exceeding the lowest price that Burma may offer to any other importing country. Japan's other exports will include, besides several edible agricultural products, teak, raw cotton, tung oil, hides and skins, rubber, tin ore, wolfram ore, lead ore, pig lead, and so forth. Japan's exports will be principally textiles, machinery, equipment for small-scale cottage industry, iron and steel products, chemicals and a host of manufactures.

Trade between the two countries is to governed by concessions negotiated under G.A.T.T. Japan has undertaken to extend technical assistance to Burma in spheres which are to be decided periodically. Japan's vital need for food imports and the equally vital need of a search for neighbouring sources to obtain them have been apparent in the last few years. In this search Burma has proved to be an acceptable source. In the first eight months of 1953 Japan's imports from Burma stood at £16.5 million as against exports of the value of £8.9 million. The deficit of £7.6 million was largely accounted for by Japan's off-take of rice placed at 160,000 long tons. Official estimate places Japan's imports in 1954 at £17 million out of which £15 million will be absorbed by rice shipments. The agreement guarantees Japanese rice imports in the last three years below the level of the eight-month period of 1953, but sufficiently high to offset a serious reversal of the present balance of trade. Japan's exports in 1954 are put at £15 million at which level they can be expected to be stabilised, or perhaps even at a higher level. India will watch with interest the impact of Japanese textiles and certain engineering goods on her export trade with Burma.

EXEMPTION FOR NON-URBAN BANKING?

While the protracted proceedings in appeal from the Shastry Award, which were taken up for the main hearing and arguments in September last, have almost come to a close and the banking world has to wait for the verdict of the Special Bench of the Labour Appellate Tribunal, the Union Government has intervened to safeguard the interest of bank branches in rural and semi-urban areas. Its application in this behalf was admitted by the Special Bench last week and is to come up for preliminary hearing soon. The decision of the Appellate Tribunal will be delayed by these fresh proceedings, but delay in this matter need not be grudged in view of the importance of relief sought in the application. The relief sought requires that existing branches of banks in rural areas and semi-urban areas, with a population of 30,000 or less, should be exempted from the application of the final award for a period of two years and similar exemption should be extended for a period of four years to new branches which will be opened in such areas hereafter. The pros and cons of this application for relief are a matter pending consideration before the Labour Appellate Tribunal and need not be discussed at this stage. But in presenting the application on behalf of the Union Government, Mr. Jamshedji Kanga made a fervent plea that full weight should be given to the recommendations of the Rural Banking Enquiry Committee in respect of increasing banking facilities in the rural areas. The plea clearly is for a due regard to the cost structure of bank branches and offices in these areas in the initial period.

U.K.-RUSSIAN TRADE PROSPECT



The news that Russia was prepared to place orders in Britain to an estimated value of about £400,000,000 within the next three years has been welcomed by the British Board of Trade, though official confirmation of the offer is still awaited. An official spokesman said recently that Her Majesty's Government's policy was to encourage trade in non-strategic goods with Russia. The Board of Trade would welcome any orders that were brought back by the business team now there. The Soviet Minister of External Trade, Mr. I. Kabanov, is said to have told the 40 British business men visiting Moscow unofficially that Russia was ready for a considerable increase in the volume of trade.

Orders for tankers, cargo ships, electrical equipment, textile machinery, consumer goods, and complete power stations were among those the Russian Government was prepared to place. Mr. Kabanov said that between 1955 and 1957 the contemplated orders would include 1,500 million roubles for ships, 600,000,000 roubles for power equipment, 400,000,000 roubles for forging and pressing equipment and machine tools, 375,000,000 roubles for textile and wool industry machinery, 125,000,000 roubles for miscellaneous equipment, and about 1,500 million roubles for raw materials, food, and industrial consumer goods. Mr. Kabanov told the British business men that Russia also wanted to increase sales of her goods to Britain. Trade turnover between the two countries would have to be increased to 3,000 million roubles (£270,000,000) a year if sales of Russian goods to the United Kingdom between 1955 and 1957 corresponded to her imports from Britain. Mr. J. B. Scott, head of the British delegation, said a great many items on the list could be supplied under existing regulations, and some others were in categories where relaxations could be expected.

yes, it is my plan!

Lights will be switched on in a thousand villages. Handlooms, lathes will hum and spin. Every small community will become the hub of a growing village industry. There will be work for everyone. The Five Year Plan provides for Rs. 127 crores to be spent on developing and adding to our power resources. Multi-purpose hydro-electric schemes will supply cheap power to industry. Here is proof of a nation's determination to take its place amongst the leaders of the world.

Lakhs of tons of Steel will be used to implement the many diverse projects of the Plan. And so, in numerous significant ways Steel will provide the foundations for a richer, more rewarding future for our nation and our people.

THE TATA IRON AND STEEL COMPANY LIMITED

TN 3933

COMPANY AFFAIRS

THE BHOPAL SUGAR INDUSTRIES LTD.

The working results of the Bhopal Sugar Industries Ltd. (Managing Agents: A.H. Bhiwandiwalla and Co., Ltd.) for the year ended 30th September, 1953, are very discouraging. The factory had to remain idle throughout the season 1952-53, as no cane was available for crushing owing to acute drought in Bhopal in the preceding rainy season.

The profit and loss account shows a loss of Rs. 2,29,812 as against a profit of Rs. 4,23,869 in 1951-52. It may be stated here that this loss is in spite of the fact that a subsidy of Rs. 2,22,436 was received from the Government of India on old stock of sugar produced during the previous season.

The directors have recommended dividend on preference shares at 5 per cent per annum free of income-tax. The dividend for the ordinary shares has been scaled down from 10 per cent to 6¼ per cent tax-free. The total amount absorbed by the proposed dividends would be Rs. 1,71,875 and would be paid out of the dividend equalisation fund.

THE NIZAM SUGAR FACTORY LTD.

The audited accounts of the Nizam Sugar Factory Ltd., for the year ended 30th June, 1953, show an appreciable increase in net profit from Rs. 36,26,739 in 1951-52 to Rs. 48,33,545 during the year under report. Allocation to the depreciation fund has, therefore, been enhanced from Rs. 18,98,638 to Rs. 27,90,777. The directors have proposed ordinary dividend at an increased rate of 12 per cent as against 9 per cent in the previous year. Bonus on ordinary shares has also been increased from 3 per cent to 4 per cent per annum.

Another notable feature of the working of the factory is the phenomenal increase in sales from Rs. 243.19 lakhs to Rs. 446.69 lakhs. Stocks on hand stand reduced at Rs. 177.98 lakhs as compared with Rs. 220.06 lakhs in 1951-52.

THE INDIAN OVERSEAS BANK LTD.

The net profit of the Indian Overseas Bank Ltd., subject to audit, for the year ended 31st December, 1953, amounts to Rs. 15,14,793 after providing for contigencies and expenses, and after including the sum of Rs. 1,89,917 brought forward from the previous year's account. The directors have allocated Rs. 6,45,000 as provision for taxation, Rs. 3,50,000 to the reserve fund and Rs. 2,94,522 towards payment of the proposed dividend at the rate of 6 per cent (free of income-tax). The balance of Rs. 2,25,271 is recommended to be carried forward.

DEVKARAN NANJI BANKING CO., LTD.

The net profit of Devkaran Nanji Banking Co., Ltd., for the year ended 31st December, 1953, amounts, subject to audit, to Rs. 8,38,008 after including Rs. 1,47,808 brought forward from the last year's accounts. The directors have appropriated Rs. 1,50,000 to the reserve fund, Rs. 50,000 to the investment reserve fund and Rs. 82,646 to the depreciation fund and Rs. 2,00,000 to the taxation fund. The dividend has been proposed at 4 per cent tax-free as compared to 3½ per cent (free of income-tax) absorbing Rs. 2,00,000. The balance of Rs. 1,55,362 is recommended to be carried forward to the next year's account.

THE BANK OF MYSORE LTD.

The result of the bank's working for the year ended 31st December, 1953, is a surplus of Rs. 17,90,687 which advances to Rs. 18,76,994 after adding the balance of Rs. 86,306 brought forward from 31st December, 1952. An interim dividend paid at the rate of 12 per cent per annum and a bonus at the rate of 4 per cent per annum free of income-tax for the half-year ended 30th June, 1953, absorbed Rs. 4,00,000. Rs. 3,50,000 were transferred by the directors to the "Reserve for Income-tax and Super-tax", and they propose to provide a further sum of Rs. 2,50,000 for the same. The directors have recommended a final dividend at the rate of 12 per cent per annum and a bonus of 4 per cent per annum for the year ended 31st December, 1953, free of income-tax, absorbing Rs. 4,00,000. Bonus to staff for three months' salary will take up another Rs. 2,50,000. The balance of Rs. 2,26,994 is proposed to be carried forward.

BHARAT COLLIERIES LTD.

The directors' report of the Bharat Collieries Ltd. (Managing Agents: Messrs Sahu Jain Ltd.) for the year ended 30th June, 1953, discloses improvement both in sales and net profit. Sales have increased from Rs. 106.05 lakhs for the year 1951-52 to Rs. 122.23 lakhs for the year under review. Net profit, after providing for taxation; depreciation etc; at Rs. 8.29 lakhs compares favourably with a net profit of Rs. 8.01 lakhs in the preceding year. The directors have recommended an ordinary dividend of As. 10 per share, the same as last year, absorbing Rs. 2.50 lakhs.

The Company have commenced deep sinking of a pair of pits at Chapui Khas colliery to win coal from the lower seams. "The prospects of the Company state the directors, "continue to be favourable".

COMMODITY NEWS AND NOTES

T.I.S.C.O. STEEL OUTPUT

The total approximate production of saleable steel by the Tata Iron and Steel Co., Ltd., for January has disclosed a modest decline of 300 tons to 71,000 tons. The production compares favourably with 69,900 tons recorded in January, 1953. The January, 1954, figure comprises 21,000 tons semis and 50,400 tons finished steel against 18,300 tons semis and 53,400 tons finished steel in December 1953.

The output of pig-iron and steel ingots during the last month has amounted to 102,800 tons and 99,800 tons, respectively. This compares with 101,400 tons of pig-iron and 95,100 tons of steel ingots produced in December, 1953, the respective figures for January, 1953, being 102,400 tons and 95,500 tons.

COTTON CONSUMPTION UP

The Indian textile industry is likely to create a new consumption record by using about 20 lakh bales of domestic cotton for the first half of the year ending February, 1954. The monthly consumption average for the first quarter of this year works at about 3.2 lakh bales of Indian cotton and about 60,000 bales of foreign growths. The second quarter is expected to show a higher consumption of domestic growths.

The monthly average consumption figures for the year 1952-53 were 2.5 lakh bales and 29,000 bales respectively. The average in regard to Indian cotton went up to 3 lakh bales for 1952-53, but declined to 70,000 bales in the case of foreign growths. It is likely to change again this season in favour of Indian cotton.

The change in the consumption averages has been made possible on account of higher output of cotton in the country around 39 lakh bales this year against 27 lakhs in 1949-50. To maintain the output of cloth, the Government of India has, however, been obliged to liberalise the import policy. The temporary limit of 7 lakh bales of foreign cotton is considered insufficient by the trade which believes that at least 10 lakh bales of foreign cotton will have to be imported to maintain the present tempo of production and to stabilise the prices of indigenous cotton. Foreign cottons will be required for fine and superfine cloth, since a major portion of indigenous cotton is of lower staple length.

CZECHOSLOVAKIA INTERESTED IN INDIAN MICA

Representatives of the "Czechoslovak Ceramics", a State mica importing concern of Czechoslovakia, propose to come to India for large mica purchases and for inspection and payment on the spot in the wake of the Indo-Czech agreement.

Mica trade has been experiencing depression for the last several months due to low price policy followed by importer brokers of the U.K. and U.S.A. and partly due to the development of alternative centres of mica production in Brazil and elsewhere.

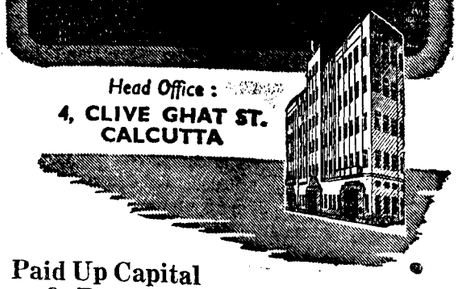
TOBACCO OUTPUT

Heavy accumulation of low quality tobacco with the growers and traders is likely to tell adversely on the production for the 1954-55 season. Recent reports indicate that many growers in the South are inclined to switch over from tobacco to groundnuts, turmeric and other cash crops.

Reports from Guntur—the chief tobacco growing centre in the country—indicate that there has been an unprecedented accumulation of Virginia tobacco there on account of a drastic fall in exports and domestic consumption during the past four months. Over 35 million pounds are lying unsold with the Guntur Marketing Committee and in spite of a fall in the price from six annas to two annas a pound, the stocks are increasing. The new marketing season starting from March is bound to add to the growers' difficulties.

The Andhra Government is trying its best to secure markets in China, Japan, U.S.S.R., Belgium and other European countries. Disposal of the low grade tobacco is, however, a difficult problem and the only effective way out is stated to be a drastic cut in the production next year. Since export prospects are now limited, the prosperity of the industry is directly linked to the indigenous demand.

WORLD COTTON OUTPUT UP



The United States Agricultural Department has estimated world cotton production in 1953-54 at 36,770,000 bales (of 500 pounds gross) compared with 35,730,000 bales in 1952-53. The 1953-54 output would be the second highest on record—exceeded only by the 1937-38 crop of 39 million bales. It would be about one million bales higher than that for each of the past two years.

PAKISTAN TO BUILD WHEAT STOCKS

The Pakistan Government will this year attempt to stockpile half a million tons of wheat to avoid repetition of last year's famine conditions. This decision was taken at a high-level food conference held at Karachi. Other major recommendations made at the conference were:

Removal of restrictions on the movement within the country of pulses and grams; encouraging cultivation of internationally popular varieties of rice; and expediting of construction of storage facilities for over 3 lakh tons of food grains.

Calcutta Calling

THE news from Calcutta this week has been far from good. On Tuesday four persons were killed and 65 injured in violent disturbances. It was necessary to call out the military at 8-30 p.m. and Section 144 was imposed in the whole of the city. It is stated that the disturbances were the worst yet witnessed in Calcutta considering the shortness of the period covered and the large number of incidents. If this is so, the situation certainly warrants much more than the routine enquiry which follows disturbances of this kind. It requires a probe into their causes, and the effectiveness of the remedial measures which have been introduced all too late. The primary cause for the disturbance is stated to be the dissatisfaction of the West Bengal Secondary School teachers who squatted on the pavements in and near the Assembly House to draw attention to their pitiful plight. There is no doubt that their grievances were real. Secondary School teachers in West Bengal, before the concessions announced on February 16, were in receipt of a salary of Rs. 50 per

month and dearness allowance of Rs. 10, making their total emoluments Rs. 60 per month. It is quite impossible for a single individual to live on this figure. It is, therefore, totally absurd for the West Bengal Government or, indeed, any State Government in India which pays similarly, to expect even moderately efficient work from its Secondary School teachers. To the written demands repeatedly made, almost all the State Governments have turned a deaf ear. It is literally true to say that the West Bengal Government Secondary School teachers have been driven to physical agitation by the refusal of the authorities to concede what was obviously a just case in time.

To say this is by no means to excuse those politicians, particularly the members of the Communist Party, who have chosen to make the grievances of these people a source of plentiful political capital. It is perhaps only natural to expect, where grievances of this kind exist, that politicians, who necessarily fish in troubled waters, will exploit them to their advantage. In this particular case, however, it was clear that there were people in Calcutta—as there always are—who were waiting for these disturbances in order to indulge in foolish acts of violence like the burning of vehicles. It is a pity that men like Dr. Suresh Banerjee, who were once Gandhians and who should know the limits of any non-violent campaign in the Calcutta scene, should have led processions at a time and at a place which could only have ended in the deplorable results which have been seen. They cannot escape responsibility. The trouble seems to be how that responsibility can be enforced. A last-minute arrest and then release as of a political hero is certainly not the way for any government to play into their hands.

It is almost no use, however, our casting the major portion of the blame on these Leftist leaders. The Government of West Bengal must take it. The truth is that the West Bengal Government's hesitation at critical points in movements of this kind has become a major liability which has done much to derogate from the reputation of even so outstanding an administrator as Dr. B. C. Roy. Why, it will be asked, if the Government of West Bengal could concede a rise in the pay of untrained undergraduate teachers of aided schools and an increase of Rs. 7-8 in dearness allowance, was this not conceded, before February 16, when it leaves every sign of having been extracted by a display of popular feeling and a show of violence. The answer is clear that the West Bengal Government has tended constantly to overrate its capacity to determine the limits within which it can hold popular discontent. It is not clear in this case who has been responsible for this miscalculation. But there is a widespread belief that no major decision in West Bengal can be taken without Dr. B. C. Roy's acquiescence; and it is legitimate to enquire whether the Chief Minister had any doubt on the sufficiency of the salaries which his Government pays to teachers in Calcutta. Why does Dr. B. C. Roy, who has been ready to prescribe counsel to private industries on the need for maintaining not merely a living but even a generous wage for workers, decline to consider the same principles when it applies to the lower grade teachers of West Bengal? Can it be that the West Bengal Government, like the Central Government, has one rule for the private and another for the public sector?

In any case, the public have now decided that what is sauce for the goose is sauce for the gander. And therein lies a source of continuous trouble; for the West Bengal Government has not the resources to fulfil its own generous prescription. The fact of the matter is that the revenues of the West Bengal Government make any concessions of this kind very difficult. It is clear that it does not make them impossible because, as the concessions of February 16 show, they are eventually made. But it does raise the question as to whether the West Bengal Government is capable of extending these concessions, late or early, indefinitely. The answer is decidedly in the negative. This does not mean that these concessions must be resisted. It only means that the Central Government must weigh in with its resources.

The conditions of Calcutta justify special treatment. With a great mass of unhoused or unsatisfactorily-housed people, the mental strain undertaken by the lower middle classes, in particular unemployed refugees as well as non-refugees, makes it inevitable that resources will need to be found to subsidise the conditions of living in most Government and corporate services in that city.

This is no more to say that the City of Calcutta is, in the last analysis, a Central responsibility. There is historical, as well as strategic, justification for Central aid. The conditions of strain in Calcutta are primarily the result of partition. It is true that the partition made only a bad situation worse but it is this removal of the capacity to manoeuvre which leaves the West Bengal Government helpless while other governments can bear such strains. Whereas other States of India may be left to deal with law and order situations unaided, in Calcutta the mere maintenance of law and order is impossible without some economic expedients devised to meet these grievances, which arise primarily on the economic front. It is arguable that the cost of living, which is the main problem, has been of the Centre's making; in any case it is the Centre which is the residual legatee of all the nation's disorders.

It seems a pity, from this point of view only, that the move to raise a debate in the House of the People on Wednesday was disallowed by the Speaker. There is justification enough for his view that education, law and order are State subjects and that the army, when called in to maintain law and order, does not bring the matter under the jurisdiction of the Centre. There are, however, other issues involved and the report has been put out that the Prime Minister on his return from PEPSU has been concerned enough about the action which the Centre should take to make it appear that this is not entirely a local affair. There is every justification for treating the current disturbances in Calcutta as a Central, as well as a State, subject. This is not to question in any way the ruling of the Speaker which is technical in character. It is to point out that when the Central Executive itself takes a different view of its responsibilities, it cannot be seriously contended that Central policy should be excluded from the discussion.

There should be no grudging acceptance by the Centre of these liabilities. The port of Calcutta is still our largest port and it commands the great areas of Bihar and Bengal which are vital for India's industrialization, present and future. It is time that confused counsels or any divisions between the Centre and the State should be closed. It is not the West Bengal Government which needs to set up a commission of enquiry. Since the resources must be found by the Centre, the situation in Calcutta and West Bengal calls for a high-powered Committee to be appointed by the President of the Indian Union. Its terms should be adequate and its recommendations for relief and assistance must be pressed into action with all possible haste.

The Molotov Basket

DURING World War II, the Molotov Basket was a bundle of incendiaries which rained destruction on German-occupied cities on the Eastern Front. In the Cold War—and the battle of wits described as the Foreign Ministers' Conference at Berlin—Mr. Molotov had a basket of another kind. Last week he submitted to the Conference of the "Big Four" a proposal for a general European treaty open to all European States, whatever their political system. The fate of this ingenious proposal was a foregone conclusion at this particular Conference. It drew from Mr. Eden last Monday a fierce retort. He told Mr. Molotov that "he had not come to Berlin to apologize for the North Atlantic Treaty Organization, still less to discuss its dissolution". The Soviet plan, he said, provided that the U.S.A. should be deliberately excluded from the defence of Europe. He offered to consider "any other proposals" which the Soviet delegation might wish to put forward but emphasised "that these must be consistent with our security in the West as with the security of the Soviet Union". And thus were underlined almost all the points of difference which have made the Berlin Conference a singularly infructuous performance.

The interest for us does not lie in these differences or in the failure to reach agreement. The differences were fully known before the Conference, and failure was expected. As it turns out, American reluctance to hold the Conference at all has been justified; and the proceedings are a rebuke even to Sir Winston Churchill whose retirement with this failure is now believed to be imminent. The interest for us lies in the curious reaction of much of Indian opinion to these proceedings. While the whole of Western Europe is not even momentarily deceived by the Russian proposals—which are nothing more or less than a new campaign for Russian hegemony over Europe—Asian opinion is often surprised and disappointed that so eminently reasonable a suggestion should be thus summarily rejected. After all, it argues, the Russians are offering a European treaty which must imply a promise of non-aggression. The Russians honour their non-aggression pacts, though their interpretation of clauses of treaty are admittedly a source of trial and tribulation. Rather than maintain all this tension, with no prospect of seeing a German treaty through, would it not be worth while keeping the Americans out of N.A.T.O.? If an act of aggression took place, the Americans could, and would, come in even without N.A.T.O. Therefore, was not this Russian proposal deserving of some gentler consideration?

In this attitude, quite widespread in India and held to a greater or less extent by many people in South-East Asia, is revealed the fundamental difference between the European and Asian mind in its approach to Communism and the Cold War. Because both have been held at bay in Asia—largely because of French resistance in Indo-China, the Himalayas and the military strength of the Free World—Asian opinion is very apt to believe that the danger of aggression in Europe is now the result of the policy of containment, and an equilibrium can be found in Europe as it has been found in Asia, without a large-scale military alliance like N.A.T.O. Whereas in Western Europe, the new Molotov Basket will have no sympathy at all, there are many people in Asia, by no means fellow-travellers, who consider that this was a genuine proposal for peace. Since it has been turned down flat by the Western Three, it is assumed that it is they, not the Russians, who are determined on the continuance of the Cold War.

To say that this is totally to misread the character of Russian Communism is not to answer the point why the Western case fails so completely to record on Asian opinion. The truth almost certainly is that the Western Powers have lamentably failed to advertise the occasions on which the Russians have made such proposals only for propaganda effect, knowing full well before they made them that they were unacceptable. In this particular Conference, a blatant example was to be found in Mr. Molotov's handling of the Austrian treaty. On February 12, Mr. Molotov did in fact propose a final Austrian treaty within three months, but at the same time served notice on the West that Russia proposed to keep 40,000 troops in Austria "indefinitely"; in fact, therefore, there was to be no Austrian treaty. On February 14, in a supreme attempt to reach agreement, the Western Foreign Ministers announced the acceptance of the Soviet version of all five disputed Articles and the Soviet amendment to Article 35, authorising payment by Austria in goods instead of dollars for German assets. Dramatically, the Western Foreign Ministers called upon the Russians to sign an Austrian treaty at 3 p.m. on Thursday, February 18, before the Conference finally breaks up. The Soviet Foreign Minister's response was typical; accepting the point "in principle," he now advanced six further conditions which make any early conclusion of a treaty quite impossible.

The significant point that when Russian proposals are accepted, there are always new obstacles, of procedure as often as of substance, has many times escaped even serious students of international affairs in Asia. In this case, while surprise is expressed at the summary rejection of Mr. Molotov's European plan, almost no attention is drawn to the fact that, when the Western Powers conceded a Russian interpretation of the disputed clauses of the Austrian draft treaty, totally new objections were immediately raised.

The truth stands out of this Conference that the Russians desire no settlement in Europe. In Realpolitik, there is almost no reason why they should. With their troops straddled across the waist of Europe, they are not merely secure in military terms; they exercise economic despotism over the economies of all the satellite countries. The West has nothing of equal value to trade against a Russian withdrawal. And, therefore, the Russians have refused to give any ground. To admit that this fits in well with their interests is by no means to imply that they have any moral case to stay where they are.

Asian opinion is not favourable to a case in Realpolitik; otherwise it would be much more sympathetic to the American idea of military containment. It claims, and probably truthfully, that it attempts to weigh in moral considerations in the pursuit of national interest. Indeed, it claims, the pursuit of peace stands above all. If this is, indeed, true, then the Western case which is based on the immoral occupation of the satellite countries by Russian troops should be conceded. Why does Asian opinion find it so difficult to appreciate the moral weakness of the Russian stand? This is a question which it is for Western instruments of publicity to answer.

Petrol—New Lamps for Old?

AT long last, the Indian motorist seems to be getting something for nothing. For years he has watched the price of his petrol steadily mounting under the joint pressure of Gulf prices and the relentless demands of both Central and State Governments. Petrol prices differ naturally because of distances from ports of landing, but the price of Rs. 2-14-6 per gallon at Delhi is a fair indication of the hostages one gives to fortune if one proposes to use a personal car. The number of people who could continue unflinchingly to maintain their demand at a constantly rising price has naturally enough tended to decline. Petrol sales leapt up after decontrol, and, for more than two years, the Indian demand curve showed a vitality as great as it did during the war. The ardour of consumers has naturally dimmed, however, with every rise in price. The demand for petrol in India has levelled off, and in some months it has looked as if it were turning down. An increase in business activity has tended not to be reflected in petrol sales. Consumer displeasure, clear enough for nearly two years on food and cloth, has chosen a new field for the exercise of its latent feeling.

The oil companies, better equipped with economic analysts than any other industry in India, have not been slow to read the signs. The Indian consumer needed to be wooed. This must be the special significance of the offensive opened this week by two leading oil companies with the marketing of additives at no additional cost to the consumer. Burmah-Shell's campaign released on Wednesday, February 10, covered an ingredient described as Ignition Control Additive which incorporates a chemical, tricresyl phosphate, which, it is claimed, abolishes pre-ignition and sparking plug fouling and thereby gives more power and more mileage per gallon. No precise figures have been given of the effect on running costs but it is stated that new cars lose fifteen per cent of their original power after the first few thousand miles, and it is implied that this loss of power can be made good to a large extent by this additive. If this claim is fulfilled and there are no deleterious effects, the bold claim that this is the greatest petrol development since tetraethyl lead was introduced in 1922 may appear to be justified.

Unhappily—differently from the discovery of tetraethyl lead—there is no unanimity on the virtues of the new additive. The Standard Vacuum Oil Company of New Jersey which had for some time added S-54 in its pumps claims that its additive has superior qualities in that it "minimises deposits in the combustion chamber and improves the functioning of the separate parts of the intake or breathing system with the result that power output is maintained at a peak". In an advertisement to be found elsewhere in this issue the technical properties of S-54 are more fully described. The two companies are, perhaps, scrupulously correct in advertising their own products and not making any precise comparison with the products of their competitors. But the consumer, who is quite incapable of discerning the merits of this highly technical argument, would welcome a decision by an unbiassed authority, if such an authority can happily be found.

As it is, with the battle at its peak, the effect on the consumer of either product has probably been neutralised. The fortunate beneficiaries of this campaign have been the newspapers, whose advertisement revenues have taken a welcome spurt in the last week, and whose hope must be that the battle will be waged long and fiercely in space which is now all too readily available. The third oil company, Caltex, will obviously also need to enter the fray, it being impossible to hold business without an additive of equal virtue or reputation. And thus a three-cornered contest is likely to ensue to determine whether any of the oil companies can increase its percentage sale at the expense of either or both of the others.

It is unlikely, notwithstanding the benefit that the consumer has obtained by obtaining an additive for nothing, that this battle, which shows every mark of high-pressure salesmanship, will alter the structure of the total demand for petrol. The Indian market, here as elsewhere, is not very sensitive to improvements in quality. It is markedly sensitive to price. And thus one wonders if all the energy and drive being thrown into the sales campaigns might not have been more usefully directed in unison to convincing the Central and State Governments that their taxation policy both on vehicles and on petrol was in urgent need of reconsideration.

About six months ago when the Planning Commission appeared momentarily in earnest about giving fresh life to the roads in order to assist in the solution of unemployment, it would seem that concerted action by the oil companies to explain their case might have produced better dividends. Too much hope was then placed in the belief that the Government of India in particular would see, even at some cost to itself, a patent and unanswerable case. After that halcyon period, disillusion has been great. Far from assisting by a reduction in price, the Central Government has even allowed Delhi State to impose a sales tax on petrol which has increased prices here by one anna and six pies per gallon. The simple point that these revenues are being obtained at the price of a further reduction in employment and business activity has gone unheeded.

It is time that the folly of existing policy in respect of the taxation of vehicles or their use should be exposed. At the present time, car-owners of India are mulcted three times by Central or State Exchequers. High import duties on spare parts keep even domestically-produced cars at a figure so high that the purchase of a car necessarily involves privation for all except the rich or corporate persons. Secondly, car maintenance and the charges payable to garages have now passed all limits of reason. Finally, the taxation on petrol is now so crushing that, considered with the price of other necessities, it is virtually impossible for the total demand for vehicles or for petrol to rise. And thus the Central and State Governments have succeeded in preventing the growth of one goose that might in time have laid a golden egg.

The most significant benefit of this campaign of two out of India's three oil companies should arise from this direction of attention to what is seriously wrong with this industry. The oil companies themselves have already spent much in the erection of competing pumps which could only be justified on the premise of an increasing total demand. It would be wasteful now for each of them to embark on a campaign designed, probably ineffectively, to increase its own share of a stationary or declining quantity. They should turn from this destructive operation to convincing the Finance Minister and the Transport Minister that they really have a duty to the roads, the neglect of which has been terrible in its effect both on employment and development. If they make this effort forcefully enough, perhaps, they may even be rewarded for their efforts at no distant date. After all, Budget day is not now so far away.

THE WEEK'S NOTES

BURMA RICE AT A REASONABLE PRICE

Although no formal communique has been issued on the purchase of Burma rice by India, it is understood a satisfactory agreement has been reached under which the Indian Government may be able to place on sale imported rice without raising internal rice prices. It is widely believed that this agreement has been reached by a compromise on Burma's debt obligations and the acceptance of repayment of debt as a component of the price of £50 per ton which is the nominal purchase price. It has always been held by the Government of Burma that some of these obligations were precedent to the formation of a democratic government and, therefore, they could not all be properly enforced against the Union of Burma in its present form. The case was one which obviously permitted some little adjustment on both sides.

India needed rice at a reasonable price and Burma, while not creating a precedent which would keep off other customers, needed to make some payment towards her debt which in principle had been accepted. If, as is rumoured, the agreement permits of both considerations to be kept in mind, it should be warmly welcomed. The Food Minister in particular is to be congratulated on having displayed both firmness and resilience in arriving at a solution of this difficult question. It is earnestly hoped, now that a major difference on this issue has been avoided, that Indo-Burmese trade which in the last twelve months has been on the decline will revive and expand, particularly in respect of textiles where Indian goods have recently come under additional discrimination.

VERDICTS FOR THE CITIZEN

Two recent judgments of the Supreme Court have made a notable contribution towards increasing the protection afforded to the citizen against the encroachments of the State on his rights. The decision that a civil servant can maintain a claim against the State for arrears of his pay is important for the conclusive manner in which the traditional plea of the Crown's non-liability to be sued has been dismissed. The peculiar principle of English law based on the maxim that the King can do no wrong and could not be sued in his own courts except through Petition of Right, was anomalous all along in Indian conditions. It was much more so after the doctrine had been modified in England itself by the Crown Proceedings Act. In Republican India, it was time to give it the quietus. The principle has done enough injustice in the past by depriving citizens of remedies against the State for tort and malfeasance. At least in the field of the rights of the civil servant, in which statute law has expressly provided certain obligations, it was hardly proper for the executive to have invoked an archaic formula in self-defence. It is hoped that this will be the beginning towards the ending of the special position of the State in actions for redress, except where such position is expressly conferred by statute law.

The second important decision relates to the declaration that the Madras Act of 1949 for the acquisition of electricity undertakings was 'ultra vires'. The decision is not a permanent handicap to the State because under the present Constitution, item 36 of List II makes the State's power of acquisition extend to all property, not merely to land as under the pre-Republican Constitution. Madras State may be able to re-enact the law at least with effect from the date of the Constitution's coming into force. The present decision is to the effect that the existence of a power of concurrent legislation on the subject of electricity did not by itself imply a power to the State of acquiring an electricity undertaking—though the Madras High Court had held that it would. This view of the Supreme Court amounts to a refusal to accept anything even feebly resembling a doctrine of "implied" powers, leading logically to the position that even the Centre—which did not have the specific power of acquisition of commercial or industrial undertakings under the old Government of India Act—could not have enacted the legislation without express authorisation by the Governor-General. It may still be argued that the scheme of the Government of India Act was to allow free scope for legislation on the subjects allocated, subject only to the right of compensation under Section 299. This principle may not rest here as it may arise in other cases coming under pre-1950 legislation but the refusal of the judiciary to read an implied power in the State vis-a-vis the citizen is heartening.

FOR CONCORD ON THE CAMPUS

It was natural that the Central Advisory Board of Education should have felt less certain about its prescriptions for the improvement of university education than about the reform of secondary education. The problem of restoring student morale was considered at length and even though there could be no disagreement over the analysis of the causes available to the Board, there could be no assurance that the remedies suggested can be immediately implemented successfully. The loss of leadership of the university teacher is the outstanding feature of the diagnosis. There has been a flow of ill-equipped personnel for the ill-paid jobs when under war-time and post-war conditions the better men could seek more lucrative jobs. Unfortunately, the position cannot be now reversed even in the changing conditions because of the steady decline in the quality and standard of the products of university education. It is difficult to say that enhanced pay and status would make up for the deficiencies of training; but if it helps to attract men who have already occupied responsible positions in other walks of life and can bring a fresh approach to the task of teaching, it would be a great gain. There is no need for over-emphasising academic experience alone in university appointments; persons experienced in business, administration, and law may prove more sober teachers, and exercise a healthier influence on students.

The effect of the recommendation for a minimum pay of Rs. 250 for college teachers and the grant of facilities to them of insurance, housing and children's education implies that Central assistance on a sufficient scale, linked to these benefits, should be forthcoming. Grants have been now assured for construction of student hostels and staff-quarters. A sense of responsibility in the appointment of examiners has also been recommended. This in turn depends on the character of the university administrations, which have been subjected to many undesirable influences. The Board has made the suggestion that two-thirds of the members of the Senate or Court should be teachers, and that one-third might be outsiders. All principals of affiliated or constituent colleges should be ex-officio members of the Senate, and, if possible, one senior teacher also from each college. To avoid the evils of the system of election, a system of membership by rotation has been recommended for the Syndicate or Executive Council. The Central Advisory Board has also considered it undesirable that the head of a State should be ex-officio Chancellor. The wider adoption of the Delhi model for the selection of Vice-Chancellors, from a panel of names submitted by a Selection Committee, is expected to make an improvement over the existing procedure in many universities.

CONSTITUTION VINDICATED IN BOMBAY

The Bombay High Court's judgment defending the right of a citizen to seek admission for his children in English-teaching schools, in spite of the State Government's prohibition against all non-Anglo-Indians, is a magnificent tribute to the Indian Constitution. The judgment highlights the flagrant character of the violation of the specific provisions of Article 29 of the Constitution which forbade such discrimination and of Article 337 which positively insisted on the admission of a specified proportion of students other than Anglo-Indians to these schools. Nothing but an extremely fanatical and narrow outlook was responsible for the Bombay Government's new educational policy; the contradictions involved in deciding the mother-tongue or in assigning a minor and insignificant role to English have been fully exposed in the course of the hearing before the Court and in the judgment. It is gratifying that the remedy against the arbitrary interpretations of the State Government was available quickly before causing serious injustice to students.

The discussion of the subject of the future role of English as a medium of instruction has been unnecessarily mixed up with a lot of half-baked ideas. No one need deny the importance of the mother-tongue but to regard instruction in the mother-tongue as an immutable principle is highly absurd for three reasons. For quite a considerable number of citizens who have to live far away from the regions to which they belong, facilities for instruction to children in the mother-tongue are just not available and cannot be established. Secondly, several generations of citizens who have been brought up in an atmosphere of English teaching have made notable contributions not only to Indian public life and culture but to the development of the regional languages and towards enriching Indian literature. Lastly, even if English is regarded as normally unnecessary for the vast majority of citizens, it may be justifiably regarded as essential by those who seek to have access to the more specialised literary, scientific or artistic treasures available in English. This country is large enough and endowed with a sufficiently liberal tradition to permit sufficient diversity and there is no reason why the average politician whose horizon is limited by his interest in the cheap slogans of the day should have the last word on these subjects. The Constitution can have no greater purpose or significance than that the citizen has a right to make choices for himself in matters which shape his individuality, without arbitrary interference from those clothed in brief authority.

PROGRESS ON NIGERIAN FEDERATION

The White Paper on the Conference on the Nigerian Constitution held at Lagos last month has disclosed that there was agreement on all the outstanding questions left over for discussion at the London Conference earlier in August. There were quite a number of matters on which there might have been sharp disagreements among the parties to the Lagos Conference. The report claims that "the deliberations went smoothly and were marked by a business-like spirit of compromise on all sides and a desire to reach agreed conclusions with a minimum of unnecessary argument". Agreement was reached on the future of the Cameroons under United Kingdom trusteeship. The report of the Fiscal Commissioner recommending Central collection of revenue, other than personal taxes, and for its allocation to the three regions has been accepted with minor modifications. The regionalisation of Nigeria's Marketing Boards, which hold reserves of nearly £75 million, has also been solved satisfactorily. There will be a federal Supreme Court with appellate powers and provisions have been made for regional and federal public services.

The question of the status of Lagos, which now forms part of the Western region, has been the most explosive of all issues and the Action Group in the Western Region has been steadily attacking the British award to the effect that Lagos should become part of the federal territory. This issue has not been raised at the Conference and it is believed that the leaders of the Western Region have thereby given their tacit agreement to allow a period of trial of the federal status until 1956. The Nigerian federation that will come into being as a result of these agreements will involve a good deal of regional autonomy. The main federal principle lies in the introduction of direct and separate elections to the federal legislature which should confer sufficient power to the Centre to act for the common good.

INVOLVEMENT IN INDO-CHINA

President Eisenhower's affirmation last week of the U.S. determination to avoid involvement in the fighting in Indo-China was made in reply to the rumours and alarms which were spread in Washington, on the basis of the presence of 200 air-force technicians in Indo-China, that an enlarged American commitment was likely. It was also a step to allay the general fear that the President's executive powers may be used to make major decisions, without the authority of the Congress. The President's statement has to be viewed in the context of the atmosphere created by the Bricker Constitutional amendment. But the indirect effect of the declaration on French morale has not been happy, not only because it frustrates hopes of eventual American intervention but also because it is felt that China would continue to aid the Viet-Minh more freely without being deterred by the prospect of U.S. intervention. At the same time, there has been anxiety in France that Mr. Dulles should explore the avenues for an Indo-China settlement in the Berlin Foreign Ministers' Conference. The French have also shown themselves highly embarrassed by Dr. Syngman Rhee's offer to send South Korean troops to fight the Communists, which they believe would lead to direct Chinese intervention.

The net result is the absence of any material change in the situation, while the Viet-Minh offensive mounts in Laos and threatens the neighbouring areas. It is too early to predict an improvement in the military situation because of the presence in Indo-China of M. Pleven, the French Defence Minister, who is armed with extraordinary powers. There are still hopes that the proposed Korean Conference in Geneva may come off in April so that the question of Indo-China may be discussed as part of a general Far Eastern settlement.

journey to prosperity

The huge, long train chugs and wheezes and groans to a stop. Villagers—eager, expectant, excited—gather round . . . it is an event of historic importance in the life of the community. For, village produce, the fruit of their labour, will travel to the city in this train.

In the years to come the produce of our villages will flow to the cities on thousands of miles of rails and roads. 3,000 miles of track will be rebuilt during the period of the Five Year Plan. 770 miles of new concrete roads, 66 giant bridges will be constructed to lay the foundations of an efficient communications system. Along these arteries of trade, commerce and culture our people will journey to a richer, more complete life.

Lakhs of tons of Steel will be used to implement the many diverse projects of the Plan. And so, in numerous significant ways Steel will provide the foundations for a richer, more rewarding future for our nation and our people.

WORLDGRAM

TRADE

Decline in East-West Trade: Exports from Russia and Eastern Europe and China during the first six months of 1953 were worth $653 million as against $736 million for the corresponding period in 1952. Imports by these countries from the rest of the world also fell from $689 million in the first six months of 1952 to $612 million during the corresponding period in 1953.

AGRICULTURE

Sound Finances of I.C.A.R.: The financial angle of a number of current and new research schemes in respect of agriculture and animal husbandry were examined by the Standing Finance Committee of the Indian Council of Agricultural Research which met recently. These schemes will now be referred to the Standing Committee and finally to the Governing Body of the Council. The Council's share for financing the current schemes carried out in conjunction with the State Governments, whose continuance has been recommended by the Advisory Board, would amount to Rs. 32,25,825. They include rice breeding, wheat-rust control, hybrid maize multiplication, grassland survey, manurial trials and soil survey, fruit preservation, cattle improvement and possibility of using Sindhi milking cows for work. The new schemes recommended for sanction by the Advisory Board would cost the Council Rs. 68,12,330. They include commercial production of hybrid maize, dry-farming and soil conservation, usarland reclamation, effect of chemicals on the storage of fruits and vegetables, survey of indigenous implements, cross-breeding of cattle, utilisation of waste products for feeding cattle, value of urea as a protein substitute in the ration of cattle and milk supply to Patna and Chandhigarh towns. The total sum available for general research work from 1954-55 to 1956-57 would be Rs. 196.10 lakhs, while the total expenditure anticipated to be incurred during the three years would be Rs. 186.85 lakhs.

* * * * * * *

Progress of Indian Council of Agricultural Research: The I. C. A. R. celebrates its silver jubilee this year. 34 extension training centres have trained 3492 key personnel including 549 supervisory staff. These centres are situated in 18 States, and were set up with financial assistance from the Ford Foundation and the U.S. T.C.A., and have a total of 1877 personnel under training. Sampling techniques relating to improvement of livestock and fisheries have been developed. Rice breeding to increase yield, and schemes for weed-resistant millets are being developed. Rinderpest control is being experimented upon in a pilot scheme. The I.C.A.R. has initiated a pilot survey for the collection of fish-catch on the South-East Coast of Madras.

* * * * * * *

Standing Committee on Central Forestry Board: The agenda for the first meeting of the Standing Committee of the Central Board of Forestry includes imposition of a cess on timber sales, as recommended by the Estimates Committee of Parliament, and fixation of timber prices for industrial use. Other subjects for consideration by the Committee relate to (1) inter-State regional forestry organisation, (2) training of forest guards, (3) extension of the diploma course for forest officers by one year and (4) arrangements for the World Forestry Congress, which is to meet in Dehra Dun in December next. The meeting will also discuss the recommendations of the Executive Committee of the Indian Board for Wild Life and the Central Advisory Board on Forest Utilisation.

* * * * * * *

F.A.O. Conference of Technical Co-operatives: The F.A.O. has convened an Asia and the Far East Conference of technical co-operatives in Colombo, some time next week. The agenda of the Conference includes (a) the functions and structure of a Government co-operative service, (b) Government financing of co-operatives, (c) marketing of agricultural products, (d) contribution of co-operatives to increase agricultural production and (e) extension of training facilities. A sub-committee of the National Liaison Committee has been proposed to study and consider the reports of the F.A.O. Conference held in Rome late last year.

* * * * * * *

India's Biggest Land Reclamation Scheme: A scheme for colonising and bringing under cultivation about 2,50,000 acres of virgin land on the Indo-Nepalese border in the districts of Lakhimpur and Pilibhit is under consideration of the Central Government, it is learnt. The Central Government are to negotiate with the Government of Nepal about the proposed scheme, since about 1,00,000 acres of this land lies in Nepal. The Rs. 25-million scheme is expected to reclaim an area of about 200 square miles at present considered one of the worst malaria-infected places in the world. The Colonisation Department is making a detailed survey of possibilities of irrigation, needs of communication and the soil conditions. It is proposed to reserve about 60 per cent of the land for educated unemployed interested in agriculture. The rest of it would be allotted to landless kisans. It is stated that it will be the biggest colonisation scheme in the country and has possibilities of becoming the nation's largest granary.

* * * * * * *

Land Reforms in West Bengal: A high-level Committee has been constituted by the Government of West Bengal, to consider the Draft Bill for the land reforms measure proposed to be enacted by the Government. While the Draft Bill is ready and published for official use only, according to informed circles, the measure for distribution of land will not be brought forward in the budget session of the State Assembly scheduled to meet on February 15.

FINANCE

U.S. Personal Income for 1953 Establishes New Record of Rs. 1,35,991 Crores: Personal income in the United States reached an all-time high of $284,500 million (approximately Rs. 13,59,91,00,000) during 1953. This record income was achieved despite a slight drop in income during the last months of the year. The year's total was 6 per cent higher than in 1952. After allowing for changes in personal taxes, consumer prices and prices and population, the American consumer in 1953 had three per cent more disposable income in terms of real spending power. In 1952, the increase was one per cent. Personal income rose moderately in the first half of 1953, reaching an annual rate of $287,500 million in July, an increase of 2½ per cent over the December 1952 rate. During the last half of 1953, personal income in the aggregate moved down one per cent. The decline was centred in the manufacturing industries.

* * * * * * *

U.S. Will Join Seaway Project: A bill authorising the United States to co-operate with Canada in building a £333-million sterling St. Lawrence seaway was approved recently by the House of Representatives Public Works Committee. The seaway would bring to life the 50-year-old dream of linking North America's Great Lakes with the Atlantic. It would enable the big ships of the world's merchant fleets to ply almost halfway across the North American continent. American supporters of U.S. participation in the vast project won Senate approval some time back.

* * * * * * *

Inquiry Into Deals with Foreign Firms: The Government of India are instituting an inquiry into the Industrial and Commercial agreements in India with foreigners, involving remittances on account of royalty or technical aid. All commercial, banking, insurance, shipping, navigation and advertising concerns have been

asked to submit information before 1st March. Railways, motor and air transport, rubber, tea, coffee and cinchona plantations and forwarding or clearing agents are included in this inquiry. Firms are expected to disclose the nature of the concern, give details of branches and associated companies, the nature of main business and the names of managing agents. Information regarding each firms' paid-up capital and the amounts of its rupee, sterling and other foreign capital are required in detail. Details of payments received from other concerns for remittances abroad for the eighteen months ended June 30, 1953, in the form of royalty, technical fees, share of profits and any other payment are also required.

* * * * * * *

Coal Board Loans to Collieries: The Indian Coal Board is considering the issue of giving loans at low interest, and increased payments as subsidy to coking coal collieries that undertake stowing for conservation. Loans at rates lower than the current rate of 4½ per cent will be granted to assist or establish equipment or plants necessary for conservation of coking coal. The stowing subsidy was recently raised from Rs. 1-4 to Rs. 1-5 per ton, and the review of the items of expenditure included in the reckoning of stowing cost may lead to the acceptance of certain other items of cost in the reckoning by the Board.

INDUSTRY

Britain's Car Exports Over Two Million: The output of the British motor industry during 1953 reached nearly 595,000 cars and 240,000 commercial vehicles, a total of almost 835,000 units, it has just been announced by the Society of Motor Manufacturers and Traders. The year's exports amounted to more than 302,000 cars and just over 111,300 commercial vehicles and the total value of the industry's exports of all motor products came to £300 million. Since the war, and up to the end of 1953, the U.K. motor industry had exported more than two million cars and over three-quarters of a million commercial vehicles.

* * * * * * *

American Firm's Services for D.V.C.: A supplementary agreement was signed recently between the Governments of India and the United States, providing for extension up to June 30, 1956, of the engineering consultant services of the Harza Engineering Co. of Chicago, Illinois, to the Damodar Valley Corporation, it was officially stated recently. The U.S. Government would make available for this purpose a sum of $632,000 (about Rs. 30 lakhs) of technical assistance funds.

* * * * * * *

Canada to Supply 120 Engines to India: Mr. Robert Morse, President of the Canadian Locomotive Company, stated recently that work would begin immediately on the 20-million dollar order for 120 steam locomotives for India. The order was first announced in Ottawa on January 5. The Company would try to make initial deliveries in 12 months and complete the order by the end of 1955.

* * * * * * *

International Spring Fair in Utrecht (Holland): Over 3,500 manufacturers and traders will be represented at the forthcoming International Spring Fair in Utrecht (Holland) to be held from March 30, to April 8, 1954. This event is organized by the Royal Netherlands Industries Fair. Besides showing a complete survey of Dutch production the Fair presents goods of foreign make, originating from 25 countries, among which Great Britain, Germany and the U.S.A. dominate. The Utrecht Fair is divided into two main sections, one where consumer goods and household articles are exhibited, the other where houses, engineering goods and industrial equipment will be displayed. The coming Spring Fair will cover a net exhibition space of over 500,000 square feet.

* * * * * * *

Labour Conditions in the Silk Industry: A Ministry of Labour survey reveals that the total number of workers employed in 31 selected units of the silk industry decreased from 12,651 in July, 1951 to 9,120 in July 1952, as a result of adverse business conditions. Of the employed workers 88 per cent are men and 12 per cent women. During the year ended June 1952, the percentage of permanent workers dropped from 74.9 per cent to 67.0 per cent. The average rate of labour turnover for 27 of the 31 units was nearly 73.6 per cent; in Mysore State it was 195.6 per cent. Monthly minimum basic wages of the least skilled workers vary from Rs. 6-8 in Saurashtra to Rs. 35 in the Punjab. Dearness allowances vary from Rs. 8-2 to Rs. 17 generally in the States whilst in Bombay State it varies from Rs. 18-4 to Rs. 50-6.

MISCELLANEOUS

E.C.A.F.E.'s Economic Survey, 1953: Prominent features in Asian economic development in 1953, as described in the E.C.A.F.E. Economic Survey, 1953, were: (1) The effects of the Korean "boom and bust" period have worked themselves out and there are indications that Asian export earnings have settled down since the second half of 1953 on a level slightly higher than that registered in the immediate pre-Korean War period (before June 1950). (2) the food situation since the second half of 1953 has changed from scarcity to surplus, and with the break in rice prices, the last vestiges of the sellers' market have disappeared. (3) While export prices have until recently continued to decline, domestic prices in most Asian countries have shown an upward tendency. (4) The purchase of capital goods has acquired a different aspect. Whereas until not too long ago delivery difficulties on the part of foreign suppliers were a limiting factor, the volume of purchases is now governed by considerations of available foreign exchange on the part of Asian importers. (5) Asian countries are hit by the price "squeeze" resulting from Asian raw material prices having suffered a sharper drop than prices of imported capital goods. (6) Lower revenues have confronted all governments of Asian countries with the dilemma of either to curtail economic projects, or to resort to controlled deficit-financing in the interest of uninterrupted economic development.

* * * * * * *

Scientific Conference on Wool Textile Research: An international conference on wool textile research is to be held in Australia in 1955. The Conference will be sponsored by the Commonwealth Scientific and Industrial Research Organisation jointly with the Australian Wool Bureau. The Conference aims at stimulating research on wool, bringing about a wider understanding of the research problems of the industry. The wool textile research laboratories of the Commonwealth Scientific and Industrial Research Organisation comprise a protein chemistry laboratory in Melbourne, a physics and engineering laboratory in Sydney, and an applied laboratory, including an experimental mill, at Geelong. Research on wool, wax and proteins is being undertaken in the Organisation's division of industrial chemistry in Melbourne, and for some years wool textile research has also been a feature of the Gordon Institute of Technology at Geelong and of the New South Wales University of Technology in Sydney.

* * * * * * *

Yugoslav Technical Aid to Other Countries: Under the programmes worked out by the Economic and Technical Aid Administration, Yugoslavia will in 1954 give industrially underdeveloped countries more technical aid than ever before. For instance, it has been planned that Yugoslavia send ten specialists to work for several months in various economically backward countries, and that it receive from these countries 380 workers and engineers on scholarships to study in Yugoslavia. Yugoslavia will extend most of its help through the United Nations as well as through bilateral agreements with various countries and international associations of engineering and economics students.

NEWS IN BRIEF

INDIAN

The 14th Annual Conference of the All-India Manufacturers' Organisation will be held in Calcutta on Saturday, 27th March and Sunday, 28th March, 1954. Sir M. Visvesvaraya will preside. Important subjects relating to the vital problems of the day affecting industry and trade of the country will be discussed.

* * * * * * *

The Government of Bihar have approved the scheme for providing a weir over the Batre river in the 38th mile of Harihargan-Daltongan Road in Palamau District at an estimated cost of over Rs. 6.5 lakhs, it is learnt. Seventy-five hundred acres of land are expected to be irrigated as a result of this scheme.

* * * * * * *

Rotary International recently announced that three students in India have been awarded Rotary Fellowships for 1954. The Fellowships entitle recipients to one year's advanced study abroad and are of value ranging from $1,800 to $3,400.

* * * * * * *

Indian Council of Agricultural Research has agreed to bear 50 per cent of the total cost of a scheme for improving sheep breeding in Bihar for three years. The scheme is estimated to cost over Rs. 37,000, half of which will be borne by the Bihar Government.

* * * * * * *

The Indian Delegation to the fifth session of the Inland Transport Committee of the International Labour Organisation, being held at Geneva this week, will comprise one government, two employers' and two workers' delegates.

* * * * * * *

The total outlay on the Five-Year Plan in relation to the State of Rajasthan has been increased since the finalisation of the Plan by a little over Rs. 6 crores. The total expenditure is now estimated to be Rs. 2297.1 lakhs. The increases are under the heads Agriculture, Veterinary and Animal Husbandry, Power Projects and Roads.

* * * * * * *

India's tea exports will be about 15 million lbs. less than in the previous year, according to the export quota allotted for 1953-54. Last year's export totalled 252 million lbs. The drop is attributed to "poor stock position".

* * * * * * *

The Government of India have sanctioned grants totalling Rs. 11,844,935 during December, 1953, and January, 1954, under the Industrial Housing Scheme, 1953-54, for the construction of 4,907 tenements.

* * * * * * *

The Government of India are exploring possibilities of marketing abroad accumulated stocks of tobacco in Guntur. An estimate places the stocks at between 32—60 million lbs. Even though the price has dropped from six annas to one anna and six pies a pound, there have been no buyers, causing widespread distress to small-scale cultivators.

* * * * * * *

The Government of India, it is reported, are to sign an Indo-Burmese rice agreement for the purchase of 6 lakh tons, following the pattern of Burma's recent contracts with Ceylon and Japan. The basic price of rice is £50 per ton for supplies in 1954.

* * * * * * *

The Government of India are reported to have decided to allow import of about 200,000 bales of U.S. cotton and an additional 500,000 bales from non-dollar areas, in order to maintain production at the present level.

FOREIGN

The Cotton Board announced Britain had increased its output of cotton and rayon cloths last year by over 340,000,000 yards.

* * * * * * *

The U.S. Defence Department announced recently that it would be sending more B-26 light bombers and about 200 more air force technicians to aid French Union forces fighting in Indo-China. The number of bombers to be sent is believed to be comparatively small, probably about ten.

* * * * * * *

The Burmese Premier recently declared open the new buildings of the branch office of the United Commercial Bank, a leading Indian bank, which has been doing business in Burma for some years now.

* * * * * * *

The Executive Board of the U.N.'s World Health Organisation has proposed a budget increase for 1955 of 21 per cent over this year's figure. The proposed budget is 10,300,000 dollars, 1,800,000 dollars above the 1954 figure.

* * * * * * *

Britain was trying to find £350 million sterling to invest in the Commonwealth countries, said Sir Jeremy Raisman, former Finance Member of the Viceroy's Executive Council and now Deputy Governor of Lloyds Bank.

* * * * * * *

According to the U.S. Bureau of Census, the U.S.A. exports during 1953 totalled $15,694 million while imports came to $10,877 million. Shipments of military aid were nearly doubled in 1953 and are included in the exports.

* * * * * * *

The U.K. contributed £122,581,667 in loans and grants to the sterling countries of the Commonwealth. This does not include foreign investments not included under the Control of Borrowing Order. The British contribution to the International Bank for Reconstruction and Development includes £5 million to India for the Indian Iron and Steel Co. Authorised grants and loans in 1953 totalled £120 million.

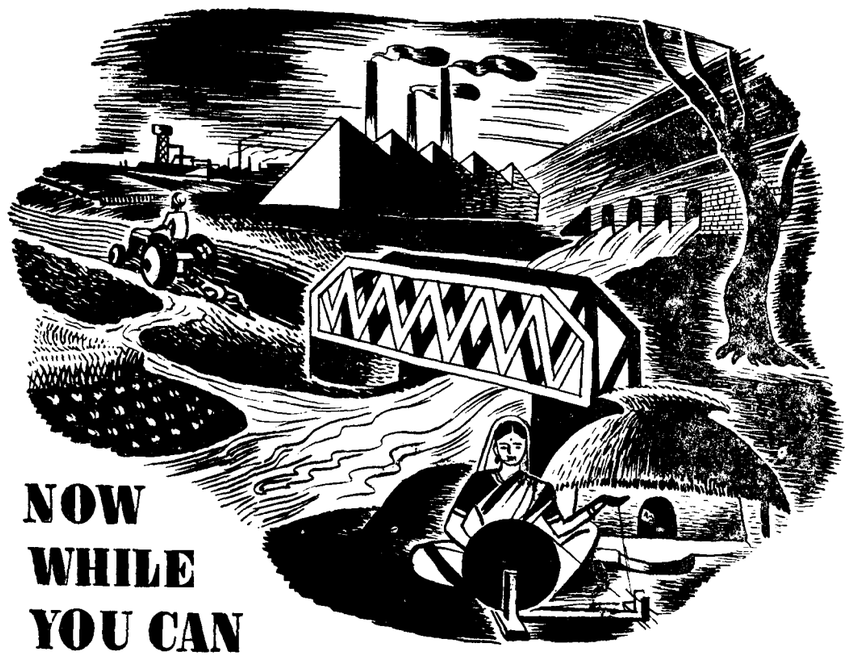
* * * * * * *

The Japanese Government has borrowed £500,000 from London Banks for three months according to reports in London. An equivalent amount of dollars has been deposited in New York to the credit of London Banks.

* * * * * * *

The Egyptian National Production Council and the Demag firm of Duisburg, Germany, are to set up an iron and steel works with an annual production of 125,000 tons to be doubled after two years, in Egypt. The Egyptian Company to run the works will have a capital of £(E) 10 million, 51 per cent of which will be Egyptian.

* * * * * * *



One of the world's largest tin deposits has been discovered on the east coast of South Korea. More than $200 million worth of tin could be produced for exports within the next two years, provided the mines were efficiently developed; the mines contain ores containing 10 per cent tin.

* * * * * * *

In 1953 Canadian exports were worth $4,172.6 million compared with the 1952 record of $4,536.0 million. Imports increased to a new record of $4,387.4 million from the 1952 figure of $4,030.5 million.

* * * * * * *

Large areas of swamp land in Kenya have been reclaimed and turned over to rice production. The rice-growing scheme is run on a co-operative basis under controlled irrigation from a nearby river. The scheme is already producing a surplus of 25,000 bags of rice a year. Rice-growing is being introduced wherever water and soil conditions permit.

NOW WHILE YOU CAN

BUILD YOUR COUNTRY'S FUTURE

Invest in 10-year Treasury Savings Deposits and plant more opportunity in your future. Your investment will be used to finance agricultural and industrial projects, dams, bridges, cottage industries, social welfare services—projects that will benefit every single individual in this vast country.

PREPARE FOR BETTER TIMES

Your investment today will be your standby tomorrow! These Treasury Savings Deposits pay a neat annual interest of 3½% free of income tax. They mature in 10 years and payment of principal is guaranteed. Deposit now and put more opportunity in your family and your country's future.

A Window On The World

EUROPEAN IMPERIALISM IN MALAYA

By

ODYSSEUS

TO FOLLOW CURRENT AFFAIRS is, for most people who have their living to earn, a leisure-time occupation, and few can do more than glance through a small selection of the news columns and editorial comments. Newspapers are, moreover, essentially concerned with new developments and the reader is assumed to know the background. Past history can only be ascertained by consulting reference books and newspaper files, which no normally busy person can be expected to do after a day's work. It therefore behoves persons such as I, whose professional job it is to try to follow the main currents of the news, to offer from time to time a factual round-up of some outstanding contemporary problem.

Malaya, for instance. As long as the cold war lasts, Malaya must continue to loom large in the thoughts of India's policy-makers and of those who try to take an intelligent interest in what is going on in the world around them. What I offer here are a few facts about the Malayan background which may help you the better to appreciate the significance of the day-to-day news from South-East Asia.

Malaya is made up of two separate political entities: the Federation of Malaya (geographically, the Malay Peninsula), 50,600 sq. miles in area (about 4,000 sq. miles less than Assam), with a population of over 5,300,000; and the Colony of Singapore, an island 291 sq. miles in area with a population of over 1,000,000. In the Federation, Malays and other Malaysians number over 2,600,000; Chinese about 2,000,000; and Indians over 500,000. Singapore's population has an overwhelming majority of Chinese who total 808,000.

British influence over Malaya arose out of the expansion of British trading and political power into Asia, particularly since 1819 when Raffles founded a trading station on the uninhabited isle of Singapore. From a small and unpromising beginning, Malaya has been developed into one of the richest corners of Asia. The huge rubber industry springs from a few seedlings sent out from the Botanical Gardens at Kew, near London, in 1877. Malaya is also the world's leading producer of tin, in which £100,000,000 of British capital has been invested.

The prosperity which followed the establishment of these and other industries attracted immigrants from all parts of Asia, so that by 1921, immigrant races outnumbered the Malays. In 1931, Malays numbered only 37.8 per cent out of a total population of 4,347,000. Of the immigrants who made up the rest, the Chinese totalled 39.2 per cent, and Indians 14.3 per cent. Commenting upon this trend the 1931 census said:

THE "ELDORADO" OF S.-E. ASIA

"The peace and security which came to Malaya with British administration; the aid of British capital and enterprise; the industry and economic genius of the Chinese; the labour of the South Indians; the adaptability and social philosophy of the Malays; all these things have conspired to make of Malaya an Eldorado in the eyes of neighbouring peoples. So it comes about that there is a continuous stream of immigrants from China, India, Java, Sumatra, and other parts of the Dutch East Indies coming to seek their fortunes in Malaya, and only a little over half the population is Malay born, and far less than half is in any sense indigenous."

This mixed population has not yet been assimilated into a new Malayan nationality, and there exists some friction and conflict of aims between the communities. To foster integration and to achieve full autonomy are, however, among the official goals of post-war British policy. A study of post-war events in Malaya (as in neighbouring Burma and India) suggests that the British are sincere in these professions, although there are signs of the usual gap between the views of the U.K. government and people and the attitude of some local British settlers. It is, however, worth remembering that what prevails in the final resort are the views of British home public opinion which—as I can vouch for by personal talks with men and women in all walks of society in the past few months that I have spent in the U.K.—is strongly in favour of granting independence at the earliest possible moment to all parts of the Commonwealth which do not yet enjoy it. Any government which tried to uphold an old-fashioned Imperialist policy would be lost in a General Election. The publicity given to the denunciation of the British government's alleged policy of "Scuttle," which arises periodically from a few die-hards in the Conservative Party, bears no relation at all to their influence in the country or, indeed, in the Conservative Party itself.

What, then, delays the advance to self-government in Malaya? Ironically, it is the action of the self-proclaimed anti-Imperialist Communist liberators, which is not only postponing Malaya's August 15, 1947, but is causing the diversion to expenditure on war of crores of rupees which, if released for investment in productive activities, would give Malaya the highest standard of living in Asia.

Who are the Communists in Malaya? What are their aims? Again, ironically, they are not indigenous to Malaya. Nor do they even work in the interests of the Malayans. They are foreigners, mostly Chinese, working in the interests of a European Imperialist power thousands of miles away—the U.S.S.R., which has no concern in Malayan affairs at all, save in so far as its aims elsewhere would be advanced by chaos in Malaya. This is so fantastic that I am relieved that I am pointing it out here to readers who, like me, live in this fantastic world and to whom, therefore, I do not have to try to explain this lunacy. But I should be hard put to explain the actions of the Malayan Communist Party to a visitor from another planet in which national affairs and international relations are guided by reason.

FOREIGN INTERFERENCE IN MALAYA

The emergence in recent years of armed gangs of Communist terrorists in Malaya, with their hard core of controlling Communist fanatics, is the outcome of the policy of the illegal Malayan Communist Party (M.C.P.) which was founded secretly in the 1920's. At that time, Russia's organisation for the spread of Communism abroad—the Comintern—set up a Far Eastern Bureau at Shanghai. Through the agency of the Communist Party, this Bureau directed infiltration into Burma, Siam, Indo-China, and Malaya. Communist ideas met with no success among the Malays but penetrated the schools and craft guilds of the Hainanese section of the Chinese community. Although the movement tried its utmost to recruit members from other races as well, it is a fact that at no time did the M.C.P.

allow any other than a Chinese to become a member of its Inner Cabinet, or of its controlling secret committees. This is equally true of the Communist terrorist organisation which is today holding Malaya to ransom. A statement by a surrendered Malay terrorist broadcast on April 14, 1950, said: "All the plans and the organisation of the Chinese Communists are kept secret to themselves. Not even a small part is explained to us Malays. It is as if our eyes were shut and our ears were stopped. What the Communists say is different from what they really mean. In discussion among the bandits, we Malays only hear. We cannot express our views or in any way oppose the Chinese. In the jungle, we Malays have to fend for ourselves, while the Chinese bandits look after their own people only. As regards weapons, there has been an even greater difference. The Chinese bandits have taken the best weapons for themselves and we Malays have been given what is left over."

From its inception, the M.C.P. was a subversive organisation and, being proscribed, worked underground. At every stage of its development, it was predominantly Chinese. Its members, mostly immigrants, had no loyalty to Malaya, and the founders of the Party worked with the unquestioning dogmatic mysticism common to Communist agents in all parts of the world. In the period between the two wars, the M.C.P. grew steadily in strength and penetrated certain sections of the labour forces. To prove its orthodoxy, the Party had a fashionable purge in 1930 followed by a reorganisation, but by 1937 it was strong enough to take a major part in fomenting a wave of strikes. In China, during the same years, a truce was called between the Kuomintang and the Chinese Communist Party in order to form a united front against Japan. In Malaya, the M.C.P. was thus enabled, under the guise of patriotism, to form "anti-Japanese" groups among sections of the Chinese population, such as the Kuomintang group, which had no Communist sympathies. By the end of 1939, the M.C.P. was an experienced underground organisation, utilising its power to foment among the Chinese community in Malaya a series of violent anti-British outbreaks. Early in 1940, the Kuomintang group, realising that it was being used by the M.C.P., withdrew its support and denounced the Communists.

I propose to conclude these notes about the Communist Party in Malaya next week.

Busy men all over the world have come to rely for guidance on weekly journals; they find the kaleidoscopic changes in national and international affairs too rapid and too deep for daily newspapers. Those of discriminating taste choose periodicals which deal with the countries and subjects in which they are interested.

THOUGHT

has earned distinction among Indian journals for its foresight and sober judgment in the nation's political, social and cultural affairs. It has built up a pool of original writers and critics who comment on events with a rare insight and balanced judgment.

THOUGHT's opinion on national and international affairs always claims the ear of responsible persons and organs of public opinion.

BOOK REVIEWS

THE FAILURE OF A MISSION?

Ambassador's Report: By Chester Bowles: Harper and Brothers, New York: $4.00.

Mr. Chester Bowles' report on his assignment as the United States Ambassador in New Delhi which has just been published in New York will naturally awaken the widest interest in India. There has seldom come from a foreign observer so understanding an assessment of Indian psychology and policy. Not a little of this understanding has come from the penetrating manner in which not only Mr. Bowles but his entire family entered into the Indian scene. Section II described as "Home work" has some chapters on history in India which show how well historical background has been absorbed. The Ambassador himself claims to have travelled 60,000 miles in India although he notes with regret that he has still left out some important places such as Banaras. Mrs. Bowles learnt Hindi and could carry on conversation in this language, being perhaps unique amongst the wives of foreign ambassadors in New Delhi. Mr. Bowles' daughter, Cynthia, worked in a hospital just outside Delhi and it is mentioned that she even decided to stay on for a few months after her parents left, preparing to spend the hot months in India rather than depart from her friends and her work. There is no doubt that the departure of the Bowles was a great personal wrench which is not adequately described in the chapters at the end.

This is a sincere book, which must reiterate the view that has been held in India that Mr. Bowles' job in India was not, as some of his critics maintained, a powerful publicity campaign. It is quite true that he brought to his task all the instruments of imaginative publicity which he had developed in abundance in his work with Benton and Bowles. It is quite true also that these instruments have not always succeeded in India. There were many people who disliked them and who were not drawn to the Bowles as a result of their dependence sometimes upon them. But, by and large, the task that was performed was far greater than the instruments which were used. As a friend of India, as an interpreter of India's foreign policy, as the one American diplomat in recent years who has been able to establish warm personal relations with the Prime Minister, Chester Bowles' record is unique.

In the long run, it will not be because of his personal contacts that his name in India will endure. It will be primarily because of the conception of community projects, which owes everything to his imaginative drive. The chapter "Community Development—A Key to Village Asia" tells only a little of the story of India's debt to this man. To appreciate it fully one has to imagine the opposition which arose in the American Congress; while Mr. Bowles was making himself more popular in India he was by no means making himself popular in the United States. A cartoon by Herblock in "The Washington Post" which is reproduced on page 346 of this book and which appears below indicates trenchantly the character of this opposition.

The chapter on "Role on Foreign Aid" contains ten sentences which sum up in a nutshell a policy for the United States. These ten commandments read as follows:

1. Neither small-scale "technical assistance", nor indiscriminate giveaway will suffice.
2. Free Asia's handicaps in its competition with China should be a yardstick for Western aid.
3. Private capital should not be expected to play a major part in the early stages of world development.
4. Economic conditions should be attached to our aid.
5. Regional planning and participation should be increased, as far as practicable through U.N.
6. Economic and military aid should be kept as parallel but completely separate programmes.
7. Non-governmental groups should be encouraged to undertake their own projects.
8. Point Four people should be carefully selected and trained.
9. Not mere anti-communism but building strong democracies should be our main emphasis.
10. We should act boldly while the initiative is still ours and not wait for a crisis.

Will the United States treat these commandments as the Tables and the Law? If it did, her relations with India would certainly improve; article 9 in particular has, after Bowles, appeared in India to be on the wane.

"I Ain't Interested in Countries Till They're Lost"

Herblock in The Washington Post

BURMA'S CURRENCY AND CREDIT

Burma's Currency and Credit: U Tun Wai: Orient Longmans, 17, Chittaranjan Avenue, Calcutta: Price Rs. 10.

"The publication of Dr. U Tun Wai's book on Burma's Currency and Credit", says Hla Myint, Lecturer in Colonial Economics, Oxford University, in his foreword, "is something of an event, for it is the first systematic work on Burmese economic affairs written by a Burmese". This is, perhaps, the greatest merit of the present work which brings together in a central place a vast amount of information on the trade, currency and credit of Burma. The author, who is at present working in the Research and Statistical Division of E.C.A.F.E., has been able to draw on the resources there also although the work was originally written as a doctorate thesis for Yale University as far back as 1949.

Opinions may well differ as to the most interesting portions in the book. But, for Indian readers, the chapters on foreign and agricultural banking in which the Chettiars of India feature predominantly will be of special interest. On pages 51, 52 and 53 there will be found some unusual figures about the lending operations of the Chettiars in Burma. The fact that 940 out of the 1,100 district Chettiar firms had their offices in the 13 main rice-growing districts of Burma shows the extent to which rice prevailed in Chettiars' trade. It is, however, a great mistake to equate the Chettiars' banking influence with the trade in rice, and the chapters on the Chettiar rate of interest (for which a graph is available on page 151 for the years 1895 to 1940) indicates the powerful financial position exercised by this rate. Because of the interest attaching to this rate, the description to be found on page 47 in regard to the fixing of the rate on called deposits known as "Nadappu—Kamakku" is of special interest. It reads as follows:

"It is fixed in the evening of the 16th of every Tamil month at a meeting held at 9 p.m. in the Chettiar temple at Rangoon, and it holds good for all the current Chettiar month including the sixteen days already passed. . .The meeting discusses the general financial situation, and fixes the current rate for the current month in accordance with this, taking into account the current pitch and tendency of the thavanai rate, the rates current amongst the Marwaris, Multanis and Gujeratis and the rates for advances by the joint-stock banks to Chettiars. As every firm has both income and expenses determined largely by this rate, great care is taken to fix the rate according to the needs of the situation. But for the first sixteen days of the month, before the rate is fixed, there is a general consensus of opinion as to the rate that will be fixed, the weekly adjustment of thavanai rate and the discussions incidental to that adjustment being sufficient guide."

It would seem that Chettiars in Rangoon fixed an Indian rate there not unlike the Bank of England rate which is announced every week when the Governors of the Bank of England meet in secrecy at London.

This is a remarkably valuable descriptive work which is essential for any economist or economic historian assessing the current Burmese scene.

LAND REFORMS IN INDIA

Land Reforms in India: H. D. Malaviya: Economic and Political Research Department: All-India Congress Committee, New Delhi: Price Rs. 3|-.

The general impression conveyed to most outside observers about the question of land reform in India is that not sufficient progress has been made. The comparison is often made with the reforms effected under high pressure in Japan under the occupation. Almost the bulk of Indian post-war legislation for land reform relates to the abolition of the rights of the intermediaries, by whatever name they were called in each region. It is felt that there is much to be done for the regulation of conditions of tenancy and for the limitation of the size of holdings in order to find land for the landless. Even then, there would remain the task of creating economic holdings by consolidating fragmented holdings and encouragement of co-operative farming methods. But the data for giving concrete shape to all these discussions are still lacking; it is not often known that the owner-cultivator is the predominant type of agriculturist and that the landlessness of the agricultural workers is more a problem of population density than one of concentration of land-ownership. Only a census of landholdings, as now proposed by the Government of India, would provide the factual basis for formulating future policies.

The survey of land reform in India published by the Research Department of the A.-I.C.C. does not attempt to analyse these larger issues of the problem. There has been a useful compilation of the steps taken in all the States till now for the abolition of intermediary rights. The brief description of the tenure involved in each case and the principles underlying reform in each case would be helpful. For a few States, like Punjab and Madras, statistical data available about the size of holdings has also been furnished. But the book is essentially an account of the achievement of the Congress Governments in the States. The introductory chapters, which trace the history of the Congress Party's interest in agrarian reform, are intended to lead up to the actual record of the Party in fulfilling past promises. Since the agrarian programme had been shaped by the Congress Agrarian Reforms Committee, any further analysis or discussion of the problem with a view to throwing fresh light was, perhaps, not to be expected. Even when credit is given for the information here assembled, the book has to be viewed as a record of party achievement than a positive contribution to the understanding of the land problem as it has to be tackled in the future.

CULTURAL FREEDOM

Proceedings of the Second Annual Conference of the Indian Committee for Cultural Freedom.

It was a happy thought for the Indian Committee for Cultural Freedom to publish in a single small volume the proceedings of the Second Annual Conference held at Madras on September 12 and 13, 1953. This publication contains a small foreword described as "A Step Forward" which shows the substantial progress that Indian Committee has made already. There follows a welcome address by Mr. M. Bhaktavatsalam, Chairman of the Reception Committee. The inaugural address, "True Freedom", by Rajaji and Dr. Sampurnanand's presidential address on "The Neuroses of the Indian Intelligentsia" have both attracted wide attention and together form a consistent piece, showing that the Indian Committee for Cultural Freedom has much more to say for itself than mere anti-communism. The resolutions to be found on pages 31 to 35 also illustrate the wide interests of the Committee.

It seems a pity that such urgently needed enlightened work should not receive the encouragement which is its due. On page 70 it is stated that the total membership of the Committee stood on August 25, 1953, at 495; Bombay with 204 and Madras with 102 comprise two-thirds of the members. Delhi and New Delhi have only 11. One wonders why Delhi and New Delhi gave such a poor showing. It is urgently hoped that this omission will now be made good; there are three members of the Executive Committee resident in Delhi.

A DELHI DIARY

IS brevity the soul of wit? If so, the President's address to Parliament on Monday was the best of its kind. It is, as far as I remember, the shortest address which he has ever delivered. It was, however, I might say, the most tame from the point of view of the interest which it aroused. There was not even a direct reference to the United States Military Pact with Pakistan, about which so much has been heard from both official and non-official sources. All the President said was that past understandings between the Indian and Pakistani Prime Ministers have suffered a set-back "owing to some other developments". And thus this Indian equivalent to the British Speech from the Throne did not even have the comforting sentence that our relations with foreign powers continued to be friendly.

It was not surprising that interest passed rapidly from the President's address to other things. The House of the People on Tuesday, sedulously avoiding the President's address, got itself heavily involved in a discussion on Ordinances. Some Members of Parliament (keen on arithmetic!) had carefully added up the President's Ordinances in recent recesses. They discovered that there had been seven Presidential Ordinances in the last recess and six in the recess before that. Such a flow of Ordinances, it was said, "brought the House into disrepute" and was an "overgenerous use" of Article 123 of the Constitution. Actually, it was not so much the number of Ordinances which hurt as the fact that tempers on the Kumbh Mela had been aroused; the Ordinance imposing a terminal tax on Kumbh pilgrims was conveniently broadened into an attack on a wider front. There was, indeed, no justification for this Ordinance because the Kumbh Mela had been (or should have been!) foreseen, and the complaints are certainly justified that Government should not have bypassed Parliament in this manner. The Finance Minister made as effective a reply as was possible, referring incidentally "to the one hundred and one pre-occupations of the Government". This burden argument—the White Man's or the other kind—failed, as always, to carry conviction. We shall hear more of the Ordinance-making powers in this session. There is no doubt that feeling on this point is widely shared.

THE THIRD TRAGEDY?

That the trouble was the feeling on the Kumbh Mela was shown clearly enough when the debate on the President's address opened on Wednesday. The United States-Pakistan Pact did get in by the back door when Mr. N. C. Chatterjee, the Hindu Mahasabha leader, was pleading for more military training; but there was no doubt that interest throughout the day lay elsewhere. Acharya Kripalani, the Praja-Socialist leader, was in good form although Congress members heckled him and Mr. N. C. Chatterjee described his speech as "the third tragedy"—the first two being the collapse of the administration resulting in the "colossal loss of human lives", and the second being "the amazing explanation" given by the Chief Minister of Uttar Pradesh that he came to know of the tragedy only late in the afternoon, some time after he went to a tea party held that evening.

What was so tragic about Acharya Kripalani's speech? He claimed that many people who went to the Kumbh Mela did not believe in purificatory baths. With dignity he said: "We do all this in an effort to make ourselves popular with the masses so that they may keep us in power. And because we do these things without faith, our efforts fail as miseraly as they failed at the Kumbh Mela and the country is plunged in gloom". Was I imagining, or did this utterance really enter deep in the minds of many members? Certainly I felt that the opposition leader struck a responsive chord in the entire House.

PAYING THE PIPER

There really was no necessity for so many "VIP's" to be present at the Mela. If they went as pilgrims, they went in the wrong way, receiving precedence which in no way belongs to them in their personal capacity. If it was merely the fun of the fair, there is no reason why State revenues should bear the cost of their transport there. The President of the Congress was certainly entitled to be present as were leaders of all parties to see for themselves the springs of deep public opinion. But if leaders of political parties go there for political reasons, the expenses of travel should not be borne by general revenues. I seem to remember the instance of a firm Auditor-General who disallowed travelling allowance claimed by a (forgotten!) Viceroy who went to Bhopal for a shoot and then claimed he had also done some official business with the Nawab. The Auditor-General (so the happy story goes) battled his way to the Secretary of State and won his point. The Viceroy had to pay for his amusement out of his own pocket! It is sincerely to be hoped that the Auditor-General of India will issue instructions that journeys to the Kumbh Mela, except for officers on duty, will not be accepted as a charge on public revenues. It is absolutely wrong that public revenues should finance trips undertaken even partly from political considerations. After that is done, perhaps the best thing is to draw down the curtain on the Kumbh affair. That act is finished. Let us get on with the next!

THE STEEL LOBBY

The decision to locate the new Steel Plant at Rourkela in Orissa rounds off the fierce controversy the embers of which gave forth some heat over the week-end. On Saturday and Sunday, lobbying was at the highest point that it has reached since Independence. There were no less than four Chief Ministers here arguing their respective cases. The Cabinet meeting which was held on Sunday evening lasted two hours without (apparently!) having the slightest effect on this decision. One does wonder whether it was wise (as well as diplomatic!) to summon the Chief Ministers here for proceedings which obviously were not a little in the form of play-acting. It was not seriously believed that the recommendation of the German technicians would be altered; was all the expenditure involved in this expensive journeying back and forth for the Chief Ministers and their significant retinues really necessary? In the case of Dr. B. C. Roy at least events this week seemed to indicate that the time spent here might have been more profitably spent in Calcutta!

WANTED: ANOTHER AMBASSADOR'S REPORT?

There have been many interesting visitors to New Delhi this week among whom was Mr. Loy W. Henderson, formerly American Ambassador in New Delhi and now American Ambassador in Iran. Mr. Henderson did much to get the Wheat Deal through and it seems a great pity that his great work in getting the idea of American aid to India accepted in the United States is insufficiently known. It was clear, however, at a reception which Mr. Allen held for Mr. Henderson that there was a small group of people who knew that story. Can we not have another Ambassador's Report?

ARGUS.

SPECIAL ARTICLES

SCHEME FOR THE SALES TAX

THE communique which has just been issued by the Government of India regarding sales tax announces a certain measure of interim relief. This relief has been possible because the officials' committee on sales tax, which has been appointed by the Finance Ministers' Conference, has been mainly concerned to simplify and standardise the procedure for the assessment of non-resident assessees. But, obviously, this is no final solution, and the officials' committee has not by any means concluded its labours. As the Finance Minister indicated in a recent statement at Madras, the question of changing the present basis of taxation in all the seventeen states or of amending Section 286 of the Constitution has on the other hand been under consideration. In due course, which is a pretty vague phrase, but which, in the circumstances, is all that the Central Government can promise, either a switch-over to a new scheme of taxation, namely, to a purchase tax within the existing ambit of Section 286, or failing that an amendment of this Article itself, will have to to be considered.

The fountain and origin of all the present confusion is a faulty drafting of Article 286. Clause (2) of this Article, which was believed to exempt inter-state trade within India from sales tax, stands excluded from the Constitution for all practical purposes, as a result of the explanation to clause (1), which enables an inter-state sale to be taxed constructively as a sale taking place within the state of dèlivery. The situation which has thus been created is certainly anomalous.

Whatever the Constituent Assembly might or might not have intended, two things today are clear. One thing which is clear is that, paradoxically, the states cannot be dissuaded from taxing the sales which have taken place outside their borders. The conditions on which such taxation is levied can be made less irksome, which is the main achievement which the recent communique sets out. But no state will be willingly ousted from exercising the powers which the Supreme Court has permitted it to exercise. The other thing which is also now clear is that the states are not going to agree to any amendment to Section 286, which would seek to simplify it at their cost. It is a moot question whether the necessary majority will be available within Parliament for any amendment which goes against state interests.

The simplified, but fashionable, view that centralisation of the sales tax is the remedy, because under centralisation all the complications are going to disappear, fails to take into account this central difficulty. In the ultimate analysis, the Congress majority at the Centre can, perhaps, carry out an amendment to the Constitution, overriding the opposition of all the states. But that possibility seems unlikely. The states, therefore, will have to be converted and not coerced at this stage, especially as they have now agreed to the concessions proposed by the officials' committee.

The Centre's proposal of a purchase tax, in order to partially replace the sales tax, is a remedy which will enable the states, in these circumstances, to get clear of the legal tangle, which has been created by the present interpretation of Article 286. It is not impossible to start again on a clean slate. Compared with the present irksome and inconvenient sales taxes (these taxes incidentally are inconvenient not only to the public, but also to the taxing authorities themselves, for the states are now coming up against the administrative problems involved in taxing non-resident assessees) the scheme for a purchase tax offers two very great advantages even if it is confined only to the taxation of inter-state sales.

The states will be enabled under the new scheme to tax the purchaser-resident, rather than the seller-non-resident, which, as the existing assessees who have lately been brought within the ambit of Article 286 can appreciate, should considerably simplify administration. The Centre for its part will also be enabled at the same time to act (within the exercise of the powers conferred on it for the purpose of regulating the taxation of essential articles) in such a manner as to minimise the deterrents to inter-state trade.

These two advantages are in fact of considerable value. In proposing a new scheme, under which they will be available, the Centre has, moreover, some bargaining strength still left which it will find useful in negotiating with the states. For one thing, the extreme remedy of centralisation is not now being pressed. Not even formal amendment of Section 286 for any other purpose is now involved. The states will, on other hand, continue to retain the major gain which the Supreme Court's interpretation has conferred on them, namely, the power to tax an inter-state sale, at the point of delivery, in accordance with the intentions of the explanation in Article 286(1). In return for freezing this substantial gain, which would retain within the states' list the units' powers to tax virtually unimpaired, administrative simplicity on the one hand and the smooth flow of inter-state trade on the other are the two advantages now proposed by the Centre, according to the view which it now holds. The quid pro quo which is sought is obviously small.

These new proposals will not cost much to the states. Since the entire basis of taxation will be changed according to these proposals, it is naturally impossible to say whether the position will be totally unaffected, but to the extent that the changeover to the new basis actually involves any cost to the states, a proper appreciation of the role of the sales or purchase tax in a developing economy may help to reconcile the states to the new scheme. It is necessary at this stage that there should be no misunderstanding on this point.

The sales tax, or the purchase tax if it replaces that, can only be a very crude instrument of taxation. It is not, in the first place, a satisfactory substitute for the direct taxation of consumption through the taxation of personal incomes. It can be argued, indeed, as it has been argued by the Finance Minister of Madras, that so long as the aim is or has to be to claim a certain amount of tax, to be used for purposes of development, it cannot very much matter exactly how that amount of tax is levied. But this argument hides a dangerous fallacy; there is, in point of fact, a great deal of difference between on the one hand taxing an essential commodity and expecting the tax-payer to readjust his budget, and on the other taxing his income more directly; it cannot always be assumed that the effect in the two cases would always be the same. The sales tax or purchase tax, moreover, is not adapted for purposes of progression. It also falls inevitably on particular sections of the community, on those who purchase from traders who are not within the exemption limits. It is to that extent inequitable; and obviously, there can be no uniformity in these taxes as between the various parts of India.

For these reasons, neither the sales tax nor the purchase tax is really a desirable source of revenue to develop, in preference to other taxes, which are inherently more equitable. In considering any arrangements in relation to these taxes, which the Centre may now propose, it is important that the states should be educated to consider the issues which may arise in this wider perspective.

If they do so, there is hardly any doubt that order may yet be evolved out of chaos; and a tax, which promises to become vexatious and unpredictable in its consequences, can be regulated so as not to impede national development. This last-mentioned criterion is now important, so that the action which the Centre now proposes to take under Article 286(3) of the Constitution must be far-reaching and well-considered and should, generally, be so liberally conceived as to reduce the import and significance of the interpretation which has made clause (2) virtually a dead letter. The arrangements which have been announced in the recent communique show that co-operation among the states is not impossible. The time has now arrived when that co-operation should become meaningful.

UNEMPLOYMENT AND PLANNING

WHILE there is a lull in the great parliamentary debate on the nature of unemployment in the country, which occupied much of the private members' time between August and December last, many doubts have now crept into the minds of those who have thought of the deeper economic implications of the disease and the remedy. The feeling of assurance that characterises the attitude of the Government and the Planning Commission, because of the expansion of the outlay cannot be only a gesture of the deep interest employment, cannot naturally be shared widely. This outlay cannot be only a gesture of the deep interest of Government in this problem; its justification as a solution has been apparently unconvincing. There has been greater interest in the analysis of the economic aspects of the problem and recently Prof. D. R. Gadgil was reported to have raised some of the more important issues before a gathering of economists at Bombay. The problem that was posed there was which of the several types of unemployment that can arise in the context of the Indian economy could or should be directly solved by the Government through the Plan, consistently with the other objects and purposes of development planning. In the course of the discussion, some at least of the issues were framed in a manner which should help to provoke thought on the right lines.

There has been quite a needless debate over certain aspects of terminology. It has been clear from the outset that there can be no attempt to provide short-term solutions to the problem of underemployment in agriculture which is inseparable from the fact of the dependence of 70 per cent of the population directly on cultivation of the land. The provision of irrigation, better methods of agriculture and credit facilities can, however, reduce this underemployment and increase incomes in this sector so as to arrest the decline in the economic condition of the surplus labour force engaged in or dependent on agriculture. This applies to all the groups engaged in this sphere of activity—whether it is the average owner-cultivator, or tenant farmer or landless worker. Though the last-mentioned group constitutes the most vulnerable section of the rural community, the question of direct short-term relief will arise, as it has arisen frequently in the last few years, only in times of distress created by drought and crop failure in particular areas. Such relief, however, cannot be truly described as a remedy for unemployment under a system of planning for economic development. In other words, a solution to the widespread underemployment in agriculture can only come through an increase in the area of land per head among those dependent on agriculture. Since land is limited, this can only be achieved by the growth of non-agricultural occupations on a scale sufficient to absorb the surplus labour in agriculture.

All this is familiar. But by ruling out this major section as not directly concerned in unemployment measures, the question naturally arises whether unemployment only pertains to the two other major groups in the economy, namely (1) the class of employees in non-agricultural occupations including industry, public administration, commerce and other professions, and (2) the numerically equal group of self-employed persons, working as artisans, in transport services, in retail trade and in various other skilled or learned occupations. The creation of more employment opportunities in the first sector alone is no solution as it can still leave the second sector with a low level of activity and incomes and consequently in distress. There can be no satisfaction in such a result because the self-employed group is as important as the other. Thus the consideration of the problem according to the several sectors creates a dilemma. Prof. Gadgil logically reached the conclusion that the problem in India is not one of a fall in total employment due to a recession as it is known in the advanced countries but one of general underdevelopment which can be solved only by more and more development, designed to increase the per capita product. Here, however, we face a further complication that the technological consequence of planning for higher per capita output levels through higher labour and capital efficiency might be to create unemployment in the least efficient sectors, just as the cotton-weaving mills have created a problem of lack of occupation and income among the handloom weavers. The question whether there should be a compromise or not at this stage to maintain the employment of handloom weavers as part of the scheme of expanding employment under the Plan raises a question of consistency in planning for long-term economic development.

These are some of the difficulties inherent in planning for development in an underdeveloped economy. Modern economic theory has gradually taken into account the distinctions to be made between policies designed to maintain full employment in the advanced countries of the world and for economic planning in a backward economy. The maintenance of full employment in the developed countries is assumed to create all the conditions necessary for long-term economic progress. It cannot be so in the other case. The rate of population growth is one of the factors which makes a major difference. Even if there is full employment at a low level of technical efficiency, a steady reduction of the death rate, for example, makes it difficult for the younger generations, added to the working force year after year, to find scope for employment by replacing those already engaged in various occupations, and new occupations do not multiply at the rate required. The Indian situation at the present time is rather typical of this feature. It cannot be said that unemployment is due to a recession in the sense of a general decline of the volume of industrial or tertiary employment or of a substantial fall in the activity of the self-employed.

Part of the difficulty in reconciling the position may be due to the argument, advanced by the Finance Minister, that the volume of unemployment, together with the advent of the buyers' market, may indicate an economic recession, which may be appropriately dealt with by monetary measures. The scope for the success of purely monetary techniques is not, however, as large as in the major countries planning for full employment; the Finance Minister has only claimed that the higher level of expenditure under the Plan envisaged in the next two years will make a material contribution to relieving the unemployment situation. There can be no denial of the general proposition, that the relevance of short-period income analysis diminishes in the underdeveloped economies. Prof. Rostow, among

others, has lately emphasised that unemployment as a structural phenomenon calls for attention not only to the level of effective demand, but also to the nature of such demand, the skills available in the unemployed working force and its physical location and mobility, and planning of the disposal of the products turned out, if costs also happen to be high (as they are in India). But even when allowance is made for all these factors, there would be marginal scope for maintaining economic activity at a high level by creating effective demand. It has to be remembered that the Indian economy is at an intermediate stage of development calling for a combination of the techniques employed in both the advanced and underdeveloped economies. A decline in employment can yet be checked so long as the total effective demand is kept up to enable, for example, the consumption of both mill-made and handloom goods.

The justification for the expansion of the outlay on the Plan is not only that the effective demand will be kept up but also that the proper social background necessary for all successful planning will be safeguarded. It may provide the environment in which structural changes in the economy may be carried out; even if it does not, so long as the character of the expenditure is such that it becomes an investment in human beings if not in material resources—through more education, scarcity relief, better health, roads and so on—the value of the programme can be vindicated. If the general environmental aspect is thus taken into consideration, the question as to which particular sector is benefited becomes immaterial. Actually, it is those sectors in which unemployment can disturb the environment of planning that should claim the first attention. It would, therefore, be incorrect to proceed to the view that because the educated youth and the urban industrial sector constitute a small fraction of the total unemployment in the country, measures directly calculated to benefit these groups cannot be characterised as policies to remedy unemployment. The general political and social climate cannot be overlooked in economic planning; the measures can have the further justification that they can contribute to the long-term development also, because they will attempt to develop those sectors which will eventually help to absorb the surplus in agriculture.

THE BUSINESS WORLD

REPORT ON MACHINE TOOLS

The seventh annual report of the Indian Machine Tool Manufacturers' Association has borrowed somewhat heavily from the report of the Planning Commission. Nevertheless, it makes one or two important points. The programme of development which has now been prescribed for this industry is much less ambitious than was contemplated in the Panel report. As the annual report points out, even this limited plan, however, is not likely to be realised, if the sense of crisis which has overtaken the industry continues to persist.

It may appear prima facie that the target set up by the Planning Commission is not too ambitious in the light of experience. The table below summarises the annual production of graded machine tools during the last eleven years:

1942	273
1943	1,713
1944	2,170
1945	3,699
1946	2,820
1947	1,400
1948	1,691
1949	2,240
1950	1,130
1951	2,834
1952	4,488

The Planning Commission's target of production of 4,600 machine tools by 1955-56 and the private investment of Rs. 20 lakhs cannot be difficult because there are fourteen producers excluding two manufacturers of auxiliary equipment and 105 producers of ungraded machine tools already in the field. The industry, however, is worried about some major problems.

One is prejudice against indigenous machine tools. The Association records the development work that was done during the year by half a dozen members, but the demand from the Railway workshops and ordnance factories is neither steady nor certain. The Machine Tool Panel of the Engineering Capacity Committee has now recommended:

(i) standardisation of sizes and types of general purpose machine tools and publication of a standard classified list,

(ii) inspection not only for geometrical accuracy, but also for purposes of reliability in working,

(iii) supply of information to the industry regarding the machine tool requirements of state factories, but something like a vicious circle—prejudice against the indigenous product leading to low production and lack of opportunities for standardisation as well as the higher cost of the local product—exists at present and will have to be broken before local production can improve in quality and quantity.

The other serious problem which faces the industry is competition from the Jalahalli factory. Starting from some time during this year, the Hindustan Machine Tools, Limited, is to produce 400 lathes of 8½" as the first part of its production programme. The industry has two observations to offer on this immediate production programme, namely:

(i) the assumptions that private industry cannot produce lathes of 8½" size or that the quality of such lathes, if produced by private industry will not be good will be unwarranted, and,

(ii) the official estimate of the total demand for machine tools, a figure as high as Rs. 10 crores being mentioned, is inflated, and if plans are based on this estimate, overproduction, which may be disastrous for private industry, which cannot market its products as easily as can the state factories, is bound to result.

The uncertainty that faces the industry is great and it may well inhibit development. Assessed capacity of the fourteen manufacturers of graded machine tools will apparently continue to be what it now is or may even increase, but actual production is bound to be affected.

The only way of helping private industry at the present time to overcome its fears and to reduce at the same time the admittedly higher cost of indigenous machine tools will be so to regulate imports or to restrict the production at Jalahalli that the established manufacturers have a steady and expanding market. It may not be advisable to restrict production at Jalahalli as the easiest way out of the difficulty—this would merely transfer the problem from the private to the public sector. If the Railway workshops and the ordnance factories shed their prejudices, however, if a common sales organisation which will do propaganda and offer technical sales service can be created, and if standardised and quality products of local origin are preferred to imported articles, it may be possible to build up the industry as general development increases the demand for machine tools. As it is, the private manufacturers seem to be in danger of being neglected and it is to this unintended result of the present development plans that the Machine Tool Manufacturers' Association has drawn attention.

INDUSTRIAL STATESMANSHIP

By

CROESUS

Peter Drucker, a noted American journalist, recently wrote in "Nation's Business", that "competent management and consideration for the individual are the basic reasons for the success of industry in the U.S.", according to members of several productivity teams that visited the U.S. in 1949 and the following years to find out for themselves, at first hand, what influenced American productivity. Can we say that these twin requirements will do for industry in a country like ours which is still in the process of becoming industrialised? They won't do not only for India, but for mankind as a whole, according to Col. L. Sawhny, Managing Director of the Associated Cement Companies, Ltd. "The industrial pattern of today", he said, "must be one in which the endeavours and ambitions of men are so co-ordinated as to produce a driving force that will consolidate industry in an accepted place in the new society which mankind aims to achieve. This will only be when management is able to guarantee an efficient and successful industrial community in which men may work willingly and live abundantly". In the considered opinion of this ex-army man, "the success or failure of industrial management will be judged by the extent to which it is able

to identify itself with this national aim (that is, the establishment, as speedily as possible, of a Welfare State) and to prove, by its actions and policies, that it can champion the hopes of those people who, in working for industry, are striving to achieve security and well-being".

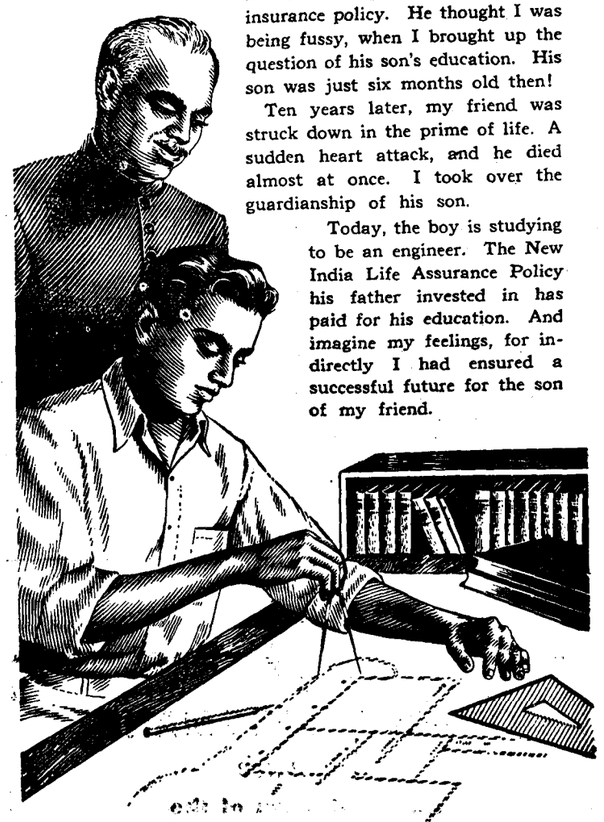
I do not think that even the worst critics of private enterprise (let alone our Government which professes "mixed economy" but, oftentimes, manages to forget that this concept envisages the co-existence of units run by both State and private enterprises alongside each other within clearly defined spheres), will be able to impose more exacting criteria to judge the success or failure of industry. Col. Sawhny does not stop even there. He wants that the activities of the private sector should not only conform to the overall national policy but that the policy of private enterprise must be based on a few sound and well-tried principles. It must, for instance, "satisfactorily fulfil certain conditions and it must guarantee to produce certain results". And, "apart from the provision of material goods and benefits", he insisted, "it should also be rooted in the spiritual and psychological fabric of Indian life." This is, indeed, strange, coming from an old timer of the army, where, according to popular belief at any rate, there is no place whatever for spiritualism. Be that as it may, in having called for this spiritual mooring, Col. Sawhny showed an unusual awareness of the characteristic genius of India. It is because modern life, be it in industry or in any other sphere, is becoming increasingly divorced from this spiritual mooring that people often find themselves tossed about in rudderless boats in deep waters. He did not say that one should regard one's duty as a form of worship by a devotee whose prayer is not sullied by thoughts of any reward, as the 'Bhagavad Gita' would have it, but the idea underlying his exhortation—that "industrial policy should inspire its work people to loyal and harmonious effort in the secure faith that their endeavours are contributing towards the betterment of society"—is no less sublime. If only our industrialists and labour leaders succeed in making workers realise that, in addition to themselves, they also owe a duty to the community at large, they will have really achieved something very great. "Unless this spiritual foundation forms the basis of industrial policy", as Col. Sawhny put it, "it is in danger of being dominated by the motive of materialism and, when this occurs, industry finds itself back in a position which has been rejected as having no place in our new world of enlightened values".

All this must have sounded highly philosophical to those Labour and Welfare Officers who met at Madras on February 12, in connection with their Second All-Indian Conferences. (Col. Sawhny presided over the section dealing with the Functions of Management and Management Training of this Conference), but what Col. Sawhny had to say after imparting this refreshingly welcome reorientation to an otherwise humdrum subject was "of the earth earthy." For, after stressing the need for a spiritual basis in evolving an industrial policy suited to the genius of the soil, he developed his thesis of industrial statesmanship. It is difficult to think of a more happily worded phrase to convey the substance of what the A.C.C. Managing Director desired to do.

Col. Sawhny did not exactly define industrial statesmanship as such. Like the author of the "Happy Warrior" he rather set out to outline the characteristics of sound management or, to put it in his own words, the responsibilities which face management today. In the first place, he said, an efficient management must guarantee adequate reward for the services rendered by its members, in addition to providing them reasonable incentive. Not only must it give a fair return on invested capital to the shareholders, but also provide necessary reserves for the maintenance of the industry and for its future development. And, in doing so, according to Mr. Sawhny, the management must shoulder the responsibility of holding an honest balance between the various interests, namely the work people, the shareholders, and the consumers. This is all very good as an ideal, but, if the policies and actions of the powers-that-be compel the management to do things which militate against the holding of an honest balance thus, who is to blame?

It is axiomatic to say that management should be responsible for technical efficiency in all its aspects. But many do not realise that this can be accomplished only by sound leadership and effective organisation, which it is the responsibility of management to ensure.

A third responsibility of management, and one which, in my opinion, is very important, is that management must be prepared to make, and to stand by, its own decision once it has done so after consulting all those whom it should reasonably and ordinarily consult. The A.C.C. Managing Director is quite right in holding that "a weak or vacillating management which attempts to pass on responsibility or decision-making to others stands immediately self-condemned". No less important a task of management is to be able to delegate both responsibility and authority instead of clinging to them as though they are an impartible possession for all times.



A sure index that anyone has bestowed thought on a subject is the way in which one puts it out to others, and, in doing so, one naturally draws upon one's own experience to illustrate the points one wishes to make. Col. Sawhny did very well, therefore, to draw on his army experience to bring home certain points. Take, for instance, the question of maintaining a high morale which is the most important single factor in the successful prosecution of any war. How is this morale ensured? Surely not by military discipline and fear of punishment, as is popularly believed. This, said Sawhny, is a mistaken conception, and pointed out that its basis lay in mutual confidence and better understanding. "If the same high degree of morale prevailed among workers in the industry as it does among men of India's fighting forces", he declared, "the advancement of any industrial progress would be readily assured".

Two other features of Col. Sawhny's address must appeal to anyone. The first was his emphasis on the right selection by the management of its administrative staff and the second, the importance of explaining to the people, who form any organisation, the purpose and aims of that organisation and the need to ensure that all policy decisions assist in the implementation of the overall aim. Taking a homely example, the A.C.C. spokesman pointed out how a man engaged in hewing limestone in a quarry would be infinitely more inspired by his work after knowing that his part of the work constituted a vital process in the manufacture of a nationally required building material than when he mechanically handled a hammer and cracked rocks for a given length of time every day. This reminds me of the exhortation which our Prime Minister also recently made to the engineers engaged on the various river valley and multi-purpose projects. He then asked these engineers to explain to the people employed the greatness of the work that they were doing from the point of view of the prosperity of the nation as a whole. In this connection, I feel I must cite the following extract from a lecture by Sir Arthur P. M. Fleming, C.B.E., Director and Manager, Research and Education Departments, Metropolitan Vickers Electrical Company, delivered during the Festival of Britain year, that is in 1951:

"The young entrant needs to be made acquainted with the purpose of the industry he has entered and its place in the national economy. He needs to know something of the set-up of his own organisation, what

NEW INDIA STORIES FROM LIFE 2

'My advice saved this boy's future!'

Years ago, I persuaded my good friend and neighbour to take out an insurance policy. He thought I was being fussy, when I brought up the question of his son's education. His son was just six months old then!

Ten years later, my friend was struck down in the prime of life. A sudden heart attack, and he died almost at once. I took over the guardianship of his son.

Today, the boy is studying to be an engineer. The New India Life Assurance Policy his father invested in has paid for his education. And imagine my feelings, for indirectly I had ensured a successful future for the son of my friend.

An insurance policy taken out now may one day stand between you and disaster. For full information, write to

THE NEW INDIA ASSURANCE CO. LTD.
Mahatma Gandhi Road, Bombay 1.

NI. 6173

are the relations between its integral parts, what are the human relationships within it. He must be made to feel that he is part of something that is vital to the community's well-being and that his job, well done, is essential to the well-being of the whole. Despite the efforts that are being made, this is one of the phases of industrial training that falls far short of the ideal."

We all talk so much about training for industry and wax eloquent over the problems of those connected with training for industry. It is said that this problem is one "of discerning the special aptitudes of persons as individuals, equating themselves to the most suitable jobs, providing the right kind of training to enable the young person to use and develop these aptitudes to the satisfaction of himself, the industry he serves and the community in which he lives, to provide means for upgrading". But, all these, however, relate to the men engaged by the management of an industry. Does this mean that there is no need for management training, especially as, to quote Col. Sawhny, no management can rely upon the constant supply of geniuses? It is, therefore, the duty of every sound management to make available to the enterprise men who will be capable of taking decisions of the future and who are qualified, trained and tested during the present to do so.

The best method of providing this training, according to Col. Sawhny, is a combination of practical experience and formal instruction. As things stand today, the young business executive is left to train himself and to learn as he goes along, which is most unsatisfactory. This haphazard and unplanned education of the managers of the future is a very serious national shortcoming which requires to be remedied forthwith. The Managing Director of the A.C.C. deplored the absence of institutions designed to impart instructions in management training. He was, of course, aware of the initiative in calling for the early establishment of an Administrative Staff College by the Commerce and Industry Minister, but he did not consider the proposed course to be adequate. "I feel that there is some danger", he said, "that the course will suffer from the disadvantages of being too little and too late", because the average age of a business man going to this course is stated to be between 35 and 40 and the duration of the course approximately three months. This is a matter on which there would appear to be considerable difference of opinion. According to at least one authority, the administrative college at Henley (U.K.), where the course is only one of three months, has been able to do wonderful work but, in the ultimate analysis, it is not so much in the age group factor or the duration factor that the success of any such training scheme lies as in the men and women involved. Unless these are people of outstanding qualities of leadership, we cannot hope to have good managers for, as has been rightly stated, "no formal course of training for management will produce good managers, unless the inherent human qualities required are there". It is a testimony to Col. Sawhny's keen perception that he himself has noted this. That is why he quoted the famous remark of Lord Wellingdon that "there are no bad battalions but there are only bad officers".

I do not know how many will view Col. Sawhny's ideals of sound business men as practicable, but no one will dispute that as an ideal it is really unexceptionable. Let me now sum up the splendid peroration of Col. Sawhny:

> "Management is concerned with the attainment of the aim of the organisation through a maximum co-ordination of work and the voluntary co-operation of those it employs. It is concerned with the delegation of authority and responsibility right down the lines. It must lay down a clear definition of duties and be responsible for the proper selection and training of all its staff. It is concerned with the flexibility of its structure and with intelligent future planning. It must ensure the economy and efficiency of all operations. It must see that its human resources are utilised to the greatest advantage through justice and decency and all that is compatible with the rights and dignity of man."

Could this not well constitute the Charter of Private Enterprise which Mr. M. R. Masani spoke of the other day?

BUSINESS NOTES

THE CHALLENGE TO BURLAP

The future of burlap in the United States is a matter of vital concern for the jute manufacturing industry in this country. India still supplies 75 per cent of the burlap requirements of the U.S. As such the U.S. burlap trade's view in this respect should serve as a very useful guide. The National Burlap Bag Dealers' Association, New York, held its annual convention on January 30, 1954, at which the Association's President, Mr. J. C. Daly, analysed the trends in the market for packing materials.

Mr. Daly is in no way pessimistic about the outlook either in the short or long term. But he has uttered a warning that all future policies must be influenced by the basic consideration that it is a world of competitive markets which burlap has to deal with. He refers to the jute manufacturing industry going into production in Pakistan in the second half of this year and emphasizes the fact that in the second half of 1955 all the mills in East Pakistan with a loomage of 3,500 are expected to go into full production on a double-shift basis. It must be stated in parenthesis that this is a significant factor which the Indian jute industry has to reckon with. But its impact on India need not be exaggerated. Bulk handling has produced some adverse effect on the U.S. market for packing materials, but Mr. Daly is confident that this market is expanding and must continue to expand. The primary concern of the burlap trade must be to fight the competition of paper with competitive prices, unremitting sales promotion and innovations. He feels quite hopeful that burlap can meet this challenge. He stresses two fundamental changes in the size of burlap bags. New weights and widths must be substituted for the traditional hundred pound burlap bag since it makes for economy in cost for the purchaser. Experimental efforts made by some big burlap companies in the U.S. in this behalf have attracted an encouraging response. Then, again, there is ample scope to enter competition with rival containers in the sphere of fifty-pound containers. Both these innovations will regain the market and offer expanding sales for the burlap trade. Support for this drive for the two innovations must come from the jute manufacturing industry in India in the shape of readjustment and on this score Mr. Daly states that the Indian industry must move much faster than it has shown its inclination to act.

It is in no mood of defeatism, but rather in a mood to get forearmed, that Mr. Daly finds it necessary to give a word of counsel:

"If the foreign manufacturers—all of them—are really interested in the preservation of the jute goods industry, if they are anxious to expand the use of burlap in this country and, incidentally, in other consuming world markets, then let them display their interest and concern in an unmistakable manner. The timing is now and quick action is essential. India, as the largest single producing nation, should accept the challenge and take the lead. The future use of burlap in the U.S.A. rests squarely on the shoulders of the Indian Jute Mills' Association as well as the Pakistan Jute Board who should encourage the cultivators to grow more jute rather than think in terms of restricted acreage. Any other policy is nothing short of slow suicide. So if these two nations want to preserve and expand the industry, and it can be done, all that we need is plenty of jute and a desire on the part of manufacturers to throw off the cloak of tradition and put some imagination into future production."

TOBACCO WITHOUT SALE

Since tobacco growers in Andhra State, which accounts for an overwhelming proportion of the country's production, drew the attention of the Indian Central Tobacco Committee at its meeting in December last to the critical situation created by unsold stocks, further deterioration has taken place. The trade's estimate places the uncleared (and for the present unsaleable) stocks in Guntur, the principal centre, at 32 million lbs. It is obvious that either the Central Tobacco Committee is not seized of the gravity of the situation as it should have been or Government has not thought it pressing to take any expeditious measures to relieve the stresses and strains on the growers and the trade. Any other explanation of the lack of relief measures is still to come forth.

The situation would have taken a worse and more acute turn had adverse weather conditions not destroyed part of the crop. Adverse weather, however, has undoubtedly affected the quality of all grades and his has partly accentuated the troubles of the trade. The hardships resulting from a flat rate of excise duty on tobacco irrespective of quality are illustrated by this unfortunate critical phase. Prices are reported to have slumped by 75 per cent without sufficient response from domestic buyers and exports on consignment basis are said to have started already. In the case of some lower grades, conversion into manure presents the only alternative to continued glut.

Short-term reliefs are indicated by the revision of the tax policy. The flat rate of excise duty for all grades of tobacco has totally failed to justify itself and the time has arrived to withdraw the export duty on Indian cigars. But the deliberations at the recent Andhra State Tobacco Growers' Conference have laid emphasis on the long-term problems of this commercial crop. The proposal of establishing a finance corporation with a capital of Rs. 2 crores for tobacco trade is of highly doubtful feasibility, but it underlines the need of a sound marketing organization. Credit facilities for the grower are also too inadequate. More basically, the yield per acre which is placed at below half of what is obtained in some European countries as also quality are at the root of the trouble. Their improvement calls for greater research and its application to the operations in the field. It seems that the useful results of research conducted at Rajahmundry have not been carried to the grower. Exports are declining—the decline being of the order of Rs. 1.32 crores in the first half of 1953-54 as compared to the corresponding period of the previous year—and the assurance to establish an export promotion committee for tobacco must now be implemented. While the recently acquired preference for Indian tobacco abroad is not lost, energetic measures ought to be taken to rehabilitate the trade.

NEGOTIATIONS FOR OIL PROSPECTING

Negotiations were scheduled to start this week between the Government of India and representatives of the Burmah-Shell and Caltex Oil Companies for Government-cum-private enterprises to undertake prospecting for oil in West Bengal. In view of the technical skill and experience required in the exploration work as well as the high cost involved, negotiations with these two companies of long standing, for prospecting on a basis of collaboration, constitute the right approach. Prospecting operations are not now considered to be a gamble, involving a corresponding gamble in investment, that they were once supposed to be. What is of vital interest in this context is the fact that the oil potentialities of West Bengal are no longer considered to be meagre and geological investigation has established reasonable certainty of good resources of oil in this State. Preliminary aerial magnetometer survey in certain regions in West Bengal has been carried out by the Government in partnership with Standard Vacuum Oil Company. The current negotiations with Burmah-Shell and Caltex Oil Companies are not expected to be protracted over a long period as the negotiations with Standard Vacuum Oil Company which lasted for 18 months. The precedent of the agreement between the Government of India and Standard Vacuum will be followed in substance in the case of the two pending negotiations. The final result is bound to ensure, according to present expectations, extensive oil exploitation work in West Bengal.

The terms of the agreement for oil prospecting between the Government of India and Standard Vacuum Oil Company are important, but it appears that since their publication early last month they have not attracted the notice they deserve. The Government and the Company are to contribute shares to the cost of the joint venture of prospecting in the ratios of 1:3, with a ceiling of Rs. 2.5 crores fixed on Government's share unless it chooses to invest a higher amount at a subsequent stage. Each party is to nominate one official to determine from time to time the programme of the exploration work. If discovery of petroleum deposits in commercial quantities is confirmed, Standard Vacuum has undertaken to give serious consideration to setting up a refinery with a daily capacity of 10,000 barrels. Since the agreements for oil refineries to be established in Bombay were entered into, attention has rightly been directed to exploring the possibilities of augmenting the sources of indigenous processed oil. A clearer and realistic appreciation of the oil refinery agreements on a collaborated basis between the Government and overseas oil companies has now emerged in this country. It will be a great gain if the prospecting projects lead to more production of processed oil from indigenous crude petroleum.

CASH ALLOWANCE IN LIEU OF RICE RATION

The substitution of a cash allowance for provision of rice ration at a fixed price had been a sore point of dispute between tea estate labour and managements for the last few years. The injustice and extreme hardship of this hastily improvised war-time arrangement consisted in the fact that tea estate managements were placed under an obligation to supply rice ration for the worker and his dependents—a term defined in practice very vaguely to include a large number not coming within its strict scope—at the ridiculously low price of Rs. 5 per maund which was fixed in relation to the pre-war level. Apart from the crushing financial burden of subsidy which it involved, the managements were further subjected to the obligation of procuring rice stocks at the gardens by their own arrangements. Transport difficulties particularly in Assam added to the burden considerably and air lifts for rice have not faded out of memory. This was a rare instance where a duty really resting on the Government was coolly passed on to the tea estate managements. Efforts made in the wake of the crisis in the tea industry to convert this privilege into a cash allowance failed and Government shirked taking a firm attitude because of the political implications of the issue.

Labour has now come out with a chastened mood and the improvement in the food situation has also altered the outlook. Nevertheless, as reports suggest, the Union Labour Minister exercised his persuasive influence in inducing labour representatives on the Industrial Committee on Plantation Labour to agree to the substitution of a cash allonwance for rice in the Assam tea estates. For A and B Zones the rate of cash allowance has been fixed at 9 annas per day and for Zone C at 8 annas per day with a concurrent obligation on the managements to provide rice at Rs. 20 per maund in the first two zones and at Rs. 17-8 per maund in C Zone. The cash allowance scheme is reported to have been accepted tentatively for one year.

ACQUISITION OF MORE TONNAGE

Some particulars of the provisional plans of the shipping companies to purchase more vessels in the remaining two years of the Plan are now available. It will be interesting to follow the final decision of each company, for this is not a matter of getting loans from the Government alone. The requirements of the companies for purchase-money throw an obligation on them to go in for debenture issue. Most of the ships which are to be purchased in the next two years are for the coastal trade. The rate of interest, which is fixed by Government at present at 4½ per cent for coastal ships, has been a major point of controversy, but indications available so far are that the Government has shown no inclination to accede to the demand of the companies for reducing it, at least by a reasonable fraction, if not by 2 per cent so as to bring it to parity with the rate on loans for the purchase of ships for the overseas trade. Since this issue of additional vessels was taken up actively by the Union Ministry of Transport more than four months back, the shipping companies have applied their mind to concrete schemes of purchase. Mr. Lal Bahadur Shastri has already given an assurance that the terms of loans relating to the amount of advance and period of repayment will be liberalised.

According to present indications, Scindias propose to buy twelve ships of which five will be of 9,000 tons d.w. each and the remaining seven of a smaller tonnage. The cost of acquisition is estimated to be Rs. 13 crores to be met by a government loan of Rs. 8 crores and by debentures of Rs. 5 crores. The Eastern Shipping Corporation will buy about three ships. The Grant Eastern Shipping Company proposes to acquire five big and small vessels. India Steamships has ordered two ships and it intends to buy two more. Bharat Line and Malabar Steamship are proposing to buy two ships each. It is difficult to estimate the achievement of the Five-Year Plan target or the shortfall in it before the schemes are finalised by the companies.

STRUCTURAL STEEL

The establishment of the Structural Steel Sectional Committee of the Indian Standards Institution at Calcutta last week marks an important new phase in the activities of the Institution. The low priority given to this committee was due to the complex nature of the difficulties involved in its work which is of basic value in conserving the steel resources of this country. These difficulties have been explained sufficiently by the Institution's Director, Dr. Lal C. Verman. The work entrusted to the committee would entail an exhaustive and critical study of the standards and practices in the use of structural steel prevalent in other countries as well as those prevailing at present in this country. Similar detailed investigations into the theoretical and practical aspects of the problems of the use of structural steel in a wide range of requirements will tax the energy of those engaged in evolving standards for this material. All this necessarily dictated the need for setting up a highly specialised secretariat organization with persons fully conversant with the manufacture and fabrication of steel and practices of designs. The technical secretariat has now been established under the initial direction of U.S. expert engineers obtained under the Point Four Programme.

The case for the utmost economy in the use of structural steel hardly needs argument. Present standards for the production of heavy sections require radical revision in the light of the standards evolved in other countries. Light-weight sections also require standardisation for their numerous products. Recent advances reigstered in welding practices which offer distinct advantages in cost, design and construction will have to be incorporated in the structural practices to be prescribed for this country. The Union Commerce and Industry Minister announced at the inauguration

of the committee that the standards may have to be enforced by Government regulation. This indicates the measure of their importance and urgency. Government as the biggest consumer can help a long way in effecting economies in the use of structural steel. The magnitude of the current waste in the country's consumption of this steel is placed at 25 per cent, valued above Rs. 8 crores.

TOURIST TRAFFIC

Since tourism was placed on an organized basis in this country about five years back under the direct initiative of the Union Ministry of Transport and a variety of amenities were provided, tourist traffic has received stimulation and the number of tourists visiting this country from abroad is on the increase. The four regional offices opened at Bombay, Calcutta, Madras and Delhi have got off to a good start. Last year in the first eleven months nearly 25,100 tourists came to this country and this figure compares well with the number of tourists in the whole of 1952 placed at 25,450. The increase in 1953, however, is not great. Earnings from tourist traffic in 1952 are estimated to be Rs. 2.5 crores (on what basis it is not clear). Similar estimate for 1953 is not available, but it is unlikely to show great difference. Mr. Lichtenberg, President of the International Union of Official Travel Organizations, who was here last week, hinted at the tourist traffic potential of this country and expressed his personal view that, given a sustained promotion campaign, India's tourist traffic should easily increase eightfold in the next decade. The two primary conditions for the success of this campaign are that the development of transport and hotel facilities must go hand in hand.

On the score of transport, the Ministry concerned has made a start in placing at the disposal of tourists luxury standards, which, however, need further improvement before they can approach the levels prevalent in other countries frequented by tourists. It is also worth while to investigate where new means of communications should be opened up to exploit the tourist traffic potential. Proprietors in the hotel industry set up the All-India Hotel Federation last month and their decision to act in close co-operation with the Central Tourist Traffic Committee is correct. Training of hotel personnel under the projected scheme for Asian countries under the auspices of the U.N. Technical Administration in this country has remained so far a proposal. A more realistic and direct approach would be for the new Hotel Federation to send a few trainees in countries like Switzerland and France. The Transport Ministry has published a large volume of pamphlets and folders for tourists, but in this context Mr. Lichtenberg's suggestions deserve to be incorporated in their new editions. Pamphlets and folders should be of a practical nature giving the tourist information on a range of subjects of personal interest including places worth visiting, climate and suitable dress, travel facilities, and so forth. There is no need to incur extra overheads for additional independent tourist offices for publicity abroad as this work can be managed under the supervision of our embassies.

CAUSTIC SODA AND BLEACHING POWDER

The third inquiry into the claim of the caustic soda and bleaching powder industry for protection and assistance in other forms started before the Tariff Commission last week. The recommendations of the former Tariff Board in the earlier two inquiries for grant of protection were subsequently found by the Government to be unrelated to the changed conditions and protection was not extended after the second inquiry completed in 1950. Mr. M. D. Bhat, Chairman of the Tariff Commission, has, however, emphasised that in the present altered context this industry's case for protection demands earnest consideration. The cost structure of the industry, the c.i.f. prices as well as selling prices of imports and the quantity of imports give a significance to the claim for protection. Apart from a protective duty, the industry has asked for other reliefs which include exemption from the cess on salt used in the manufacture of caustic soda and reduced freight rates on raw materials and fuel. The case for protection is advanced by eight units in the industry whose combined installed capacity is 30,000 tons. Production though on the increase from 12,563 tons in 1951 to an annual rate of 14,442 tons in the first half of 1953 is much below capacity. The causes of the shortfall need critical analysis in view of the expanding domestic market.

WINNING THE BATTLE AGAINST FUEL FORMED DEPOSITS

The recognition that fuel contributes to the formation of deposits and that they have an important bearing on the operation of the automobile gasoline engine opened up a new field of research investigation into the means of their amelioration. Fuel formed deposits may be found in combustion chambers, on other parts of the intake system and the exhaust passages. These deposits make themselves felt in plug mal-functioning, pre-ignition, knocking, and engine stalling, with the result that the engine does not develop its full power.

In the research laboratories studies were made extending over many years on the deposition tendencies of fuels in different makes of engines and for evaluating the ability of a new gasoline to ensure proper acceptance. Extensive improvements in refinery practices were made to provide a high quality gasoline, but with the advent of high compression engines and the use of TEL (tetra-ethyl-lead) as an anti-knock agent, the problems of building into the gasoline properties to meet the more severe requirements became more complex and difficult.

This article is devoted to a description of the factors that contribute to fuel formed deposits, their influence on engine operation and how MOBILGAS with S-54 developed by Standard-Vacuum's Principals in one of the world's largest laboratories and proven by road performance in America and Europe, overcomes the problems associated with them.

SOURCES OF DEPOSITS

The carburettor is designed to supply the engine with the proper mixture of air and gasoline over a wide range of speeds and loads. However, under certain conditions of driving, combustion of the gasoline-air mixture in the cylinders is often incomplete with the result that various parts are likely to become more or less covered with fine carbon, as for example the plugs, combustion chambers, piston tops, exhaust passages and pipes. This carbon by itself would not be so objectionable as it is of a sooty nature. However, other factors such as gum and TEL in the gasoline contribute to deposit formation and in combination with the carbon may foster relatively hard deposits of a troublesome nature.

TEL is now almost universally used in gasoline to suppress 'knocking'. If used alone in gasoline it forms lead oxide on combustion, which tends to accumulate on the spark plugs and exhaust valve seats. To overcome this, a product is incorporated to assist in the evacuation by the exhaust gases of the TEL-formed deposit. However, some amount of this deposit will be left in the combustion chamber, the extent of which will be influenced to a great extent by the amount of gum in the gasoline, by the nature of the carbon left by the burning of the lubricating oil and by engine operating conditions.

A small amount of gum exists in dissolved form in all gasoline. When, however, gasoline is stored for long periods, it absorbs oxygen from the air to form additional gum. This gum can form residues that can cause more trouble than other gasoline deposits. When gum goes into the engine it does not evaporate along with the rest of the gasoline and some is deposited wherever the gasoline evaporates, as on carburettor jets, in the intake manifold or on inlet valve stems and it may also be carried into the combustion chamber. At first the deposited material is sticky like varnish. It combines, however, with other deposits, absorbs more oxygen from the air and under the drying action of heat it may assume a form ranging from molasses to a hard flint-like deposit. It will be seen therefore that if the structure of the gum can be altered to prevent it from sticking on the parts of the intake system and from promoting the formation of hard deposits in the combustion chambers and on exhaust valves, deposit accumulation can be overcome to a great extent. This is what MOBILGAS with S-54 does in a gasoline engine. It prevents the gum from being deposited in a sticky state when the gasoline is vaporised; instead, the gum-forming material is modified so that it is in a non-adherent state.

The power output of a gasoline engine can be seriously impaired by fuel formed deposits. MOBILGAS with S-54 not only assists in minimising the deposits in the combustion chamber but it improves the functioning of the separate parts of the intake or breathing system with the result that the power output is maintained at a peak. Let us consider how MOBILGAS with S-54 improves the functioning of the engine beginning with the throttle valve in the carburettor and continuing to the exhaust valves.

The throttle valve in a carburettor consists of a pivoted disc located in the venturi tube, which the driver operates by means of an accelerator pedal. The gasoline-air mixture from the carburettor is drawn by the suction of the engine via the manifold and the supply is controlled by the throttle valve. When the throttle valve is "closed", the engine is said to be idling. Actually, however, in the "closed" position the throttle valve allows a small quantity of gasoline mixture to be drawn into the engine. This is done by providing an annular space between the periphery of the disc and the walls of the venturi tube. However, the annular space is very restricted and if the rim of the disc gets gummy or sticky the passageway may actually be sealed thus stopping the flow of the intake charge of the air-gasoline mixture and causing the engine to stall.

MOBILGAS with S-54 prevents the "gum" from being deposited on the throttle valve.

In modern gasolines there are incorporated several components like inhibitors and anti-knock agents, which contain much non-volatile material. These added materials do contribute somewhat to the deposition of residues in the engine manifold particularly if the interior surfaces are coated with gum. MOBILGAS with S-54 prevents this material from being deposited and clogging the passages.

Near the intake ports of the combustion chamber, all the while that the engine is running, there is a constant pulsation of gases, including the fresh air-gasoline mixture about to enter the ports and a mixture of products of combustion tending to get past the intake ports owing to the designed overlapping action of the intake and exhaust valves. In the course of time the products of incomplete combustion tend to deposit a coating of varnish-like substance on the walls of the passages at the intake ports.

Sometimes the gumming on the underside of the inlet valve head may be so severe as to reduce considerably the power output of the engine. The valves must also effectively seal the gases in the combustion chamber at pressures up to or possibly exceeding 600 pounds per square inch. If gummy deposits collect on the underside of the valve heads power is lost and the valves and valve seats may also suffer damage.

MOBILGAS with S-54 serves to prevent the formation of these harmful deposits.

It may be said therefore that the inlet valves and manifold are the lungs of a gasoline engine and like mortals, when affected with congestion of the respiratory system, cannot breathe freely if the passages are clogged with deposits. In the automotive engine such deposits will result in the cylinders not receiving the right amount of air-fuel mixture and therefore the engine cannot develop its full power.

The stems of the intake valves are fitted into cylindrical guides and are normally lubricated by a thin film of lubricating oil supplied from the engine sump. The valves are required to operate at lightning-like speed and open and close in a fraction of a second. However, when the engine is overloaded it is likely to run "hot" and there is a tendency for the oxidised lubricant to combine with the gum in the fuel and accumulate in a sticky film in the clearance space near the top of the valve guides. When this happens the valve stems stick and the valves operate sluggishly.

MOBILGAS with S-54 assists in free movement of the inlet valves.

The intake valve being constantly cooled by the incoming charge of the gasoline-air mixture operates at a comparatively cool temperature. The exhaust valve, on the other hand, is subjected to a very high temperature, sometimes high enough to cause it to operate at red heat. If deposits find their way on the valve seat it ultimately results in burnt out or broken valves.

MOBILGAS with S-54 alters the characteristics of the deposits in the combustion chamber resulting from gum or material incorporated in the gasoline, making them non-adherent with the result that combustion chamber deposits are minimised.

Proof of the effectiveness of MOBILGAS with S-54 in minimising deposit formation has been established in actual use in America and Europe. Summarising, therefore, its use helps to (1) create better engine breathing and hence more efficient utilisation of fuel resulting in greater power and lower fuel consumption, (2) reduce the knocking tendency due to better breathing and minimum deposit formation, (3) provide easier starting and warm up as valves move freely and the carburettor does not stick, (4) greatly reduce valve and hence engine maintenance.

So far we have dealt with fuel formed deposits. However, cleanliness of the moving parts in the crankcase and of the pistons is also equally important since deposits on these parts can be a great source of trouble. MOBILOIL, a modern motor oil, developed by Standard-Vacuum is a highly detergent oil. This powerful property enables MOBILOIL to hold in suspension in a finely divided state contaminants such as fuel soot and any oxidation products resulting from the fuel and lubricant that find their way into the engine sump. When the oil is changed the impurities are drained out of the sump with the oil and permanently removed. To coin a phrase, MOBILOIL keeps engine crankcases and pistons 'MOBILOIL clean'.

The best advice that can be given for keeping down to a minimum the formation of deposits in the automotive engine is, firstly to use only the best gasoline and secondly to use a selected motor oil. MOBILGAS with S-54 and MOBILOIL when used together in the gasoline tank and engine sump respectively, will provide complete engine cleanliness.

A HINDUSTAN TIMES PUBLICATION

MEMORIES OF BAPU

A PUBLICATION FOR EVERY HOUSEHOLD, DRAWING ROOM AND LIBRARY.

It is a 13" x 9½" magazine size album printed on art paper. It consists of 100 pages of over 200 pictures with their full description. Two pages are in colour. The publication contains a selection of tributes and an introduction by the Editor of the book, Mr. Devadas Gandhi.

THE HINDUSTAN TIMES, NEW DELHI

COMPANY AFFAIRS

"MACNEILL & BARRY" GROUP OF JUTE COMPANIES

The audited accounts and balance sheets for the half-year ended 30th September, 1953, of all the three jute companies managed by Messrs. Macneill & Barry Ltd., are now available for review. It is gratifying to note that despite trying trading conditions during the period under report, all the companies have done well. Net profits, after providing for depreciation and taxation, have advanced in all the three cases. Gourepore and Nuddea have declared dividends on the ordinary shares but Ganges could not do so because of a heavy brought forward debit balance.

The stocks of hessian cloth and bags remained at a high level during the major part of the half-year under review. The table below gives the stocks of hessian cloth and bags with the members of Indian Jute Mills' Association from April 1953 to September 1953. There is a sudden fall in the last month, i.e., September, because the Government of India reduced the duty on hessian from Rs. 275 per ton to Rs. 120 per ton, which led to a further stimulation of hessian prices and a material improvement in the overall stock position".

Stocks of Hessian Cloth and Bags
(at the end of each month)

1953	(000 tons)
April	46
May	48
June	47
July	45
August	42
September	37

It may be stated that the stocks with the members of I.J.M.A. declined to 31,000 tons by the end of October, 1953.

All the three companies show a fall in the cost of raw jute consumed in spite of the fact that the prices of raw jute moved upward because of curtailment in jute sowings in the early part of the year. The current crops have declined both in India and Pakistan.

The working results of the individual companies are analysed below.

	GANGES				GOUREPORE		NUDDEA

a After transferring Rs. 2 lakhs from "Machinery and Replacement Reserve".
b After transferring Rs. 13,00,000 from "General Reserve".
c After transferring Rs. 7 lakhs from "General Reserve".

THE GANGES MANUFACTURING CO., LTD.

The sales for the half-year under report have declined from Rs. 163.35 lakhs to Rs. 136.46 lakhs. The value of stocks has also fallen from Rs. 18.85 lakhs to Rs. 7.19 lakhs. Manufacturing costs and the cost of raw jute show a downward trend though the bill for salaries and wages has remained rigid. The net profit at Rs. 3.91 lakhs has helped only to bring down the debit balance to Rs. 4.62 lakhs. No provisions could be made for depreciation or taxation or dividends.

The balance sheet shows the gross block at Rs. 210.72 lakhs. Depreciation so far provided comes to Rs. 134.24 lakhs. The net block, therefore, amounts to Rs. 76.48 lakhs.

THE GOUREPORE CO., LTD.

In line with other jute companies, the figures for sales, stocks, manufacturing costs, etc., all point downwards. Even the bill for salaries and wages shows a fall from Rs. 31.40 lakhs to Rs. 29.18 lakhs. Net profit, however, shows a happy rise from Rs. 61,266 to Rs. 4,59,564. The directors have provided Rs. 2 lakhs for depreciation and Rs. 8,521 for taxation. Dividend on the ordinary shares has been proposed at the rate of 7½ per cent per annum as against nil in the preceding two half-years.

The balance sheet shows a very sound position of the company. The gross block stands at Rs. 219.26 lakhs. Total provision for depreciation up-to-date is as high as Rs. 164.08 lakhs. The net block, therefore, is down to Rs. 55.18 lakhs. As against a total capital of Rs. 50.50 lakhs, the reserves provided in the different funds total Rs. 26.30 lakhs.

THE NUDDEA MILLS LTD.

The net profit of the Nuddea Mills for the half-year under report comes to Rs. 1.53 lakhs as against a loss of Rs. 0.64 lakhs in the previous half-year. The directors have provided Rs. 1 lakh for depreciation as against nil in the preceding two half-years. The ordinary dividend has been proposed at the rate of 2 per cent per annum. The gross block stands at Rs. 213.29 lakhs. Total depreciation, so far provided, amounts to Rs. 136.90 lakhs. Net block, therefore, comes to Rs. 76.39 lakhs.

COMMODITY NEWS AND NOTES

SMALL DECREASE IN LINSEED ACREAGE

According to the Directorate of Economics and Statistics, Ministry of Food and Agriculture, Government of India, the all-India first estimate of linseed for 1953-54 puts the current year's area at 2,490,000 acres, as against 2,576,000 acres of the adjusted first estimate for last year, thereby showing a decline of 86,000 acres or 3.3 per cent in area. The decline in acreage under linseed during the current year has occurred mainly in Hyderabad, Rajasthan and Vindhya Pradesh. In Hyderabad, the decline in area has been due to delay in sowings caused by heavy rains in October 1953. On the other hand in Rajasthan and Vindhya Pradesh the decline has been due to inadequate soil moisture at the time of sowing. The decline has, however, been offset, to some extent, by increases reported by Bombay, U.P. and West Bengal. The information given in this estimate relates generally to the period up to the middle of December 1953. Till then the condition of the crop was reported to be generally satisfactory in all the States, except in parts of the Ahmednagar district of Bombay, where the crop was reported to be withering on account of insufficient rains. This estimate does not cover the entire area sown to linseed crop during 1953-54. Past experience has shown that the area at the first estimate stage forms roughly 80 per cent of the area under the crop finally reported.

SHARP RISE IN TEA PRICES

Prices of different kinds of loose tea in the Gauhati market went up from As. 12 to As. 14 per pound during the first week of the current month. First quality tea is almost unavailable. Busine's circles attribute the increase in price and shortage of stock in the market to (a) less production this year because of crop control and selective plucking for quality production; (b) the trade pact with Russia, which has agreed to make bulk purchase; (c) lifting of tea rationing in the U.K. with the resultant increased demand for tea from abroad; and (d) new markets in the U.S.A. where people are becoming more tea-minded.

RECORD CEMENT PRODUCTION IN INDIA IN 1953

Cement production registered a rise of nearly 200,000 tons during the year, reaching the record level of 3.73 million tons as against 3.53 million tons produced in 1952. The increase in production this year was due to the expansion of two existing factories and the setting up of a new one.

RESERVES OF IRON-ORE IN INDIA

'Indian Minerals', published by the Geological Survey of India gives the estimated reserves of high grade iron-ore containing 60 per cent and over of metallic iron in India as follows:

	(In million tons)
Hematite Ores	
Bihar and Orissa	8,000
Madhya Pradesh	3,000
Mysore	1,000
Sandur	250
Magnetite Ores	
Madras	1,000
Mysore	200
Limonitic Spathic Ores	
West Bengal	500

BRIGHT FUTURE FOR INDIA'S MANGANESE EXPORTS

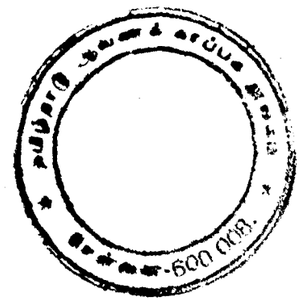
India's manganese export trade has a bright future owing to expected increase in world manganese consumption by 60 to 70 per cent in the next 25 years, Dr. A. M. Bateman, Chairman, Department of Geology, Yale University, said recently at Nagpur. He visited manganese mines in Madhya Pradesh, and stated that the deposits here were superior because they were formed as "primary" manganese minerals without being the result of consolidation and concentration on the surface.

BUILDING CENTRAL RICE RESERVE

Shri Rafi Ahmed Kidwai, Union Food Minister, stated recently that the Government of India wanted to build up a Central Rice Reserve of 10 to 15 lakh tons before introducing complete decontrol. About seven lakh tons of rice might be imported this year provided the price was "reasonable" and, together with the surplus stocks from Madhya Pradesh, Orissa and Mysore, they could build up a reserve from which requirements of deficit States would be freely met. He further stated that India had now enough rice of her own to go round and "even something to be left over". The rice production during 1953-54 would be 2 million tons more than in 1952-53 and 4 million tons higher than in 1951-52.

KOLAR GOLD CUTPUT

Gold returns for January 1954, in fine .025 were:



Company	January 1954	December 1953	November 1953
Mysore ..	6,174	5,709	6,342
Champion Reef ..	5,845	5,709	5,709
Ooregum ..	114	258	212
Nandydroog ..	5,743	3,686	4,074
TOTAL ..	17,876	15,362	16,337

FALL IN EGYPT'S OIL OUTPUT

Egypt's annual oil output has fallen by 25 per cent chiefly because of the near failure of supplies from a field operated jointly by the British and U.S. companies. Production at the Asl oilfield operated by the Anglo-Egyptian Oilfield Ltd. and the American Socony Vacuum Oil Company dropped recently from about 1,500 tons a day to about 80 tons a day. The failure of the Asl field on the Sinai peninsula between the Suez and Jordan means that Egypt will have to increase her annual oil imports from one million to one and a half million tons a year, if she is to maintain her present consumption. The two companies warned the Egyptian Government two years ago that a fall in production was to be expected because of an almost complete cessation of exploratory work for new fields.

INCREASED OUTPUT OF TEA IN CEYLON

Ceylon will shortly ask the International Tea Committee to raise her quota of tea exports so as to enable her to market her increased tea output in the current year. Ceylon along with India and Indonesia is a party to the International Tea Agreement under which Ceylon has been permitted to export 339.6 million pounds of tea for the year ending March 1954. The object of the agreement is to control production and thus ensure economic prices. Ceylon expects that her exports in the current year will far exceed the quota with a record yield on hand. Accordingly to customs returns, Ceylon has already exported 335.5 million pounds in the current tea year. Her production in 1953 was over 343 million pounds, the highest on record. In 1952 Ceylon exported 314.4 million pounds of tea from her crop of 316.8 million pounds.

Before the Budget

THE Budget of the Indian Union for the year 1954-55 is to be introduced tomorrow, February 27. The Budget Number of "The Eastern Economist" to be published on March 5 will describe the situation, so to speak, after the event. There is, however, not a little to be said before the Budget; *there* has been no year except 1946—when conditions were wildly exceptional —when the Stock Exchanges have been in this state of almost unsuppressed fervour. In the last few months, many counters in the Stock Exchanges of Calcutta and Bombay have advanced by fifteen per cent; in the case of a few, like the Textile Machinery Corporation, Calcutta, the advance has been something like fifty per cent. The economic situation has certainly improved in the last two years, but there is hardly any student of economic affairs, here or abroad, who will be prepared to admit that the improvement has been as significant as the stock market indicators would imply, or that the improvement is material to something which has happened in the last three months. The situation

is one which cries out for explanation. Are there no adverse factors to be borne in mind to restrain the bullish fervour which has taken possession of speculative activity on the Stock Exchanges?

There certainly are some factors which need a somewhat heavier weightage than they have been given. Apart from the real possibility of a downturn of between three to five per cent in industrial production in the United States, there is the significant recession in India's own production since the peak of April 1953, which is marked in the official Interim Index of Indian Industrial Production at 140.6. Figures are not available beyond October, but it is significant that there is no month after April 1953 when the figure has reached the 140 mark. The actual figures for the General Interim Index are: May 131.1; June 132.6; July 136.2; August 130.9; September 136.9 and October 133.2. It is not unlikely that for the official year 1953-54 there will be only a small increase of organised industrial production beyond the figure for 1952-53.

Against this temporary stagnancy of industrial production, there are certainly some favourable offsetting factors. The first of these is the reduction of export duties on coarse and medium cloth and a general recognition that export duties will no longer be raised, and will, in the event of increasing international competition, be lowered. The second of these is a general expectation that import duties will not now be lowered and, partly under the pressure to provide employment, they will, if anything, be raised. The fact that the agreement of G.A.T.T. has been obtained to a raising of some duties by negotiation with the countries concerned has been taken to imply that in the Budget to be introduced tomorrow, several new import duties will be levied for revenue purposes. This result is highly probable. But whether it materialises at once or not, it is certain that the Indian economy is now likely to be hedged in by more import duties and fewer, or at least less stringent, export levies.

Again, there is no doubt that as the Plan proceeds, there is to be injected in the economic system not merely purchasing power, which will help consumption, but many full order books which will greatly help production. Indian industry has always come to life in the presence of plentiful finance and full order books. In World War II, it will be remembered that it was in just these conditions that Indian Industrial Production measured by "The Eastern Economist" Index (Base August 1939=100) moved up to a peak of 126.8 in 1943-44. The war conditions are returning. The Railways in particular have placed large orders on private industry apart from the construction of their new locomotives at Chittaranjan and Telco. That this utilisation of indigenous capacity will grow is not in doubt. But there is no indication that of itself it is enough to generate larger dividends. For costs have shown an unhappy tendency to rise even faster than gross receipts.

This is abundantly illustrated in the Railway Budget which was presented last week. In the Leading Article "The Indian Railways" which follows and in a Special Article "The Railway Operating Ratio" some significant features of the management of the Indian Railways are discussed. For the present, however, it is the general result which needs to be stressed. An increase in activity does by no means imply an increase in profits. The increase in rolling stock, engines and engine-making capacity has not brought a larger net surplus either to the Railways or to general revenues. The revised estimate for 1953-54 gives the net surplus to general revenues at Rs. 3.18 crores, the lowest figure in fifteen years. And this is not because gross traffic receipts have declined. Gross traffic receipts are running at an all-time peak of Rs. 272 crores.

The truth is that, whether one is in the public or in the private sector, it is becoming extremely difficult not to pass on to labour or to salaries or taxation (now largely indirectly as, for example, on petrol) almost everything one earns. Therein lies the major weakness in India's plans. We have overcome almost every financial obstacle in the way of development. Our foreign exchange resources are abundant; notwithstanding the Finance Minister's optimism on this point, there really is no prospect in a good agricultural year of utilisation of these resources except by a greatly enhanced plan. Our internal capacity is now seen to be much larger than was assumed, making the import of capital goods a far less significant factor in our industrial progress than was previously assumed. Indian management is acquiring rich experience and a large widening of outlook, particularly in respect of public relations. Salesmanship is still weak; but it is improving. Almost the only real defect lies in this absence of incentive for the undertaking of new enterprises where the risk factor is high.

This, and this only, should be the Finance Minister's problem tomorrow. For once, the problem of the Finance Minister will not be resources. On February 5, Central Government deposits with the Reserve Bank of India stood at Rs. 93.28 crores; it is likely that this figure will continue to be the order of these deposits on March 31, 1954. It will be remembered that on March 31, 1953, the figure was about Rs. 97 crores, implying that if we have deficit financed in cash rupee terms in the year 1953-54, it will probably be of the order of Rs. 4 crores only. When we remember that our average of foreign securities in 1952-53 was Rs. 697.9 crores and for the week ending February 12, 1954, it was Rs. 740 crores, India as a whole has been in this year a net exporter of capital of the order of Rs. 50 crores. It is quite impossible, therefore, for the Finance Minister to contend that he is short of overall resources which justify any increase of taxation of any kind.

The rupee problem remains. And this will become more acute when receipts from income-tax decline as they will on assessments for the years 1952 and 1953. The remedy for this situation is true deficit financing, and not deficit financing on paper. On paper, the Finance Minister was supposed to be deficit financing to the extent of Rs. 140 crores; except for the writing down of the value of food grains by the showing of a loss on trading account, there has been virtually no deficit financing and the chances are that unless there is a radical change to allow for enterprise in public spending, there will be no deficit financing in the current year. This points to only one conclusion.

If money is really to be injected rapidly into new investment, the concentration of investment in public hands is an error. Much more must be done on the lines of the new Industrial Development Bank or the proposed Industrial Development Corporation to get private enterprise also on the job. Finance by itself is not enough though it remains for the private sector a major hurdle. There must be reasonable guarantees that the rewards of investment will be available to the risk-taken and will not be dissipated in ceaseless demands for rises in wages which can easily defeat the incentive which is needed. The only real question involved in India's industrial progress now is the maintenance of this incentive. Will the Finance Minister recognise that his problem today is not to balance his budget, or to find resources, but only to see that it is attractive to use the resources which are available? Tomorrow will show.

The Indian Railways

THE Budget of the Indian Railways introduced by Mr. Lal Bahadur Shastri on February 19 was one of the most colourless records of work that has ever been placed before an Indian Parliament. In the Minister's speech there was to be found no enthusiasm anywhere; this all too correctly reflects the broad feeling throughout this grand enterprise, in mileage the largest single Railway management in the world. There have been spectacular successes such, for example, as the great progress made in Chittaranjan, comparable in some respects to the work done on the Assam Rail Link in a previous year. It is true Chittaranjan could have done even better if some of its jigs and fixtures had been placed outside at the beginning instead of pursuing a rigid self-sufficiency which has prevented its beating its schedule as did the Assam Rail Link. Nevertheless, here was a task over which the Railway Minister and the House might have become enthusiastic. The Railwaymen all over India, with grievances enough because of wooden administration here and there, need this encouragement. There was almost no warmth to be found in the Railway Minister's speech. Much of the trouble on the Indian Railways today is that there is no imaginative and inspired leadership. The Railway Minister must take responsibility for the loss of morale among his men.

The truth is—and this should be frankly faced—that the Railway Minister is too heavily engaged on Congress party politics to be a really efficient Railway Minister. He has, it is true, a special place in Congress politics. With a reputation for integrity which is justly high, he commands, particularly in the politics of Uttar Pradesh, opportunities for effecting political compromise which are vouchsafed to no party politician other than the Prime Minister himself. It is wholly wrong, however, that the Minister of Railways should be spending so much of his time on politics, and it is wholly wrong that he should not today have a much more critical hand in the activities of his Ministry than was displayed in this Budget Speech. That the Railway Minister should have made light of the fall in traffic receipts and relatively light of the rise in working expenses arises from a simple fact that he is unable, because of his strictly amateur status, to lay his hands on the weaknesses in the technical working of the equipment committed to his charge.

Two facts cry out for explanation. One concerns receipts. The gross traffic receipts on Indian Railways have fallen in money terms from Rs. 290.81 crores in 1951-52 to Rs. 272 crores in 1953-54. It is true that of the difference, Rs. 15.01 crores represents a difference in accounting, being freight charges on Railway materials which have been eliminated from the financial accounts from 1952-53. Nevertheless, there has been a drop in gross traffic receipts of Rs. 5 crores at a time when average industrial production was about 10 per cent up, and when Railway statistics show there were 75 more engines and over 6,000 more wagons on the lines. If passenger traffic was down, it surely should have been possible to carry more freight, it being clear, particularly in respect of coal, that Railway loadings remain far from completely adequate. Even a gentle probe into the figures for equipment in terms of earnings will show that there has been a deterioration in operation in the year.

Far from admitting this fall in operation, there is a specific claim in a booklet published with the Budget papers on "Review on Working of the Regrouped Railways" that there has been an improvement. This pamphlet is a terrible distortion of the true operational picture between the two years, but it cannot help showing that on goods trains engine miles per day have been down for both broad and metre-gauge trains. It might be added that the speed of "all goods" trains has come down from 10.7 miles per hour to 10.4 miles per hour on the broad gauge, and from 9.22 miles to 9.14 miles on the metre gauge. And yet, nowhere is the conclusion drawn that operation after regrouping is worse, not better, than before.

It is significant that neither in the Railway Minister's speech nor in any of the Budget papers is to be found any reference to wagon turn-round, Hitherto every Budget speech sought to display prominently that main indicator of operational efficiency—the comparative figure for wagon 'turn-round'. The omission of 'turn-round' figures can have only one explanation. The turn-round figures have deteriorated. Therefore, they have been hidden. Members of Parliament must demand that these figures should be presented in a form which admit comparison with previous years.

The second significant factor arises from expenses. The Railways certainly can be excused for the extra expenditure of Rs. 3.15 crores arising from the implementation of the Gadgil Committee's recommendations. The benefit of merger of half of the dearness allowance in the basic rates of wages, which had been granted to other Central Government employees, could not be withheld from Railwaymen. But right through the recent years successive concessions have been made to Railway employees in the matter of wages and pay. They were made distinctly on the reasonable expectation that liberal scales of wages and allowances would certainly be repaid in the form of improved efficiency. Statistics of operations on the Railways revealed only five years back that the productivity of labour as measured by the criteria of train miles, vehicle miles, gross ton miles and traffic units recorded an astounding decline from 100 in 1938-39 to 69.38 in 1948-49. In a transitional phase when traffic receipts have commenced declining, it is surely obligatory on the Railway Ministry to launch a vigorous drive for recovery of the pre-war per capita labour productivity. How the situation now stands in relation to labour productivity is comfortably left to imagination. The omission in the Railway Minister's speech to disclose this vital fact constitutes another departure from the healthy precedent set by his predecessor in office. Parliament as well as the tax-payers must be taken into confidence on this important issue.

The extra bill of expenditure on other counts also demands more explanation than the Railway Minister has considered adequate to offer. The excess of Rs. 7 crores in the fuel bill over 1948-49 cannot be excused on the ground of additional train services. The appointment of the Railway Fuel Enquiry Committee contains an implicit admission of wasteful expenditure on coal. The last Budget Speech succeeded in putting off a probe into this excess with a promise of substantial economy pursuant to the implementation of the proposals of the Driver Committee in its interim report. The House must call for an explanation of that assurance. Of the diverse items of expenditure which need vigilance, the allocation of over Rs. 66 crores to repair and maintenance certainly requires priority. Other ingredients of expenditure are equally important. A mere expression of anxiety over the mounting trend of expenditure out of proportion to revenue surely leaves not a little unsaid.

Legislation by Ordinance

THE promulgation of seven Ordinances during a brief parliamentary recess of less than two months—including one measure of taxation—has at last proved the last straw for Parliament which had suffered for some time in silence the liberal use of the emergency powers of legislation permitted under Article 123 of the Constitution. If all the laws enacted in the last few years in the first instance through an Ordinance and ratified later by the Legislature, were viewed together, there could be no doubt that only a small fraction of the number would show the existence of reasonable grounds of urgency for their enactment in that manner. They revealed a tendency which could be regarded at best as the growth of habitual inertia in planning the Government's legislative programme for each parliamentary session or at worst, as attempts of the Executive to present Parliament with a fait accompli in each case, much restricting the scope for amendments and modification, if not of complete rejection. The most important thing to be remembered about last week's debate in the House of the People on the Government's use of the Ordinance-making powers is that it was not a premature or hasty attempt of a House jealous of its powers to take the Executive to task for trespassing on its authority. It came after a long period of sufferance, and while those who criticised the Government were unequivocal and emphatic, there was still a commendable non-partisan approach to the question.

This approach was facilitated because a division in the House on this issue was dispensed with and the Speaker's ruling showed an anxiety to establish constitutional propriety and conventions rather than to create opportunity for an attack on Government. While the two main speakers on the motion in the House—Dr. A. Krishnaswami and Dr. Lanka Sundaram—ably defended the dignity of the House against the affronts to it presented by the Executive, the strength of the case was impressively shown in the strong criticism by Mr. Thakur Das Bhargava from the Congress benches and the candour of the Finance Minister in conceding that administrative delays and lapses alone made these Ordinances necessary. The Home Minister alone proved to be an unrepentant apologist for the Government's contravention of constitutional propriety. Dr. Katju relied only on the letter of the Constitution which enabled the exercise of the powers under the safeguards provided. But it was not the letter of the Constitution that was in question. The case against the Government rested entirely on the ground that in invoking the literal meaning of Article 123 of the Constitution, it was grossly violating its spirit. That case was proved to the hilt.

Article 123 does not actually require the existence of an emergency as such. It only stipulates that either House of Parliament should not be in session and that circumstances should exist which render it necessary for the President to take immediate action, before an Ordinance could be so promulgated. It was easy, therefore, for Government to take shelter under a provision so widely worded. The power, read with the limitation that the Ordinance should cease to operate at the expiration of six weeks from the re-assembly of Parliament unless approved by both Houses, would show that an Ordinance was not a ready substitute for the normal legislative process, as indeed it could not be under the full-fledged parliamentary democracy set up by the Constitution. That the provisions were so abused as to enact a measure of taxation of the pilgrim traffic to Kumbh Mela proves the extremity of the violation. It was improper for two reasons. It made the Executive, not the peoples' representatives, decide on taxation, which is repugnant to all democratic notions and would have been reprehensible even if Parliament had been asked to approve of it subsequently. And in this case, it was worse, because there was no necessity to seek such approval at all, the measure having served its purpose during its brief career. The stark fact is that the Executive has levied taxation on its own, ostensibly on the plea of administrative delays caused in deciding upon the measure. It would be no unwarranted insinuation to suggest that the prospect of completely by-passing Parliament in such cases could prove too good a temptation to be resisted.

The precedents invoked by the Finance Minister were not relevant so far as they dated earlier than the present Constitution. The two other instances—the Hardwar Kumbh Mela and the Additional Cloth Excise Duty—only establish the point made earlier that Parliament has not been too alert in establishing its rights all along. Its earlier tolerance cannot be an argument against a move to check the increasing breach of constitutional propriety, later if not sooner. Actually, however, no rigid convention for future guidance has been drawn up on this occasion. The expression of strong parliamentary disapproval must alone restrict the extent of the Executive's resort to Ordinances in future. There can, however, be no great harm done to the smooth functioning of Government if the Executive is prevented wholly from resorting to special powers in order to levy taxation. In the other types of cases, its own sense of moderation and more scrupulous regard for constitutional propriety should be trusted to serve as guides to policy.

Opinion within and outside Parliament has even swung in favour of creating agencies for scrutiny of each Ordinance before it is sought to be promulgated. This view derives strength from the fact that what is sought thus to be circumscribed are not the powers of the President—who does not actually decide whether or not circumstances warrant the issue of an Ordinance—but of the Cabinet by whose advice he is always bound. But the effectiveness of an agency like a committee of Parliament in exercising such prior check is open to doubt. The demand of the Executive, when it comes after administrative lapses in placing measures before Parliament in sufficient time, will generally prove irresistible and a committee with an official majority cannot be expected to offer serious resistance to such proposals. At the same time, the approval by such a committee is apt to lay the flattering unction to the Executive soul and enable it to derive strength and justification against subsequent parliamentary criticism. A remedy on such lines may perhaps prove worse than the evil itself.

The Executive must be left to its own resources to avoid lapses of the kind which prevent measures from coming before Parliament in the first instance. The Home Minister had no valid excuse to offer for the Press Bill's not being placed before the Business Advisory Committee at the earlier session. In a situation of that kind, parliamentary traditions would demand a mood of humility, a plea for mercy rather than an unrepentant challenge. The oftener a Minister has to approach Parliament in such a mood, the greater would be the vigilance with which he would seek to avoid a repetition of such occasions. Last week's debate has clarified the issue and entered a timely protest. It remains for Government to take note of it and avoid exploiting parliamentary recesses to get through measures which bear no trace of urgency in any real sense.

THE WEEK'S NOTES

VERDICT ON THE BERLIN MEETING

The verdict on the Berlin Conference is bound to be a mixed one The agreement on the convening of a Conference at Geneva on April 26 is likely to be held as sufficient vindication of the view that top-level meetings are bound to pave the way for eventual understanding so long as they are not bogged down on differences over agenda and procedure. On this view, the agreement of the Western Powers to sit with the Peking Government to discuss the two specific Far Eastern questions would be regarded as a great step forward. But, at the same time, the failure to agree on a clear-cut issue like that of the Austrian peace treaty is depressing. The Western Powers went far out of the way to meet Russian demands, only to discover new objections and obstacles. Austria was prepared to secure her freedom and independence even by accepting a heavy economic burden of reparations in real terms and the stationing of Four-Power troops until June 1955. But M. Molotov's fresh counter-proposals would have involved the retention of foreign troops in Austria for an indefinite period and restrictions on Austrian freedom in foreign relations—conditions which made a peace treaty meaningless.

It is not, however, the actual proposals on Austria or the impossible conditions suggested for German unity that are so important as the feeling now created that Russian objectives have not substantially changed. There has been the same insistence on the prevention of the E.D.C. materialising, on the disbandment of N.A.T.O. and on the withdrawal of American troops from Europe; in other words, on the promotion of European disunity. Further exchanges of views among the four Powers, promised in the final communique of the four Foreign Ministers, on the questions of disarmament or substantial reduction of armaments cannot make headway so long as these attitudes are not substantially modified. M. Molotov has, however, expressed the satisfaction that there has been a correct understanding of the views of the four Powers and if he was impressed by Western solidarity sufficiently, he may be able to refrain from planning for serious tactical reverses for the Western Powers in future talks, and concentrate on exploring areas of agreement. The Conference has not, as expected, succeeded in its main objectives but it has not been a total disappointment.

CONFERENCE AT GENEVA

The Berlin Conference of Foreign Ministers began with an emphatic rejection of he Russian suggestion of a Big-Five Conference, including China, to discuss world tensions but ended with a decision to hold a Conference at Geneva, with China at the Conference table, to discuss two specific subjects now causing tension. It sounds a fair compromise and one that bypasses many ticklish issues that complicated the question of convening a Korean Political Conference. Mr. Arthur Dean's refusal to negotiate with the Communists until they withdrew the perfidy charges, and the latter's refusal to retract their statements, were not the least of the hurdles. The other deadlocked issue was the status of the Soviet Union at the Political Conference; at Geneva, Russia will not be present as a belligerent, as the U.S.A. had insisted, but as one of the Big-Four inviting Powers. Thirdly, the old controversy whether the Conference table should be round or rectangular has also been solved by ignoring all references to the two sides. All the parties concerned will now gather at Geneva, on the 26th April to consider a peaceful settlement of the Korean question. The Big-Four Agreement, however, provides only for the attendance of the Powers with forces in Korea, and not of neutrals as the Chinese and North Korean Governments have demanded. Though the United States has won its point that the Conference would not involve recognition of the Peking regime, Russia has been able to show that there is a 'quid pro quo' in this matter because she would not be recognising the South Korean and the Indo-China Associated States Governments.

The reactions in Peking to these proposals have to be watched. The definition of the term "interested" States in relation to the Conference on Indo-China has to be clarified. Even if these hurdles are crossed safely, there is no reason to feel that these two major problems would provide scope for a settlement. There is no reason to feel that Korean unity and independence will be more successfully tackled than the problem of German unity. The Conference on Indo-China would, however, meet the desire of a large number of French politicians to seek a negotiated settlement in Indo-China. The Russian intention may be to hold out the prospect of such settlement in order to destroy French willingness, where it exists, to ratify the E.D.C. and at the moment there appears to be sufficient basis for the success of Russian calculations.

ANGLO-SOVIET TRADE

The attractive opportunities for increased Anglo-Soviet trade, which M. Kabanov, the Soviet Minister of Foreign Trade, held out to visiting British business men at Moscow appear to have been greatly exaggerated with a view to proving that the ban on export of strategic materials to the Communist countries is a serious obstacle. The anxiety in Britain and indeed in Western Europe, for improving East-West trade has naturally been heightened by the uncertainties about the future level of the American economy and the dim prospects for the reduction of U.S. tariffs, despite the recommendations of the Randall Commission. But on the most optimistic calculations of the prospects for increased trade, it is difficult to see any basis for the Russian offer to place orders in the United Kingdom for 4,000 million roubles (or £400 million) in three years from 1955 to 1957. Mr. Heathcoat Amery, speaking in the House of Commons last week for the Board of Trade, estimated that rather less than half of the business proposed would be free from strategic controls. The value of even that level of trade would be about £180 million, which is quite a substantial figure. The question that arises is how Russia would finance such a high annual level of trade, which will be six times the post-war peak exports from Britain of £10 million in 1950.

It is unlikely that it would be financed for the major part by transfer of gold, though Russia holds substantial gold stocks and has already met last year's deficit by sending gold to the U.K. Russia has in the past found a ready market in the U.K. for her food grains, and exports of a million tons of grain, if she can manage it, may pay for the bulk of the imports of non-strategic British goods. The chances of such grain exports are not bright, firstly, because of the recent dissatisfaction over Soviet agricultural production and, secondly, because of the decision of the Malenkov regime to increase internal consumption levels. Britain may also have to reconsider the question of grain purchases from the U.S.S.R. in view of the present surplus in the rest of the world and the prospects of obtaining grain at much lower prices than before. At the moment, however, it is reported that £16 million worth of contracts have been signed in Moscow and that other contracts for £48 million are under negotiation. These negotiations have had official approval though they do not directly concern the U.K. Government. A better appraisal of the position is expected when the business men return from Moscow.

NEXT STEP IN BRITISH GUIANA

The reception accorded to Dr. Cheddi Jagan and Mr. Burnham at Georgetown was an indication of their continued popularity and the next few weeks would show how far the P.P.P. can agree or secure sufficient support for its programme of non-co-operation. The Governor of British Guiana has, however, made the best use of the interval in completing the plan for the development of the colony. There is no doubt that the moral of the recent events has been fully realised by the colonial administration. The difference it would now make to the development plan, which has been long talked about, must be seen in the readiness to remove obstacles placed by local interests.

The programme of development, for which Sir Alfred Savage, the Governor, has secured approval in London involves an expenditure of £9 million in the next two years—£3 million for transport and communications, £2.5 million for agriculture and forestry, £2.5 million for social development, mainly housing and £1 million for agriculture and industrial credits. It is reported that the Governor secured a wholly unexpected extent of financial assistance from the British Government. There has been an additional grant of £3,125,000 from Colonial Development and Welfare Funds and promise of facilities for loans to be raised in London up to £3,417,000. This is in addition to the resources already available (including sugar funds of £500,000) of about £2.5 million from unspent loans and general revenues. This special development expenditure has to be compared with the colony's normal revenue expenditure this year of £6 million. The plan is regarded in some quarters as too ambitious, though financially feasible. If the P.P.P. can, in spite of its sullen discontent, refrain from obstructing the implementation of the programme, or better still, offer constructive co-operation, it can make a real difference to the welfare of the people. A per capita investment of £20 in two years cannot be dismissed as a meagre or intangible contribution to the development of the colony.

STANDARDISED RATES FOR RIVER PROJECTS

The river valley projects are, like Oliver Twist, always asking for some more. The demands in Parliament for supplementary grants last week included additional amounts of Rs. 4.60 crores as Central loans for irrigation purposes. The Bhakra Nangal project alone required Rs. 6.76 crores over the sum of Rs. 23.65 crores originally allotted in the Budget; Rs. 84 lakhs was the additional appropriation needed by the D.V.C. over Rs. 10.90 crores allotted before. The net additional has, however, been smaller because of the saving of Rs. 3 crores in the Hirakud project from the original appropriation of Rs. 11.72 crores, due to difficulties that have arisen in maintaining the schedule of operations. There has, however, been sufficient ground for viewing with concern the rising estimates of expenditure for the river valley projects. The reasons for such periodical increases, which are unrelated to the pace of progress of the construction of the projects, certainly need investigation before the Planning Commission starts considering the projects to be undertaken in the second Five-Year Plan. A Committee has now been appointed by the Government to study the major projects under construction in the country and to report within three months a basic schedule of rates for river valley projects.

There has always been a great deal of underestimation of project costs at the time of the preparation of the estimates, partly because of lack of information and partly with a view to securing the immediate sanction of the Planning Commission and the Government to the inclusion of projects in the Plan and for making a beginning thereon. It is time to discover whether there is any basis for the wide variations in the schedule of rates adopted by the State Governments so that there can be an independent check on the estimates presented. If the major items can be standardised and the causes making for local variations understood better, it should be possible to regulate development expenditure, without upsetting the ways and means position of the Government constantly. The terms of reference of the Committee are comprehensive enough and its findings will be awaited with interest.

A NEW G.A.T.T. PLAN AND INDIA'S REQUEST

India's recent request for permission to re-negotiate the agreements with the contracting parties to G.A.T.T. with a view to raising tariffs may sound odd in the context of the objective of G.A.T.T. steadily to reduce tariffs. The objective, however, is to prove to the Contracting Parties that higher tariffs without import controls and quotas would be more consistent with the objectives of G.A.T.T. than lower tariffs with exchange and quantitative restrictions. The liberalisation of imports along with lower tariffs would, it is feared, injure domestic industry and cause strain on exchange reserves, whereas free imports with a fair tariff margin could make available to the consumer a variety in the quality of goods which could spur domestic manufacturers to improve standards, without causing severe competition or involving serious strain on the balance of payments. It is quite possible, however, that the actual negotiations will be difficult in cases where exporting countries fear contraction of demand because of tariff increases.

Within G.A.T.T. itself there has been an anxious search for a new approach to tariff reduction because of the weak negotiating position hitherto of the countries which have relatively low tariffs. These countries could only bind themselves to keep these low rates, which enabled the high-tariff countries also to stand firm on their own tariffs. The French plan for tariff reduction, as modified and presented at the Eighth Session of the Contracting Parties last October, proposes that all participating governments should reduce the protective incidence of their tariffs in accordance with a common standard. Mutual advantage of the Contracting Parties is to be judged not by concessions on specific items as hitherto, but by a comparison of the overall reductions under a common standard. The plan requires efforts proportionate to each country's tariff level, with an obligation not to exceed given levels on specific items. The plan is now before the individual Contracting Parties for eliciting opinion and support and it is believed that it could be put into operation when the main trading countries of North America and Europe accept it.

"Five wonderful years ! Time to build, time to create. For my child it will bring health, free schooling. For my family, security . . . may be, with hard work, a home to call our own !"

Nearly a quarter of the funds of the Five Year Plan will be used in increasing, improving and widening the scope of our Social Services. Rs. 425 crores will go to raising the standard of living of the people, training 13,000 new doctors, 20,000 new nurses and midwives. By 1956, more than 60% of all children over six years of age will be in our 2,02,142 primary schools. This long-range planning makes manifest our faith in the future. Here, indeed, is . . .

a pledge to posterity

Lakhs of tons of Steel will be used to implement the many diverse projects of the Plan. And so, in numerous significant ways Steel will provide the foundations for a richer, more rewarding future for our nation and our people.

Supply and Prices of Goods Act, 1950: The Supply and Prices of Goods Act, 1950, lapsed recently. As a result of the controls instituted under this Act in respect of non-ferrous metals, caustic soda, soda ash and sulphur cease to be operative. While Government have the necessary powers to exercise control over these under the Industries (Development and Regulation) Act, they consider that in the improved condition of availability the controls are no longer necessary and they have every hope that the conditions which necessitated their imposition will not recur.

* * * * * * *

Customs and Excise Revenue in Indian Union: According to the returns received in the Department of Commercial Intelligence and Statistics, the total gross sea and land customs revenue collected in India during the months of August, September, October and November, 1953, amounted to Rs. 1,206 lakhs, Rs. 1,449 lakhs, Rs. 1,205 lakhs and Rs. 1,336 lakhs respectively. Of the total customs revenue collections, import duties accounted for Rs. 914 lakhs, Rs. 1,016 lakhs, Rs. 901 lakhs ann Rs. 998 lakhs; export duties for Rs. 273 lakhs, Rs. 408 lakhs, Rs. 276 lakhs, and Rs. 313 lakhs and land customs and miscellaneous for Rs. 10 lakhs, Rs. 25 lakhs, Rs. 28 lakhs and Rs. 25 lakhs during the months of August, September, October and November, 1953, respectively. The total gross collection of Union excise duties amounted to Rs. 707 lakhs, Rs. 756 lakhs, Rs. 735 lakhs and Rs. 767 lakhs during the months of August, September, October and November, 1953, respectively. During the eight months, April to November, 1953, the grand total of gross customs and Union excise revenue realised was Rs. 16,572 lakhs as compared with Rs. 17,648 lakhs during the corresponding period of the preceding year. Of this amount, import duties accounted for Rs. 7,660 lakhs as against Rs. 7,941 lakhs, export duties for Rs. 2,659 lakhs as against Rs. 3,848 lakhs, land customs and miscellaneous for Rs. 171 lakhs as against Rs. 272 lakhs and Union excise duties for Rs. 6,082 lakhs as against Rs. 5,587 lakhs.

* * * * * * *

Export of Imported Goods to Nepal: The Government of India have decided to relax existing restrictions on export from India of the imported goods purchased in this country and sent out to Nepal through trade channels. Union Finance Ministry has requested State Governments of Bihar and Uttar Pradesh to issue instructions relating to movements of the goods on these lines across Indo-Nepal border. Henceforth, it is stated no customs duty will be charged on foreign duty will be charged on foreign goods at the Indo-Nepal border previously imported in India and no licence will be required under Export Trade Control Regulations.

* * * * * * *

Export to Burma: In September 1953, the Union Bank of Burma, Exchange Control Department, Rangoon, had issued instructions to all authorised dealers in foreign exchange that their correspondents overseas should be instructed not to negotiate any drafts or bills relating to imports into Burma unless the relative shipping documents were accompained by a survey report furnished by an official surveyor or a firm of official surveyors in the country from which the goods are consigned. Information has now been received that the Union Bank of Burma has suspended the enforcement of their order regarding the production of survey certificates up to March 31, 1954.

INDUSTRY

$6,500,000 Order for U.K. Electrical Manufacturers: Three British electrical equipment manufacturers—Ferranti, the General Electric Company, and British Thomson-Houston (a subsidiary of Associated Electrical Industries)—share an initial order of $6.5 million placed by a New York firm under its offshore-procurement prime contract with the U.S. Navy Department. Further orders worth many millions of dollars are expected to be placed shortly. The three firms will manufacture electronic equipment and associated test gear in the United Kingdom. It will be installed in ships and ground stations as part of the North Atlantic Treaty Organisation defence system. It is estimated that these initial orders will take two-and-a-half years to complete.

* * * * * * *

The Indian Cable Company: The Indian Cable Company, pioneers in the manufacture of Electric Cables in India, have produced a handy pocket-sized booklet, which they have named Indian Cables and Tables. This booklet which for the first time in this country brings all the technical information required by all those in and connected with the electrical trade in a handy and concise form can be rightly called a symposium of technical data containing as it does the latest tables of the Indian Specifications as they concern Copper, Aluminium, A.C.S.R., and Rubber Cables and in addition much essential information on testing installations, I.E.E., Wiring Regulations, Voltage Drop and Power Factor correction. This booklet of 60 pages is being distributed to all Architects, Builders, Electrical Engineers, Indenting and Purchasing Officers.

* * * * * * *

Commonwealth Pavilion at British Industries Fair: India will be the biggest exhibitor in the Commonwealth pavilion of the British Industries Fair in London (May 3 to 14), with a prominent site occupying 4,000 square feet. For the second year in succession the Commonwealth section—always one of the most spectacular in the Fair—breaks its own record for size. This year it will cover 12,000 square feet, as against 9,000 last year. The displays will surround a decorative and colourful centre court arranged as a spacious lounge. Making a first appearance will be the newly founded Federation of Rhodesia and Nyasaland. Canada will be exhibiting a special display of its high-grade furs and fur garments. British Guiana and most of the British West Indies islands will have a composite stand.

Twin-Twisted Steel for Building Economy: C.B.R.I.s Work: A small plant for the production of twin-twisted steel, in working condition, has been prepared by the Central Building Research Institute. The process consists in twisting two mild steel bars of equal length and diameter into one twisted unit whereby the strength and other qualities of reinforcing steel are considerably improved. By this process of cold deformation the yield strength of the ordinary mild steel is raised by 50 per cent over that of plain mild steel bars. The building regulations of almost all Western countries allow a 5 per cent increase in the working stresses of this steel. In other words, two tons of the twin-twisted steel do the work of three tons of ordinary mild steel. A saving of one-third of reinforcing steel can thus be obtained. A capital expenditure of approximately Rs. 50,000 is usually required for the plant producing twin-twisted bars. Through a simplification in this production process, the Central Building Research Institute evolved a small plant of simple equipment made in a local workshop for a cost of less than Rs. 2,000. This opens up the possibility of making twin-twisted bars with small capital expenditure so that the process could be used on all major construction jobs with a considerable saving of steel.

FINANCE

Devaluation of the Piastre: Indo-China's banks recently suspended transfer of money abroad by French military personnel, according to authoritative financial sources. The sources made the statement following current reports that the French Government contemplated a new devaluation of Indo-

China's piastre. The sources said they did not know why army transfers had been temporarily interrupted. Civilian funds continued to be transferred as the exchange control service received the order to block only army funds, the sources stated. French official sources denied that the Government contemplated any new devaluation. The last devaluation took place on May 11, 1953, when the piastre fell from 17 to 10 francs. It hit all classes of Indo-China's population and had serious political consequences.

Shroff Committee to Submit Report in April: Mr. B. T. Thakur, Member of the Shroff Committee, said recently that the Committee would be submitting its report early in April. The Committee was appointed by the Reserve Bank of India with the approval of the Government of India last October to examine how increased finance could be made available to the private sector of industry through sources other than those which were under the consideration of Taxation Enquiry Committee at present. In particular, the Committee would examine the possibility of providing on a larger scale bank finance for development in this sector. Mr. Thakur said that the Committee already had four meetings, one each in Calcutta, Delhi, Bombay and Bangalore. The final meeting of the Committee would be held at Madras during the next two days. Headed by Mr. A. D. Shroff, the Committee includes, besides Mr. Thakur, Mr. V. Joshi, Mr. S. Anantharamakrishnan, Mr. C. W. Middleton, Mr. V. R. Sonalkar and Mr. B. K. Dutt.

* * * * * * *

Afghanistan to Invite Foreign Capital: The Prime Minister of Afghanistan, Mohammad Daud Khan, said that his Government would encourage foreign capital to mix with Afghan capital within the framework of suitable regulations and laws. It served no purpose for a nation to have its doors closed to foreign help, he said. The Prime Minister, who was addressing a meeting of the Chamber of Commerce said that for making progress, co-operation and mutual help from other nations was necessary. He advocated an economic policy which promoted production and gave all classes just advantage.

AGRICULTURE

Coconut Pest Control: India has been selected as one of the countries for a research project for the biological control of insect pests which cause damage to coconut palms, it was announced recently. An expert from the Indian Agricultural Research Institute in New Delhi, Mr. T. V. Venkataraman, has been appointed as entomologist in this research project. Mr. Venkataraman is to establish a laboratory in the main coconut area in South India to study factors which determine the population levels of some of the coconut pests in India with special reference to possible biological control by means of parasites, predators or diseases which can be transferred from India to the Pacific. The research project is expected to produce results of value not only to the Pacific region but also to India, which has a large acreage under coconut palms.

* * * * * * *

Agricultural Experts Meeting: Meetings will be held at Jalsalmer House in New Delhi from Tuesday for three days between the Agricultural Experts of the U.S. Technical Co-operation Mission and officials of the Union Ministry of Food and Agriculture, the Community Projects Administration and the Ford Foundation to discuss ways and means for more effective assistance in agricultural development in India. The subjects proposed to be discussed at the meetings will deal with plans for propagating the Japanese method of paddy cultivation in 1954, the country's agricultural productivity in relation to its population, agricultural research, extension and education programme under the Ministry of Food and Agriculture, improving the efficiency and increasing the utilization of T.C.M. assistance, fertilizer research and demonstration, and agricultural information and audiovisual aids.

* * * * * * *

Food Cultivation on Rubber Estates: The Ceylon Government has decided to enforce food cultivation on all rubber estates of 35 acres or more. Tea estates already come under this order. Food production on rubber estates was enforced during the last war but stopped in 1949 because of uneconomic rubber prices. Estates unable to cultivate the prescribed 12 per cent with food crops can instead contribute Rs. 10 an acre to a food production fund.

* * * * * * *

Indian Agriculturists Start Farm Operations in Ethiopia: A team of eight Indian agriculturists recently arrived in Ethiopia to start experimental farming on Ethiopian soil. This batch of Indian farmers is the vanguard of a team of 20 Indian agriculturists, who according to existing plans, are expected to start agricultural operations in this country in the near future. Two of the eight men are graduates from an Indian University and have already had experience of scientific farming in India. Out of the rest, one is a carpenter and another a blacksmith, besides being experienced farmers. The average age of these men is 30 years. The agriculturists are financing the scheme themselves, and land is being allotted to them by the Ethiopia Ministry of Agriculture.

MISCELLANEOUS

U.S.A. to Equip Thai Forces: Thailand will soon have an American-equipped home defence force as a second line of defence force to her regular armed forces. A Bill passed by the National Assembly authorizes the Government to recruit persons between the ages of 18 and 55 who are not already connected with some form of military or police duties in the new force. To be known as the Territorial Voluntary Defence Force, it will be a purely voluntary organization with an allowed strength of up to 100,000. The strength of the regular army is about 60,000. There were reports recently that the Government was planning to double its regular army strength in view of the menacing international situation along her borders. These reports, mainly emanating from outside, have been unofficially denied. The plan to raise a voluntary defence force which will, in effect, be a home guard in peace-time and become automatically part of the army in war-time or any threatened aggression against the country, was perhaps behind the foreign reports of an expanded army. The Thai Government has asked the U.S. Government to supply the latest arms and equipment to the volunteer defence force. The Government plan is that the voluntary force should be so trained and equipped that it will not be inferior to the regular army in any respect. But it has been explained that arms will not be issued to the force except as part of its training.

* * * * * * *

U.N. Railway Training Centre in Lahore: Britain, France, U.S.A., the Netherlands and Japan are contributing equipment to a United Nations Railway Training Centre now being established in Lahore, Punjab (P), the Treasury announced recently. Government manufacturers of Britain are giving 26,000 worth of modern signalling equipment. Supply of batteries and cable is also being considered. The centre is a joint venture by the U.N. Technical Assistance Administration and the Economic Commission for Asia and the Far East (E.C.A.F.E.) and it will give training in the latest methods of operating railways for students from all the countries which are members of the E.C.A.F.E. Half the cost of the signalling equipment is being borne by the British Government under the Technical Co-operation Scheme of £2,000 million six-year "Colombo Plan" for the economic development of South and South-East Asia. The Pakistan Government will provide buildings for the centre. Mr. R. E. A. Rogers, Deputy Chief Signal Engineer of the British Transport Commission, has been appointed principal lecturer for the centre.

NEWS IN BRIEF

INDIAN

Further grants and loans amounting to about Rs. 195,000 have been sanctioned by the Government of India for the development of handloom industry in the States of West Bengal, Orissa, Uttar Pradesh, Saurashtra, Ajmer and Madhya Bharat.

* * * * * * *

According to a Commerce and Industry Ministry Press Note, controls instituted under the Supply and Prices of Goods Act 1950, in respect of non-ferrous metals, caustic soda, soda ash and sulphur will hereafter cease to be operative with the lapsing of the Act last week.

* * * * * * *

Shri G. D. Birla, a prominent Indian industrialist, has offered a donation of Rs. 14,00,000 to the Chief Minister of West Bengal, to establish an agricultural college and hostel in West Bengal. The proposed college will, it is learnt, be located in Haringhata, where the State Government already has a dairy agricultural farm.

* * * * * * *

Negotiations for the sale of 6,00,000 tons of surplus Burma rice to India are reported to have been concluded. The sources said that this rice will finally settle Burma's financial debt to India. The debt represents the assets of the Government of India transferred to Burma on its separation in 1937. Both in Government and private circles there were fears that the non-sale of surplus rice may affect the new crop and lead to economic hazards in Burma.

* * * * * * *

Miners numbering 4.5 million will down tools from March 1, unless the Government of India announces a Conciliation Board for adjudicating their various demands. Strike notices have already been served on more than 50 per cent of the thousand collieries in India. The demands of the workers include increase in pay and dearness allowance, introduction of grading system and other service amenities.

* * * * * * *

The All-India Khadi and Village Industries Board has planned to spend Rs. 12 crores this year for development of khadi and small-scale industries all over India. The Board is expected to receive Rs. 3 crores from the mill cess fund for intensifying khadi production. It is believed that the serious rural unemployment situation could be counteracted to a great extent by intensification of khadi production and expansion of cottage industries.

* * * * * * *

The Ministry of Works, Housing and Supply has examined slum-clearance schemes submitted to it by several States, most of whom, however, are understood to have urged subsidies and not loans to implement them. The Planning Commission had suggested in its report that out of a provision of Rs. 38.5 crores for housing schemes during the period of the Plan a certain amount should be set apart every year for acquisition and demolition of slums.

* * * * * * *

The Government of India have set up a Committee to inquire into all aspects of three plantation industries—tea, coffee and rubber. The Committee will investigate the ownership of the industries, character and volume of capital invested, cost and methods of production and the financing and marketing of industries.

THE COURSE OF EVENTS during the Second World War revealed the subservience of the Malayan Communist Party to Moscow and also created conditions in Malaya favourable to the growth of any party with social disruption as its target. In common with Communist parties in all countries, the M.C.P. opposed the war at first and fomented labour unrest in the tin and rubber industries. When, however, Germany attacked Russia in June, 1941, the M.C.P. like the Communist Party of India, suddenly saw how wrong it was to aid Hitler, and after the Japanese invasion of Malaya in December, 1941, offered the Malayan Government all-out co-operation against the "common" enemy. The offer was accepted but neither then nor afterwards when the South-East Asia Command (S.-E.A.C.) had established contact with the Chinese Communist guerillas in Malaya was there any political agreement. Co-operation was purely military throughout.

During the interval between the Japanese surrender in 1945 and the first landing of Allied troops in Malaya, the Communist guerillas appointed themselves guardians of law and order and represented themselves as having defeated the Japanese single-handed! Although a number of fighting units carried out their peaceful administrative tasks reasonably well, armed gangs gained control of many districts and lawlessness was general. This lost the Communists much of the respect and good will that they had gained by their resistance during the occupation, and their influence then, as now, became limited chiefly to rural areas on the fringes of the jungle.

The Communist guerillas made a show of co-operation during the months of the immediate post-war military administration, but it was clear from the outset that the M.C.P. had its own aims. During this period there was no restriction on the formation of associations and the Malayan Communist Party was a legal entity along with the other political parties then being formed. From the moment of the Japanese surrender, the M.C.P. turned its attack on the government. Existing problems were exploited, and new problems deliberately created in hopes of discrediting, weakening, and finally overthrowing the administration. Working through the newly developed trade union movement, the Communists tried to paralyse the vitally important tin and rubber industries. That the majority of the country did not sympathise with them is clear since, despite all the Communist efforts and despite all the ready-made difficulties of those chaotic early post-war days, Malaya made a remarkable recovery. Communications, public utilities, and social services were restored, adequate food supplies were secured, public health improved, industry rehabilitated, and production rose steadily. Moreover, the inauguration of the Federation of Malaya, in February, 1946, was an appreciable step in political progress.

When the Communists realised the failure of their "constitutional" campaign, the M.C.P. began early in 1948 a campaign of violence and terror, accompanied by increased labour troubles engineered by the Communist-controlled Pan-Malayan Federation of Trade Unions. This resort to terrorism was no sudden snap decision, for the M.C.P. had been secretly preparing for revolution for a long time. Arms and stores, some dropped by S.-E.A.C. during the war, had been hidden away, methods of mobilisation had been worked out in detail, and a net-work of jungle camps built up all over the country.

COMMUNIST REVOLT PLANNED IN CALCUTTA

The revolt in Malaya, as well as that in Burma and Indonesia, followed three now notorious conferences held in Calcutta between February and March, 1948, attended by delegates of the Communist parties of Malaya, Burma, Indonesia, and the U.S.S.R. One hopes that Pandit Nehru's government would today be more alive to the dangers, as well as the impropriety, of allowing foreign Communists to meet on Indian soil to plan revolutionary coups in neighbouring countries.

In Singapore, as a prelude to armed revolt, the Communists aimed to close the port by strike action, to paralyse transport and essential services, thereby confining the army to Singapore, and generally to create merry hell in the city. The Communist D day was to have been a mass public meeting and a procession of 100,000 on May day, 1948. The authorities, handicapped as ever by liberal ideas of democracy in their dealings with revolutionaries, were ready to allow the public meeting but not the procession which would have been beyond the capacity of the police to control. The Communists threatened to hold both the procession and the meeting, but my authority for these facts says cryptically, "prompt police action forestalled them", which I translate as meaning that there were wholesale arrests.

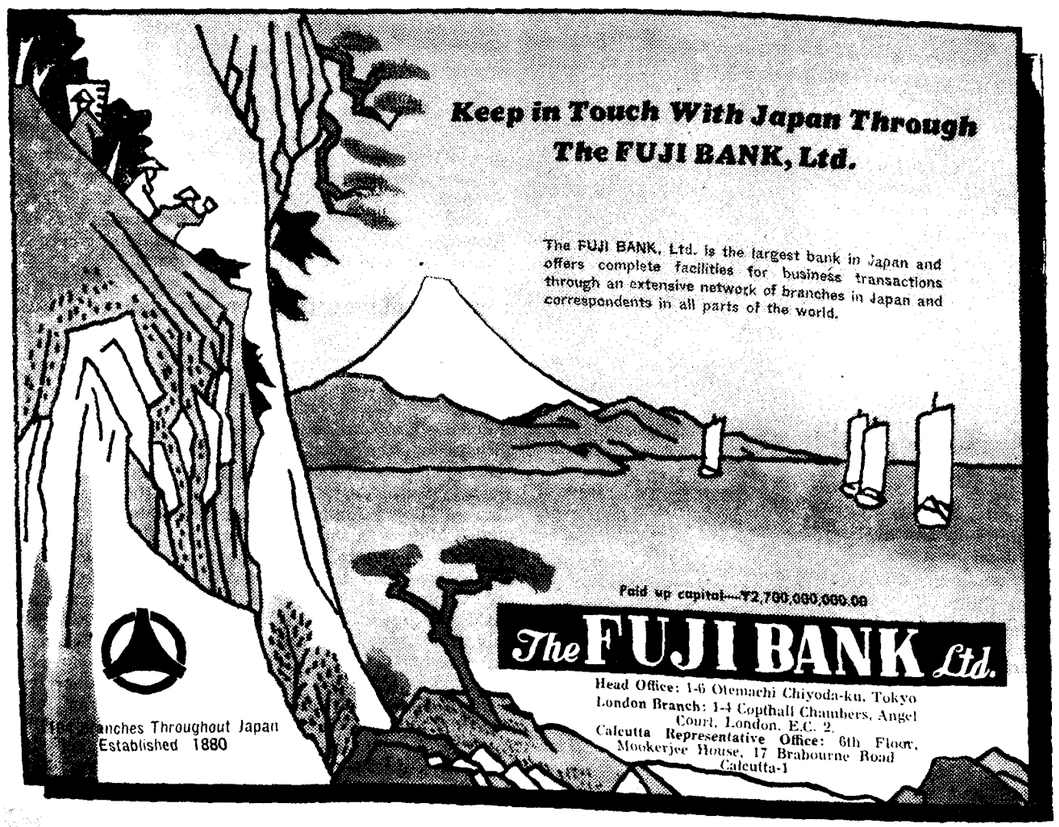
In the Federation, violence increased and many strikes were engineered on the rubber estates and in tin mines. Captured Communist documents and published manifestoes have shown that the aim was the complete disruption of industry and the administration and the establishment of "liberated areas" from which the campaign could be extended to the whole country. The Communists planned to bring these nucleii of a Communist state into existence by August 3, 1948. On June 16, however, after the murder of three rubber planters in Perak, the Federation government proclaimed a state of emergency and the next day the police carried out extensive raids on M.C.P. offices in all parts of the country. Estate workers and planters formed themselves into local constabularies for self-protection, and on June 18, 1948, the state of emergency was extended to the whole Federation.

REMARKABLE COMMUNIST ADMISSIONS

Documents, statements, and acts, all show that the campaign of terror let loose by the Communists in Malaya is part of the general offensive being waged throughout Asia by militant Russian-directed Communists. Only in tactics dictated by purely local conditions does the campaign in Malaya differ from Communist activity elsewhere in Asia. Communist directives to South-East Asia published in the "Cominform Journal" dated January 27 and September 1, 1950, included Malaya in the general order to all Asian peoples to continue and to extend the armed struggle. Communist terrorism in Malaya is in line with, and helping out, Communist policy elsewhere. A remarkable M.C.P. document passed by the Central Politburo in July, 1949, says: "To achieve victory, it is necessary that our party (the M.C.P.) should go a step forward in thought, in politics, and in organisation, to become a political party of militant Marxism and Leninism of iron discipline, with all the comrades unified under one line of action, one will, one discipline, combining themselves into a solid entity.....Today, we admit that there are weaknesses in our party, but the most

important weakness is that generally our party members and workers do not have a sufficiently strong party character. This lack among many of the Malayan terrorists can be explained by the fact that large numbers of their rank and file are either professional thugs (sic!) or illiterate youths, pressganged (sic!) into their ranks: knowledge of, or interest in, Communist ideology is not the guiding principle of either group." The end is naturally represented as worth all the difficulties, struggle, and sacrifice involved, for, says the document, "Communist enterprises are the greatest enterprises in human history".

Another recurrent theme found in captured terrorist documents is the admission that popular support for their aim of establishing a Communist dictatorship in Malaya is lacking. That they recognise this does not deter the terrorists from adopting the usual Communist practice of describing their forces as the "People's Liberation Army", and attempting to carry out their self-appointed mission by extortion and intimidation, by the destruction of property, and by the indiscriminate murder of men, women, and children, alike.



All the evidence suggests that the terrorists in Malaya do not represent a national movement. General Sir Gerald Templar said on June 19, 1953: "The leaders and members of the Communist terrorist bands are alien Chinese. Of 3,045 terrorists killed since 1948, 2,485 were Chinese. The Communist propaganda claim to lead a 'national movement' is refuted by the wholehearted support which the Malayan people are giving to the Federal government. Today, in the Federation, one-third of the able-bodied male population are voluntarily giving their services to part-time security forces, auxiliary police, home guards, and similar organisations. In a population of some 5,500,000, more than half of whom are under 21 years of age, this voluntary effort of some 400,000 is striking testimony to the falsity of the Communist claim."

And it is thanks to this lack of enthusiasm for Communism that the Malayan Government has been able gradually to restore the over-all political and economic situation to within measureable distance of normal. It remains true, however, that large and costly security forces have to be kept up to protect the great majority from the tiny Communist minority. If, as I said last week, the huge sums required for this purpose could be released for productive investment, the Malayan standard of living would be the highest in Asia and would bid fair to cut a respectable figure in the world scale.

I would not dispute that the blame for impeding economic prosperity and for delaying political progress in Malaya must be laid at the door of European Western Imperialism. I hope, however, that this week and last I have said enough to raise doubts as to whether the building into which the door leads is in London or Moscow.

CORRECTION FROM MINNESOTA

In bringing to your notice on November 20, Dr. Werner Levi's first-rate book "Free India in Asia" (Minnesota University Press, 1952), I said: "I regret that I have not the pleasure of Dr. Levi's acquaintance but I picture him as judicious and unexcitable, with a dispassionate gaze from steady and penetrating blue eyes." Dr. Levi writes to me: "Let me correct you right away—my eyes are not blue but dark brown.... I have practically no hair left and I can get very excited when I am advocating a point...." I may have been wrong about the colour of Dr. Levi's eyes but you will observe that he does not deny their steadiness or penetration. It is encouraging to note that this column is read with such scholarly care in America's spectacular North Star state.

LETTERS TO THE EDITOR

PANDIT NEHRU, THE COMMUNISTS AND THE COMMITTEE FOR CULTURAL FREEDOM

Sir,

May I avail myself of your columns to explain the response of many members of the Indian Committee for Cultural Freedom to recent statements of the Prime Minister on communism in India?

The Congress for Cultural Freedom came into existence with certain pusposes, one of which was the dispelling of some of the confusion prevailing among considerable sections of the intelligentsia about the real nature of totalitarian communism.

We in this Committee have been only too painfully conscious of the fact that we have functioned during the past three years of our existence in an uncongenial climate of thought and emotion. The progress that we have undoubtedly made has been against heavy odds. It has been no joy to us to find that from time to time we have been forced to disagree with some of the intellectual attitudes and pronouncements of the Prime Minister. Rather, it has been a matter of infinite sadness to us to be compelled to part company intellectually with one whom we recognise as being unquestionably the greatest single personal force in this country. It has never been easy, and has always been unpleasant, for us to adopt a critical line towards some of his politics. Believing as we do, however, that the evil of totalitarianism exemplified by the international communist movement and the Communist Party of India is the greatest menace that our country faces today to its national independence, its physical security and its way of life, we have had no option but to adhere to a position of uncompromising hostility to this evil, whatever the cost. It has been hard in this uphill task not to have had the support of those who should have been on our side.

In this context, it has been a source of great encouragement to many of us to read about the vigorous and hard-hitting campaign which the Prime Minister recently undertook in the beleaguered State of Travancore-Cochin. An analysis of Pandit Nehru's various statements shows that he attacked the very fundamentals of communism. The main charge levelled by the Prime Minister against the Communists was that they owe allegiance to a foreign power and are out to disrupt the unity of India. "The Communist Party", he charged, "leans or depends on, or looks to, foreign countries". He accused the communists of "going about posing as if they are Russians....Their body was in India but their mind was somewhere else....The communists have no roots in our soil. Their slogans are born in some other country....The communist policy changes a great deal, but one thing remains constant, and that is that their entire thinking is based on something outside India....The capacity of the Communist Party to condemn everything done in India and acclaim only those done in Russia or certain other countries was something ununderstandable".

The Prime Minister instanced the use of the Soviet flag as a symbol of this extra-territorial nature of the Party. "Look at their flag", he observed; "they have copied the Russian flag. Very extraordinary....My mind fails to grasp why that flag should be imported to India and displayed here as a party symbol....They have insulted the country by adopting a foreign flag".

Moving on from this, the Prime Minister drew the only possible conclusion when he said: "Their policy indicated lack of allegiance not only to the national flag but to the conception of India itself." He warned his listeners: "If you follow the communist policy, I am sure the unity of India will be shattered."

Other aspects of communist policy and practice in regard to which the Prime Minister did not mince his words were the unswerving adherence of the communists to a belief in violence, the mendacity of their propaganda, the vulgarity of their "Cultural Front" and the reactionary nature of the Party's stand. "Their principles which apparently govern their mind and action not only do not exclude violence but deliberately include violence," he asserted. As an example of their mendacious propaganda, he cited: "The communists will go on saying: 'We are sold to America'. A worse bit of nonsense I cannot imagine." Mr. Nehru condemned the methods adopted by the Communist Party in its election propaganda which he considered to be vulgar though they proceeded as part of what was called a "Cultural Front".

Mr. Nehru deplored the tendency among some people "to reduce our public life to a level of vulgarity". He said that he heard about a "Cultural Front" of the Communist Party here with so-called plays, etc....'I am told that I am supposed to appear on the stage and I am described as 'pot-bellied'." He had no complaint against caricature, but it should not go beyond fair and justifiable limits. "To reduce our public life to the level of vulgarity is a very dangerous thing."

Mr. Nehru rightly accused the communists of having "degraded" political life. He accused them of having become reactionary. "The Communist Party, as a thinking party, has stopped twenty years ago....The Party has almost arrived at a stage of static reaction".

Finally, Pandit Nehru came to the conclusion, not unjustified by all that he had said above, that "the whole basis of the Communist Party is all wrong".

We are particularly happy to welcome these pronouncements because it has been no pleasure to us to be critical of earlier ones emanating from the Prime Minister. Whatever the immediate result of the electoral contest in the State of Travancore-Cochin may be, these categorical statements—coming as they do from a person of the Prime Minister's stature in the eyes of his countrymen—are bound to have a far-reaching effect on the minds of the people and play their part in tilting the balance in favour of democracy and decency. It is to be hoped that the implications of the truths to which attention has thus forcefully been drawn will become increasingly clear to larger and larger numbers of men and women and that there will be greater readiness to grapple fearlessly with the greatest moral issue of our time.

There can be little question that, if the Prime Minister were to continue to give the country a consistent and uncompromising anti-totalitarian lead, the threat to the country's integrity and free way of life would within a year be reduced to negligible proportions, for it is at this high level that we rate the influence of Jawaharlal Nehru on the mind of our people.

Yours faithfully,

M. R. MASANI.

BOMBAY,

DIRECTIVE PRINCIPLES: A JURIDICAL PROBLEM

Sir,

The appointment of the Prohibition Enquiry Committee by the Andhra Government has started the controversy whether any State Government has got the right or option to go back on a Directive Principle of the Constitution which had already been implemented. The forthcoming discussion is intended to understand the true constitutional and juridical principles involved by 'a' priori' reasoning and not by any means to discuss the merits of Prohibition.

It is stated explicitly in Article 37 itself of our Constitution that no Directive Principle shall be enforceable by any court. It seems to follow axiomatically, therefore, that any State's handling of any Directive Principle, inclusive of its right to follow it or retrace its step, is a matter concerning its autonomy, so long as the Constitution is not otherwise violated. If the State has the option to adopt a Directive Principle it has an equal right to delay to follow it, or not follow it at all. Even the Centre has no power to compel any State to follow it so long as Parliament does not enact any Union legislation on the matter.

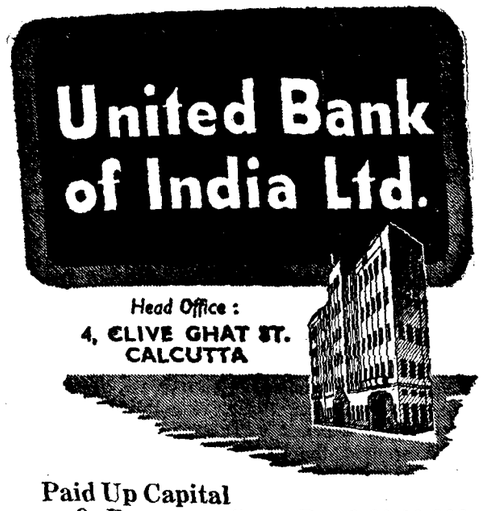
In making the local law on Prohibition the State could be said to have made it by applying the Directive Principle as envisaged in Article 37 and not in pursuance of any Fundamental Right as such. Its reversal of policy can at the worst be said to offend a Directive Principle but not a Fundamental Right.

It is altogether a different matter if in the reversal of its policy the State offends any Fundamental Rights embodied in the Constitution in explicit terms. In this context, we have before us the judgment of the Supreme Court in Madras State vs. Champakam Dorairajan in which it has been held that the Directive Principles cannot override the Fundamental Rights and had to be subsidiary to the latter. Failure to follow, or a reversal of the following of, a Directive Principle cannot indeed amount to a breach of a Fundamental Right, which alone could attract the court's jurisdiction. Here it may be contended that even in Article 37 it has been stated that though the Directive Principle could not be enforced in a court of law, such a principle is, nevertheless, fundamental in the governance of the country. True. While it is accepted that a Directive Principle lacks the enforceable sanction as in the case of the Fundamental Right, what the State does when going back on a Directive Principle is a repeal of its own earlier legislation based on that principle and this could not be tantamount to offending any recognised Fundamental Right.

Again, the State (the Centre as well as the States) has not followed many Directive Principles yet. If the courts of law cannot take cognizance of this fact to enforce compliance, it seems to follow that they cannot interfere at any stage in the working (or repeal) of any local law either, so long as the question involved is one relating to a Directive Principle and not a Fundamental Right.

Nowhere in the Constitution is it laid down that having once chosen to follow a Directive Principle any State stands committed to it for all time and has no option to retrace its steps according to the exigencies of its own position and without violating other provisions of the Constitution. There are no provisions in the Constitution relating to a breach of the Directive Principles, which are only highly recommendatory but not absolutely mandatory.

Instances where States' legislations have been clearly repugnant to the spirit of the Constitution had been cured by other constitutional provisions themselves (e.g. tax on Essential Goods) when the President's assent was obtained for the continuation of the old law. Going back on a local legislation or executive action for which the foundation was a Directive Principle may be repugnant to the spirit of the Constitution, but the cure for it has not been prescribed, inasmuch as it could not be proved that the breach in itself invokes the jurisdiction of the courts by transgression of any enforceable provision of the Constitution.



In the foregoing discussion I do not wish to be understood as championing the cause of the several States to recall any measure taken in furtherance of a Directive Principle, for such a thing would indeed be undesirable. What I was concerned with was the purely juridical question.

Under the circumstances, I feel that instead of waiting for anybody to take up the matter to the Supreme Court, the President could be moved to refer it to the Supreme Court for its opinion under Article 143 of the Constitution, as this is a question of far-reaching constitutional importance and serious repercussions, good or bad. In Madhya Pradesh, the recall of Prohibition in one area is already an accomplished fact. We do not know what Andhra will do. Other States are watching avidly.

Yours faithfully,

A DELHI DIARY

CANADA AND INDIA

IT has been a full week in Parliament and out of it. In Parliament the highlight was taken by the Prime Minister's speech on Monday which contained what has been described as "an earnest appeal" to the powers concerned for a cease-fire in Indo-China. Outside the House, the spotlight has rested on another Prime Minister. Mr. St. Laurent, the Prime Minister of Canada, arrived on Sunday and has been busy throughout the week meeting people of every kind. His address to both Houses of Parliament on Tuesday was one of the most impressive addresses which has been delivered to a joint Session; there is no doubt that the Canadian Prime Minister has scored a notable triumph in this, his first official visit to India. His obvious sincerity, his agile and responsive mind, and his sense of destiny, which he shares with India's Prime Minister, have all been factors in making his visit to New Delhi memorable.

Members of Parliament have been discussing in various terms of appreciation the wise, and yet friendly, manner in which India's foreign policy was placed in perspective with that of Canada. Mr. St. Laurent referred to the difference in approach between Canada and India whilst stressing the point that Canada respected India's attempt to refrain from international commitments. It was noticed that the word "attempt" looked like receiving some little prominence. The tribute to the United States "as the most unselfish country" and as a great and dynamic nation whose "only ambition was to live and let others live in mutually helpful international intercourse" was read, not unnaturally, as a rebuke to anti-American sentiment here. Again, on colonial issues, Mr. St. Laurent referred to the point that, while Canada welcomed the advance of all dependent peoples to self-government, she believed in a gradual process of change in the interest of firm foundations. Thus, while there were several complimentary references to India and in particular to the "splendid services of General Thimayya and the Indian Custodian Force in Korea", most members of Parliament were not slow to see that Indian foreign policy had not won from the Canadian Prime Minister any full and ungrudging support. It was good, however, that he spoke as he did, for any other speech would clearly have lacked that fine sincerity which has been his major asset in arousing warm feelings amongst the people he has met.

THE KUMBH MELA AGAIN

The Kumbh Mela was back in the fray on Monday. And on this occasion it served to provide at least one unusual bond between Orthodoxy and Secularism. Mr. Purshottamdas Tandon spoke with feeling which surprised not a few people (including my innocent self!) who thought that his orthodoxy necessarily implied approval of the Mela. What he said made us sit up sharp on our hard wooden seats. It ran as follows:

> "The Kumbh Mela is a great superstition because the people who went there thought that by taking a dip or two in the Ganges, they would go to heaven. This is a fantastic belief and has nothing to do with Hindu culture or religion. Hindu culture clearly lays down that anything opposed to intellect and reason is opposed to culture and religion. Let all people, be they Hindus, Muslims or Christians, take note of this, that whatever is against reason is against religion."

The Prime Minister was in a happily approving mood. He said: "If I may say so" (an opening phrase not unusual in his discourses!) "I am in full agreement with what my friend, Mr. P. D. Tandon, said just now about this business of people imagining that their fate or the country's fate is governed by the planets or the sun or the moon or washing away their sins in the Ganges and that kind of thing. I do not want to shock anybody's faith or to pain them, but perhaps many members know that I seldom allow an opportunity to escape of saying something about astrologers and their like. I think they are a most undesirable crew and they do harm to the country". The Prime Minister then went on to proclaim that the only way to fight "political and economic superstitions" was to increase the temper and climate of science and that is why the best thing that the Government has done was to establish national laboratories. It was not, to my mind, a very adequate index of the good that the Government has done. Is the best not often the worst enemy of the good?

THE RAILWAY BUDGET

State Budgets have been plentiful this week. They are coming in from everywhere and all seem to have one feature in common. They are all deficit budgets! The Central Railway Budget, by no means a happy document on its own account, can at least claim to be exceptional in that it was India's one and only surplus budget last week. The Railway Minister failed to exploit this significant claim to distinction. He seemed apologetic on the whole record; when the coffers of almost every State showed so much emptiness, might he not have claimed the virtue of being at least the best boy in the class?

The Council of States was in a critical mood on the budget. Its Railway expert, Pandit H. N. Kunzru, who has been on more Railway Committees than any man in India (dead or alive!), found that an analysis of the figures provided by the Railway Minister had not shown that the railways were working efficiently or that regrouping had enabled them to maintain old standards. Mrs. Lilavati Munshi was (as usual!) keen on greater facilities for cheap refreshments via the All-India Women's Food Council. Prof. N. G. Ranga was keen on the revival of the post of Chief Commissioner. He was obviously right, but what was the suggestion in the remark that "it was incomprehensible that such highly paid officers as members of the Railway Board would not courageously give their opinions because the Railway Minister presided over the Board?" Was the reference to the need of subduing one's opinion in the presence of a politician, or merely to the magnitude of the gap which exists between a (full-fleged!) Minister and a mere member of the Railway Board? It is difficult to believe that there is any general fear of the Railway Minister or his Deputy; and, in any case, there seems to be no means of avoiding contact with either merely by making the Chief Commissioner President of the Board's meetings.

ELECTION RESULTS

Last (but not least!), New Delhi is in a state of some little suspense while waiting for the results of the Tranvancore-Cochin and Pepsu elections. At the time of writing, results in Pepsu have been declared in 14 seats, of which the Congress has won 10. There is naturally elation in the Congress camp. But have the Congress election arithmeticians recognised that their party has only obtained 140,893 votes out of 313,679 cast? The Congress score remains 45 per cent; it is the only constant factor in a changing world. There has been no growth in popularity; only it seems the fortunate operation of the election law of the cube!

ARGUS.

SPECIAL ARTICLES

THE RAILWAY OPERATING RATIO

THE Railway Budget for 1954-55 cannot fail to focus attention on one fundamental source of concern over the management of railway finances in the years to come. It relates to the persisting tendency of working expenses to rise with little or no expansion in gross receipts. The deterioration on the expenditure side since the commencement of the Five-Year Plan is reflected in the tendency of the operating ratio to go up. The operating ratio, which represents the proportion of total working expenses to gross earnings and measures the balance left over for payment of interest on capital and appropriation to net profit, has shown a rapid increase from 77 per cent in 1951-52 to 82.2 per cent in 1954-55. The ratio of 77 per cent is high and it exceeds the maximum operating ratio of 76.22 per cent reached in 1921-22 during the period between 1900 and the commencement of the last war. The urgency to bring down the operating ratio dictates strong control on expenditure in view of the impracticability of pushing up revenues. In the order of priorities, the next important factor in railway finance is the fall in traffic earnings.

The downward trend in traffic earnings has introduced a new element of rigidity in the pattern of railway finances. The fall in revenues was considerable in 1952-53. But apprehensions that it would pursue a still worsening course have been warded off. The behaviour of traffic since then has shown that the process of decline may be presumed to have ceased. This is, however, a negative conclusion and in the positive context it is safe to assume that railway revenues will be stabilised, for the present, at the current year's level or slightly above it. Nevertheless, it does not alter the fact of inflexibility which has been imparted to the financial operations of the railways. The budget estimates for 1954-55 have corroborated this trend and it is hardly surprising if they do not contain any assurance that it would be reversed.

The major components of the budget estimates for the coming year set out in the table below disclose only a marginal variation in gross traffic receipts as compared to the current year. The increase anticipated in passenger earnings is negligible, while the fractional increase in gross earnings is attributable to receipts from goods traffic. The demand for goods traffic is being sustained by the progress in industrial production and the improving outlook for agriculture. The rising trend of this demand can reasonably be expected to continue, but passenger traffic is unlikely to disclose any assurance of increase. The peak has been passed and it would appear that the incentives to travel offered by the Railway Minister in the form of various concessions in fares constitute an endeavour to consolidate the position. A word of explanation is necessary, in parenthesis, in respect of the traffic earnings for 1952-53. The real magnitude of the shortfall is not as great as is apparent from the figures in the table inasmuch as quite a substantial part is accounted for by the new procedure adopted in that year to eliminate inter-railway transactions.

MAJOR COMPONENTS OF RAILWAY FINANCES

(Rs. in crores)

	1951-52	1952-53	1953-54	1954-55
Gross traffic receipts ..	290.82	270.56	272.00	273.25
Total working expenses	224.35	218.17	227.86	224.53
Operation ratio ..	77.0%	80.6%	83.8%	82.2%
Net traffic receipts ..	66.47	52.39	44.14	48.72
Net miscellaneous expenditure ..	4.72	5.21	6.49	8.08
Net revenue ..	61.75	47.18	37.65	40.64
Dividend to general revenues ..	33.41	33.99	34.47	35.50
Surplus ..	28.34	13.19	3.18	5.14
Capital-at-charge ..	850.11	857.38	875.16	909.09
Ratio of net revenue to capital-at-charge ..	7.3%	5.5%	4.3%	4.4%

The implications of the results of the financial working of the railways bear examination. Over the entire period of boom since the war and extending up to 1951-52, gross traffic receipts kept their upward trend and the increasing volume of traffic necessitated higher expenditure. But the rise in expenditure has been disproportionate and much steeper than the rise in the revenue. Net traffic receipts have suffered in the result. Between 1948-49, the first complete post-partition year, and 1954-55 gross traffic receipts increased by 28.1 per cent, but the increase in net traffic receipts was lower by 5.6 per cent at 22.5 per cent only. The margin of net revenue has disclosed a corresponding shrinkage, but particularly between 1951-52 and 1954-55 it registered a sudden fall from Rs. 61.75 crores to Rs. 40.64 crores. It has reduced the rate of return on the capital-at-charge from 7.3 per cent to 4.4 per cent, which is too inadequate by ordinary commercial standards. It has to meet the claims of interest on the loaned capital and contribution to the general revenues (now merged in the overall dividend of 4 per cent) before a net profit or surplus can be appropriated to the railway reserves.

The size of this surplus or net profit has undergone drastic reduction from Rs. 28.34 crores in 1951-52 to Rs. 5.14 crores in the budget year. Its bearing on the reserve funds and on the works, machinery and rolling stock programme cannot be missed. The entire surplus is being appropriated to the Development Fund in the current year as well as in the budget year, leaving no allocation whatsoever to the Revenue Reserve Fund. The depletion of the Development Fund will leave a closing balance of only Rs. 13.67 crores in 1954-55 which is below the balance as on partition of the railways. The Development Fund cannot make any mentionable contributions to this vital programme. The tendency to make inroads on the Depreciation Reserve Fund and to inflate the capital-at-charge cannot now be halted. Similarly, the trend towards rapid capitalisation is significant. Since a fixed dividend of 4 per cent on the loaned capital is payable to the general revenues under the existing financial convention, the parliamentary committee which is to be appointed shortly to review its operation will have to give adequate thought to this flat rate in the light of the over-capitalisation that is going to take place.

The increase in the operating ratio, which is distinctly noticeable in the recent past, however, does not connote unmixed deterioration. It is fractionally due to some healthy ingredients in the total working expenses. Since the adoption of the revised current financial convention in 1950-51, a sizable appropriation of Rs. 30 crores is being made to the Depreciation Reserve Fund every year and the backlog of repairs and maintenance of assets is being cleared at a rapid rate by large allocations of amounts ranging upwards of Rs. 62 crores since the Plan period.

But, in essence, the disproportionately high amounts of working expenses manifest either waste due to lack of proper exercise of control or liberal expenditure without an increase in productivity which it is expected to generate. The most telling example of this latter description is the phenomenal rise in the wages bill since independence. Between the 31st March, 1948 and 31st March, 1953 the total cost of staff shot up from Rs. 67.34 crores to Rs. 126.88 crores—an increase of 88

per cent. To this must be added subsequent increase in the current year of which Rs. 3.15 crores consequent on the treatment of 50 per cent of the dearness allowance as basic wage is an important illustration. A strict assessment of the rise in the wages bill must take into consideration some factors of variation. A higher volume of traffic involves a larger labour force. Since the ex-princely State railways were fully integrated with the Indian railways on 1st April, 1950, the pay scales of the employees on those railways were brought to parity with the scales in operation in the Indian railways. But this is believed to have cost about Rs. 10 crores. By and large, the rise in the wages bill is due to successive instalments of increases. It is clear that some of it was due on genuine considerations of cost of living, but undoubtedly part of it is a clear concession to political issues. It has now come to stay. To make the best of the situation, the Railway Board must make a determined effort to obtain improvement in labour productivity. No measure, even on a rough basis, on the changes in this vital factor of efficiency in the recent past is available. There is clear scope for immediate improvement. The report on regrouping of railways makes special reference to sub-standard operational performance on the ex-princely State railways. On other railway lines also the return from labour is below reasonable standards. Regrouping with its centralisation and co-ordination of control ought to show concrete results in more efficient utilisation of labour.

The fuel bill has increased since 1948-49 by Rs. 7 crores. Much of it is due to absence of economy and conservation. In his budget speech of last year, Mr. Lal Bahadur Shastri assured the House that substantial economies would be effected in the fuel bill by the implementation of the proposals in the interim report of the Railway Fuel Enquiry Committee, but his budget speech of last week makes a significant omission of any reference to this potential source of economy.

A drive for economy and efficiency promises substantial results, if it is pursued at points which require vigilant supervision. The repairs and maintenance bill which now runs to Rs. 67 crores certainly calls for rigorous measures for avoidance of waste. This is a major illustration. The report on railway regrouping emphasizes the improvement in the utilisation of wagons by elimination of delays at former points of interchange between railway systems, reduction in return journeys of empties and expeditious disposal at transhipment points. It is difficult, in the absence of official estimates, to determine how far these benefits are reflected in wagon-turn-round and likewise it is difficult to assess the improvement in locomotive utilisation due to more efficient performance in the workshops. The anticipated shortfall of Rs. 60 crores in the contribution of the railways to the resources of their five-year development plan underlines a firm drive to bring about a reduction in the operating ratio. This is in fact the primary task of the newly established Efficiency Bureau.

AN INDUSTRIAL DEVELOPMENT CORPORATION

THE Finance Minister's statement in Parliament on Wednesday and the outlines of the tentative scheme for an industrial development and finance corporation given by Mr. Robert H. Crafts on behalf of the World Bank Mission, have set at rest speculation on the subject and confirmed earlier forecasts. The resources immediately available to the proposed Corporation will include an equity capital of Rs. 5 crores, with minority participation by foreign subscribers, the use of Rs. 7½ crores from counterpart funds, to be made available by the Government on easy terms, and the World Bank's line of credit, now placed at Rs. 5 crores. It is expected that the Bank may develop total resources of Rs. 50 crores, without competing with the banking system for ordinary deposits. The Corporation which will be established without special legislation is expected to undertake a wide range of activity by granting loans, participation in equity capital, underwriting of shares, and by furnishing technical and managerial aid. The rapidity with which the scheme has been settled and the general co-operation shown by the private sector are of good augury.

The Development Corporation on the lines now suggested may not actually be a substitute for the State-sponsored Industrial Development Corporation discussed by the Government of India in recent months. There is nothing to preclude Government from taking measures in its own way to tackle the problem of industrialisation and unemployment, in which context these proposals have been made. In such cases, however, there may be no foreign assistance forthcoming either from the World Bank or from foreign private investors, so long as there is another specially chosen private agency available for the specific purpose of industrial development. In the circumstances, the Government may have to consider the advisability of abandoning its own scheme for a Development Corporation, at least for the present, and watch the autonomous and independent Development Corporation grow in stature. The Government's responsibility for its functioning cannot be wholly excluded so long as it has to guarantee any loans given by the World Bank and possibly also take responsibility for the proper management of the counterpart funds given as a loan on easy terms. The main idea seems to be only that no single group or participant in the Bank should own a controlling share.

The establishment of this new type of institution should not present any serious difficulty. But its establishment would only be the beginning of its problems and of the Government. Obviously, the business of the institution will have to be conducted on sound and prudent banking considerations and with the obligation of accountability to its participants. It is difficult to foresee the conditions under which these considerations will be linked with the need for taking large risks involved in industrial development, which is its raison d'etre. The idea of creating an institution for industrial banking, especially for financing the establishment of new industries, has a long history in this country and the elaborate investigations of the Banking Enquiry Committee in 1931 have borne no fruit in the two decades since. Some of the questions that have arisen from time to time in that connection are not less relevant today and there is no reason to hope that the difficulties felt before have disappeared.

Two major questions have been raised in the past. They relate, firstly, to whether such an institution should finance only new enterprises of a non-competitive character or have a free field of its own choice, and, secondly, whether it could engage in financing small industries also, which might involve difficulties in supervision and in judging risks. At the present time, since there is an insistence on freedom of operations of the Corporation, there should be no restriction on its decision to promote expansion in any field, competitive or otherwise. This may be entirely desirable, judged from one point of view. The expansion of employment and production need not be restricted, wherever it occurs, by decisions extraneous to the profitability of an enterprise which, in a free economy is the ultimate test of its reason to come into existence. Such an attitude might, however, conflict with the details of the Plan as conceived by the Government. No hard and fast line can be drawn as to the extent to which financing should or should not be done to foster greater competition, since competition can be justified in terms of economic progress. But it would be relevant to consider whether there should not be a brake on the duplication of limited resources during the stage of planned development and, if so, whether an autonomous

financing corporation can function as freely as planned, within the framework of an overall policy of priorities.

It can function so only when it accepts its task of development as falling within those sectors in which such development is considered desirable and expedient. It is a view widely shared that the task in a predominantly agricultural economy like India's is to promote a large number of small industries in order to absorb the surplus manpower in agriculture and diversify production. The I.M.F. Mission also gave expression to this view. It said: "It is possible that worth while investment on a large scale could be undertaken in smaller enterprises if better provision could be made to provide finance for such investment. As the modernisation of the small and medium-sized enterprises in the rural regions could provide full and part-time employment for many people now engaged exclusively in agriculture, there is a need to consider what measures could be taken to encourage a greater development of such industries." Even if cottage and very small-scale industries are ruled out of this scheme, it seems that any new scheme of industrial financing cannot escape the responsibility, even in the initial stages of its operation, to concern itself over a wide range of industries, with preparedness for taking the risks which are inherent in such widespread activity.

The point is whether there would be readiness on the part of a private banking concern, constituted as now contemplated, to undertake that role. If large-scale projects, like the establishment of steel units should be ruled out on the one hand, because of the high capital outlay and the unlikelihood of private enterprise entering these fields in the present circumstances, and if, on the other, the highly competitive fields —like cotton textiles—should also be accorded a low priority, there would be few other alternatives open except to promote many new industries, small or medium.

There may be no need to be highly pessimistic. Obviously, there will be attempts to strike a balance between assistance to new undertakings starting from scratch and financial aid to existing industries planning to expand within the scope allowed for them. There will, perhaps, also be a balance between the provision of working capital requirements to existing industries and long-term assistance for building, machinery and plant for new units and expansions. To place greater emphasis on the latter aspect alone, which Indian opinion has favoured strongly all along, would mean locking up the capital of the Bank in long-term loans, the profitability of which will depend on the fate of the new undertakings. In the Indian context, the problem of creating effective demand for new industrial products to be manufactured has not been regarded as easy. The question is whether an institution functioning entirely in an autonomous way, with a liability to show dividends to its subscribers and interest on loans advanced by the World Bank, can readily accept all the implications of giving an impetus to industrial development in this country.

Much would depend on the charter of the Corporation and the scope it would allow to its free activity. As an institution giving special attention to the current needs of industry for working capital and finance for expansion on safe lines and helping obviously profitable new enterprises to come into the field, it can always play a useful and important role. It can even acquire an important place among the financial institutions in the country. But this would not be the same as fulfilling current expectations of promoting large-scale industrial development. It will then not be a substitute to the other proposals under consideration like the State-managed Industrial Development Corporation which could afford to take greater risks in promoting enterprises not so much on lines of individual profitability as on the larger advantage to the national interest in imparting a dynamic impulse to the economy. If these two spheres are regarded as independent, the role of the Development Corporation would naturally diminish in importance.

It is necessary to bear in mind that the problems cannot be solved by merely freeing the Corporation from State control while the other rigidities of the economy—like the ban on labour retrenchment, the high cost-structure, the restrictions on freedom of company management and the frequently strict application of industrial regulation—can yet act as more powerful deterrents than finance against making a freer and fuller use of available opportunities. To seek profitable investments within this scope might be difficult enough; and if found, they cannot be regarded adequate to give a rate of industrial expansion and increase of national income sufficient to justify its description as development. This does not mean that a State-sponsored scheme is necessarily superior. It will, however, be free from the compulsion to secure direct and immediate returns on its investments to enable a liberal policy of assistance.

THE BUSINESS WORLD

THE STEEL SITE

Now that the controversy regarding the site for the steel project has after all been amicably settled, it is possible with the benefits of hindsight and also of the knowledge of the detailed arguments which have been put forward by the various states, to consider the real case for Rourkela. The decision to locate the steel project at this junction on the main line connecting the coal and iron fields in the east of India rests, as it happens, on wholly economic grounds. The fact that Orissa is a backward state is an additional argument. But the German mission has been concerned in reality and not merely in theory with technical and not political or other considerations. It is fortunate that all the arguments, or most of them, have been in favour of Orissa, so that what was technically justified could also be supported on wider grounds.

The two main considerations which seem to have weighed with the mission are,

(i) transport saving, both inward and outward, and

(ii) use of the existing raw material resources which have been most fully developed.

In considering the sites from these two points of view, the arguments advanced on behalf of West Bengal, namely, speed of construction in an industrialised area, scope for finding an outlet for by-products like coal gas and slack, and economy in distribution were not as conclusive, in the opinion of the Government of India, as they prima facie seemed to be. An increase in the capital-at-charge of the new steel mills, because of transportation of the materials for construction over larger distances, will have its counterpart in increased railway earnings. Increased distribution costs, if any, in the event of location at any site other than Durgapur, will also be matched by the fact that the industrial development of Rourkela will,

(i) utilise the power which is to be generated ultimately at Hirakud,

(ii) help to expand the cement factory in the neighbourhood and,

(iii) utilise the facilities offered by the repair shop and foundry at Hirakud during the period of construction.

For these reasons, as also because the transport situation in the industrial area within Bihar and West Bengal area is already tight, whereas empties may to some extent be used in the case of transport to Rourkela, the mission appears to have rejected the Sindri and Durgapur sites at a fairly early stage in its deliberations. In the result, the two criteria to which the mission has attached much value, namely,

(i) saving in transport costs, and

(ii) speed of erection, resulting from the utilisation of mines which are already opened up,

have to be applied to the two other sites which remained, namely, Rourkela and Bilhai. Once the choice was thus narrowed, the answer seemed to be clear.

The country may, therefore, have the satisfaction, at this stage, that the best possible decision has been made. The new steel project, at the site at which it is going to be erected, will not call for heavy additional investment on rail transport facilities. The mission seems to have calculated that the cost of improvements, including the cost of additional rolling stock, would be about Rs. 6.5 crores, in view of the present decision. This is fairly cheap and well within the capacity of the railways to manage within the construction period.

The new project will likewise have the benefit of Hirakud's power. This, according to present expectations, is to be 85,000 k.w.s on the completion of the first stage and about 200,000 k.w.s on the completion of the second stage. There may be something in the West Bengal Government's argument that hydro-electric power is less satisfactory than power from a grid which can draw on both thermal and hydel power; but, obviously, the danger of such dependence is not very great.

Subsidiary industries can also grow up rapidly in the vicinity of Rourkela. Coal, iron, limestone, bauxite, timber and grasses are available within easy reach of Rourkela and Sambalpur, and the industrialisation of the area later on should prove to be easy.

Above all, priority for Rourkela does not mean that another steel site situated to the west of Rourkela at or near Bilhai in Madhya Pradesh need not be developed in the immediate rather than the distant future. The establishment of a steel unit at Rourkela may, on the other hand, actually help Madhya Pradesh indirectly in this matter. Industrial development in and around Sambalpur and Rourkela may help in due course to develop the Madhya Pradesh coalfields on the one hand and on the other create a market in the east for finished steel and iron. In both cases, the result will be that a steel project in Madhya Pradesh would prove to be more economical and justified than it seems to be today. If the new steel project makes good progress, now that the initial obstacles have been cleared, the time may soon arrive when in retrospect the controversy over the site, which has now happily ended, may be seen to have been meaningless.

INDIAN SHIPPING PROGRESS : A DIFFERENCE IN VIEWS

By

CROESUS

This year's annual general meeting of the Indian National Steamship Owners' Association, Bombay, provided an opportunity for the President of the Association, Mr. N. Dandekar, and the Union Production Minister, Mr. K. C. Reddy, to compare notes about the rate of progress of Indian shipping. While Mr. Dandekar felt the rate of progress to be disappointing—the net increase in the tonnage of Indian shipping during last year was only 13,000 tons—especially in the context of the growth of world shipping tonnage, Mr. Reddy was of the opinion that, except in the field of overseas shipping, progress has not been unsatisfactory. He, however, admitted that "our own Plan target for shipping is a very modest one", although he added that by and large, the target must be considered as "the most practical one that could have been fixed under the circumstances." In making this latter statement, the Union Production Minister was probably replying to those who have been arguing that, considering the needs of the country, even the aggregate target of 600,000 tons set under the Five-Year Plan is hopelessly inadequate.

Notwithstanding this initial difference of opinion, it must be said that both expressed satisfaction at the turn of events lately. "A marked change has come about during the last year", observed Mr. Dandekar, "both in the attitude of Government and as regards response from shipowners". Mr. Reddy, for his part

referred "with appreciation" to the carefully planned and vigorous efforts which have followed upon the meeting held by the Transport Minister with the consultative committee of Indian shipowners. He summed up the latest position succinctly when he said: "Adding up, we find that 121,000 g.r.t. (including the two ships about to be completed at Vishakhapatnam) have already been acquired (while another 138,780 tons are either to be acquired or built during the Plan period). If the total commitments in respect of purchase and building are taken into account the total is likely to be of the order of 281,000 tons. From this, about 260,000 tons should be expected to be actually available, the balance being on order at the Vizag Shipyard and partly in the course of construction. This is to be compared with the target of an additional 275,000 tons envisaged in the Plan."

The I.N.S.O.A. President dwelt on nearly all the problems facing the Indian shipping industry today but none of these can be regarded as arising anew as such, except for the demand for an Indian-owned tanker fleet. In this connection, Mr. Dandekar referred to the agreement with the oil companies and complained: "It is difficult to understand why the Government of India agreed to the insertion of such shipping clauses in these oil agreements, as they have the effect of excluding Indian-owned tankers not only from bringing crude oil from foreign countries to India, but also from operating in the carriage of oil on the coast." He, however, hoped that the implications of the clause in question "are not as serious as may appear at first sight and that Indian shipping companies may go ahead with any plans they may have for owning and operating a tanker fleet with the full confidence that they will have free scope to operate on the coast carrying the products of the refineries to other Indian ports". He further added that "Indian shipowners would also be interested in carrying crude oil from foreign countries to the refineries". This point, it may be mentioned here, was ere now made out prominently by Mr. M. A. Master, and Mr. Reddy's reply to the part must naturally be expected to be well-considered. It is a pity that even this considered reply should have fallen flat on his audience. To argue that at the time the negotiations were undertaken with the oil companies, India did not own any tankers nor was there any prospect of her acquiring tankers at an early date and, therefore, the Government gave the permission (or is it carte blanche?) it has done under the agreements with the oil companies is only to advertise the lack of farsightedness on the part of the authorities. But it was positively adding insult to injury when Mr. Reddy went on to give the analogy of coastal reservation to explain that "a nucleus at least of Indian-owned tankers will obviously be necessary before complete reservation can be contemplated". In the first place, no Indian shipowner has claimed "complete reservation" of tankers; all that Indian shipping interests wanted, and still want, is that, as and when they go in for tankers, they must not find themselves confronted with the kind of disability that the clause in question envisages. One only hopes that Mr. Reddy is right when he says that "it seems to me an overstatement, if not an actual misunderstanding, of the relevant agreements" and that "the implications of the clause in the oil agreement are not as serious as seem to have been understood". And, one also hopes that, in welcoming Indian shipping enterprise in this field and offering that the Government would "readily consider any specific proposals that may be put forward", the Union Minister for Production is not unaware of the fact that no private-owned shipping company can well do so, for under the clause, as far as one can make out, it is not open to a tanker not owned by the Government or by a company in which the Government has a majority interest to carry crude oil or refined products for the period of the agreement and then too, subject to the commitments at the time of the oil companies permitting such a course. By inference, therefore, one must regard what Mr. Reddy said as an offer to any Indian shipping company to go in for tankers provided it is prepared to give a majority interest in it to the Government.

As for the Government itself acquiring tankers, there can be no trouble. It is, therefore, gratifying to learn from the disclosure that the Minister made that the Union Government has "almost decided" to acquire two tankers. It is also probable that the Vizag yard may be asked to build these tankers, if possible.

On another controversial point, however, Mr. Reddy had the better of Mr. Dandekar. This was in regard to the latter's poser regarding the growing inapplicability of the U.K.-parity price and the difficulty of estimating the said parity by the Vizag Shipyard. He told the shipowners that, if it is difficult to ascertain the U.K.-parity price, it will be still more difficult to estimate the "world parity price", that is "the lowest price at which, say, the Scandinavian, German, Japanese, Dutch or British shipyards can deliver a ship of a particular type". And his justification for the Hindustan Shipyard Ltd., basing its price at which the U.K. shipyards would deliver similar ships was quite tenable. Moreover, as he rightly added, it is not unlikely that the U.K. shipbuilders will not hesitate or delay to make their prices more competitive, once they realise they are losing the world market for other competitors in the field, especially as shipbuilding plays a very important role in the economy of the U.K. In effect, beyond saying that this issue would receive careful attention, Mr. Reddy did not commit himself to anything, even as he cleverly evaded committing himself on either the subsidy question or the question of customs duty and sales tax on bunkers and other ship stores. When all argument fails, apparently, Government spokesmen now get away in a novel way, as witness this reply of Mr. Reddy: "As practical men, I have no doubt that you will either reinforce such cases as you may have presented in the past with additional facts and arguments, or reconcile yourselves to the fact that it is not possible for the Government to assist you in this particular direction". It is said that the great British poet, Pope, used to send away prospective poets who brought to him their pieces of poetry by saying "keep your peace for nine years". The poor prospective poets at least reconciled themselves, thinking that Pope must have meant "piece" while he actually meant "peace". But Mr. Reddy did not afford Indian shipowners scope for even such a benefit of the doubt.

A TRIBUTE TO A STATE UNDERTAKING

By

CROESUS

Although I am no advocate or admirer of nationalisation and have had occasions on which I have strongly criticised the working of the Bombay State Road Transport Corporation, particularly in the matter of maintenance of accounts on the basis of certain remarks made in the Public Accounts Inquiry Committee Report, I am tempted to pay a tribute on this occasion to this nationalised undertaking. For, if the six years' progress of the B.S.R.T. Corporation (or S.T.C., for short) as outlined by Mr. Chhotabhai S. Patel, Chairman, at a Press Conference on Monday is any criterion, one cannot withhold one's admiration for what has been achieved, even when one views the undertaking as a commercial venture.

It is well known that the S.T.C. started operations in 1948 with only 35 vehicles, but, over the past few years, it has expanded so much that there are today ramifications of the Corporation all over the State—there are as many as 15 divisions—and the total number of vehicles is as much as nearly 2,500. Until the beginning of this year, the Corporation's operations were mainly concerned with passenger traffic, but, when it received from Canada, under the Colombo Aid Plan (this is a gift to India but a loan to the S.T.), some trucks also (835 trucks to be precise) along with 510 buses, it thought of extending its operations to the sphere of goods transport also and has, indeed, already put a number of these vehicles on the road. For the greater part, these S.T. trucks are engaged in transporting imported food grains, thereby rendering perhaps an invaluable service at a time when the Railways are not in a position to provide all the wagons necessary for the purpose. I was anxious to ascertain from the S.T. Chairman whether there would be further encroachment on the private sector in this sphere and I am glad to say, from the reply I received, that, at least for the present, the Government does not propose to push this nationalisation of goods transport ahead, although neither Mr. Patel nor the State Government are apparently averse to doing so, if they can. Meanwhile, it is sporting of Mr. Patel to suggest that the S.T. proposes to compete with private operators and prove its relative advantages over the latter. While one would wish both Mr. Patel and the State Government success, one must draw their attention pointedly to the growing public opinion against the extension of the transport nationalisation scheme, if only not to aggravate the present acute unemployment situation in the country. Accordingly, the Planning Commission also is stated to have advised a go-slow policy in this behalf.

A notable feature of the S.T.C. Chairman's observations at the Press conference was his claim that, "although this undertaking is a Government-sponsored one, it has neither sought nor obtained any concessions so far by way of exemptions from Government taxes or local taxes, and has met all its statutory obligations promptly". This is as it should be, and it is also proper that the accounts of the Corporation should be maintained strictly on commercial lines, providing for adequate depreciation, insurance, payment of interest on capital and loans, etc. The creation of a sinking fund in order to repay the debenture loan floated by the S.T.C. in 1952 and the decision to pay annual equated contributions to it regularly are healthy conventions such as one notices in every well-run commercial organisation in the private sector.

If, after doing all these, and that without raising the rate structure above 9 pies per mile, the organisation is able to increase its interest or dividend to participating Governments—it may be noted here that the capital of the S.T.C. has been contributed by both the Union Government and the State Government in the proportion of 1 : 2 (Rs. 286 lakhs and Rs. 578 lakhs)—from Rs. 20.40 lakhs (audited) in 1948-49 to Rs. 54.41 lakhs (budget estimate) in 1954-55, it seems to me that there is no special virtue in the S.T.C. Chairman's claim that the S.T.C. has neither sought nor obtained any concessions. The Government would in any case be opposed to granting any such concessions, partly because it would thereby lose a portion of its dividend, which is otherwise assured, and partly because it would lay itself open to the blame of being partial towards State-sponsored or semi-Government institutions. From the point of view of private operators, on the other hand, this is actually a disservice, inasmuch as, either because of statutory obligations or for other reasons, the S.T.C. is prevented from joining other road operators in pressing for any relief by way of reduced taxes on, say, petrol, etc. But this is only by the way.

Since Mr. Patel became the Chairman of the S.T.C., much attention has been paid to effecting economies in the organisation, and this has yielded results. There is no space for me here to reproduce the detailed statement showing the results of the plans in this behalf introduced in 1952-53. But, briefly, the statement shows that the staff ratio has come down from 8.40 to 6.84; the establishment cost per bus mile has fallen from 62.54 pies to 59.76 pies and the cost of spare parts from 27.10 pies to 16.87 pies. In respect of fuel, again, there has been a reduction, I notice, from 48.49 pies per bus mile to 10.75 pies, mainly due to conversion of petrol-driven vehicles into diesel ones.

According to the S.T.C. Chairman, the twin aims of nationalisation of the road transport are provision of maximum amenities to the travelling public and efficient and economic management of the organisation. That these objectives have been fully kept in mind, and even achieved to some extent, should be obvious even to the most discerning critic, and credit for it must go in a large measure to Mr. Vadilal, the first Chairman, and to Mr. D. D. Sathe, first Motor Transport Controller and, later, Vice-Chairman until recently. Mr. R. J. Rebello, who has just taken over from Mr. Sathe is, I am glad to find, no stranger to State Transport, having, at one time, been Deputy State Transport Officer. He also has behind him a distinguished academic record. All the same, I have yet to reconcile myself to the sudden shifting of Mr. Sathe from a position in which he has undoubtedly distinguished himself. Transport has become so much a part of his being these days that I am told that, even when he recently visited the Continent on a holiday, he lost no opportunity of visiting a transport organisation wherever he went.

The State Government's decision may be, nay is, in line with the latest Government of India's policy not to keep the same officer, however senior he may be, in the same post for more than four years continuously, a policy at the altar of which even the acknowledged excellent work of a former Director-General of Shipping in Bombay was not a sufficient enough sacrifice to appease the powers-that-be and leave him undisturbed to carry on his good work. Whatever the other compelling reasons for these mechanical transfers, in deference to certain imaginary inhibitions, I feel convinced that, after an officer acquires considerable experience and has made good in any particular post, especially one of a commercial or semi-commercial nature, the powers-that-be should pause and think a thousand times before shifting him unceremoniously to some corner in a far off place where there is no scope, whatever, for the exercise of his special experience, training, and knowledge. Unless these officers are guilty of something for which they must be punished, the least that can be done, by way of recognition of their good work is to transfer them, whoever they may be, to a post where there is some scope at least for the use of their erstwhile experience. It is at the cost of the tax-payer, be it noted, that all such officers acquire experience, and would it not be a waste of public money if, no sooner than these officers become really useful and indispensable, they are shunted out? The only anology I can find for this is the indiscriminate way in which the services of several of those scholars—both those in Government service and others—who were deputed by the Government of India, itself, at considerable cost to the public exchequer, to learn or specialise in given fields are being utilised today. Is anything more needed for one—and we do not want a Bradley for it—to elaborate a theory of waste?

BUSINESS NOTES

THE PRICING OF SHIPS AT VISAKH

The annual general meeting of the Indian National Steamship Owners' Association has become an important occasion for the consideration of issues of policy of vital concern to the Indian shipping world. The convention which is now well established of inviting one of the Ministers of the Union Cabinet dealing with shipping or shipbuilding for inauguration has helped to impart significance to the Association's annual session. At the last session held in Bombay on February 20, 1954, Mr. N. Dandekar, President of the Association, raised three important issues about the policy of pricing in regard to the ships built at Visakhpatnam yard. The present formula is to charge Indian companies, placing orders for new vessels on the Visakh yard, the U.K.-parity price, the balance being subsidised by the Government of India. Mr. Dandekar raised the three following issues on the pricing formula:

(1) The assessment of the U.K.-parity price in respect of ships similar in material specifications with those to be built at Visakh has proved in practice extremely difficult.

(2) Parity with U.K. prices has lost its value as an acceptable base in view of the fact that Indian shipping companies have been required in the recent past to enter competition with ships constructed at lower cost in other countries, particularly Germany and Japan.

(3) The prospective Indian purchaser as well as the Visakh yard have to grope in the dark in the negotiations over price as no approximate idea of the final price can be ascertained. This is a great handicap to shipowners in preparing their plans for outlay.

Mr. K. C. Reddy, the Union Minister of Production, conceded the force of the argument of Mr. Dandekar on the third issue since the latter spoke from personal experience as a Director of the Hindustan Shipyard. All that he could state in reply was to promise consideration of this grievance. It seems rather odd that approximate forecast of price should prove impossible, but it is to be hoped that a workable mode of calculation in respect of different components of construction will be evolved. On the assessment of the U.K.-parity price, Mr. Reddy was probably right in explaining the present state of affairs, but here again a modus vivendi ought to be found. The same difficulty would arise, he urged, in determining the parity price in respect of other shipbuilding countries. Mr. Reddy's defence for sticking to the U.K.-parity formula was, however, quite unconvincing. In brief, his argument was that the U.K. retains the lead as the potential supplier of ships to the world merchant fleets, the position of the shipbuilding industry in that country is fluid at the moment and she cannot fail to make adjustment to the level of rival supplying countries. There is no sanctity attached to the U.K. price parity and certainly not when that parity has lost ground to competitive builders. What is of direct and real concern to Indian shipowners from the operating viewpoint is the price of ships whose competition they have to face in trade. Price parity must be governed by this factor and when the U.K. recovers competitive superiority, it would be only reasonable to revert to her price parity.

OTHER RELIEF TO SHIPPING

Mr. Dandekar also urged the Government to take a cue from the advanced and well-established maritime countries and offer direct relief to Indian shipping companies, whose case for such help gathers force by reason of the infant stage of the industry in this country. He cited the case of the United States Government in offering operating subsidies to the shipping corporations in that country as an important illustration of policy influenced by the strategic importance of the merchant navy as the second line of defence. It was on this strategic consideration that Mr. Dandekar pleaded with the Government to treat the case of the shipping industry on a distinct footing from other industries.

The case of the coastal shipping trade for exemption from the customs duty on bunkers and stores as well as from the sales-tax levied by the State Governments is of immediate importance. Mr. Dandekar has indicated the difficulties of approaching the State Governments for relief from sales tax unless the shipping companies are forearmed with the concession from the Union Government in respect of the customs duty. The Union Government has extended this relief in respect of bunkers and stores used for the distant and overseas trades. Mr. Reddy's response need not be taken as discouraging. This plea has been made in general terms on prior occasions and the Minister has advised the companies to put their case in an objective form with proof of statistical data.

JUTE DECONTROL IN THE U.K.

The clarification given by Mr. Heathcoat-Amory, Minister of State at the Board of Trade, in the House of Commons last week on the U.K. Government's decision to remove the remaining control on raw jute and jute goods makes it plain that what is contemplated is not an immediate lifting of regulation of the import trade there. It has operated to create a feeling of subdued optimism in Calcutta. The war-time process of clamping controls on jute, which was started in the U.K. in 1940, was later extended to processing of raw jute and jute yarn and licensing for internal distribution was also enforced. When the reversal of controls began in September, 1952, many of these controls were removed, but the centralised control of raw jute and jute goods which is basic to the trade was retained. Mr. Heathcoat-Amory's statement now explains that this control too would disappear as soon as negotiations with private industry and the trade unions for the switch-over are concluded. However, what is of greater significance in the Minister's statement is the unequivocal commitment that suitable measures would be devised and introduced to safeguard the jute manufacturing industry. Until then public trade in jute would continue.

This assurance of safeguards for Dundee has been hailed by Mr. Hill, Chairman of the British Jute Trade Federal Council, as "one of the most momentous that has affected the jute industry of this country in its entire history". The significance of this reaction cannot be missed in Calcutta. The assurance of protection for Dundee discloses two vital factors in the British jute industry. In the first place, it is not in a position to supply the requirements of the domestic market in full and the shortfall will need to be filled by imports obviously from Calcutta. In the next place, it implies that Dundee's competitive strength vis-a-vis Calcutta is weak and requires support in the form of protective methods. The entire position in the long-term view of the jute goods trade in the U.K. has not been fully stated. Mr. Heathcoat-Amory's statement is taken to mean in U.K. jute circles that imported jute goods from Calcutta will be available to the internal consumer at the same price as British-manufactured goods in the interim period. What sort of regulation of trade is contemplated will be clear after the projected scheme of safeguards is put through. It will be hasty to presume that there is going to be a return to unrestricted competitive conditions.

RURAL BANKING IN TRAVANCORE-COCHIN

The extent to which rural banking has penetrated in Travancore-Cochin State is at once gathered from the fact that there are about 200 bank offices in this small State, of which 175 are accounted for as branch offices of only 10 banks. This is a much larger spread of rural banking than can be found in any other State and the phenomenon of bank branches being opened in villages where post offices are lacking is probably witnessed in Travancore-Cochin alone. Their effect on traditional usurious money lending is easily seen. The rate of interest charged by money lenders in villages as high as 24 per cent has now slumped to 9 per cent. The dominant characteristic of the loan policy of Travancore-Cochin bank establishments in the rural areas is to make advances to agricultural clients as the staple business and to treat business advances as ancillary activity. Loans are almost invariably safeguarded by collateral security of land or crop. In the peculiar conditions of Travancore-Cochin, it means plantation land and cash crops including tea, rubber, cardamoms, cocoanut, pepper, and so forth. The risk undertaken by Travancore-Cochin banks in assuming the functions of catering to rural and particularly agricultural credit is explained by this feature of the State's agricultural economy. A performance on a similar scale in the sphere of rural banking cannot be expected in other States in view of this distinctive difference.

Mr. M. Ct. M. Chidambaram Chettyar, who presided over the Travancore-Cochin Bankers' Conference recently, however, made a reference to the necessity for structural change. He urged the bankers not to overlook, from a long-term perspective, the advisability of amalgamation of smaller units on the ground of economic operation and also stressed that linking of groups of non-scheduled banks with scheduled banks as a preliminary step to merger in due course was a proposition worth while keeping in view.

RATIONALISATION IN GLASS AND CERAMICS

The progress made by the glass and ceramics industry in the last three decades gives reassuring proof of more intensive exploitation of the potentialities of its development. The internal market for the industry is large enough to absorb its expanded production, but in the competitive conditions which it has necessarily to encounter, further progress must depend upon the improvement of its competitive efficiency. Dr. Atma Ram, President of the Indian Ceramic Society, was forthright in his advice to the industry to turn to self-help. Neither constant requests to the Government for assistance nor appeals to the patriotic sentiments of the consumer, he reminded the industry, are going to make the future safe for it. Safety must be sought in improvement through rationalisation on production techniques.

The current higher cost of production of the indigenous manufactures is due to lower efficiency of production and higher cost of raw materials. To this must he added the high percentage of rejects. Dr. Atma Ram has stressed the vital importance of judicious selection of raw materials and their proper processing, due attention to scientific control over the operation of furnaces and supervision at key points by men technically qualified to do the job. This means, inevitably, more costs on employment of technical persons and trust in their ability to perform their jobs. This investment is worth making and now it has become indispensable by reason of the impact of superior scientific techniques adopted by competitors abroad. The present position is that many of the enquiries on the processes in production addressed to the Society prove unfruitful since there is lack of technical persons to adopt the instructions issued in response to them. If any deficiency is noticed at present in the standards of performance of technicians, that is no reason to grudge the utilisation of their services and a correct approach would underline the need for a close liaison between the industry and the universities to give a practical bias to the courses of technical studies. Universities, of course, cannot be expected to surrender their basic duty to impart fundamental knowledge of theory and, what is vitally important, procurement of adequate equipment is beyond their financial strength. While Government is allocating more funds for this specific purpose, it is certainly the obligation of the industry, which is directly interested in the training of technicians, to share the burden of training in the technological institutions. The cost of this investment to be contributed by the industry is placed at Rs. 2 lakhs per year.

RESTORING THE ROLE OF THE IMPORTER

The import trade has never grudged a due measure of protection to indigenous industry in the larger national interests of the development of the economy and in fact it has accepted the restriction which protection puts on its freedom of operation as a healthy obligation. Such an attitude of accommodation is essential as the developing economy continues to make demands for increasing industrialisation. But this trend cannot be misconstrued as elimination of the import trade in indigenously manufactured goods. The emphasis of Mr. Shantilal Shah in his presidential address at the annual session of the All-India Importers' Association was on the growing tendency on the part of industry to lapse into this error. Even when protection is in force in an effective measure in the shape of adequate tariff duties, demands continue to pour from industry for drastic restriction and in a few cases for practical elimination of imports. This tendency is demonstrated in the practice of pressing claims for unwarranted restriction of imports once protection is granted to an industry. The Tariff Commission's recommendations after a thorough and scientific enquiry into each case ought to be accepted as the proper measure of protection. Protection plus a moderate dose of import control has now become the accepted policy. But any concession to the demand for import restriction on an unwarranted scale is bound to remove the healthy stimulus of competition so vitally needed for higher standards of efficiency and the consumer's legitimate interests in price and quality are apt to be ignored.

There is another aspect of import policy which hinders the restoration of the importer's role as a distributive agency. With the easier availability of materials, all representative organizations of industry and trade have lent their support to the withdrawal of actual users' licences. It is, therefore, difficult to comprehand why Government should insist on their retention. Mr. Shah's grievance in regard to the new technique employed by industry to bypass normal trade channels by setting up its own or collaborating media for trade cannot be redressed by State intervention. The best remedy for it is proof of the competitive efficiency of the normal trader.

THE COASTAL SHIPPING TRADE

The speech of Mr. Dharamsey M. Khatau, Chairman of the Scindia Steam Navigation Company, at the last annual meeting held on 24th February, extracts from which appear elsewhere in this issue, makes it amply clear that this premier shipping company maintained in the year under report its tradition of progressive performance. This was in spite of practical set-backs to the freight trade on the coastal as well as overseas services. The regrettable turn which the coastal trade took last year needs serious attention and remedial measures. The position, in brief, was that the supply of tonnage plying the coastal lines was quite out of proportion to the cargo offering bringing in its train ruinous competition. Not only were freight rates cut

down to uneconomic levels but unfair practices became rampant.

The Scindia Steam Navigation Company which has always taken the lead in building up the national coastal shipping trade urged the Indian Coastal Conference to intervene and set the matters right. The resolution adopted by the Conference was of a voluntary nature and in practice it was not implemented. The stalemate ultimately forced a decision on Scindias to withdraw from the Conference. The withdrawal is to be effective from March 1, 1954. This development is very much to be regretted and it should serve as a warning to take effective measures to improve trade practices on the coast without any further delay. The Scindias have now proposed that a reasonable quota system, based upon the size of the fleet of a company and its performance in trade in the last few years should be evolved as it will put an end to unhealthy competition and in the long run restore proper equilibrium between the supply of tonnage and availability of cargo. Similar agreement on freight rates and its faithful observation is essential. The state of affairs on the coast calls for immediate rectification and this can be done only by the Conference with the authority it wields on the member companies. A compromise to the benefit of all the companies should pave the way for the re-entry of Scindias in the Conference.

EXPORT OF IRON AND MANGANESE ORES

The Government of India has further reviewed the procedure for licensing the export of iron and manganese ores through Madras port, and has decided that any consignment of iron and manganese ores offered for loading at the broad-gauge stations will be accepted by the railways without insisting upon export allotments. Such consignments on reaching Madras port will be licensed on shipping bills. With regard to the movement between the Bellary-Hospet-Guntakal (meter gauge) and the meter gauge section up to Bangalore, the railways will provide wagons pro rata taking into consideration the total allotment made to established shippers and mine-owners and the availability of wagons.

THE OUTLOOK FOR TEXTILES

While the textile industry in this country attained a new all-time peak in 1953 and pushed up the output 12 per cent above the preceding year, there can be no complacency on the ground that five-year target for textiles has been advanced by two years. Before the outlook for this industry in the immediate future can be taken to imply a phase of continuous expansion the condition precedent about obtaining the market for its products must be assured. On this specific score present indications are that the Export Promotion Council must take the lead in exploring the sources of demand. The overseas consumers' requirements and bias must be ascertained to ensure that goods supplied will find ready customers. The prospect in respect of the domestic market in the immediate context is not free from difficulties and easily the one major difficulty is the purchasing power in the hands of the consumer to absorb the supplies offered to him. How soon it may be expected to stabilise and expand is a matter of speculation, but at the present time the trend is in the other direction.

Discussing this issue at the last annual meeting of the Madhya Pradesh Millowners' Association, its president, Mr. Daga, explained that the alternative device of adjusting prices to the purchasing power of the consumer was not feasible in his State. Raw cotton absorbed three-fifths of the production costs in Madhya Pradesh and when the wages bill is added to it, the balance of 12 per cent did not leave any scope for reduction. Price-cutting in other manufacturing States also is not practicable and this fact has been conceded by the Union Commerce and Industry Minister. Inflexibility of production costs has posed a problem before each industry with the return of competitive conditions, but while efforts continue to be made to tackle it, market studies must be pursued intensively.

THE TATA IRON AND STEEL COMPANY LIMITED

NOTICE

Notice is hereby given that pursuant to the Scheme of Arrangement sanctioned by the High Court of Bombay the Directors will allot the new fully paid Ordinary Shares in lieu of existing Deferred Shares and the additional fully paid bonus shares to holders of Deferred and Ordinary Shares on the Register of Members on 29th March, 1954.

Notice is also given that the Transfer Books of the Company will be closed from Monday, 15th March, 1954, to Monday, 29th March, 1954, both days inclusive.

By Order of the Directors,

COMPANY MEETING

THE SCINDIA STEAM NAVIGATION COMPANY, LTD.

Speech delivered by Shri Dharamsey M. Khatau, Chairman of The Scindia Steam Navigation Co., Ltd., at the 34th Ordinary General Meeting of the Company, held on Wednesday, the 24th February, 1954, at 4 P.M. at Scindia House, Ballard Estate, Bombay.

Gentlemen:

Before we begin, I am sure it is the desire of all those assembled here that we should pay tribute to the memory of our great former Chairman, Sheth Walchand Hirachand.

In enterprise, daring and imagination he was equalled by none; his vision was wide, and his plans were always drawn on a large canvas. In the field of industry, generally, and of transport in particular, he has left indelible marks of great and lasting achievement. Shipping and Shipbuilding, Aviation and Aeronautical Construction, the manufacture of Motor Vehicles and the execution of large Civil Engineering Projects in cement, steel and concrete—these are the living monuments to his constructive imagination and ceaseless energy. His place in our recent economic history will assuredly be among the few really great industrialists which this country has produced.

The Company's operations in 1952-53 have yielded satisfactory results. The provision for Normal Depreciation in 1952-53 is higher than in the previous year by over Rs. 20 lakhs; and the provision made for Deferred Taxation relative to the profits of the year under report is Rs. 60 lakhs as against only Rs. 3 lakhs provided in the previous year. Notwithstanding these larger provisions, the profits earned during the year have enabled the Board not only to recommend an increase in the rate of dividend from As. 8 per share to As. 12 per share, but also to create, for the first time, a Dividend Equalisation Fund with an initial allocation of Rs. 11,75,000. It has also been possible to transfer from the profits a sum of Rs. 10 lakhs to the Fleet Replacement Account which at the end of the year stands at Rs. 2,13,19,434.

The broad picture of our present total Capital Resources inclusive of the Paid-up Capital, the Reserves and Surpluses, and the Debentures (excluding the Debentures of the Bombay Steam which are to be paid off), is that they aggregate Rs. 19.72 crores, of which Rs. 7.05 crores only is accounted for by the Paid-up Capital. As against this our total Fixed Capital Expenditure and Investments in Subsidiary and Associated Companies aggregate Rs. 20.01 crores. In these circumstances your Directors have recommended in their Report that, subject to the sanction of the Controller of Capital Issues which has been applied for, the paid-up value of the shares of your Company may be increased from Rs. 15 each to Rs. 20 each, by capitalising the sum required for this purpose from the premium on shares collected on the issues of Capital made in 1946 and 1948, and at present forming part of the Reserves and Surpluses of the Company. Certain aspects of this proposal are, however, under further examination by your Directors.

B.S.N. LINE

The cargo and passenger trade on the West Coast in which the former Bombay Steam Navigation Co., Ltd., (hereinafter referred to as the B.S.N. Line) operated constitutes a distinctive part of the Coastal Trade of India. In spite of our continued efforts at rationalisation, the total cargo carried by the B.S.N. Line during 1952-53 was considerably less than in the previous year, though we did carry extra traffic in food grains. As regards the causes responsible for the general decline in our liftings, a material factor was the increasing resort to irregular practices due to overtonnaging on this sector of the Coastal Trade. Other contributory causes were the virtual stoppage of all movement of cargoes by sea between India and Pakistan, and the diversion to rail-routes of some of the traffic which used formerly to move to Saurashtra by sea.

As for passenger traffic, we carried about 20,000 passengers more during 1952-53 than in the previous year. During the year under review, we have implemented the Recommendations of the Deck Passenger Committee as regards increased space and amenities on our passenger-carrying ships, as a result of which their carrying-capacity has diminished by about 20 per cent; but the fares were not increased.

COASTAL AND ADJACENT TRADES

The aggregate liftings of cargo in all the above trades by the Company's fleet rose by about 1.98 lakhs of tons in 1952-53 compared with the previous year; and the aggregate freight earnings from these operations rose by about Rs. 76.22 lakhs, notwithstanding considerable reductions in the rates of freight on rice from Burma to India and Ceylon and in the rates for the carriage of salt from Saurashtra and Tuticorin to Calcutta.

While the inordinate delays which colliers used to experience both at loading and discharging ports lessened considerably during 1952-53, normal despatch of ships was hardly attained at any port owing mainly to labour trouble in one form or another and deteriorating labour output at about all the coastal ports. This "go-slow" policy of Port Labour, resulting in reduction of output at all Coast Ports, has reached such a stage that the Government must devise suitable measures immediately, and must effectively enforce the same, so as to restore the normal rate of working and ensure quicker turn-round of ships on the Indian Coast.

While the early months of the current year began with prospects which, so far as the Coastal Trade was concerned, seemed decidedly gloomy, the picture does not seem quite so bad to me now.

INDIAN COASTAL CONFERENCE

Gentlemen, you will no doubt recall the prominent part your Company played in securing reservation of the Indian Coastal Trade for Indian Shipping. Soon after reservation, in the general interests of all Indian Lines and with a view to promoting healthy development of Indian Shipping, we contributed our full share of effort in the formation of the Indian Coastal Conference and in working it wholeheartedly. However, it is to be regretted that since the latter half of 1952, we have been observing a steady growth of irregular practices on the Coast, especially in the West Coast Trade, designed to secure cargoes by improper means. During the second half of 1952, this problem became so serious that the Conference had specifically to consider these developments and try to rectify the situation; but these efforts were unsuccessful. Basically, there was a serious state of imbalance between the supply and demand factors in the Coastal Trade; and this resulted in a disparity between the tonnage capacity available, the cargoes offering and the prevailing level of freight rates.

These developments naturally caused serious concern to your Directors. After watching the situation for some months it was found that the position was steadily deteriorating and cargoes were being frequently diverted from our ships by irregular practices. Under these circumstances, your Directors were reluctantly compelled to the conclusion that no useful purpose would be served by continuing in the Conference. Your Company therefore regretfully gave the required six months' notice at the end of August of last year of termination of the Conference Agreement so far as we were concerned. Our withdrawal from the Conference will thus be effective from the first of next month. In the light of our experience of the working of Conference arrangements on the Indian Coast in

recent years as well as over a long period prior to the formation of the present Indian Coastal Conference, your Directors are convinced that the most satisfactory way of solving the problem now facing the Conference so as to ensure orderly progress of Indian Shipping in the Coastal Trades, lies in fixing a system of quotas for Member Lines having due regard to the size of the fleet owned by each Company and the past performance of each Line during the three years ending December 1952. Under a proper quota system, there would be no restriction on expansion of tonnage as, in practice, the supply of tonnage for the requirements of Coastal Trades would then be bound to adjust itself almost automatically to trade requirements on a fairly long-term basis. Further, it will also facilitate rationalisation or berthings which is essential not only for offering a better, more regular, frequent and reliable service to the public but also for better utilization and, therefore, for more economic employment of available tonnage.

OVERSEAS TRADE—INDIA-U.K.-CONTINENT

The two passenger ships, the s. s. Jalazad and the s. s. Jaljawahar, continued to maintain regular services in the India-U.K. trade during the year under review. But it has since been decided to withdraw them from India-U.K. passenger service and to sell them to the Eastern Shipping Corporation for employment in the India-Africa and India-Malaya passenger services. The decision to withdraw the "Azad" and "Jawahar" from the India-U.K. passenger service was taken by your Directors with a heavy heart.

I appreciate how deeply disappointed you all are that the Government of India should have declined to shoulder even the modest share we suggested of our heavy burden in continuing to run the U.K. Passenger service, and in consequence of which your Directors have felt reluctantly compelled to discontinue that service altogether. But while I share your feeling of despondency at this outcome, I would ask you to remember that what we and the country may lose by way of prestige in the field from which we shall now withdraw; will probably be more than made up for in the new field we shall enter through the Eastern Shipping Corporation with which we are so closely connected. Indeed, in some respects, the need for suitable Indian-owned passenger vessels operating in the India-Africa service and the India-Malaya service where these two vessels will in future be employed is, in my judgment, perhaps more acute than in the India-U.K. Service, though the "glamour value" of the latter may be greater.

The withdrawal of these vessels from the U.K. passenger trade will not be allowed to affect the regularity and frequency of the cargo service which your Company has been maintaining between the West Coast of India and U.K. Continental ports. Two fast vessels, namely m.v. Nordhval and m.v. Nordvard, have been chartered as immediate replacements, to be substituted eventually by owned vessels as early as possible, so that the service we offer in this trade may continue to be maintained at the same level of efficiency as heretofore.

Towards the close of the year opportunity was taken to re-organise these services by the employment of 12 steamers; and it is expected that the cargo services, as now re-organised, will provide more regular shipping opportunities to the mercantile community.

The Joint Service operated by your Company in collaboration with India Steamships Ltd. from the ports of Hamburg and Bremen to ports in India, Pakistan and Ceylon, has been functioning satisfactorily and is very much appreciated by the shippers in Germany and the importers at this end.

Your Company has now been admitted to partial membership of the Western Italy-India-Pakistan-Burma Conference. We have accordingly commenced berthing our vessels at Genoa; but as our membership is restricted to the Indian section of the Conference only, we may have some initial difficulty in securing adequate loads.

OVERSEAS TRADE—INDIA-U.S.A.

As indicated in my speech last year, the decline in the availabilities of cargoes from Atlantic Ports (U.S.N.H. range) adversely affected the freight earnings in the American service. As a result, more vessels were diverted to the Far East and Pacific trades during the year under review, on account of the fact that the earning position there was somewhat better than in the North Atlantic American trade. Even so, freight rates eventually went down so low as to necessitate our gradual withdrawal from the India-U.S.A. trade altogether. The American service thus remains suspended for the present; but under the expansion programme we have now in hand, we have planned for its revival with faster vessels such as will enable us to re-enter the trade with adequate support from Shippers at both ends.

TONNAGE POSITION

The keels of three out of the five 7,000 dwt. cargo motor ships of Maierform design, ordered from Messrs. Hindustan Shipyard Ltd. at Visakhapatnam, have been laid and it is expected that they will be completed and delivered to us during our next accounting year. The remaining two will be delivered during 1955-56. These five ships are primarily intended for Coastal Services; but they are of a type and design which will readily fit them for operation in Overseas Trades also. In fact it is intended to employ two of them in our Overseas Services from the very start.

I referred last year to the question of expansion of Indian Shipping and the provision made in the Five-Year Plan for loans from Government on attractive terms for purchase or building of ships suitable for the Overseas Trade. As a result of further discussion, it has been decided that loans will now also be available from Government, though at a higher rate of interest, for purchasing or building ships for the requirements of Coastal Trade.

Your Directors have therefore given careful consideration to the question of additional tonnage required to enable your Company to participate adequately in the Coastal and Overseas Trades and the extent to which the acquisition of such additional tonnage should be financed by accepting loans from Government. The conclusion they have reached is that, in addition to the six ships already ordered from Messrs Hindustan Shipyard Ltd., there is scope for adding two or three cargo vessels of small size and three cargo vessels of intermediate size, partly by way of replacement of old units due for scrapping and partly as net additions to the Fleet employed in the Coastal Trade. Furthermore, six modern cargo vessels suitable for the Overseas Trade will also be required; two in replacement of the "Azad" and "Jawahar" and four for the India-U.S.A. Service. This large programme will be financed by loans from Government to the extent of about Rs. 820 lakhs, the balance to the extent of about Rs. 410 lakhs being found from out of our own present and prospective resources.

These are ambitious plans, involving long-term financial commitments on a large scale, and requiring, therefore, very careful consideration by the shareholders also. Your Directors have accordingly decided that it would be best to place the whole scheme before the shareholders at a meeting which will be specially called for the purpose, so that all shareholders may have an opportunity to consider our plans and proposals in some detail and at leisure.

CONCLUSION

Before I conclude, I should like to express the warm appreciation of your Company for the co-operation, assistance and advice which we have always received from the Ministry of Transport and the Directorate-General of Shipping. I should like also to convey the thanks of the shareholders and the Directors to the Management, the staff, both ashore and afloat, and the Agents of the Company at various ports for having discharged their responsibilities in a manner which has enabled the Company to achieve satisfactory results.

FOR BETTER SOCIAL SERVICES AND SOCIAL AMENITIES

Every little is needed to add to the nation's pool of investment — to finance the great development schemes to help build the Welfare State of tomorrow.

THE SMALL SAVINGS SCHEME grows and flourishes under a guarantee of absolute security.

WHY HAS IT GROWN because it fulfils an obvious and urgent need—it puts your money to work for your and the nation's good.

COMPANY AFFAIRS

THE NEW CITY OF BOMBAY MANUFACTURING CO., LTD.

The working results of the New City of Bombay Manufacturing Company Ltd., (Managing Agents: W. H. Brady & Co., Ltd.,) for the year ended 31st December, 1953, show a marked improvement in the figure for total sales from Rs. 149.11 lakhs for the year 1952 to Rs. 164.23 lakhs for the year under report. Cloth sales have improved by more than Rs. 10 lakhs from Rs. 80.97 lakhs to Rs. 91.50 lakhs, whereas the figure for sale of yarn shows an improvement of more than Rs. 4 lakhs from Rs. 66.65 lakhs to Rs. 70.96 lakhs. The gross profit also stands at a higher figure of Rs. 7.09 lakhs as against Rs. 4.04 lakhs in the preceding year.

The provision for depreciation is slightly lower at Rs. 2.26 lakhs as against Rs. 2.32 lakhs in the previous year. No provision has been made for taxation while Rs. 2 lakhs have been transferred to the reserve fund and Rs. 50,000 to the reserve for Rehabilitation of Machinery and Plant. The Dividend rate per cent per annum stands unchanged at 10 per cent. The fluctuations in the fortune of the Company during the last three years are tabulated below:

Year ended 31st December	1951 Rs.	1952 Rs.	1953 Rs.
Sales of yarn ..	75,79,367	66,64,500	70,95,874
Sales of cloth ..	95,11,626	80,96,780	91,49,956
Sales of work ..	2,33,610	1,50,068	1,77,206
Total sales ..	1,73,24,603	1,49,11,348	1,64,23,036
Gross profit ..	20,94,575	4,40,196a	7,09,262b
Provision for depreciation	2,72,062	2,52,383	2,25,689
Provision for taxation	8,00,000	..	..
Transfer to reserve fund	1,00,000	..	2,00,000
Transfer to reserve for rehabilitation of machinery and plant	75,000	75,000	50,000
Dividend rate per cer per annum ..	15	10	10

a Includes E.P.T. post-war refund of Rs. 4,40,196.

b Includes E.P.T. post-war refund of Rs. 11,879.

THE KOHINOOR MILLS COMPANY LIMITED

The directors' report of the Kohinoor Mills Company Limited (Managing Agents: Killick Industries, Ltd.,) for the year ended 31st December, 1953, shows an increase of nearly Rs. 37 lakhs in the figure for total sales. Net profit before providing for taxation, but after providing for depreciation stands doubled from Rs. 21.75 lakhs as at the end of the year 1952 to Rs. 43.68 lakhs as at the end of the year under report. The provision for depreciation is slightly higher at Rs. 14.97 lakhs while the provision for taxation has been enhanced from Rs. 3 lakhs to Rs. 17.8 lakhs. The directors have transferred Rs. 5 lakhs to the Machinery Reserve Account as against Rs. 1 lakh in the preceeding year. No transfer was made last year to the equalisation of dividend account but during the year under review a sum of Rs. 1 lakh has been transferred under the same account.

The dividend has been increased in the year 1953 to 20 per cent per annum which consists of 6 per cent as the interim dividend paid on 24th September, 1953, a final dividend of 12 per cent and a bonus at the rate of 2 per cent. The working results are tabulated below:

Year ended 31st December	1951 Rs.	1952 Rs.	1953 Rs.
Sales	7,86,85,309	7,09,43,576	7,37,18,790
Gross profits ..	83,63,251	36,13,496a	58,65,752
Provision for depreciation	18,21,609	14,38,179	14,97,414
Provision for taxation	28,00,000	3,00,000	17,80,000
Transfer to machinery reserve account	5,00,000	1,00,000	5,00,000
Transfer to equalisation of dividend account	2,00,000	..	..
Dividend rate per cent per annum ..	25	18	20

a After including the E.P.T. post-war refund of Rs. 18,32,743.

THE BANK OF INDIA LTD.

The audited accounts of the Bank of India Limited for the year ended 31st December, 1953, show a reduction of more than a crore in the figure for total deposits. The fixed deposits have moved up from Rs. 950.79 lakhs to Rs. 1,187.37 lakhs while the deposits for current and contingency accounts have dropped by more than Rs. 3 crores from Rs. 3,792.83 lakhs to Rs. 3,446.95 lakhs. The figure for investments (at below market value) stands fractionally reduced to Rs. 1,934.93 lakhs. Advances, however, show a slight improvement from Rs. 3,221.76 lakhs to Rs. 3,358.04 lakhs. The net profit for the year is almost unchanged at Rs. 35.93 lakhs as against Rs. 35.76 lakhs in 1952, with the result that the provision for taxation for the year at 29 lakhs is not materially different from a similar provision of 31 lakhs in 1952. Dividend rate also remains unaltered at 14 per cent per annum.

The salient features of working of the Bank during the last three years are summarised in the table below:

Year ended 31st December	1951 Rs.	1952 Rs.	1953 Rs.
(a) Deposits:			
Fixed deposits	9,19,36,659	9,50,78,507	11,87,37,005
Savings bank deposits	8,66,80,710	8,68,89,841	8,54,41,524
Current account, contingency accounts, etc.	39.92,76,182	37,92,83,382	34,46,94,570
Total	57,78,93,551	56,12,51,730	54,88,73,099
(b) Investment (at below market value)	15,48,44,516	19,57,61,379	19,34.93.400
(c) Advances	42,43,09,691	32,21,76,434	33,58,40,363
(d) Interest paid on deposits, borrowings, etc.	32,87,779	46,22,920	42,24,922
(e) Interest and discount earnings	1,51,06,361	1,75,98,919	1,75,76,509
(f) Net profit	44,55,048	35,75,937	35,93,225
(g) Provision for taxation	25,00,000	31,00,000	29,00,000
(h) Dividend rate per cent per annum	14	14	14

COMMODITY NEWS AND NOTES

SECOND ESTIMATE OF RICE FOR 1953-54

According to the Directorate of Economics and Statistics, Union Ministry of Food and Agriculture, the all-India second estimate of rice for 1953-54 puts the current year's area at 71,198,000 acres, as against the corresponding adjusted estimate of 69,591,000 acres for 1952-53, thereby showing an increase of 1,607,000 acres or 2.3 per cent in area. The increase in acreage under the rice crop during the current year has been shared mainly by West Bengal, Assam, Hyderabad, Madras, Andhra, Madhya Pradesh, Bombay, Mysore, the Punjab and P.E.P.S.U., and has been due to favourable weather conditions at the time of sowing. The estimate generally covers the period up to the beginning of December 1953. Till then, the condition of the crop was reported to be generally satisfactory. In the unirrigated tracts of Madhya Pradesh, the crop was slightly affected by lack of sufficient rains, while in parts of the Gujerat and Konkan divisions of Bombay State, the crop suffered from excessive rainfall. In parts of Bombay, Madhya Pradesh and West Bengal, the crop was also attacked by insects and pests. This estimate does not cover the entire area sown to the rice crop during 1953-54. Past experience has shown that the area at the second estimate stage forms roughly 95 per cent of the area under the crop finally reported.

PRODUCTION OF COTTON IN INDIA

The Cotton Advisory Board, meeting in Bombay, recently estimated the 1953-54 Indian cotton crop at 4,100,000 bales against the previous estimate of 4,018,000 bales. Despite this increase in estimated outturn, the Board decided that no further quotas of Indian cotton could be allocated to mills under any circumstances this season. This decision is understood to have been taken to maintain a safe carry-over into the 1954-55 season. The carry-over as on August 31 was estimated at 16.96 lakh bales, the total availability at 64.96 lakh bales and the total disappearance at 48 lakh bales. The Board strongly recommended to the Government of India that the target of cotton production in India for 1954-55 be raised to 45 lakh bales from the Planning Commission's target of 42 lakh bales in 1955-56. The Board felt that this would make the country less dependent on foreign supply. The raising of the target would also help maintain cloth production at the current level of 1,415 million yards a month, support employment and enable the country to produce sufficient quantities of cloth, particularly of the coarse and medium varieties which are in demand at home and abroad. This recommendation is an endorsement of the recommendation made by the Indian Central Cotton Committee earlier this month.

INDIA'S STEEL PRODUCTION BY 1958

Mr. T. T. Krishnamachari, Union Minister for Commerce and Industry, said recently that India's annual production of finished steel was expected to reach two million tons by 1958. The Minister who inaugurated the first meeting of the Structural Steel Sectional Committee of Indian Standards Institution said the steel industry in India reached peak production of 1,360,000 tons in 1941-42. Owing to the intensive use of steel plants during the war period without proper facilities for repair and replacement, this rate of production, however, could not be maintained thereafter. The annual production came down to 854,000 tons in 1948 and could only be brought up gradually to about one million tons in 1952.

The expansion and modernization programme, which was already in the process of implementation, was expected to increase the annual outturn by over 600,000 tons. The new steel plant, proposals for which had recently been almost finalized by the Government would have to begin with a capacity of 350,000 tons.

FIVE LAKH TONS OF SUGAR TO BE IMPORTED

Mr. Rafi Ahmed Kidwai, Union Minister for Food and Agriculture, indicated recently that 500,000 tons of sugar are being imported for the country between February 1, 1954 and March 13, 1955. He added that production of sugar in India this year so far had not been less than the production in the corresponding period last year. The production this year, however, is expected to be lower because the cane crop in Uttar Pradesh has been affected.

GOA'S MANGANESE AND IRON MINES

Manganese and iron ore industries in Goa are facing a crisis following a sharp decline in prices of these ores in the overseas market, it is learnt. The slump has affected the smaller mine-owners mostly and they are finding it difficult even to pay wages to workers. Following the tightening of customs restrictions by the Government of India, general trading in Goa has also suffered heavily.

WORLD OIL OUTPUT

World oil production in 1953 is estimated to have reached the new record level of about 675 million metric tons, according to figures published by the Petroleum Information Bureau. This total includes output of natural gasoline and compares with last year's world oil production of 640 million metric tons. U.S.A. produced 50 per cent of the total output. There has been marked expansion in output from the fields in the Middle East which is expected to reach over 112 million metric tons, well above last year's record total of 105 million tons.

DECLINE IN WORLD COCOA PRODUCTION

World cocoa production for the 1953-54 season is estimated at 1,554 million lbs., a decrease of approximately 7 per cent from the previous season. African production was placed at 1,010 million lbs., a fall of 138 million lbs. Of the decline, 100 million lbs. is attributed to smaller production in Gold Coast as a result of unfavourable weather conditions. North, South and Central American areas continued to reflect rising production.

WORLD STEEL PRODUCTION IN 1953

World steel production in 1953 was 11 per cent greater than in 1952. Total world output in 1953 was 254 million tons, compared with 229.4 million tons in 1952. Well over half of the "free world" production in 1953 was in U.S.A., which produced 111.9 million tons. This was a gain of 18.7 million tons, or 70.1 per cent over 1952 production of 93.2 million tons. Steel production in the United States in 1953 was more than twice as great as that of the entire Soviet bloc which produced 54.3 million tons. The 20 per cent gain in production by the U.S. in 1953 compared with an increase of 16 per cent by the Soviet Union.

BRITAIN'S COAL EXPORTS

Britain's coal exports in 1953 were 13.96 million tons and exceeded the 1952 total by 2.14 million tons. It was the best effort since 1948. There has, however, been a decrease in consumption by foreign bunkers, being 2.86 million tons against 3.33 million tons in 1952.

U.S. CROP ESTIMATES

The final official estimates of production of grain crops in the United States for 1953 are as under:

(In million bushels)

	1953	1952
Wheat	1,169	1,291
Maize	3,177	3,307
Oats	1,216	1,268
Barley	241	227
Rye	18	16
Linseed	37	31
Soya Beans	262	292

The importance of banking to the COFFEE INDUSTRY

COMMERCIAL cultivation of coffee in India dates from about 1830, and is still almost entirely confined to South India. The yearly crop varies between 20,000 and 30,000 tons, most of which is consumed in India. When a surplus of Indian coffee is available for export, it finds ready buyers in fastidious foreign markets.

Without banking, the growth of the coffee industry would have been impossible. The availability of ready funds when needed, the collection of dues in any part of the country, and the other facilities and guidance offered by a good bank—these are an integral part of the structure of the coffee industry.

We at Palai are proud that so many leading coffee plantations, and indeed important firms in every field of business and industry in South India, employ the *complete* banking service we offer.

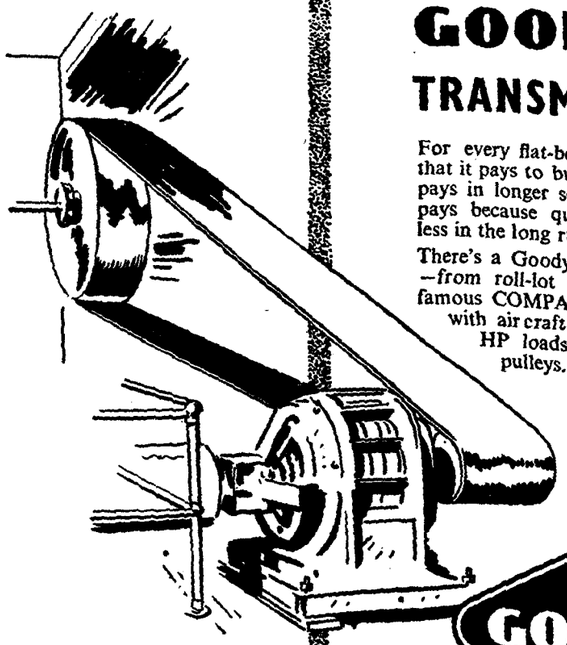
Current Accounts—Demand Drafts—Telegraphic Transfers—Investments—Bill Collection—Letters of Credit—Deposits—Loans & Overdrafts—Confidential Credit Reports, etc.

* * * *

If you have business interests in the South, it will pay you to open an account with us. Our 24 branches are strategically located, 22 in important South Indian business centres and two in Delhi and New Delhi; and we have correspondents in all important Indian cities. We offer a fully comprehensive banking service at each office.

Our clients can make deposits at any of our correspondent banks, situated in all important Indian towns, and have the amounts credited to their accounts at any of our branches.

PALAI CENTRAL BANK LTD.



(Incorporated in Travancore-Cochin with Limited Liability).

Head Office: PALAI, TRAVANCORE

Branches at: Madras, Cochin, Quilon, Trivandrum, Alleppey, Mangalore, Bangalore, etc. *Also at:* Delhi & New Delhi.

A LEADING BANK IN SOUTH INDIA

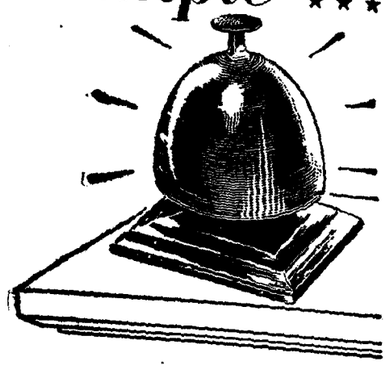
Your Best Buy
for the Long Pull...

GOODYEAR

TRANSMISSION BELTS

For every flat-belt transmission drive, you'll find that it pays to buy and specify Goodyear belting—pays in longer service, pays in lower maintenance, pays because quality Goodyear belting costs you less in the long run.



There's a Goodyear construction to fit every need—from roll-lot belting for agricultural use to the famous COMPASS Steel Cable Belt that is bodied with air craft-type steel cables to handle highest HP loads and cope with small, high-speed pulleys.

Ask us for help in belting your drives—and always insist on Goodyear transmission belting.

INDUSTRIAL GOODYEAR PRODUCTS

A shining Example

A gentle rub with Brasso will quickly brighten all the brassware on your office desk. Brasso gives a brilliant, lasting shine.

The Business Mind

THE 27th meeting of the Federation of Indian Chambers of Commerce and Industry held on March 6 and 7 at New Delhi will be ranked by impartial observers as one of the most significant business meetings ever held. Not, indeed, that there was anything dashingly original in the suggestions made or in the resolutions adopted. What was new was the conviction which business men were able to convey that their philosophy could stand comparison in moral terms with that of any of their critics. Hitherto, there has been a notable reluctance to claim that the demands of the private sector were fully in accordance with the total national interest. It was generally argued that they were good for production; or good for the investor; or merely good in principle in that the recognition of a private sector necessarily involved, as a logical step, the removal of dictation by the public sector. On this occasion, Mr. R. G. Saraiya, the President of the Federation, referred in a notable paragraph of his speech to the fact that business men had to recognise the principle of service as being superior to the profit motive by itself. The point was taken up by Mr. G. D. Birla, who, on Sunday, moved the main resolution on 'Unemployment' and 'Economic Development'. Mr. Birla's exhortation to the young business man was that he should abandon the amassing of wealth as the main criterion of success. Reputations today in India were to be built on other things; on the capacity to lead; on the capacity to organize; on the capacity, while producing efficiently in an economic

sense, to serve the paramount end of creating and distributing wealth on the widest possible base.

It was this pronouncement which marked at this meeting the change in the Indian business mind. It would be foolish to pretend that Mr. Birla's views in this matter are shared by the great majority of Indian business men. They are not. The great majority of Indian business men attach at the present time far more importance to the making of money than is good for themselves or for the country. The Prime Minister's only rebuke to business men on this occasion concerned the ostentation, some of it undoubtedly artistically vulgar, which business men often display. This rebuke was just; but, as Mr. Birla pointed out, even if business men did not correct themselves on this point, the Estate Duty would do the job for them. In fifteen years from now there would, he said drily, be no opportunity for ostentation, "vulgar or even decent". This is the guarantee that the Indian business mind, which is still largely addicted to money-making as a supreme end, will adjust itself to India's changing society. There was enough response even in this meeting to Mr. Birla's appeal to suggest that the change will take place long before the Estate Duty makes it inevitable. There was an earnestness in the speeches which followed which showed that many other leading business men, notably Mr. Shanti Prasad Jain and Mr. G. D. Somani, were of the same healthy cast of mind.

The battle of ideas inside the Indian business community is, however, not yet over. But two things at least give cause for optimism. The first of these is that the purposes for which Mr. Birla was arguing are not purposes accepted only by the best leaders in Indian industry. They are purposes which have been decreed by the broad character of public opinion in the Indian Revolution. The business man who fails to adopt the new philosophy must lose out; it is futile for him to kick against the goad. Secondly, in any case, the capacity of the business man to attract business to himself depends, as Mr. Birla pointed out, on a quite new appreciation of what is happening in the public sector. Already business conditions are being transformed by what is happening in the community projects, the areas of the great multi-purpose projects, and the demand from agriculturists whose real incomes have increased following a rise in agricultural production. If the narrow business man will be thwarted by the political and social changes of the Indian Revolution, he will be thwarted even more by economic blindness which will prevent him from seeing how tremendously his interests are now bound up with the great transformation included in the activities of the public sector.

One of the most interesting aspects of Mr. Birla's speech was the spelling out of some of these points which had been raised earlier in a different form by Mr. R. G. Saraiya in his Presidential address. It was no good, Mr. Birla said, for business men now to look after their own business only. There was a silent revolution going on in the countryside; they had to go out and see community projects, one or other of which could be found within a hundred miles of their places of business. Again, it was high time that the Federation gave its mind to a competent research study of the effect of the large injection of new money by deficit financing or otherwise into the Indian economic system. Mere generalities, like that we needed more purchasing power, were not enough. It was necessary to track down the money that went into the system; at the other end it was necesary to study what was happening to the new production which the agriculturist was bringing forth. Was he consuming it all, or was there to be a significant increase in his purchasing power by reason of larger sales? The business man had a vital interest in enlarging his sales in the rural areas. Why had the Federation not undertaken research to that end?

The answer here is not far to seek. It is partly lack of research appropriations in the Federation Secretariat. For an institution of the importance and influence of the Federation of Indian Chambers of Commerce and Industry, the present budget of the Federation which runs to about Rs. 2.6 lakhs per year is a standing disgrace to Indian business understanding. The British-controlled Associated Chambers of Commerce operate on many times this figure, apart from having far greater resources in the Secretariats of the Industrial Associations which operate from the same building. What has prevented Indian business men from making the necessary funds available is not lack of finance. It is a wooden outlook on the whole question of economic analysis and research; and, with even less justification, a total lack of understanding of the value of good secretariat work. Even to this day one can count on the fingers of one's hand the names of Indian business houses adequately equipped to present really competent memoranda on large issues of public policy.

It is because of this great weakness that much should be made of the point that Mr. Birla made that it is no use now, with very altered conditions, for resolutions at Federation meetings to go on haranguing the Government of India as in the days of old. Good wine needs no bush; if the case was good and well presented, as was Mr. Birla's philosophy, it can be addressed to the people. There is enough mature judgment in the Indian people to appreciate public spirit in whatever form it may appear. The real trouble about Indian business men is not that they have no case. Many speeches at this Federation meeting showed how basically strong the case was. Indian business men in the last few years have done things; they have not merely talked. But the time has come for them now to do some more talking. And unhappily for talking and writing in this democratic age most Indian business men are very ill-equipped.

The position is certainly improving but no one living in New Delhi can be convinced that it is improving fast enough. And the reason for this hesitancy in good public relations is partly a defect in early training which prevents many business houses from seeking talent on the widest possible intellectual base. Considerations of family and community continue to prevail over the real needs of business, and because the value of public relations is not fully appreciated, the salaries to draw very able men into Indian business are not forthcoming except in a few outstanding firms. There is urgent need, even at this late hour of the day, for many large firms to revise altogether their conception of Chamber and Advisory work. Most business men look upon Chambers or Economic Advisers merely as instruments to be used, as cheaply as possible, for the propagation of their views. The idea that the Chamber or Economic Advisers might serve as a valuable corrective to their own ignorance or lack of economic understanding is rarely entertained.

This meeting of the Federation has been valuable in turning the searchlight a little inwards. The leaders of front rank in this meeting showed that they have a sound appreciation of the country's interests and see those interests in accordance with their own. They cannot leave the matter there. There is urgent need for correctives to be applied to the business mind just as there is urgent need in the public sector for an appreciation of the extent to which the Indian business mind has changed. It is sincerely to be hoped that the work thus happily begun will be pushed forward rapidly to an early conclusion.

Egyptian Comedy

THE exciting political developments in Egypt, which commenced on February 25, and left the rest of the world wondering for a time, have now ended without any apparent change in the status quo. The events had all the characteristics of a political drama bordering now on comedy. They proved, perhaps, that palace revolutions could take place even if there were no royal palaces. The significance of these swift developments has as yet escaped even the most intrepid among the experts on the Middle East and on Egypt in particular. It passes ordinary understanding how General Naguib, openly accused on February 25 of the worst offence of sabotaging the work of the Revolution Council, placed under house arrest after serious consideration of the question of ending his life, could have been received back into the bosom of his accusers in a spirit of camaraderie. Obviously, what has been known so far is not the whole truth, and General Naguib has indicated that the real story behind these developments will become known only at some distant date.

These events have, however, given a shake-up to the very confident, and sometimes even complacent, interpreters of the Egyptian situation, who have tried to predict the course which Egyptian policy would take in relation to the countries interested in this area. It has been hitherto readily assumed that General Naguib was only the symbol of the Egyptian Army revolution and that the real power behind the revolution was Col. Nasser, who temporarily took over General Naguib's role on February 25. The theory was based on the fact that General Naguib was in the first instance a nominee of the Council and that Col. Nasser had not only controlled the support of all the members of the Council, but had also been more firm and clear-headed about the policies of the military dictatorship. In spite of such a key position, Col. Nasser has now been unable to have his way with General Naguib, showing that in the still fluid state of Egyptian politics, political currents cannot be regarded as having stabilised in any particular manner.

There has been one other recent parallel to such falsification of the facile views of political analysts about the location of power in the political set-up of the Middle East countries. For long it remained a firmly held belief that Dr. Mossadeq alone held the key to the future of Iran, and that no outside power could think of any alternative to negotiating with him and on his terms. The events of August 16-19 last year belied these assumptions and the aftermath of the Royalist triumph has shown that other centres of stable power could emerge. In Iran, popular acclamation of Dr. Mossadeq seemed to make his authority invincible, just as the army support assumed for Col. Nasser appeared to make the latter the inevitable successor to power. In Iran, that popular support for Dr. Mossadeq proved fickle, or was in any case forfeited when he took the extreme course of challenging the Shah himself. In Egypt, apart from the split in the army itself, popular feeling has been overwhelmingly in favour of General Naguib. It shows that the small group of army men, who were themselves under a necessity to find a sufficiently respectable and worthy symbol for their movement in General Naguib, could not control the actual extent to which the influence of that symbol was being built into the minds of the people.

Even if there was nothing to detract from Col. Nasser's status as the power behind the throne, other external factors had altered the relative status, as it had altered Dr. Mossadeq's position in Iran. This may not exactly imply a complete ascendency of the popular will but it does seem that modern coups d'etat, whether military or otherwise, cannot long exist without being responsive to the popular wishes. The same moral may be drawn from the dramatic events in Syria which coincided with the Egyptian developments. The Shishakly dictatorship had, on the whole, been a benevolent, though a firm, one and the attack on its existence came, curiously enough, not when it was becoming firmer but when there was a genuine move to relax the dictatorship. General Shishakly, like Col. Nasser, bowed to the inevitable, though in either case an attempt could have been made to resist with bloodshed the forces that compelled them to surrender. Such patriotism is entirely to their credit.

For all outward purposes, the situation in Egypt may continue to remain as before. Whatever policy differences there were are not now known. In Syria, the exile of General Shishakly has been interpreted as a development favourable to the Western policy of creating Middle East solidarity around the nucleus of Turkey, Iraq and Pakistan. No such clear-cut differences in the attitudes of General Naguib and Col. Nasser are discernible, either in their attitude to the question of the Suez or on the Middle East Defence System. General Naguib had, in spite of his recent severe indictment of the Turco-Pakistan pact, expressed several times that once the Suez question was settled, Egypt would recognise her vital links with Western policy. There has undoubtedly been a good deal of equivocation about this matter in public declarations, in which Col. Nasser has not taken a leading part. But quite recently he was quoted as having said that the Middle East should be independent of the domination of powers, Western or Eastern, and should "live in peace far from the struggle and win the friendship of all". It is too soon to say that the recent events implied a reverse for this view in Egypt, as it seems to have been in Syria.

But it is clear that if Col. Nasser had been the astute, strong and shrewd personality behind General Naguib as reports have described him, he should not have committed this grave miscalculation of the position that General Naguib had acquired. Not the least of the advantages of that position was the General's influence in the Sudan, which has yet to decide its future relationship with Egypt. General Naguib's relationship with the Sudan through his mother and his popularity there had been assets in the diplomatic success of Egypt in the Sudan settlement and in the subsequent elections. The effect of Col. Nasser's miscalculation has been to restore General Naguib with reinforced prestige and authority. But the crisis has now helped to fix the date on which there should be a resumption of normal political life. Events between now and the end of July may alter the programme but this decision is significant for the realisation shown by the military group that it cannot continue in power indefinitely. Egypt's foremost problem being a settlement on the Suez Canal dispute, it was inconceivable that a foreign power would regard a settlement reached with a military dictatorship as final. Further, if the idea was that the military leaders themselves should infiltrate into Egyptian political life in order to maintain the standards so far enforced on political parties, the popularity of General Naguib should prove an asset too good to be lost. The significance of recent events which have seemed too farcial to be taken seriously, has, therefore, to be sought in this acquisition of additional and unexpected importance by the General.

Parliament and Finance

THE general debate on the budget, which has just concluded in the Council of States, has been more or less formal and, for this reason, entirely un-illuminating. This is unavoidable, perhaps. The restraints within which Parliament can discuss finance are very considerable; and it is not unfair to say that tradition has prescribed that criticism should be along two main lines, namely, concern with the measures proposed in regard to the revenue deficit, and the ventilation of grievances regarding the exclusion of particular schemes of expenditure. It is necessary to examine at the present time whether this tradition should not be changed. It will be useful also to understand exactly what control, if any, Parliament can exercise over the executive in financial matters.

One or two matters must obviously be referred to at the outset. Parliament's formal control extends only to the issues from Consolidated Fund. The Public Account, however, is not the less important for the reason that it is not regulated by the votes of the House; and similarly, the House's powers to prescribe the limits, within which the Government can borrow, are not the less useful and relevant, because there has been no occasion so far to use these powers.

It has been suggested in order to extend Parliament's formal control that a Development Loan Bill should be presented every year; and if it is possible at the same time to include within the Consolidated Fund all the items of development expenditure, whether or not they are voted at the present time, this will make the discussion additionally more realistic. Since deficit-financing is to be undertaken regularly hereafter in the Central budget every year, it may also be necessary for Parliament to think of restraints within which the executive can be allowed to borrow. But before these powers are acquired or can be usefully exercised, the fundamental problems of economic development will have to be much better appreciated.

The parliamentary system is designed particularly to reduce expenditure. Both British and American rules of procedure are based on the recognition of this need; and within India itself, a report on the control of expenditure by a Sub-Committee of the Public Accounts Committee has exhibited recently grave concern at the possibility that the votes of Parliament may, in practice, be exceeded. A question of some importance which arises, out of this report, however, is whether, if a country's main problem is to achieve certain levels of expenditure within a stipulated time, an excessive and exclusive preoccupation with formal sanction to expenditure will be justified. Expenditure will have to be covered in time, no doubt, and will have to be sooner rather than later by Parliament's votes. But there are certain other matters to which Parliament should be devoting equal or even greater attention.

There is accuracy of budgeting, for example. It is no exaggeration to say that the budget of the Government of India today is in some danger of becoming, not a record of actual and estimated expenditure as it should be, the estimates being made as accurate as possbile having regard to the probabilities, but a string of certain targets, which as time passes reflects more and more the wishful thinking of the concerned ministries. Matters have now reached a stage at which one may honestly wonder whether any serious discussion of deficit-financing, based on the estimate that it would be of the order of Rs. 250 crores, will be worth while.

The trend of development expenditure within the Plan period so far does not lead to the belief that the heavy programme, which has been undertaken in the coming financial year—about Rs. 565 crores—can at all be carried out. In these circumstances, the Finance Minister had necessarily to choose one of two alternatives in framing his estimates. Either he could carry forward the arrears of spending, hoping that the rate of spending can be stepped up in future, as much as may be necessary. Or, he could choose, instead, to make the Central Government's budget realistic, accepting the inevitable fact that the Plan is going slow. Posed in these terms, the choice involves difficulties. But there is much to be said, on balance, for making the budget realistic rather than wishful. Parliament, by insisting on the accuracy of the estimates, can and should give the appropriate directives to the Ministry of Finance.

The accuracy of estimates is a matter of very great importance now, because the coming budgets will be based on the principle that it will be all right to cover the requirements of the Centre residually by inflationary borrowing from the Central Bank. It is too late in the day for anyone to question this principle. On the other hand, the size of the permissible deficit has already been widened from the Rs. 300 crores, which was mentioned in the Bernstein report, to anything from Rs. 500 crores to Rs. 600 crores. As long as this is the present or prospective budgetary position, it must be a matter of some importance to forecast the measure of the actual deficit every year as accurately as can be managed. It is not enough that the expenditure estimates should be made accurate rather than wishful. Parliament must also be satisfied that the receipts in the budget, particularly within the Public Account, have been stepped up to the fullest extent possible, so that the borrowing is needed only to cover the minimum residual needs.

The gross inflationary effect of the deficit thus arrived at is intended to be offset in two principal ways, namely, increased production and increased imports. These are, therefore, relevant, if Parliament begins to think, as sooner or later it must, of prescribing borrowing limits for the Government of India, as in the United States, in the exercise of the powers which are conferred for this purpose by Article 292 of the Constitution. There is one other criterion which is or should be relevant. As the Bernstein mission has pointed out, the new money supply, which inflationary borrowing from the Central Bank will create, should be available to the private as to the public sector. It cannot be the monopoly of the public sector only, as it may well become, if no one does anything about it.

The time has now arrived when the conventional approach to the Indian budget can no longer be adequate. Financial policy in India is becoming what it has not been so far, namely, increasingly positive. This means that the traditional functions of Parliament will, of course, continue. It will be necessary to enforce economy, because the country is after all poor, and to ensure also that there is equity, because the burdens of planning will not otherwise be evenly spread. But alongside of these traditional functions, there is also the need now to watch the effect of the present unorthodox measures of finance, which the country has deliberately chosen on a calculation of the risks. It is for this purpose that Parliament has to educate itself. This week's debates in Parliament conclusively establish this point.

THE WEEK'S NOTES

THE RETURN OF SARDAR PANIKKAR

Sardar K. M. Panikkar's Convocation Address at the Patna University marks the return of an active, and sometimes intriguing, personality to Indian public life in the domestic sphere. His role till now, as India's Ambassador, first at Peking and later at Cairo, was aimed at shaping, as much as any diplomat can successfully attempt such a task, India's foreign policy. In both assignments, he has been succeeded by persons with much less initiative and capacity to influence fundamentally the course of policy. This may be interpreted either as the success of the foundations so laid, which helped less enterprising persons to step in without difficulty, or as avoiding the embarrassments which over-active representation abroad may cause to the policies decided at home. However, Sardar Panikkar's return to the country should help to energise Indian political life by contributing new ideas at a time when staleness has set in through the tiresome repetition of worn-out cliches.

Sardar Panikkar has made a start in that direction already in his highly stimulating address to Patna graduates and there will undoubtedly be many more such opportunities for him to expand on other themes relevant to the present times. His great scholarship was applied to the task of defining India's role at the present time in a perspective which, paying due attention to her geography, history and tradition, transcended the limitations which have been incorporated by others who have been enslaved by that tradition and history. The ancient glory of Nalanda provided the peg on which to hang a theory of internationalism and the need for intellectual curiosity and spirit of adventure. He emphasised the historical role of English, the richness of the regional languages and the vital importance of developing "our national language as a medium of all-India thought and culture." His work in the States Reorganisation Commission should provide him the opportunity for reconciling what appears to many to be difficult to reconcile except by repudiating one or other of these three linguistic influences.

There would, however, be a wider acceptance of his timely reminder that though civilisation was not mere material prosperity, material prosperity was essential for all civilisation and for the creation of things of beauty. Unlike an economist, obsessed with the statistical consequences of development in India, Sardar Panikkar as a historian sees in our irrigation projects and factories and community projects something of the revival of the glories of Ellora and the Taj. This provocative address had, however, also a very provocative ending. The situation in India now, he declared, was characteristic for the gradual attempts being made to substitute the collective conscience for defining those standards and values which were formerly decided by tradition or authority. Democracy, he said, must concede the right even to totalitarian systems to persuade the people, for otherwise it would amount to a denial of democracy. Democracies do give free scope for such persuasion. The real issue was whether a democracy should or should not prevent a reversion to new authority and new traditions which are more deadly and more cramping than the old. The right of persuasion is misconceived when it makes persuasion to totalitarianism final at one point of time and subsequently binding not only on the same but all succeeding generations. The superiority of the democratic society arises from the fact that persuasion is continuous and uninterrupted. Sardar Panikkar having raised the issue should, perhaps, not have left the argument incomplete, especially when he was seeking to influence impressionable youth.

AFTER STALIN—TRANSITION OR CONSOLIDATION?

The first anniversary of Stalin's death on March 5 provided the occasion in all Western capitals for an assessment of the changes that have occurred in the Soviet Union in the last twelve months. The verdict was that there has been no change in the fundamental objectives of Soviet policy in relation to the rest of the world. This opinion was largely reinforced by the Soviet attitude at the Berlin Conference of Foreign Ministers. There has undoubtedly been a great deal of impatience in expecting changes in Soviet policy and to some extent the present verdict may seem premature. It was obviously unwise to expect that a Big Power would not seek to consolidate its internal and external position, however questionable might have been the methods employed earlier in securing that position. The world may have to wait much longer to know whether behind the new conciliatory gestures and diplomatic courtesies practised by the Soviet Union, there lies a genuine desire to move in the direction of peaceful coexistence. While it waits for more reliable indications of such movement, the West is inevitably compelled to continue its plans for being prepared for the worst.

Some of the internal changes have certainly been drastic. The fall of Beria, who only a year ago was so high up in Stalin's estimation that he could not be ignored, was no small matter. The decision to increase the welfare standards of the Russians and to devote more resources to consumption indicates that the contentment of the people has become a top priority. There has been open dissatisfaction with the progress of Soviet agriculture and new policies and incentives have been planned. These are not minor changes to effect in the course of a year of the Malenkov regime. In the international sphere, the prospects for East-West trade have improved and the recent talks in Moscow on Anglo-Soviet trade promise substantial expansion of trade, though the scope for such expansion has been highly exaggerated. Whether all these changes were planned even during Stalin's lifetime has been debated. They might well have been and even if optimism is stretched to the point of hoping that other changes in the international sphere might also have been thought of, for implementation in due course, it should be no ground for wishful thinking.

CONCILIATION IN KENYA

For the first time since the beginning of the campaign against Mau Mau terrorism in Kenya, hopes have been raised of bringing about an early surrender of the terrorists through a more conciliatory approach to the Kikiyus. The hideous Mau Mau ritual and the fanatical adherence of a substantial section of the Kikiyus had been sufficient justification till now of the savage reprisals and shocking excesses practised by the Government forces. The logical conclusion to this war could only be the virtual extermination of the Kikiyu tribe in order to make the land safe for the European settlers and for their enjoyment of their privileged position in the White Highlands. It is not a prospect to be contemplated with a clear conscience. The initiative taken by General Erskine in interrogating the Mau Mau leader, General "China", and the latitude given to the latter to negotiate with the other Mau Mau leaders are therefore commendable. The results have been encouraging and there is hope for an alternative course of policy. If clemency and conciliation can now persuade the Kikiyus to abjure Mau Mau methods, the Kenya Government must halt its shooting war to explore the possibilities of a compromise.

Unfortunately, the reactions among the White settlers have been otherwise. Even Mr. Blundell, who

once derided the policy of finding safety in bullets and who is regarded as the leader of liberal opinion among the settlers, has characterised the new policy as a "sell-out", on the assumption that the Mau Mau mentality could never be cured or changed. This fanaticism on the other side can be equally dangerous to the future success of negotiations. Such an assumption not only fails to take account of the successes achieved elsewhere in Malaya and in the Philippines in taming violent outlaws but also ignores, perhaps deliberately, the fact that Mau Mau is of recent origin and that large numbers of Kikiyus must have been drawn into the business through fear and intimidation. If the ring-leaders could be persuaded to abjure it openly, it may give the chance to thousands of others to redeem themselves from the awkward predicament into which they have been drawn involuntarily. It would be sheer folly if the Kenya Government allows itself to be guided by this opinion.

HEAVY ODDS AGAINST HISTORY TEACHING

The five 'lakshanas' or features prescribed for the Puranas—Primary Creation, Secondary Creation, Geneology of Gods and of Rishis and dynastic history of the mundane monarchs—may sound archaic in the modern context but they are nearer to the conception of history (of such moderns like H. G. Wells) as the history of the universe and of the world as a whole. The Conference on the Teaching of History held last week did not approach the problem of history teaching in any such large perspective. There was even a suggestion that too detailed an acquaintance with world history might tend to overshadow the significance of national history. National history was thus seen as exposed to dangers from two sides, the other being the study of regional history. The golden mean in this, as in everything else, will probably elude our search. But the large number of recommendations at this conference on a variety of matters will not hold out the promise that the teachers are quite clear about their objectives.

There has been a long period of neglect of the teaching of history and the other humanities. The emphasis till now on the natural and the physical sciences diverted talent away from history; and history teaching has to start with the problem of finding the teachers and the authors, who could discover the appropriate balance between all the factors. By one simple 'ipse dixit' to the effect that at the university stage the medium of instruction in history should be the regional language or the national language, much of the available material in books or teachers is further condemned to remain out of commission. Finally, there is the irrepressible enthusiasm of the politician to prescribe what is good in education. An instance of such enthusiasm was the decision that the I.A.S. trainees should imbibe the Five-Year Plan in the place of history, regional, national or universal. The odds against history are heavy at the moment even if the question had not been complicated by the language at the university level. The latest decision should provide the 'coup de grace.'

EXPECTATION OF LIFE IN INDIA

The estimate of life expectation in India on the basis of the census data of 1951 is 32.45 years for males and 31.66 for females. It shows only a very slight improvement over the estimate made by Prof. Kingsley Davis on the census figures of 1941, of 32.09 for males and 31.37 for females. In 1931, the corresponding estimates were 26.91 and 26.56 for males and females respectively. Prima facie, the conclusion is that the decade before the war contributed much more to longevity than the succeeding one. It is, however, claimed that there has been a refinement in the technique of collecting data in 1951 which has enhanced the value of the figure now calculated. This has been described as the "single year age tabulation of a 10 per cent systematic sample of the entire population", which enabled a detailed study of the peculiarities of the Indian age returns. Till now the most reliable figures available were only those of Oriental Ultimate Experience (1925-35) based on data relating to insured lives and hence limited to a special section of the population.

The percentage of Indian males surviving to age 20 is now 58 and to age 32 is 50. The figures for these ages for the better developed countries are 80 per cent and 65 to 70 per cent respectively. India is still very low down in the list of countries arranged in descending order of expectation of life, in spite of the visible improvement in the last two decades. This is largely found to be due to the heavier infant mortality, the expectation of life at age 20 exceeding that at birth. The exception, however, is the high mortality rate among women in the reproductive period.

A matter for satisfaction is the improvement now effected in the technique of collection of data on these aspects of the census. This has been due to the special pains taken by Mr. S. P. Jain, the Census Actuary, to devise and adapt methods suited to Indian conditions.

KOHINOOR MILLS CO., LTD.

Agents: KILLICK INDUSTRIES LTD.

Sole Yarn Selling Agents: NAHALCHAND LALOOCHAND LTD.

POWER IN INDUSTRY

The Thermal Power Station at Bokaro is the largest of its kind in Asia, with an initial capacity of 150,000 k.w. expandable to 200,000 k.w. Built at a cost of Rs. 13.8 crores the Bokaro Power Station represents one of the major triumphs of India's industrial progress.

STEEL played one of the most important roles in the construction of this giant station, no less than 6,500 tons of the heaviest rolled steel ever used in India going into the building and equipment.

From the cranes and draglines of the early stages to the final installation of massive boilers and generators STEEL has made an essential contribution to the generation of power—the driving force of industry.

TRADE

Tariff Commission's Recommendation: The Tariff Commission in their report on the continuance of protection to the fountain pen ink industry recommended *inter alia* that industrial units, particularly those producing foreign brands of ink, should clearly mark their products both on the bottles and on the paper cartons as "Made in India". The Government of India have accepted this recommendation and have accordingly issued a notification under the Indian Merchandise Marks Act, 1889, to the effect that fountain pen ink and inks of all kinds produced in India should have the country of origin marked on the bottles and paper cartons. This notification will come into effect from June 6, 1954, so as to give time to importers and the domestic industry to follow the new regulation of marking.

* * * * * * *

Hungary Steps Up Trade Drive: Hungary is planning to exhibit goods in 15 big world cities this year. This is a considerable increase on last year when Hungarian goods were on show at nine exhibitions. The first exhibition this year was in Cairo, opening on January 29. Others will be in Casablanca, Milan, Frankfurt, Sao Paulo, Montevideo, Leipzig, Helsinki, Vienna, Stockholm, Toronto, Teheran, Djakarta, and in Pakistan. Syria has asked for an exhibition in Damascus.

INDUSTRY

Cutback in French Jute Production Likely: There are possibilities of a serious cutback in French production of jute goods during the current year, due to the threatened loss of some important export markets, notably the United States. France's production of jute yarn during 1953 is estimated to amount to 91,000 tons and of cloth to 69,000 tons, compared with 85,000 and 69,700 tons, respectively, in the previous year. The 1953 figures are said to include 30,000 tons for export, of which 15,000 tons were for destinations abroad, compared with 11,400 tons in 1952, and 14,500 tons for the French Union as against 15,200 tons in 1952.

* * * * * * *

Caltex (India) Limited: The appointment of Mr. H. C. Hose as Vice-President, Marketing, was announced by the California Texas Oil Company Limited. Mr. Hose has been Assistant Vice-President and General Manager in New York in charge of the Company's European Division. In 1927 he became a Field Engineer for the Texas Company at the Port Arthur Works. He subsequently held the positions of Assistant Area Engineer and Area Engineer and in 1930 became Assistant Chief Engineer. In 1936 he was transferred to the Lockport Works as Chief Engineer, and in 1937 to New York City as Assistant Chief Engineer, Refining Department. From 1939 to 1944, Mr. Hose was Assistant Superintendent of Beacon Research Laboratory and in 1944 he was transferred to Foreign Operations, becoming Manager of Foreign Operations in 1947. In his present position Mr. Hose will continue to direct the affairs of the European Division for Caltex.

* * * * * * *

Dutch Company to Manufacture "Terylene": Imperial Chemical Industries Ltd. have concluded a licence agreement with Algemene Kunstzijde Unie, N. V. Velperweg 76, Arnhem, the Dutch manufacturers of rayon and nylon, under which the latter company will have the right to manufacture in the Netherlands and Belgium the new versatile synthetic fibre "Terylene". In addition to production by I.C.I. at the great factory now being built in the United Kingdom at Wilton in North Yorkshire, this fibre will be produced in France, Italy and Western Germany and also in Canada, where Imperial Chemical Industries of Canada Ltd., are building their own plant for the production of "Terylene" at a cost of more than $20,000,000.

* * * * * * *

The German Industries Fair, Hannover: At the German Industries Fair, Hannover 1954, open from April 25, to May 4, there will be, among other exhibitors, 168 firms manufacturing hand tools, precision tools (including some machine tools) and gauges, complemented by abrasives and polishing materials. The Fair will include 174 firms making all kinds of textile machines, textile testing machines, laundry machines and various other machinery for the clothing industry including sewing machines and accessories, many of which will be shown in action. All types of machines used for woodworking, including some foreign ones, will be on view. A section of the exhibition is to deal with office equipment (office supplies) paper goods, mechanical and other office appliances), including drawing requisites, office furniture and packing materials. The latest models in typewriters, bookkeeping machines, calculating machines, addressing machines, duplicators etc., will be on display. At the Fair, the group transport technique, which includes, inter alia, stacking trollies, belt-conveyors, assembly line conveyors, roller conveyors, electric trucks, stapling and transport containers etc., will be housed in a special reserved hall. The *International Containers* Exhibition will also take place.

FINANCE

Japan's Budget for 1954: The Japanese Lower House recently passed the budget for 1954, designed to reduce money in circulation, increase exports and cut production costs, higher than world levels in many of Japan's industries. The House passed the budget for 899,588 million Yens by a majority vote. Despite the austerity emphasis, 9,000 million Yens are made in appropriations for Social Security, Agriculture and Forestry and Education. The budget provides for greater Defence expenditure this year. The Government plans to spend 139 thousand million Yens on Defence in 1954, a rise of 133 thousand million Yens over 1953, though it has cut drastically appropriations for Public Works, Capital Investment in Industries, and Import and Export subsidies.

* * * * * * *

Ceylon's External Trade in 1953: Ceylon's external assets rose in January 1954 by 22.8 million rupees to 630 million rupees according to a bulletin of the Central Bank of Ceylon, issued recently. The bulletin also stated that trade with the U.S. which accounted for ten per cent of Ceylon's foreign trade in 1952 dropped to 5.5 per cent in 1953, reflecting a considerable reduction in the value of exports and a much greater reduction in the value of imports. Exports to the dollar area decreased from 236 million rupees to 209 million rupees. The proportion of trade in 1953 with Commonwealth countries remained almost at 1952 level.

* * * * * * *

Deficit Budget for M.P.: The Madhya Pradesh Finance Minister, presenting the Budget for 1954-55 in the State Assembly, forecast a deficit of Rs. 1,85,00,000 The revenue for the year was estimated at Rs. 28,83,00,000 and the expenditure at Rs. 30,68,00,000. No new taxes were proposed. A reduction in entertainment duties to 25 per cent of the gross takings against the average of 33-1|3 per cent at present was announced. The Finance Minister estimated the closing balance for 1954-55 at Rs. 17,54,00,000 including cash balance and investment in Treasury Bills and long-term securities.

The current year's closing balance is expected to be Rs. 18,07,00,000. In the revised estimate for the current year, the originally estimated surplus of Rs. 53,71,000 would be reduced to Rs. 51,80,000.

* * * * * * *

Orissa Budget Shows Deficit of Rs. 73.39 Lakhs: The budget estimates of Orissa for the year 1954-55 presented in the Orissa Assembly by the Finance Minister, revealed a revenue deficit of Rs. 73.39 lakhs. The total revenue for 1954-55 is estimated at Rs. 14,12,42,000 against Rs. 12,46,61,000 in the revised budget for 1953-54 thus indicating an increase of Rs. 1,65,81,000. The expenditure charged to revenue is expected to amount to Rs. 14,85,81,000 against the revised estimates of Rs. 14,66,77,000 for 1953-54. A sum of Rs. 3,67,80,000 has been provided for new schemes. This includes:—for continuing schemes included in the Five-Year Plan Rs. 55,24,000; continued schemes not included in the Five-Year Plan; 2,08,65,000. The receipts other than revenue are estimated at Rs. 49,94,97,000 and expenditure not charged to revenue at Rs. 49,56,09,000, the net surplus being Rs. 38,88,000. These transactions will have the effect of reducing the total overall balance from Rs. 55,85,000 at the beginning of the year to Rs. 21,24,000 at the close of the year.

* * * * * * *

Rs. 5-Lakh Surplus Budget for Delhi: The Chief Minister of Delhi, who also holds the portfolio of finance, presented in the State Assembly a Rs. 5-lakh surplus budget for 1954-55. The budget estimated a revenue of Rs. 4,45,41,000 and an expenditure of Rs. 5,05,83,000 thus leaving a revenue deficit of Rs. 60,42,000. This deficit was, however, converted into a surplus of Rs. 5 lakhs as a result of an opening balance of Rs. 52,52,000 and a grant of Rs. 12,90,000 from the Union Government to cover the revenue deficit.

* * * * * * *

Over Rs. 13 Crores Deficit in West Bengal Budget: The Budget estimates of West Bengal Government for 1954-55, presented to the State Legislative Assembly by the Finance Minister, disclosed a revenue deficit of Rs. 13 crores 38 lakhs. Revenue receipts and expenditure for the year have been placed at Rs. 39 lakhs (against revised estimates of Rs. 38 crores 82 lakhs for the current year—1953-54) and Rs. 53 crores 31 lakhs (against revised estimates of Rs. 50 crores 57 lakhs in 1953-54) respectively. The transaction of the current year 1953-54 is estimated to result in a deficit of Rs. 11 crores 75 lakhs on revenue account. Government proposed to raise a loan of Rs. 4 crores next year to finance certain development schemes involving capital expenditure and to meet the expenses in connection with the revisional settlement operation for the abolition of Zamindary. There is no proposal in the Budget for fresh taxation.

* * * * * * *

East Bengal Budget, 1954-55: A total provision of over Rs. 34.43 crores for displaced persons from West and East Pakistan has been included in the 1954-55 Budget. The current provision raises the total expenditure on displaced persons incurred in the past and to be incurred in the new financial year to nearly Rs. 236 crores. The estimated expenditure on rehabilitation of displaced persons till the end of March 1954 is more than Rs. 201 crores, excluding the provision of Rs. 4 crores for payment of compensation and Rs. 2.4 crores allotted to the Rehabilitation of Finance Administration. The balance of expenditure on relief and rehabilitation will be in roughly equal proportions between displaced persons from West and East Pakistan. The total expenditure during the year on housing, which gets pride of place as in past year, will be just under Rs. 10 crores for West and East Pakistan displaced persons. Including this amount, the expenditure on housing provided so far will exceed Rs. 75 crores. Provision also exists in the Budget for advancing urban and rural loans, education of displaced children, vocational and technical traning, and rural rehabilitation.

TRANSPORT

Progress of T.W.A.: Trans World Airlines, now in its ninth year of international operations, expects to fly more than 600 million passenger miles on its overseas routes alone, in the year 1954, making 457 per cent increase over the corresponding figures during the year 1946. In 1954, the airline statisticians estimate that 13,000 passengers will fly on T.W.A.'s international routes. As many as 24,500 passengers were carried by T.W.A. in a single month during summer on its international routes—significantly showing the results of T.W.A.'s efforts in promoting tourism in Europe, Middle East and to India and Ceylon. Concentrated international operations are profitable to the airline and the countries that are linked by their network, leading to an exchange of culture. In 1954, T.W.A. plans as many as 88 trans-Atlantic flights weekly during the peak months to meet this increasing demand. With the introduction of tourist fares, the travellers will seek newer playgrounds in the Middle East and Asia, which are available to them for the same cost as the European haunts of a year ago.

AGRICULTURE

Work of Central Soil Conservation Board: The Union Minister for Agriculture reports in relation to the work of the Central Soil Conservation Board that (1) **Bombay**—This State has done 'bunding' terracing to control erosion and to conserve water on a large-scale covering about 12 lakh acres. Proposals for work on a further 7 lakh acres up to 1956-57 are under consideration. (2) **Vindhya Pradesh**—This State has treated about 2,000 acres in the ravines of the Sindh River in Datia district. (3) **The Punjab**—This State has reclaimed much 'Cho' (Torrent) gullied land in the Siwalak foot-hills, the details of the work done being: Closures 16,59,531 acres, 'Cho' training 210 miles, Afforestation—Area planted: 26,621 acres and Area sown: 33,755 acres, Contour trenching 18,440 acres, Terracing and Watbandi by manual labour and machinery 21,945 acres, Bhabar grass planting 3,897 acres and Area reclaimed 828 acres. (4) **Mysore**—500 acres have been bunded. (6) **P.E.P.S.U.**—The details of the work done are: Contour trenching 4,482 acres, Afforestation (including afforestation of private wastes in hill slopes) 11,370 acres and 93 miles of forest paths laid, Training of water courses (streams and ravines) 17.5 miles, Check-damming 1,133 acres, Treat of cultivated fields (levelling, terracing and embanking) 594 acres. (6) **Damodar Valley Corporation**—Research on soil conservation, demonstration centres and land-use planning is being done. Survey of 30 square miles in the Siwane subcatchment for erosion control measures has been finished. (7) **Madhya Pradesh**—Area contour ploughed 132 acres, Contour bunds 141,174 running feet, and Broad base terracing 40,370 running feet. (8) **West Bengal**—Afforestation completed over 19 square miles up to 1952-53 against a target of 53 square miles in the Plan period. In addition, afforestation of 30 miles of canal banks in the Mayurakshi reservoir project is in execution. (9) **Madras**—(a) Agricultural areas: Work has been done only on a limited scale covering 6,661 acres and costing Rs. 2.56 lakhs during the last two years. (b) Forest areas: Experiments were carried out on a 15-acre plot and the area was planted with blue gum and wattle with satisfactory results. Ten thousand acres of barren reserved forests were taken up for afforestation in 1953-54. In 1954-55, the work is being doubled. Information is awaited from the other States.

NEWS IN BRIEF

INDIAN

The total contribution by the Union Government up to April 1955 towards the oil exploration scheme in West Bengal, in agreement with Standard-Vacuum Oil Co., is expected to amount to Rs. 25 lakhs. The Company is expected to spend Rs. 75 lakhs.

* * * * * * *

The third instalment of assistance amounting to Rs. 2 lakhs was recently granted to 66 voluntary welfare organisations by the Central Social Welfare Board. The total assistance provided out of the current year's allotment of Rs. 25 lakhs, now totals Rs. 18.54 lakhs benefiting 546 institutions.

* * * * * * *

India will buy 9 lakh tons of rice from Burma. An agreement was expected to be signed between the two countries. It is understood that the rice will be purchased at the rate of £48 per ton, out of which £15 per ton will be adjusted against Burma's debt to India.

* * * * * * *

Baby cars assembled in India are expected to be available by the middle of this year. Two schemes relate to the "Morris Minor" by Messrs. Hindustan Motors Limited and "Standard Eight". A third scheme was submitted by Messrs. Premier Automobiles Ltd., for the manufacture of "Fiat 1100" which is somewhat of a bigger model.

* * * * * * *

Central assistance to the extent of about Rs. 1 crore, including a grant of nearly Rs. 11.8 lakhs, for schemes in Madhya Pradesh includes loans for the supply of improved paddy and rust-resistant wheat seeds, installation of pumping sets, etc. The financial aid sanctioned by the Government of India to the State in 1953-54 amounted to about Rs. 1.88 crores.

* * * * * * *

The Union Government has allocated over Rs. 53 lakhs, including grant of Rs. 3.62 lakhs for the G.M.F. programme in Pepsu during 1954-55. The schemes include sinking of tube and percolation wells, land reclamation, purchase of tractors and equipment, pumping sets and urban composting.

* * * * * * *

About Rs. 108.80 lakhs, comprising Rs. 78.56 lakhs as grants-in-aid and Rs. 30.24 lakhs as loans, was given by the Union Government to the State Governments for 224 National Extension Service Blocks on which work was taken up on October 2, 1953.

* * * * * * *

The foreign income assessed on accrual basis of people in India in 1952-53 aggregated Rs. 809 lakhs and the tax thereon for the assessment year was Rs. 359 lakhs. The corresponding figures for 1951-52 were Rs. 2,322 lakhs and Rs. 478 lakhs, respectively.

* * * * * * *

India's sterling balances amounted to Rs. 710.75 crores at the end of December, 1952, and Rs. 734.32 crores at the end of January 1954.

* * * * * * *

After discussion with Andhra Government representatives and the Planning Commission in February 1954, a loan of Rs. 3.75 crores was granted to the Andhra Government in the current year for financing the expenditure on their schemes on capital accounts such as irrigation, electricity and building schemes.

* * * * * * *

During the five years ending 1953-54, $243,954,170 was added to the dollar debt of India, while $9,686,024 had been repaid. No sinking fund has been established for the repayment of the various loans. The major part of the debt was $196,164,486 by way of the wheat loan.

FOREIGN

The Pakistan Government has announced reduction in coal prices. Coal will now be available in West Pakistan at Rs. 43 a ton as against the present price of Rs. 50-4. In East Pakistan the rate has been brought down to Rs. 39 from Rs. 42-10.

* * * * * * *

The U.S. Government has granted Iran an additional $6 million to help the country until revenues from an oil agreement are received. The U.S. Government granted Iran $45 million in September 1953, after the Mossadeq regime was overthrown.

* * * * * * *

Mr. I. G. Harrison, a former chairman of the New South Wales Wheat Committee and Manager of the N.S.W. Government grain elevators, left recently to make a six-month survey of the wheat industry in India. The survey is being sponsored by the United Nations Food and Agriculture Organisation.

* * * * * * *

During 1953 Britain imported from all sources 492,857,000 lbs. of tea, valued at £83,026,000. Well over three-fifths of these imports came from India, which sent 315,356,000 lbs. for which Britain paid £51,928,000. This compared with the 304,381,000 lbs., worth £48,743,000 in 1952, and 276,071,000 lbs. to the value of £44,401,000 in 1951.

* * * * * * *

A total of 6,882 tins of refined coconut oil weighing 115 long tons was sent to Egypt, as the Philippines' contribution to the United Nations International Children's Emergency Fund (U.N.I.C.E.F.). The oil will be processed in Egypt into margarine and distributed to U.N.I.C.E.F. missions in Europe and Asia.

* * * * * * *

The world will again have plenty of vegetable oils for food uses in 1954, according to the recent prediction of the Commonwealth Economic Committee. The Commonwealth accounted for 23 per cent of the world oil and oilseed production in 1952-53 compared with 22 per cent in 1951-52 and 23 per cent before the war.

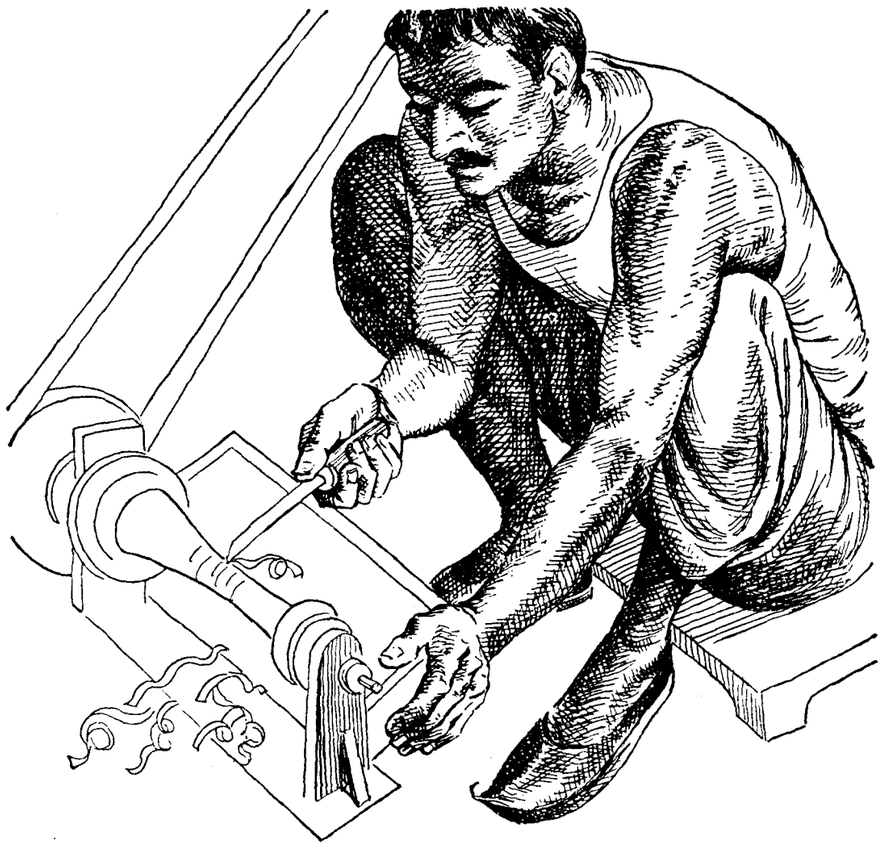
* * * * * * *

The population of England and Wales rose by 150,000 to 44,90,000 between June 30, 1952, and the same date last year (1953), according to the Registrar General's estimates published recently. The increase represents a rise of 3.5 per cent.

* * * * * * *

The Australian Wheat Board has received 180.6 million bushels of wheat from the harvest just ended, which is the highest total since 1949-50 when deliveries to the Board were 201.9 million bushels.

* * * * * * *



Proposals for aid to Asian children are to be reviewed at the 26-nation Board meeting of the U.N. Children's Fund. Allocations for Latin America, Europe, Africa and the Eastern Mediterranean are also to be recommended.

* * * * * * *

Trade increases between West Germany, Czechoslovakia and Bulgaria are provided for in trade agreement signed recently. The treaty with Czechoslovakia called for an exchange of goods valued at $37 million ($15 million more than in the previous year). The agreement with Bulgaria provides for an exchange of goods valued at $26 million ($3 million more than the previous year).

* * * * * * *

A loan of $54 million to the Commonwealth of Australia was announced last week by the International Bank for Reconstruction and Development. The loan is to be used for agriculture, which accounts for 80 per cent of Australian exports; towards transportation, and the development of electric power and manufacturing industries.

yes, it is my plan!

Lights will be switched on in a thousand villages. Handlooms, lathes will hum and spin. Every small community will become the hub of a growing village industry. There will be work for everyone. The Five Year Plan provides for Rs. 127 crores to be spent on developing and adding to our power resources. Multi-purpose hydro-electric schemes will supply cheap power to industry. Here is proof of a nation's determination to take its place amongst the leaders of the world.

Lakhs of tons of Steel will be used to implement the many diverse projects of the Plan. And so, in numerous significant ways Steel will provide the foundations for a richer, more rewarding future for our nation and our people.

A Window On The World

THE QUEEN AND THE COMMONWEALTH

By

ODYSSEUS

"IN THE WEST" is the title of Mr. Neville Shute's latest novel which I have recently read with pleasure and profit. It was not until I began to recommend it among my friends that I discovered that the book was regarded as "anti-British" and in "bad taste". I was astonished. Neither of these points had suggested themselves to me when I read the book.

Mr. Shute looks into the future of the Commonwealth thirty years ahead and envisages the Welfare State in Britain extended to the Nth degree; everything is socialised and controlled, with the result that the best brains and all the more adventurous people with initiative have emigrated to those parts of the Commonwealth, such as Australia, which are envisaged as having restored initiative to the individual and to have reformed the state along enterprising lines.

One of Mr. Shute's ideas for reform strikes me as admirable, and I do not see why it should be treated as frivolous because it has been put forward in a work of fiction. In common with every intelligent contemporary observer, Mr. Shute has seen the weakness of the "one man—one vote" system of levelling political thought down to the average of the masses, instead of up to the average of the educated, and he suggests that the weight of voting could be levelled up by giving more than one vote to certain people: a citizen might be able to earn as many as seven votes.

The first vote would be that of the universal franchise in operation now—everybody to have one vote at the age of twentyone. The second would be given to those with higher educational qualifications or with a Commission in one of the Services. I open a parenthesis here to observe that the justification for granting such a vote would depend on the standard of intellectual training achieved by the national universities. As matters stand in India today—don't take my word for it, but read the Report of the University Education Commission, presided over by Dr. Radhakrishnan in 1948-49—all that an honours degree means here is that a man has crammed enough text books to justify the examiners in not failing him, but it tells you nothing of his capacity to think. Mr. Shute's third vote goes to those who have seen something of the world by living outside their native country for two years or more. The fourth—one that will cause some tolerant smiles in India—is for raising two children to the age of fourteen without a divorce. The vote goes to both parents.

VOTES FOR RICHES AND PIETY

The fifth vote would go to anyone earning over Rs. 65,000 a year, and the more that I think about the implications of this proposal, the more I like it. Note that it is the opposite of the contemporary belief in India (as in Britain) that only parasites get rich. Mr. Shute's theory is a re-assertion of the now unfashionable truth that it takes intelligence and hard work to acquire riches.

Mr. Shute's sixth vote goes to anyone engaged in active church work. At first sight this seems irrelevant in India where piety is widespread, but church work is not the same as negative piety; it is active participation in religious social work. This exists in India (e.g. in the Servants of India Society), but the extent and practice is limited to a mere handful compared with the needs of our teeming population. Mr. Shute's seventh vote, rarely given, is an honour bestowed by the Sovereign (in our case the President) for outstanding services to the state.

It is easy to pick holes in these particular suggestions for qualifications for a multiple vote, but such disagreement does not invalidate the principle which is worth study, and worth popularising by the leaders of our thought.

In Mr. Shute's Britain of 1983, nobody outside the ranks of civil servants can buy a car or obtain any petrol. The country, financially, is ruined. A quarter of the population has emigrated to the flourishing Dominions. No new houses have been built for years and the people lead a life of crushing war-time austerity. The "Economist" of London has on occasion pointed out that, given certain circumstances, such a future could await Britain, yet no one has suggested that Geoffrey Crowther, its brilliant and physically and morally rotund editor, is anti-British.

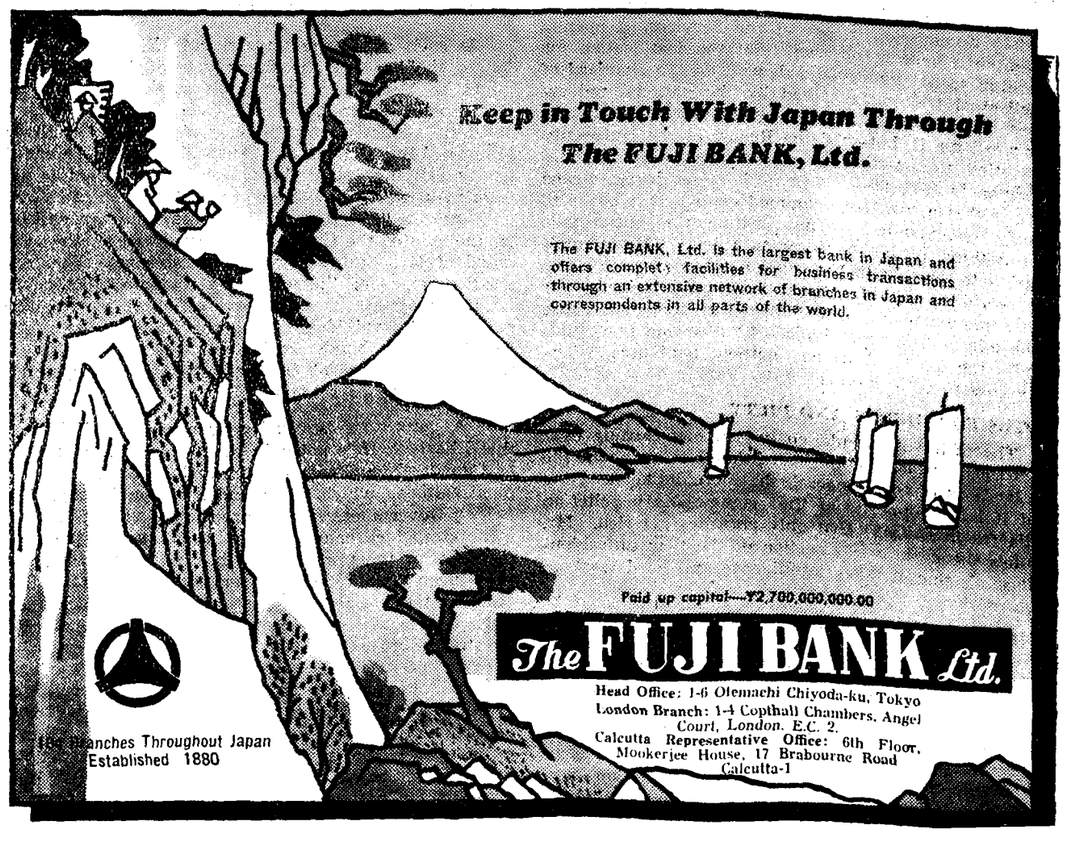
In Mr. Shute's Britain, a Socialist government is in power, headed by a Welsh Prime Minister, who still thinks in terms of class hatred, and who, therefore, makes the Queen's life miserable by pin-pricks and indignities. He is jealous of the affection that the people of Britain and of the Dominions still lavish on the Crown and he wants to damage its prestige wherever possible. Here is an example of the Prime Minister's attitude: "It seems to me a bloody waste of money. If the Queen wants to go to Australia, she can book a seat on the airline like everybody else, or go by sea."

AN INSULT TO THE QUEEN?

Is such a passage unpatriotic? Disloyal? Insulting to the head of the Commonwealth? The answer might be Yes if Mr. Shute's object were to hold the Queen up to hatred, ridicule, and contempt, and to enlist the reader's sympathies on the side of the Prime Minister. But Canada and Australia are shown indignantly rallying round the Queen. The blood of the book's Australian hero boils at the British Prime Minister's attitude, and the reader's sympathies are enlisted on the side of the Crown by every device at the command of Mr. Shute's very considerable art. Far from insidiously sowing the seeds of a revolution, Mr. Shute is (if I may use a crude expression to convey his gallant and loyal idea) giving the Crown a boost and Her Majesty a handsome leg up. If that is disloyal, then either she hasn't a leg left to stand on, or the word needs to be re-defined.

A point that is usually overlooked in Britain is that Elizabeth II is not only the Queen of England but of Canada, New Zealand, etc., and head of the Commonwealth to which India and Pakistan belong. The British Government has no proprietary rights over the monarchy which belongs every bit as much to the other members of the Commonwealth. Is it not wrong that the Queen should reside permanently in Britain, thus creating the impression that she is an exclusively English Queen? Are her periodical, hurried, and exhausting tours of the Commonwealth's member countries really useful? Should she not rather live in each member country in succession for a period of, say, a year? Would this not help to cement the bonds of Commonwealth? Would it not bring home in concrete fashion the interest that each member country has in the Crown? Seeing the Queen daily at work among them with cables and files pouring in from all

parts of the Commonwealth, would not the host member for the time being realise better its links with the others?



Whatever your answers to these questions, I imagine that you regard their submission in this column a legitimate topic for debate. But I am here only putting forward in editorial form some of the questions that Mr. Shute elaborates in his story. Mr. Shute's hero, David Anderson, whom he interestingly depicts as a man of mixed European and Australian aboriginal parentage in order to stress the Commonwealth's racial mixture, is an airman. The Australian High Commissioner in London tells David that the British Government wishes to make the Queen's movements dependent on the R.A.F. "The Australian Federal Government," he said quietly, "and the Canadian Government also—we think it very wrong that the freedom of movement of the monarchy in the Commonwealth should be in any way restricted by the British Government through the Royal Air Force, however generously that control may be exercised. To prevent that situation from arising, our Government, and that of Canada, have each offered to present an aeroplane to the Queen's Flight." An offer which the Queen accepts with the request that the crews be Canadians and Australians.

The story goes on to relate how Prince Charles (become the Prince of Wales) creates a constitutional crisis by threatening to abdicate if he is called upon to succeed to a Crown subject to the British Premier's indignities, and how a solution is found by a full recognition that the Crown belongs to the Commonwealth and not to any one member, so that the Queen takes up her residence in Australia where she is given a royal welcome, and appoints a Governor-General for Britain. This so shocks British public opinion that the Socialist Premier is thrown out and a more traditionally minded government wins the General Election.

As I am here concerned with the political and controversial aspects of Mr. Shute's novel, and not with its literary merits, I will merely say that it is an exciting and well-told tale, by an author who is reasonably described as "a prince of story tellers". I defy you to put the book down once you have begun it. It kept me awake throughout the whole of a night's train journey.

Wondering over the reception accorded to the book by so many British reviewers, I am led to conclude that their indignation arose partly because the Queen's permanent residence in Britain makes them regard Elizabeth II as essentially a British prerogative (so to speak!) and that other members of the Commonwealth have but a reversionary interest in her, and partly because they consider that a novelist's function is to entertain without provoking thought. Mr. Shute cannot scape some of the blame for this misconception of the novelist's function, for he has written an apologetic note to his book in which he refers to his "impertinence" and suggests that no one takes a novelist seriously. As a writer of fiction myself (under a non-Odysseyian incarnation), I protest vigorously against this narrow view of the novelist's art. Why does an idea cease to be worthy of consideration because it wears fancy dress rather than work-a-day clothes?

The U.K. edition of "In the West" has, I am told, sold 100,000 copies. This is heartening. It suggests that the British reading public is keen to listen to the discussion of new ideas and is not so easily alarmed and scandalised as the reviewers would have us believe.

BOOK REVIEWS

COMMODITY PRICE STABILISATION

Commodity Trade and Economic Development: United Nations: Department of Economic Affairs: N.Y., 1953: Price $0.75.

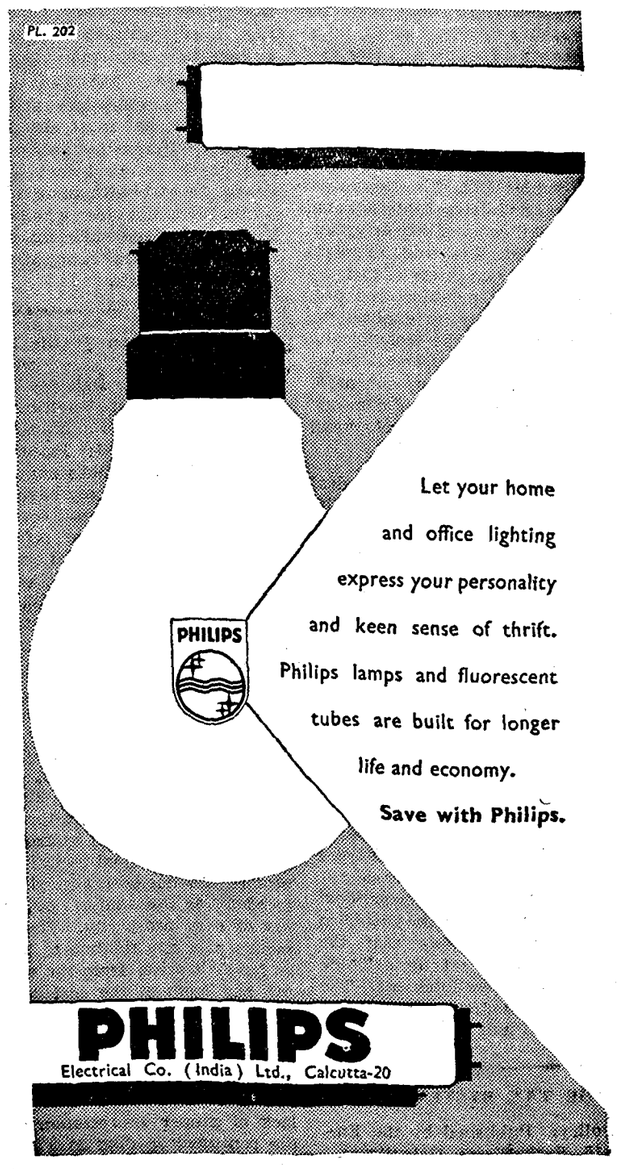
The post-Korean boom in world commodity prices and the subsequent steep decline have posed serious problems for the underdeveloped primary producers of the world. In particular, it is a problem of the sterling area which includes a large number of such countries and it was with a certain amount of dismay that they heard the Randall Commission's verdict against international commodity agreements. Though it is true that such agreements often tended to operate in a restrictive manner, they have been too few to be of assistance to the primary producers. A comprehensive attempt has now been made by an Expert Committee appointed by the U.N. Secretary-General pursuant to a General Assembly Resolution of December 1952. The Resolution had recommended multilateral or bilateral international agreements relating to individual commodities or groups of them to ensure stability of prices in order to maintain an equitable relationship between prices of primary commodities and capital goods and manufactured products. In other words, its object was to explore the scope for fair terms of trade between the economically backward primary producers and the advanced countries, for on that would depend the improvement of the standards of living and the formation of domestic savings in the countries engaged in development schemes.

The Expert Committee has not attempted to deal with individual commodities. After a review of the proposals that have been made from time to time the Committee has examined the types of agreement that are possible and has expressed the view that if the problem of finance could be solved, buffer stocks for individual commodities or for groups of them would be preferable to multilateral contracts. There are, however, no grounds for confidence for the success of either proposal and hence suggestions have been made to mitigate the effects of instability of prices to primary producers. One of them is "contra-cyclical" lending, involving the maintenance of disbursements by industrial countries, when they are themselves afflicted by a business recession. There is an interesting examination of a "commodity reserve currency scheme" and though there has been no agreement, it is recommended for closer study. Other national measures and types of compensation schemes are mentioned for consideration. Emphasising the existing gap in international organisation—which is attributed mainly to the still-born Havana Charter—the Committee suggests that the Economic and Social Council should set up a Trade Stabilisation Commission with advisory functions. The report is of value for drawing attention to a problem which is of immediate interest to half the world.

REFORMING THE TAX SYSTEM

Objectives of Taxation Policy: Published by the Employers' Association, 15, Park Street, Calcutta.

This booklet provides in convenient form a summary of the views of the Employers' Association regarding the existing taxation system. The highlights of the proposals are that the basic income-tax and the corporation tax can be combined, that the total levy on corporations should be reduced to 64 pies and that undistributed profits should be differentially taxed at four annas in the rupee. Additional depreciation allowances up to 100 per cent of the original cost in respect of machinery installed before 1947, reconsideration of the requirement that private limited companies should distribute prescribed minimum percentages out of their profits, and the liberalisation of allowances have also been suggested.



There is a logical and consistent case which can be argued in favour of these reliefs. Whether that case, which involves a shift to indirect taxation, and the reimposition of the salt tax, will be accepted in full is another matter. The Association's suggestions are that the cost of the reliefs, which it estimates at Rs. 60 crores, should be met from the salt tax to the extent of Rs. 15 crores, brisker collections (Rs. 5 crores), transfer of some items to capital (Rs. 20 crores), reduction in administrative expenditure (Rs. 5 crores) and savings in exceptional charges and general improvement (Rs. 15 crores).

Two considerations arise. The tax system must not only be but must also be seen to be equitable as between different sections of the community. It must also be so designed that it is not necessary for the Centre to part with more revenues to the states than it can. It is not clear whether these two considerations have been given sufficient weight, but there is much in the Employers' Association's case which can stand on its own merits.

The Indian Cotton Textile Industry (1952-53 Annual) and
The Indian Sugar Industry (1952-53 Annual): Editor: M. P. Gandhi: Publishers: Messrs. M. P. Gandhi and Company, Jan Mansion, Sir Pherozeshah Mehta Road, Bombay-1: Price Rs. 6 each.

Mr. M. P. Gandhi's annuals on the two key industries in India's economy have now become indispensable to the student of current economic affairs. Their lasting virtue consists in the refreshing analysis of major events during the year of review, which far transcends the rigid framework of a routine survey. This tradition has been admirably maintained in the latest two annuals. The Cotton Textile Annual rightly starts with the premise that the year 1952-53 marks a landmark in the history of the industry; it marks a return to normality and freedom after a decade of a restrictive regime of controls. The narration of factual events goes on to demonstrate that the industry's successful battle for greater production, carried to the point of almost achieving the final targets of the Five-Year Plan for the production of cloth and yarn, was the basic factor which won the restoration of full freedom from price and distribution controls by July 1953. The case for the next and final logical step—lifting of controls on production—has been argued reasonably. The return to freedom, as the analysis points out, does not mark an era of easy prosperity. The repercussions of Government's policy in relation to the industry particularly in so far as it arises from the outlook on taxation and aid to handloom at the cost of the industry have not escaped a brief review.

It was a different background against which the sugar industry had to operate in 1952-53. The inherent capacity of the industry to satisfy the requirements of domestic consumption in full cannot be in doubt. But lack of proper appreciation of the changing habits of the consumer leading to a higher demand was at the root of the Government's shifting policy in respect of the industry. The major trends in the prices of gur and khandsari did not receive the vigilance they required and the rediversion of demand to sugar from the two products owing to the steep rise in their prices almost to parity with sugar prices in important markets was not detected in advance. In the result, as the thread of the analysis in the Sugar Annual shows, policy for sugar deteriorated into a policy of expediency driven to a resort to import. An integrated policy for sugar, gur and khandsari is stressed in the review. As usual, copious statistical tables enhance the objective value of the Annual.

A DELHI DIARY

THE COCKTAIL PARTY

I KNOW T.S. Eliot has a play called "The Cocktail Party", but that was merely a title with no rebuke to the cocktails that enlivened the conversation. Otherwise, the cocktail party seems to have attracted no notice. On Saturday, however, cocktail parties moved into first place in the proceedings of the Federation of Indian Chambers of Commerce and Industry. The Prime Minister ended both his Hindi and his English speeches with a fierce denunciation of cocktail parties in New Delhi. The English rendering was probably the more vehement. It ran (and read!) "cocktail parties here are disgusting". And thus ended one of the most important speeches given to Indian business men, most of whom have never attended a New Delhi cocktail party (or any other!) in their lives, and many of whom must now be wondering why the sins of other folk are being flung upon their shoulders. Have they none of their own?

Some explanation of this extraordinary peroration had to be sought. And I am proud to be able to say that my researches in this direction have been duly rewarded. It would appear that a certain Deputy Minister, acting as an official host to a certain Rajpramukh a day or two before this momentous meeting, erred somewhat on the side of (alcoholic?) ostentation. He was unwise enough to number among his distinguished guests a source of information close to the Prime Minister. The story was duly reported, possibly with some embellishment. The Prime Minister was rightly upset that public example from a Deputy Minister was no better. It was not, however, possible to bring home the offence to a wide public by a personal rebuke to the Deputy Minister concerned. And, therefore, since the next public occasion was the Federation meeting, an accident decreed that business men received the rebuke intended for a member of the Congress Party in office. In this mixed economy, it would appear the private sector sometimes must receive the blows aimed primarily at the public sector. And cocktail parties (which can in moderation be quite interesting and useful occasions!) have also received the frown of official displeasure. Indian business men are innocent and will probably forget all about the rebuke in a day or two. But neither the Diplomatic Corps nor many other entertainers, official and otherwise, can be unaffected. Is New Delhi likely to become even duller than it already is?

I sincerely hope not. And yet almost everyone including members of the Diplomatic Corps (who suffer most!) will agree that cocktail parties in New Delhi are excessive in size and frequency. While, therefore, there should be no surrender of the fundamental right to give a cocktail party in any non-prohibition area, I hope advantage will be taken of the Prime Minister's remarks to effect a minor reform in the administration of this highly stimulating form of (intellectual?) entertainment. Let us have fewer and smaller cocktail parties; but let us demand (while working hard for the country!) that the government shall not administer our private, as well as our public, lives!

NO FIREWORKS!

The Federation meeting was voted a large success. Credit must be given to Mr. R. G. Saraiya, the President of the Federation, for striking just the right chords for an opening address. He pointed out that the common interest of the public and private sectors is that their common goal is the raising of the standard of life of the people. He was firm, however, on the rights of the private sector to pursue, in a mixed economy, the end in its own unfettered way. I thought that this bold assertion of the need for independence would draw the Prime Minister's fire. Curiously it did not; or, if it did, the fire was dispersed over such a wide range of targets that almost none of it hit the opening address. I can remember a previous occasion when a sentence in the speech of the President's address attracted such heavy fire from the Prime Minister that it created the feeling that the Federation inaugural meeting was a good place for fireworks. For the last two years, (alas!) there have been none!

The closing of the gap between the public and private sectors seems to be proceeding far more happily than looked possible three years ago. And not a little of the credit goes to business men who have found the capacity to meet the public sector in argument and, by words as well as by deeds, show that they can judge the national interest as keenly and serve it as well. In this meeting this was best shown by a fine speech by Mr. G. D. Birla when moving the main resolution on "Unemployment and Economic Development". He pointed out first that, on the ends of endeavour, there was no difference; both sectors wanted development and the diminution of unemployment. The question was how this was to be done. Not, as some people seemed to imagine, by a 'loss' motive to replace a 'profit' motive. He pointed out that the Government of India was as concerned about the losses on the Indian Airlines Corporation as any private management. They wanted commercial operation for commercial undertakings like the Railways, Airlines, Sindri and so on. Where was the difference? And why was it necessary, so far as avoiding losses was concerned, for the pot to call the kettle black?

The real difference was not in respect of profit and loss, but in respect of the scope of operations and the number of agencies that could be put into the field. The advocates of private enterprise held that in a country as vast as India the job could not be done by six men, or sixty men and (Mr. Birla might have added!) by six hundred or six thousand men. It needed literally millions of people. And the public sector could not get millions of people into its fold and direct them like sheep; (unless, I suppose, we went Communist!). Mr. Birla argued, therefore, that the only means to obtain the development required was to create a climate in which millions of people could find a new urge to work hard for themselves and thereby add to the country's development in the process.

THE BUDGET LEAK!

I have just time at the tail-end of my piece to talk about Parliament. This is not to do Parliament injustice; quite often the tail wags the head, or (as with the scorpion!) the sting is in the tail! It has been an exciting week in Parliament. On the Railway Budget in the House of the People there were two excellent speeches, one by Mr. Frank Anthony and the other by Mr. Tulsidas Kilachand. While Mr. Frank Anthony made a powerful point on the productivity of Railway labour, Mr. Tulsidas Kilachand stressed the misleading character of comparisons (on operating ratio) with other countries where the Railways filled a much smaller place in the general transport picture. All this was good for serious students of Railway statistics. I must confess that I found much greater fun when there was talk of a Budget Leak. It seems that on Budget day, Part 'B' of the Finance Minister's speech was put out in a few cases in place of Part 'A'. Now, Part 'B' covers the Budget proposals. Somebody might have made some quick money; unhappily the mistake was detected at once and the behaviour of the Press (according to Dr. B. V. Kaskar!) was excellent; no premature publication or leakage occurred. And thus the great story about this leak was that there was no leak; or rather it was plugged in time!

ARGUS.

SPECIAL ARTICLES

THE VOTING IN THE TRAVANCORE-COCHIN ELECTIONS

A VERY active democratic spirit has been at work in Travancore-Cochin. The results of the general elections held last month have confirmed, what was already revealed in the general elections of 1952, that a high population density—there are 1,000 persons per square mile in Travancore-Cochin—and a very high percentage of literacy stimulates political consciousness to a marked degree.. Even so, the degree of interest shown in these elections would not be fully explained by these two features. Other democracies, where these features are present to an equal degree, have shown that in a second local election held soon after country-wide general elections, it is unusual for an electorate to manifest great excitement unless far-reaching and momentous issues have arisen in the interval. It is hardly possible to say that the issue of finding a stable administration for the State posed anything so dramatically new or excitable. Yet the polling on this occasion has been heavier than before. From the high figure of 81 per cent of the electorate in 1952, the percentage of polling has now increased to 88.4. Two successive verdicts given by such an overwhelming majority of the electorate leave little to doubt about the state of mind of the voters of the State. They may indicate a rather highly volatile temperament of the people but they emphasise the existence of strong political loyalties either to political parties or personalities which are unlikely to undergo substantial change in a short period.

The electorate and the number of persons to be elected to the Assembly were slightly larger than what they were two years ago. Many of the constituencies were redrawn, or otherwise rearranged by the Delimitation Commission as single and double-member constituencies so that a direct comparison of the result in each constituency is not a sure guide to the changes that have occurred in the voting. The total electorate was larger only by about 200,000 but half a million more votes have been polled on the present occasion. The total number of candidates fell from 441 on the last occasion to 260 and this was entirely due to the fact that the Socialists who fared worst in the last election reduced their nominees by nearly half and the Communists and Independents by over two-thirds. This reduction is partly explained by the general realisation that individuals seeking election on their own merits had little chance in a fray in which the leading political parties were fighting in full armour. The other major feature responsible for the reduction was the understanding reached among the anti-Congress political parties to avoid splitting the opposition vote by dividing among themselves the constituencies in which to oppose the Congress.

All these factors had changed the nature of the electoral combat on the present occasion. It is remarkable, however, that the outcome has not differed substantially from the earlier one. The Congress party increased its total vote from 1.2 million to 1.76 million. This increase is as much as the additional half a million votes polled on this occasion. In percentage terms, there has been an increase for the Congress party from 35 per cent of the votes polled in 1952 to 45 per cent. With all these favourable factors, only one seat has been secured in addition, which is less than proportionate to the increase of 8 seats in the strength of the State legislature. The explanation thus lies largely in the electoral understanding reached by the opposition parties.

The Travancore Tamil Nad Congress has maintained its hold on those sections of the State for which its appeal for linguistic solidarity was strongest. In this area at least, the improvement in its strength from 8 to 12 shows that no extremist attitudes prevailed. The additional votes secured by the Praja-Socialist party of over 150,000 seem to have come mainly from the votes formerly secured by a large number of Independent candidates not affiliated to the United Front of Leftists; the more extremist section of this vote has apparently favoured the Revolutionary Socialist party which has now doubled its total votes.

The structure of voting reveals the existence of a solid core of about a million Communist votes; these were formerly secured in 1952 by the United Front of Leftists (other than the R.S.P. and non-Communist Independents) and now polled by the Communist party and the U.F.L. Independents. The voting, therefore, indicates that there has been no substantial accession to the voting strength of the Communists on the present occasion in absolute numbers, much less as a percentage of the total. This is quite an important factor to be borne in mind in assessing the results. The additional votes available through the larger polling and the fewer unaffiliated candidates have all gone to the two pro-democratic groups—the Congress and the P.S.P. The T.T.N.C. has only kept its limited stronghold, as it was expected to.

The main difference between the Congress and the opposition parties which emerges is that the parties which put up fewer candidates in the field secured a larger proportion of successes. As the biggest party which set up candidates for all constituencies except two, the Congress has emerged as the largest single group. But it has won only 40 per cent of the seats contested, as compared with the 50 per cent success for the P.S.P., 67 per cent for the Communists and 75 per cent each for the R.S.P. and the T.T.N.C. That is a result which was almost inevitable so long as the Congress was compelled to fight three different groups irrevocably opposed to it and each sufficiently strong in the particular area in which it chose to concentrate its fighting strength. Such a diversified and localised opposition could be fought only if there had been sufficient rivalry within the opposing groups. That has been avoided by electoral strategy. The taste of this victory in Travancore-Cochin may make it likely that electoral alliances would be more common in future elections to create instability for Congress rule.

It may show the need for Congress not creating more enemies for itself than are inevitable. In the present case, the rupture with the T.T.N.C. over a secondary issue—which has been responsible for ushering in the present awkward situation—has to be healed through a fair compromise. On the issue on which the T.T.N.C. challenged the main body of the Congress, it has secured a verdict in its favour. Its demand for a separate Pradesh Congress Committee which precipitated the crisis, was not unprecedented; the separate Pradesh Congress Committee for Malabar district alone in Madras State was sufficient basis for such a demand. The confidence felt by the John Ministry that it would be able to override the T.T.N.C. by added gains elsewhere has been proved to have been misplaced and the verdict by a preponderant majority of the electorate must for the present be regarded as conclusive and incapable of being reopened in the near future. The beneficiaries of the split are the Socialists who have gathered strength in numbers but are placed in a dilemma about the next step. While the opposition groups take satisfaction in the size of the non-Congress victories, it is some matter for satisfaction that the non-Communist vote and non-Communist victories have increased.

VOTING ANALYSIS IN TRAVANCORE-COCHIN ELECTIONS

	1952 Total No. of electors: 4,202,574. No. of seats: 109				1954 Total No. of electors: 4,410,958. No. of seats: 117			
	Set up	Elected	Votes polled	Percentage of votes polled	Set up	Elected	Votes polled	Percentage of votes polled
Congress	104	44	1,188,227	35	115	45	1,762,939	45
Socialist-P.S.P.	70	11	485,174	14.5	38	19	631,622	16
T.T.N.C.	15	8	201,118	6.0	16	12	237,408	6
R.S.P.	11	6	118,333	3.5	12	9	212,354	5.5
Other parties and Independents*	241	40	1,405,321	41.0	44	9†	403,182	10.5
Communists	..	..	..	..	35	23	641,046	17.0
TOTAL	441	109	3,398,173	100.0	260	117	3,889,014	100.0

* Includes Communists who stood as Independents in 1952 belonging to the United Front of Leftists and the Kerala Socialist Party.
† Includes 5 Independents belonging to the pro-Communist U.F.L. and 3 of the Kerala Socialist Party.

DEBATE ON THE INDUSTRIAL FINANCE CORPORATION

THE debate in the House of the People on the Industrial Finance Corporation, which is to be resumed at a later date, illustrates the extreme difficulty of Parliament sitting in judgment over a Corporation which is expected to exercise a considerable measure of discretion. This debate raises a question of principle, as did many of the earlier ones. How far will a nagging and paralysing control, 'ex post facto' of the decisions taken in respect of individual companies, be consistent with progress? Progress means, or should mean, with reference to the Industrial Finance Corporation at the present time, the utilisation of the funds which the Corporation now has invested in government securities, the putting to productive use, for the purposes of industry, of the proceeds of the contemplated bond issue of Rs. 2 crores, and the speeding up of the new dormant loan negotiations with the World Bank. There is every reason to fear that this progress of the Corporation is being hindered rather than helped.

The Corporation has not, of course, satisfied every expectation which has been entertained in regard to it. Basically, it has been and is still trying to find a precarious balance between the need to lend on the one hand (about Rs. 20 crores in a five-year period seemed once upon a time to be a reasonable target) and the need on the other hand to be conservative (latterly, as experience in the year ended June 30, 1953, has shown, the Corporation has also had some real reason to be concerned that applications for new investment rather than for modernisation or expansion are falling off). On any view of the problems, the recent past has certainly been a difficult period in which the Corporation has had to prove and to justify itself.

The rate of lending at present is, for example, high, especially when legal and other charges of the borrower are taken into account. If the volume of lending can be quickly expanded, the revenue of the Corporation being thereby raised, then the rate which it is necessary to charge can, perhaps, be brought down. The Corporation's finances, in any case, will be strengthened in such an event. Necessarily, therefore, an institution of this kind, which is at its present stage of development, has had to be concerned about extending its remunerative assets as rapidly as possible. This has not been too easy so far; and it is likely to prove to be a problem of some complexity. To sidetrack the Corporation from this preoccupation, even to impair its standing by means of hostile criticism, can therefore at this stage be productive only of the greatest harm.

The Corporation has laboured under serious handicaps, even as it is. The self-denying ordinance to the effect that those who have cases pending before the Income Tax Investigation Commission cannot be granted loans by the Corporation has removed many potential applicants from its list of customers. This has been responsible in part for the impression which has been produced that the Corporation has been excessively concerned with particular business groups. But it is obvious that to base any judgment only on these superficial impressions, during a period when loan applications could not have been many or representative, will be grossly unfair.

The test of the Corporation's bona fides in these circumstances is or should be two-fold, namely, first, has the Corporation unreasonably rejected any application for a loan, and secondly, has it or has it not become increasingly alive to the need for despatch in the disposal of these applications? The much-maligned Resolution of the Government of India has acquitted the Corporation on the first charge after a full review of the individual cases. As to the second, the fact that the number of rejections has gone down steeply since the end of June 1950 shows that the Corporation has been anxious to speed up its examination and procedure—a matter on which legitimate complaints could once have been made.

The more important among detailed sins of omission or of commission with which the Corporation has been charged by the enquiry committee are, once we accept the need for discretion, so minor as to be trivial. Typical charges are revaluation of assets by the companies borrowing from the Corporation, lending by the Corporation against assets which are to be created from out of the proceeds of the loan, the variation, in practice, of the margins which were prescribed, the repayment of earlier debts out of the loans secured from the Corporation, and the expenditure of the loan proceeds on non-productive expenditure. It is doubtful if a doctrinaire approach will be desirable in any of these matters.

The loans of the Corporation are well secured in law as well as in practice; a first mortgage and the joint and several liability of the directors furnishes a security which is valuable in itself. For the rest, the credit-worthiness of the borrower depends in the last resort on the earning power of the business; and although differences of opinion are possible, these questions must, as in normal banking practice, be left to

the managing directorate, and no abstract principles for or against can be laid down.

On two of these points, for example, the Corporation's explanations are quite relevant. They are that the margin happens to work out differently for different borrowers, partly because it has to be relaxed in certain cases (it has been relaxed after discussion in the executive committee) and partly because the actual amount of the loan, which is drawn or which can be disbursed under the Act, may well prove, in retrospect, to be very much lower than the value of the asset which is mortgaged. These explanations must be accepted as completely satisfactory. There can be no escape really from the conclusion that the Corporation's loan can be made, in the final analysis, only on the impressionistic judgments of those who are called upon to deal with the loan applications. Once this is granted, it will be extremely uncharitable to read motives into the various decisions, which could have been taken only ad hoc, so as to suit in each case the circumstances of each borrower.

Indeed, it is questionable wisdom even at the present time to seek to restrain the Corporation within the scope of any but the most generally-worded directives. The extract, which follows, from Viscount Bruce's recent review of the activities of the Finance Corporation for Industry in the United Kingdom, illustrates the fact that the approach to this problem elsewhere has been totally different:

"For such new ventures or expansions, a period of time is required for construction and the installation of the necessary plant and machinery, and after this is done a period of operation must elapse, before it is possible to determine the success or otherwise of the venture and the possibility of replacing our finance by a private or a public issue.

"During this period of construction and installation, and before operational results have demonstrated the value of the project, it is impossible for your directors to assess with confidence the value of the securities that we hold."

The British institution does not regard this as a mere formal statement. The extent to which it has utilised its profits to write down its investments shows that properly regarded and viewed in the wider perspective of what the country needs, a special institution like the Industrial Finance Corporation cannot afford to be bound by too many rules or to play safe and be more than usually conservative.

The dangers which an institution of this kind is likely to face in the initial years are two-fold. In the first place, the freedom which is necessary for the institution may be misused; in that case the Corporation will be unable to realise its paper investments at good value. Or, the Corporation may fail to live up to its pioneering role, and may deteriorate into a mere agency for lending to government, by taking up government securities. The history of India's first venture in industrial banking should serve constantly to remind us of the first danger. But it is just as well to recognise, in the changed context of modern times, that the second danger, which appears already to have overtaken the South African National Finance Corporation, is the one against which we have to be on our guard.

India's Industrial Finance Corporation, like the Finance Corporation for Industry in the United Kingdom, has tried to pursue the golden mean. Its sins of omission or commission, if any, have been inadvertent. To seek to build these up into a charge-sheet against the institution is, therefore, both unnecessary and unwise; unnecessary because the evidence does not support this attempt, and unwise because the Corporation's prestige must be maintained. Its directorate must be encouraged to face and tackle complicated issues on their own, at as far as possible a decentralised level, if the institution is at all to play any useful role in promoting industrial development.

A NEW INDUSTRY FOR INDIA

THE FIRST STAPLE FIBRE TO BE MADE IN INDIA PRODUCED AT BIRLAGRAM NAGDA BY GRASIM

(STAPLE FIBRE DIVISION)

A FINE PROSPECT : PRODUCTION CAPACITY OVER ELEVEN MILLION POUNDS OF STAPLE FIBRE PER ANNUM PRODUCING FIBRE WHICH WILL SAVE VALUABLE IMPORTS OF FOREIGN COTTON

A UNITED EFFORT : REPRESENTING THE CLOSEST COLLABORATION OF BRITISH MACHINERY MAKERS AND TECHNICIANS WITH INDIAN ENTERPRISE AND CIVIL ENGINEERING WORK

A GREAT ACHIEVEMENT : THE WHOLE INSTALLATION COMPLETED IN FOURTEEN MONTHS FROM COMMENCEMENT OF ERECTION TO START-UP

PLANT & MACHINERY DESIGNED, MANUFACTURED AND INSTALLED BY DOBSON AND BARLOW

BOMBAY-26

THE BUSINESS WORLD

VANASPATHI FACES THE FUTURE

The annual report of the Vanaspathi Manufacturers' Association, covering the year 1953, shows that the industry is in a stage of transition, adapting itself to the changing problems from day to day. Production in 1953 has been well maintained at 191,182 tons and progress has been reported in the following directions.

(i) In implementation of the recommendation of the Ghee Adulteration Committee, the industry is now adding vitamin A to vanaspathi. The technical problems have been solved in consultation with Messrs. Hoffman-La Roche of Switzerland, and very soon the industry may be in a position to ensure the stability of vitamin A.

(ii) The Association has continued the practice of buying samples of vanaspathi in the bazaar in order to establish responsibility for adulteration.

(iii) The labelling requirements have been revised, so that it is now only necessary to indicate that vanaspathi is made from vegetable oils, the particular oil not necessarily being indicated.

(iv) The ban on the transport of vanaspathi in mineral oil tankers has been reconsidered, so that the transport position has not been too difficult.

The uncertainties which face the industry are by no means unimportant even at the present time. The ban on vanaspathi in Rajasthan continues, for example. Private members' prejudice also still exists. The target of the Five-Year Plan at 300,000 tons of actual production, rated capacity being 388,828 tons, are also so far ahead of production in 1953 (although that production indicated a slight increase) that the industry has reason to be worried whether the market for its products, which incidentally is mainly in Northern India, will justify the expansion which is projected in the Plan.

There is all the more reason for this worry, because the individual members of the Association, as the President has pointed out, have more reason to be concerned with the course of oil prices than with marketing, the penalties of failure to exercise intelligent discretion in the matter of purchasing oil being much greater than the gains of extending the market can apparently be. The oils used before the recent attempts to change the raw materials base were as follows (figures are for 1950).

	(In tons)
Groundnut	193,222
Sesame	9,672
Coconut	3,284
Cottonseed	1,803
TOTAL	207,981

The course of groundnut oil prices throughout 1953 has been erratic in the extreme and the peak which was reached in July 1953, was the result of speculation in a market which is highly susceptible to its influence. Since then, prices have declined because of the ban on exports and the firm attitude of the Commerce Minister and also because the final estimate of the 1953-54 crop has turned out to be much better than was expected. But a hand-to-mouth policy or existence, as the President has pointed out, is hardly conducive to economy or to the efficient utilisation of resources. The problem of raw material must obviously be solved in more permanent fashion.

The accepted policy at the present time is to encourage the use of palm oil, copra, and cottonseed oil, in substitution of groundnut oil to an increasing extent. This is done on two grounds, namely,

(i) an imported source of supply is likely to prove to be more stable than groundnut prices have proved to be in the recent past, and

(ii) by exporting groundnut oil and importing palm oil instead, the country can save some foreign exchange.

Palm oil does not present any serious difficulties, but the use of cottonseed oil, which is another possible substitute, may. The use of a mixture of bleaching earth and of activated carbons will be necessary in order to free it from its objectionable colour. Delinting and dehulling machines may also have to be installed, before the cottonseed, of which the supply which is available in the country is expected to be about 12 lakhs of tons, can be fed into the expellers. These problems should not, in the course of the next few years, prove to be too difficult to solve. The President of the Vanaspathi Manufacturers' Association has now called for some attention to this problem. In addition to the fact that about one lakh tons of good edible oil can be produced from the cottonseed which is now available, the feeding of cottonseed oil cake to cattle after the fibre has been removed and the oil content has been reduced is to be preferred to the feeding of cottonseed in the present form. The matter is so important that the Planning Commission suggested a differential and lower level of excise duty on vanaspathi produced from cottonseed oil, in order to encourage the use of cottonseed, in spite of the additional expenditure, if any, which may be involved in changing over to this base.

The crux of the problem reduces to this. Groundnut is a good hardy crop, which on the result of actual experience can be steadily extended in India. There is a good case for such extension, but if the vanaspathi industry can use cheaper mediums, instead of being dependent on a commodity of which the prices are very highly erratic, there is no reason why this should not be done. The conversion to raw materials the prices of which are more stable may cheapen the prices of vanaspathi and in any case will leave the industry some time to concentrate on the two really important questions which should engage its attention, namely, quality and marketing. There is much in the latest Annual Report of the Vanaspathi Manufacturers' Association, which may be studied with benefit from this point of view.

THE STAPLE FIBRE INDUSTRY

By

CROESUS

February 1954 will go down in the economic history of India as a memorable month. For the month witnessed the production, for the first time in India, of that man-made fibre with innumerable possibilities, namely staple fibre. To the Grasim Factory at Nagda goes the distinction of having been the pioneer of staple manufacture in this country. (Incidentally, another factory manufacturing man-made fibre, namely

Rayon, made history in February by declaring a maiden dividend of Rs. 9 per ordinary share. I mean the National Rayon Corporation).

Until I saw samples of staple fibre and the cloth manufactured out of it, which were on display to the Press people, thanks to the special arrangements made by the Gwalior Rayon and Silk Manufacturing and Weaving Co., Ltd., I had an altogether different notion of staple fibre. But after seeing the products displayed, I can well imagine that, even in a large cotton-growing country like ours, the scope for the manufacture of this man-made fibre is not inconsiderable. According to one estimate, it would be necessary to produce 135,000 tons of staple fibre per annum to replace about 8 lakh bales of imported cotton; that means 20 factories producing at the rate of 20 tons per day. As against this, the 15-tons-per-day that the Grasim produces or its annual production of 5,400 tons is a negligible quantity. But that is about all the quantity of staple fibre that the country is importing today. In other words, even with the production of this one unit, the country can well become self-sufficient in the matter of its requirements of staple fibre presently being imported.

At the Press conference when the staple fibre produced by Grasim was displayed, Mr. D. P. Mandelia of the Gwalior Rayon and Silk Manufacturing and Weaving Co., Ltd., and Mr. Thomas Blackburn, Director, Dobson and Barlow (Rayon Plants) Ltd.—the suppliers of the plant to the factory—gave some facts about the Grasim factory which will be of interest. The construction of this factory was begun in October, 1951, and completed in February, 1954, that is over a period of just 27 months. But the actual erection work was completed in only 14 months, which is believed to be a record for this kind of work. The total outlay on the factory was given as Rs. 3¼ crores and the factory, when it goes into full production, is expected to employ nearly 600 people. But a notable feature, it was stated, is the scope for, and the opportunities before, highly educated people, especially chemical engineers. The Grasim started working only during the second week of February and the first samples of the product have just become available. But the interest with which these samples have been greeted and the eagerness with which the fibre market has absorbed the limited quantities offered (at about Rs. 2-1 per pound) are sure indications of the future of the new enterprise.

Being anxious to find out how the price of staple fibre compares with the corresponding varieties of cotton, namely Egyptian and American, I happened to ascertain from the spokesman of the factory and Mr. Blackburn that the price of staple fibre compares very favourably with the price of cotton of equivalent quality. Even if the prices are the same per pound for both cotton and staple fibre, I understand, if allowance is made for about 30 to 35 per cent waste contained in cotton, as against no waste in respect of staple fibre, the relative cheapness of staple fibre becomes obvious.

Now for a few general facts about staple fibre. The world production of staple fibre, according to Mr. Blackburn, is about 650,000 tons per annum. As compared to this, the production of the new factory that has been started in India will be less than one per cent! It is estimated that India needs to import about 8 lakh bales of foreign cotton per year which, at the present-day prices, may be valued at some Rs. 60 crores. If staple fibre should take the place of these imports, so much of foreign exchange could easily be saved. Furthermore, if staple fibre is popularised, so much of the land which would otherwise have to be devoted for growing cotton might be diverted for growing food, because the raw materials from which staple fibre could be produced are either imported or generally grown in places which are not ordinarily devoted to growing either cotton or food grains.

World production of man-made fibres today is estimated to be over 20 per cent of all other fibres, whereas world production of staple fibre alone amounts to about 20 per cent of that of cotton fibres. About 2 million spindles in Lancashire are permanently engaged in spinning staple fibre, whilst the U.S., which is the largest cotton-growing country, is also the largest producer of staple fibre. The consumption of staple fibre in England is about 10 yards per capita. In order to give a consumption of even one yard per capita, it has been computed India should produce 34,000 tons of staple fibre, or over 6 times the annual production of Grasim. And, in order to make use of this fibre, it is estimated at least 400,000 spindles must be permanently set apart.

In conclusion, it is perhaps necessary to mention that Grasim has plans to manufacture all other raw materials except wood pulp and sulphur which have to be imported and caustic soda which is produced within the country itself in abundant quantities, in the factory itself. As there are possibilities of making use of cotton linters, bagasse and even gutter waste for producing chemical pulp from which staple fibre is produced, it is not unlikely, mentioned Mr. Mandelia, that Messrs. Birla Brothers, who are the sponsors of the new staple fibre factory, may also sponsor the setting up of a factory for the manufacture of wood pulp in the not distant future.

The formal opening of the Nagda factory is likely to take place very soon, say, by the end of the next month or early April, when the factory will have reached its full production capacity.

ART SILK AND THE NEW LEVY

By

CROESUS

In commenting on the reactions of the Central Budget in the Special Budget Number of "The Eastern Economist", I had made only a passing reference to the effect of the Finance Minister's proposal to levy an excise duty of Re. 0-1-6 per yard in addition to a levy of 3 ps. per yard, under the Khadi and other Handloom Industries Development (Additional Excise Duty on Cloth) Act, 1953, on artificial silk fabrics. Since then the Silk and Art Silk Mills' Association, Bombay, has prepared a detailed memorandum on the effects of the proposed excise duty. Further, at a Press conference on Monday, Mr. D. M. Shroff, President of the Association, referred to the recent visit of a delegation to New Delhi to present the case of the industry to the Union Minister of Commerce and Industry and to the Union Finance Minister. I understand that the delegation, which has returned to Bombay, will again go to Delhi after the Government has had time to verify the elaborate data compiled by the silk and art silk mill interests.

In the meanwhile, the S.A.S.M.A. President has done well to make an appeal to all rayon mills not to close down, pending a decision by the Government. This was absolutely necessary in view of the fear created in the minds of the art silk mill workers, which has prompted the silk section of the Mill Mazdoor Sabha, Bombay, already to organise the 18,000 silk workers in the city (who would be thrown out of employment if all the silk mills in Bombay were to decide on a lock-out) in order, to use the very words of the appeal of the Sabha to its workers, "to gird up their loins to fight out this forced unemployment". By the way, it is interesting to note that the workers' organisation also feels that the duty imposed by the Government is unjustifiable. Thus, it observes: "Naturally, the proposed excise duty will be very heavy on the cloth which is being sold at As. 7-0 and As. 8-0 per yard. This duty has been imposed by the Government of India in order to collect additional revenue for development schemes. If, however, this duty is going to add to the unemployment, it is totally unjustifiable. No act of the Government should lead to an increased unemployment; instead, it should facilitate new industries to be started giving more and more employment. The Government has let loose upon the workers the demon of unemployment by the imposition of the excise duty".

In the opinion of the Indian Merchants Chamber, Bombay, this proposal "will result in developments and difficulties which perhaps have not received due consideration at the hands of Government". The Chamber has opined that "the art silk fabric manufacturing industry and the trade connected therewith is passing through a period of comparative difficulty as a result of setback in demand by reason, firstly, of a constriction in the export markets, and, secondly, of a setback in the purchasing power of the class of persons normally providing market for the items in question". According to the I.M.C., the cheaper varieties of art silk fabrics, where there is a volume of offtake, are priced between As. 8 and Re. 1 per yard, and it is here that the incidence of a cumulative charge (by way of excise duty and cess) of 21 ps. per yard will prove to be a burden and depress the demand for such fabrics.

But to revert to the memorandum, to the Finance Minister, of the S.A.S.M. Association. The memorandum, I think, makes a very pertinent point in answer to the justification for the imposition of the new duty put forward by the Finance Minister. Shri Chintaman Deshmukh said in his budget speech: "There is no reason why, when the bulk of cotton cloth is subject to taxation, artificial silk fabrics should be exempt". In reply, the Association contends that it is inappropriate to compare the art silk industry with the cotton textile industry. The following interesting comparative statement, showing the capital invested, the cloth produced, the number of workers employed, the wage bills, etc., of these two sectors of the textile industry fully substantiates the contention of the Association:

COMPARATIVE STATEMENT SHOWING THE POSITION OF THE SILK AND ART SILK INDUSTRY WITH COTTON TEXTILE INDUSTRY

	Cotton Textile Industry	Silk and Art Silk Textile Industry	Percentage of the Art Silk Industry with Cotton Industry
1 Total No. of Mills ..	453 | 200 Bombay State (65 Bombay City, 74 Ahmedabad, 61 Others) | 99 Madras State | 163 Other States	About 400—296 Bombay State (178 Proper Bombay, 71 Surat, 47 Others) —104 Others	
2 No. of Looms and Spindles	Spindles 1,14,27,034 Looms 2,03,786 (60% in Bombay State)	Spindles Nil Looms 26,000	12·22%
3 Consumption of raw material	30,00,000 bales Indian Cotton 10,00,000 bales Foreign Cotton Cost 121 Crores rupees of Indian Cotton. 45 Crores rupees of Foreign Cotton	25,000 Cases Indian 1,25,000 Cases Foreign Cost 1·5 to 2 Crores Indian About 7 Crores Foreign	5·42%
4 Production Average Yearly	Yarn 134 Crore lbs. Cloth 413 Crore Yds.	Yarn Nil Cloth 18 Crore Yards	4·35%
5 Exports of cloth during 1948-52 Average Yearly ..	Yds. 67 Crores Rs. 58 Crores	Year Yds. Rs. 1947-48 19,74,518 37,58,773 1948-49 2,44,79,997 5,19,11,637 1949-50 1,22,29,607 1,48,68,518 1950-51 69,90,304 96,72,809 1951-52 84,14,266 1,16,98,353 1952-53 34,97,287 49,46,318	1·43% yds. 2·77% Rs.
6 No. of workers employed in the industry ..	7,43,000	65,000	8·75%
7 Yearly Wage Bill inclusive of D.A. ..	Rs. 81 Crores	Rs. 6,25,00,000	7·71%
Other benefits ..	18 Crores	1,20,00,000 (approximately)	6·33%
8 Total paid up capital ..	Rs. 77,95,00,000	Rs. 12,00,00,000	9%

It will be seen from the table that the percentage of the number of looms that the art silk industry has vis-a-vis the cotton textile industry is only 12.22 its consumption of raw materials works out to 5.42 per cent of that of the cotton mill industry; its average yearly production is but 4.35 per cent of that of the cotton textile industry; the total exports of art silk fabrics as compared to those of cotton fabrics were 1.43 per cent in 1947-48 and 2.77 per cent in 1950-51; the silk and art silk industry employs only 8.75 per cent of the total number of workers employed in the cotton mill industry. The yearly wage bill, inclusive of dearness allowance, of the silk and art silk mills constitutes 7.7 per cent of that of the cotton mill industry, and, finally, the total paid-up capital is no more than 9 per cent of that of the cotton mill industry.

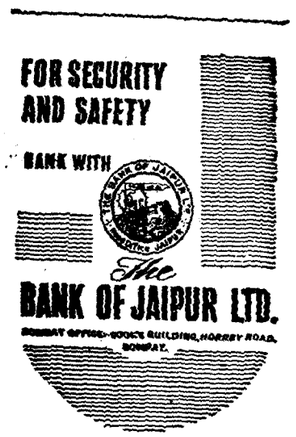
As regards the financial position, the Association points out that, in the year 1951, out of the 41 mills created in the Bombay city (local area) only 10 mills made a profit of Rs. 15.74 lakhs, while the remaining 31 mills made a total loss of Rs. 20.78 lakhs. In other words, the overall position of these 41 mills was a total loss of Rs. 5.04 lakhs. From the beginning of 1951, the financial position of the industry has been worsening, reaching almost the climax in 1952-53. According to the latest available audited balance-sheets of 43 member-mills of the Association, only 14 per cent of the mills made profits, while the remaining 86 per cent not only showed losses, but very heavy losses at that. Since the total number of looms installed by these 43 mills amounts to 4323, or roughly 40 per cent of the loomage in the mills situated in Bombay city (local area), the picture may be taken as being more or less representative of the industry as a whole.

The art silk industry is still an infant industry, being only 17 years old. The following table shows the progress of the industry over the past few years:

LIST OF MEMBER MILLS AND THE TOTAL LOOMS REGISTERED WITH THE SILK AND ART SILK MILLS ASSOCIATION LTD., BOMBAY

Looms Yearwise

Year		Mills	Looms
1937	..	16	2,000
1942	..	26	3,341
1947	..	44	4,610
1948	..	117	8,678
1949	..	175	11,510
1950	..	237	17,816
1951	..	312	21,375
1952	..	320	20,911
1953	..	311	20,855



A glance at the foregoing table reveals that, although the industry started about 17 years ago (as compared to the 100-year old cotton textile industry), most of the art silk mills are hardly 8 years old. Another interesting feature which the table brings out is that both the membership of the Association and the number of looms have been declining steadily since 1952.

Yet another notable point that the Association has made in its memorandum is that, as the industry is constituted today, it is more like a cottage industry. Thus, out of 26,000 looms, as much as 85 per cent comprises of small units, which is more or less on the lines of the cottage industry system prevailing in Japan. In some cases, it may even be described as a "domestic industry", for all those who work are members of the family. We are told, for instance, that there is one factory having only 34 looms with 19 partners and another with but 30 looms and 10 partners.

Even as it is, the industry has to bear a heavy import duty of 36¼ per cent theoretically and almost 50 per cent in practice, inasmuch as the customs authorities charge duty on market value, which, in this case, is particularly subject to wild fluctuations, due to speculation, an aspect to which even the Tariff Commission has made a reference (the Tariff Commission even recommended that a ban be placed on speculation in the art silk yarn market with a view to stabilising prices). It has, therefore, been complained that, if, in addition to this, the industry is called upon to pay the new excise duty, a factory of 25 looms costing only Rs. 40,000, will have to pay, by way of excise duty alone, as much as Rs. 41,000 per year. In other words, the duty would exceed a greater bulk of the total capital outlay of the whole factory. Surely this cannot be considered as equitable by any means.

Apart from everything else, at a time when the Finance Minister and the Commerce and Industry Minister are both saying that everything should be done to stimulate exports and to ensure a favourable balance of payments position to counter the inflationary forces that may be generated by the large deficit financing under the Five-Year Plan, it is surprising that so little thought has apparently been given to the possible effects of the new impost on exports of art silk fabrics. In a buyers' market, such a heavy burden will not only mean lower competitive capacity in the world markets, but even the internal consumer will refuse to pay the increased prices. As it is, the industry has not been able to pass on to the consumer even the incidence of the 3 ps. sales-tax and so it is not difficult to imagine the impossibility of transferring the incidence of the new excise duty amounting to seven times as much.

Finally, the industry has been passing through a very critical period over the past few years and no one conversant with the present plight of the industry would have the heart to suggest, let alone impose, such an unfair impost. In the circumstances, it is to be hoped that the powers-that-be would review the position sympathetically and revise the duty at least in respect of the cheaper priced varieties, if they cannot do away with the duty altogether. Since the Finance Minister wants to enforce the new principle in the sphere of taxation, he may not perhaps like to take back the entire proposal. But even this vital consideration need not prevent him from giving adequate relief to the industry, especially to the smaller producers and producers of the cheaper varieties of fabrics.

BUSINESS NOTES

DEBATE ON RAILWAY BUDGET

The general debate on the railway budget in both the Houses, and particularly in the House of the People, raised two points of long-term importance. They referred to the rationalisation of the freight structure and the adoption of a bold plan of expansion of line capacity to meet not only the requirements of a developing economy for additional transport but to provide a margin in anticipation of extra demand so that development may not be hampered. Mr. Shastri's reply on both these points showed that his Ministry has not yet thought it urgent to apply an objective mind to them.

A drastic overhaul of the rating structure that would upset the stability of railway revenues has never been demanded in any quarter. But repeated complaints about anomalies in important rates and concrete suggestions by spokesmen of railway users from time to time have indicated where revision of rates is feasible. The flaw in the rate structure is apparent from the fact that goods earnings have not shown fair elasticity in response to the rising volume of agricultural and industrial production. Another function of the rate structure should be to stimulate traffic to give an additional impetus to a developing economy. Mr. Shastri's reference in his budget speech to a revision of rates was ambiguously worded and his explanation has also not served to clarify his precise intention. His explanation that he had a certain measure of readjustment in view was not helpful and at any rate a precise and broad indication of that adjustment was surely to be expected in the budget speech. On the other hand, his proposal to levy about 50 per cent higher rates on newly built sections on an inflated mileage basis runs the risk of penalising traffic in backward areas.

The railway projects in the First Five-Year Plan are essentially in the nature of rehabilitation. The Railway Minister has now come out with the announcement that about 1,500 miles of new lines would be laid in the Second Five-Year Plan. Mr. Shastri was right in insisting that certain dismantled lines which are either wholly unremunerative or now replaced by well-developed road services need not be revived. But if experience in railway construction is to serve any useful purpose, it is that preliminary surveys must be completed without waste of time if regular construction is to be taken in hand. The process of preparing blueprints ought not to be allowed to consume the greater part of the period of the next plan.

By a curious logic the Railway Minister sought to make out a case that the operating ratio of the Indian railways was much better than in leading European countries picked up for comparison. Apparently, the fact that the transport systems in those countries were very badly damaged by actual warfare was irrelevant in his view.

INDIAN TEA IN 1954

Another year of high level exports is confidently predicted for tea in 1954. For the first three quarters of the current calendar year at least, this is to be accompanied by a high level of prices. On February 22, last, Indian common tea touched the record price of 4sh. 4¾d. per lb. in the London auctions. The basis of this optimistic forecast for tea exports to the U.K. is the time-lag between the emergence of a rising demand and adjustment of supply. Whether prices in Mincing Lane follow a still upward course, it is too early to anticipate and already some concern is expressed by consumers in U.K. at their trend in the past few months. But it seems fairly certain that until the impact of the arrival of the new crop in Calcutta is felt in September, the current level of prices is unlikely to go down. Since the derationing of tea and sugar in the U.K., consumption has steadily gone up and in 1953 it is presumed to have reached the pre-war per capita figure of 9.3 lbs. The ruling level of higher prices for coffee and the traditional preference for tea are sustaining the demand in spite of a spurt in prices.

Tea has ranked among the first earners of foreign exchange and shipments to the U.K. are naturally the highest. From gross exports of 304.4 million lbs. in 1952, they went up to 315.4 million lbs. In terms of export earnings, there was a rise in the same period from £48.74 million to £51.93 million. The world demand for tea (excluding China, Formosa and Japan) in 1954 is estimated to be somewhere between 1,000 million lbs. and 1,020 million lbs. With the present permissible limit of 135 per cent above the standard exports under the international tea agreement, it seems almost certain that it may go up to 1,020 million lbs. On this basis India can look forward to a total export of 470 million lbs. which means that output should be stepped up by 38 million lbs. above 1953 to satisfy the combined overseas and domestic requirements of the order of 645 million lbs. This cheerful outlook cannot conceal the fact that there can no longer be any justification of crop regulation in North India and Sir Percival Griffiths, Adviser of the Indian Tea Association, London, has lent the weight of his view to this vital fact.

SMALL-SCALE SALT MANUFACTURE

The Production Ministry's recently announced policy in respect of permissible limits of the operation of salt manufacture on a small scale can be appreciated only against the background of the existing state of affairs and its repercussion on salt manufacture under the system of licensing which is the mainstay of the industry. Small-scale manufacture on land by individuals or groups of individuals was exempted from the restrictions of licensing to the extent of 10 acres in each case. The special concessions which were offered to small-scale production were exempt from the levy of the cess and quality control. The basis of this policy accepted since April 1948 was no doubt to be traced to political causes, but an important consideration at that time was to stimulate production for home consumption and overcome the deficiency in salt output which was serious at that time. Since production has reached the stage of a clear exportable surplus, this consideration no longer prevails. Nevertheless, in the ordinary course, concessional production would have been continued on existing conditions. But its abuse on an extensive scale left no other remedy but to put severe restrictions. In practice, collusion between small producers and traders, as the Government Press note amplifies, made it possible to run salt works on land as large as 100 acres in contiguous area without violating the theoretical limit of 10 acres. Between 1949 and 1952 production enjoying special concession rose from 3 lakh maunds to 40 lakh maunds. Exemption from cess and quality regulation gave this category of salt production considerable competitive advantage over other salt. In several instances its permissibility for sale was clearly questionable from the viewpoint of human consumption.

The new policy, which is to be effective from March 1, 1955, to allow enough time to clear existing stocks, limits the size of an individual salt work to be operated as concessional small-scale unit to 2½ acres, and although no licence will be required in respect of it, quality standards may be enforced at the discretion of the Government. No transport facilities for move-

ment of salt output of this description by railway will be provided to ensure that its production is limited to the genuine purpose of local consumption. To the extent that other transport is available, this purpose may still be defeated, but its likelihood is very small. The real problem will be how to cope with the administrative aspect of the enforcement of quality control. Past experience about supervision gives some idea of the magnitude of the difficulties inherent in such enforcement. Concessional operation will have to justify the special treatment continued in favour of it.

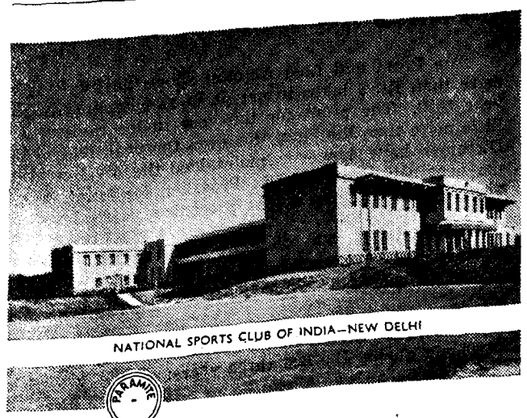
TRADE WITH U.K.

Since India has been able to reduce drastically her imports of food and raw materials, the U.K. has emerged as her principal partner in overseas trade. During the calendar year 1953 India's imports from the U.K. were valued at £114.49 million and exports at £113.44 million. The trade deficit of £1.05 million which the U.K. Trade and Navigation Accounts have disclosed was small and is indicative of the lower volume of this country's external trade in the last year.

Among the imports which this country took from the U.K. last year, machinery valued at £33.77 million was easily the largest group of items and represented one-third of the total. India was U.K.'s biggest customer of textile machinery and her share was valued at £6.99 million. Other main components in this group were: boilers and boiler-house plants (£1.65 million), generating sets and generators (£1.51 million), motors and parts (£0.78 million), other electrical machinery (£5.08 million), mechanical handling equipment (£1.44 million) and machine tools (£1.93 million). Vehicles accounted for £15.31 million of India's imports including locomotives, agricultural tractors, commercial vehicles, chassis, cycles and parts of all these. Imports of electrical goods and apparatus were worth £10.51 million. The group of chemicals, drugs, dyes and colours accounted for £9.94 million worth of imports.

About 60 per cent of U.K.'s imports of tea in 1953 valued at £51.93 million came from India—an excess of £3.19 million above 1952. Leather and its manufactures occupied the second place in the order of importance in India's exports and were valued at £14.01 million—an excess of £4.73 million over the previous year. This was equivalent to three-fourths of U.K.'s aggregate imports of these goods. Exports of jute piecegoods were of the value of £5.51 million and of jute sacks and bags £1.98 million. Tobacco has proved to be another strong point in exports to U.K. and last year unmanufactured tobacco valued at £4.51 million was shipped, amounting to half of the imports of U.K. Exports of unstripped tobacco were valued at £1.28 million. Among the other exports raw wool valued at £3.94 million, raw cotton and cotton waste worth £2.99 million (of which cotton waste accounted for £2.26 million) and manganese ore valued at £2.69 million bear mention.

WOOD SCREW INDUSTRY



Since the Tariff Commission tendered its report on the continuance of protection to the wood screw industry in August 1953, vital trends have come to the fore in the operation of the industry which necessitate reconsideration of the ways in which protection can be made effective. The glut of wood screws in the market and the level of prices at which indigenous screws are currently selling underline the claim for reconsideration. As against the average fair ex-works price of Rs. 1-2-6 per gross inch which was accepted by the Tariff Commission, it is stated that the present range of actual selling price varies between As. 12 and As. 14. This gives a rough measure of the financial losses incurred by the manufacturers who are operating mostly on a small scale. This gross disparity arises, first, from the Tariff Commission's assumption that double-shift working is the only basis on which economic operation is possible, whereas in practice only one shift is run. The second cause of sales of indigenous products below production costs arises from the import policy and certain developments in import since the Commission's report.

Japanese imports which at the time of the Commission's enquiry were in fact insignificant are no longer so and they have risen from 0.7 per cent of the total in 1951-52 to 27.2 per cent in the nine months ended July 1953. Japanese prices are equal to the prices of the Indian products and experience has demonstrated that the quantum of protection offered would have been adequate only in the absence of Japanese imports. Since the conclusion of the enquiry the emergence of the demand for lathe pointed screws and their use as substitutes for gimlet pointed screws has created a new situation; imports of the former at 100 per cent of the best year's imports have now proved a real risk. Apart from this effective competition from what was considered to be a harmless import, the permissible limit of 5 per cent import quota has added substantially to the accumulations in the last two years. It is in the light of these inroads of imports that Mr. K. L. Sakhuja has appealed to the Government in his presidential address at the last annual session of the Screw Manufacturers' Association to revise the import policy so as to make protection really operative in fostering the domestic industry.

FOOD AND TRADE IN ASIA

The changing pattern of food production and external trade in the countries of Asia was the subject of brief analysis by the executive secretary of E.C.A.F.E. If there was nothing novel in the analysis of recent trends and the suggestions for a long-term policy that he made, the emphasis which he placed on keeping a correct perspective of the inter-regional trade was surely appropriate.

Food shortages were quite naturally the principal preoccupation of most of the E.C.A.F.E. countries. But even in the rice-exporting countries of Thailand and Burma the stress was on production of more rice as the surest way to recover foreign trade. The success achieved by them in expanding their rice production, however, does not promise to ensure stable exports of this commodity inasmuch as the importing countries, including India, have gone much ahead with their programme of greater food production. The change in the rice export situation which Burma is called upon to face this year is an indication of the transition from the post-war short-term problem of food shortage. Nevertheless, the slogan of food self-sufficiency need not be pushed to an extreme to the point of ignoring the long-term equilibrium of external trade. The rice deal between India and Burma is indicative of the desire on the part of this country to help sustain trade relations between the two with reciprocal benefit. India has succeeded in some measure in giving an industrial bias to her economy and in keeping with this change industrial goods are assuming importance in her exports to the countries of this region. Large food production will always remain the goal of policy in India to feed a growing population as well as to raise per capita consumption, but if the purchasing power of the masses is to be increased to create an effective demand for more goods, more of industrialisation is the only dependable remedy. In respect of trade with the countries of the region, India's aspiration to shift the emphasis in her exports on manufactures implies readiness to respond to the requirements of their staple exports.

COMPANY AFFAIRS

THE BANK OF MYSORE LTD.

The Report of the Directors of the Bank of Mysore Limited for the year ended 31st December, 1953, discloses a sizable increase both in fixed deposits and savings bank deposits. Fixed deposits which stood at Rs. 221.94 lakhs in 1951 increased to Rs. 259.13 lakhs in 1952 and Rs. 339.81 lakhs in the year under reference. Similarly savings bank deposits increased from Rs. 159.22 lakhs in 1951 to Rs. 180.87 lakhs in 1953. On the other hand, current and contingency accounts show a sharp decline from Rs. 610.89 lakhs in 1951 to Rs. 368.22 lakhs in 1953. The overall picture discloses a slight rise of about Rs. 11 lakhs in total deposits from Rs. 877.93 lakhs in 1952 to Rs. 888.92 lakhs in 1953.

The Profit and Loss Account shows an increase of more than Rs. 3 lakhs in net profit as compared to the year 1952. The profit for the year under review is a little more than the figure for even the year 1951. The Directors have, however, maintained the dividend rate per cent per annum at 16. Provision for taxation has also been maintained at the preceding year's level.

The interest and discount earnings of the bank show an increase of more than Rs. 4 lakhs while the interest paid on deposits has advanced by Rs. 2.34 lakhs only.

The table below summarises the working results of the bank during the last three years:

Year ended 31st December	1951 (Rs. lakhs)	1952 (Rs. lakhs)	1953 (Rs. lakhs)
(a) Deposits:			
Fixed deposits	221.94	259.13	339.81
Savings bank deposits	159.22	166.78	180.87
Current account, contingency accounts etc.	610.89	452.01	368.22
TOTAL	992.04	877.93	888.90
(b) Investment (at or below cost)	285.15	300.34	292.61
(c) Advances	722.61	603.20	687.78
(d) Interest on deposits	10.49	13.13	15.47
(e) Interest and discount earnings	43.42	43.18	47.35
(f) Net profit	17.44	14.49	17.91
(g) Provision for taxation	5.10	6.00	6.00
(h) Dividend rate per cent per annum	16	16	16

PENCH VALLEY COAL CO., LTD.

The working results of the Pench Valley Coal Company Limited (Managing Agents: Shaw Wallace & Co., Ltd.) for the half-year ended 31st August, 1953, make very encouraging reading. There is an all-round increase in both raisings and despatches. Sales have shown a magnificent increase from Rs. 31.4 lakhs to Rs. 33.33 lakhs while the colliery expenses as well as the bill for salaries and wages show a downward trend. The profit for the half-year under review has increased from Rs. 5.31 lakhs to Rs. 6.77 lakhs with the result that the Directors have increased both the provisions for depreciation and taxation. They have also transferred an increased amount to the "development reserve account". The dividend rate per annum has also been enhanced from 15¼ to 17½ per cent.

The fluctuations in the fortune of the Company during the last three accounting periods are summarised in the table below:

Half-year ended	31-8-1952	28-2-1953	31-8-1953
(a) Raisings (lakh tons)	1.97	2.11	2.14
(b) Despatches (lakh tons)	2.01	2.05	2.17
(c) Sales (Rs. lakhs)	31.39	31.42	33.33
(d) Colliery expenses (Rs. lakhs)	8.40	8.97	8.79
(e) Salaries and wages (Rs. lakhs)	18.30	16.70	15.92
(f) Profit before providing for depreciation and taxation (Rs. lakhs)	4.01	5.31	6.77
(g) Provision for depreciation (Rs. lakhs)	1.28	1.50	1.94
(h) Provision for taxation (Rs. lakhs)	1.18	1.67	2.13
(i) Transfer to development reserve account (Rs. lakhs)	0.50	1.00	1.37
(j) Dividend rate per cent per annum	12½	15½	17½

BENGAL PAPER MILLS CO., LTD.

The working results of the Bengal Paper Mills Co., Ltd. (Managing Agents: Balmer Lawrie & Co., Ltd.) for the half-year ended 30th June, 1953, show a loss of Rs. 4.97 lakhs after providing Rs. 11,036 for debenture interest and Rs. 1.53 lakhs for block depreciation. The debit balance of Rs. 4.70 lakhs brought forward from the preceding half-year carries the total loss to Rs. 9.67 lakhs. The directors have written off this loss by drawing Rs. 3.37 lakhs from the "general reserve", Rs. 2.00 lakhs from the "provision for taxation fund" and Rs. 34,054 from "unclaimed dividends".

The loss during the half-year under report was a direct result of the illegal strike which started in October 1952 and continued till the 23rd March, 1953. The directors anticipate satisfactory results for the half-year ended 31st December, 1953.

No dividend has been proposed for the ordinary shareholders while the cumulative preference shareholders have been recommended 7 per cent per annum, free of income-tax. Dividend on "B" cumulative redeemable preference shares has been proposed at 6 per cent per annum (subject to deduction of Indian Income-tax).

FEDERATION OF INDIAN CHAMBERS OF COMMERCE AND INDUSTRY

Presidential Address of

Shri R. G. Saraiya

at the Twenty-seventh Annual Session held on Saturday, the 6th March, 1954, at New Delhi.

Respected Prime Minister, Your Excellencies and Friends.....,

Two years ago the Federation celebrated its Silver Jubilee Session. This year marks the Silver Jubilee of an allied body, the Indian National Committee of the International Chamber of Commerce. Ever since its inception in 1928 the Indian National Committee has consistently put forward before the international forum, the views and aspirations of India and the other less developed areas. It is also largely through the initiative of this Committee that a Regional Commission of the International Chamber of Commerce, called the Commission on Asian and Far Eastern Affairs, was set up in 1952 with New Delhi as its headquarters, so that the problems of this region may receive more adequate attention....

Turning to developments at home during the last year, it is indeed a matter of satisfaction that many of the targets set by the Five-Year Plan, notably in regard to the production of food grains, cotton and sugarcane are nearing realisation. Some of the magnificent river valley schemes are nearing completion, and the fruits of some of the small irrigation schemes as also of the community projects and agricultural development programmes are beginning to be reaped. The production of food grains in 1952-53 was some 4½ million tons higher than in 1950-51 and the estimates of crops for 1953-54 are also satisfactory. The imports of food grains have been coming down. Imports in 1953 were only about 2 million tons against 4.7 million tons in 1951. The increased production of food has enabled Government to announce relaxations in food controls. This step has been welcomed throughout the country by almost every section of the community. I should, however, like to stress that we must build up adequate stocks of food grains and keep them at a satisfactory level so as to prevent the recurrence of shortage as in the past.

The business community is keenly aware of the fundamental dependence of commerce and industry upon agricultural production. We, therefore, wholeheartedly welcome the importance given to agriculture, and the measures taken by Government for stepping up agricultural production by improving irrigation facilities, undertaking vast irrigation projects, providing better seeds, fertilisers and agricultural implements and encouraging research. The demand for agricultural products will continue to rise with our increasing population and the rise in the general standard of living. For example, the most important industry in India, viz., the textile industry, is primarily dependent on Indian cotton. As a result of the energetic steps taken by the Central and State Governments and with the assistance of the Indian Central Cotton Committee, a crop of over 4 million bales has been assured so that the gap left by the partition of the country has to a great extent been filled up both quantitatively and qualitatively. But the demand for Indian cotton is intense and the Indian textile industry could use more of it if it were available. It is, therefore, necessary to increase cotton production to not less than 4.5 million bales even during the period of the first Five-Year Plan, and to lay down plans for a further increase in the second Five-Year Plan in order to keep the Indian mills running at a satisfactory level.

In the context of the present-day conditions of soil, water supply, fragmentation of holdings etc., the Indian agriculturist is, according to best informed opinion, doing a very good job indeed and getting the maximum return which the soil in its present condition is capable of yielding. For many decades now, nearly 70 per cent of our increasing population has been dependent on agriculture. This meant increasing pressure of population on land, increasing impoverishment of the soil and increasing unemployment or underemployment in the rural areas. In order to ensure a fair return to the grower, it is necessary in the first place to provide better facilities for standardisation, grading and storage of his produce and better communications particularly in the rural areas, and to remove all handicaps to free marketing. It is also necessary to make available to him improved implements, seeds and fertilisers and better sources of water supply for cultivation. But above all, it is imperative to create conditions in which the pressure on land could be relieved so that the number of acres cultivated per agricultural worker may be increased. This naturally involves a fundamental change in the economy by resorting to such practices as mixed farming, diversion of a part of the agricultural population to other fields of activity and, over and above all this, population control. Viewed in this perspective, improvement in agriculture as well as the development of Indian industries and creation of additional employment are all seen as integral parts of one and the same programme.

In the industrial field, although some industries felt the impact of the change from a seller's to a buyer's market, throughout the year the general level of production was not only maintained, but actually increased. The index of industrial production with 1946 as the base was 117.2 in 1951. In 1952 it had risen to 128.9, while in 1953 the index has been around 134. In many industries, such as cement, power alcohol, heavy chemicals, rayon filament and light engineering, there have been sizable increases in production mainly through greater utilisation of existing capacity. In regard to cotton textiles, the current production is in fact running at a rate which is higher than the target laid down by the Five-Year Plan. At the same time, the price index for manufactured articles which was 377.5 in 1952 came down to 367 in 1953 and 364.3 in January 1954. This performance may be considered satisfactory as the fall in the price level was brought about in spite of an increase in costs, particularly labour cost, to which the Tariff Commission refer in their first Annual Report, and of industrial raw materials, the price index of which rose from 453.8 in 1952 to 459.7 in 1953 and 481.1 in January 1954.

While this rate of increase in industrial production may be regarded as satisfactory on the basis of existing installed capacity, the fact remains that investment

has not been of an order that would help sustain development on a scale necessary for a rapidly developing economy. While industry is doing its best to find capital, it would appear that investment is neither increasing nor being diverted in a significant manner to new lines of production. Although complete figures are not available, some idea of this can be gained from the figures of licences granted under the Industries (Development and Regulation) Act for new establishments in the scheduled industries. These figures do not include what would be termed as "normal" expansion, nor do they include industries outside the 37 then covered by the Industries (Development and Regulation) Act. During the one-year period ending September 1953 the total amount of additional capital required for proposed developments was about Rs. 82 crores. Of this, about Rs. 33 crores were for new establishments and the remainder, i.e., Rs. 49 crores, were for expansion of existing undertakings. Now prima facie these figures look very encouraging. But out of the Rs. 33 crores required for new establishments, Rs. 18 crores are for one of the proposed oil refineries, thus leaving only Rs. 15 crores for new industrial undertakings in other industries. Similarly, in the case of expansion also, out of the Rs. 49 crores, over Rs. 31 crores are accounted for by the iron and steel industry alone. In other words, excluding iron and steel and petroleum, the figures of investment are about Rs. 15 crores for new undertakings and about Rs. 18 crores on account of expansion schemes in other industries. It has to be noted that out of the 37 industries then covered by the Act, only 23 were granted, during the year, licences for new undertakings or for expansion. These figures can be said to be hardly encouraging in the context of the rate of industrial development necessary for the country.

Against this background, one is naturally led to a consideration of the problem of unemployment, concerning which there has been, in the course of the year, considerable public discussion. All kinds of diagnoses, and equally varied remedies, have been suggested. But the essential point which seems to have been overlooked and which I should like to emphasise is that unemployment in India is not of the type of 'cyclical unemployment' which occurs periodically in industrially advanced countries, but of a pattern characteristic of an underdeveloped economy. The real solution to the problem of unemployment lies, therefore, in diversification of employment which in turn requires a rapid development of our economy both in agriculture and industry. The magnitude of this problem is enhanced by the fact that our population is growing at the rate of about 4½ million people every year. Even assuming that the rate of growth of population is kept in check, the problem of fresh non-agricultural employment is going to be immense. Assuming that only about 40 per cent of the total population seek work or belong to the working age group as they do now, nearly two million people will be added annually to our working force. In the absence of adequate and increasing non-agricultural employment, I am afraid our economic position is bound to worsen, with all its attendant social and political implications.

There are two points which I would like to make here. It has been argued, I regret to say, even in responsible quarters, that large-scale modern industry is no solution to the employment problem. This argument does not take into account indirect employment which the manufacturing industry creates. A textile factory may employ only, say, a thousand workers, but indirectly it gives employment to many more. When we consider the employment created by the mill, we ought not to think only of the people who are directly employed, but of all the others also who depend for their livelihood on the running of the mill. This chain of indirect employment is most obvious in the industrial townships we find in various parts of our country. The numbers directly employed in the factories may be small; but 8 to 10 times that number share the prosperity created by new industries by finding employment in secondary or subsidiary industries and tertiary occupations.

There is another common argument to the effect that organised industries create unemployment by displacing people who are working on small-scale or cottage industry basis without the aid of motive power or machines. The fact is that large-scale production with the aid of modern machinery vastly increases the productivity of labour, improves the quality of the finished article, and leads to considerable reduction in the cost and thus increases consumer demand far beyond the limit that could be catered for by hand-made articles. Equally important is the fact that in this way the aggregate national income is maximised.

I realise that I am treading here on controversial ground, but I do desire that all concerned, whether in industry, in administration or elsewhere, should seriously consider the question whether employment 'per se' is the goal of our economic organisation. I would myself draw a clear distinction between employment that is gainful from the point of view of the nation in the sense that it maximises the aggregate national income and employment that merely keeps people at work at the lowest level of man-hour output. I concede there is still a considerable scope for rural industries; but I urge that that field has clear demarcations, and that we should not, in our enthusiasm to see people employed, divert our attention, energy and resources from the objective of employing them more productively and gainfully to that of keeping them merely employed, however wastefully.

I submit, therefore, that whichever way one looks at it, the industrial development of the country is a necessary condition not only for its progress but also for its survival. It is in this light, Sir, that I would comment on some events and policies which are causing concern or uneasiness to industry. No doubt, in the last few years Government have, from time to time, taken various measures to help industrial development, and we do appreciate what has already been done. Concessions have been granted in matters like higher depreciation allowances; and in some cases, Government have come to the aid of the industry by providing financial accommodation to tide over an emergency. Excise levies or export duties have been reduced in order to enable industry to market its product at home or abroad. Protection has been given in a number of cases, and tariff policies have been formulated with a view to helping industrial development. Institutions like the Industrial Finance Corporation have been set up to augment the financial resources available to industry. But, by and large, Government policies have so far been evolved merely to meet particular situations; and the manner of tackling them has also been piecemeal and almost on an ad hoc basis. What I would urge, however, is the desirability of launching a policy which, as a whole, has the clear impress of Government's earnest desire to create a new atmosphere, that is to say, an environment in which private initiative and enterprise can contribute its best in the task of building up the nation, with the conviction that effort will have its reward, and that the fruits of initiative and work will not be denied.

In this connection, it is well to remember that Government have adopted the concept of a mixed economy, a concept which has found broad public acceptance and with which business and industry are anxious to co-operate. But mixed economy implies the co-existence of public and private sectors, neither inferior to the other like the two sides of the same coin. In this scheme of things, it cannot and must not mean that the public sector enjoys some form of precedence, where the private industrial class is only temporarily tolerated and permitted merely to survive pending further developments in the public sector. A mixed economy can only function if there is, within the community, a balance of forces, with free enterprise operating as one of the autonomous forces pulling its weight alongside State enterprise, trade union and other elements in society. No programming, therefore, which seeks to fulfil the plans only in the public sector would really serve the needs of the community, if, as a result of the policies pursued, the private sector were to be starved of the requisite resources to perform its functions, or if it were meant to operate in an environment where its motives are in doubt or its mode of operation is unduly circumscribed by complex rules and regulations. What I am urging is that, within the broad limits inherent in the concept of a mixed economy, private enterprise must be allowed a certain freedom of action to function according to its own ways. I am glad, Sir, that this point was recognised by you in the course of your Speech last year.

But unfortunately Government policies do not always show sufficient awareness of the conditions under which private enterprise in a mixed economy can function. Of course, in modern times private enterprise cannot survive unless it is imbued with the spirit of service. Yet, everywhere its ideal should be the highest level of efficiency, realisable under conditions of free and fair competition and when the entrepreneur and the investor can look forward to a reasonable return for the service rendered and risks run. Under these conditions, free enterprise, in search of larger returns, will produce more goods, make them available to society at cheaper prices, expand the volume of employment and discover new ways of satisfying consumer wants. It should be recognised that the returns or profits of free enterprise do not constitute merely the income of the entrepreneur or of the investor, but they also form an important source of further investment in industry. At present, the importance of adequate returns for the development of industries is not often appreciated. For example, take the recent case of fixation of prices of cement. The Tariff Commission, in the case of cement, as also steel, after detailed scrutiny had recommended a price which was calculated to ensure a return of 10 per cent on the gross block to the industries—a return which would have left a net return to the producers of only some 4 per cent after payment of company taxation, managing agency commission, bonus to workers, etc. The suggested gross return has been reduced by Government to 8 per cent, so that the net return will come to only about 3 per cent. Similarly the return to the investor in the electric supply industry was limited by the Electricity (Supply) Act, 1948, to a ceiling of 5 per cent on the "capital base" which has been meticulously defined but is roughly equivalent to the net block. In spite of tightening money conditions since then, the Government have so far not agreed to allow an increase in this rate of return. I seriously doubt whether, on this basis, we can ever hope to secure the savings of the average investor in this or any other country to Indian industry. I would strongly urge upon Government the need to readjust their concept of "fair return" and the basis for computing it.

On the question of protection to indigenous industry also, there are certain things which deserve the careful consideration of Government. Apart from recommending the levy of import duties or increases in the rates of duties, the Tariff Commission generally recommend certain other forms of assistance also such as, placing of orders by Government with indigenous manufacturers, refund of duty on capital goods or raw materials, facilities for technical training, concessions in railway freights, etc. Often, these recommendations are accepted by Government in general terms; and it has been the experience that difficulties arise inasmuch as these ancillary recommendations are not given effect to and mere tariff protection is given to the extent recommended, or even to a lesser extent. Government should view the Tariff Commission's recommendations as an integral whole and if some of them are not implemented, the effective protection becomes much less. In fact, then the extent of tariff protection required would have to be even higher than what was recommended by the Tariff Commission.

Besides direct tariff protection, Government can also do a great deal through placing restrictions on imports. This is particularly true of industries in which the ultimate cost to the user is quite small—for instance, tea chests, ball-bearings, or pencils—because, in such cases, consumer prejudice in favour of imported articles cannot be overcome merely by levying a higher import duty. The need for import restrictions to safeguard the domestic industries also exists where the normal channels of distribution are largely in the hands of foreign firms, as in the case of certain chemicals and allied products. At the same time, Indian industrialists who require machinery and engineering goods for their factories can assist Indian industry very greatly by insisting on purchasing Indian goods wherever they are available, in spite possibly of a slightly higher price or slightly lower quality, so as to give breathing time to the Indian engineering industry to build itself up. Similarly, the purchase policy of Government can also play an important role now, when with the gradual expansion of the public sector, Government purchases have a significant influence on the production programmes of indigenous industry. We have made detailed suggestions to Government in this regard in our replies to the Stores Purchase Committee, and I shall not go into them now. I would like, however, to mention that Government patronage to indigenous manufacture is extended even in advanced industrial countries like the U.S.A. The legislation popularly known as the 'Buy American Act', which was enacted as far back as in 1933, and which requires the Government of the United States to give preference up to 25 per cent of the price of the competing foreign product "laid down" in the U.S.A. after paying duty to domestic purchasers, still continues to be in force. If the most advanced industrial country like the United States finds it necessary and desirable to give preference to indigenous manufacture, there is all the more reason why, in the early stages of our industrial development, our official policies must be outspokenly in favour of Swadeshi manufacture.

In addition to the assistance in the form of protection and Government purchases, there is the broader question of resources for the private sector, which in turn is closely linked up with the structure of taxation, and also with the existence of suitable institutional arrangements for securing industrial finance. On the important question of taxation, the Federation has submitted its views to the Taxation Enquiry Commission. There is, at present, a widespread agreement among informed opinion, that the present burden of taxation is acting as a serious deterrent to industrial development. The sheer weight of current taxation on those very sections of the community which form the entrepreneurial class, has tended to reduce the incentive to invest. Anything which says to those who organise new industries "if you should make a profit a large slice of it will be taken as tax, while if you make a loss that is your hard luck" can have no other consequence than to restrain people from organising and conducting corporate enterprise which involves risk. The whole question of the taxation structure is now before the Taxation Enquiry Commission, and I trust that they would make a realistic appraisal of the present system,

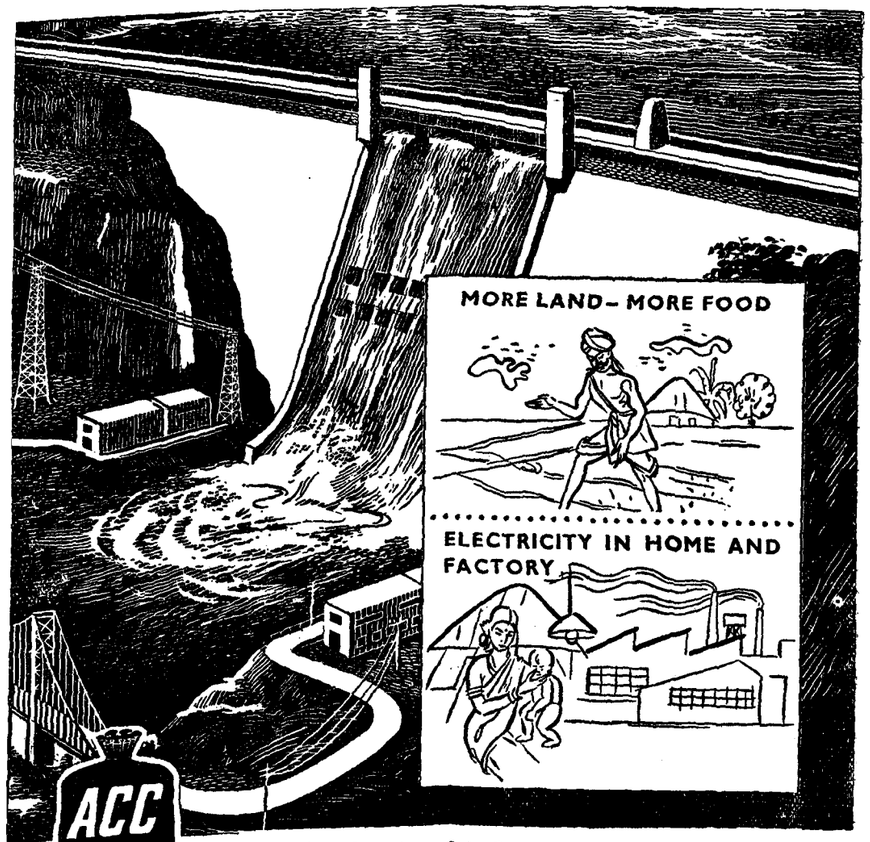
and suggest modifications which will encourage savings and investments.

There is another difficulty which I think constitutes a serious handicap to anyone wanting to launch forth into fresh fields of industrial activity. There are a number of 'don'ts' which Government policies have laid down. For instance, no one may put up a new line of manufacture or undertake what is known as "substantial expansion" without securing permission under the Industries (Development and Regulation) Act, and the Licensing Committee sees to it that investment does not take place in certain directions. But there is nothing positive, so far as I know, in present Government policy which would indicate to a prospective investor and entrepreneur, that the Government are actually eager that he should venture forth in one particular industry or the other, or that, if he does so, he will receive certain specified types of assistance. What I am suggesting is that just as there are a series of 'don'ts', there should also be specific fields of activity in which Government actually want private enterprise to come forward. I am sure that if a clear indication were given of any new or poorly established lines which Government think private industries should develop, the industrialists in this country will not be found wanting.

There is an important aspect of Government policy which continues to create difficulties for industry. Recently, the Federation conducted an urgent enquiry amongst its members to find out whether and to what extent employers had been deterred from expanding on account of labour legislation now in force. The replies received support the general feeling that labour legislation is acting as a restrictive influence on new employment. The same pattern is revealed in other sectors also. For instance, largely as a result of the operation of legislation relating to industrial disputes since 1948, the total number of offices of scheduled banks fell from 2913 in 1948 to 2647 in 1951. In the case of the non-scheduled banks, the decline was equally large, the number of offices declining from 1769 in 1948 to 1504 in 1951. The fall in the number of offices of banks has not had any appreciable effect on the volume of employment mainly because banks have been prevented from discharging surplus staff by the orders of the Labour Commissioners or Tribunals. There is a further anomaly in the present situation in that Government Departments are allowed to retrench personnel, but private industry is denied the right to adjust its labour force and costs in the context of improved available methods of production or of changing market conditions. While justifying retrenchment in some Government offices, it was stated, and quite rightly, on the floor of the House, that it was impossible to keep people who had absolutely no work. I, for one, can see no reason why the same principle should not hold good in private industry as well.

Of course, I am aware, Sir, that the entire question of labour relations is a human problem and that one cannot apply merely economic considerations to a problem which is a broader sociological one. But, the fundamental question is, whether the present labour policy is really in the long-term interests of labour itself. At present, if anything, it places all kinds of restraints and restrictions on the employer and discourages him from giving more employment. Perhaps the hands of those who are already in employment are strengthened through the current labour legislation but this is done at the cost of those who are seeking employment. Government, in their attempts to stem temporary unemployment, are also lessening the chances of those presently unemployed of securing employment and to this extent the present policies are self-defeating. While the important contribution of labour to production is acknowledged, and while labour must certainly receive its just dues, it should be remembered that real earnings are ultimately linked up with productivity. It is, however, heartening to note that in responsible labour circles also the truth that the only way in which the earnings of labour can be really improved is by improving the productivity of labour is gaining ground. Recently Shri Jaiprakash Narain has boldly and frankly come out publicly in favour of this idea. In a message to the All-India Postmen and Lower Grade Staff Union on the occasion of the Union's Silver Jubilee Conference he had stated quite explicitly that "if labour is to advance further, which it should undoubtedly do, trade unions must be prepared to take the responsibility for increased production". He was also equally explicit that "a stage has been reached in which little improvement is possible unless the trade union movement is prepared to co-operate in improving efficiency and standards of production."

Permit me, Sir, to refer to a point in which all of us, quite irrespective of the vocation we pursue, are and should be interested as citizens of a free country. It is as to how best we can preserve our freedom. To my mind, the primary condition is the unshakable faith not only in our country's destiny but also in its unity. In a country so large as ours, with wide diversities in race, language and religion, we must always vigilantly guard against conscious or unconscious words and deeds which exaggerate differences or undermine the basic unity of the nation. I am convinced that, more than anything else, modern commerce and industry is the most important single factor that promotes political and economic unity. In fact, Commerce and industry can themselves neither thrive nor contribute their maximum to the welfare of the community except on the solid foundation of political and economic unity. It is in this light that the policies pursued by some of the State Governments in matters like sales tax and Government purchases have to be considered.



The policies of many State Governments in regard to sales tax have, no doubt, unwittingly, impeded inter-State trade and the impediments seemed at one time likely to threaten to some extent the economic solidarity of the country. Fortunately, wiser counsels appear to have prevailed and the question of sales tax in relation to inter-State trade is being reconsidered. I would respectfully urge all the State Governments to establish and maintain conditions under which inter-State trade can flow freely in all directions within this great country without let or hindrance. Similarly the policy of some State Governments in discriminating against manufactures of other States cuts at the very root of our national unity. "Regional development", like all slogans, can be and is over-stated; and such merit as it undoubtedly possesses is vitiated by excessive zeal. It behoves the Central Government, which is charged with the general economic well-being and political unity of the nation, to insist that no policies shall be countenanced which tend to disrupt the solidarity of the country.

One final word to my friends—the business community. The ultimate test by which we the business men of India will be judged will be the service we render to the Indian people, and the reputation we establish for fair dealing and integrity. We, too, must not be ensnared by narrow considerations of linguism, or by the attractive pitfalls of regionalism. For us there can be no better objective than the best interests of our country and no higher Court of Appeal than our own countrymen. Ours is a great country with a great future, and its business men can play an important part in shaping its destiny. In this role the Federation can be a valuable instrument, if it has the co-operation and support of the business community as a whole.

BHAKRA-NANGAL PROJECT
Built to last with ACC Cement

The colossal Bhakra-Nangal scheme will harness the waters of the river Sutlej for irrigation and power. It consists of two mighty dams, at Bhakra and Nangal respectively, and five power stations. When completed, it will bring millions of acres of land under irrigation and will supply electric power to the surrounding areas.

In this task of increasing the economic wealth of the country, ACC Cement is playing a vital part.

The free technical services of the Concrete Association of India at 82/84 Queensway, New Delhi, are available on all construction problems.

"CARBON" DEPOSITS IN PETROL ENGINES

Ignition Control Additive And Its Technical Background

THERE is, at the present time, a great deal of inaccurate thought not only on the part of motorists, but of many automobile engineers, in regard to the so-called "carbon" deposits which form in the combustion chambers of a modern petrol-driven engine.

"Carbon", in this context, really means the products formed by the incomplete combustion of pure hydrocarbon substances such as the straight petrol and the undoped lubricating oils used in early engines, which were of relatively low compression ratio and of low speed.

Development in engine design, resulting from demands for more power, greater economy and, to a lesser extent, reduction in overall weight in units of given capacity, has lead to higher and higher compression ratios and speeds which, in turn, have made the use of leaded fuels and doped lubricating oils essential.

The result of this has been that combustion chamber deposits, although still referred to by most people as "carbon" are in practice far from it and, in fact, consist of lead compounds derived from the fuel, to the extent of 70 to 90 per cent of the total.

It is, of course, well known that tetra ethyl lead is added to motor spirit to raise its octane value to a level suitable for the requirements of the modern high compression engine and, the difference in combustion chamber deposits resulting from lead compounds and those of carbonaceous origin are clearly seen by visual examination as, while the latter are black, the former are of a greyish colour.

The problems arising from the ill effects of lead compound deposits in combustion chambers first became acute in the case of aero engines where, of course, fuels of a very much higher tetra ethyl lead content are employed than that of Motor Spirit, and plug fouling became so pronounced that it formed the major cause, in the Second World War, of unscheduled delays of aircraft, rapid increase in maintenance and, in some cases, dangerous power loss at take off.

Plug Fouling

The problem was more pronounced in the case of in-line engines than in the radial type, on account of the greater difficulty involved in obtaining uniform fuel-air mixture distribution to all cylinders in the former design, and Shell Research Laboratories first gave thought to the possibilities of improving the "scavenger" introduced with tetra ethyl lead which is normally ethylene dibromide.

The purpose of the introduction of a "scavenger" into gasoline along with the tetra ethyl lead is, as its name implies, to combine with it chemically and scavenge it from combustion chambers in a form in which it is readily dissipated.

Very complete investigation of the performance and effect of ethylene dibromide then took place and, although alternative "scavengers" were tried, it was found that as ethylene dibromide was already removing 97 or 98 per cent of the lead compounds formed during combustion the remedy did not lie in this direction, as the remaining 2 or 3 per cent were generally the result of inequal lead distribution between cylinders caused by inlet manifold design features, which could not be eradicated because of general engine layout.

In view of this conclusion, research was then directed towards a thorough investigation of the mechanism of plug fouling in which X-ray analysis was the key technique used to identify deposits, which proved to be complex combinations of lead, bromine, oxygen and sulphur—these compounds constituted 70 to 90 per cent of the total, the remainder being carbonaceous material.

Cause of Failures

The particular compounds found on plugs were then examined for their physical and electrical properties and it was found they were capable of causing plug failure as a result of three main causes:

(i) Under operating conditions resulting in high plug temperatures they are capable of causing short circuits, as their electrical resistance diminishes rapidly with temperature. This phenomenon is most likely to be noticed by motorists when accelerating after a spell of traffic driving in the form of a mysterious misfire, which disappears when the engine cools off, only again to reappear on further acceleration.

(ii) Bridging of the plug gap by flying chunks of deposit. This cuts out the plug completely by forming a direct short circuit, and it will not function again at all until it has been removed from the engine and cleaned. This phenomenon may be mistaken for "oiling up" by the motorist although, in practice, it has nothing to do with it.

(iii) The third, more common, is caused by the formation of an electrically conductive track to earth along the inside of the plug insulator. This phenomenon is exceedingly difficult to detect in the modern type of automobile plug which cannot be dismantled for inspection and cleaning and, although its effect is similar to that described under (i) above, it will not respond to sand blasting, whereas the former can be corrected, temporarily, by this means; current aircraft practice is now swinging to chemical cleaning methods to remove such deposits.

In view of the fact that Shell investigators had reached the conclusion that complete eradictation of lead deposits from combustion chambers was impracticable, and having acquired data in regard to the particular features of these deposits which were responsible for plug failures, they set about a new line of investigation to find a substance, to be added to the fuel, which would change these deposits chemically into a form in which they would be innocuous.

Combustion chamber and piston head deposits were found to consist mostly of lead bromide, lead oxybromide and lead oxysulphate which have melting points of 370 deg. c., 710 deg. c. and 980 deg c. respectively. Those on plug insulators were slightly more complex, they too contained a large proportion of lead bromide of the low melting point of 370 deg. c., which also has the undesirable features of losing all electrical resistance at engine operating temperatures and, when combined with carbon, a catalytic effect is obtained.

This reduces the latter's ignition temperature from 500 deg. c. to approximately 200 deg. c., a figure which is, of course, well within the operating temperature of a petrol engine.

New Additive

The substance found the most satisfactory for reducing plug fouling was tri-cresyl phosphate which, by forming lead phosphate complexes, raised the general melting point of the deposits from 370 deg. c. for lead bromide to temperatures ranging from 950 deg. c. to over 1,000 deg. c.; furthermore, the lead phosphate complexes so formed have excellent electrical resistance at temperature as high as 600 deg. c. and still retain resistance at 750 deg. c. which is beyond the range normally encountered in a petrol engine.

In 1930 the average compression ratio of petrol-driven automotive engines was slightly less than 5 : 1 whereas today it is 7 : 1, and, there are cars on the road with ratios of 8.5 : 1.

This change alone has meant an improvement in consumption of 15 to 20 per cent, and it has been met by increasing the octane number of Motor Spirit.

There is, naturally, a desire on the part of engine manufacturers to pursue this policy to new levels, but experience has shown that the production of fuels of high octane value to meet the need of still higher compression ratios, is not the only obstacle to development.

Pre-ignition

Pre-ignition which, in the automotive engine, usually takes the form of uncontrolled ignition of the fuel-air mixture by incandescent deposits, is a problem quite separate from what is known as "knock", is much less amenable to treatment by increased octane quality and is, to some extent, more serious than plug fouling, as the latter could be corrected by fitting new plugs but, before the introduction of I.C.A., the former could only be corrected by stripping the engine and removing the deposits physically.

Road vehicle engines are generally of in-line construction, that is to say, they are generally of straight four cylinder, straight six cylinder, straight or V. 8 design and, as such, they tend to suffer from uneven lead distribution between cylinders with its attendant plug fouling and pre-ignition troubles.

The symptoms of pre-ignition vary considerably and are not easy to define but, generally speaking, mysterious noises, lack of power and rough running which shew up when an engine is hot, subside when it cools off only to reappear when full power is again employed, have their basis in pre-ignition.

Another sympton which may have the same cause is "running on" i.e., the engine continues to run when the ignition is switched off but, on the other hand, "running on" is not necessarily caused by incandescent cylinder head deposits, as a hot spot of any kind such as a plug electrode or exhaust valve can have the same effect.

Tri-cresyl phosphate does not, itself, improve the octane value as measured by the Motor Research Methods on the C.F.R. variable compression ratio test engine, but the actual octane requirement of an engine which has covered many miles in a road vehicle increases appreciably as a result of fouling and tendency to pre-ignition and it is found, in practice, that it is generally possible to advance ignition settings appreciably with a consequent gain in economy and power as a result of its use.

I.C.A. (Ignition Control Additive) now contained in all supplies of Shell and B.O.C. leaded Motor Spirit is tri-cresyl phosphate, which converts combustion chamber deposits into lead phosphate complexes thereby rendering them harmless is, itself, a major discovery which will be of incalculable assistance in engine development.

Undivided India

§Average of weeks from November 1951

INDIA'S TRADE WITH THE U. K.

I. PRINCIPAL EXPORTS

(Thousand £)

	Full year 1952	December		12 Months Jan–Dec.	
		1952	1953	1952	1953
Total All Exports	114,554	10,598	11,983	114,554	101,500
Of which :–					
Tea	48,732	5,160	7,183	48,743	51,928
Tobacco	6,956	391	485	6,956	5,790
Non-metalliferous mining and quarry products other than coal	2,760	220	165	2,760	1,650
Non-ferrous metalliferous ores and scrap*	3,184	425	317	3,184	3,303
Raw cotton and cotton waste	2,297	308	177	2,297	2,993
Wool, raw and waste and woollen rags	3,447	530	67	3,447	3,935
Seeds and nuts for oil, oils, fats, resins and gums	6,139	378	111	6,139	4,147
Hides and skins, undressed	538	79	64	538	954
Woollen and worsted yarns and manufactures@	1,231	175	162	1,231	1,958
Coir mats and matting	1,216	191	198	1,216	1,869
Jute manufactures	13,261	109	900	13,261	6,493
Oils, fats and resins, manufactured	1,230	71	62	1,230	650
Leather and manufactures	9,284	1,497	1,014	9,284	14,014

* Mainly manganese ore. @ Mainly carpets, floor rugs, etc.

II. PRINCIPAL IMPORTS

(Thousand £)

	Full year 1952	December		12 Months Jan–NDec.	
		1952	1953	1952	1953
Total All Imports	112,149	3,009	9,679	112,149	114,491
Of which :					
Machinery	35,625	3,009	2,898	35,625	33,767
Vehicles (including ships & locomotives)	16,824	1,300	1,295	16,824	15,308
Iron & steel & manufactures	7,752	748	672	7,752	7,391
Pottery, glass, abrasives, etc.	1,885	135	139	1,885	1,726
Non-ferrous metals & manufactures	2,348	184	172	2,348	3,445
Cutlery, hardware, implements & instruments	3,572	312	238	3,572	3,673
Electrical goods & apparatus	11,393	1,217	470	11,393	10,509
Cotton yarns & manufactures	3,478	380	222	3,478	2,319
Woollen & worsted yarns & manufactures	4,840	227	357	4,840	5,733
Silk & artificial silk yarns & manufactures	692	38	96	692	841
Chemicals, drugs, dyes & colours	9,969	492	695	9,969	9,938
Paper, cardboard, etc.	2,128	122	58	2,128	1,282

III. INDIA'S IMPORTS OF MACHINERY FROM THE U. K.

(Thousand £)

	Full year 1952	December		12 Months Jan–Dec.	
		1952	1953	1952	1953
Total Machinery	35,626	3,009	2,898	35,625	33,767
Of which :					
Agricultural machinery	460	11	6	460	122
Boilers & boiler-house plant—					
Boilers, water tube	593	51	54	593	464
Other	865	133	69	865	1,189
Electrical machinery—					
Generators	1,236	103	150	1,236	1,505
Motors & parts	613	44	59	613	777
Other descriptions	3,921	385	561	3,921	5,079
Excavating & earth-moving machinery	790	14	59	790	483
Mechanical handling equipment	1,004	148	168	1.004	1,443
Machine tools (metal working)	1,336	188	114	1,336	1,934
Mining machinery, other than portable power tools	418	34	21	418	307
Internal combustion engines—					
Marine	58	5	9	58	65
Other	3,437	104	42	3,437	407
Printing, bookbinding, etc., machines	697	31	35	697	801
Pumps	980	79	57	980	856
Refrigerating machinery	228	12	18	228	263
Sugar making & refining machinery	216	18	8	216	279
Textile machinery	8,668	728	593	8,668	6,990

Pakistan: This Picture and That

THE people of Pakistan have good reason to be satisfied with the Budget for 1954-55 which Mr. Mohammed Ali presented to the Pakistan Parliament last Monday. The income-tax exemption limit has been raised from Rs. 3,600 to Rs. 4,200 and income-tax and super-tax exemptions on investments of share capital in approved industrial public companies have been continued for a further period of one year subject to existing limits. The import and excise duties on motor spirit have been reduced from Rs. 2 to Rs. 1-8 per gallon; the import duties on coconut oil, copra or coconut kernels, and spices have all been reduced to 30 per cent. The exemption from tea export duty has been continued for another year; and there is also exemption in respect of taxation on money brought from abroad for another year. A twenty per cent rebate of import duty will now be granted on radio parts imported for assembly of sets in Pakistan. And there is relief described as "cent per cent of Pakistan tax or foreign tax, whichever is lower," to residents of Pakistan in respect of their foreign income. There have been concessions all round. And yet there is a small surplus (after these concessions) on revenue account of Rs. 10 lakhs, expenditure being estimated at Rs. 111.37 crores and revenue at Rs. 111.47 crores. A surplus of the same order is shown in the revised estimates for 1953-54 with revenue at Rs. 107.92 crores and expenditure at Rs. 107.83 crores.

It is just that a tribute should be paid to Mr. Mohammed Ali, whose management of the finances of Pakistan, now that he is back at the helm, bears every sign of imagination and understanding of the popular mind. There are no irritating little levies like our soap and footwear excises; there are substantial psychological reliefs, although from the fact that they only cost the Exchequer Rs. 2.2 crores, nobody need be deceived on their generosity in substance. Nevertheless, the Finance Minister of Pakistan has better understood the political temper of our age than has the Finance Minister of India. Both have stopped short of soaking the rich, but the Finance Minister of Pakistan has refrained from making even a token thrust at the poor. On the contrary, he has shown his sympathy in a form which will win quick appreciation. The only complaint that can be made is that it is still too little and a little too late.

By a coincidence which had its striking parallel on Budget day in India, the first results of the East Bengal elections were released in Karachi on Budget day. As the first results of the Travancore-Cochin elections contained a rebuke to Congress administration in Travancore-Cochin, the preliminary results in East Bengal show an overwhelming rebuke to the Muslim League Government there. The humiliation has been far greater for the Muslim League than was the Congress set-back in Travancore-Cochin. Mr. Nurul Amin, Chief Minister of East Bengal, was defeated in his home constituency by 7,000 votes by a student leader, Mr. Khaliq Nawaz, of whom nothing has been heard outside Pakistan until this day. At the time of writing, the United Front has won 85 out of 96 seats the results of which have been announced; the Muslim League has won only 3 seats. There is no record in the history of the subcontinent of any rout as great as this of the forces of an administration in power. Two conclusions would appear to follow. Firstly, these elections have been fair; secondly, because these elections have been fair, the stock of the Muslim League in East Bengal has slumped to about zero.

The satisfaction with which Karachi might have viewed the splendid stewardship of Mr. Mohammed Ali—whose gallant fight back to health has been highly correlated with Pakistan's financial recovery—has thus been rudely shaken. An element of high instability has thus appeared in the economic life of Pakistan which not all the spacious inducements that the Finance Minister can hold out can affect or restrain. At this particular moment, it is not clear what the United Front will do with its spectacular victory. But it is becoming increasingly clear that Mr. Mohammed Ali, Prime Minister of Pakistan, whose party has been overwhelmingly defeated, cannot for long hold the reins in Karachi. His position as Prime Minister of Pakistan was a concession to his following in East Bengal. Now that his following in East Bengal has been hopelessly exposed, it can only be a matter of weeks—may be even days—before he vacates his office.

As the 80-year old United Front Leader, Fazl-ul-Haq, moves into office in East Bengal, the question will arise what pressure his arrival will exert on the Central Government. Almost certainly the way will be paved for the arrival in Karachi of Shaheed Suhrawardy, and no more controversial figure could be thrown into the politics of West Pakistan. A Cabinet crisis in Karachi cannot be very long delayed. There is every justification for the Finance Minister to be asked to stay at his post whatever political pressures arise. But almost every other Minister of the Central Government must be deemed for the present to be a bird of no certain abode.

These results cannot be viewed with satisfaction in India. Stability in the sub-continent is of mutual interest to India and Pakistan. There is also no indication that these changes involve friendlier relations with India than Mr. Mohammed Ali, Pakistan's present Prime Minister, was able to provide. Moreover, the greater the political instability in Pakistan, the greater will be the temptation for politicians in Pakistan to inflame passions on Kashmir to distract public opinion from internal differences and fix round a foreign issue, on which it is known all Pakistan is passionately united. The situation is full of dangerous possibilities. It is vital that Indian opinion today should be restrained and particularly cautious in its expression.

One conclusion should at least follow from the uncertainty which the present elections have created. In her present state, Pakistan is in no position to fulfil all her obligations as an instrument in a policy of military containment in the form which both Turkey and the United States were led to expect a month or even a week ago. It follows, therefore, that the military alliances of Pakistan will certainly be weakened in fact, and, to that extent, India has less reason for concern that much military material will be poured into Pakistan. A period of rapid rethinking is certainly decreed on the State Department by these events. The United States has backed the wrong horse before with results which are written in blood across the story of recent Sino-American relations. It is almost certain that a period of pause in the backing given to Mr. Mohammed Ali will now ensue.

These fierce set-backs should not detract from Pakistan's substantial achievements in the economic field. Two of these achievements, which are of the utmost concern to India, deserve to be repeated in the words in which they were described by Mr. Mohammed Ali is his Budget speech. He said: "The year 1953 has a remarkable record of industrial production, with the cotton textile industry in the forefront. The installed capacity of this industry now is 792,898 spindles and 11,911 looms, as against 410,226 spindles and 6,964 looms on 1st January, 1953. In addition, 209,530 spindles and 618 looms are under installation. Textile and yarn production registered an increase of 37 per cent and 163 per cent respectively during 1953 over the previous year. With the installation of the spindles and looms that have already arrived and those on order, the country is expected to attain self-sufficiency in the coarse and medium varieties of cloth in the near future. Looking back to 1949, when Pakistan had no more than 177,418 spindles and 4,824 looms and had to import textiles and yarn exceeding Rs. 50 crores, the rapid development of the cotton textile industry in the last few years is indeed an outstanding achievement.

"Of similar significance is the progress made by the jute industry. Pakistan is now producing more than its full requirements of jute goods which are estimated at about Rs. 4 crores per annum. Our jute goods have already made their debut in foreign markets, where they have had a good reception. During 1954, about 66,000 tons of jute manufactures valued at about Rs. 7 crores are expected to be exported. Of these about half will go to the dollar area. On account of the rapid progress of the jute industry, the target of 6,000 looms fixed earlier for 1957 is now expected to be reached in 1955."

Has the Ministry of Commerce and Industry in India seen the full significance of these two paragraphs? For India, they may well prove to be the most significant paragraphs of a remarkable speech which deserves close study under many other heads.

By Force of Hands

USING his brute majority in the House of the People, the Home Minister succeeded last Saturday in defacing the Statute Book by extending the life of the Press (Objectionable Matter) Act by two more years. For friends of Indian democracy, it was an unhappy occasion. Nowhere did the Government case look good to reason; the opposition parties were, for once, all together. Even a token concession to this opposition might have justified this view that Indian democracy was at least in some small part an exercise in persuasion. But on this occasion bad argument was attended by bad public relations. The Press has been angered; the opposition has been humiliated; the public everywhere has been given a deplorable exhibition of the use of the party whip to compel Congress legislators to conform to the will of one man. As far as can be ascertained, only the Home Minister was keen on rushing this measure on the Statute Book. Everyone else was quite prepared to leave legislation until the Press Commission had reported later in the year.

It is difficult to explain why Home Ministers of the Government of India are so readily stampeded into preventive measures and restrictive practices. Men with the powerful and liberal traditions of the law that Rajaji and Dr. Katju himself have had suffer a curious change of countenance when they become protagonists of the Home Ministry in the restriction of civil liberties which, as legal practitioners, they have spent their whole lives in upholding. When Rajaji was putting through the Amendment to the Constitution in 1951 and then the Press Act, many of his friends in the Press as well as outside were unable to recognise the stalwart friend of the Press which they had known him previously to be. It was fortunately only a temporary eclipse in his case. As Chief Minister of Madras, Rajaji has shown that the Press (Objectionable Matter) Act is not necessary for the executive; he has consistently declined to use it. And there is thus prima facie evidence that, when he was pressing for restrictive legislation as Home Minister, he had only become a cog in a machine which has not changed its character merely because the representatives of the people have stepped into places formerly made for members of the old steel frame.

The point that the ordinary law of the land is now sufficient for Rajaji while it is not sufficient for Dr. Katju is significant. Great confusion was created in this debate by the alternative presented by the Home Minister in a jesting sentence—"I make a fair offer; do you want to be prosecuted under the ordinary law or do you want to take this lenient law?" Everyone knows the Press has already exercised its choice; it wants the ordinary law. But, apart from this, the choice presented is dishonest. With this special law, it is not a question of either/or but both. Since the ordinary law is not repealed, the Press has an additional disability. To present the case as an alternative was typical of the arguments which the Home Minister chose to employ.
